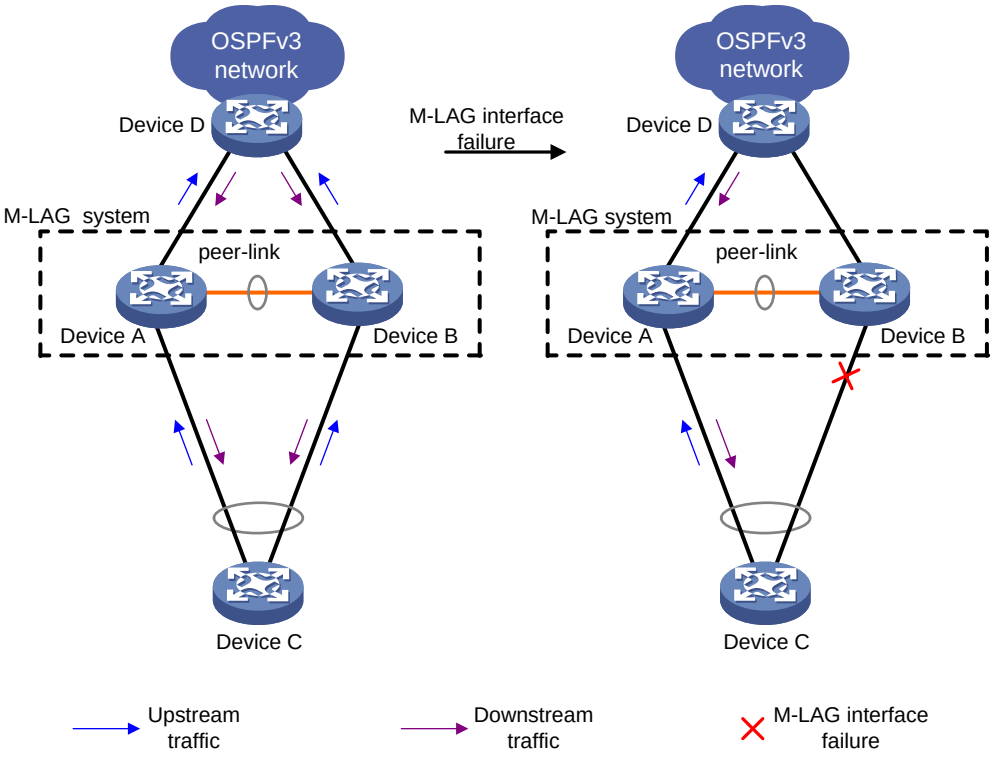
- Device D cannot detect the M-LAG interface failure and still forwards traffic through Device B. Because the link between Device B and Device C fails, traffic from Device D to Device C is switched from path Device D->Device B->Device C to path Device D->Device B->Device A->Device C.

Figure 2 Traffic forwarding path after M-LAG interface failure



To prevent the downstream traffic from detouring through the M-LAG peer link, perform the following tasks on Device B:

1. Execute the **track interface** command to create a track entry and associate it with the link state of the M-LAG interface. For more information about the **track interface** command, see track commands in *High Availability Command Reference*.
2. Execute the **ospfv3 track adjust-cost** command to associate the gateway interface with the track entry.

Then, Device B adjusts the cost of the gateway interface based on the state of the associated track entry:

- When the M-LAG interface fails, the track entry state becomes negative, and OSPFv3 increases the cost of the gateway interface. Then, traffic from Device D to Device C is switched to path Device D->Device A->Device C.
- When the M-LAG interface recovers, the track entry state becomes positive, and OSPFv3 restores the cost of the gateway interface to the original value. Then, traffic from Device D to Device C is switched back to path Device D->Device B->Device C.

Figure 3 Traffic forwarding path after associating OSPFv3 with Track

Restrictions and guidelines

The S5200-EI-G switch series does not support M-LAG.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Associate the OSPFv3 interface with a track entry to adjust the cost of the interface based on the track entry state.
   ospfv3 track *track-entry-number* **adjust-cost** { *cost-offset* | **max** }
   By default, an OSPFv3 interface is not associated with any track entry.

Setting the maximum number of OSPFv3 ECMP routes

About this task

OSPFv3 might find multiple equal-cost routes to the same destination, which can be used to share the traffic load. This task allows you to set the maximum number of ECMP routes.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of ECMP routes.

maximum load-balancing *number*

By default, the maximum number of OSPFv3 ECMP routes equals the maximum number of ECMP routes supported by the system.

Setting a preference for OSPFv3

About this task

A router can run multiple routing protocols. The system assigns a priority for each protocol. When these routing protocols find the same route, the route found by the protocol with the highest priority is selected.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set a preference for OSPFv3.

   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPFv3 internal routes is 10, and the preference of OSPFv3 external routes is 150.

Configuring OSPFv3 route redistribution

Restrictions and guidelines

Because OSPFv3 is a link state routing protocol, it cannot directly filter LSAs to be advertised. OSPFv3 filters only redistributed routes. Only routes that are not filtered out can be advertised in LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure route redistribution.

   import-route bgp4+ [*as-number*] [**allow-ibgp**] [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, OSPFv3 does not redistribute routes.

   The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command redistributes both EBGP and IBGP routes, which might cause routing loops. Therefore, use the **import-route bgp4+ allow-ibgp** command with caution.

4. (Optional.) Configure OSPFv3 to filter redistributed routes.

filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [**bgp4+** | **direct** | { **isisv6** | **ospfv3** | **ripng** } [*process-id*] | **static**]

By default, OSPFv3 accepts all redistributed routes.

This command filters only routes redistributed by the **import-route** command. If no routes are redistributed by the **import-route** command, this command does not take effect.

5. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Configuring default route redistribution

About this task

The **import-route** command cannot redistribute a default external route. To redistribute a default route, perform this task.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no default route is redistributed.

4. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Setting OSPFv3 timers

Setting OSPFv3 packet timers

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospfv3 timer hello *seconds* [**instance** *instance-id*]

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the dead interval.

   ospfv3 timer dead *seconds* [**instance** *instance-id*]

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

The dead interval set on neighboring interfaces cannot be too short. If the interval is too short, a neighbor is easily down.

5. Set the poll interval.

   ospfv3 timer poll *seconds* [**instance** *instance-id*]

   By default, the poll interval is 120 seconds.

6. Set the LSA retransmission interval.

   ospfv3 timer retransmit *interval* [**instance** *instance-id*]

   The default LSA retransmission interval is 5 seconds.

   The LSA retransmission interval cannot be too short. If the interval is too short, unnecessary retransmissions will occur.

Setting the LSA transmission delay

About this task

Each LSA in the LSDB has an age that increases by 1 every second, but the age does not change during transmission. Therefore, it is necessary to add a transmission delay into the age time, especially for low-speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospfv3 trans-delay *seconds* [**instance** *instance-id*]

   By default, the LSA transmission delay is 1 second.

Setting the OSPFv3 route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.
- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.

- The interval for subsequent route calculations is *maximum-interval*.

- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPFv3.
   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the LSA generation interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA generation interval settings for OSPFv3.

By default, the LSA generation interval is fixed at 5 seconds for OSPFv3.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation**-*interval maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The LSA generation interval is fixed at *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for subsequent LSA generations is *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA generation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Setting the LSU transmit rate

About this task

Sending large numbers of LSU packets affects router performance and consumes a large amount of network bandwidth. You can configure the router to send LSU packets at an interval and to limit the maximum number of LSU packets sent out of an OSPFv3 interface at each interval.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSU transmit rate.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPFv3 interface sends a maximum of three LSU packets every 20 milliseconds.

Setting a DR priority for an interface

About this task

The router priority is used for DR election. Interfaces having the priority 0 cannot become a DR or BDR.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set a router priority.

   ospfv3 dr-priority *priority* [**instance** *instance-id*]

   The default router priority is 1.

Configuring OSPFv3 packet parameters

Ignoring MTU check for DD packets

About this task

When LSAs are few in DD packets, it is unnecessary to check the MTU in DD packets to improve efficiency.

Restrictions and guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Ignore MTU check for DD packets.
   ospfv3 mtu-ignore [**instance** *instance-id*]
   By default, OSPFv3 does not ignore MTU check for DD packets.

Disabling interfaces from receiving and sending OSPFv3 packets

About this task

After an OSPFv3 interface is set to **silent**, direct routes of the interface can still be advertised in Intra-Area-Prefix LSAs through other interfaces, but other OSPFv3 packets cannot be advertised. No neighboring relationship can be established on the interface. This feature can enhance the adaptability of OSPFv3 networking.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable interfaces from receiving and sending OSPFv3 packets.
   silent-interface { *interface-type interface-number* | **all** }
   By default, the interfaces can receive and send OSPFv3 packets.
   This command disables only the interfaces that run the current process. However, multiple OSPFv3 processes can disable the same interface from receiving and sending OSPFv3 packets.

Configuring prefix suppression

About prefix suppression

By default, an OSPFv3 interface advertises all of its prefixes in LSAs. To speed up OSPFv3 convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-8 LSAs.
- On broadcast and NBMA networks, the DR does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-2 LSAs.
- On P2P and P2MP networks, OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPFv3 routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPFv3 process

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable prefix suppression for the OSPFv3 process.
   prefix-suppression
   By default, prefix suppression is disabled for an OSPFv3 process.
   Enabling prefix suppression for an OSPFv3 process does not suppress the prefixes of loopback interfaces and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable prefix suppression for the interface.
   ospfv3 prefix-suppression [**disable**] [**instance** *instance-id*]
   By default, prefix suppression is disabled for an interface.

Configuring OSPFv3 advanced features

Configuring a stub router

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPFv3 routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Use either of the following methods to configure a router as a stub router:

- Clear the R-bit of the Option field in Type-1 LSAs. When the R-bit is clear, the OSPFv3 router can participate in OSPFv3 topology distribution without forwarding traffic.
- Use the OSPFv3 max-metric router LSA feature. This feature enables OSPFv3 to advertise its locally generated Type-1 LSAs with a maximum cost of 65535. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.

ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure the router as a stub router.
   - Configure the router as a stub router and clear the R-bit of the Option field in Type-1 LSAs.

     stub-router r-bit [**include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *
   - Configure the router as a stub router and advertise the locally generated Type-1 LSAs with the maximum cost of 65535.

     stub-router max-metric [**external-lsa** [*max-metric-value*] | **summary-lsa** [*max-metric-value*] | **include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPFv3 isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPFv3 isolation works as follows:

1. After OSPFv3 isolation is enabled for a device, OSPFv3 increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is set to 65535.
   - The link cost in Type-9 LSAs (Intra-area-prefix LSAs) that reference Type-1 LSAs is set to 65535.
   - The link cost in the following LSAs is set to 16711680:
     - Type-3 LSAs (Inter-area-prefix LSAs).
     - Type-4 LSAs (Inter-area-router LSAs).
     - Type-5 LSAs (AS external LSAs).
     - Type-7 LSAs (NSSA LSAs).
2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPFv3 isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router max-metric external-lsa 16711680 summary-lsa 16711680 include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router max-metric** commands, follow these restrictions and guidelines:

- If you specify the **external-lsa** and **summary-lsa** keywords in the **stub-router max-metric** command, the higher one of the two link costs provided by the isolation feature and the stub router feature takes effect.
- If the **on-startup** keyword is specified in the **stub-router max-metric** command, traffic forwarding path selection is affected only by the isolation feature when the stub router feature does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 isolation.
   - Enable OSPFv3 isolation to gracefully isolate the device from the network.
     isolate enable
   - Disable OSPFv3 isolation to gracefully add the device back to the network.
     undo isolate enable

   By default, OSPFv3 isolation is disabled.

Configuring OSPFv3 shutdown

About this task

For maintenance purposes, you can use this feature to shut down processes on the device with small impact on the network. If you shut down an OSPFv3 process, it will perform the following operations:

- Send 1-way hello packets to its neighbors.

  On receipt of the packets, the neighbors disconnect from the process and use the backup path to forward traffic.
- Stop receiving and sending OSPFv3 packets.
- Clear its neighbor, LSDB, and OSPFv3 route information.

After maintenance, you can use the **undo shutdown process** command to restart the process for neighbor relationship re-establishment.

This feature shuts down an OSPFv3 process while retaining the process-associated settings to facilitate your maintenance.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 shutdown for OSPFv3 maintenance.
   a. Shut down an OSPFv3 process to isolate it from the network.
      shutdown process
   b. Restart the OSPFv3 process to add it back to the network.
      undo shutdown process

   By default, the OSPFv3 process is not shut down.

Configuring OSPFv3 GR

About OSPFv3 GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must be Graceful Restart capable.
- **GR helper**—The neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

After the active/standby switchover, the GR restarter sends a Grace LSA to tell its neighbors that it performs a GR. Upon receiving the Grace LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Restrictions and guidelines for OSPFv3 GR

You cannot enable OSPFv3 NSR on a device that acts as GR restarter.

Configuring GR restarter

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR capability.
   graceful-restart enable [**global** | **planned-only**] *
   By default, OSPFv3 GR restarter capability is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring GR helper

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, the GR helper capability is enabled.

4. Enable strict LSA checking.

   graceful-restart helper strict-lsa-checking

   By default, strict LSA checking is disabled.

Triggering OSPFv3 GR

About this task

OSPFv3 GR is triggered by an active/standby switchover or when this task is performed.

Procedure

To trigger OSPFv3 GR, execute the **reset ospfv3** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPFv3 NSR

About this task

Nonstop routing (NSR) backs up OSPFv3 link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPFv3 NSR or OSPFv3 GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPFv3 NSR and OSPFv3 GR as follows:

- **Device requirements**—The active and standby processes of OSPFv3 must run on different IRF member devices. To run OSPFv3 NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPFv3 GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPFv3 GR when the IRF fabric contains only one member device.
- **OSPFv3 neighbor requirements**—When you use OSPFv3 NSR, OSPFv3 neighbors cannot detect process restart or active/standby switchover on the local device. OSPFv3 NSR can recover OSPFv3 route information without requiring the cooperation of OSPFv3 neighbors. OSPFv3 GR requires OSPFv3 neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

When both GR and NSR are configured for OSPFv3 on a device, the following rules apply:

- OSPFv3 NSR has a higher priority than OSPFv3 GR. When the active process goes down, the device does not act as the GR restarter and performs NSR to ensure nonstop forwarding.
- When the following conditions exist, the GR process might fail even if NSR is enabled on the GR helper:
  - OSPFv3 is restarted through GR.
  - An active/standby switchover is triggered on the GR helper before the GR process finishes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPFv3 NSR.

   non-stop-routing

For the S5200-EI-G switch series, OSPFv3 NSR is disabled. For the S5200-HI-G switch series, OSPFv3 NSR is enabled.

This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

Configuring BFD for OSPFv3

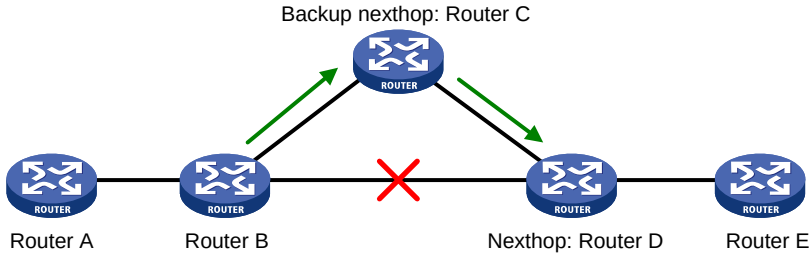
About this task

Bidirectional forwarding detection (BFD) provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3. For more information about BFD, see *High Availability Configuration Guide*.

After discovering neighbors by sending hello packets, OSPFv3 notifies BFD of the neighbor addresses, and BFD uses these addresses to establish sessions. Before a BFD session is established, it is in the down state. In this state, BFD control packets are sent at an interval of no less than 1 second to reduce BFD control packet traffic. After the BFD session is established, BFD control packets are sent at the negotiated interval, thereby implementing fast fault detection.

To configure BFD for OSPFv3, you need to configure OSPFv3 first.

Procedure



1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Specify a router ID.
   router-id *router-id*
4. Quit the OSPFv3 view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
7. Enable BFD on the interface.
   ospfv3 bfd enable [**instance** *instance-id*]
   By default, BFD is disabled on the OSPFv3 interface.

Configuring OSPFv3 FRR

About OSPFv3 FRR

A primary link failure can cause packet loss and even a routing loop until OSPFv3 completes routing convergence based on the new network topology. OSPFv3 FRR enables fast rerouting to minimize the failover time.

Figure 4 Network diagram for OSPFv3 FRR

As shown in Figure 4, configure FRR on Router B. OSPFv3 FRR automatically calculates a backup next hop or specifies a backup next hop by using a routing policy. When the primary link fails, OSPFv3 directs packets to the backup next hop. At the same time, OSPFv3 calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPFv3 FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Configuring OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface on which LFA is enabled can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Enable OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop.
   fast-reroute lfa [**abr-only**]
   By default, OSPFv3 FRR is disabled.
   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPFv3 FRR to use a backup next hop in a routing policy

About this task

Before you perform this task, use the **apply ipv6 fast-reroute backup-interface** command to specify a backup next hop in the routing policy to be used. For more information about

the **apply ipv6 fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Configure OSPFv3 FRR to use a backup next hop in a routing policy.
   fast-reroute route-policy *route-policy-name*
   By default, OSPFv3 FRR is disabled.

Configuring BFD for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD control packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on both OSPFv3 routers on the link.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd ctrl [**instance** *instance-id*]
   By default, BFD control packet mode is disabled for OSPFv3 FRR.

Configuring BFD echo packet mode for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD echo packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on one OSPFv3 router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IPv6 address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*

By default, the source IPv6 address of BFD echo packets is not configured.

The source IPv6 address cannot be on the same network segment as any local interface's IP address.

For more information about this command, see *High Availability Command Reference*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD echo packet mode for OSPFv3 FRR.

   ospfv3 primary-path-detect bfd echo [**instance** *instance-id*]

   By default, BFD echo packet mode is disabled for OSPFv3 FRR.

Enhancing OSPFv3 security

Configuring OSPFv3 authentication

About this task

OSPFv3 uses keychain authentication to prevent routing information from being leaked and routers from being attacked.

OSPFv3 adds the Authentication Trailer option into outgoing packets, and uses the authentication information in the option to authenticate incoming packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPFv3 neighbor relationship cannot be established.

Restrictions and guidelines

The authentication mode specified for an OSPFv3 interface has a higher priority than the mode specified for an OSPFv3 area.

OSPFv3 supports only the HMAC-SHA-256 and HMAC-SM3 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Configuring OSPFv3 area authentication

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Specify an authentication mode for the area.

   For HMAC-SHA-256/HMAC-SM3 authentication:

   authentication-mode { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string*

   For keychain authentication:

   authentication-mode keychain *keychain-name*

   By default, no authentication is performed for the area.

   For more information about keychains, see *Security Configuration Guide*.

Configuring OSPFv3 interface authentication

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify an authentication mode for the interface.

   For HMAC-SHA-256/HMAC-SM3 authentication:

   ospfv3 authentication-mode { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string* [**instance** *instance-id*]

   For keychain authentication:

   ospfv3 authentication-mode keychain *keychain-name* [**instance** *instance-id*]

   By default, no authentication is performed for the interface.

   For more information about keychains, see *Security Configuration Guide*.

Applying an IPsec profile for authenticating OSPFv3 packets

About this task

To protect routing information and prevent attacks, OSPFv3 can authenticate protocol packets by using an IPsec profile. For more information about IPsec profiles, see *Security Configuration Guide*.

Outbound OSPFv3 packets carry the Security Parameter Index (SPI) defined in the relevant IPsec profile. A device compares the SPI carried in a received packet with the configured IPsec profile. If they match, the device accepts the packet. Otherwise, the device discards the packet and will not establish a neighbor relationship with the sending device.

Restrictions and guidelines for applying an IPsec profile

You can configure an IPsec profile for an area, an interface, or a virtual link .

- To implement area-based IPsec protection, configure the same IPsec profile on the routers in the target area.
- To implement interface-based IPsec protection, configure the same IPsec profile on the interfaces between two neighboring routers.
- To implement virtual link-based IPsec protection, configure the same IPsec profile on the two routers connected over the virtual link.
- If an interface and its area each have an IPsec profile configured, the interface uses its own IPsec profile.
- If a virtual link and area 0 each have an IPsec profile configured, the virtual link uses its own IPsec profile.

Applying an IPsec profile to an area

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to the area.

   enable ipsec-profile *profile-name*

   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ospfv3 ipsec-profile *profile-name* [**instance** *instance-id*]
   By default, no IPsec profile is applied.

Applying an IPsec profile to a virtual link

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Apply an IPsec profile to a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | { { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string* | **keychain** *keychain-name* } | **retransmit** *seconds* | **trans-delay** *seconds*] *
   By default, no IPsec profile is applied.

Configuring OSPFv3 logging and SNMP notifications

Enabling logging for neighbor state changes

About this task

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable logging for neighbor state changes.
   log-peer-change
   By default, this feature is enabled.

Setting the maximum number of OSPFv3 logs

About this task

OSPFv3 logs include route calculation logs, neighbor logs, and LSA aging logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the maximum number of OSPFv3 logs.

   event-log { **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the maximum number of LSA aging logs, neighbor logs, or route calculation logs is 10.

Configuring OSPFv3 network management

About this task

This task involves the following configurations:

- Bind an OSPFv3 process to MIB so that you can use network management software to manage the specified OSPFv3 process.
- Enable SNMP notifications for OSPFv3 to report important events.
- Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPFv3 events to an NMS, enable SNMP notifications for OSPFv3. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

The standard OSPFv3 MIB provides only single-instance MIB objects. To identify multiple OSPFv3 processes in the standard OSPFv3 MIB, you must assign a unique context name to each OSPFv3 process.

Context is a method introduced to SNMPv3 for multiple-instance management. For SNMPv1/v2c, you must specify a community name as a context name for protocol identification.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPFv3 process.

   ospfv3 mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPFv3.

   snmp-agent trap enable ospfv3 [**grhelper-status-change** | **grrestarter-status-change** | **if-bad-pkt** | **if-cfg-error** | **if-networktype-mismatch** | **if-state-change** | **inter-area-router-id-conflict** | **intra-area-router-id-conflict** | **last-auth-key-expiry** | **neighbor-state-change** | **nssatranslator-status-change** | **virtgrhelper-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtneighbor-state-change**]*

   By default, SNMP notifications for OSPFv3 are enabled.

4. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

5. Configure an SNMP context for the OSPFv3 process.

snmp context-name *context-name*

By default, no SNMP context is configured for the OSPFv3 process.

6. (Optional.) Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPFv3 outputs a maximum of seven SNMP notifications within 10 seconds.

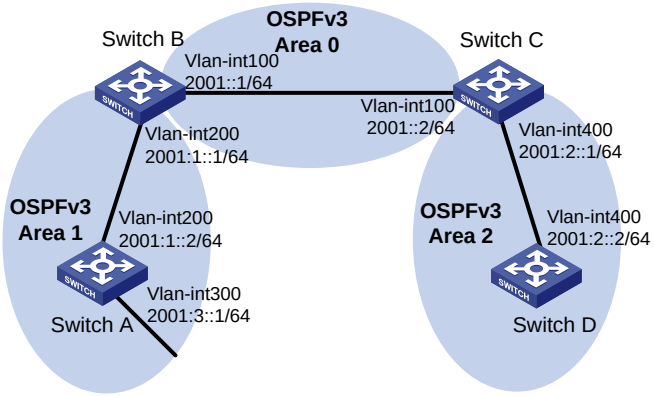
Display and maintenance commands for OSPFv3

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPFv3 ABR.	**display ospfv3** [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 neighbor information.	**display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]
Display OSPFv3 request list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 retransmission list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 topology information.	**display ospfv3** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPFv3 process information.	**display ospfv3** [*process-id*] [**verbose**]
Display information about the routes to OSPFv3 ABR and ASBR.	**display ospfv3** [*process-id*] **abr-asbr**
Display summary route information on the OSPFv3 ASBR.	**display ospfv3** [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 log information.	**display ospfv3** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPFv3 GR information.	**display ospfv3** [*process-id*] **graceful-restart** [**verbose**]
Display OSPFv3 interface information.	**display ospfv3** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display OSPFv3 LSDB information.	**display ospfv3** [*process-id*] **lsdb** [{ **e-inter-prefix** | **e-inter-router** | **e-router** | **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **intra-te** | **link** | **locator** | **network** | **nssa** | **router** | **router-information** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]

Task	Command
Display OSPFv3 next hop information.	**display ospfv3** [*process-id*] **nexthop**
Display OSPFv3 NSR information.	**display ospfv3** [*process-id*] **non-stop-routing**
Display OSPFv3 routing information.	**display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length*]
Display OSPFv3 statistics.	**display ospfv3** [*process-id*] **statistics** [**error**]
Display OSPFv3 virtual link information.	**display ospfv3** [*process-id*] **vlink**
Clear OSPFv3 log information.	**reset ospfv3** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Restart an OSPFv3 process.	**reset ospfv3** [*process-id*] **process** [**graceful-restart**]
Restart OSPFv3 route redistribution.	**reset ospfv3** [*process-id*] **redistribution**
Clear OSPFv3 statistics.	**reset ospfv3** [*process-id*] **statistics**

OSPFv3 configuration examples



Example: Configuring OSPFv3 stub area

Network configuration

As shown in Figure 5:

- Enable OSPFv3 on all switches.
- Split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 2 as a stub area to reduce LSAs in the area without affecting route reachability.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)

2. Configure basic OSPFv3:

On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ospfv3 1 area 1
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 1 area 2
[SwitchC-Vlan-interface400] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] ospfv3 1 area 2
[SwitchD-Vlan-interface400] quit
```

Display OSPFv3 neighbors on Switch B.

```
[SwitchB] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 2.2.2.2

 Area: 0.0.0.0
```

```
 ----------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 3.3.3.3         1   Full/BDR          00:00:40  0      Vlan100

 Area: 0.0.0.1
 ----------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DR           00:00:40  0      Vlan200
```

Display OSPFv3 neighbors on Switch C.

```
[SwitchC] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 3.3.3.3

 Area: 0.0.0.0
 ----------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   Full/DR           00:00:40  0      Vlan100

 Area: 0.0.0.2
 ----------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 4.4.4.4         1   Full/BDR          00:00:40  0      Vlan400
```

Display OSPFv3 routing table information on Switch D.

```
[SwitchD] display ospfv3 routing

              OSPFv3 Process 1 with Router ID 4.4.4.4
----------------------------------------------------------------------------

  BkNexthop  : N/A
  Status     : Rely
  Delay Flag : N/A

 *Destination: 2001:2::/64
  Type       : I                         Area       : 0.0.0.2
  AdvRouter  : 4.4.4.4                   Preference : 10
  NibID      : 0x23000001                Cost       : 1
  Interface  : Vlan400                   BkInterface: N/A
  Nexthop    : ::
  BkNexthop  : N/A
  Status     : Direct
  Delay Flag : N/A

 *Destination: 2001:3::1/128
  Type       : IA                        Area       : 0.0.0.2
  AdvRouter  : 3.3.3.3                   Preference : 10
  NibID      : 0x23000003                Cost       : 3
  Interface  : Vlan400                   BkInterface: N/A
  Nexthop    : FE80::48C0:26FF:FEDA:305
  BkNexthop  : N/A
  Status     : Rely
```

```
  Delay Flag : N/A

 Total: 5
 Intra area: 1         Inter area: 4         ASE: 0         NSSA: 0
```

The output shows that a default route is added, and its cost is the cost of a direct route plus the configured cost.

4. Configure Area 2 as a totally stub area:

Configure Area 2 as a totally stub area on Switch C.

```
[SwitchC] ospfv3
[SwitchC-ospfv3-1] area 2
[SwitchC-ospfv3-1-area-0.0.0.2] stub no-summary
[SwitchC-ospfv3-1-area-0.0.0.2] quit
[SwitchC-ospfv3-1] quit
```

Display OSPFv3 routing table information on Switch D.

```
[SwitchD] display ospfv3 routing

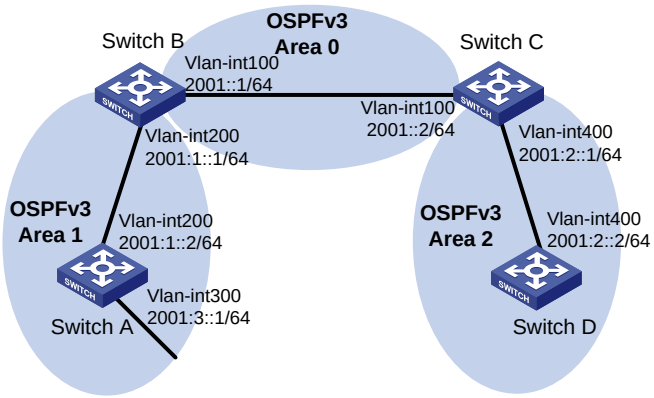
               OSPFv3 Process 1 with Router ID 4.4.4.4
------------------------------------------------------------------------------
 I  - Intra area route,  E1 - Type 1 external route,  N1 - Type 1 NSSA route
 IA - Inter area route,  E2 - Type 2 external route,  N2 - Type 2 NSSA route
 *  - Selected route

*Destination: ::/0
  Type       : IA                        Area       : 0.0.0.2
  AdvRouter  : 3.3.3.3                   Preference : 10
  NibID      : 0x23000003                Cost       : 11
  Interface  : Vlan400                   BkInterface: N/A
  Nexthop    : FE80::48C0:26FF:FEDA:305
  BkNexthop  : N/A
  Status     : Rely
  Delay Flag : N/A

 *Destination: 2001:2::/64
  Type       : I                         Area       : 0.0.0.2
  AdvRouter  : 4.4.4.4                   Preference : 10
  NibID      : 0x23000001                Cost       : 1
  Interface  : Vlan400                   BkInterface: N/A
  Nexthop    : ::
  BkNexthop  : N/A
  Status     : Direct
  Delay Flag : N/A

 Total: 2
 Intra area: 1         Inter area: 1         ASE: 0         NSSA: 0
```

The output shows that route entries are reduced. All indirect routes are removed, except the default route.



Example: Configuring OSPFv3 NSSA area

Network configuration

As shown in Figure 6:

- Configure OSPFv3 on all switches and split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch A as an ASBR to redistribute static routes into the AS.

Figure 6 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3 (see "Example: Configuring OSPFv3 stub area").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

```
[SwitchA] ospfv3
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] nssa
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

   # Configure Switch B.

```
[SwitchB] ospfv3
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] nssa
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

   # Display OSPFv3 routing information on Switch D.

```
[SwitchD] display ospfv3 1 routing

                OSPFv3 Process 1 with Router ID 4.4.4.4
------------------------------------------------------------------------
 I   - Intra area route,  E1 - Type 1 external route,  N1 - Type 1 NSSA route
 IA  - Inter area route,  E2 - Type 2 external route,  N2 - Type 2 NSSA route
 *   - Selected route
```

```
*Destination: 2001::/64

 Total: 4
 Intra area: 1         Inter area: 3         ASE: 0         NSSA: 0
```

4. Configure route redistribution:

Configure an IPv6 static route, and configure OSPFv3 to redistribute the static route on Switch A.

```
[SwitchA] ipv6 route-static 1234:: 64 null 0
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] import-route static
[SwitchA-ospfv3-1] quit
```

Display OSPFv3 routing information on Switch D.

```
[SwitchD] display ospfv3 1 routing
```

```
                OSPFv3 Process 1 with Router ID 4.4.4.4
-------------------------------------------------------------------------
 I  - Intra area route,  E1 - Type 1 external route,  N1 - Type 1 NSSA route
 IA - Inter area route,  E2 - Type 2 external route,  N2 - Type 2 NSSA route
 *  - Selected route

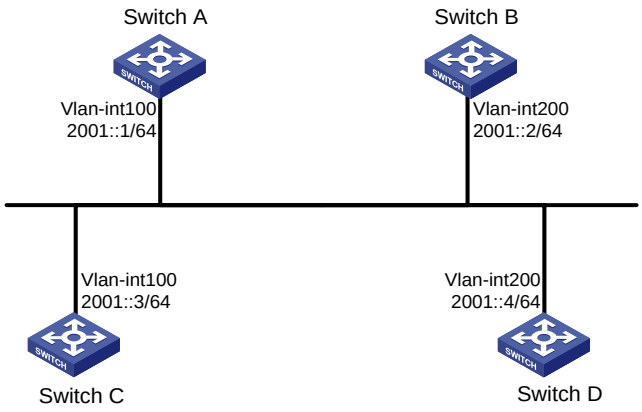
```

```
 BkNexthop  : N/A
 Status     : Normal

Total: 5
Intra area: 1         Inter area: 3         ASE: 1         NSSA: 0
```

The output shows an AS external route imported from the NSSA area exists on Switch D.



Example: Configuring OSPFv3 DR election

Network configuration

As shown in Figure 7:

- Configure router priority 100 for Switch A, the highest priority on the network, so it will become the DR.
- Configure router priority 2 for Switch C, the second highest priority on the network, so it will become the BDR.
- Configure router priority 0 for Switch B, so it cannot become a DR or BDR.
- Switch D uses the default router priority 1.

Figure 7 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 0
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
```

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 0
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ospfv3 1 area 0
[SwitchD-Vlan-interface200] quit
```

Display neighbor information on Switch A. The switches have the same default DR priority 1, so Switch D (the switch with the highest router ID) is elected as the DR, and Switch C is the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. The neighbor states are all full.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         1   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:31  0      Vlan100
```

3. Configure router priorities for interfaces:

Set the router priority of VLAN-interface 100 to 100 on Switch A.

```
[SwitchA] interface Vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 dr-priority 100
[SwitchA-Vlan-interface100] quit
```

Set the router priority of VLAN-interface 200 to 0 on Switch B.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 dr-priority 0
[SwitchB-Vlan-interface200] quit
```

Set the router priority of VLAN-interface 100 to 2 on Switch C.

```
[SwitchC] interface Vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 dr-priority 2
[SwitchC-Vlan-interface100] quit
```

Display neighbor information on Switch A. Router priorities have been updated, but the DR and BDR are not changed.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan200
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. Switch D is still the DR.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         0   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

4. Restart DR and BDR election:

Use the **shutdown** and **undo shutdown** commands on interfaces to restart DR and BDR election. (Details not shown.)

Display neighbor information on Switch A. The output shows that Switch C becomes the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   Full/DROther      00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DROther      00:00:33  0      Vlan200
```

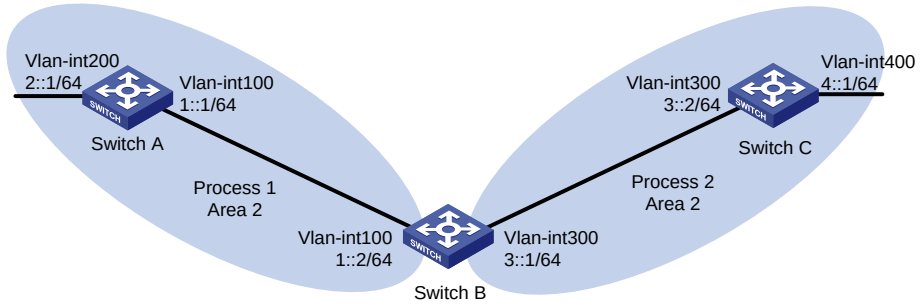
Display neighbor information on Switch D.

```
[SwitchD] display ospfv3 peer
```

```
                OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
------------------------------------------------------------------------
 Router ID       Pri State            Dead-Time InstID Interface
 1.1.1.1         100 Full/DR          00:00:30  0      Vlan100
 2.2.2.2         0   2-Way/DROther    00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR         00:00:31  0      Vlan100
```

The output shows that Switch A becomes the DR.



Example: Configuring OSPFv3 route redistribution

Network configuration

As shown in Figure 8:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2.
- Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3. Switch C can then learn the routes destined for 1::0/64 and 2::0/64, and Switch A cannot learn the routes destined for 3::0/64 or 4::0/64.

Figure 8 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

   # Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
```

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: 4::1/128                                   Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0
```

```
Destination: FE80::/10                                  Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0

Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1 cost 3
[SwitchB-ospfv3-2] import-route direct cost 3
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9

```

Example: Configuring OSPFv3 route summarization

Network configuration

As shown in Figure 9:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2, respectively.
- On Switch A, configure IPv6 addresses 2:1:1::1/64, 2:1:2::1/64, and 2:1:3::1/64 for VLAN-interface 200.
- On Switch B, configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1. Switch C can then learn the routes destined for 2::/64, 2:1:1::/64, 2:1:2::/64, and 2:1:3::/64.
- On Switch B, configure route summarization to advertise only summary route 2::/16 to Switch C.

Figure 9 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 2:1:1::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:2::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:3::1 64
```

```
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1
[SwitchB-ospfv3-2] import-route direct
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 12 Routes : 12

Destination: ::1/128                                Protocol  : Direct

Interface  : NULL0                                  Cost      : 0

Destination: FF00::/8                               Protocol  : Direct
NextHop    : ::                                     Preference: 0
Interface  : NULL0                                  Cost      : 0
```

4. Configure ASBR route summarization:

On Switch B, configure OSPFv3 process 2 to advertise a single route 2::/16.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] asbr-summary 2:: 16
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9
```

```
Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: 1::/64                                     Protocol  : O_ASE2
NextHop    : FE80::200:CFF:FE01:1C03                    Preference: 150
Interface  : Vlan300                                    Cost      : 1

Destination: 2::/16                                     Protocol  : O_ASE2

NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
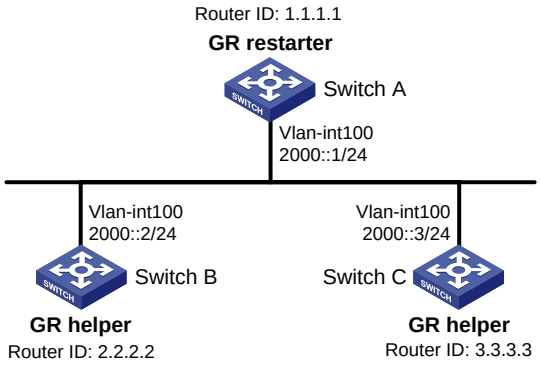
```



Example: Configuring OSPFv3 GR

Network configuration

As shown in Figure 10:

- Switch A, Switch B, and Switch C that reside in the same AS and the same OSPFv3 routing domain are GR capable.
- Switch A acts as the GR restarter. Switch B and Switch C act as the GR helpers, and synchronize their LSDBs with Switch A through GR.

Figure 10 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 process 1, enable GR, and set the router ID to 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] graceful-restart enable
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 1
[SwitchA-Vlan-interface100] quit
```

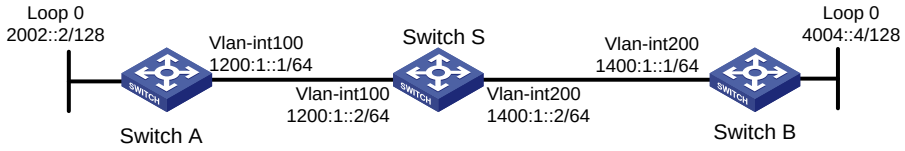
   # On Switch B, enable OSPFv3 and set the router ID to 2.2.2.2. (By default, GR helper is enabled on Switch B.)

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 1
[SwitchB-Vlan-interface100] quit
```

   # On Switch C, enable OSPFv3 and set the router ID to 3.3.3.3. (By default, GR helper is enabled on Switch C.)

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 1
[SwitchC-Vlan-interface100] quit
```

Verifying the configuration



Perform a master/backup switchover on Switch A to trigger an OSPFv3 GR operation. (Details not shown.)

Example: Configuring OSPFv3 NSR

Network configuration

As shown in Figure 11, Switch S, Switch A, and Switch B belong to the same OSPFv3 routing domain. Enable OSPFv3 NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 11 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch S, Switch A, and Switch B can communicate with each other at Layer 3. (Details not shown.)
3. Configure OSPFv3:

   # On Switch A, enable OSPFv3, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable OSPFv3, and set the router ID to 2.2.2.2.

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] ospfv3 1 area 1
   [SwitchB-Vlan-interface200] quit
   ```

   # On Switch S, enable OSPFv3, and set the router ID to 3.3.3.3.

   ```
   <SwitchS> system-view
   [SwitchS] ospfv3 1
   [SwitchS-ospfv3-1] router-id 3.3.3.3
   [SwitchS-ospfv3-1] quit
   [SwitchS] interface vlan-interface 100
   [SwitchS-Vlan-interface100] ospfv3 1 area 1
   [SwitchS-Vlan-interface100] quit
   [SwitchS] interface vlan-interface 200
   [SwitchS-Vlan-interface200] ospfv3 1 area 1
   [SwitchS-Vlan-interface200] quit
   ```

4. Configure OSPFv3 NSR:

   # Enable OSPFv3 NSR on Switch S.

```
[SwitchS] ospfv3 1
[SwitchS-ospfv3-1] non-stop-routing
[SwitchS-ospfv3-1] quit
```

Verifying the configuration

Verify the following:

- When an active/standby switchover occurs on Switch S, the neighbor relationships and routing information on Switch A and Switch B have not changed. (Details not shown.)
- The traffic from Switch A to Switch B has not been impacted. (Details not shown.)

Example: Configuring BFD for OSPFv3

Network configuration

As shown in Figure 12:

- Configure OSPFv3 on Switch A, Switch B and Switch C and configure BFD over the link Switch A<—>L2 Switch<—>Switch B.
- After the link Switch A<—>L2 Switch<—>Switch B fails, BFD can quickly detect the failure and notify OSPFv3 of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 12 Network diagram

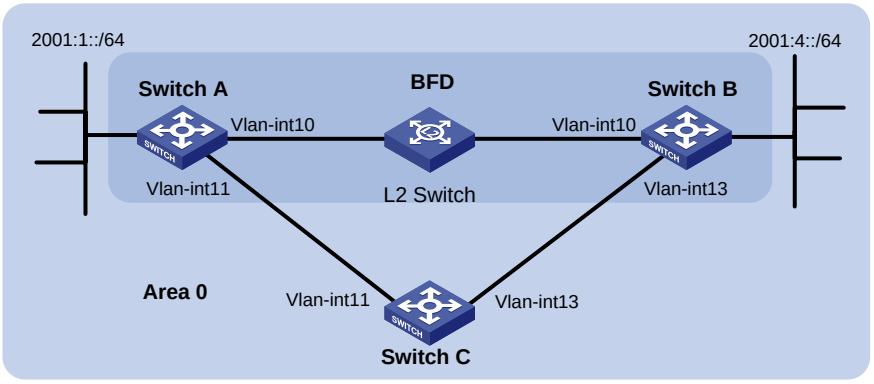


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64
Switch A	Vlan-int11	2001:2::1/64
Switch B	Vlan-int10	2001::2/64
Switch B	Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64
Switch C	Vlan-int13	2001:3::1/64

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3
   ```

```
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 1 area 0
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ospfv3 1 area 0
[SwitchA-Vlan-interface11] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 1 area 0
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] ospfv3 1 area 0
[SwitchB-Vlan-interface13] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] ospfv3 1 area 0
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] ospfv3 1 area 0
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
[SwitchA] display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv6 session working in control packet mode:

          Local discr: 1441                      Remote discr: 1450
            Source IP: FE80::20F:FF:FE00:1202 (link-local address of VLAN-interface 10
on Switch A)
       Destination IP: FE80::20F:FF:FE00:1200 (link-local address of VLAN-interface 10
on Switch B)
         Session state: Up                           Interface: Vlan10
             Hold time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::20F:FF:FE00:1200                     Preference: 10
Interface  : Vlan10                                     Cost      : 1
```

The output information shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display routes to 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::BAAF:67FF:FE27:DCD0                  Preference: 10
Interface  : Vlan11                                     Cost      : 2
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPFv3 FRR

Network configuration

As shown in Figure 13, Switch A, Switch B, and Switch C reside in the same OSPFv3 domain. Configure OSPFv3 FRR so that when Link A fails, traffic is immediately switched to Link B.

Figure 13 Network diagram

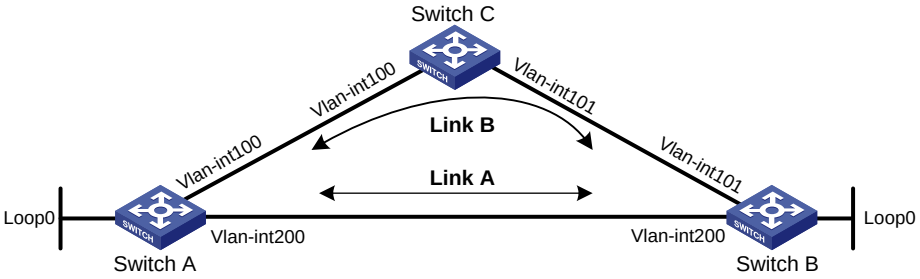

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	1::1/64	Switch B	Vlan-int101	3::1/64
	Vlan-int200	2::1/64		Vlan-int200	2::2/64
	Loop0	10::1/128		Loop0	20::1/128
Switch C	Vlan-int100	1::2/64			
	Vlan-int101	3::2/64			

Procedure

1. Configure IPv6 addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPFv3 FRR to automatically calculate the backup next hop:

   You can enable OSPFv3 FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPFv3 FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute lfa
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospfv3 1
     [SwitchB-ospfv3-1] fast-reroute lfa
     [SwitchB-ospfv3-1] quit
     ```

   - (Method 2.) Enable OSPFv3 FRR to designate a backup next hop by using a routing policy:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 100 backup-nexthop fe80::6eab:8bff:fed4:205
     ```

```
[SwitchA-route-policy-frr-10] quit
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] fast-reroute route-policy frr
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop fe80::6eab:8bff:fed4:206
[SwitchB-route-policy-frr-10] quit
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] fast-reroute route-policy frr
[SwitchB-ospfv3-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

```

Example: Configuring OSPFv3 IPsec profile

Network configuration

As shown in Figure 14, all switches run OSPFv3, and the AS is divided into two areas.

Configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 14 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 basic features:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
```

```
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

3. Configure OSPFv3 IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchA] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchA-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-trans] protocol esp
  [SwitchA-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchA-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchA-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchA-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchB] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchB-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-trans] protocol esp
  [SwitchB-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchB-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchB-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchB-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  ```

```
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchB] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchB-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchB-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchB-ipsec-profile-manual-profile002] quit
```

- On Switch C:

Create an IPsec transform set named **trans**.

```
[SwitchC] ipsec transform-set trans
```

Specify the encapsulation mode as **transport**.

```
[SwitchC-ipsec-transform-set-trans] encapsulation-mode transport
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchC-ipsec-transform-set-trans] protocol esp
[SwitchC-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
[SwitchC-ipsec-transform-set-trans] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-trans] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchC] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchC-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchC-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchC-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchC-ipsec-profile-manual-profile002] quit
```

4. Apply the IPsec profiles to areas:

Configure Switch A.

```
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] area 0
```

```
[SwitchB-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Configure Switch C.

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
```

Verifying the configuration

Verify that OSPFv3 packets between Switches A, B, and C are protected by IPsec. (Details not shown.)

Configuring IPv6 PBR

About IPv6 PBR

IPv6 policy-based routing (PBR) uses user-defined policies to route IPv6 packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop and default next hop.

IPv6 packet forwarding process

When the device receives an IPv6 packet, the device searches the IPv6 PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
    - No next hops are specified on the node.
    - Forwarding failed based on the next hops.

  c. Uses the default next hops specified on the node to forward the packet if one of the following conditions exists:
    - No matching route was found in the routing table.
    - The routing table-based forwarding failed.

  d. Uses the default route to forward the packet if one of the following conditions exists:
    - No default next hops are specified on the node.
    - The forwarding failed based on the default next hops.
- The device perfoms routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

IPv6 PBR types

IPv6 PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as the ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface only.

Policy

An IPv6 policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.

- A node has a match mode of **permit** or **deny**.

An IPv6 policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup for the packet.

Relationship between if-match clauses

IPv6 PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about the relationship between the **`apply`** clauses, see "Configuring actions for an IPv6 node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match **clauses on the node?**	**Match mode**	
	In permit mode	**In deny mode**
Yes	• If the node contains **`apply`** clauses, IPv6 PBR executes the **`apply`** clauses on the node. ○ If IPv6 PBR-based forwarding succeeds, IPv6 PBR does not compare the packet with the next node. ○ If IPv6 PBR-based forwarding fails, IPv6 PBR compares the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No	IPv6 PBR compares the packet with the next node.	IPv6 PBR compares the packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

IPv6 PBR and Track

IPv6 PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or default next hop.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and IPv6 PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: IPv6 PBR configuration

If a packet destined for the local device matches an IPv6 PBR policy, IPv6 PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure an IPv6 PBR policy, be careful to avoid this situation.

IPv6 PBR tasks at a glance

To configure IPv6 PBR, perform the following tasks:

1. Configuring an IPv6 policy
   a. Creating an IPv6 node
   b. Setting match criteria for an IPv6 node
   c. Configuring actions for an IPv6 node
2. Specifying a policy for IPv6 PBR

   Choose the following tasks as needed:
   - Specifying an IPv6 policy for IPv6 local PBR
   - Specifying an IPv6 policy for IPv6 interface PBR
   - Specifying an IPv6 policy for IPv6 global PBR

Configuring an IPv6 policy

Creating an IPv6 node

1. Enter system view.

   system-view
2. Create an IPv6 policy or policy node and enter its view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the IPv6 policy node.

   description *text*

   By default, no description is configured for an IPv6 policy node.

Setting match criteria for an IPv6 node

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl [**user-defined**] { *ipv6-acl-number* | **name** *ipv6-acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

When using the ACL to match packets, IPv6 PBR ignores the action (**permit** or **deny**) and time range settings in the ACL. If the specified ACL does not exist, no packets will match this criterion.

- Set a local QoS ID match criterion.
  if-match qos-local-id *local-id-value*
  By default, no local QoS ID match criterion is set.

Configuring actions for an IPv6 node

About this task

The **apply** clauses allow you to specify actions to take on matching packets on a node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**
- **apply default-next-hop**

IPv6 PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in IPv6 PBR

Clause	Meaning	Remarks
apply precedence	Sets an IP precedence.	This clause is always executed.
apply loadshare next-hop	Enables load sharing among multiple next hops.	Multiple next hop options operate in either primary/backup or load sharing mode. • **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple next hops are configured, the first configured next hop is selected. When the selected next hop fails, the next available next hop takes over. • **Load sharing mode**—Matching traffic is distributed across the available options. They load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry. After you configure the **apply loadshare-mode** command, the load sharing mode specified in the command applies. By default, the primary/backup mode applies. For the load sharing mode to take effect, make sure multiple next hops are set in the policy.
apply	Specifies the load sharing mode for	Specify one of the following load sharing

loadshare-modenext-hop robin	multiple next hops.	modes for multiple next hops: • **robin**: Selects load-shared links randomly based on packets.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.
apply default-next-hop	Sets default next hops.	The configuration take effect only in the following cases: • No next hops or output interfaces are set or the next hops and output interfaces are invalid. • The IPv6 packet does not match any route in the routing table.
apply statistics	Counts successful matches and matching bytes on the IPv6 policy node.	To include the number of successful matches and matching bytes on an IPv6 policy node in the statistics displayed by a **display** command, execute this command. This clause is always executed for matching packets.

Restrictions and guidelines for action configuration

If you specify a next hop, IPv6 PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if IPv6 PBR does not update the route immediately after its availability status changes.

If you configure the **apply loadshare-mode** command, you cannot specify next hop addresses as VXLAN tunnel addresses.

In an IPv6 policy node, if you configure per-packet forwarding with the **apply loadshare-mode** command, and apply the policy locally with the **ip local policy-based-route** command, per-packet forwarding does not take effect. Instead, per-flow forwarding still takes effect. As a best practice to have IPv6 PBR take effect correctly, configure other IPv6 PBR types with the policy.

Setting an IP preference

1. Enter system view.
   system-view
2. Enter IPv6 policy node view.
   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set an IP precedence.
   apply precedence { *type* | *value* }
   By default, no IP precedence is specified.

Configuring actions for a node

1. Enter system view.
   system-view
2. Enter IPv6 policy node view.
   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Configure actions for a node.
   - Set next hops for permitted IPv6 packets.
     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-8>

By default, no next hops are specified.

You can specify multiple next hops for backup or load sharing in one command line or by executing this command multiple times. You can specify a maximum of eight next hops for a node.

If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

For the S5200-EI-G switch series, you can specify a maximum of four next hops in one command, and a maximum of four next hops for each node.

- Enable load sharing among multiple next hops.

  apply loadshare next-hop

  By default, the next hops operate in primary/backup mode.

  Only the S5200-HI-G switch series supports load sharing among multiple next hops.

- Specify the load sharing mode for multiple next hops.

  apply loadshare-mode next-hop robin

  By default, multiple next hops load share traffic in round robin manner, starting from the first configured next hop. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry.

- Set output interfaces.

  apply output-interface NULL 0

  By default, no output interfaces are specified.

- Set default next hops.

  apply default-next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] }&<1-4>

  By default, no default next hops are specified.

  You can specify multiple default next hops for backup in one command line or by executing this command multiple times. You can specify a maximum of eight default next hops for a node.

  Only the S5200-HI-G switch series supports this command.

Collecting statistics

1. Enter system view.

   system-view

2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Count successful matches and matching bytes on the IPv6 policy node.

   apply statistics

   By default, counting successful matches is disabled on IPv6 policy nodes.

Specifying a policy for IPv6 PBR

Specifying an IPv6 policy for IPv6 local PBR

About this task

Perform this task to specify an IPv6 policy for IPv6 local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for IPv6 local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR might affect local services, such as ping and Telnet. When you use IPv6 local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.
   system-view
2. Specify an IPv6 policy for IPv6 local PBR.
   ipv6 local policy-based-route *policy-name*
   By default, IPv6 local PBR is not enabled.

Specifying an IPv6 policy for IPv6 interface PBR

About this task

Perform this task to apply an IPv6 policy to an interface to guide the forwarding of packets received on the interface only.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IPv6 policy for IPv6 interface PBR.
   ipv6 policy-based-route *policy-name*
   By default, no IPv6 policy is applied to the interface.

Specifying an IPv6 policy for IPv6 global PBR

About this task

Perform this task to apply an IPv6 policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one IPv6 policy for IPv6 global PBR and the specified IPv6 policy must already exist. Before you can apply a new IPv6 policy, you must first remove the current IPv6 policy.

IPv6 interface PBR takes precedence over IPv6 global PBR on an interface. When they are both configured and packets fail to match the IPv6 interface PBR policy, IPv6 global PBR applies.

Procedure

1. Enter system view.
   system-view
2. Specify an IPv6 policy for IPv6 global PBR.

ipv6 global policy-based-route *policy-name*

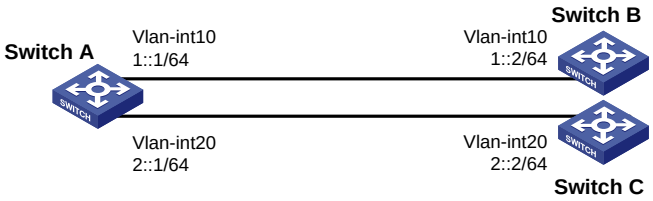
By default, no IPv6 policy is specified for IPv6 global PBR.

Display and maintenance commands for IPv6 PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PBR policy information.	**display ipv6 policy-based-route** [**policy** *policy-name*]
Display IPv6 global PBR configuration and statistics.	**display ipv6 policy-based-route global** [**slot** *slot-number*]
Display IPv6 interface PBR configuration and statistics.	**display ipv6 policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display IPv6 local PBR configuration and statistics.	**display ipv6 policy-based-route local** [**slot** *slot-number*]
Display IPv6 PBR configuration.	**display ipv6 policy-based-route setup**
Clear IPv6 PBR statistics.	**reset ipv6 policy-based-route statistics** [**policy** *policy-name*]

IPv6 PBR configuration examples



Example: Configuring packet type-based IPv6 local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C are connected through Switch A. Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets to the next hop 1::2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IPv6 addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ipv6 address 1::1 64
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 2::1 64
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3001 to match TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 local PBR by applying policy **aaa** to Switch A.

   ```
   [SwitchA] ipv6 local policy-based-route aaa
   ```

2. Configure Switch B:

   # Create VLAN 10.

   ```
   <SwitchB> system-view
   [SwitchB] vlan 10
   ```

```
[SwitchB-vlan10] quit
```

Configure the IPv6 address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
[SwitchB-Vlan-interface10] quit
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IPv6 address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
[SwitchC-Vlan-interface20] quit
```

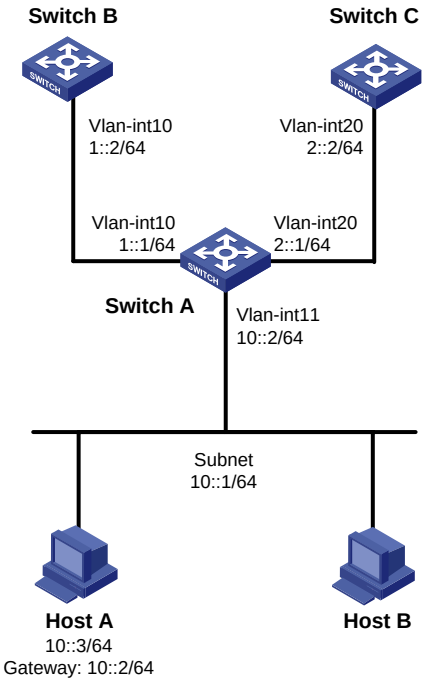
Verifying the configuration

1. Perform telnet operations to verify that IPv6 local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based IPv6 interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1::2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses and unicast routing protocol settings to make sure that Switch B and Switch C each have a route to reach Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3001 to match TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 interface PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   [SwitchA-Vlan-interface11] ipv6 policy-based-route aaa
   [SwitchA-Vlan-interface11] quit
   ```

Verifying the configuration

1. Enable IPv6 and configure the IPv6 address 10::3 for Host A.

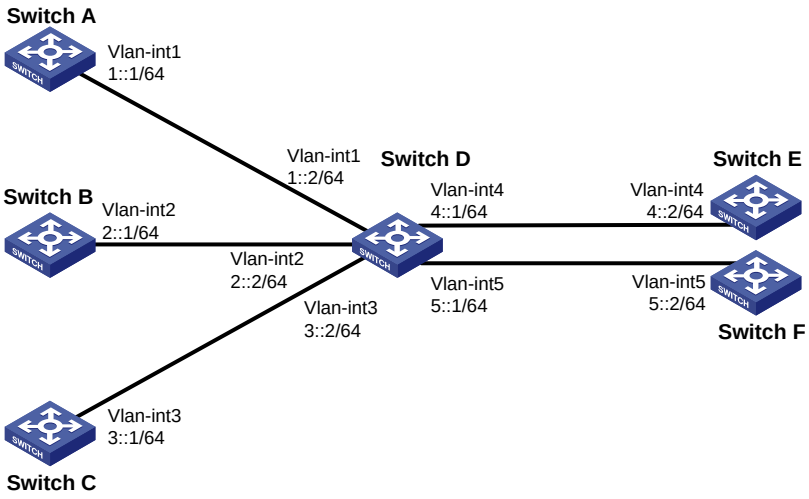
   ```
   C:\>ipv6 install
   Installing...
   Succeeded.
   C:\>ipv6 adu 4/10::3
   ```

2. Perform telnet operations to verify that IPv6 interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

3. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)



Example: Configuring packet type-based IPv6 global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure IPv6 global PBR on Switch D to forward TCP packets to the next hop 4::2 (Switch E).

Figure 3 Network diagram

Procedure

1. Assign IPv6 addresses to the interfaces, as shown in Figure 3. (Details not shown.)
2. Configure unicast routing protocol settings to make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
3. Configure Switch D:

   # Configure IPv6 ACL 3101 to match TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

   ```
   <SwitchD> system-view
   [SwitchD] acl ipv6 advanced 3101
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 1::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 2::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 3::0 64
   [SwitchD-acl-ipv6-adv-3101] quit
   ```

   # Configure node 5 in IPv6 PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 4::2.

   ```
   [SwitchD] ipv6 policy-based-route aaa permit node 5
   [SwitchD-pbr6-aaa-5] if-match acl 3101
   [SwitchD-pbr6-aaa-5] apply next-hop 4::2
   [SwitchD-pbr6-aaa-5] quit
   ```

   # Specify IPv6 PBR policy **aaa** as the IPv6 global PBR policy.

   ```
   [SwitchD] ipv6 global policy-based-route aaa
   ```

Verifying the configuration

1. Perform telnet operations to verify that IPv6 global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 4::2 (Switch E), as follows:

   # Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)

2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Configuring routing policies

About routing policies

Routing policies control routing paths by filtering and modifying routing information.

Routing policies can filter advertised, received, and redistributed routes, and modify attributes for specific routes.

Implementation of a routing policy

To configure a routing policy:

1. **Define route filters**—Configure filters based on route attributes.
2. **Apply route filters**—Create a routing policy and apply filters to the routing policy.

Filters

Routing policies can use the following filters to match routes.

ACL

An Access Control List (ACL) can match the destination or next hop of routes.

For more information about ACLs, see ACL configuration in *ACL and QoS Configuration Guide*.

IP prefix list

An IP prefix list matches the destination address of routes.

An IP prefix list can contain multiple items that specify prefix ranges. Each destination IP address prefix of a route is compared with these items in ascending order of their index numbers. A prefix matches the IP prefix list if it matches one item in the list.

AS path list

An AS path list matches the AS_PATH attribute of BGP routes. The AS_PATH attribute identifies the ASs through which a route has passed.

For more information about the AS_PATH attribute, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Community list

A community list matches the COMMUNITY attribute of BGP routes. The COMMUNITY attribute identifies the community of BGP routes.

A route can carry one or more COMMUNITY attribute values (each of which is represented by a 4-byte integer). A router uses the COMMUNITY attribute to determine whether to advertise the route and the advertising scope without using complex filters such as ACLs. This mechanism simplifies routing policy configuration and network maintenance.

For more information about community lists, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Extended community list

An extended community list matches the extended community attribute of BGP routes.

The device supports the link bandwidth extended community attribute, route target (also called VPN target) extended community attribute, and Site of Origin (SoO) extended community attribute. The extended community list is actually a route filter based on these attributes.

For more information about extended community lists, see *MCE Configuration Guide.*

RD list

A route distinguisher (RD) list matches the RD of routes. After you add an RD as a prefix to an IPv4 address prefix, the address prefix becomes a unique VPN-IPv4 address prefix.

An RD list is identified by an RD list number and can contain multiple items that specify RD ranges. Each item is identified by an index number. The RD of a route is compared with these items in ascending order of their index numbers. An RD matches the RD list if it matches one item in the list.

For information about RD, see MCE configuration in *MCE Configuration Guide*.

Routing policy

A routing policy can contain multiple nodes, which are in a logical OR relationship. A node with a smaller number is matched first. A route matches the routing policy if it matches one node (except the node configured with the **continue** clause) in the routing policy.

Each node has a match mode of **permit** or **deny**.

- **permit**—Specifies the **permit** match mode for a routing policy node. If a route meets all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. The route is not compared with the next node unless the **continue** clause is configured. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.
- **deny**—Specifies the **deny** match mode for a routing policy node. The **apply** and **continue** clauses of a deny node are never executed. If a route meets all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.

A node can contain a set of **if-match**, **apply**, and **continue** clauses.

- **if-match** clauses—Specify the match criteria that match the attributes of routes. The **if-match** clauses of different types are in a logical AND relationship and the **if-match** clauses of the same type are in a logical OR relationship. A route must meet **if-match** clauses of all types to match the node.
- **apply** clauses—Specify the actions to be taken on permitted routes, such as modifying a route attribute.
- **continue** clause—Specifies the next node. A route that matches the current node (permit node) must match the specified next node in the same routing policy. The **continue** clause combines the **if-match** and **apply** clauses of the two nodes to improve flexibility of the routing policy. After you configure a **continue** clause, a route can pass the routing policy even if it does not match the specified next node. To reject such a route, add a **deny** node without clauses.

Follow these guidelines when you configure **if-match**, **apply**, and **continue** clauses:

- If you only want to filter routes, do not configure **apply** clauses.
- If you do not configure any **if-match** clauses for a permit node, the node will permit all routes.
- Configure a permit node containing no **if-match** or **apply** clauses following multiple deny nodes to allow unmatched routes to pass.

Hardware compatibility with routing policy

Only the S5200-HI-G switch series support commands and parameters associated with BGP or IS-IS.

Routing policy tasks at a glance

To configure a routing policy, perform the following tasks:

1. (Optional.) Configure filters:

- Configuring an IPv4 prefix list
- Configuring an IPv6 prefix list
- Configuring an AS path list
- Configuring a community list
- Configuring an extended community list

2. Configuring a routing policy:
   a. Creating a routing policy
   b. Configuring if-match clauses
   c. Configuring apply clauses
   d. Configuring the continue clause
3. (Optional.) Configuring the routing policy change delay timer

Configuring an IPv4 prefix list

About this task

An IPv4 prefix list is used to filter IPv4 addresses. It can contain multiple items, each of which specifies a range of IPv4 prefixes. The relation between the items is logical OR. A route can pass an IPv4 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv4 prefix list cannot be passed.

Restrictions and guidelines

If the *ip-address mask-length* argument is specified as **0.0.0.0 0**, only the default route will be matched. To match all routes, use **0.0.0.0 0 less-equal 32**.

If all the items are set to deny mode, no routes can pass the IPv4 prefix list. To permit IPv4 routes that do not match any of the items, you must configure the **permit 0.0.0.0 0 less-equal 32** item following multiple deny items.

Procedure

1. Enter system view.

   system-view
2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

Configuring an IPv6 prefix list

About this task

An IPv6 prefix list is used to filter IPv6 addresses. It can contain multiple items, each of which specifies a range of IPv6 prefixes. The relation between the items is logical OR. A route can pass an IPv6 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv6 prefix list cannot be passed.

Restrictions and guidelines

If the *ipv6-address prefix-length* argument is specified as :: 0, only the default route matches. To match all routes, configure **:: 0 less-equal** 128.

If all items are set to **deny** mode, no routes can pass the IPv6 prefix list. To permit IPv6 routes that do not match any of the items, you must configure the **permit** :: 0 **less-equal** 128 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 prefix list.

   ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { **inverse** *inverse-prefix-length* | *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] }

Configuring an AS path list

About this task

The AS_PATH attribute identifies the ASs through which a BGP route has passed. Figure 1 shows the AS_PATH attribute format in the BGP routing table.

Figure 1 AS_PATH attribute

The AS_PATH attribute value is a character string containing digits, parentheses, brackets, braces, and spaces. It is a sequence of the following AS path segments:

- **AS_CONFED_SEQUENCE**—Ordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_CONFED_SET**—Unordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_SEQUENCE**—Ordered set of ASs a route in the UPDATE message has traversed.
- **AS_SET**—Unordered set of ASs a route in the UPDATE message has traversed.

NOTE:

The AS_PATH attribute of a BGP route might not contain all of the four AS path segments.

An AS path list consists of regular expressions used for filtering BGP routes by their AS_PATH attributes. A regular expression can contain the special characters described in Table 1.

Table 1 Special characters supported in a regular expression

Character	Description	Example
^	Matches the beginning of a line.	Match a local route if its AS_PATH attribute is null: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^$**
$	Matches the end of a line.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **100$**

Character	Description	Example
.	Matches any single character.	Match a route if it has passed AS 100 but is not originated or received from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **. 100 .**
*	Matches the preceding character or string zero, one, or multiple times.	Match a route if it has an AS_PATH attribute: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **.***
+	Matches the preceding character or string one or multiple times.	Match a route if its AS_PATH attribute value contains **5**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **5+**
x|y	Matches the preceding or succeeding string.	Match a route if it is originated from AS 100 or AS 200: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **100$\|200$**
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	Match a route if its AS_PATH attribute value contains **123**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **(123)+**
[xyz]	Matches a single character in the brackets.	Match a route if it is received from AS 10 through AS 19: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^1[0-9]**$
[^xyz]	Matches a single character that is not in the brackets.	Match a route if its originating AS number does not end with **2** or **4**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **[^24]$**
{n}	Matches the preceding character *n* times. The number *n* must be a nonnegative integer.	Match a route if its AS_PATH attribute value contains two **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2}
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	Match a route if its AS_PATH attribute value contains two or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2,}
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	Match a route if its AS_PATH attribute value contains one or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{1,2}

Character	Description	Example
[a-z]	Matches a single character within the specified range for only once.	Match a route if its AS_PATH attribute value contains **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }[0-2]
[^a-z]	Matches a single character that is not in the specified range.	Match a route if its AS_PATH attribute value contains digits other than **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }^[^0-2]$
_	Matches a punctuation. The expression can begin or end with _.	Match a route if it has passed AS101 100: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 101_100_
\b	Matches a word that starts with the pattern following \b or ends with the pattern preceding \b.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **\b100$**
\B	Matches a word that contains the pattern but does not start or end with the pattern.	Match a route if its AS_PATH attribute value starts with **1**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^1\B**
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	N/A
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	Match a route if its AS_PATH attribute value contains double digits: **ip as-path** { *as-path-number* | *as-path-name* } \w{2}
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	N/A
\index	Matches the specified string in the parentheses followed by \ twice. Each string in the parentheses is numbered from 1 in order. The *index* argument represents the sequence number of the string you want to match. If the parentheses contain *n* strings, you can specify the sequence number of the string in the range of 1 to *n*.	Match a route if its AS_PATH attribute value contains two consecutive **1**: **ip as-path** { *as-path-number* | *as-path-name* } (1)\1

NOTE:

The regular expressions shown in Table 1 are used for illustration only. Other regular expressions might be available to achieve the same effect.

Restrictions and guidelines

You can configure multiple items for an AS path list that is identified by a number. The relationship between the items is logical OR. A route matches the AS path list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an AS path list.

   ip as-path { *as-path-number*| *as-path-name* } { **deny** | **permit** } *regular-expression*

Configuring a community list

About this task

You can configure multiple items for a community list that is identified by a number. The relationship between the items is logical OR. A route matches the community list if it matches one item in the list.

An advanced community list matches the community attributes of BGP routes based on regular expressions. For more information about regular expressions, see the table that describes the special characters supported in a regular expression in "Configuring an AS path list."

Procedure

1. Enter system view.

   system-view

2. Configure a community list.
   - Configure a basic community list.

     ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } { **deny** | **permit** } [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *
   - Configure an advanced community list.

     ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } { **deny** | **permit** } *regular-expression*

Configuring an extended community list

About this task

You can configure multiple items for an extended community list that is identified by a number. The relationship between the items is logical OR. A route matches the extended community list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an extended community list.

   ip extcommunity-list *ext-comm-list-number* [**index** *index-number*] { **deny** | **permit** } { **bandwidth** *link-bandwidth-value* | **rt** *route-target* | **soo** *site-of-origin* }&<1-32>

Configuring an RD list

About this task

RD lists are used to filter VPN routing information. You can configure multiple items for an RD list that is identified by a number. The relationship between the items is logical OR. A route matches the RD list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an RD list.

   ip rd-list *rd-list-number* [**index** *index-number*] { **deny** | **permit** } *route-distinguisher*&<1-10>

Configuring a routing policy

Creating a routing policy

About this task

A routing policy must have a minimum of one permit node. If all the nodes are in **deny** mode, no routes can pass the routing policy.

Procedure

1. Enter system view.

   system-view

2. Create a routing policy and a node, and enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. (Optional.) Enable consistency check between the IP version in routing information and the IP version of the prefix list specified by an **if-match** clause. Routing information with a different IP version does not match the clause.

   a. Return to system view.

      quit

   b. Enable consistency check between the IP version in routing information and the IP version of the prefix list specified by an **if-match** clause. Routing information with a different IP version does not match the clause.

      route-policy prefix-protocol-check

      By default, routing policies do not check the consistency between the IP version in routing information and the IP version of the prefix list specified by an if-match clause:

      - If the if-match clause uses an IPv6 address prefix list, all IPv4 routes can match the clause.
      - If the if-match clause uses an IPv4 address prefix list, all IPv6 routes can match the clause.

Configuring if-match clauses

About this task

You can either specify no **if-match** clauses or multiple **if-match** clauses for a routing policy node. If no **if-match** clause is specified for a permit node, all routes can pass the node. If no **if-match** clause is specified for a deny node, no routes can pass the node.

Restrictions and guidelines

When you configure **if-match** clauses, follow these restrictions and guidelines:

- The **if-match** clauses of a routing policy node have a logical AND relationship. A route must meet all **if-match** clauses before it can be executed by the **apply** clauses of the node. If an **if-match** command exceeds the maximum length, multiple **if-match** clauses of the same type are generated. These clauses have a logical OR relationship. A route only needs to meet one of them.
- All IPv4 routes match a node if the **if-match** clauses of the node use only IPv6 ACLs. All IPv6 routes match a node if the **if-match** clauses of the node use only IPv4 ACLs.
- If the ACL used by an **if-match** clause does not exist or the ACL is not configured with any rules, the clause is always matched. When the ACL of an **if-match** clause is configured with rules, a route cannot match the **if-match** clause in one of the following scenarios:
  - The route cannot match any rule of the specified ACL.
  - The route matches a deny-mode rule of the specified ACL.
- If the prefix list, AS path list, community list, extended community list, MAC list, or RD list used by an **if-match** clause does not exist, the clause is always matched. The clause is not matched if one of the following conditions exists:
  - No rules of the specified prefix list, AS path list, community list, extended community list, MAC list, or RD list are matched.
  - The specified prefix list, AS path list, community list, extended community list, MAC list, or RD list is in **deny** mode.
- The **rule** [*rule-id*] **permit ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command can create a rule for an advanced ACL to match specific routes. The **source** *sour-addr sour-wildcard* option represents the destination network address and the **destination** *dest-addr dest-wildcard* option represents the mask in dotted decimal notation. For example, to match route 3.3.3.0/24, the rule configuration should be **rule** [*rule-id*] **permit ip source** 3.3.3.0 0.0.0.255 **destination** 255.255.255.0 0.0.0.255.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Match routes whose destination, next hop, or source address matches an ACL or prefix list.

   IPv4:

   if-match ip { **address** | **next-hop** | **route-source** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

   IPv6:

   if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name* }

   By default, no ACL or prefix list match criterion is configured.

   The ACL specified in an **if-match** clause must be a non-VPN ACL.

4. Configure BGP route match criteria.
   - Match BGP routes whose AS_PATH attribute matches a specified AS path list.
     if-match as-path { *as-path-number*&<1-32> | *as-path-name* }
   - Match BGP routes whose COMMUNITY attribute matches a specified community list.
     if-match community { { *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number* }&<1-32>
   - Match BGP routes whose extended community attribute matches a specified extended community list.
     if-match extcommunity *ext-comm-list-number*&<1-32>
   - Match BGP routes having the specified local preference.
     if-match local-preference *preference*
   - Match BGP routes with the specified RPKI validation state.
     if-match rpki { **invalid** | **not-found** | **valid** }

   By default, no BGP route match criteria are configured.
5. Configure route match criteria.
   - Match routes having the specified cost.
     if-match cost *cost-value*
   - Match routes having the specified output interface.
     if-match interface { *interface-type interface-number* }&<1-16>

     This command is not supported by BGP.
   - Match routes having the specified route type.
     if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *
   - Match IGP routes having the specified tag value.
     if-match tag *tag-value*

   By default, no route match criteria are configured.
6. Match routes whose RD matches the specified RD list.
   if-match rd-list *rd-list-number*

   By default, no RD match criterion is configured.
7. Match IPv6 route prefixes of the specified length whose last bit is an odd or even number.
   - Match IPv6 route prefixes of the specified length whose last bit is an odd number.
     if-match ipv6 odd-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.
   - Match IPv6 route prefixes of the specified length whose last bit is an even number.
     if-match ipv6 even-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.

Configuring apply clauses

1. Enter system view.

system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Configure BGP route attributes.

   - Set the AS_PATH attribute for BGP routes.

     apply as-path { *as-number*&<1-32> [**delete** | **replace**] | **clear** }

   - Delete the specified COMMUNITY attribute for BGP routes.

     apply comm-list { *comm-list-number* | *comm-list-name* } **delete**

     By default, no COMMUNITY attribute is deleted for BGP routes.

   - Set the specified COMMUNITY attribute for BGP routes.

     apply community { **none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**] }

   - Set the link bandwidth extended community attribute for BGP routes.

     apply extcommunity bandwidth *link-bandwidth-value* [**additive**]

   - Set the RT extended community attribute for BGP routes.

     apply extcommunity { **rt** *route-target* }&<1-32> [**additive**]

   - Set the SoO extended community attribute for BGP routes.

     apply extcommunity soo *site-of-origin*&<1-32> [**additive**]

   - Set a local preference for BGP routes.

     apply local-preference *preference*

   - Set the ORIGIN attribute for BGP routes.

     apply origin { **egp** *as-number* | **igp** | **incomplete** }

   - Set a preferred value for BGP routes.

     apply preferred-value *preferred-value*

   - Set a traffic index for BGP routes.

     apply traffic-index { *value* | **clear** }

   By default, no BGP route attributes are configured.

4. Configure the route cost and cost type.

   - Set a cost for routes.

     apply cost [**+** | **-**] *cost-value*

     By default, no cost is set for routes.

   - Set a cost type for routes.

     apply cost-type { **external** | **inherit-link-cost** | **internal** | **internal-inc-ibgp** | **med-plus-igp** | **type-1** | **type-2** }

     By default, no cost type is set for routes.

5. Set the next hop for routes.

   IPv4:

   apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

   IPv6:

   apply ipv6 next-hop *ipv6-address*

   By default, no next hop is set for routes.

   The configuration does not apply to redistributed routes.

6. Configure route priorities.
   - Set an IP precedence for matching routes.
     apply ip-precedence { *value* | **clear** }
     By default, no IP precedence is set.
   - Set a preference.
     apply preference *preference*
     By default, no preference is set.
   - Set a prefix priority.
     apply prefix-priority { **critical** | **high** | **medium** }
     By default, the prefix priority is low.
7. Associate a Track entry with BGP routes.
   apply track *track-entry-number*
   By default, no track entry is associated with BGP routes.
8. Redistribute routes to the specified IS-IS level.
   apply isis { **level-1** | **level-1-2** | **level-2** }
   By default, routes are not redistributed into the specified IS-IS level.
9. Set a tag value for IGP routes.
   apply tag *tag-value*
   By default, no tag value is set for IGP routes.
10. Set a backup link for fast reroute (FRR).
    IPv4:
    apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }
    IPv6:
    apply ipv6 fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ipv6-address*] | **backup-nexthop** *ipv6-address* }
    By default, no backup link is set for FRR.

Configuring the continue clause

Restrictions and guidelines

When you configure the **continue** clause to combine multiple nodes, follow these restrictions and guidelines:

- If you configure an **apply** clause that sets different attribute values on all the nodes, the **apply** clause of the node configured most recently takes effect.
- If you configure the following **apply** clauses on all the nodes, the **apply** clause of each node takes effect:
  - **apply as-path** without the **replace** or **clear** keyword.
  - **apply cost** with the **+** or **–** keyword.
  - **apply community** with the **additive** keyword.
  - **apply extcommunity** with the **additive** keyword.
- The **apply comm-list delete** clause configured on the current node cannot delete the community attributes set by the **apply community** clauses of the preceding nodes.

- The **apply as-path delete** or **apply as-path clear** clause configured on the current node will delete or clear the AS numbers added or replaced by the **apply as-path** clauses of the preceding nodes.

Procedure

1. Enter system view.

   system-view
2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
3. Specify the next node to be matched.

   continue [*node-number*]

   By default, no continue clause is configured.

   The specified next node must have a larger number than the current node.

Configuring the routing policy change delay timer

About this task

This feature makes a routing policy take effect after a delayed time interval, which prevents incomplete routing policy configuration from being issued to cause incorrect route advertisement. The system automatically starts the timer when a routing policy changes. The changes will not take effect on the policy until the change delay timer expires.

A routing policy changes when one of the following events occurs:

- A routing policy is created.
- A routing policy node, **if-match** clause, or **apply** clause is added, modified, or deleted for a routing policy.
- You add, modify, or delete one of the following lists:
  - IPv4 prefix list.
  - IPv6 prefix list.
  - AS path list.
  - Community list.
  - Extended community list.
- The ACL used by an **if-match** clause changes.

Procedure

1. Enter system view.

   system-view
2. Set the routing policy change delay timer.

   route-policy-change delay-time { *time-value* | **unlimited** }

   By default, routing policy changes immediately take effect, but the routing protocol waits five seconds before processing routes from the new routing policy.

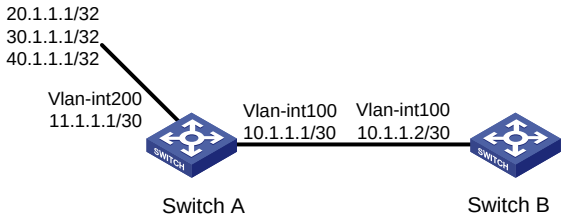
   When the delay timer expires, the routing protocol waits five seconds before processing routes from the new routing policy.

Display and maintenance commands for routing policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display BGP AS path list information.	**display ip as-path** [*as-path-number* | *as-path-name*]
Display BGP community list information.	**display ip community-list** [*basic-community-list-number* | *adv-community-list-number* | **name** *comm-list-name*]
Display BGP extended community list information.	**display ip extcommunity-list** [*ext-comm-list-number*]
Display IPv4 prefix list statistics.	**display ip prefix-list** [**name** *prefix-list-name*]
Display RD list information.	**display ip rd-list** [*rd-list-number*]
Display IPv6 prefix list statistics.	**display ipv6 prefix-list** [**name** *prefix-list-name*]
Display routing policy information.	**display route-policy** [**name** *route-policy-name*]
Clear BGP AS path list statistics.	**reset ip as-path** [*as-path-number* | *as-path-name*]
Clear IPv4 prefix list statistics.	**reset ip prefix-list** [*prefix-list-name*]
Clear IPv6 prefix list statistics.	**reset ipv6 prefix-list** [*prefix-list-name*]

Routing policy configuration examples



Example: Configuring a routing policy for redistributing static routes to RIP

Network configuration

As shown in Figure 2, Switch A exchanges routing information with Switch B by using RIP.

On Switch A, configure three static routes. Use a routing policy to configure Switch B to redistribute networks 20.1.1.1/32 and 40.1.1.1/32 and block network 30.1.1.1/32.

Figure 2 Network diagram

Procedure

1. Configure Switch A:

Configure IP addresses for interfaces VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-vlan-interface100] ip address 10.1.1.1 30
[SwitchA-vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-vlan-interface200] ip address 11.1.1.1 30
[SwitchA-vlan-interface200] quit
```

Enable RIP on interface VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-vlan-interface100] rip 1 enable
[SwitchA-vlan-interface100] quit
```

Configure three static routes and set the next hop of the three routes to 11.1.1.2.

```
[SwitchA] ip route-static 20.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 30.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 40.1.1.1 32 11.1.1.2
```

Configure a routing policy.

```
[SwitchA] ip prefix-list a index 10 permit 30.1.1.1 32
[SwitchA] route-policy static2rip deny node 0
[SwitchA-route-policy-static2rip-0] if-match ip address prefix-list a
[SwitchA-route-policy-static2rip-0] quit
[SwitchA] route-policy static2rip permit node 10
[SwitchA-route-policy-static2rip-10] quit
```

Enable RIP and apply routing policy **static2rip** to filter redistributed static routes.

```
[SwitchA] rip
[SwitchA-rip-1] import-route static route-policy static2rip
```

2. Configure Switch B:

Configure an IP address for interface VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] ip address 10.1.1.2 30
```

Enable RIP.

```
[SwitchB] rip
[SwitchB-rip-1] quit
```

Enable RIP on the interface.

```
[SwitchB] interface vlan-interface 100
```

```
[SwitchB-vlan-interface100] rip 1 enable
[SwitchB-vlan-interface100] quit
```

Verifying the configuration

Display the routing table information on Switch B.

```
<SwitchB> display ip routing-table

Destinations : 14       Routes : 14

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0
10.1.1.0/30         Direct  0   0           10.1.1.2        Vlan100

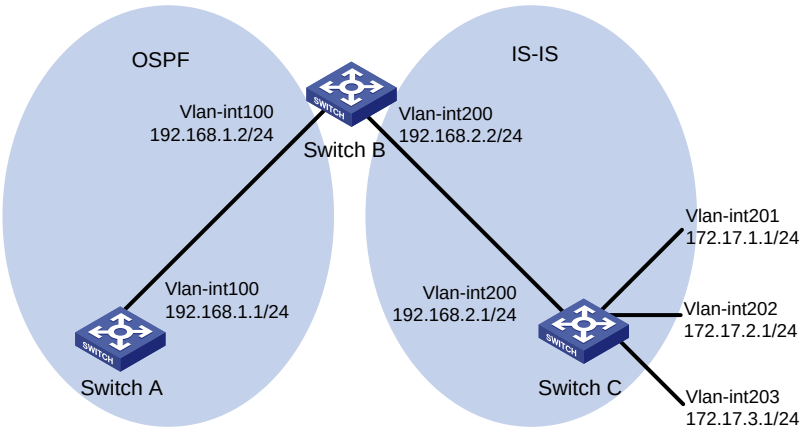
```



Example: Configuring a routing policy for redistributing IS-IS routes to OSPF

Network configuration

As shown in Figure 3, Switch B exchanges routing information with Switch A by using OSPF and with Switch C by using IS-IS.

On Switch B, enable route redistribution from IS-IS to OSPF. Use a routing policy to set the cost of route 172.17.1.0/24 to 100 and the tag of route 172.17.2.0/24 to 20.

Figure 3 Network diagram

Procedure

1. Specify IP addresses for interfaces. (Details not shown.)
2. Configure IS-IS:

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis
[SwitchC-isis-1] is-level level-2
[SwitchC-isis-1] network-entity 10.0000.0000.0001.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 201
[SwitchC-Vlan-interface201] isis enable
[SwitchC-Vlan-interface201] quit
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] isis enable
[SwitchC-Vlan-interface202] quit
[SwitchC] interface vlan-interface 203
[SwitchC-Vlan-interface203] isis enable
[SwitchC-Vlan-interface203] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis
[SwitchB-isis-1] is-level level-2
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable
[SwitchB-Vlan-interface200] quit
```

3. Configure OSPF and route redistribution:

   # Configure OSPF on Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # On Switch B, configure OSPF and enable route redistribution from IS-IS to OSPF.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] import-route isis 1
[SwitchB-ospf-1] quit
```

   # Display the OSPF routing table on Switch A to view redistributed routes.

```
[SwitchA] display ospf routing
```

```
          OSPF Process 1 with Router ID 192.168.1.1
                  Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop        AdvRouter     Area
 192.168.1.0/24     1        Stub    192.168.1.1    192.168.1.1   0.0.0.0

 Routing for ASEs
 Destination        Cost     Type    Tag        NextHop        AdvRouter
 172.17.1.0/24      1        Type2   1          192.168.1.2    192.168.2.2
 172.17.2.0/24      1        Type2   1          192.168.1.2    192.168.2.2
 172.17.3.0/24      1        Type2   1          192.168.1.2    192.168.2.2

 Total Nets: 4
 Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

4. Configure filtering lists:

Configure IPv4 basic ACL 2002 to permit route 172.17.2.0/24.

```
[SwitchB] acl basic 2002
[SwitchB-acl-ipv4-basic-2002] rule permit source 172.17.2.0 0.0.0.255
[SwitchB-acl-ipv4-basic-2002] quit
```

Configure IP prefix list **prefix-a** to permit route 172.17.1.0/24.

```
[SwitchB] ip prefix-list prefix-a index 10 permit 172.17.1.0 24
```

5. Configure a routing policy.

```
[SwitchB] route-policy isis2ospf permit node 10
[SwitchB-route-policy-isis2ospf-10] if-match ip address prefix-list prefix-a
[SwitchB-route-policy-isis2ospf-10] apply cost 100
[SwitchB-route-policy-isis2ospf-10] quit
[SwitchB] route-policy isis2ospf permit node 20
[SwitchB-route-policy-isis2ospf-20] if-match ip address acl 2002
[SwitchB-route-policy-isis2ospf-20] apply tag 20
[SwitchB-route-policy-isis2ospf-20] quit
[SwitchB] route-policy isis2ospf permit node 30
[SwitchB-route-policy-isis2ospf-30] quit
```

6. Apply the routing policy to route redistribution:

On Switch B, enable route redistribution from IS-IS to OSPF and apply the routing policy.

```
[SwitchB] ospf
[SwitchB-ospf-1] import-route isis 1 route-policy isis2ospf
[SwitchB-ospf-1] quit
```

Display the OSPF routing table on Switch A.

```
[SwitchA] display ospf routing

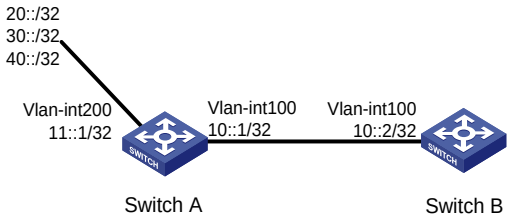
          OSPF Process 1 with Router ID 192.168.1.1
                  Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop         AdvRouter     Area
 192.168.1.0/24     1        Transit 192.168.1.1     192.168.1.1   0.0.0.0
```

```
Routing for ASEs
Destination        Cost     Type    Tag         NextHop       AdvRouter
172.17.1.0/24      100      Type2   1           192.168.1.2   192.168.2.2
172.17.2.0/24      1        Type2   20          192.168.1.2   192.168.2.2
172.17.3.0/24      1        Type2   1           192.168.1.2   192.168.2.2

Total Nets: 4
Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

The output shows that the cost of route 172.17.1.0/24 is 100 and the tag of route 172.17.2.0/24 is 20.



Example: Configuring a routing policy for IPv6 route redistribution

Network configuration

As shown in Figure 4:

- Run RIPng on Switch A and Switch B.
- Configure three static routes on Switch A.
- On Switch A, apply a routing policy to redistribute static routes 20::/32 and 40::/32 and deny route 30::/32.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

   # Configure IPv6 addresses for VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 address 10::1 32
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 11::1 32
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

   # Configure three static routes with next hop 11::2, and make sure the static routes are active.

```
[SwitchA] ipv6 route-static 20:: 32 11::2
[SwitchA] ipv6 route-static 30:: 32 11::2
```

```
[SwitchA] ipv6 route-static 40:: 32 11::2
```

Configure a routing policy.

```
[SwitchA] ipv6 prefix-list a index 10 permit 30:: 32
[SwitchA] route-policy static2ripng deny node 0
[SwitchA-route-policy-static2ripng-0] if-match ipv6 address prefix-list a
[SwitchA-route-policy-static2ripng-0] quit
[SwitchA] route-policy static2ripng permit node 10
[SwitchA-route-policy-static2ripng-10] quit
```

Enable RIPng and apply the routing policy to static route redistribution.

```
[SwitchA] ripng
[SwitchA-ripng-1] import-route static route-policy static2ripng
```

2. Configure Switch B:

Configure the IPv6 address for VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipv6 address 10::2 32
```

Enable RIPng.

```
[SwitchB] ripng
[SwitchB-ripng-1] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Verifying the configuration

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::7D58:0:CA03:1 on Vlan-interface 100
 Destination 20::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 8 secs
 Destination 40::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 3 secs
 Local route
 Destination 10::/32,
     via ::, cost 0, tag 0, DOF
```

Configuring DCN

About DCN

Data communication network (DCN) is built for the network management system (NMS) to implement operation, administration, and maintenance (OAM) on the network elements (NEs).

On large-scaled networks with DCN configured, the NMS remotely manages and controls all NEs through the gateway network element (GNE), which reduces operation and maintenance costs.

On the DCN network, all NEs must operate in Area 0 of OSPF process 65535.

Basic concepts

NE

A network device managed by the NMS on the DCN network.

GNE

The NE that is directly connected to the NMS. The NSM communicates with the GNE at the network layer or application layer and manages the NEs through the GNE.

NE table

Stores the NE ID-to-NE IP mappings for each NE in the DCN domain. After DCN is enabled, an NE encapsulates its NE ID and NE IP in a Type-10 Opaque LSA. It floods the LSA to synchronize the mappings with other NEs in the DCN domain.

The NE IP in the Type-10 Opaque LSA might be inconsistent with the NE's router ID when DCN is enabled on an OSPF network. Devices from other vendors will fail to identify the NE. To avoid this problem, make sure the following requirements are met:

- Change the router ID by modifying the NE IP. Do not change the default IP address of the DCN's loopback interface.
- Do not associate other loopback interfaces with the DCN VPN instance.

GNE

The GNE allows the NMS to access NEs on the DCN network. The GNE provides the NE ID-to-NE IP mappings of all NEs for the Telnet users to access the target NE remotely.

NE search

The NE search feature allows the NMS to search for all NEs that are connected to the GNE. With this feature, the GNE can report information about all NEs in its NE table and the GNE itself to the NMS.

Automatic report

The automatic report feature enables the GNE to automatically report online or offline events of NEs to the NMS.

DCN tasks at a glance

To configure DCN, perform the following tasks:

1. Enabling DCN
2. (Optional.) Configuring the NE ID and NE IP
3. Configuring DCN VPN
4. (Optional.) Enabling the automatic report feature
5. Configuring the LLDP features
   a. Advertising the LLDP management address
   b. Enabling the device to generate ARP entries for received management address LLDP TLVs

Enabling DCN

About this task

After DCN is enabled, the device assigns an NE IP to the loopback interface with the largest interface number and uses the interface for communication. The NE IP is specified as the management address and advertised in an LLDP frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enable DCN and enter DCN view.
   `dcn`
   By default, DCN is disabled.

Configuring the NE ID and NE IP

About this task

Typically an NE automatically generates an NE IP according to its NE ID. The automatically generated NE IP changes when the NE ID changes. When you replan your network or an NE ID conflict occurs, you can manually configure the NE ID and NE IP. The manually configured NE IP does not change when the NE ID changes.

Procedure

1. Enter system view.
   `system-view`
2. Enter DCN view.
   `dcn`
3. Configure the NE ID.
   `ne-id` *`id-number`*
   By default, the NE ID is automatically generated by using the 24 low-order bits of the bridge MAC address.
4. Configure the NE IP.
   `ne-ip` *`ip-address`* { *`mask-length`* | *`mask`* }

By default, the NE IP is automatically generated by using 129 as the eight high-order bits and the NE ID as the rest 16 bits. The mask length is 32.

Configuring DCN VPN

About this task

Perform this task to ensure the independence of DCN services. For more information about VPN instances, see MCE configuration in *MCE Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter its view, or enter the view of an existing VPN instance.
   ip vpn-instance *vpn-instance-name*
   For more information about this command, see MCE commands in *MCE Command Reference*.
3. Quit VPN instance view.
   quit
4. Create a loopback interface and enter its view, or enter the view of an existing loopback interface.
   interface loopback *interface-number*
5. Associate the loopback interface with a VPN instance.
   ip binding vpn-instance *vpn-instance-name*
   By default, the loopback interface is not associated with a VPN instance.
   For more information about this command, see MCE commands in *MCE Command Reference*.

Enabling the automatic report feature

Restrictions and guidelines

Perform this task only on GNE to enable it to automatically report online or offline events of NEs to the NMS.

Procedure

1. Enter system view.
   system-view
2. Enter DCN view.
   dcn
3. Enable the automatic report feature.
   auto-report
   By default, the automatic report feature is disabled.

Configuring the LLDP features

Advertising the LLDP management address

About this task

An NE on the DCN network learns the MAC address of its neighbor through LLDP. Perform this task to enable an NE to advertise the IP address of the specified loopback interface (management address) for ARP entry learning. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Restrictions and guidelines

This feature is supported only on Layer 3 physical interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Advertise the LLDP management address.

   lldp tlv-enable basic-tlv management-address-tlv [*ip-address* | **interface loopback** *interface-number*]

   By default, the LLDP management address is not advertised.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Enabling the device to generate ARP entries for received management address LLDP TLVs

About this task

This feature enables the device to generate an ARP entry for a received LLDP frame that meets the following requirements:

- The LLDP frame carries a management address TLV.
- The management address TLV contains an IPv4 address.

The generated ARP entry contains the management address and the source MAC address of the frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Restrictions and guidelines

This feature is supported only on Layer 3 physical interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the device to generate an ARP entry when receiving a management address LLDP TLV.

   lldp management-address arp-learning [**vlan** *vlan-id*]

By default, the device does not generate an ARP entry when receiving a management address LLDP TLV.

The device uses the current Layer 3 Ethernet subinterface as the output interface for generated ARP entries.

For more information about this command, see LLDP commands in *Layer 2—LAN Switching Configuration Guide*.

Display and maintenance commands for DCN

Execute the **display** commands in any view.

Task	Command
Display the brief DCN information.	**display dcn**
Display information about all online NEs on the DCN network.	**display dcn ne-info**

DCN configuration examples

Example: Configuring DCN

Network configuration

As shown in Figure 1, the GNE, Device A, and Device B run DCN in the same VPN instance. The NMS uses SNMP to manage the GNE, and the GNE automatically sends notifications to the NMS to report online or offline events of NEs.

Figure 1 Network diagram

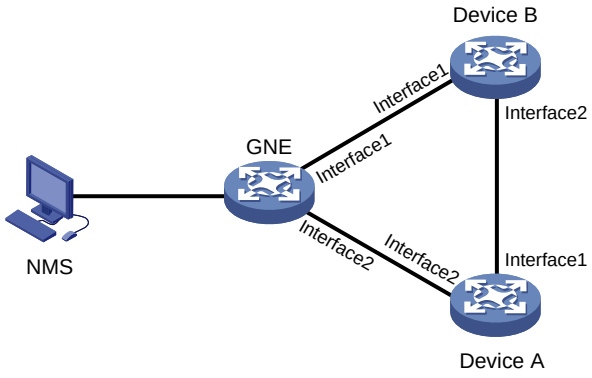

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Procedure

1. Configure the GNE:

Enable SNMP on the GNE. (Details not shown. For more information, see *Network Management and Monitoring Configuration Guide*.)

Enable DCN, configure the NE ID as 100001 and NE IP as 11.1.1.1/32, and enable the automatic report feature.

```
<GNE> system-view
[GNE] dcn
[GNE-dcn] ne-id 100001
[GNE-dcn] ne-ip 11.1.1.1 32
[GNE-dcn] auto-report
[GNE-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[GNE] ip vpn-instance dcn_vpn
[GNE-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[GNE] interface loopback 1023
[GNE-LoopBack1023] ip binding vpn-instance dcn_vpn
[GNE-LoopBack1023] quit
```

Enable LLDP globally.

```
[GNE] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[GNE] interface gigabitethernet 1/0/1
[GNE-GigabitEthernet1/0/1] port access vlan 3001
[GNE-GigabitEthernet1/0/1] lldp source-mac vlan 3001
[GNE-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3001 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[GNE-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
[GNE-GigabitEthernet1/0/1] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[GNE] interface gigabitethernet 1/0/2
[GNE-GigabitEthernet1/0/2] port access vlan 3002
[GNE-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[GNE-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3002 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[GNE-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[GNE-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ip binding vpn-instance dcn_vpn
[GNE-Vlan-interface3001] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3001] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

```
[GNE] interface Vlan-interface 3002
[GNE-Vlan-interface3002] ip binding vpn-instance dcn_vpn
[GNE-Vlan-interface3002] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3002] quit
```

Enable OSPF process 65535 and create area 0.

```
[GNE] ospf 65535 vpn-instance dcn_vpn
[GNE-ospf-65535] area 0
[GNE-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[GNE-ospf-65535-area-0.0.0.0] quit
[GNE-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ospf network-type p2p
[GNE-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[GNE] interface Vlan-interface 3002
[GNE-Vlan-interface3002] ospf network-type p2p
[GNE-Vlan-interface3002] quit
```

2. Configure Device A:

Enable DCN, configure the NE ID as 200002 and NE IP as 22.2.2.2/32.

```
<DeviceA> system-view
[DeviceA] dcn
[DeviceA-dcn] ne-id 200002
[DeviceA-dcn] ne-ip 22.2.2.2 32
[DeviceA-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceA] ip vpn-instance dcn_vpn
[DeviceA-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceA] interface loopback 1023
[DeviceA-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceA-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceA] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port access vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3002 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port access vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp source-mac vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3003 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3003
[DeviceA-GigabitEthernet1/0/1] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

[DeviceA-Vlan-interface3002] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ip binding vpn-instance dcn_vpn
[DeviceA-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceA-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceA] ospf 65535 vpn-instance dcn_vpn
[DeviceA-ospf-65535] area 0
[DeviceA-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceA-ospf-65535-area-0.0.0.0] quit
[DeviceA-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[DeviceA] interface Vlan-interface 3002
[DeviceA-Vlan-interface3002] ospf network-type p2p
[DeviceA-Vlan-interface3002] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ospf network-type p2p
[DeviceA-Vlan-interface3003] quit
```

3. Configure Device B:

Enable DCN, configure the NE ID as 300003 and NE IP as 33.3.3.3/32.

```
<DeviceB> system-view
[DeviceB] dcn
[DeviceB-dcn] ne-id 300003
[DeviceB-dcn] ne-ip 33.3.3.3 32
[DeviceB-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceB] ip vpn-instance dcn_vpn
[DeviceB-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceB] interface loopback 1023
[DeviceB-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceB-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceB] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address. Configure the system to issue the generated ARP entry after GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-mode route
[DeviceB-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
[DeviceB-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-mode route
[DeviceB-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
[DeviceB-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3003
[DeviceB-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ip binding vpn-instance dcn_vpn
[DeviceB-Vlan-interface3001] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3001] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ip binding vpn-instance dcn_vpn
[DeviceB-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceB] ospf 65535 vpn-instance dcn_vpn
[DeviceB-ospf-65535] area 0
[DeviceB-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceB-ospf-65535-area-0.0.0.0] quit
[DeviceB-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ospf network-type p2p
[DeviceB-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ospf network-type p2p
[DeviceB-Vlan-interface3003] quit
```

Verifying the configuration

Display brief DCN information on the GNE.

```
[GNE] display dcn

              DCN Brief Information

 NE ID        : 0x100001
 NE IP        : 11.1.1.1
 Mask         : 255.255.255.255
 DCN interface: LoopBack1023
 Auto report  : Enabled
```

Display all DCN NE information on the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

 NE ID          NE IP            Metric   Device Type
 0x100001       11.1.1.1         0        UNIS S5200-36S-PWR-HI-G
 0x200002       22.2.2.2         1        UNIS S5200-36S-PWR-HI-G
 0x300003       33.3.3.3         1        UNIS S5200-36S-PWR-HI-G

 Total number: 3
```

The output shows that GNE, Device A, and Device B are online. The GNE notifies the NMS of the online event. You can successfully ping the NE IP addresses of Device A and Device B from the GNE.

Remove Device B from the DCN network and display all DCN NE information for the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

 NE ID          NE IP            Metric   Device Type
 0x100001       11.1.1.1         0        UNIS S5200-36S-PWR-HI-G
 0x200002       22.2.2.2         1        UNIS S5200-36S-PWR-HI-G

 Total number: 2
```

The output shows that GNE and Device A are online. The GNE notifies the NMS of the offline event of Device B. You can still successfully ping the NE IP address of Device A from the GNE.

Configuring dual-stack PBR

About dual-stack PBR

Dual-stack policy-based routing (dual-stack PBR) uses user-defined policies to route packets. A policy can specify parameters for IPv4 or IPv6 packets that match specific criteria such as ACLs. The parameters include the next hop , output interface, and default next hop.

Dual-stack policy

A dual-stack PBR policy includes match criteria and actions to be taken on the matching packets. A dual-stack PBR policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

A dual-stack PBR policy compares packets with dual stack PBR policy nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup.

Relationship between if-match clauses

On a node, you can specify only one **`if-match acl`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about relationship between **`apply`** clauses, see "Configuring actions for a dual-stack policy node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match **clauses on the node?**	**Match mode**	
	Permit	**Deny**
Yes.	• If the node contains **`apply`** clauses, dual-stack PBR executes the **`apply`** clauses on the node. ○ If dual-stack PBR-based forwarding succeeds, dual-stack PBR does not compare the packet with the next node. ○ If dual-stack PBR-based forwarding fails, dual-stack PBR does not compare the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No.	Dual-stack PBR compares the packet	Dual-stack PBR compares the

Does a packet match all the if-match clauses on the node?	Match mode	
	Permit	**Deny**
	with the next node.	packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

Packet forwarding process

You can apply a dual-stack PBR policy to an interface or to all interfaces on the device. Once the policy is applied, the device searches the policy for a matching node to forward that packet upon receiving a packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
    – No next hops are specified on the node.
    – Forwarding failed based on the next hops.
  c. Uses the default route to forward the packet if no matching route was found in the routing table.
- The device performs routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

Dual-stack PBR and Track

Dual-stack PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or default next hop.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and dual-stack PBR collaboration, see *High Availability Configuration Guide*.

Restrictions: Hardware compatibility with dual-stack PBR

The S5200-EI-G switch series does not support dual-stack PBR.

Restrictions and guidelines: Dual-stack PBR configuration

If a packet destined for the local device matches a dual-stack PBR policy, dual-stack PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure a dual-stack PBR policy, be careful to avoid this situation.

Dual-stack PBR tasks at a glance

To configure dual-stack PBR, perform the following tasks:

1. Configuring a dual-stack PBR policy
   d. Creating a dual-stack policy node
   e. Setting match criteria for a dual-stack policy node
   f. Configuring actions for a dual-stack policy node
2. Specifying a policy for dual-stack PBR

   Choose the following tasks as needed:
   - Specifying a policy for interface dual-stack PBR
   - Specifying a policy for global dual-stack PBR

     A global dual-stack PBR policy applies to all interfaces on the device.

Configuring a dual-stack PBR policy

Creating a dual-stack policy node

1. Enter system view.

   system-view
2. Create a node for a dual-stack policy, and enter its view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the policy node.

   description *text*

   By default, no description is configured for a dual-stack policy node.

Setting match criteria for a dual-stack policy node

1. Enter system view.

   system-view
2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl { **ipv4** | **ipv6** } { *acl-number* | **name** *acl-name* }

     By default, no ACL match criterion is set.

When using the ACL to match packets, dual-stack PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.

- Set a local QoS ID match criterion.

  if-match qos-local-id *local-id-value*

  By default, no local QoS ID match criterion is set.

Configuring actions for a dual-stack policy node

About this task

The **apply** clauses allow you to specify the actions to be taken on matching packets on a dual-stack policy node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**
- **apply default-next-hop**

Dual-stack PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in PBR

Clause	Meaning	Remarks
apply precedence	Sets an IP precedence.	This clause is always executed.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.
apply default-next-hop	Sets default next hops	The clause takes effect only in the following cases: • No next hops are set or the next hops are invalid. • The packet does not match any route in the routing table.
apply statistics	Counts successful matches and matching bytes on the policy node.	To include the number of successful matches and matching bytes on a policy node in the statistics displayed by a **display** command, execute this command. This clause is always executed for matching packets.

Restrictions and guidelines

If you specify a next hop, dual-stack PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if dual-stack PBR does not update the route immediately after its availability status changes.

Configuring actions to set the IP precedence for packets

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Set an IP precedence for packets.

   apply precedence { *type* | *value* }

   By default, no IP precedence is specified for packets.

Configuring actions to direct packet forwarding

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions.

   - Set next hops.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { { *ipv4-address* | *ipv6-address* } [**direct**] [**track** *track-entry-number*] }&<1-4>

     By default, no next hops are specified.

     On a node, you can specify a maximum of four next hops for backup in one command line or by executing this command multiple times.

     If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

   - Set output interfaces.

     apply output-interface NULL 0

     By default, no output interfaces are specified.

   - Set default next hops.

     apply default-next-hop [**vpn-instance** *vpn-instance-name*] { { *ipv4-address* | *ipv6-address* } [**direct**] [**track** *track-entry-number*] }&<1-4>

     By default, no default next hops are specified.

     On a node, you can specify a maximum of four default next hops for backup in one command line or by executing this command multiple times.

Collecting policy node statistics

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Count successful matches and matching bytes on the policy node.

   apply statistics

   By default, matching counting is disabled on policy nodes.

Specifying a policy for dual-stack PBR

Specifying a policy for interface dual-stack PBR

About this task

Perform this task to apply a dual-stack policy to an interface to guide the forwarding of packets received on the interface.

Restrictions and guidelines

You can apply only one dual-stack policy to an interface and make sure the specified policy already exists. Before you can apply a new dual-stack PBR policy to an interface, you must first remove the current dual-stack policy from the interface.

You can apply a dual-stack policy to multiple interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a dual-stack policy for interface PBR.
   dual-stack policy-based-route *policy-name*

   By default, no interface dual-stack policy is applied to an interface.

Specifying a policy for global dual-stack PBR

About this task

Perform this task to apply a dual-stack policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one policy for global dual-stack PBR and the specified policy must already exist. Before you can apply a new policy, you must first remove the current policy.

Interface dual-stack PBR takes precedence over global dual-stack PBR on an interface. When they are both configured and packets fail to match the interface dual-stack PBR policy, global dual-stack PBR applies.

Procedure

1. Enter system view.
   system-view
2. Specify a policy for global dual-stack PBR.
   dual-stack global policy-based-route *policy-name*

   By default, no policy is specified for global dual-stack PBR.

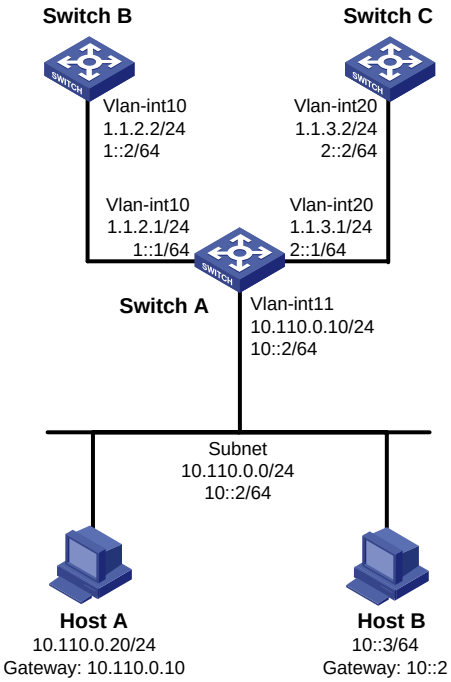
Display and maintenance commands for dual-stack PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display dual-stack PBR policy information.	**display dual-stack policy-based-route** [**policy** *policy-name*]
Display global dual-stack PBR configuration and statistics.	**display dual-stack policy-based-route global** [**slot** *slot-number*]
Display interface dual-stack PBR configuration and statistics.	**display dual-stack policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display dual-stack PBR configuration.	**display dual-stack policy-based-route setup**
Clear dual-stack PBR statistics.	**reset dual-stack policy-based-route statistics** [**policy** *policy-name*]

Dual-stack PBR configuration examples

Example: Configuring packet type-based interface dual-stack PBR



Network configuration

As shown in Figure 1, Switch B and Switch C do not have a route to reach each other.

Configure dual-stack PBR on Switch A to implement the following requirements:

- Forward all IPv4 TCP packets received on VLAN-interface 11 to next hop 1.1.2.2 (Switch B).
- Forward all IPv6 TCP packets received on VLAN-interface 11 to next hop 2::2 (Switch C).

Figure 1 Network diagram

Procedure

1. Assign IP addresses to the interfaces as shown in Figure 1. (Details not shown.)
2. Configure static or dynamic routing protocol settings to make sure Host A and B can communicate with Switch B and Switch C, respectively. (Details not shown.)
3. Configure dual-stack PBR on Switch A:

   # Configure ACL 3101 to match IPv4 TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule permit tcp
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Configure ACL 3102 to match IPv6 TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3102
   [SwitchA-acl-ipv6-adv-3102] rule permit tcp
   [SwitchA-acl-ipv6-adv-3102] quit
   ```

   # Configure Node 5 for the dual-stack policy **aaa** to forward IPv4 TCP packets to next hop 1.1.2.2.

   ```
   [SwitchA] dual-stack policy-based-route aaa permit node 5
   [SwitchA-pbrdual-aaa-5] if-match acl ipv4 3101
   [SwitchA-pbrdual-aaa-5] apply next-hop 1.1.2.2
   [SwitchA-pbrdual-aaa-5] quit
   ```

   # Configure Node 10 for the dual-stack policy **aaa** to forward IPv6 TCP packets to next hop 2::2.

   ```
   [SwitchA] dual-stack policy-based-route aaa permit node 10
   [SwitchA-pbrdual-aaa-10] if-match acl ipv6 3102
   [SwitchA-pbrdual-aaa-10] apply next-hop 2::2
   [SwitchA-pbrdual-aaa-10] quit
   ```

   # Configure interface dual-stack PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   ```

```
[SwitchA-Vlan-interface11] dual-stack policy-based-route aaa
[SwitchA-Vlan-interface11] quit
```

Verifying the configuration

Perform telnet and ping operations to verify that interface dual-stack PBR on Switch A operates as configured to perform packet forwarding as follows:

- Forwards the matching IPv4 TCP packets to the next hop 1.1.2.2 (Switch B).
- Forwards the matching IPv6 TCP packets to the next hop 2::2 (Switch C).

Verify that you can telnet to Switch B (1.1.2.2) from Host A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C (1.1.3.2) from Host A. (Details not shown.)

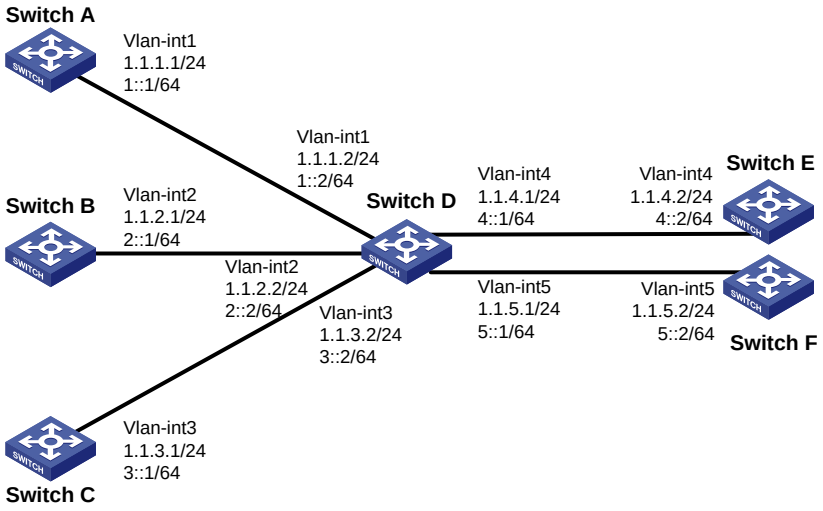
Verify that you can ping Switch C (1.1.3.2) from Host A successfully. (Details not shown.)

Verify that you can telnet to Switch C (2::2) from Host B successfully. (Details not shown.)

Verify that you cannot telnet to Switch B (1::2) from Host B. (Details not shown.)

Verify that you can ping Switch B (1::2) from Host B successfully. (Details not shown.)

Example: Configuring packet type-based global dual-stack PBR



Network configuration

As shown in Figure 2, Switch E and Switch F do not have a route to reach each other.

Configure global dual-stack PBR on Switch D to implement the following requirements:

- Forward IPv4 TCP packets to next hop 1.1.4.2 (Switch E).
- Forward IPv6 TCP packets to next hop 5::2 (Switch F).

Figure 2 Network diagram

Procedure

1. Assign IP addresses to the interfaces, as shown in Figure 2. (Details not shown.)
2. Configure static or dynamic routing protocol settings to make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
3. Configure dual-stack PBR on Switch D:

Configure ACL 3101 to match IPv4 TCP packets sourced from networks 1.1.1.0/24, 1.1.2.0/24, and 1.1.3.0/24.

```
<SwitchD> system-view
[SwitchD] acl advanced 3101
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.2.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.3.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] quit
```

Configure ACL 3102 to match IPv6 TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

```
<RouterD> system-view
[RouterD] acl ipv6 advanced 3102
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 1::0 64
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 2::0 64
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 3::0 64
[RouterD-acl-ipv6-adv-3102] quit
```

Configure node 5 in dual-stack PBR policy **aaa** to forward IPv4 TCP packets that match ACL 3101 to next hop 1.1.4.2.

```
[SwitchD] dual-stack policy-based-route aaa permit node 5
[SwitchD-pbrdual-aaa-5] if-match acl ipv4 3101
[SwitchD-pbrdual-aaa-5] apply next-hop 1.1.4.2
[SwitchD-pbrdual-aaa-5] quit
```

Configure node 10 in dual-stack PBR policy **aaa** to forward IPv6 TCP packets that match ACL 3102 to next hop 5::2.

```
[SwitchD] dual-stack policy-based-route aaa permit node 10
[SwitchD-pbrdual-aaa-10] if-match acl ipv6 3102
[SwitchD-pbrdual-aaa-10] apply next-hop 5::2
[SwitchD-pbrdual-aaa-10] quit
```

Specify dual-stack PBR policy **aaa** as the global PBR policy.

```
[SwitchD] dual-stack global policy-based-route aaa
```

Verifying the configuration

Perform telnet and ping operations to verify that global dual-stack PBR on Switch D operates as configured to perform packet forwarding as follows:

- Forwards the matching IPv4 TCP packets to the next hop 1.1.4.2 (Switch E).
- Forwards the matching IPv6 TCP packets to the next hop 5::2 (Switch F).

Verify that you can telnet to Switch E (1.1.4.2) successfully and cannot telnet to Switch F (1.1.5.2), from Switch A, B, and C. (Details not shown.)

Verify that you can ping Switch F (1.1.5.2) from Switch A, B and C successfully. (Details not shown.)

Verify that you can telnet to Switch F (5::2) successfully and cannot telnet to Switch E (4::2/64), from Switch A, B, and C. (Details not shown.)

Verify that you can ping Switch F (4::2) from Switch A, B and C successfully. (Details not shown.)

Preface

This configuration guide describes IP multicast fundamentals and configuration procedures. It covers the IPv4 multicast configuration and IPv6 multicast configuration. With multicast, you can implement efficient point-to-multipoint data transmission in your network.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

Convention	Description
	Folder.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

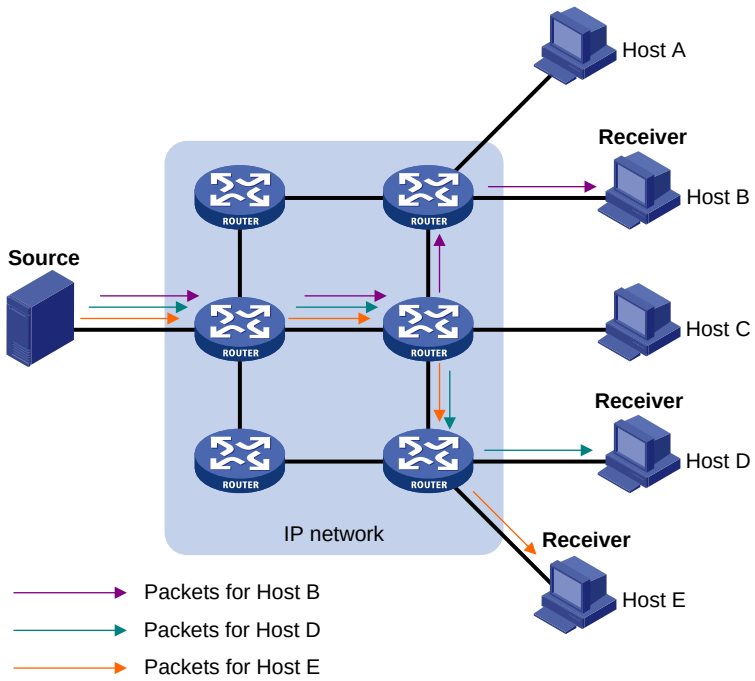
Multicast overview

Introduction to multicast

As a technique that coexists with unicast and broadcast, the multicast technique effectively addresses the issue of point-to-multipoint data transmission. By enabling high-efficiency point-to-multipoint data transmission over a network, multicast greatly saves network bandwidth and reduces network load.

By using multicast technology, a network operator can easily provide bandwidth-critical and time-critical information services. These services include live webcasting, Web TV, distance learning, telemedicine, Web radio, and real-time video conferencing.



Information transmission techniques

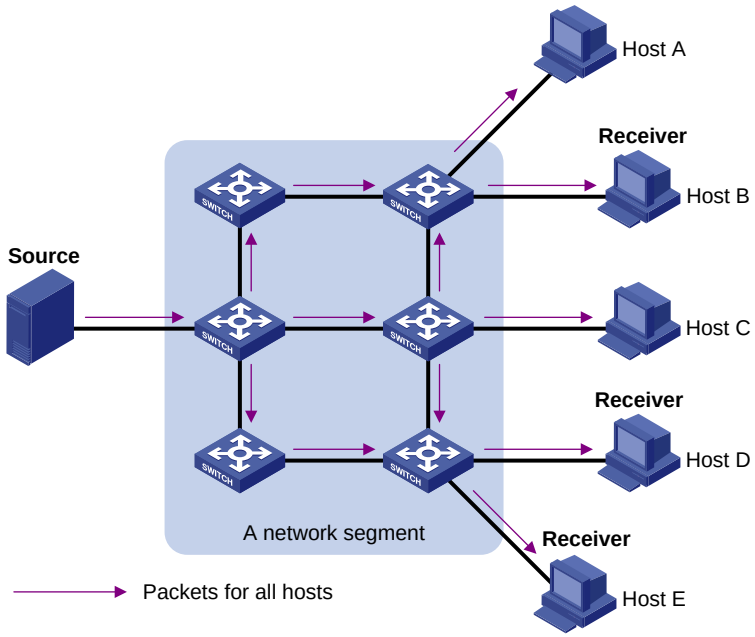
The information transmission techniques include unicast, broadcast, and multicast.

Unicast

In unicast transmission, the information source must send a separate copy of information to each host that needs the information.

Figure 1 Unicast transmission

In Figure 1, Host B, Host D, and Host E need the information. A separate transmission channel must be established from the information source to each of these hosts.



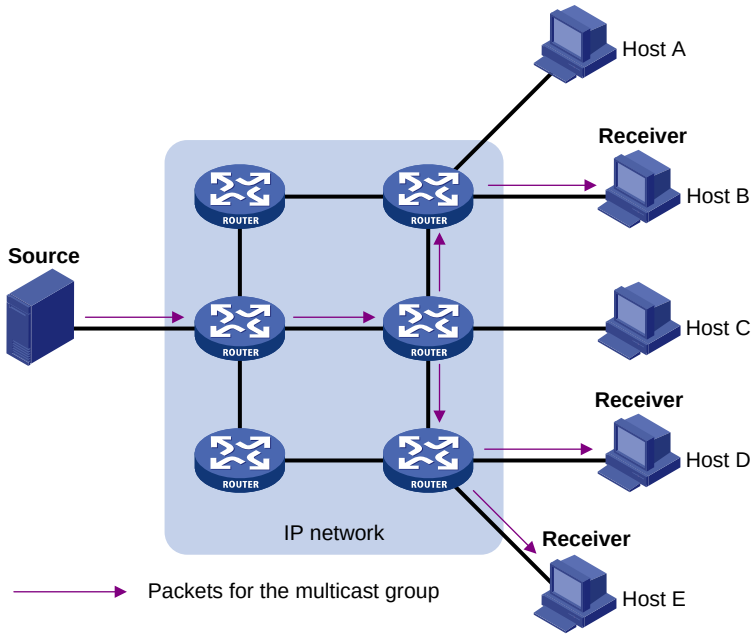
In unicast transmission, the traffic transmitted over the network is proportional to the number of hosts that need the information. If a large number of hosts need the information, the information source must send a separate copy of the same information to each of these hosts. Sending many copies can place a tremendous pressure on the information source and the network bandwidth.

Unicast is not suitable for batch transmission of information.

Broadcast

In broadcast transmission, the information source sends information to all hosts on the subnet, even if some hosts do not need the information.

Figure 2 Broadcast transmission



In Figure 2, only Host B, Host D, and Host E need the information. If the information is broadcast to the subnet, Host A and Host C also receive it. In addition to information security issues, broadcasting to hosts that do not need the information also causes traffic flooding on the same subnet.

Broadcast is disadvantageous in transmitting data to specific hosts. Moreover, broadcast transmission is a significant waste of network resources.

Multicast

Multicast provides point-to-multipoint data transmissions with the minimum network consumption. When some hosts on the network need multicast information, the information sender, or multicast source, sends only one copy of the information. Multicast distribution trees are built through multicast routing protocols, and the packets are replicated only on nodes where the trees branch.

Figure 3 Multicast transmission

In Figure 3, the multicast source sends only one copy of the information to a multicast group. Host B, Host D, and Host E, which are information receivers, must join the multicast group. The routers on the network duplicate and forward the information based on the distribution of the group members. Finally, the information is correctly delivered to Host B, Host D, and Host E.

To summarize, multicast has the following advantages:

- **Advantages over unicast**—Multicast data is replicated and distributed until it flows to the farthest-possible node from the source. The increase of receiver hosts will not remarkably increase the load of the source or the usage of network resources.
- **Advantages over broadcast**—Multicast data is sent only to the receivers that need it. This saves network bandwidth and enhances network security. In addition, multicast data is not confined to the same subnet.

Multicast features

- A multicast group is a multicast receiver set identified by an IP multicast address. Hosts must join a multicast group to become members of the multicast group before they receive the multicast data addressed to that multicast group. Typically, a multicast source does not need to join a multicast group.
- A multicast source is an information sender. It can send data to multiple multicast groups at the same time. Multiple multicast sources can send data to the same multicast group at the same time.
- The group memberships are dynamic. Hosts can join or leave multicast groups at any time. Multicast groups are not subject to geographic restrictions.
- Multicast routers or Layer 3 multicast devices are routers or Layer 3 switches that support Layer 3 multicast. They provide multicast routing and manage multicast group memberships on stub subnets with attached group members. A multicast router itself can be a multicast group member.

For a better understanding of the multicast concept, you can compare multicast transmission to the transmission of TV programs.

Table 1 Comparing TV program transmission and multicast transmission

TV program transmission	Multicast transmission
A TV station transmits a TV program through a channel.	A multicast source sends multicast data to a multicast group.
A user tunes the TV set to the channel.	A receiver joins the multicast group.
The user starts to watch the TV program transmitted by the TV station on the channel.	The receiver starts to receive the multicast data sent by the source to the multicast group.
The user turns off the TV set or tunes to another channel.	The receiver leaves the multicast group or joins another group.

Multicast benefits and applications

Multicast benefits

- **Enhanced efficiency**—Reduces the processor load of information source servers and network devices.
- **Optimal performance**—Reduces redundant traffic.
- **Distributed application**—Enables point-to-multipoint applications at the price of minimum network resources.

Multicast applications

- Multimedia and streaming applications, such as Web TV, Web radio, and real-time video/audio conferencing
- Communication for training and cooperative operations, such as distance learning and telemedicine
- Data warehouse and financial applications (stock quotes)
- Any other point-to-multipoint application for data distribution

Multicast models

Based on how the receivers treat the multicast sources, the multicast models include any-source multicast (ASM), source-filtered multicast (SFM), and source-specific multicast (SSM).

ASM model

In the ASM model, any multicast sources can send information to a multicast group. Receivers can join a multicast group and get multicast information addressed to that multicast group from any multicast sources. In this model, receivers do not know the positions of the multicast sources in advance.

SFM model

The SFM model is derived from the ASM model. To a multicast source, the two models appear to have the same multicast membership architecture.

The SFM model functionally extends the ASM model. The upper-layer software checks the source address of received multicast packets and permits or denies multicast traffic from specific sources.

The receivers obtain the multicast data from only part of the multicast sources. To a receiver, multicast sources are not all valid, but are filtered.

SSM model

The SSM model provides a transmission service that enables multicast receivers to specify the multicast sources in which they are interested.

In the SSM model, receivers have already determined the locations of the multicast sources. This is the main difference between the SSM model and the ASM model. In addition, the SSM model uses a different multicast address range than the ASM/SFM model. Dedicated multicast forwarding paths are established between receivers and the specified multicast sources.

Multicast addresses

IP multicast addresses

IPv4 multicast addresses

IANA assigned the Class D address block (224.0.0.0 to 239.255.255.255) to IPv4 multicast.

Table 2 Class D IP address blocks and description

Address block	Description
224.0.0.0 to 224.0.0.255	Reserved permanent group addresses. The IP address 224.0.0.0 is reserved. Other IP addresses can be used by routing protocols and for topology searching, protocol maintenance, and so on. Table 3 lists common permanent group addresses. A packet destined for an address in this block will not be forwarded beyond the local subnet regardless of the TTL value in the IP header.
224.0.1.0 to 238.255.255.255	Globally scoped group addresses. This block includes the following types of designated group addresses: • **232.0.0.0/8**—SSM group addresses. • **233.0.0.0/8**—Glop group addresses.
239.0.0.0 to 239.255.255.255	Administratively scoped multicast addresses. These addresses are considered locally unique rather than globally unique. You can reuse them in domains administered by different organizations without causing conflicts. For more information, see RFC 2365.

NOTE:

Glop is a mechanism for assigning multicast addresses between different ASs. By filling an AS number into the middle two bytes of 233.0.0.0, you get 255 multicast addresses for that AS. For more information, see RFC 2770.

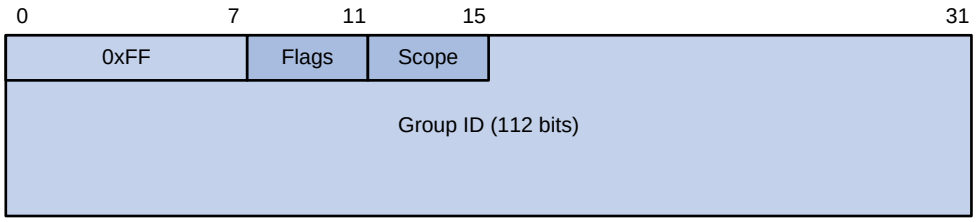


Table 3 Common permanent multicast group addresses

Address	Description
224.0.0.1	All systems on this subnet, including hosts and routers.
224.0.0.2	All multicast routers on this subnet.
224.0.0.3	Unassigned.
224.0.0.4	DVMRP routers.
224.0.0.5	OSPF routers.

Address	Description
224.0.0.6	OSPF designated routers and backup designated routers.
224.0.0.7	Shared Tree (ST) routers.
224.0.0.8	ST hosts.
224.0.0.9	RIPv2 routers.
224.0.0.11	Mobile agents.
224.0.0.12	DHCP server/relay agent.
224.0.0.13	All Protocol Independent Multicast (PIM) routers.
224.0.0.14	This protocol is not supported in the current software version. RSVP encapsulation.
224.0.0.15	All Core-Based Tree (CBT) routers.
224.0.0.16	Designated SBM.
224.0.0.17	All SBMs.
224.0.0.18	VRRP.

IPv6 multicast addresses

Figure 4 IPv6 multicast format

The following describes the fields of an IPv6 multicast address:

- **0xFF**—The most significant eight bits are 11111111.
- **Flags**—The Flags field contains four bits.

  Figure 5 Flags field format

  Table 4 Flags field description

Bit	Description
0	Reserved, set to 0.
R	• When set to 0, this address is an IPv6 multicast address without an embedded RP address. • When set to 1, this address is an IPv6 multicast address with an embedded RP address. (The P and T bits must also be set to 1.)
P	• When set to 0, this address is an IPv6 multicast address not based on a unicast prefix. • When set to 1, this address is an IPv6 multicast address based on a unicast prefix. (The T bit must also be set to

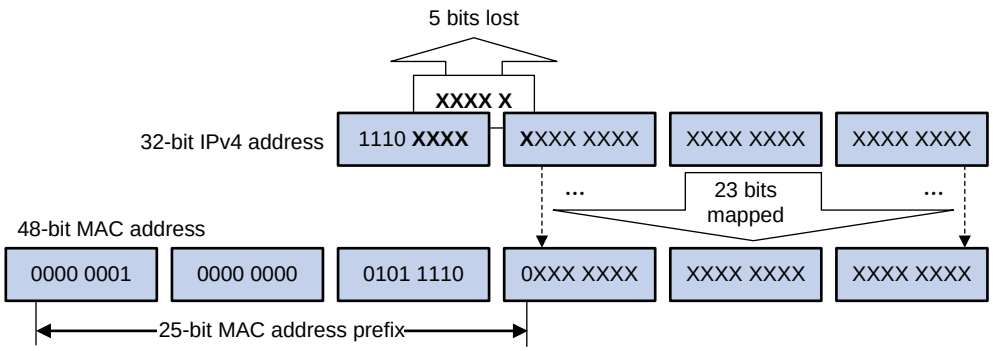
Bit	Description
	1.)
T	• When set to 0, this address is an IPv6 multicast address permanently-assigned by IANA. • When set to 1, this address is a transient or dynamically assigned IPv6 multicast address.

- **Scope**—The Scope field contains four bits, which represent the scope of the IPv6 internetwork for which the multicast traffic is intended.

  Table 5 Values of the Scope field

Value	Meaning
0, F	Reserved.
1	Interface-local scope.
2	Link-local scope.
3	Subnet-local scope.
4	Admin-local scope.
5	Site-local scope.
6, 7, 9 through D	Unassigned.
8	Organization-local scope.
E	Global scope.

- **Group ID**—The Group ID field contains 112 bits. It uniquely identifies an IPv6 multicast group in the scope that the Scope field defines.



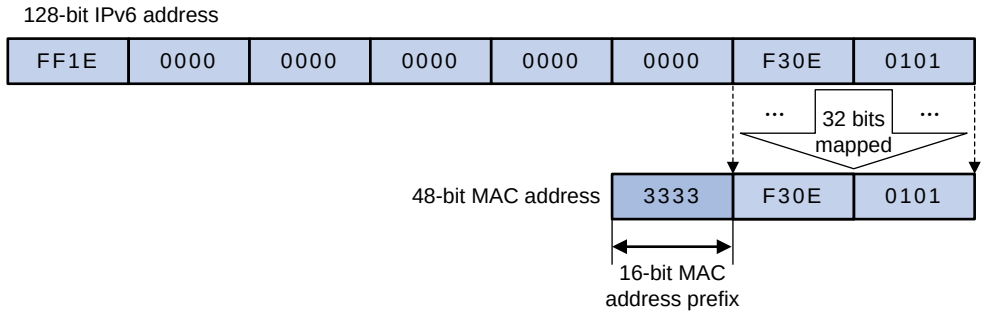
Ethernet multicast MAC addresses

An Ethernet multicast MAC address identifies receivers that belong to the same multicast group at the data link layer.

IPv4 multicast MAC addresses

As defined by IANA, the most significant 24 bits of an IPv4 multicast MAC address are 0x01005E. Bit 25 is 0, and the other 23 bits are the least significant 23 bits of an IPv4 multicast address.

Figure 6 IPv4-to-MAC address mapping



The most significant four bits of an IPv4 multicast address are fixed at 1110. In an IPv4-to-MAC address mapping, five bits of the IPv4 multicast address are lost. As a result, 32 IPv4 multicast addresses are mapped to the same IPv4 multicast MAC address. A device might receive unwanted multicast data at Layer 2 processing, which needs to be filtered by the upper layer.

IPv6 multicast MAC addresses

As defined by IANA, the most significant 16 bits of an IPv6 multicast MAC address are 0x3333. The least significant 32 bits are mapped from the least significant 32 bits of an IPv6 multicast address. Therefore, the problem of duplicate IPv6-to-MAC address mapping also arises like IPv4-to-MAC address mapping.

Figure 7 IPv6-to-MAC address mapping

IMPORTANT:

Because of the duplicate mapping from multicast IP address to multicast MAC address, the device might inadvertently send multicast protocol packets as multicast data in Layer 2 forwarding. To avoid this, do not use the IP multicast addresses that are mapped to multicast MAC addresses 0100-5E00-00xx and 3333-0000-00xx (where "x" represents any hexadecimal number from 0 to F).

Multicast protocols

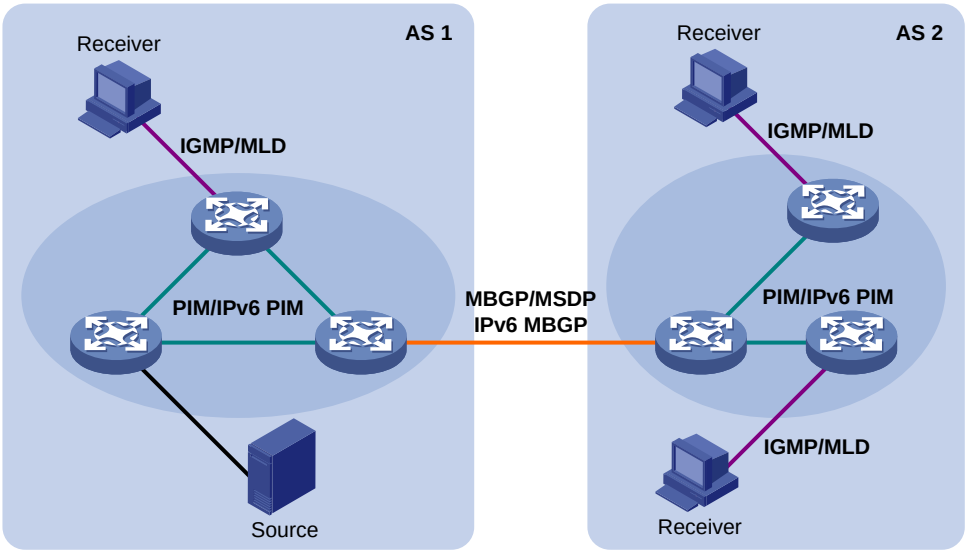
Multicast protocols include the following categories:

- Layer 3 and Layer 2 multicast protocols:
  - Layer 3 multicast refers to IP multicast operating at the network layer.

    Layer 3 multicast protocols—IGMP, MLD, PIM, IPv6 PIM, MSDP, MBGP, and IPv6 MBGP.
  - Layer 2 multicast refers to IP multicast operating at the data link layer.

    Layer 2 multicast protocols—IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.
- IPv4 and IPv6 multicast protocols:
  - **For IPv4 networks**—IGMP snooping, PIM snooping, multicast VLAN, IGMP, PIM, MSDP, and MBGP.
  - **For IPv6 networks**—MLD snooping, IPv6 PIM snooping, IPv6 multicast VLAN, MLD, IPv6 PIM, and IPv6 MBGP.

This section provides only general descriptions about applications and functions of the Layer 2 and Layer 3 multicast protocols in a network. For more information about these protocols, see the related chapters.



NOTE:

PIM snooping and IPv6 PIM snooping are not supported in the current software version.

Layer 3 multicast protocols

In Figure 8, Layer 3 multicast protocols include multicast group management protocols and multicast routing protocols.

Figure 8 Positions of Layer 3 multicast protocols

- Multicast group management protocols:

  Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) protocol are multicast group management protocols. Typically, they run between hosts and Layer 3 multicast devices that directly connect to the hosts to establish and maintain multicast group memberships.

- Multicast routing protocols:

  A multicast routing protocol runs on Layer 3 multicast devices to establish and maintain multicast routes and correctly and efficiently forward multicast packets. Multicast routes constitute loop-free data transmission paths (also known as multicast distribution trees) from a data source to multiple receivers.

  In the ASM model, multicast routes include intra-domain routes and inter-domain routes.

  - An intra-domain multicast routing protocol discovers multicast sources and builds multicast distribution trees within an AS to deliver multicast data to receivers. Among a variety of mature intra-domain multicast routing protocols, PIM is most widely used. Based on the forwarding mechanism, PIM has dense mode (often referred to as PIM-DM) and sparse mode (often referred to as PIM-SM).
  - An inter-domain multicast routing protocol is used for delivering multicast information between two ASs. So far, mature solutions include Multicast Source Discovery Protocol (MSDP) and MBGP. MSDP propagates multicast source information among different ASs. MBGP is an extension of the MP-BGP for exchanging multicast routing information among different ASs.

  For the SSM model, multicast routes are not divided into intra-domain routes and inter-domain routes. Because receivers know the positions of the multicast sources, channels established through PIM-SM are sufficient for the transport of multicast information.

Layer 2 multicast protocols

In Figure 9, Layer 2 multicast protocols include IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.

Figure 9 Positions of Layer 2 multicast protocols

- IGMP snooping and MLD snooping:

  IGMP snooping and MLD snooping are multicast constraining mechanisms that run on Layer 2 devices. They manage and control multicast groups by monitoring and analyzing IGMP or MLD messages exchanged between the hosts and Layer 3 multicast devices. This effectively controls the flooding of multicast data in Layer 2 networks.

- PIM snooping and IPv6 PIM snooping:

  PIM snooping and IPv6 PIM snooping run on Layer 2 devices. They work with IGMP snooping or MLD snooping to analyze received PIM messages. Then, they add the ports that are interested in specific multicast data to a PIM snooping routing entry or IPv6 PIM snooping routing entry. In this way, multicast data can be forwarded to only the ports that are interested in the data.

- Multicast VLAN and IPv6 multicast VLAN:

  Multicast VLAN or IPv6 multicast VLAN runs on a Layer 2 device in a multicast network where multicast receivers for the same group exist in different VLANs. With these protocols, the Layer 3 multicast device sends only one copy of multicast to the multicast VLAN or IPv6 multicast VLAN on the Layer 2 device. This method avoids waste of network bandwidth and extra burden on the Layer 3 device.

Multicast packet forwarding mechanism

In a multicast model, receiver hosts of a multicast group are usually located at different areas on the network. They are identified by the same multicast group address. To deliver multicast packets to these receivers, a multicast source encapsulates the multicast data in an IP packet with the multicast group address as the destination address. Multicast routers on the forwarding paths forward multicast packets that an incoming interface receives through multiple outgoing interfaces. Compared to a unicast model, a multicast model is more complex in the following aspects:

- To ensure multicast packet transmission on the network, different routing tables are used to guide multicast forwarding. These routing tables include unicast routing tables, routing tables for multicast (for example, the MBGP routing table), and static multicast routing tables.
- To process the same multicast information from different peers received on different interfaces, the multicast device performs an RPF check on each multicast packet. The RPF check result determines whether the packet will be forwarded or discarded. The RPF check mechanism is the basis for most multicast routing protocols to implement multicast forwarding.

For more information about the RPF mechanism, see "Configuring multicast routing and forwarding" and "Configuring IPv6 multicast routing and forwarding."

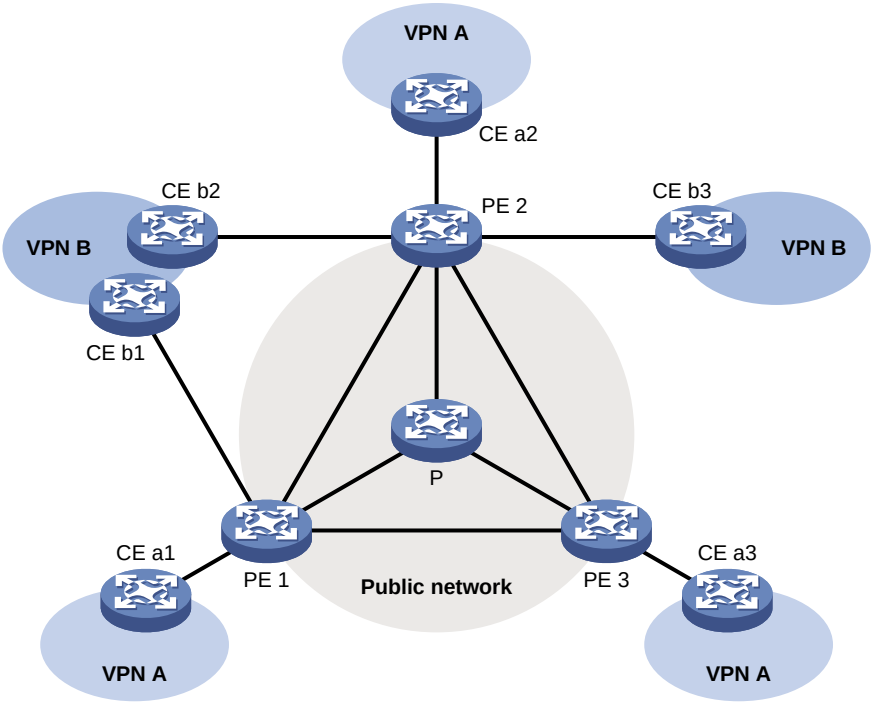
IP multicast architecture

IP multicast addresses the following issues:

- Where should the multicast source transmit information to? (Multicast addressing.)
- What receivers exist on the network? (Host registration.)
- Where is the multicast source that will provide data to the receivers? (Multicast source discovery.)
- How is the information transmitted to the receivers? (Multicast routing.)

IP multicast is an end-to-end service. The multicast architecture involves the following parts:

- **Addressing mechanism**—A multicast source sends information to a group of receivers through a multicast address.
- **Host registration**—Receiver hosts can join and leave multicast groups dynamically. This mechanism is the basis for management of group memberships.
- **Multicast routing**—A multicast distribution tree (a forwarding path tree for multicast data on the network) is constructed for delivering multicast data from a multicast source to receivers.
- **Multicast applications**—A software system that supports multicast applications, such as video conferencing, must be installed on multicast sources and receiver hosts. The TCP/IP stack must support reception and transmission of multicast data.



Multicast support for VPNs

Multicast support for VPNs refers to multicast applied in VPNs.

Introduction to VPN instances

VPNs are isolated from one another and from the public network. As shown in Figure 10, VPN A and VPN B separately access the public network through PE devices.

Figure 10 VPN networking diagram

- The P device belongs to the public network. The CE devices belong to their respective VPNs. Each CE device serves its own VPN and maintains only one set of forwarding mechanisms.
- The PE devices connect to the public network and the VPNs. Each PE device must strictly distinguish the information for different networks, and maintain a separate forwarding mechanism for each network. On a PE device, a set of software and hardware that serve the same network forms an instance. Multiple instances can exist on the same PE device, and an instance can reside on different PE devices. On a PE device, the instance for the public network is called the public network instance, and those for VPNs are called VPN instances.

Multicast application in VPNs

A PE device that supports multicast for VPNs performs the following operations:

- Maintains an independent set of multicast forwarding mechanisms for each VPN, including the multicast protocols, PIM neighbor information, and multicast routing table. In a VPN, the device forwards multicast data based on the forwarding table or routing table for that VPN.
- Implements the isolation between different VPNs.
- Implements information exchange and data conversion between the public network and VPN instances.

For example, as shown in Figure 10, a multicast source in VPN A sends multicast data to a multicast group. Only receivers that belong to both the multicast group and VPN A can receive the multicast data. The multicast data is multicast both in VPN A and on the public network. If you configure MVPN extranet, multicast data can be transmitted across different VPNs.

Common notations in multicast

The following notations are commonly used in multicast transmission:

- **(*, G)**—Rendezvous point tree (RPT), or a multicast packet that any multicast source sends to multicast group G. The asterisk (*) represents any multicast source, and "G" represents a specific multicast group.

- **(S, G)**—Shortest path tree (SPT), or a multicast packet that multicast source "S" sends to multicast group "G." "S" represents a specific multicast source, and "G" represents a specific multicast group.

For more information about the concepts RPT and SPT, see "PIM overview" and "IPv6 PIM overview."

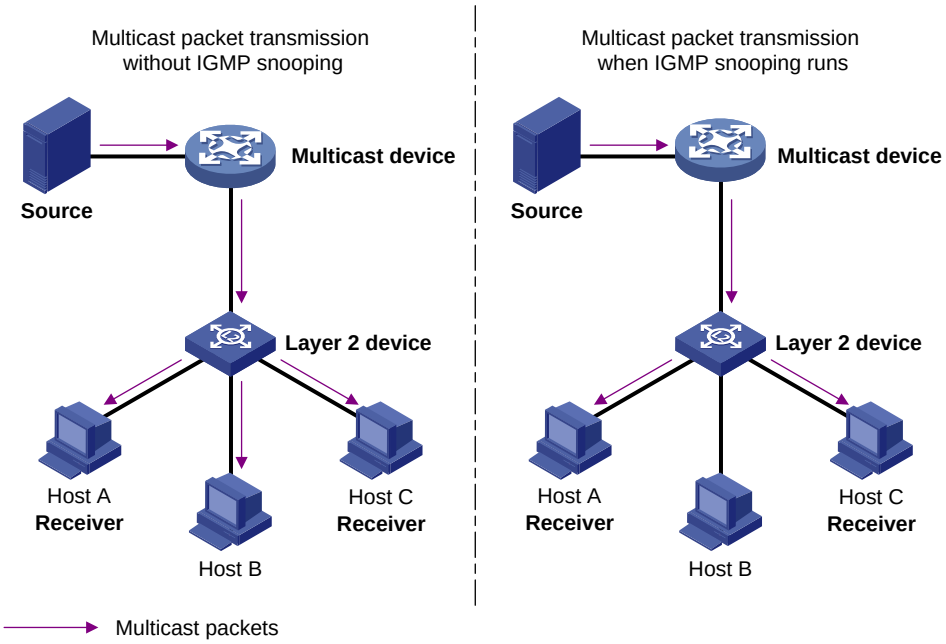
Configuring IGMP snooping



About IGMP snooping

IGMP snooping runs on a Layer 2 device as a multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from IGMP packets that are exchanged between the hosts and the Layer 3 device.

Fundamentals of IGMP snooping

As shown in Figure 1, when IGMP snooping is not enabled, the Layer 2 switch floods multicast packets to all hosts. When IGMP snooping is enabled, the Layer 2 switch forwards multicast packets of known multicast groups to only the receivers.

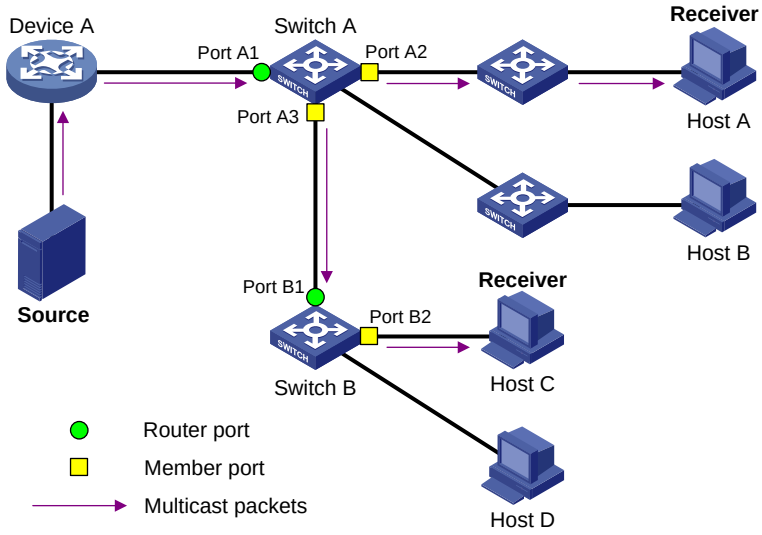


Figure 1 Multicast packet transmission without and with IGMP snooping

IGMP snooping ports

As shown in Figure 2, IGMP snooping runs on Switch A and Switch B, and Host A and Host C are receivers in a multicast group. IGMP snooping ports are divided into member ports and router ports.

Figure 2 IGMP snooping ports

Router ports

On an IGMP snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an IGMP general query whose source address is not 0.0.0.0 or receives a PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive an IGMP general query whose source address is not 0.0.0.0 or a PIM hello message when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in IGMP snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in IGMP snooping is a Layer 2 interface.

Member ports

On an IGMP snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an IGMP report, it is added to the associated dynamic IGMP snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an IGMP report before the timer expires, the timer is reset. If the port does not receive an IGMP report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static IGMP snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How IGMP snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

IGMP messages types include general query, IGMP report, and leave message. An IGMP snooping-enabled Layer 2 device performs differently depending on the message types.

General query

The IGMP querier periodically sends IGMP general queries to all hosts and devices on the local subnet to check for the existence of multicast group members.

After receiving an IGMP general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

IGMP report

A host sends an IGMP report to the IGMP querier for the following purposes:

- Responds to queries if the host is a multicast group member.
- Applies for a multicast group membership.

After receiving an IGMP report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the address of the reported multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an IGMP report through a non-router port because of the host IGMP report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their IGMP reports upon receiving IGMP reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Leave message

An IGMPv1 receiver host does not send any leave messages when it leaves a multicast group. The Layer 2 device cannot immediately update the status of the port that connects to the receiver host. The Layer 2 device does not remove the port from the outgoing interface list in the associated forwarding entry until the aging time for the group expires.

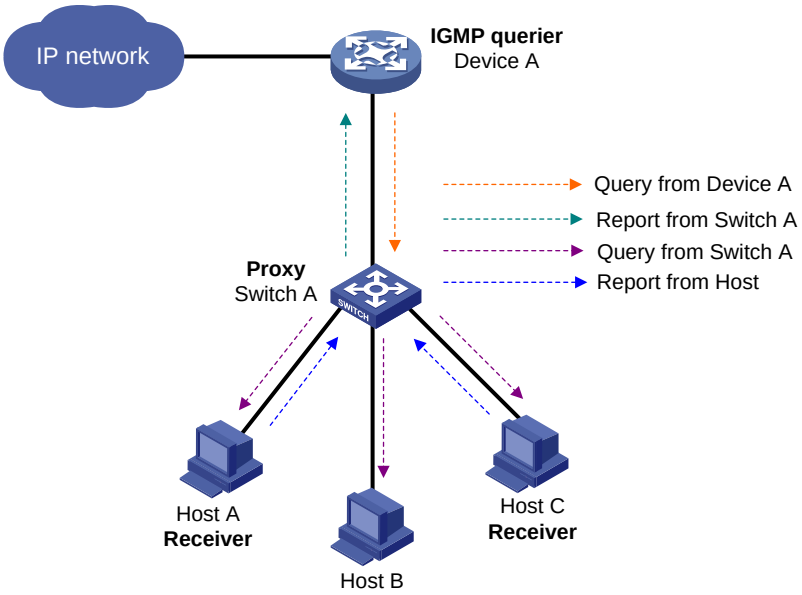
An IGMPv2 or IGMPv3 host sends an IGMP leave message when it leaves a multicast group.

When the Layer 2 device receives an IGMP leave message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the group address in the message.

- If no match is found, the Layer 2 device discards the IGMP leave message.

- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the IGMP leave message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the IGMP leave message.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.
- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the IGMP leave message to all router ports in the VLAN.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.

After receiving the IGMP leave message on a port, the IGMP querier resolves the multicast group address in the message. Then, it sends an IGMP group-specific query to the multicast group through the receiving port.



After receiving the IGMP group-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding IGMP report from the directly connected hosts. For the dynamic member port that received the leave message, the Layer 2 device also performs one of the following actions:

- If the port receives an IGMP report before the aging timer expires, the Layer 2 device resets the aging timer.
- If the port does not receive an IGMP report when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the multicast group.

IGMP snooping proxying

As shown in Figure 3, to reduce the number of IGMP report and leave messages received by the upstream device, you can enable IGMP snooping proxying on the edge device. With IGMP snooping proxying enabled, the edge device acts as a host for the upstream IGMP snooping querier to send IGMP report and leave messages to Device A. The host IGMP report suppression mechanism on the edge device does not take effect. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Figure 3 IGMP snooping proxying

The IGMP snooping proxy device processes different IGMP messages as follows:

- General query.

  After receiving an IGMP general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an IGMP report based on the local membership information and sends the report to all router ports.

- Group-specific query or group-and-source-specific query.

  After receiving an IGMP group-specific query or group-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a report to all router ports in the VLAN.

- Report.

  After receiving an IGMP report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Leave message.

  After receiving the IGMP leave message on a port, the device sends an IGMP group-specific query through the receiving port. The device sends the IGMP leave message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: IGMP snooping configuration

The IGMP snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in IGMP-snooping view. The configuration made in VLAN view and the configuration made in IGMP-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in IGMP-snooping view. The interface-specific configuration takes priority over the configuration made in IGMP-snooping view.

VLAN-based IGMP snooping tasks at a glance

To configure IGMP snooping for VLANs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for VLANs
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Configuring static multicast MAC address entries
   - Setting the IGMP last member query interval
4. (Optional.) Configuring IGMP snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Specifying the Layer 2 multicast forwarding mode
6. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses
   - Enabling the device to send IGMP general queries upon a path change
   - Enabling the device to send IGMP general queries upon a port state change
7. (Optional.) Enabling IGMP snooping proxying

8. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
9. (Optional.) Configuring IGMP snooping policies
   - Configuring a multicast group policy
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
   - Setting the maximum number of multicast groups on a port
   - Enabling multicast group replacement
   - Enabling host tracking
10. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
11. (Optional.) Enabling SNMP notifications for IGMP snooping
12. (Optional.) Configuring IGMP snooping logging
    - Enabling IGMP snooping logging
    - Enabling IGMP snooping logging suppression

Enabling the IGMP snooping feature

About this task

You must enable the IGMP snooping feature before you configure other IGMP snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, the IGMP snooping feature is disabled.

Enabling IGMP snooping

Enabling IGMP snooping globally

About this task

After you enable IGMP snooping globally, IGMP snooping is enabled for all VLANs. You can disable IGMP snooping for a VLAN when IGMP snooping is globally enabled.

Restrictions and guidelines

To configure other IGMP snooping features for VLANs, you must enable IGMP snooping for the specific VLANs even though IGMP snooping is enabled globally.

The VLAN-specific IGMP snooping configuration takes priority over the global IGMP snooping configuration. For example, if you enable IGMP snooping globally and then use the **`igmp-snooping disable`** command to disable IGMP snooping for a VLAN, IGMP snooping is disabled in the VLAN.

Procedure

1. Enter system view.

system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable IGMP snooping globally.

4. **global-enable**

   By default, IGMP snooping is disabled globally.

5. (Optional.) Disable IGMP snooping for a VLAN.

   a. Return to system view.

      quit

   b. Enter VLAN view.

      vlan *vlan-id*

   c. Disable IGMP snooping for the VLAN.

      igmp-snooping disable

      By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for VLANs

Restrictions and guidelines

You can enable IGMP snooping for multiple VLANs by using the **enable vlan** command in IGMP-snooping view or for a VLAN by using the **igmp-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view.

IGMP snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling IGMP snooping for multiple VLANs

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable IGMP snooping for the specified VLANs.

   enable vlan *vlan-list*

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Configuring basic IGMP snooping features

Specifying an IGMP snooping version

About this task

Different IGMP snooping versions process different versions of IGMP messages.

- IGMPv2 snooping processes IGMPv1 messages, IGMPv2 messages, and IGMPv3 queries, but it floods IGMPv3 reports in the VLAN instead of processing them.
- IGMPv3 snooping processes IGMPv1, IGMPv2, and IGMPv3 messages.

Restrictions and guidelines

If you change the IGMP snooping version from 2 to 3, the device performs the following actions:

- Clears all IGMP snooping forwarding entries that are dynamically created.
- Keeps static IGMPv3 snooping forwarding entries (*, G).
- Clears static IGMPv3 snooping forwarding entries (S, G), which will be restored when the IGMP snooping version is switched back to 3.

For more information about static IGMP snooping forwarding entries, see "Configuring a static member port."

Specifying an IGMP snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Specify an IGMP snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an IGMP snooping version for the VLAN.
   igmp-snooping version *version-number*
   By default, the IGMP snooping version for a VLAN is 2.

Setting the maximum number of IGMP snooping forwarding entries

About this task

You can modify the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum number of IGMP snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of IGMP snooping forwarding entries is 4294967295.

Configuring static multicast MAC address entries

About this task

In Layer 2 multicast, multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as IGMP snooping). You can also manually configure static multicast MAC address entries by binding multicast MAC addresses and ports to control the destination ports of the multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the IGMP last member query interval

About this task

A receiver host starts a report delay timer for a multicast group when it receives an IGMP group-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the group.

The IGMP last member query interval defines the maximum response time advertised in IGMP group-specific queries. Set an appropriate value for the IGMP last member query interval to speed up hosts' responses to IGMP group-specific queries and avoid IGMP report traffic bursts.

Setting the IGMP last member query interval globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the IGMP last member query interval globally.
   last-member-query-interval *interval*
   By default, the global IGMP last member query interval is 1 second.

Setting the IGMP last member query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP last member query interval for the VLAN.
   igmp-snooping last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second for a VLAN.

Configuring IGMP snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an IGMP general query or PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an IGMP report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports. For example, if the memberships of multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports. If the memberships of multicast groups rarely change, set a relatively large value.

If a dynamic router port receives a PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **router-aging-time** or **igmp-snooping router-aging-time** command does not take effect on the port.

IGMP group-specific queries originated by the Layer 2 device trigger the adjustment of aging timers for dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the IGMP last member query interval. For more information about setting the IGMP last member query interval on the Layer 2 device, see "Setting the IGMP last member query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.

igmp-snooping

3. Set the aging timer for dynamic router ports globally.

   router-aging-time *seconds*

   By default, the aging timer for dynamic router ports is 260 seconds.

4. Set the global aging timer for dynamic member ports globally.

   host-aging-time *seconds*

   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging timer for dynamic router ports in the VLAN.

   igmp-snooping router-aging-time *seconds*

   By default, a VLAN uses the global aging timer for dynamic router ports.

4. Set the aging timer for dynamic member ports in the VLAN.

   igmp-snooping host-aging-time *seconds*

   By default, a VLAN uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for a multicast group so that hosts attached to the port can always receive multicast for the group. The static member port does not respond to IGMP queries. When you complete or cancel this configuration on a port, the port does not send an unsolicited IGMP report or leave message.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.

   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*

   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

3. Configure the port as a static member port.

   igmp-snooping static-group *group-address* [**source-ip** *source-address*] { **vlan** *vlan-id* | **service-instance** *instance-id* }

   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for a multicast group so that all multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.
   igmp-snooping static-router-port vlan *vlan-id*
   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited IGMP report when you complete the configuration.
- It responds to IGMP general queries with IGMP reports.
- It sends an IGMP leave message when you cancel the configuration.

The version of IGMP running on the simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*
   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave massage. The Layer 2 device no longer sends or forwards IGMP group-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts in a VLAN. If you do so, the remaining receivers cannot receive multicast data for a group after a receiver leaves the group.

On a network where both Layer 2 multicast and Layer 3 multicast are enabled, when multicast group members on a port need to leave, you only need to enable fast-leave processing on the Layer 2 port. To avoid multicast service interruption on the other ports in the same VLAN, do not enable fast-leave processing for Layer 3 multicast group members at the same time (by using the **igmp fast leave** command). For more information about the **igmp fast leave** command, see IGMP commands in *IP Multicast Command Reference*.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   igmp-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send IGMP general queries or PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive multicast data that it does not want to receive.
- The port forwards the IGMP general queries or PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the IGMP querier or M-LAG election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable a port from becoming a dynamic router port. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.

system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   igmp-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an IGMP snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable IGMP snooping in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   igmp-snooping router-port-discard
   By default, the device forwards multicast data to static router ports in a VLAN.

Specifying the Layer 2 multicast forwarding mode

About Layer 2 multicast forwarding modes

The device supports the following Layer 2 multicast forwarding modes:

- **MAC-based mode**—The device forwards Layer 2 multicast packets based on the multicast MAC addresses in the packets.
- **IP-based mode**—The device forwards Layer 2 multicast packets based on the IP addresses (multicast source addresses and multicast group addresses) in the packets.

To display Layer 2 multicast IP forwarding entries, use the **display l2-multicast ip forwarding** command.

To display Layer 2 multicast MAC forwarding entries, use the **display l2-multicast mac forwarding** command.

Restrictions and guidelines for specifying the Layer 2 multicast forwarding mode

Multiple multicast IP addresses might be mapped to the same multicast MAC address. This causes that non-members of a multicast group receive the multicast data of this group if the device uses the MAC-based forwarding mode. As a best practice, specify the IP-based Layer 2 multicast forwarding mode on Layer 3 multicast devices.

As a best practice, specify the IP-based Layer 2 multicast forwarding mode on the device if a device running IGMPv3 exists in the network.

Specifying the Layer 2 multicast forwarding mode for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify the Layer 2 multicast forwarding mode.
   igmp-snooping forwarding-mode { **ip** | **mac** }
   By default, the device forwards Layer 2 multicast packets based on the MAC addresses in the packets.

Configuring the IGMP snooping querier

Enabling the IGMP snooping querier

About this task

This feature enables the Layer 2 device to periodically send IGMP general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an IGMP snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the IGMP snooping querier on a multicast network that runs IGMP. An IGMP snooping querier does not take part in IGMP querier elections. However, it might affect IGMP querier elections if it sends IGMP general queries with a low source IP address. For more information about IGMP querier, see "Configuring IGMP."

Enabling the IGMP snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the IGMP snooping querier for the VLAN.
   igmp-snooping querier
   By default, the IGMP snooping querier is disabled for a VLAN.

Enabling IGMP snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for IGMP snooping querier election is the same as that for IGMP querier election. For more information about IGMP querier election, see "Configuring IGMP."

Prerequisites for enabling IGMP snooping querier election

Before you enable IGMP snooping querier election, you must complete the following tasks:

- Enable the IGMP snooping querier for a VLAN. For more information about enabling the IGMP snooping querier, see "Enabling the IGMP snooping querier."
- Configure the source IP address for IGMP general queries as an IP address different from 0.0.0.0 and the local querier IP address. An IGMP snooping querier performs querier election only if the source IP address of a received IGMP general query is not 0.0.0.0 or its own IP address.
- Make sure the candidate IGMP snooping queriers run the same IGMP snooping version. To specify the IGMP snooping version, use the **igmp-snooping version** command.

Enabling IGMP snooping querier election for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable IGMP snooping querier election for the VLAN.

   igmp-snooping querier-election

   By default, IGMP snooping querier election is disabled for a VLAN.

Configuring parameters for IGMP general queries and responses

About this task

You can modify the IGMP general query interval based on the actual condition of the network.

A receiver host starts a report delay timer for each multicast group that it has joined when it receives an IGMP general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the corresponding multicast group.

Set an appropriate value for the maximum response time for IGMP general queries to speed up hosts' responses to IGMP general queries and avoid IGMP report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting multicast group members, make sure the IGMP general query interval is greater than the maximum response time for IGMP general queries.

Configuring parameters for IGMP general queries and responses globally

1. Enter system view.

   system-view
2. Enter IGMP-snooping view.

igmp-snooping

3. Set the maximum response time for IGMP general queries.

   max-response-time *seconds*

   By default, the maximum response time for IGMP general queries is 10 seconds.

Configuring parameters for IGMP general queries and responses in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the IGMP general query interval in the VLAN.

   igmp-snooping query-interval *interval*

   By default, the IGMP general query interval is 125 seconds for a VLAN.

4. Set the maximum response time for IGMP general queries in the VLAN.

   igmp-snooping max-response-time *seconds*

   By default, the maximum response time for IGMP general queries is 10 seconds for a VLAN.

Enabling the device to send IGMP general queries upon a path change

About this task

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when a path changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the IGMP snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.

   system-view

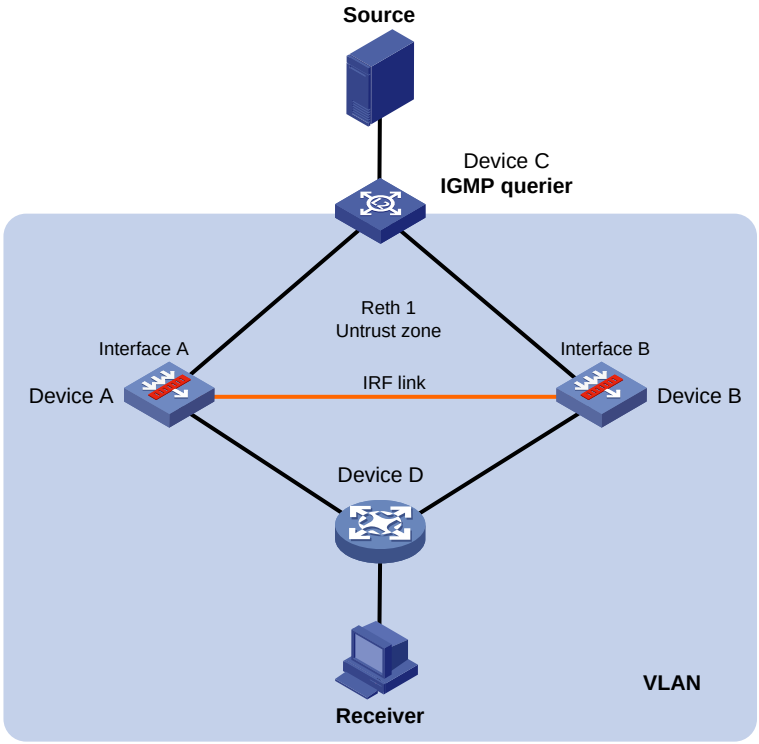
2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable the device to send IGMP general queries upon a path change.

   send-query enable

   By default, the device does not send IGMP general queries upon a path change.



Enabling the device to send IGMP general queries upon a port state change

About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an IGMP general query immediately and cannot update interface B to multicast forwarding entries.

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send IGMP general queries upon a port state change.
   igmp-snooping triggered-query enable { **port-down** | **port-up** } *
   By default, the device does not send IGMP general queries upon a port state change.

Enabling IGMP snooping proxying

About enabling IGMP snooping proxying

The device enabled with IGMP snooping proxying is called an IGMP snooping proxy. The IGMP snooping proxy acts as a host to the upstream device. Enabled with IGMP snooping querier, the IGMP snooping proxy acts as the router to downstream devices and receives report and leave messages on behalf of the upstream device. As a best practice, enable IGMP snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling IGMP snooping proxying

Before you enable IGMP snooping proxying for a VLAN, you must first enable IGMP snooping globally and enable IGMP snooping for the VLAN. IGMP snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with IGMP snooping querier. For more information about enabling IGMP snooping querier, see "Enabling the IGMP snooping querier."

Enabling IGMP snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping proxying for the VLAN.
   igmp-snooping proxy enable
   By default, IGMP snooping proxying is disabled for a VLAN.

Configuring parameters for IGMP messages

Configuring source IP addresses for IGMP messages

About this task

The IGMP snooping querier might send IGMP general queries with the source IP address 0.0.0.0. The port that receives such queries will not be maintained as a dynamic router port. This might prevent the associated dynamic IGMP snooping forwarding entry from being correctly created at the data link layer and eventually cause multicast traffic forwarding failures. To avoid this problem, you can configure a non-all-zero IP address as the source IP address of the IGMP queries on the IGMP snooping querier. This configuration might affect the IGMP querier election within the subnet.

You can also change the source IP address of IGMP reports or leave messages sent by a simulated member host or an IGMP snooping proxy.

Configuring the source IP addresses for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Configure the source IP address for IGMP general queries.
   igmp-snooping general-query source-ip *ip-address*
   By default, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.
4. Configure the source IP address for IGMP group-specific queries.
   igmp-snooping special-query source-ip *ip-address*
   By default, the source IP address of IGMP group-specific queries is one of the following:

- The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
- The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
- 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

   By default, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

Setting the 802.1p priority for IGMP messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards IGMP messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to IGMP messages that are created or forwarded by the device.

Setting the 802.1p priority for IGMP messages globally

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Set the 802.1p priority for IGMP messages.

   dot1p-priority *priority*

   By default, the global 802.1p priority is not set.

Setting the 802.1p priority for IGMP messages in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the 802.1p priority for IGMP messages in the VLAN.

   igmp-snooping dot1p-priority *priority*

   By default, the 802.1p priority is not set.

Configuring IGMP snooping policies

Configuring a multicast group policy

About this task

This feature enables the Layer 2 device to filter IGMP reports by using an ACL that specifies the multicast groups and the optional sources. It is used to control the multicast groups that hosts can join. This configuration takes effect only on the multicast groups that ports join dynamically.

In a multicast application, a host sends an unsolicited IGMP report when a user requests a multicast program. The Layer 2 device uses the multicast group policy to filter the IGMP report. The host can join the multicast group only if the IGMP report is permitted by the multicast group policy.

Configuring a multicast group policy globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Configure a multicast group policy globally.
   group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured, and hosts can join any multicast groups.

Configuring a multicast group policy on a port

1. Enter system view.
   system-view
2. **Enter Layer 2 interface view.**
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a multicast group policy on the port.
   igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured on a port, and hosts attached to the port can join any multicast groups.

Enabling dropping unknown multicast data

About this task

Unknown multicast data refers to multicast data for which no forwarding entries exist in the IGMP snooping forwarding table. This feature enables the device to forward unknown multicast data only to the router port. If the device does not have a router port, unknown multicast data will be dropped.

If you do not enable this feature, the unknown multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv4 multicast data is enabled, the device also drops unknown IPv6 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown multicast data out of router ports except the receiving router port in this VLAN.

Enabling dropping unknown multicast data for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable dropping unknown multicast data for the VLAN.
   igmp-snooping drop-unknown
   By default, dropping unknown multicast data is disabled for a VLAN. Unknown multicast data is flooded in the VLAN.

Enabling IGMP report suppression

About this task

This feature enables the Layer 2 device to forward only the first IGMP report for a multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable IGMP report suppression.
   report-aggregation
   By default, IGMP report suppression is enabled.

Setting the maximum number of multicast groups on a port

About this task

You can set the maximum number of multicast groups on a port to regulate the port traffic. This feature takes effect only on the multicast groups that a port joins dynamically.

If the number of multicast groups on a port exceeds the limit, the system removes all the forwarding entries associated with the port. The receiver hosts attached to that port can join multicast groups again before the number of multicast groups on the port reaches the limit. When the number of multicast groups on the port reaches the limit, the port automatically drops IGMP reports for new groups.

Procedure

1. Enter system view.
   system-view
2. **Enter Layer 2 interface view.**
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*

3. Set the maximum number of multicast groups on the port.

   igmp-snooping group-limit *limit* [**vlan** *vlan-list*]

   By default, no limit is placed on the maximum number of multicast groups on a port.

Enabling multicast group replacement

About this task

When multicast group replacement is enabled, the port does not drop IGMP reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves the multicast group that has the lowest IP address and joins the new group contained in the IGMP report. The multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that a port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the IGMP snooping forwarding entries on the device reaches the upper limit.
- The multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling multicast group replacement globally

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable multicast group replacement globally.

   overflow-replace [**vlan** *vlan-list*]

   By default, multicast group replacement is disabled globally.

Enabling multicast group replacement on a port

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

3. Enable multicast group replacement on the port.

   igmp-snooping overflow-replace [**vlan** *vlan-list*]

   By default, multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving multicast data. The information includes IP addresses of the hosts, length of time elapsed since the hosts joined multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   igmp-snooping host-tracking
   By default, host tracking is disabled for a VLAN.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP snooping view.
   igmp-snooping
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP snooping

About this task

To report critical IGMP snooping events to an SNMP NMS, enable SNMP notifications for IGMP snooping.

For IGMP snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.

system-view

2. Enable SNMP notifications for IGMP snooping.

   snmp-agent trap enable igmp-snooping [**entry-refresh-failed**]

   By default, SNMP notifications are enabled for IGMP snooping.

Configuring IGMP snooping logging

Enabling IGMP snooping logging

About this task

This feature enables the IGMP snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable IGMP snooping logging or use the **igmp-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.

   system-view

2. Enter IGMP snooping view.

   igmp-snooping

3. Enable IGMP snooping logging.

   igmp-snooping log enable [**group**]

   By default, IGMP snooping logging is enabled.

Enabling IGMP snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the IGMP snooping module to the information center.

Procedure

1. Enter system view.

   system-view

2. Enter IGMP snooping view.

   igmp-snooping

3. Enable IGMP snooping logging suppression.

   igmp-snooping log suppress [**group**]

   By default, IGMP snooping logging suppression is enabled.

Display and maintenance commands for IGMP snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IGMP snooping status.	**display igmp-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic IGMP snooping group entries.	**display igmp-snooping group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display igmp-snooping host-tracking vlan** *vlan-id* **group** *group-address* [**source** *source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display igmp-snooping router-port** [**vlan** *vlan-id* [**verbose**] [**slot** *slot-number*]
Display static IGMP snooping group entries.	**display igmp-snooping static-group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display igmp-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the IGMP messages and PIMv2 hello messages learned by IGMP snooping.	**display igmp-snooping statistics**
Display Layer 2 multicast fast forwarding entries.	**display l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*source-address* | *group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IP multicast groups.	**display l2-multicast ip** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IP multicast group entries.	**display l2-multicast ip forwarding** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 MAC multicast groups.	**display l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 MAC multicast group entries.	**display l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Clear dynamic IGMP snooping group entries.	**reset igmp-snooping group** { *group-address*

Task	Command
	[*source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset igmp-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping.	**reset igmp-snooping statistics**
Clear Layer 2 multicast fast forwarding entries.	**reset l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]

IGMP snooping configuration examples

Example: Configuring VLAN-based IGMP snooping group polices and simulated joining

Network configuration

As shown in Figure 5, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping.

Configure a multicast group policy and simulated joining to meet the following requirements:

- Host A and Host B receive only the multicast data addressed to multicast group 224.1.1.1. Multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

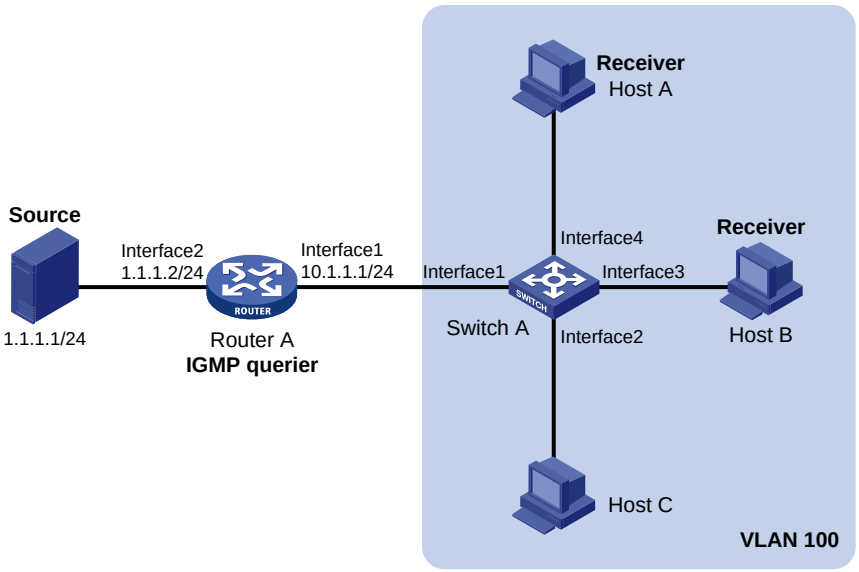


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <Sysname> system-view
   [Sysname] sysname RouterA
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchA
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping drop-unknown
   [SwitchA-vlan100] quit
   ```

   # Configure a multicast group policy so that hosts in VLAN 100 can join only multicast group 224.1.1.1.

   ```
   [SwitchA] acl basic 2001
   [SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
   [SwitchA-acl-ipv4-basic-2001] quit
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] group-policy 2001 vlan 100
   [SwitchA-igmp-snooping] quit
   ```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts of multicast group 224.1.1.1.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.2.2.2. (Details not shown.)

Display dynamic IGMP snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                          (00:03:23)
      GE1/0/4                          (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined multicast group 224.1.1.1 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join multicast group 224.2.2.2.

Configuration files

- Router A:

```
#
 sysname RouterA
#
interface GigabitEthernet1/0/1
 port link-mode route
 ip address 10.1.1.1 255.255.255.0

#
return
```

Example: Configuring VLAN-based IGMP snooping static ports

Network configuration

As shown in Figure 6:

- Router A runs IGMPv2 and acts as the IGMP querier. Switch A, Switch B, and Switch C run IGMPv2 snooping.
- Host A and host C are permanent receivers of multicast group 224.1.1.1.

Configure static ports to meet the following requirements:

- To enhance the reliability of multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for multicast group 224.1.1.1.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. Multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one IGMP query-response cycle must be completed before multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, multicast data can flow to the receivers nearly uninterruptedly along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

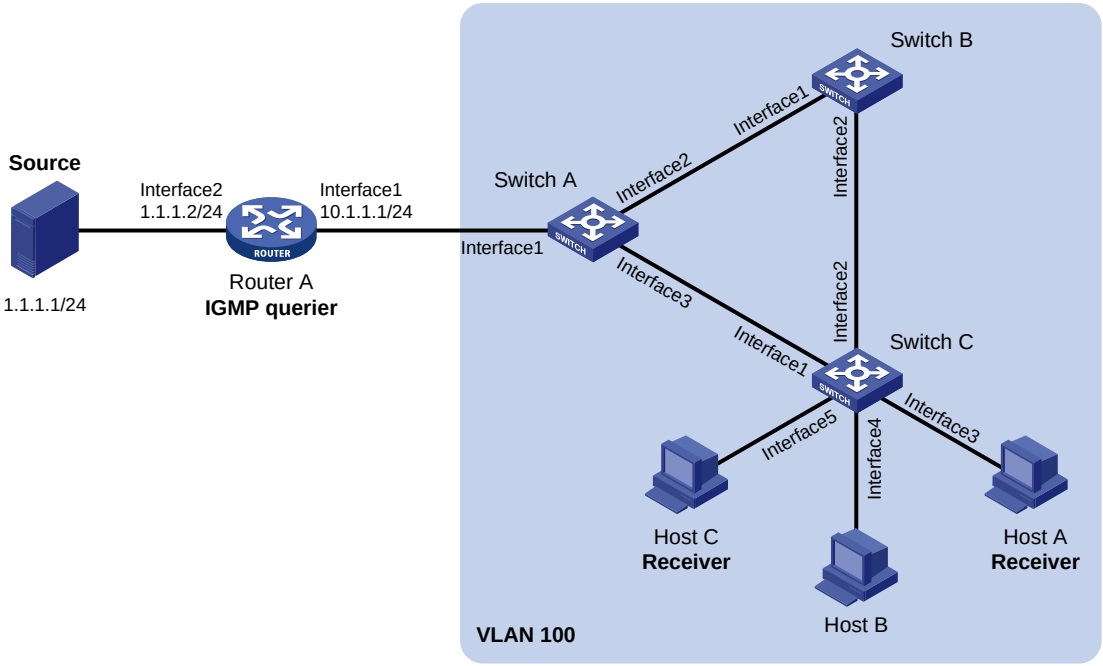

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4
Interface5	GigabitEthernet1/0/5

Procedure

1. Configure Router A:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname RouterA
[RouterA] multicast routing
[RouterA-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
[RouterA-GigabitEthernet1/0/1] igmp enable
[RouterA-GigabitEthernet1/0/1] quit
```

Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
```

```
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

Configure STP.

```
[SwitchA] stp region-configuration
[SwitchA-mst-region] instance 1 vlan 100
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

3. Configure Switch B:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable IGMP snooping for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] quit
```

Configure STP.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] instance 1 vlan 100
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

4. Configure Switch C:

Enable the IGMP snooping feature.

```
<Sysname> system-view
```

```
[Sysname] sysname SwitchC
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable IGMP snooping for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for multicast group 224.1.1.1.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Configure STP.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] instance 1 vlan 100
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static IGMP snooping group entries for VLAN 100 on Switch C.

```
[SwitchC] display igmp-snooping static-group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of multicast group 224.1.1.1.

#
return
```

Example: Configuring the VLAN-based IGMP snooping querier

Network configuration

As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Host A and Host C are receivers of multicast group 224.1.1.1, and Host B and Host D are receivers of multicast group 225.1.1.1.
- All host receivers run IGMPv2, and all switches run IGMPv2 snooping. Switch A (which is close to the multicast sources) acts as the IGMP snooping querier.

Configure the switches to meet the following requirements:

- To prevent the switches from flooding unknown data in the VLAN, enable all the switches to drop unknown multicast data.
- A switch does not mark a port that receives an IGMP query with source IP address 0.0.0.0 as a dynamic router port. This adversely affects the establishment of Layer 2 forwarding entries and multicast traffic forwarding. To avoid this, configure the source IP address of IGMP queries as a non-zero IP address.

Figure 7 Network diagram

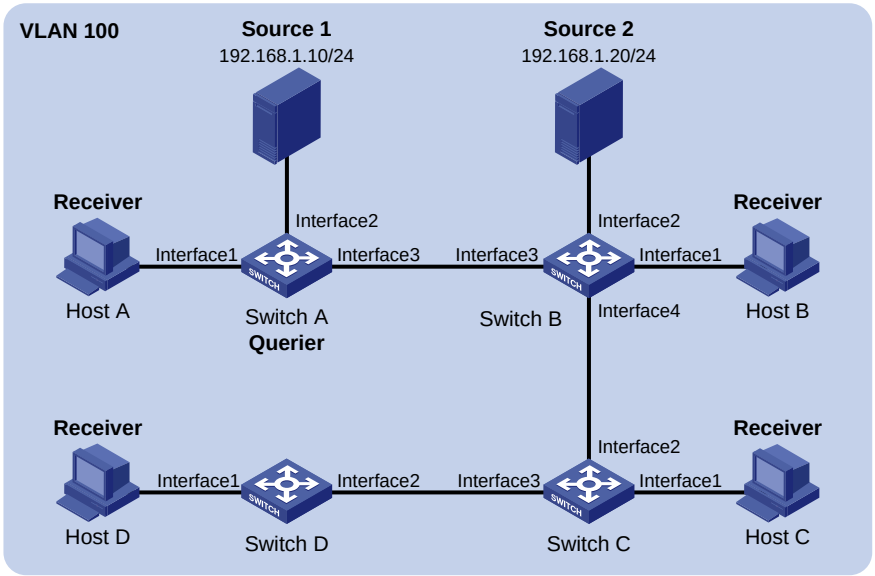

Table 3 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchA
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping drop-unknown
   ```

   # Configure Switch A as the IGMP snooping querier.

   ```
   [SwitchA-vlan100] igmp-snooping querier
   [SwitchA-vlan100] quit
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP general queries.

   ```
   [SwitchA-vlan100] igmp-snooping general-query source-ip 192.168.1.1
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP group-specific queries.

   ```
   [SwitchA-vlan100] igmp-snooping special-query source-ip 192.168.1.1
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the IGMP snooping feature.

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchB
   [SwitchB] igmp-snooping
   [SwitchB-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchB] vlan 100
   [SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchB-vlan100] igmp-snooping enable
   [SwitchB-vlan100] igmp-snooping drop-unknown
   [SwitchB-vlan100] quit
   ```

3. Configure Switch C:

   # Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] igmp-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[SwitchD] igmp-snooping
[SwitchD-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchD-vlan100] igmp-snooping enable
[SwitchD-vlan100] igmp-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping on Switch B.

```
[SwitchB] display igmp-snooping statistics
Received IGMP messages:
  IGMP general queries: 19
  IGMPv2 specific queries: 10
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
  IGMPv1 reports: 0
  IGMPv2 reports: 19
  IGMPv3 reports: 0
  IGMPv3 reports with right and wrong records: 0
  IGMP leaves: 5
  Error IGMP messages: 1
Sent IGMP messages:
  IGMPv2 specific queries: 0
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
Received PIMv2 hello : 0
```

The output shows that all switches except Switch A can receive the IGMP general queries after Switch A acts as the IGMP snooping querier.

Configuration files

- Switch A:

```
#
 sysname SwitchA
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping drop-unknown

#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/3
 port link-mode bridge
 port access vlan 100
#
return
```

- Switch D:

```
#
 sysname SwitchD
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping drop-unknown
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#
return
```

Example: Configuring VLAN-based IGMP snooping proxying

Network configuration

As shown in Figure 8, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping. Configure IGMP snooping proxying so that Switch A can perform the following actions:

- Forward IGMP report and leave messages to Router A.
- Respond to IGMP queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

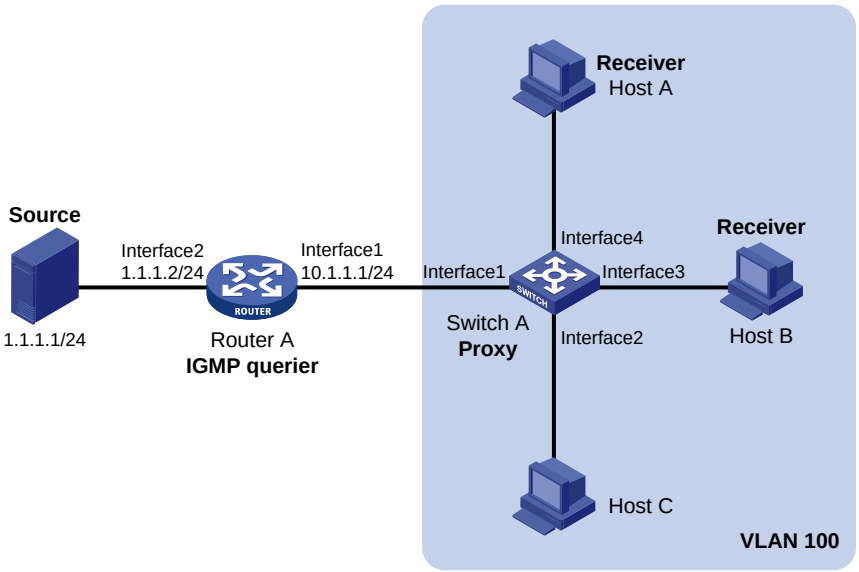

Table 4 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <Sysname> system-view
   [Sysname] sysname RouterA
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP and PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and IGMP snooping proxying for the VLAN.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping proxy enable
[SwitchA-vlan100] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:00)
      GE1/0/4                                  (00:04:04)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of multicast group 224.1.1.1. Host A and Host B become receivers of the group.

Display IGMP group membership information on Router A.

```
[RouterA] display igmp group
IGMP groups in total: 1
 GigabitEthernet1/0/1(10.1.1.1):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   224.1.1.1       0.0.0.0         00:00:31    00:02:03
```

Send an IGMP leave message from Host A to leave multicast group 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
```

```
Host ports (1 in total):
  GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1. Only Host B remains as the receiver of the group.

Configuration files

- Router A:

```
#
 sysname RouterA
#
interface GigabitEthernet1/0/1
 port link-mode route
 ip address 10.1.1.1 255.255.255.0
 pim dm
 igmp enable
#
interface GigabitEthernet1/0/2
 port link-mode route
 ip address 1.1.1.2 255.255.255.0
 pim dm
#
multicast routing
#
return
```

- Switch A:

```
#
 sysname SwitchA
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping proxy enable
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/3
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/4
 port link-mode bridge
```

```
 port access vlan 100
#
return
```

Troubleshooting IGMP snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function on the Layer 2 device.

Solution

To resolve the problem:

1. Use the **display igmp-snooping** command to display IGMP snooping status.
2. If IGMP snooping is not enabled, use the **igmp-snooping** command in system view to enable the IGMP snooping feature. Then, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
3. If IGMP snooping is enabled globally but not enabled for the VLAN, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Multicast group policy does not work

Symptom

Hosts can receive multicast data for multicast groups that are not permitted by the multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl** command to verify that the configured ACL meets the multicast group policy requirements.
2. Use the **display this** command in IGMP-snooping view or in a corresponding interface view to verify that the correct multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **igmp-snooping group-policy** command to apply the correct multicast group policy.
3. Use the **display igmp-snooping** command to verify that dropping unknown multicast data is enabled. If it is not, use the **igmp-snooping drop-unknown** command to enable dropping unknown multicast data.
4. If the problem persists, contact H3C Support.

Configuring multicast VLANs

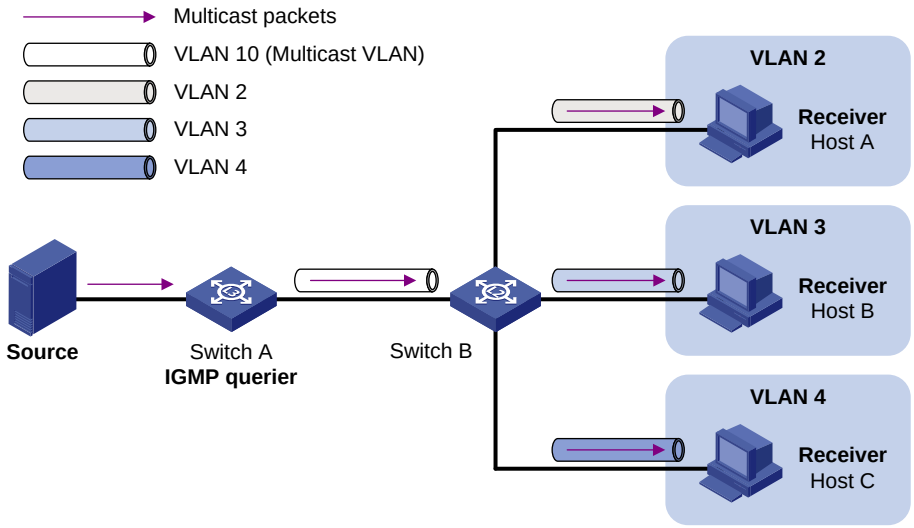
Multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in three different VLANs and the same multicast group. When Switch A (Layer 3 device) receives multicast data for that group, it sends three copies of the multicast data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the multicast VLAN feature

After a multicast VLAN is configured on Switch B, Switch A sends only one copy of the multicast data to the multicast VLAN on Switch B. This method saves network bandwidth and lessens the burden on the Layer 3 device.

Multicast VLAN implementations



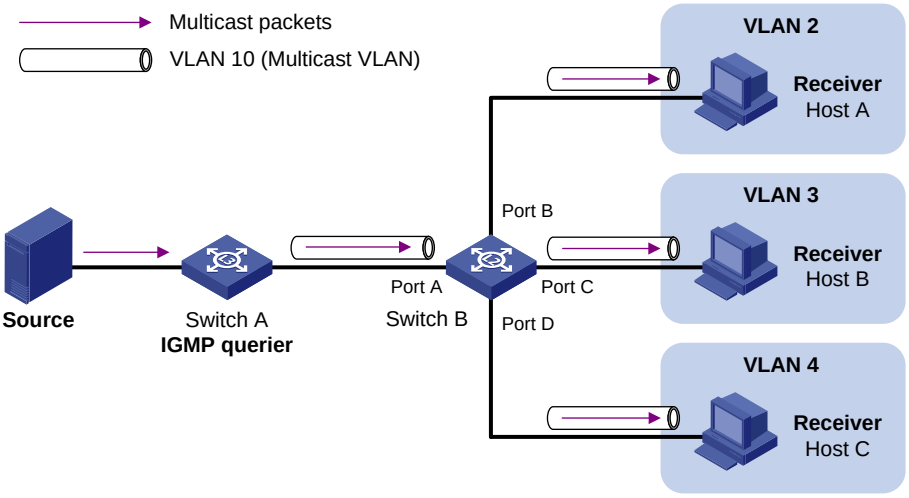
Multicast VLANs include sub-VLAN-based multicast VLANs and port-based multicast VLANs.

Sub-VLAN-based multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



IGMP snooping manages router ports in the multicast VLAN and member ports in each sub-VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN in the multicast VLAN.

Port-based multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. All the user ports are hybrid ports and are assigned to VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and VLAN 2 through VLAN 4.

Figure 3 Port-based multicast VLAN

IGMP snooping manages the router ports and member ports in the multicast VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Switch B sends a separate copy to each user port in the multicast VLAN.

Restrictions and guidelines: Multicast VLAN configuration

The VLAN to be configured as a multicast VLAN must exist.

If you have configured both a sub-VLAN-based multicast VLAN and a port-based multicast VLAN on a device, the port-based multicast VLAN configuration takes effect.

Do not configure a multicast VLAN on a device that is enabled with IP multicast routing. Otherwise, the system displays errors. Do not enable IP multicast routing on a device that is configured with multicast VLANs. Otherwise, multicast forwarding exceptions occur.

Do not configure a VLAN as a multicast VLAN or a multicast sub-VLAN if the VLAN interface is enabled with PIM or IGMP. Otherwise, the system displays errors. Do not enable PIM or IGMP on a VLAN interface if the VLAN interface belongs to a multicast VLAN or a multicast sub-VLAN. Otherwise, multicast forwarding exceptions occur.

Configuring a sub-VLAN-based multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of a multicast VLAN must exist and cannot be multicast VLANs or sub-VLANs of any other multicast VLAN.

Prerequisites

Before you configure a sub-VLAN-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign VLANs to the multicast VLAN as sub-VLANs.
   subvlan *vlan-list*

Configuring a port-based multicast VLAN

Restrictions and guidelines

You can assign user ports to a multicast VLAN in multicast VLAN view or assign a user port to a multicast VLAN in interface view. These configurations have the same priority.

A user port can belong to only one multicast VLAN.

Prerequisites

Before you configure a port-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN.

- Enable IGMP snooping for all the VLANs that contain multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to a multicast VLAN in multicast VLAN view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign ports to the multicast VLAN.
   port *interface-list*

Assigning user ports to a multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the multicast VLAN.
   port multicast-vlan *vlan-id*
   By default, a port does not belong to any multicast VLAN.

Setting the maximum number of multicast VLAN forwarding entries

About this task

You can set the maximum number of multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of multicast VLAN forwarding entries.
   multicast-vlan entry-limit *limit*
   By default, the maximum number of multicast VLAN forwarding entries is 8192.

Display and maintenance commands for multicast VLAN

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about multicast VLANs.	**display multicast-vlan** [*vlan-id*]
Display information about multicast VLAN forwarding entries.	**display multicast-vlan forwarding-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about multicast groups in multicast VLANs.	**display multicast-vlan group** [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear multicast groups in multicast VLANs.	**reset multicast-vlan group** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Multicast VLAN configuration examples

Example: Configuring sub-VLAN-based multicast VLAN

Network configuration

As shown in Figure 4:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

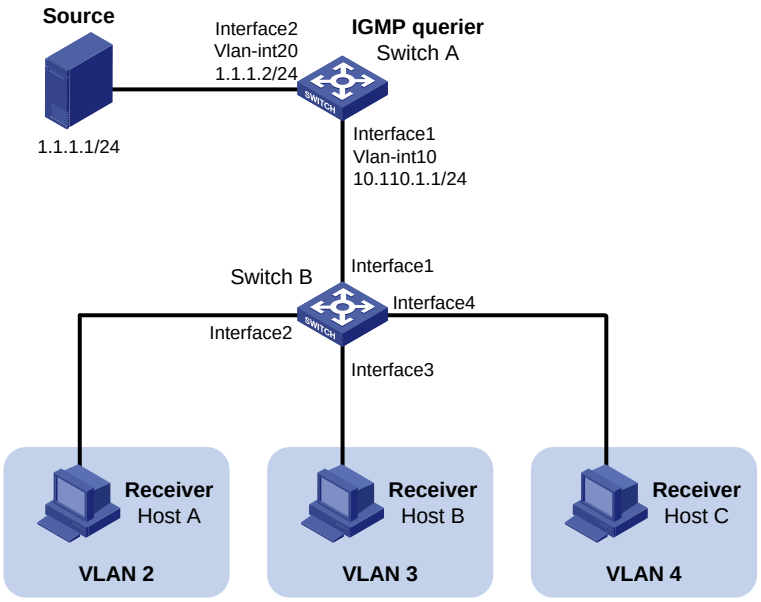


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

Enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.1.2 24
[SwitchA-Vlan-interface20] pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as a multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] multicast-vlan 10
[SwitchB-mvlan-10] subvlan 2 to 4
[SwitchB-mvlan-10] quit
```

Verifying the configuration

Display information about all multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about multicast groups in multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan group
Total 1 entries.

Multicast VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that multicast group 224.1.1.1 belongs to multicast VLAN 10. Multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based multicast VLAN

Network configuration

As shown in Figure 5:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

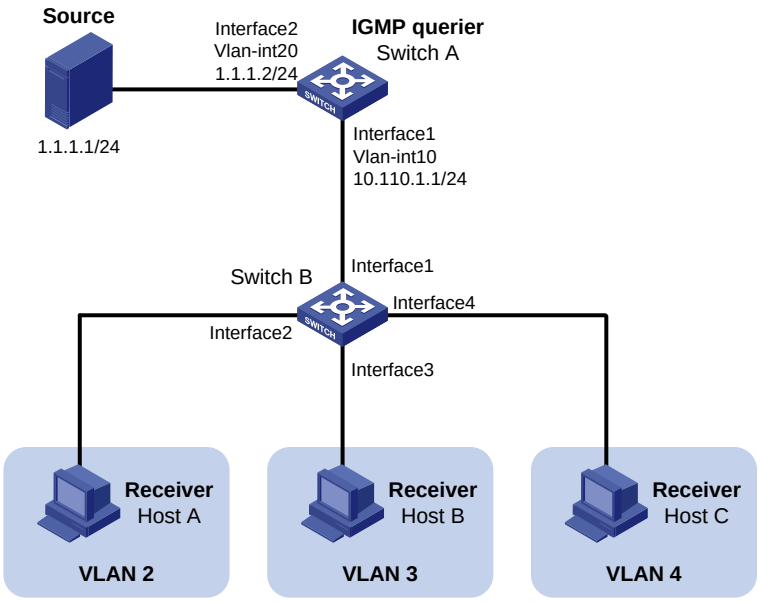

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface20] pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] port gigabitethernet 1/0/1
   [SwitchA-vlan10] quit
   ```

   # Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
```

```
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as a multicast VLAN.

```
[SwitchB] multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic IGMP snooping forwarding entries on Switch B.

```
[SwitchB] display igmp-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (3 in total):
      GE1/0/2        (00:03:23)
      GE1/0/3        (00:04:07)
      GE1/0/4        (00:04:16)
```

The output shows that IGMP snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the multicast data of VLAN 10 through these user ports.

PIM overview

About PIM

Protocol Independent Multicast (PIM) provides IP multicast forwarding by leveraging unicast static routes or unicast routing tables generated by any unicast routing protocol. PIM uses the underlying unicast routing to generate a multicast routing table without relying on any particular unicast routing protocol. PIM uses the RPF mechanism to implement multicast forwarding. For more information about RPF, see "Configuring multicast routing and forwarding."

PIM modes

Based on the implementation mechanism, PIM includes the following modes:

- Protocol Independent Multicast–Dense Mode (PIM-DM).
- Protocol Independent Multicast–Sparse Mode (PIM-SM).
- Protocol Independent Multicast Source-Specific Multicast (PIM-SSM).

In this document, a PIM domain refers to a network that contains PIM devices.

PIM-DM

PIM-DM uses the push mode for multicast forwarding, and is suitable for small-sized networks with densely distributed multicast members.

PIM-DM assumes that all downstream nodes want to receive multicast data from a source, so multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees. When a pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In PIM-DM, the multicast forwarding paths for a multicast group constitutes a forwarding tree. The forwarding tree is rooted at the multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the multicast source to the receivers, it is also called a "shortest path tree (SPT)."

PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

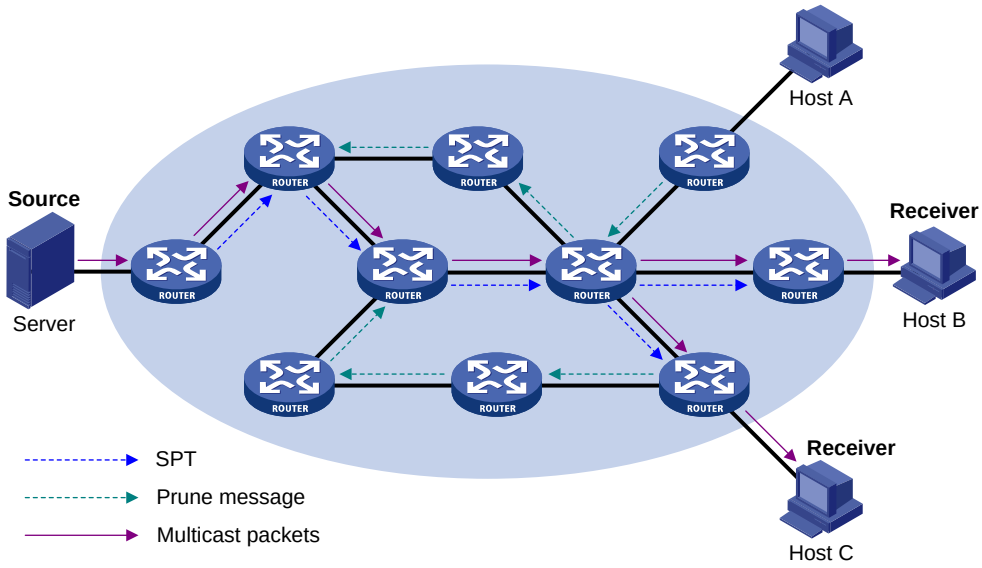
Neighbor discovery

In a PIM domain, each PIM interface on a device periodically multicasts PIM hello messages to all other PIM devices (identified by the address 224.0.0.13) on the local subnet. Through the exchanging of hello messages, all PIM devices on the subnet determine their PIM neighbors, maintain PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In a PIM-DM domain, the multicast data from the multicast source S to the multicast group G is flooded throughout the domain. A device performs an RPF check on the multicast data. If the RPF check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes on the network. In the flooding process, all the devices in the PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all PIM devices on the subnet. When an upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that multicast group down to this node.

NOTE:

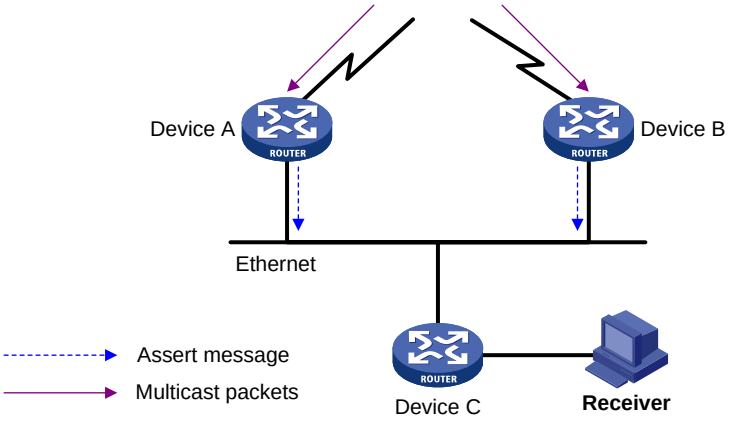
An (S, G) entry contains a multicast source address S, a multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the multicast source. This prune process goes on until only necessary branches are left in the PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all PIM devices (224.0.0.13) on the local subnet through the interface that received the packet. The assert message contains the multicast source address (S), the multicast group address (G), and the metric preference and metric of the unicast route/MBGP route/static multicast route to the multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the shared-media LAN. The comparison process is as follows:

1. The device with a higher metric preference to the multicast source wins.
2. If both devices have the same metric preference, the device with a smaller metric wins.
3. If both devices have the same metric, the device with a higher IP address on the downstream interface wins.

PIM-SM

PIM-DM uses the flood-and-prune cycles to build SPTs for multicast data forwarding. Although an SPT has the shortest paths from the multicast source to the receivers, it is built with a low efficiency. Therefore, PIM-DM is not suitable for large and medium-sized networks. PIM-SM uses the pull mode for multicast forwarding, and it is suitable for large- and medium-sized networks with sparsely and widely distributed multicast group members.

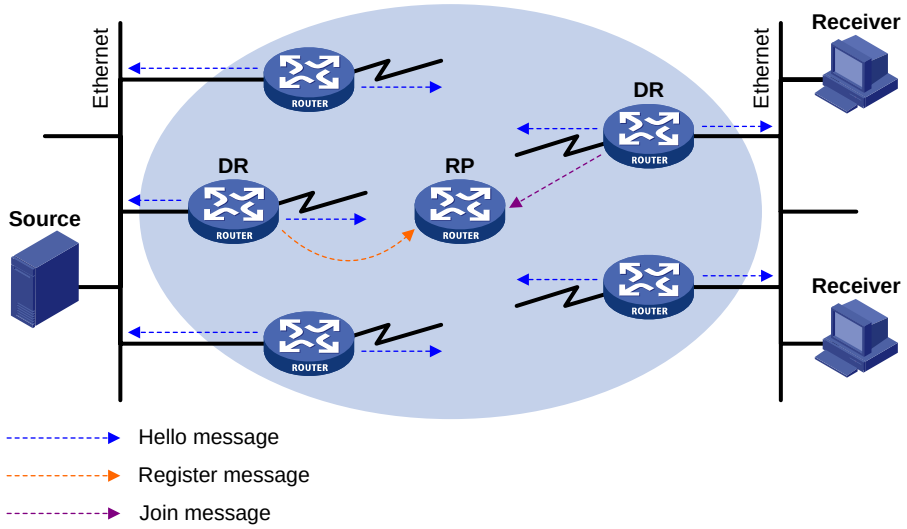
PIM-SM assumes that no hosts need multicast data. A multicast receiver must express its interest in the multicast data for a multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of a PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement multicast data forwarding. An SPT is rooted at the multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

PIM-SM uses the same neighbor discovery mechanism as PIM-DM does. For more information, see "Neighbor discovery."

DR election



A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the multicast receivers to send join messages to the RP.

PIM-DM does not require a DR. However, if IGMPv1 runs on any shared-media LAN in a PIM-DM domain, a DR must be elected to act as the IGMPv1 querier for the LAN. For more information about IGMP, see "Configuring IGMP."

IMPORTANT:

IGMP must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any multicast groups.

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IP address wins the DR election under one of following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its PIM neighbor lifetime expires and the other devices will initiate to elect a new DR.

RP discovery

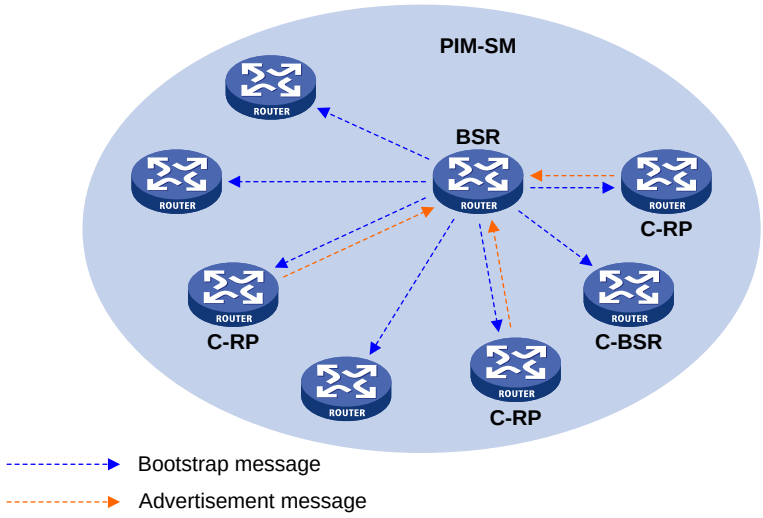
An RP is the core of a PIM-SM domain. A multicast group can have only one RP for multicast forwarding, and an RP can be designated to multiple multicast groups.

RP selection

An RP can be statically configured or dynamically elected. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs



A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election

Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to a multicast group.
- **BSR**—A BSR is the core of the administrative core of the PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. A PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

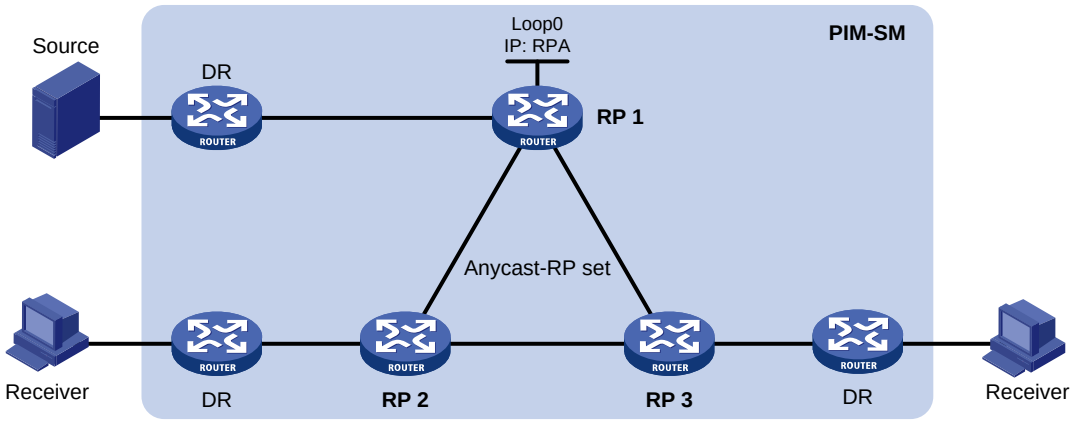
1. Each C-BSR sends a bootstrap message (BSM) to other devices in the PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IP address wins. The loser uses the winner's BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.
3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the multicast group range to which it is designated.

4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between multicast groups and RPs. The BSR encapsulates the RP-set information in the bootstrap messages (BSMs) and floods the BSMs to the entire PIM-SM domain.
5. All devices in the PIM-SM domain select an RP for a multicast group based on the following rules:
   a. The C-RP that is designated to the smallest multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Anycast RP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IP address. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—A multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented in either of the following methods:

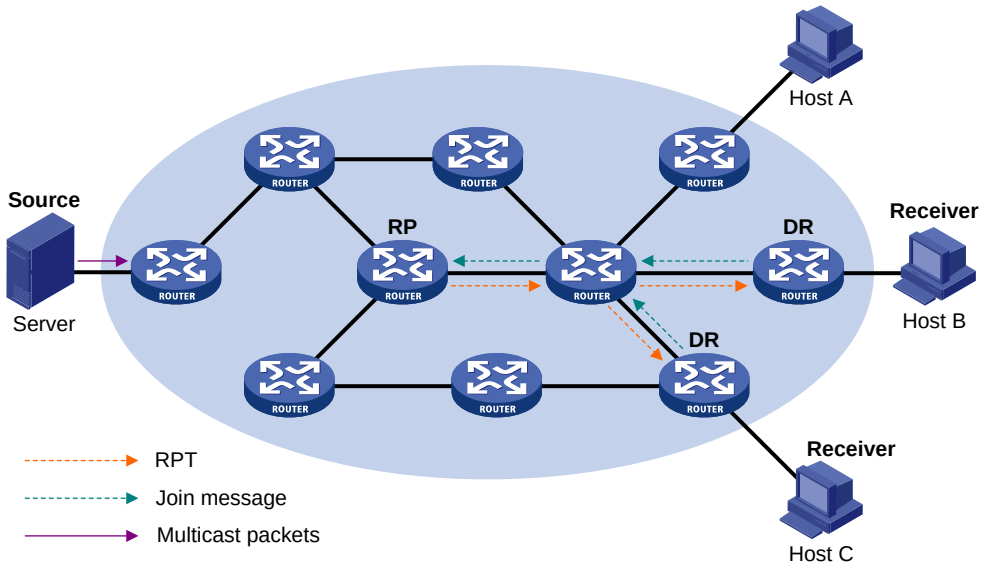
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through PIM-SM**—In this method, you can configure multiple RPs for one multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IP address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IP address of the Anycast RP set for communication within the PIM-SM domain. It is also known as RPA.

  As shown in Figure 5, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 5 Anycast RP through PIM-SM

The following describes how Anycast RP through PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IP address of the register message to its own address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

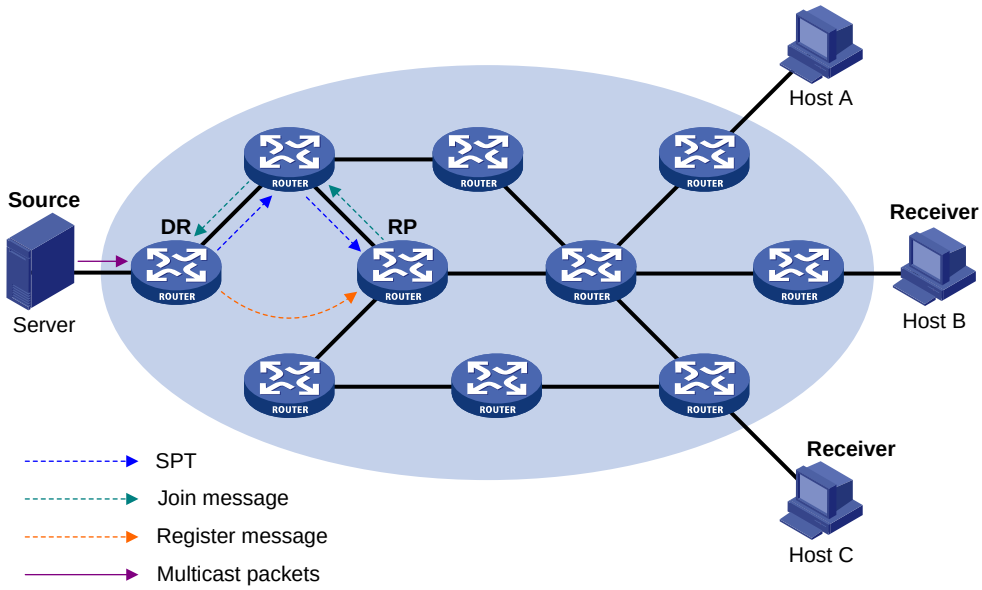
In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize multicast source information.

RPT building

Figure 6 RPT building in a PIM-SM domain

As shown in Figure 6, the process of building an RPT is as follows:

1. When a receiver wants to join the multicast group G, it uses an IGMP message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any multicast source. The RP is the root of the RPT, and the DR is a leaf of the RPT.



When the multicast data addressed to the multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT, and finally to the receiver.

When a receiver is no longer interested in the multicast data addressed to the multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that multicast group. If no receivers for the multicast group exist, the device continues to forward the prune message to its upstream device.

Multicast source registration

The multicast source uses the registration process to inform an RP of its presence.

Figure 7 Multicast source registration

As shown in Figure 7, the multicast source registers with the RP as follows:

1. The multicast source S sends the first multicast packet to the multicast group G. When receiving the multicast packet, the source-side DR encapsulates the packet into a PIM register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates the register message and forwards the register message down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the multicast source. The devices along the path from the RP to the multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent multicast data from the multicast source are forwarded to the RP along the established SPT. When the multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

This section takes a router as an example. As compared with the switchover to SPT on a router, switchover to SPT is implemented in a simpler way on a switch.

In a PIM-SM domain, only one RP and one RPT provide services for a specific multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

Multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for a multicast packet might not be the shortest one.
- The RP might be overloaded by multicast traffic bursts.

To eliminate these weaknesses, PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives multicast traffic, it sends an (S, G) source-specific join message toward the multicast source. The routers along the path from the RP to the multicast source constitute an SPT. The subsequent multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

  For more information about the switchover to SPT initiated by the RP, see "Multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the multicast source. The routers along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the router where the RPT and the SPT branches, the router drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent multicast packets travel along the SPT from the multicast source to the receiver hosts.

With the switchover to SPT, PIM-SM builds SPTs more economically than PIM-DM does.

Assert

PIM-SM uses a similar assert mechanism as PIM-DM does. For more information, see "Assert."

Administrative scoping

Administrative scoping mechanism

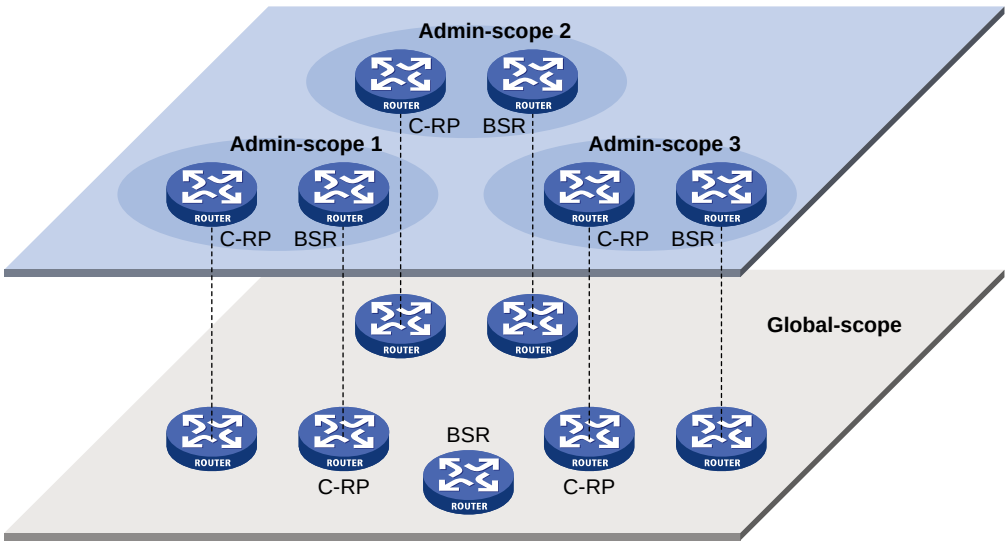
Administrative scoping mechanisms for PIM-SM include non-scoped BSR mechanism and administrative scoping mechanism.

- **Non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.

- **Administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

Admin-scoped zones are divided for multicast groups. Zone border devices (ZBRs) form the boundary of an admin-scoped zone. Each admin-scoped zone maintains one BSR for multicast groups within a specific range. Multicast protocol packets, such as assert messages and BSMs, for a specific group range cannot cross the boundary of the admin-scoped zone for the group range. Multicast group ranges that are associated with different admin-scoped zones can have intersections. However, the multicast groups in an admin-scoped zone are valid only within the local zone, and theses multicast groups are regarded as private group addresses.

The global-scoped zone maintains a BSR for the multicast groups that do not belong to any admin-scoped zones.



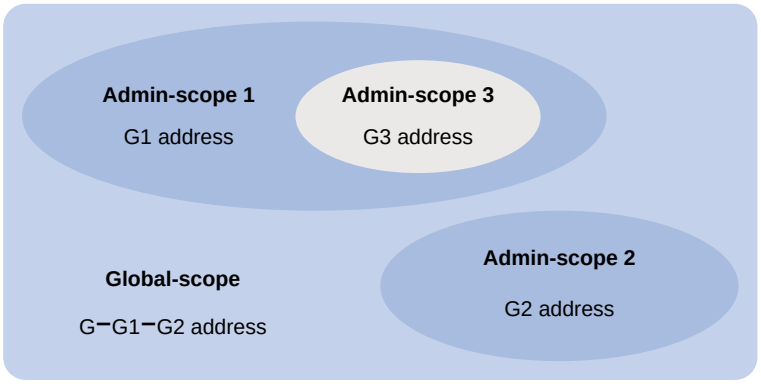
Relationship between admin-scoped zones and the global-scoped zone

The global-scoped zone and each admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each admin-scoped zone has its own boundary. The multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the global-scoped zone and admin-scoped zones based on geographical locations and multicast group address ranges.

- In view of geographical locations:

  An admin-scoped zone is a logical zone for particular multicast groups. The multicast packets for such multicast groups are confined within the local admin-scoped zone and cannot cross the boundary of the zone.

  Figure 8 Relationship in view of geographical locations



As shown in Figure 8, for the multicast groups in a specific group address range, the admin-scoped zones must be geographically separated and isolated. A device cannot belong to multiple admin-scoped zones. An admin-scoped zone cannot contain a device that belongs to any other admin-scoped zone. However, the global-scoped zone includes all devices in the PIM-SM domain. Multicast packets that do not belong to any admin-scoped zones are forwarded in the entire PIM-SM domain.

- In view of multicast group address ranges:

  Each admin-scoped zone is designated to specific multicast groups, of which the multicast group addresses are valid only within the local zone. The multicast groups of different admin-scoped zones might have intersections. All the multicast groups other than those of the admin-scoped zones use the global-scoped zone.

  Figure 9 Relationship in view of multicast group address ranges

  As shown in Figure 9, the admin-scoped zones 1 and 2 have no intersection, but the admin-scoped zone 3 is a subset of the admin-scoped zone 1. The global-scoped zone provides services for all the multicast groups that are not covered by the admin-scoped zones 1 and 2, G—G1—G2 in this case.

PIM-SSM

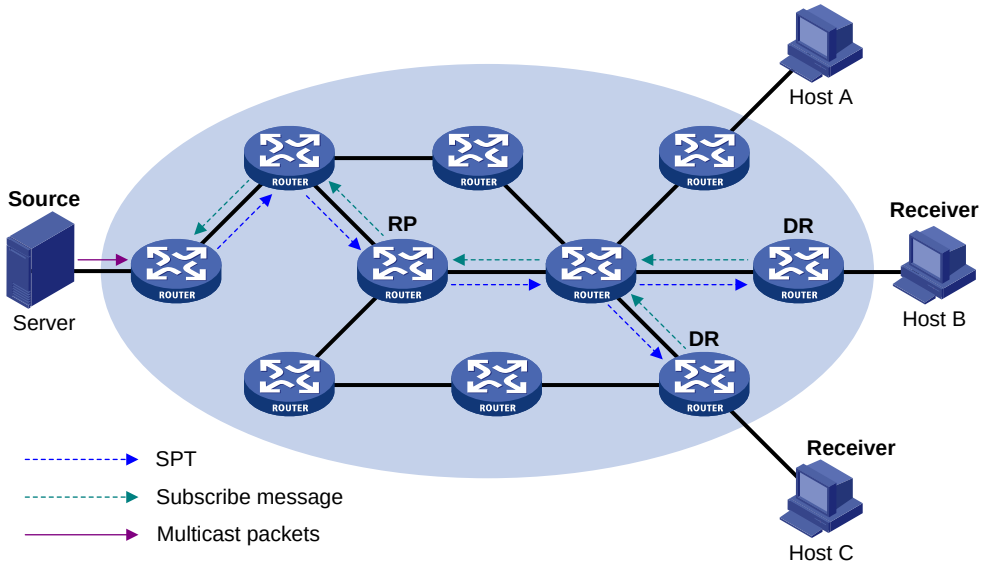
The ASM model includes PIM-DM and PIM-SM. The SSM model can be implemented by leveraging part of the PIM-SM technique. It is also called "PIM-SSM."

The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through IGMPv3.

In actual applications, part of IGMPv3 and PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located a multicast source, no RP or RPT is required. Multicast sources do not register with the RP, and the MSDP is not needed for discovering multicast sources in other PIM domains.

PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery



PIM-SSM uses the same neighbor discovery mechanism as PIM-SM. For more information, see "Neighbor discovery."

DR election

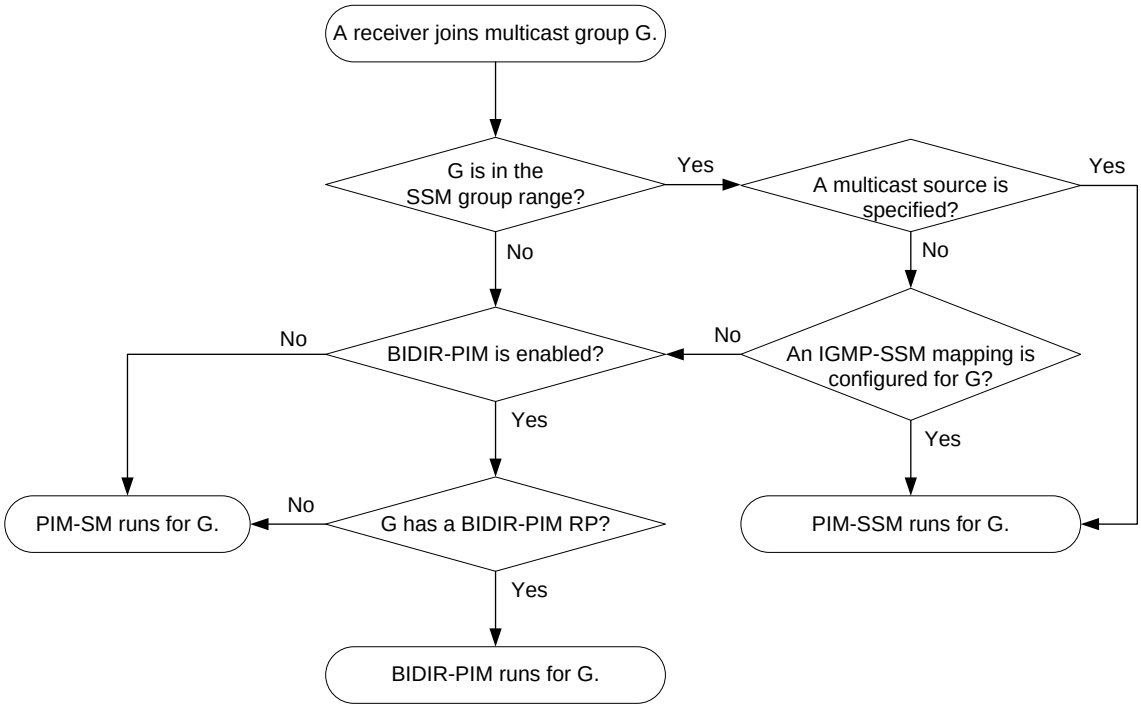
PIM-SSM uses the same DR election mechanism as PIM-SM. For more information, see "DR election."

SPT building

Figure 10 SPT building in PIM-SSM

As shown in Figure 10, an SPT is built as follows:

1. Host B and Host C are receivers. They send IGMPv3 report messages to their DRs to express their interest in the multicast information that the multicast source S sends to the multicast group G.
2. After receiving a report message, the DR sends a subscribe message hop by hop toward the multicast source S. All devices along the path from the DR to the source create an (S, G) entry to build an SPT. The SPT is rooted at the multicast source S and has the receivers as its leaves. This SPT is the transmission channel in PIM-SSM.



In PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among PIM protocols

In a PIM network, PIM-DM cannot run together with PIM-SM, BIDIR-PIM, or PIM-SSM. However, PIM-SM, BIDIR-PIM, and PIM-SSM can run together. (BIDIR-PIM is not supported in the current software version.) Figure 11 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about IGMP SSM mapping, see "Configuring IGMP."

Figure 11 Relationship among PIM protocols

PIM support for VPNs

To support PIM for VPNs, a multicast device that runs PIM maintains an independent set of PIM neighbor table, multicast routing table, BSR information, and RP-set information for each VPN.

After receiving a multicast data packet, the multicast device checks which VPN the data packet belongs to. Then, the device forwards the packet according to the multicast routing table for that VPN or creates a multicast routing entry for that VPN.

Protocols and standards

Configuring PIM

Restrictions and guidelines: PIM configuration

All the interfaces on a device must operate in the same PIM mode on the public network or the same VPN instance.

Configuring PIM-DM

PIM-DM tasks at a glance

To configure PIM-DM, perform the following tasks:

1. Enabling PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the PIM-DM graft retry timer
4. (Optional.) Configuring common PIM timers

Prerequisites for PIM-DM

Before you configure PIM-DM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-DM

About this task

With PIM-DM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-DM on all non-border interfaces of the devices when you deploy a PIM-DM domain.

For PIM-DM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-DM.
   pim dm
   By default, PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the PIM device directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. It prevents the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can configure the time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own PIM-DM state, and resets the waiting timer.
- **TTL value of state refresh messages**—The TTL value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the TTL value comes down to 0. A state refresh message with a large TTL value might cycle on a small network.

  To effectively control the propagation scope of state refresh messages, configure an appropriate TTL value based on the network size on the device directly connected with the multicast source.

Restrictions and guidelines

Perform this task on all devices in the PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the state refresh feature.
   pim state-refresh-capable
   By default, the state refresh feature is enabled.
4. Return to system view.
   quit
5. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
6. Set the state refresh interval.
   state-refresh-interval *interval*
   The default setting is 60 seconds.
   Perform this task on the device directly connected to the multicast source.
7. Set the amount of time that the device must wait to accept a new state refresh message.

state-refresh-rate-limit *time*

The default setting is 30 seconds.

8. Set the TTL value of state refresh messages.

   state-refresh-ttl *ttl-value*

   The default setting is 255.

Setting the PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the graft retry timer.

   pim timer graft-retry *interval*

   The default setting is 3 seconds.

Configuring PIM-SM

PIM-SM tasks at a glance

To configure PIM-SM, perform the following tasks:

1. Enabling PIM-SM
2. Configuring static RPs

   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring a PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple PIM devices exist in the network.

   You can configure static RPs, dynamic RPs, or both.
4. (Optional.) Enabling Auto-RP listening
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common PIM features

Prerequisites for PIM-SM

Before you configure PIM-SM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-SM

About this task

With PIM-SM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SM domain.

For PIM-SM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-SM.
   pim sm
   By default, PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth because of frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In a PIM-SM domain, you can configure the same static RP for different multicast groups by using the same RP address but different ACLs.

You do not need to enable PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for a multicast group, only the static RP with the highest IP address takes effect.

The static RP configuration must be the same on all devices in the PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP.

   static-rp *rp-address* [{ *ipv4-acl-number* | **name** *ipv4-acl-number* } | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword in the **static-rp** command to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the PIM-SM domain because every C-BSR might become the BSR.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv4-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses. It is used to prevent the legal BSR from being replaced by a malicious host.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-BSRs and other devices.

The C-BSR configuration on the devices in the PIM-SM domain must be the same.

For a successful RPF check, configure static multicast routes to ensure that the next hop to a C-BSR is a tunnel interface when C-BSRs connect to other PIM devices through tunnels. For more information about static multicast routes, see "Configuring multicast routing and forwarding."

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv4-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.

system-view

2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits BSMs from the BSR for 130 seconds before sending BSMs.

Configuring a PIM domain border

About this task

A PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different PIM-SM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a PIM domain border.

pim bsr-boundary

By default, an interface is not a PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Enabling Auto-RP listening

About this task

This feature enables the device to receive Auto-RP announcement and discovery messages and learn RP information. The destination IP addresses for Auto-RP announcement and discovery messages are 224.0.1.39 and 224.0.1.40, respectively.

Restrictions and guidelines

After this feature is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Enable Auto-RP listening.
   auto-rp enable
   By default, Auto-RP listening is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IP address. The IP address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IP address of a loopback interface as the RP member address.

If you configure IP addresses of multiple interfaces on the same device as RP member addresses, the lowest IP address takes effect. The rest of the interface addresses become backup RP member addresses.

An Anycast RP address must be a host address with subnet mask 255.255.255.255.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RP or C-RPs in the PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *anycast-rp-address member-rp-address*

By default, Anycast RP is not configured.

You can repeat this command to add multiple RP member addresses to the Anycast RP set.

Configuring multicast source registration

About this task

- **PIM register policy**—A PIM register policy enables an RP to filter register messages by using an ACL that specifies the multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time—**The source-side DR stops sending register messages encapsulated with multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. Otherwise, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is fixed to 5 seconds. You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure a PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

As a best practice, set the suppression time to be longer than or equal to 11 seconds.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a PIM register policy.

   register-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM register policy is configured. All PIM register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate multicast data in register messages destined to the RP. As a best practice to avoid multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure RPT to SPT switchover.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

   By default, the first multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring PIM-SSM

PIM-SSM tasks at a glance

To configure PIM-SSM, perform the following tasks:

1. Enabling PIM-SM

2. (Optional.) Configuring the SSM group range
3. (Optional.) Configuring the delay time for DR election
4. (Optional.) Configuring common PIM features

Prerequisites for PIM-SSM

Before you configure PIM-SSM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable PIM-SM.
- Enable IGMPv3 on PIM devices that connect to multicast receivers.

Enabling PIM-SM

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SSM domain.

Procedure

1. Enter system view.
   `system-view`
2. Enable multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable PIM-SM.
   `pim sm`
   By default, PIM-SM is disabled.

Configuring the SSM group range

About this task

When a PIM-SM enabled interface receives a multicast packet, it checks whether the multicast group address of the packet is in the SSM group range. If the multicast group address is in this range, the PIM mode for this packet is PIM-SSM. If the multicast group address is not in this range, the PIM mode is PIM-SM.

Restrictions and guidelines

Configure the same SSM group range on all devices in the entire PIM-SSM domain. Otherwise, multicast information cannot be delivered through the SSM model.

When a member of a multicast group in the SSM group range sends an IGMPv1 or IGMPv2 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the SSM group range.
   ssm-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }
   By default, the SSM group range is 232.0.0.0/8.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the delay time for DR election.
   pim timer dr-elect-delay *delay-time*
   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common PIM features

Common PIM feature tasks at a glance

All the following tasks are optional.

- Configuring a multicast source policy
- Configuring a PIM hello policy
- Configuring PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common PIM timers

- Setting the maximum size of a join or prune message
- Configuring a PIM join policy
- Setting the DSCP value for outgoing PIM protocol packets
- Enabling BFD for PIM
- Enabling PIM passive mode
- Enabling PIM NSR
- Enabling SNMP notifications for PIM
- Enabling PIM logging
- Enabling log message suppression for PIM

Configuring a multicast source policy

About this task

This feature enables the device to filter multicast data by using an ACL that specifies the multicast sources and the optional groups. It filters not only data packets but also register messages with multicast data encapsulated. It controls the information available to downstream receivers.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a multicast source policy.

   source-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no multicast source policy is configured. The device does not filter multicast data packets.

Configuring a PIM hello policy

About this task

This feature enables the device to filter PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against PIM message attacks and to establish correct PIM neighboring relationships.

If hello messages of an existing PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure a PIM hello policy.

   pim neighbor-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM hello policy is configured on an interface. All PIM hello messages are regarded as legal.

Configuring PIM hello message options

About this task

In either a PIM-DM domain or a PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the multicast source or the receivers.
- **Holdtime**—PIM neighbor lifetime. If a device does not receive a hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the PIM message propagation delay. The override interval defines a period for a device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different PIM devices on a shared-media LAN are different, the largest ones apply.

If you want to enable neighbor tracking, you must enable it on all PIM devices on a shared-media LAN. Otherwise, the upstream device cannot track join messages from every downstream devices.

You can configure hello message options for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

Configuring hello message options globally

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.

   hello-option dr-priority *priority*

   The default setting is 1.
4. Set the neighbor lifetime.

   hello-option holdtime *time*

   The default setting is 105 seconds.
5. Set the PIM message propagation delay for a shared-media LAN.

hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the DR priority.

   pim hello-option dr-priority *priority*

   The default setting is 1.

4. Set the neighbor lifetime.

   pim hello-option holdtime *time*

   The default setting is 105 seconds.

5. Set the PIM message propagation delay.

   pim hello-option lan-delay *delay*

   The default setting is 500 milliseconds.

6. Set the override interval.

   pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with PIM. The generation ID is a random value, but it changes only when the status of the device changes. If a PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

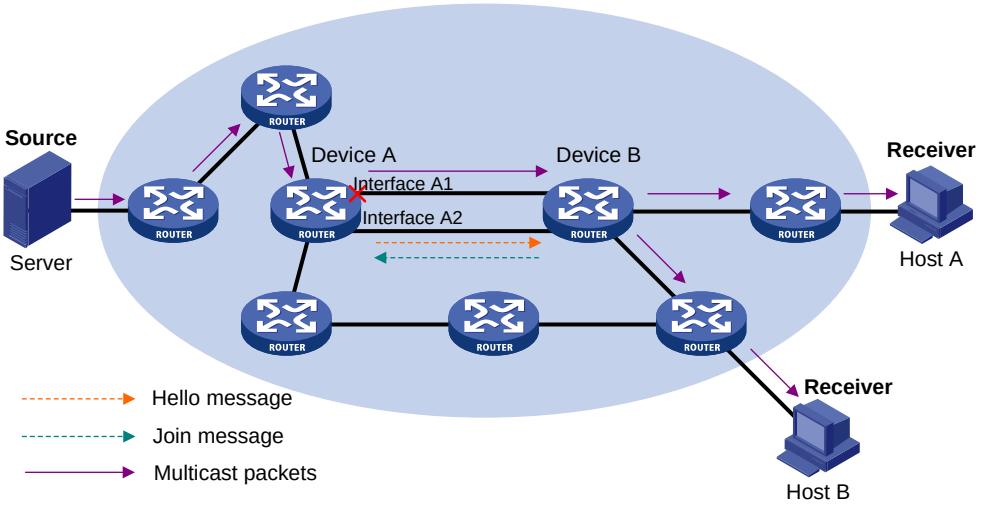
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

pim require-genid

By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 12, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send a PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 12 Network diagram

Procedure

1. Enter system view.

   system-view

2. Enter VLAN interface view.

   interface vlan-interface *interface-number*

3. Enable the interface to send hello messages with a different Generation ID upon a port state change.

   pim triggered-hello enable { **port-down** | **port-up** } *

   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common PIM timers

About this task

The following are common PIM timers:

- **Hello interval**—Interval at which a PIM device sends hello messages to discover PIM neighbors, and maintain PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, a PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join/Prune interval**—Interval at which a PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which a PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is specified in a join or prune message.
- **Multicast source lifetime**—Lifetime that a PIM device maintains for a multicast source. If a device does not receive subsequent multicast data from the multicast source S when the timer expires, it deletes the (S, G) entry for the multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common PIM timers for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common PIM timers globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.
   timer hello *interval*
   The default setting is 30 seconds.
4. Set the join or prune interval.
   timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.
   holdtime join-prune *time*
   The default setting is 210 seconds.
6. Set the multicast source lifetime.
   source-lifetime *time*
   The default setting is 210 seconds.

Configuring common PIM timers on an interface

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

About this task

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum size of a join or prune message.
   jp-pkt-size *size*
   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring a PIM join policy

About this task

The PIM join policy filters joined multicast sources and groups in PIM join or prune messages to protect the device against invalid PIM join or prune message attacks. The policy identifies valid joined multicast source and groups in PIM join or prune messages and filters out invalid joined multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined multicast sources and groups.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*

3. Configure a PIM join policy to filter joined multicast sources and groups in PIM join or prune messages.

   pim join-policy { { *ipv4-acl-number* | **name** *ipv4-acl-name* } | [**asm** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **ssm** { *ipv4-acl-number* | **name** *ipv4-acl-number* }] * }

   By default, no PIM join policy is configured and joined multicast sources and groups in PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing PIM protocol packets.

   dscp *dscp-value*

   By d efault, the DSCP value is 48 for outgoing PIM protocol packets.

Enabling BFD for PIM

About this task

If a DR on a shared-media network fails, a new DR election process does not start until the DR ages out. In addition, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, enable BFD for PIM to detect link failures among PIM neighbors.

You must enable BFD for PIM on all PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for PIM.

   pim bfd enable

   By default, BFD is disabled for PIM.

Enabling PIM passive mode

About this task

To guard against PIM hello spoofing, you can enable PIM passive mode on a receiver-side interface. The PIM passive interface cannot receive or forward PIM protocol messages (excluding register, register-stop, and C-RP-Adv messages), and it acts as the DR on the subnet.

Restrictions and guidelines

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple PIM devices.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable PIM passive mode on the interface.
   pim passive
   By default, PIM passive mode is disabled on an interface.

Enabling PIM NSR

About this task

This feature enables PIM to back up protocol state information and data, including PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable PIM NSR.
   pim non-stop-routing
   By default, PIM NSR is disabled.
3. (Optional.) Specify a reserved VLAN for the peer link in an M-LAG system.
   m-lag peer-link reserved
   By default, no reserved VLAN is specified for the peer link in an M-LAG system.
   Execute this command in the view of the VLAN to be specified as the reserved VLAN. For more information about this command, see *Layer 2—LAN Switching Command Reference*.

Enabling SNMP notifications for PIM

About this task

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for PIM.
   snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **interface-election** | **invalid-join-prune** | **invalid-register** | **neighbor-loss** | **private-interface-election** |

private-neighbor-loss | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

By default, SNMP notifications for PIM are enabled.

Enabling PIM logging

About this task

To report critical PIM events to the information center, enable PIM logging. For PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable PIM logging or use the **pim log suppress** command to enable log message suppression for PIM.

Procedure

1. Enter system view.
   system-view
2. Enable PIM logging.
   pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *
   PIM logging is enabled by default.

Enabling log message suppression for PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for PIM. With this feature configured, the speed of sending PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure PIM logging has been enabled using the **pim log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for PIM.
   pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *
   By default, log message suppression is enabled for PIM.

Display and maintenance commands for PIM

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display register-tunnel interface	**display interface** [**register-tunnel**

Task	Command
information.	[*interface-number*]] [**brief** [**description** | **down**]]

Display statistics for PIM packets.	**display pim statistics**

PIM configuration examples

Example: Configuring PIM-DM

Network configuration

As shown in Figure 13:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the dense mode.
- Host A and Host C are multicast receivers on two stub networks.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 13 Network diagram

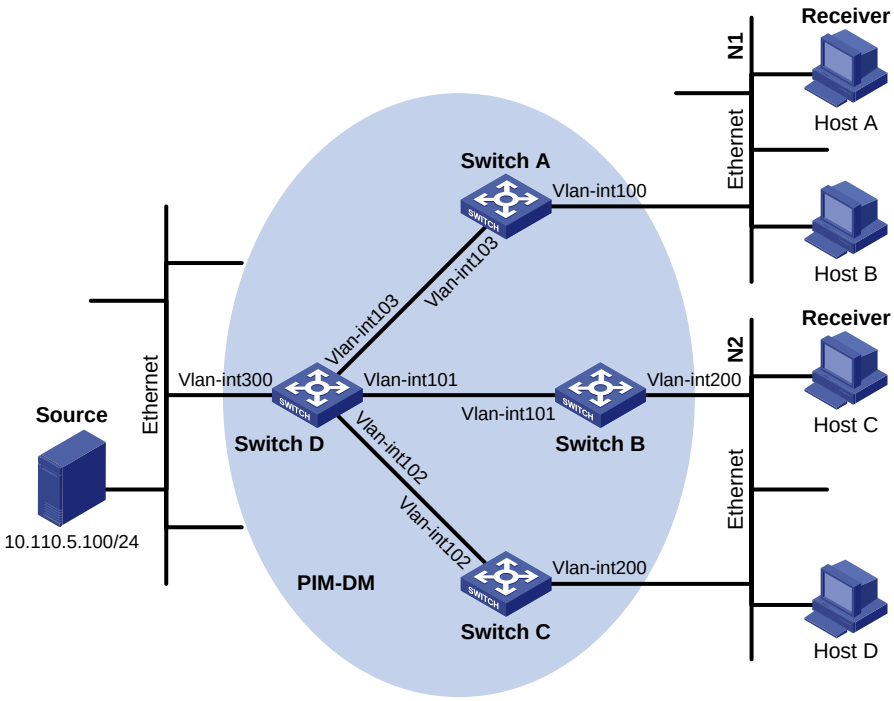

Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int102	192.168.3.1/24
Switch A	Vlan-int103	192.168.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch B	Vlan-int200	10.110.2.1/24	Switch D	Vlan-int103	192.168.1.2/24
Switch B	Vlan-int101	192.168.2.1/24	Switch D	Vlan-int101	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch D	Vlan-int102	192.168.3.2/24

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 13, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
```

```
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing, IGMP, and PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IP multicast routing, and enable PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display PIM information on Switch D.

```
[SwitchD] display pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: 10.110.5.1 (local)
 Interface: Vlan103
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2 (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.2.2 (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.3.2 (local)
```

Display PIM neighboring relationships on Switch D.

```
[SwitchD] display pim neighbor
 Total pim neighbors: 3
  Neighbor: 192.168.1.1
    Interface: Vlan103
    Uptime: 00:02:22
```

```
    Expiry time: 00:01:27
    DR priority: 1
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan101
    Uptime: 00:00:22
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan102
    Uptime: 00:00:23
    Expiry time: 00:01:31
    DR priority: 5
    Mode: N/A
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from multicast source 10.110.5.100/24 to multicast group 225.1.1.1. (Details not shown.)

Display PIM routing entries on Switch A.

```
[SwitchA] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: igmp, UpTime: 00:04:25, Expires: -

 (10.110.5.100, 225.1.1.1)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:06:14
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.1.2
         RPF prime neighbor: 192.168.1.2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 225.1.1.1)
```

```
Protocol: pim-dm, Flag: LOC ACT
UpTime: 00:03:27
Upstream interface: Vlan-interface300
    Upstream neighbor: NULL
    RPF prime neighbor: NULL
Downstream interface(s) information:
Total number of downstream interfaces: 2
    1: Vlan-interface103
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
    2: Vlan-interface102
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has the correct (*, G) entry.

Example: Configuring non-scoped PIM-SM

Network configuration

As shown in Figure 14:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist on each stub network.
- The entire PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers on two stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to multicast group range 225.1.1.0/24. Specify VLAN-interface 101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 14 Network diagram

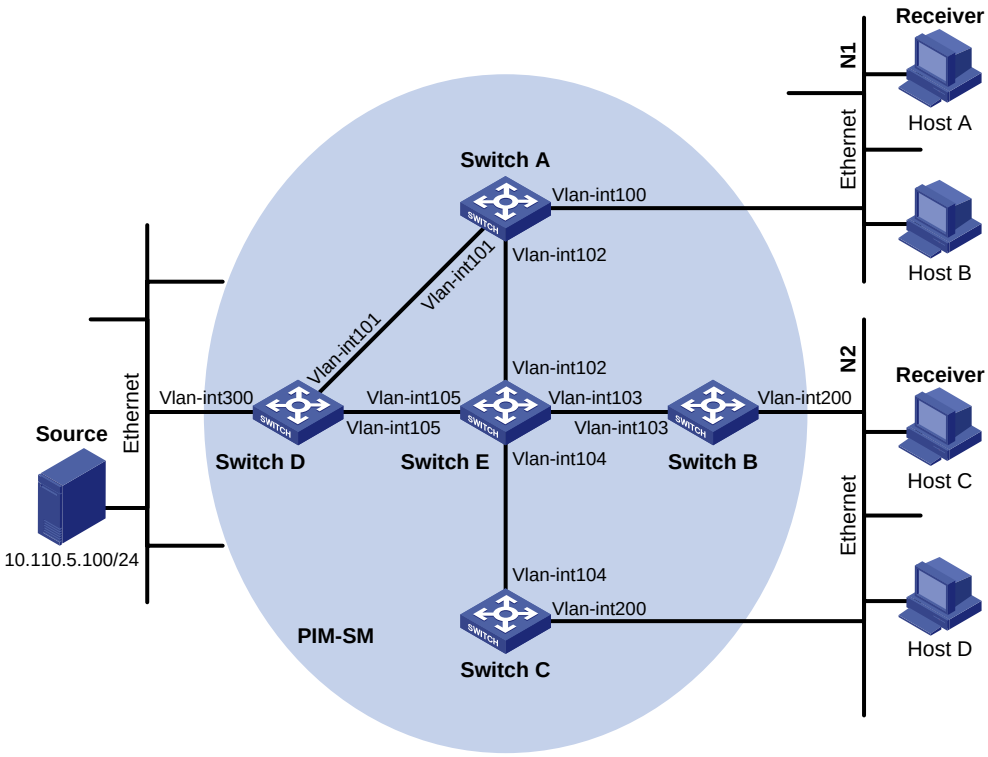

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 14, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and the static RP:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl basic 2005
[SwitchE-acl-ipv4-basic-2005] rule permit source 225.1.1.0 0.0.0.255
[SwitchE-acl-ipv4-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP.

```
[SwitchE] pim
[SwitchE-pim] c-bsr 192.168.9.2
[SwitchE-pim] c-rp 192.168.9.2 group-policy 2005
```

Configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE-pim] static-rp 192.168.1.2
[SwitchE-pim] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as the static RP.

```
<SwitchA> system-view
[SwitchA] pim
[SwitchA-pim] static-rp 192.168.1.2
[SwitchA-pim] quit
```

Configure the static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.9.2
```

Display BSR information on Switch A.

```
[SwitchA] display pim bsr-info
```

```
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
     Candidate BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch A.

```
[SwitchA] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 225.1.1.0/24
       RP address               Priority  HoldTime  Uptime    Expires
       192.168.9.2              192       180       00:51:45  00:02:22

Static RP information:
       RP address               ACL   Mode    Preferred
       192.168.1.2              ----  pim-sm  No
```

Example: Configuring admin-scoped PIM-SM

Network configuration

As shown in Figure 15:

- VOD streams are sent to receiver hosts in multicast. The entire PIM-SM domain is divided into admin-scoped zone 1 and the global-scoped zone. Switch B and Switch C are ZBRs of admin-scoped zone 1.
- Source 1 sends multicast data to the multicast group 224.1.1.1, and Host A is a multicast receiver. Source 2 sends multicast data to multicast group 239.1.1.1, and Host B is a multicast receiver.
- VLAN-interface 20 of Switch B acts as a C-BSR and a C-RP for admin-scoped zone 1, and is designated to multicast group range 239.0.0.0/8. VLAN-interface 50 of Switch D acts as a C-BSR and a C-RP for the global-scoped zone, and is designated to all the multicast groups that are not in the range 239.0.0.0/8.
- IGMPv2 runs between Switch A, Switch C, and the receivers that directly connect to them, respectively.

Figure 15 Network diagram

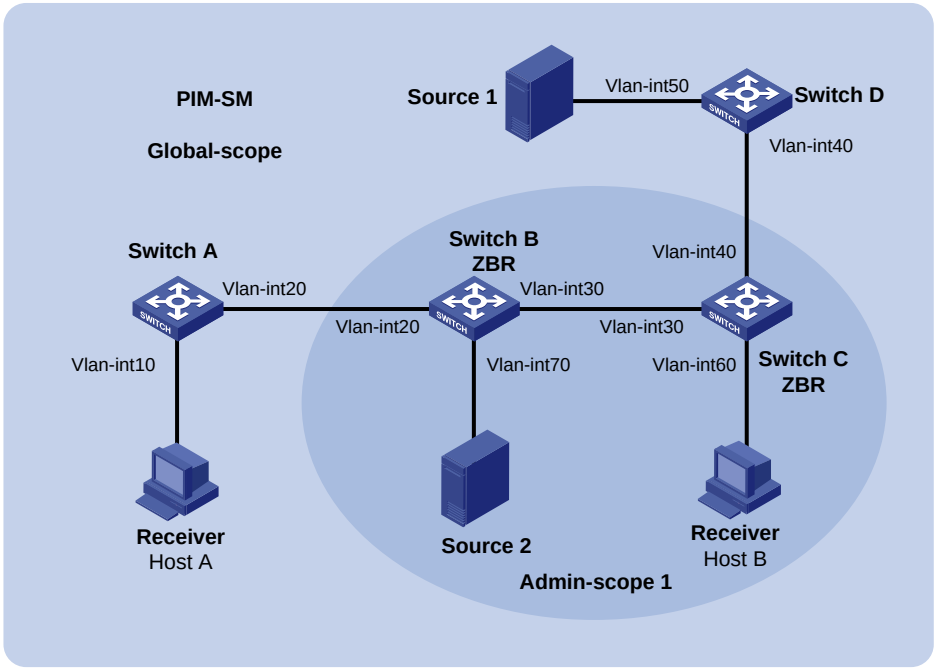

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.5.100/24	Source 2	—	10.110.6.100/24
Switch A	Vlan-int10	192.168.1.1/24	Switch D	Vlan-int50	10.110.5.2/24
Switch A	Vlan-int20	10.110.1.1/24	Switch D	Vlan-int40	10.110.7.1/24
Switch B	Vlan-int70	10.110.6.1/24	Switch C	Vlan-int30	10.110.2.2/24
Switch B	Vlan-int20	10.110.1.2/24	Switch C	Vlan-int60	10.110.4.1/24
Switch B	Vlan-int30	10.110.2.1/24	Switch C	Vlan-int40	10.110.7.2/24

Prerequisites

Assign an IP address and subnet mask to each interface, and make sure the switches in the PIM-DM domain can reach other.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface (VLAN-interface 20).

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] igmp enable
   [SwitchA-Vlan-interface20] quit
   ```

   # Enable PIM-SM on VLAN-interface 10.

   ```
   [SwitchA] interface vlan-interface 10
   ```

```
[SwitchA-Vlan-interface10] pim sm
[SwitchA-Vlan-interface10] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch C in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IP multicast routing, and enable PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 70
[SwitchB-Vlan-interface70] pim sm
[SwitchB-Vlan-interface70] quit
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] pim sm
[SwitchB-Vlan-interface20] quit
[SwitchB] interface vlan-interface 30
[SwitchB-Vlan-interface30] pim sm
[SwitchB-Vlan-interface30] quit
```

Enable IP multicast routing and PIM-SM on Switch D in the same way Switch B is configured. (Details not shown.)

2. Configure admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 20 as the boundary of admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface20] quit
```

On Switch C, configure VLAN-interface 40 as the boundary of the global-scoped zone.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 40
[SwitchC-Vlan-interface40] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface40] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure the service scope of RP advertisements, and configure VLAN-interface 20 as a C-BSR and a C-RP for admin-scoped zone 1.

```
[SwitchB] acl basic 2001
[SwitchB-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchB-acl-ipv4-basic-2001] quit
[SwitchB] pim
[SwitchB-pim] c-bsr 10.110.1.2 scope 239.0.0.0 8
[SwitchB-pim] c-rp 10.110.1.2 group-policy 2001
[SwitchB-pim] quit
```

Configure VLAN-interface 50 as a C-BSR and a C-RP for admin-scoped zone 2.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 10.110.5.2
[SwitchD-pim] c-rp 10.110.5.2
[SwitchD-pim] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display pim bsr-info
```

```
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:17
     Elected BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:05:02
 Scope: 239.0.0.0/8
     State: Elected
     Bootstrap timer: 00:00:26
     Elected BSR address: 10.110.1.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:05:48
     Candidate BSR address: 10.110.1.2
       Priority: 64
       Hash mask length: 30
```

Display BSR information on Switch D.

```
[SwitchD] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:00:38
     Elected BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:06:31
     Candidate BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch B.

```
[SwitchB] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.5.2               192       180       00:07:05  00:02:54
   Scope: 239.0.0.0/8
     Group/MaskLen: 239.0.0.0/8
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.1.2 (local)       192       180       00:07:47  00:02:13
```

Display RP information on Switch D.

```
[SwitchD] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.5.2 (local)       192       180       00:08:20  00:02:39
```

Example: Configuring PIM-SSM

Network configuration

As shown in Figure 16:

- OSPF runs on the network.
- The receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the SSM mode.
- Host A and Host C are multicast receivers on two stub networks.
- The SSM group range is 232.1.1.0/24.
- IGMPv3 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 16 Network diagram

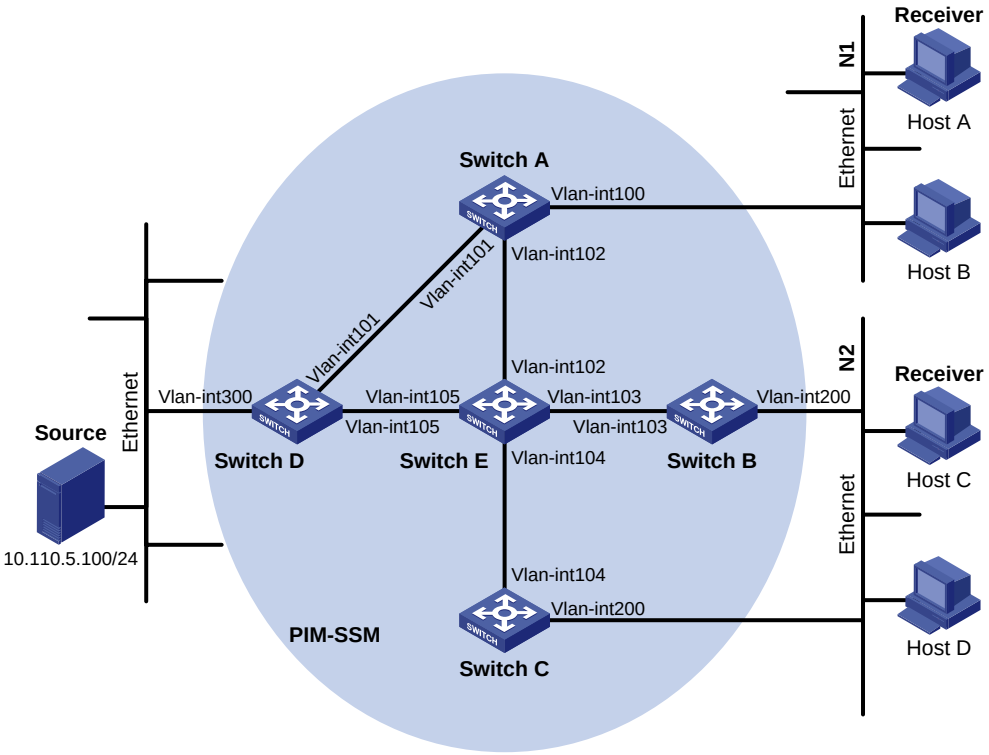

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 16, and configure OSPF on the switches in the PIM-SSM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMPv3 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] igmp version 3
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim sm
   [SwitchA-Vlan-interface102] quit
   ```

   # Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

   # Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

   # Configure the SSM group range 232.1.1.0/24 on Switch A.

   ```
   [SwitchA] acl basic 2000
   [SwitchA-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
   [SwitchA-acl-ipv4-basic-2000] quit
   [SwitchA] pim
   [SwitchA-pim] ssm-policy 2000
   [SwitchA-pim] quit
   ```

   # Configure the SSM group range on Switch B, Switch C, Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
```

```
   DR address: 192.168.9.2
```

Send an IGMPv3 report from Host A to join the multicast source and group (10.110.5.100/24, 232.1.1.1). (Details not shown.)

Display the PIM routing table on Switch A.

```
[SwitchA] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:13:25
     Upstream interface: Vlan-interface101
         Upstream neighbor: 192.168.1.2
         RPF prime neighbor: 192.168.1.2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: igmp, UpTime: 00:13:25, Expires: 00:03:25
```

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
     Protocol: pim-ssm, Flag: LOC
     UpTime: 00:12:05
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface105
             Protocol: pim-ssm, UpTime: 00:12:05, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Example: Configuring a multicast source policy

Network configuration

As shown in Figure 17:

- Source 1 and Source 3 send multicast data with different content to multicast group 225.0.0.1, and Source 2 sends multicast data to multicast group 225.0.0.2.
- Host A acts as a receiver and belongs to both multicast group 225.0.0.1 and multicast group 225.0.0.2.
- IGMPv2 runs between Device B and Host A.
- Device A discards multicast data from multicast source 10.110.7.2 and multicast data destined for multicast group 225.0.0.2.

Figure 17 Network diagram

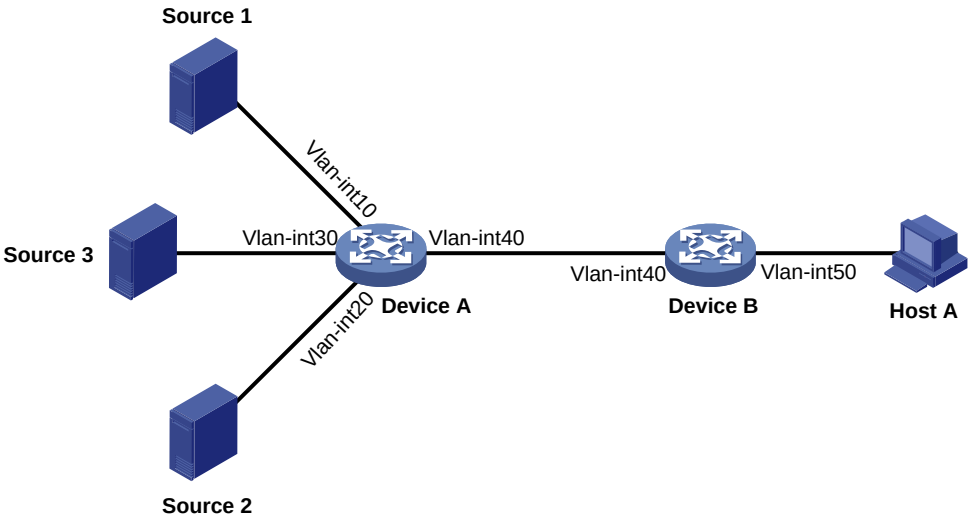

Table 5 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1		192.168.50.1/24	Device A	Vlan-int10	192.168.50.2/24
Source 2		192.168.56.1/24	Device A	Vlan-int20	192.168.56.2/24
Source 3		10.110.7.2/24	Device A	Vlan-int30	10.110.7.10/24
Device B	Vlan-int50	192.168.1.1/24	Device A	Vlan-int40	10.110.5.2/24
Device B	Vlan-int40	10.110.5.1/24			

Procedure

1. Configure Device A:

Enable IP multicast routing.

```
<DeviceA> system-view
[DeviceA] multicast routing
[DeviceA-mrib] quit
```

Configure OSPF.

```
[DeviceA] ospf 1
[DeviceA-ospf-1] area 0
[DeviceA-ospf-1-area-0.0.0.0] quit
[DeviceA-ospf-1] quit
```

Assign IP addresses to VLAN-interface 10, VLAN-interface 20, VLAN-interface 30, and VLAN-interface 40. Enable PIM-SM and OSPF on the interfaces.

```
[DeviceA] interface Vlan-interface10
[DeviceA-Vlan-interface10] ip address 192.168.50.2 255.255.255.0
[DeviceA-Vlan-interface10] pim sm
[DeviceA-Vlan-interface10] ospf 1 area 0
[DeviceA-Vlan-interface10] quit
[DeviceA] interface Vlan-interface20
[DeviceA-Vlan-interface20] ip address 192.168.56.2 255.255.255.0
[DeviceA-Vlan-interface20] pim sm
```

```
[DeviceA-Vlan-interface20] ospf 1 area 0
[DeviceA-Vlan-interface20] quit
[DeviceA] interface Vlan-interface30
[DeviceA-Vlan-interface30] ip address 10.110.7.10 255.255.255.0
[DeviceA-Vlan-interface30] pim sm
[DeviceA-Vlan-interface30] ospf 1 area 0
[DeviceA-Vlan-interface30] quit
[DeviceA] interface Vlan-interface40
[DeviceA-Vlan-interface40] ip address 10.110.5.2 255.255.255.0
[DeviceA-Vlan-interface40] pim sm
[DeviceA-Vlan-interface40] ospf 1 area 0
[DeviceA-Vlan-interface40] quit
```

Configure a multicast source policy to discard multicast data from multicast source 10.110.7.2 and multicast data destined for multicast group 225.0.0.2.

```
[DeviceA] acl advanced 3000
[DeviceA-acl-ipv4-adv-3000] rule 0 deny ip source 10.110.7.2 0
[DeviceA-acl-ipv4-adv-3000] rule 5 deny ip destination 225.0.0.2 0
[DeviceA-acl-ipv4-adv-3000] rule 10 permit ip
[DeviceA-acl-ipv4-adv-3000] quit
[DeviceA] pim
[DeviceA-pim] source-policy 3000
[DeviceA] quit
```

2. Configure Device B:

Enable IP multicast routing.

```
<DeviceB> system-view
[DeviceB] multicast routing
[DeviceB-mrib] quit
```

Configure OSPF.

```
[DeviceB] ospf 1
[DeviceB-ospf-1] area 0
[DeviceB-ospf-1-area-0.0.0.0] quit
[DeviceB-ospf-1] quit
```

Assign an IP address to VLAN-interface 50, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface Vlan-interface50
[DeviceB-Vlan-interface50] ip address 192.168.1.1 255.255.255.0
[DeviceB-Vlan-interface50] igmp enable
[DeviceB-Vlan-interface50] ospf 1 area 0
[DeviceB-Vlan-interface50] quit
```

Assign an IP address to VLAN-interface 40, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface Vlan-interface40
[DeviceB-Vlan-interface40] ip address 10.110.5.1 255.255.255.0
[DeviceB-Vlan-interface40] pim sm
[DeviceB-Vlan-interface40] ospf 1 area 0
[DeviceB-Vlan-interface40] quit
```

Assign an IP address to Loopback 0, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface LoopBack0
[DeviceB-LoopBack0] ip address 1.1.1.1 255.255.255.255
[DeviceB-LoopBack0] pim sm
```

```
[DeviceB-LoopBack0] ospf 1 area 0
[DeviceB-LoopBack0] quit
```

Configure Loopback 0 as a C-BSR and a C-RP.

```
[DeviceB] pim
[DeviceB-pim] c-bsr 1.1.1.1
[DeviceB-pim] c-rp 1.1.1.1
[DeviceB-pim] quit
```

Verifying the configuration

Display the PIM routing table on Device B.

```
[DeviceB] display pim routing-table
 Total 2 (*, G) entries; 1 (S, G) entries

 (*, 225.0.0.1)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 16:27:44
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: igmp, UpTime: 16:27:44, Expires: -

 (192.168.50.1, 225.0.0.1)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: SPT 2MSDP ACT 2MVPN
     UpTime: 00:00:37
     Upstream interface: Vlan-interface40
         Upstream neighbor: 10.110.5.2
         RPF prime neighbor: 10.110.5.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: pim-sm, UpTime: 00:00:37, Expires: -

 (*, 225.0.0.2)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 16:27:52
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: igmp, UpTime: 16:27:52, Expires: -
```

The output shows that Host A can receive multicast data from only Source 1.

Troubleshooting PIM

A multicast distribution tree cannot be correctly built

Symptom

No multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in a PIM network. This means that a multicast distribution tree cannot be built correctly.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the multicast source or the RP is available.
2. Use the **display pim interface** command to verify PIM information on each interface, especially on the RPF interface. If PIM is not enabled on the interfaces, use the **pim dm** or **pim sm** command to enable PIM-DM or PIM-SM for the interfaces.
3. Use the **display pim neighbor** command to verify that the RPF neighbor is a PIM neighbor.
4. Verify that PIM and IGMP are enabled on the interfaces that directly connect to the multicast sources or the receivers.
5. Use the **display pim interface verbose** command to verify that the same PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same PIM mode is enabled on all devices. For PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

Multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives multicast data but does not create an (S, G) entry in the PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the multicast forwarding boundary settings. Use the **multicast boundary** command to change the multicast forwarding boundary settings to make the multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the multicast source.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the RP is available on each device.
2. Use the **display pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or multicast source registration fails in PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command on each device to view routing table information. Verify that unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display pim bsr-info** command to verify that the BSR information exists on each device.
3. Use the **display pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display pim neighbor** command to verify that PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

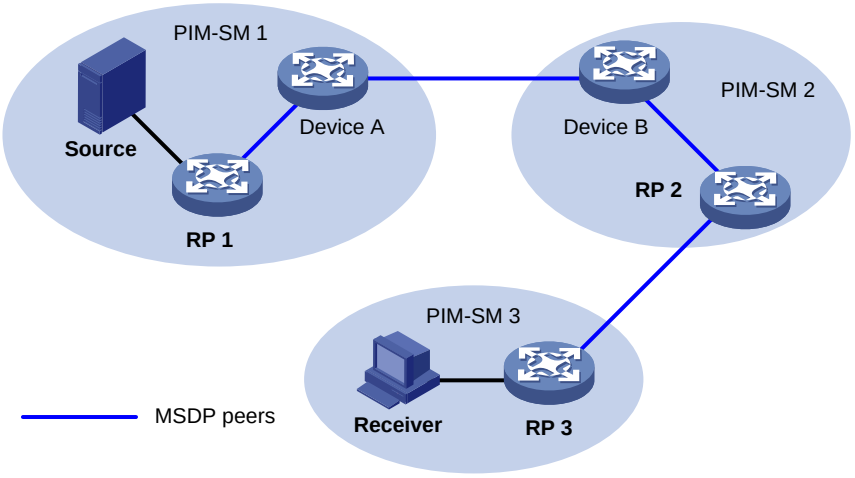
Configuring MSDP

About MSDP

Multicast Source Discovery Protocol (MSDP) is an inter-domain multicast solution that addresses the interconnection of PIM-SM domains. It discovers multicast source information in other PIM-SM domains.

MSDP is applicable only to the ASM model.

How MSDP works



MSDP peer relationships are established between appropriate devices on the network, so that the RPs of different PIM-SM domains are interconnected with one another. These MSDP peers exchange source active (SA) messages, so that the multicast source information is shared among these domains.

For more information about DRs, BSRs, C-BSRs, RPs, C-RPs, SPTs, and RPTs, see "PIM overview."

MSDP peers

One or more pairs of MSDP peers on the network form an MSDP interconnection map.

Figure 1 MSDP peer locations on the network

As shown in Figure 1, an MSDP peer can be created on any PIM-SM device. MSDP peers created on PIM-SM devices that assume different roles function differently.

- MSDP peers created on RPs:
  - **Source-side MSDP peer**—MSDP peer closest to the multicast source, such as RP 1. The source-side RP creates and sends SA messages to its remote MSDP peer to notify the MSDP peer of the locally registered multicast source information.

    A source-side MSDP peer must be created on the source-side RP. Otherwise, it cannot advertise the multicast source information out of the PIM-SM domain.
  - **Receiver-side MSDP peer**—MSDP peer closest to the receivers, typically the receiver-side RP, such as RP 3. After receiving an SA message, the receiver-side MSDP peer resolves the multicast source information carried in the message. Then, it joins the SPT rooted at the multicast source across the PIM-SM domains. When multicast data from the multicast

source arrives, the receiver-side MSDP peer forwards the data to the receivers along the RPT.

- **Intermediate MSDP peer**—MSDP peer with multiple remote MSDP peers, such as RP 2. An intermediate MSDP peer forwards SA messages received from one remote MSDP peer to other remote MSDP peers. It acts as a relay for forwarding multicast source information.

- MSDP peers created on PIM-SM devices that are not RPs:

  Device A and Device B are MSDP peers on multicast devices that are not RPs. Such MSDP peers only forward SA messages.

In a PIM-SM network using the BSR mechanism, the RP is dynamically elected from C-RPs. A PIM-SM network typically has multiple C-RPs to ensure network robustness. Because the RP election result is unpredictable, MSDP peering relationships must be built between all C-RPs to always keep the winning C-RP on the MSDP interconnection map. Losing C-RPs assume the role of common PIM-SM devices on this map.

Inter-domain multicast delivery through MSDP

As shown in Figure 2, an active source (Source) exists in the domain PIM-SM 1, and RP 1 has learned the existence of Source through multicast source registration. RPs in PIM-SM 2 and PIM-SM 3 also seek the location of Source so that multicast traffic from Source can be sent to their receivers. MSDP peering relationships must be established between RP 1 and RP 3 and between RP 3 and RP 2.

Figure 2 Inter-domain multicast delivery through MSDP

The process of implementing PIM-SM inter-domain multicast delivery by leveraging MSDP peers is as follows:

1. When the multicast source in PIM-SM 1 sends the first multicast packet to multicast group G, DR 1 encapsulates the data within a register message. It sends the register message to RP 1, and RP 1 obtains information about the multicast source.
2. As the source-side RP, RP 1 creates SA messages and periodically sends them to its MSDP peer.

   An SA message contains the address of the multicast source (S), the multicast group address (G), and the address of the RP that has created this SA message (RP 1, in this example).

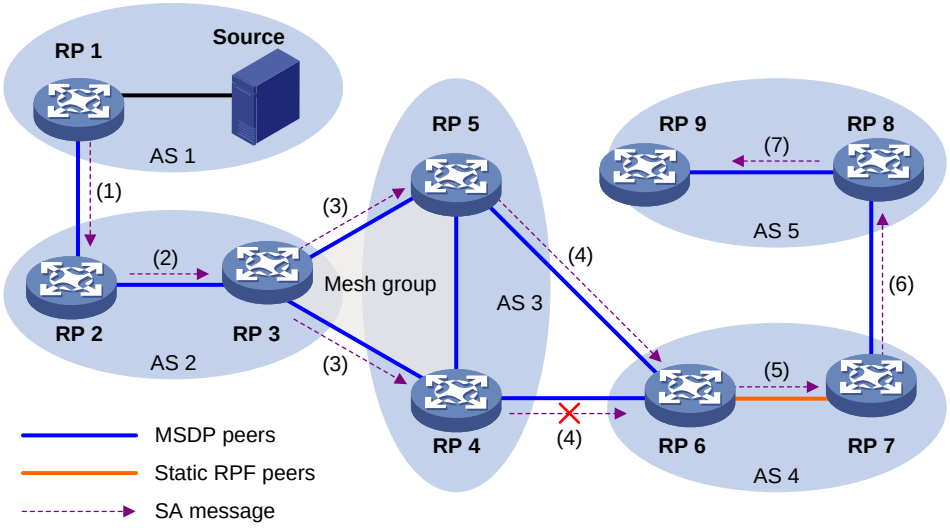
3. On MSDP peers, each SA message undergoes an RPF check and multicast policy-based filtering. Only SA messages that have arrived along the correct path and passed the filtering are received and forwarded. This avoids delivery loops of SA messages. In addition, you can configure MSDP peers into an MSDP mesh group to avoid SA message flooding between MSDP peers. An MSDP mesh group refers to a group of MSDP peers that establish MSDP peering relationships with each other and share the same group name.
4. SA messages are forwarded from one MSDP peer to another. Finally, information about the multicast source traverses all PIM-SM domains with MSDP peers (PIM-SM 2 and PIM-SM 3, in this example).
5. After receiving the SA message that RP 1 created, RP 2 in PIM-SM 2 examines whether any receivers for the multicast group exist in the domain.
   - If a receiver exists in the domain, the RPT for the multicast group G is maintained between RP 2 and the receivers. RP 2 creates an (S, G) entry and sends an (S, G) join message. The join message travels hop by hop toward the multicast source, and the SPT is established across the PIM-SM domains.

     The subsequent multicast data flows to RP 2 along the SPT, and from RP 2 to the receiver-side DR along the RPT. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.
   - If no receivers exist in the domain, RP 2 neither creates an (S, G) entry nor sends a join message toward the multicast source.

In inter-domain multicasting using MSDP, once an RP gets information about a multicast source in another PIM-SM domain, it no longer relies on RPs in other PIM-SM domains. The receivers can override the RPs in other domains and directly join the multicast SPT rooted at the source.

MSDP peer-RPF forwarding

The MSDP peer-RPF check is used for forwarding SA messages on a network that runs MSDP. If the peer-RPF check succeeds, the SA message is accepted and forwarded. Otherwise, the SA message is discarded.



As shown in Figure 3:

- There are five ASs on the network. IGP runs within each AS, and BGP or MBGP runs between these ASs.
- Each AS contains a minimum of one PIM-SM domain, and each PIM-SM domain contains a minimum of one RP.
- MSDP peering relationship has been established among these RPs.

  RP 3, RP 4, and RP 5 are in the same MSDP mesh group.

  RP 6 is configured as the static RPF peer of RP 7.

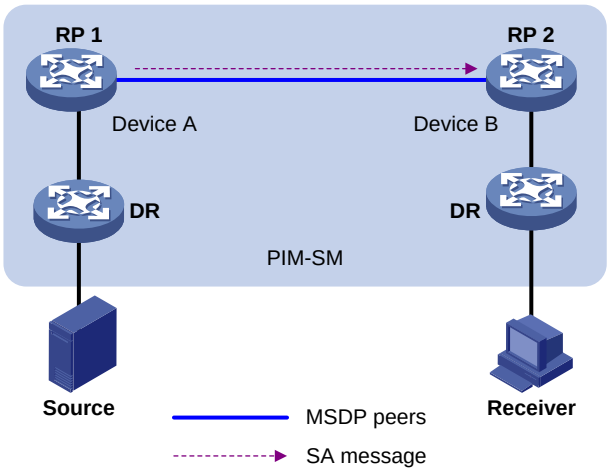
Figure 3 MSDP peer-RPF forwarding

The process of peer-RPF forwarding is as follows:

1. RP 1 creates an SA message and forwards it to its peer RP 2.
2. RP 2 determines that RP 1 is the RP that creates the SA message because the RP address in the SA message is the same as that of RP 1. Then, RP 2 accepts and forwards the SA message.
3. RP 3 accepts and forwards the SA message, because RP 2 and RP 3 reside in the same AS and RP 2 is the next hop of RP 3 to RP 1.
4. RP 4 and RP 5 accept the SA message, because RP 3 is in the same mesh group with them. Then, RP 4 and RP 5 forward the SA message to their peer RP 6 rather than other members of the mesh group.
5. RP 4 and RP 5 reside in the closest AS in the route to RP 1. However, RP 6 accepts and forwards only the SA message from RP 5, because the IP address of RP 5 is higher than that of RP 4.
6. RP 7 accepts and forwards the SA message, because RP 6 is its static RPF peer.
7. RP 8 accepts and forwards the SA message, because RP 7 is the EBGP or MBGP next hop of the peer-RPF route to RP 1.
8. RP 9 accepts the SA message, because RP 8 is the only RP of RP 9.

Anycast RP through MSDP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup between two or more RPs by configuring multiple RPs with the same IP address for one multicast group. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.



For Anycast RP implemented through MSDP, all member RPs in the Anycast RP set have the same IP address, and MSDP peering connections are established between the RPs.

As shown in Figure 4, within a PIM-SM domain, a multicast source sends multicast data to multicast group G, and the receiver joins the multicast group. To implement Anycast RP through MSDP, complete the following tasks:

1. Assign the same IP address (known as Anycast RP address, typically a private address) to an interface on Device A and Device B.
2. Configure the interfaces as C-RPs.

3. Establish an MSDP peering relationship between Device A and Device B.

Figure 4 Anycast RP through MSDP

The following describes how Anycast RP through MSDP is implemented:

4. After receiving the multicast data from Source, the source-side DR registers with the closest RP (RP 1 in this example).
5. After receiving the IGMP report message from the receiver, the receiver-side DR sends a join message toward the closest RP (RP 2 in this example). An RPT rooted at this RP is established.
6. The RPs share the registered multicast source information through SA messages. After obtaining the multicast source information, RP 2 sends an (S, G) source-specific join message toward the source to create an SPT.
7. When the multicast data reaches RP 2 along the SPT, the RP forwards the data along the RPT to the receiver. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.

MSDP support for VPNs

Interfaces on the multicast devices in a VPN can set up MSDP peering relationships with each other. With the SA messages exchanged between MSDP peers, the multi-instance VPN implements the forwarding of multicast data across different PIM-SM domains.

To support MSDP for VPNs, a multicast device that runs MSDP maintains an independent set of MSDP mechanism for each VPN that it supports. These mechanisms include SA message cache, peering connection, timers, sending cache, and cache for exchanging PIM messages.

One VPN is isolated from another, and MSDP and PIM-SM messages can be exchanged only within the same VPN.

Protocols and standards

- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*

Restrictions: Hardware compatibility with MSDP

The S5200-EI-G switch series does not support this feature.

MSDP tasks at a glance

1. Enabling MSDP
2. Creating an MSDP peer
3. (Optional.) Configuring a static RPF peer
4. (Optional.) Configuring an MSDP mesh group
5. (Optional.) Controlling MSDP peering connections
   - Tearing down MSDP peering connections
   - Setting the keepalive timer and peer hold timer for MSDP sessions
   - Setting the MSDP connection retry interval
   - Enabling MD5 authentication for TCP connection establishment
6. (Optional.) Configuring SA message-related parameters
   - Enabling multicast data encapsulation in SA messages
   - Configuring the originating RP of SA messages
   - Configuring SA request messages
   - Configuring SA message policies
   - Configuring the SA cache mechanism
7. (Optional.) Configuring MSDP-based Anycast RP
8. (Optional.) Enabling MSDP NSR
9. (Optional.) Setting the DSCP value for outgoing MSDP protocol packets

Prerequisites for MSDP

Before you configure MSDP, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Configure PIM-SM to enable intra-domain multicast.

Enabling MSDP

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enable MSDP and enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
   By default, MSDP is disabled.

Creating an MSDP peer

About this task

An MSDP peering relationship is identified by an address pair (the addresses of the local MSDP peer and the remote MSDP peer). To create an MSDP peering connection, you must perform the following operation on both devices that are a pair of MSDP peers.

You can configure a description for an MSDP peer to easily distinguish an MSDP peer from other MSDP peers.

Restrictions and guidelines

If an MSDP peer and a BGP or MBGP peer share the same interface, specify the MSDP peer and the BGP or MBGP peer by using the same IP address.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Create an MSDP peer.
   peer *peer-address* **connect-interface** *interface-type interface-number*
4. (Optional.) Configure a description for the MSDP peer.
5. **peer** *peer-address* **description** *text*
6. By default, an MSDP peer does not have a description.

Configuring a static RPF peer

About this task

You can configure a static RPF peer, so the static RPF peer does not perform RPF check on received SA messages. This simplifies the RPF check mechanism for SA messages.

Restrictions and guidelines

If only one MSDP peer is configured on a device, this MSDP peer is considered to be a static RPF peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure a static RPF peer.
   static-rpf-peer *peer-address* [**rp-policy** *ip-prefix-name*]

Configuring an MSDP mesh group

About this task

This feature avoids SA message flooding among MSDP peers within an AS. It also simplifies the RPF check mechanism because you do not need to run BGP or MBGP between these MSDP peers.

When receiving an SA message from outside the mesh group, a member MSDP peer performs the RPF check on the SA message. If the SA message passes the RPF check, the member MSDP peer floods the message to the other members in the mesh group. When receiving an SA message from another member, the MSDP peer neither performs an RPF check on the message nor forwards the message to the other members.

To organize multiple MSDP peers in a mesh group, assign the same mesh group name to these MSDP peers.

Restrictions and guidelines

Before you configure an MSDP mesh group, make sure the devices are interconnected with one another.

If you assign an MSDP peer to multiple MSDP mesh groups, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an MSDP mesh group.
   peer *peer-address* **mesh-group** *name*
   By default, an MSDP peer does not belong to any mesh group.

Controlling MSDP peering connections

Tearing down MSDP peering connections

About this task

MSDP peers are interconnected over TCP (port number 639). You can tear down or re-establish MSDP peering connections to control SA message exchange between the MSDP peers. When the connection between two MSDP peers is torn down, SA messages are no longer delivered between them. No attempt is made to re-establish the connection. The configuration information for the peer remains unchanged.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Tear down an MSDP peering connection.
   shutdown *peer-address*
   By default, an MSDP peering connection is active.

Setting the keepalive timer and peer hold timer for MSDP sessions

About this task

MSDP peers periodically send keepalive messages to each other to keep a session alive. When a session is established, an MSDP peer sends a keepalive message to its peer and starts a keepalive timer and a peer hold timer. When the keepalive timer expires, the MSDP peer sends a new keepalive message. If the MSDP peer receives an MSDP message from its peer before the peer hold timer expires, it resets the peer hold timer. Otherwise, the MSDP peer tears down the session.

Because MSDP peers cannot negotiate the keepalive timer and peer hold timer, you must configure the same keepalive timer and peer hold timer for the MSDP peers of a session. The keepalive timer must be smaller than the peer hold timer.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the keepalive timer and peer hold timer for MSDP sessions.

   timer keepalive *keepalive holdtime*

   By default, the keepalive timer and peer hold timer are 60 seconds and 75 seconds, respectively.

   This command immediately takes effect on an established session.

Setting the MSDP connection retry interval

About this task

A TCP connection is required when one of the following conditions exists:

- A new MSDP peer is created.
- A previously deactivated MSDP peering connection is reactivated.
- A previously failed MSDP peer attempts to resume operation.

Perform this task to adjust the interval between MSDP peering connection attempts.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the MSDP connection retry interval.

   timer retry *interval*

   The default setting is 30 seconds.

Enabling MD5 authentication for TCP connection establishment

About this task

To enhance MSDP security, enable MD5 authentication for both MSDP peers to establish a TCP connection. If the MD5 authentication fails, the TCP connection cannot be established.

Restrictions and guidelines

Configure the same authentication method and key for the MSDP peers involved in MD5 authentication to avoid authentication and TCP connection failures.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Configure the device to perform MD5 authentication when establishing a TCP connection with an MSDP peer.

   peer *peer-address* **password** { **cipher** | **simple** } *password*

   By default, the device does not perform MD5 authentication when establishing a TCP connection with an MSDP peer.

Configuring SA message-related parameters

Enabling multicast data encapsulation in SA messages

About this task

Some multicast sources send multicast data at an interval longer than the aging time of (S, G) entries. In this case, the source-side DR must encapsulate multicast data packet-by-packet in register messages and send them to the source-side RP. The source-side RP transmits the (S, G) information to the remote RP through SA messages. Then, the remote RP sends join messages to the source-side DR and builds an SPT. Because the (S, G) entries have timed out, remote receivers can never receive the multicast data from the multicast source.

To avoid this problem, you can enable the source-side RP to encapsulate multicast data in SA messages. As a result, the source-side RP can forward the multicast data in SA messages to its remote MSDP peers. After receiving the SA messages, the remote RP decapsulates the SA messages and forwards the multicast data to the receivers in the local domain along the RPT.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Enable multicast data encapsulation in SA messages.

   encap-data-enable

   By default, an SA message contains only (S, G) entries, but not the multicast data.

Configuring the originating RP of SA messages

About this task

This feature enables an interface to originate SA messages and to use its IP address as the RP address in SA messages. It is typically used in the Anycast-RP application.

By default, the RP address in SA messages originated by a member Anycast-RP is the Anycast-RP address. The SA messages will fail the RPF check on the other members because the RP address in SA messages is the same as the local RP address. In this case, source information cannot be exchanged within the Anycast-RP. To solve the problem, you must specify an interface other than the interface where the member Anycast-RP resides as the originating RP of SA messages.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an interface as the originating RP of SA messages.

   originating-rp *interface-type interface-number*

   By default, SA messages are originated by the actual RPs.

Configuring SA request messages

About this task

By default, after receiving a new join message, a device waits for an SA message to obtain the multicast source information and to join the SPT. You can enable the device to request source information by sending SA request messages to an MSDP peer. This reduces the join latency.

An SA request policy enables the device to filter SA request messages from an MSDP peer by using an ACL that specifies the multicast groups.

Prerequisites

Before you enable the device to send SA requests, make sure you have disabled the SA message cache mechanism by the **undo cache-sa-enable** command.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the device to send SA request messages to an MSDP peer.

   peer *peer-address* **request-sa-enable**

   By default, after receiving a new join message, a device does not send an SA request message to any MSDP peer. Instead, it waits for the next SA message from its MSDP peer.
4. Configure an SA request policy for an MSDP peer.

   peer *peer-address* **sa-request-policy** [**acl** *ipv4-acl-number*]

   By default, no SA request policy exists, and all SA request from an MSDP peer are permitted.

Configuring SA message policies

About this task

To control the propagation of multicast source information, you can configure the following policies:

- **SA creation policy**—Limits the multicast source information advertised in SA messages. This policy enables the device to advertise (S, G) entries based on the used ACL that specifies the multicast sources and groups.
- **SA incoming or outgoing policy**—Limits the receipt or forwarding of SA messages. This policy enables the device to receive or forward SA messages based on the used ACL that specifies the multicast sources and groups.
- **The lower TTL threshold for multicast data packets encapsulated in SA messages**—By default, multicast data packets are encapsulated in SA messages and forwarded to MSDP peers only if the TTL values in the packets are larger than zero. You can set the lower TTL threshold for multicast data packets encapsulated in SA messages that are sent to an MSDP peer. Then, only multicast data packets whose TTL values are larger than or equal to the configured value are encapsulated in SA messages. Only SA messages whose TTL values are larger than or equal to the configured value are forwarded to the specified MSDP peer. This controls the multicast data packet encapsulation and limits the propagation range of the SA messages.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an SA creation policy.

   import-source [**acl** *ipv4-acl-number*]
4. Configure an SA incoming or outgoing policy.

   peer *peer-address* **sa-policy** { **export** | **import** } [**acl** *ipv4-acl-number*]

   By default, no SA incoming or outgoing policy is configured. The device does not filter incoming or outgoing SA messages.
5. Set the lower TTL threshold for multicast data packets encapsulated in SA messages.

   peer *peer-address* **minimum-ttl** *ttl-value*

   The default setting is 0.

Configuring the SA cache mechanism

About this task

The SA cache mechanism enables the device to locally cache (S, G) entries contained in SA messages. It reduces the time for obtaining multicast source information, but increases memory occupation.

With the SA cache mechanism enabled, when the device receives a new (*, G) join message, it searches its SA message cache first.

- If no matching (S, G) entry is found, the device waits for the SA message that its MSDP peer sends in the next cycle.
- If a matching (S, G) entry is found in the cache, the device joins the SPT rooted at S.

To protect the device against DoS attacks, you can set a limit on the number of (S, G) entries in the SA cache from an MSDP peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the SA cache mechanism.
   cache-sa-enable
   By default, the SA message cache mechanism is enabled. The device caches the (S, G) entries contained in the received SA messages.
4. (Optional.) Set the maximum number of (S, G) entries in the SA cache from an MSDP peer.
   peer *peer-address* **sa-cache-maximum** *sa-limit*
   The default setting is 4294967295.

Configuring MSDP-based Anycast RP

1. Configure the same RP on multiple devices.
   For more information about configuring RP, see "Configuring PIM."
2. Establish MSDP peer relationship between the devices. The RP address must be different from the MSDP peer address.
   For more information about establishing MSDP peer relationships, see "Creating an MSDP peer."
   The IP address for establishing MSDP peer relationship must be different from the Anycast RP address.

Enabling MSDP NSR

About this task

This feature enables MSDP to back up protocol state information and data, such as MSDP peer and remote multicast source information, from the active process to standby processes. A standby process seamlessly takes over when the active process fails. Use this feature to avoid forwarding interruption for MSDP when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable MSDP NSR.
   msdp non-stop-routing
   By default, MSDP NSR is disabled.

Setting the DSCP value for outgoing MSDP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MSDP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MSDP protocol packets.

Display and maintenance commands for MSDP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display brief information about MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **brief** [**state** { **connect** | **disabled** | **established** | **listen** | **shutdown** }]
Display MSDP NSR status information.	**display msdp non-stop-routing status**
Display detailed status of MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **peer-status** [*peer-address*]
Display (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address* | *source-address* | *as-number*] *
Display the number of (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-count** [*as-number*]
Reset the TCP connection with an MSDP peer and clear statistics for the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **peer** [*peer-address*]
Delete (S, G) entries in the SA cache.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address*]
Clear statistics for an MSDP peer without resetting the TCP connection with the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **statistics** [*peer-address*]

MSDP configuration examples

Example: Configuring PIM-SM inter-domain multicast

Network configuration

As shown in Figure 5:

- OSPF runs within AS 100 and AS 200 and BGP runs between them.
- Each PIM-SM domain has a minimum of one multicast source or receiver.

Set up MSDP peering relationships between the RPs in the PIM-SM domains to share multicast source information among the PIM-SM domains.

Figure 5 Network diagram

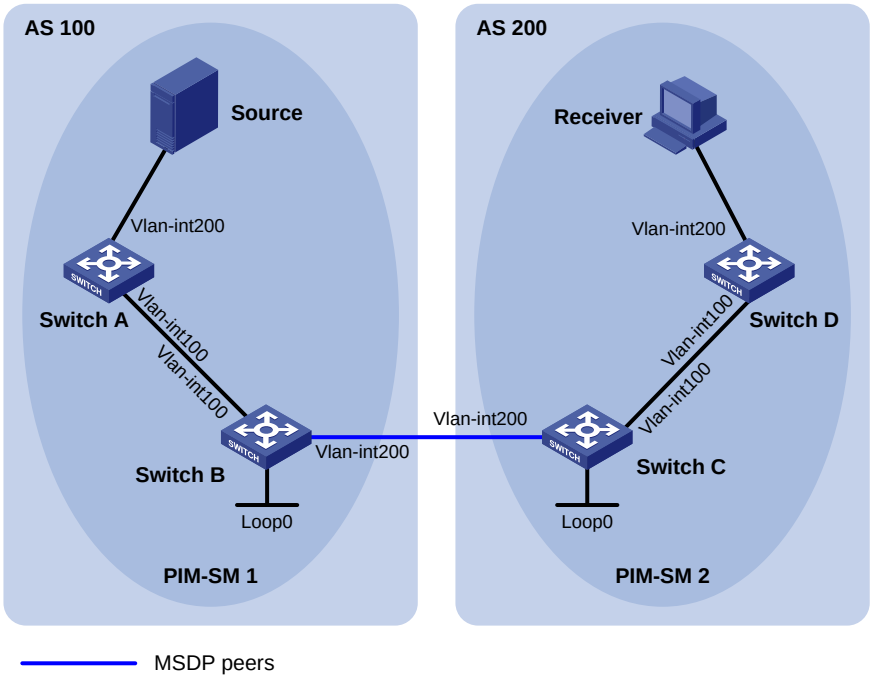


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source	N/A	10.110.2.100/24	Switch C	Vlan-int100	10.110.4.1/24
Switch A	Vlan-int100	10.110.1.2/24	Switch C	Vlan-int200	192.168.1.2/24
Switch A	Vlan-int200	10.110.2.1/24	Switch C	Loop0	2.2.2.2/32
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int100	10.110.4.2/24
Switch B	Vlan-int200	192.168.1.1/24	Switch D	Vlan-int200	10.110.5.1/24
Switch B	Loop0	1.1.1.1/32			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing and PIM-SM, and configure PIM-SM domain borders:

   # On Switch A, enable IP multicast routing, and enable PIM-SM on interfaces.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim sm
[SwitchA-Vlan-interface200] quit
```

   # On Router D, enable IP multicast routing, enable IGMP on the receiver-side interface, and enable PIM-SM on the source-side interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] pim sm
[SwitchD-Vlan-interface100] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] igmp enable
[SwitchD-Vlan-interface200] quit
```

   # On Router B, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] pim sm
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] pim sm
[SwitchB-Vlan-interface200] pim bsr-boundary
[SwitchB-Vlan-interface200] quit
[SwitchB] interface LoopBack0
[SwitchB-LoopBack0] pim sm
[SwitchB-LoopBack0] quit
```

   # On Router C, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] pim sm
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] pim sm
```

```
[SwitchC-Vlan-interface200] pim bsr-boundary
[SwitchC-Vlan-interface200] quit
[SwitchC] interface LoopBack0
[SwitchC-LoopBack0] pim sm
[SwitchC-LoopBack0] quit
```

2. Configure C-BSRs and C-RPs:

On Switch B, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 1.1.1.1
[SwitchB-pim] c-rp 1.1.1.1
[SwitchB-pim] quit
```

On Switch C, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchC] pim
[SwitchC-pim] c-bsr 2.2.2.2
[SwitchC-pim] c-rp 2.2.2.2
[SwitchC-pim] quit
```

3. Configure BGP for mutual route redistribution between BGP and OSPF:

On Switch B, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] router-id 1.1.1.1
[SwitchB-bgp-default] peer 192.168.1.2 as-number 200
[SwitchB-bgp-default] address-family ipv4
[SwitchB-bgp-default-ipv4] import-route ospf 1
[SwitchB-bgp-default-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] address-family ipv4 multicast
[SwitchB-bgp-default-mul-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-mul-ipv4] quit
[SwitchB-bgp-default] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 2.2.2.2
[SwitchC-bgp-default] peer 192.168.1.1 as-number 100
[SwitchC-bgp-default] address-family ipv4
[SwitchC-bgp-default-ipv4] import-route ospf 1
[SwitchC-bgp-default-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] address-family ipv4 multicast
[SwitchC-bgp-default-mul-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-mul-ipv4] quit
[SwitchC-bgp-default] quit
```

Redistribute BGP routes into OSPF on Switch B.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

Redistribute BGP routes into OSPF on Switch C.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route bgp
```

```
[SwitchC-ospf-1] quit
```

4. Configure MSDP peers:

Configure an MSDP peer on Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] peer 192.168.1.2 connect-interface vlan-interface 200
[SwitchB-msdp] quit
```

Configure an MSDP peer on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 200
[SwitchC-msdp] quit
```

Verifying the configuration

Display information about BGP peer groups on Switch B.

```
[SwitchB] display bgp peer ipv4

 BGP local router ID: 1.1.1.1
 Local AS number: 100
 Total number of peers: 1                 Peers in established state: 1

 * - Dynamically created peer
 Peer                    AS  MsgRcvd  MsgSent OutQ  PrefRcv Up/Down  State

 192.168.1.2             200 24       21      0    6        00:13:09 Established
```

Display information about BGP peer groups on Switch C.

```
[SwitchC] display bgp peer ipv4

 BGP local Switch ID: 2.2.2.2
 Local AS number: 200
 Total number of peers: 1                 Peers in established state: 1

 * - Dynamically created peer
 Peer                    AS  MsgRcvd  MsgSent OutQ  PrefRcv Up/Down  State

 192.168.1.1            100       18       16    0        1 00:12:04 Established
```

Display brief information about MSDP peers on Switch B.

```
[SwitchB] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
192.168.1.2     Established 00:12:19        200        0          0
```

Display brief information about MSDP peers on Switch C.

```
[SwitchC] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0
Peer address    State       Up/Down time    AS         SA count   Reset count
192.168.1.1     Established 00:06:11        100        0          0
```

Display detailed MSDP peer information on Switch B.

```
[SwitchB] display msdp peer-status
MSDP Peer 192.168.1.2; AS 200
 Description:
 Information about connection status:
   State: Established
   Up/down time: 00:15:47
   Resets: 0
   Connection interface: Vlan-interface200 (192.168.1.1)
   Received/sent messages: 16/16
   Discarded input messages: 0
   Discarded output messages: 0
   Elapsed time since last connection or counters clear: 00:17:40
   Mesh group peer joined: momo
   Last disconnect reason: Hold timer expired with truncated message
   Truncated packet: 5 bytes in buffer, type: 1, length: 20, without packet time: 75s
 Information about (Source, Group)-based SA filtering policy:
   Import policy: None
   Export policy: None
 Information about SA-Requests:
   Policy to accept SA-Requests: None
   Sending SA-Requests status: Disable
 Minimum TTL to forward SA with encapsulated data: 0
 SAs learned from this peer: 0, SA cache maximum for the peer: 4294967295
 Input queue size: 0, Output queue size: 0
 Counters for MSDP messages:
   RPF check failure: 0
   Incoming/outgoing SA: 0/0
   Incoming/outgoing SA-Request: 0/0
   Incoming/outgoing SA-Response: 0/0
   Incoming/outgoing Keepalive: 867/867
   Incoming/outgoing Notification: 0/0
   Incoming/outgoing Traceroutes in progress: 0/0
   Incoming/outgoing Traceroute reply: 0/0
   Incoming/outgoing Unknown: 0/0
   Incoming/outgoing data packet: 0/0
```

Example: Configuring inter-AS multicast by leveraging static RPF peers

Network configuration

As shown in Figure 6:

- The network has two ASs: AS 100 and AS 200. OSPF runs within each AS. BGP runs between the two ASs.
- PIM-SM 1 belongs to AS 100, and PIM-SM 2 belongs to AS 200. Each PIM-SM domain has a minimum of one multicast source or receiver.

Configure inter-AS multicast as follows:

- Configure Loopback 0 as the C-BSR and C-RP of the related PIM-SM domain on Switch A and Switch D.
- According to the peer-RPF forwarding rule, the switches accept SA messages that pass the filtering policy from its static RPF peers. To share multicast source information among PIM-SM domains without changing the unicast topology structure, configure MSDP peering relationships for the RPs of the PIM-SM domains and configure the static RPF peering relationships.

Figure 6 Network diagram

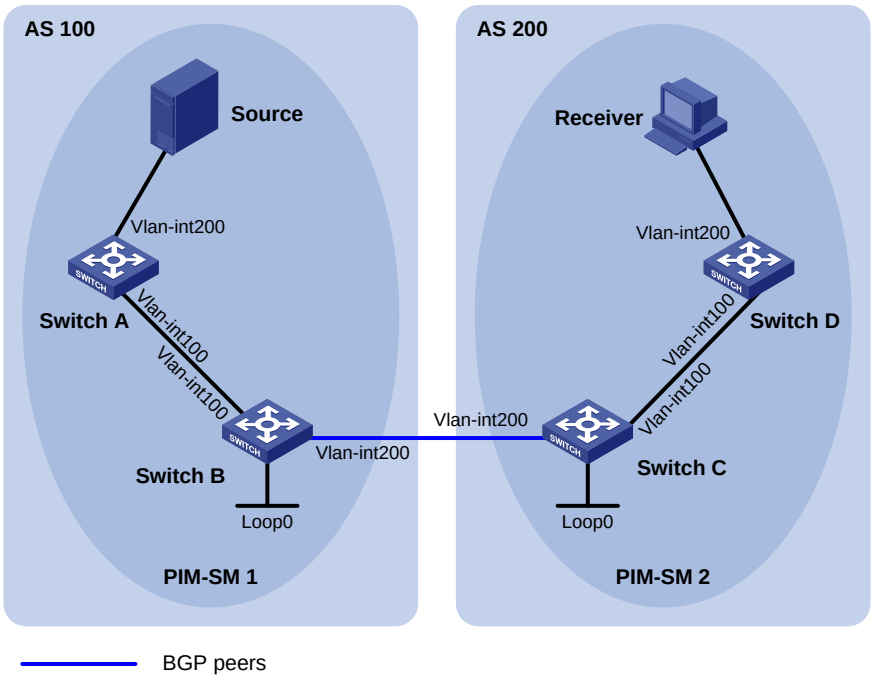

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source	N/A	10.110.2.100/24	Switch C	Vlan-int100	10.110.4.1/24
Switch A	Vlan-int100	10.110.1.2/24	Switch C	Vlan-int200	192.168.1.2/24
Switch A	Vlan-int200	10.110.2.1/24	Switch C	Vlan-int100	10.110.4.2/24
Switch B	Loop0	1.1.1.1/32	Switch D	Vlan-int200	10.110.5.1/24
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Loop0	2.2.2.2/32
Switch B	Vlan-int200	192.168.1.1/24			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP, and configure PIM-SM domain borders:

   # On Switch C, enable IP multicast routing, and enable PIM-SM on interfaces.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim sm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface LoopBack0
[SwitchA-LoopBack0] pim sm
[SwitchA-LoopBack0] quit
```

On Switch C, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] pim sm
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] pim sm
[SwitchC-Vlan-interface200] pim bsr-boundary
[SwitchC-Vlan-interface200] quit
```

On Switch D, enable IP multicast routing, enable IGMP on the receiver-side interface, and enable PIM-SM on other interfaces.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] pim sm
[SwitchD-Vlan-interface100] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] igmp enable
[SwitchD-Vlan-interface200] quit
[SwitchD] interface LoopBack0
[SwitchD-LoopBack0] pim sm
[SwitchD-LoopBack0] quit
```

2. Configure C-BSRs and C-RPs:

On Switch A, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchA] pim
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

On Switch D, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 2.2.2.2
[SwitchD-pim] c-rp 2.2.2.2
[SwitchD-pim] quit
```

3. Configure BGP, and redistribute BGP routing information into OSPF and OSPF routing information into BGP:

On Switch B, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] router-id 1.1.1.1
[SwitchB-bgp-default] peer 192.168.1.2 as-number 200
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-ipv4] import-route direct
[SwitchB-bgp-default-ipv4] import-route ospf 1
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 2.2.2.2
[SwitchC-bgp-default] peer 192.168.1.1 as-number 100
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-ipv4] import-route direct
[SwitchC-bgp-default-ipv4] import-route ospf 1
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

On Switch B, redistribute BGP routing information into OSPF.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

On Switch C, redistribute BGP routing information into OSPF.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route bgp
[SwitchC-ospf-1] quit
```

4. Configure MSDP peers and static RPF peers:

On Switch A, configure Switch D and Switch G as the MSDP peers and static RPF peers.

```
[SwitchA] ip prefix-list list-dg permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchA] msdp
[SwitchA-msdp] peer 10.110.4.2 connect-interface vlan-interface 100
[SwitchA-msdp] static-rpf-peer 10.110.4.2 rp-policy list-dg
[SwitchA-msdp] quit
```

On Switch D, configure Switch A as the MSDP peer and static RPF peer.

```
[SwitchD] ip prefix-list list-a permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchD] msdp
[SwitchD-msdp] peer 10.110.1.2 connect-interface vlan-interface 100
[SwitchD-msdp] static-rpf-peer 10.110.1.2 rp-policy list-a
[SwitchD-msdp] quit
```

Verifying the configuration

Display the BGP peering relationships on Switch A.

```
[SwitchA] display bgp peer
```

No information is output, because no BGP peering relationship has been established between Switch A and Switch D. This means that the unicast topology is not changed.

Display brief information about MSDP peers on Switch A.

```
[SwitchA] display msdp brief
Configured    Established  Listen       Connect      Shutdown     Disabled
1             1            0            0            0            0

Peer address     State       Up/Down time    AS         SA count    Reset count
10.110.4.2       Established 01:07:08        ?          8           0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured    Established  Listen       Connect      Shutdown     Disabled
1             1            0            0            0            0

Peer address     State       Up/Down time    AS         SA count    Reset count
10.110.1.2       Established 01:07:09        ?          8           0
```

Example: Configuring Anycast RP

Network configuration

As shown in Figure 7, OSPF runs within the domain to provide unicast routes.

Configure the Anycast RP application so that the receiver-side DRs and the source-side DRs can initiate a join process to their respective RPs that are topologically closest to them.

Configure the router IDs of Switch B and Switch D as 1.1.1.1 and 2.2.2.2, respectively. Set up an MSDP peering relationship between Switch B and Switch D.

Figure 7 Network diagram

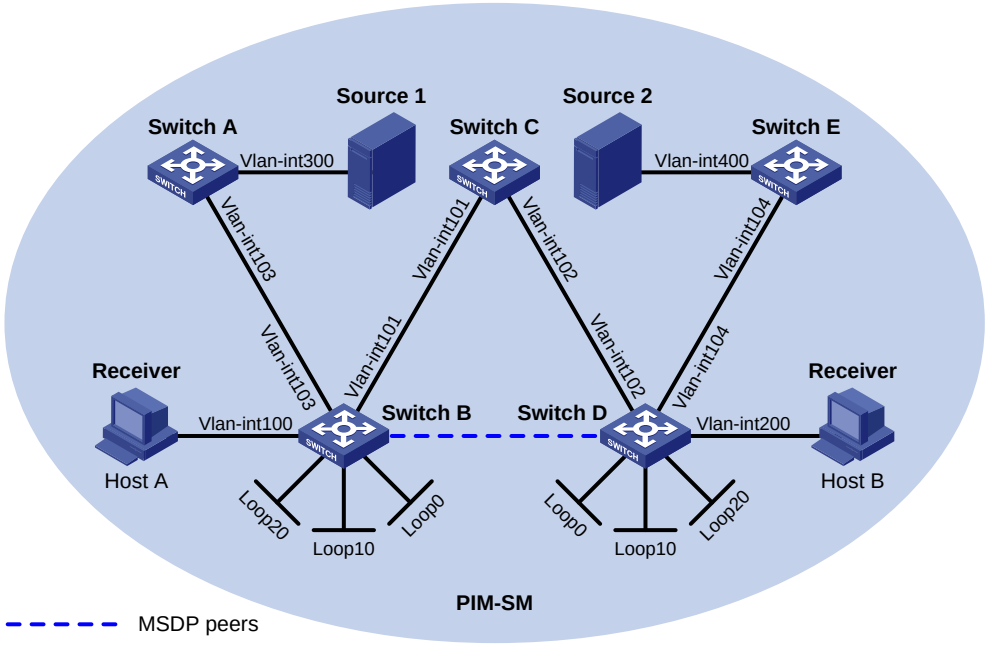

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.5.100/24	Switch C	Vlan-int101	192.168.1.2/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int102	192.168.2.2/24

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int300	10.110.5.1/24	Switch D	Vlan-int200	10.110.3.1/24
Switch A	Vlan-int103	10.110.2.2/24	Switch D	Vlan-int104	10.110.4.1/24
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int102	192.168.2.1/24
Switch B	Vlan-int103	10.110.2.1/24	Switch D	Loop0	2.2.2.2/32
Switch B	Vlan-int101	192.168.1.1/24	Switch D	Loop10	4.4.4.4/32
Switch B	Loop0	1.1.1.1/32	Switch D	Loop20	10.1.1.1/32
Switch B	Loop10	3.3.3.3/32	Switch E	Vlan-int400	10.110.6.1/24
Switch B	Loop20	10.1.1.1/32	Switch E	Vlan-int104	10.110.4.2/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 7, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

On Switch B, enable IP multicast routing.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 100).

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] igmp enable
[SwitchB-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim sm
[SwitchB-Vlan-interface103] quit
[SwitchB] interface Vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] pim sm
[SwitchB-LoopBack0] quit
[SwitchB] interface loopback 10
[SwitchB-LoopBack10] pim sm
[SwitchB-LoopBack10] quit
[SwitchB] interface loopback 20
[SwitchB-LoopBack20] pim sm
[SwitchB-LoopBack20] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch A, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

Configure Loopback 10 as a C-BSR and Loopback 20 as a C-RP on Switch B.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 3.3.3.3
```

```
[SwitchB-pim] c-rp 10.1.1.1
[SwitchB-pim] quit
```

Configure a C-BSR and a C-RP on Switch D in the same way Switch B is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Loopback 0 of Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] originating-rp loopback 0
[SwitchB-msdp] peer 2.2.2.2 connect-interface loopback 0
[SwitchB-msdp] quit
```

Configure an MSDP peer on Loopback 0 of Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] originating-rp loopback 0
[SwitchD-msdp] peer 1.1.1.1 connect-interface loopback 0
[SwitchD-msdp] quit
```

Verifying the configuration

Display brief information about MSDP peers on Switch B.

```
[SwitchB] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
2.2.2.2         Established 00:10:57        ?          0          0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
1.1.1.1         Established 00:10:57        ?          0          0
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from Source 1 to multicast group 225.1.1.1. (Details not shown.)

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
```

No information is output on Switch D.

Display the PIM routing table on Switch B.

```
[SwitchB] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     RP: 10.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 00:15:04
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
```

```
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: igmp, UpTime: 00:15:04, Expires: -

 (10.110.5.100, 225.1.1.1)
    RP: 10.1.1.1 (local)
    Protocol: pim-sm, Flag: SPT 2MSDP ACT
    UpTime: 00:46:28
    Upstream interface: Vlan-interface103
        Upstream neighbor: 10.110.2.2
        RPF prime neighbor: 10.110.2.2
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: pim-sm, UpTime:  - , Expires:  -
```

The output shows that Switch B now acts as the RP for Source 1 and Host A.

Send an IGMP leave message from Host A to leave multicast group 225.1.1.1. (Details not shown.),

Send an IGMP report from Host B to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from Source 2 to multicast group 225.1.1.1. (Details not shown.)

Display the PIM routing table on Switch B.

```
[SwitchB] display pim routing-table
```

No information is output on Switch B.

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
    RP: 10.1.1.1 (local)

        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface200
            Protocol: igmp, UpTime: 00:12:07, Expires: -

 (10.110.6.100, 225.1.1.1)
    RP: 10.1.1.1 (local)
    Protocol: pim-sm, Flag: SPT 2MSDP ACT
    UpTime: 00:40:22
    Upstream interface: Vlan-interface104
        Upstream neighbor: 10.110.4.2
        RPF prime neighbor: 10.110.4.2
```

```
Downstream interface(s) information:
Total number of downstream interfaces: 1
    1: Vlan-interface200
        Protocol: pim-sm, UpTime:  - , Expires:  -
```

The output shows that Switch D now acts as the RP for Source 2 and Host B.

Example: Configuring SA message filtering

Network configuration

As shown in Figure 8:

- OSPF runs within and among the PIM-SM domains to provide unicast routing.
- Set up an MSDP peering relationship between Switch A and Switch C and between Switch C and Switch D.
- Source 1 sends multicast data to multicast groups 225.1.1.0/30 and 226.1.1.0/30, and Source 2 sends multicast data to the multicast group 227.1.1.0/30.

Configure SA message policies so that:

- Host A and Host B receive the multicast data only addressed to multicast groups 225.1.1.0/30 and 226.1.1.0/30.
- Host C receives the multicast data only addressed to multicast groups 226.1.1.0/30 and 227.1.1.0/30.

Figure 8 Network diagram

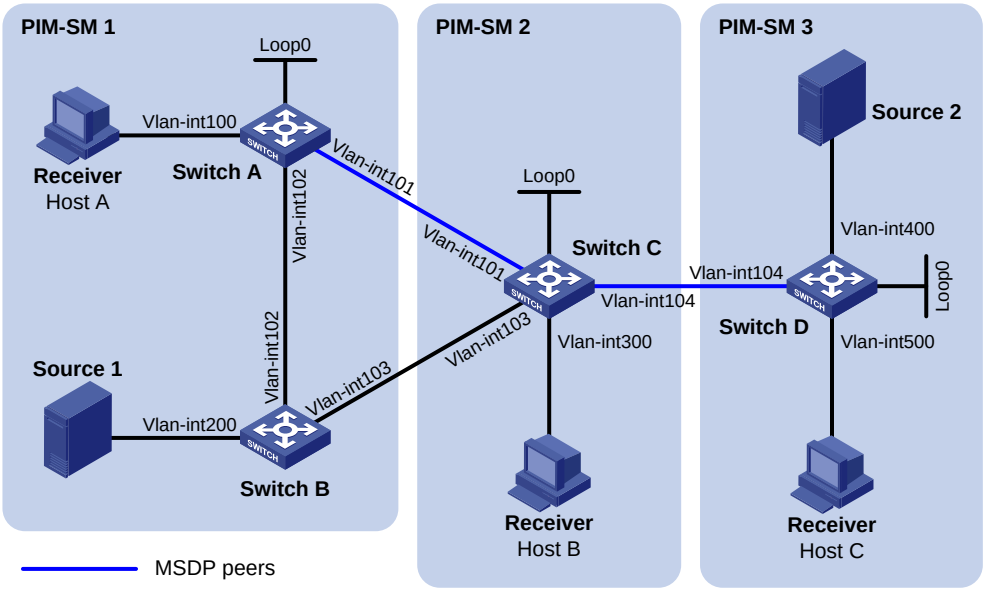

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.3.100/24	Switch C	Vlan-int300	10.110.4.1/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int104	10.110.5.1/24
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	10.110.2.1/24	Switch C	Vlan-int103	192.168.2.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Loop0	2.2.2.2/32

Device	Interface	IP address	Device	Interface	IP address
Switch A	Loop0	1.1.1.1/32	Switch D	Vlan-int400	10.110.6.1/24
Switch B	Vlan-int200	10.110.3.1/24	Switch D	Vlan-int500	10.110.7.1/24
Switch B	Vlan-int102	10.110.2.2/24	Switch D	Vlan-int104	10.110.5.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch D	Loop0	3.3.3.3/32

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 8, and configure OSPF on the switches in the PIM-SM domains.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM, and configure PIM domain borders:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface (VLAN-interface 100).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim sm
   [SwitchA-Vlan-interface102] quit
   [SwitchA] interface loopback 0
   [SwitchA-LoopBack0] pim sm
   [SwitchA-LoopBack0] quit
   ```

   # Enable IP multicast routing, IGMP, and PIM-SM on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

   # Configure a PIM domain border on Switch C.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] pim bsr-boundary
   [SwitchC-Vlan-interface101] quit
   [SwitchC] interface vlan-interface 103
   [SwitchC-Vlan-interface103] pim bsr-boundary
   [SwitchC-Vlan-interface103] quit
   [SwitchC] interface vlan-interface 104
   [SwitchC-Vlan-interface104] pim bsr-boundary
   [SwitchC-Vlan-interface104] quit
   ```

   # Configure PIM domain borders on Switch A, Switch B, and Switch D in the same way Switch C is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

   # Configure Loopback 0 as a C-BSR and a C-RP on Switch A.

   ```
   [SwitchA] pim
   ```

```
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

Configure C-BSRs and C-RPs on Switch C and Switch D in the same way Switch A is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Switch A.

```
[SwitchA] msdp
[SwitchA-msdp] peer 192.168.1.2 connect-interface vlan-interface 101
[SwitchA-msdp] quit
```

Configure MSDP peers on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 101
[SwitchC-msdp] peer 10.110.5.2 connect-interface vlan-interface 104
[SwitchC-msdp] quit
```

Configure an MSDP peer on Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] peer 10.110.5.1 connect-interface vlan-interface 104
[SwitchD-msdp] quit
```

4. Configure SA message policies:

Configure an SA accepting and forwarding policy on Switch C so that Switch C will not forward SA messages for (Source 1, 225.1.1.0/30) to Switch D.

```
[SwitchC] acl advanced 3001
[SwitchC-acl-ipv4-adv-3001] rule deny ip source 10.110.3.100 0 destination 225.1.1.0
0.0.0.3
[SwitchC-acl-ipv4-adv-3001] rule permit ip source any destination any
[SwitchC-acl-ipv4-adv-3001] quit
[SwitchC] msdp
[SwitchC-msdp] peer 10.110.5.2 sa-policy export acl 3001
[SwitchC-msdp] quit
```

Configure an SA creation policy on Switch D so that Switch D will not create SA messages for Source 2.

```
[SwitchD] acl basic 2001
[SwitchD-acl-ipv4-basic-2001] rule deny source 10.110.6.100 0
[SwitchD-acl-ipv4-basic-2001] quit
[SwitchD] msdp
[SwitchD-msdp] import-source acl 2001
[SwitchD-msdp] quit
```

Verifying the configuration

Display the (S, G) entries in the SA message cache on Switch C.

```
[SwitchC] display msdp sa-cache
 MSDP Total Source-Active Cache - 8 entries
 Matched 8 entries

Source        Group          Origin RP       Pro  AS     Uptime   Expires
10.110.3.100  225.1.1.0      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  225.1.1.1      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  225.1.1.2      1.1.1.1         ?    ?      02:03:30 00:05:31
```

```
10.110.3.100  225.1.1.3      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  226.1.1.0      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  226.1.1.1      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  226.1.1.2      1.1.1.1         ?    ?      02:03:30 00:05:31
10.110.3.100  226.1.1.3      1.1.1.1         ?    ?      02:03:30 00:05:31
```

Display the (S, G) entries in the SA message cache on Switch D.

```
[SwitchD] display msdp sa-cache
 MSDP Total Source-Active Cache - 4 entries
 Matched  4 entries

Source        Group          Origin RP       Pro  AS     Uptime   Expires

```

Troubleshooting MSDP

This section describes common MSDP problems and how to troubleshoot them.

MSDP peers stay in disabled state

Symptom

The configured MSDP peers stay in disabled state.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Use the **display current-configuration** command to verify that the local interface address and the MSDP peer address of the remote device are the same.
4. If the problem persists, contact H3C Support.

No SA entries exist in the device's SA message cache

Symptom

MSDP fails to send (S, G) entries through SA messages.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Verify the configuration of the **import-source** command and its *ipv4-acl-number* argument, and make sure the ACL rule filters appropriate (S, G) entries.

4. If the problem persists, contact H3C Support.

No exchange of locally registered (S, G) entries between RPs

Symptom

RPs fail to exchange their locally registered (S, G) entries with one another in the Anycast RP application.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will establish an MSDP peering relationship.
3. Verify the configuration of the **originating-rp** command. In the Anycast RP application environment, use the **originating-rp** command to configure the RP address in the SA messages, which must be the local interface address.
4. Verify that the C-BSR address is different from the Anycast RP address.
5. If the problem persists, contact H3C Support.

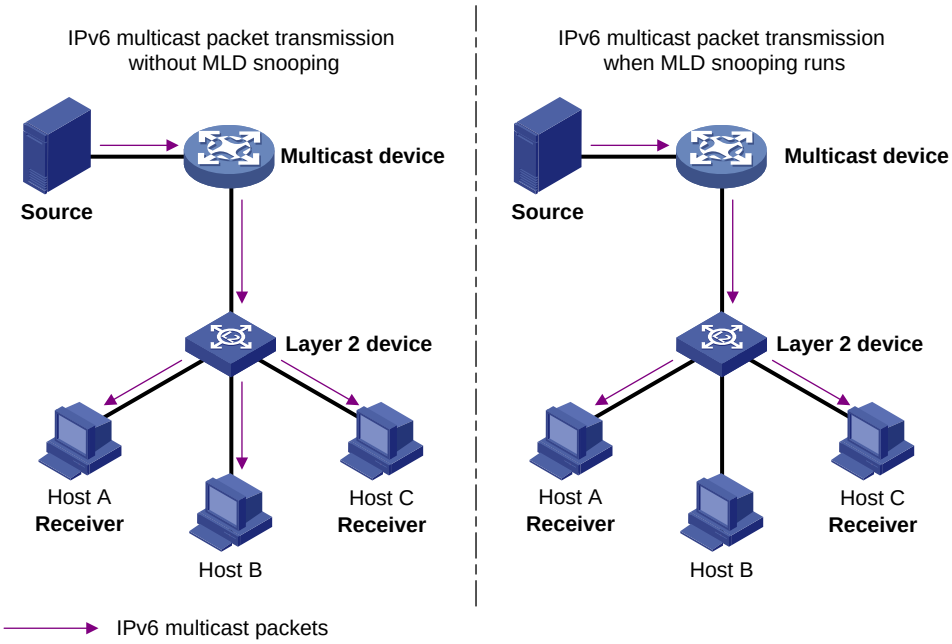
Configuring MLD snooping



About MLD snooping

MLD snooping runs on a Layer 2 device as an IPv6 multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from MLD messages that are exchanged between the hosts and the Layer 3 device.

Fundamentals of MLD snooping

As shown in Figure 1, when MLD snooping is not enabled, the Layer 2 switch floods IPv6 multicast packets all hosts in a VLAN. When MLD snooping is enabled, the Layer 2 switch forwards multicast packets of known IPv6 multicast groups to only the receivers.

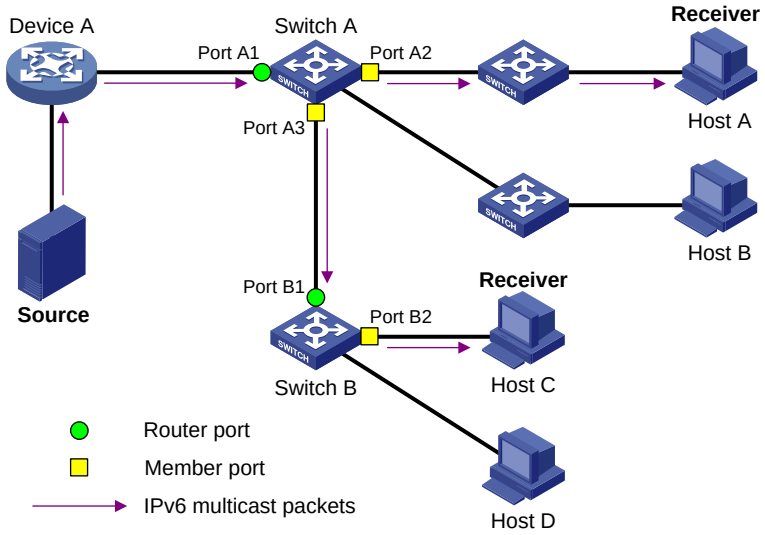


Figure 1 Multicast packet transmission processes without and with MLD snooping

MLD snooping ports

As shown in Figure 2, MLD snooping runs on Switch A and Switch B, and Host A and Host C are receiver hosts in an IPv6 multicast group. MLD snooping ports are divided into member ports and router ports.

Figure 2 MLD snooping ports

Router ports

On an MLD snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an MLD general query whose source address is not 0::0 or receives an IPv6 PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives an MLD general query whose source address is not 0::0 or an IPv6 PIM hello message before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in MLD snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in MLD snooping is a Layer 2 interface.

Member ports

On an MLD snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an MLD report, it is added to the associated dynamic MLD snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an MLD report before the timer expires, the timer is reset. If the port does not receive an MLD report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static MLD snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How MLD snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

MLD messages include general query, MLD report, and done message. An MLD snooping-enabled Layer 2 device performs differently depending on the MLD message types.

General query

The MLD querier periodically sends MLD general queries to all hosts and devices on the local subnet to check for the existence of IPv6 multicast group members.

After receiving an MLD general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the router port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

MLD report

A host sends an MLD report to the MLD querier for the following purposes:

- Responds to queries if the host is an IPv6 multicast group member.
- Applies for an IPv6 multicast group membership.

After receiving an MLD report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the IPv6 address of the reported IPv6 multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry for the group with the receiving port an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the port as a dynamic member port to the forwarding entry and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an MLD report through a non-router port because of the host MLD report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their MLD reports upon receiving MLD reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Done message

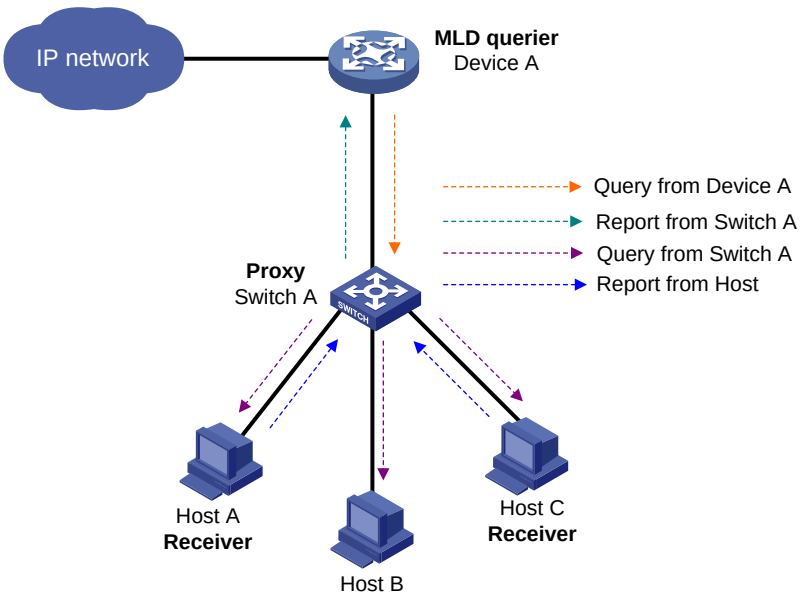
When a host leaves an IPv6 multicast group, the host sends an MLD done message to the Layer 3 devices. When the Layer 2 device receives the MLD done message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the IPv6 multicast group address in the message.

- If no match is found, the Layer 2 device discards the MLD done message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the MLD done message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:

- Discards the MLD done message.
- Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
- Sets the aging timer for the receiving port to twice the MLD last listener query interval.

- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the MLD done message to all router ports in the VLAN.
  - Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the MLD last listener query interval.

After receiving the MLD done message on a port, the MLD querier resolves the IPv6 multicast group address in the message. Then, it sends an MLD multicast-address-specific query to the IPv6 multicast group through the receiving port.



After receiving the MLD multicast-address-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding MLD report from the directly connected hosts. For the dynamic member port that received the done message, the Layer 2 device also performs one of the following actions:

- If the port receives an MLD report before the aging timer expires, the Layer 2 device resets the aging timer for the port.
- If the port does not receive any MLD report messages when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the IPv6 multicast group.

MLD snooping proxying

As shown in Figure 3, to reduce the number of MLD report and done messages received by the upstream device, you can enable MLD snooping proxying on the edge device. With MLD snooping proxying enabled, the edge device acts as a host for the upstream MLD snooping querier to send MLD report and done messages to Device A. The host MLD report suppression mechanism on the edge device does not take effect. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Figure 3 MLD snooping proxying

The MLD snooping proxy device processes different MLD messages as follows:

- General query.

  After receiving an MLD general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an MLD report based on the local membership information and sends the report to all router ports.

- Multicast-address-specific query or multicast-address-and-source-specific query.

  After receiving an MLD multicast-address-specific query or multicast-address-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a response to all router ports in the VLAN.

- Report.

  After receiving an MLD report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Done message.

  After receiving the MLD done message on a port, the device sends an MLD multicast-address-specific query through the receiving port. The device sends the MLD done message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: MLD snooping configuration

For MLD reports received from secondary VLANs, the relevant MLD snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable MLD snooping only for the primary VLAN. The configuration made in secondary VLANs will not take effect..

The MLD snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in MLD-snooping view. The VLAN-specific configuration and the configuration made in MLD-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in MLD-snooping view. The interface-specific configuration takes priority over the configuration made in MLD-snooping view.

VLAN-based MLD snooping tasks at a glance

To configure MLD snooping for VLANs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:

   - Enabling MLD snooping globally
   - Enabling MLD snooping for VLANs
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Configuring static IPv6 multicast MAC address entries
   - Setting the MLD last listener query interval
4. (Optional.) Configuring MLD snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Specifying the Layer 2 IPv6 multicast forwarding mode
6. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
   - Enabling the device to send MLD general queries upon a path change
   - Enabling the device to send MLD general queries upon a port state change
7. (Optional.) Enabling MLD snooping proxying
8. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
9. (Optional.) Configuring MLD snooping policies
   - Configuring an IPv6 multicast group policy
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
   - Setting the maximum number of IPv6 multicast groups on a port
   - Enabling IPv6 multicast group replacement
   - Enabling host tracking
10. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
11. (Optional.) Enabling SNMP notifications for MLD snooping
12. (Optional.) Configuring MLD snooping logging
    - Enabling MLD snooping logging

- Enabling MLD snooping logging suppression

Enabling the MLD snooping feature

About this task

You must enable the MLD snooping feature before you configure other MLD snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the MLD snooping feature and enter MLD-snooping view.
   `mld-snooping`
   By default, the MLD snooping feature is disabled.

Enabling MLD snooping

Enabling MLD snooping globally

About this task

After you enable MLD snooping globally, MLD snooping is enabled for all VLANs. You can disable MLD snooping for a VLAN when MLD snooping is globally enabled.

Restrictions and guidelines

To configure other MLD snooping features for VLANs, you must enable MLD snooping for the specific VLANs even though MLD snooping is enabled globally.

The VLAN-specific MLD snooping configuration takes priority over the global MLD snooping configuration. For example, if you enable MLD snooping globally and then use the **`mld-snooping disable`** command to disable MLD snooping for a VLAN, MLD snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter MLD-snooping view.
   `mld-snooping`
3. Enable MLD snooping globally.
4. **`global-enable`**
   By default, MLD snooping is disabled globally.
5. (Optional.) Disable MLD snooping for a VLAN.
   a. Return to system view.
      `quit`
   b. Enter VLAN view.
      `vlan` *`vlan-id`*
   c. Disable MLD snooping for the VLAN.
      `mld-snooping disable`
      By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for VLANs

Restrictions and guidelines

You can enable MLD snooping for multiple VLANs by using the **enable vlan** command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view.

MLD snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling MLD snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping for multiple VLANs.
   enable vlan *vlan-list*

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping for the VLAN.
   mld-snooping enable

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Configuring basic MLD snooping features

Specifying an MLD snooping version

About this task

Different MLD snooping versions can process different versions of MLD messages:

- MLDv1 snooping can process MLDv1 messages and MLDv2 queries, but it floods MLDv2 reports in the VLAN instead of processing them.
- MLDv2 snooping can process MLDv1 and MLDv2 messages.

Restrictions and guidelines

If you change the version of MLD snooping from 2 to 1, the system performs the following actions:

- Clears all MLD snooping forwarding entries that are dynamically created.
- Keeps static MLDv2 snooping forwarding entries (*, G).
- Clears static MLDv2 snooping forwarding entries (S, G), which will be restored when MLD snooping is switched back to MLDv2 snooping.

For more information about static MLD snooping forwarding entries, see "Configuring a static member port."

Specifying an MLD snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Specify an MLD snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an MLD snooping version for the VLAN.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VLAN is 1.

Setting the maximum number of MLD snooping forwarding entries

About this task

You can modify the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum number of MLD snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of MLD snooping forwarding entries is 4294967295.

Configuring static IPv6 multicast MAC address entries

About this task

In Layer 2 IPv6 multicast, IPv6 multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as MLD snooping). You can also manually configure static IPv6 multicast MAC address entries by binding IPv6 multicast MAC addresses and ports to control the destination ports of the IPv6 multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static IPv6 multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static IPv6 multicast MAC address entry in system view

1. Enter system view.

   system-view
2. Configure a static IPv6 multicast MAC address entry.

   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static IPv6 multicast MAC address entry in interface view

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure a static IPv6 multicast MAC address entry.

   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the MLD last listener query interval

About this task

A receiver host starts a report delay timer for an IPv6 multicast group when it receives an MLD multicast-address-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the group.

The MLD last listener query interval defines the maximum response time advertised in MLD multicast-address-specific queries. Set an appropriate value for the MLD last listener query interval to speed up hosts' responses to MLD multicast-address-specific queries and avoid MLD report traffic bursts.

Setting the MLD last listener query interval globally

1. Enter system view.

   system-view
2. Enter MLD-snooping view.

   mld-snooping
3. Set the MLD last listener query interval globally.

   last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.

Setting the MLD last listener query interval for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

vlan *vlan-id*

3. Set the MLD last listener query interval for the VLAN
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VLAN.

Configuring MLD snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an MLD general query or IPv6 PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an MLD report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports based on the actual network requirement. For example, if the memberships of IPv6 multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports.

If a dynamic router port receives an IPv6 PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **mld-snooping router-aging-time** command does not take effect on the port.

MLD multicast-address-specific queries originated by the Layer 2 device trigger the adjustment of aging timers of dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the MLD last listener query interval. For more information about setting the MLD last listener query interval on the Layer 2 device, see "Setting the MLD last listener query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   mld-snooping router-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic router ports.

4. Set the aging timer for dynamic member ports in the VLAN.

   mld-snooping host-aging-time *seconds*

   By default, a VLAN uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for an IPv6 multicast group so that all hosts attached to the port can always receive IPv6 multicast data for the group. The static member port does not respond to MLD queries. When you complete or cancel this configuration, the port does not send an unsolicited report or done message.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

3. Configure the port as a static member port.

   mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] { **vlan** *vlan-id* | **service-instance** *instance-id* }

   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for an IPv6 multicast group so that all IPv6 multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

3. Configure the port as a static router port.

   mld-snooping static-router-port vlan *vlan-id*

   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited MLD report when you complete the configuration.
- It responds to MLD general queries with MLD reports.
- It sends an MLD done message when you remove the configuration.

The version of MLD running on the simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same ways as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*
   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message. The device no longer sends or forwards MLD multicast-address-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts attached in a VLAN. If you do so, the remaining receivers cannot receive IPv6 multicast data for a group after a receiver leaves the group.

As a best practice to avoid multicast service interruption on other ports in the same VLAN, enable only MLD snooping fast-leave processing on a port on a network configured with both MLD snooping and MLD. Do not use the **mld fast-leave** command to enable MLD fast-leaving processing.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   mld-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send MLD general queries or IPv6 PIM hello messages for testing purposes. On the Layer 2 device, the port that receives MLD general queries or IPv6 PIM hello messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All IPv6 multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive IPv6 multicast data that it does not expect.
- The port forwards the MLD general queries or IPv6 PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the MLD querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable the port from becoming a dynamic router port when receiving MLD general queries or IPv6 PIM hello messages. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   mld-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an MLD snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable MLD snooping in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter VLAN view.
   `vlan` *`vlan-id`*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   `mld-snooping router-port-discard`
   By default, the device forwards multicast data to static router ports in a VLAN.

Specifying the Layer 2 IPv6 multicast forwarding mode

About Layer 2 IPv6 multicast forwarding modes

The device supports the following Layer 2 IPv6 multicast forwarding modes:

- **MAC-based mode**—The device forwards Layer 2 IPv6 multicast packets based on the IPv6 multicast MAC addresses in the packets.
- **IP-based mode**—The device forwards Layer 2 IPv6 multicast packets based on the IPv6 addresses (IPv6 multicast source addresses and IPv6 multicast group addresses) in the packets.

To display Layer 2 IPv6 multicast IP forwarding entries, use the **`display ipv6 l2-multicast ip forwarding`** command.

To display Layer 2 IPv6 multicast MAC forwarding entries, use the **`display ipv6 l2-multicast mac forwarding`** command.

Restrictions and guidelines for specifying the Layer 2 IPv6 multicast forwarding mode

Multiple IPv6 multicast addresses might be mapped to the same IPv6 multicast MAC address. This causes that non-members of an IPv6 multicast group receive the multicast data of this IPv6 group if the device uses the MAC-based forwarding mode. As a best practice, specify the IP-based Layer 2 IPv6 multicast forwarding mode on Layer 3 multicast devices.

As a best practice, specify the IP-based Layer 2 IPv6 multicast forwarding mode on the device if a device running MLDv2 exists in the network.

Specifying the Layer 2 IPv6 multicast forwarding mode for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify the Layer 2 IPv6 multicast forwarding mode.
   mld-snooping forwarding-mode { **ip** | **mac** }
   By default, the device forwards Layer 2 IPv6 multicast packets based on the MAC addresses in the packets.

Configuring the MLD snooping querier

Enabling the MLD snooping querier

About this task

This feature enables the Layer 2 device to periodically send MLD general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an MLD snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the MLD snooping querier on an IPv6 multicast network that runs MLD. An MLD snooping querier does not participate in MLD querier elections. However, it might affect MLD querier elections if it sends MLD general queries with a low source IPv6 address. For more information about MLD queries, see "Configuring MLD."

Enabling the MLD snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the MLD snooping querier for the VLAN.
   mld-snooping querier
   By default, the MLD snooping querier is disabled for a VLAN.

Enabling MLD snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for MLD snooping querier election is the same as that for MLD querier election. For more information about MLD querier election, see "Configuring MLD."

Prerequisites

Before you enable MLD snooping querier election, you must complete the following tasks:

- Enable the MLD snooping querier for a VLAN. For more information about enabling the MLD snooping querier, see "Enabling the MLD snooping querier."
- Configure the source IPv6 address for MLD general queries as an IPv6 address different from :: and the local querier IPv6 address. An MLD snooping querier performs querier election only if the source IPv6 address of a received MLD general query is not :: or its own IPv6 address.
- Make sure the candidate MLD snooping queriers run the same MLD snooping version. To specify the MLD snooping version, use the **mld-snooping version** command.

Enabling MLD snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping querier election for the VLAN.
   mld-snooping querier-election
   By default, MLD snooping querier election is disabled for a VLAN.

Configuring parameters for MLD general queries and responses

About this task

You can modify the MLD general query interval based on the actual network conditions.

A receiver host starts a report delay timer for each IPv6 multicast group that it has joined when it receives an MLD general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the corresponding IPv6 multicast group.

Set an appropriate value for the maximum response time for MLD general queries to speed up hosts' responses to MLD general queries and avoid MLD report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting IPv6 multicast group members, make sure the MLD general query interval is greater than the maximum response time for MLD general queries.

Configuring parameters for MLD general queries and responses globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum response time for MLD general queries.
   max-response-time *seconds*
   By default, the maximum response time for MLD general queries is 10 seconds.

Configuring parameters for MLD general queries and responses for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD general query interval in the VLAN.

mld-snooping query-interval *interval*

By default, the MLD general query interval for a VLAN is 125 seconds.

4. Set the maximum response time for MLD general queries in the VLAN.

   mld-snooping max-response-time *seconds*

   By default, the maximum response time for MLD general queries for a VLAN is 10 seconds.

Enabling the device to send MLD general queries upon a path change

About this task

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the path changes. This feature ensures that the device can update the member port information in IPv6 multicast forwarding entries and switch IPv6 multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the MLD snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.

   system-view

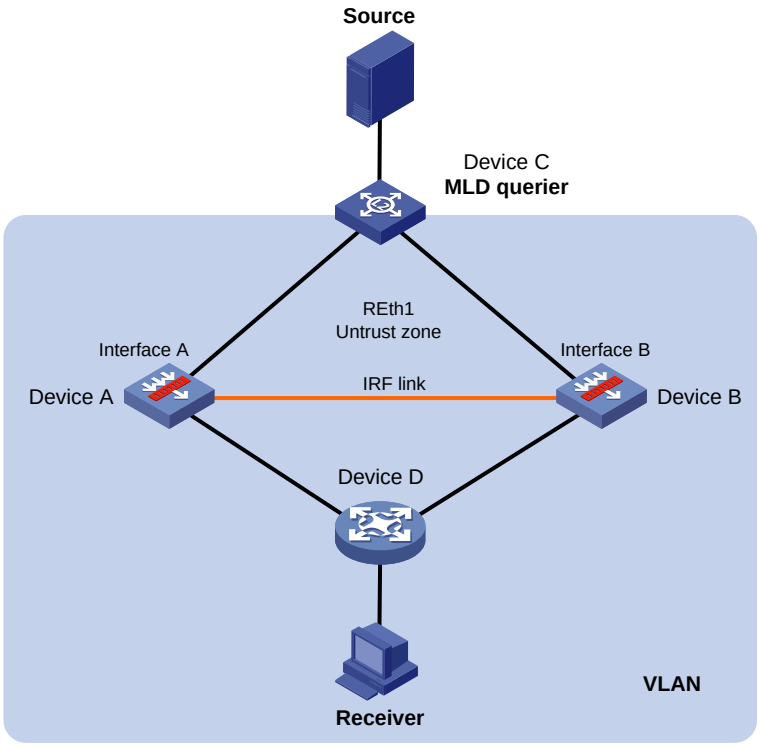
2. Enter MLD-snooping view.

   mld-snooping

3. Enable the device to send MLD general queries upon a path change.

   send-query enable

   By default, the device does not send MLD general queries upon a path change.



Enabling the device to send MLD general queries upon a port state change

About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an MLD general query immediately and cannot update interface B to multicast forwarding entries. For information about Reth interfaces, see *High Availability Configuration Guide*.

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send MLD general queries upon a port state change.
   mld-snooping triggered-query enable { **port-down** | **port-up** } *
   By default, the device does not send MLD general queries upon a port state change.

Enabling MLD snooping proxying

About MLD snooping proxying

The device enabled with MLD snooping proxying is called an MLD snooping proxy. The MLD snooping proxy acts as a host to the upstream device. Enabled with MLD snooping querier, the MLD snooping proxy acts as the router to downstream devices and receives report and done messages on behalf of the upstream device. As a best practice, enable MLD snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling MLD snooping proxying

Before you enable MLD snooping proxying for a VLAN, you must first enable MLD snooping globally and enable MLD snooping for the VLAN. MLD snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with MLD snooping querier. For more information about enabling MLD snooping querier, see "Enabling the MLD snooping querier."

Enabling MLD snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping proxying for the VLAN.
   mld-snooping proxy enable
   By default, MLD snooping proxying is disabled for a VLAN.

Configuring parameters for MLD messages

Configuring source IPv6 addresses for MLD messages

About this task

You can change the source IPv6 address of the MLD queries sent by an MLD snooping querier. This configuration might affect MLD querier election within the subnet.

You can also change the source IPv6 address of MLD reports or done messages sent by a simulated member host or an MLD snooping proxy.

Configuring the source IPv6 addresses for MLD messages for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Configure the source IPv6 address for MLD general queries.
   mld-snooping general-query source-ip *ipv6-address*
   By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.
4. Configure the source IPv6 address for MLD multicast-address-specific queries.
   mld-snooping special-query source-ip *ipv6-address*
   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:
   - The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.
   - The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
   - FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.
5. Configure the source IPv6 address for MLD reports.
   mld-snooping report source-ip *ipv6-address*

By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Setting the 802.1p priority for MLD messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards MLD messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to MLD messages that are created or forwarded by the device.

Setting the 802.1p priority for MLD messages globally

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Set the 802.1p priority for MLD messages globally.

   dot1p-priority *priority*

   By default, the global 802.1p priority is not set for MLD messages.

Setting the 802.1p priority for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the 802.1p priority for MLD messages in the VLAN.

   mld-snooping dot1p-priority *priority*

   By default, the 802.1p priority is not set for MLD messages.

Configuring MLD snooping policies

Configuring an IPv6 multicast group policy

About this task

This feature enables the Layer 2 device to filter MLD reports by using an ACL that specifies the IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that receiver hosts can join. This configuration takes effect on the IPv6 multicast groups that ports join dynamically.

In an IPv6 multicast application, a host sends an unsolicited MLD report when a user requests an IPv6 multicast program. The Layer 2 device uses the IPv6 multicast group policy to filter the MLD report. The host can join the IPv6 multicast group only if the MLD report is permitted by the IPv6 multicast group policy.

Configuring an IPv6 multicast group policy globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Configure an IPv6 multicast group policy globally.
   group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Configuring an IPv6 multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure an IPv6 multicast group policy on the port.
   mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist on a port. Hosts attached to the port can join any IPv6 multicast groups.

Enabling dropping unknown IPv6 multicast data

About this task

Unknown IPv6 multicast data refers to IPv6 multicast data for which no forwarding entries exist in the MLD snooping forwarding table. This feature enables the device to forward unknown IPv6 multicast data only to the router port. If the device does not have a router port, unknown IPv6 multicast data will be dropped.

If you do not enable this feature, the unknown IPv6 multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv6 multicast data is enabled, the device also drops unknown IPv4 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown IPv6 multicast data out of router ports (except the receiving router port) in this VLAN.

If the outgoing ports of the IPv6 multicast forwarding entry for a Layer 3 IPv6 multicast packet are in the same VLAN, enable dropping unknown IPv6 multicast data for the VLAN as a best practice. This restriction prevents the device from flooding the Layer 3 IPv6 multicast packet in the VLAN.

Enabling dropping unknown IPv6 multicast data for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable dropping unknown IPv6 multicast data for the VLAN.

mld-snooping drop-unknown

By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling MLD report suppression

About this task

This feature enables the Layer 2 device to forward only the first MLD report for an IPv6 multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce the multicast traffic.

Procedure

1. Enter system view.

   system-view
2. Enter MLD-snooping view.

   mld-snooping
3. Enable MLD report suppression.

   report-aggregation

   By default, MLD report suppression is enabled.

Setting the maximum number of IPv6 multicast groups on a port

About this task

You can set the maximum number of IPv6 multicast groups on a port to regulate the port traffic. This feature takes effect only on the IPv6 multicast groups that the port joins dynamically.

If the number of IPv6 multicast groups on a port exceeds the limit, the system removes all the forwarding entries related to that port. In this case, the receiver hosts attached to that port can join IPv6 multicast groups again before the number of IPv6 multicast groups on the port reaches the limit. When the number of IPv6 multicast groups on the port reaches the limit, the port automatically drops MLD reports for new IPv6 multicast groups.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Set the maximum number of IPv6 multicast groups on the port.

   mld-snooping group-limit *limit* [**vlan** *vlan-list*]

   By default, no limit is placed on the maximum number of IPv6 multicast groups on a port.

Enabling IPv6 multicast group replacement

About this task

When IPv6 multicast group replacement is enabled, the port does not drop MLD reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves an IPv6 multicast group that has the lowest IPv6 address and joins the new group contained in the MLD report. The IPv6 multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that the port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the MLD snooping forwarding entries on the device reaches the upper limit.
- The IPv6 multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling IPv6 multicast group replacement globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled globally.

Enabling IPv6 multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable IPv6 multicast group replacement on the port.
   mld-snooping overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving IPv6 multicast data. The information includes IPv6 addresses of the hosts, length of time elapsed since the hosts joined IPv6 multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view

2. Enter MLD-snooping view.
   mld-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   mld-snooping host-tracking
   By default, host tracking is disabled in a VLAN.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD snooping

About this task

To report critical MLD snooping events to an SNMP NMS, enable SNMP notifications for MLD snooping.

For MLD snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for MLD snooping.
   snmp-agent trap enable mld-snooping [**entry-refresh-failed**]
   By default, SNMP notifications are enabled for MLD snooping.

Configuring MLD snooping logging

Enabling MLD snooping logging

About this task

This feature enables the MLD snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable MLD snooping logging or use the **mld-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Enable MLD snooping logging.
   mld-snooping log enable [**group**]
   By default, MLD snooping logging is enabled.

Enabling MLD snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the MLD snooping module to the information center.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Enable MLD snooping logging suppression.
   mld-snooping log suppress [**group**]
   By default, MLD snooping logging suppression is enabled.

Display and maintenance commands for MLD snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display Layer 2 IPv6 multicast fast forwarding entries.	**display ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*ipv6-source-address* |

Task	Command

Clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**reset mld-snooping statistics**

MLD snooping configuration examples

Example: Configuring VLAN-based IPv6 group policy and simulated joining

Network configuration

As shown in Figure 5, Router A runs MLDv1 and acts as the MLD querier, and Switch A runs MLDv1 snooping.

Configure the group policy and simulate joining to meet the following requirements:

- Host A and Host B receive only the IPv6 multicast data addressed to the IPv6 multicast group FF1E::101. IPv6 multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown IPv6 multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

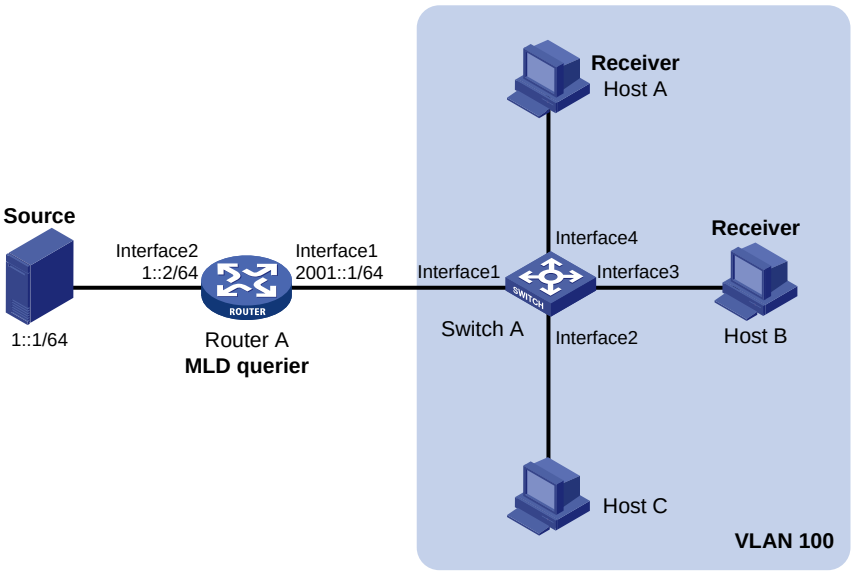

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping, and enable dropping IPv6 unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   [SwitchA-vlan100] quit
   ```

   # Configure an IPv6 multicast group policy so that hosts in VLAN 100 can join only IPv6 multicast group FF1E::101.

   ```
   [SwitchA] acl ipv6 basic 2001
   [SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
   [SwitchA-acl-ipv6-basic-2001] quit
   [SwitchA] mld-snooping
   [SwitchA–mld-snooping] group-policy 2001 vlan 100
   [SwitchA–mld-snooping] quit
   ```

   # Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts to join IPv6 multicast group FF1E::101.

   ```
   [SwitchA] interface gigabitethernet 1/0/3
   [SwitchA-GigabitEthernet1/0/3] mld-snooping host-join ff1e::101 vlan 100
   [SwitchA-GigabitEthernet1/0/3] quit
   [SwitchA] interface gigabitethernet 1/0/4
   [SwitchA-GigabitEthernet1/0/4] mld-snooping host-join ff1e::101 vlan 100
   [SwitchA-GigabitEthernet1/0/4] quit
   ```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast groups FF1E::101 and FF1E::202. (Details not shown.)

Display dynamic MLD snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined IPv6 multicast group FF1E::101 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join the multicast group FF1E::202.

Example: Configuring VLAN-based static ports

Network configuration

As shown in Figure 6:

- Router A runs MLDv1 and acts as the MLD querier. Switch A, Switch B, and Switch C run MLDv1 snooping.
- Host A and Host C are permanent receivers of IPv6 multicast group FF1E::101.

Configure static ports to meet the following requirements:

- To enhance the reliability of IPv6 multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for IPv6 multicast group FF1E::101.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. IPv6 multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one MLD query-response cycle must be completed before IPv6 multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, IPv6 multicast data can flow to the receivers nearly uninterrupted along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

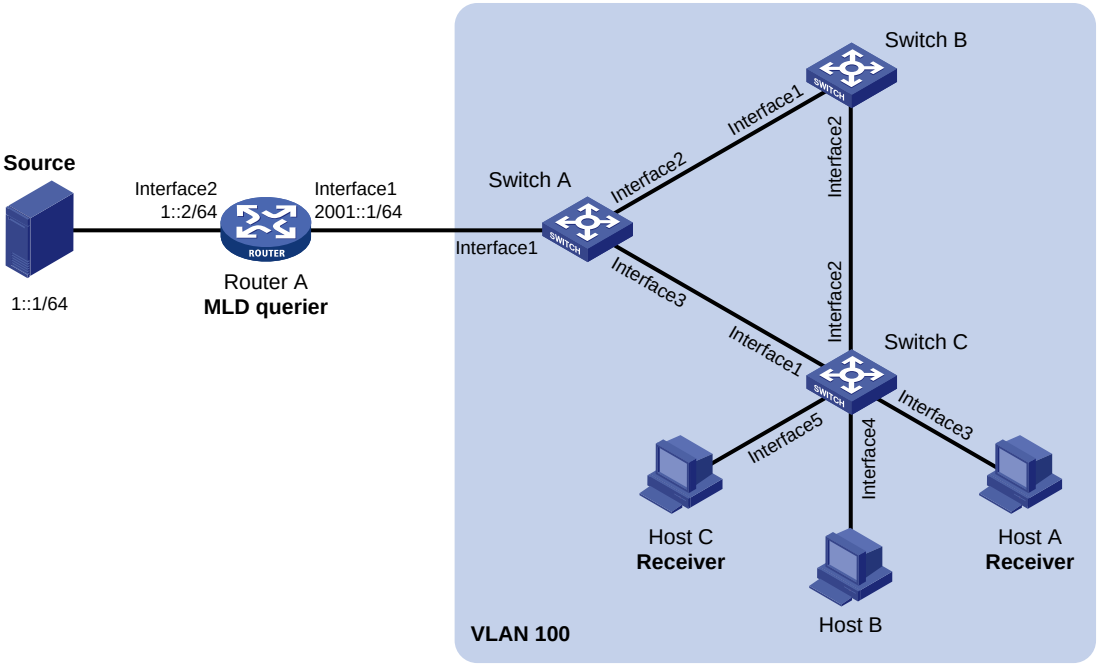

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4
Interface5	GigabitEthernet1/0/5

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 6.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable MLD snooping for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable MLD snooping for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for IPv6 multicast group FF1E::101.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static MLD snooping group entries in VLAN 100 on Switch C.

```
[SwitchC] display mld-snooping static-group vlan 100
Total 1 entries).

VLAN 100: Total 1 entries).
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of IPv6 multicast group FF1E::101.

Example: Configuring the VLAN-based MLD snooping querier

Network configuration

As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to IPv6 multicast groups FF1E::101 and FF1E::102, respectively.
- Host A and Host C are receivers of IPv6 multicast group FF1E::101, and Host B and Host D are receivers of IPv6 multicast group FF1E::102.
- All host receivers run MLDv1 and all switches run MLDv1 snooping. Switch A (which is close to the multicast sources) acts as the MLD snooping querier.

To prevent the switches from flooding unknown IPv6 packets in the VLAN, enable all the switches to drop unknown IPv6 multicast packets.

Figure 7 Network diagram

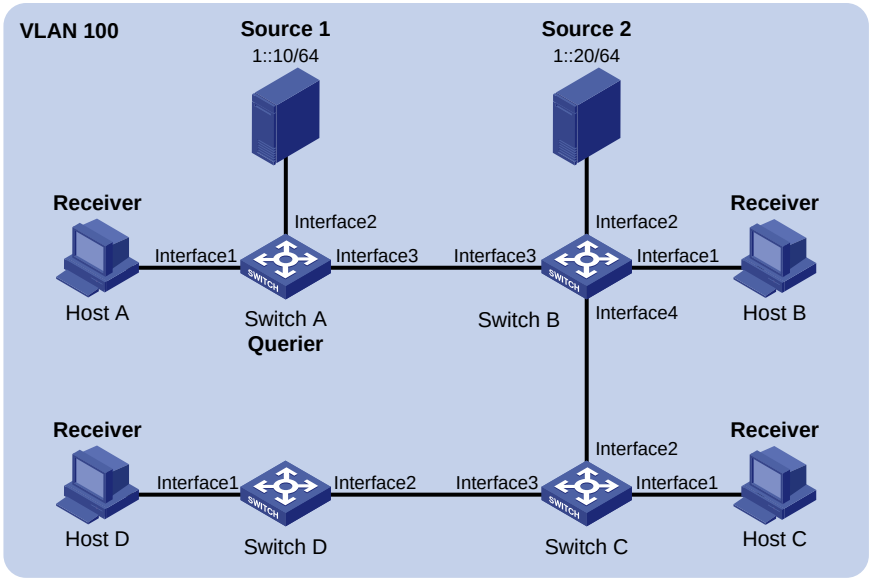

Table 3 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   ```

   # Configure Switch A as the MLD snooping querier.

   ```
   [SwitchA-vlan100] MLD-snooping querier
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the MLD snooping feature.

   ```
   <SwitchB> system-view
   [SwitchB] mld-snooping
   [SwitchB-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] mld-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] mld-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the MLD snooping feature.

```
<SwitchD> system-view
[SwitchD] mld-snooping
[SwitchD-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchD-vlan100] mld-snooping enable
[SwitchD-vlan100] mld-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping on Switch B.

```
[SwitchB] display mld-snooping statistics
Received MLD messages:
  MLD general queries: 19
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
  MLDv1 reports: 19
  MLDv2 reports: 0
  MLDv2 reports with right and wrong records: 0
  MLD dones: 5
  Error MLD messages: 1
```

```
Sent MLD messages:
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
Received IPv6 PIM hello: 0
```

The output shows that all switches except Switch A can receive the MLD general queries after Switch A acts as the MLD snooping querier.

Example: Configuring VLAN-based MLD snooping proxying

Network configuration

As shown in Figure 8, Router A runs MLDv1 and acts as the MLD querier. Switch A runs MLDv1 snooping. Configure MLD snooping proxying so that Switch A can perform the following actions:

- Forward MLD report and done messages to Router A.
- Respond to MLD queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

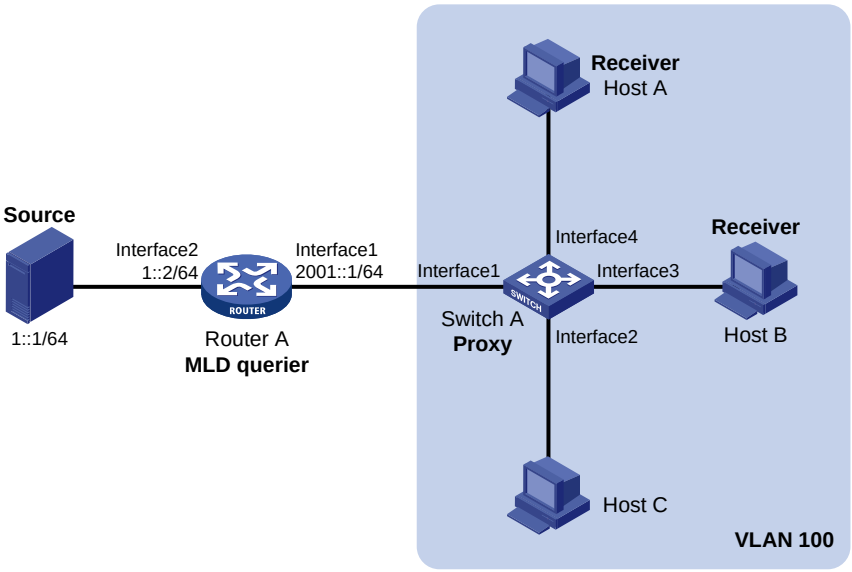

Table 4 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and subnet mask to each interface, as shown in Figure 8.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

```
<RouterA> system-view
[RouterA] ipv6 multicast routing
[RouterA-mrib6] quit
```

Enable MLD and IPv6 PIM-DM on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] mld enable
[RouterA-GigabitEthernet1/0/1] ipv6 pim dm
[RouterA-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] ipv6 pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and MLD snooping proxying for the VLAN.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] mld-snooping proxy enable
[SwitchA-vlan100] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                 (00:04:09)
      GE1/0/4                                 (00:03:06)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of IPv6 multicast group FF1E::101. Host A and Host B will receive IPv6 multicast data for the group.

Display MLD group membership information on Router A.

```
[RouterA] display mld group
MLD groups in total: 1
 GigabitEthernet1/0/1(2001::1):
  MLD groups reported in total: 1
   Group address: FF1E::101
    Last reporter: FE80::2FF:FFFF:FE00:1
    Uptime: 00:00:31
```

```
    Expires: 00:03:48
```

Send an MLD done message from Host A to leave IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101. Only Host B will receive IPv6 multicast data for the group.

Troubleshooting MLD snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function through MLD snooping.

Solution

To resolve the problem:

1. Use the **display mld-snooping** command to display MLD snooping status.
2. If MLD snooping is not enabled, use the **mld-snooping** command in system view to enable the MLD snooping feature. Then, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
3. If MLD snooping is enabled globally but not enabled for the VLAN, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
4. If the problem persists, contact H3C Support.

IPv6 multicast group policy does not work

Symptom

Hosts can receive IPv6 multicast data for IPv6 multicast groups that are not permitted by the IPv6 multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl ipv6** command to verify that the configured IPv6 ACL meets the IPv6 multicast group policy requirements.
2. Use the **display this** command in MLD-snooping view or in interface view to verify that the correct IPv6 multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **mld-snooping group-policy** command to apply the correct IPv6 multicast group policy.
3. Use the **display mld-snooping** command to verify that dropping unknown IPv6 multicast data is enabled. If it is not, use the **drop-unknown** or **mld-snooping drop-unknown** command to enable dropping unknown IPv6 multicast data.

4. If the problem persists, contact H3C Support.

Configuring IPv6 multicast VLANs

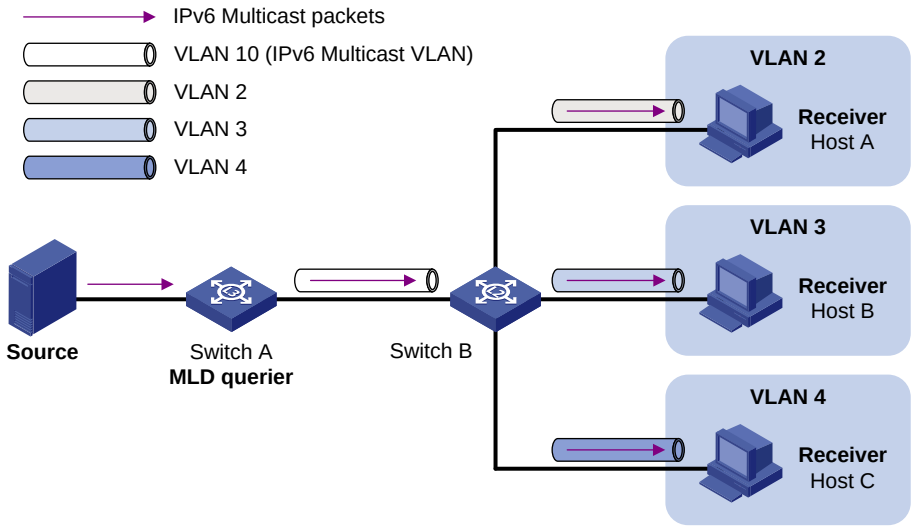
IPv6 multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in different VLANs and the same IPv6 multicast group. When Switch A (Layer 3 device) receives IPv6 multicast data for that group, it forwards three copies of the data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the IPv6 multicast VLAN feature

After an IPv6 multicast VLAN is configured on Switch B, Switch A sends one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. This saves network bandwidth and lessens the burden on the Layer 3 device.

IPv6 multicast VLAN methods



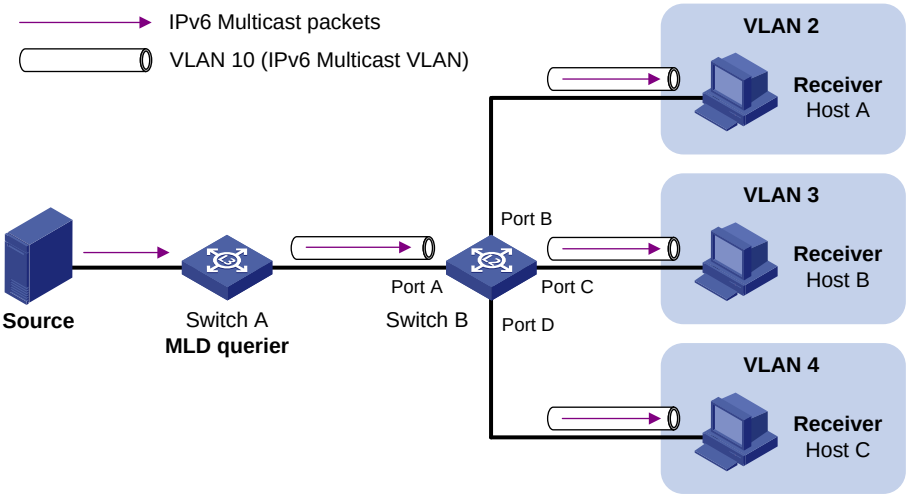
IPv6 multicast VLANs support sub-VLAN-based IPv6 multicast VLANs and port-based IPv6 multicast VLANs.

Sub-VLAN-based IPv6 multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- MLD snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



MLD snooping manages router ports in the IPv6 multicast VLAN and member ports in each sub-VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN of the IPv6 multicast VLAN.

Port-based IPv6 multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively. All the user ports (ports with attached hosts) on Switch B are hybrid ports.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. All the user ports are assigned to VLAN 10.
- MLD snooping is enabled for the IPv6 multicast VLAN and its sub-VLANs.

Figure 3 Port-based IPv6 multicast VLAN

MLD snooping manages the router ports and member ports in the IPv6 multicast VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each user port in the IPv6 multicast VLAN.

Restrictions and guidelines: IPv6 multicast VLAN configuration

The VLAN to be configured as an IPv6 multicast VLAN must exist.

If you have configured both a sub-VLAN-based IPv6 multicast VLAN and a port-based IPv6 multicast VLAN on a device, the port-based IPv6 multicast VLAN configuration takes effect.

Do not configure an IPv6 multicast VLAN on a device that is enabled with IPv6 multicast routing. Otherwise, the system displays errors. Do not enable IPv6 multicast routing on a device that is configured with IPv6 multicast VLANs. Otherwise, IPv6 multicast forwarding exceptions occur.

Do not configure a VLAN as an IPv6 multicast VLAN or an IPv6 sub-VLAN if the VLAN interface is enabled with IPv6 PIM or MLD. Otherwise, the system displays errors. Do not enable IPv6 PIM or MLD on a VLAN interface if the VLAN interface belongs to an IPv6 multicast VLAN or an IPv6 multicast sub-VLAN. Otherwise, IPv6 multicast forwarding exceptions occur.

Configuring a sub-VLAN-based IPv6 multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN must exist and cannot be IPv6 multicast VLANs or sub-VLANs of any other IPv6 multicast VLANs.

Prerequisites

Before you configure a sub-VLAN-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN, and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.

   ipv6 multicast-vlan *vlan-id*

   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign VLANs to the IPv6 multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

   By default, an IPv6 multicast VLAN does not have any sub-VLANs.

Configuring a port-based IPv6 multicast VLAN

Restrictions and guidelines

You can assign user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view or assign a user port to an IPv6 multicast VLAN in interface view.

A user port can belong to only one IPv6 multicast VLAN.

Prerequisites

Before you configure a port-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN.
- Enable MLD snooping for all the VLANs that contain the multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the IPv6 multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign ports to the IPv6 multicast VLAN as user ports.
   port *interface-list*

Assigning user ports to an IPv6 multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the IPv6 multicast VLAN as a user port.
   ipv6 port multicast-vlan *vlan-id*
   By default, a port does not belong to any IPv6 multicast VLAN.

Setting the maximum number of IPv6 multicast VLAN forwarding entries

About this task

You can set the maximum number of IPv6 multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create IPv6 multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.

system-view

2. Set the maximum number of IPv6 multicast VLAN forwarding entries.
   ipv6 multicast-vlan entry-limit *limit*
   By default, the maximum number of IPv6 multicast VLAN forwarding entries is 4096.

Display and maintenance commands for IPv6 multicast VLANs

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IPv6 multicast VLANs.	**display ipv6 multicast-vlan** [*vlan-id*]
Display IPv6 multicast VLAN forwarding entries.	**display ipv6 multicast-vlan forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about information about IPv6 multicast group entries in IPv6 multicast VLANs.	**display ipv6 multicast-vlan group** [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear IPv6 multicast group entries in IPv6 multicast VLANs.	**reset ipv6 multicast-vlan group** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

IPv6 multicast VLAN configuration examples

Example: Configuring sub-VLAN-based IPv6 multicast VLAN

Network configuration

As shown in Figure 4:

- Layer 3 device Switch A runs MLD and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

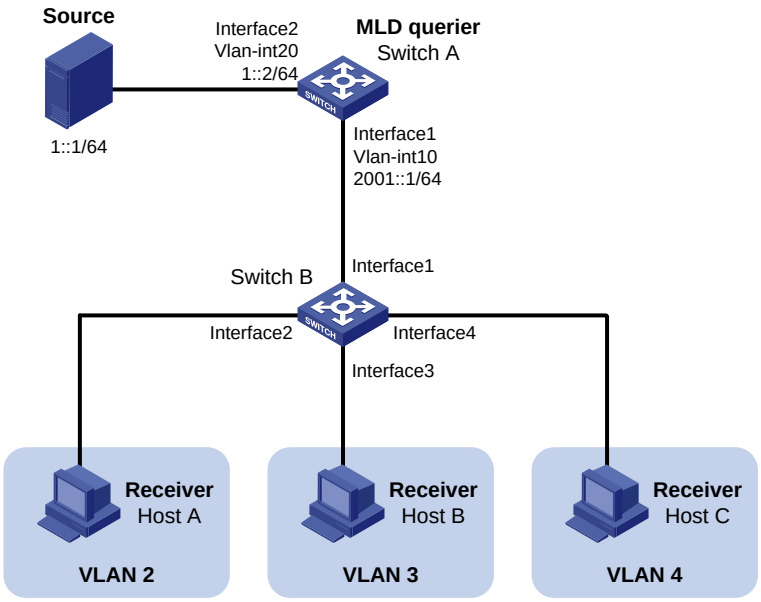


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

Enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] ipv6 multicast-vlan 10
[SwitchB-ipv6-mvlan-10] subvlan 2 to 4
[SwitchB-ipv6-mvlan-10] quit
```

Verifying the configuration

Display information about all IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about IPv6 multicast groups in IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan group
Total 1 entries.

IPv6 multicast VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that IPv6 multicast group FF1E::101 belongs to IPv6 multicast VLAN 10. IPv6 multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the IPv6 multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based IPv6 multicast VLAN

Network configuration

As shown in Figure 5:

- Layer 3 device Switch A runs MLDv1 and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

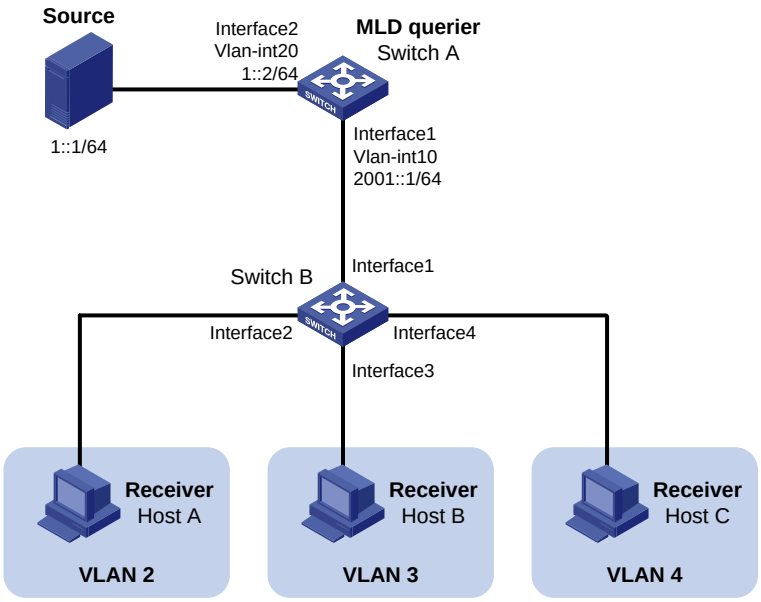

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 1::2 64
   [SwitchA-Vlan-interface20] ipv6 pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] port gigabitethernet 1/0/1
   [SwitchA-vlan10] quit
   ```

   # Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
```

```
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN.

```
[SwitchB] ipv6 multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-ipv6-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-ipv6-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic MLD snooping forwarding entries on Switch B.

```
[SwitchB] display mld-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Host ports (3 in total):
      GE1/0/2         (00:03:23)
      GE1/0/3         (00:04:07)
      GE1/0/4         (00:04:16)
```

The output shows that MLD snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the IPv6 multicast data of VLAN 10 through these user ports.

IPv6 PIM overview

IPv6 Protocol Independent Multicast (IPv6 PIM) provides IPv6 multicast forwarding by leveraging IPv6 unicast static routes or IPv6 unicast routing tables generated by any IPv6 unicast routing protocol. IPv6 PIM uses the underlying IPv6 unicast routing to generate an IPv6 multicast routing table without relying on any particular IPv6 unicast routing protocol.

IPv6 PIM uses the RPF mechanism to implement IPv6 multicast forwarding. For more information about RPF, see "Configuring IPv6 multicast routing and forwarding."

IPv6 PIM modes

Based on the implementation mechanism, IPv6 PIM includes the following modes:

- IPv6 Protocol Independent Multicast–Dense Mode (IPv6 PIM-DM).
- IPv6 Protocol Independent Multicast–Sparse Mode (IPv6 PIM-SM).
- IPv6 Protocol Independent Multicast Source-Specific Multicast (IPv6 PIM-SSM).

In this document, an IPv6 PIM domain refers to a network composed of IPv6 PIM devices.

IPv6 PIM-DM

IPv6 PIM-DM uses the push mode for multicast forwarding and is suitable for small networks with densely distributed IPv6 multicast members.

IPv6 PIM-DM assumes that all downstream nodes want to receive IPv6 multicast data from a source, so IPv6 multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees, leaving only those branches that contain receivers. When the pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In IPv6 PIM-DM, the multicast forwarding paths for an IPv6 multicast group constitute a forwarding tree. The forwarding tree is rooted at the IPv6 multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the IPv6 multicast source to the receivers, it is also called a "shortest path tree (SPT)."

IPv6 PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

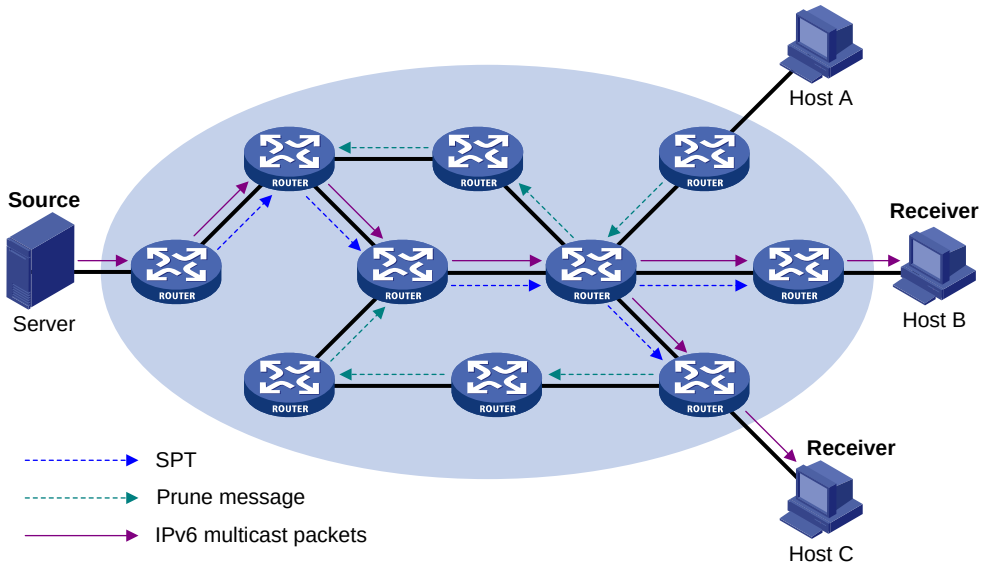
Neighbor discovery

In an IPv6 PIM domain, each IPv6 PIM interface periodically multicasts IPv6 PIM hello messages to all other IPv6 PIM devices on the local subnet. Through the exchanging of hello messages, all IPv6 PIM devices determine their IPv6 PIM neighbors, maintain IPv6 PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In an IPv6 PIM-DM domain, the IPv6 multicast data from the IPv6 multicast source S to the IPv6 multicast group G is flooded throughout the domain. A device performs an RPF check on the IPv6 multicast data. If the check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes in the network. In the flooding process, all the devices in the IPv6 PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all IPv6 PIM devices on the subnet. When the upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that IPv6 multicast group down to this node.

NOTE:

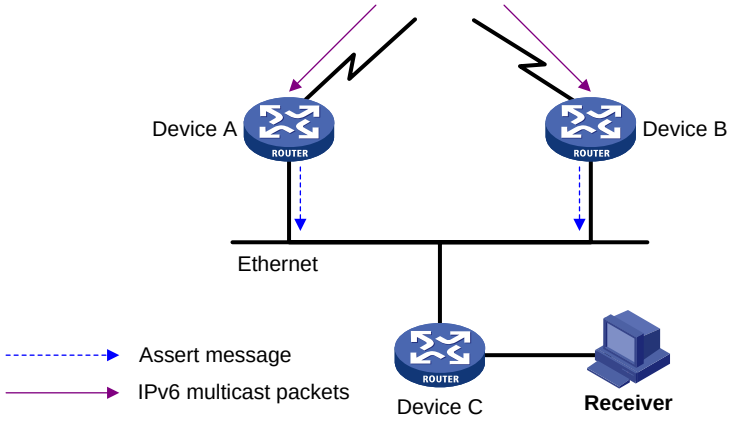
An (S, G) entry contains an IPv6 multicast source address S, an IPv6 multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the IPv6 multicast source. This prune process goes on until only necessary branches are left in the IPv6 PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, IPv6 multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the IPv6 multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all IPv6 PIM devices on the local subnet through the interface that received the packet. The assert message contains the IPv6 multicast source address (S), the IPv6 multicast group address (G), and the metric preference and metric of the IPv6 unicast route/MBGP route/static multicast route to the IPv6 multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the subnet. The comparison process is as follows:

2. The device with a higher metric preference to the IPv6 multicast source wins.
3. If both devices have the same metric preference to the IPv6 multicast source, the device with a smaller metric to the IPv6 multicast source wins.
4. If both devices have the same metric, the device with a higher IPv6 link-local address on the downstream interface wins.

IPv6 PIM-SM

IPv6 PIM-DM uses the flood-and-prune cycles to build SPTs for IPv6 multicast data forwarding. Although an SPT has the shortest paths from the IPv6 multicast source to the receivers, it is built with a low efficiency. Therefore, IPv6 PIM-DM is not suitable for large- and medium-sized networks.

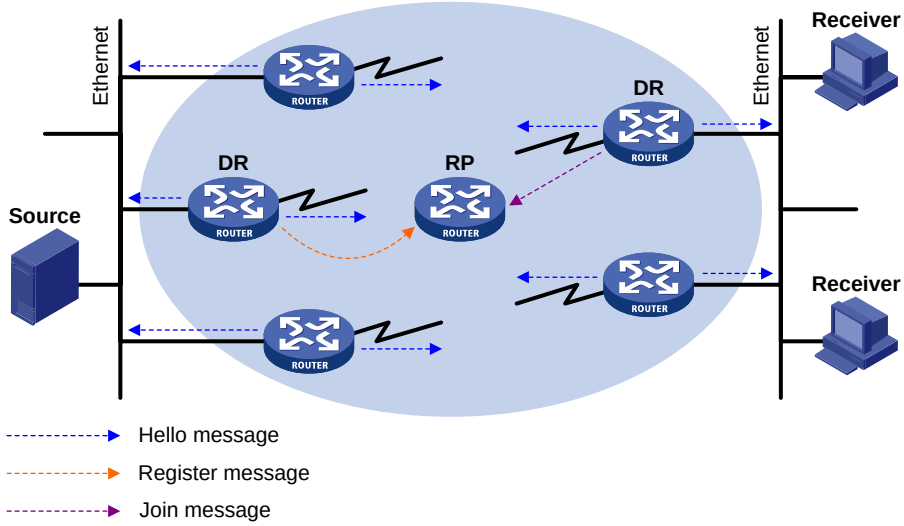
IPv6 PIM-SM uses the pull mode for IPv6 multicast forwarding, and it is suitable for large-sized and medium-sized networks with sparsely and widely distributed IPv6 multicast group members.

IPv6 PIM-SM assumes that no hosts need IPv6 multicast data. A multicast receiver must express its interest in the IPv6 multicast data for an IPv6 multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of an IPv6 PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement IPv6 multicast data forwarding. An SPT is rooted at the IPv6 multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

IPv6 PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

IPv6 PIM-SM uses the same neighbor discovery mechanism as IPv6 PIM-DM does. For more information, see "Neighbor discovery."



DR election

A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the IPv6 multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the receiver hosts to send join messages to the RP.

IMPORTANT:

MLD must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any IPv6 multicast groups. For more information about MLD, see "Configuring MLD."

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

2. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
3. The device with the highest IPv6 link-local address wins the DR election under one of the following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its IPv6 PIM neighbor lifetime expires, and the other devices initiate a new DR election.

RP discovery

An RP is the core of an IPv6 PIM-SM domain. An IPv6 multicast group can have only one RP for IPv6 multicast forwarding, and an RP can be designated to multiple IPv6 multicast groups.

RP selection mechanism

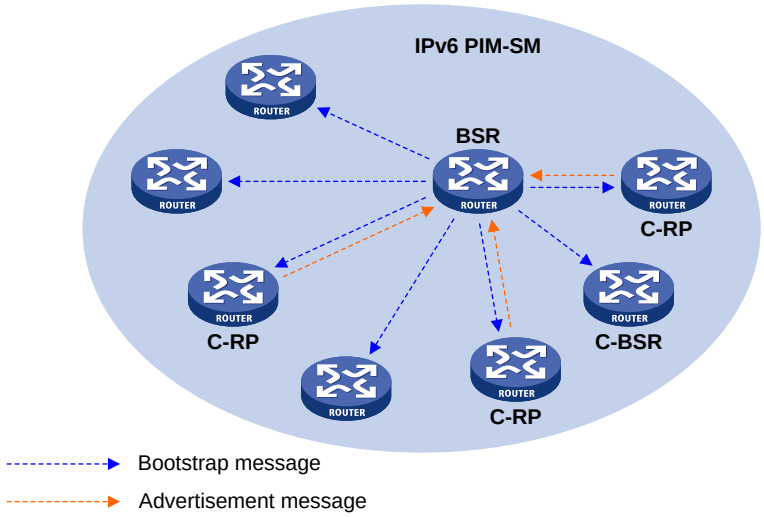
An RP can be statically configured, dynamically elected, or extracted from an IPv6 multicast address with embedded RP. The embedded RP takes precedence over the static RP and the dynamic RP. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs

A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election



Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to an IPv6 multicast group.
- **BSR**—A BSR is the core of the administrative core of the IPv6 PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. An IPv6 PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the IPv6 PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

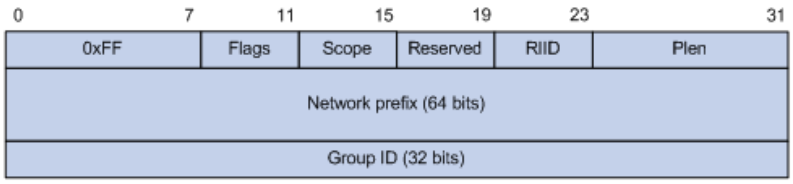
NOTE:

A device can act as a C-RP and a C-BSR at the same time.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

2. Each C-BSR sends a BSM to other devices in the IPv6 PIM-SM domain.
3. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IPv6 address wins. The loser uses the winner's



BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.

4. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the IPv6 multicast group range to which it is designated.
5. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between IPv6 multicast groups and RPs. The BSR encapsulates the RP-set information in the BSMs and advertises the BSMs to the entire IPv6 PIM-SM domain.
6. All devices in the IPv6 PIM-SM domain select an RP for an IPv6 multicast group based on the following rules:
   a. The C-RP that is designated to the smallest IPv6 multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Embedded RP

The embedded RP mechanism enables a device to resolve the RP address from an IPv6 multicast group address to map the IPv6 multicast group to an RP. This RP can take the place of the configured static RP or the RP dynamically elected by the bootstrap mechanism. A DR does not need to learn the RP address beforehand. Figure 5 shows the format of an IPv6 multicast group address with embedded RP.

Figure 5 Format of an IPv6 multicast address with embedded RP

As shown in Figure 5, the requirements for each field are as follows:

- **First 8 bits**—Fixed to 0xFF.
- **Flags**—The R, P, and T bits must be set to 1.
- **Reserved**—Contains 4 bits and must be set to 0.
- **RIID**—Contains 4 bits and indicates the RP interface ID.
- **Plen**—Contains 8 bits and indicates the valid length (in bits) of the RP address prefix. This field value cannot be greater than 64 and cannot be 0.
- **Network prefix**—Contains 64 bits and indicates the prefix of the RP address. The valid length of the prefix is determined by the Plen field.
- **Group ID**—Reduced to 32 bits and indicates the ID of the IPv6 multicast group.

The process of discovering an embedded RP is as follows:

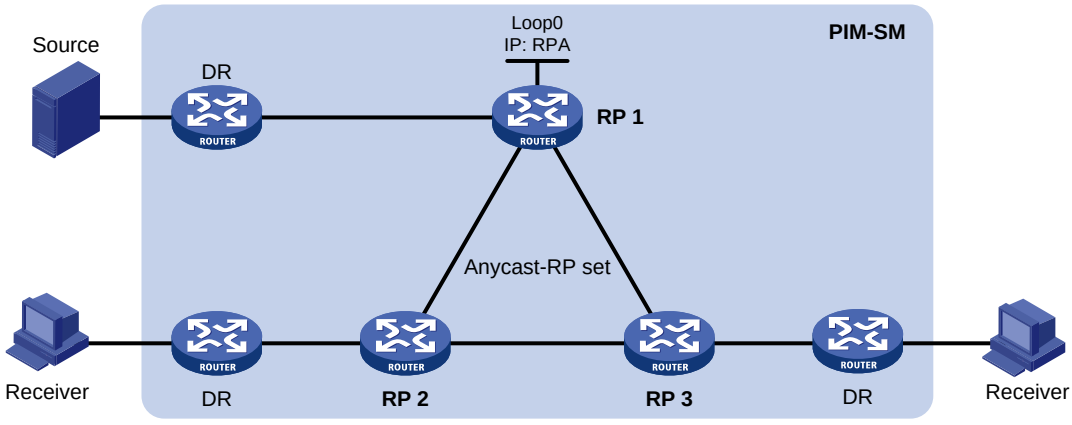
- At the receiver side, a receiver host initiates an MLD report to join an IPv6 multicast group. Upon receiving the MLD report, the receiver-side DR resolves the RP address embedded in the IPv6 multicast group address and uses the RP for the IPv6 multicast group.
- At the IPv6 multicast source side, the IPv6 multicast source sends an IPv6 multicast packet to an IPv6 multicast group. Upon receiving the IPv6 multicast packet, the source-side DR resolves

the RP address embedded in the IPv6 multicast address and uses the RP for the IPv6 multicast group.

Anycast RP

IPv6 PIM-SM requires only one active RP to serve each IPv6 multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IPv6 address for one multicast group. An IPv6 multicast source registers with the closest RP or a receiver-side DR joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—An IPv6 multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented by using either of the following methods:

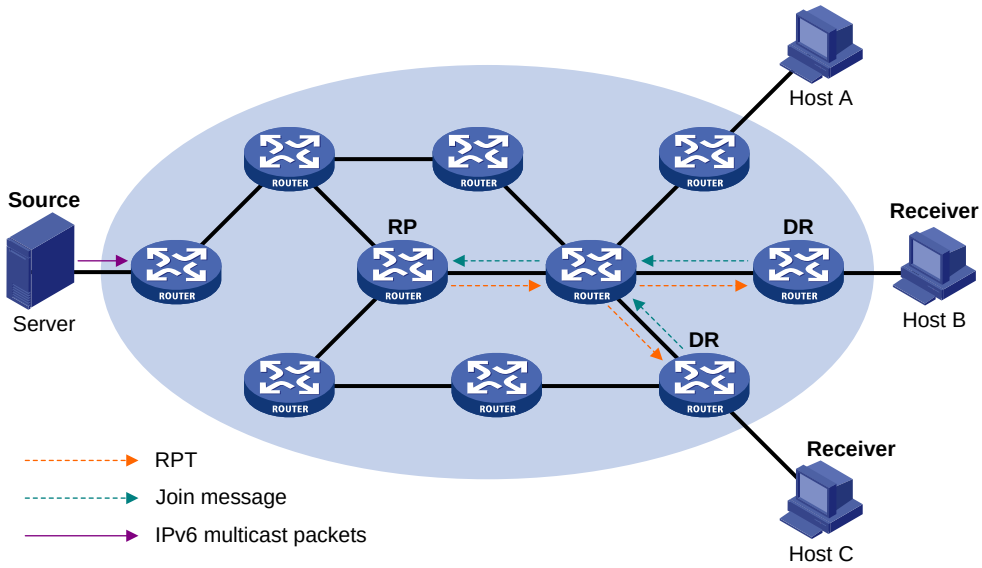
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through IPv6 PIM-SM**—In this method, you can configure multiple RPs for one IPv6 multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same IPv6 multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IPv6 address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IPv6 address of the Anycast RP set for communication within the IPv6 PIM-SM domain. It is also known as RPA.

  As shown in Figure 6, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 6 Anycast RP through IPv6 PIM-SM

The following describes how Anycast RP through IPv6 PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IPv6 address of the register message to its own IPv6 address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize IPv6 multicast source information.

RPT building

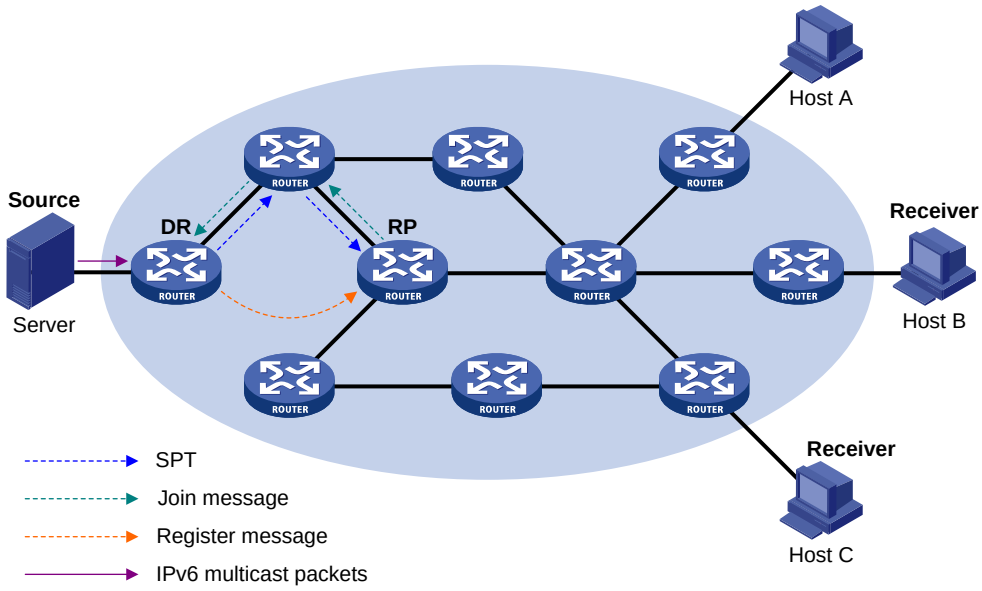
Figure 7 RPT building in an IPv6 PIM-SM domain

As shown in Figure 7, the process of building an RPT is as follows:

2. When a receiver wants to join the IPv6 multicast group G, it uses an MLD message to inform the receiver-side DR.

3. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the IPv6 multicast group.

4. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any IPv6 multicast source. The RPT is rooted at the RP and has the DR as its leaf.



When the IPv6 multicast data addressed to the IPv6 multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT. Finally, the DR forwards the IPv6 multicast data to the receiver hosts.

When a receiver is no longer interested in the IPv6 multicast data addressed to the IPv6 multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that IPv6 multicast group. If no receivers for the IPv6 multicast group exist, the device continues to forward the prune message to its upstream device.

IPv6 multicast source registration

The IPv6 multicast source uses the registration process to inform an RP of its presence.

Figure 8 IPv6 multicast source registration

As shown in Figure 8, the IPv6 multicast source registers with the RP as follows:

2. The IPv6 multicast source S sends the first multicast packet to the IPv6 multicast group G. When receiving the multicast packet, the source-side DR that directly connects to the IPv6 multicast source encapsulates the packet into a register message and unicasts the message to the RP.
3. After the RP receives the register message, it decapsulates it and forwards it down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
4. The subsequent IPv6 multicast data from the IPv6 multicast source are forwarded to the RP along the SPT. When the IPv6 multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

In an IPv6 PIM-SM domain, only one RP and one RPT provide services for a specific IPv6 multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all IPv6 multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

IPv6 multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for an IPv6 multicast packet might not be the shortest one.
- The RP might be overloaded by IPv6 multicast traffic bursts.

To eliminate these weaknesses, IPv6 PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives IPv6 multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives IPv6 multicast traffic, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. The subsequent IPv6 multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

For more information about the switchover to SPT initiated by the RP, see "IPv6 multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives IPv6 multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the device where the RPT and the SPT branches, the device drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the IPv6 multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent IPv6 multicast packets for the IPv6 multicast group travel along the SPT from the IPv6 multicast source to the receiver hosts.

With the switchover to SPT, IPv6 PIM-SM builds SPTs more economically than IPv6 PIM-DM does.

Assert

IPv6 PIM-SM uses a similar assert mechanism as IPv6 PIM-DM does. For more information, see "Assert."

IPv6 administrative scoping

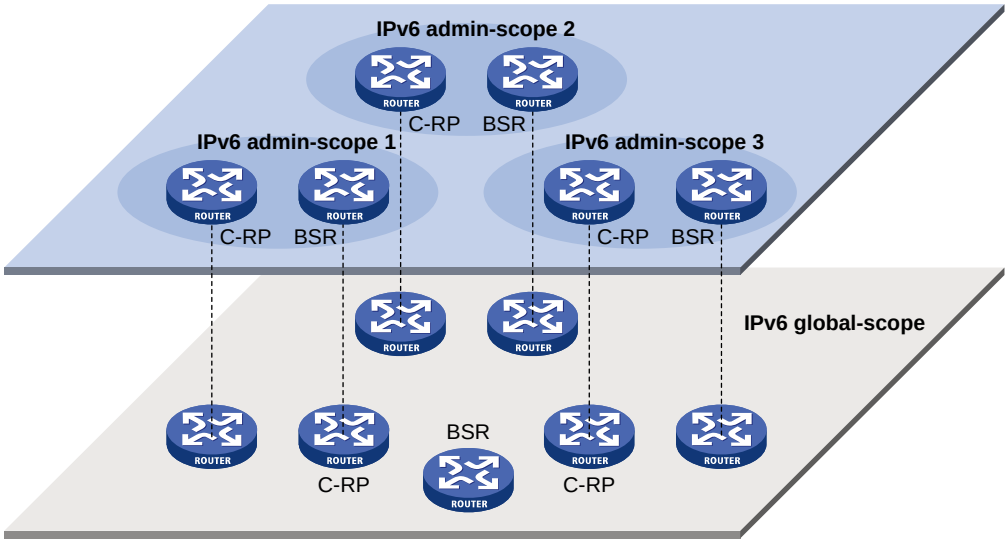
IPv6 administrative scoping mechanism

IPv6 administrative scoping mechanisms for IPv6 PIM-SM include IPv6 non-scoped BSR mechanism and IPv6 administrative scoping mechanism.

- **IPv6 non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **IPv6 administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (IPv6 admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

An IPv6 admin-scoped zone is designated to particular IPv6 multicast groups with the same scope field value in their group addresses. Zone border routers (ZBRs) form the boundary of an IPv6 admin-scoped zone. Each IPv6 admin-scoped zone maintains one BSR for IPv6 multicast groups with the same scope field value. IPv6 multicast protocol packets, such as assert messages and BSMs, of these IPv6 multicast groups cannot cross the boundary of the IPv6 admin-scoped zone for the group range. The IPv6 multicast group ranges to which different IPv6 admin-scoped zones are designated can have intersections. However, the IPv6 multicast groups in an IPv6 admin-scoped zone are valid only within its local zone, and theses IPv6 multicast groups are regarded as private group addresses.

The IPv6 global-scoped zone can be regarded as a special IPv6 admin-scoped zone, and it maintains a BSR for the IPv6 multicast groups with the scope field value as 14.



Relationship between IPv6 admin-scoped zones and the IPv6 global-scoped zone

The IPv6 global-scoped zone and each IPv6 admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each IPv6 admin-scoped zone has its own boundary. The IPv6 multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the IPv6 global-scoped zone and IPv6 admin-scoped zones based on geographical locations and the scope field values.

- In view of geographical locations:

  An IPv6 admin-scoped zone is a logical zone for particular IPv6 multicast groups with the same scope field value. The IPv6 multicast packets for such IPv6 multicast groups are confined within the local IPv6 admin-scoped zone and cannot cross the boundary of the zone.

  Figure 9 Relationship in view of geographical locations

  As shown in Figure 9, for the IPv6 multicast groups with the same scope field value, the IPv6 admin-scoped zones must be geographically separated and isolated. The IPv6 global-scoped zone includes all devices in the IPv6 PIM-SM domain. IPv6 multicast packets that do not belong to any IPv6 admin-scoped zones are forwarded in the entire IPv6 PIM-SM domain.

- In view of the scope field values:

  In terms of the scope field values, the scope field in an IPv6 multicast group address shows the zone to which the IPv6 multicast group belongs.

  Figure 10 IPv6 multicast address format

  An IPv6 admin-scoped zone with a larger scope field value contains an IPv6 admin-scoped zone with a smaller scope field value. The zone with the scope field value of E is the IPv6 global-scoped zone. Table 1 lists the possible values of the scope field.

Table 1 Values of the Scope field

Value	Meaning	Remarks
0, F	Reserved	N/A
1	Interface-local scope	N/A
2	Link-local scope	N/A
3	Subnet-local scope	IPv6 admin-scoped zone.
4	Admin-local scope	IPv6 admin-scoped zone.
5	Site-local scope	IPv6 admin-scoped zone.
6, 7, 9 through D	Unassigned	IPv6 admin-scoped zone.
8	Organization-local scope	IPv6 admin-scoped zone.
E	Global scope	IPv6 global-scoped zone.

IPv6 PIM-SSM

The ASM model includes IPv6 PIM-DM and IPv6 PIM-SM. The SSM model can be implemented by leveraging part of the IPv6 PIM-SM technique. It is also called "IPv6 PIM-SSM."

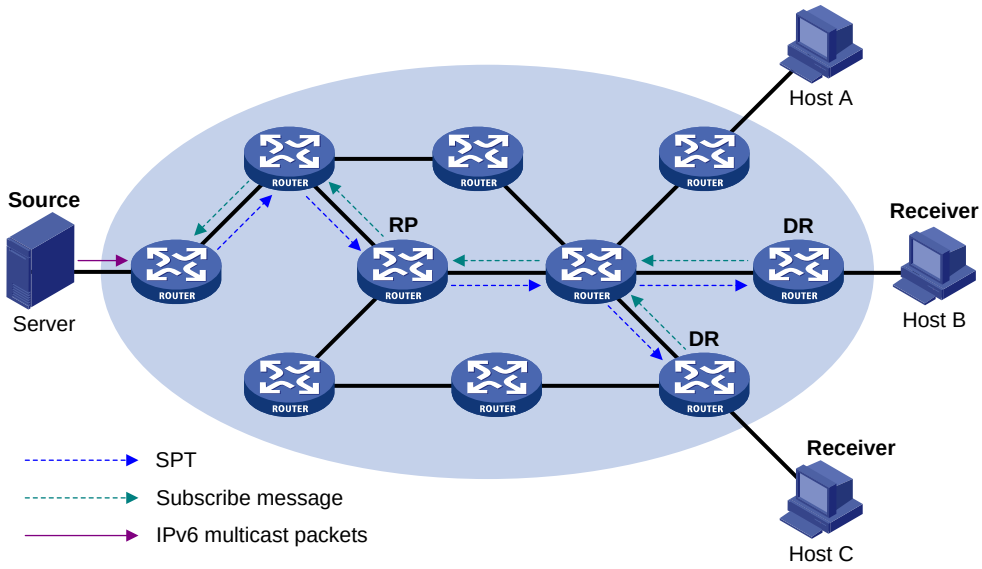
The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through MLDv2.

In actual applications, part of MLDv2 and IPv6 PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located an IPv6 multicast source, no RP or RPT is required. No source registration process is required for discovering IPv6 multicast sources in other IPv6 PIM domains.

IPv6 PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery

IPv6 PIM-SSM uses the same neighbor discovery mechanism as IPv6 PIM-SM. For more information, see "Neighbor discovery."



DR election

IPv6 PIM-SSM uses the same DR election mechanism as IPv6 PIM-SM. For more information, see "DR election."

SPT building

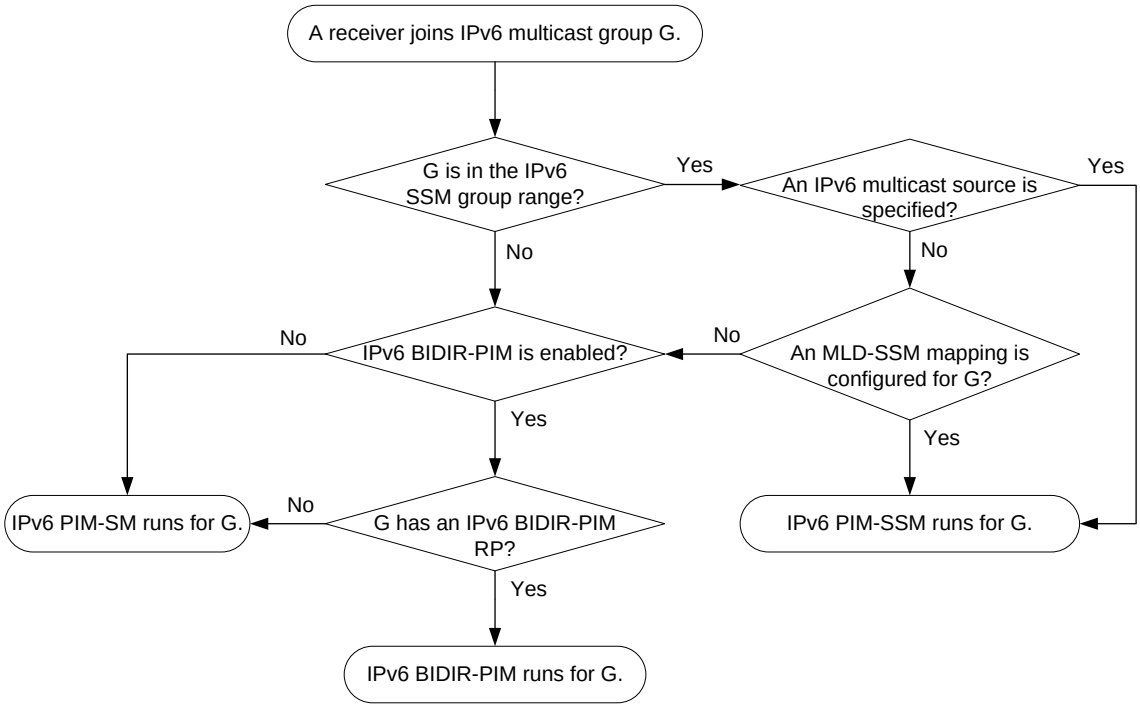
The decision to build an RPT for IPv6 PIM-SM or an SPT for IPv6 PIM-SSM depends on whether the IPv6 multicast group that the receiver host joins is in the IPv6 SSM group range. The IPv6 SSM group range reserved by IANA is FF3x::/32, where "x" represents any legal address scope.

Figure 11 SPT building in IPv6 PIM-SSM

As shown in Figure 11, Host B and Host C are receivers. They send MLDv2 report messages to their DRs to express their interest in the multicast information that the IPv6 multicast source S sends to the IPv6 multicast group G.

After receiving a report message, the DR first checks whether the group address in the message is in the IPv6 SSM group range and does the following:

- If the group address is in the IPv6 SSM group range, the DR sends a subscribe message hop by hop toward the IPv6 multicast source S. All devices along the path from the DR to the IPv6 multicast source create an (S, G) entry to build an SPT. The SPT is rooted the IPv6 multicast source S and has the receivers as its leaves. This SPT is the transmission channel in IPv6 PIM-SSM.
- If the group address is not in the IPv6 SSM group range, the receiver-side DR sends a (*, G) join message to the RP. The IPv6 multicast source registers with the source-side DR.



In IPv6 PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among IPv6 PIM protocols

In an IPv6 PIM network, IPv6 PIM-DM cannot run together with IPv6 PIM-SM, IPv6 BIDIR-PIM, or IPv6 PIM-SSM. However, IPv6 PIM-SM, IPv6 BIDIR-PIM, and IPv6 PIM-SSM can run together. (IPv6 BIDIR-PIM is not supported in the current software version.) Figure 12 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about MLD SSM mapping, see "Configuring MLD."

Figure 12 Relationship among IPv6 PIM protocols

IPv6 PIM support for VPNs

To support IPv6 PIM for VPNs, a multicast device that runs IPv6 PIM maintains an independent set of IPv6 PIM neighbor table, IPv6 multicast routing table, BSR information, and RP-set information for each VPN.

After receiving an IPv6 multicast data packet, the multicast device checks which VPN the IPv6 data packet belongs to. Then, the device forwards the IPv6 packet according to the IPv6 multicast routing table for that VPN or creates an IPv6 multicast routing entry for that VPN.

Protocols and standards

Configuring IPv6 PIM

Restrictions and guidelines: IPv6 PIM configuration

All the interfaces on a device must operate in the same IPv6 PIM mode on the public network or the same VPN instance.

Configuring IPv6 PIM-DM

IPv6 PIM-DM tasks at a glance

To configure IPv6 PIM-DM, perform the following tasks:

1. Enabling IPv6 PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the IPv6 PIM-DM graft retry timer
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-DM

Before you configure IPv6 PIM-DM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-DM

About this task

With IPv6 PIM-DM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-DM on all non-border interfaces of devices when you deploy an IPv6 PIM-DM domain.

Procedure

1. Enter system view.
   `system-view`
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   `ipv6 multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.

interface *interface-type interface-number*

5. Enable IPv6 PIM-DM.

   ipv6 pim dm

   By default, IPv6 PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the IPv6 PIM device that is directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. Use this feature to prevent the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can adjust the amount of time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own IPv6 PIM-DM state, and resets the waiting timer.
- **Hop limit value of state refresh messages**—The hop limit value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the hop limit comes down to 0. A state refresh message with a large hop limit value might cycle on a small network. To control the propagation scope of state refresh messages, configure an appropriate hop limit value based on the network size on the device directly connected with the IPv6 multicast source.

Restrictions and guidelines

Perform this task on all devices in the IPv6 PIM-DM domain.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the state refresh feature.

   ipv6 pim state-refresh-capable

   By default, the state refresh feature is enabled.

4. Return to system view.

   quit

5. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

6. Set the state refresh interval.

   state-refresh-interval *interval*

   The default setting is 60 seconds.

7. Set the amount of time that the device must wait to accept a new state refresh message.

   state-refresh-rate-limit *time*

   The default setting is 30 seconds.

8. Set the hop limit value of state refresh messages.

state-refresh-hoplimit *hoplimit-value*

The default setting is 255.

Setting the IPv6 PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv6 PIM-DM graft retry timer.
   ipv6 pim timer graft-retry *interval*
   By default, the IPv6 PIM-DM graft retry timer is 3 seconds.

Configuring IPv6 PIM-SM

IPv6 PIM-SM tasks at a glance

To configure IPv6 PIM-SM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. Configuring static RPs
   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configure dynamic RP election:
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring an IPv6 PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple IPv6 PIM devices exist in the network.
4. Enabling embedded RP
   Enable embedded RP on each device for inter-domain communication when the devices are located in different IPv6 PIM-SM domains.
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring IPv6 multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SM

Before you configure IPv6 PIM-SM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-SM

About this task

With IPv6 PIM-SM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.

   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

   By default, IPv6 multicast routing is disabled.

   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

   quit
4. Enter interface view.

   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.

   ipv6 pim sm

   By default, IPv6 PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In the IPv6 PIM-SM domain, you can configure the same static RP for multiple IPv6 multicast groups by using the same RP address but different ACLs.

You do not need to enable IPv6 PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for an IPv6 multicast group, only the static RP with the highest IPv6 address takes effect.

The static RP configuration must be the same on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for IPv6 PIM-SM.

   static-rp *ipv6-rp-address* [{ *ipv6-acl-number* | **name** *ipv6-acl-name* }] | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the IPv6 PIM-SM domain because every C-BSR might become the BSR.

The device might use the BSR RP hash algorithm described in RFC 4601 or in RFC 2362 to calculate the RP for a multicast group. To ensure consistent group-to-RP mappings on all PIM devices in the IPv6 PIM-SM domain, specify the same BSR RP hash algorithm on the devices.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv6-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

5. (Optional.) Configure the device to use the BSR RP hash algorithm described in RFC 2362.

   bsr-rp-mapping rfc2362

   By default, the device uses the BSR RP hash algorithm described in RFC 4601.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between the C-BSR and other devices.

The C-BSR configuration on the devices in the IPv6 PIM-SM domain must be the same.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv6-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits for BSMs from the BSR for 130 seconds before sending BSMs.

Configuring an IPv6 PIM domain border

About this task

An IPv6 PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of IPv6 PIM domain border interfaces partition a network into different IPv6 PIM-SM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Configure an IPv6 PIM domain border.

   ipv6 pim bsr-boundary

   By default, an interface is not an IPv6 PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the IPv6 PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated IPv6 multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Enabling embedded RP

Restrictions and guidelines

This feature is supported only for IPv6 multicast group addresses in the range of FF7x::/12 or FFFx::/12 and in compliance with RFC 3956.

Enable this feature on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim[**vpn-instance** *vpn-instance-name*]

3. Enable embedded RP.

   embedded-rp [*ipv6-acl-number*]

   By default, embedded RP is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IPv6 address. The IPv6 address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IPv6 address of a loopback interface as the RP member address.

If you configure IPv6 addresses of multiple interfaces on the same device as RP member addresses, the lowest IPv6 address takes effect. The rest of the interface addresses become backup RP member addresses.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RPs or C-RPs in the IPv6 PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure Anycast RP.

   anycast-rp *ipv6-anycast-rp-address ipv6-member-address*

   You can repeat this command to add multiple RP member addresses to an Anycast RP set.

Configuring IPv6 multicast source registration

About this task

- **IPv6 PIM register policy**—An IPv6 PIM register policy enables an RP to filter register messages by using an ACL that specifies the IPv6 multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time**—The source-side DR stops sending register messages encapsulated with IPv6 multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated IPv6 multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. If the DR does not receive a register-stop message when the register probe timer expires, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is (5 seconds). You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure an IPv6 PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

As a best practice, set the suppression time to be longer than or equal to 11 seconds.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 PIM register policy.

   register-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 register policy is configured. All IPv6 register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate IPv6 multicast data in register messages destined to the RP. As a best practice to avoid IPv6 multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the switchover to SPT.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv6-acl-number*]

   By default, the first IPv6 multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   ipv6 pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring IPv6 PIM-SSM

IPv6 PIM-SSM tasks at a glance

To configure IPv6 PIM-SSM, perform the following tasks:

1. Enabling IPv6 PIM-SM

2. (Optional.) Specifying the IPv6 SSM group range
3. (Optional.) Configuring the delay time for DR election
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SSM

Before you configure IPv6 PIM-SSM, you must complete the following tasks:

- Configure an IPv6 unicast IPv6 routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 PIM-SM.
- Enable MLDv2 on the IPv6 PIM devices that connect to IPv6 multicast receivers.

Enabling IPv6 PIM-SM

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SSM domain.

Procedure

1. Enter system view.
   `system-view`
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   `ipv6 multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable IPv6 PIM-SM.
   `ipv6 pim sm`
   By default, IPv6 PIM-SM is disabled.

Specifying the IPv6 SSM group range

About this task

When an IPv6 PIM-SM enabled interface receives an IPv6 multicast packet, it checks whether the IPv6 multicast group address of the packet is in the IPv6 SSM group range. If the IPv6 multicast group address is in this range, the IPv6 PIM mode for this packet is IPv6 PIM-SSM. If the IPv6 multicast group address is not in this range, the IPv6 PIM mode is IPv6 PIM-SM.

Restrictions and guidelines

Configure the same IPv6 SSM group range on all devices in the entire IPv6 PIM-SM domain. Otherwise, IPv6 multicast information cannot be delivered through the IPv6 SSM model.

When a member of an IPv6 multicast group in the IPv6 SSM group range sends an MLDv1 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the IPv6 SSM group range.
   ssm-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   The default range is FF3x::/32, where x can be any valid scope.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the delay time for DR election.
   ipv6 pim timer dr-elect-delay *delay-time*
   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common IPv6 PIM features

Common IPv6 PIM feature tasks at a glance

All the following tasks are optional.

- Configuring an IPv6 multicast source policy
- Configuring an IPv6 PIM hello policy
- Configuring IPv6 PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common IPv6 PIM timers

- Setting the maximum size of a join or prune message
- Configuring an IPv6 PIM join policy
- Setting the DSCP value for outgoing IPv6 PIM protocol packets
- Enabling BFD for IPv6 PIM
- Enabling IPv6 PIM passive mode
- Enabling IPv6 PIM NSR
- Enabling SNMP notifications for IPv6 PIM
- Enabling IPv6 PIM logging
- Enabling log message suppression for IPv6 PIM

Configuring an IPv6 multicast source policy

About this task

This feature enables the device to filter IPv6 multicast data by using an ACL that specifies the IPv6 multicast sources and the optional groups. It filters not only IPv6 multicast data packets but also IPv6 PIM register messages with IPv6 multicast data encapsulated. This also reduces the IPv6 multicast traffic on the network.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 multicast source policy.

   source-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 multicast source policy is configured. The device does not filter IPv6 multicast data packets.

Configuring an IPv6 PIM hello policy

About this task

This feature enables the device to filter IPv6 PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against IPv6 PIM message attacks and to establish correct IPv6 PIM neighboring relationships.

If hello messages of an existing IPv6 PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure an IPv6 PIM hello policy.

   ipv6 pim neighbor-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 PIM hello policy is configured on an interface. All IPv6 PIM hello messages are regarded as legal.

Configuring IPv6 PIM hello message options

About this task

In either an IPv6 PIM-DM domain or an IPv6 PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for IPv6 PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the IPv6 multicast source or the receivers.
- **Holdtime**—IPv6 PIM neighbor lifetime. If a device receives no hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the IPv6 PIM message propagation delay. The override interval defines a time period for a downstream device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different IPv6 PIM devices on a shared-media LAN is different, the largest ones apply.

If you enable neighbor tracking, you must enable it on all IPv6 PIM devices on a shared-media LAN or the upstream device to track join messages from every downstream device.

You can configure hello message options for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

Configuring hello message options globally

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.

   hello-option dr-priority *priority*

   The default setting is 1.
4. Set the neighbor lifetime.

   hello-option holdtime *time*

   The default setting is 105 seconds.
5. Set the IPv6 PIM message propagation delay for a shared-media LAN.

hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the DR priority.

   ipv6 pim hello-option dr-priority *priority*

   The default setting is 1.

4. Set the neighbor lifetime.

   ipv6 pim hello-option holdtime *time*

   The default setting is 105 seconds.

5. Set the IPv6 PIM message propagation delay.

   ipv6 pim hello-option lan-delay *delay*

   The default setting is 500 milliseconds.

6. Set the override interval.

   ipv6 pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   ipv6 pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with IPv6 PIM. The generation ID is a random value, but it changes only when the status of the device changes. If an IPv6 PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

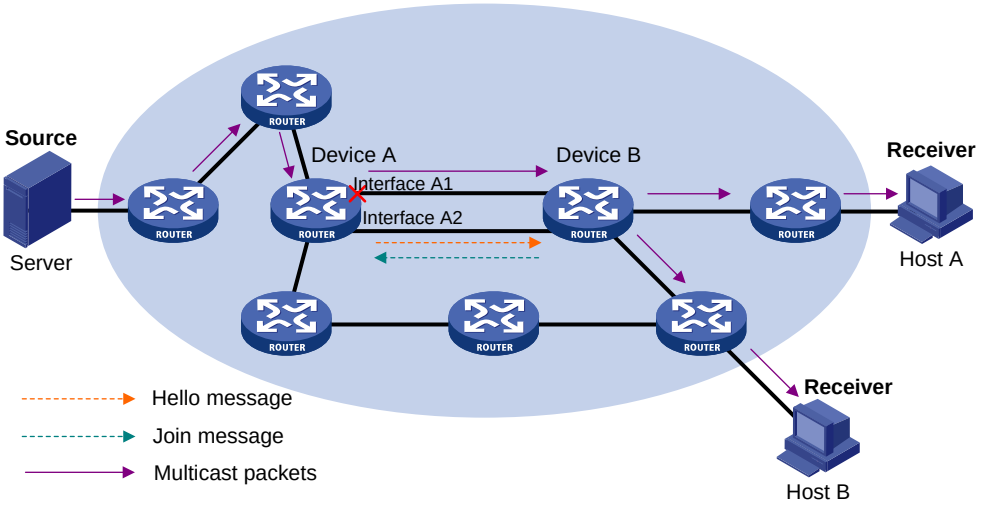
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

ipv6 pim require-genid

By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 13, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send an IPv6 PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 13 Network diagram

Procedure

1. Enter system view.

   system-view

2. Enter VLAN interface view.

   interface vlan-interface *interface-number*

3. Enable the interface to send hello messages with a different Generation ID upon a port state change.

   ipv6 pim triggered-hello enable { **port-down** | **port-up** } *

   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common IPv6 PIM timers

About this task

The following are common IPv6 PIM timers:

- **Hello interval**—Interval at which an IPv6 PIM device sends hello messages to discover IPv6 PIM neighbors and maintain IPv6 PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, an IPv6 PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join or prune interval**—Interval at which an IPv6 PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which an IPv6 PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is contained in a join or prune message.
- **IPv6 multicast source lifetime**—Lifetime that an IPv6 PIM device maintains for an IPv6 multicast source. If a device does not receive subsequent IPv6 multicast data from the IPv6 multicast source S when the timer expires, it deletes the (S, G) entry for the IPv6 multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common IPv6 PIM timers for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common IPv6 PIM timers globally

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.

   timer hello *interval*

   By default, the interval to send hello messages is 30 seconds.
4. Set the join or prune interval.

   timer join-prune *interval*

   By default, the interval to send join or prune messages is 60 seconds.

   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.

   holdtime join-prune *time*

   By default, the joined/pruned state holdtime timer is 210 seconds.
6. Set the IPv6 multicast source lifetime.

   source-lifetime *time*

   By default, the IPv6 multicast source lifetime is 210 seconds.

Configuring common IPv6 PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   ipv6 pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   ipv6 pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   ipv6 pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   ipv6 pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

Restrictions and guidelines

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum size of a join or prune message.
   jp-pkt-size *size*
   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring an IPv6 PIM join policy

About this task

The IPv6 PIM join policy filters joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages to protect the device against invalid IPv6 PIM join or prune message attacks. The policy identifies valid joined IPv6 multicast source and groups in IPv6 PIM join or prune messages and filters out invalid joined IPv6 multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined IPv6 multicast sources and groups.

Procedure

1. Enter system view.
   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 PIM join policy to filter joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages.

   ipv6 pim join-policy { { *ipv6-acl-number* | **name** *ipv6-acl-name* } | [**asm** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **ssm** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] * }

   By default, no IPv6 PIM join policy is configured and joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing IPv6 PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing IPv6 PIM protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IPv6 PIM protocol packets.

Enabling BFD for IPv6 PIM

About this task

If a DR on a shared-media network fails, a new DR election process will start after the DR ages out. However, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, you can enable BFD for IPv6 PIM to detect link failures among IPv6 PIM neighbors.

You must enable BFD for IPv6 PIM on all IPv6 PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

You must enable IPv6 PIM-DM or IPv6 PIM-SM on an interface before you configure this feature on the interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for IPv6 PIM.

   ipv6 pim bfd enable

   By default, BFD is disabled for IPv6 PIM.

Enabling IPv6 PIM passive mode

About this task

To guard against IPv6 PIM hello spoofing, you can enable IPv6 PIM passive mode on a receiver-side interface. The interface cannot receive or forward IPv6 PIM protocol messages (excluding register, register-stop and C-RP-Adv messages), and acts as the DR on the subnet.

Restrictions and guidelines

This feature takes effect only when IPv6 PIM-DM or IPv6 PIM-SM is enabled on the interface.

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple IPv6 PIM devices.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IPv6 PIM passive mode on the interface.
   ipv6 pim passive
   By default, IPv6 PIM passive mode is disabled on an interface.

Enabling IPv6 PIM NSR

About this task

This feature enables IPv6 PIM to back up protocol state information, including IPv6 PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for IPv6 PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 PIM NSR.
   ipv6 pim non-stop-routing
   By default, IPv6 PIM NSR is disabled.

Enabling SNMP notifications for IPv6 PIM

About this task

To report critical IPv6 PIM events to an NMS, enable SNMP notifications for IPv6 PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IPv6 PIM.

snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **invalid-join-prune** | **invalid-register** | **interface-election** | **neighbor-loss** | **private-interface-election** | **private-neighbor-loss** | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

By default, SNMP notifications for IPv6 PIM are enabled.

Enabling IPv6 PIM logging

About this task

To report critical IPv6 PIM events to the information center, enable IPv6 PIM logging. For IPv6 PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IPv6 PIM logging or use the **ipv6 pim log suppress** command to enable log message suppression for IPv6 PIM.

Procedure

1. Enter system view.

   system-view
2. Enable IPv6 PIM logging.

   ipv6 pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *

   IPv6 PIM logging is enabled by default.

Enabling log message suppression for IPv6 PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IPv6 PIM. With this feature configured, the speed of sending IPv6 PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IPv6 PIM logging has been enabled using the **ipv6 pim log enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable log message suppression for IPv6 PIM.

   ipv6 pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *

   By default, log message suppression is enabled for IPv6 PIM.

Display and maintenance commands for IPv6 PIM

Execute **display** commands in any view.

Task	Command

IPv6 PIM configuration examples

Example: Configuring IPv6 PIM-DM

Network configuration

As shown in Figure 14:

- OSPFv3 runs on the network.

- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain is operating in the dense mode.
- Host A and Host C are multicast receivers in two stub networks N1 and N2.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 14 Network diagram

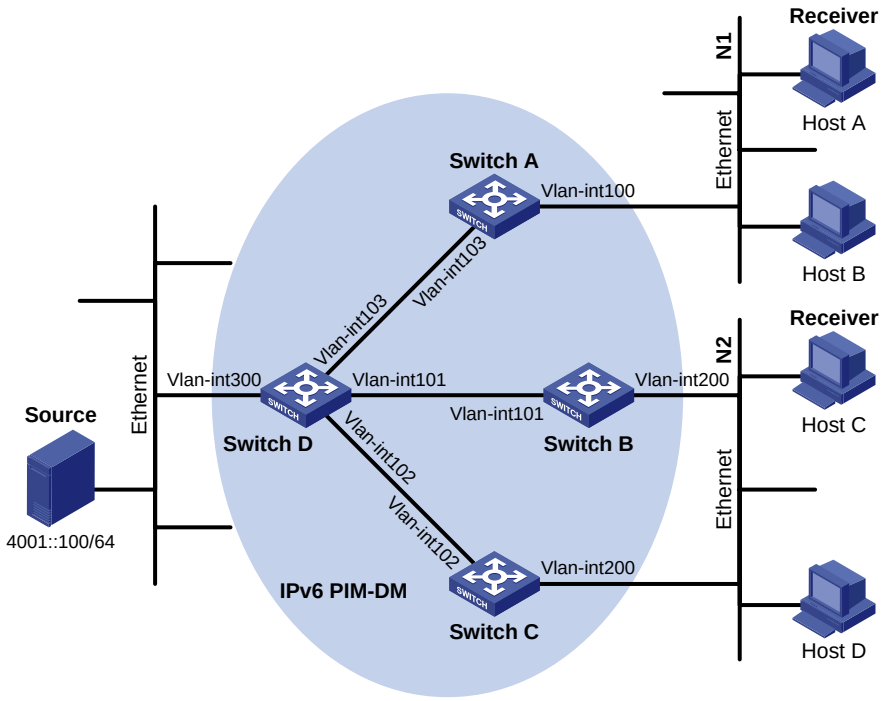

Table 2 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int103	1002::1/64	Switch D	Vlan-int103	1002::2/64
Switch B	Vlan-int200	2001::1/64	Switch D	Vlan-int101	2002::2/64
Switch B	Vlan-int101	2002::1/64	Switch D	Vlan-int102	3001::2/64
Switch C	Vlan-int200	2001::2/64	Switch D	Vlan-int300	4001::1/64
Switch C	Vlan-int102	3001::1/64	Switch D	Vlan-int103	1002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 14, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IPv6 multicast routing, and enable IPv6 PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] ipv6 pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] ipv6 pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] ipv6 pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display IPv6 PIM information on Switch D.

```
[SwitchD] display ipv6 pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:1    (local)
 Interface: Vlan103
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2    (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3    (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
```

```
  DR address: FE80::A01:201:4    (local)
```

Display IPv6 PIM neighboring relationship on Switch D.

```
[SwitchD] display ipv6 pim neighbor
 Total IPv6 pim neighbors: 3
  Neighbor: FE80::A01:101:1
    Interface: Vlan103
    Uptime: 00:04:00
    Expiry time: 00:01:29
    DR priority: 1
    Mode: N/A
  Neighbor: FE80::B01:102:2
    Interface: Vlan101
    Uptime: 00:04:16
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: FE80::C01:103:3
    Interface: Vlan102
    Uptime: 00:03:54
    Expiry time: 00:01:17
    DR priority: 5
    Mode: N/A
```

Send an MLD report from Host A to join IPv6 multicast group FF0E::101. (Details not shown.)

Send IPv6 multicast data from IPv6 multicast source 4001::100/64 to IPv6 multicast group FF0E::101. (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, FF0E::101)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:01:24
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:01:20, Expires: -

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:01:20
     Upstream interface: Vlan-interface103
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
```

```
        1: Vlan-interface100
            Protocol: pim-dm, UpTime: 00:01:20, Expires: -
```

Display IPv6 PIM multicast routing table information on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: LOC ACT
     UpTime: 00:02:19
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 2
         1: Vlan-interface103
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
         2: Vlan-interface102
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has a correct (*, G) entry.

Example: Configuring non-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 15:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist in each stub network. The entire IPv6 PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers in the stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to the IPv6 multicast group range FF0E::101/64. Specify VLAN-interface101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 15 Network diagram

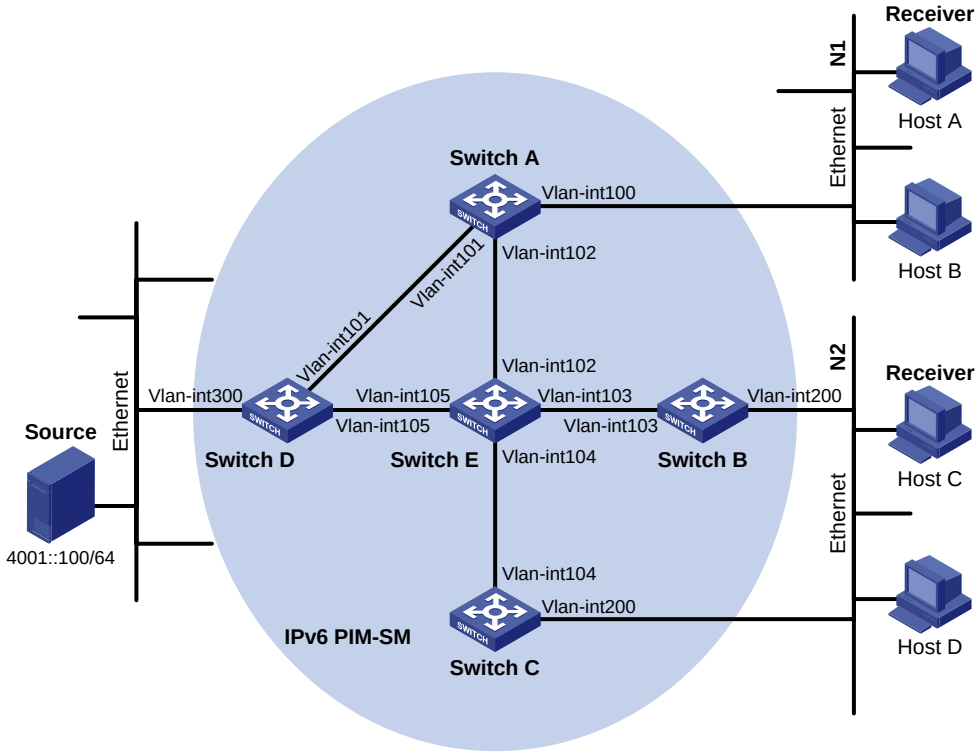

Table 3 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 15, and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and static RPs:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl ipv6 basic 2005
[SwitchE-acl-ipv6-basic-2005] rule permit source ff0e::101 64
[SwitchE-acl-ipv6-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP, and configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE] ipv6 pim
[SwitchE-pim6] c-bsr 1003::2
[SwitchE-pim6] c-rp 1003::2 group-policy 2005
[SwitchE-pim6] static-rp 1002::2
[SwitchE-pim6] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as a static RP.

```
[SwitchA] ipv6 pim
[SwitchA-pim6] static-rp 1002::2
[SwitchA-pim6] quit
```

Configure a static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3
```

Display BSR information on Switch A.

```
[SwitchA] display ipv6 pim bsr-info
 Scope: non-scoped
```

```
    State: Accept Preferred
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display ipv6 pim bsr-info
 Scope: non-scoped
    State: Elected
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
    Candidate BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
```

Display RP information on Switch A.

```
[SwitchA] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF0E::101/64
       RP address               Priority  HoldTime  Uptime    Expires
       1003::2                  192       180       00:05:19  00:02:11

Static RP information:
       RP address               ACL   Mode    Preferred
       1002::2                  ----  pim-sm  No
```

Example: Configuring admin-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 16:

- VOD streams are sent to receiver hosts in multicast. The entire IPv6 PIM-SM domain is divided into IPv6 admin-scoped zone 1 and the IPv6 global-scoped zone. Router B and Router C are ZBRs of IPv6 admin-scoped zone 1.
- Source 2 sends IPv6 multicast data to the IPv6 multicast group FF14::101, and Host A is an IPv6 multicast receiver. Source 1 sends IPv6 multicast data to the IPv6 multicast group FF1E::202, and Host A is an IPv6 multicast receiver.
- VLAN-interface 20 of Switch B acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 1, and is designated to the IPv6 multicast groups with the scope field value of 4. VLAN-interface 50 of Switch D acts as a C-BSR and a C-RP for the IPv6 global-scoped zone, and it is designated to the IPv6 multicast groups with the scope field value of 14.
- MLDv1 runs between Switch A, Switch C, and the receivers that directly connect to them, respectively.

Figure 16 Network diagram

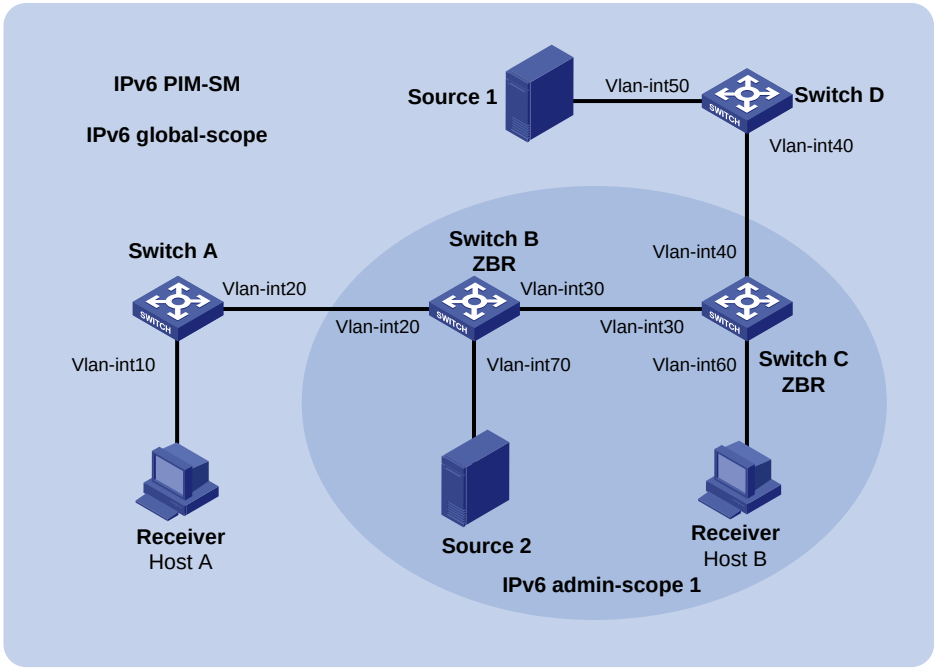

Table 4 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	500::1/64	Source 2	—	600::1/64
Switch A	Vlan-int10	1001::1/64	Switch D	Vlan-int50	500::2/64
Switch A	Vlan-int20	1002::1/64	Switch D	Vlan-int40	6001::1/64
Switch B	Vlan-int70	600::2/64	Switch C	Vlan-int30	2002::2/64
Switch B	Vlan-int20	1002::2/64	Switch C	Vlan-int60	3002::2/64
Switch B	Vlan-int30	2002::1/64	Switch C	Vlan-int40	6001::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface, and make sure the switches in the IPv6 PIM-DM domain can reach each other.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface (VLAN-interface 20).

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] mld enable
   [SwitchA-Vlan-interface20] quit
   ```

   # Enable IPv6 PIM-SM on VLAN-interface 10.

   ```
   [SwitchA] interface vlan-interface 10
   ```

```
[SwitchA-Vlan-interface10] ipv6 pim sm
[SwitchA-Vlan-interface10] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch C in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IPv6 multicast routing, and enable IPv6 PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] ipv6 multicast routing
[SwitchB-mrib6] quit
[SwitchB] interface vlan-interface 70
[SwitchB-Vlan-interface70] ipv6 pim sm
[SwitchB-Vlan-interface70] quit
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] ipv6 pim sm
[SwitchB-Vlan-interface20] quit
[SwitchB] interface vlan-interface 30
[SwitchB-Vlan-interface30] ipv6 pim sm
[SwitchB-Vlan-interface30] quit
```

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D in the same way Switch B is configured. (Details not shown.)

2. Configure IPv6 admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 20 as the boundary of IPv6 admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] ipv6 multicast boundary scope 4
[SwitchB-Vlan-interface20] quit
```

On Switch C, configure VLAN-interface 40 as the boundary of IPv6 admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 40
[SwitchC-Vlan-interface40] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface40] quit
```

3. Configure C-BSRs and C-RPs:

On Switch D, configure VLAN-interface 50 as a C-BSR and a C-RP for the IPv6 global-scoped zone.

```
[SwitchD] ipv6 pim
[SwitchD-pim6] c-bsr 6001::1
[SwitchD-pim6] c-rp 6001::1
[SwitchD-pim6] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:25
     Elected BSR address: 6001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45
 Scope: 4
     State: Elected
```

```
    Bootstrap timer: 00:00:06
    Elected BSR address: 1002::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:04:54
    Candidate BSR address: 1002::2
      Priority: 64
      Hash mask length: 126
```

Display BSR information on Switch D.

```
[SwitchD] display ipv6 pim bsr-info
 Scope: non-scoped
    State: Elected
    Bootstrap timer: 00:00:49
    Elected BSR address: 6001::1
      Priority: 64
      Hash mask length: 126
      Uptime: 00:01:11
    Candidate BSR address: 6001::1
      Priority: 64
      Hash mask length: 126
```

Display RP information on Switch B.

```
[SwitchB] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address               Priority  HoldTime  Uptime    Expires
       6001::1                  192       180       00:38:59  00:02:07
   Scope: 4
     Group/MaskLen: FF04::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF14::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF24::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF34::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31

Example: Configuring IPv6 PIM-SSM

Network configuration

As shown in Figure 17:

- OSPFv3 runs on the network.
- Receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain operates in the SSM mode.
- Host A and Host C are IPv6 multicast receivers on two stub networks N1 and N2.
- The SSM group range is FF3E::/64.
- MLDv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 17 Network diagram

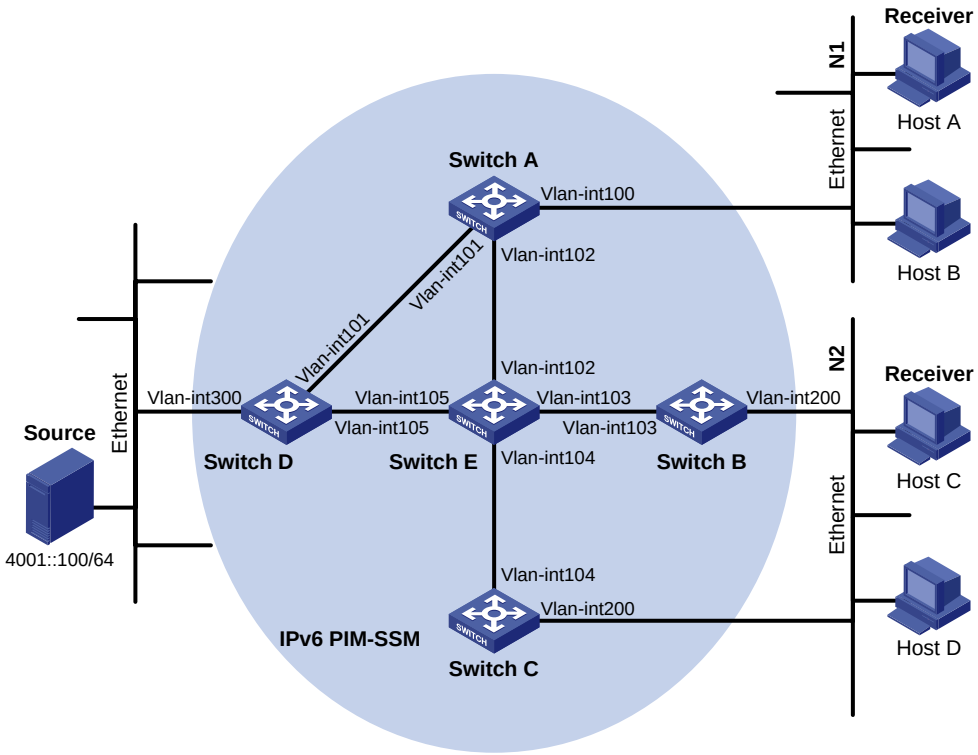

Table 5 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 17, and configure OSPFv3 on the switches in the IPv6 PIM-SSM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLDv2 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] mld version 2
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] ipv6 pim sm
   [SwitchA-Vlan-interface102] quit
   ```

   # Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

   # Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range FF3E::/64 on Switch A.

   ```
   [SwitchA] acl ipv6 basic 2000
   [SwitchA-acl-ipv6-basic-2000] rule permit source ff3e:: 64
   [SwitchA-acl-ipv6-basic-2000] quit
   [SwitchA] ipv6 pim
   [SwitchA-pim6] ssm-policy 2000
   [SwitchA-pim6] quit
   ```

3. Configure the IPv6 SSM group range on Switch B, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3
```

Send an MLDv2 report from Host A to join the IPv6 multicast source and group (4001::100/64, FF3E::101). (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:00:11
     Upstream interface: Vlan-interface101
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:00:11, Expires: 00:03:25
```

Display IPv6 PIM multicast routing table information on Switch B.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: LOC
     UpTime: 00:08:02
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface105
             Protocol: pim-ssm, UpTime: 00:08:02, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting IPv6 PIM

A multicast distribution tree cannot be correctly built

Symptom

No IPv6 multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in an IPv6 PIM network. This means that an IPv6 multicast distribution tree cannot be correctly built.

Solution

To resolve the problem:

1. Use the **`display ipv6 routing-table`** command to verify that an IPv6 unicast route to the IPv6 multicast source or the RP is available.
2. Use the **`display ipv6 pim interface`** command to verify IPv6 PIM information on each interface, especially on the RPF interface. If IPv6 PIM is not enabled on the interfaces, use

ipv6 pim dm or **ipv6 pim sm** to command enable IPv6 PIM-DM or IPv6 PIM-SM for the interfaces.

3. Use the **display ipv6 pim neighbor** command to verify that the RPF neighbor is an IPv6 PIM neighbor.
4. Verify that IPv6 PIM and MLD are enabled on the interfaces that directly connect to the IPv6 multicast sources or the receivers.
5. Use the **display ipv6 pim interface verbose** command to verify that the same IPv6 PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same IPv6 PIM mode is enabled on all devices on the network. For IPv6 PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

IPv6 multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive IPv6 multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives IPv6 multicast data but does not create an (S, G) entry in the IPv6 PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IPv6 multicast forwarding boundary settings. Use the **ipv6 multicast boundary** command to change the multicast forwarding boundary settings to make the IPv6 multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the IPv6 multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the IPv6 multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in IPv6 PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the IPv6 multicast source.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the RP is available on each device.
2. Use the **display ipv6 pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display ipv6 pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or IPv6 multicast source registration fails in IPv6 PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no IPv6 unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the IPv6 multicast source with the RP.

Solution

To resolve the problem:

1. Use the **`display ipv6 routing-table`** command on each device to view routing table information. Verify that IPv6 unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **`display ipv6 pim bsr-info`** command to verify that the BSR information exists on each device.
3. Use the **`display ipv6 pim rp-info`** command to verify that the RP information is correct on each device.
4. Use the **`display ipv6 pim neighbor`** command to verify that IPv6 PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

Configuring IGMP

About IGMP

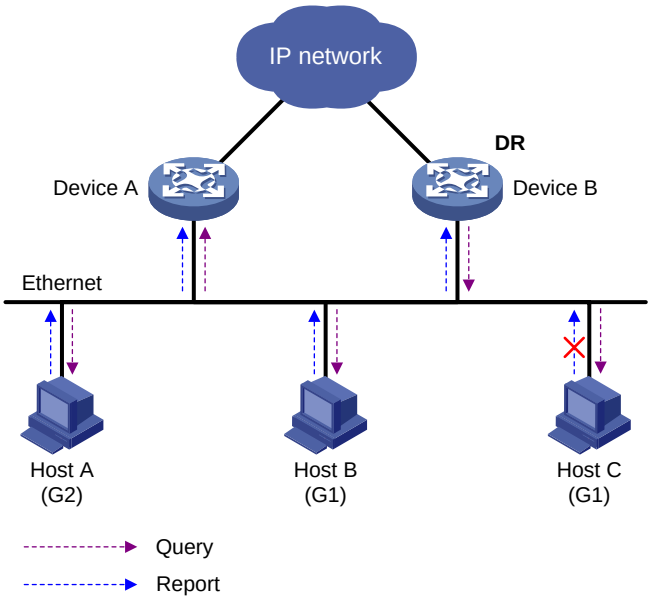
Internet Group Management Protocol (IGMP) establishes and maintains the multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

IGMP versions

IGMP has the following versions:

- IGMPv1 (defined by RFC 1112).
- IGMPv2 (defined by RFC 2236).
- IGMPv3 (defined by RFC 3376).

All IGMP versions support the ASM model. IGMPv3 can directly implement the SSM model. IGMPv1 and IGMPv2 must work with the IGMP SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."



IGMPv1 overview

IGMPv1 manages multicast group memberships based on the query and response mechanism.

All devices that run IGMP on the same subnet can get IGMP membership report messages (called reports) from hosts. However, only one device can act as the IGMP querier to send IGMP query messages (called queries). The querier election mechanism determines which device acts as the IGMP querier on the subnet.

In IGMPv1, the DR elected by the multicast routing protocol (such as PIM) acts as the IGMP querier. For more information about DR, see "PIM overview."

Figure 1 IGMP queries and reports

As shown in Figure 1, Host B and Host C are interested in the multicast data addressed to the multicast group G1. Host A is interested in the multicast data addressed to G2. The following process

describes how the hosts join the multicast groups and how the IGMP querier (Device B in Figure 1) maintains the multicast group memberships:

1. The hosts send unsolicited IGMP reports to the multicast groups they want to join without having to wait for the IGMP queries.
2. The IGMP querier periodically multicasts IGMP queries (with the destination address of 224.0.0.1) to all hosts and devices on the local subnet.
3. After receiving a query message, the host whose report delay timer expires first sends an IGMP report to multicast group G1 to announce its membership for G1. In this example, Host B sends the report message. After receiving the report from Host B, Host C suppresses its own report for G1.

   Because IGMP devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host IGMP report suppression, helps reduce traffic on the local subnet.
4. At the same time, Host A sends a report to the multicast group G2 after receiving a query.
5. Through the query and response process, the IGMP devices (Device A and Device B) determine that the local subnet has members of G1 and G2. The multicast routing protocol (PIM, for example) on the devices generates (*, G1) and (*, G2) multicast forwarding entries, where asterisk (*) represents any multicast source. These entries are the basis for subsequent multicast forwarding.
6. When the multicast data addressed to G1 or G2 reaches an IGMP device, the device looks up the multicast forwarding table. Based on the (*, G1) or (*, G2) entries, the device forwards the multicast data to the local subnet. Then, the receivers on the subnet can receive the data.

IGMPv1 does not define a leave group message (often called a leave message). When an IGMPv1 host is leaving a multicast group, it stops sending reports to that multicast group. If the subnet has no members for a multicast group, the IGMP devices will not receive any report addressed to that multicast group. In this case, the devices clear the information for that multicast group after a period of time.

IGMPv2 enhancements

Backwards-compatible with IGMPv1, IGMPv2 has introduced a querier election mechanism and a leave-group mechanism.

Querier election mechanism

In IGMPv1, the DR elected by the Layer 3 multicast routing protocol (such as PIM) acts as the querier.

IGMPv2 introduced an independent querier election mechanism. The querier election process is as follows:

1. Initially, every IGMPv2 device assumes itself to be the querier. Each device sends IGMP general query messages (called general queries) to all hosts and devices on the local subnet. The destination address is 224.0.0.1.
2. After receiving a general query, every IGMPv2 device compares the source IP address of the query with its own interface address. The device with the lowest IP address becomes the querier. All the other IGMPv2 devices become non-queriers.
3. All the non-queriers start the other querier present timer. If a device receives an IGMP query from the querier before the timer expires, it resets this timer. Otherwise, the device considers that the querier has timed out. In this case, the device initiates a new querier election process.

"Leave group" mechanism

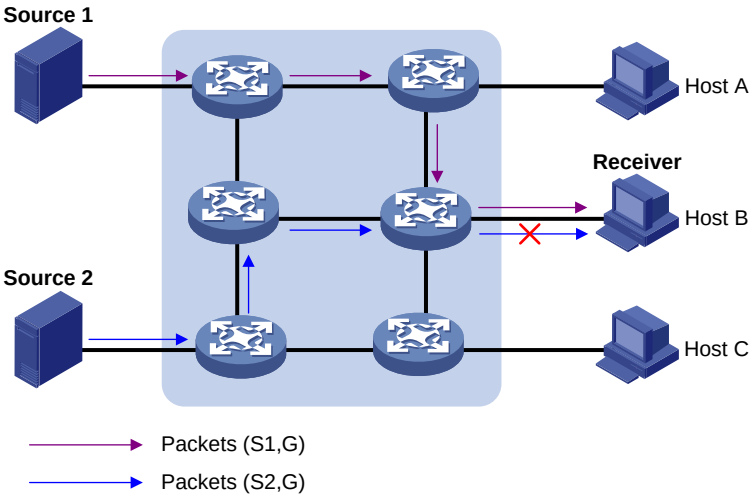
In IGMPv1, when a host leaves a multicast group, it does not send any notification to the multicast devices. The multicast devices determine whether a group has members by using the maximum response time. This adds to the leave latency.

In IGMPv2, when a host is leaving a multicast group, the following process occurs:

1. The host sends a leave message to all devices on the local subnet. The destination address of leave messages is 224.0.0.2.
2. After receiving the leave message, the querier sends a configurable number of IGMP group-specific queries to the group that the host is leaving. Both the destination address field and the group address field of the message are the address of the multicast group that is being queried.
3. One of the remaining members (if any on the subnet) in the group should send a report within the maximum response time advertised in the group-specific queries.
4. If the querier receives a report for the group before the maximum response timer expires, it maintains the memberships for the group. Otherwise, the querier assumes that the local subnet has no member hosts for the group and stops maintaining the memberships for the group.

IGMPv3 enhancements

IGMPv3 is based on and is compatible with IGMPv1 and IGMPv2. It enhances the control capabilities of hosts and the query and report capabilities of IGMP devices.



Enhancements in control capability of hosts

IGMPv3 introduced two source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified multicast sources. When a host joins a multicast group, one of the following occurs:

- If the host expects to receive multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host expects to reject multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two multicast sources: Source 1 (S1) and Source 2 (S2). Both of these sources can send multicast data to the multicast group G. Host B wants to receive the multicast data addressed to G from Source 1 but not from Source 2.

Figure 2 Flow paths of source-and-group-specific multicast traffic

In IGMPv1 or IGMPv2, Host B cannot select multicast sources when it joins the multicast group G. The multicast streams from both Source 1 and Source 2 flow to Host B whether or not it needs them.

In IGMPv3, Host B can explicitly express that it needs to receive multicast data destined to the multicast group G from Source 1 but not from Source 2.

Enhancements in query and report capabilities

IGMPv3 introduces IGMP group-and-source queries and IGMP reports carrying group records.

- Query message carrying the source addresses

  IGMPv3 is compatible with IGMPv1 and IGMPv2 and supports IGMP general queries and IGMP group-specific queries. It also introduces IGMP group-and-source-specific queries.

  - A general query does not carry a group address or a source address.
  - A group-specific query carries a group address, but no source address.
  - A group-and-source-specific query carries a group address and one or more source addresses.

- Reports containing multiple group records

  Unlike an IGMPv1 or IGMPv2 report, an IGMPv3 report is destined to 224.0.0.22 and contains one or more group records. Each group record contains a multicast group address and a multicast source address list.

  Group records include the following categories:

  - **IS_IN**—The current filtering mode is Include. The report sender requests the multicast data only from the sources specified in the Source Address field.
  - **IS_EX**—The current filtering mode is Exclude. The report sender requests the multicast data from any sources except those specified in the Source Address field.
  - **TO_IN**—The filtering mode has changed from Exclude to Include.
  - **TO_EX**—The filtering mode has changed from Include to Exclude.
  - **ALLOW**—The Source Address field contains a list of additional sources from which the receiver wants to obtain data. If the current filtering mode is Include, these sources are added to the multicast source list. If the current filtering mode is Exclude, these sources are deleted from the multicast source list.
  - **BLOCK**—The Source Address field contains a list of the sources from which the receiver no longer wants to obtain data. If the current filtering mode is Include, these sources are deleted from the multicast source list. If the current filtering mode is Exclude, these sources are added to the multicast source list.

IGMP SSM mapping

An IGMPv3 host can explicitly specify multicast sources in its IGMPv3 reports. From the reports, the IGMP device can obtain the multicast source addresses and directly provide the SSM service. However, an IGMPv1 or IGMPv2 host cannot specify multicast sources in its IGMPv1 or IGMPv2 reports.

The IGMP SSM mapping feature enables the IGMP device to provide SSM support for IGMPv1 or IGMPv2 hosts. The device translates (*, G) in IGMPv1 or IGMPv2 reports into (G, INCLUDE, (S1, S2...)) based on the configured IGMP SSM mappings.

Figure 3 IGMP SSM mapping

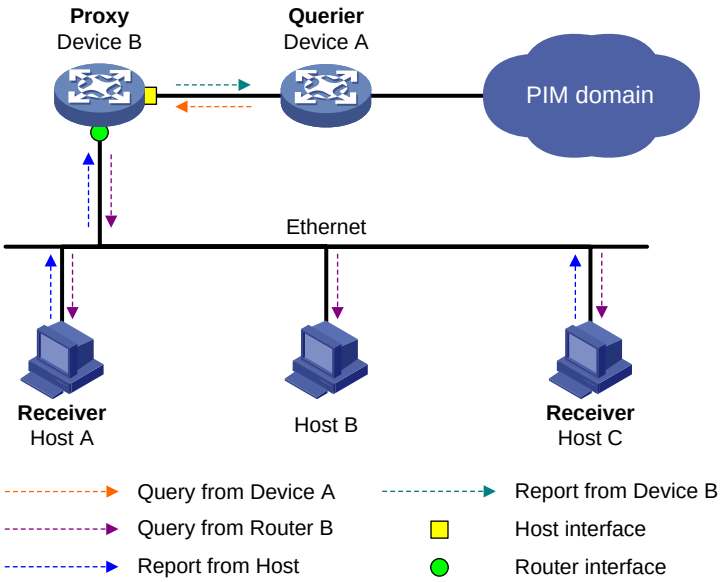
As shown in Figure 3, on an SSM network, Host A, Host B, and Host C run IGMPv1, IGMPv2, and IGMPv3, respectively. To provide the SSM service for Host A and Host B, you must configure the IGMP SSM mapping feature on Device A.

After IGMP SSM mappings are configured, Device A checks the multicast group address G in the received IGMPv1 or IGMPv2 report, and performs the following operations:

- If G is not in the SSM group range, Device A provides the ASM service.
- If G is in the SSM group range but does not match any IGMP SSM mapping, Device A drops the report.
- If G is in the SSM group range and matches IGMP SSM mappings, Device A translates (*, G) in the report into (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The IGMP SSM mapping feature does not process IGMPv3 reports.



For more information about SSM group ranges, see "PIM overview" and "Configuring PIM."

IGMP proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to run multicast routing protocols, such as PIM, on edge devices. Instead, you can configure IGMP proxying on these devices. With IGMP proxying configured, the edge device acts as an IGMP proxy:

- For the upstream IGMP querier, the IGMP proxy device acts as a host.
- For the downstream receiver hosts, the IGMP proxy device acts as an IGMP querier.

Figure 4 IGMP proxying

The following types of interfaces are defined in IGMP proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running IGMP. IGMP proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running IGMP. IGMP must be configured on this interface.

An IGMP proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or send join/leave messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received IGMP reports.

IGMP support for VPNs

IGMP maintains group memberships on a per-interface basis. After receiving an IGMP message on an interface, IGMP processes the packet within the VPN to which the interface belongs. IGMP only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 1112, *Host Extensions for IP Multicasting*
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 3376, *Internet Group Management Protocol, Version 3*

IGMP tasks at a glance

To configure IGMP, perform the following tasks:

1. Enabling IGMP
2. (Optional.) Configuring basic IGMP features
   - Specifying an IGMP version
   - Configuring a static group member
   - Configuring a multicast group policy
3. (Optional.) Adjusting IGMP performance
   - Configuring IGMP query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring IGMP SSM mappings
5. (Optional.) Configuring IGMP proxying

7. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
8. (Optional.) Enabling SNMP notifications for IGMP
9. (Optional.) Configuring IGMP logging
   - Enabling IGMP logging
   - Enabling log message suppression for IGMP

Prerequisites for IGMP

Before you configure IGMP, you must configure any unicast routing protocol so that all devices can interoperate at the network layer.

Enabling IGMP

Restrictions and guidelines

Enable IGMP on interfaces where the multicast group memberships are established and maintained.

For IGMP to take effect on an interface, you must configure the primary IP address for the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable IGMP.
   `igmp enable`

By default, IGMP is disabled.

Configuring basic IGMP features

Specifying an IGMP version

Restrictions and guidelines

For IGMP to operate correctly, specify the same IGMP version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IGMP version on the interface.
   igmp version *version-number*
   By default, the IGMP version on an interface is IGMPv2.

Configuring a static group member

About this task

You can configure an interface as a static group member of a multicast group. Then, the interface can always receive multicast data addressed to the specified multicast group.

A static group member does not respond to IGMP queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited IGMP report or leave message.

Restrictions and guidelines

The interface to be configured as a static group member has the following restrictions:

- If the interface is IGMP and PIM-SM enabled, it must be a PIM-SM DR.
- If the interface is IGMP enabled but not PIM-SM enabled, it must be an IGMP querier.

For more information about PIM-SM and DR, see "PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a static group member.
   igmp static-group *group-address* [**source** *source-address*]

Configuring a multicast group policy

About this task

This feature enables an interface to filter IGMP reports by using an ACL that specifies multicast groups and the optional sources. It is used to control the multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send IGMP reports.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a multicast group policy.
   igmp group-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* } [*version-number*]

Adjusting IGMP performance

Configuring IGMP query and response parameters

About this task

The following are IGMP query and response parameters:

- **IGMP querier's robustness variable**—Number of times for retransmitting IGMP queries in case of packet loss. A higher robustness variable makes the IGMP querier more robust, but increases the timeout time for multicast groups.
- **IGMP startup query interval**—Interval at which an IGMP querier sends IGMP general queries at startup.
- **IGMP startup query count**—Number of IGMP general queries that an IGMP querier sends at startup.
- **IGMP general query interval**—Interval at which an IGMP querier sends IGMP general queries to check for multicast group members on the network.
- **IGMP last member query interval**—In IGMPv2, it sets the interval at which a querier sends group-specific queries after receiving a leave message. In IGMPv3, it sets the interval at which a querier sends group-and-source-specific queries after receiving a report that changes multicast source and group mappings.
- **IGMP last member query count**—In IGMPv2, it sets the number of group-specific queries that a querier sends after receiving a leave message. In IGMPv3, it sets the number of group-and-source-specific queries that a querier sends after receiving a report that changes multicast source and group mappings.
- **IGMP maximum response time**—Maximum time before a receiver responds with a report to an IGMP general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the IGMP query. When the timer value for a group decreases to 0, the receiver sends an IGMP report to the group.
- **IGMP other querier present timer**—Lifetime for an IGMP querier after a non-querier receives an IGMP general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

To avoid frequent IGMP querier changes, set the IGMP other querier present timer greater than the IGMP general query interval. In addition, configure the same IGMP other querier present timer for all IGMP devices on the same subnet.

To avoid mistakenly deleting multicast receivers, set the IGMP general query interval greater than the maximum response time for IGMP general queries.

To speed up the response to IGMP queries and avoid simultaneous timer expirations that cause IGMP report traffic bursts, set an appropriate maximum response time.

- For IGMP general queries, the maximum response time is set by the **max-response-time** command.
- For IGMP group-specific queries and IGMP group-and-source-specific queries, the maximum response time equals the IGMP last member query interval.

The following configurations take effect only on the devices that run IGMPv2 and IGMPv3:

- Maximum response time for IGMP general queries.
- IGMP last member query interval.
- IGMP last member query count.
- IGMP other querier present interval.

You can configure the IGMP query and response parameters globally for all interfaces in IGMP view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the IGMP query and response parameters globally

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the IGMP querier's robustness variable.
   robust-count *count*
   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.
   startup-query-interval *interval*
   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.
   startup-query-count *count*
   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.
   query-interval *interval*
   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.
   last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.
   last-member-query-count *count*
   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.
   max-response-time *time*
   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.
    other-querier-present-interval *interval*

By default, the IGMP other querier present timer is calculated by using the following formula: [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Configuring the IGMP query and response parameters on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the IGMP querier's robustness variable.

   igmp robust-count *count*

   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.

   igmp startup-query-interval *interval*

   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.

   igmp startup-query-count *count*

   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.

   igmp query-interval *interval*

   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.

   igmp last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.

   igmp last-member-query-count *count*

   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.

   igmp max-response-time *time*

   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.

    igmp other-querier-present-interval *interval*

    By default, the IGMP other querier present timer is calculated by using the following formula:

    [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an IGMP querier to send leave notifications to the upstream without sending group-specific or group-and-source-specific queries after receiving a leave message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Restrictions and guidelines

The fast-leave processing configuration takes effect only when the device runs IGMPv2 or IGMPv3.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   igmp fast-leave [**group-policy** *ipv4-acl-number*]
   By default, fast-leave processing is disabled.

Configuring IGMP SSM mappings

About this task

This feature enables the device to provide SSM services for IGMPv1 or IGMPv2 hosts.

Restrictions and guidelines

This feature does not process IGMPv3 messages. Enable IGMPv3 on the receiver-side interface to ensure that IGMPv3 reports can be processed..

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Configure an IGMP SSM mapping.
   ssm-mapping *source-address* { *ipv4-acl-number* | **name** *ipv4-acl-name* }

Configuring IGMP proxying

Prerequisites for configuring IGMP proxying

Before you configure IGMP proxying, determine the router interfaces and host interfaces based on the network topology, and enable IGMP on the router interfaces.

Enabling IGMP proxying

Restrictions and guidelines

If IGMP proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward multicast traffic.

Enable IGMP proxying on the receiver-side interfaces.

On an interface enabled with IGMP proxying, only the **igmp version** command takes effect and other IGMP commands do not take effect.

If you enable both IGMP proxying and a multicast routing protocol (such as PIM or MSDP) on the same device, the multicast routing protocol does not take effect.

In IGMPv1, the DR is elected by PIM and acts as the IGMP querier. Because PIM does not take effect on a proxy device, a router interface running IGMPv1 cannot be elected as the DR. To ensure that the downstream receiver hosts on the router interface can receive multicast data, you must

enable multicast forwarding on the interface. For more information, see "Enabling multicast forwarding on a non-querier interface."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IGMP proxying.
   igmp proxy enable
   By default, IGMP proxying is disabled.

Enabling multicast forwarding on a non-querier interface

About this task

Typically, only IGMP queriers can forward multicast traffic and non-queriers cannot. This prevents multicast data from being repeatedly forwarded. If a router interface on an IGMP proxy device failed in the querier election, enable multicast forwarding on the interface to forward multicast data to attached receiver hosts.

Restrictions and guidelines

A shared-media network might have multiple IGMP proxies, including one proxy acting as a querier. To avoid duplicate multicast traffic, do not enable multicast forwarding on any of the non-querier IGMP proxies for the network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable multicast forwarding on the interface.
   igmp proxy forwarding
   By default, multicast forwarding is disabled on a non-querier interface.

Configuring multicast load splitting for IGMP proxy interfaces

About this task

If multiple IGMP proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards multicast traffic. You can enable multicast load splitting for IGMP proxy interfaces so that all the proxy interfaces can share multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Enable multicast load splitting for IGMP proxy interfaces.
   proxy multipath
   By default, multicast load splitting is disabled for IGMP proxy interfaces.

Enabling IGMP NSR

About this task

This feature backs up information about IGMP interfaces and IGMP multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP NSR.
   igmp non-stop-routing
   By default, IGMP NSR is disabled.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP

About this task

To report critical IGMP events to an SNMP NMS, enable SNMP notifications for IGMP.

For IGMP SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IGMP.
   snmp-agent trap enable igmp [**join** | **leave**] *
   By default, SNMP notifications are enabled for IGMP.

Configuring IGMP logging

Enabling IGMP logging

About this task

To report critical IGMP events to the information center, enable IGMP logging. For IGMP log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see Network Management and Monitoring Configuration Guide.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IGMP logging or use the **igmp log suppress** command to enable IGMP log message suppression.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP logging.
   igmp log enable [**group**]
   IGMP logging is enabled by default.

Enabling log message suppression for IGMP

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IGMP. With this feature configured, the speed of sending IGMP log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IGMP logging has been enabled using the **igmp log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for IGMP.
   igmp log suppress [**group**]
   By default, log message suppression is enabled for IGMP.

Display and maintenance commands for IGMP

CAUTION:
The **reset igmp group** command might cause multicast data transmission failures.

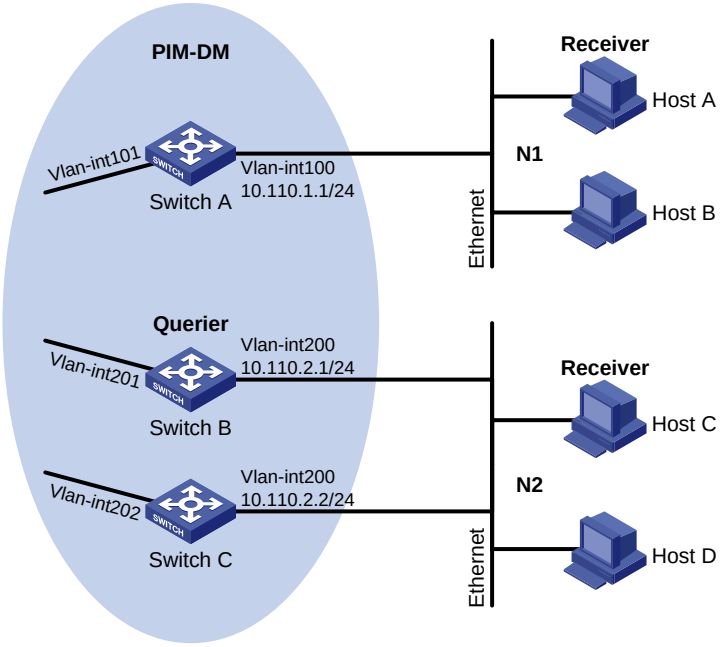
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IGMP multicast groups.	**display igmp** [**vpn-instance** *vpn-instance-name*] **group** [*group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display IGMP information for interfaces.	**display igmp** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**host** | **proxy**] [**verbose**]
Display multicast group membership information maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display multicast routing entries maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]
Display IGMP SSM mappings.	**display igmp** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*
Display authorization information for IGMP users.	**display igmp user-authorization** [**interface** *interface-type interface-number*]
Clear dynamic IGMP multicast group entries.	**reset igmp** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

IGMP configuration examples

Example: Configuring basic IGMP features

Network configuration



As shown in Figure 5:

- OSPF and PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are receiver hosts in N1 and N2, respectively.
- IGMPv2 runs between Switch A and N1, and between the other two switches and N2. Switch A acts as the IGMP querier in N1. Switch B acts as the IGMP querier in N2 because it has a lower IP address.

Configure the routers to meet the following requirements:

- The hosts in N1 can join only multicast group 224.1.1.1.
- The hosts in N2 can join any multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches in the PIM-DM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   ```

```
[SwitchB-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IP multicast routing.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure a multicast group policy on Switch A so that hosts connected to VLAN-interface 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display IGMP information for VLAN-interface 200 on Switch B.

```
[SwitchB] display igmp interface vlan-interface 200
 Vlan-interface200(10.110.2.1):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
   Maximum query response time for IGMP: 10s
   Querier for IGMP: 10.110.2.1 (This router)
  IGMP groups reported in total: 1
```

Example: Configuring IGMP SSM mapping

Network configuration

As shown in Figure 6:

- OSPF runs on the network.
- The PIM-SM domain uses the SSM model for multicast delivery. The SSM group range is 232.1.1.0/24.
- IGMPv3 runs on VLAN-interface 400 of Switch D. The receiver host runs IGMPv2, and does not support IGMPv3. The receiver host cannot specify multicast sources in its membership reports.

- Source 1, Source 2, and Source 3 send multicast packets to multicast groups in the SSM group range 232.1.1.0/24.

Configure the IGMP SSM mapping feature on Switch D so that the receiver host can receive multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

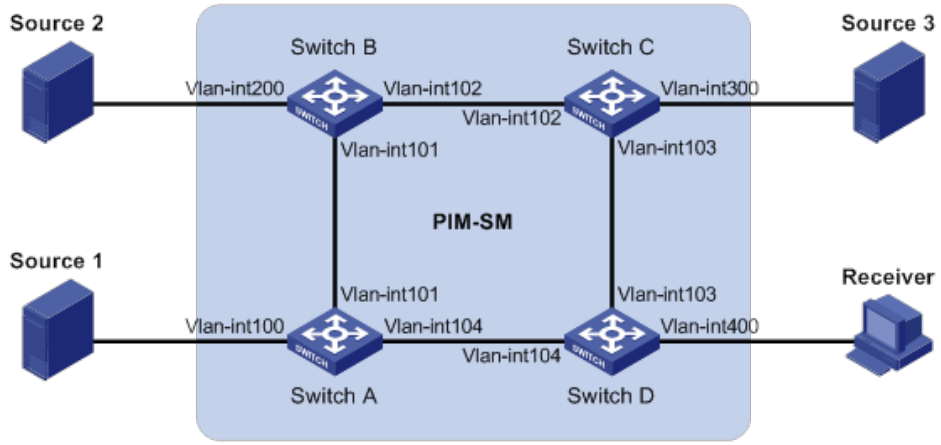


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	133.133.1.1/24	Source 3	—	133.133.3.1/24
Source 2	—	133.133.2.1/24	Receiver	—	133.133.4.1/24
Switch A	Vlan-int100	133.133.1.2/24	Switch C	Vlan-int300	133.133.3.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Vlan-int103	192.168.3.1/24
Switch A	Vlan-int104	192.168.4.2/24	Switch C	Vlan-int102	192.168.2.2/24
Switch B	Vlan-int200	133.133.2.2/24	Switch D	Vlan-int400	133.133.4.2/24
Switch B	Vlan-int101	192.168.1.2/24	Switch D	Vlan-int103	192.168.3.2/24
Switch B	Vlan-int102	192.168.2.1/24	Switch D	Vlan-int104	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches in the PIM-SM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP:

   # On Switch D, enable IP multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] multicast routing
   [SwitchD-mrib] quit
   ```

   # Enable IGMPv3 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] igmp enable
   [SwitchD-Vlan-interface400] igmp version 3
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

On Switch D, specify 232.1.1.0/24 as the SSM group range.

```
[SwitchD] acl basic 2000
[SwitchD-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-basic-2000] quit
[SwitchD] pim
[SwitchD-pim] ssm-policy 2000
[SwitchD-pim] quit
```

Configure the SSM group range on Switch A, Switch B, and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure IGMP SSM mappings on Switch D.

```
[SwitchD] igmp
[SwitchD-igmp] ssm-mapping 133.133.1.1 2000
[SwitchD-igmp] ssm-mapping 133.133.3.1 2000
[SwitchD-igmp] quit
```

Verifying the configuration

Display IGMP SSM mappings for multicast group 232.1.1.1 on Switch D.

```
[SwitchD] display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        133.133.1.1
        133.133.3.1
```

On Switch D, display information about IGMP multicast groups that hosts have dynamically joined.

```
[SwitchD] display igmp group
IGMP groups in total: 1
 Vlan-interface400(133.133.4.2):
```

```
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   232.1.1.1       133.133.4.1     00:02:04    off
```

Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (133.133.1.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: 192.168.4.2
         RPF prime neighbor: 192.168.4.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -

 (133.133.3.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.3.1
         RPF prime neighbor: 192.168.3.1
     Downstream interface information:
     Total number of downstream interfaces: 1

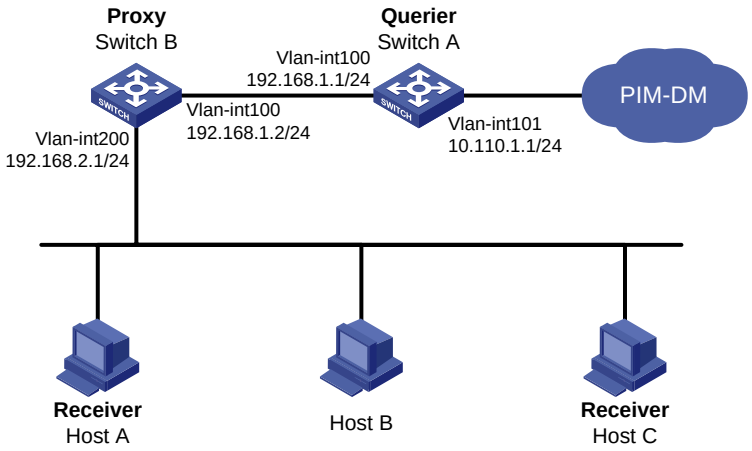
             Protocol: igmp, UpTime: 00:13:25, Expires: -
```

Example: Configuring IGMP proxying



Network configuration

As shown in Figure 7:

- PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information sent to multicast group 224.1.1.1.

Configure the IGMP proxying feature on Switch B so that Switch B can maintain group memberships and forward multicast traffic without running PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Enable IP multicast routing, PIM-DM, IGMP, and IGMP proxying:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp proxy enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   [SwitchB-Vlan-interface200] quit
   ```

Verifying the configuration

Display multicast group membership information maintained by the IGMP proxy on Switch B.

```
[SwitchB] display igmp proxy group
IGMP proxy group records in total: 1
```

```
Vlan-interface100(192.168.1.2):
 IGMP proxy group records in total: 1
  Group address      Member state      Expires
  224.1.1.1          Delay             00:00:02
```

Troubleshooting IGMP

No membership information on the receiver-side device

Symptom

When a host sends a report for joining multicast group G, no membership information of multicast group G exists on the device closest to that host.

Solution

To resolve the problem:

1. Use the **display igmp interface** command to verify that the networking, interface connection, and IP address configuration are correct.
2. Use the **display current-configuration** command to verify that multicast routing is enabled. If it is not enabled, use the **multicast routing** command in system view to enable IP multicast routing. In addition, verify that IGMP is enabled on the associated interfaces.
3. Use the **display igmp interface** command to verify that the IGMP version on the interface is lower than that on the host.
4. Use the **display current-configuration interface** command to verify that no multicast group policies have been configured to filter IGMP reports for multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different IGMP devices on the same subnet.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IGMP information on the interfaces. Make sure the devices on the subnet have the same IGMP settings on their interfaces.
2. Use the **display igmp interface** command on all devices on the same subnet to verify the IGMP-related timer settings. Make sure the settings are consistent on all the devices.
3. Use the **display igmp interface** command to verify that all devices on the same subnet are running the same IGMP version.
4. If the problem persists, contact H3C Support.

Configuring MLD

About MLD

Multicast Listener Discovery (MLD) establishes and maintains IPv6 multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

MLD versions

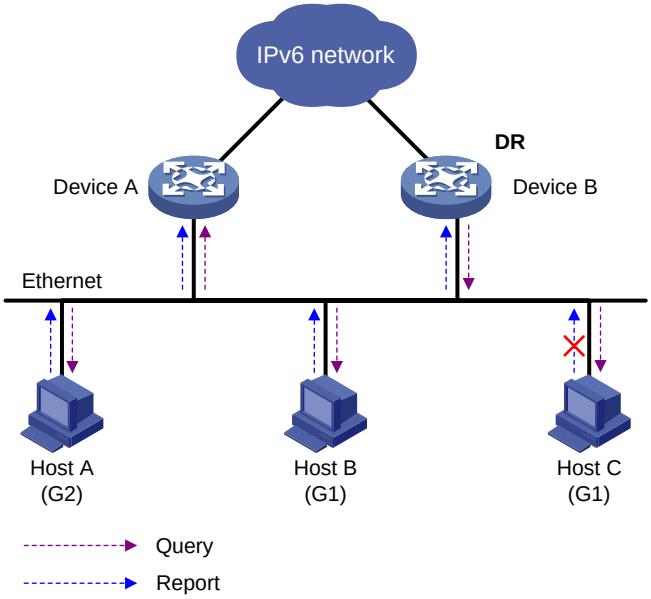
MLD has the following versions:

- MLDv1 (defined by RFC 2710), which is derived from IGMPv2.
- MLDv2 (defined by RFC 3810), which is derived from IGMPv3.

MLDv1 and MLDv2 support the ASM model. MLDv2 can directly implement the SSM model, but MLDv1 must work with the MLD SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."

How MLDv1 works

MLDv1 implements IPv6 multicast listener management based on the query and response mechanism.



Electing the MLD querier

All IPv6 multicast devices that run MLD on the same subnet can monitor MLD listener report messages (often called reports) from hosts. However, only one device can act as the MLD querier to send MLD query messages (often called queries). A querier election mechanism determines which device acts as the MLD querier on the subnet.

1. Initially, every MLD device assumes itself as the querier. Each device sends MLD general query messages (often called general queries) to all hosts and devices on the local subnet. The destination address of the general queries is FF02::1.
2. After receiving a general query, every MLD device compares the source IPv6 address of the query with its own link-local interface address. The device with the lowest IPv6 address wins the querier election and becomes the querier. All the other devices become non-queriers.
3. All the non-queriers start a timer called the "other querier present timer." If a device receives an MLD query from the querier before the timer expires, it resets this timer. Otherwise, it considers that the querier has timed out. In this case, the device initiates a new querier election process.

Joining an IPv6 multicast group

Figure 1 MLD queries and reports

As shown in Figure 1, Host B and Host C want to receive the IPv6 multicast data addressed to IPv6 multicast group G1. Host A wants to receive the IPv6 multicast data addressed to G2. The following process describes how the hosts join the IPv6 multicast groups and how the MLD querier (Device B in Figure 1) maintains the IPv6 multicast group memberships:

1. The hosts send unsolicited MLD reports to the IPv6 multicast groups they want to join without having to wait for the MLD queries.
2. The MLD querier periodically multicasts MLD queries (with the destination address FF02::1) to all hosts and devices on the local subnet.
3. After receiving a query, the host whose report delay timer expires first sends an MLD report to the IPv6 multicast group G1 to announce its membership for G1. In this example, Host B sends the report. After hearing the report from Host B, Host C, which is on the same subnet as Host B, suppresses its own report for G1.

   Because the MLD devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host MLD report suppression, helps reduce traffic on the local subnet.
4. At the same time, because Host A is interested in G2, it sends a report to the IPv6 multicast group G2.
5. Through the query/report process, the MLD devices determine that G1 and G2 have members on the local subnet. The IPv6 multicast routing protocol (for example, IPv6 PIM) that is running on the devices generates (*, G1) and (*, G2) multicast forwarding entries. These entries are the basis for subsequent IPv6 multicast forwarding. The asterisk (*) represents any IPv6 multicast source.
6. When the IPv6 multicast data addressed to G1 or G2 reaches an MLD device, the device looks up the IPv6 multicast forwarding table. Based on the (*, G1) and (*, G2) entries, the device forwards the IPv6 multicast data to the local subnet. Then, the receivers on the subnet receive the data.

Leaving an IPv6 multicast group

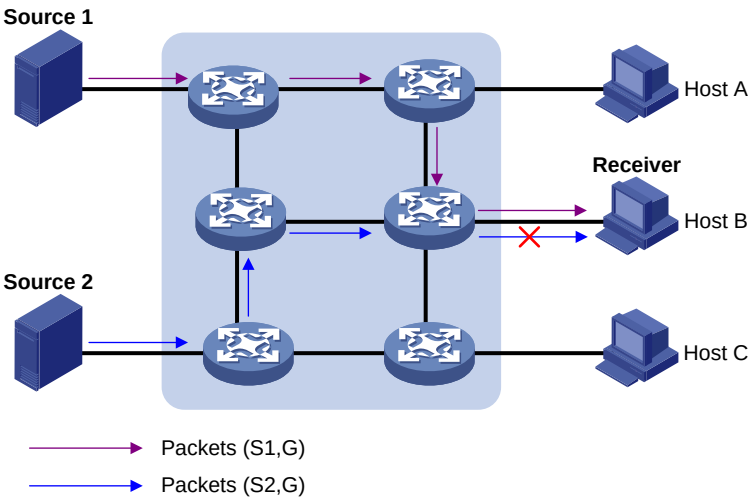
When a host is leaving an IPv6 multicast group, the following process occurs:

1. The host sends an MLD done message to all IPv6 multicast devices on the local subnet. The destination address of done messages is FF02::2.

2. After receiving the MLD done message, the querier sends a configurable number of multicast-address-specific queries to the group that the host is leaving. The IPv6 multicast addresses queried include both the destination address field and the group address field of the message.
3. One of the remaining members (if any on the subnet) in the group sends a report within the time of the maximum response time advertised in the multicast-address-specific queries.
4. If the querier receives a report for the group within the maximum response time, it maintains the memberships of the IPv6 multicast group. Otherwise, the querier assumes that no hosts on the subnet are interested in IPv6 multicast traffic addressed to that group and stops maintaining the memberships of the group.

MLDv2 enhancements

MLDv2 is based on and backwards-compatible with MLDv1. MLDv2 provides hosts with enhanced control capabilities and enhances the MLD state.



Enhancements in control capability of hosts

MLDv2 has introduced IPv6 multicast source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified IPv6 multicast sources. When a host joins an IPv6 multicast group, one of the following occurs:

- If the host expects IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host does not expect IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two IPv6 multicast sources, Source 1 (S1) and Source 2 (S2). Both of the sources can send IPv6 multicast data to IPv6 multicast group G. Host B wants to receive IPv6 multicast data addressed to G from Source 1 but not from Source 2.

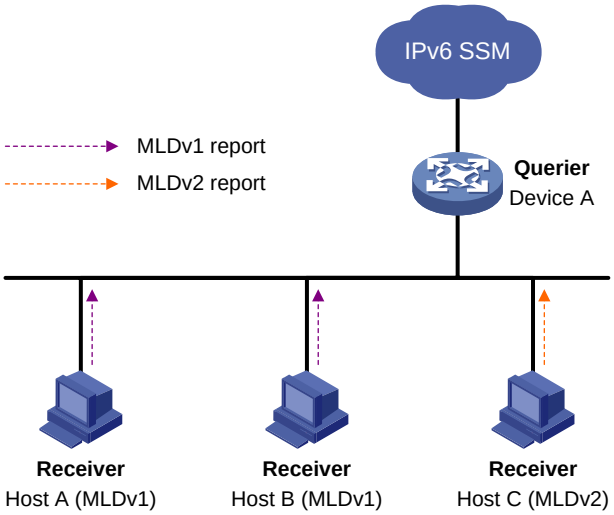
Figure 2 Flow paths of multicast-address-and-source-specific multicast traffic

In MLDv1, Host B cannot select IPv6 multicast sources when it joins IPv6 multicast group G. The IPv6 multicast streams from both Source 1 and Source 2 flow to Host B whether it needs them or not.

In MLDv2, Host B can explicitly express its interest in IPv6 multicast data destined to G from Source 1 but not from Source 2. Then, Host B receives only IPv6 multicast data from Source 1.

Enhancement in MLD state

A multicast device that is running MLDv2 maintains the multicast address state for each multicast address on each attached subnet. The multicast address state consists of the following information:



- **Filter mode**—Device keeps tracing the Include or Exclude state.
- **List of sources**—Device keeps tracing the newly added or deleted IPv6 multicast source.
- **Timers**—Filter timers, which include the time that the device waits before switching to the Include mode after an IPv6 multicast address times out, and source timers for source recording.

MLD SSM mapping

An MLDv2 host can explicitly specify multicast sources in its MLDv2 reports. From the reports, the MLD device can obtain the multicast source addresses and directly provide the SSM service. However, an MLDv1 host cannot specify multicast sources in its MLDv1 reports.

The MLD SSM mapping feature enables the MLD device to provide SSM support for MLDv1 receiver host. The device translates (*, G) in MLDv1 reports into (G, INCLUDE, (S1, S2...)) based on the configured MLD SSM mappings.

Figure 3 Network diagram

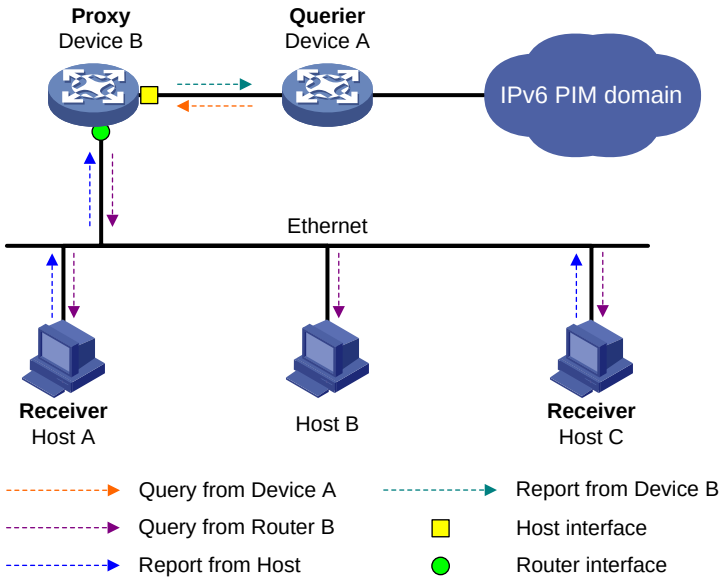
As shown in Figure 3, Host A and Host B on the IPv6 SSM network run MLDv1, and Host C runs MLDv2. To provide the SSM service for Host A and Host B, you must configure the MLD SSM mapping feature on Device A.

After MLD SSM mappings are configured, Device A checks the IPv6 multicast group address G carried in the message, and performs the following operations:

- If G is not in the IPv6 SSM group range, Device A provides the ASM service.
- If G is in the IPv6 SSM group range but does not match any MLD SSM mapping, Device A drops the report.
- If G is in the IPv6 SSM group range and matches MLD SSM mappings, Device A translates (*, G) in the report to (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The MLD SSM mapping feature does not process MLDv2 reports.



For more information about the IPv6 SSM group ranges, see "IPv6 PIM overview" and "Configuring IPv6 PIM."

MLD proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to configure IPv6 multicast routing protocols, such as IPv6 PIM, on edge devices. Instead, you can configure MLD proxying on these devices. With MLD proxying configured, the edge device acts as an MLD proxy:

- For the upstream MLD querier, the MLD proxy device acts as a host.
- For the downstream receiver hosts, the MLD proxy device acts as an MLD querier.

Figure 4 Network diagram

The following interfaces are defined in MLD proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running MLD. MLD proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running MLD. MLD must be configured on this interface.

An MLD proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or sends join/done messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received MLD reports.

MLD support for VPNs

MLD maintains group memberships on a per-interface basis. After receiving an MLD message on an interface, MLD processes the packet within the VPN to which the interface belongs. MLD only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*

- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*

MLD tasks at a glance

To configure MLD, perform the following tasks:

1. Enabling MLD
2. (Optional.) Configuring basic MLD features
   - Specifying an MLD version
   - Configuring a static group member
   - Configuring an IPv6 multicast group policy
3. (Optional.) Adjusting MLD performance
   - Configuring MLD query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring MLD SSM mappings
5. (Optional.) Configuring MLD proxying
   - Enabling MLD proxying
   - Enabling IPv6 multicast forwarding on a non-querier interface
   - Enabling IPv6 multicast load splitting for MLD proxy interfaces
6. (Optional.) Enabling MLD NSR
7. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
8. (Optional.) Enabling SNMP notifications for MLD
9. (Optional.) Configuring MLD logging
   - Enabling MLD logging
   - Enabling log message suppression for MLD

Prerequisites for MLD

Before you configure MLD, you must configure an IPv6 unicast routing protocol so that all devices can interoperate at the network layer.

Enabling MLD

Restrictions and guidelines

Perform this task on interfaces where IPv6 multicast group memberships are created and maintained.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable MLD.
   mld enable
   By default, MLD is disabled.

Configuring basic MLD features

Specifying an MLD version

Restrictions and guidelines

For MLD to operate correctly, specify the same MLD version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an MLD version on the interface.
   mld version *version-number*
   By default, the MLD version on an interface is MLDv1.

Configuring a static group member

About this task

You can configure an interface as a static member of an IPv6 multicast group. Then, the interface can always receive IPv6 multicast data for the group.

A static group member does not respond to MLD queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited MLD report or done message.

Restrictions and guidelines

The interface to be configured as a static member of an IPv6 multicast group has the following restrictions:

- If the interface is MLD and IPv6 PIM-SM enabled, it must be an IPv6 PIM-SM DR.
- If the interface is MLD enabled but not IPv6 PIM-SM enabled, it must be an MLD querier.

For more information about IPv6 PIM-SM and DR, see "IPv6 PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a static group member.
   mld static-group *ipv6-group-address* [**source** *ipv6-source-address*]
   By default, an interface is not a static group member.

Configuring an IPv6 multicast group policy

About this task

This feature enables an interface to filter MLD reports by using an ACL that specifies IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send MLD reports.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 multicast group policy on the interface.

   mld group-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* } [*version-number*]

   By default, the hosts attached to an interface can join any IPv6 multicast group policy.

Adjusting MLD performance

Configuring MLD query and response parameters

About this task

The following are MLD query and response parameters:

- **MLD querier's robustness variable**—Number of times for retransmitting MLD queries in case of packet loss. A higher robustness variable makes the MLD querier more robust, but increases the timeout time for IPv6 multicast groups.
- **MLD startup query interval**—Interval at which an MLD querier sends MLD general queries at startup.
- **MLD startup query count**—Number of MLD general queries that an MLD querier sends at startup.
- **MLD general query interval**—Interval at which an MLD querier sends MLD general queries to check for IPv6 multicast group members on the network.
- **MLD last listener query interval**—In MLDv1, it sets the interval at which a querier sends multicast-address-specific queries after receiving a done message. In MLDv2, it sets the interval at which a querier sends multicast-address-and-source-specific queries after receiving a report that changes IPv6 multicast source and group mappings.
- **MLD last listener query count**—In MLDv1, it sets the number of multicast-address-specific queries that the querier sends after receiving a done message. In MLDv2, it sets the number of multicast-address-and-source-specific queries that the querier sends after receiving a report that changes IPv6 multicast group and source mappings.
- **MLD maximum response time**—Maximum time before a receiver responds with a report to an MLD general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the MLD query. When the timer value decreases to 0, the receiver sends an MLD report to the group.

- **MLD other querier present timer**—Lifetime for an MLD querier after a non-querier receives an MLD general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

- To avoid frequent MLD querier changes, set the MLD other querier present timer greater than the MLD general query interval. In addition, configure the same MLD other querier present timer for all MLD devices on the same subnet.
- To speed up the response to MLD queries and avoid simultaneous timer expirations that cause MLD report traffic bursts, you must set an appropriate maximum response time.
  - For MLD general queries, the maximum response time is set by the **max-response-time** command.
  - For MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, the maximum response time equals the MLD last listener query interval.
- You can configure MLD query and response parameters globally for all interfaces in MLD view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the MLD query and response parameters globally

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the MLD querier's robustness variable.
   robust-count *count*
   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.
   startup-query-interval *interval*
   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.
   startup-query-count *count*
   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.
   query-interval *interval*
   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.
   last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.
   last-listener-query-count *count*
   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.
   max-response-time *time*
   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.
    other-querier-present-timeout *time*

By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Configuring the MLD query and response parameters on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the MLD querier's robustness variable.

   mld robust-count *count*

   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.

   mld startup-query-interval *interval*

   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.

   mld startup-query-count *count*

   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.

   mld query-interval *interval*

   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.

   mld last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.

   mld last-listener-query-count *count*

   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.

   mld max-response-time *time*

   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.

    mld other-querier-present-timeout *time*

    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an MLD querier to send leave notifications to the upstream without sending multicast-address-specific or multicast-address-and-source-specific queries after receiving a done message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   mld fast-leave [**group-policy** *ipv6-acl-number*]
   By default, fast-leave processing is disabled.

Configuring MLD SSM mappings

About this task

This feature enables the device to provide SSM services for MLDv1 hosts.

Restrictions and guidelines

This feature does not process MLDv2 messages. Enable MLDv2 on the receiver-side interface to ensure that MLDv2 reports from MLDv2 receiver hosts can be processed.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Configure an MLD SSM mapping.
   ssm-mapping *ipv6-source-address* { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   By default, no MLD SSM mapping is configured.

Configuring MLD proxying

Prerequisites for MLD proxying

Before you configure MLD proxying, determine the router interfaces and host interface based on the network topology. Then, enable MLD on the router interfaces.

Enabling MLD proxying

Restrictions and guidelines

- If MLD proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward IPv6 multicast traffic.
- Enable MLD proxying on the receiver-side interfaces.
- On an interface enabled with MLD proxying, only the **mld version** command takes effect and other MLD commands do not take effect.
- If you enable both MLD proxying and an IPv6 multicast routing protocol on the same device, the IPv6 multicast routing protocol does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Enable MLD proxying.

   mld proxy enable

   By default, MLD proxying is disabled.

Enabling IPv6 multicast forwarding on a non-querier interface

About this task

Typically, only MLD queriers can forward IPv6 multicast traffic and non-queriers cannot. This prevents IPv6 multicast data from being repeatedly forwarded. If a router interface on the MLD proxy failed the querier election, enable IPv6 multicast forwarding on the interface to forward IPv6 multicast data to downstream receivers.

Restrictions and guidelines

A shared-media network might have multiple MLD proxies, including one proxy acting as a querier. To avoid duplicate IPv6 multicast traffic, do not enable IPv6 multicast forwarding on any of the non-querier MLD proxies for the network.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable IPv6 multicast forwarding on a non-querier interface.

   mld proxy forwarding

   By default, IPv6 multicast forwarding is disabled on a non-querier interface.

Enabling IPv6 multicast load splitting for MLD proxy interfaces

About this task

If multiple MLD proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards IPv6 multicast traffic. You can enable IPv6 multicast load splitting on the device so that all the proxy interfaces can share IPv6 multicast traffic.

Procedure

1. Enter system view.

   system-view

2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]

3. Enable IPv6 multicast load splitting for MLD proxy interfaces.

   proxy multipath

   By default, IPv6 multicast load splitting is disabled for MLD proxy interfaces.

Enabling MLD NSR

About this task

This feature backs up information about MLD interfaces and MLD multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the IPv6 multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable MLD NSR.
   mld non-stop-routing
   By default, MLD NSR is disabled.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD

About this task

To report critical MLD events to an SNMP NMS, enable SNMP notifications for MLD.

For MLD SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for MLD.
   snmp-agent trap enable mld [**join** | **leave**] *
   By default, SNMP notifications are enabled for MLD.

Configuring MLD logging

Enabling MLD logging

About this task

To report critical MLD events to the information center, enable MLD logging. For MLD log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see Network Management and Monitoring Configuration Guide.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable MLD logging or use the **mld log suppress** command to enable log message suppression for MLD.

Procedure

1. Enter system view.
   system-view
2. Enable MLD logging.
   mld log enable [**group**]
   MLD logging is enabled by default.

Enabling log message suppression for MLD

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for MLD. With this feature configured, the speed of sending MLD log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure MLD logging has been enabled using the **mld log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for MLD.
   mld log suppress [**group**]
   By default, log message suppression is enabled for MLD.

Display and maintenance commands for MLD

CAUTION:
The **reset mld group** command might cause IPv6 multicast data transmission failures.

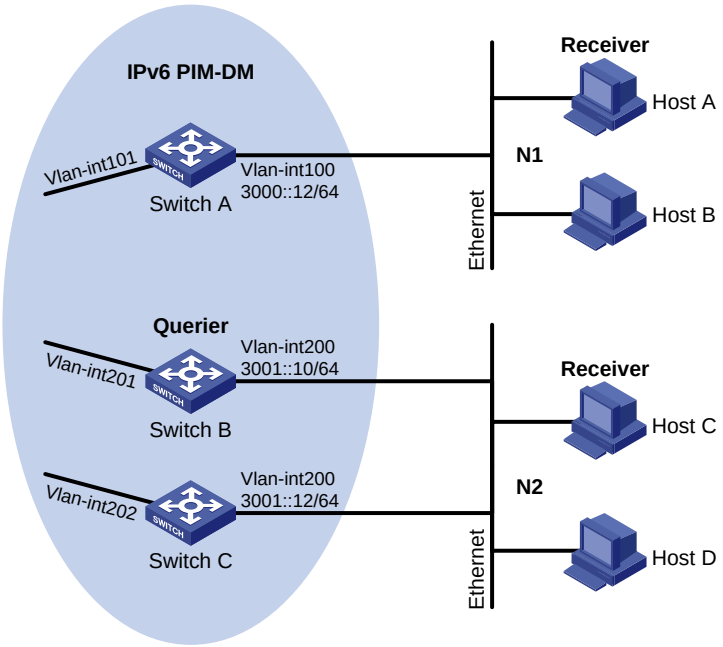
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about MLD multicast groups.	**display mld** [**vpn-instance** *vpn-instance-name*] **group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display MLD information for interfaces.	**display mld** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**proxy**] [**verbose**]
Display IPv6 multicast routing entries maintained by the MLD proxy.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display information about the MLD proxy routing table.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*]] * [**verbose**]
Display MLD SSM mappings.	**display mld** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*
Clear dynamic MLD multicast group entries.	**reset mld** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

MLD configuration examples

Example: Configuring basic MLD features

Network configuration



As shown in Figure 5:

- OSPFv3 and IPv6 PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are multicast receiver hosts in N1 and N2, respectively.
- MLDv1 runs between Switch A and N1, and between the other two switches (Switch B and Switch C) and N2.
- Switch A acts as the MLD querier in N1. Switch B acts as the MLD querier in N2 because it has a lower IPv6 address.

Configure the switches to meet the following requirements:

- The hosts in N1 can join only IPv6 multicast group FF1E::101.
- The hosts in N2 can join any IPv6 multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 5, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable the IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] mld enable
   [SwitchB-Vlan-interface200] quit
   ```

Enable IPv6 PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] ipv6 pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IPv6 multicast routing.

```
<SwitchC> system-view
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] mld enable
[SwitchC-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] ipv6 pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure an IPv6 multicast group policy on Switch A so that the hosts connected to VLAN-interface 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display MLD information for VLAN-interface 200 on Switch B.

```
[SwitchB] display mld interface vlan-interface 200
 Vlan-interface200(FE80::200:5EFF:FE66:5100):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
   Other querier present time for MLD: 255s
   Maximum query response time for MLD: 10s
   Querier for MLD: FE80::200:5EFF:FE66:5100 (This router)
  MLD groups reported in total: 1
```

Example: Configuring MLD SSM mapping

Network configuration

As shown in Figure 6:

- OSPFv3 runs on the network.
- The IPv6 PIM-SM domain uses the SSM model for IPv6 multicast delivery. The SSM group range is FF3E::/64.
- MLDv2 runs on VLAN-interface 400 of Switch D. The receiver host runs MLDv1, and does not support MLDv2. The receiver host cannot specify IPv6 multicast sources in its membership reports.

- Source 1, Source 2, and Source 3 send IPv6 multicast packets to multicast groups in IPv6 SSM group range FF3E::/64.

Configure the MLD SSM mapping feature on Switch D so that the receiver host will receive IPv6 multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

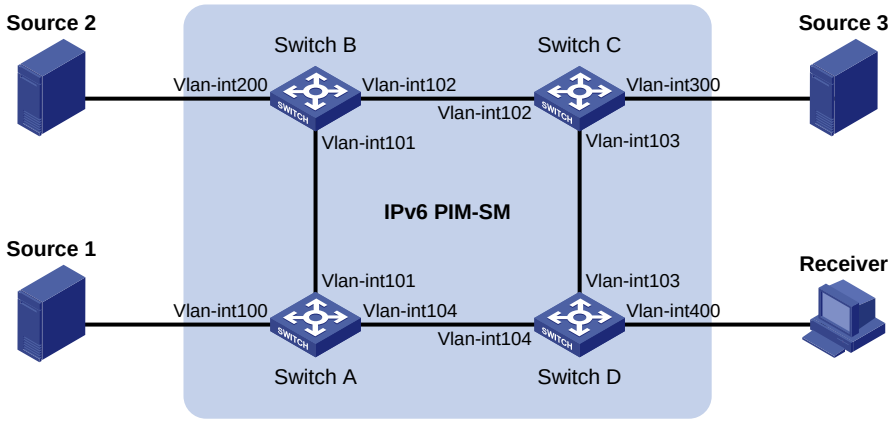


Table 1 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	1001::1/64	Source 3	—	3001::1/64
Source 2	—	2001::1/64	Receiver	—	4001::1/64
Switch A	Vlan-int100	1001::2/64	Switch C	Vlan-int300	3001::2/64
Switch A	Vlan-int101	1002::1/64	Switch C	Vlan-int103	3002::1/64
Switch A	Vlan-int104	1003::1/64	Switch C	Vlan-int102	2002::2/64
Switch B	Vlan-int200	2001::2/64	Switch D	Vlan-int400	4001::2/64
Switch B	Vlan-int101	1002::2/64	Switch D	Vlan-int103	3002::2/64
Switch B	Vlan-int102	2002::1/64	Switch D	Vlan-int104	1003::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Table 1, and configure OSPFv3 on the switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, and enable IPv6 PIM-SM and MLD:

   # On Switch D, enable IPv6 multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] ipv6 multicast routing
   [SwitchD-mrib6] quit
   ```

   # Enable MLDv2 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] mld enable
   [SwitchD-Vlan-interface400] mld version 2
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] ipv6 pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] ipv6 pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range:

On Switch D, specify FF3E::/64 as the IPv6 SSM group range.

```
[SwitchD] acl ipv6 basic 2000
[SwitchD-acl-ipv6-basic-2000] rule permit source ff3e:: 64
[SwitchD-acl-ipv6-basic-2000] quit
[SwitchD] pim ipv6
[SwitchD-pim6] ssm-policy 2000
[SwitchD-pim6] quit
```

Configure Switch A, Switch B and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure MLD SSM mappings on Switch D.

```
[SwitchD] mld
[SwitchD-mld] ssm-mapping 1001::1 2000
[SwitchD-mld] ssm-mapping 3001::1 2000
[SwitchD-mld] quit
```

Verifying the configuration

Display MLD SSM mappings for IPv6 multicast group FF3E::101 on Switch D.

```
[SwitchD] display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
        1001::1
        3001::1
```

On Switch D, display information about MLD multicast groups that hosts have dynamically joined.

```
[SwitchD] display mld group
MLD groups in total: 1
 Vlan-interface400(FE80::101):
```

```
  MLD groups reported in total: 1
   Group address: FF3E::101
    Last reporter: FE80::1
    Uptime: 00:02:04
    Expires: Off
```

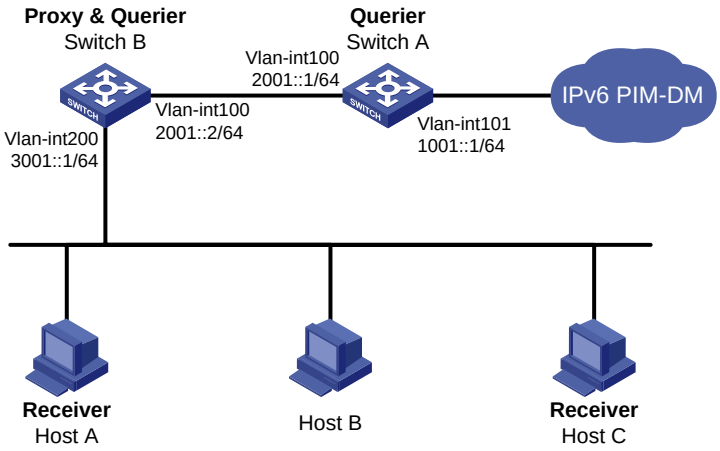
Display IPv6 PIM routing entries on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (1001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -

 (3001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -
```

Example: Configuring MLD proxying



Network configuration

As shown in Figure 7:

- IPv6 PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information destined to IPv6 multicast group FF3E::101.

Configure the MLD proxying feature on Switch B so that Switch B can maintain group memberships and forward IPv6 multicast traffic without running IPv6 PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 7.

Procedure

1. Enable IPv6 multicast routing, IPv6 PIM-DM, MLD, and MLD proxying:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast ipv6 routing-enable
   [SwitchB-mrib6] quit
   ```

   # Enable MLD proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] mld proxying enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable MLD on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] mld enable
   [SwitchB-Vlan-interface200] quit
   ```

Verifying the configuration

Display IPv6 multicast group membership information maintained by the MLD proxy on Switch B.

```
[SwitchB] display mld proxy group
MLD proxy group records in total: 1
```

```
Vlan-interface100(FE80::16:1):
 MLD proxy group records in total: 1
  Group address: FF1E::1
   Member state: Delay
   Expires: 00:00:02
```

Troubleshooting MLD

No member information exists on the receiver-side device

Symptom

When a host sends a message to announce that it is joining IPv6 multicast group G, no member information of multicast group G exists on the immediate device.

Solution

To resolve the problem:

1. Use the **`display mld interface`** command to verify that the networking, interface connections, and IP address configuration are correct.
2. Use the **`display current-configuration`** command to verify that the IPv6 multicast routing is enabled. If it is not enabled, use the **`ipv6 multicast routing`** command in system view to enable IPv6 multicast routing. In addition, verify that MLD is enabled on the associated interfaces.
3. Use the **`display mld interface`** command to verify that the MLD version on the interface is lower than that on the host.
4. Use the **`display current-configuration interface`** command to verify that no IPv6 multicast group policies have been configured to filter MLD reports for IPv6 multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different MLD devices on the same subnet.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to verify the MLD information on the interface. Make sure the devices on the subnet have the same MLD settings on their interfaces.
2. Use the **`display mld interface`** command on all devices on the same subnet to check the MLD timers for inconsistent configurations.
3. Use the **`display mld interface`** command to verify that all devices are running the same MLD version.
4. If the problem persists, contact H3C Support.

Configuring multicast routing and forwarding

About multicast routing and forwarding

Each multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the multicast routing protocols and statically configured multicast routing entries are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general multicast routing table. The optimal multicast routing entries in the general multicast routing table are added to the multicast forwarding table to guide multicast data forwarding.

RPF check mechanism

A multicast routing protocol uses reverse path forwarding (RPF) check to ensure the multicast data delivery along the correct path and to avoid data loops.

RPF check process

A multicast device performs the RPF check on a multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the unicast, MBGP, and static multicast routing tables.

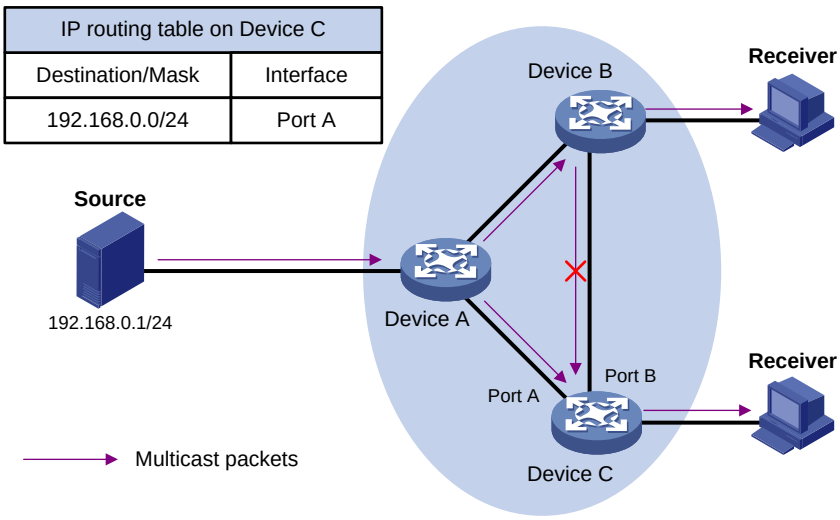
   The term "packet source" means different things in different situations:

   - For a packet that travels along the SPT, the packet source is the multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "PIM overview."
2. Selects one of the three optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with the highest subnet mask becomes the RPF route. If the routes have the same mask, the route with the highest route preference becomes the RPF route. If the routes have the same route preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with the highest route preference becomes the RPF route. If the routes have the same preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

   The RPF route contains the RPF interface and RPF neighbor information.
   - If the RPF route is a unicast route or MBGP route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
   - If the RPF route is a static multicast route, the RPF interface and RPF neighbor are specified in the route.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.



- If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in multicast

Implementing an RPF check on each received multicast packet brings a big burden to the device. The use of a multicast forwarding table is the solution to this issue. When the device creates a multicast forwarding entry for an (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up the multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source and the RPF interface. Then, it creates a forwarding entry with the RPF interface as the incoming interface and makes the following judgments:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all the outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all the outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following actions:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

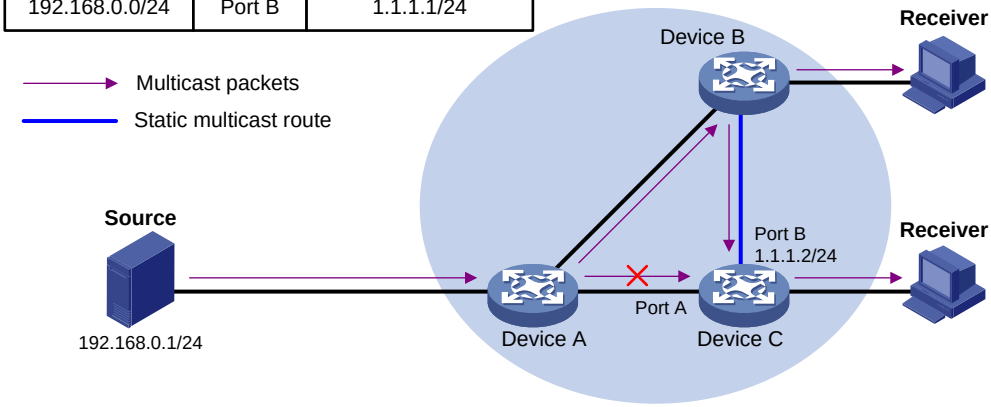
Figure 1 RPF check process

As shown in Figure 1, assume that unicast routes are available on the network, MBGP is not configured, and no static multicast routes have been configured on Device C. Multicast packets travel along the SPT from the multicast source to the receivers. The multicast forwarding table on Device C contains the (S, G) entry, with Port A as the incoming interface.

- If a multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.

- If a multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its unicast routing table and finds that the outgoing interface to the source (the RPF interface) is Port A. In this case, the (S, G) entry is correct, but the packet traveled along a wrong path. The packet fails the RPF check and Device C discards the packet.

Usages of static multicast routes



A static multicast route can change an RPF route or create an RPF route.

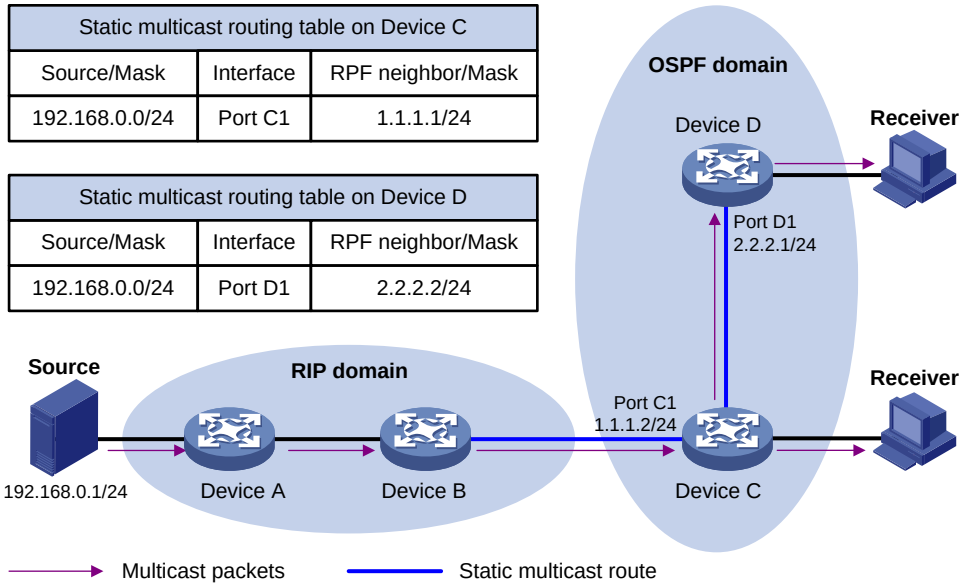
Changing an RPF route

Typically, the topology structure of a multicast network is the same as that of a unicast network, and multicast traffic follows the same transmission path as unicast traffic does. You can configure a static multicast route for a multicast source to change the RPF route. As a result, the device creates a transmission path for multicast traffic that is different from the transmission path for unicast traffic.

Figure 2 Changing an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port B	1.1.1.1/24

As shown in Figure 2, when no static multicast route is configured, Device C's RPF neighbor on the path back to the source is Device A. The multicast data from the source travels through Device A to Device C. You can configure a static multicast route on Device C and specify Device B as Device C's RPF neighbor on the path back to the source. The multicast data from the source travels along the path: Device A to Device B and then to Device C.



Creating an RPF route

When a unicast route is blocked, multicast forwarding might be stopped due to lack of an RPF route. You can configure a static multicast route to create an RPF route. In this way, a multicast routing entry is created to guide multicast forwarding.

Figure 3 Creating an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port C1	1.1.1.1/24

Static multicast routing table on Device D		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port D1	2.2.2.2/24

As shown in Figure 3, the RIP domain and the OSPF domain are unicast isolated from each other. For the receiver hosts in the OSPF domain to receive multicast packets from the multicast source in the RIP domain, you must configure Device C and Device D as follows:

- On Device C, configure a static multicast route for the multicast source and specify Device B as the RPF neighbor.
- On Device D, configure a static multicast route for the multicast source and specify Device C as the RPF neighbor.

Mtrace

Mtrace is a traceroute facility used to trace the path along which multicast group data travels from a source to a destination.

Device roles

Mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has a multicast-enabled interface on the same subnet as the destination and can forward specific multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the multicast source.
- **Client**—A client is a router that initiates an mtrace.

Process

The mtrace process is as follows:

1. The client sends an mtrace Query message (with a **hops** field indicating the maximum number of hops to trace) to the destination.
2. The LHR turns the received Query message to an mtrace Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

If the client does not receive a Reply message within the waiting time, the client initiates a hop-by-hop trace to determine which device on the path encountered an error. It sends a Query message with the **hops** field set to 1 and waits for a Reply message. If it does not receive a Reply message within the waiting time, the client determines that this hop encountered an error. If the client receives a Reply message within the waiting time, it sends a Query message with the **hops** field value increased by 1 and waits for a Reply message. This process continues until the client does not receive a Reply message within the waiting time any more.

Restrictions and guidelines: Multicast routing and forwarding configuration

During ISSU on a multichassis IRF, if the incoming interface of Layer 3 multicast traffic contains non-local member ports, Layer 3 multicast traffic interruption might occur when the device is rebooting.

Multicast routing and forwarding tasks at a glance

To configure multicast routing and forwarding, perform the following tasks:

1. Enabling IP multicast routing
2. (Optional.) Configuring static multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring multicast load splitting
5. (Optional.) Configuring a multicast forwarding boundary
6. (Optional.) Using mtrace to trace a multicast path
7. (Optional.) Setting the maximum number of cached unknown multicast packets
8. (Optional.) Setting the maximum number of copied multicast packets during software forwarding
9. (Optional.) Enabling multicast replication resource reuse

Prerequisites for multicast routing and forwarding

Before you configure multicast routing and forwarding, configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IP multicast routing

About this task

Enable IP multicast routing before you configure any Layer 3 multicast functionality on the public network or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.

Configuring static multicast routes

About this task

To configure a static multicast route for a multicast source, you can specify an RPF interface or an RPF neighbor for the multicast traffic from that source.

Restrictions and guidelines

Static multicast routes take effect only on the multicast devices on which they are configured, and will not be advertised throughout the network or redistributed to other devices.

Procedure

1. Enter system view.

   system-view

2. Configure a static multicast route.

   ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *gateway-address* | *interface-type interface-number* } [**preference** *preference*]

3. (Optional.) Delete all static multicast routes.

   delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

   You can use the **undo ip rpf-route-static** command to delete a specific static multicast route or use the **delete ip rpf-route-static** command to delete all static multicast routes.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check mechanism."

Procedure

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Specify the longest prefix match principle.

   longest-match

   By default, the route preference principle is used.

Configuring multicast load splitting

About this task

You can enable the device to split multiple data flows on a per-source basis or on a per-source-and-group basis. This optimizes the traffic delivery.

Procedure

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Configure multicast load splitting.

   load-splitting { **balance-ecmp** | **balance-ucmp** | **ecmp** | **flow-ucmp** | **source** | **source-group** | **ucmp** }

   By default, multicast load splitting is disabled.

Configuring an IPv4 multicast flow policy

About this task

You can configure the estimated bandwidth for matching multicast flows through an IPv4 multicast flow policy on a downstream device if the following conditions exist:

- ECMP routes between the downstream device and an upstream device.
- The multicast load-splitting mode is **flow-ucmp**.

When the downstream device selects an incoming interface on the upstream device, it selects the link with the smallest bandwidth usage calculated based on the estimated bandwidth. If two links have the same bandwidth usage, the link with the higher next-hop IP address is selected.

The bandwidth usage is calculated according to the following formula: Bandwidth usage = (Used bandwidth+Estimated bandwidth)/(Total interface bandwidth x (1–Unicast reserved bandwidth)).

- The estimated bandwidth is configured by the **bandwidth** command in IPv4 multicast flow policy view.
- The total interface bandwidth is configured by the **bandwidth** command in interface view.
- The unicast reserved bandwidth is configured by the **flow-ucmp unicast reserve-bandwidth** or **multicast flow-ucmp unicast reserve-bandwidth** command.

Restrictions and guidelines for configuring an IPv4 multicast flow policy

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

Adding, deleting, or modifying an IPv4 multicast flow policy does not affect the link selection results of existing multicast flows and affects link selection for only new multicast flows. Before configuring the multicast load-splitting mode as **flow-ucmp**, you must plan the configuration of an IPv4 multicast flow policy and the unicast reserved bandwidth configuration.

The change of link bandwidth and the change in the number of ECMP routes do not affect the route selection of existing multicast flows.

This feature does not affect multicast source-side link selection, link selection in PIM-DM, RPT link selection in PIM-SM, or local RP link selection.

If both IPv4 and IPv6 multicast flows exist in the network, increase the unicast reserved bandwidth as needed to avoid congestion.

Creating an IPv4 multicast flow policy

1. Enter system view.

   system-view

2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Create an IPv4 multicast flow policy.
   - Create a custom IPv4 multicast flow policy.
     flow-policy name *policy-name*
   - Create the default IPv4 multicast flow policy.
     flow-policy default

Configuring the multicast group range

About this task

Perform this task to configure a multicast group range in which an IPv4 multicast flow policy takes effect. If a multicast group matches the ACL specified in an IPv4 multicast flow policy, the estimated bandwidth configured in the policy is used for the multicast flows of the multicast group.

Restrictions and guidelines

This feature is not supported by the default IPv4 multicast flow policy.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv4 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the multicast group range.
   acl { *ipv4-acl-number* | **name** *ipv4-acl-name* }
   By default, an IPv4 multicast flow policy does not take effect on any multicast groups.

Configuring the estimated bandwidth

About this task

The estimated bandwidth is selected for IPv4 multicast flows as follows:

1. If the multicast group of an IPv4 multicast flow matches the ACL specified in a custom IPv4 multicast flow policy, the estimated bandwidth configured in the policy is selected for the multicast flow.
2. If the multicast group of an IPv4 multicast flow does not match an ACL in any custom IPv4 multicast flow policy, the estimated bandwidth configured in the default policy is selected for the multicast flow.
3. If the default policy is not created or the estimated bandwidth is not configured in the default policy, the estimated bandwidth for the multicast flow is 0.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv4 multicast flow policy view.

flow-policy { **default** | **name** *policy-name* }

4. Configure the estimated bandwidth.
   bandwidth *bandwidth* { **gbps** | **kbps** | **mbps** }
   By default, the estimated bandwidth is 0.

Configuring the IPv4 unicast reserved bandwidth percentage

About this task

Perform this task when IPv4 unicast traffic and IPv4 multicast traffic coexist in the network. The available bandwidth for multicast traffic is calculated based on the total interface bandwidth and the configured IPv4 unicast reserved bandwidth percentage. For example, if the total interface bandwidth is 100 kbps and the unicast reserved bandwidth percentage is 20% (20 kbps), the available bandwidth for multicast traffic is 80 kbps.

Restrictions and guidelines

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

The **flow-ucmp unicast reserve-bandwidth** command takes effect on all interfaces, and the **multicast flow-ucmp unicast reserve-bandwidth** command takes effect only on the current interface. If you execute both commands, the latter has higher priority.

Setting the global IPv4 unicast reserved bandwidth percentage

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Set the global IPv4 unicast reserved bandwidth percentage.
   flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the global IPv4 unicast reserved bandwidth percentage is not set.

Setting the IPv4 unicast reserved bandwidth percentage on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv4 unicast reserved bandwidth percentage on the interface.
   multicast flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the IPv4 unicast reserved bandwidth percentage is not set on an interface.

Configuring a multicast forwarding boundary

About this task

You can configure an interface as a multicast forwarding boundary for a multicast group range. The interface cannot receive or forward multicast packets for the group range.

Restrictions and guidelines

You do not need to enable IP multicast before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a multicast forwarding boundary for a multicast group range.
   multicast boundary *group-address* { *mask-length* | *mask* }
   By default, an interface is not a multicast forwarding boundary.

Using mtrace to trace a multicast path

Using mtrace1 to trace a multicast path

Hardware and feature compatibility

Only the S5200-HI-G switch series supports this feature.

Procedure

To use mtrace version 1 (mtrace1) to trace a multicast path, execute the following command in any view:

mtrace [**v1**] [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address*] [**verbose**]

Using mtrace2 to trace a multicast path

Hardware and feature compatibility

Only the S5200-HI-G switch series supports this feature.

Restrictions and guidelines

For successful mtrace, do not specify a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Specify the UDP port number used by mtrace.
   mtrace-service port *number*
   By default, mtrace uses UDP port number 10240.
3. Use mtrace version 2 (mtrace2) to trace a multicast path.
   mtrace v2 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]
   Execute this command in any view.
   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown multicast packets

About this task

The device caches a multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **multicast forwarding-table cache-unknown total** command to be far greater than the value in the **multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of unknown multicast packets that can be cached for an (S, G) entry.
   multicast forwarding-table cache-unknown per-entry *per-entry-limit*
   By default, the device can cache only one unknown multicast packet for an (S, G) entry.
3. Set the maximum number of unknown multicast packets that can be cached in total.
   multicast forwarding-table cache-unknown total *total-limit*
   By default, the device can cache 1024 unknown multicast packets in total.

Setting the maximum number of copied multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause multicast packets to be dropped.

CAUTION:
Perform this task under the guidance of H3C Support.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of copied multicast packets during software forwarding.
   multicast cpu-forwarding max-copy-count *count*
   The default setting is 5.

Enabling multicast replication resource reuse

About this task

Multicast replication resources are hardware resources used to replicate multicast traffic. By default, multiple (S, G) entries with the same outgoing interface use multiple multicast replication resources.

This feature allows (S, G) entries with the same outgoing interface to use the same multicast replication resource.

Restrictions and guidelines

For this feature to take effect ,you must use the **reboot** command to reboot the device.

Procedure

1. Enter system view.
   system-view
2. Enable multicast replication resource reuse.
   multicast replication-share enable
   By default, multicast replication resource reuse is disabled.

Display and maintenance commands for multicast routing and forwarding

CAUTION:
The **reset** commands might cause multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the MRIB.	**display mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display link selection information for IPv4 multicast flow policies.	**display multicast** [**vpn-instance** *vpn-instance-name*] **flow-policy info** [**interface** *interface-type interface-number* | **source** *source-address* | **group** *group-address* | **policy** { **default** | **name** *policy-name* }] *
Display multicast boundary information.	**display multicast** [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]
Display multicast fast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*source-address* | *group-address*] * [**slot** *slot-number*]
Display statistics for multicast forwarding	**display multicast** [**vpn-instance**

Task	Command
events.	*vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display multicast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number*| **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index* | **slot** *slot-number* | **statistics**] *
Display multicast forwarding capability information.	**display multicast forwarding-table capability [slot slot-number]**
Display multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]
Display RPF information for a multicast source.	**display multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]
Display multicast replication resource information.	**display multicast replication-share info** [**outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index*] * [**slot** *slot-number*]
Clear multicast fast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for multicast forwarding events.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear multicast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear multicast routing entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *source-address* [**mask** { *mask-length* |

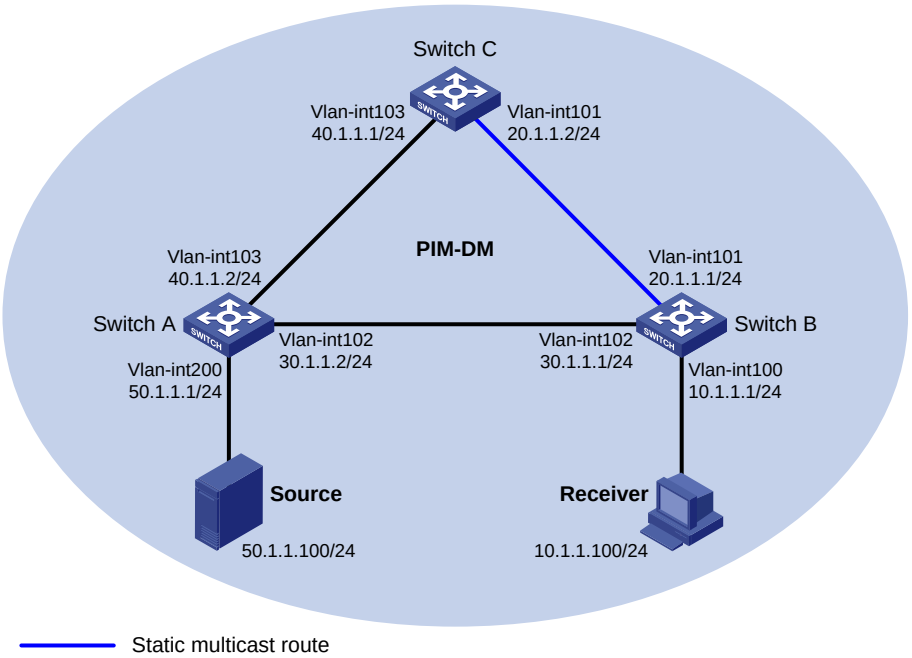
Task	Command
	mask }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear a multicast routing entry, the associated multicast forwarding entry is also cleared.
- When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 4:

- PIM-DM runs on the network.
- All switches on the network support multicast.
- Switch A, Switch B and Switch C run OSPF.
- Typically, the receiver host can receive the multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the multicast data from the source travels to the receiver through the path: Switch A to Switch C to Switch B. This is different from the unicast route.

Figure 4 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 4, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable PIM-DM on other interfaces.

   ```
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] pim dm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] pim dm
   [SwitchB-Vlan-interface102] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 200
   [SwitchA-Vlan-interface200] pim dm
   [SwitchA-Vlan-interface200] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim dm
   [SwitchA-Vlan-interface102] quit
   [SwitchA] interface vlan-interface 103
   [SwitchA-Vlan-interface103] pim dm
   [SwitchA-Vlan-interface103] quit
   ```

   # Enable IP multicast routing and PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

   ```
   [SwitchB] display multicast rpf-info 50.1.1.100
    RPF information about source 50.1.1.100:
        RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
        Referenced route/mask: 50.1.1.0/24
        Referenced route type: igp
        Route selection rule: preference-preferred
        Load splitting rule: disable
        Source AS: 0
        C-multicast route target: 0x0000000000000000
   ```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. Configure a static multicast route on Switch B and specify Switch C as its RPF neighbor on the route to the source.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 20.1.1.2
```

Verifying the configuration

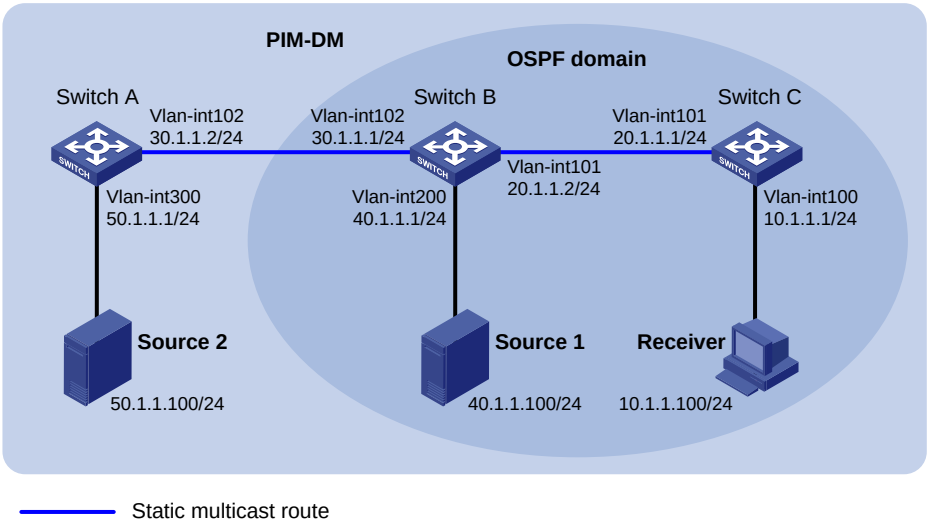
Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route



Network configuration

As shown in Figure 5:

- PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPF, and have no unicast routes to Switch A.
- Typically, the receiver host receives the multicast data from Source 1 in the OSPF domain.

Configure the switches so that the receiver host receives multicast data from Source 2, which is outside the OSPF domain.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 5, and configure OSPF on Switch B and Switch C.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch C, enable IP multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] multicast routing
   [SwitchC-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] igmp enable
   [SwitchC-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] pim dm
   [SwitchC-Vlan-interface101] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 300
   [SwitchA-Vlan-interface300] pim dm
   [SwitchA-Vlan-interface300] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim dm
   [SwitchA-Vlan-interface102] quit
   ```

   # Enable IP multicast routing and PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

   ```
   [SwitchB] display multicast rpf-info 50.1.1.100
   [SwitchC] display multicast rpf-info 50.1.1.100
   ```

   No output is displayed because no RPF routes to Source 2 exist on Switch B or Switch C.

3. Configure a static multicast route:

   # Configure a static multicast route on Switch B and specify Switch A as its RPF neighbor on the route to Source 2.

   ```
   [SwitchB] ip rpf-route-static 50.1.1.0 24 30.1.1.2
   ```

   # Configure a static multicast route on Switch C and specify Switch B as its RPF neighbor on the route to Source 2.

   ```
   [SwitchC] ip rpf-route-static 10.1.1.0 24 20.1.1.2
   ```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
```

```
    Referenced route/mask: 50.1.1.0/24
    Referenced route type: multicast static
    Route selection rule: preference-preferred
    Load splitting rule: disable
    Source AS: 0
    C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
    RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
    Referenced route/mask: 50.1.1.0/24
    Referenced route type: multicast static
    Route selection rule: preference-preferred
    Load splitting rule: disable
    Source AS: 0
    C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. The routes are the configured static routes.

Troubleshooting multicast routing and forwarding

Static multicast route failure

Symptom

No dynamic routing protocol is enabled on the device, and the physical status and link layer status of interfaces are both up, but the static multicast route fails.

Solution

To resolve the problem:

1. Use the **`display multicast routing-table static`** command to display information about static multicast routes. Verify that the static multicast route has been correctly configured and that the route entry exists in the static multicast routing table.
2. Check the type of interface that connects the static multicast route to the RPF neighbor. If the interface is not a point-to-point interface, be sure to specify the address for the RPF neighbor.
3. If the problem persists, contact H3C Support.

Configuring IPv6 multicast routing and forwarding

About IPv6 multicast routing and forwarding

Each IPv6 multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the IPv6 multicast routing protocols are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general IPv6 multicast routing table. The optimal IPv6 multicast routing entries in the general IPv6 multicast routing table are added to the IPv6 multicast forwarding table to guide IPv6 multicast data forwarding.

RPF check mechanism

An IPv6 multicast routing protocol uses the reverse path forwarding (RPF) check mechanism to ensure IPv6 multicast data delivery along the correct path and to avoid data loops.

RPF check process

An IPv6 multicast device performs the RPF check on an IPv6 multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the IPv6 unicast and IPv6 MBGP routing tables.

   In RPF check, the "packet source" means difference things in difference situations:

   - For a packet that travels along the SPT, the packet source is the IPv6 multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "IPv6 PIM overview."
2. Selects one of the optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with a higher prefix length becomes the RPF route. If the routes have the same prefix length, the route with a higher route preference becomes the RPF route. If the routes have the same route preference, the IPv6 MBGP route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IPv6 address becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with a higher route preference becomes the RPF route. If the routes have the same route preference, the IPv6 MBGP route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IPv6 address becomes the RPF route.

   In the RPF route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.
   - If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in IPv6 multicast

Implementing an RPF check on each received IPv6 multicast packet would heavily burden the device. The use of an IPv6 multicast forwarding table is the solution to this issue. When the device creates an IPv6 multicast forwarding entry for an IPv6 (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up its IPv6 multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source. Then, it creates a forwarding entry with the RPF interface as the incoming interface and performs one of the following tasks:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following tasks:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

Figure 1 RPF check process

As shown in Figure 1, assume that IPv6 unicast routes are available on the network. IPv6 MBGP is not configured. IPv6 multicast packets travel along the SPT from the multicast source to the receivers. The IPv6 multicast forwarding table on Device C contains the (S, G) entry, with Port A as the RPF interface.

- If an IPv6 multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.
- If an IPv6 multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its IPv6 unicast routing table and finds

that the outgoing interface to the source (the RPF interface) is Port A. This means that the (S, G) entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and Device C discards the packet.

IPv6 mtrace

IPv6 mtrace uses mtrace2 to trace the path along which IPv6 multicast group data travels from a source to a destination.

Device roles

IPv6 mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has an IPv6 multicast-enabled interface on the same subnet as the destination and can forward specific IPv6 multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the IPv6 multicast source.
- **Client**—A client is a router that initiates an mtrace2.

Process

The IPv6 mtrace process is as follows:

1. The client sends an mtrace2 Query message (with a **hops** field indicating the maximum number of hops to be traced) to the destination.
2. The LHR turns the received Query message to an mtrace2 Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace2 Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

Restrictions and guidelines: IPv6 multicast routing and forwarding configuration

During ISSU on a multichassis IRF, if the incoming interface of Layer 3 multicast traffic contains non-local member ports, Layer 3 multicast traffic interruption might occur when the device is rebooting.

IPv6 multicast routing and forwarding tasks at a glance

To configure IPv6 multicast routing and forwarding, perform the following tasks:

1. Enabling IPv6 multicast routing
2. (Optional.) Configuring static IPv6 multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring IPv6 multicast load splitting
5. (Optional.) Configuring an IPv6 multicast flow policy
6. (Optional.) Configuring an IPv6 multicast forwarding boundary

7. (Optional.) Using mtrace2 to trace an IPv6 multicast path
8. (Optional.) Setting the maximum number of cached unknown IPv6 multicast packets
9. (Optional.) Setting the maximum number of copied IPv6 multicast packets during software forwarding
10. (Optional.) Enabling IPv6 multicast replication resource reuse

Prerequisites for IPv6 multicast routing and forwarding

Before you configure multicast routing and forwarding, configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IPv6 multicast routing

About this task

Enable IPv6 multicast routing before you configure any Layer 3 IPv6 multicast functionality in the public network or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.

Configuring static IPv6 multicast routes

About this task

When configuring a static IPv6 multicast route for an IPv6 multicast source, you can specify an RPF interface or an RPF neighbor for the IPv6 multicast traffic from that source.

Restrictions and guidelines

Static IPv6 multicast routes take effect only on the IPv6 multicast devices on which they are configured, and will not be broadcast or redistributed to other devices.

Procedure

1. Enter system view.
   system-view
2. Configure a static multicast route.
   ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*] *ipv6-source-address prefix-length* { *ipv6-gateway-address* | *interface-type interface-number* } [**preference** *preference*]
3. (Optional.) Delete all static IPv6 multicast routes.
   delete ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*]
   To delete a single static IPv6 multicast route, use the **undo ip rpf-route-static** command.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Specify the longest prefix match principle for RPF route selection.
   longest-match
   By default, the route preference principle is used.

Configuring IPv6 multicast load splitting

About this task

You can enable the device to split multiple IPv6 multicast data flows on a per-source basis or on a per-source-and-group basis.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Configure IPv6 multicast load splitting.
   load-splitting { **balance-ecmp** | **balance-ucmp** | **ecmp** | **flow-ucmp** | **source** | **source-group** | **ucmp** }
   By default, IPv6 multicast load splitting is disabled.

Configuring an IPv6 multicast flow policy

About this task

You can configure the estimated bandwidth for matching IPv6 multicast flows through an IPv6 multicast flow policy on a downstream device if the following conditions exist:

- ECMP routes between the downstream device and an upstream device.
- The multicast load-splitting mode is **flow-ucmp**.

When the downstream device selects an incoming interface on the upstream device, it selects the link with the smallest bandwidth usage calculated based on the estimated bandwidth. If two links have the same bandwidth usage, the link with the higher next-hop IPv6 address is selected.

The bandwidth usage is calculated according to the following formula: Bandwidth usage = (Used bandwidth+Estimated bandwidth)/(Total interface bandwidth x (1–Unicast reserved bandwidth)).

- The estimated bandwidth is configured by the **bandwidth** command in IPv6 multicast flow policy view.

- The total interface bandwidth is configured by the **bandwidth** command in interface view.
- The unicast reserved bandwidth is configured by the **flow-ucmp unicast reserve-bandwidth** or **ipv6 multicast flow-ucmp unicast reserve-bandwidth** command.

Restrictions and guidelines for configuring an IPv6 multicast flow policy

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

Adding, deleting, or modifying an IPv6 multicast flow policy does not affect the link selection results of existing multicast flows and affects link selection for only new multicast flows. Before configuring the multicast load-splitting mode as **flow-ucmp**, you must plan the configuration of an IPv6 multicast flow policy and the unicast reserved bandwidth configuration.

The change of link bandwidth and the change in the number of ECMP routes do not affect the route selection of existing multicast flows.

This feature does not affect multicast source-side link selection, link selection in IPv6 PIM-DM, RPT link selection in IPv6 PIM-SM, or local RP link selection.

If both IPv4 and IPv6 multicast flows exist in the network, increase the unicast reserved bandwidth as needed to avoid congestion.

Creating an IPv6 multicast flow policy

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Create an IPv6 multicast flow policy.
   - Create a custom IPv6 multicast flow policy.
     flow-policy name *policy-name*
   - Create the default IPv6 multicast flow policy.
     flow-policy default

Configuring the multicast group range

About this task

Perform this task to configure a multicast group range in which an IPv6 multicast flow policy takes effect. If a multicast group matches the ACL specified in an IPv6 multicast flow policy, the estimated bandwidth configured in the policy is used for the multicast flows of the multicast group.

Restrictions and guidelines

This feature is not supported by the default IPv6 multicast flow policy.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

3. Enter IPv6 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the multicast group range.
   acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   By default, an IPv6 multicast flow policy does not take effect on any multicast groups.

Configuring the estimated bandwidth

About this task

The estimated bandwidth is selected for IPv6 multicast flows as follows:

1. If the multicast group of an IPv6 multicast flow matches the ACL specified in a custom IPv6 multicast flow policy, the estimated bandwidth configured in the policy is selected for the multicast flow.
2. If the multicast group of an IPv6 multicast flow does not match an ACL in any custom IPv6 multicast flow policy, the estimated bandwidth configured in the default policy is selected for the multicast flow.
3. If the default policy is not created or the estimated bandwidth is not configured in the default policy, the estimated bandwidth for the multicast flow is 0.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv6 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the estimated bandwidth.
   bandwidth *bandwidth* { **gbps** | **kbps** | **mbps** }
   By default, the estimated bandwidth is 0.

Configuring the IPv6 unicast reserved bandwidth percentage

About this task

Perform this task when IPv6 unicast traffic and IPv6 multicast traffic coexist in the network. The available bandwidth for multicast traffic is calculated based on the total interface bandwidth and the configured IPv6 unicast reserved bandwidth percentage. For example, if the total interface bandwidth is 100 kbps and the unicast reserved bandwidth percentage is 20% (20 kbps), the available bandwidth for multicast traffic is 80 kbps.

Restrictions and guidelines

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

The **flow-ucmp unicast reserve-bandwidth** command takes effect on all interfaces, and the **ipv6 multicast flow-ucmp unicast reserve-bandwidth** command takes effect only on the current interface. If you execute both commands, the latter has higher priority.

Setting the global IPv6 unicast reserved bandwidth percentage

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.

ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

3. Set the global IPv6 unicast reserved bandwidth percentage.
   flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the global IPv6 unicast reserved bandwidth percentage is not set.

Setting the IPv6 unicast reserved bandwidth percentage on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv6 unicast reserved bandwidth percentage on the interface.
   ipv6 multicast flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the IPv6 unicast reserved bandwidth percentage is not set on an interface.

Configuring an IPv6 multicast forwarding boundary

About this task

You can configure an interface as an IPv6 multicast forwarding boundary for an IPv6 multicast group range. The interface cannot receive or forward IPv6 multicast packets for the groups in the range.

Restrictions and guidelines

You do not need to enable IPv6 multicast routing before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 multicast forwarding boundary.
   ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }
   By default, an interface is not an IPv6 multicast forwarding boundary for any IPv6 multicast groups.

Using mtrace2 to trace an IPv6 multicast path

Hardware and feature compatibility

Only the S5200-HI-G switch series supports this feature.

Restrictions and guidelines

For successful IPv6 mtrace, do not use a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.
   system-view

2. (Optional.) Specify the UDP port number used by IPv6 mtrace.

   ipv6 mtrace-service port *number*

   By default, IPv6 mtrace uses UDP port number 10240.

3. Use mtrace2 to trace an IPv6 multicast path.

   mtrace v2 ipv6 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]

   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown IPv6 multicast packets

About this task

The device caches an IPv6 multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping IPv6 multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **ipv6 multicast forwarding-table cache-unknown total** command to be far greater than the value in the **ipv6 multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry.

   ipv6 multicast forwarding-table cache-unknown per-entry *per-entry-limit*

   By default, the device can cache only one unknown IPv6 multicast packet for an (S, G) entry.

3. Set the maximum number of unknown IPv6 multicast packets that can be cached in total.

   ipv6 multicast forwarding-table cache-unknown total *total-limit*

   By default, the device can cache 1024 unknown IPv6 multicast packets in total.

Setting the maximum number of copied IPv6 multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause IPv6 multicast packets to be dropped.

CAUTION:
Perform this task under the guidance of H3C Support.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of copied IPv6 multicast packets during software forwarding.
   ipv6 multicast cpu-forwarding max-copy-count *count*
   The default setting is 5.

Enabling IPv6 multicast replication resource reuse

About this task

IPv6 multicast replication resources are hardware resources used to replicate IPv6 multicast traffic. By default, multiple IPv6 (S, G) entries with the same outgoing interface use multiple IPv6 multicast replication resources.

This feature allows IPv6 (S, G) entries with the same outgoing interface to use the same IPv6 multicast replication resource.

Restrictions and guidelines

For this feature to take effect ,you must use the **reboot** command to reboot the device.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast replication resource reuse.
   ipv6 multicast replication-share enable
   By default, IPv6 multicast replication resource reuse is disabled.

Display and maintenance commands for IPv6 multicast routing and forwarding

CAUTION:
The **reset** commands might cause IPv6 multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the IPv6 MRIB.	**display ipv6 mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display IPv6 multicast boundary information.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]

Task	Command
Display IPv6 multicast fast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display statistics for IPv6 multicast forwarding events.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display IPv6 multicast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index* | **slot** *slot-number* | **statistics**] *
Display IPv6 multicast forwarding capability information.	**display ipv6 multicast forwarding-table capability** [**slot slot-number**]
Display IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*ipv6-source-address* [*prefix-length*]]
Display RPF information for an IPv6 multicast source.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]
Display IPv6 multicast replication resource information.	**display ipv6 multicast replication-share info** [**outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index*] * [**slot** *slot-number*]
Display link selection information for IPv6 multicast flow policies.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **flow-policy info** [**interface** *interface-type interface-number* | **source** *source-address* | **group** *group-address* | **policy** { **default** | **name** *policy-name* }] *
Clear IPv6 multicast fast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot**

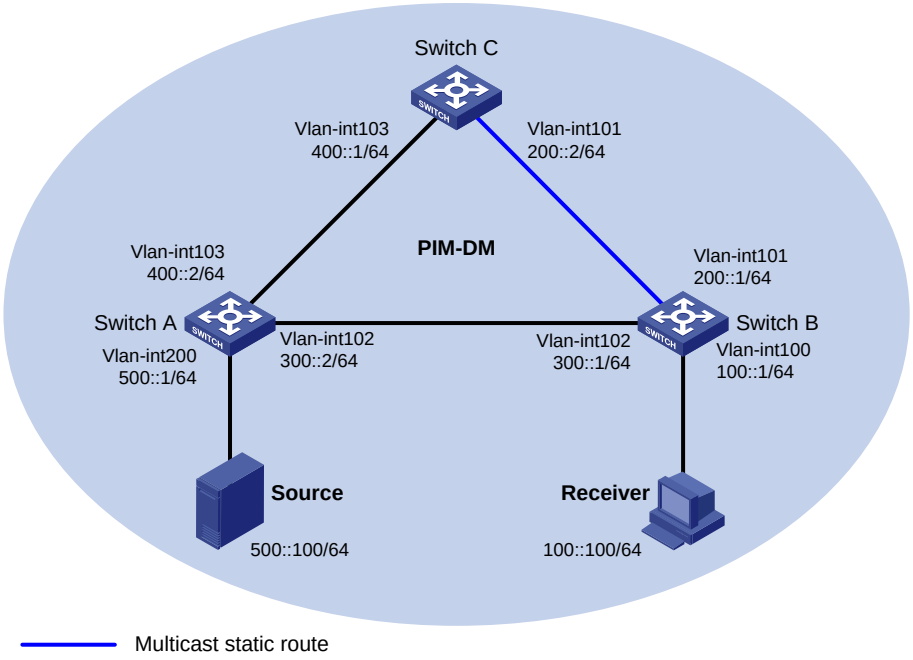
Task	Command
	slot-number]
Clear statistics for IPv6 multicast forwarding events.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear IPv6 multicast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear IPv6 multicast routing entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.
- When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

IPv6 multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 2:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IPv6 multicast.
- Switch A, Switch B, and Switch C run OSPFv3.
- Typically, the receiver host can receive the IPv6 multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the IPv6 multicast data from the source travels to the receiver along the following path: Switch A to Switch C to Switch B. This path is different from the unicast route.

Figure 2 Network diagram

Prerequisites

1. Assign an IP address and prefix length for each interface, as shown in Figure 2.
2. Configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] mld enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on the other interfaces.

   ```
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] ipv6 pim dm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] ipv6 pim dm
   [SwitchB-Vlan-interface102] quit
   ```

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 200
   [SwitchA-Vlan-interface200] ipv6 pim dm
   ```

```
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. On Switch B, configure a static IPv6 multicast route to the source and specify Switch C as the RPF neighbor.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for the source on Switch B.

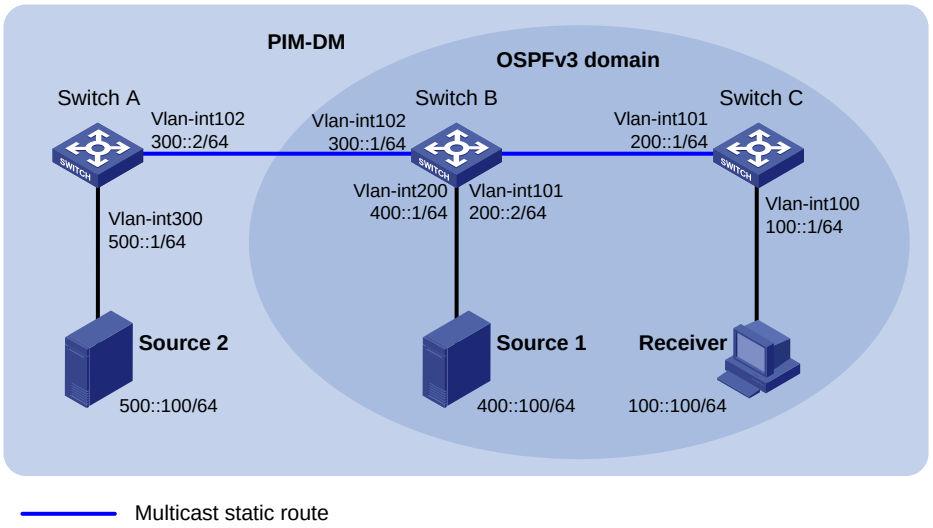
```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static IPv6 multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route

Network configuration



As shown in Figure 3:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPFv3, and have no unicast routes to Switch A.

- Typically, the receiver host receives the IPv6 multicast data from the source 1 in the OSPFv3 domain.

Configure the switches so that the receiver host can receive IPv6 multicast data from Source 2, which is outside the OSPFv3 domain.

Figure 3 Network diagram

Prerequisites

1. Assign an IP address and subnet mask for each interface, as shown in Figure 3.
2. Configure OSPFv3 on Switch B and Switch C.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch C, enable IPv6 multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 multicast routing
   [SwitchC-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] mld enable
   [SwitchC-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] ipv6 pim dm
   [SwitchC-Vlan-interface101] quit
   ```

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 300
   [SwitchA-Vlan-interface300] ipv6 pim dm
   [SwitchA-Vlan-interface300] quit
   [SwitchA] interface vlan-interface 102
   ```

```
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
[SwitchC] display ipv6 multicast rpf-info 500::100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B and Switch C.

3. Configure a static IPv6 multicast route:

Configure a static IPv6 multicast route on Switch B and specify Switch A as its RPF neighbor to Source 2.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 300::2
```

Configure a static IPv6 multicast route on Switch C and specify Switch B as its RPF neighbor to Source 2.

```
[SwitchC] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 50::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. These RPF routes are the configured static IPv6 multicast routes.

Configuring PIM snooping

About PIM snooping

PIM snooping runs on Layer 2 devices. It works with IGMP snooping to analyze received PIM messages, and adds the ports that are interested in specific multicast data to a PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the PIM routers are in the same VLAN.

- When the Layer 2 switch runs only IGMP snooping, it performs the following actions:
  - **a.** Maintains the router ports according to the received PIM hello messages that PIM routers send.
  - **b.** Floods all other types of received PIM messages except PIM hello messages in the VLAN.
  - **c.** Forwards all multicast data to all router ports in the VLAN.

Each PIM router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all PIM messages except PIM hello messages.

- When the Layer 2 switch runs both IGMP snooping and PIM snooping, it performs the following actions:
  d. Examines whether a PIM router is interested in the multicast data addressed to a multicast group according to the received PIM messages that the router sends.
  e. Adds only the ports that connect to the router and are interested in the data to a PIM snooping routing entry.
  f. Forwards PIM messages and multicast data to only the routers that are interested in the data, which saves network bandwidth.

For more information about IGMP snooping and the router port, see "Configuring IGMP snooping."

Restrictions: Hardware compatibility with PIM snooping

The S5200-EI-G switch series does not support PIM snooping.

Restrictions and guidelines: PIM snooping configuration

Make sure the maximum size of a PIM join or prune message is smaller than the path MTU of devices connected to PIM snooping devices. Otherwise, fragmented PIM join or prune messages prevent PIM snooping from correctly forwarding multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring PIM."

PIM snooping is supported only for PIM-SM and PIM-SSM. As a best practice, do not configure PIM snooping for PIM-DM and BIDIR-PIM. For more information about PIM, see "PIM overview."

After you configure PIM snooping for a VLAN, PIM snooping takes effect only on ports that belong to the VLAN.

PIM snooping tasks at a glance

To configure PIM snooping, perform the following tasks:

1. Enabling PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling PIM snooping

Restrictions and guidelines

You must enable the IGMP snooping feature and enable IGMP snooping for a VLAN before you enable PIM snooping for the VLAN.

PIM snooping does not take effect on sub-VLANs of a multicast VLAN.

Procedure

1. Enter system view.

system-view

2. Enable the IGMP snooping feature and enter IGMP-snooping view.

   igmp-snooping

   By default, IGMP snooping is disabled.

   For more information about this command, see IGMP snooping commands in *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter VLAN view.

   vlan *vlan-id*

5. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, IGMP snooping is disabled in a VLAN.

   For more information about this command, see *IP Multicast Command Reference*.

6. Enable PIM snooping for the VLAN.

   pim-snooping enable

   By default, PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 multicast data interruption caused by the aging of PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives a PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives a PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

pim-snooping graceful-restart neighbor-aging-time *seconds*

By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PIM snooping neighbor information.	**display pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping router port information.	**display pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping routing entries.	**display pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the PIM messages learned through PIM snooping.	**display pim-snooping statistics**
Clear statistics for the PIM messages learned through PIM snooping.	**reset pim-snooping statistics**

PIM snooping configuration examples

Example: Configuring PIM snooping

Network configuration

As shown in Figure 2:

- OSPF runs on the network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.

- Receiver 1 and Receiver 2 belong to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Router C and Router D run IGMP on GigabitEthernet 1/0/1. Router A, Router B, Router C, and Router D run PIM-SM.
- GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure IGMP snooping and PIM snooping on Switch A. Then, Switch A forwards PIM protocol packets and multicast data packets only to the routers that are connected to receivers.

Figure 2 Network diagram

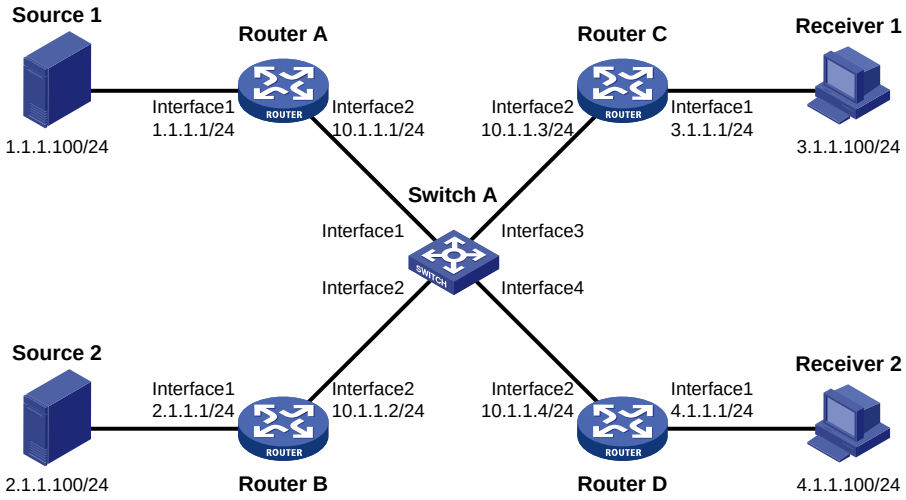

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 2, and configure OSPF on the routers.

Procedure

1. Configure Router A:

Enable IP multicast routing.

```
<RouterA> system-view
[RouterA] multicast routing
[RouterA-mrib] quit
```

Enable PIM-SM on each interface.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] pim sm
[RouterA-GigabitEthernet1/0/1] quit
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] pim sm
[RouterA-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

```
[RouterA] pim
[RouterA-pim] c-bsr 10.1.1.1
[RouterA-pim] c-rp 10.1.1.1
[RouterA-pim] quit
```

2. Configure Router B:

Enable IP multicast routing.

```
<RouterB> system-view
[RouterB] multicast routing
[RouterB-mrib] quit
```

Enable PIM-SM on each interface.

```
[RouterB] interface gigabitethernet 1/0/1
[RouterB-GigabitEthernet1/0/1] pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IP multicast routing.

```
<RouterC> system-view
[RouterC] multicast routing
[RouterC-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] igmp enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IP multicast routing.

```
<RouterD> system-view
[RouterD] multicast routing
[RouterD-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] igmp enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
```

```
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and PIM snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  10.1.1.1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  10.1.1.2
    Ports (1 in total):
      GE1/0/2                 (00:32:43)
  10.1.1.3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  10.1.1.4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are PIM snooping neighbors.

On Switch A, display PIM snooping routing entries for VLAN 100.

```
[SwitchA] display pim-snooping routing-table vlan 100
Total 4 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 4 entries.
  (*, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (1.1.1.100, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Slots (0 in total):
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Slots (0 in total):
```

```
    Downstream Ports (1 in total):
      GE1/0/3
        Expires: 00:02:33, FSM: J
(*, 225.1.1.1)
  Upstream neighbor: 10.1.1.1
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/1
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:03:11, FSM: J
(2.1.1.100, 225.1.1.1)
  Upstream neighbor: 10.1.1.2
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/2
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:02:34, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for multicast group 224.1.1.1 only to Router C.
- Switch A will forward the multicast data intended for multicast group 225.1.1.1 only to Router D.

Troubleshooting PIM snooping

PIM snooping does not work on a Layer 2 device

Symptom

PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about IGMP snooping and PIM snooping.
2. If IGMP snooping is not enabled, enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for the VLAN.
3. If PIM snooping is not enabled, enable PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Configuring IPv6 PIM snooping

About IPv6 PIM snooping

IPv6 PIM snooping runs on Layer 2 devices. It works with MLD snooping to analyze received IPv6 PIM messages, and adds the ports that are interested in specific multicast data to an IPv6 PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with IPv6 PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the IPv6 PIM-capable routers are in the same VLAN.

- When the Layer 2 switch only runs MLD snooping, it performs the following actions:
  a. Maintains the router ports according to the received IPv6 PIM hello messages that IPv6 PIM-capable routers send.

b. Floods all other types of received IPv6 PIM messages except PIM hello messages in the VLAN.

c. Forwards all multicast data to all router ports in the VLAN.

Each IPv6 PIM-capable router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all IPv6 PIM messages except IPv6 PIM hello messages.

- When the Layer 2 switch runs both MLD snooping and IPv6 PIM snooping, it performs the following actions:

d. Examines whether an IPv6 PIM router is interested in the multicast data destined for a multicast group according to the received IPv6 PIM messages that the router sends.

e. Adds only the ports that connect to the router and are interested in the data to an IPv6 PIM snooping routing entry.

f. Forwards IPv6 PIM messages and the multicast data only to the router according to the multicast forwarding entry, which saves network bandwidth.

For more information about MLD snooping and the router port, see "Configuring MLD snooping."

Restrictions: Hardware compatibility with IPv6 PIM snooping

The S5200-EI-G switch series does not support this feature.

Restrictions and guidelines: IPv6 PIM snooping configuration

As a best practice, do not configure IPv6 PIM snooping for secondary VLANs because IPv6 PIM snooping does not take effect on secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of an IPv6 PIM join or prune message is smaller than the path MTU of devices connected to IPv6 PIM snooping devices. Otherwise, fragmented IPv6 PIM join or prune messages prevent IPv6 PIM snooping from correctly forwarding IPv6 multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring IPv6 PIM."

IPv6 PIM snooping is supported only for IPv6 PIM-SM and IPv6 PIM-SSM. As a best practice, do not configure IPv6 PIM snooping in the IPv6 PIM-DM or IPv6 BIDIR-PIM network. For more information about IPv6 PIM, see "IPv6 PIM overview."

After you enable IPv6 PIM snooping for a VLAN, IPv6 PIM snooping takes effect only on ports that belong to the VLAN.

IPv6 PIM snooping tasks at a glance

To configure IPv6 PIM snooping, perform the following tasks:

1. Enabling IPv6 PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling IPv6 PIM snooping

1. Enter system view.
   system-view
2. Enable the MLD snooping feature and enter MLD -snooping view.
   mld-snooping
   By default, MLD snooping is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter VLAN view.
   vlan *vlan-id*
5. Enable MLD snooping for the VLAN.
   mld-snooping enable
   By default, MLD snooping is disabled in a VLAN.
   For more information about this command, see *IP Multicast Command Reference*.
6. Enable IPv6 PIM snooping for the VLAN.
   ipv6 pim-snooping enable
   By default, IPv6 PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface, AC, N-PW, and U-PW. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 IPv6 multicast data interruption caused by the aging of IPv6 PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives an IPv6 PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives an IPv6 PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.
   system-view
2. Enter VLAN view.

vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for IPv6 PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PIM snooping neighbor information.	**display ipv6 pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping router port information.	**display ipv6 pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping routing entries.	**display ipv6 pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**display ipv6 pim-snooping statistics**
Clear statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**reset ipv6 pim-snooping statistics**

IPv6 PIM snooping configuration examples

Example: Configuring IPv6 PIM snooping

Network configuration

As shown in Figure 2:

- OSPFv3 runs on the network.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Receiver 1 and Receiver 2 belong to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Router C and Router D run MLD on GigabitEthernet 1/0/1.
- Router A, Router B, Router C, and Router D run IPv6 PIM-SM. GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure MLD snooping and IPv6 PIM snooping on Switch A. Then, Switch A forwards IPv6 PIM protocol packets and IPv6 multicast data packets only to routers that are connected to receivers.

Figure 2 Network diagram

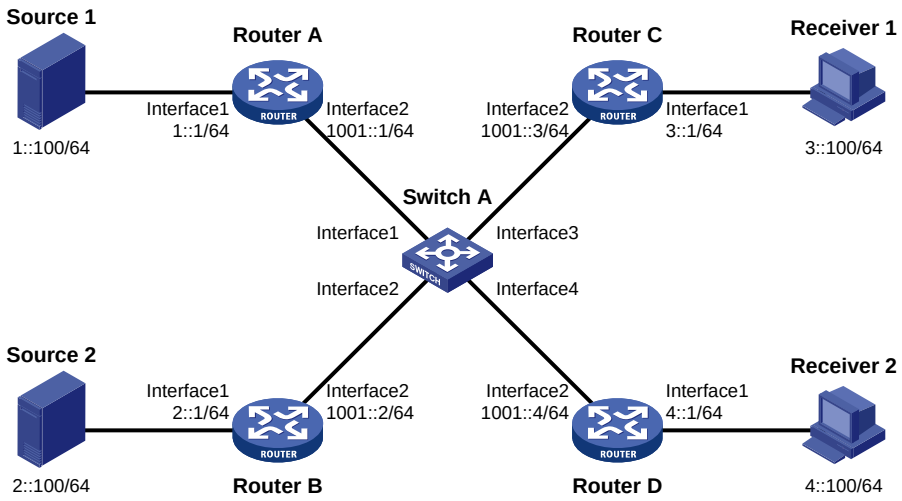

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 2, and then configure OSPFv3 on the routers.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ipv6 pim sm
   ```

```
[RouterA-GigabitEthernet1/0/1] quit
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] ipv6 pim sm
[RouterA-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

```
[RouterA] ipv6 pim
[RouterA-pim6] c-bsr 1001::1
[RouterA-pim6] c-rp 1001::1
[RouterA-pim6] quit
```

2. Configure Router B:

Enable IPv6 multicast routing.

```
<RouterB> system-view
[RouterB] ipv6 multicast routing
[RouterB-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[RouterB] interface gigabitethernet 1/0/1
[RouterB-GigabitEthernet1/0/1] ipv6 pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] ipv6 pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IPv6 multicast routing.

```
<RouterC> system-view
[RouterC] ipv6 multicast routing
[RouterC-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] mld enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] ipv6 pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IPv6 multicast routing.

```
<RouterD> system-view
[RouterD] ipv6 multicast routing
[RouterD-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] mld enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] ipv6 pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and IPv6 PIM snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] ipv6 pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display IPv6 PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  FE80::1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  FE80::2
   Ports (1 in total):
      GE1/0/2                 (00:32:43)
  FE80::3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  FE80::4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are IPv6 PIM snooping neighbors.

On Switch A, display IPv6 PIM snooping routing entries for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping routing-table vlan 100
Total 4 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 4 entries.
  (*, FF1E::101)
    Upstream neighbor: FE80::8CE5:7AFF:FE3F:107
      Upstream Slots (0 in total):
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Slots (0 in total):
      Downstream Ports (1 in total):
        GE1/0/3
```

```
        Expires: 00:02:32, FSM: J
(1::100, FF1E::101)
  Upstream neighbor: FE80::8CE5:7AFF:FE3F:107
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/1
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/3
        Expires: 00:02:57, FSM: J
(*, FF2E::101)
  Upstream neighbor: FE80::8CE5:7AFF:FE3F:107
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/1
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:02:32, FSM: J
(2::100, FF2E::101)
  Upstream neighbor: FE80::8CE5:7EFF:FE3B:207
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/2
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:03:05, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for IPv6 multicast group FF1E::101 to only Router C.
- Switch A will forward the multicast data intended for IPv6 multicast group FF2E::101 to only Router D.

Troubleshooting IPv6 PIM snooping

This section describes common IPv6 PIM snooping problems and how to troubleshoot them.

IPv6 PIM snooping does not work on a Layer 2 device

Symptom

IPv6 PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about MLD snooping and IPv6 PIM snooping.

2. If MLD snooping is not enabled, enable the MLD snooping feature, and then enable MLD snooping and IPv6 PIM snooping for the VLAN.
3. If IPv6 PIM snooping is not enabled, enable IPv6 PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Preface

This configuration guide describes the MCE fundamentals and configuration procedures.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring MCE

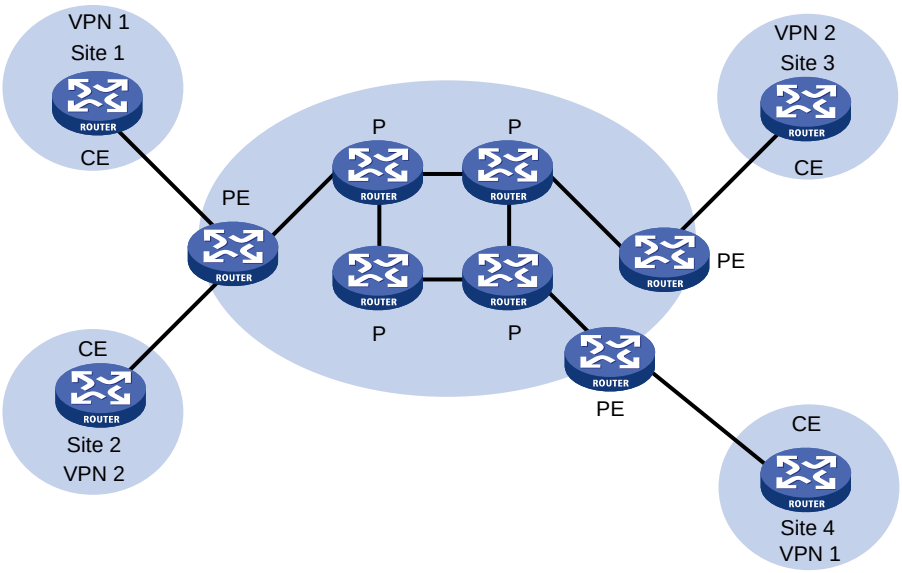
About MCE

The Multi-VPN Instance Customer Edge (MCE) feature allows multiple VPNs to share a CE with ensured data security in an MPLS L3VPN network. MCE provides traffic separation between VPNs by distinguishing routes of the VPNs.

MPLS L3VPN problems solved by MCE

MPLS L3VPN is a L3VPN technology used to interconnect geographically dispersed VPN sites. MPLS L3VPN uses BGP to advertise VPN routes and uses MPLS to forward VPN packets over a service provider backbone.

In conventional MPLS L3VPN, a VPN site must exclusively use a CE to connect a PE. With increasing business, a private network must be divided into multiple VPNs and the VPNs must be isolated from one another for data security. Using a CE exclusively for each VPN costs much in buying and maintaining the network devices. Using a common CE for multiple VPNs cannot ensure data security because the VPNs use the same routing table.



The MCE feature offers balance between cost and security. It creates multiple VPN instances on a CE to provide logically separated routing tables and address spaces for the VPNs, so the VPNs can share the CE. This CE is called the MCE device.

Basic MPLS L3VPN architecture

A basic MPLS L3VPN architecture has the following types of devices:

- **Customer edge device**—A CE device resides on a customer network and has one or more interfaces directly connected to a service provider network. It does not support MPLS.
- **Provider edge device**—A PE device resides at the edge of a service provider network and is connected to one or more CEs. All MPLS VPN services are processed on PEs.
- **Provider device**—A P device is a core device on a service provider network. It is not directly connected to any CEs. A P device has only basic MPLS forwarding capability and does not handle VPN routing information.

Figure 1 Basic MPLS L3VPN architecture

MCE-related MPLS L3VPN concepts

Site

A site has the following features:

- A site is a group of IP systems with IP connectivity that does not rely on any service provider networks.
- The classification of a site depends on the topology relationship of the devices, rather than the geographical positions. However, the devices at a site are, in most cases, adjacent to each other geographically.
- The devices at a site can belong to multiple VPNs, which means that a site can belong to multiple VPNs.
- A site is connected to a provider network through one or more CEs. A site can contain multiple CEs, but a CE can belong to only one site.

Sites connected to the same provider network can be classified into different sets by policies. Only the sites in the same set can access each other through the provider network. Such a set is called a VPN.

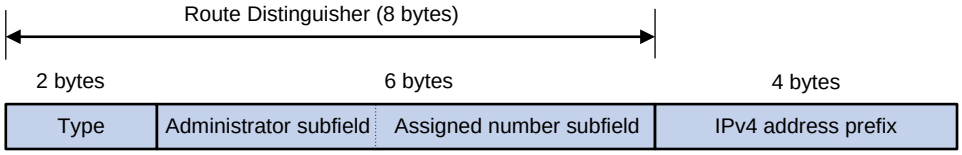
VPN instance

VPN instances implement route isolation, data independence, and data security for VPNs.

A VPN instance has the following components:

- A separate Label Forwarding Information Base (LFIB).
- An IP routing table.
- Interfaces bound to the VPN instance.
- VPN instance administration information, including route distinguishers (RDs), route targets (RTs), and route filtering policies.

To associate a site with a VPN instance, bind the VPN instance to the PE's interface connected to the site. A site can be associated with only one VPN instance, and different sites can be associated with the same VPN instance. A VPN instance contains the VPN membership and routing rules of associated sites.



VPN-IPv4 address

Each VPN independently manages its address space. The address spaces of VPNs might overlap. For example, if both VPN 1 and VPN 2 use the addresses on subnet 10.110.10.0/24, address space overlapping occurs.

Multiprotocol BGP (MP-BGP) can solve this problem by advertising VPN-IPv4 addresses (also called VPNv4 addresses).

As shown in Figure 2, a VPN-IPv4 address consists of 12 bytes. The first eight bytes represent the RD, followed by a four-byte IPv4 prefix. The RD and the IPv4 prefix form a unique VPN-IPv4 prefix.

Figure 2 VPN-IPv4 address structure

An RD can be in one of the following formats:

- When the Type field is 0, the Administrator subfield occupies two bytes, the Assigned number subfield occupies four bytes, and the RD format is *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- When the Type field is 1, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit IPv4 address*:*16-bit user-defined number*. For example, 172.1.1.1:1.
- When the Type field is 2, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the Administrator subfield to any private AS number or private IP address.

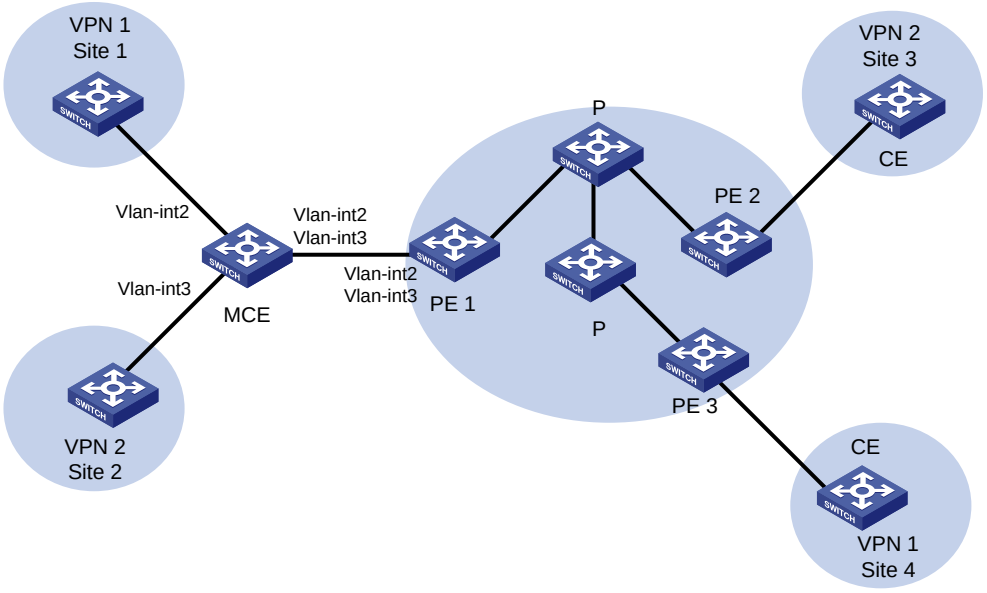
Route target attribute

MPLS L3VPN uses route target community attributes to control the advertisement of VPN routing information. A VPN instance on a PE supports the following types of route target attributes:

- **Export target attribute**—A PE sets the export target attribute for VPN-IPv4 routes learned from directly connected sites before advertising them to other PEs.
- **Import target attribute**—A PE checks the export target attribute of VPN-IPv4 routes received from other PEs. If the export target attribute matches the import target attribute of a VPN instance, the PE adds the routes to the routing table of the VPN instance.

Route target attributes define which sites can receive VPN-IPv4 routes, and from which sites a PE can receive routes.

Like RDs, route target attributes can be one of the following formats:



- *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- *32-bit IPv4 address:16-bit user-defined number*. For example, 172.1.1.1:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

MCE working mechanism

As shown in Figure 3, the MCE exchanges private routes with VPN sites and PE 1, and adds the private routes to the routing tables of corresponding VPN instances.

- **Route exchange between MCE and VPN site**—Create VPN instances VPN 1 and VPN 2 on the MCE. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE adds a received route to the routing table of the VPN instance that is bound to the receiving interface.
- **Route exchange between MCE and PE**—The MCE connects to PE 1 through trunk links. On PE 1, create VPN instances for VPN 1 and VPN 2. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE and PE add a received route to the routing table of the VPN instance that is bound to the receiving interface.

Figure 3 Network diagram for the MCE feature

You can configure static routes, RIP, OSPF, IS-IS, EBGP, or IBGP between an MCE and a VPN site and between an MCE and a PE.

NOTE:

To implement dynamic IP assignment for DHCP clients in private networks, you can configure DHCP server or DHCP relay agent on the MCE. When the MCE functions as the DHCP server, the IP addresses assigned to different private networks cannot overlap.

Restrictions and guidelines: MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

MCE tasks at a glance

To configure MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site

3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter VPN instance view.
   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for a VPN instance.
4. (Optional.) Configure a description for the VPN instance.
   description *text*
   By default, no description is configured for a VPN instance.
5. (Optional.) Configure a VPN ID for the VPN instance.
   vpn-id *vpn-id*
   By default, no VPN ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   This interface connects the device to the CE.
3. Associate a VPN instance with the interface.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:
Associating a VPN instance with an interface or disassociating a VPN instance from an interface will clear the IP address and routing protocol settings of the interface.

Configuration of this command deletes the IP address of the current interface. You must reconfigure an IP address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv4 address family view, IPv4 VPN uses the configuration in VPN instance IPv4 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv4 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Execute the following commands in sequence to enter VPN instance IPv4 address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from learning too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through a static route. Static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding a static route to a VPN instance, so that the static routes of different VPN instances can be isolated from each other.

Perform this configuration on the MCE. On the VPN site, configure a common static route.

Procedure

1. Enter system view.
   system-view
2. Configure a static route for a VPN instance.
   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }
3. (Optional.) Configure the default preference for static routes.
   ip route-static default-preference *default-preference*
   The default preference is 60.

Configuring RIP between an MCE and a VPN site

About this task

Binding RIP processes to VPN instances can isolate routes of different VPNs. For more information about RIP, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common RIP process.

Procedure

1. Enter system view.
   system-view
2. Create a RIP process for a VPN instance and enter RIP view.
   rip [*process-id*] **vpn-instance** *vpn-instance-name*
   A RIP process can belong to only one VPN instance.
3. Enable RIP on the interface attached to the specified network.
   network *network-address* [*wildcard-mask*]
   By default, RIP is disabled on an interface.
4. Redistribute remote site routes advertised by the PE into RIP.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *
   By default, no route is redistributed into RIP.

Configuring OSPF between an MCE and a VPN site

About this task

Binding OSPF processes to VPN instances can isolate routes of different VPNs. For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common OSPF process.

Procedure

1. Enter system view.
   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.

ospf [*process-id*] **router-id** *router-id* **vpn-instance** *vpn-instance-name*

Keywords	Usage guidelines
router-id *router-id*	An OSPF process that is bound to a VPN instance does not use the public network router ID configured in system view. Therefore, you must specify a router ID when creating a process or configure an IP address for a minimum of one interface in the VPN instance.
vpn-instance *vpn-instance-name*	An OSPF process can belong to only one VPN instance. If you delete a VPN instance, all OSPF processes of the VPN instance are also deleted.

3. Redistribute remote site routes advertised by the PE into OSPF.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
4. Create an OSPF area and enter OSPF area view.

   area *area-id*
5. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to any area nor runs OSPF.

Configuring IS-IS between an MCE and a VPN site

About this task

Binding IS-IS processes to VPN instances can isolate routes of different VPNs. For more information about IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure a common IS-IS process.

Procedure

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

   An IS-IS process can belong to only one VPN instance.
3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.
4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
5. Redistribute remote site routes advertised by the PE into IS-IS.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the IS-IS process on the interface.
   isis enable [*process-id*]
   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a VPN site

About this task

To run EBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise the VPN network addresses it can reach to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
   Commands in BGP-VPN instance view are the same as those in BGP instance view. For more information, see *Layer 3—IP Routing Configuration Guide*.
4. Configure the VPN site as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. (Optional.) Allow the local AS number to appear in the AS_PATH attribute of routes received from the peer, and set the maximum number of repetitions.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop** [*number*]
   By default, BGP discards incoming route updates that contain the local AS number.
8. Redistribute remote site routes advertised by the PE into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

system-view

2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the MCE as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
4. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
5. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
6. Redistribute the IGP routes of the VPN into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a VPN site

About this task

To run IBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise VPN network addresses to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
7. (Optional.) Configure the local device as the RR, and specify the peer as the client of the RR.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**
   By default, no RR or RR client is configured.
   After you configure a VPN site as an IBGP peer, the MCE does not advertise the BGP routes learned from the VPN site to other IBGP peers, including VPNv4 peers. The MCE advertises

routes learned from a VPN site only when you configure the VPN site as a client of the RR (the MCE).

8. Redistribute remote site routes advertised by the PE into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Configure the MCE as an IBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

4. Enter BGP IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

5. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

6. Redistribute the IGP routes of the VPN into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes these tasks:

- Binding the MCE-PE interfaces to VPN instances.
- Performing route configurations.
- Redistributing VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring static routing between an MCE and a PE

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

3. (Optional.) Set the default preference for static routes.

ip route-static default-preference *default-preference*

The default preference is 60.

Configuring RIP between an MCE and a PE

1. Enter system view.

   system-view
2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*
3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no routes are redistributed into RIP.

Configuring OSPF between an MCE and a PE

1. Enter system view.

   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable routing loop detection.

   vpn-instance-capability simple

   By default, routing loop detection is enabled and the MCE does not receive OSPF routes from the PE.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
5. Create an OSPF area and enter OSPF area view.

   area *area-id*
6. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to an area nor runs OSPF.

Configuring IS-IS between an MCE and a PE

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.

4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

5. Redistribute VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IS-IS process on the interface.

   isis enable [*process-id*]

   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an EBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

5. Enter BGP-VPN IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

6. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

7. Redistribute the VPN routes of the VPN site.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a PE

1. Enter system view.

system-view

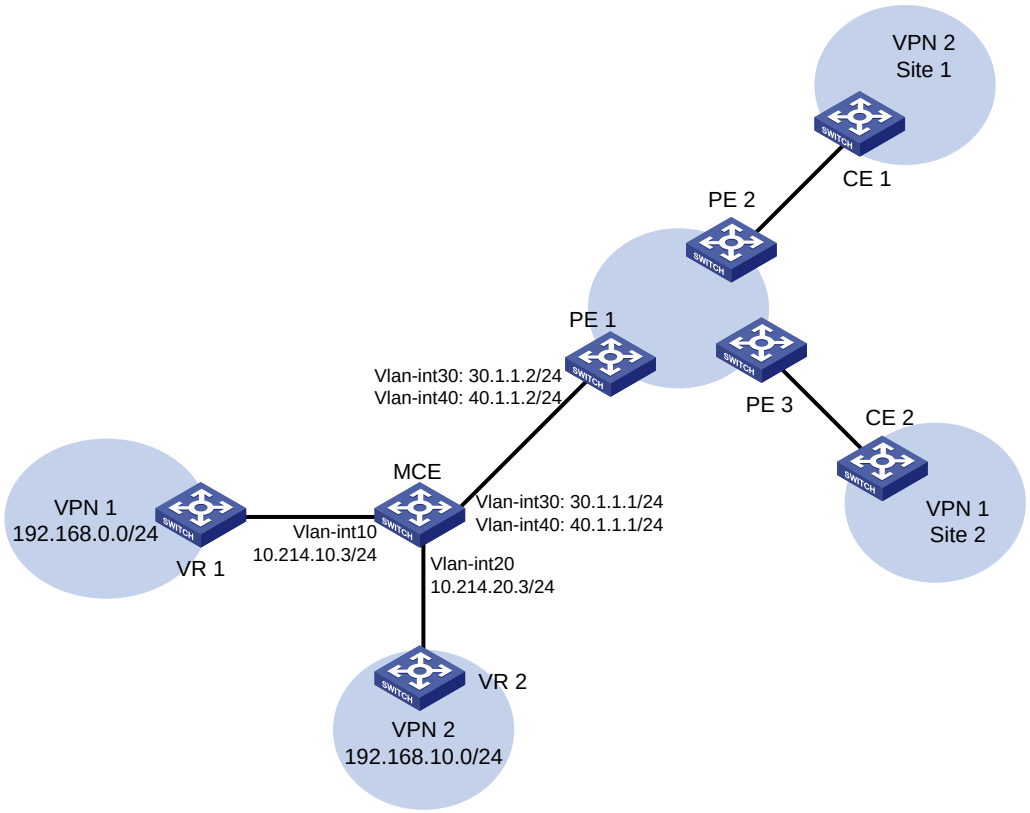
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the PE as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. Redistribute the VPN routes of the VPN site.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Display and maintenance commands for MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



MCE configuration examples

Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE

Network configuration

As shown in Figure 4, VPN 2 runs OSPF. The edge devices of VPN 1 and VPN 2 are VR 1 and VR 2, respectively. Configure the MCE device to separate routes from different VPNs and to advertise the VPN routes to PE 1 through OSPF.

Figure 4 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   [MCE-vpn-instance-vpn2] vpn-target 20:1
   [MCE-vpn-instance-vpn2] quit
   ```

   # Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 10
   [MCE-Vlan-interface10] ip binding vpn-instance vpn1
   [MCE-Vlan-interface10] ip address 10.214.10.3 24
   [MCE-Vlan-interface10] quit
   ```

   # Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 20
   [MCE-Vlan-interface20] ip binding vpn-instance vpn2
   [MCE-Vlan-interface20] ip address 10.214.20.3 24
   ```

```
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure static routes.

On VR 1, assign IP address 10.214.10.2/24 to the interface connected to MCE and 192.168.0.1/24 to the interface connected to VPN 1. Add ports to VLANs correctly. (Details not shown.)

On VR 1, configure a default route with the next hop being 10.214.10.3.

```
<VR1> system-view
[VR1] ip route-static 0.0.0.0 0.0.0.0 10.214.10.3
```

On the MCE, configure a static route to 192.168.0.0/24 with the next hop 10.214.10.2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ip route-static vpn-instance vpn1 192.168.0.0 24 10.214.10.2
```

On the MCE, display the routing information maintained for VPN instance **vpn1**.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24     Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32     Direct  0   0           10.214.10.3     Vlan10
10.214.10.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32   Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24     Static  60  0           10.214.10.2     Vlan10
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has a static route for VPN instance **vpn1**.

Run OSPF in VPN 2. Create OSPF process 20 and bind it to VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ospf 2 vpn-instance vpn2
```

Advertise subnet 10.214.20.0.

```
[MCE-ospf-2] area 0
[MCE-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[MCE-ospf-2-area-0.0.0.0] quit
[MCE-ospf-2] quit
```

On VR 2, assign IP address 10.214.20.2/24 to the interface connected to MCE and 192.168.10.1/24 to the interface connected to VPN 2. (Details not shown.)

Configure OSPF process 2, and advertise subnets 192.168.10.0 and 10.214.20.0.

```
<VR2> system-view
[VR2] ospf 2
[VR2-ospf-2] area 0
[VR2-ospf-2-area-0.0.0.0] network 192.168.10.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] quit
[VR2-ospf-2] quit
```

On the MCE, display the routing information maintained for VPN instance **vpn2**.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.20.0/24     Direct  0   0           10.214.20.3     Vlan20
10.214.20.0/32     Direct  0   0           10.214.20.3     Vlan20
10.214.20.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.20.255/32   Direct  0   0           10.214.20.3     Vlan20
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.10.0/24    O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private routes of VPN 2. The MCE maintains the routes of VPN 1 and those of VPN2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ip address 30.1.1.1 24
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ip address 40.1.1.1 24
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ip address 30.1.1.2 24
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ip address 40.1.1.2 24
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPF process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospf 10 router-id 101.101.10.1 vpn-instance vpn1
```

Disable OSPF routing loop detection for the VPN instance.

```
[MCE-ospf-10] vpn-instance-capability simple
```

Set the domain ID to 10.

```
[MCE-ospf-10] domain-id 10
```

On the MCE, advertise subnet 30.1.1.0 in area 0, and redistribute the static route of VPN 1.

```
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] import-route static
[MCE-ospf-10] quit
```

On PE 1, enable OSPF process 10, and bind the process to VPN instance **vpn1**.

```
[PE1] ospf 10 router-id 100.100.10.1 vpn-instance vpn1
```

Set the domain ID to 10.

```
[PE1-ospf-10] domain-id 10
```

Advertise subnet 30.1.1.0 in area 0.

```
[PE1-ospf-10] area 0
[PE1-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[PE1-ospf-10-area-0.0.0.0] quit
[PE1-ospf-10] quit
```

Use similar procedures to configure OSPF process 20 between MCE and PE 1 and redistribute VPN 2's routing information. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the static route of VPN 1 through OSPF.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
30.1.1.0/24        Direct  0   0           30.1.1.2        Vlan30
30.1.1.0/32        Direct  0   0           30.1.1.2        Vlan30
```

```

```

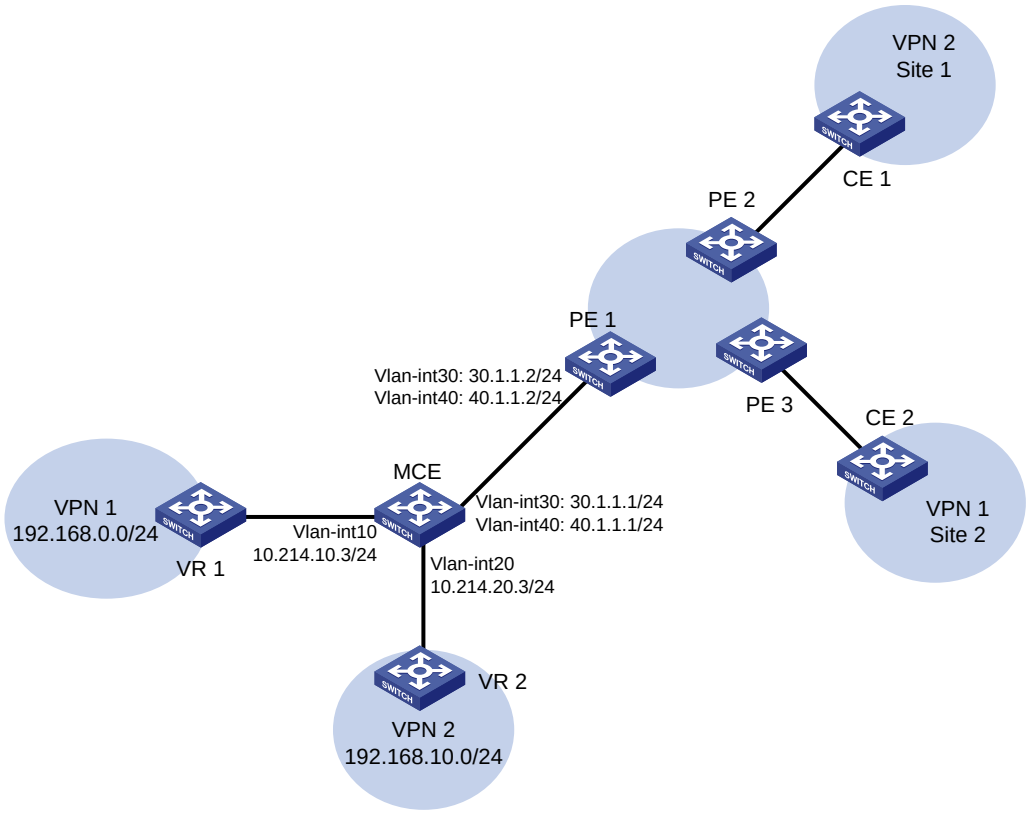
The routing information for the two VPNs has been redistributed into the routing tables on PE 1.



Example: Configuring the MCE that uses EBGP to advertise VPN routes to the PE

Network configuration

As shown in Figure 5, configure the MCE to advertise the routes of VPNs 1 and 2 to PE 1, so that the sites of each VPN can communicate with each other over the MPLS backbone.

Run OSPF in both VPN 1 and VPN 2. Run EBGP between the MCE and PE 1.

Figure 5 Network diagram

Procedure

1. Create VPN instances on the MCE and PE 1, and bind the VPN instances to VLAN interfaces. For the configuration procedure, see "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE."
2. Configure routing between the MCE and VPN sites:

   # Enable an OSPF process on the devices in the two VPNs, and advertise the subnets. (Details not shown.)

   # Configure OSPF on the MCE, and bind OSPF process 10 to VPN instance **vpn1** to learn the routes of VPN 1.

```
<MCE> system-view
[MCE] ospf 10 router-id 10.10.10.1 vpn-instance vpn1
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 10.214.10.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] quit
```

   # Display the routing table of VPN 1 on the MCE.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24      Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32      Direct  0   0           10.214.10.3     Vlan10
```

```
10.214.10.3/32      Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32    Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8         Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32        Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24      O_INTRA 10  2           10.214.10.2     Vlan10
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private route of VPN 1 through OSPF process 10.

On the MCE, bind OSPF process 20 to VPN instance **vpn2** to learn the routes of VPN 2. The configuration procedure is similar to that for OSPF process 10.

The output shows that the MCE has learned the private route of VPN 2 through OSPF.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface

127.0.0.0/32        Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
192.168.10.0/24     O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

3. Configure routing between the MCE and PE 1:

Configure the ports between the MCE and PE 1 as trunk ports. The configuration procedure is similar to that described in "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE." (Details not shown.)

Enable BGP in AS 100 on the MCE.

```
[MCE] bgp 100
```

Enter the BGP-VPN instance view of VPN instance **vpn1**.

```
[MCE-bgp-default] ip vpn-instance vpn1
```

Specify the EBGP peer PE 1 in AS 200.

```
[MCE-bgp-default-vpn1] peer 30.1.1.2 as-number 200
```

Activate the EBGP VPNv4 peer PE 1, and redistribute routing information from OSPF process 10 to BGP.

```
[MCE-bgp-default-vpn1] address-family ipv4
[MCE-bgp-default-ipv4-vpn1] peer 30.1.1.2 enable
[MCE-bgp-default-ipv4-vpn1] import-route ospf 10
```

```
[MCE-bgp-default-ipv4-vpn1] quit
[MCE-bgp-default-vpn1] quit
[MCE-bgp-default] quit
```

On PE 1, enable BGP in AS 200, and specify the MCE as its EBGP peer.

```
[PE1] bgp 200
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.1.1.1 as-number 100
[PE1-bgp-default-vpn1] address-family ipv4
[PE1-bgp-default-ipv4-vpn1] peer 30.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Use similar procedures to configure VPN 2 settings on MCE and PE 1. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the OSPF route of VPN 1 through BGP.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

```

The MCE has redistributed the OSPF routes of the two VPN instances into the EBGP routing tables of PE 1.

Configuring IPv6 MCE

About IPv6 MCE

IPv6 MCE provides traffic separation between VPNs by distinguishing routes of the VPNs. It allows multiple VPNs to share the same CE with ensured data security in an IPv6 MPLS L3VPN network.

IPv6 MPLS L3VPN uses BGP to advertise IPv6 VPN routes and uses MPLS to forward IPv6 VPN packets on the service provider backbone.

IPv6 MCE uses the same working mechanism as MCE. It advertises IPv6 routes and exchanges IPv6 packets between the internal network and the PE.

Restrictions and guidelines: IPv6 MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

IPv6 MCE tasks at a glance

To configure IPv6 MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site
3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.

   system-view
2. Create a VPN instance and enter VPN instance view.

   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.

   route-distinguisher *route-distinguisher*

By default, no RD is configured for a VPN instance.

4. (Optional.) Configure a description for the VPN instance.

   description *text*

   By default, no description is configured for a VPN instance.

   The description should contain the VPN instance's related information, such as its relationship with a certain VPN.

5. (Optional.) Set an ID for the VPN instance.

   vpn-id *vpn-id*

   By default, no ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

Table 1 Enter system view.

system-view

2. Enter interface view.

   interface *interface-type interface-number*

   This interface connects the device to the CE.

3. Associate a VPN instance with the interface.

   ip binding vpn-instance *vpn-instance-name*

   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:

Associating a VPN instance with an interface or disassociating a VPN instance from an interface will clear the IP address and routing protocol settings of the interface.

Configuration of this command deletes the IPv6 address of the current interface. You must reconfigure an IPv6 address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv6 address family view, IPv6 VPN uses the configurations in VPN instance IPv6 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv6 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Enter VPN instance IPv6 address family view.

ip vpn-instance *vpn-instance-name*

address-family ipv6

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from storing too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring IPv6 static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through an IPv6 static route. IPv6 static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding an IPv6 static route with an IPv6 VPN instance, so that the IPv6 static routes of different IPv6 VPN instances can be isolated from each other.

Perform this configuration on the MCE. On a VPN site, configure normal IPv6 static routes.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Configure the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default preference for IPv6 static routes is 60.

Configuring RIPng between an MCE and a VPN site

About this task

By configuring RIPng process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different VPNs to be exchanged between the MCE and the sites through different RIPng processes, ensuring the separation and security of IPv6 VPN routes.

For more information about RIPng, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure normal RIPng.

Procedure

1. Enter system view.
   system-view
2. Create a RIPng process for a VPN instance and enter RIPng view.
   ripng [*process-id*] **vpn-instance** *vpn-instance-name*
   A RIPng process can belong to only one IPv6 VPN instance.
3. Redistribute remote site routes advertised by the PE.
   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *
   By default, no routes are redistributed into RIPng.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled.

Configuring OSPFv3 between an MCE and a VPN site

About this task

By configuring OSPFv3 process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different IPv6 VPNs to be exchanged between the MCE and the sites through different OSPFv3 processes, ensuring the separation and security of IPv6 VPN routes.

For more information about OSPFv3, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure common OSPFv3.

Procedure

1. Enter system view.
   system-view
2. Create an OSPFv3 process for a VPN instance and enter OSPFv3 view.
   ospfv3 [process-id | **vpn-instance** vpn-instance-name] *
   An OSPFv3 process can belong to only one IPv6 VPN instance.
   Deleting a VPN instance also deletes all related OSPFv3 processes.
3. Set the router ID.
   router-id *router-id*
4. Redistribute remote site routes advertised by the PE.

import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

By default, no routes are redistributed into OSPFv3.

5. Return to system view.

   quit

6. Enter interface view.

   interface *interface-type interface-number*

7. Enable OSPFv3 on the interface.

   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

   By default, OSPFv3 is disabled on an interface.

Configuring IPv6 IS-IS between an MCE and a VPN site

About this task

By configuring IPv6 IS-IS process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different IPv6 VPNs to be exchanged between the MCE and the sites through different IPv6 IS-IS processes. This ensures the separation and security of IPv6 VPN routes. For more information about IPv6 IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure common IPv6 IS-IS.

Procedure

1. Enter system view.

   system-view

2. Create an IPv6 IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

   An IPv6 IS-IS process can belong to only one IPv6 VPN instance.

3. Configure a network entity title for the IS-IS process.

   network-entity *net*

   By default, no NET is configured.

4. Create the IS-IS IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

5. (Optional.) Redistribute remote site routes advertised by the PE.

   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no routes are redistributed to IPv6 IS-IS.

   If you do not specify the route level in the command, redistributed routes are added to the level-2 routing table.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IPv6 IS-IS process on the interface.

   isis ipv6 enable [*process-id*]

   By default, no IPv6 IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a VPN site

About this task

To use EBGP between an MCE and IPv6 VPN sites, you must configure a BGP peer for each IPv6 VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the IPv6 VPN sites.

For more information about IPv6 BGP, see *Layer 3—IP Routing Configuration Guide*.

Restrictions and guidelines

A VPN site must advertise IPv6 VPN network addresses it can reach to the connected MCE.

Configuring the MCE

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an EBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv6 unicast address family view.

   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the specified peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with any peer.
7. Redistribute remote site routes advertised by the PE.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no route redistribution is configured.

Configuring the VPN site

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Configure the MCE as an EBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
4. Enter BGP IPv6 unicast address family view.

   address-family ipv6 [**unicast**]
5. Enable BGP to exchange IPv6 unicast routes with the specified peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with any peer.
6. Redistribute the IGP routes of the VPN.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a VPN site

About this task

To use IBGP between an MCE and a VPN site, you must configure a BGP peer for each IPv6 VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

A VPN site must advertise VPN network addresses to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an IBGP peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with any peer.
7. (Optional.) Configure the local device as the RR, and specify the peer as the client of the RR.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**
   By default, no RR or RR client is configured.
   After you configure a VPN site as an IBGP peer, the MCE does not advertise the BGP routes learned from the VPN site to other IBGP peers, including VPNv6 peers. The MCE advertises routes learned from a VPN site only when you configure the VPN site as a client of the RR (the MCE).
8. Redistribute remote site routes advertised by the PE into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the MCE as an IBGP peer.

peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

4. Enter BGP IPv6 unicast address family view.

   address-family ipv6 [**unicast**]

5. Enable BGP to exchange IPv6 unicast routes with the peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with any peer.

6. Redistribute the IGP routes of the VPN into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes the following tasks:

- Binding the MCE-PE interfaces to IPv6 VPN instances.
- Performing routing configurations.
- Redistributing IPv6 VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring IPv6 static routing between an MCE and a PE

1. Enter system view.

   system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Set the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default value is 60.

Configuring RIPng between an MCE and a PE

1. Enter system view.

   system-view

2. Create a RIPng process for an IPv6 VPN instance and enter RIPng view.

   ripng [*process-id*] **vpn-instance** *vpn-instance-name*

3. Redistribute VPN routes.

   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, no routes are redistributed into RIPng.

4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable the RIPng process on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on an interface.

Configuring OSPFv3 between an MCE and a PE

1. Enter system view.
   system-view
2. Create an OSPFv3 process for an IPv6 VPN instance and enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the router ID.
   router-id *router-id*
4. Disable routing loop detection.
   vpn-instance-capability simple
   By default, routing loop detection is enabled and the MCE does not receive OSPFv3 routes from the PE.
5. Redistribute VPN routes.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   By default, no routes are redistributed into OSPFv3.
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, OSPFv3 is disabled on an interface.

Configuring IPv6 IS-IS between an MCE and a PE

1. Enter system view.
   system-view
2. Create an IS-IS process for an IPv6 VPN instance and enter IS-IS view.
   isis [*process-id*] **vpn-instance** *vpn-instance-name*
3. Configure a network entity title.
   network-entity *net*
   By default, no NET is configured.
4. Create the IS-IS IPv6 unicast address family and enter its view.
   address-family ipv6 [**unicast**]
5. Redistribute VPN routes.

import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

By default, IPv6 IS-IS does not redistribute routes from any other routing protocol.

If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IPv6 IS-IS process on the interface.

   isis ipv6 enable [*process-id*]

   By default, no IPv6 IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an EBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

5. Enter BGP-VPN IPv6 unicast address family view.

   address-family ipv6 [**unicast**]

6. Enable BGP to exchange IPv6 unicast routes with the specified peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with peers.

7. Redistribute VPN routes.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an IBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

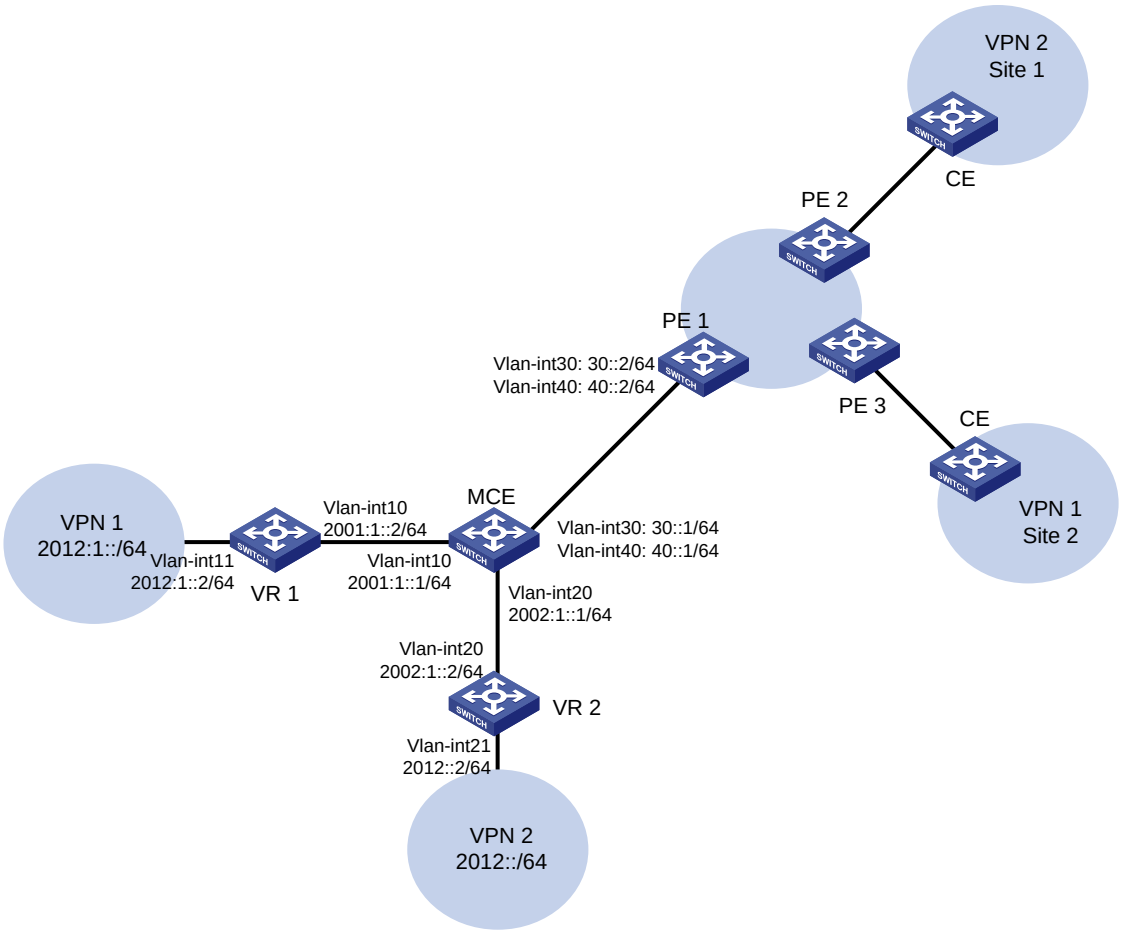
5. Enter BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the specified peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with peers.
7. Redistribute the VPN routes of the VPN site.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Display and maintenance commands for IPv6 MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



IPv6 MCE configuration examples

Example: Configuring IPv6 MCE

Network configuration

As shown in Figure 6, RIPng runs in VPN 2. The edge routers of VPN 1 and VPN 2 are VR1 and VR2, respectively. Configure the MCE device to separate routes from different VPNs and advertise VPN routes to PE 1 through OSPFv3.

Figure 6 Network diagram

Procedure

Table 2 Configure the VPN instances on the MCE and PE 1:

On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<MCE> system-view
[MCE] ip vpn-instance vpn1
[MCE-vpn-instance-vpn1] route-distinguisher 10:1
[MCE-vpn-instance-vpn1] vpn-target 10:1
[MCE-vpn-instance-vpn1] quit
[MCE] ip vpn-instance vpn2
[MCE-vpn-instance-vpn2] route-distinguisher 20:1
[MCE-vpn-instance-vpn2] vpn-target 20:1
[MCE-vpn-instance-vpn2] quit
```

Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 10
[MCE-Vlan-interface10] ip binding vpn-instance vpn1
[MCE-Vlan-interface10] ipv6 address 2001:1::1 64
[MCE-Vlan-interface10] quit
```

Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ip binding vpn-instance vpn2
[MCE-Vlan-interface20] ipv6 address 2002:1::1 64
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure IPv6 static routes.

On VR 1, assign IPv6 address 2001:1::2/64 to the interface connected to the MCE and 2012:1::2/64 to the interface connected to VPN 1. Add ports to VLANs. (Details not shown.)

On VR 1, configure a default route with the next hop being 2001:1::1.

```
<VR1> system-view
[VR1] ipv6 route-static :: 0 2001:1::1
```

On the MCE, configure an IPv6 static route to 2012:1::/64 with the next hop 2001:1::2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ipv6 route-static vpn-instance vpn1 2012:1:: 64 2001:1::2
```

Run RIPng in VPN 2. Configure RIPng process 20 for VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ripng 20 vpn-instance vpn2
```

Advertise subnet 2002:1::/64 through RIPng.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ripng 20 enable
[MCE-Vlan-interface20] quit
```

On VR 2, assign IPv6 address 2002:1::2/64 to the interface connected to the MCE and 2012::2/64 to the interface connected to VPN 2. (Details not shown.)

Configure RIPng, and advertise subnets 2012::/64 and 2002:1::/64.

```
<VR2> system-view
[VR2] ripng 20
[VR2-ripng-20] quit
[VR2] interface vlan-interface 20
[VR2-Vlan-interface20] ripng 20 enable
[VR2-Vlan-interface20] quit
[VR2] interface vlan-interface 21
[VR2-Vlan-interface21] ripng 20 enable
[VR2-Vlan-interface21] quit
```

On the MCE, display the routing tables of VPN instances **vpn1** and **vpn2**.

```
[MCE] display ipv6 routing-table vpn-instance vpn1
```

```

Interface  : NULL0                                      Cost      : 0
```

```
Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

The output shows that the MCE has learned the private route of VPN 2. The MCE maintains the routes of VPN 1 and VPN 2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ipv6 address 30::1 64
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ipv6 address 40::1 64
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ipv6 address 30::2 64
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ipv6 address 40::2 64
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPFv3 process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospfv3 10 vpn-instance vpn1
```

Redistribute the IPv6 static route of VPN 1.

```
[MCE-ospf-10] router-id 101.101.10.1
[MCE-ospf-10] import-route static
[MCE-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ospfv3 10 area 0.0.0.0
[MCE-Vlan-interface30] quit
```

On PE 1, enable OSPFv3 process 10 and bind the process to VPN instance **vpn1**.

```
[PE1] ospfv3 10 vpn-instance vpn1
[PE1-ospf-10] router-id 100.100.10.1
[PE1-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ospfv3 10 area 0.0.0.0
[PE1-Vlan-interface30] quit
```

Configure OSPFv3 process 20 between the MCE and PE 1. (Details not shown.)

Redistribute VPN 2's routes from RIPng process 20 into the OSPFv3 routing table of the MCE. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the private route of VPN 1 through OSPFv3.

```
[PE1] display ipv6 routing-table vpn-instance vpn1

All contents in this document, including statements, information, and recommendations, are believed to be accurate, but they are presented without warranty of any kind, express or implied. H3C shall not be liable for technical or editorial errors or omissions contained herein.

Preface

This configuration guide describes the fundamentals and configuration procedures for ACL and QoS features, including ACL, QoS, data buffer, and time range.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring ACLs

Only the S5200-HI-G switch series supports user-defined ACLs.

About ACLs

An access control list (ACL) is a set of rules for identifying traffic based on criteria such as source IP address, destination IP address, and port number. The rules are also called permit or deny statements.

ACLs are primarily used for packet filtering. You can also use ACLs in QoS, security, routing, and other modules for identifying traffic. The packet drop or forwarding decisions depend on the modules that use ACLs.

Numbering and naming ACLs

When creating an ACL, you must assign it a number or name for identification. You can specify an existing ACL by its number or name. Each ACL type has a unique range of ACL numbers.

For basic or advanced ACLs with the same number, you must use the **`ipv6`** keyword to distinguish them. For ACLs with the same name, you must use the **`ipv6`**, **`mac`**, and **`user-defined`** keywords to distinguish them.

ACL types

Type	ACL number	IP version	Match criteria
Basic ACLs	2000 to 2999	IPv4	Source IPv4 address.
		IPv6	Source IPv6 address.
Advanced ACLs	3000 to 3999	IPv4	Source IPv4 address, destination IPv4 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
		IPv6	Source IPv6 address, destination IPv6 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
Layer 2 ACLs	4000 to 4999	IPv4 and IPv6	Layer 2 header fields, such as source and destination MAC addresses, 802.1p priority, and link layer protocol type.
User-defined ACLs	5000 to 5999	IPv4 and IPv6	User specified matching patterns in protocol headers.

Match order

The rules in an ACL are sorted in a specific order. When a packet matches a rule, the device stops the match process and performs the action defined in the rule. If an ACL contains overlapping or conflicting rules, the matching result and action to take depend on the rule order.

The following ACL match orders are available:

- **config**—Sorts ACL rules in ascending order of rule ID. A rule with a lower ID is matched before a rule with a higher ID. If you use this method, check the rules and their order carefully.

NOTE:

The match order of user-defined ACLs can only be **config**.

- **auto**—Sorts ACL rules in depth-first order. Depth-first ordering makes sure any subset of a rule is always matched before the rule. The following table lists the sequence of tie breakers that depth-first ordering uses to sort rules for each type of ACL.

Table 1 Sort ACL rules in depth-first order

ACL type	Sequence of tie breakers
IPv4 basic ACL	**1.** VPN instance. **1.** More 0s in the source IPv4 address wildcard (more 0s means a narrower IPv4 address range). **2.** Rule configured earlier.
IPv4 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** More 0s in the source IPv4 address wildcard mask. **4.** More 0s in the destination IPv4 address wildcard. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
IPv6 basic ACL	**1.** VPN instance. **2.** Longer prefix for the source IPv6 address (a longer prefix means a narrower IPv6 address range). **3.** Rule configured earlier.
IPv6 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** Longer prefix for the source IPv6 address. **4.** Longer prefix for the destination IPv6 address. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
Layer 2 ACL	**1.** More 1s in the source MAC address mask (more 1s means a smaller MAC address). **2.** More 1s in the destination MAC address mask. **3.** Rule configured earlier.

A wildcard mask, also called an inverse mask, is a 32-bit binary number represented in dotted decimal notation. In contrast to a network mask, the 0 bits in a wildcard mask represent "do care" bits, and the 1 bits represent "don't care" bits. If the "do care" bits in an IP address are identical to the "do care" bits in an IP address criterion, the IP address matches the criterion. All "don't care" bits are ignored. The 0s and 1s in a wildcard mask can be noncontiguous. For example, 0.255.0.255 is a valid wildcard mask.

Comments and remarks for rules

An ACL can have multiple rules. To identify rules, you can add a comment for each rule one by one, or add the same remark for multiple rules.

- For rules requiring different identification, you can add a comment for a particular rule or add a different comment for each rule.
- For a range of rules requiring the same identification, you can insert a remark before the start rule and a remark after the end rule. This configuration mode eliminates the need for configuring a comment for each rule one by one and improves configuration efficiency.

Rule numbering

ACL rules can be manually numbered or automatically numbered. This section describes how automatic ACL rule numbering works.

Rule numbering step

If you do not assign an ID to the rule you are creating, the system automatically assigns it a rule ID. The rule numbering step sets the increment by which the system automatically numbers rules. For example, the default ACL rule numbering step is 5. If you do not assign IDs to rules you are creating, they are automatically numbered 0, 5, 10, 15, and so on. The wider the numbering step, the more rules you can insert between two rules.

By introducing a gap between rules rather than contiguously numbering rules, you have the flexibility of inserting rules in an ACL. This feature is important for a config-order ACL, where ACL rules are matched in ascending order of rule ID.

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step or start rule ID changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Automatic rule numbering and renumbering

The ID automatically assigned to an ACL rule takes the nearest higher multiple of the numbering step to the current highest rule ID, starting with 0.

For example, if the step is 5, and there are five rules numbered 0, 5, 9, 10, and 12, the newly defined rule is numbered 15. If the ACL does not contain a rule, the first rule is numbered 0.

Whenever the step changes, the rules are renumbered, starting from 0. For example, changing the step from 5 to 2 renumbers rules 5, 10, 13, and 15 as rules 0, 2, 4, and 6.

For an ACL of the match order **auto**, rules are sorted in depth-first order, and are renumbered based on the match order. For example, rules are in the match order of 0, 10, and 5. Changing the numbering step to 2 renumbers rules 0, 10, and 5 (not 0, 5, and 10) as rules 0, 2, 4.

Fragment filtering with ACLs

Traditional packet filtering matches only first fragments of packets, and allows all subsequent non-first fragments to pass through. Attackers can fabricate non-first fragments to attack networks.

To avoid risks, the ACL feature is designed as follows:

- Filters all fragments by default, including non-first fragments.
- Allows for matching criteria modification for efficiency. For example, you can configure the ACL to filter only non-first fragments.

Restrictions and guidelines: ACL configuration

- If you create a numbered ACL, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **number** *acl-number*.
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } *acl-number*.

- If you create a ACL by using the **acl** [**ipv6**] **number** *acl-number* **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*].
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name*.
- If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** | **user-defined** } **name** *acl-name*.

ACL tasks at a glance

To configure an ACL, perform the following tasks:

- Configure ACLs according to the characteristics of the packets to be matched
  - Configuring a basic ACL
  - Configuring an advanced ACL
  - Configuring a Layer 2 ACL
  - Configuring a user-defined ACL
- (Optional.) Copying an ACL
- (Optional.) Configuring the QoS and ACL resource hardware mode
- (Optional.) Configuring packet filtering with ACLs

Configuring a basic ACL

About basic ACLs

Basic ACLs match packets based only on source IP addresses.

Basic ACLs can be used in the following scenarios:

- To improve security when the device acts as an FTP or TFTP server, you can use basic ACLs to allow only matching clients to access the server. For more information, see FTP and TFTP configuration in *Fundamentals Configuration Guide*.
- In a multicast scenario, you can use basic ACLs in a multicast source policy to receive or forward only matching multicast packets. For more information about multicast source policy, see PIM configuration and IPv6 PIM configuration in *IP Multicast Configuration Guide*.
- To filter routes in a routing policy, you can use basic ACLs to receive or send matching routes. For more information about routing policy, see *Layer 3—IP Routing Configuration Guide*.
- To take different QoS actions on different traffic types, you can use basic ACLs to classify traffic. For more information about traffic classes, see "Configuring QoS."

Configuring an IPv4 basic ACL

1. Enter system view.

   system-view
2. Create an IPv4 basic ACL and enter its view. Choose one option as needed:

- Create an IPv4 basic ACL by specifying an ACL number.

  acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

- Create an IPv4 basic ACL by specifying the **basic** keyword.

  acl basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv4 basic ACL.

   description *text*

   By default, an IPv4 basic ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | [**flow-logging** | **logging**] | **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

   The **flow-logging** or **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring an IPv6 basic ACL

1. Enter system view.

   system-view

2. Create an IPv6 basic ACL view and enter its view. Choose one option as needed:

   - Create an IPv6 basic ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

   - Create an IPv6 basic ACL by specifying the **basic** keyword.

     acl ipv6 basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 basic ACL.

   description *text*

   By default, an IPv6 basic ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | [**flow-logging** | **logging**] | **routing** [**type** *routing-type*] | **source** { *source-address*

source-prefix | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

The **flow-logging** or **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

rule *rule-id* **comment** *text*

By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

rule [*rule-id*] **remark** *text*

By default, no rule remark is configured.

Configuring an advanced ACL

About advanced ACLs

Advanced ACLs can be used in the following scenarios:

- When the device acts as an FTP or TFTP server, you can use advanced ACLs to allow only matching clients to access the server. For more information, see FTP and TFTP configuration in *Fundamentals Configuration Guide*.
- In a multicast scenario, you can use advanced ACLs in a multicast source policy to receive or forward only matching multicast packets. For more information about multicast source policy, see PIM configuration and IPv6 PIM configuration in *IP Multicast Configuration Guide*.
- To filter routes in a routing policy, you can use advanced ACLs to receive or send matching routes. For more information about routing policy, see *Layer 3—IP Routing Configuration Guide*.
- To take different QoS actions on different traffic types, you can use advanced ACLs to classify traffic. For more information about traffic classification see "Configuring QoS."

Advanced ACLs match packets based on the following criteria:

- Source IP addresses.
- Destination IP addresses.
- Packet priorities.
- Local QoS IDs.
- Protocol types.
- Other protocol header information, such as TCP/UDP source and destination port numbers, TCP flags, ICMP message types, and ICMP message codes.
- Encapsulation types.
- Inner source IPv4 addresses.
- Inner destination IPv4 addresses.
- Inner protocol types.
- Other inner protocol header information, such as inner TCP/UDP source and destination port numbers.

Compared to basic ACLs, advanced ACLs allow more flexible and accurate filtering.

Configuring an IPv4 advanced ACL

1. Enter system view.

system-view

2. Create an IPv4 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv4 advanced ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 advanced ACL by specifying the **advanced** keyword.

     acl advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the IPv4 advanced ACL.

   description *text*

   By default, an IPv4 advanced ACL does not have a description.
4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.
5. Create or edit a rule. Choose the options to configure as needed:
   - Create or edit a rule for matching non-encapsulated packets.

     rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **packet-length** *operator length-value1* [*length-value2*] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **user-group** *group-name* | **vpn-instance** *vpn-instance-name*] *
   - Create or edit a rule for matching encapsulated packets.

     rule [*rule-id*] { **deny** | **permit** } { **gre-encapsulation** | **ipinip-encapsulation** | **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | [**flow-logging** | **logging**] | **packet-length** *operator length-value1* [*length-value2*] | **time-range** *time-range-name*] *

Parameter	Description
gre-encapsulation	Matches GRE packets. The **source-port** *operator port1* [*port2*] and **vxlan-id** *vxlan-id* options cannot be configured if you specify the **gre-encapsulation** keyword.
ipinip-encapsulation	Matches IP-in-IP encapsulation packets. The **source-port** *operator port1* [*port2*] and **vxlan-id** *vxlan-id* options cannot be configured if you specify the **ipinip-encapsulation** keyword.
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

6. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [**counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { **dscp** *dscp* | **precedence** *precedence* } | [**first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name*] *

7. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

  In a VXLAN network, only the inner header information of VXLAN packets can be matched on edge devices, and only the outer header information of VXLAN packets can be matched on core devices.

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg**

inner-urg-value } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner header information.

8. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this

	keyword.

9. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | **precedence** *precedence* | **dscp** *dscp* } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name*] *

10. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name* | **vpn-instance** *vpn-instance-name*] *

The S5200-EI-G switch series does not support the following keywords:

- **any-fragment**
- **first-fragment**
- **non-fragment**
- **non-or-first-fragment**

11. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

12. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

13. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

14. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] *

inner-protocol *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner header information.

15. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

Only the S5560X-HI and S6520X-HI switch series support the **microsegment** parameter.

16. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg**

inner-urg-value } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

17. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **logging** | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

18. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn**

ecn } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | **logging** | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by outer or inner packet information.

19. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

  An IPv4 advanced ACL rule containing the **qos-local-id** keyword cannot be used for outbound QoS traffic classification or outbound packet filtering.

  The VPN instance cannot be matched in the outbound direction.

  In the inbound direction on edge devices in a VXLAN network, the inner header information of VXLAN packets is matched first, and the outer header information is matched if no matched is found in the inner header information. On core devices, only the outer header information of VXLAN packets can be matched.

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin**

inner-fin-value | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

20. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id**

	geneve-id and **option-header-length** *option-length* options only after you specify this keyword.

21. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | **logging** | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

22. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **qos-local-id** *local-id-value* | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id*] *

inner-protocol *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | **logging** | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

23. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.

geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

24. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

25. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [**counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | **precedence** *precedence* } | [**first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type**

{ *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

26. Create or edit a rule.

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | **inner-source-port** *operator port1* [*port2*] | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

27. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [**counting** | **destination** { **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **object-group**

address-group-name | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

28. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

Only the S6813 switch series supports the **microsegment** parameter.

29. Create or edit a rule. Choose the options to configure as needed:

- Create or edit a rule for matching non-encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-wildcard* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | { **precedence** *precedence* | **ecn** *ecn* } * | { **dscp** *dscp* | **ecn** *ecn* } * } | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | [**flow-logging** | **logging**] | **qos-local-id** *local-id-value* | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-wildcard* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching encapsulated packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**destination** { *dest-address dest-wildcard* | **any** } | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-wildcard* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-wildcard* | **any** } | **inner-source-port** *operator port1* [*port2*] | { { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | { **inner-ecn** *inner-ecn* | **inner-precedence** *inner-precedence* } * | { **inner-precedence** *inner-precedence* | **inner-tos** *inner-tos* } * } | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches VXLAN packets by both outer and inner packet information.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

The **flow-logging** or **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

30. (Optional.) Add or edit a rule comment.

    rule *rule-id* **comment** *text*

    By default, no rule comment is configured.

31. (Optional.) Add a rule remark.

    rule [*rule-id*] **remark** *text*

    By default, no rule remark is configured.

Configuring an IPv6 advanced ACL

1. Enter system view.

   system-view

2. Create an IPv6 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv6 advanced ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv6 advanced ACL by specifying the **advanced** keyword.

     acl ipv6 advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 advanced ACL.

   description *text*

   By default, an IPv6 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule. Choose the options to configure as needed:
   - Create or edit a rule for matching non-encapsulated packets.

     rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **destination-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **destination-port** *operator port1* [*port2*] | | { **dscp** *dscp* | **ecn** *ecn-value* } * | **dscp** *dscp* | **dscp** *dscp* | **dscp** *dscp* | **dscp** *dscp* | **dscp** *dscp* | **flow-label** *flow-label-value* | [**any-fragment** | **first-fragment** | **fragment** | **non-fragment** | **non-or-first-fragment**] | **fragment** | [**first-fragment**

| **fragment** | **non-fragment** | **non-or-first-fragment**] | **fragment** | **fragment** | **fragment** | **fragment** | **fragment** | **fragment** | **fragment** | **fragment** | **icmp6-type** { *icmp6-type icmp6-code* | *icmp6-message* } | [**flow-logging** | **logging**] | **logging**| | **packet-length** *operator length-value1* [*length-value2*] | **qos-local-id** *local-id-value* | **routing** [**type** *routing-type*] | **hop-by-hop** [**type** *hop-type*] | **source** { **microsegment** *microsegment-id* [**mask-length** *mask-length*] | **object-group** *address-group-name* | *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** { **object-group** *port-group-name* | *operator port1* [*port2*] } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name*| **user-group** *group-name* | **vpn-instance** *vpn-instance-name*] *

- Create or edit a rule for matching IPv4 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **packet-length** *operator length-value1* [*length-value2*] | **time-range** *time-range-name*] *

- Create or edit a rule for matching IPv4 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan** | **geneve** } [**vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

- Create or edit a rule for matching IPv4 VXLAN packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**vxlan-id** *vxlan-id*] **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | **logging** | **time-range** *time-range-name*] *

- Create or edit a rule for matching IPv4 VXLAN packets.

  rule [*rule-id*] { **deny** | **permit** } **vxlan** [**vxlan-id** *vxlan-id*] **inner-protocol** *inner-protocol* [**counting** | **inner-destination**

Parameter	Description
vxlan	Matches IPv4 VXLAN packets by both outer and inner packet information. The following outer header information is not supported for matching IPv4 VXLAN packets: • Outer source IP address. • Outer destination IP address. • Outer source port number. • Outer destination port number.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.
vxlan-ipv6	Matches IPv6 VXLAN packets by both outer and inner packet information.
geneve-ipv6	Matches IPv6 Geneve packets. You can specify the **geneve-id** *geneve-id* and

	option-header-length *option-length* options only after you specify this keyword.

- Create or edit a rule for matching IPv6 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan-ipv6** | **geneve-ipv6** } [**destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches IPv4 VXLAN packets by both outer and inner packet information. The following outer header information is not supported for matching IPv4 VXLAN packets: • Outer source IP address. • Outer destination IP address. • Outer source port number. • Outer destination port number.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.
vxlan-ipv6	Matches IPv6 VXLAN packets by both outer and inner packet information.
geneve-ipv6	Matches IPv6 Geneve packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

- Create or edit a rule for matching IPv6 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan-ipv6** | **geneve-ipv6** } [**destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn**

inner-syn-value | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches IPv4 VXLAN packets by both outer and inner packet information. The following outer header information is not supported for matching IPv4 VXLAN packets: • Outer source IP address. • Outer destination IP address. • Outer source port number. • Outer destination port number.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.
vxlan-ipv6	Matches IPv6 VXLAN packets by both outer and inner packet information.
geneve-ipv6	Matches IPv6 Geneve packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

- Create or edit a rule for matching IPv6 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan-ipv6** | **geneve-ipv6** } [**destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | { { **inner-ack** *inner-ack-value* | **inner-fin** *inner-fin-value* | **inner-psh** *inner-psh-value* | **inner-rst** *inner-rst-value* | **inner-syn** *inner-syn-value* | **inner-urg** *inner-urg-value* } * | **inner-established** } | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches IPv4 VXLAN packets by both outer and inner packet information. The following outer header information is not supported for matching IPv4 VXLAN packets: • Outer source IP address. • Outer destination IP address. • Outer source port number.

	• Outer destination port number.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.
vxlan-ipv6	Matches IPv6 VXLAN packets by both outer and inner packet information.
geneve-ipv6	Matches IPv6 Geneve packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

- Create or edit a rule for matching IPv6 VXLAN or Geneve packets.

  rule [*rule-id*] { **deny** | **permit** } { **vxlan-ipv6** | **geneve-ipv6** } [**destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1* [*port2*] | **vxlan-id** *vxlan-id* | **geneve-id** *geneve-id* | **option-header-length** *option-length*] * **inner-protocol** *inner-protocol* [**counting** | **inner-destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **inner-destination-port** *operator port1* [*port2*] | **inner-source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **inner-source-port** *operator port1* [*port2*] | { **inner-dscp** *inner-dscp* | **inner-ecn** *inner-ecn* } * | [**flow-logging** | **logging**] | **time-range** *time-range-name*] *

Parameter	Description
vxlan	Matches IPv4 VXLAN packets by both outer and inner packet information. The following outer header information is not supported for matching IPv4 VXLAN packets: • Outer source IP address. • Outer destination IP address. • Outer source port number. • Outer destination port number.
geneve	Matches Generic Network Virtualization Encapsulation (Geneve) packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.
vxlan-ipv6	Matches IPv6 VXLAN packets by both outer and inner packet information.
geneve-ipv6	Matches IPv6 Geneve packets. You can specify the **geneve-id** *geneve-id* and **option-header-length** *option-length* options only after you specify this keyword.

The **flow-logging** or **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

The S5200-EI-G switch series does not support the following keywords:

- **any-fragment**

- **first-fragment**
- **non-fragment**
- **non-or-first-fragment**

6. (Optional.) Add or edit a rule comment.
   rule *rule-id* **comment** *text*
   By default, no rule comment is configured.
7. (Optional.) Add a rule remark.
   rule [*rule-id*] **remark** *text*
   By default, no rule remark is configured.

Configuring a Layer 2 ACL

About this task

Layer 2 ACLs can be used in the following scenarios:

- To improve security when the device acts as a Telnet server, you can use Layer 2 ACLs to allow only matching clients to access the server. For more information, see login management in *Fundamentals Configuration Guide*.
- To take different QoS actions on different traffic types, you can use Layer 2 ACLs to classify traffic. For more information about traffic classes, see "Configuring QoS."

Layer 2 ACLs, also called Ethernet frame header ACLs, match packets based on Layer 2 Ethernet header fields, such as:

- Source MAC address.
- Destination MAC address.
- 802.1p priority (VLAN priority).
- Link layer protocol type.
- Encapsulation type.

Procedure

1. Enter system view.
   system-view
2. Create a Layer 2 ACL and enter its view. Choose one option as needed:
   - Create a Layer 2 ACL by specifying an ACL number.
     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create a Layer 2 ACL by specifying the **mac** keyword.
     acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the Layer 2 ACL.
   description *text*
   By default, a Layer 2 ACL does not have a description.
4. (Optional.) Set the rule numbering step.
   step *step-value* [**start** *start-value*]
   By default, the rule numbering step is 5 and the start rule ID is 0.
5. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | **type** *protocol-type protocol-type-mask* | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring a user-defined ACL

About this task

User-defined ACLs allow you to customize rules based on information in protocol headers. You can define a user-defined ACL to match packets. A specific number of bytes after an offset (relative to the specified header) are compared against a match pattern after being ANDed with a match pattern mask.

Procedure

1. Enter system view.

   system-view

2. Create a user-defined ACL and enter its view. Choose one option as needed:
   - Create a user-defined ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*]
   - Create a user-defined ACL by specifying the **user-defined** keyword.

     acl user-defined { *acl-number* | **name** *acl-name* }

3. (Optional.) Configure a description for the user-defined ACL.

   description *text*

   By default, a user-defined ACL does not have a description.

4. Create or edit a rule.

   Command set 1:

   rule [*rule-id*] { **deny** | **permit** } [{ { **ipv4** | **ipv6** | **l2** | **l4** } *rule-string rule-mask offset* }&<1-8>] [**counting** | **time-range** *time-range-name*] *

   Command set 2:

   rule [*rule-id*] { **deny** | **permit** } [**ipv6-protocol**] *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** { *operator port1* [*port2*] } | { { **precedence** *precedence* | **tos** *tos* } * | **dscp** *dscp* } | **source** { *source-address source-wildcard* | **any** } | **source-port** { *operator port1* [*port2*] } | **vpn-instance** *vpn-instance-name*] * [{ { **ipv4** | **ipv6** | **l2** | **l4** } *rule-string rule-mask offset* }&<1-8>] [**counting** | **time-range** *time-range-name*] *

5. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

6. (Optional.) Add a rule remark.

rule [*rule-id*] **remark** *text*

By default, no rule remark is configured.

Copying an ACL

About this task

You can create an ACL by copying an existing ACL (source ACL). The new ACL (destination ACL) has the same properties and content as the source ACL, but uses a different number or name than the source ACL.

Restrictions and guidelines

To successfully copy an ACL, make sure:

- The destination ACL is the same type as the source ACL.
- The source ACL already exists, but the destination ACL does not.

Procedure

1. Enter system view.

   system-view

2. Copy an existing ACL to create a new ACL.

   acl [**ipv6** | **mac** | **user-defined**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Configuring the QoS and ACL resource hardware mode

About this task

Different chips produce different packet matching results for QoS and ACL resources. Perform this task to enhance matching capabilities of QoS and ACL resources.

Restrictions and guidelines

This feature occupies more QoS and ACL resources when an ACL is applied.

The S5200-HI-G switch series does not support this feature.

Procedure

1. Enter system view.

   system-view

2. Configure the QoS and ACL resource hardware mode.

   qos-acl resource hardware-mode *hardware-mode-value*

   By default, no QoS and ACL resource hardware mode is configured.

Configuring packet filtering with ACLs

About packet filtering with ACLs

This section describes procedures for using an ACL to filtering packets. For example, you can apply an ACL to an interface to filter incoming or outgoing packets.

Applying an ACL to filter packets globally

Restrictions and guidelines

Procedure

1. Enter system view.

   system-view

2. Apply an ACL globally.

   packet-filter [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } **global** { **inbound** | **outbound** } [**hardware-count**]

   By default, global packet filtering is not configured.

Applying an ACL to an interface for packet filtering

Restrictions and guidelines

An ACL applied to the outbound direction of a VLAN interface cannot match untagged packets.

The following restrictions apply to the **extend** keyword:

- If equal-cost routes exist from the device to the network accessed through a VLAN interface, the VLAN interface does not support the **extend** keyword.
- support the **extend** keyword only on VLAN interfaces.
- The packet filtering feature on a VLAN interface that uses expanded ACL resources and the **packet-filter filter all** command are mutually exclusive.
- If you apply an ACL to the outbound direction of a VLAN interface with the keyword and execute the **packet-filter default deny** command, the deny action takes effect on only Layer 3 packets on that VLAN interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an ACL to the interface to filter packets.

   packet-filter [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** [**extend**] } [**hardware-count**]

   By default, an interface does not filter packets.

Configuring the applicable scope of packet filtering on a VLAN interface

About this task

You can configure the packet filtering on a VLAN interface to filter the following packets:

- Packets forwarded at Layer 3 by the VLAN interface.
- All packets, including packets forwarded at Layer 3 by the VLAN interface and packets forwarded at Layer 2 by the physical ports associated with the VLAN interface.

Procedure

1. Enter system view.

system-view

2. Create a VLAN interface and enter its view.
   interface vlan-interface *vlan-interface-id*
   If the VLAN interface already exists, you directly enter its view.
   By default, no VLAN interface exists.
3. Specify the applicable scope of packet filtering on the VLAN interface.
   packet-filter filter [**route** | **all**]
   By default, the packet filtering filters packets forwarded at Layer 3.

Configuring logging and SNMP notifications for packet filtering

About this task

You can configure the ACL module to generate log entries or SNMP notifications for packet filtering and output them to the information center or SNMP module at the output interval. When the first packet of a flow matches an ACL rule, the output interval starts. At the end of the interval, the device outputs a log entry or notification to record the number of matching packets and the matched ACL rule during the interval.

For more information about the information center and SNMP, see *Network Management and Monitoring Configuration Guide.*

Procedure

1. Enter system view.
   system-view
2. Set the interval for outputting packet filtering logs or notifications.
   acl { **logging** | **trap** } **interval** *interval*
   The default setting is 0 minutes. By default, the device does not generate log entries or SNMP notifications for packet filtering.

Setting the packet filtering default action

1. Enter system view.
   system-view
2. Set the packet filtering default action to deny.
   packet-filter default deny
   By default, the packet filter permits packets that do not match any ACL rule to pass.

Display and maintenance commands for ACL

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ACL configuration and match statistics.	**display acl** [**ipv6** | **mac** | **user-defined**] { *acl-number* | **all** | **name** *acl-name* }
Display ACL application information for packet filtering.	**display packet-filter** { **global** | **interface** [*interface-type interface-number*] } [**inbound** |

Task	Command
	outbound] [**slot** *slot-number*]
Display match statistics for packet filtering ACLs.	**display packet-filter statistics** { **global** | **interface** *interface-type interface-number* } { **inbound** | **outbound** } [[**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* }] [**brief**]
Display the accumulated statistics for packet filtering ACLs.	**display packet-filter statistics sum** { **inbound** | **outbound** } [**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* } [**brief**]
Display detailed ACL packet filtering information.	**display packet-filter verbose** { **global** | **interface** *interface-type interface-number* } { **inbound** | **outbound** } [[**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* }] [**slot** *slot-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Clear ACL statistics.	**reset acl** [**ipv6** | **mac** | **user-defined**] **counter** { *acl-number* | **all** | **name** *acl-name* }
Clear match statistics for packet filtering ACLs.	**reset packet-filter statistics** { **global** | **interface** [*interface-type interface-number*] } { **inbound** | **outbound** } [[**ipv6** | **mac** | **user-defined**] { *acl-number* | **name** *acl-name* }]

ACL configuration examples

Example: Configuring interface-based packet filter

Network configuration

A company interconnects its departments through the device. Configure a packet filter to:

- Permit access from the President's office at any time to the financial database server.
- Permit access from the Finance department to the database server only during working hours (from 8:00 to 18:00) on working days.
- Deny access from any other department to the database server.

Figure 1 Network diagram

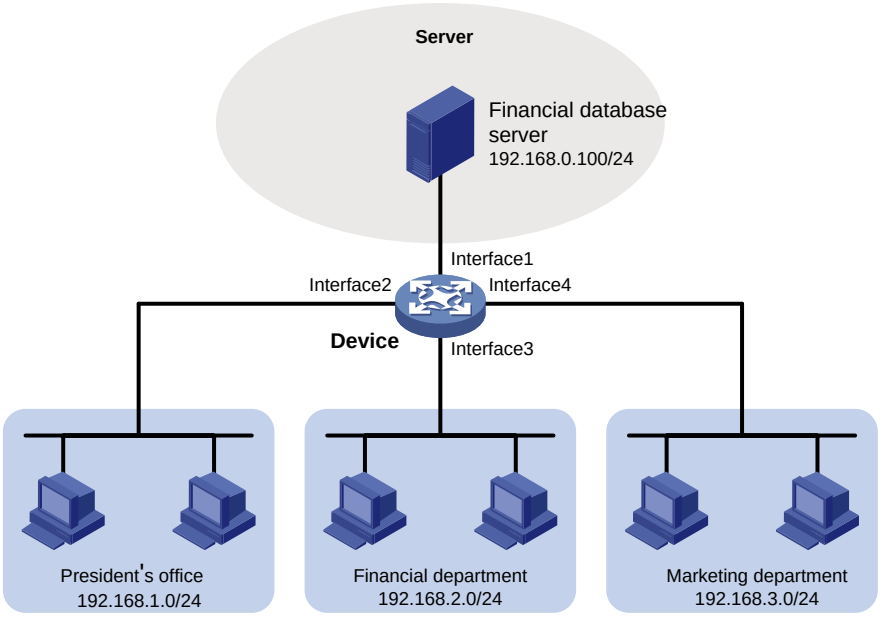

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

Create a periodic time range from 8:00 to 18:00 on working days.

```
<Device> system-view
[Sysname] sysname Device
[Device] time-range work 08:0 to 18:00 working-day
```

Assign IP addresses to interfaces.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] ip address 192.168.0.1 24
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] ip address 192.168.1.1 24
[Device-GigabitEthernet1/0/2] quit
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] ip address 192.168.2.1 24
[Device-GigabitEthernet1/0/3] quit
[Device] interface gigabitethernet 1/0/4
[Device-GigabitEthernet1/0/4] ip address 192.168.3.1 24
[Device-GigabitEthernet1/0/4] quit
```

Configure IS-IS.

```
[Device] isis 1
```

```
[Device-isis-1] network-entity 00.0000.0000.0001.00
[Device-isis-1] is-level level-2
[Device-isis-1] cost-style wide
[Device-isis-1] address-family ipv4
[Device-isis-1-ipv4] quit
[Device-isis-1] quit
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] isis enable 1
[Device-GigabitEthernet1/0/1] quit
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] isis enable 1
[Device-GigabitEthernet1/0/2] quit
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] isis enable 1
[Device-GigabitEthernet1/0/3] quit
[Device] interface gigabitethernet 1/0/4
[Device-GigabitEthernet1/0/4] isis enable 1
[Device-GigabitEthernet1/0/4] quit
```

Create an IPv4 advanced ACL numbered 3000.

```
[Device] acl advanced 3000
```

Configure a rule to permit access from the President's office to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.1.0 0.0.0.255 destination
192.168.0.100 0
```

Configure a rule to permit access from the Finance department to the database server during working hours.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.2.0 0.0.0.255 destination
192.168.0.100 0 time-range work
```

Configure a rule to deny access to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule deny ip source any destination 192.168.0.100 0
[Device-acl-ipv4-adv-3000] quit
```

Apply IPv4 advanced ACL 3000 to filter outgoing packets on interface GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] packet-filter 3000 outbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that a PC in the Finance department can ping the database server during working hours. (All PCs in this example use Windows XP).

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Reply from 192.168.0.100: bytes=32 time=1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.0.100:
```

```
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Verify that a PC in the Marketing department cannot ping the database server during working hours.

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Display configuration and match statistics for IPv4 advanced ACL 3000 on the device during working hours.

```
[Device] display acl 3000
Advanced IPv4 ACL 3000, 3 rules,
ACL's step is 5
 rule 0 permit ip source 192.168.1.0 0.0.0.255 destination 192.168.0.100 0
 rule 5 permit ip source 192.168.2.0 0.0.0.255 destination 192.168.0.100 0 time-range work (Active)
 rule 10 deny ip destination 192.168.0.100 0
```

The output shows that rule 5 is active. Rule 5 and rule 10 have been matched four times as the result of the ping operations.

Configuration files

```
#

QoS overview

In data communications, Quality of Service (QoS) provides differentiated service guarantees for diversified traffic in terms of bandwidth, delay, jitter, and drop rate, all of which can affect QoS.

QoS manages network resources and prioritizes traffic to balance system resources.

The following section describes typical QoS service models and widely used QoS techniques.

QoS service models

This section describes several typical QoS service models.

Best-effort service model

The best-effort model is a single-service model. The best-effort model is not as reliable as other models and does not guarantee delay-free delivery.

The best-effort service model is the default model for the Internet and applies to most network applications. It uses the First In First Out (FIFO) queuing mechanism.

IntServ model

The integrated service (IntServ) model is a multiple-service model that can accommodate diverse QoS requirements. This service model provides the most granularly differentiated QoS by identifying and guaranteeing definite QoS for each data flow.

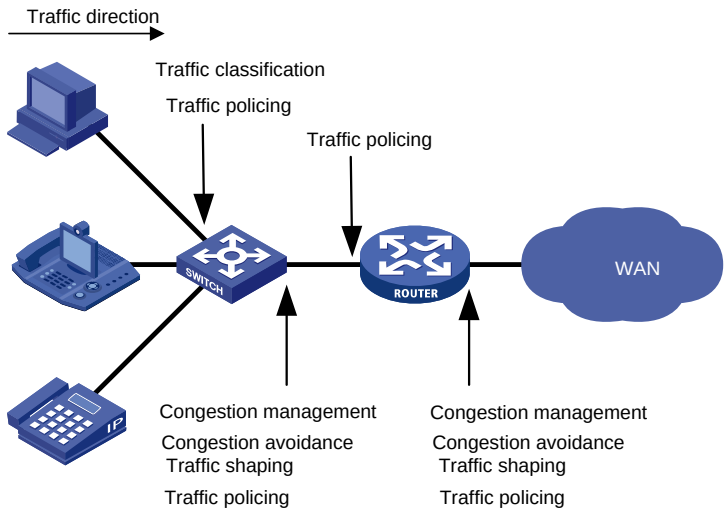
In the IntServ model, an application must request service from the network before it sends data. IntServ signals the service request with the RSVP. All nodes receiving the request reserve resources as requested and maintain state information for the application flow.

The IntServ model demands high storage and processing capabilities because it requires all nodes along the transmission path to maintain resource state information for each flow. This model is suitable for small-sized or edge networks. However, it is not suitable for large-sized networks, for example, the core layer of the Internet, where billions of flows are present.

DiffServ model

The differentiated service (DiffServ) model is a multiple-service model that can meet diverse QoS requirements. It is easy to implement and extend. DiffServ does not signal the network to reserve resources before sending data, as IntServ does.

QoS techniques in a network



The QoS techniques include the following features:

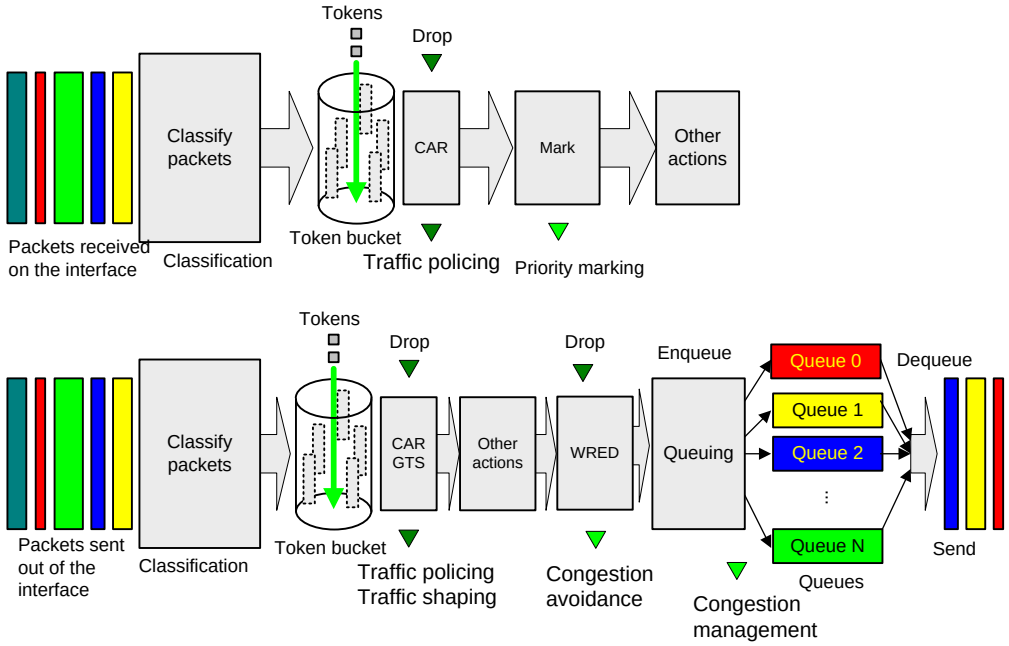
- Traffic classification.
- Traffic policing.
- Traffic shaping.
- Rate limit.
- Congestion management.
- Congestion avoidance.

The following section briefly introduces these QoS techniques.

All QoS techniques in this document are based on the DiffServ model.

Figure 1 Position of the QoS techniques in a network

As shown in Figure 1, traffic classification, traffic shaping, traffic policing, congestion management, and congestion avoidance mainly implement the following functions:



- **Traffic classification**—Uses match criteria to assign packets with the same characteristics to a traffic class. Based on traffic classes, you can provide differentiated services.
- **Traffic policing**—Polices flows and imposes penalties to prevent aggressive use of network resources. You can apply traffic policing to both incoming and outgoing traffic of a port.
- **Traffic shaping**—Adapts the output rate of traffic to the network resources available on the downstream device to eliminate packet drops. Traffic shaping usually applies to the outgoing traffic of a port.
- **Congestion management**—Provides a resource scheduling policy to determine the packet forwarding sequence when congestion occurs. Congestion management usually applies to the outgoing traffic of a port.
- **Congestion avoidance**—Monitors the network resource usage. It is usually applied to the outgoing traffic of a port. When congestion worsens, congestion avoidance reduces the queue length by dropping packets.

QoS processing flow in a device

Figure 2 briefly describes how the QoS module processes traffic.

1. Traffic classifier identifies and classifies traffic for subsequent QoS actions.
2. The QoS module takes various QoS actions on classified traffic as configured, depending on the traffic processing phase and network status. For example, you can configure the QoS module to perform the following operations:
   - Traffic policing for incoming traffic.
   - Traffic shaping for outgoing traffic.
   - Congestion avoidance before congestion occurs.
   - Congestion management when congestion occurs.

Figure 2 QoS processing flow

QoS configuration approaches

You can configure QoS by using the MQC approach or non-MQC approach.

In the modular QoS configuration (MQC) approach, you configure QoS service parameters by using QoS policies. A QoS policy defines QoS actions to take on different classes of traffic and can be applied to an object (such as an interface) to control traffic.

In the non-MQC approach, you configure QoS service parameters without using a QoS policy. For example, you can use the rate limit feature to set a rate limit on an interface without using a QoS policy.

Configuring a QoS policy

About QoS policies

A QoS policy has the following components:

- **Traffic class**—Defines criteria to match packets.
- **Traffic behavior**—Defines QoS actions to take on matching packets.

By associating a traffic class with a traffic behavior, a QoS policy can perform the QoS actions on matching packets.

A QoS policy can have multiple class-behavior associations.

QoS policy tasks at a glance

To configure a QoS policy, perform the following tasks:

1. Defining a traffic class
2. Defining a traffic behavior
3. Defining a QoS policy
4. Applying the QoS policy
   - Applying the QoS policy to an interface
   - Applying the QoS policy to VLANs
   - Applying the QoS policy globally
   - Applying the QoS policy to a control plane
   - Applying the QoS policy in control-plane management view

Defining a traffic class

Restrictions and guidelines

A match criterion without IPv6 attributes cannot match IPv6 packets.

Procedure

1. Enter system view.
   system-view
2. Create a traffic class and enter traffic class view.
   traffic classifier *classifier-name* [**operator** { **and** | **or** }]
3. (Optional.) Configure a description for the traffic class.
   description *text*

   By default, no description is configured for a traffic class.
4. Configure a match criterion.
   if-match *match-criteria*

   By default, no match criterion is configured.

   For more information, see the **if-match** command in *ACL and QoS Command Reference*.

Defining a traffic behavior

1. Enter system view.

   system-view
2. Create a traffic behavior and enter traffic behavior view.

   traffic behavior *behavior-name*
3. Configure an action in the traffic behavior.

   By default, no action is configured for a traffic behavior.

   For more information about configuring an action, see the subsequent chapters for traffic policing, traffic filtering, priority marking, class-based accounting, and so on.

Defining a QoS policy

1. Enter system view.

   system-view
2. Create a QoS policy and enter QoS policy view.

   qos [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy** *policy-name*

Parameter	Description
ipv6-matching	Represents an IPv6-matching QoS policy.
accounting	Represents an accounting-type QoS policy.
mirroring	Represents a mirroring-type QoS policy.
remarking	Represents a marking-type QoS policy.
tcp-erspan	Represents a TCP ERSPAN-type QoS policy.

3. Associate a traffic class with a traffic behavior to create a class-behavior association in the QoS policy.

   classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]

   By default, a traffic class is not associated with a traffic behavior.

   Repeat this step to create more class-behavior associations.

Applying the QoS policy

Application destinations

You can apply a QoS policy to the following destinations:

- **Interface**—The QoS policy can be applied to the traffic sent or received on the interface.
- **VLAN**—The QoS policy can be applied to the traffic sent or received on all ports in the VLAN.
- **Globally**—The QoS policy can be applied to the traffic sent or received on all ports.
- **Control plane**—The QoS policy can be applied to the traffic received on the control plane.

- **Management interface control plane**—The QoS policy can be applied to the traffic sent from the management interface to the control plane.

Restrictions and guidelines for applying a QoS policy

You can modify traffic classes, traffic behaviors, and class-behavior associations in a QoS policy even after it is applied (except that it is applied to a user profile). If a traffic class uses an ACL for traffic classification, you can delete or modify the ACL.

If a traffic behavior is configured with multiple actions and one of these actions does not take effect, the whole class-behavior association does not take effect.

A QoS policy applied in control-plane management view does not support matching the following protocols in a traffic class: ARP-snooping, bfd, dhcp, dhcp-snooping, dhcp6, dot1x, lacp, mvrp, oam, portal, pvst, rrpp, smart-link, stp, udp-helper, lldp.

When a QoS policy containing a CAR action is applied on an IRF fabric, the traffic matching the QoS policy might enter the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the CAR action multiplied by the number of involved IRF member devices by default.

Applying the QoS policy to an interface

Restrictions and guidelines

A QoS policy can be applied to multiple interfaces. However, only one QoS policy can be applied to one direction (inbound or outbound) of an interface.

A maximum of six QoS policies (one for each type) can be applied to one direction of an interface. Different actions can be taken on the same traffic class if QoS policies of different types are applied to an interface.

The QoS policy applied to the outgoing traffic on an interface does not regulate local packets. Local packets refer to critical protocol packets sent by the local system for operation maintenance. The most common local packets include link maintenance, RIP, and SSH packets.

If you specify the **longest-match** keyword, the system first matches the traffic class with a source or destination address with the longest mask and takes the actions in the associated traffic behavior. Suppose three class-behavior associations are configured in a QoS policy. ACL 3001 in the traffic class of the first class-behavior association is not configured with a source or destination address. ACL 3002 in the traffic class of the second class-behavior association is configured with destination address 10.10.10.0/24. ACL 3003 in the traffic class of the third class-behavior association is configured with destination address 10.10.10.10/32. The match order of the three class-behavior associations is the third class-behavior association, the second class-behavior association, the first class-behavior association. If both source and destination addresses exist in ACLs of different traffic classes, the system matches destination addresses before matching source addresses.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply the QoS policy to the interface.

   qos apply [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy** *policy-name* { **inbound** | **outbound** [**longest-match**]

   By default, no QoS policy is applied to an interface.

Applying the QoS policy to VLANs

About this task

You can apply a QoS policy to VLANs to regulate the traffic on all ports of the VLANs.

Restrictions and guidelines

QoS policies cannot be applied to dynamic VLANs, including VLANs created by GVRP.

If you specify the **longest-match** keyword, the system first matches the traffic class with a source or destination address with the longest mask and takes the actions in the associated traffic behavior. Suppose three class-behavior associations are configured in a QoS policy. ACL 3001 in the traffic class of the first class-behavior association is not configured with a source or destination address. ACL 3002 in the traffic class of the second class-behavior association is configured with destination address 10.10.10.0/24. ACL 3003 in the traffic class of the third class-behavior association is configured with destination address 10.10.10.10/32. The match order of the three class-behavior associations is the third class-behavior association, the second class-behavior association, the first class-behavior association. If both source and destination addresses exist in ACLs of different traffic classes, the system matches destination addresses before matching source addresses.

When you apply a QoS policy to VLANs, the QoS policy is applied to the specified VLANs on all IRF member devices. If the hardware resources of an IRF member device are insufficient, applying a QoS policy to VLANs might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, use the **undo qos vlan-policy vlan** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.

   system-view

2. Apply the QoS policy to VLANs.

   qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** } [**longest-match**]

   By default, no QoS policy is applied to a VLAN.

Applying the QoS policy globally

About this task

You can apply a QoS policy globally to the inbound or outbound direction of all ports.

Restrictions and guidelines

If you do not specify the **longest-match** keyword, the system matches traffic against traffic classes in the order class-behavior associations are configured. When the traffic matches a traffic class, the matching process stops, and the actions in the associated traffic behavior are taken on the matching traffic.

If you specify the **longest-match** keyword, the system first matches the traffic class with a source or destination address with the longest mask and takes the actions in the associated traffic behavior. Suppose three class-behavior associations are configured in a QoS policy. ACL 3001 in the traffic class of the first class-behavior association is not configured with a source or destination address. ACL 3002 in the traffic class of the second class-behavior association is configured with destination address 10.10.10.0/24. ACL 3003 in the traffic class of the third class-behavior association is configured with destination address 10.10.10.10/32. The match order of the three class-behavior associations is the third class-behavior association, the second class-behavior association, the first class-behavior association. If both source and destination addresses exist in ACLs of different traffic classes, the system matches destination addresses before matching source addresses.

If the hardware resources of an IRF member device are insufficient, applying a QoS policy globally might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, you must use the **undo qos apply policy global** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.

   system-view

2. Apply the QoS policy globally.

   qos apply[**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy** *policy-name* **global** { **inbound** | **outbound** } [**longest-match**]

   By default, no QoS policy is applied globally.

Applying the QoS policy to a control plane

About this task

A device provides the user plane and the control plane.

- **User plane**—The units at the user plane are responsible for receiving, transmitting, and switching (forwarding) packets, such as various dedicated forwarding chips. They deliver super processing speeds and throughput.
- **Control plane**—The units at the control plane are processing units running most routing and switching protocols. They are responsible for protocol packet resolution and calculation, such as CPUs. Compared with user plane units, the control plane units allow for great packet processing flexibility but have lower throughput.

When the user plane receives packets that it cannot recognize or process, it transmits them to the control plane. If the transmission rate exceeds the processing capability of the control plane, the control plane will be busy handling undesired packets. As a result, the control plane will fail to handle legitimate packets correctly or timely. As a result, protocol performance is affected.

To address this problem, apply a QoS policy to the control plane to take QoS actions, such as traffic filtering or traffic policing, on inbound traffic. This ensures that the control plane can correctly receive, transmit, and process packets.

A predefined control plane QoS policy uses the protocol type or protocol group type to identify the type of packets sent to the control plane. You can use protocol types or protocol group types in **if-match control-plane** commands in traffic class view for traffic classification. Then you can reconfigure traffic behaviors for these traffic classes as required. You can use the **display qos policy control-plane pre-defined** command to display predefined control plane QoS policies.

Procedure

1. Enter system view.

   system-view

2. Enter control plane view.

   control-plane slot *slot-number*

3. Apply the QoS policy to the control plane.

   qos apply policy *policy-name* **inbound**

   By default, no QoS policy is applied to a control plane.

Applying the QoS policy in control-plane management view

About this task

If the rate of packets from the management interface to the control plane exceeds the processing capability, the control plane will fail to handle the packets correctly or timely. As a result, protocol performance is affected.

This feature allows you to rate limit the packets sent from the management interface to the control plane. This ensures that the control plane can correctly receive, transmit, and process packets from the management interface.

By default, a predefined QoS policy is applied in control-plane management view. To display the predefined QoS policy, use the **display qos policy control-plane management pre-defined** command. The predefined QoS policy uses the protocol type or protocol group type to identify the type of packets sent from the management interface to the control plane. You can use protocol types or protocol group types in **if-match** commands in traffic class view for traffic classification. Then, you can reconfigure traffic behaviors for these traffic classes as required.

Procedure

1. Enter system view.
   system-view
2. Enter control-plane management view.
   control-plane management
3. Apply the QoS policy.
   qos apply policy *policy-name* **inbound**
   By default, no QoS policy is applied in control-plane management view.

Enabling SNMP notifications for QoS

About this task

To report critical QoS events to an SNMP NMS, enable SNMP notifications for QoS.

For QoS notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for QoS.
   snmp-agent trap enable qos
   By default, SNMP notifications are disabled for QoS.

Display and maintenance commands for QoS policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display QoS policy configuration.	**display qos policy user-defined** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] [*policy-name* [**classifier** *classifier-name*]] [**slot** *slot-number*]
Display information about QoS policies applied to the control plane.	**display qos policy control-plane slot** *slot-number*
Display information about QoS policies applied in control-plane management view.	**display qos policy control-plane management**
Display information about the predefined QoS policy applied in control-plane management view.	**display qos policy control-plane management pre-defined**
Display information about the predefined QoS policy applied to the control plane.	**display qos policy control-plane pre-defined** [**slot** *slot-number*]
Display information about QoS policies applied globally.	**display qos** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy global** [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to interfaces.	**display qos** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy interface** [*interface-type interface-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to VLANs.	**display qos vlan-policy** { **name** *policy-name* | **vlan** [*vlan-id*] } [**slot** *slot-number*] [**inbound** | **outbound**]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*] [**slot** *slot-number*]
Display traffic class configuration.	**display traffic classifier user-defined** [*classifier-name*] [**slot** *slot-number*]
Display statistics for the QoS policy applied to a control plane.	**display qos policy control-plane slot** *slot-number* **rule-statistics**
Display statistics for QoS policies applied globally.	**display qos** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy global** [**slot** *slot-number*] [**inbound** | **outbound**] **rule-statistics**
Display statistics for QoS policies applied to interfaces.	**display qos** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy interface** [*interface-type interface-number*] [**slot** *slot-number*] [**inbound** | **outbound**] **rule-statistics**
Display statistics for QoS policies applied to VLANs.	**display qos vlan-policy vlan** [*vlan-id*] [**slot** *slot-number*] [**inbound** | **outbound**] **rule-statistics**

Task	Command
Clear the statistics for the QoS policy applied to the control plane.	**reset qos policy control-plane slot** *slot-number*
Clear the statistics for the QoS policy applied in control-plane management view.	**reset qos policy control-plane management**
Clear the statistics for a QoS policy applied globally.	**reset qos** [**ipv6-matching** | **accounting** | **mirroring** | **remarking** | **tcp-erspan**] **policy global** [**inbound** | **outbound**]
Clear the statistics of the QoS policy applied in a certain direction of a VLAN.	**reset qos vlan-policy** [**vlan** *vlan-id*] [**inbound** | **outbound**]

Configuring priority mapping

About priority mapping

When a packet arrives, a device assigns a set of QoS priority parameters to the packet based on either of the following:

- A priority field carried in the packet.
- The port priority of the incoming port.

This process is called priority mapping. During this process, the device can modify the priority of the packet according to the priority mapping rules. The set of QoS priority parameters decides the scheduling priority and forwarding priority of the packet.

Priority mapping is implemented with priority maps and involves the following priorities:

- 802.11e priority.
- 802.1p priority.
- DSCP.
- EXP.
- IP precedence.
- Local precedence.
- Drop priority.

About priorities

Priorities include the following types: priorities carried in packets, and priorities locally assigned for scheduling only.

Packet-carried priorities include 802.1p priority and DSCP precedence. These priorities have global significance and affect the forwarding priority of packets across the network. For more information about these priorities, see "Appendixes."

Locally assigned priorities only have local significance. They are assigned by the device only for scheduling. These priorities include the local precedence, drop priority, and user priority, as follows:

- **Local precedence**—Used for queuing. A local precedence value corresponds to an output queue. A packet with higher local precedence is assigned to a higher priority output queue to be preferentially scheduled.
- **Drop priority**—Used for making packet drop decisions. Packets with the highest drop priority are dropped preferentially.

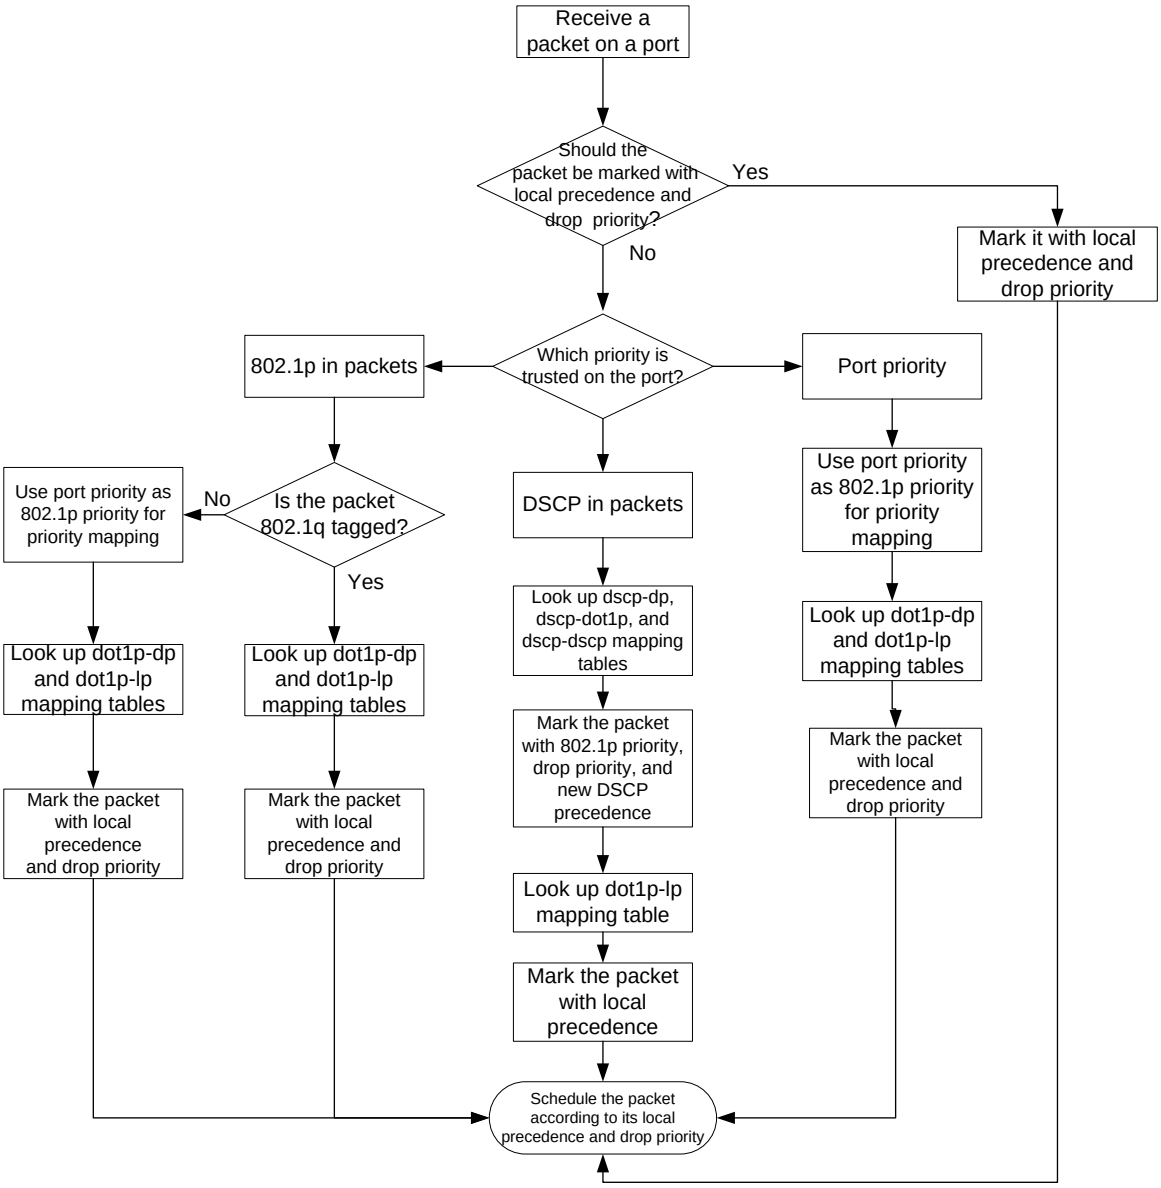
The device supports only local precedence and drop priority for scheduling.

Priority maps

The device provides various types of priority maps. By looking through a priority map, the device decides which priority value to assign to a packet for subsequent packet processing.

The default priority maps (as shown in Appendix B Default priority maps) are available for priority mapping. They are adequate in most cases. If a default priority map cannot meet your requirements, you can modify the priority map as required.

Priority mapping configuration methods



You can configure priority mapping by using any of the following methods:

- **Configuring priority trust mode**—In this method, you can configure a port to look up a trusted priority type (802.1p, for example) in incoming packets in the priority maps. Then, the system maps the trusted priority to the target priority types and values.
- **Changing port priority**—If no packet priority is trusted, the port priority of the incoming port is used. By changing the port priority of a port, you change the priority of the incoming packets on the port.

Priority mapping process

On receiving an Ethernet packet on a port, the switch marks the scheduling priorities (local precedence and drop precedence) for the Ethernet packet. This procedure is done according to the priority trust mode of the receiving port and the 802.1Q tagging status of the packet, as shown in Figure 3.

Figure 3 Priority mapping process for an Ethernet packet

For information about priority marking, see "Configuring priority marking."

Priority mapping tasks at a glance

To configure priority mapping, perform the following tasks:

1. (Optional.) Configuring a priority map
2. Configure a priority mapping method:
   - Configuring a port to trust packet priority for priority mapping
   - Changing the port priority of an interface

Configuring a priority map

Configuring an uncolored priority map

1. Enter system view.

   system-view

2. Enter priority map view.

   qos map-table { **dot1p-dp** | **dot1p-lp** | **dscp-dp** | **dscp-dscp** | **dscp-lp** | **exp-lp** | **lp-exp** }

3. Configure mappings for the priority map.

   import *import-value-list* **export** *export-value*

   By default, the default priority maps are used. For more information, see "Appendix B Default priority maps."

   If you execute this command multiple times, the most recent configuration takes effect.

Configuring a port to trust packet priority for priority mapping

About this task

You can configure the device to trust a particular priority field carried in packets for priority mapping on ports or globally. When you configure the trusted packet priority type on an interface, use the following available keywords:

- **dot1p**—Uses the 802.1p priority of received packets for mapping.
- **dscp**—Uses the DSCP precedence of received IP packets for mapping.

Restrictions and guidelines

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Interface Configuration Guide*).

If you configure both either the following settings and the **qos trust dscp** command on the same interface, only the **qos trust dscp** command takes effect:

- DSCP port priority (**qos priority dscp** *priority-value*).
- DSCP marking action in a QoS policy.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the trusted packet priority type.

   qos trust { **dot1p** | **dscp** }

   By default, an interface does not trust any packet priority.

4. Return to system view.

   quit

5. (Optional.) Configure the global priority trust mode for VXLAN packets.

qos trust tunnel-dscp

By default, the global priority trust mode for VXLAN packets is not configured.

Changing the port priority of an interface

About this task

If an interface does not trust any packet priority, the device uses its port priority to look for priority parameters for the incoming packets. By changing port priority, you can prioritize traffic received on different interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port priority of the interface.
   qos priority *priority-value*
   The default setting is 0.

Display and maintenance commands for priority mapping

Execute **display** commands in any view.

Task	Command
Display priority map configuration.	**display qos map-table** [**dot1p-dp** | **dot1p-lp** | **dscp-dp** | **dscp-dscp** | **dscp-lp** | **exp-lp** | **lp-exp**]
Display the trusted packet priority type on a port.	**display qos trust interface** [*interface-type interface-number*]

Priority mapping configuration examples

Example: Configuring a priority trust mode

Network configuration

As shown in Figure 4:

- The 802.1p priority of traffic from Device A to Device C is 3.
- The 802.1p priority of traffic from Device B to Device C is 1.

Configure Device C to preferentially process packets from Device A to the server when GigabitEthernet 1/0/3 of Device C is congested.

Figure 4 Network diagram

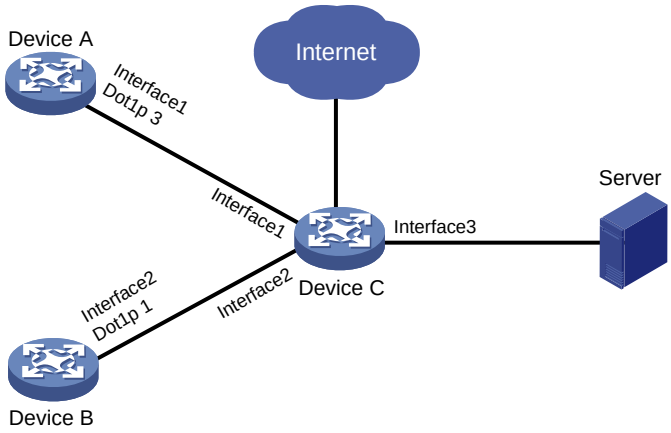


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3

Procedure

(Method 1) Configure Device C to trust packet priority

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to trust the 802.1p priority for priority mapping.

```
<Sysname> system-view
[Sysname] sysname DeviceC
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos trust dot1p
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos trust dot1p
[DeviceC-GigabitEthernet1/0/2] quit
```

(Method 2) Configure Device C to trust port priority

Assign port priority to GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. Make sure the following requirements are met:

- The priority of GigabitEthernet 1/0/1 is higher than that of GigabitEthernet 1/0/2.
- No trusted packet priority type is configured on GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2.

```
<Sysname> system-view
[Sysname] sysname DeviceC
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos priority 3
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos priority 1
[DeviceC-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Use the **display qos trust interface** command to verify that the configuration has been performed successfully.

Configuration files

- Method 1:

```
#
 sysname DeviceC
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos trust dot1p
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 qos trust dot1p
#
return
```

- Method 2:

```
#
 sysname DeviceC
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos priority 3
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 qos priority 1
#
return
```

Example: Configuring priority mapping tables and priority marking

Network configuration

As shown in Figure 5:

- The Marketing department connects to GigabitEthernet 1/0/1 of Device, which sets the 802.1p priority of traffic from the Marketing department to 3.
- The R&D department connects to GigabitEthernet 1/0/2 of Device, which sets the 802.1p priority of traffic from the R&D department to 4.
- The Management department connects to GigabitEthernet 1/0/3 of Device, which sets the 802.1p priority of traffic from the Management department to 5.

Configure port priority, 802.1p-to-local mapping table, and priority marking to implement the plan as described in Table 2.

Table 2 Configuration plan

Traffic destination	Traffic priority order	Queuing plan		
		Traffic source	Output queue	Queue priority
Public servers	R&D department > Management department > Marketing department	R&D department	6	High
		Management department	4	Medium
		Marketing department	2	Low
Internet	Management department > Marketing department > R&D department	R&D department	2	Low
		Management department	6	High
		Marketing department	4	Medium

Figure 5 Network diagram

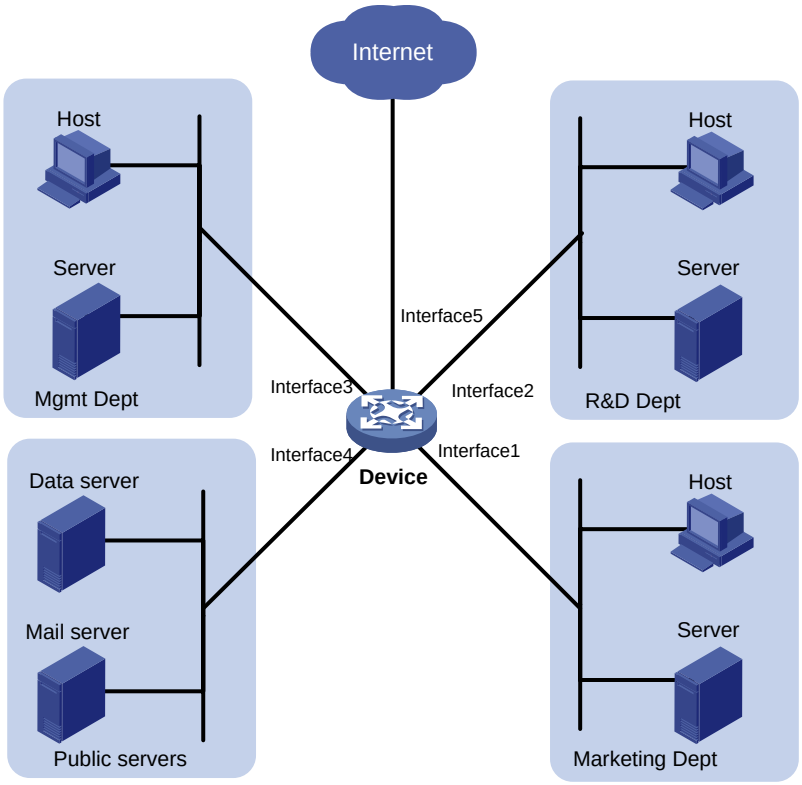

Table 3 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3

Procedure

1. Configure trusting port priority:

   # Set the port priority of GigabitEthernet 1/0/1 to 3.

```
<Sysname> system-view
[Sysname] sysname Device
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos priority 3
[Device-GigabitEthernet1/0/1] quit
```

Set the port priority of GigabitEthernet 1/0/2 to 4.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos priority 4
[Device-GigabitEthernet1/0/2] quit
```

Set the port priority of GigabitEthernet 1/0/3 to 5.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos priority 5
[Device-GigabitEthernet1/0/3] quit
```

2. Configure the 802.1p-to-local mapping table to map 802.1p priority values 3, 4, and 5 to local precedence values 2, 6, and 4.

This guarantees the R&D department, Management department, and Marketing department decreased priorities to access the public servers.

```
[Device] qos map-table dot1p-lp
[Device-maptbl-dot1p-lp] import 3 export 2
[Device-maptbl-dot1p-lp] import 4 export 6
[Device-maptbl-dot1p-lp] import 5 export 4
[Device-maptbl-dot1p-lp] quit
```

3. Configure priority marking to mark the packets from Management department, Marketing department, and R&D department to the Internet with 802.1p priority values 4, 5, and 3.

This guarantees the Management department, Marketing department, and R&D department decreased priorities to access the Internet.

Create ACL 3000, and configure a rule to match HTTP packets.

```
[Device] acl advanced 3000
[Device-acl-adv-3000] rule permit tcp destination-port eq 80
[Device-acl-adv-3000] quit
```

Create a traffic class named **http**, and use ACL 3000 as a match criterion.

```
[Device] traffic classifier http
[Device-classifier-http] if-match acl 3000
[Device-classifier-http] quit
```

Create a traffic behavior named **admin**, and configure a marking action for the Management department.

```
[Device] traffic behavior admin
[Device-behavior-admin] remark dot1p 4
[Device-behavior-admin] quit
```

Create a QoS policy named **admin**, and associate traffic class **http** with traffic behavior **admin** in QoS policy **admin**.

```
[Device] qos policy admin
[Device-qospolicy-admin] classifier http behavior admin
[Device-qospolicy-admin] quit
```

Apply QoS policy **admin** to the inbound direction of GigabitEthernet 1/0/3.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos apply policy admin inbound
```

Create a traffic behavior named **market**, and configure a marking action for the Marketing department.

```
[Device] traffic behavior market
[Device-behavior-market] remark dot1p 5
[Device-behavior-market] quit
```

Create a QoS policy named **market**, and associate traffic class **http** with traffic behavior **market** in QoS policy **market**.

```
[Device] qos policy market
[Device-qospolicy-market] classifier http behavior market
[Device-qospolicy-market] quit
```

Apply QoS policy **market** to the inbound direction of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy market inbound
```

Create a traffic behavior named **rd**, and configure a marking action for the R&D department.

```
[Device] traffic behavior rd
[Device-behavior-rd] remark dot1p 3
[Device-behavior-rd] quit
```

Create a QoS policy named **rd**, and associate traffic class **http** with traffic behavior **rd** in QoS policy **rd**.

```
[Device] qos policy rd
[Device-qospolicy-rd] classifier http behavior rd
[Device-qospolicy-rd] quit
```

Apply QoS policy **rd** to the inbound direction of GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos apply policy rd inbound
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Use the **display qos map-table** and **display qos policy interface** commands to verify that the configuration has been performed successfully.

Configuration files

```
#
 sysname Device

Configuring traffic policing, GTS, and rate limit

About traffic policing, GTS, and rate limit

Traffic limit helps assign network resources (including bandwidth) and increase network performance. For example, you can configure a flow to use only the resources committed to it in a certain time range. This avoids network congestion caused by burst traffic.

Traffic policing, Generic Traffic Shaping (GTS), and rate limit control the traffic rate and resource usage according to traffic specifications. You can use token buckets for evaluating traffic specifications.

Traffic evaluation and token buckets

Token bucket features

A token bucket is analogous to a container that holds a certain number of tokens. Each token represents a certain forwarding capacity. The system puts tokens into the bucket at a constant rate. When the token bucket is full, the extra tokens cause the token bucket to overflow.

Evaluating traffic with the token bucket

A token bucket mechanism evaluates traffic by looking at the number of tokens in the bucket. If the number of tokens in the bucket is enough for forwarding the packets:

- The traffic conforms to the specification (called conforming traffic).
- The corresponding tokens are taken away from the bucket.

Otherwise, the traffic does not conform to the specification (called excess traffic).

A token bucket has the following configurable parameters:

- Mean rate at which tokens are put into the bucket, which is the permitted average rate of traffic. It is usually set to the committed information rate (CIR).
- Burst size or the capacity of the token bucket. It is the maximum traffic size permitted in each burst. It is usually set to the committed burst size (CBS). The set burst size must be greater than the maximum packet size.

Each arriving packet is evaluated.

Complicated evaluation

You can set two token buckets, bucket C and bucket E, to evaluate traffic in a more complicated environment and achieve more policing flexibility. The following are main mechanisms used for complicated evaluation:

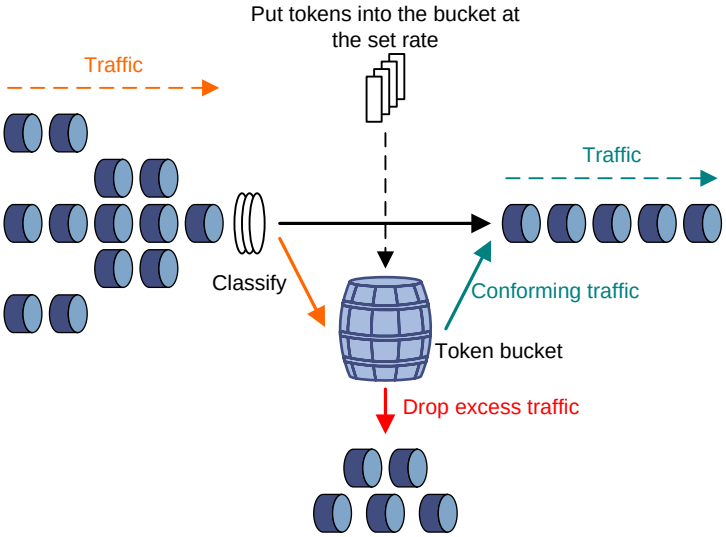
- **Single rate two color**—Uses one token bucket and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens to forward the packet, the packet is colored green.
  - Otherwise, the packet is colored red.
- **Single rate three color**—Uses two token buckets and the following parameters:

- **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
- **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
- **EBS**—Size of bucket E minus size of bucket C, which specifies the transient burst of traffic that bucket E can forward. The EBS cannot be 0. The size of E bucket is the sum of the CBS and EBS.

When a packet arrives, the following rules apply:

- If bucket C has enough tokens, the packet is colored green.
- If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
- If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.



- **Two rate three color**—Uses two token buckets and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
  - **PIR**—Rate at which tokens are put into bucket E, which specifies the average packet transmission or forwarding rate allowed by bucket E.
  - **EBS**—Size of bucket E, which specifies the transient burst of traffic that bucket E can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens, the packet is colored green.
  - If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
  - If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.

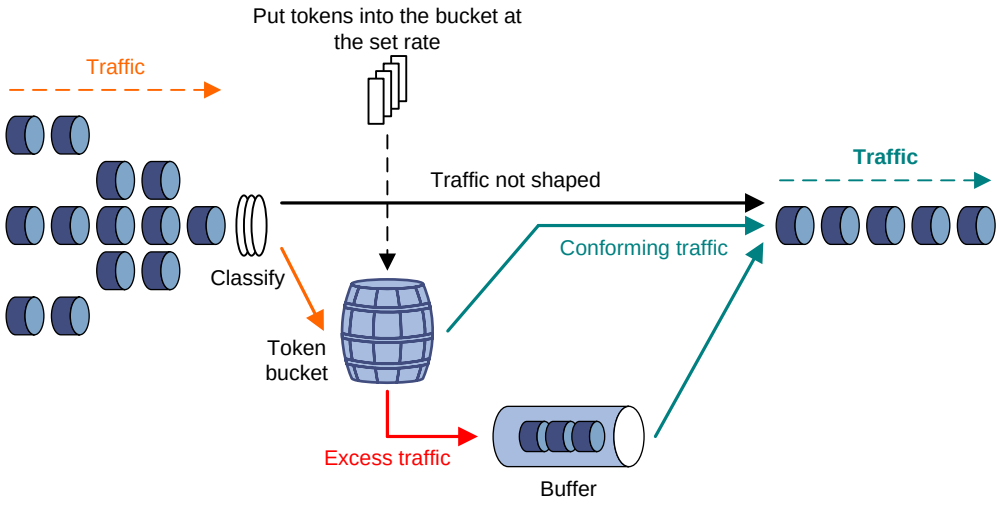
Traffic policing

A typical application of traffic policing is to supervise the specification of traffic entering a network and limit it within a reasonable range. Another application is to "discipline" the extra traffic to prevent aggressive use of network resources by an application. For example, you can limit bandwidth for HTTP packets to less than 50% of the total. If the traffic of a session exceeds the limit, traffic policing can drop the packets or reset the IP precedence of the packets. Figure 6 shows an example of policing outbound traffic on an interface.

Figure 6 Traffic policing

Traffic policing can classify the policed traffic and take predefined policing actions on each packet depending on the evaluation result:

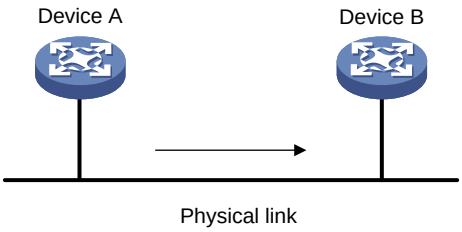
- Forwarding the packet.
- Dropping the packet.
- Forwarding the packet with its precedence re-marked.
- Delivering the packet to next-level traffic policing with its precedence re-marked.



GTS

GTS limits the traffic rate by buffering exceeding traffic. You can use GTS to adapt the traffic output rate on a device to the input traffic rate of its connected device to avoid packet loss.

The differences between traffic policing and GTS are as follows:

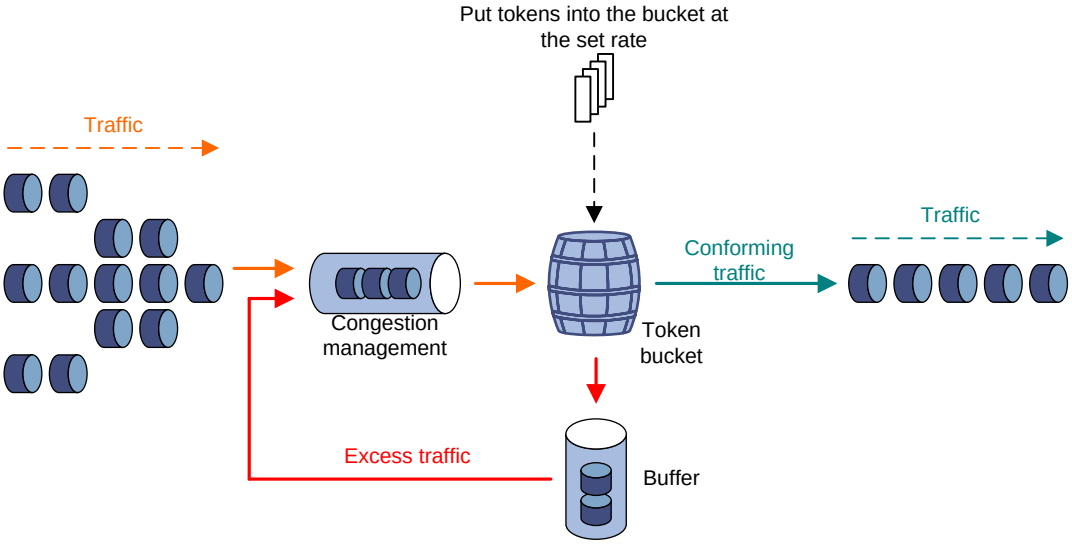


- Packets to be dropped with traffic policing are retained in a buffer or queue with GTS, as shown in Figure 7. When enough tokens are in the token bucket, the buffered packets are sent at an even rate.
- GTS can result in additional delay and traffic policing does not.

Figure 7 GTS

For example, in Figure 8, Device B performs traffic policing on packets from Device A and drops packets exceeding the limit. To avoid packet loss, you can perform GTS on the outgoing interface of Device A so that packets exceeding the limit are cached in Device A. Once resources are released, GTS takes out the cached packets and sends them out.

Figure 8 GTS application



Rate limit

The rate limit of an interface or PW specifies the maximum rate for forwarding packets (excluding critical packets).

Rate limit also uses token buckets for traffic control. When rate limit is configured on an interface, a token bucket handles all packets to be sent through the interface for rate limiting. If enough tokens are in the token bucket, packets can be forwarded. Otherwise, packets are put into QoS queues for congestion management. In this way, the traffic passing the interface is controlled.

Figure 9 Rate limit implementation

The token bucket mechanism limits traffic rate when accommodating bursts. It allows bursty traffic to be transmitted if enough tokens are available. If tokens are scarce, packets cannot be transmitted until efficient tokens are generated in the token bucket. It restricts the traffic rate to the rate for generating tokens.

Rate limit controls the total rate of all packets on an interface. It is easier to use than traffic policing in controlling the total traffic rate.

Restrictions and guidelines: Traffic policing, GTS, and rate limit configuration

The specified CIR does not take traffic transmitted in interframe gaps into account, and the actually allowed rate on an interface is greater than the specified CIR.

An interframe gap is a time interval for transmitting 12 bits between frames. This gap serves the following roles:

- Allows the device to differentiate one frame from another.
- Allows for time for the device to process the current frame and to prepare for receiving the next frame.

Configuring traffic policing

Configuring traffic policing by using the MQC approach

Restrictions and guidelines

A traffic policing action takes effect only when a QoS policy is applied to the following application destinations:

- Interface.
- VLANs.
- Globally.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic policing action.
      car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]][**green** *action* | **red** *action* | **yellow** *action*] *
      car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *
      By default, no traffic policing action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.

Configuring GTS

Configuring queue-based GTS

Restrictions and guidelines

A queue-based GTS action takes effect only on outgoing traffic in the specified queue.

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Interface Configuration Guide*).

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure GTS for a queue.
   qos gts queue *queue-id* **cir** *committed-information-rate* [**cbs** *committed-burst-size*]
   By default, GTS is not configured on an interface queue.

Configuring the rate limit

Configuring the rate limit for an interface

Restrictions and guidelines

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*).

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the rate limit for the interface.
   qos lr { **inbound** | **outbound** } **cir** *committed-information-rate* [**cbs** *committed-burst-size*]
   By default, no rate limit is configured on an interface.

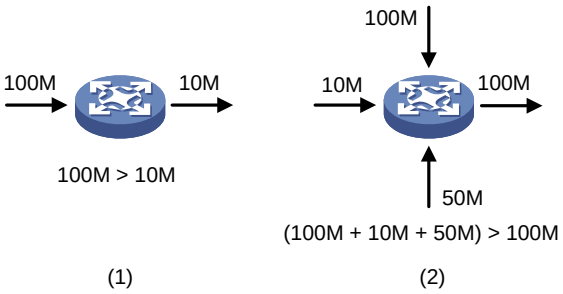
Display and maintenance commands for traffic policing, GTS, and rate limit

Execute **display** commands in any view.

Task	Command
Display ACL rules in the ACL whitelist.	**display acl whitelist** [**ipv6**] **slot** *slot-number*
Display GTS configuration and statistics for interfaces.	**display qos gts interface** [*interface-type interface-number*]
Display rate limit configuration and statistics.	**display qos lr interface** [*interface-type*

	interface-number]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*]

Configuring congestion management



About congestion management

Cause, negative results, and countermeasure of congestion

Congestion occurs on a link or node when traffic size exceeds the processing capability of the link or node. It is typical of a statistical multiplexing network and can be caused by link failures, insufficient resources, and various other causes.

Figure 10 shows two typical congestion scenarios.

Figure 10 Traffic congestion scenarios

Congestion produces the following negative results:

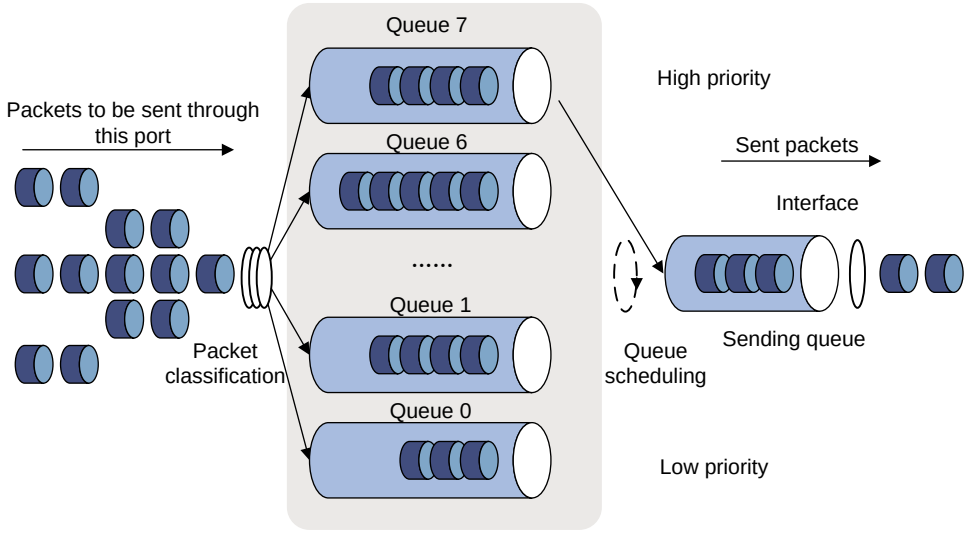
- Increased delay and jitter during packet transmission.
- Decreased network throughput and resource use efficiency.
- Network resource (memory, in particular) exhaustion and even system breakdown.

Congestion is unavoidable in switched networks and multiuser application environments. To improve the service performance of your network, take measures to manage and control it.

The key to congestion management is defining a resource dispatching policy to prioritize packets for forwarding when congestion occurs.

Congestion management methods

Congestion management uses queuing and scheduling algorithms to classify and sort traffic leaving a port.



The device supports the following queuing mechanisms:

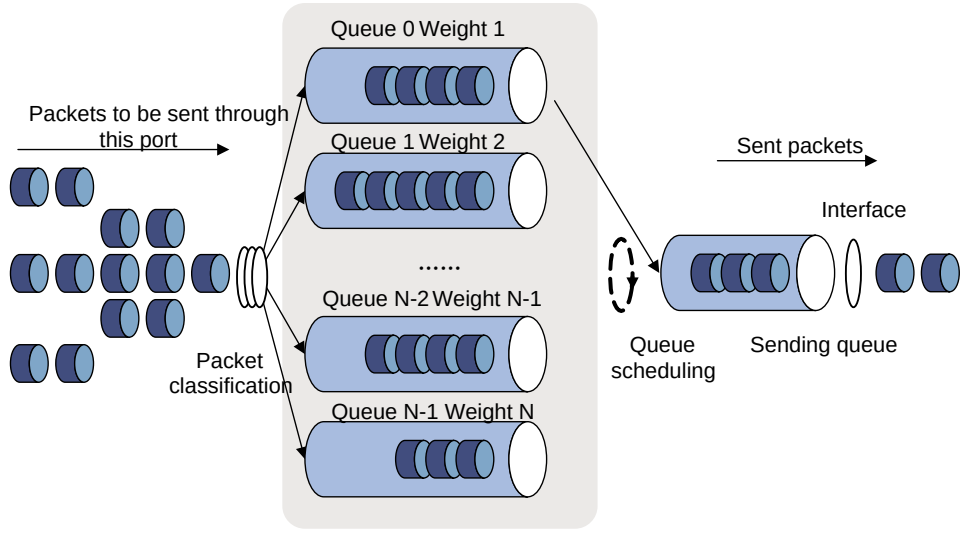
- SP.
- WRR.
- WFQ.
- CBQ.

SP queuing

SP queuing is designed for mission-critical applications that require preferential service to reduce the response delay when congestion occurs.

Figure 11 SP queuing

In Figure 11, SP queuing classifies eight queues on a port into eight classes, numbered 7 to 0 in descending priority order.



SP queuing schedules the eight queues in the descending order of priority. SP queuing sends packets in the queue with the highest priority first. When the queue with the highest priority is empty, it sends packets in the queue with the second highest priority, and so on. You can assign mission-critical packets to a high priority queue to make sure they are always served first. Common service packets can be assigned to low priority queues to be transmitted when high priority queues are empty.

The disadvantage of SP queuing is that packets in the lower priority queues cannot be transmitted if packets exist in the higher priority queues. In the worst case, lower priority traffic might never get serviced.

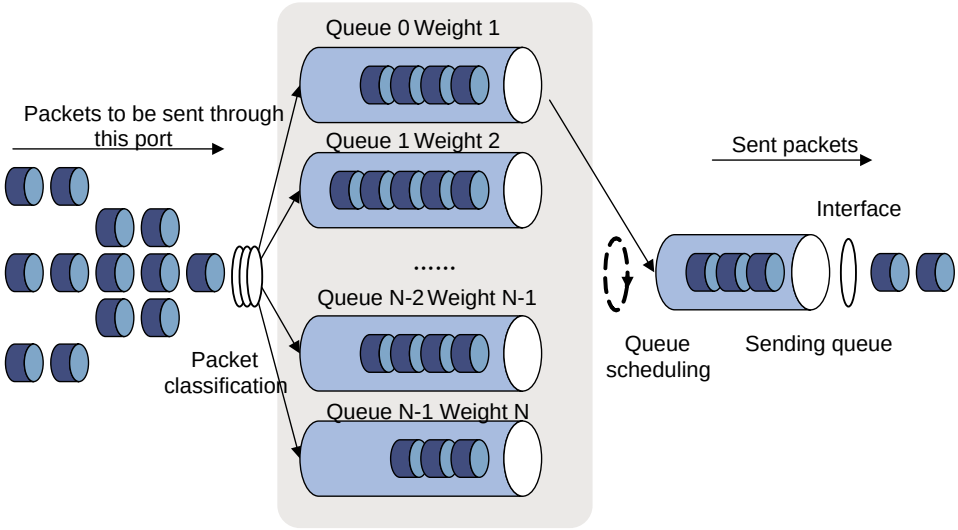
WRR queuing

WRR queuing schedules all the queues in turn to ensure that every queue is served for a certain time, as shown in Figure 12.

Figure 12 WRR queuing

Assume a port provides eight output queues. WRR assigns each queue a weight value (represented by w7, w6, w5, w4, w3, w2, w1, or w0). The weight value of a queue decides the proportion of resources assigned to the queue. On a 100 Mbps port, you can set the weight values to 50, 30, 10, 10, 50, 30, 10, and 10 for w7 through w0. In this way, the queue with the lowest priority can get a minimum of 5 Mbps of bandwidth. WRR solves the problem that SP queuing might fail to serve packets in low-priority queues for a long time.

Another advantage of WRR queuing is that when the queues are scheduled in turn, the service time for each queue is not fixed. If a queue is empty, the next queue will be scheduled immediately. This improves bandwidth resource use efficiency.



WRR queuing includes the following types:

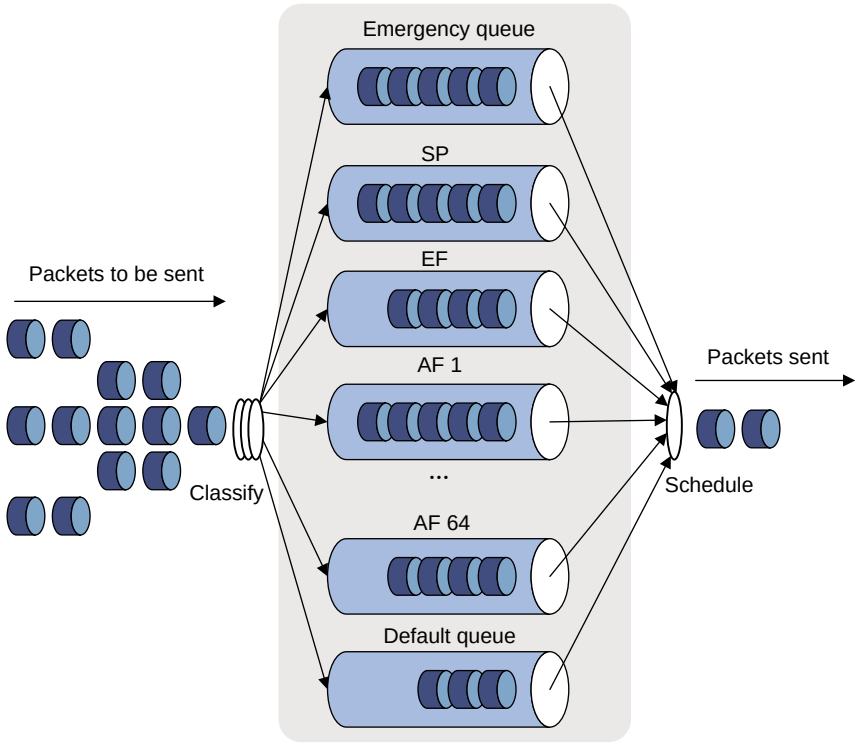
- **Basic WRR queuing**—Contains multiple queues. You can set the weight for each queue, and WRR schedules these queues based on the user-defined parameters in a round robin manner.
- **Group-based WRR queuing**—All the queues are scheduled by WRR. You can divide output queues to WRR priority queue group 1 and WRR priority queue group 2. Round robin queue scheduling is performed for group 1 first. If group 1 is empty, round robin queue scheduling is performed for group 2.

On an interface enabled with group-based WRR queuing, you can assign queues to the SP group. Queues in the SP group are scheduled with SP. The SP group has higher scheduling priority than the WRR groups.

WFQ queuing

Figure 13 WFQ queuing

WFQ is similar to WRR. WFQ queuing includes basic WFQ queuing and group-based WFQ queuing.



On an interface with group-based WFQ queuing enabled, you can also assign queues to the SP group. The difference is that WFQ enables you to set guaranteed bandwidth that a WFQ queue can get during congestion.

SP+WFQ queuing schedules traffic in the following order:

1. Schedules the traffic conforming to the minimum guaranteed bandwidth of each queue in the WFQ group.
2. Schedules the queues in the SP group based on their priorities.
3. Schedules the traffic in each queue in the WFQ group according to the configured weights when all queues in the SP group are empty.

CBQ

Figure 14 CBQ

Class-based queuing (CBQ) extends WFQ by supporting user-defined classes. When network congestion occurs, CBQ uses user-defined traffic match criteria to enqueue packets. Before packets are enqueued, congestion avoidance actions, such as tail drop or WRED and bandwidth restriction check, are performed. When being dequeued, packets are scheduled by WFQ.

CBQ provides the following queues:

- **Emergency queue**—Enqueues emergent packets. The emergency queue is a FIFO queue without bandwidth restriction.
- **Strict priority (SP) queuing**—SP queuing is designed for mission-critical applications. Mission-critical applications require preferential treatment to reduce the response delay when congestion occurs. With SP queuing, CBQ can provide strict priority service. A maximum of 64 SP queues are supported.
- **Low Latency Queuing (LLQ)**—An EF queue. Because packets are fairly treated in CBQ, delay-sensitive flows like video and voice packets might not be transmitted timely. To solve this problem, LLQ combines PQ and CBQ to preferentially transmit delay-sensitive flows like voice packets. When defining traffic classes for LLQ, you can configure a class of packets to be preferentially transmitted. The packets of all priority classes are assigned to the same priority queue. Bandwidth restriction on each class of packets is checked before the packets are enqueued. During the dequeuing operation, packets in the priority queue are transmitted first. To reduce the delay of the other queues except the priority queue, LLQ assigns the maximum available bandwidth to each priority class. The bandwidth value polices traffic during congestion. When no congestion is present, a priority class can use more than the bandwidth assigned to it. During congestion, the packets of each priority class exceeding the assigned bandwidth are discarded.
- **Bandwidth queuing (BQ)**—An AF queue. The BQ provides guaranteed bandwidth for AF traffic, and schedules the AF classes proportionally. The system supports up to 64 AF queues.
- **Default queue**—A WFQ queue. The default queue transmits the BE traffic by using the remaining interface bandwidth.

The system matches packets with classification rules in the following order:

- Match packets with priority classes and then the other classes.
- Match packets with priority classes in the configuration order.
- Match packets with other classes in the configuration order.
- Match packets with classification rules in a class in the configuration order.

congestion management tasks at a glance

To configure congestion management, perform the following tasks:

1.
2. Configuring queuing on an interface
   - Configuring SP queuing
   - Configuring WRR queuing
   - Configuring WFQ queuing
   - Configuring SP+WRR queuing
   - Configuring SP+WFQ queuing
3. Configuring a queue scheduling profile

Configuring queuing on an interface

Restrictions and guidelines for queuing configuration

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*).

Configuring SP queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure SP queuing.
   qos sp
   By default, an interface uses SP queuing.

Configuring WRR queuing

Configuring group-based WRR queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable WRR queuing.

qos wrr { **byte-count** | **weight** }

By default, an interface uses SP queuing.

4. Assign a queue to a WRR group, and configure scheduling parameters for the queue.

qos wrr *queue-id* **group** { **1** | **2** } { **byte-count** | **weight** } *schedule-value*

By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring WFQ queuing

Configuring grouped WFQ queues

1. Enter system view.

system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Enable WFQ queuing.

qos wfq { **byte-count** | **weight** }

By default, an interface uses SP queuing.

4. Assign a queue to a WFQ group, and configure scheduling parameters for the queue.

qos wfq *queue-id* **group** { **1** | **2** } { **byte-count** | **weight** } *schedule-value*

By default, all queues on a WFQ-enabled interface are in WFQ group 1 and have a weight of 1.

Configuring SP+WRR queuing

Restrictions and guidelines

To configure the scheduling weight, you must specify the same scheduling unit as specified when enabling WRR queuing.

Procedure

1. Enter system view.

system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Enable byte-count or packet-count WRR queuing.

qos wrr { **byte-count** | **weight** }

By default, an interface uses SP queuing.

4. Assign a queue to the SP group.

qos wrr *queue-id* **group sp**

By default, all queues on a WRR-enabled interface are in WRR group 1.

5. Assign a queue to a WRR group, and configure a scheduling weight for the queue.

qos wrr *queue-id* **group** { **1** | **2** } { **byte-count** | **weight** } *schedule-value*

By default, all queues on a WRR-enabled interface are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring SP+WFQ queuing

Restrictions and guidelines

To configure the scheduling weight, you must specify the same scheduling unit as specified when enabling WFQ queuing.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable byte-count or packet-count WFQ queuing.
   qos wfq { **byte-count** | **weight** }
   By default, an interface uses SP queuing.
4. Assign a queue to the SP group.
   qos wfq *queue-id* **group sp**
   By default, all queues on a WFQ-enabled interface are in WFQ group 1.
5. Assign a queue to a WFQ queue scheduling group, and configure a scheduling weight for the queue.
   qos wfq *queue-id* **group** { **1** | **2** } { **byte-count** | **weight** } *schedule-value*
   By default, all queues on a WFQ-enabled interface are in WFQ group 1 and have a weight of 1.
6. (Optional.) Set the minimum guaranteed bandwidth for a queue.
   qos bandwidth queue *queue-id* **min** *bandwidth-value*
   By default, the minimum guaranteed bandwidth for a WFQ queue in an WFQ group is not set.

Configuring CBQ

Restrictions and guidelines for CBQ configuration

When you configure CBQ, follow these restrictions and guidelines:

- Only one of the following queuing actions can be configured in the same behavior:
  - AF.
  - EF.
  - SP.
  - WFQ.
- To configure **queue af** for multiple classes of a policy, you must configure them in one of the following units:
  - Bandwidth in kbps.
  - Percentage of the available bandwidth.
  - Percentage of the remaining bandwidth.
- In a QoS policy, if AF is configured in percentage of the remaining bandwidth, EF can be configured in absolute value or in percentage.
- In a QoS policy, if AF is configured in absolute value or in percentage, EF can be configured in absolute value or in percentage.

- You must configure the rate limit on the main interface for the CBQ feature to take effect on a subinterface.
- The default class cannot be associated with a traffic behavior including EF or SP.
- You can associate the traffic behavior that contains a WFQ action only with the default class.
- RTPQ and CBQ are mutually exclusive. CBQ can use LLQ to provide priority service for real-time traffic.
-

Configure AF and the minimum guaranteed bandwidth

Restrictions and guidelines

- The **undo queue af** command also cancels the **queue-length** command configuration and all WRED-related settings.
- The **wred** and **queue-length** commands are mutually exclusive in a traffic behavior.
- The **undo wred** [**dscp** | **ip-precedence**] command also cancels all other WRED-related settings.
- A QoS policy that contains an AF action can be applied to the outbound direction of an interface or the inbound direction for a user profile. To modify a QoS policy applied to a user profile, follow these steps:
  a. Remove the QoS policy from the user profile.
  b. Configure a new QoS policy.
  c. Apply the new QoS policy to the user profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
   traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
   if-match [**not**] *match-criteria*
   By default, no match criterion is configured.
   For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
   quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
   traffic behavior *behavior-name*
   b. Configure AF and the minimum guaranteed bandwidth.
   queue af bandwidth { *bandwidth* [**pir** *peak-information-rate*] | **pct** *percentage* | **remaining-pct** *remaining-percentage* }
   By default, AF is not configured.
   c. (Optional.) Set a weight for the AF queue.
   weight *weight-value*
   The default setting is 1.

d. (Optional.) Set the maximum queue size.

queue-length *queue-length*

The default for this command varies by device model.

If the burst traffic is too heavy, increase the queue length to make queue scheduling more accurate.

e. Enable WRED.

wred [**dscp** | **ip-precedence**]

By default, WRED is not enabled.

f. Set the exponent for WRED to calculate the average queue size.

wred weighting-constant *exponent*

The default setting is 9.

g. Set the lower limit, upper limit, and drop probability denominator for a DSCP value in WRED

wred dscp *dscp-value* **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]

By default, the lower limit is 10, the upper limit is 30, and the drop probability denominator is 10.

You must enable DSCP-based WRED by using the **wred dscp** command before you configure this command.

h. Set the lower limit, upper limit, and drop probability denominator for an IP precedence in WRED.

wred ip-precedence *precedence* **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]

By default, the lower limit is 10, the upper limit is 30, and the drop probability denominator is 10.

i. Return to system view.

quit

4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate a traffic behavior with a class in the policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a class is not associated with a behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

Configuring EF and the maximum bandwidth

Restrictions and guidelines

A QoS policy that contains an EF action can be applied to the outbound direction of an interface or the inbound direction for a user profile. To modify a QoS policy applied to a user profile, follow these steps:

1. Remove the QoS policy from the user profile.

2. Configure a new QoS policy.

3. Apply the new QoS policy to the user profile.

Procedure

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match [**not**] *match-criteria*

      By default, no match criterion is configured.

      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.

      traffic behavior *behavior-name*
   b. Configure EF and the maximum bandwidth.

      queue ef bandwidth { *bandwidth* [**cbs** *burst*] [**pir** *peak-information-rate*] | **pct** *percentage* [**cbs-ratio** *ratio*] }

      By default, EF is not configured.
   c. (Optional.) Set a weight for the EF queue.

      weight *weight-value*

      The default setting is 1.
   d. Return to system view.

      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

      qos policy *policy-name*
   b. Associate a traffic behavior with a class in the policy.

      classifier *classifier-name* **behavior** *behavior-name*

      By default, a class is not associated with a behavior.
   c. Return to system view.

      quit
5. Apply the QoS policy.

   For more information, see "Applying the QoS policy."

   By default, no QoS policy is applied.

Configuring SP

Restrictions and guidelines

A QoS policy that contains an SP action can be applied to the outbound direction of an interface or the inbound direction for a user profile. To modify a QoS policy applied to a user profile, follow these steps:

1. Remove the QoS policy from the user profile.
2. Configure a new QoS policy.
3. Apply the new QoS policy to the user profile.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match [**not**] *match-criteria*
      By default, no match criterion is configured.
      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure SP.
      queue sp
      By default, SP is not configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate a traffic behavior with a class in the policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a class is not associated with a behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.

Configuring WFQ

Restrictions and guidelines

- The **undo queue wfq** command also cancels the **queue-length** command configuration and all WRED-related settings.
- The **wred** and **queue-length** commands are mutually exclusive in a traffic behavior.
- The **undo wred** [**dscp** | **ip-precedence**] command also cancels all other WRED-related settings.

- A QoS policy that contains a WFQ action can be applied to the outbound direction of an interface or the inbound direction for a user profile. To modify a QoS policy applied to a user profile, follow these steps:
  a. Remove the QoS policy from the user profile.
  b. Configure a new QoS policy.
  c. Apply the new QoS policy to the user profile.

Procedure

1. Enter system view.
system-view

2. Define a traffic class.
a. Create a traffic class and enter traffic class view.
traffic classifier *classifier-name* [**operator** { **and** | **or** }]
b. Configure a match criterion.
if-match [**not**] *match-criteria*
By default, no match criterion is configured.
For more information about configuring match criteria, see *ACL and QoS Command Reference*.
c. Return to system view.
quit

3. Define a traffic behavior.
a. Create a traffic behavior and enter traffic behavior view.
traffic behavior *behavior-name*
b. Configure WFQ.
queue wfq [**queue-number** *total-queue-number*]
By default, WFQ is not configured.
c. (Optional.) Set a weight for the WFQ queue.
weight *weight-value*
The default setting is 1.
d. Set the maximum queue size.
queue-length *queue-length*
The default for this command varies by device model.
If the burst traffic is too heavy, increase the queue length to make queue scheduling more accurate.
e. Enable WRED.
wred [**dscp** | **ip-precedence**]
By default, WRED is not enabled.
f. Set the exponent for WRED to calculate the average queue size
wred weighting-constant *exponent*
The default setting is 9.
g. Set the lower limit, upper limit, and drop probability denominator for a DSCP value in WRED
wred dscp *dscp-value* **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]
By default, the lower limit is 10, the upper limit is 30, and the drop probability denominator is 10.

h. Set the lower limit, upper limit, and drop probability denominator for an IP precedence in WRED.

wred ip-precedence *precedence* **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]

By default, the lower limit is 10, the upper limit is 30, and the drop probability denominator is 10.

i. Return to system view.

quit

4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate a traffic behavior with a class in the policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a class is not associated with a behavior.

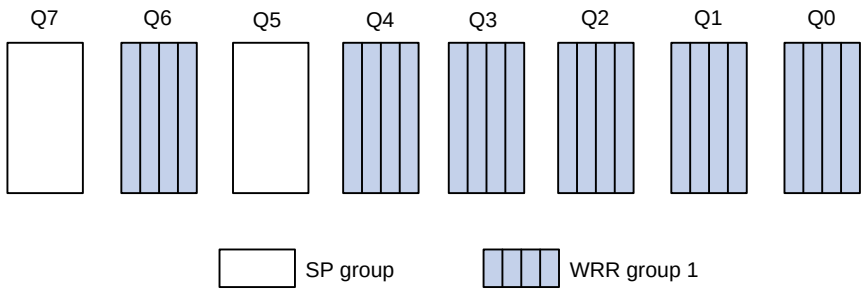
c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.



Configuring a queue scheduling profile

About queue scheduling profiles

In a queue scheduling profile, you can configure scheduling parameters for each queue. By applying the queue scheduling profile to an interface or session group profile, you can implement congestion management on the interface or session group profile.

Queue scheduling profiles support three queue scheduling algorithms: SP, WRR, and WFQ. In a queue scheduling profile, you can configure SP + WRR or SP + WFQ. For information about each scheduling algorithm, see "About congestion management." When SP and WRR groups are configured in a queue scheduling profile, Figure 15 shows the scheduling order.

Figure 15 Queue scheduling profile configured with both SP and WRR

- Queue 7 has the highest priority in the SP group. Its packets are sent preferentially.
- Queue 5 has the second highest priority in the SP group. Packets in queue 5 are sent when queue 7 is empty.
- All queues in WRR group 1 are scheduled according to their weights. When queue 7 and queue 5 are empty, WRR group 1 is scheduled.

Restrictions and guidelines for queue scheduling profile configuration

When you configure a queue scheduling profile, follow these restrictions and guidelines:

- The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*)
- Only one queue scheduling profile can be applied to an interface or session group profile.
- You can modify the scheduling parameters in a queue scheduling profile already applied to an interface, the switching fabric module, or a session group profile.

Configuring a queue scheduling profile

1. Enter system view.

   system-view
2. Create a queue scheduling profile and enter queue scheduling profile view.

   qos qmprofile *profile-name*
3. (Optional.) Configure queue scheduling parameters.
   - Configure a queue to use SP.

     queue *queue-id* **sp**
   - Configure a queue to use WRR.

     queue *queue-id* **wrr group** *group-id* { **weight** | **byte-count** } *schedule-value*
   - Configure a queue to use WFQ.

     queue *queue-id* **wfq group** *group-id* { **weight** | **byte-count** } *schedule-value*

   By default, all queues in a queue scheduling profile are SP queues.
4. (Optional.) Set the minimum guaranteed bandwidth for a WFQ queue.

   bandwidth queue *queue-id* **min** *bandwidth-value*

   By default, the minimum guaranteed bandwidth is not set for a WFQ queue.

Applying a queue scheduling profile

1. Enter system view.

   system-view
2. Execute the following commands in sequence to apply the queue scheduling profile to the outbound direction of an interface:

   interface *interface-type interface-number*

   qos apply qmprofile *profile-name*

   By default, no queue scheduling profile is applied to an interface.

Example: Configuring a queue scheduling profile

Network configuration

Configure a queue scheduling profile to meet the following requirements on GigabitEthernet 1/0/1:

- Queue 7 has the highest priority, and its packets are sent preferentially.
- Queue 0 through queue 6 are in the WRR group and are scheduled according to their packet-count weights, which are 2, 1, 2, 4, 6, 8, and 10, respectively. When queue 7 is empty, the WRR group is scheduled.

Procedure

Enter system view.

```
<Sysname> system-view
```

Create a queue scheduling profile named **qm1**.

```
[Sysname] qos qmprofile qm1
[Sysname-qmprofile-qm1]
```

Configure queue 7 to use SP queuing.

```
[Sysname-qmprofile-qm1] queue 7 sp
```

Assign queue 0 through queue 6 to WRR group 1, with their packet-count weights as 2, 1, 2, 4, 6, 8, and 10, respectively.

```
[Sysname-qmprofile-qm1] queue 0 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 1 wrr group 1 weight 1
[Sysname-qmprofile-qm1] queue 2 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 3 wrr group 1 weight 4
[Sysname-qmprofile-qm1] queue 4 wrr group 1 weight 6
[Sysname-qmprofile-qm1] queue 5 wrr group 1 weight 8
[Sysname-qmprofile-qm1] queue 6 wrr group 1 weight 10
[Sysname-qmprofile-qm1] quit
```

Apply queue scheduling profile **qm1** to GigabitEthernet 1/0/1.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos apply qmprofile qm1
```

After the configuration is completed, GigabitEthernet 1/0/1 performs queue scheduling as specified in queue scheduling profile **qm1**.

Display and maintenance commands for congestion management

Execute **display** commands in any view.

Task	Command
Display the configuration of queue scheduling profiles.	**display qos qmprofile configuration** [*profile-name*] [**slot** *slot-number*]
Display the queue scheduling profiles applied to interfaces.	**display qos qmprofile interface** [*interface-type interface-number*]
Display outbound queue-based traffic statistics for interfaces.	**display qos queue-statistics interface outbound**
Display SP queuing configuration.	**display qos queue sp interface** [*interface-type interface-number*]
Display WFQ queuing configuration.	**display qos queue wfq interface** [*interface-type*

Task	Command
	interface-number]
Display WRR queuing configuration.	**display qos queue wrr interface** [*interface-type interface-number*]

Configuring congestion avoidance

About congestion avoidance

Avoiding congestion before it occurs is a proactive approach to improving network performance. As a flow control mechanism, congestion avoidance:

- Actively monitors network resources (such as queues and memory buffers).
- Drops packets when congestion is expected to occur or deteriorate.

When dropping packets from a source end, congestion avoidance cooperates with the flow control mechanism at the source end to regulate the network traffic size. The combination of the local packet drop policy and the source-end flow control mechanism implements the following functions:

- Maximizes throughput and network use efficiency.
- Minimizes packet loss and delay.

Tail drop

Congestion management techniques drop all packets that are arriving at a full queue. This tail drop mechanism results in global TCP synchronization. If packets from multiple TCP connections are dropped, these TCP connections go into the state of congestion avoidance and slow start to reduce traffic. However, traffic peak occurs later. Consequently, the network traffic jitters all the time.

RED and WRED

You can use Random Early Detection (RED) or Weighted Random Early Detection (WRED) to avoid global TCP synchronization.

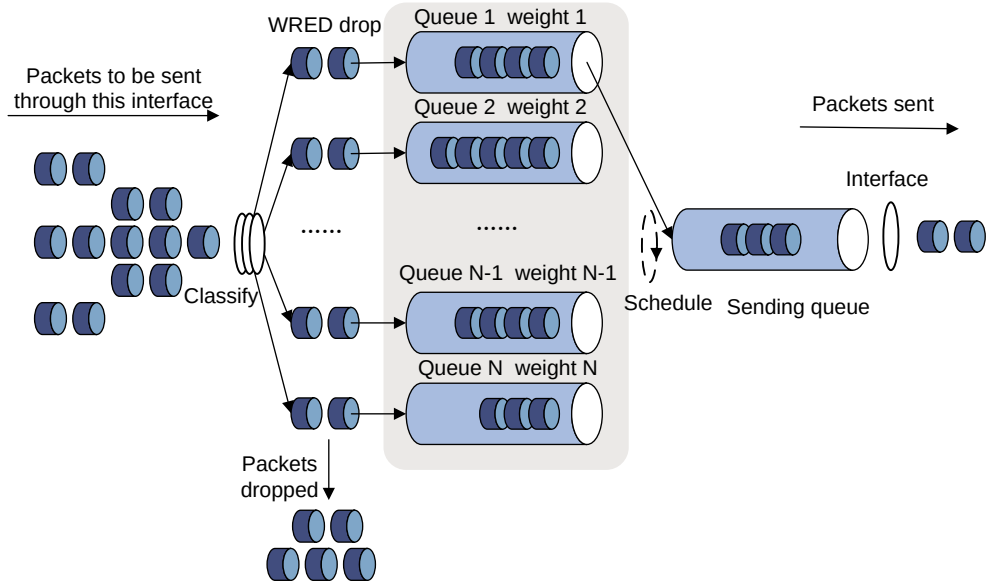
Both RED and WRED avoid global TCP synchronization by randomly dropping packets. When the sending rates of some TCP sessions slow down after their packets are dropped, other TCP sessions remain at high sending rates. Link bandwidth is efficiently used, because TCP sessions at high sending rates always exist.

The RED or WRED algorithm sets an upper threshold and lower threshold for each queue, and processes the packets in a queue as follows:

- When the queue size is shorter than the lower threshold, no packet is dropped.
- When the queue size reaches the upper threshold, all subsequent packets are dropped.
- When the queue size is between the lower threshold and the upper threshold, the received packets are dropped at random. The drop probability in a queue increases along with the queue size under the maximum drop probability.

If the current queue size is compared with the upper threshold and lower threshold to determine the drop policy, burst traffic is not fairly treated. To solve this problem, WRED compares the average queue size with the upper threshold and lower threshold to determine the drop probability.

The average queue size reflects the queue size change trend but is not sensitive to burst queue size changes, and burst traffic can be fairly treated.



When WFQ queuing is used, you can set the following parameters for packets with different precedence values to provide differentiated drop policies:

- Exponent for average queue size calculation.
- Upper threshold.
- Lower threshold.

- Drop probability.

Relationship between WRED and queuing mechanisms

Figure 16 Relationship between WRED and queuing mechanisms

Through combining WRED with WFQ, the flow-based WRED can be realized. Each flow has its own queue after classification.

- A flow with a smaller queue size has a lower packet drop probability.
- A flow with a larger queue size has a higher packet drop probability.

In this way, the benefits of the flow with a smaller queue size are protected.

ECN

By dropping packets, WRED alleviates the influence of congestion on the network. However, the network resources for transmitting packets from the sender to the device which drops the packets are wasted. When congestion occurs, it is a better idea to perform the following actions:

- Inform the sender of the congestion status.
- Have the sender proactively slow down the packet sending rate or decrease the window size of packets.

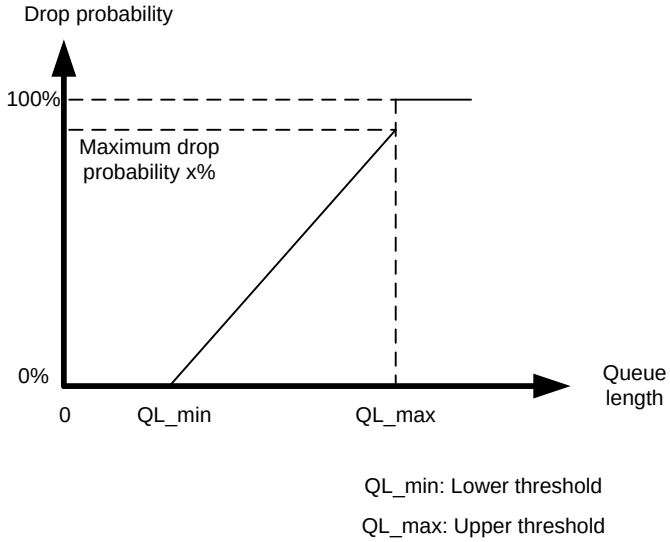
This better utilizes the network resources.

RFC 2481 defined an end-to-end congestion notification mechanism named Explicit Congestion Notification (ECN). ECN uses the DS field in the IP header to mark the congestion status along the packet transmission path. An ECN-capable endpoint can determine whether congestion occurs on the transmission path according to the packet contents. Then, it adjusts the packet sending speed to avoid deteriorating congestion. ECN defines the last two bits (ECN field) in the DS field of the IP header as follows:

- Bit 6 indicates whether the sending endpoint device supports ECN, and is called the ECN-Capable Transport (ECT) bit.
- Bit 7 indicates whether the packet has experienced congestion along the transmission path, and is called the Congestion Experienced (CE) bit.

For more information about the DS field, see "Appendixes."

In actual applications, the following packets are considered as packets that an ECN-capable endpoint transmits:



- Packets with ECT set to 1 and CE set to 0.
- Packets with ECT set to 0 and CE set to 1.

To enable ECN, do not specify ToS field bit 6 or 7 as the flag bit in iNQA, and vice versa. For more information about iNQA, see *Network Management and Monitoring Configuration Guide*.

As shown in Figure 17, the WRED algorithm sets an upper threshold and lower threshold for each queue, and processes the packets in a queue as follows if ECN is not enabled:

- When the queue size is shorter than the lower threshold, no packet is dropped.
- When the queue size reaches the upper threshold, all subsequent packets are dropped.
- When the queue size is between the lower threshold and the upper threshold, the received packets are dropped at random. The drop probability in a queue increases along with the queue size under the maximum drop probability.

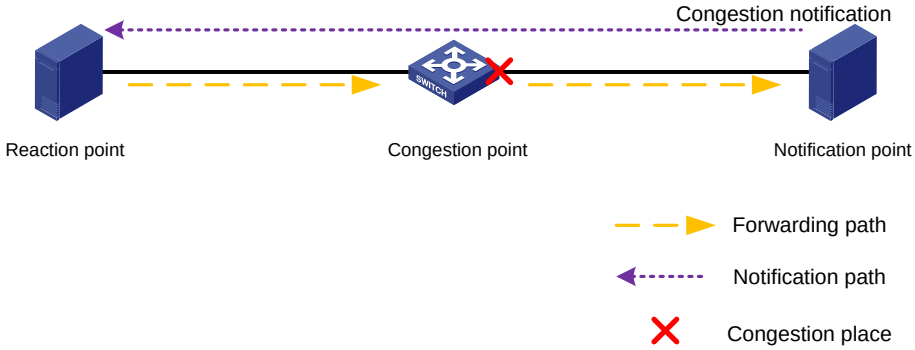


Figure 17 Drop probability and queue length

As shown in Figure 18, the network is deployed with ECN and has the following device roles:

- **Congestion point**—It forwards packets from the packet sender to the packet receiver. It supports ECN and can identify the ECN field. Congestion might occur on the congestion point. ECN must be configured on the congestion point.
- **Notification point**—It is an endpoint that receives packets. Its NIC supports ECN and can identify the ECN values 01, 10, and 11. After receiving a packet with the ECN field as 11, the notification point will notify the reaction point to slow down transmission by sending CE packets at the interval T1.
- **Reaction point**—It is an endpoint that sends packets. Its NIC supports ECN, and the ECN field of packets sent by it can be 01 or 10. After receiving a CE packet, the reaction point slows down transmission and starts a timer (T2, (T2>T1)). If the reaction point does not receive another CE packet when the timer expires, it considers that there is no congestion in the network and restores the previous transmission rate. If the reaction point receives another CE packet before the timer expires, it further reduces the transmission rate.

Figure 18 Network diagram with ECN enabled

After you enable ECN on the congestion point, it processes an incoming packet that enters an output queue as follows:

- When the average queue size is below the lower threshold, the congestion point forwards the packet without modifying the ECN field.
- When the average queue size is between the lower threshold and the upper threshold:
  - If the ECN field is 00, the packet comes from an ECN-incapable endpoint, and the congestion point determines whether to drop the packet according to the drop probability.
  - If the ECN field is 01 or 10, the packet comes from an ECN-capable endpoint, and the congestion point determines whether to modify the ECN field according to the drop probability and then forwards the packet. All packets will not be dropped.
  - If the ECN field is 11, the packet has experienced congestion along the transmission path, and the congestion point forwards the packet without modifying the ECN field.
- When the average queue size is above the upper threshold:
  - If the ECN field is 00, the packet comes from an ECN-incapable endpoint, and the congestion point drops the packet.
  - If the ECN field is 01 or 10, the packet comes from an ECN-capable endpoint, and the congestion point determines whether to modify the ECN field according to the drop probability and then forwards the packet. All packets will not be dropped.
  - If the ECN field is 11, the packet has experienced congestion along the transmission path, and the congestion point forwards the packet without modifying the ECN field.

Proper ECN thresholds can improve the network delay and throughput while alleviating congestion.

WRED parameters

Determine the following parameters before configuring WRED:

- **Upper threshold and lower threshold**—When the average queue size is smaller than the lower threshold, packets are not dropped. When the average queue size is between the lower threshold and the upper threshold, the packets are dropped at random. The longer the queue, the higher the drop probability. When the average queue size exceeds the upper threshold, subsequent packets are dropped.
- **Drop precedence**—A parameter used for packet drop. The value 0 corresponds to green packets, the value 1 corresponds to yellow packets, and the value 2 corresponds to red packets. Red packets are dropped preferentially.
- **Exponent for average queue size calculation**—The greater the exponent, the less sensitive the average queue size is to real-time queue size changes. The formula for calculating the average queue size is:

  Average queue size = (previous average queue size x $(1 – 2^{-n})$) + (current queue size x 2^{-n}), where n is the exponent.

- **Drop probability**—Drop probability in percentage. The greater the value, the higher the drop probability. (Applicable when you configure a WRED table on an interface.)

Configuring and applying a queue-based WRED table to an interface

Restrictions and guidelines

By using a WRED table, WRED randomly drops packets during congestion based on the queues that hold packets.

One WRED table can be applied to multiple interfaces. You can modify the parameters of a WRED table applied to an interface, but you cannot delete the WRED table.

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*).

Procedure

1. Enter system view.
   system-view
2. Create a WRED table and enter its view.
   qos wred queue table *table-name*
3. (Optional.) Set the WRED exponent for average queue size calculation.
   queue *queue-id* **weighting-constant** *exponent*
   The default setting is 9.
4. (Optional.) Configure the other WRED parameters.
   queue *queue-id* [**drop-level** *drop-level*] **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]
   By default, the lower limit is 100, the higher limit is 1000, and the drop probability is 10%.
   If you configure the same value for the lower limit and higher limit and set the drop probability to 100%, tail drop is used for the queue.
5. Return to system view.
   quit
6. Enter interface view.
   interface *interface-type interface-number*
7. Apply the WRED table to the interface.
   qos wred apply [*table-name*]
   By default, no WRED table is applied to an interface, and tail drop is used on an interface.

Example: Configuring and applying a queue-based WRED table

Network configuration

Apply a WRED table to GigabitEthernet 1/0/2, so that the packets are dropped as follows when congestion occurs:

- For the interface to preferentially forward higher-priority traffic, set a lower drop probability for a queue with a greater queue number. Set different drop parameters for queue 0, queue 3, and queue 7.
- Drop packets according to their colors.
  - In queue 0, set the drop probability to 25%, 50%, and 75% for green, yellow, and red packets, respectively.
  - In queue 3, set the drop probability to 5%, 10%, and 25% for green, yellow, and red packets, respectively.
  - In queue 7, set the drop probability to 1%, 5%, and 10% for green, yellow, and red packets, respectively.

Procedure

Configure a queue-based WRED table, and set different drop parameters for packets with different drop levels in different queues.

```
<Sysname> system-view
[Sysname] qos wred queue table queue-table1
[Sysname-wred-table-queue-table1] queue 0 drop-level 0 low-limit 128 high-limit 512
discard-probability 25
[Sysname-wred-table-queue-table1] queue 0 drop-level 1 low-limit 128 high-limit 512
discard-probability 50
[Sysname-wred-table-queue-table1] queue 0 drop-level 2 low-limit 128 high-limit 512
discard-probability 75
[Sysname-wred-table-queue-table1] queue 3 drop-level 0 low-limit 256 high-limit 640
discard-probability 5
[Sysname-wred-table-queue-table1] queue 3 drop-level 1 low-limit 256 high-limit 640
discard-probability 10
[Sysname-wred-table-queue-table1] queue 3 drop-level 2 low-limit 256 high-limit 640
discard-probability 25
[Sysname-wred-table-queue-table1] queue 7 drop-level 0 low-limit 512 high-limit 1024
discard-probability 1
[Sysname-wred-table-queue-table1] queue 7 drop-level 1 low-limit 512 high-limit 1024
discard-probability 5
[Sysname-wred-table-queue-table1] queue 7 drop-level 2 low-limit 512 high-limit 1024
discard-probability 10
[Sysname-wred-table-queue-table1] quit
```

Apply the queue-based WRED table to GigabitEthernet 1/0/2.

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] qos wred apply queue-table1
[Sysname-GigabitEthernet1/0/2] quit
```

Display and maintenance commands for WRED

Execute **display** commands in any view.

Task	Command
Display WRED configuration and statistics for an interface.	**display qos wred interface** [*interface-type interface-number*]
Display the configuration of a WRED table or all WRED tables.	**display qos wred table** [**name** *table-name*] [**slot** *slot-number*]

Configuring traffic filtering

About traffic filtering

You can filter in or filter out traffic of a class by associating the class with a traffic filtering action. For example, you can filter packets sourced from an IP address according to network status.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure the traffic filtering action.
      filter { **deny** | **permit** }
      By default, no traffic filtering action is configured.
      If a traffic behavior has the **filter deny** action, all other actions in the traffic behavior except class-based accounting do not take effect.
      If a traffic behavior has the filter permit action, matching packets will not dropped by a lower-priority configuration even if the action of the lower-priority configuration is drop.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display the traffic filtering configuration.

   display traffic behavior user-defined [*behavior-name*]

   This command is available in any view.

Traffic filtering configuration examples

Example: Configuring traffic filtering

Network configuration

As shown in Figure 19, configure traffic filtering on GigabitEthernet 1/0/1 to deny the incoming packets with destination port number 21.

Figure 19 Network diagram

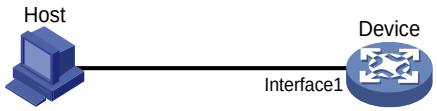

Table 4 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1

Procedure

Create advanced ACL 3000, and configure a rule to match packets whose destination port number is 21.

```
<Sysname> system-view
[Sysname] sysname Device
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 permit tcp destination-port eq 21
[Device-acl-ipv4-adv-3000] quit
```

Create a traffic class named **classifier_1**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 3000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the traffic filtering action to drop packets.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] filter deny
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Use the **display qos policy interface** command to verify that the configuration has been performed successfully.

Configuration files

```
#
 sysname Device
#
traffic classifier classifier_1 operator and
 if-match acl 3000
#
traffic behavior behavior_1
 filter deny
#
qos policy policy
 classifier classifier_1 behavior behavior_1
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos apply policy policy inbound
#
acl advanced 3000
 rule 0 permit tcp destination-port eq ftp
#
return
```

Configuring priority marking

About priority marking

Priority marking sets the priority fields or flag bits of packets to modify the priority of packets. For example, you can use priority marking to set IP precedence or DSCP for a class of IP packets to control the forwarding of these packets.

To configure priority marking to set the priority fields or flag bits for a class of packets, perform the following tasks:

1. Configure a traffic behavior with a priority marking action.
2. Associate the traffic class with the traffic behavior.

Priority marking can be used together with priority mapping. For more information, see "Configuring priority mapping."

Configuring priority marking

Restrictions and guidelines

The device supports the following application destinations for priority marking:

- Interface in the inbound direction.
- VLANs in the inbound direction.
- Globally in the inbound direction.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a priority marking action.
      For configurable priority marking actions, see the **remark** commands in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.
qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.
classifier *classifier-name* **behavior** *behavior-name*
By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.
quit

5. Apply the QoS policy.
For more information, see "Applying the QoS policy."
By default, no QoS policy is applied.

6. (Optional.) Display the priority marking configuration.
display traffic behavior user-defined [*behavior-name*]
This command is available in any view.

Configuring nesting

About nesting

Nesting adds a VLAN tag to the matching packets to allow the VLAN-tagged packets to pass through the corresponding VLAN. For example, you can add an outer VLAN tag to packets from a customer network to a service provider network. This allows the packets to pass through the service provider network by carrying a VLAN tag assigned by the service provider.

Restrictions and guidelines: Nesting configuration

A VLAN tag adding action takes effect only when a QoS policy is applied to the inbound direction of an interface, VLAN, or globally.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an outer VLAN tag adding action.
      nest top-most vlan *vlan-id*
      By default, no outer VLAN tag adding action is configured for a traffic behavior.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.

quit

5. Apply the QoS policy.

   For more information, see "Applying the QoS policy."

   By default, no QoS policy is applied.

6. (Optional.) Display the nesting configuration.

   display traffic behavior user-defined [*behavior-name*]

   This command is available in any view.

Nesting configuration examples

Example: Configuring nesting

Network configuration

As shown in Figure 20:

- Site 1 and Site 2 in VPN A are two branches of a company. They use VLAN 5 to transmit traffic.
- Because Site 1 and Site 2 are located in different areas, the two sites use the VPN access service of a service provider. The service provider assigns VLAN 100 to the two sites.

Configure nesting, so that the two branches can communicate through the service provider network.

Figure 20 Network diagram

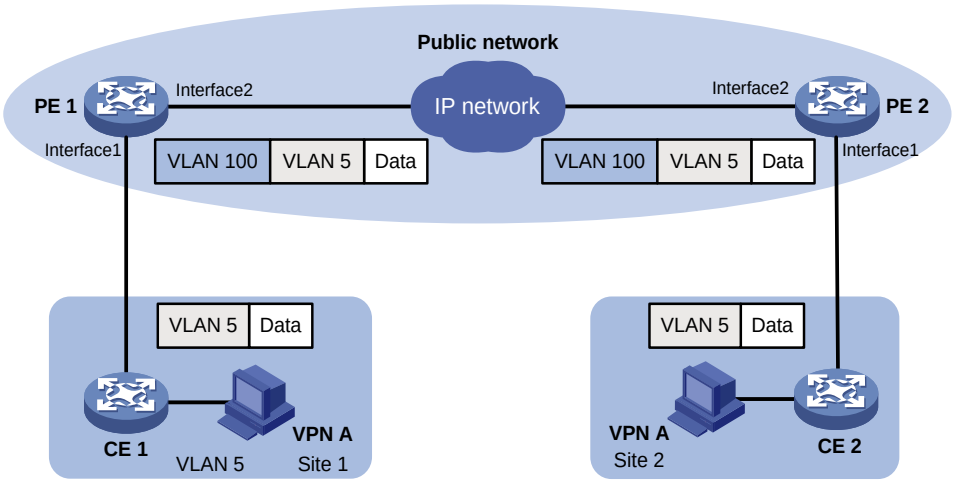

Table 5 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Procedure

1. Configuring PE 1:

   # Create a traffic class named **test** to match traffic with VLAN ID 5.

   ```
   <Sysname> system-view
   [Sysname] sysname PE1
   [PE1] traffic classifier test
   ```

```
[PE1-classifier-test] if-match service-vlan-id 5
[PE1-classifier-test] quit
```

Configure an action to add outer VLAN tag 100 in traffic behavior **test**.

```
[PE1] vlan 100
[PE1-vlan100] quit
[PE1] traffic behavior test
[PE1-behavior-test] nest top-most vlan 100
[PE1-behavior-test] quit
```

Create a QoS policy named **test**, and associate class **test** with behavior **test** in the QoS policy.

```
[PE1] qos policy test
[PE1-qospolicy-test] classifier test behavior test
[PE1-qospolicy-test] quit
```

Configure the downlink port (GigabitEthernet 1/0/1) as a hybrid port, and assign the port to VLAN 100 as an untagged member.

```
[PE1] interface gigabitethernet 1/0/1
[PE1-GigabitEthernet1/0/1] port link-type hybrid
[PE1-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Apply QoS policy **test** to the incoming traffic of GigabitEthernet 1/0/1.

```
[PE1-GigabitEthernet1/0/1] qos apply policy test inbound
[PE1-GigabitEthernet1/0/1] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a trunk port, and assign it to VLAN 100.

```
[PE1] interface gigabitethernet 1/0/2
[PE1-GigabitEthernet1/0/2] port link-type trunk
[PE1-GigabitEthernet1/0/2] port trunk permit vlan 100
[PE1-GigabitEthernet1/0/2] quit
```

2. Configuring PE 2:

Create a traffic class named **test** to match traffic with VLAN ID 5.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] traffic classifier test
[PE2-classifier-test] if-match service-vlan-id 5
[PE2-classifier-test] quit
```

Configure an action to add outer VLAN tag 100 in traffic behavior **test**.

```
[PE2] vlan 100
[PE2-vlan100] quit
[PE2] traffic behavior test
[PE2-behavior-test] nest top-most vlan 100
[PE2-behavior-test] quit
```

Create a QoS policy named **test**, and associate class **test** with behavior **test** in the QoS policy.

```
[PE2] qos policy test
[PE2-qospolicy-test] classifier test behavior test
[PE2-qospolicy-test] quit
```

Configure the downlink port (GigabitEthernet 1/0/1) as a hybrid port, and assign the port to VLAN 100 as an untagged member.

```
[PE2] interface gigabitethernet 1/0/1
[PE2-GigabitEthernet1/0/1] port link-type hybrid
```

```
[PE2-GigabitEthernet1/0/1] port hybrid vlan 100 untagged
```

Apply QoS policy **test** to the incoming traffic of GigabitEthernet 1/0/1.

```
[PE2-GigabitEthernet1/0/1] qos apply policy test inbound
[PE2-GigabitEthernet1/0/1] quit
```

Configure the uplink port (GigabitEthernet 1/0/2) as a trunk port, and assign it to VLAN 100.

```
[PE2] interface gigabitethernet 1/0/2
[PE2-GigabitEthernet1/0/2] port link-type trunk
[PE2-GigabitEthernet1/0/2] port trunk permit vlan 100
[PE2-GigabitEthernet1/0/2] quit
[PE2] commit
```

Verifying the configuration

Site 1 and site 2 can access each other.

Configuration files

```

Configuring traffic redirecting

About traffic redirecting

Traffic redirecting redirects packets matching the specified match criteria to a location for processing.

You can redirect packets to the following destinations:

- CPU.
- Interface.
- Next hop.

Restrictions and guidelines: Traffic redirecting configuration

- A traffic redirecting action takes effect only when a QoS policy is applied to the inbound direction of the following application destinations:
  - Interface.
  - VLANs.
  - Globally.
- If you execute the **redirect** command multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic redirecting action.
      See the **redirect** commands in the command reference.
      By default, no traffic redirecting action is configured for a traffic behavior.
   c. Return to system view.

quit

4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display traffic redirecting configuration.
   display traffic behavior user-defined [*behavior-name*]
   This command is available in any view.

Traffic redirecting configuration examples

Example: Configuring traffic redirecting

Network configuration

As shown in Figure 21:

- Device A is connected to Device B through two links. Device A and Device B are each connected to other devices.
- GigabitEthernet 1/0/1 of Device A is a trunk port and belongs to VLAN 200 and VLAN 201.
- GigabitEthernet 1/0/2 of Device A and GigabitEthernet 1/0/2 of Device B belong to VLAN 200.
- GigabitEthernet 1/0/3 of Device A and GigabitEthernet 1/0/3 of Device B belong to VLAN 201.
- On Device A, the IP address of VLAN-interface 200 is 200.1.1.1/24, and that of VLAN-interface 201 is 201.1.1.1/24.
- On Device B, the IP address of VLAN-interface 200 is 200.1.1.2/24, and that of VLAN-interface 201 is 201.1.1.2/24.

Configure the actions of redirecting traffic to an interface to meet the following requirements:

- Packets with source IP address 2.1.1.1 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/2.
- Packets with source IP address 2.1.1.2 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/3.
- Other packets received on GigabitEthernet 1/0/1 of Device A are forwarded according to the routing table.

Figure 21 Network diagram

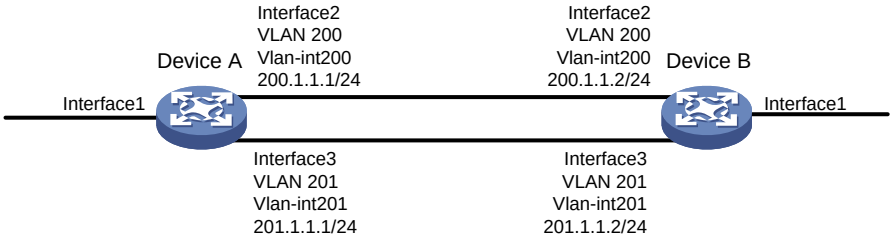

Table 6 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 2.1.1.1.

```
<Sysname> system-view
[Sysname] sysname DeviceA
[DeviceA] acl basic 2000
[DeviceA-acl-ipv4-basic-2000] rule permit source 2.1.1.1 0
[DeviceA-acl-ipv4-basic-2000] quit
```

Create basic ACL 2001, and configure a rule to match packets with source IP address 2.1.1.2.

```
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 2.1.1.2 0
[DeviceA-acl-ipv4-basic-2001] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_1
[DeviceA-classifier-classifier_1] if-match acl 2000
[DeviceA-classifier-classifier_1] quit
```

Create a traffic class named **classifier_2**, and use ACL 2001 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_2
[DeviceA-classifier-classifier_2] if-match acl 2001
[DeviceA-classifier-classifier_2] quit
```

Create a traffic behavior named **behavior_1**, and configure the action of redirecting traffic to GigabitEthernet 1/0/2.

```
[DeviceA] traffic behavior behavior_1
[DeviceA-behavior-behavior_1] redirect interface gigabitethernet 1/0/2
[DeviceA-behavior-behavior_1] quit
```

Create a traffic behavior named **behavior_2**, and configure the action of redirecting traffic to GigabitEthernet 1/0/3.

```
[DeviceA] traffic behavior behavior_2
[DeviceA-behavior-behavior_2] redirect interface gigabitethernet 1/0/3
[DeviceA-behavior-behavior_2] quit
```

Create a QoS policy named **policy**.

```
[DeviceA] qos policy policy
```

Associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_1 behavior behavior_1
```

Associate traffic class **classifier_2** with traffic behavior **behavior_2** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_2 behavior behavior_2
[DeviceA-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy policy inbound
[DeviceA-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Use the **`display qos policy interface`** command to verify that the configuration has been performed successfully.

Configuration files

```
#
 sysname DeviceA
#
traffic classifier classifier_1 operator and
 if-match acl 2000
#
traffic classifier classifier_2 operator and
 if-match acl 2001
#
traffic behavior behavior_1
 redirect interface GigabitEthernet1/0/2
#
traffic behavior behavior_2
 redirect interface GigabitEthernet1/0/3
#
qos policy policy
 classifier classifier_1 behavior behavior_1
 classifier classifier_2 behavior behavior_2
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos apply policy policy inbound
#

 rule 5 permit source 2.1.1.1 0
#
acl basic 2001
 rule 5 permit source 2.1.1.2 0
#
return
```

Configuring global CAR

About global CAR

Global committed access rate (CAR) is an approach to policing traffic flows globally. It adds flexibility to common CAR where traffic policing is performed only on a per-traffic class or per-interface basis. In this approach, CAR actions are created in system view and each can be used to police multiple traffic flows as a whole.

Global CAR provides the following CAR actions: aggregate CAR and hierarchical CAR.

Aggregate CAR

An aggregate CAR action is created globally. It can be directly applied to interfaces or used in the traffic behaviors associated with different traffic classes to police multiple traffic flows as a whole. The total rate of the traffic flows must conform to the traffic policing specifications set in the aggregate CAR action.

Hierarchical CAR

A hierarchical CAR action is created globally. It must be used in conjunction with a common CAR or aggregate CAR action. With a hierarchical CAR action, you can limit the total traffic of multiple traffic classes.

A hierarchical CAR action can be used in the common or aggregate CAR action for a traffic class in either AND mode or OR mode.

- In AND mode, the rate of the traffic class is strictly limited under the common or aggregate CAR. This mode applies to flows that must be strictly rate limited.
- In OR mode, the traffic class can use idle bandwidth of other traffic classes associated with the hierarchical CAR. This mode applies to high priority, bursty traffic like video.

By using the two modes appropriately, you can improve bandwidth efficiency.

For example, suppose two flows exist: a low priority data flow and a high priority, bursty video flow. Their total traffic rate cannot exceed 4096 kbps and the video flow must be assured of at least 2048 kbps bandwidth. You can perform the following tasks:

- Configure common CAR actions to set the traffic rate to 2048 kbps for the two flows.
- Configure a hierarchical CAR action to limit their total traffic rate to 4096 kbps.
- Use the action in AND mode in the common CAR action for the data flow.
- Use the action in OR mode in the common CAR action for the video flow.

The video flow is assured of 2048 kbps bandwidth and can use idle bandwidth of the data flow.

In a bandwidth oversubscription scenario, the uplink port bandwidth is lower than the total downlink port traffic rate. You can use hierarchical CAR to meet the following requirements:

- Limit the total rate of downlink port traffic.
- Allow each downlink port to forward traffic at the maximum rate when the other ports are idle.

For example, you can perform the following tasks:

- Use common CAR actions to limit the rates of Internet access flow 1 and flow 2 to both 128 kbps.
- Use a hierarchical CAR action to limit their total traffic rate to 192 kbps.

- Use the hierarchical CAR action for both flow 1 and flow 2 in AND mode.

When flow 1 is not present, flow 2 is transmitted at the maximum rate, 128 kbps. When both flows are present, the total rate of the two flows cannot exceed 192 kbps. As a result, the traffic rate of flow 2 might drop below 128 kbps.

Restrictions and guidelines: Global CAR configuration

The device supports only aggregate CAR in the current software version, and an aggregate CAR action cannot be applied in both the inbound direction and outbound direction.

When a QoS policy containing an aggregate CAR action is applied on an IRF fabric, the traffic matching the QoS policy might enter the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the aggregate CAR action multiplied by the number of involved IRF member devices by default.

Configuring aggregate CAR

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

      For configurable match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
3. Configure an aggregate CAR action.

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

   By default, no aggregate CAR action is configured.
4. Define a traffic behavior.
   a. Enter traffic behavior view.

      traffic behavior *behavior-name*
   b. Use the aggregate CAR in the traffic behavior.

      car name *car-name*

      By default, no aggregate CAR action is used in a traffic behavior.
5. Apply the QoS policy.

   For more information, see "Applying the QoS policy."

   By default, no QoS policy is applied.

Display and maintenance commands for global CAR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display statistics for global CAR actions.	**display qos car name** [*car-name*]
Clear statistics for global CAR actions.	**reset qos car name** [*car-name*]

Global CAR configuration examples

Example: Configuring MQC aggregate CAR

Network configuration

As shown in Figure 22, configure MQC aggregate CAR to limit the total rate of traffic in VLAN 10 and VLAN 100 to CIR 2560 kbps and CBS 20480 bytes and drop the exceeding packets.

Figure 22 Network diagram

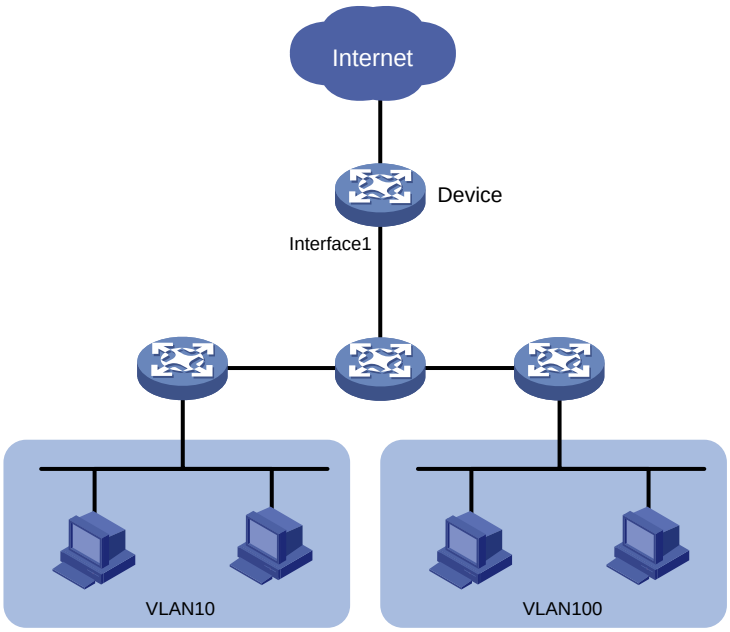

Table 7 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1

Procedure

Configure an aggregate CAR action according to the rate limit requirements.

```
<Sysname> system-view
[Sysname] sysname Device
```

```
[Device] qos car aggcar-1 aggregative cir 2560 cbs 20480 red discard
```

Create traffic class 1, and use VLAN ID 10 as the match criterion in the traffic class.

```
[Device] traffic classifier 1
[Device-classifier-1] if-match service-vlan-id 10
[Device-classifier-1] quit
```

Create traffic behavior 1, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 1
[Device-behavior-1] car name aggcar-1
[Device-behavior-1] quit
```

Create traffic class 2, and use VLAN ID 100 as the match criterion in the traffic class.

```
[Device] traffic classifier 2
[Device-classifier-2] if-match service-vlan-id 100
[Device-classifier-2] quit
```

Create traffic behavior 2, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 2
[Device-behavior-2] car name aggcar-1
[Device-behavior-2] quit
```

Create a QoS policy named **car**, and associate traffic classes 1 and 2 with traffic behaviors 1 and 2 in the QoS policy, respectively.

```
[Device] qos policy car
[Device-qospolicy-car] classifier 1 behavior 1
[Device-qospolicy-car] classifier 2 behavior 2
[Device-qospolicy-car] quit
```

Apply QoS policy **car** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy car inbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Use the **`display qos policy interface`** command to verify that the configuration has been performed successfully.

Configuration files

```
#
 sysname Device
#
 qos car aggcar-1 aggregative cir 2560 cbs 20480 ebs 0 green pass red discard yellow pass
#
traffic classifier 1 operator and
 if-match service-vlan-id 10
#
traffic classifier 2 operator and
 if-match service-vlan-id 100
#
traffic behavior 1
 car name aggcar-1
#
traffic behavior 2
```

```
 car name aggcar-1
#
qos policy car
 classifier 1 behavior 1
 classifier 2 behavior 2
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos apply policy car inbound
#
return
```

Configuring class-based accounting

About class-based accounting

Class-based accounting collects statistics on a per-traffic class basis. For example, you can define the action to collect statistics for traffic sourced from a certain IP address. By analyzing the statistics, you can determine whether anomalies have occurred and what action to take.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an accounting action.
      accounting [**byte** | **packet**]
      By default, no traffic accounting action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display the class-based accounting configuration.
   display traffic behavior user-defined [*behavior-name*]

Class-based accounting configuration examples

Example: Configuring class-based accounting

Network configuration

As shown in Figure 23, configure class-based accounting on GigabitEthernet 1/0/1 to collect statistics for incoming traffic from 1.1.1.1/24.

Figure 23 Network diagram

Table 8 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 1.1.1.1.

```
<Sysname> system-view
[Sysname] sysname Device
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Device-acl-ipv4-basic-2000] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 2000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the class-based accounting action.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] accounting packet
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Display traffic statistics to verify the configuration.

```
[Device] display qos policy interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: policy
   Classifier: classifier_1
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: behavior_1
      Accounting enable:
        28529 (Packets)
```

Configuration files

```
#
 sysname Device
#
traffic classifier classifier_1 operator and
 if-match acl 2000
#
traffic behavior behavior_1
 accounting packet
#
qos policy policy
 classifier classifier_1 behavior behavior_1
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 qos apply policy policy inbound
#
acl basic 2000
 rule 5 permit source 1.1.1.1 0
#
return
```

Setting an alarm threshold for protocol packets

About an alarm threshold for protocol packets

The device generates an alarm when the rate of protocol packets sent to the CPU exceeds the alarm threshold.

Restrictions and guidelines: Alarm threshold for protocol packets configuration

This feature does not support the **commit** command to deploy target configuration. For more information about target configuration, see target configuration management in *Fundamentals Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Set an alarm threshold for protocol packets sent to the CPU.
   qos soft-car protocol *protocol-type* **alarm-threshold** *alarm-threshold-rate* **slot** *slot-number*
   By default, the device does not generate alarms for protocol packets sent to the CPU.

Display and maintenance commands for alarm threshold for protocol packets

Execute **display** commands in any view.

Task	Command
Display the alarm threshold configuration for protocol packets.	**display qos soft-car protocol** [*protocol-type*] **slot** *slot-number*

7	7

Appendix C Introduction to packet precedence

IP precedence and DSCP values

Figure 24 ToS and DS fields

As shown in Figure 24, the ToS field in the IP header contains 8 bits. The first 3 bits (0 to 2) represent IP precedence from 0 to 7. According to RFC 2474, the ToS field is redefined as the differentiated services (DS) field. A DSCP value is represented by the first 6 bits (0 to 5) of the DS field and is in the range 0 to 63. The remaining 2 bits (6 and 7) are reserved.

Table 13 IP precedence

IP precedence (decimal)	IP precedence (binary)	Description
0	000	Routine
1	001	priority
2	010	immediate

IP precedence (decimal)	IP precedence (binary)	Description
3	011	flash
4	100	flash-override
5	101	critical
6	110	internet
7	111	network

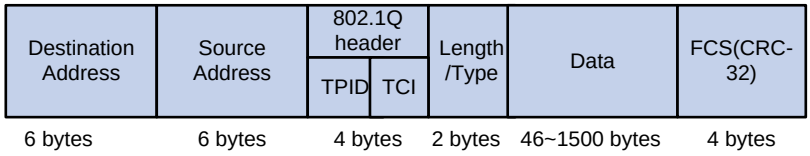

Table 14 DSCP values

DSCP value (decimal)	DSCP value (binary)	Description
46	101110	ef
10	001010	af11

24	011000	cs3
32	100000	cs4
40	101000	cs5
48	110000	cs6
56	111000	cs7
0	000000	be (default)

802.1p priority

802.1p priority lies in the Layer 2 header. It applies to occasions where Layer 3 header analysis is not needed and QoS must be assured at Layer 2.

Figure 25 An Ethernet frame with an 802.1Q tag header

As shown in Figure 25, the 4-byte 802.1Q tag header contains the 2-byte tag protocol identifier (TPID) and the 2-byte tag control information (TCI). The value of the TPID is 0x8100. Figure 26 shows the format of the 802.1Q tag header. The Priority field in the 802.1Q tag header is called 802.1p priority, because its use is defined in IEEE 802.1p. Figure 26Table 15 shows the values for 802.1p priority.

Figure 26 802.1Q tag header

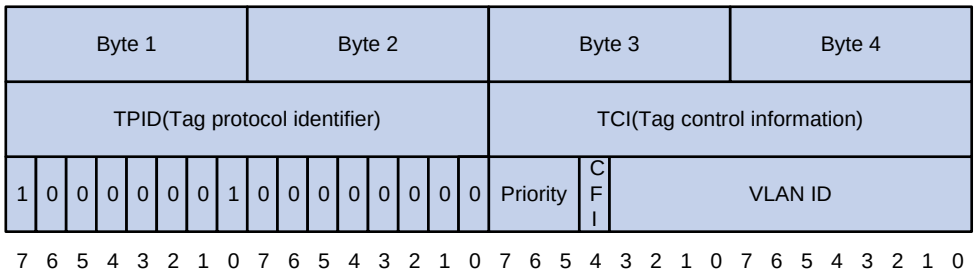

Table 15 Description on 802.1p priority

802.1p priority (decimal)	802.1p priority (binary)	Description
0	000	best-effort
1	001	background
2	010	spare

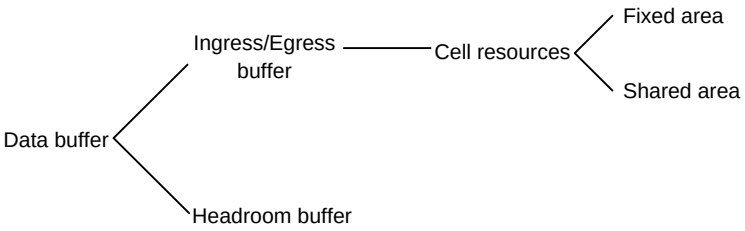
Configuring data buffers

About data buffers

Sudden traffic in a short period on the network might cause congestion, while device interfaces have limited processing capabilities, potentially leading to packet loss. Therefore, high-speed forwarding devices use data buffers to cache packets, reducing the probability of packet loss due to congestion. If the network experiences significant sudden traffic, resources in the data buffer might be exhausted, making it impossible to continue caching packets, which might still be discarded. Properly allocating data buffer resources allows high-priority queues or interface traffic to be cached, minimizing congestion impact.

The size and processing capability of the buffer depend entirely on the hardware forwarding chip and interfaces. Generally, all interfaces on the forwarding chip share the chip's data buffer resources, while queues on an interface share the interface's data buffer resources.



Data buffer types

The following data buffers are available:

- **Ingress buffer**—Stores incoming packets when the CPU is busy.
- **Egress buffer**—Stores outgoing packets when network congestion occurs.
- **Headroom buffer**—Stores packets when the ingress buffer or egress buffer is used up.

Figure 1 shows the structure of ingress and egress buffers.

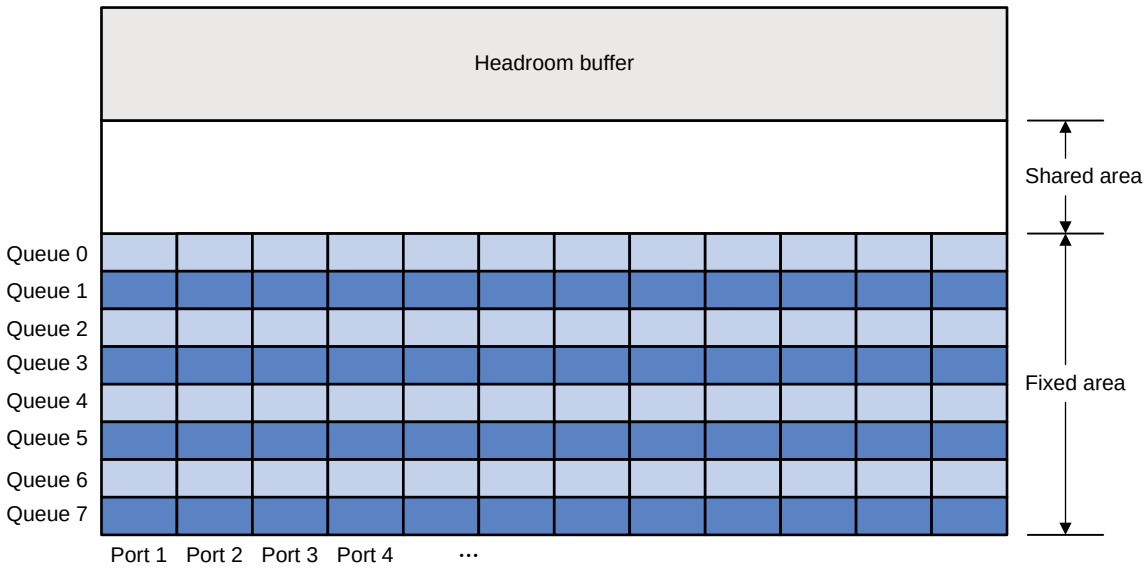
Figure 1 Data buffer structure

Cell resources

A buffer uses cell resources to store packets based on packet sizes. Suppose a cell resource provides 208 bytes. The buffer allocates one cell resource to a 128-byte packet and two cell resources to a 300-byte packet.

Fixed area and shared area

The cell resources have a fixed area and a shared area.



- **Fixed area**—Partitioned into queues, each of which is equally divided by all the interfaces on the switch, as shown in Figure 2. When congestion occurs or the CPU is busy, the following rules apply:
  - **a.** An interface first uses the relevant queues of the fixed area to store packets.
  - **b.** When a queue is full, the interface uses the corresponding queue of the shared area.
  - **c.** When the queue in the shared area is also full, the interface discards subsequent packets.

The system allocates the fixed area among queues as specified by the user. Even if a queue is not full, other queues cannot preempt its space. Similarly, the share of a queue for an interface cannot be preempted by other interfaces even if it is not full.

- **Shared area**—Partitioned into queues, each of which is not equally divided by the interfaces, as shown in Figure 2. The system determines the actual shared-area space for each queue according to user configuration and the number of packets actually received and sent. If a queue is not full, other queues can preempt its space.

  The system puts packets received or sent on all interfaces into a queue in the order they arrive. When the queue is full, subsequent packets are dropped.

Figure 2 Fixed area and shared area

Restrictions and guidelines: Data buffer configuration

You cannot configure data buffers on the S5200-EI-G switch series.

IRF physical interfaces do not support this feature.

Data buffer tasks at a glance

To configure the data buffer, perform the following tasks:

- (Optional.) Configuring data buffer alarms
  - Configuring per-interface alarm thresholds for the ingress or egress buffer
  - Configuring per-queue alarm thresholds for the ingress or egress buffer
  - Configuring per-interface alarm thresholds for the Headroom buffer
  - Configuring packet-drop alarms

Configuring data buffer alarms

About data buffer alarms

This feature works with a network management system (such as IMC). Data buffer alarms include threshold-crossing alarms and packet drop alarms. The device reports these alarms to the network management system for displaying the data buffer usage.

You can configure data buffer alarms on a per-interface basis or a per-queue basis.

Restrictions and guidelines for data buffer alarm configuration

Configuring per-queue alarm thresholds is supported for only the egress buffer.

Configuring per-interface alarm thresholds for the ingress or egress buffer

1. Enter system view.

   system-view
2. Configure the alarm thresholds. Choose the options to configure as needed:
   - Configure the global alarm threshold.

     buffer { **egress** | **ingress** } **usage threshold slot** *slot-number* **null-queue ratio** *ratio*

     The default setting is 100%.
   - Execute the following commands in sequence to configure the alarm threshold on an interface:

     interface *interface-type interface-number*

     port buffer { **egress** | **ingress** } **usage threshold null-queue ratio** *ratio*

     By default, an interface uses the global alarm threshold.

   If you configure both the global alarm threshold and the alarm threshold on an interface, the latter takes effect.
3. Enable threshold-crossing alarms.

   buffer threshold alarm { **egress** | **ingress** } **enable**

   By default, threshold-crossing alarms are disabled.
4. (Optional.) Set the interval for sending threshold-crossing alarms.

   buffer threshold alarm { **egress** | **ingress** } **interval** *interval*

   The default setting is 5 seconds.

Configuring per-queue alarm thresholds for the ingress or egress buffer

1. Enter system view.

   system-view
2. Configure the alarm thresholds.

- Execute the following commands in sequence to configure the alarm threshold for a queue on an interface:

  interface *interface-type interface-number*

  buffer egress usage threshold queue *queue-id* **ratio** *ratio*

  The default setting is 100%.

3. Enable threshold-crossing alarms.

   buffer threshold alarm { **egress** | **ingress** } **enable**

   By default, threshold-crossing alarms are disabled.

4. (Optional.) Set the interval for sending threshold-crossing alarms.

   buffer threshold alarm { **egress** | **ingress** } **interval** *interval*

   The default setting is 5 seconds.

Configuring per-interface alarm thresholds for the Headroom buffer

1. Enter system view.

   system-view

2. Configure the alarm thresholds. Choose the options to configure as needed:
   - Configure the global alarm threshold.

     buffer usage threshold headroom slot *slot-number* **ratio** *ratio*

     The default setting is 100%.
   - Execute the following commands in sequence to configure the alarm threshold on an interface:

     interface *interface-type interface-number*

     port buffer usage threshold headroom null-queue ratio *ratio*

     By default, an interface uses the global alarm threshold.

   If you configure both the global alarm threshold and the alarm threshold on an interface, the latter takes effect.

3. Enable threshold-crossing alarms.

   buffer threshold alarm headroom enable

   By default, threshold-crossing alarms are disabled.

4. (Optional.) Set the interval for sending threshold-crossing alarms.

   buffer threshold alarm headroom interval *interval*

   The default setting is 5 seconds.

Configuring packet-drop alarms

About this task

This feature allows the device to periodically send packet-drop information to the NMS.

Restrictions and guidelines

This feature does not take effect on the Headroom buffer.

Procedure

1. Enter system view.

   system-view

2. Enable packet-drop alarms.

   buffer packet-drop alarm enable

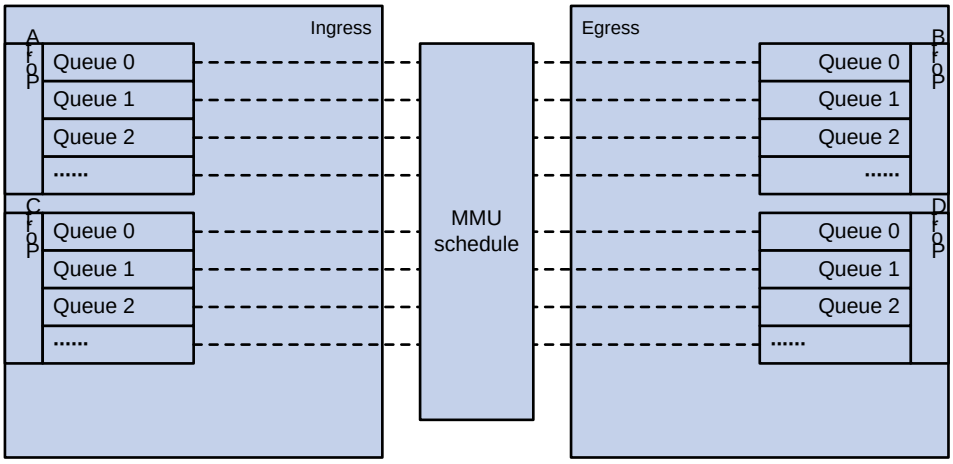
   By default, packet-drop alarms are disabled.

3. (Optional.) Set the interval for sending packet-drop alarms.

   buffer packet-drop alarm interval *interval*

   The default setting is 5 seconds.

Configuring TCB



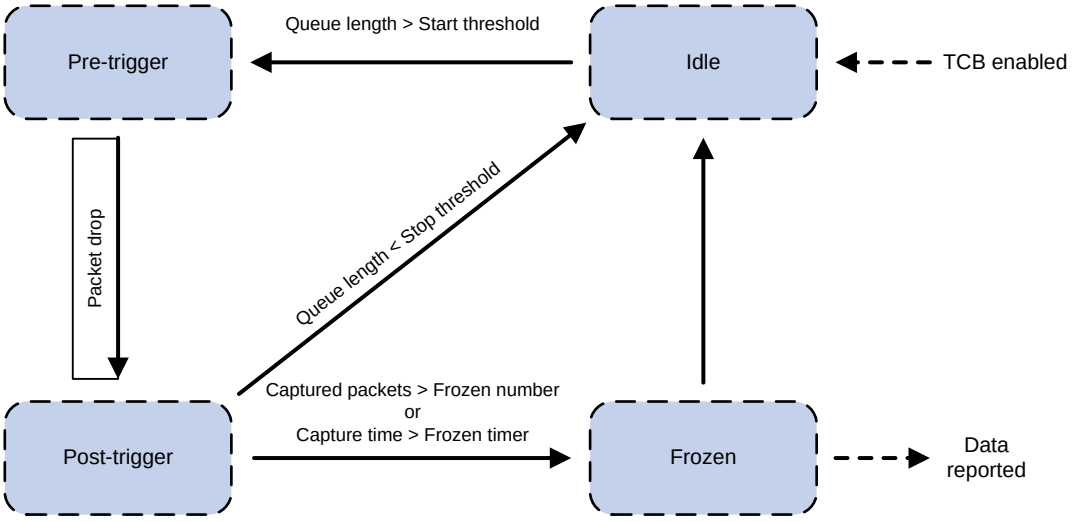
About TCB

Overview

The Transient Capture Buffer (TCB) feature monitors packet drop events on a set of memory management unit (MMU) resources. When a packet is dropped on a queue, the system collects drop time, drop reason, packet metadata, and other information and reports them to an NMS through gRPC.

An MMU manages the allocation of the ingress buffer and egress buffer and flexibly schedules queues to deal with traffic bursts.

Figure 3 MMU queues



How TBC works

The TCB state machine works as follows:

1. The state machine enters the idle state when TCB is enabled.
2. When the queue length is greater than *start-threshold-value*, the state machine transitions from the idle state to the pre-trigger state. The system captures packets by using the **pre-sample-rate**.
3. When packet drops occur on the queue, the state machine transitions from the pre-trigger to the post-trigger state.
4. When the queue length is smaller than *stop-threshold-value*, the state machine transitions from the post-trigger to the idle state. The system stops capturing packets.
5. When the queue length is greater than *start-threshold-value*, step 2 is repeated.

6. When the number of captured packets reaches the *frozen-number* or the capture timer expires, the state machine transitions from the post-trigger to the frozen state.
7. The state machine analyzes the drop reason and dropped packet characteristics and sends the analysis results to the gRPC module, which reports them to an NMS.
8. The state machine transitions from the frozen to the idle state.

Figure 4 TCB state machine

Restrictions and guidelines: TCB configuration

You can configure TCB in system view or interface view, but not in both views at the same time. For example, if you have configured TCB in system view, to configure TCB in interface view, you must first delete the TCB configuration in system view.

The TCB configuration in system view takes effect on all TCB-capable interfaces. The TCB configuration in interface view takes effect only on the specified interface.

Only one interface on the device can be configured with TCB when you configure TCB in interface view.

TCB cannot identify tunnel-encapsulated TCP or UDP packets if local analysis is enabled or an ACL is referenced.

During congestion, packet drop information is displayed for only TCP or UDP packets.

The gRPC sampling paths for TCB are **tcb/tcbpacketinfoevent** and **tcb/tcbrawpacketinfoevent**. For more information about gRPC, see "Configuring gRPC."

Enabling and configuring TCB

Enabling and configuring TCB in system view

1. Enter system view.

   system-view
2. Enable and configure TCB.

   buffer transient-capture global [**slot** *slot-number*] **egress enable** [**no-local-analysis**] [**acl**{ *ipv4-acl-number*|**name** *ipv4-acl-name*}]

[**start-threshold** *start-threshold-value* **stop-threshold** *stop-threshold-value*] [**frozen-number** *frozen-number* **frozen-timer** *timer-value*] [**pre-sample-rate** *pre-sample-rate* **post-sample-rate** *post-sample-rate*] [**poll-frequency** *frequency-value*]

By default, TCB is disabled.

Enabling and configuring TCB in interface view

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable and configure TCB.

   buffer transient-capture egress [**queue** *queue-id*] **enable** [**no-local-analysis**] [**acl** { *ipv4-acl-number* | **name** *ipv4-acl-name* }] [**start-threshold** *start-threshold-value* **stop-threshold** *stop-threshold-value*] [**frozen-number** *frozen-number* **frozen-timer** *timer-value*] [**pre-sample-rate** *pre-sample-rate* **post-sample-rate** *post-sample-rate*] [**poll-frequency** *frequency-value*]

   By default, TCB is disabled.

Display and maintenance commands for TCB

Execute **display** commands in any view.

Task	Command
Display packet drop information.	**display buffer transient-capture packet-drop slot** *slot-number* { **ethernet** | **ipv4** | **ipv6** }

TCB configuration examples

Example: Configuring TCB on an interface

Network configuration

As shown in Figure 5, configure TCB and gRPC on the device to monitor packet drops and report packet drop information to the collector through gRPC.

Figure 5 Network diagram

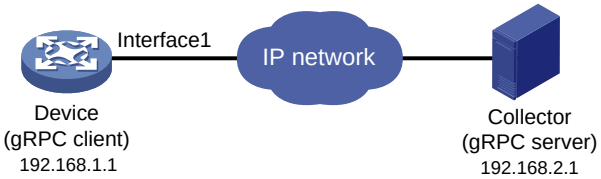


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1

Procedure

1. Assign IP addresses to the device and the collector and configure routes. Make sure the network connections are available. (Details not shown.)
2. Configure TCB:

   # Create an IPv4 advanced ACL numbered 3001, and configure a rule to match packets with source IP address 192.168.5.2.

   ```
   <Device> system-view
   [Device] acl advanced 3001
   [Device-acl-ipv4-adv-3001] rule permit ip source 192.168.5.2 0
   [Device-acl-ipv4-adv-3001] quit
   ```

   # Configure TCB on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] buffer transient-capture egress queue 1 enable no-local-analysis acl 3001 start-threshold 10000 stop-threshold 5000 frozen-number 1000 frozen-timer 400 pre-sample-rate 10 post-sample-rate 10 poll-frequency 600
   [Device-GigabitEthernet1/0/1] quit
   ```

3. Configure gRPC:

   # Enable the gRPC service.

   ```
   [Device] grpc enable
   ```

   # Create a sensor group named **test**, and add sensor paths **tcb/tcbpacketinfoevent** and **tcb/tcbrawpacketinfoevent**.

   ```
   [Device] telemetry
   [Device-telemetry] sensor-group test
   [Device-telemetry-sensor-group-test] sensor path tcb/tcbpacketinfoevent
   [Device-telemetry-sensor-group-test] sensor path tcb/tcbrawpacketinfoevent
   [Device-telemetry-sensor-group-test] quit
   ```

   # Create a destination group named **collector1**. Specify a collector that uses IPv4 address 192.168.2.1 and port number 50050.

   ```
   [Device-telemetry] destination-group collector1
   [Device-telemetry-destination-group-collector1] ipv4-address 192.168.2.1 port 50050
   [Device-telemetry-destination-group-collector1] quit
   ```

   # Configure a subscription named **A** to bind sensor group **test** with destination group **collector1**. Set the sampling interval to 10 seconds.

   ```
   [Device-telemetry] subscription A
   [Device-telemetry-subscription-A] sensor-group test sample-interval 10
   [Device-telemetry-subscription-A] destination-group collector1
   [Device-telemetry-subscription-A] quit
   [Device-telemetry] quit
   ```

Verifying the configuration

Verify that the collector receives packet drop information when packet drops occur on a queue enabled with TCB. (Details not shown.)

Procedure 1
Display and maintenance commands for time ranges 1
Time range configuration examples 2
Example: Configuring a time range 2

Configuring time ranges

About time ranges

You can implement a service based on the time of the day by applying a time range to it. A time-based service takes effect only in time periods specified by the time range. For example, you can implement time-based ACL rules by applying a time range to them.

The following basic types of time ranges are available:

- **Periodic time range**—Recurs periodically on a day or days of the week.
- **Absolute time range**—Represents only a period of time and does not recur.

The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Restrictions and guidelines: Time range configuration

When you configure the ACL hardware mode, follow these restrictions and guidelines:

- If a time range does not exist, the service based on the time range does not take effect.
- You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements.

Procedure

1. Enter system view.

   system-view

2. Create or edit a time range.

   time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

   If an existing time range name is provided, this command adds a statement to the time range.

Display and maintenance commands for time ranges

Execute the **display** command in any view.

Task	Command
Display time range configuration and status.	**display time-range** { *time-range-name* | **all** }

Time range configuration examples

Example: Configuring a time range

Network configuration

As shown in Figure 1, configure an ACL on the device to allow Host A to access the server only during 8:00 and 18:00 on working days from June 2015 to the end of the year.

Figure 1 Network diagram

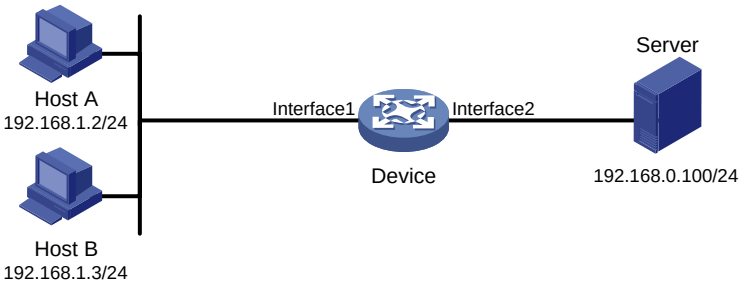

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Procedure

Create a periodic time range during 8:00 and 18:00 on working days from June 2015 to the end of the year.

```
<Device> system-view
[Device] time-range work 8:0 to 18:0 working-day from 0:0 6/1/2015 to 24:00 12/31/2015
```

Create an IPv4 basic ACL numbered 2001, and configure a rule in the ACL to permit packets only from 192.168.1.2/32 during the time range **work**.

```
[Device] acl basic 2001
[Device-acl-ipv4-basic-2001] rule permit source 192.168.1.2 0 time-range work
[Device-acl-ipv4-basic-2001] rule deny source any time-range work
[Device-acl-ipv4-basic-2001] quit
```

Apply IPv4 basic ACL 2001 to filter outgoing packets on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] packet-filter 2001 outbound
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the time range **work** is active on the device.

```
[Device] display time-range all
Current time is 13:58:35 6/19/2015 Friday

Time-range : work (Active)
 08:00 to 18:00 working-day
 from 00:00 6/1/2015 to 00:00 1/1/2016
```

H3C shall not be liable for technical or editorial errors or omissions contained herein.

Preface

This configuration guide describes the fundamentals and configuration procedures for security features.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

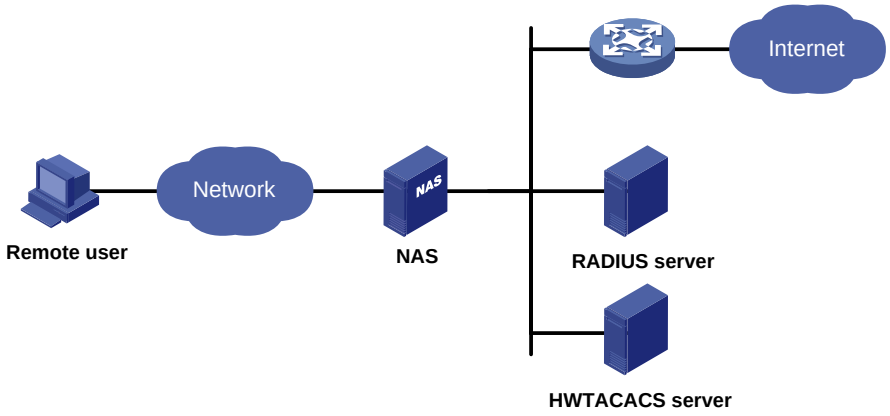
Configuring AAA

About AAA

AAA implementation



Authentication, Authorization, and Accounting (AAA) provides a uniform framework for implementing network access management. This feature specifies the following security functions:

- **Authentication**—Identifies users and verifies their validity.
- **Authorization**—Grants different users different rights, and controls the users' access to resources and services. For example, you can permit office users to read and print files and prevent guests from accessing files on the device.
- **Accounting**—Records network usage details of users, including the service type, start time, and traffic. This function enables time-based and traffic-based charging and user behavior auditing.

AAA network diagram

AAA uses a client/server model. The client runs on the access device, or the network access server (NAS), which authenticates user identities and controls user access. The server maintains user information centrally. See Figure 1.

Figure 1 AAA network diagram

To access networks or resources beyond the NAS, a user sends its identity information to the NAS. The NAS transparently passes the user information to AAA servers and waits for the authentication, authorization, and accounting result. Based on the result, the NAS determines whether to permit or deny the access request.

AAA has various implementations, including RADIUS, HWTACACS, and LDAP. RADIUS is most often used.

You can use different servers to implement different security functions. For example, you can use an HWTACACS server for authentication and authorization, and use a RADIUS server for accounting.

You can choose the security functions provided by AAA as needed. For example, if your company wants employees to be authenticated before they access specific resources, you would deploy an authentication server. If network usage information is needed, you would also configure an accounting server.

The device performs dynamic password authentication.

RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed information interaction protocol that uses a client/server model. The protocol can protect networks against unauthorized access and is often used in network environments that require both high security and remote user access.

The RADIUS authorization process is combined with the RADIUS authentication process, and user authorization information is piggybacked in authentication responses. RADIUS uses UDP port 1812 for authentication and UDP port 1813 for accounting.

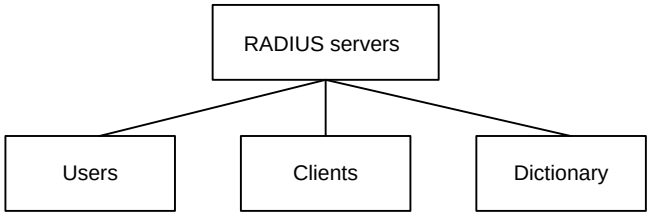
RADIUS was originally designed for dial-in user access, and has been extended to support additional access methods, such as Ethernet and ADSL.

Client/server model

The RADIUS client runs on the NASs located throughout the network. It passes user information to RADIUS servers and acts on the responses to, for example, reject or accept user access requests.

The RADIUS server runs on the computer or workstation at the network center and maintains information related to user authentication and network service access.

The RADIUS server operates using the following process:



1. Receives authentication, authorization, and accounting requests from RADIUS clients.
2. Performs user authentication, authorization, or accounting.
3. Returns user access control information (for example, rejecting or accepting the user access request) to the clients.

The RADIUS server can also act as the client of another RADIUS server to provide authentication proxy services.

The RADIUS server maintains the following databases:

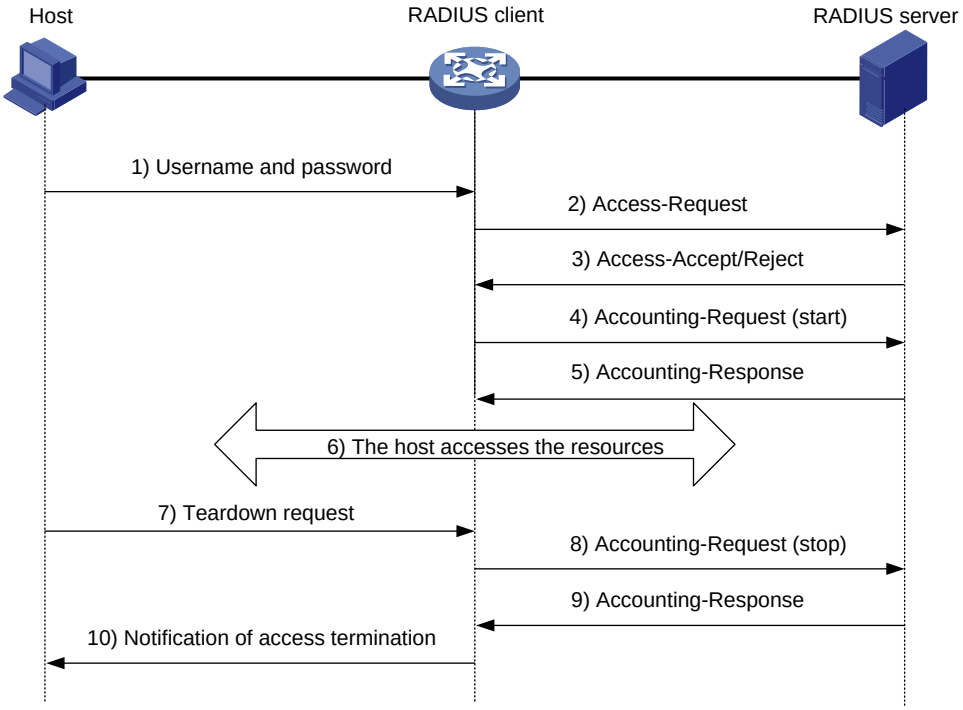
- **Users**—Stores user information, such as the usernames, passwords, applied protocols, and IP addresses.
- **Clients**—Stores information about RADIUS clients, such as shared keys and IP addresses.
- **Dictionary**—Stores RADIUS protocol attributes and their values.

Figure 2 RADIUS server databases

Information exchange security mechanism

The RADIUS client and server exchange information between them with the help of shared keys, which are preconfigured on the client and server. A RADIUS packet has a 16-byte field called Authenticator. This field includes a signature generated by using the MD5 algorithm, the shared key, and some other information. The receiver of the packet verifies the signature and accepts the packet only when the signature is correct. This mechanism ensures the security of information exchanged between the RADIUS client and server.

The shared keys are also used to encrypt user passwords that are included in RADIUS packets.



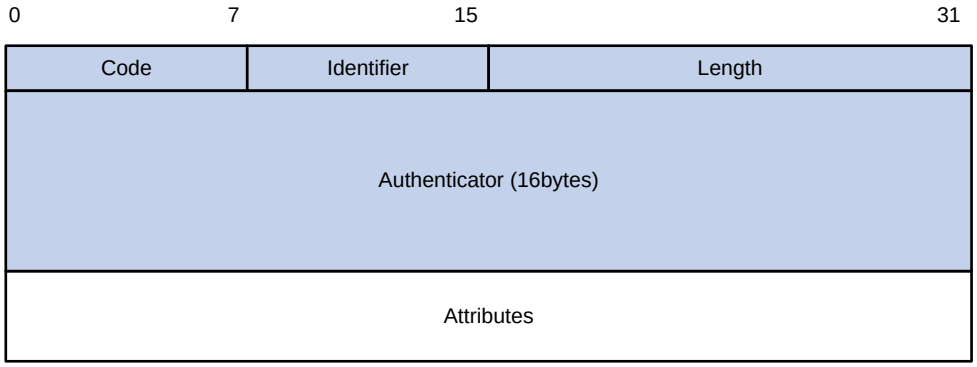
User authentication methods

The RADIUS server supports multiple user authentication methods, such as PAP, CHAP, and EAP.

Basic RADIUS packet exchange process

Figure 3 illustrates the interactions between a user host, the RADIUS client, and the RADIUS server.

Figure 3 Basic RADIUS packet exchange process



RADIUS uses in the following workflow:

1. The host sends a connection request that includes the user's username and password to the RADIUS client.
2. The RADIUS client sends an authentication request (Access-Request) to the RADIUS server. The request includes the user's password, which has been processed by the MD5 algorithm and shared key.
3. The RADIUS server authenticates the username and password. If the authentication succeeds, the server sends back an Access-Accept packet that contains the user's authorization information. If the authentication fails, the server returns an Access-Reject packet.
4. The RADIUS client permits or denies the user according to the authentication result. If the result permits the user, the RADIUS client sends a start-accounting request (Accounting-Request) packet to the RADIUS server.
5. The RADIUS server returns an acknowledgment (Accounting-Response) packet and starts accounting.
6. The user accesses the network resources.
7. The host requests the RADIUS client to tear down the connection.
8. The RADIUS client sends a stop-accounting request (Accounting-Request) packet to the RADIUS server.
9. The RADIUS server returns an acknowledgment (Accounting-Response) and stops accounting for the user.
10. The RADIUS client notifies the user of the termination.

RADIUS packet format

RADIUS uses UDP to transmit packets. The protocol also uses a series of mechanisms to ensure smooth packet exchange between the RADIUS server and the client. These mechanisms include the timer mechanism, the retransmission mechanism, and the backup server mechanism.

Figure 4 RADIUS packet format

Descriptions of the fields are as follows:

- The Code field (1 byte long) indicates the type of the RADIUS packet. Table 1 gives the main values and their meanings.

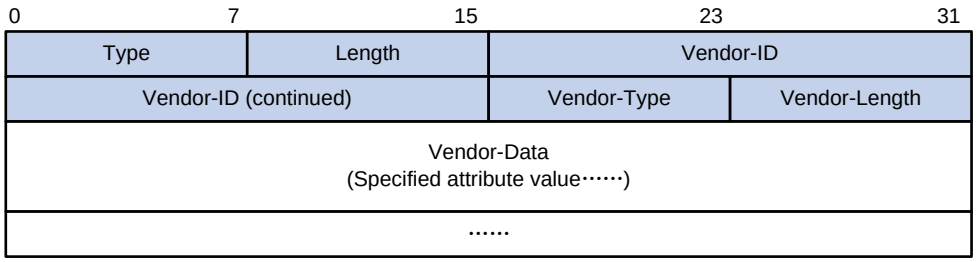
  Table 1 Main values of the Code field

Code	Packet type	Description
1	Access-Request	From the client to the server. A packet of this type includes user information for the server to authenticate the user. It must contain the User-Name attribute and can optionally contain the attributes of NAS-IP-Address, User-Password, and NAS-Port.
2	Access-Accept	From the server to the client. If all attribute values included in the Access-Request are acceptable, the authentication succeeds, and the server sends an Access-Accept response.
3	Access-Reject	From the server to the client. If any attribute value included in the Access-Request is unacceptable, the authentication fails, and the server sends an Access-Reject response.
4	Accounting-Request	From the client to the server. A packet of this type includes user information for the server to start or stop accounting for the user. The Acct-Status-Type attribute in the packet indicates whether to start or stop accounting.
5	Accounting-Response	From the server to the client. The server sends a packet of this type to notify the client that it has received the Accounting-Request and has successfully recorded the accounting information.

- The Identifier field (1 byte long) is used to match response packets with request packets and to detect duplicate request packets. The request and response packets of the same exchange process for the same purpose (such as authentication or accounting) have the same identifier.
- The Length field (2 bytes long) indicates the length of the entire packet (in bytes), including the Code, Identifier, Length, Authenticator, and Attributes fields. Bytes beyond this length are considered padding and are ignored by the receiver. If the length of a received packet is less than this length, the packet is dropped.
- The Authenticator field (16 bytes long) is used to authenticate responses from the RADIUS server and to encrypt user passwords. There are two types of authenticators: request authenticator and response authenticator.

- The Attributes field (variable in length) includes authentication, authorization, and accounting information. This field can contain multiple attributes, each with the following subfields:
  - **Type**—Type of the attribute.
  - **Length**—Length of the attribute in bytes, including the Type, Length, and Value subfields.
  - **Value**—Value of the attribute. Its format and content depend on the Type subfield.

Extended RADIUS attributes



The RADIUS protocol features excellent extensibility. The Vendor-Specific attribute (attribute 26) allows a vendor to define extended attributes. The extended attributes can implement functions that the standard RADIUS protocol does not provide.

A vendor can encapsulate multiple subattributes in the TLV format in attribute 26 to provide extended functions. As shown in Figure 5, a subattribute encapsulated in attribute 26 consists of the following parts:

- **Vendor-ID**—ID of the vendor. The most significant byte is 0. The other three bytes contains a code compliant to RFC 1700.
- **Vendor-Type**—Type of the subattribute.
- **Vendor-Length**—Length of the subattribute.
- **Vendor-Data**—Contents of the subattribute.

The device supports private RADIUS subattributes with a vendor ID of 25506. For more information, see "Appendix C RADIUS subattributes (vendor ID 25506)."

Figure 5 Format of attribute 26

HWTACACS

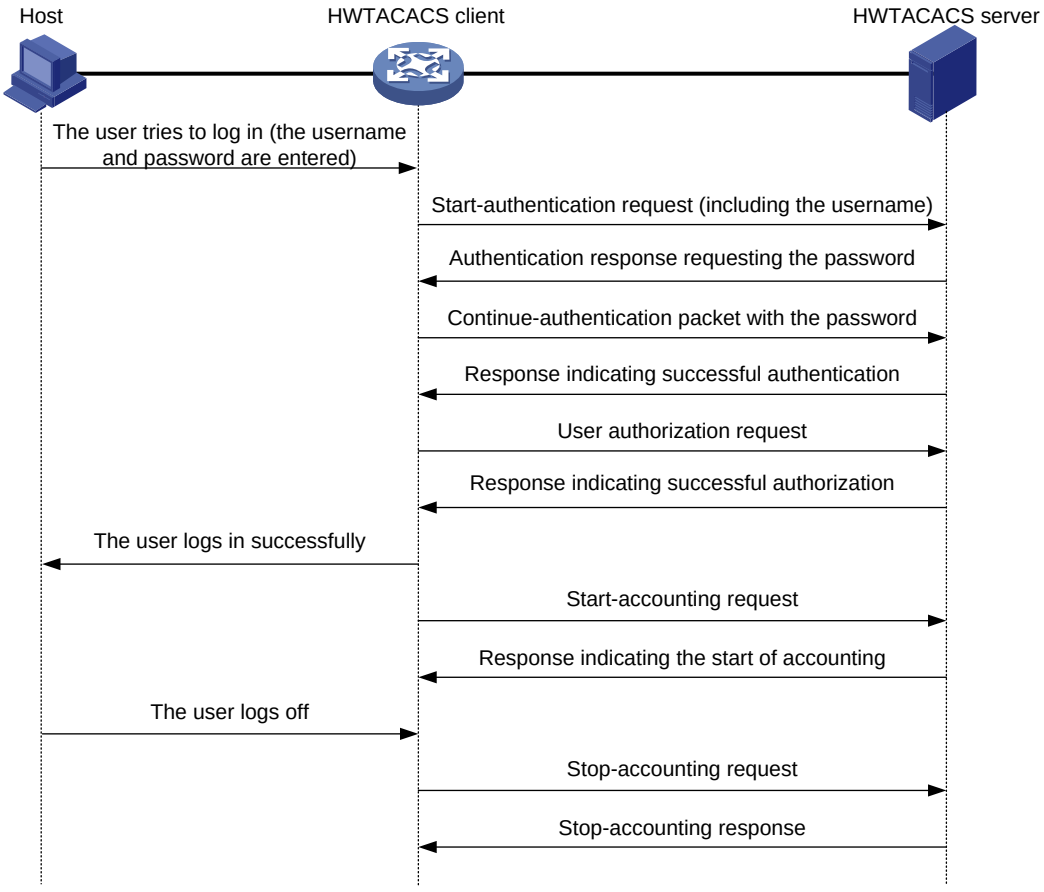
HW Terminal Access Controller Access Control System (HWTACACS) is an enhanced security protocol based on TACACS (RFC 1492). HWTACACS is similar to RADIUS, and uses a client/server model for information exchange between the NAS and the HWTACACS server.

HWTACACS typically provides AAA services for PPP, VPDN, and terminal users. In a typical HWTACACS scenario, terminal users need to log in to the NAS. Working as the HWTACACS client, the NAS sends users' usernames and passwords to the HWTACACS server for authentication. After passing authentication and obtaining authorized rights, a user logs in to the device and performs operations. The HWTACACS server records the operations that each user performs.

Differences between HWTACACS and RADIUS

HWTACACS and RADIUS have many features in common, such as using a client/server model, using shared keys for data encryption, and providing flexibility and scalability. Table 2 lists the primary differences between HWTACACS and RADIUS.

Table 2 Primary differences between HWTACACS and RADIUS



HWTACACS	RADIUS
Uses TCP, which provides reliable network	Uses UDP, which provides high transport efficiency.

HWTACACS	RADIUS
transmission.	
Encrypts the entire packet except for the HWTACACS header.	Encrypts only the user password field in an authentication packet.
Protocol packets are complicated and authorization is independent of authentication. Authentication and authorization can be deployed on different HWTACACS servers.	Protocol packets are simple and the authorization process is combined with the authentication process.
Supports authorization of configuration commands. Access to commands depends on both the user's roles and authorization. A user can use only commands that are permitted by the user roles and authorized by the HWTACACS server.	Does not support authorization of configuration commands. Access to commands solely depends on the user's roles. For more information about user roles, see *Fundamentals Configuration Guide*.

Basic HWTACACS packet exchange process

Figure 6 describes how HWTACACS performs user authentication, authorization, and accounting for a Telnet user.

Figure 6 Basic HWTACACS packet exchange process for a Telnet user

HWTACACS operates using in the following workflow:

1. A Telnet user requests to Telnet to the device and provides the username and password as instructed by the system.
2. The HWTACACS client sends a start-authentication request that includes the username to the HWTACACS server when it receives the Telnet request.

3. The HWTACACS server sends back an authentication response to request the login password.
4. Upon receipt of the response, the HWTACACS client sends the HWTACACS server a continue-authentication packet that includes the login password.
5. If the authentication succeeds, the HWTACACS server sends back an authentication response to indicate that the user has passed authentication.
6. The HWTACACS client sends a user authorization request packet to the HWTACACS server.
7. If the authorization succeeds, the HWTACACS server sends back an authorization response, indicating that the user is now authorized.
8. Knowing that the user is now authorized, the HWTACACS client pushes its CLI to the user and permits the user to log in.
9. The HWTACACS client sends a start-accounting request to the HWTACACS server.
10. The HWTACACS server sends back an accounting response, indicating that it has received the start-accounting request.
11. The user logs off.
12. The HWTACACS client sends a stop-accounting request to the HWTACACS server.
13. The HWTACACS server sends back a stop-accounting response, indicating that the stop-accounting request has been received.

LDAP

The Lightweight Directory Access Protocol (LDAP) provides standard multiplatform directory service. LDAP was developed on the basis of the X.500 protocol. It improves the following functions of X.500:

- Read/write interactive access.
- Browse.
- Search.

LDAP is suitable for storing data that does not often change. The protocol is used to store user information. For example, LDAP server software Active Directory Server is used in Microsoft Windows operating systems. The software stores the user information and user group information for user login authentication and authorization.

LDAP directory service

LDAP uses directories to maintain the organization information, personnel information, and resource information. The directories are organized in a tree structure and include entries. An entry is a set of attributes with distinguished names (DNs). The attributes are used to store information such as usernames, passwords, emails, computer names, and phone numbers.

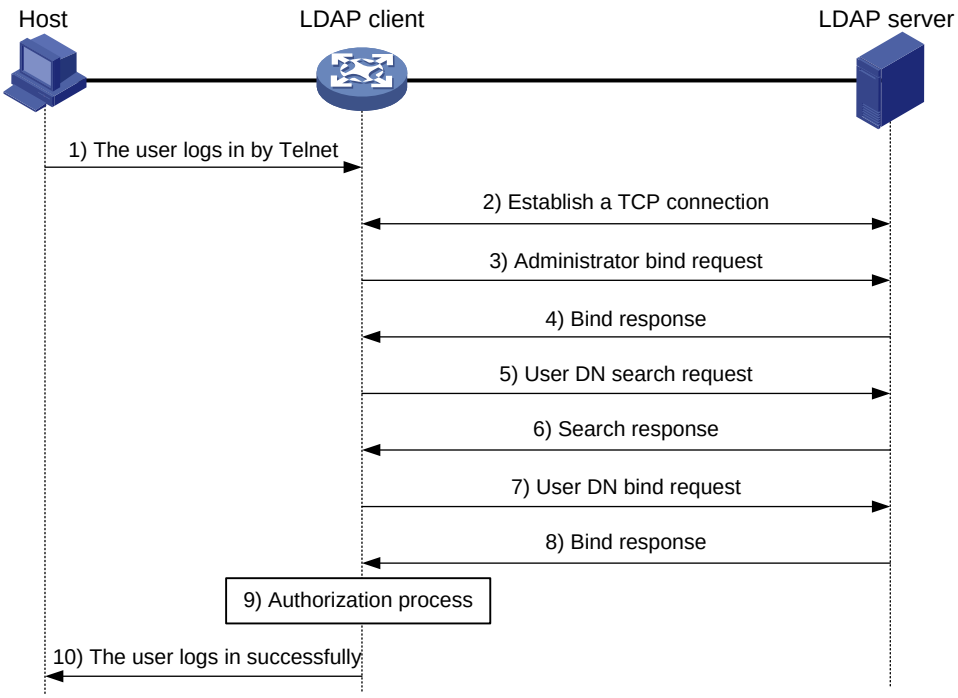
LDAP uses a client/server model, and all directory information is stored in the LDAP server. Commonly used LDAP server products include Microsoft Active Directory Server, IBM Tivoli Directory Server, and Sun ONE Directory Server.

LDAP authentication and authorization

AAA can use LDAP to provide authentication and authorization services for users. LDAP defines a set of operations to implement its functions. The main operations for authentication and authorization are the bind operation and search operation.

- The bind operation allows an LDAP client to perform the following operations:
  - Establish a connection with the LDAP server.
  - Obtain the access rights to the LDAP server.
  - Check the validity of user information.
- The search operation constructs search conditions and obtains the directory resource information of the LDAP server.

In LDAP authentication, the client completes the following tasks:



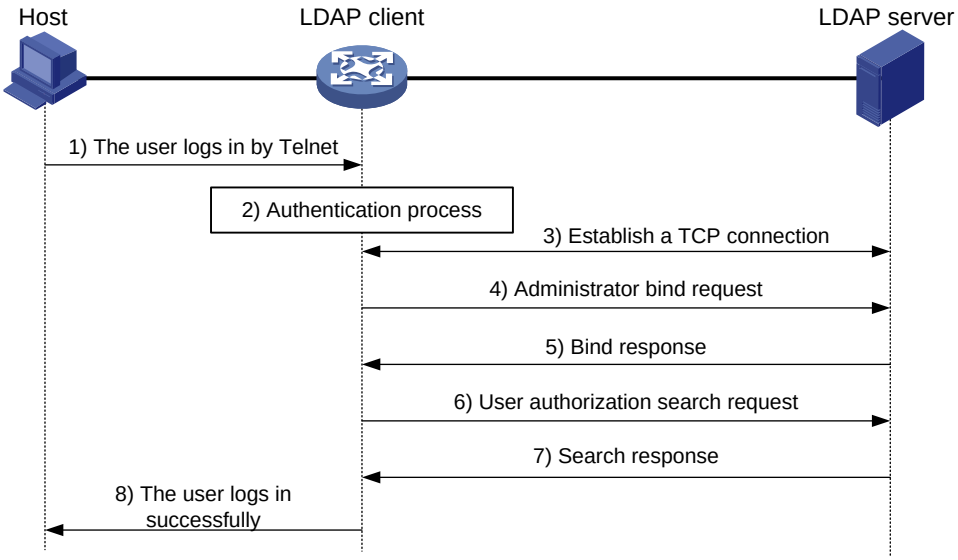
1. Uses the LDAP server administrator DN to bind with the LDAP server. After the binding is created, the client establishes a connection to the server and obtains the right to search.
2. Constructs search conditions by using the username in the authentication information of a user. The specified root directory of the server is searched and a user DN list is generated.
3. Binds with the LDAP server by using each user DN and password. If a binding is created, the user is considered legal.

In LDAP authorization, the client performs the same tasks as in LDAP authentication. When the client constructs search conditions, it obtains both authorization information and the user DN list.

Basic LDAP authentication process

The following example illustrates the basic LDAP authentication process for a Telnet user.

Figure 7 Basic LDAP authentication process for a Telnet user



The following shows the basic LDAP authentication process:

1. A Telnet user initiates a connection request and sends the username and password to the LDAP client.
2. After receiving the request, the LDAP client establishes a TCP connection with the LDAP server.
3. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
4. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.
5. The LDAP client sends a user DN search request with the username of the Telnet user to the LDAP server.
6. After receiving the request, the LDAP server searches for the user DN by the base DN, search scope, and filtering conditions. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search. There might be one or more user DNs found.
7. The LDAP client uses the obtained user DN and the entered user password as parameters to send a user DN bind request to the LDAP server. The server will check whether the user password is correct.

8. The LDAP server processes the request, and sends a response to notify the LDAP client of the bind operation result. If the bind operation fails, the LDAP client uses another obtained user DN as the parameter to send a user DN bind request to the LDAP server. This process continues until a DN is bound successfully or all DNs fail to be bound. If all user DNs fail to be bound, the LDAP client notifies the user of the login failure and denies the user's access request.
9. The LDAP client saves the user DN that has been bound and exchanges authorization packets with the authorization server.
   - If LDAP authorization is used, see the authorization process shown in Figure 8.
   - If another method is expected for authorization, the authorization process of that method applies.
10. After successful authorization, the LDAP client notifies the user of the successful login.

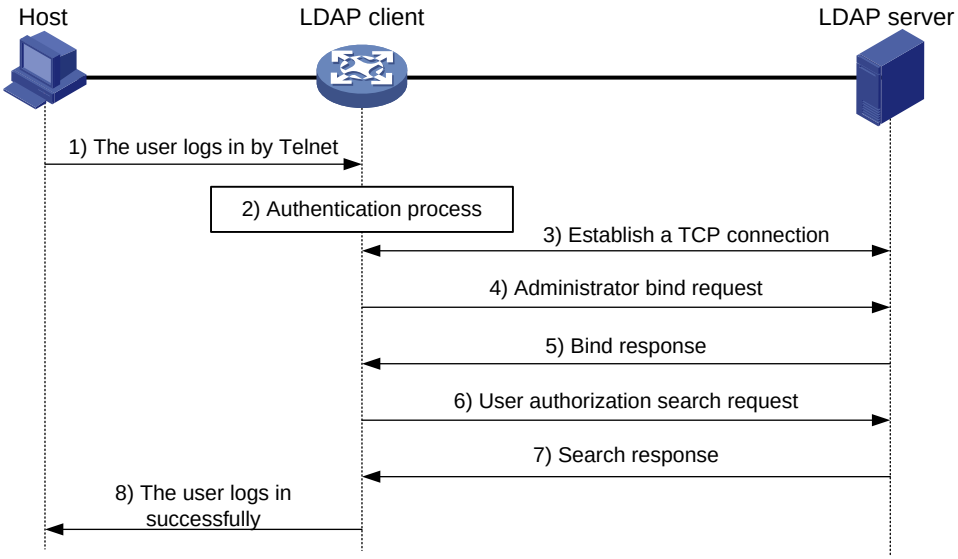


Figure 8 Basic LDAP authorization process for a Telnet user

Basic LDAP authorization process

The following example illustrates the basic LDAP authorization process for a Telnet user.

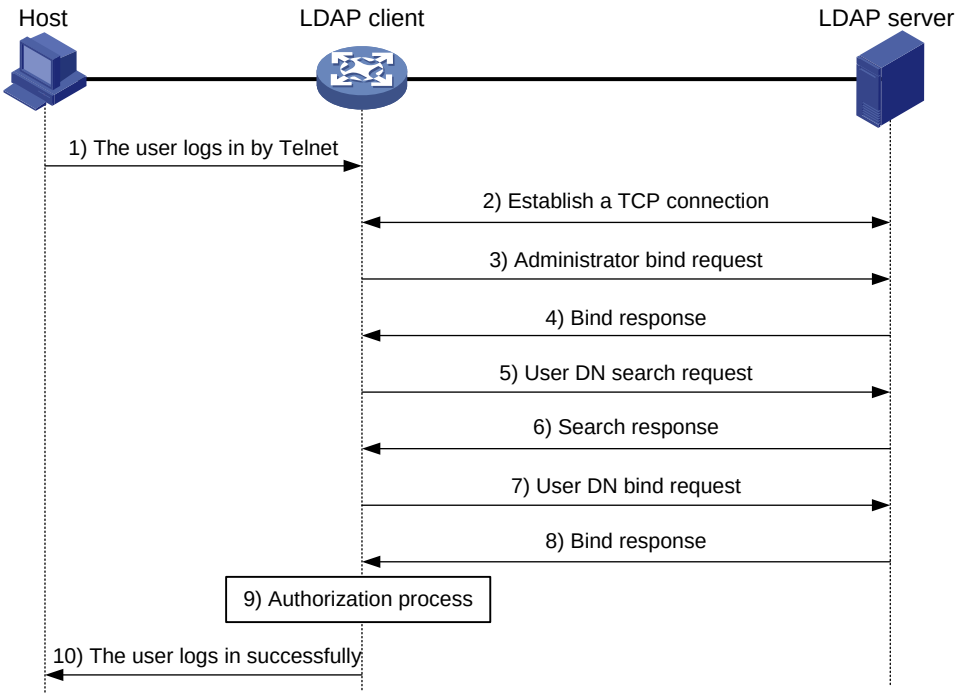

Figure 9 Basic LDAP authorization process for a Telnet user

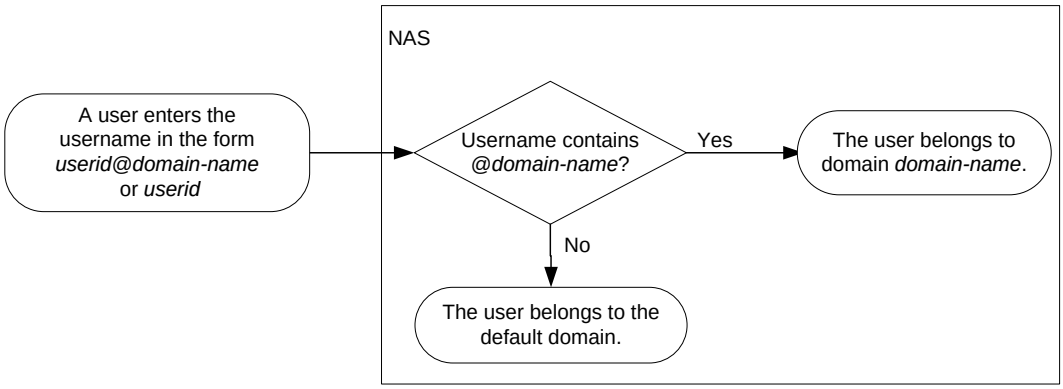
The following shows the basic LDAP authorization process:

1. A Telnet user initiates a connection request and sends the username and password to the device. The device will act as the LDAP client during authorization.
2. After receiving the request, the device exchanges authentication packets with the authentication server for the user:
   - If LDAP authentication is used, see the authentication process shown in Figure 10.
     - If the device (the LDAP client) uses the same LDAP server for authentication and authorization, skip to step 6.
     - If the device (the LDAP client) uses different LDAP servers for authentication and authorization, skip to step 4.
   - If another authentication method is used, the authentication process of that method applies. The device acts as the LDAP client. Skip to step 3.
3. The LDAP client establishes a TCP connection with the LDAP authorization server.
4. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
5. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.
6. The LDAP client sends an authorization search request with the username of the Telnet user to the LDAP server. If the user uses the same LDAP server for authentication and authorization, the client sends the request with the saved user DN of the Telnet user to the LDAP server.
7. After receiving the request, the LDAP server searches for the user information by the base DN, search scope, filtering conditions, and LDAP attributes. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search.
8. After successful authorization, the LDAP client notifies the user of the successful login.

Figure 10 Basic LDAP authentication process for a Telnet user



User management based on ISP domains and user access types

AAA manages users based on the users' ISP domains and access types.

On a NAS, each user belongs to one ISP domain. The NAS determines the ISP domain to which a user belongs based on the username entered by the user at login.

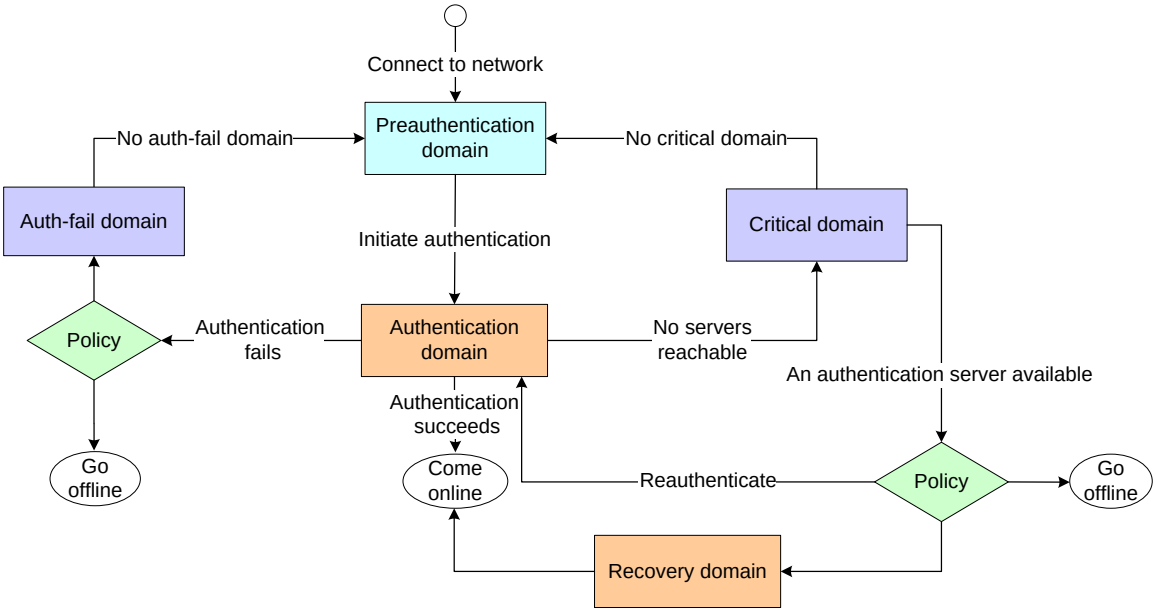
Figure 11 Determining the ISP domain for a user by username

AAA manages users in the same ISP domain based on the users' access types. The device supports the following user access types:

- **LAN**—LAN users must pass 802.1X or MAC authentication to come online.
- **Login**—Login users include SSH, Telnet, FTP, and terminal users that log in to the device. Terminal users can access through a console port.
- **Portal**—Portal users must pass portal authentication to access the network.
- **HTTP/HTTPS**—Users log in to the device through HTTP or HTTPS.

The device also provides authentication modules (such as 802.1X) for implementation of user authentication management policies. If you configure these authentication modules, the ISP domains for users of the access types depend on the configuration of the authentication modules.

The device provides the following types of ISP domains for you to control access of wired 802.1, Web authentication, and MAC authentication users to network resources at different phases of authentication:



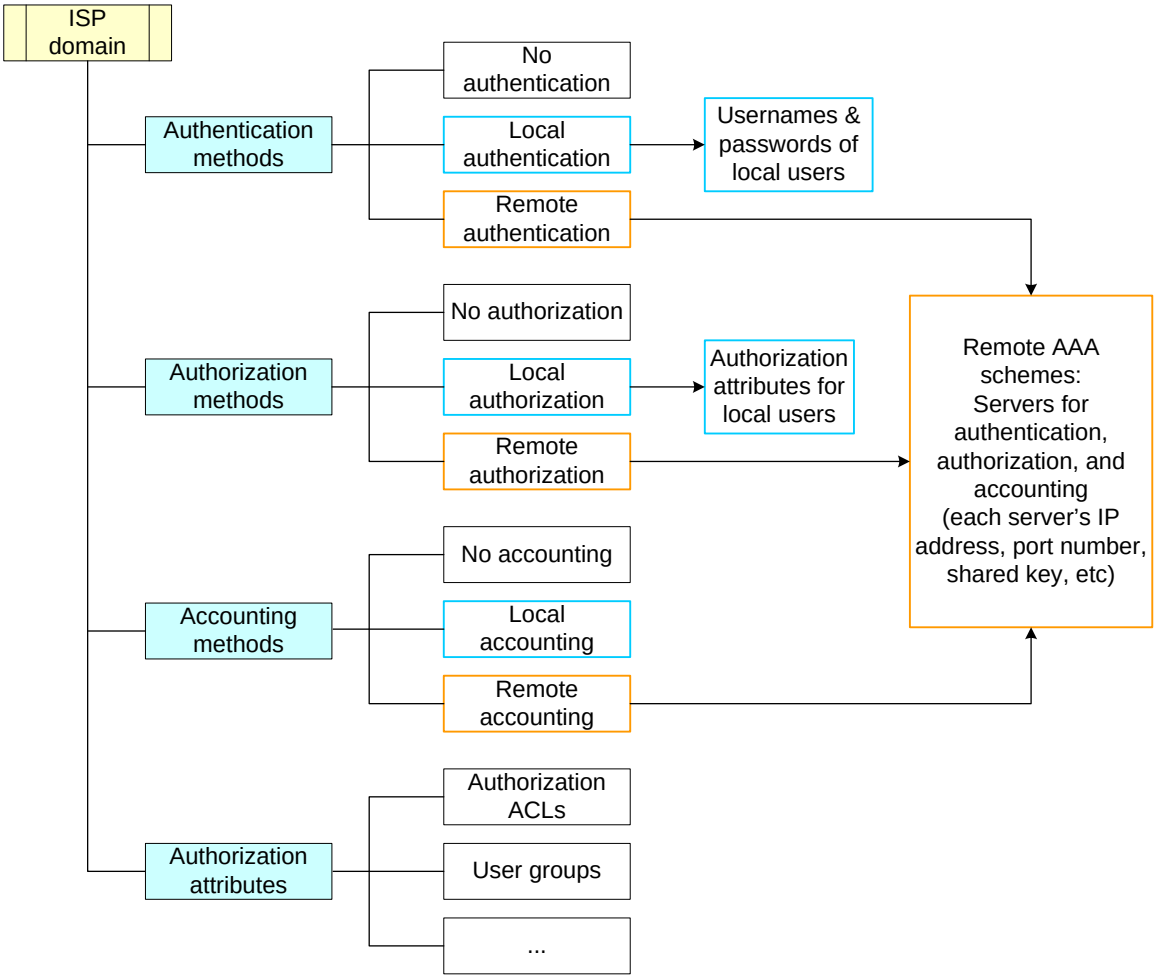
- **Preauthentication domain**—The domain to which users belong before authentication starts for them. For example, users are placed in the preauthentication domain in the following situations:
  - Before they authenticate to the network for the first time.
  - When they fail authentication in an ISP domain that does not have an auth-fail domain.
  - When no authentication servers are available, they are assigned to the specified critical domain. However, the specified critical domain does not exist.

  The preauthentication domain is applicable only to 802.1X and Web authentication users.
- **Authentication domain**—The ISP domain in which users are authenticated and come online.
- **Auth-fail domain**—The ISP domain specified to accommodate users that have failed authentication in an authentication domain.
- **Critical domain**—The ISP domain specified to accommodate users that access an authentication domain when all RADIUS servers in that authentication domain are unavailable.
- **Recovery domain**—The ISP domain to which users in the critical domain are moved after a RADIUS authentication server in their authentication domain becomes available.

IMPORTANT:

In the current version, you must specify the authentication domain as the recovery domain.

Figure 12 Movement of users between different types of ISP domains



Authentication, authorization, and accounting methods

As shown in Figure 13, an ISP domain represents a set of authentication, authorization, and accounting methods for different types of users in an ISP domain. The NAS determines the ISP domain and access type of a user. The NAS also uses the methods configured for the access type in the domain to control the user's access.

AAA also supports configuring a set of default methods for an ISP domain. These default methods are applied to users for whom no AAA methods are configured.

Figure 13 AAA configuration structure for an ISP domain

Authentication methods

The device supports the following authentication methods:

- **No authentication**—This method trusts all users and does not perform authentication. For security purposes, do not use this method.
- **Local authentication**—The NAS authenticates users by itself, based on the locally configured user information including the usernames, passwords, and attributes. Local authentication allows high speed and low cost, but the amount of information that can be stored is limited by the size of the storage space.
- **Remote authentication**—The NAS works with a remote server to authenticate users. The NAS communicates with the remote server through the RADIUS, HWTACACS, or LDAP protocol. The server manages user information in a centralized manner. Remote authentication provides high capacity, reliable, and centralized authentication services for multiple NASs. You can configure backup methods to be used when the remote server is not available.

Authorization methods

The device supports the following authorization methods:

- **No authorization**—The NAS performs no authorization exchange. The following default authorization information applies after users pass authentication:
  - Login users obtain the level-0 user role. For more information about the level-0 user role, see RBAC configuration in *Fundamentals Configuration Guide*.

    - The working directory for FTP, SFTP, and SCP login users is the root directory of the NAS. However, the users do not have permission to access the root directory.
    - Non-login users can access the network.
- **Local authorization**—The NAS performs authorization according to the user attributes locally configured for users.
- **Remote authorization**—The NAS works with a remote server to authorize users. RADIUS authorization is bound with RADIUS authentication. RADIUS authorization can work only after RADIUS authentication is successful, and the authorization information is included in the Access-Accept packet. HWTACACS or LDAP authorization is separate from authentication, and the authorization information is included in the authorization response after successful authentication. You can configure backup methods to be used when the remote server is not available.

Accounting methods

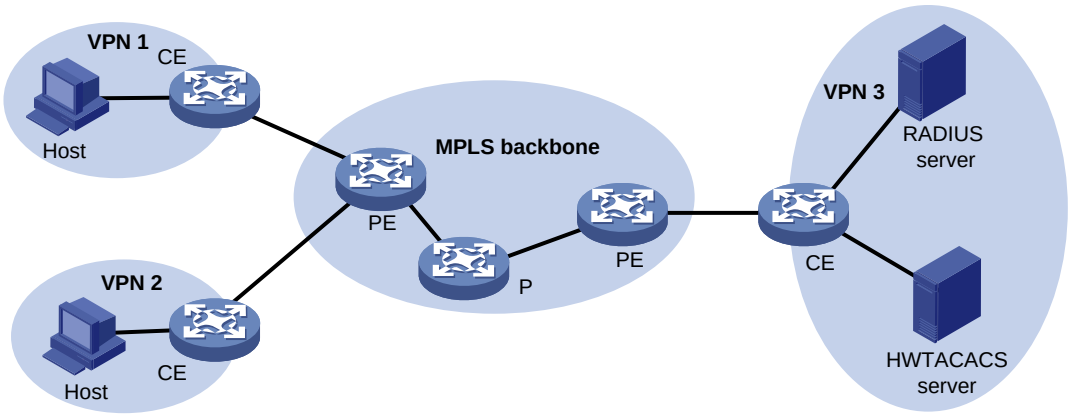
The device supports the following accounting methods:

- **No accounting**—The NAS does not perform accounting for the users.
- **Local accounting**—Local accounting is implemented on the NAS. It counts and controls the number of concurrent users that use the same local user account, but does not provide statistics for charging.
- **Remote accounting**—The NAS works with a RADIUS server or HWTACACS server for accounting. You can configure backup methods to be used when the remote server is not available.

Authorization attribute configuration methods

You can configure authorization attributes for an ISP domain on the NAS, on a server, or on both the NAS and a server. Server-assigned authorization attributes have higher priority than NAS-assigned settings. NAS-assigned attributes can take effect only if they do not conflict with server-assigned attributes. If a NAS-assigned attribute conflicts with a server-assigned attribute, the server-assigned attribute takes effect.

AAA extended functions



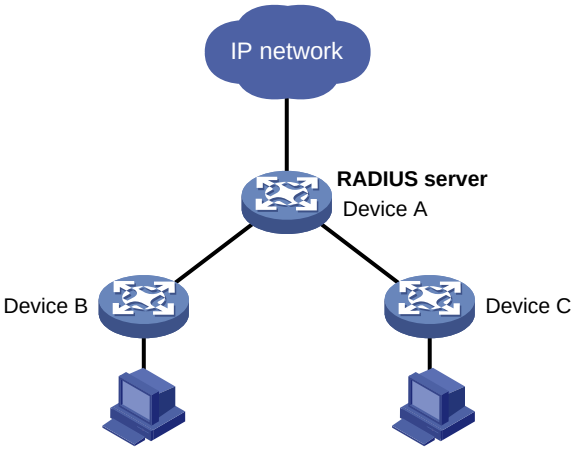
The device provides the following login services to enhance device security:

- **Command authorization**—Enables the NAS to let the authorization server determine whether a command entered by a login user is permitted. Login users can execute only commands permitted by the authorization server. For more information about command authorization, see *Fundamentals Configuration Guide*.
- **Command accounting**—When command authorization is disabled, command accounting enables the accounting server to record all valid commands executed on the device. When command authorization is enabled, command accounting enables the accounting server to record all authorized commands. For more information about command accounting, see *Fundamentals Configuration Guide*.
- **User role authentication**—Authenticates each user that wants to obtain another user role without logging out or getting disconnected. For more information about user role authentication, see *Fundamentals Configuration Guide*.

AAA for VPNs

You can deploy AAA across VPNs to enable forwarding of authentication, authorization, and accounting packets across VPNs. For example, as shown in Figure 14, the PE at the left side of the MPLS backbone acts as a NAS. The NAS transparently delivers the AAA packets of private users in VPN 1 and VPN 2 to the AAA servers in VPN 3 for centralized authentication. Authentication packets of private users in different VPNs do not affect each other.

Figure 14 Network diagram



This feature can also help an MCE to implement portal authentication for VPNs. For more information about MCE, see *MCE Configuration Guide*. For more information about portal authentication, see "Configuring portal authentication."

RADIUS server feature of the device

Enable the RADIUS server feature of the device to work with RADIUS clients for user authentication and authorization. The device can act as a dedicated RADIUS server or as both a RADIUS server and a RADIUS client at the same time.

The RADIUS server feature provides for flexible networks with less cost. As shown in Figure 15, Device A provides RADIUS server functions at the distribution layer; Device B and Device C are configured with RADIUS schemes to implement user authentication and authorization at the access layer.

Figure 15 Network diagram

The RADIUS server feature supports the following operations:

- Manages RADIUS user data, which is generated from local user information and includes user name, password, description, authorization ACL, authorization VLAN, and expiration time.
- Manages RADIUS clients. You can add, modify, and delete RADIUS clients. A RADIUS client is identified by the IP address, and it includes attribute information such as the shared key. The RADIUS server feature processes authentication requests only from the managed RADIUS clients and ignores requests from unknown clients.

- Authenticates and authorizes users of the network access type. The server does not provide accounting.

When the RADIUS server receives a RADIUS packet, it performs the following actions:

1. Verifies that the packet is sent from a managed RADIUS client.
2. Verifies the packet with the shared key.
3. Verifies that the user account exists, the password is correct, and other attributes meet the requirements (for example, the account is in the validity period).
4. Determines the authentication result and authorizes specific privileges to the authenticated user.

The RADIUS server feature of the device has the following restrictions:

- The authentication port is fixed at UDP 1812 and cannot be modified.
- The feature is supported on IPv4 networks, but not on IPv6 networks.
- The server provides only PAP and CHAP authentication methods.
- User names sent to the RADIUS server cannot include a domain name.

Protocols and standards

- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 2866, *RADIUS Accounting*
- RFC 2867, *RADIUS Accounting Modifications for Tunnel Protocol Support*
- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 3576, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 1777, *Lightweight Directory Access Protocol*
- RFC 2251, *Lightweight Directory Access Protocol (v3)*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

AAA tasks at a glance

To configure AAA, perform the following tasks:

1. Configuring AAA schemes

   If local authentication is used, configure local users and the related attributes. If remote authentication is used, configure the required RADIUS, HWTACACS, or LDAP schemes.

   - Configuring local users
   - Configuring RADIUS

- Configuring HWTACACS
- Configuring LDAP

2. Configuring an ISP domain
   a. Creating an ISP domain
   b. Configuring ISP domain attributes
3. Configuring AAA methods for an ISP domain

   Configure authentication, authorization, and accounting methods for an ISP domain as needed. These methods use existing AAA schemes.
   - Configuring authentication methods for an ISP domain
   - Configuring authorization methods for an ISP domain
   - Configuring accounting methods for an ISP domain
4. (Optional.) Configuring advanced AAA features
   - Configuring AAA fail-permit and recovery
   - Setting the maximum number of concurrent login users
   - Configuring a NAS-ID
   - Configuring the device ID
   - Enabling password change prompt logging
   - Configuring the RADIUS server feature
   - Configuring the connection recording policy
   - Displaying user MAC and UUID binding entries
   - Configuring the AAA test feature
   - Configuring authorization information cache for AAA users

Configuring local users

About local users

To implement local authentication, authorization, and accounting, create local users and configure user attributes on the device. The local users and attributes are stored in the local user database on the device. A local user is uniquely identified by the combination of a username and a user type.

Local users are classified into the following types:

- **Device management user**—User that logs in to the device for device management.
- **Network access user**—User that accesses network resources through the device.

  Network access users also include guests that access the network temporarily. Guests can use only LAN and portal services.

The following shows the configurable local user attributes:

- **Description**—Descriptive information of the user.
- **Service type**—Services that the user can use. Local authentication checks the service types of a local user. If none of the service types is available, the user cannot pass authentication.
- **User state**—Whether or not a local user can request network services. There are two user states: active and blocked. A user in active state can request network services, but a user in blocked state cannot.
- **Upper limit of concurrent logins using the same user name**—Maximum number of users that can concurrently access the device by using the same user name. When the number reaches the upper limit, no more local users can access the device by using the user name.

- **User group**—Each local user belongs to a local user group and has all attributes of the group. The attributes include the password control attributes and authorization attributes. For more information about local user group, see "Configuring user group attributes."
- **Binding attributes**—Binding attributes control the scope of users, and are checked during local authentication of a user. If the attributes of a user do not match the binding attributes configured for the local user account, the user cannot pass authentication.
- **Authorization attributes**—Authorization attributes indicate the user's rights after it passes local authentication.

  Configure the authorization attributes based on the service type of local users.

  You can configure an authorization attribute in user group view or local user view. The setting of an authorization attribute in local user view takes precedence over the attribute setting in user group view.

  The attribute configured in user group view takes effect on all local users in the user group.

  The attribute configured in local user view takes effect only on the local user.
- **Password control attributes**—Password control attributes help control password security for local users. Password control attributes include password aging time, minimum password length, password composition checking, password complexity checking, and login attempt limit.

  You can configure a password control attribute in system view, user group view, or local user view. A password control attribute with a smaller effective range has a higher priority. For more information about password management and global password configuration, see "Configuring password control."
- **Validity period**—Time period in which a network access user is considered valid for authentication.

Local user configuration tasks at a glance

To configure local users, perform the following tasks:

1. Configuring local user attributes
   - Configuring attributes for device management users
   - Configuring attributes for network access users
   - Configuring local guest attributes
2. (Optional.) Configuring user group attributes
3. (Optional.) Managing local guests
4. (Optional.) Configuring the local user auto-delete feature
5. (Optional.) Configuring SNMP notifications for local users

Configuring attributes for device management users

Restrictions and guidelines

When you configure the interface binding attribute for a device management user, follow these restrictions and guidelines to avoid authentication failure:

- Specify the actual access interface of the user as the binding interface for the user.
- Make sure the user's authentication packets include the user's access interface.

If password control is globally enabled for device management users by using the **`password-control enable`** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for device management users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **`display current-configuration`** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Procedure

1. Enter system view.

   system-view

2. Add a device management user and enter device management user view.

   local-user *user-name* **class manage**

3. Configure a password for the device management user.

   In non-FIPS mode:

   password [{ **hash** | **simple** } *string*]

   A non-password-protected user passes authentication if the user provides the correct username and passes attribute checks. To enhance security, configure a password for each device management user.

   In FIPS mode:

   password

   Only password-protected users can pass authentication. You must set the password in interactive mode for a device management user.

4. Assign services to the device management user.

   In non-FIPS mode:

   service-type { **ftp** | { **http** | **https** | **ssh** | **telnet** | **terminal** } * }

   In FIPS mode:

   service-type { **https** | **ssh** | **terminal** } *

   By default, no services are authorized to a device management user.

5. (Optional.) Set the status of the device management user.

   state { **active** | **block** }

   By default, a device management user is in active state and can request network services.

6. (Optional.) Set the upper limit of concurrent logins using the device management username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a device management user.

   This command takes effect only when local accounting is configured for device management users. This command does not apply to FTP, SFTP, or SCP users that do not support accounting.

7. (Optional.) Configure the interface binding attribute for the device management user.

   bind-attribute location interface *interface-type interface-number*

   By default, no interface binding attribute is configured for a device management user.

8. (Optional.) Configure authorization attributes for the device management user.

   authorization-attribute { **idle-cut** *minutes* | **user-role** *role-name* | **work-directory** *directory-name* } *

   The following default settings apply:

   - The working directory for FTP, SFTP, and SCP users is the root directory of the NAS. However, the users do not have permission to access the root directory.
   - The network-operator user role is assigned to the device management local users that are created by a network-admin, system-admin, or level-15 user.

9. (Optional.) Configure password control attributes for the device management user. Choose the following tasks as needed:

   - Set the password aging time.

password-control aging *aging-time*

- Set the minimum password length.
  password-control length *length*
- Configure the password composition policy.
  password-control composition type-number *type-number* [**type-length** *type-length*]
- Configure the password complexity checking policy.
  password-control complexity { **same-character** | **user-name** } **check**
- Configure the maximum login attempts and the action to take if there is a login failure.
  password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

By default, a device management user uses password control attributes of the user group to which the user belongs.

10. (Optional.) Assign the device management user to a user group.
group *group-name*
By default, a device management user belongs to user group **system**.

Configuring attributes for network access users

Restrictions and guidelines

If password control is globally enabled for network access users by using the **password-control enable network-class** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for network access users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Configure the **location** binding attribute based on the service types of users.

- For 802.1X users, specify the 802.1X-enabled Layer 2 Ethernet interfaces or Layer 2 aggregate interfaces through which the users access the device.
- For MAC authentication users, specify the MAC authentication-enabled Layer 2 Ethernet interfaces or Layer 2 aggregate interfaces through which the users access the device.
- For Web authentication users, specify the Web authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For portal users, specify the portal-enabled interfaces through which the users access the device. Specify the Layer 2 Ethernet interfaces if portal is enabled on VLAN interfaces and the **portal roaming enable** command is not used.

Procedure

1. Enter system view.
system-view

2. Add a network access user and enter network access user view.
local-user *user-name* **class network**

3. (Optional.) Configure a password for the network access user.
password { **cipher** | **simple** } *string*

4. (Optional.) Configure a description for the network access user.
description *text*

By default, no description is configured for a local user.

5. Assign services to the network access user.

   service-type { **lan-access** | **portal** }

   By default, no services are authorized to a network access user.

6. (Optional.) Set the status of the network access user.

   state { **active** | **block** }

   By default, a network access user is in active state and can request network services.

7. (Optional.) Set the upper limit of concurrent logins using the network access username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a network access user.

8. (Optional.) Configure binding attributes for the network access user.

   bind-attribute { **ip** *ip-address* | **location interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

   By default, no binding attributes are configured for a network access user.

9. (Optional.) Configure authorization attributes for the network access user.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **url** *url-string* | **vlan** *vlan-id* } *

   By default, a network access user does not have authorization attributes.

10. (Optional.) Configure password control attributes for the network access user. Choose the following tasks as needed:

    - Set the minimum password length.

      password-control length *length*

    - Configure the password composition policy.

      password-control composition type-number *type-number* [**type-length** *type-length*]

    - Configure the password complexity checking policy.

      password-control complexity { **same-character** | **user-name** } **check**

    By default, a network access user uses password control attributes of the user group to which the user belongs.

11. (Optional.) Assign the network access user to a user group.

    group *group-name*

    By default, a network access user belongs to user group **system**.

12. (Optional.) specify the validity period for the local user.

    validity-datetime { **from** *start-date start-time* **to** *expiration-date expiration-time* | **from** *start-date start-time* | **to** *expiration-date expiration-time* }

    By default, the validity period for a network access user does not expire.

Configuring local guest attributes

About this task

Create local guests and configure guest attributes to control temporary network access behavior. Guests can access the network after passing local authentication. You can configure the recipient addresses and email attribute information to the local guests and guest sponsors.

Procedure

1. Enter system view.
   system-view
2. Create a local guest and enter local guest view.
   local-user *user-name* **class network guest**
3. (Optional.) Configure a password for the local guest.
   password { **cipher** | **simple** } *string*
4. Configure basic information for the local guest. Choose the following tasks as needed:
   - Configure a description for the local guest.
     description *text*
     By default, no description is configured for a local guest.
   - Specify the name of the local guest.
     full-name *name-string*
     By default, no name is specified for a local guest.
   - Specify the company of the local guest.
     company *company-name*
     By default, no company is specified for a local guest.
   - Specify the phone number of the local guest.
     phone *phone-number*
     By default, no phone number is specified for a local guest.
   - Specify the email address of the local guest.
     email *email-string*
     By default, no email address is specified for a local guest.
   - Specify the sponsor name for the local guest.
     sponsor-full-name *name-string*
     By default, no sponsor name is specified for a local guest.
   - Specify the sponsor department for the local guest.
     sponsor-department *department-string*
     By default, no sponsor department is specified for a local guest.
   - Specify the sponsor email address for the local guest.
     sponsor-email *email-string*
     By default, no sponsor email address is specified for a local guest.
5. (Optional.) Configure the validity period for the local guest.
   validity-datetime from *start-date start-time* **to** *expiration-date expiration-time*
   By default, a local guest does not expire.
6. (Optional.) Assign the local guest to a user group.
   group *group-name*
   By default, a local guest belongs to the system-defined user group **system**.
7. (Optional.) Configure the local guest status.
   state { **active** | **block** }
   By default, a local guest is in active state and is allowed to request network services.

Configuring user group attributes

About this task

User groups simplify local user configuration and management. A user group contains a group of local users and has a set of local user attributes. You can configure local user attributes for a user group to implement centralized user attributes management for the local users in the group. Local user attributes that are manageable include authorization attributes.

Procedure

1. Enter system view.

   system-view

2. Create a user group and enter user group view.

   user-group *group-name*

   By default, a system-defined user group exists. The group name is **system**.

3. Configure authorization attributes for the user group.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **url** *url-string* | **vlan** *vlan-id* | **work-directory** *directory-name* } *

   By default, no authorization attributes are configured for a user group.

4. (Optional.) Configure password control attributes for the user group. Choose the following tasks as needed:

   - Set the password aging time.

     password-control aging *aging-time*

   - Set the minimum password length.

     password-control length *length*

   - Configure the password composition policy.

     password-control composition type-number *type-number* [**type-length** *type-length*]

   - Configure the password complexity checking policy.

     password-control complexity { **same-character** | **user-name** } **check**

   - Configure the maximum login attempts and the action to take for login failures.

     password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, a user group uses the global password control settings. For more information, see "Configuring password control."

Managing local guests

About this task

The local guest management features are for registration, approval, maintenance, and access control of local guests.

The device provides the following local guest management features:

- **Registration and approval**—The device creates local guests after the guest registration information is approved by a guest manager.

  The registration and approval processes are as follows:

  a. The device pushes the portal user registration page to a user that wants to access the network as a local guest.

b. The user submits account information for registration, including the user name, password, and email address.

c. The device forwards the registration request to the guest manager in an email notification.

d. The guest manager adds supplementary information as needed and approves the registration information.

The guest manager must process the registration request before the waiting-approval timeout timer expires. The device automatically deletes expired registration request information.

e. The device creates a local guest account and sends an email notification to the user and guest sponsor. The email contains local guest account, password, validity period, and other account information.

The user can access the network as a local guest.

- **Email notification**—The device notifies the local guests, guest sponsors, or guest managers by email of the guest account information or guest registration requests.
- **Local guest creation in batch**—Create a batch of local guests.
- **Local guest import**—Import guest account information from a .csv file to create local guests on the device based on the imported information.
- **Local guest export**—Export local guest account information to a .csv file. You can import the account information to other devices as needed.

Procedure

1. Enter system view

system-view

2. Configure the email notification feature for local guests.

a. Configure the subject and body of email notifications.

local-guest email format to { **guest** | **manager** | **sponsor** } { **body** *body-string* | **subject** *sub-string* }

By default, no subject or body is configured.

b. Configure the email sender address in the email notifications sent by the device for local guests.

local-guest email sender *email-address*

By default, no email sender address is configured for the email notifications sent by the device.

c. Specify an SMTP server for sending email notifications of local guests.

local-guest email smtp-server *url-string*

By default, no SMTP server is specified.

3. Configure the guest manager's email address.

local-guest manager-email *email-address*

By default, the guest manager's email address is not configured.

4. (Optional.) Set the waiting-approval timeout timer for guest registration requests.

local-guest timer waiting-approval *time-value*

By default, the waiting-approval timeout timer for guest registration requests is 24 hours.

5. (Optional.) Create local guests in batch.

local-guest generate username-prefix *name-prefix* [**password-prefix** *password-prefix*] **suffix** *suffix-number* [**group** *group-name*] **count** *user-count* **validity-datetime** *start-date start-time* **to** *expiration-date expiration-time*

Batch generated local guests share the same name prefix. You can also configure a password prefix to be shared by the guests.

6. (Optional.) Import guest account information from a .csv file in the specified path to create local guests based on the imported information.

   local-user-import class network guest url *url-string* **validity-datetime** *start-date start-time* **to** *expiration-date expiration-time* [**auto-create-group** | **override** | **start-line** *line-number*] *

7. (Optional.) Export local guest account information to a .csv file in the specified path.

   local-user-export class network guest url *url-string*

8. (Optional.) Send email notifications to the local guest or the guest sponsor.

   a. Return to user view.

      quit

   b. Send email notifications to the local guest or the guest sponsor. The email contents include the user name, password, and validity period of the guest account.

      local-guest send-email user-name *user-name* **to** { **guest** | **sponsor** }

Configuring the local user auto-delete feature

About this task

This feature enables the device to examine the validity of local users at fixed time periods of 10 minutes and automatically delete expired local users.

Procedure

1. Enter system view

   system-view

2. Enable the local user auto-delete feature.

   local-user auto-delete enable

   By default, the local user auto-delete feature is disabled.

Configuring SNMP notifications for local users

About this task

With SNMP notifications enabled for password changes of local users, the system generates alarms when one of the following cases occurs:

- The password of a local user is configured or changed from the CLI.
- The password of a local user is changed through NETCONF or MIB.
- The password of a portal user is changed online on the login page.

For RADIUS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view

   system-view

2. Enable SNMP notifications for password changes of local users.

   snmp-agent trap enable local-server [**manage-password-change** | **network-password-change**] *

By default, all SNMP notifications are disabled for password changes of local users.

Display and maintenance commands for local users and local user groups

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display pending registration requests for local guests.	**display local-guest waiting-approval** [**user-name** *user-name*]
Display the local user configuration and online user statistics.	**display local-user** [**class** { **manage** | **network** [**guest**] } | **idle-cut** { **disable** | **enable** } | **service-type** { **ftp** | **http** | **https** | **lan-access** | **portal** | **ssh** | **telnet** | **terminal** } | **state** { **active** | **block** } | **user-name** *user-name* **class** { **manage** | **network** [**guest**] } | **vlan** *vlan-id*]
Display user group configuration.	**display user-group** { **all** | **name** *group-name* }
Clear pending registration requests for local guests.	**reset local-guest waiting-approval** [**user-name** *user-name*]

Configuring RADIUS

RADIUS tasks at a glance

To configure RADIUS, perform the following tasks:

1. Configuring an EAP profile

   To perform EAP-based RADIUS server status detection, you must configure an EAP profile and specify the EAP profile in a test profile.
2. Configuring a test profile for RADIUS server status detection

   To detect the status of a RADIUS server, you must configure a test profile and configure the RADIUS server to use the test profile in a RADIUS scheme.
3. Creating a RADIUS scheme
4. Specifying RADIUS authentication servers
5. Specifying the RADIUS accounting servers
6. Specifying the shared keys for secure RADIUS communication

   Perform this task if no shared keys are specified when configuring RADIUS authentication or accounting servers.
7. Specifying the MPLS L3VPN instance for a RADIUS scheme

   Perform this task if no MPLS L3VPN instances are specified when configuring RADIUS authentication or accounting servers.
8. (Optional.) Setting the status of RADIUS servers
9. (Optional.) Setting RADIUS timers
10. (Optional.) Configuring parameters for RADIUS packets
    - Specifying the source IP address for outgoing RADIUS packets

- Setting the username format and traffic statistics units
- Setting the maximum number of RADIUS request transmission attempts
- Setting the maximum number of real-time accounting attempts
- Setting the DSCP priority for RADIUS packets

11. (Optional.) Configuring parameters for RADIUS attributes
    - Configuring the format of the RADIUS NAS-Port attribute
    - Configuring the Login-Service attribute check method for SSH, FTP, and terminal users
    - Interpreting the RADIUS class attribute as CAR parameters
    - Configuring the MAC address format for the RADIUS Called-Station-Id attribute
    - Configuring the MAC address format for the RADIUS Calling-Station-Id attribute
    - Configuring the format of RADIUS attribute 87
    - Setting the data measurement unit for the Remanent_Volume attribute
    - Configuring the RADIUS attribute translation feature
12. (Optional.) Configuring extended RADIUS features
    - Configuring RADIUS stop-accounting packet buffering
    - Enabling forcibly sending stop-accounting packets
    - Enabling the RADIUS server load sharing feature
    - Specifying a RADIUS server selection mode for reauthentication
    - Configuring the RADIUS accounting-on feature
    - Configuring the RADIUS session-control feature
    - Configuring the RADIUS DAS feature
    - Configuring the device to preferentially process RADIUS authentication requests
    - Enabling SNMP notifications for RADIUS
    - Disabling the RADIUS service

Restrictions and guidelines for RADIUS configuration

If the authentication server in a RADIUS scheme is provided by the RADIUS server feature on the device, you need to configure only the following items for the RADIUS scheme:

- RADIUS authentication server.
- Shared key for RADIUS communication.
- Username format for interaction with the RADIUS server.

Configuring an EAP profile

About this task

An EAP profile is a collection of EAP authentication settings, including the EAP authentication method and the CA certificate file to be used for some EAP authentication methods.

Restrictions and guidelines

You can specify an EAP profile in multiple test profiles.

You can configure a maximum of 16 EAP profiles.

Prerequisites

Before you specify a CA certificate file, use FTP or TFTP to transfer the CA certificate file to the root directory of the default storage medium on the device.

In an IRF fabric, make sure the CA certificate file exists in the root directory of the default storage medium on the master device before you specify the file.

Procedure

1. Enter system view.

   system-view

2. Create an EAP profile and enter EAP profile view.

   eap-profile *eap-profile-name*

3. Specify the EAP authentication method.

   method { **md5** | **peap-gtc** | **peap-mschapv2** | **ttls-gtc** | **ttls-mschapv2** }

   By default, the EAP authentication method is MD5-challenge.

4. Specify a CA certificate file for EAP authentication.

   ca-file *file-name*

   By default, no CA certificate file is specified for EAP authentication.

   You must specify a CA certificate file to verify the RADIUS server certificate if the EAP authentication method is PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, or TTLS-MSCHAPv2.

Configuring a test profile for RADIUS server status detection

About this task

To detect the reachability or availability of a RADIUS authentication server, specify a test profile for the RADIUS server when you specify the server in a RADIUS scheme. With the test profile, the device refreshes the RADIUS server status at each detection interval according to the detection result. If the server is unreachable or unavailable, the device sets the status of the server to blocked. If the server is reachable or available, the device sets the status of the server to active.

The device supports the following RADIUS server status detection methods:

- **Simple detection**—For a RADIUS server, the device simulates an authentication request with the username and password specified in the test profile used by the server. The authentication request is sent to the RADIUS server within each detection interval. The device determines that the RADIUS server is reachable if the device receives a response from the server within the interval.
- **EAP-based detection**—For a RADIUS server, the device simulates an EAP authentication with the username and password specified in the test profile used by the server. The simulated EAP authentication starts at the beginning of each detection interval. If the EAP authentication completes within a detection interval, the device determines that the RADIUS server is available.

Simulating a complete EAP authentication process, EAP-based detection provides more reliable detection results than simple detection. As a best practice, configure EAP-based detection on a network environment where EAP authentication is configured.

Restrictions and guidelines

You can configure multiple test profiles in the system.

The device starts detecting the status of a RADIUS authentication server only if an existing test profile is specified for the server.

If you specify a nonexistent EAP profile in a test profile, the device performs simple detection for the RADIUS servers that use the test profile. After the EAP profile is configured, the device will start EAP-based detection at the next detection interval.

The device stops detecting the status of a RADIUS server when one of the following operations is performed:

- The RADIUS server is removed from the RADIUS scheme.

- The test profile configuration for the RADIUS server is removed in RADIUS scheme view.
- The test profile specified for the RADIUS server is deleted.
- The RADIUS server is manually set to the blocked state.
- The RADIUS scheme that contains the RADIUS server is deleted.

Procedure

1. Enter system view.
   system-view
2. Configure a test profile for detecting the status of RADIUS authentication servers.
   radius-server test-profile *profile-name* **username** *name* [**password** { **cipher** | **simple** } *string*] [**interval** *interval*] [**confirm** | **eap-profile** *eap-profile-name*]

Creating a RADIUS scheme

Restrictions and guidelines

You can configure a maximum of 16 RADIUS schemes. A RADIUS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.
   system-view
2. Create a RADIUS scheme and enter RADIUS scheme view.
   radius scheme *radius-scheme-name*

Specifying RADIUS authentication servers

About this task

A RADIUS authentication server completes authentication and authorization together, because authorization information is piggybacked in authentication responses sent to RADIUS clients.

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unreachable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an authentication request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS authentication server can function as the primary authentication server for one scheme and a secondary authentication server for another scheme at the same time.

Two authentication servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.
   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS authentication server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS authentication servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the RADIUS accounting servers

About this task

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unavailable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an accounting request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS accounting server can function as the primary accounting server for one scheme and a secondary accounting server for another scheme at the same time.

Two accounting servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

RADIUS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS accounting server.

   primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS accounting server is specified.

The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS accounting server.

   secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS accounting servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the shared keys for secure RADIUS communication

About this task

The RADIUS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

A key configured in this task is for all servers of the same type (accounting or authentication) in the scheme. The key has a lower priority than a key configured individually for a RADIUS server.

Restrictions and guidelines

The shared key configured on the device must be the same as the shared key configured on the RADIUS server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a shared key for secure RADIUS communication.

   key { **accounting** | **authentication** } { **cipher** | **simple** } *string*

   By default, no shared key is specified for secure RADIUS communication.

Specifying the MPLS L3VPN instance for a RADIUS scheme

About this task

The VPN instance specified for a RADIUS scheme applies to all authentication and accounting servers in that scheme. If a VPN instance is also configured for an individual RADIUS server, the VPN instance specified for the RADIUS scheme does not take effect on that server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a VPN instance for the RADIUS scheme.

   vpn-instance *vpn-instance-name*

   By default, a RADIUS scheme belongs to the public network.

Setting the status of RADIUS servers

About this task

To control the RADIUS servers with which the device communicates when the current servers are no longer available, set the status of RADIUS servers to blocked or active. You can specify one primary RADIUS server and multiple secondary RADIUS servers. The secondary servers function as the backup of the primary server. When the RADIUS server load sharing feature is disabled, the device chooses servers based on the following rules:

- When the primary server is in active state, the device first tries to communicate with the primary server. If the primary server is unreachable, the device searches for an active secondary server in the order the servers are configured.
- When one or more servers are in active state, the device tries to communicate with these active servers only, even if the servers are unavailable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If a server is unreachable, the device performs the following operations:
  - Changes the server status to blocked.
  - Starts a quiet timer for the server.
  - Tries to communicate with the next secondary server in active state that has the highest priority.
- When the quiet timer of a server expires or you manually set the server to the active state, the status of the server changes back to active. The device does not check the server again during the authentication or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is reachable, the device considers the authentication or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When a RADIUS server's status changes automatically, the device changes this server's status accordingly in all RADIUS schemes in which this server is specified.
- When a RADIUS server is manually set to blocked, server detection is disabled for the server, regardless of whether a test profile has been specified for the server. When the RADIUS server is set to active state, server detection is enabled for the server on which an existing test profile is specified.

By default, the device sets the status of all RADIUS servers to active. However, in some situations, you must change the status of a server. For example, if a server fails, you can change the status of the server to blocked to avoid communication attempts to the server.

Restrictions and guidelines

The configured server status cannot be saved to any configuration file, and can only be viewed by using the **`display radius scheme`** command.

After the device restarts, all servers are restored to the active state.

The device selects a reachable server for the authentication or accounting of a new user according to the server selection rules in this section if the RADIUS server load sharing feature is disabled. However, these rules are inapplicable to the reauthentication of online users if the RADIUS server selection mode for reauthentication is set to inherit by using the **`reauthentication server-select inherit`** command.

Procedure

1. Enter system view.

system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the RADIUS server status. Choose the following tasks as needed:

   - Set the status of the primary RADIUS authentication server.

     state primary authentication { **active** | **block** }

   - Set the status of the primary RADIUS accounting server.

     state primary accounting { **active** | **block** }

   - Set the status of a secondary RADIUS authentication server.

     state secondary authentication [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }

   - Set the status of a secondary RADIUS accounting server.

     state secondary accounting [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }

   By default, a RADIUS server is in active state.

Setting RADIUS timers

About this task

The device uses the following types of timers to control communication with a RADIUS server:

- **Server response timeout timer** (**response-timeout**)—Defines the RADIUS request retransmission interval. The timer starts immediately after a RADIUS request is sent. If the device does not receive a response from the RADIUS server before the timer expires, it resends the request.
- **Server quiet timer** (**quiet**)—Defines the duration to keep an unreachable server in blocked state. If one server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.
- **Real-time accounting timer** (**realtime-accounting**)—Defines the intervals at which the device sends real-time accounting packets to the RADIUS accounting server for online users.

Restrictions and guidelines

Consider the number of secondary servers when you configure the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer. If the RADIUS scheme includes many secondary servers, the retransmission process might be too long and the client connection in the access module, such as Telnet, can time out.

When the client connections have a short timeout period, a large number of secondary servers can cause the initial authentication or accounting attempt to fail. In this case, reconnect the client rather than adjusting the RADIUS packet transmission attempts and server response timeout timer. Typically, the next attempt will succeed, because the device has blocked the unreachable servers to shorten the time to find a reachable server.

Make sure the server quiet timer is set correctly. A timer that is too short might result in frequent authentication or accounting failures. This is because the device will continue to attempt to communicate with an unreachable server that is in active state. A timer that is too long might temporarily block a reachable server that has recovered from a failure. This is because the server will remain in blocked state until the timer expires.

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set the interval to 15 minutes or longer.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set RADIUS timers. Choose the following tasks as needed:
   - Set the RADIUS server response timeout timer.
     timer response-timeout *seconds*
     The default setting is 3 seconds.
   - Set the quiet timer for the servers.
     timer quiet *minutes*
     The default setting is 5 minutes.
   - Set the real-time accounting timer.
     timer realtime-accounting *interval* [**second**]
     The default setting is 12 minutes.

Specifying the source IP address for outgoing RADIUS packets

About this task

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS configured on the RADIUS server. A RADIUS server identifies a NAS by its IP address. Upon receiving a RADIUS packet, the RADIUS server checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending a RADIUS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the RADIUS scheme.
2. The source IP address specified in system view for the VPN or public network, depending on where the RADIUS server resides.
3. The IP address of the outbound interface specified by the route.

In an M-LAG system, you must specify the source IP address for outgoing RADIUS packets on both the M-LAG member devices. Each M-LAG member device selects a source IP address in order as described previously. To make user traffic switchover caused by primary/secondary M-LAG member device switchover transparent to the RADIUS server, the source IP address of outgoing RADIUS packets must remain unchanged after switchover. You must specify the source IP address depending on the load sharing mode for user authentication on M-LAG interfaces:

- In centralized mode, you must specify the same source IP address on both the M-LAG member devices.

  When an M-LAG member device fails, the active M-LAG member device uses the source IP address for outgoing RADIUS packets sent for users authenticated on the failed M-LAG member device.
- In distributed mode, use either of the following methods to specify source IP addresses for outgoing RADIUS packets:
  - Specify different source addresses on the M-LAG member devices. The M-LAG member devices will automatically advertise their source addresses to each other.

- Specify a local and peer source IP address pair on both of the M-LAG member devices. Make sure the peer source IP address on one M-LAG member device is the local IP address on the other M-LAG member device.

When one M-LAG member device fails, the other member device uses the automatically obtained or manually configured peer source IP address to send RADIUS packets for users authenticated on the failed member device.

Restrictions and guidelines for source IP address configuration

You can specify a source IP address for outgoing RADIUS packets in RADIUS scheme view or in system view.

- The IP address specified in RADIUS scheme view applies only to one RADIUS scheme.
- The IP address specified in system view applies to all RADIUS schemes.

The source IP address of RADIUS packets that a NAS sends must match the IP address of the NAS that is configured on the RADIUS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing RADIUS packets to avoid RADIUS packet loss caused by physical port errors.

The source address of outgoing RADIUS packets is typically the IP address of an egress interface on the NAS to communicate with the RADIUS server. However, in some situations, you must change the source IP address. For example, when VRRP is configured for stateful failover, configure the virtual IP of the uplink VRRP group as the source address.

You can directly specify a source IP address for outgoing RADIUS packets or specify a source interface to provide the source IP address for outgoing RADIUS packets. The source interface configuration and the source IP address configuration overwrite each other.

In an M-LAG system, you must specify a virtual IP address for the M-LAG system as the source IP address of RADIUS packets. For more information about virtual IP addresses for the M-LAG system, see M-LAG configuration in *Layer 2—LAN Switching Configuration Guide*.

S5200-EI-G series switches do not support M-LAG-related functions and parameters.

Specifying a source interface or source IP address for all RADIUS schemes

1. Enter system view.

   system-view

2. Specify a source interface or source IP address for outgoing RADIUS packets.

   radius nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

   By default, the source IP address of an outgoing RADIUS packet is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for a RADIUS scheme

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a source interface or source IP address for outgoing RADIUS packets.

   nas-ip [**m-lag** { **local** | **peer** }] { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing RADIUS packet is that specified by using the **radius nas-ip** command in system view. If the **radius nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

The **m-lag** { **local** | **peer** } parameters are applicable only to an M-LAG system. Specify a source IP address for outgoing RADIUS packets on each M-LAG member device as follows, depending on the load sharing mode for user authentication on M-LAG interfaces:

- In centralized mode, execute the **nas-ip** command with or without the **m-lag local parameters to specify the local source IP address. The two methods have the same result except that you must use the same method on both devices.**
- In distributed mode, execute the **nas-ip** command with the **m-lag local parameters and with the m-lag peer parameters to specify the local and peer source IP addresses, respectively. Alternatively,** execute the **nas-ip** command with or without the **m-lag local parameters to specify the local source IP address. These methods have the same result, except that you must use the same method on both devices.**

If you do not specify the keywords, the system does not send accounting-on packets when the device restarts.

Setting the username format and traffic statistics units

About this task

A username is in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. However, older RADIUS servers might not recognize usernames that contain the ISP domain names. In this case, you can configure the device to remove the domain name of each username to be sent.

The device reports online user traffic statistics in accounting packets. The traffic measurement units are configurable.

Restrictions and guidelines

If two or more ISP domains use the same RADIUS scheme, configure the RADIUS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic statistics units configured on the device and on the RADIUS accounting servers are the same.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Set the format for usernames sent to the RADIUS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

   By default, the ISP domain name is included in a username.

   If the device is specified as the RADIUS server in the scheme, the username format must be set to **without-domain**.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Setting the maximum number of RADIUS request transmission attempts

About this task

RADIUS uses UDP packets to transfer data. Because UDP communication is not reliable, RADIUS uses a retransmission mechanism to improve reliability. A RADIUS request is retransmitted if the NAS does not receive a server response for the request within the response timeout timer. For more information about the RADIUS server response timeout timer, see "Setting the status of RADIUS servers."

You can set the maximum number for the NAS to retransmit a RADIUS request to the same server. When the maximum number is reached, the NAS tries to communicate with other RADIUS servers in active state. If no other servers are in active state at the time, the NAS considers the authentication or accounting attempt a failure.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the maximum number of RADIUS request transmission attempts.
   retry *retries*
   By default, the maximum number is 3 for RADIUS request transmission attempts.

Setting the maximum number of real-time accounting attempts

About this task

If you set the maximum number of real-time accounting attempts, the device will disconnect users from whom no accounting responses are received within the permitted attempts.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the maximum number of real-time accounting attempts.
   retry realtime-accounting *retries*
   By default, the maximum number is 5 for real-time accounting attempts.

Setting the DSCP priority for RADIUS packets

About this task

DSCP priority determines the transmission priority of RADIUS packets. A larger value represents a higher priority. DSCP priority is contained in the ToS field of the IPv4 header and in the Traffic Class field of the IPv6 header.

Procedure

1. Enter system view.
   system-view
2. Set the DSCP priority for RADIUS packets.
   radius [**ipv6**] **dscp** *dscp-value*
   By default, the DSCP priority is 0 for RADIUS packets.

Configuring the format of the RADIUS NAS-Port attribute

About this task

The device supports the following formats for the RADIUS NAS-Port attribute (attribute 5):

- **Default format**—Contains the following portions:
  - 8-bit IRF member ID.
  - 4-bit slot number.
  - 8-bit interface index.
  - 12-bit VLAN ID.
- **Port format**—Contains the last segment for the interface number of the interface through which a user accesses the device. For example, if a user accesses the device through GigabitEthernet 1/0/2, 2 is used as the value for the RADIUS NAS-Port attribute.

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the format of the NAS-Port attribute. To ensure correct RADIUS packet exchange, make sure the format of the NAS-Port attribute meets the requirements of the RADIUS servers.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Configure the format of the RADIUS NAS-Port attribute as the port format.
   attribute 5 format port
   By default, the RADIUS NAS-Port attribute uses the default format.

Configuring the Login-Service attribute check method for SSH, FTP, and terminal users

About this task

The Login-Service attribute (RADIUS attribute 15) identifies the service that can be used to connect a user to the device. For example, a value of 0 represents the Telnet service. This attribute is contained in the Access-Accept message sent from the RADIUS server to the device. To log in to the device, the access service type of a RADIUS authentication user must match the Login-Service attribute value in the Access-Accept message.

The RADIUS standards do not assign a Login-Service attribute value for the SSH, FTP, HTTP, HTTPS, or terminal users. To perform service type consistency checks for these types of login users, H3C defines the extended Login-Service attribute values in Table 3.

Table 3 Extended Login-Service attribute values

Attribute value	Service type
50	SSH
51	**FTP**
52	**Terminal**
53	**HTTP**
54	**HTTPS**

The device provides the following Login-Service attribute check methods:

- **Strict**—Checks the service types of login users based on the standard and extended attribute values. SSH, FTP, HTTP, HTTPS, and terminal users can pass the check only if the Access-Accept messages for them contain the extended Login-Service attribute values specified for them.
- **Loose**—Checks the service types of login users based only on the standard attribute values. SSH, FTP, HTTP, HTTPS, and terminal users pass the check if the attribute value is 0.

Restrictions and guidelines

Use the loose check method if the server does not issue the extended Login-Service attribute values for SSH, FTP, HTTP, HTTPS, and terminal users.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Configure the Login-Service attribute check method for SSH, FTP, and terminal users.
   attribute 15 check-mode { **loose** | **strict** }
   The default check method is strict.

Interpreting the RADIUS class attribute as CAR parameters

About this task

A RADIUS server may deliver CAR parameters for user-based traffic monitoring and control by using the RADIUS class attribute (attribute 25) in RADIUS packets. You can configure the device to interpret the class attribute to CAR parameters.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Interpret the RADIUS class attribute as CAR parameters.
   attribute 25 car
   By default, the RADIUS class attribute is not interpreted as CAR parameters.

Configuring the MAC address format for the RADIUS Called-Station-Id attribute

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the MAC address format in the RADIUS Called-Station-Id attribute (attribute 30). Configure the MAC address format for this attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the MAC address format for the RADIUS Called-Station-Id attribute.

   attribute 30 mac-format section { **one** | { **six** | **three** } **separator** *separator-character* } { **lowercase** | **uppercase** }

   By default, the MAC address in the RADIUS Called-Station-Id attribute is in the format of HH-HH-HH-HH-HH-HH. The MAC address is separated by hyphen (-) into six sections with letters in upper case.

Configuring the MAC address format for the RADIUS Calling-Station-Id attribute

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the MAC address format in the RADIUS Calling-Station-Id attribute (attribute 31). Configure the MAC address format for this attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Configure the MAC address format for the RADIUS Calling-Station-Id attribute.

   attribute 31 mac-format section { **one** | { **six** | **three** } **separator** *separator-character* } { **lowercase** | **uppercase** }

   By default, the MAC address in the RADIUS Calling-Station-Id attribute is in the format of HH-HH-HH-HH-HH-HH. The MAC address is separated by hyphen (-) into six sections with letters in upper case.

Configuring the format of RADIUS attribute 87

About this task

RADIUS attribute 87 is the NAS-Port-Id attribute. This attribute has the following format types:

- **Default format**—The default format varies by user access type.
  - For portal users, the NAS-Port-Id attribute in this format contains the following portions:
    - 2-bit slot number.

        - 2-bit 0s.
        - 3-bit interface index.
        - 9-bit VLAN ID.
      - For 802.1X and MAC authentication users, the NAS-Port-Id attribute is in the format of **slot=***xx***;subslot=***xx***;port=***xx***;vlanid=***xx*.
        - **slot**—IRF member ID.
        - **subslot**—Slot number.
        - **port**—Interface index.
        - **vlanid**—VLAN ID.
      - For login users, the NAS-Port-Id attribute is not included in RADIUS packets.
- **Interface name format**—Contains the name of the interface through which a user accesses the device. For example, if a user accesses the device through GigabitEthernet 1/0/1, GigabitEthernet 1/0/1 is used as the value for the RADIUS NAS-Port-Id attribute.

Restrictions and guidelines

RADIUS servers of different types might have different requirements for the format of the NAS-Port-Id attribute. To ensure correct RADIUS packet exchange, configure the format of the NAS-Port-Id attribute to meet the requirements of the RADIUS servers.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Configure the format of RADIUS attribute 87 as the interface name format.
   attribute 87 format interface-name
   By default, the default format is used for RADIUS attribute 87.

Setting the data measurement unit for the Remanent_Volume attribute

About this task

The RADIUS server uses the Remanent_Volume attribute in authentication or real-time accounting responses to notify the device of the current amount of data available for online users.

Restrictions and guidelines

Make sure the configured measurement unit is the same as the user data measurement unit on the RADIUS server.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Set the data measurement unit for the Remanent_Volume attribute.
   attribute remanent-volume unit { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** }
   By default, the data measurement unit is kilobyte.

Configuring the RADIUS attribute translation feature

About this task

The RADIUS attribute translation feature enables the device to work correctly with the RADIUS servers of different vendors that support RADIUS attributes incompatible with the device.

RADIUS attribute translation has the following implementations:

- **Attribute conversion**—Converts source RADIUS attributes into destination RADIUS attributes based on RADIUS attribute conversion rules.
- **Attribute rejection**—Rejects RADIUS attributes based on RADIUS attribute rejection rules.

When the RADIUS attribute translation feature is enabled, the device processes RADIUS packets as follows:

- For the sent RADIUS packets:
  - Deletes the rejected attributes from the packets.
  - Uses the destination RADIUS attributes to replace the attributes that match RADIUS attribute conversion rules in the packets.
- For the received RADIUS packets:
  - Ignores the rejected attributes in the packets.
  - Interprets the attributes that match RADIUS attribute conversion rules as the destination RADIUS attributes.

To identify proprietary RADIUS attributes, you can define the attributes as extended RADIUS attributes, and then convert the extended RADIUS attributes to device-supported attributes.

Restrictions and guidelines for RADIUS attribute translation configuration

Configure either conversion rules or rejection rules for a RADIUS attribute.

Configure either direction-based rules or packet type-based rules for a RADIUS attribute.

For direction-based translation of a RADIUS attribute, you can configure a rule for each direction (inbound or outbound). For packet type-based translation of a RADIUS attribute, you can configure a rule for each RADIUS packet type (RADIUS Access-Accept, RADIUS Access-Request, or RADIUS accounting).

Configuring the RADIUS attribute translation feature for a RADIUS scheme

1. Enter system view.

   system-view

2. (Optional.) Define an extended RADIUS attribute.

   radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute reject rule. Choose the following tasks as needed:
   - Configure a RADIUS attribute conversion rule.

     attribute convert *src-attr-name* **to** *dest-attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

By default, no RADIUS attribute conversion rules are configured.

- Configure a RADIUS attribute rejection rule.

  attribute reject *attr-name* { { **access-accept** | **access-request** | **accounting** } * | { **received** | **sent** } * }

  By default, no RADIUS attribute rejection rules are configured.

Configuring the RADIUS attribute translation feature for a RADIUS DAS

1. Enter system view.

   system-view

2. (Optional.) Define an extended RADIUS attribute.

   radius attribute extended *attribute-name* [**vendor** *vendor-id*] **code** *attribute-code* **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** }

3. Enter RADIUS DAS view.

   radius dynamic-author server

4. Enable the RADIUS attribute translation feature.

   attribute translate

   By default, this feature is disabled.

5. Configure a RADIUS attribute conversion rule or a RADIUS attribute rejection rule. Choose the following tasks as needed:

   - Configure a RADIUS attribute conversion rule.

     attribute convert *src-attr-name* **to** *dest-attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute conversion rules are configured.

   - Configure a RADIUS attribute rejection rule.

     attribute reject *attr-name* { { **coa-ack** | **coa-request** } * | { **received** | **sent** } * }

     By default, no RADIUS attribute rejection rules are configured.

Configuring RADIUS stop-accounting packet buffering

About this task

The device sends RADIUS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer RADIUS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of transmission attempts that can be made for individual RADIUS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable buffering of RADIUS stop-accounting requests to which no responses have been received.

stop-accounting-buffer enable

By default, the buffering feature is enabled.

4. (Optional.) Set the maximum number of transmission attempts for individual RADIUS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 500.

Enabling forcibly sending stop-accounting packets

About this task

Typically, if the device does not send a start-accounting packet to the RADIUS server for an authenticated user, it does not send a stop-accounting packet when the user goes offline. If the server has generated a user entry for the user without start-accounting packets, it does not release the user entry when the user goes offline. This feature forces the device to send stop-accounting packets to the RADIUS server when the user goes offline for timely releasing the user entry on the server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable the device to send stop-accounting packets when users for which no start-accounting packets are sent go offline.

   stop-accounting-packet send-force

   By default, forcibly sending stop-accounting packets is disabled. The device does not send stop-accounting packets when users for which no start-accounting packets are sent go offline.

Enabling the RADIUS server load sharing feature

About this task

By default, the device communicates with RADIUS servers based on the server roles. It first attempts to communicate with the primary server, and, if the primary server is unreachable, it then searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication. In this process, the workload is always placed on the active server.

Use the RADIUS server load sharing feature to dynamically distribute the workload over multiple servers regardless of their server roles. The device forwards an AAA request to the most appropriate server of all active servers in the scheme after it compares the weight values and numbers of currently served users. Specify a weight value for each RADIUS server based on the AAA capacity of the server. A larger weight value indicates a higher AAA capacity.

In RADIUS server load sharing, once the device sends a start-accounting request to a server for a user, it forwards all subsequent accounting requests of the user to the same server. If the accounting server is unreachable, the device returns an accounting failure message rather than searching for another active accounting server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Enable the RADIUS server load sharing feature.

   server-load-sharing enable

   By default, this feature is disabled.

Specifying a RADIUS server selection mode for reauthentication

About this task

Use this feature to configure the RADIUS server selection mechanism in reauthentication. The following RADIUS server selection modes are available:

- **Inherit**—The device uses the RADIUS server that performed authentication for a user to reauthenticate that user. This mode reduces the amount of time used in reauthentication. However, if the RADIUS server is unreachable, the reauthentication will fail.
- **Reselect**—The device searches for a reachable RADIUS server to reauthenticate a user. This mode requires more time than the inherit mode. However, this mode ensures that the device uses the optimal reachable RADIUS server for reauthentication. The following factors affect the RADIUS server selection:
  - Server configuration in the RADIUS scheme, including the configuration order.
  - Enabling status of the RADIUS server load sharing feature.
  - Status of the RADIUS servers in the RADIUS scheme.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a RADIUS server selection mode for reauthentication.

   reauthentication server-select { **inherit** | **reselect** }

   By default, the inherit mode is used.

Configuring the RADIUS accounting-on feature

About this task

When the accounting-on feature is enabled, the device automatically sends an accounting-on packet to the RADIUS server after the entire device reboots. Upon receiving the accounting-on packet, the RADIUS server logs out all online users so they can log in again through the device. Without this feature, users cannot log in again after the reboot, because the RADIUS server considers them to come online.

You can configure the interval for which the device waits to resend the accounting-on packet and the maximum number of retries.

The extended accounting-on feature enhances the accounting-on feature in a distributed architecture.

The extended accounting-on feature is applicable to LAN users. The user data is saved to the IRF member devices through which the users access the system. When the extended accounting-on feature is enabled, the system automatically sends an accounting-on packet to the RADIUS server after a member device reboots. The packet contains the member device identifier. Upon receiving the accounting-on packet, the RADIUS server logs out all online users that access the system through the member device. If no users have come online through the member device, the IRF fabric does not send an accounting-on packet after the member device reboots.

Restrictions and guidelines

For the extended accounting-on feature to take effect, the RADIUS server must run on IMC and the accounting-on feature must be enabled.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable accounting-on.
   accounting-on enable [**interval** *interval* | **send** *send-times*] *
   By default, the accounting-on feature is disabled.
4. (Optional.) Enable extended accounting-on.
   accounting-on extended
   By default, extended accounting-on is disabled.

Configuring the RADIUS session-control feature

About this task

Enable this feature for the RADIUS server to dynamically change the user authorization information (for example, authorization ACL, VLAN, user group, or blackhole MAC) or forcibly disconnect users by using session-control packets. This task enables the device to receive RADIUS session-control packets on UDP port 1812.

To verify the session-control packets sent from a RADIUS server, specify the RADIUS server as a session-control client to the device.

Restrictions and guidelines

The RADIUS session-control feature can only work with RADIUS servers running on IMC. The session-control client configuration takes effect only when the session-control feature is enabled.

Procedure

1. Enter system view.
   system-view
2. Enable the session-control feature.
   radius session-control enable
   By default, the session-control feature is disabled.
3. Specify a session-control client.
   radius session-control client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name*] *
   By default, no session-control clients are specified.

Configuring the RADIUS DAS feature

About this task

Dynamic Authorization Extensions (DAE) to RADIUS, defined in RFC 5176, can log off online users and change online user authorization information.

In a RADIUS network, the RADIUS server typically acts as the DAE client (DAC) and the NAS acts as the DAE server (DAS).

When the RADIUS DAS feature is enabled, the NAS performs the following operations:

1. Listens to the default or specified UDP port to receive DAE requests.
2. Logs off online users that match the criteria in the requests, changes their authorization information, shuts down or reboots their access ports, or reauthenticates the users.
3. Sends DAE responses to the DAC.

DAE defines the following types of packets:

- **Disconnect Messages (DMs)**—The DAC sends DM requests to the DAS to log off specific online users.
- **Change of Authorization Messages (CoA Messages)**—The DAC sends CoA requests to the DAS to change the authorization information of specific online users.

Procedure

1. Enter system view.

   system-view

2. Enable the RADIUS DAS feature and enter RADIUS DAS view.

   radius dynamic-author server

   By default, the RADIUS DAS feature is disabled.

3. Specify a RADIUS DAC.

   client { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**key** { **cipher** | **simple** } *string* | **ssl-client-policy** *policy-name* | **vpn-instance** *vpn-instance-name*] *

   By default, no RADIUS DACs are specified.

4. (Optional.) Specify the RADIUS DAS port.

   port *port-number*

   By default, the RADIUS DAS port is 3799.

5. (Optional.) Set the idle timeout for TLS connections of the RADIUS DAE service.

   timer tls-idle-timeout *timeout-value*

   By default, the idle timeout is 60 seconds for TLS connections.

6. (Optional.) Specify the TLS connection listening port for the RADIUS DAE service.

   tls-port *port-number*

   By default, the TLS connection listening port for the RADIUS DAE service is 2083.

Configuring the device to preferentially process RADIUS authentication requests

About this task

RADIUS requests include RADIUS authentication requests, RADIUS accounting-start requests, RADIUS accounting-update requests, and RADIUS accounting-stop requests. By default, the device processes the RADIUS requests in the sequence that the requests are initiated.

When a large number of users go offline and then try to come online immediately, authentication might fail for these users because of authentication request timeout. To resolve this issue, configure the device to preferentially process authentication requests.

Restrictions and guidelines

Do not perform this task if the RADIUS server identifies users by the username and does not allow repeated authentication for the same username. A violation might cause authentication failure for users that try to come online immediately after going offline.

As a best practice, do not perform this task when the device has online users.

Procedure

1. Enter system view.

   system-view

2. Configure the device to preferentially process RADIUS authentication requests.

   radius authentication-request first

   By default, the device processes RADIUS requests in the sequence that the requests are initiated.

Enabling SNMP notifications for RADIUS

About this task

When SNMP notifications are enabled for RADIUS, the SNMP agent supports the following notifications generated by RADIUS:

- **RADIUS server unreachable notification**—The RADIUS server cannot be reached. RADIUS generates this notification if it does not receive a response to an accounting or authentication request within the specified number of RADIUS request transmission attempts.
- **RADIUS server reachable notification**—The RADIUS server can be reached. RADIUS generates this notification for a previously blocked RADIUS server after the quiet timer expires.
- **Excessive authentication failures notification**—The number of authentication failures compared to the total number of authentication attempts exceeds the specified threshold.

For RADIUS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Make sure the RADIUS server status change notifications sent by the device can be recognized by the NMS. Choose a MIB node version depending on the NMS requirements. For more information about the MIB node versions, see AAA in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for RADIUS.

   snmp-agent trap enable radius [**accounting-server-down** | **accounting-server-up** | **authentication-error-threshold** | **authentication-server-down** | **authentication-server-up**] *

   By default, all SNMP notifications are disabled for RADIUS.

3. Set the version of RADIUS server status change MIB nodes.

   radius trap-version { **v1** | **v2** } [**accounting-server-down** | **accounting-server-up** | **authentication-server-down** | **authentication-server-up**] *

   By default, the device sends notifications about RADIUS server status change MIB nodes over SNMPv1.

Enabling RADIUS server parallel authentication

About this task

The implementation mechanism of this feature varies by authentication method as follows:

- For 802.1X EAP termination authentication or MAC authentication, the device simultaneously sends authentication requests to all servers in Active state, without distinguishing between primary and secondary servers. If any one of the servers responds with successful authentication, the user authentication is considered successful. In the case where user authentication fails on all servers, authentication fail-permit is triggered for the user. User authentication is considered failed if no server responds or if all servers respond with a failure result at least once.
- For 802.1X EAP relay authentication, the device uses the primary and secondary server mode for authentication. If the primary server responds with a failure result, the device checks whether any other servers are in Active state. If an active server is detected, the system notifies the device to send an authentication request to the server for re-authentication. If no active server exists, the device considers that the user authentication fails. In the authentication process, an authentication request is sent to the next active server only when the previous authentication server responds with a fail or does not respond. If any one of the servers responds with successful authentication, the user authentication is considered successful. In the case where user authentication fails on all servers, authentication fail-permit is triggered for the user. User authentication is considered failed if no server responds or if all servers respond with a failure result at least once.

Restrictions and guidelines

If you enable both this feature and RADIUS server load sharing (**server-load-sharing enable**), RADIUS server load sharing does not take effect.

If you enable this feature and specify a RADIUS server selection mode for authentication (**reauthentication server-select**), the specified selection mode does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Enable RADIUS server parallel authentication.
   server-parallel-auth enable
   By default, RADIUS server parallel authentication is disabled.

Configuring the idle timeout for TLS connections in RADIUS authentication

About this task

After the device processes the last authentication or accounting request, it uses the idle timeout configured for TLS connections in the RADIUS scheme of the last request to update the idle timeout timer. If the timer expires but no authentication or accounting request is received, the system disconnects the TLS connection. Setting the idle timeout to 0 disables the system from disconnecting TLS connections due to timeout.

If you change the idle timeout under a RADIUS scheme from 0 to a non-zero value, the system traverses the connections of the servers under the scheme and updates the idle timeout to the new value.

Procedure

1. Enter system view.
   system-view
2. Enter RADIUS scheme view.

radius scheme *radius-scheme-name*

3. Specify the idle timeout for TLS connections in RADIUS authentication.

   timer tls-idle-timeout *timeout-value*

   By default, the idle timeout is 60 seconds for TLS connections in RADIUS authentication.

Disabling the RADIUS service

About this task

By default, the RADIUS service is enabled. The device can send and receive RADIUS packets. Attackers might use RADIUS session-control and DAE ports to attack the device. To protect the device when such an attack occurs, disable the RADIUS service temporarily on the device. After the network is secure, re-enable the RADIUS service.

If settings on the RADIUS servers require modification or the RADIUS servers cannot provide services temporarily, you can temporarily disable the RADIUS service on the device.

When the RADIUS service is disabled, the device stops sending and receiving RADIUS packets. If a new user comes online, the device uses the backup authentication, authorization, or accounting method to process that user. If the device has not finished requesting authentication or accounting for a user before the RADIUS service is disabled, it uses the following rules to process that user:

- If the device has sent RADIUS authentication requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it uses the response to determine whether that user has passed authentication. If that user has passed authentication, the device assigns authorization information to that user according to the response.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup authentication method to authenticate that user.
- If the device has sent RADIUS start-accounting requests for that user to a RADIUS server, the device processes that user depending on whether it receives a response from the RADIUS server.
  - If the device receives a response from the RADIUS server, it allows that user to come online. However, the device cannot send out accounting-update or stop-accounting requests to the RADIUS server. It cannot buffer the accounting requests, either. When that user goes offline, the RADIUS server cannot log off that user in time. The accounting result might be inaccurate.
  - If the device does not receive any response from the RADIUS server, it attempts to use the backup accounting method.

Restrictions and guidelines

Disabling the RADIUS service does not affect the RADIUS server feature of the device.

The authentication, authorization, and accounting processes undertaken by other methods are not switched to RADIUS when you re-enable the RADIUS service.

Procedure

1. Enter system view.

   system-view

2. Disable the RADIUS service.

   undo radius enable

   By default, the RADIUS service is enabled.

   To re-enable the RADIUS service, use the **radius enable** command.

Display and maintenance commands for RADIUS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about globally cached RADIUS packets.	**display radius buffer**
Display the RADIUS scheme configuration.	**display radius scheme** [*radius-scheme-name*]
Display authentication and accounting load statistics for all RADIUS servers.	**display radius server-load statistics**
Display RADIUS packet statistics.	**display radius statistics**
Display information about buffered RADIUS stop-accounting requests to which no responses have been received.	**display stop-accounting-buffer** { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }
Clear history authentication and accounting load statistics for all RADIUS servers.	**reset radius server-load statistics**
Clear RADIUS statistics.	**reset radius statistics**
Clear the buffered RADIUS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer** { **radius-scheme** *radius-scheme-name* | **session-id** *session-id* | **time-range** *start-time end-time* | **user-name** *user-name* }

Configuring HWTACACS

HWTACACS tasks at a glance

To configure HWTACACS, perform the following tasks:

1. Creating an HWTACACS scheme
2. Specifying the HWTACACS authentication servers
3. Specifying the HWTACACS authorization servers
4. Specifying the HWTACACS accounting servers
5. Specifying the shared keys for secure HWTACACS communication

   Perform this task if no shared keys are specified when configuring HWTACACS servers.
6. Specifying an MPLS L3VPN instance for the scheme

   Perform this task if no MPLS L3VPN instances are specified when configuring HWTACACS servers.
7. (Optional.) Setting HWTACACS timers
8. (Optional.) Configuring parameters for HWTACACS packets
   - Specifying the source IP address for outgoing HWTACACS packets
   - Setting the username format and traffic statistics units
   - Setting the DSCP priority for HWTACACS packets
9. (Optional.) Configuring HWTACACS stop-accounting packet buffering

Creating an HWTACACS scheme

Restrictions and guidelines

You can configure a maximum of 16 HWTACACS schemes. An HWTACACS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view

2. Create an HWTACACS scheme and enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

Specifying the HWTACACS authentication servers

About this task

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for an HWTACACS scheme. When the primary server is unreachable, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authentication server in one scheme and as the secondary authentication server in another scheme at the same time.

Two HWTACACS authentication servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no primary HWTACACS authentication server is specified.

4. (Optional.) Specify a secondary HWTACACS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no secondary HWTACACS authentication servers are specified.

Specifying the HWTACACS authorization servers

About this task

You can specify one primary authorization server and a maximum of 16 secondary authorization servers for an HWTACACS scheme. When the primary server is not available, the device searches

for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary authorization server of one scheme and as the secondary authorization server of another scheme at the same time.

Two HWTACACS authorization servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS authorization server.

   primary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no primary HWTACACS authorization server is specified.

4. (Optional.) Specify a secondary HWTACACS authorization server.

   secondary authorization { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

   By default, no secondary HWTACACS authorization servers are specified.

Specifying the HWTACACS accounting servers

About this task

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for an HWTACACS scheme. When the primary server is not available, the device searches for the secondary servers in the order they are configured. The first secondary server in active state is used for communication.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

An HWTACACS server can function as the primary accounting server of one scheme and as the secondary accounting server of another scheme at the same time.

Two HWTACACS accounting servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

HWTACACS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify the primary HWTACACS accounting server.

primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

By default, no primary HWTACACS accounting server is specified.

4. (Optional.) Specify a secondary HWTACACS accounting server.

secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **single-connection** | **vpn-instance** *vpn-instance-name*] *

By default, no secondary HWTACACS accounting servers are specified.

Specifying the shared keys for secure HWTACACS communication

About this task

The HWTACACS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

Perform this task to configure shared keys for servers in an HWTACACS scheme. The keys take effect on all servers for which a shared key is not individually configured.

Restrictions and guidelines

Make sure the shared key configured on the device is the same as the shared key configured on the HWTACACS server.

Procedure

1. Enter system view.

system-view

2. Enter HWTACACS scheme view.

hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a shared key for secure HWTACACS authentication, authorization, or accounting communication.

key { **accounting** | **authentication** | **authorization** } { **cipher** | **simple** } *string*

By default, no shared key is specified for secure HWTACACS communication.

Specifying an MPLS L3VPN instance for the scheme

About this task

The VPN instance specified for an HWTACACS scheme applies to all servers in that scheme. If a VPN instance is also configured for an individual HWTACACS server, the VPN instance specified for the HWTACACS scheme does not take effect on that server.

Procedure

1. Enter system view.

system-view

2. Enter HWTACACS scheme view.

hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a VPN instance for the HWTACACS scheme.

vpn-instance *vpn-instance-name*

By default, an HWTACACS scheme belongs to the public network.

Setting HWTACACS timers

About this task

The device uses the following timers to control communication with an HWTACACS server:

- **Server response timeout timer (response-timeout)**—Defines the HWTACACS server response timeout timer. The device starts this timer immediately after an HWTACACS authentication, authorization, or accounting request is sent. If the device does not receive a response from the server within the timer, it sets the server to blocked. Then, the device sends the request to another HWTACACS server.
- **Real-time accounting timer (realtime-accounting)**—Defines the intervals at which the device sends real-time accounting packets to the HWTACACS accounting server for online users.
- **Server quiet timer (quiet)**—Defines the duration to keep an unreachable server in blocked state. If a server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.

The server quiet timer setting affects the status of HWTACACS servers. If the scheme includes one primary HWTACACS server and multiple secondary HWTACACS servers, the device communicates with the HWTACACS servers based on the following rules:

- When the primary server is in active state, the device communicates with the primary server. When the primary server is unreachable, the device researches a secondary server in active status in the order they are configured.
- When one or more servers are in active state, the device tries to communicate with these servers only, even if they are unreachable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If the primary server is unreachable, the device changes the server status to blocked and starts a quiet timer for the server. When the quiet timer of the server expires, the status of the server changes back to active. The device does not check the server again during the authentication, authorization, or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is available, the device considers the authentication, authorization, or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When an HWTACACS server's status changes automatically, the device changes this server's status accordingly in all HWTACACS schemes in which this server is specified.

Restrictions and guidelines

A short real-time accounting interval helps improve accounting precision but requires many system resources. When there are 1000 or more users, set a real-time accounting interval longer than 15 minutes.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

hwtacacs scheme *hwtacacs-scheme-name*

3. Set the HWTACACS timers. Choose the following tasks as needed:
   - Set the HWTACACS server response timeout timer.

     timer response-timeout *seconds*

     By default, the HWTACACS server response timeout timer is 5 seconds.
   - Set the real-time accounting interval.

     timer realtime-accounting *minutes*

     By default, the real-time accounting interval is 12 minutes.
   - Set the server quiet timer.

     timer quiet *minutes*

     By default, the server quiet timer is 5 minutes.

Specifying the source IP address for outgoing HWTACACS packets

About this task

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS configured on the HWTACACS server. An HWTACACS server identifies a NAS by IP address. When the HWTACACS server receives a packet, it checks the source IP address of the packet.

- If it is the IP address of a managed NAS, the server processes the packet.
- If it is not the IP address of a managed NAS, the server drops the packet.

Before sending an HWTACACS packet, the NAS selects a source IP address in the following order:

1. The source IP address specified for the HWTACACS scheme.
2. The source IP address specified in system view for the VPN or public network, depending on where the HWTACACS server resides.
3. The IP address of the outbound interface specified by the route.

Restrictions and guidelines for source IP address configuration

You can specify the source IP address for outgoing HWTACACS packets in HWTACACS scheme view or in system view.

- The IP address specified in HWTACACS scheme view applies to one HWTACACS scheme.
- The IP address specified in system view applies to all HWTACACS schemes.

The source IP address of HWTACACS packets that a NAS sends must match the IP address of the NAS that is configured on the HWTACACS server.

As a best practice, specify a loopback interface address as the source IP address for outgoing HWTACACS packets to avoid HWTACACS packet loss caused by physical port errors.

To communicate with the HWTACACS server, the source address of outgoing HWTACACS packets is typically the IP address of an egress interface on the NAS. However, in some situations, you must change the source IP address. For example, when VRRP is configured for stateful failover, configure the virtual IP of the uplink VRRP group as the source address.

You can directly specify a source IP address for outgoing HWTACACS packets or specify a source interface to provide the source IP address for outgoing HWTACACS packets. The source interface configuration and the source IP address configuration overwrite each other.

Specifying a source interface or source IP address for all HWTACACS schemes

1. Enter system view.

   system-view

2. Specify a source interface or source IP address for outgoing HWTACACS packets.

   hwtacacs nas-ip { **interface** *interface-type interface-number* | { *ipv4-address* | **ipv6** *ipv6-address* } [**vpn-instance** *vpn-instance-name*] }

   By default, the source IP address of an HWTACACS packet sent to the server is the primary IPv4 address or the IPv6 address of the outbound interface.

Specifying a source interface or source IP address for an HWTACACS scheme

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Specify a source interface or source IP address for outgoing HWTACACS packets.

   nas-ip { *ipv4-address* | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* }

   By default, the source IP address of an outgoing HWTACACS packet is that configured by using the **hwtacacs nas-ip** command in system view. If the **hwtacacs nas-ip** command is not used, the source IP address is the primary IP address of the outbound interface.

Setting the username format and traffic statistics units

About this task

A username is typically in the *userid@isp-name* format, where the *isp-name* part represents the user's ISP domain name. By default, the ISP domain name is included in a username. If HWTACACS servers do not recognize usernames that contain ISP domain names, you can configure the device to send usernames without domain names to the servers.

The device reports online user traffic statistics in accounting packets.

Restrictions and guidelines

If two or more ISP domains use the same HWTACACS scheme, configure the HWTACACS scheme to keep the ISP domain name in usernames for domain identification.

For accounting accuracy, make sure the traffic measurement units configured on the device are the same as the traffic measurement units configured on the HWTACACS accounting servers.

Procedure

1. Enter system view.

   system-view

2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*

3. Set the format of usernames sent to the HWTACACS servers.

   user-name-format { **keep-original** | **with-domain** | **without-domain** }

   By default, the ISP domain name is included in a username.

4. Set the data flow and packet measurement units for traffic statistics.

   data-flow-format { **data** { **byte** | **giga-byte** | **kilo-byte** | **mega-byte** } | **packet** { **giga-packet** | **kilo-packet** | **mega-packet** | **one-packet** } }*

   By default, traffic is counted in bytes and packets.

Setting the DSCP priority for HWTACACS packets

About this task

DSCP priority determines the transmission priority of HWTACACS packets. A larger value represents a higher priority.

DSCP priority is contained in the ToS field of the IPv4 header and in the Traffic Class field of the IPv6 header.

Procedure

1. Enter system view.

   system-view
2. Set the DSCP priority for HWTACACS packets.

   hwtacacs [**ipv6**] **dscp** *dscp-value*

   By default, the DSCP priority is 0 for HWTACACS packets.

Configuring HWTACACS stop-accounting packet buffering

About this task

The device sends HWTACACS stop-accounting requests when it receives connection teardown requests from hosts or connection teardown commands from an administrator. However, the device might fail to receive a response for a stop-accounting request in a single transmission. Enable the device to buffer HWTACACS stop-accounting requests that have not received responses from the accounting server. The device will resend the requests until responses are received.

To limit the transmission times, set a maximum number of attempts that can be made for transmitting individual HWTACACS stop-accounting requests. When the maximum attempts are made for a request, the device discards the buffered request.

Procedure

1. Enter system view.

   system-view
2. Enter HWTACACS scheme view.

   hwtacacs scheme *hwtacacs-scheme-name*
3. Enable buffering of HWTACACS stop-accounting requests to which no responses have been received.

   stop-accounting-buffer enable

   By default, the buffering feature is enabled.
4. (Optional.) Set the maximum number of transmission attempts for individual HWTACACS stop-accounting requests.

   retry stop-accounting *retries*

   The default setting is 100.

Enabling SNMP notifications for HWTACACS

About this task

When SNMP notifications are enabled for HWTACACS, the SNMP agent supports the following notifications generated by HWTACACS:

- **HWTACACS server unreachable notification**—The HWTACACS server cannot be reached. The NAS generates this notification if it does not receive a response to an accounting,

authentication, or authorization request within the specified number of HWTACACS request transmission attempts.

- **HWTACACS server reachable notification**—The HWTACACS server can be reached. The NAS generates this notification for a previously blocked HWTACACS server after the quiet timer expires and sets the server status to active.

For HWTACACS SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for HWTACACS.
   snmp-agent trap enable hwtacacs [**accounting-server-down** | **accounting-server-up** | **authentication-server-down** | **authentication-server-up** | **authorization-server-down** | **authorization-server-up**] *
   By default, all types of SNMP notifications for HWTACACS are disabled.

Display and maintenance commands for HWTACACS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the configuration or server statistics of HWTACACS schemes.	**display hwtacacs scheme** [*hwtacacs-scheme-name* [**statistics**]]
Display information about buffered HWTACACS stop-accounting requests to which no responses have been received.	**display stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*
Display HWTACACS packet statistics.	**display hwtacacs statistics**
Clear HWTACACS statistics.	**reset hwtacacs statistics** { **accounting** | **all** | **authentication** | **authorization** }
Clear the buffered HWTACACS stop-accounting requests to which no responses have been received.	**reset stop-accounting-buffer hwtacacs-scheme** *hwtacacs-scheme-name*

Configuring LDAP

LDAP tasks at a glance

To configure LDAP, perform the following tasks:

1. Configuring an LDAP server
   a. Creating an LDAP server
   b. Configuring the IP address of the LDAP server
   c. (Optional.) Specifying the LDAP version
   d. (Optional.) Setting the LDAP server timeout period

e. Configuring administrator attributes
f. Configuring LDAP user attributes

2. (Optional.) Configuring an LDAP attribute map
3. Creating an LDAP scheme
4. Specifying the LDAP authentication server
5. (Optional.) Specifying the LDAP authorization server
6. (Optional.) Specifying an LDAP attribute map for LDAP authorization

Creating an LDAP server

1. Enter system view.
   system-view
2. Create an LDAP server and enter LDAP server view.
   ldap server *server-name*

Configuring the IP address of the LDAP server

Restrictions and guidelines

You can configure either an IPv4 address or an IPv6 address for an LDAP server. If you configure the IP address for an LDAP server multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Configure the IP address of the LDAP server.
   { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]
   By default, an LDAP server does not have an IP address.

Specifying the LDAP version

Restrictions and guidelines

The device supports LDAPv2 and LDAPv3.

A Microsoft LDAP server supports only LDAPv3.

The LDAP version specified on the device must be consistent with the version specified on the LDAP server.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the LDAP version.
   protocol-version { **v2** | **v3** }

By default, LDAPv3 is used.

Setting the LDAP server timeout period

About this task

If the device sends a bind or search request to an LDAP server without receiving the server's response within the server timeout period, the authentication or authorization request times out. Then, the device tries the backup authentication or authorization method. If no backup method is configured in the ISP domain, the device considers the authentication or authorization attempt a failure.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Set the LDAP server timeout period.
   server-timeout *time-interval*
   By default, the LDAP server timeout period is 10 seconds.

Configuring administrator attributes

About this task

To configure the administrator DN and password for binding with the LDAP server during LDAP authentication:

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the administrator DN.
   login-dn *dn-string*
   By default, no administrator DN is specified.
   The administrator DN specified on the device must be the same as the administrator DN configured on the LDAP server.
4. Configure the administrator password.
   login-password { **cipher** | **simple** } *string*
   By default, no administrator password is specified.

Configuring LDAP user attributes

About this task

To authenticate a user, an LDAP client must complete the following operations:

1. Establish a connection to the LDAP server.
2. Obtain the user DN from the LDAP server.
3. Use the user DN and the user's password to bind with the LDAP server.

LDAP provides a DN search mechanism for obtaining the user DN. According to the mechanism, an LDAP client sends search requests to the server based on the search policy determined by the LDAP user attributes of the LDAP client.

The LDAP user attributes include:

- Search base DN.
- Search scope.
- Username attribute.
- Username format.
- User object class.

Restrictions and guidelines

If the LDAP server contains many directory levels, a user DN search starting from the root directory can take a long time. To improve efficiency, you can change the start point by specifying the search base DN.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP server view.
   ldap server *server-name*
3. Specify the user search base DN.
   search-base-dn *base-dn*
   By default, no user search base DN is specified.
4. (Optional.) Specify the user search scope.
   search-scope { **all-level** | **single-level** }
   By default, the user search scope is **all-level**.
5. (Optional.) Specify the username attribute.
   user-parameters user-name-attribute { *name-attribute* | **cn** | **uid** }
   By default, the username attribute is **cn**.
6. (Optional.) Specify the username format.
   user-parameters user-name-format { **with-domain** | **without-domain** }
   By default, the username format is **without-domain**.
7. (Optional.) Specify the user object class.
   user-parameters user-object-class *object-class-name*
   By default, no user object class is specified, and the default user object class on the LDAP server is used. The default user object class for this command varies by server model.

Configuring an LDAP attribute map

About this task

Configure an LDAP attribute map to define a list of LDAP-AAA attribute mapping entries. To apply the LDAP attribute map, specify the name of the LDAP attribute map in the LDAP scheme used for authorization.

The LDAP attribute map feature enables the device to convert LDAP attributes obtained from an LDAP authorization server to device-recognizable AAA attributes based on the mapping entries. Because the device ignores unrecognized LDAP attributes, configure the mapping entries to include important LDAP attributes that should not be ignored.

An LDAP attribute can be mapped only to one AAA attribute. Different LDAP attributes can be mapped to the same AAA attribute.

Procedure

1. Enter system view.
   system-view
2. Create an LDAP attribute map and enter LDAP attribute map view.
   ldap attribute-map *map-name*
3. Configure a mapping entry.
   map ldap-attribute *ldap-attribute-name* [**prefix** *prefix-value* **delimiter** *delimiter-value*] **aaa-attribute user-group**

Creating an LDAP scheme

Restrictions and guidelines

You can configure a maximum of 16 LDAP schemes. An LDAP scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.
   system-view
2. Create an LDAP scheme and enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*

Specifying the LDAP authentication server

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify the LDAP authentication server.
   authentication-server *server-name*
   By default, no LDAP authentication server is specified.

Specifying the LDAP authorization server

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify the LDAP authorization server.
   authorization-server *server-name*
   By default, no LDAP authorization server is specified.

Specifying an LDAP attribute map for LDAP authorization

About this task

Specify an LDAP attribute map for LDAP authorization to convert LDAP attributes obtained from the LDAP authorization server to device-recognizable AAA attributes.

Restrictions and guidelines

You can specify only one LDAP attribute map in an LDAP scheme.

Procedure

1. Enter system view.
   system-view
2. Enter LDAP scheme view.
   ldap scheme *ldap-scheme-name*
3. Specify an LDAP attribute map.
   attribute-map *map-name*
   By default, no LDAP attribute map is specified.

Display and maintenance commands for LDAP

Execute **display** commands in any view.

Task	Command
Display the configuration of LDAP schemes.	**display ldap scheme** [*ldap-scheme-name*]

Creating an ISP domain

About ISP domains

In a networking scenario with multiple ISPs, the device can connect to users of different ISPs. These users can have different user attributes, such as different username and password structures, different service types, and different rights. To manage users of different ISPs, configure authentication, authorization, and accounting methods and domain attributes for each ISP domain as needed.

The device supports a maximum of 16 ISP domains, including the system-defined ISP domain **system**. You can specify one of the ISP domains as the default domain.

On the device, each user belongs to an ISP domain. If a user does not provide an ISP domain name at login, the device considers the user belongs to the default ISP domain.

Each ISP domain has a set of system-defined AAA methods, which are local authentication, local authorization, and local accounting. If you do not configure any AAA methods for an ISP domain, the device uses the system-defined AAA methods for users in the domain.

The device chooses an authentication domain for each user in the following order:

1. The authentication domain specified for the access module.
2. The ISP domain in the username.
3. The default ISP domain of the device.

If the chosen domain does not exist on the device, the device searches for the ISP domain that accommodates users assigned to nonexistent domains. (Support for the authentication domain configuration depends on the access module.) If no such ISP domain is configured, user authentication fails.

Restrictions and guidelines for ISP domain configuration

An ISP domain cannot be deleted when it is the default ISP domain. Before you use the **undo domain** command, change the domain to a non-default ISP domain by using the **undo domain default enable** command.

You can modify the settings of the system-defined ISP domain **system**, but you cannot delete the domain.

To avoid RADIUS authentication, authorization, or accounting failures, use short domain names to ensure that usernames containing a domain name do not exceed 253 characters.

To avoid RADIUS accounting failures, make sure the domain name contained in usernames sent to the RADIUS server does not exceed 247 characters.

Creating an ISP domain

1. Enter system view.
   system-view
2. Create an ISP domain and enter ISP domain view.
   domain *isp-name*
   By default, a system-defined ISP domain exists. The domain name is **system**.

Specifying the default ISP domain

1. Enter system view.
   system-view
2. Specify the default ISP domain.
   domain default enable *isp-name*
   By default, the default ISP domain is the system-defined ISP domain **system**.

Specifying an ISP domain for users that are assigned to nonexistent domains

1. Enter system view.
   system-view
2. Specify the ISP domain to accommodate users that are assigned to nonexistent domains.
   domain if-unknown *isp-name*
   By default, no ISP domain is specified to accommodate users that are assigned to nonexistent domains.

Configuring ISP domain attributes

Setting ISP domain status

About this task

By placing the ISP domain in active or blocked state, you allow or deny network service requests from users in the domain.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. Set the status of the ISP domain.

   state { **active** | **block** }

   By default, an ISP domain is in active state, and users in the domain can request network services.

Configuring authorization attributes for an ISP domain

About this task

The device supports the following authorization attributes:

- **ACL**—The device restricts authenticated users to access only the network resources permitted by the ACL.
- **Idle cut**—The device logs out a user if the user's total traffic in the idle timeout period at the specified direction is less than the specified minimum traffic.
- **Maximum number of multicast groups**—The attribute restricts the maximum number of multicast groups that an authenticated user can join concurrently.
- **IPv4 address pool**—The device assigns IPv4 addresses from the pool to authenticated users in the domain.
- **IPv6 address pool**—The device assigns IPv6 addresses from the pool to authenticated users in the domain.
- **Redirect URL**—The device redirects users in the domain to the URL after they pass authentication.
- **User group**—Authenticated users in the domain obtain all attributes of the user group.
- **VLAN**—The device authorizes the authenticated users to access the network resources in the specified VLAN.

Restrictions and guidelines

When you specify matching rules for user terminals, follow these restrictions and guidelines:

- Vertical bars (|) are used as the delimiter in matching rules and cannot be input as part of a rule.
- Do not input vertical bars (|) consecutively, such as ||, |||, or | |.
- Matching rules can include spaces, but spaces do not participate in the match and will occupy string length.

Procedure

1. Enter system view.

system-view

2. Enter ISP domain view.

   domain *isp-name*

3. Configure authorization attributes for authenticated users in the ISP domain.

   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* [*flow*] [**traffic** { **both** | **inbound** | **outbound** }] | **igmp max-access-number** *max-access-number* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **mld max-access-number** *max-access-number* | **redirect** { **deny** | **permit** } **user-agent match** *match-string* | **url** *url-string* | **user-group** *user-group-name* | **vlan** *vlan-id* }

   The default settings are as follows:

   - The idle cut feature is disabled.
   - An IPv4 user can concurrently join a maximum of four IGMP multicast groups.
   - An IPv6 user can concurrently join a maximum of four MLD multicast groups.
   - No other authorization attributes exist.

Including the idle timeout period in the user online duration to be sent to the server

About this task

If a user goes offline due to connection failure or malfunction, the user's online duration sent to the server includes the idle timeout period assigned by the authorization server. The online duration generated on the server is longer than the actual online duration of the user.

For portal users, the device includes the idle timeout period set for the online portal user detection feature in the user online duration. For more information about online detection for portal users, see "Configuring portal authentication."

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. Configure the device to include the idle timeout period in the user online duration to be sent to the server.

   session-time include-idle-time

   By default, the user online duration sent to the server does not include the idle timeout period.

Enabling temporary redirect

About this task

Typically, the device carries the redirect URL coded in JavaScript in HTTP or HTTPS responses sent to users, and the status code in the responses is 200. The users obtain the redirect URL by parsing the JavaScript codes. If the endpoint of a user (application, for example) does not support JavaScript, the user will fail to be redirected.

To resolve this issue, enable the temporary redirect feature. This feature enables the device to send HTTP or HTTPS responses with status code 302 to users so that the users can obtain the redirect URL.

Restrictions and guidelines

As a best practice, enable this feature only when users that do not support decoding Java Script in HTTP/HTTPS packets exist in the network.

This feature takes effect only on wired 802.1X and MAC authentication users authorized with a redirection URL.

If you change the temporary redirect setting, the change takes effect only on users that come online afterwards or users that are reauthorized.

Procedure

1. Enter system view.
   system-view
2. Enter ISP domain view.
   domain *isp-name*
3. Enable temporary redirect.
   redirect move-temporarily enable
   By default, temporary redirect is disabled.

Specifying the user address type in an ISP domain

1. Enter system view.
   system-view
2. Enter ISP domain view.
   domain *isp-name*
3. Specify the user address type in the ISP domain.
   user-address-type { **ds-lite** | **ipv6** | **nat64** | **private-ds** | **private-ipv4** | **public-ds** | **public-ipv4** }
   By default, no user address type is specified.

Configuring the authentication failure policy for users in an ISP domain

About this task

By default, users cannot come online if they fail authentication. To have authentication-failed users in an authentication domain stay online and access a limited set of network resources, specify an auth-fail domain to accommodate them. In the auth-fail domain, you can specify a set of authorization and accounting schemes to assign resources to the authentication-failed users.

Restrictions and guidelines

The authen-fail online feature is applicable only to wired 802.1X, Web authentication, and MAC authentication users.

The authen-fail online feature does not apply to users that fail authentication for one of the following reasons:

- Authentication times out, for example, because no authentication servers respond or no matching local users are found.
- The authentication domain is in blocked state or is a denied domain.

Procedure

1. Enter system view.

system-view

2. Enter ISP domain view.
   domain *isp-name*
3. Configure the authentication failure policy for users in the ISP domain.
   authen-fail { **offline** | **online domain** *new-isp-name* **no-authen** }
   By default, the device logs out users in an ISP domain if the users fail authentication.

Configuring AAA methods for an ISP domain

Configuring authentication methods for an ISP domain

Restrictions and guidelines

When you configure remote authentication, follow these restrictions and guidelines:

- For high availability, you can specify one primary authentication method and multiple backup authentication methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local none** parameters specify a primary RADIUS authentication method and two backup methods (local authentication and no authentication). The device performs RADIUS authentication by default and performs local authentication when the RADIUS server is invalid. The device does not perform authentication when both of the previous methods are invalid.

  The remote authentication method is invalid in the following situations:

  - The specified authentication scheme does not exist.
  - The device fails to send authentication request packets.
  - The device does not receive any authentication response packets from an authentication server.

  The local authentication method is invalid if the device fails to find the matching local user configuration.
- If the authentication method uses a RADIUS scheme and the authorization method does not use a RADIUS scheme, AAA accepts only the authentication result from the RADIUS server. The Access-Accept message from the RADIUS server also includes the authorization information, but the device ignores the information.
- If an HWTACACS scheme is specified, the device uses the entered username for role authentication. If a RADIUS scheme is specified, the device uses username **$enab***n***$** on the RADIUS server for role authentication. The variable *n* represents a user role level. For more information about user role authentication, see *Fundamentals Configuration Guide*.

The **none** keyword is not supported in FIPS mode.

When the primary authentication method is local, the following rules apply to the authentication of a user:

- The device uses the backup authentication methods in sequence only if local authentication is invalid for one of the following reasons:
  - An exception occurs in the local authentication process.
  - The device connection is terminated or the user account is not configured on the device.
- The device does not turn to the backup authentication methods if local authentication is invalid because of any other reason. Authentication fails for the user.

Prerequisites

Before configuring authentication methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authentication method for each access type and service type.
2. Determine whether to configure the default authentication method for all access types or service types. The default authentication method applies to all access users. However, the method has a lower priority than the authentication method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authentication methods for all types of users.

   authentication default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **local** [**ldap-scheme** *ldap-scheme-name*] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the default authentication method is **local**.

4. Specify authentication methods for a user type or a service.
   - Specify authentication methods for LAN users.

     authentication lan-access { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**ldap-scheme** *ldap-scheme-name* | **radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authentication methods are used for LAN users.
   - Specify authentication methods for login users.

     authentication login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **local** [**ldap-scheme** *ldap-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default authentication methods are used for login users.
   - Specify authentication methods for portal users.

     authentication portal { **ldap-scheme** *ldap-scheme-name* [**local**] [**none**] | **local** [**ldap-scheme** *ldap-scheme-name* | **radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authentication methods are used for portal users.
   - Specify authentication methods for obtaining a temporary user role.

     authentication super { **hwtacacs-scheme** *hwtacacs-scheme-name* | **radius-scheme** *radius-scheme-name* } *

     By default, the default authentication methods are used for obtaining a temporary user role.

Configuring authorization methods for an ISP domain

Restrictions and guidelines

For high availability, you can specify one primary authorization method and multiple backup authorization methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local none** parameters specify a primary RADIUS authorization method and two backup methods (local authorization and no authorization). The device performs RADIUS authorization by default and performs local authorization when the RADIUS server is invalid. The device does not perform authorization when both of the previous methods are invalid.

The remote authorization method is invalid in the following situations:

- The specified authorization scheme does not exist.
- The device fails to send authorization request packets.
- The device does not receive any authorization response packets from an authorization server.

The local authorization method is invalid if the device fails to find the matching local user configuration.

Only SSL VPN users support LDAP authorization in the current software version.

To use a RADIUS scheme as the authorization method, specify the name of the RADIUS scheme that is configured as the authentication method for the ISP domain. If an invalid RADIUS scheme is specified as the authorization method, RADIUS authentication and authorization fail.

The **none** keyword is not supported in FIPS mode.

When the primary authorization method is local, the following rules apply:

- The device uses the backup authorization methods in sequence only if local authorization is invalid for one of the following reasons:
  - An exception occurs in the local authorization process.
  - The device connection is terminated or the user account is not configured on the device
- The device does not turn to the backup authorization methods if local authorization is invalid because of any other reason. Authorization fails for the user.

Prerequisites

Before configuring authorization methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an authorization scheme for each access type and service type.
2. Determine whether to configure the default authorization method for all access types or service types. The default authorization method applies to all access users. However, the method has a lower priority than the authorization method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view

2. Enter ISP domain view.

   domain *isp-name*

3. (Optional.) Specify default authorization methods for all types of users.

   authorization default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme**

radius-scheme-name [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

By default, the authorization method is **local**.

4. Specify authorization methods for a user type or a service.
   - Specify command authorization methods.

     authorization command { **hwtacacs-scheme** *hwtacacs-scheme-name* [**local**] [**none**] | **local** [**none**] | **none** }

     By default, the default authorization methods are used for command authorization.
   - Specify authorization methods for LAN users.

     authorization lan-access { **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authorization methods are used for LAN users.
   - Specify authorization methods for login users.

     authorization login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default authorization methods are used for login users.
   - Specify authorization methods for portal users.

     authorization portal { **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default authorization methods are used for portal users.

Configuring accounting methods for an ISP domain

Restrictions and guidelines

For high availability, you can specify one primary accounting method and multiple backup accounting methods. When the primary method is invalid, the device attempts to use the backup methods in sequence. For example, the **radius-scheme** *radius-scheme-name* **local** **none** parameters specify a primary RADIUS accounting method and two backup methods (local accounting and no accounting). The device performs RADIUS accounting by default and performs local accounting when the RADIUS server is invalid. The device does not perform accounting when both of the previous methods are invalid.

The remote accounting method is invalid in the following situations:

- The specified accounting scheme does not exist.
- The device fails to send accounting request packets.
- The device does not receive any accounting response packets from an accounting server.

The local accounting method is invalid if the device fails to find the matching local user configuration.

FTP, SFTP, and SCP users do not support accounting.

Local accounting does not provide statistics for charging. It only counts and controls the number of concurrent users that use the same local user account. The threshold is configured by using the **access-limit** command.

The **none** keyword is not supported in FIPS mode.

When the primary accounting method is local, the following rules apply:

- The device uses the backup accounting methods in sequence only if local accounting is invalid for one of the following reasons:
  - An exception occurs in the local accounting process.
  - The device connection is terminated or the user account is not configured on the device
- The device does not turn to the backup accounting methods if local accounting is invalid because of any other reason. Accounting fails for the user.

Prerequisites

Before configuring accounting methods, complete the following tasks:

1. Determine the access type or service type to be configured. With AAA, you can configure an accounting method for each access type and service type.
2. Determine whether to configure the default accounting method for all access types or service types. The default accounting method applies to all access users. However, the method has a lower priority than the accounting method that is specified for an access type or service type.

Procedure

1. Enter system view.

   system-view
2. Enter ISP domain view.

   domain *isp-name*
3. (Optional.) Specify default accounting methods for all types of users.

   accounting default { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

   By default, the accounting method is **local**.
4. Specify accounting methods for a user type.
   - Specify the command accounting method.

     accounting command hwtacacs-scheme *hwtacacs-scheme-name*

     By default, the default accounting methods are used for command accounting.
   - Specify accounting methods for LAN users.

     accounting lan-access { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

     By default, the default accounting methods are used for LAN users.
   - Specify accounting methods for login users.

     accounting login { **hwtacacs-scheme** *hwtacacs-scheme-name* [**radius-scheme** *radius-scheme-name*] [**local**] [**none**] | **local** [**radius-scheme** *radius-scheme-name* | **hwtacacs-scheme** *hwtacacs-scheme-name*] * [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**hwtacacs-scheme** *hwtacacs-scheme-name*] [**local**] [**none**] }

     By default, the default accounting methods are used for login users.
   - Specify accounting methods for portal users.

     accounting portal { **broadcast radius-scheme** *radius-scheme-name1* **radius-scheme** *radius-scheme-name2* [**local**] [**none**] | **local**

[**radius-scheme** *radius-scheme-name*] [**none**] | **none** | **radius-scheme** *radius-scheme-name* [**local**] [**none**] }

By default, the default accounting methods are used for portal users.

5. (Optional.) Configure extended accounting policies.
   - Configure access control for users that encounter accounting-start failures.

     accounting start-fail { **offline** | **online** }

     By default, the device allows users that encounter accounting-start failures to stay online.
   - Configure access control for users that have failed all their accounting-update attempts.

     accounting update-fail { [**max-times** *max-times*] **offline** | **online** }

     By default, the device allows users that have failed all their accounting-update attempts to stay online.
   - Configure access control for users that have used up their data or time accounting quotas.

     accounting quota-out { **offline** | **online** }

     By default, the device logs off users that have used up their accounting quotas.

Display and maintenance commands for ISP domains

Execute **display** commands in any view.

Task	Command
Display configuration information about an ISP domain or all ISP domains.	**display domain** [*isp-name*]

Configuring AAA fail-permit and recovery

About this task

This feature is used to resolve the issue that users cannot come online when all RADIUS servers are unavailable. The feature contains the following settings in a user authentication domain:

- In the user authentication domain, specify a critical domain (also known as fail-permit domain) to accommodate users that access the authentication domain when all RADIUS servers are unavailable. The users can come online in the critical domain without being authenticated when all RADIUS servers are unavailable.
- In the user authentication domain, specify an action to take on users that have been assigned to the critical domain when a RADIUS server becomes available.
  - To perform authentication, authorization, and accounting for the users, log off the users.
  - To allow the users to stay online without being authenticated, specify a recovery domain. When a RADIUS server becomes available, the users in the critical domain are assigned to the recovery domain.
  - To reauthenticate users in the original authentication domain without users being aware of the process, specify the reauthentication action.

For the device to obtain the status of RADIUS authentication servers in time, it detects the status of the RADIUS authentication servers in each RADIUS scheme at intervals. In addition, the device notifies access modules to remove users that use a RADIUS scheme from the critical domain when that RADIUS scheme has reachable RADIUS servers.

Restrictions and guidelines

This feature takes effect only on the 802.1X authentication, Web authentication, and MAC authentication for wired users.

When you specify a critical domain for an ISP domain, follow these restrictions and guidelines:

- If non-none authentication, authorization, or accounting methods are configured in the critical domain for an ISP domain, the non-none authentication or authorization methods cannot take effect on users. However, the non-none accounting methods in the critical domain can take effect on users.
- If an ISP domain has been specified as a critical domain, do not specify a critical domain for that ISP domain. If you do so, the critical domain specified for that ISP domain cannot take effect.
- If a critical domain has been specified for an ISP domain, do not specify that ISP domain as a critical domain. If you do so, that ISP domain cannot act as a critical domain.

When you specify a recovery domain for an ISP domain, follow these restrictions and guidelines:

- If the **none** method is configured as the backup authentication method in the original authentication domain before the users are assigned to the critical domain, the users are still assigned to the recovery domain when a RADIUS server becomes available.
- As a best practice to accurately identify whether a RADIUS authentication server is available and the recovery configuration can take effect in time, configure RADIUS server status detection.
- In the current software version, you can specify only an ISP domain as its own recovery domain in the view of the ISP domain.

When you set the interval at which the device detects the status of RADIUS authentication servers, follow these restrictions and guidelines:

- A too short interval consumes too many system resources for access services. A too long interval cannot detect server status changes in time.
- As a best practice, consider the processing efficiency for access services and the accuracy for fail-permit and recovery when a large number of users come online in a short time.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Set the interval at which the device detects the status of RADIUS authentication servers.

   radius-server authen-state-check interval *interval*

   By default, the device detects the status of RADIUS authentication servers at intervals of 10 minutes.

3. Enter ISP domain view.

   domain *isp-name*

4. Specify a critical domain to accommodate users that access the ISP domain when all RADIUS servers are unavailable.

   authen-radius-unavailable online domain *new-isp-name*

   By default, no critical domain is specified for an ISP domain to accommodate users that access the ISP domain when all RADIUS servers are unavailable.

5. Specify an action to take on users in the critical domain when a RADIUS server becomes available.

   authen-radius-recover { **offline** | **online domain** *new-isp-name* | **re-authen** }

   By default, no action is specified for users in the critical domain when a RADIUS server becomes available.

Setting the maximum number of concurrent login users

About this task

Perform this task to set the maximum number of concurrent users that can log on to the device through a specific protocol, regardless of their authentication methods. The authentication methods include no authentication, local authentication, and remote authentication.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of concurrent login users.
   In non-FIPS mode:
   aaa session-limit { **ftp** | **http** | **https** | **ssh** | **telnet** } *max-sessions*
   In FIPS mode:
   aaa session-limit { **https** | **ssh** } *max-sessions*
   By default, the maximum number of concurrent login users is 32 for each user type.

Configuring a NAS-ID

About this task

During RADIUS authentication, the device uses a NAS-ID to set the NAS-Identifier attribute of RADIUS packets so that the RADIUS server can identify the access location of users.

The device selects the NAS-ID for the NAS-Identifier attribute in the following order:

1. NAS-ID in a VSRP instance. For more information, see VSRP configuration in *High Availability Configuration Guide*.
2. NAS-ID bound with VLANs in a NAS-ID profile.

If no NAS-ID is configured, the device uses the device name (set by using the **sysname** command) as the NAS-ID.

Configure a NAS-ID profile to maintain NAS-ID and VLAN bindings on the device so that the device can send different NAS-Identifier attribute strings in RADIUS requests from different VLANs.

Restrictions and guidelines

You can apply a NAS-ID profile to portal- or port security-enabled interfaces. For more information, see "Configuring portal authentication" and "Configuring port security."

You can configure multiple NAS-ID and VLAN bindings in a NAS-ID profile.

A NAS-ID can be bound with more than one VLAN, but a VLAN can be bound with only one NAS-ID. If you configure multiple bindings for the same VLAN, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Create a NAS-ID profile and enter NAS-ID profile view.
   aaa nas-id profile *profile-name*
3. Configure a NAS-ID and VLAN binding in the profile.
   nas-id *nas-identifier* **bind vlan** *vlan-id*

Configuring the device ID

About this task

RADIUS uses the value of the Acct-Session-ID attribute as the accounting ID for a user. The device generates an Acct-Session-ID value for each online user based on the system time, random digits, and device ID.

Restrictions and guidelines

On a VSRP network where multiple devices use the same accounting server, accounting ID conflicts might occur. To avoid duplicate accounting IDs, perform this task to assign a unique device ID to each device.

Procedure

1. Enter system view.
   `system-view`
2. Configure the device ID.
   `aaa device-id` *`device-id`*
   By default, the device ID is 0.

Enabling password change prompt logging

About this task

Use this feature to enhance the protection of passwords for Telnet, SSH, HTTP, HTTPS, NETCONF over SSH, and NETCONF over SOAP users and improve the system security.

This feature enables the device to generate logs to prompt users to change their weak passwords at an interval of 24 hours and at the users' login.

A password is a weak password if it does not meet the following requirements:

- Password composition restriction configured by using the **`password-control composition`** command.
- Minimum password length restriction set by using the **`password-control length`** command.
- Password complexity checking policy configured by using the **`password-control complexity`** command.

For a NETCONF over SSH or NETCONF over SOAP user, the device also generates a password change prompt log if any of the following conditions exists:

- The current password of the user is the default password or has expired.
- The user logs in to the device for the first time or uses a new password to log in after global password control is enabled.

The device will no longer generate password change prompt logs for a user when one of the following conditions exists:

- The password change prompt logging feature is disabled.
- The user has changed the password and the new password meets the password control requirements.
- The enabling status of a related password control feature has changed so the current password of the user meets the password control requirements.
- The password composition policy or the minimum password length has changed.

Restrictions and guidelines

You can use the **display password-control** command to display password control configuration. For more information about password control commands, see password control commands in *Security Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enable password change prompt logging.
   local-server log change-password-prompt
   By default, password change prompt logging is enabled.

Configuring the RADIUS server feature

RADIUS server feature tasks at a glance

To configure the RADIUS server feature, perform the following tasks:

1. Configuring RADIUS users
2. Specifying RADIUS clients
3. Activating the RADIUS server configuration

Restrictions and guidelines for the RADIUS server feature

To ensure correct operation of the RADIUS server feature, disable RADIUS session-control on the device.

Configuring RADIUS users

To configure RADIUS users, you must configure network access users, which are the basis of RADIUS user data.

A RADIUS user has the following attributes: user name, password, description, authorization ACL, authorization VLAN, and expiration time. For more information, see "Configuring attributes for network access users."

Specifying RADIUS clients

About this task

Perform this task to specify RADIUS clients and shared keys for centralized management. The RADIUS server feature does not accept requests from RADIUS clients that are not managed by the system.

Restrictions and guidelines

The IP address of a RADIUS client must be the same as the source IP address for outgoing RADIUS packets specified on the RADIUS client.

The shared key of a RADIUS client specified on the RADIUS server must be the same as the setting on the RADIUS client.

Procedure

1. Enter system view.

system-view

2. Specify a RADIUS client.
   radius-server client ip *ipv4-address* **key** { **cipher** | **simple** } *string*

Activating the RADIUS server configuration

About this task

At the device startup, the RADIUS server configuration is automatically activated, including RADIUS users and RADIUS clients. You can immediately activate the most recent RADIUS server configuration if you have added, modified, or deleted RADIUS clients and network access users from which RADIUS user data is generated.

Procedure

1. Enter system view.
   system-view
2. Activate the RADIUS server configuration.
   radius-server activate

   Executing this command restarts the RADIUS server process and an authentication service interruption will occur during the restart.

Display and maintenance commands for RADIUS users and clients

Execute **display** commands in any view.

Task	Command
Display information about activated RADIUS users.	**display radius-server active-user** [*user-name*]
Display information about activated RADIUS clients.	**display radius-server active-client**

Configuring the connection recording policy

About the connection recording policy

Use this feature on scenarios where the device acts as an FTP, SSH, SFTP, or Telnet login client to establish a connection with a login server. This feature enables the device to provide an accounting server with the connection start and termination information. When the login client establishes a connection with the login server, the system sends a start-accounting request to the accounting server. When the connection is terminated, the system sends a stop-accounting request to the accounting server.

Restrictions and guidelines

The device includes the username entered by a user in the accounting packets to be sent to the AAA server for connection recording. The username format configured by using the **user-name-format** command in the accounting scheme does not take effect.

Procedure

1. Enter system view.
   system-view
2. Create a connection recording policy and enter its view.
   aaa connection-recording policy
3. Specify the accounting method for the connection recording policy.
   accounting hwtacacs-scheme *hwtacacs-scheme-name*

Display and maintenance commands for the connection recording policy

Execute **display** commands in any view.

Task	Command
Display the connection recording policy configuration.	**display aaa connection-recording policy**

Displaying user MAC and UUID binding entries

About this task

To help administrators identify whether a universally unique identifier (UUID) has been assigned to a user and maintain the MAC and UUID binding entries for users, use this feature.

In some scenarios, administrators configure and manage MAC address and UUID binding entries for users on the authentication server, depending on the user access control policies. The binding entries will be assigned to the users after they pass authentication. The device automatically generates the MAC and UUID binding entry of a user when the user comes online and automatically deletes the binding entry when the user goes offline.

When a user's client requests the DHCP server to assign or release an IP address, the DHCP snooping module first searches for the UUID bound to the client MAC address. Then, the device replaces the value of Option 61 (client ID) in the client's DHCP packets with the UUID and forwards the DHCP packets to the DHCP server. The DHCP server will assign or reclaim an IP address based on the UUID in the received DHCP packets. UUID-based IP address assignment flexibly meets the IP address requirements of different scenarios.

Hardware and feature compatibility

The S5200-EI-G switch series does not support configuring this feature.

Restrictions and guidelines

The device supports user MAC and UUID binding entries only for 802.1X and MAC authentication users that use the iNode client.

Procedure

To display user MAC and UUID binding entries, execute the following command in any view:

display mubm record [**mac** *mac-address*] [**interface** *interface-type interface-number* | **slot** *slot-number*] [**access-type** { **dot1x** | **mac-auth** }]

Configuring user online and offline recording

About user online and offline recording

This feature enables the device to record user information when the users fail to come online, or the users go offline normally or abnormally. These records help the administrator to quickly identify the causes of user online and offline faults. The feature occupies the system memory. To reduce the memory usage, you can disable this feature.

Restrictions and guidelines for user online and offline recording configuration

This feature is applicable only to portal, login, and LAN users.

Enabling user online failure recording

1. Enter system view.
   system-view
2. Enable user online failure recording.
   aaa online-fail-record enable
   By default, user online failure recording is disabled.

Enabling user offline recording

1. Enter system view.
   system-view
2. Enable user offline recording.
   aaa offline-record enable
   By default, user offline recording is disabled.
3. Enable user normal offline recording.
   aaa normal-offline-record enable
   By default, user normal offline recording is disabled.
4. Enable user abnormal offline recording.
   aaa abnormal-offline-record enable
   By default, user abnormal offline recording is disabled.

Enabling real-time recording of AAA user associations and disassociations

1. Enter system view.
   system-view
2. Enabling real-time recording of AAA user associations and disassociations.
   aaa { **abnormal-offline-record** | **normal-offline-record** | **online-fail-record** } * **realtime-backup enable**
   By default, real-time recording of AAA user associations and disassociations is disabled.

Display and maintenance commands for user online and offline recording

Execute **display** commands in any view and **reset** commands in user view and **reset** commands in user view.

Task	Command
Display user abnormal offline records.	**display aaa abnormal-offline-record** { **access-type** { **lan-access** | **login** | **portal** } | **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*] **display aaa abnormal-offline-record offline-reason** { **idle-cut** | **quota-out** | **realtime-acct-fail** | **session-timeout** | **user-detect-fail** } [**brief**] **display aaa abnormal-offline-record time** *begin-time end-time* [**date** *begin-date end-date*] [**brief**] **display aaa abnormal-offline-record**
Display user normal offline records.	**display aaa normal-offline-record** { **access-type** { **lan-access** | **login** | **portal** } | **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*] **display aaa normal-offline-record time** *begin-time end-time* [**date** *begin-date end-date*] [**brief**] **display aaa normal-offline-record**
Display user offline records.	**display aaa offline-record** { **access-type** { **lan-access** | **login** | **portal** } | **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*] **display aaa offline-record time** *begin-time end-time* [**date** *begin-date end-date*] [**brief**]

	display aaa offline-record
Display user online failure records.	**display aaa online-fail-record** { **access-type** { **lan-access** | **login** | **portal** } | **domain** *domain-name* | **interface** *interface-type interface-number* | { **ip** *ipv4-address* | **ipv6** *ipv6-address* } | **mac-address** *mac-address* | **s-vlan** *svlan-id* [**c-vlan** *cvlan-id*] | **slot** *slot-number* | **username** *user-name* [**fuzzy-match**] | **reason-code** *code* } * [**time** *begin-time end-time* [**date** *begin-date end-date*]] [**brief** | **count** *count*] **display aaa online-fail-record time** *begin-time end-time* [**date** *begin-date end-date*] [**brief**] **display aaa online-fail-record**
Clear user abnormal offline records.	**reset aaa abnormal-offline-record**
Clear user normal offline records.	**reset aaa normal-offline-record**
Clear user offline records.	**reset aaa offline-record**
Clear user online failure records.	**reset aaa online-fail-record**

Configuring the AAA test feature

About this task

This feature enables the device to send authentication or accounting requests to the specified AAA servers to simulate an authentication or accounting process of a user. Use this feature to identify the reasons for the failure of the interaction between the device and the AAA servers. This feature is applicable only to RADIUS.

When performing an AAA test, the device ignores the status of the specified AAA servers and the RADIUS server load sharing feature. The process of an AAA test is as follows:

1. The device sends authentication requests that carry the specified username and password to the specified authentication server or to the authentication servers in the specified RADIUS scheme. The device tries to communicate with the authentication servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives an authentication response (no matter the authentication succeeds or fails).
   - The device does not receive any authentication response after making all authentication request attempts.

   This step is skipped if no correct authentication server is specified for the AAA test or no authentication servers are configured in the specified RADIUS scheme.
2. The device sends start-accounting requests to the specified accounting server or to the accounting servers in the specified RADIUS scheme. The device tries to communicate with the accounting servers in the specified scheme in sequence.

   The process goes to the next step in the following situations:

   - The device receives a start-accounting response (no matter the accounting succeeds or fails).

- The device does not receive any start-accounting response after making all start-accounting request attempts.

This step and the next step are skipped if no correct accounting server is specified for the AAA test or no accounting servers are configured in the specified RADIUS scheme.

3. The device sends stop-accounting requests to the accounting servers to which it has sent a start-accounting request.

   The process finishes in the following situations:

   - The device receives a stop-accounting response.
   - The device does not receive any stop-accounting response after making all stop-accounting request attempts.

To identify attributes that cause authentication or accounting failures, you can configure the device to carry specific attributes in RADIUS requests or define values for specific attributes in the requests. Table 4 shows the attributes that RADIUS requests carry by default.

Table 4 Attributes that RADIUS requests carry by default

Packet type	Attributes that the type of packets carry by default
RADIUS authentication request	User-Name CHAP-Password (or User-Password) CHAP-Challenge NAS-IP-Address (or NAS-IPv6-Address) Service-Type Framed-Protocol NAS-Identifier NAS-Port-Type Acct-Session-Id
RADIUS accounting request	User-Name Acct-Status-Type NAS-IP-Address (or NAS-IPv6-Address) NAS-Identifier Acct-Session-Id Acct-Delay-Time Acct-Terminate-Cause

Restrictions and guidelines

When you perform an AAA test, follow these restrictions and guidelines:

- The device might communicate with the AAA servers incorrectly during an AAA test. Make sure no users come online or go offline during an AAA text.
- If the configuration of the specified RADIUS scheme changes, the new configuration does not affect the current AAA test. The modification will take effect in the next test.
- The system can have only one AAA test at a time. Another AAA test can be performed only after the current test finishes.

When you configure attributes to be included in or excluded from RADIUS requests, follow these restrictions and guidelines:

- Before you include an attribute that is already configured to be excluded from RADIUS requests, you must cancel the exclusion configuration by using the **undo exclude** command.
- Before you exclude an attribute that is already configured to be included in RADIUS requests, you must cancel the inclusion configuration by using the **undo include** command.

Prerequisites

Before you perform an AAA test, you must configure a RADIUS scheme that contains the RADIUS servers to be tested.

Plan the RADIUS attributes to be included in RADIUS requests. Besides the attributes carried by default, the device adds the specified attributes to RADIUS packets in the order that they are specified by using the **include** command. Additional attributes cannot be added to a RADIUS request if the length of the RADIUS request reaches 4096 bytes.

Procedure

1. (Optional.) Configure a RADIUS attribute test group:
   a. Enter system view.

      system-view

   b. Create a RADIUS attribute test group and enter its view.

      radius attribute-test-group *attr-test-group-name*

      You can create multiple RADIUS attribute test groups.

   c. Include an attribute in RADIUS requests.

      include { **accounting** | **authentication** } { **name** *attribute-name* | [**vendor** *vendor-id*] **code** *attribute-code* } **type** { **binary** | **date** | **integer** | **interface-id** | **ip** | **ipv6** | **ipv6-prefix** | **octets** | **string** } value *attribute-value*

      Use this command to add attributes that RADIUS requests do not carry by default to the RADIUS requests.

      For an attribute that RADIUS requests carry by default, you can use this command to change its attribute value.

   d. Exclude an attribute from RADIUS requests.

      exclude { **accounting** | **authentication** } **name** *attribute-name*

      Use this command to exclude an attribute that RADIUS requests carry by default from the RADIUS requests sent during an AAA test to help troubleshoot authentication or accounting failures.

   e. Return to system view.

      quit

   f. Return to user view.

      quit

2. Perform an AAA test in user view.

   test-aaa user *user-name* **password** *password* **radius-scheme** *radius-scheme-name* [**radius-server** { *ipv4-address* | **ipv6** *ipv6-address* } *port-number* [**vpn-instance** *vpn-instance-name*]] [**chap** | **pap**] [**attribute-test-group** attr-*test-group-name*] [**trace**]

Configuring authorization information cache for AAA users

Enabling RADIUS authorization information cache for LAN users

About this task

With this feature enabled, when a LAN user passes RADIUS authentication and comes online in an ISP domain, the system records the authorization information returned by the RADIUS server in the authorization information cache. When the user tries to perform RADIUS authentication and come online in the same ISP domain again, if no server is available, the system queries the cached authorization information for the user. If a match is found, the system uses the cached information to perform authentication and authorization and returns authentication success to the user.

With this feature disabled, the system does not record the authorization information returned by the RADIS server for users.

Restrictions and guidelines

For this feature to take effect, you must also enable authorization information cache for AAA users globally (**aaa authorization-cache enable**).

To use this feature, if the accounting scheme and authentication scheme are the same in the ISP domain, configure RADIUS-based remote authentication as the primary accounting method and configure no authentication as the backup accounting method, or allow users that have failed all their accounting-update attempts to stay online.

Procedure

1. Enter system view.
   system-view
2. Enable authorization information cache for AAA users.
   aaa authorization-cache enable
   By default, authorization information cache is disabled for AAA users.
3. Specify the aging time of authorization information cache entries.
   aaa authorization-cache expiry *expiry-time*
   By default, the aging time of authorization information cache entries is 336 hours.
4. Enter ISP domain view.
   domain *isp-name*
5. Enable RADIUS authorization information cache for LAN users.
   authorization lan-access radius-cache enable
   By default, RADIUS authorization information cache is disabled for LAN users.

Display and maintenance commands for authorization information cache for AAA users

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display the recorded authorization information cache entries.	**display aaa authorization-cache** [**dot1x** | **mac-auth** | **static** | **web-auth**] [**mac** *mac-address*]
Clear the recorded authorization information cache entries.	**reset aaa authorization-cache** [**dot1x** | **mac-auth** | **static** | **web-auth**] [mac *mac-address*] [**username** *username*]

Enable authorization information cache for AAA users globally

About this task

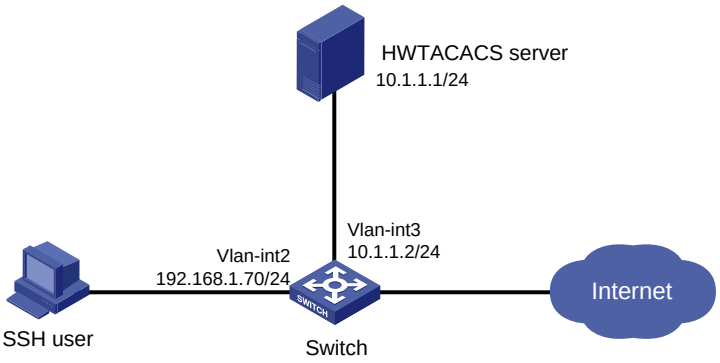
This feature enables the system to record and query specific authorization information cache of users during the authentication process in each ISP domain. After you disable this feature, the system stops recording and querying user authorization information cache and deletes existing authorization information cache entries.

Procedure

1. Enter system view.
   system-view
2. Enable authorization information cache for AAA users.
   aaa authorization-cache enable
   By default, authorization information cache is disabled for AAA users.
3. Specify the aging time of authorization information cache entries.
   aaa authorization-cache expiry *expiry-time*
   By default, the aging time of authorization information cache entries is 336 hours.
4. Specify the maximum number of authorization information cache entries for AAA users.
   aaa authorization-cache max-number max-number
   By default, the system can record a maximum of 8000 authorization information cache entries for AAA users.
5. Specify the aging time of authorization information cache entries for AAA users matching the specified ACL.
   aaa authorization-cache acl *acl-number* **expiry** *expiry-time*
   By default, the aging time is determined by the configuration of the **aaa authorization-cache expiry** command.

AAA configuration examples

Example: Configuring AAA for SSH users by an HWTACACS server



Network configuration

As shown in Figure 16, configure the switch to meet the following requirements:

- Use the HWTACACS server for SSH user authentication, authorization, and accounting.

- Assign the default user role **network-operator** to SSH users after they pass authentication.
- Exclude domain names from the usernames sent to the HWTACACS server.
- Use **expert** as the shared keys for secure HWTACACS communication.

Figure 16 Network diagram

Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for the interfaces. (Details not shown.)

Create an HWTACACS scheme.

```
<Switch> system-view
[Switch] hwtacacs scheme hwtac
```

Specify the primary authentication server.

```
[Switch-hwtacacs-hwtac] primary authentication 10.1.1.1 49
```

Specify the primary authorization server.

```
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.1 49
```

Specify the primary accounting server.

```
[Switch-hwtacacs-hwtac] primary accounting 10.1.1.1 49
```

Set the shared keys to **expert** in plaintext form for secure HWTACACS communication.

```
[Switch-hwtacacs-hwtac] key authentication simple expert
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] key accounting simple expert
```

Exclude domain names from the usernames sent to the HWTACACS server.

```
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Create an ISP domain named **bbb** and configure the domain to use the HWTACACS scheme for authentication, authorization, and accounting of login users.

```
[Switch-isp-bbb] authentication login hwtacacs-scheme hwtac
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login hwtacacs-scheme hwtac
[Switch-isp-bbb] quit
```

Create local RSA and DSA key pairs.

```
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

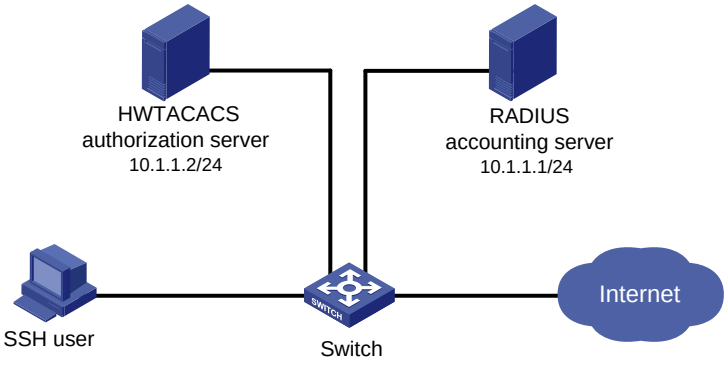
```
[Switch] role default-role enable
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter the correct username and password. The user logs in to the switch. The username must carry the domain name **bbb** in the *username*@**bbb** format. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring local authentication, HWTACACS authorization, and RADIUS accounting for SSH users



Network configuration

As shown in Figure 17, configure the switch to meet the following requirements:

- Perform local authentication for SSH users.
- Use the HWTACACS server and RADIUS server for SSH user authorization and accounting, respectively.
- Exclude domain names from the usernames sent to the servers.
- Assign the default user role **network-operator** to SSH users after they pass authentication.

Configure an account named **hello** for the SSH user. Configure the shared keys to **expert** for secure communication with the HWTACACS server and RADIUS server.

Figure 17 Network diagram

Configuring the HWTACACS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the RADIUS server

Set the shared keys to **expert** for secure communication with the switch, add an account for the SSH user, and specify the password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an HWTACACS scheme.

```
[Switch] hwtacacs scheme hwtac
[Switch-hwtacacs-hwtac] primary authorization 10.1.1.2 49
[Switch-hwtacacs-hwtac] key authorization simple expert
[Switch-hwtacacs-hwtac] user-name-format without-domain
[Switch-hwtacacs-hwtac] quit
```

Configure a RADIUS scheme.

```
[Switch] radius scheme rd
[Switch-radius-rd] primary accounting 10.1.1.1 1813
[Switch-radius-rd] key accounting simple expert
[Switch-radius-rd] user-name-format without-domain
[Switch-radius-rd] quit
```

Create a device management user.

```
[Switch] local-user hello class manage
```

Assign the SSH service to the local user.

```
[Switch-luser-manage-hello] service-type ssh
```

Set the password to **123456TESTplat&!** in plaintext form for the local user. In FIPS mode, you must set the password in interactive mode.

```
[Switch-luser-manage-hello] password simple 123456TESTplat&!
[Switch-luser-manage-hello] quit
```

Create an ISP domain named **bbb** and configure the login users to use local authentication, HWTACACS authorization, and RADIUS accounting.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login local
[Switch-isp-bbb] authorization login hwtacacs-scheme hwtac
[Switch-isp-bbb] accounting login radius-scheme rd
[Switch-isp-bbb] quit
```

Enable the default user role feature to assign authenticated SSH users the default user role **network-operator**.

```
[Switch] role default-role enable
```

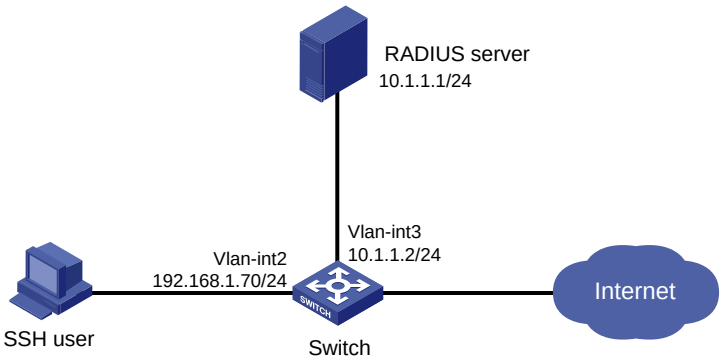
Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-operator user role. (Details not shown.)

Example: Configuring authentication and authorization for SSH users by a RADIUS server

Network configuration



As shown in Figure 18, configure the switch to meet the following requirements:

- Use the RADIUS server for SSH user authentication and authorization.
- Include domain names in the usernames sent to the RADIUS server.
- Assign the **network-admin** user role to SSH users after they pass authentication.

The RADIUS server runs IMC PLAT 7.3 (E0605) and IMC UAM 7.3 (E0512). Add an account with username **hello@bbb** on the RADIUS server.

The RADIUS server and the switch use **expert** as the shared key for secure RADIUS communication. The ports for authentication and accounting are **1812** and **1813**, respectively.

Figure 18 Network diagram

Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

   Log in to IMC, click the **User** tab, and select **User Access Policy** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the ports for authentication and accounting to 1812 and 1813, respectively.

   b. Select **Device Management Service** from the **Service Type** list.

   c. Select **H3C (General)** from the **Access Device Type** list.

   d. Set the shared key to **expert** for secure RADIUS communication.

   e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.

   f. Use the default values for other parameters and click **OK**.

   The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

   - IP address specified by using the **`nas-ip`** command.

- IP address specified by using the **`radius nas-ip`** command.
- IP address of the outbound interface (the default).

Figure 19 Adding the switch as an access device

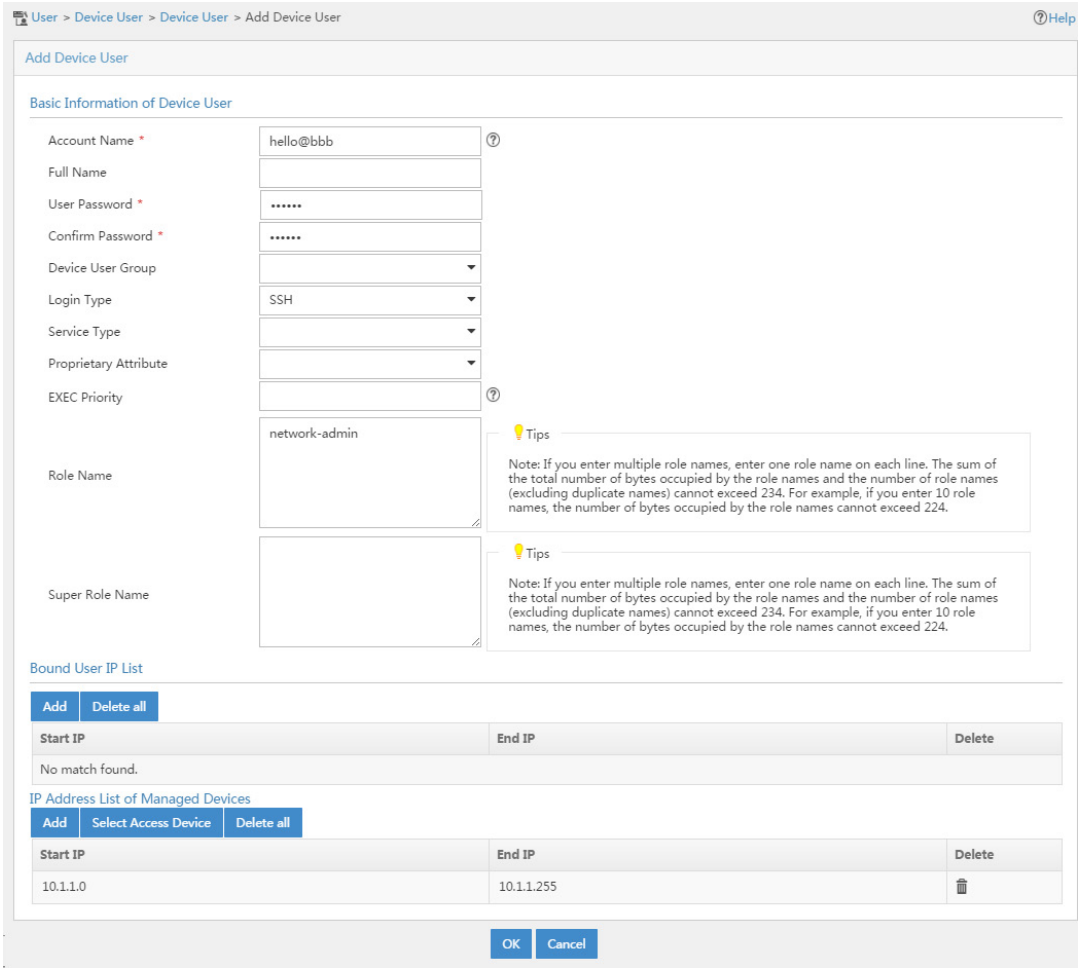
2. Add an account for device management:

Click the **User** tab, and select **Device User** > **Device User** from the navigation tree. Then, click **Add** to configure a device management account as follows:

a. Enter account name **hello@bbb** and specify the password.

b. Select **SSH** from the **Login Type** list.

c. Enter user role **network-admin**.



d. Specify 10.1.1.0 to 10.1.1.255 as the IP address range of the hosts to be managed.

e. Click **OK**.

NOTE:

The IP address range must contain the IP address of the switch.

Figure 20 Adding an account for device management

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Create a RADIUS scheme.

```
[Switch] radius scheme rad
```

Specify the primary authentication server.

```
[Switch-radius-rad] primary authentication 10.1.1.1 1812
```

Set the shared key to **expert** in plaintext form for secure communication with the server.

```
[Switch-radius-rad] key authentication simple expert
```

Include domain names in the usernames sent to the RADIUS server.

```
[Switch-radius-rad] user-name-format with-domain
[Switch-radius-rad] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login radius-scheme rad
[Switch-isp-bbb] authorization login radius-scheme rad
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

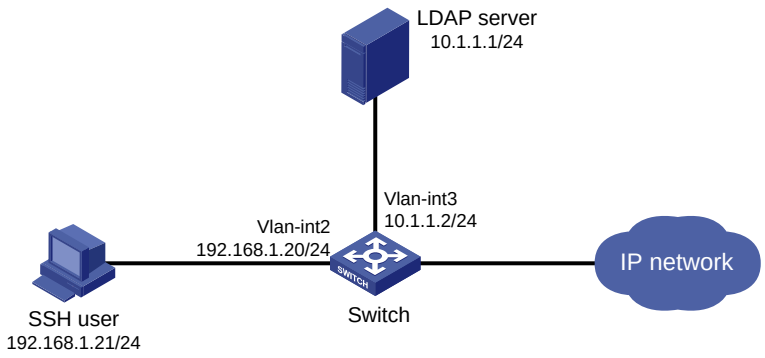
Verifying the configuration

Initiate an SSH connection to the switch, and enter username **hello@bbb** and the correct password. The user logs in to the switch. (Details not shown.)

Verify that the user can use the commands permitted by the network-admin user role. (Details not shown.)

Example: Configuring authentication for SSH users by an LDAP server

Network configuration



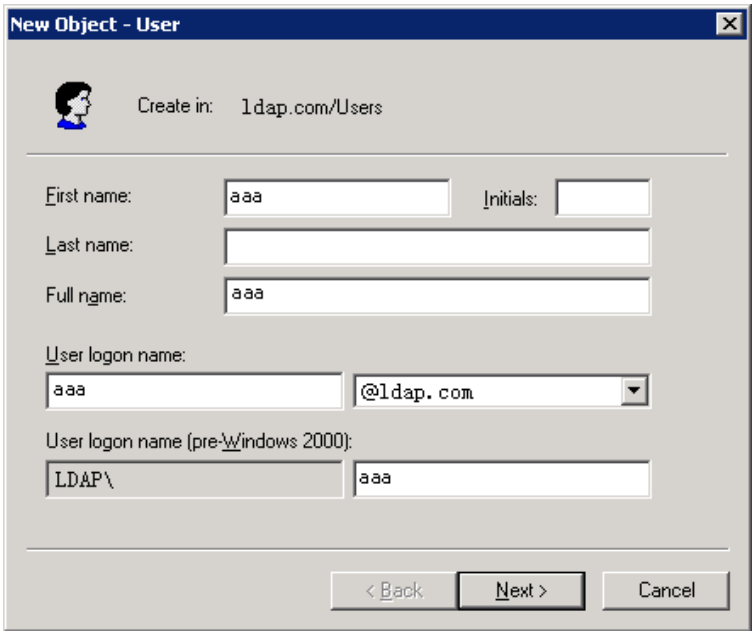
As shown in Figure 21, the LDAP server uses domain **ldap.com** and runs Microsoft Windows 2003 Server Active Directory.

Configure the switch to meet the following requirements:

- Use the LDAP server to authenticate SSH users.
- Assign the level-0 user role to SSH users after they pass authentication.

On the LDAP server, set the administrator password to **admin!123456**, add a user named **aaa**, and set the user's password to **ldap!123456**.

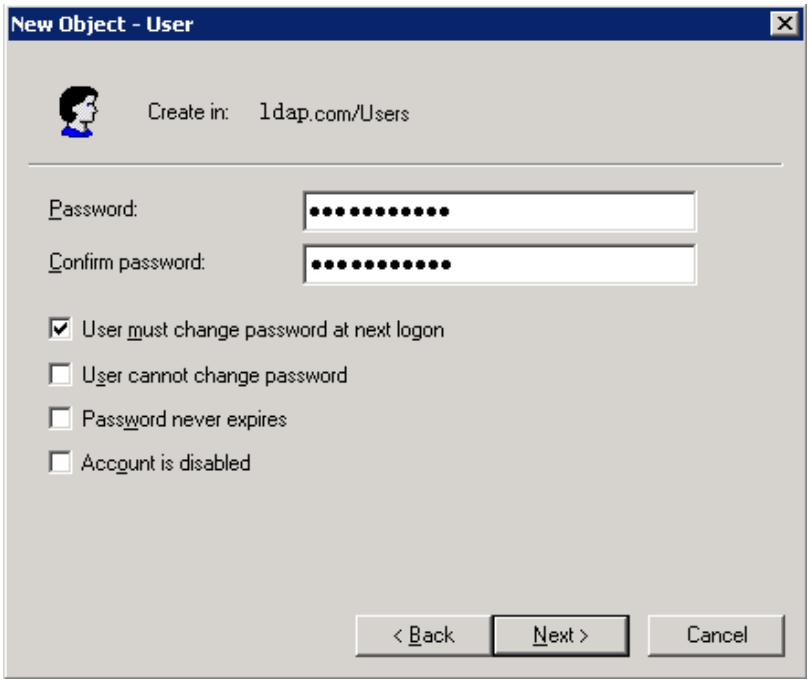
Figure 21 Network diagram



Configuring the LDAP server

1. Add a user named **aaa** and set the password to **ldap!123456**:
   a. On the LDAP server, select **Start** > **Control Panel** > **Administrative Tools**.
   b. Double-click **Active Directory Users and Computers**.
      The **Active Directory Users and Computers** window is displayed.
   c. From the navigation tree, click **Users** under the **ldap.com** node.

d. Select **Action** > **New** > **User** from the menu to display the dialog box for adding a user.



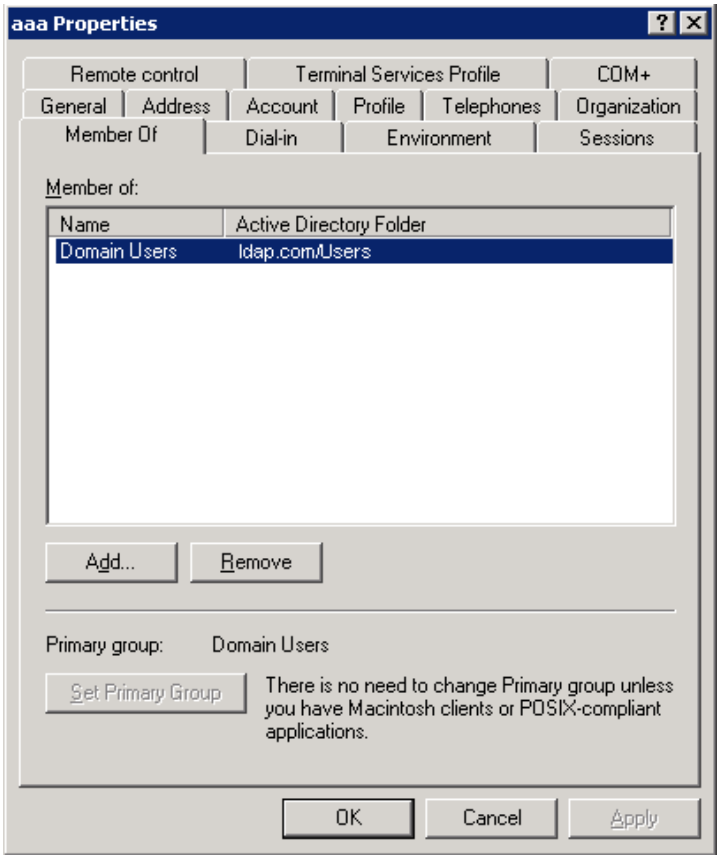
e. Enter logon name **aaa** and click **Next**.

Figure 22 Adding user aaa

f. In the dialog box, enter password **ldap!123456**, select options as needed, and click **Next**.

Figure 23 Setting the user's password

g. Click **OK**.



2. Add user **aaa** to group **Users**:

a. From the navigation tree, click **Users** under the **ldap.com** node.

b. In the right pane, right-click user **aaa** and select **Properties**.

c. In the dialog box, click the **Member Of** tab and click **Add**.

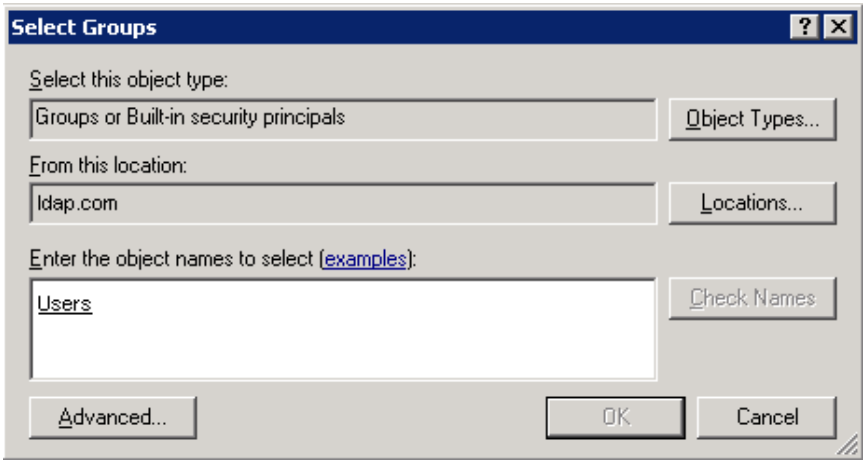


Figure 24 Modifying user properties

d. In the **Select Groups** dialog box, enter **Users** in the **Enter the object names to select** field, and click **OK**.

User **aaa** is added to group **Users**.

Figure 25 Adding user aaa to group Users

3. Set the administrator password to **admin!123456**:

a. In the right pane, right-click user **Administrator** and select **Set Password**.

b. In the dialog box, enter the administrator password. (Details not shown.)

Configuring the switch

Configure IP addresses for interfaces. (Details not shown.)

Create local RSA and DSA key pairs.

```
<Switch> system-view
[Switch] public-key local create rsa
[Switch] public-key local create dsa
```

Enable the Stelnet service.

```
[Switch] ssh server enable
```

Enable scheme authentication for user lines VTY 0 through VTY 63.

```
[Switch] line vty 0 63
[Switch-line-vty0-63] authentication-mode scheme
[Switch-line-vty0-63] quit
```

Configure an LDAP server.

```
[Switch] ldap server ldap1
```

Specify the IP address of the LDAP authentication server.

```
[Switch-ldap-server-ldap1] ip 10.1.1.1
```

Specify the administrator DN.

```
[Switch-ldap-server-ldap1] login-dn cn=administrator,cn=users,dc=ldap,dc=com
```

Specify the administrator password.

```
[Switch-ldap-server-ldap1] login-password simple admin!123456
```

Configure the base DN for user search.

```
[Switch-ldap-server-ldap1] search-base-dn dc=ldap,dc=com
[Switch-ldap-server-ldap1] quit
```

Create an LDAP scheme.

```
[Switch] ldap scheme ldap-shm1
```

Specify the LDAP authentication server.

```
[Switch-ldap-ldap-shm1] authentication-server ldap1
[Switch-ldap-ldap-shm1] quit
```

Create an ISP domain named **bbb** and configure authentication, authorization, and accounting methods for login users.

```
[Switch] domain bbb
[Switch-isp-bbb] authentication login ldap-scheme ldap-shm1
[Switch-isp-bbb] authorization login none
[Switch-isp-bbb] accounting login none
[Switch-isp-bbb] quit
```

Verifying the configuration

Initiate an SSH connection to the switch, and enter username **aaa@bbb** and password **ldap!123456**. The user logs in to the switch. (Details not shown.)

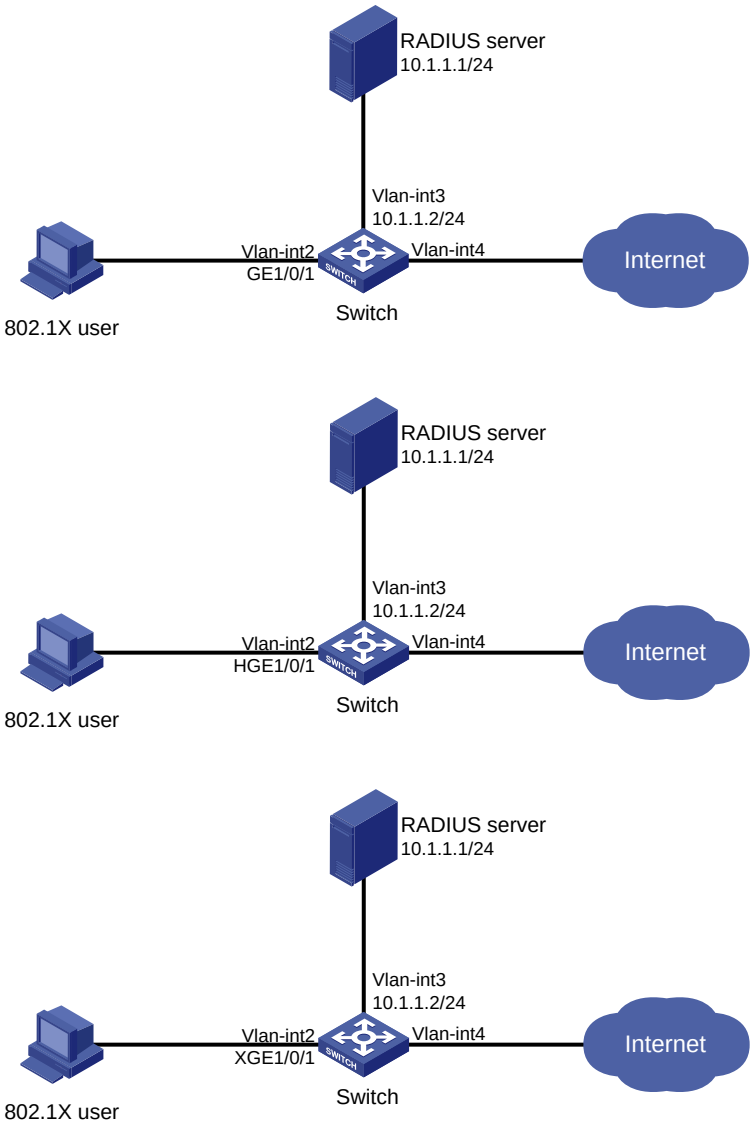
Verify that the user can use the commands permitted by the level-0 user role. (Details not shown.)

Example: Configuring AAA for 802.1X users by a RADIUS server

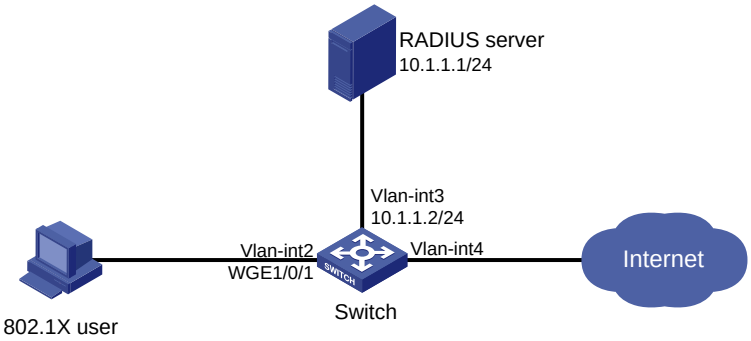
Network configuration

As shown in Figure 26, configure the switch to meet the following requirements:

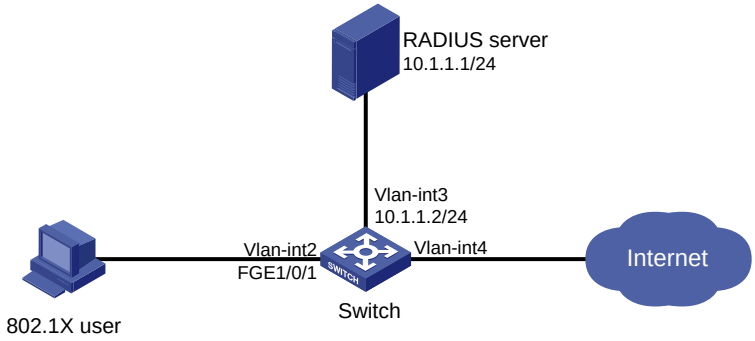
- Use the RADIUS server for authentication, authorization, and accounting of 802.1X users.



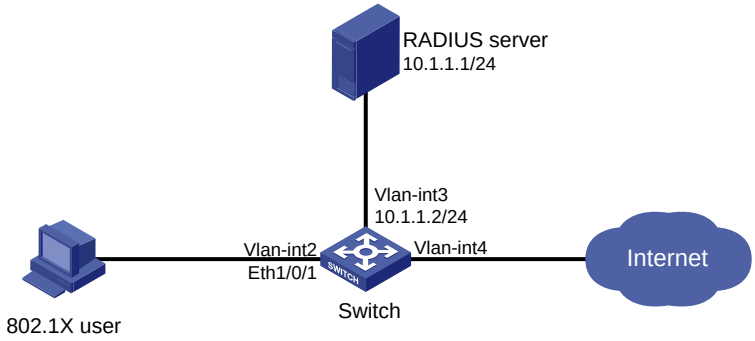
- Use MAC-based access control on GigabitEthernet 1/0/1 to authenticate all 802.1X users on the port separately.
- Include domain names in the usernames sent to the RADIUS server.



In this example, the RADIUS server runs IMC PLAT 7.1 (E0303), IMC UAM 7.1 (E0304), and IMC CAMS 7.1 (E0301). On the RADIUS server, perform the following tasks:



- Add a service that charges 120 dollars for up to 120 hours per month and assigns authenticated users to VLAN 4.
- Configure a user with name **dot1x@bbb** and assign the service to the user.



Set the shared keys to **expert** for secure RADIUS communication. Set the ports for authentication and accounting to 1812 and 1813, respectively.

Configuring the RADIUS server

1. Add the switch to the IMC Platform as an access device:

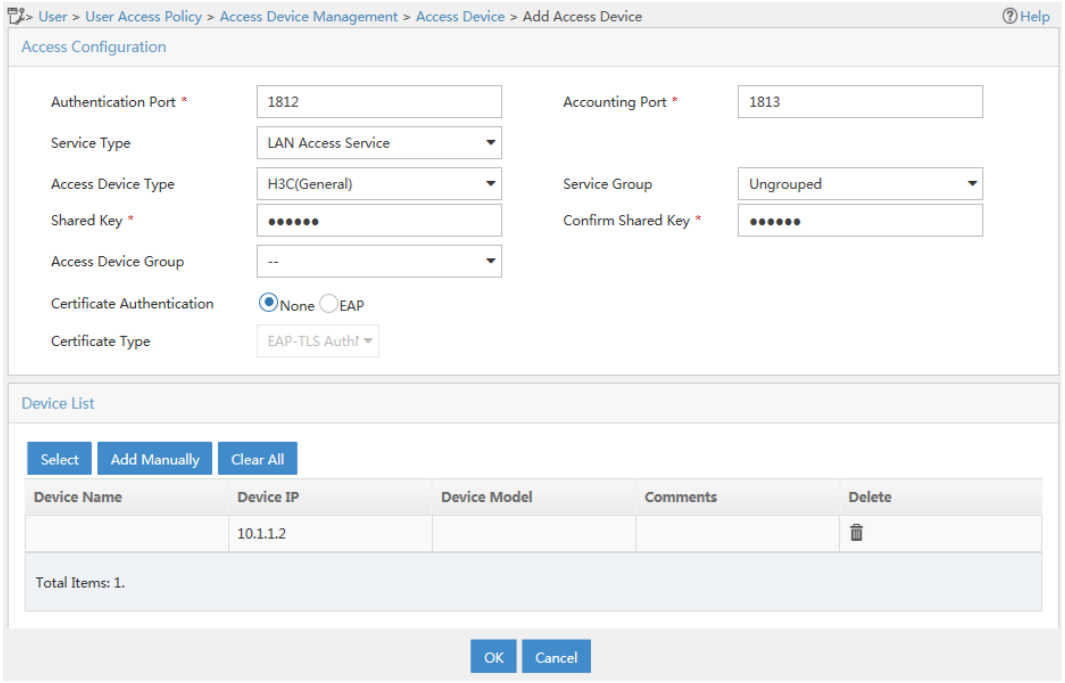
   Log in to IMC, click the **User** tab, and select **User Access Policy** > **Access Device Management** > **Access Device** from the navigation tree. Then, click **Add** to configure an access device as follows:

   a. Set the ports for authentication and accounting to 1812 and 1813, respectively.

b. Select **LAN Access Service** from the **Service Type** list.

c. Select **H3C(General)** from the **Access Device Type** list.

d. Set the shared key to **expert** for secure authentication and accounting communication.



e. Select an access device from the device list or manually add an access device. In this example, the device IP address is 10.1.1.2.

f. Use the default values for other parameters and click **OK**.

The IP address of the access device specified here must be the same as the source IP address of the RADIUS packets sent from the switch. The source IP address is chosen in the following order on the switch:

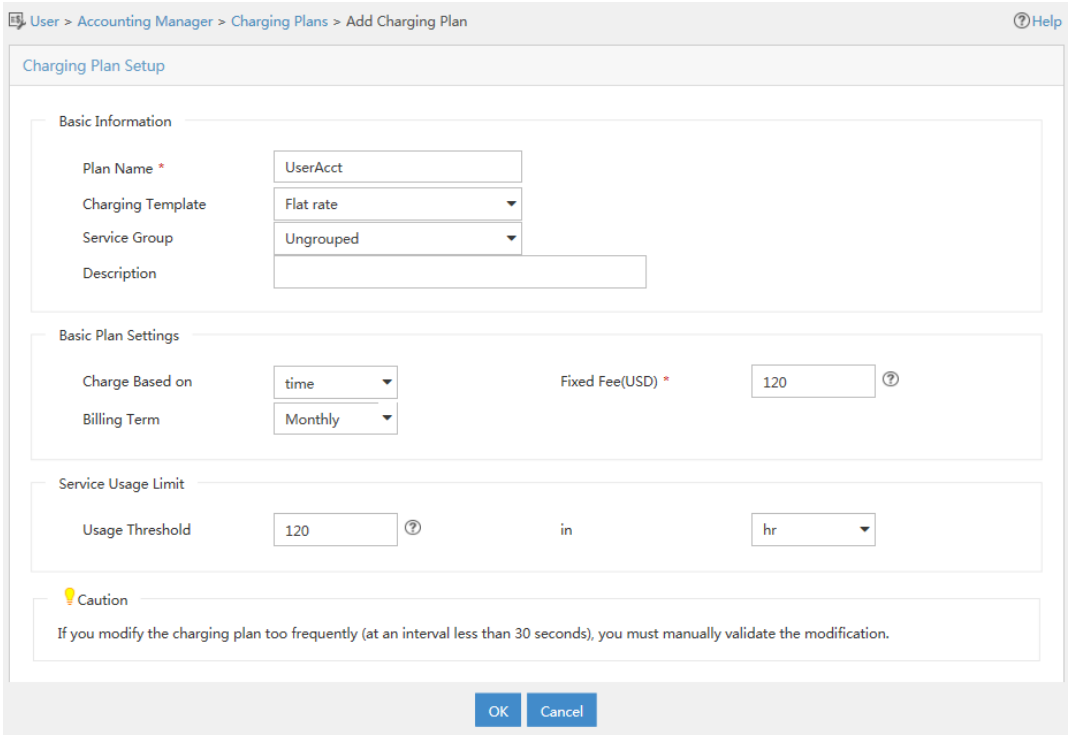
- IP address specified by using the **`nas-ip`** command.
- IP address specified by using the **`radius nas-ip`** command.
- IP address of the outbound interface (the default).

Figure 27 Adding the switch as an access device

2. Add a charging plan:

Click the **User** tab, and select **Accounting Manager** > **Charging Plans** from the navigation tree to enter the charging plan configuration page. Then, click **Add** to configure a charging plan as follows:

a. Add a plan named **UserAcct**.



b. Select **Flat rate** from the **Charging Template** list.

c. Select **time** for **Charge Based on**, select **Monthly** for **Billing Term**, and enter **120** in the **Fixed Fee** field.

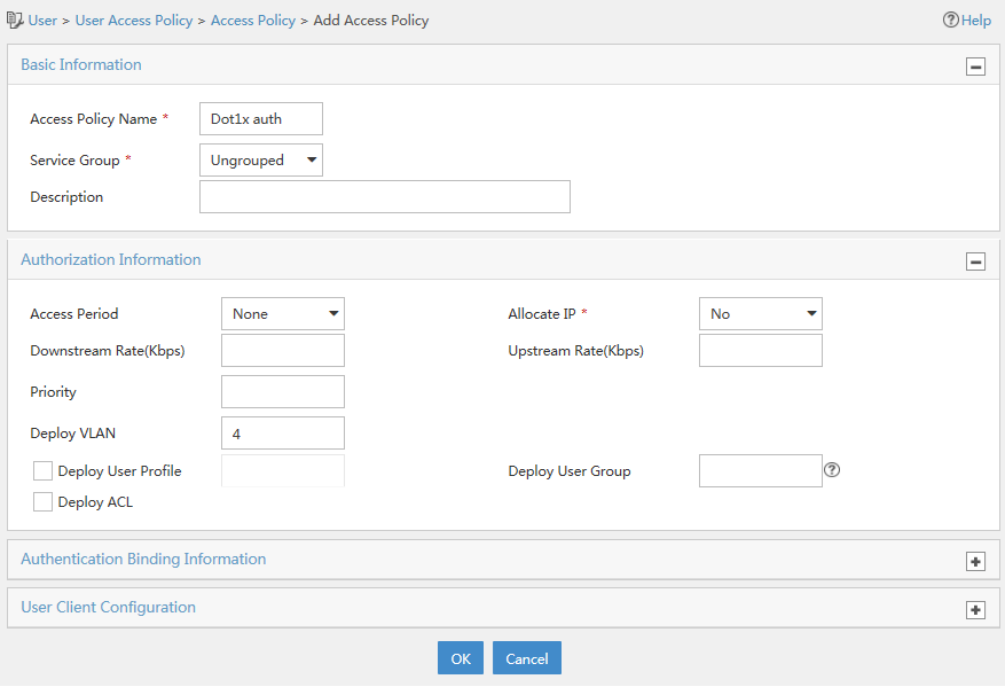
d. Enter **120** in the **Usage Threshold** field and select **hr** (hours) for the **in** field. The configuration allows the user to access the Internet for up to 120 hours per month.

e. Click **OK**.

Figure 28 Adding a charging plan

3. Add an access policy:

Click the **User** tab, and select **User Access Policy** > **Access Policy** from the navigation tree. Then, click **Add** to configure an access policy as follows:



a. Enter access policy name **Dot1x auth**.

b. Set the ID of the VLAN to be deployed to **4**.

c. Configure other parameters as needed.

d. Click **OK**.

Figure 29 Adding an access policy

4. Add an access service:

   Click the **User** tab, and select **User Access Policy** > **Access Service** from the navigation tree. Then, click **Add** to configure a service as follows:

   a. Add a service named **Dot1x Service,** and set the service suffix to **bbb**, the authentication domain for the 802.1X user. With the service suffix configured, you must configure the access device to send usernames that include domain names to the RADIUS server.

   b. Select **UserAcct** from the **Charging Plan** list.

   c. Select **Dot1x auth** from the **Default Access Policy** list.

   d. Configure other parameters as needed.

   e. Click **OK**.

Figure 30 Adding an access service

5. Add a user:

   Click the **User** tab, and select **All Access Users** from the navigation tree to enter the **All Access Users** page. Then, click **Add** to configure a user as follows:

   a. Select the user or add a user named **test**.

   b. Specify the account name as **dot1x** and configure the password.

   c. Select **Dot1x Service** in the **Access Service** area.

   d. Configure other parameters as needed and click **OK**.

Figure 31 Adding an access user account

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rad** and enter RADIUS scheme view.

   ```
   <Switch> system-view
   ```

```
[Switch] radius scheme rad
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rad] primary authentication 10.1.1.1
[Switch-radius-rad] primary accounting 10.1.1.1
[Switch-radius-rad] key authentication simple expert
[Switch-radius-rad] key accounting simple expert
```

Include domain names in the usernames sent to the RADIUS server.

```
[Switch-radius-rad] user-name-format with-domain
[Switch-radius-rad] quit
```

2. Configure an ISP domain:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [Switch] domain bbb
   ```

   # Configure the ISP domain to use RADIUS scheme **rad** for authentication, authorization, and accounting of LAN users.

   ```
   [Switch-isp-bbb] authentication lan-access radius-scheme rad
   [Switch-isp-bbb] authorization lan-access radius-scheme rad
   [Switch-isp-bbb] accounting lan-access radius-scheme rad
   [Switch-isp-bbb] quit
   ```

3. Configure 802.1X authentication:

   # Enable 802.1X globally.

   ```
   [Switch] dot1x
   ```

   # Enable 802.1X for GigabitEthernet 1/0/1.

   ```
   [Switch] interface gigabitethernet 1/0/1
   [Switch-GigabitEthernet1/0/1] dot1x
   ```

   # Configure the access control method. By default, an 802.1X-enabled port uses the MAC-based access control.

   ```
   [Switch-GigabitEthernet1/0/1] dot1x port-method macbased
   ```

Verifying the configuration

1. On the host, use account **dot1x@bbb** to pass 802.1X authentication:

   # If the host runs the Windows XP 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.
   b. Select the **Enable IEEE 802.1X authentication for this network** option.
   c. Select MD5 challenge as the EAP type.
   d. Click **OK**.

   The user passes authentication after entering the correct username and password on the authentication page.

   # If the host runs the iNode client, no advanced authentication options are required. The user can pass authentication after entering username **dot1x@bbb** and the correct password on the client property page.

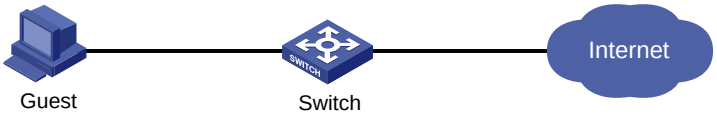
   IMPORTANT:

   Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

2. On the switch, verify that the server assigns the port connecting the client to VLAN 4 after the user passes authentication. (Details not shown.)

3. Display 802.1X connection information on the switch.

```
[Switch] display dot1x connection
```



Example: Configuring and managing a local guest

Network configuration

As shown in Figure 32, create an 802.1X local guest named **user1** for Jack. Configure local guest attributes and manage the local guest on the switch as follows:

- Configure attributes for the local guest, including the password, user group, validity period, and sponsor information.
- Enable the local user auto-delete feature.
- Specify an SMTP server and email sender address for the device to send local guest email notifications.
- Configure email addresses for the local guest, guest manager, and guest sponsor.
- Configure the subject and body of the email notifications to be sent to the guest, guest sponsor, and guest manager.
- Send email notifications of the local guest account information to the guest and guest sponsor.

Figure 32 Network diagram

Procedure

1. Configure 802.1X settings. Make sure the guest can pass 802.1X authentication to access the network. (Details not shown.)
2. Manage local guests:

   # Enable the local user auto-delete feature for expired local guests.

   ```
   <Switch> system-view
   [Switch] local-user auto-delete enable
   ```

   # Specify an SMTP server to send local guest email notifications.

   ```
   [Switch] local-guest email smtp-server smtp://192.168.0.112/smtp
   ```

   # Specify the email sender address as **bbb@ccc.com** in the email notifications sent by the device for local guests.

   ```
   [Switch] local-guest email sender bbb@ccc.com
   ```

   # Specify the email address of the guest manager as **guest-manager@ccc.com**.

   ```
   [Switch] local-guest manager-email guest-manager@ccc.com
   ```

   # Configure the subject and body of the email notifications to be sent to the local guest.

   ```
   [Switch] local-guest email format to guest subject Guest account information
   [Switch] local-guest email format to guest body A guest account has been created for
   you. The username, password, and validity period of the account are given below.
   ```

   # Configure the subject and body of the email notifications to be sent to the guest sponsor.

   ```
   [Switch] local-guest email format to sponsor subject Guest account information
   [Switch] local-guest email format to sponsor body A guest account has been created
   for you. The username, password, and validity period of the account are given below.
   ```

   # Configure the subject and body of the email notifications to be sent to the guest manager.

   ```
   [Switch] local-guest email format to manager subject Guest registration information
   ```

```
[Switch] local-guest email format to manager body A guest account has been registered.
The username of the account is given below. Please approve the registration
information.
```

3. Configure the local guest:

   # Create a user group named **guest1**.

   ```
   [Switch] user-group guest1
   [Switch-ugroup-guest1] quit
   ```

   # Create a local guest named **user1** and enter local guest view.

   ```
   [Switch] local-user user1 class network guest
   ```

   # Set the guest password to **123456** in plain text.

   ```
   [Switch-luser-network(guest)-user1] password simple 123456
   ```

   # Assign the guest to user group **guest1**.

   ```
   [Switch-luser-network(guest)-user1] group guest1
   ```

   # Specify the name of the local guest.

   ```
   [Switch-luser-network(guest)-user1] full-name Jack
   ```

   # Specify the company of the local guest.

   ```
   [Switch-luser-network(guest)-user1] company cc
   ```

   # Configure the email address of the local guest.

   ```
   [Switch-luser-network(guest)-user1] email Jack@cc.com
   ```

   # Configure the phone number of the local guest.

   ```
   [Switch-luser-network(guest)-user1] phone 131129237
   ```

   # Configure a description for the local guest.

   ```
   [Switch-luser-network(guest)-user1] description A guest from company cc
   ```

   # Configure the validity period of the local guest.

   ```
   [Switch-luser-network(guest)-user1] validity-datetime from 2015/4/1 08:00:00 to
   2015/4/3 18:00:00
   ```

   # Specify the guest sponsor name as **Sam**.

   ```
   [Switch-luser-network(guest)-user1] sponsor-full-name Sam
   ```

   # Configure the email address of the guest sponsor.

   ```
   [Switch-luser-network(guest)-user1] sponsor-email Sam@aa.com
   ```

   # Configure the department of the guest sponsor as **security**.

   ```
   [Switch-luser-network(guest)-user1] sponsor-department security
   [Switch-luser-network(guest)-user1] quit
   [Switch] quit
   ```

4. Configure the device to send guest email notifications:

   # Send an email notification to the guest sponsor.

   ```
   <Switch> local-guest send-email user-name user1 to sponsor
   ```

   # Send an email notification to the guest.

   ```
   <Switch> local-guest send-email user-name user1 to guest
   ```

Verifying the configuration

Display local guest information.

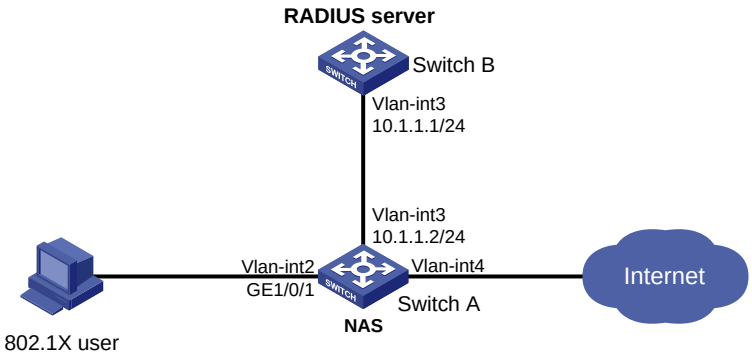
```
<Switch> display local-user user-name user1 class network guest
Total 1 local users matched.

Network access guest user1:
  State:                    Active
```

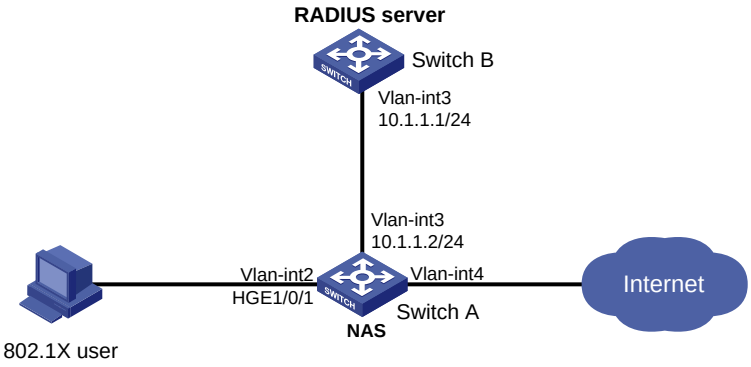
```
Service type:              LAN-access/Portal
User group:                guest1
Full name:                 Jack
Company:                   cc
Email:                     Jack@cc.com
Phone:                     131129237
Description:               A guest from company cc
Sponsor full name:         Sam
Sponsor department:        security
Sponsor email:             Sam@aa.com
Description:               A guest from company cc
Validity period:
  Start date and time:     2015/04/01-08:00:00
  Expiration date and time:2015/04/03-18:00:00
```

Verify that Jack can use username **user1** and password **123456** to pass local authentication and come online during the validity period. (Details not shown.)

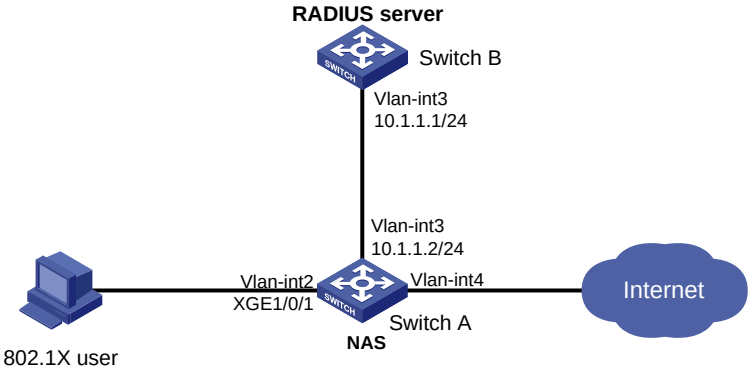
Example: Configuring authentication and authorization for 802.1X users by the device as a RADIUS server



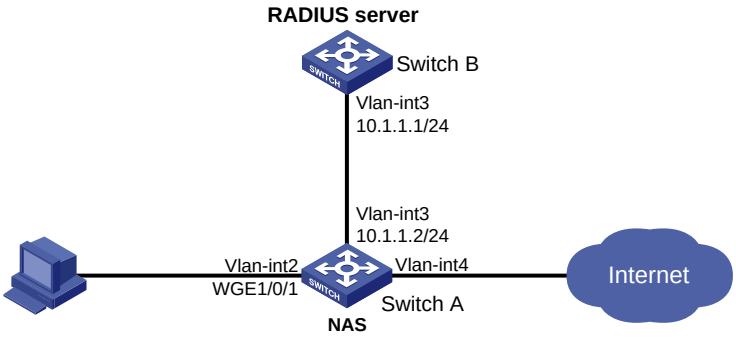
Network configuration



As shown in Figure 33, Switch B acts as the RADIUS server for authentication and authorization of 802.1X users connected to the NAS (Switch A).



Configure the switches to meet the following requirements:



- Perform 802.1X user authentication on GigabitEthernet 1/0/1 of the NAS.
- The shared key is **expert** and the authentication port is 1812.
- Exclude domain names from the usernames sent to the RADIUS server.
- The user name for 802.1X authentication is **dot1x**.
- After the user passes authentication, the RADIUS server authorizes VLAN 4 to the NAS port that the user is connecting to.

Internet
Switch A
NAS
802.1X user

Procedure

1. Configure the NAS:

   a. Configure a RADIUS scheme:

   # Configure a RADIUS scheme named **rad** and enter RADIUS scheme view.

   ```
   <SwitchA> system-view
   [SwitchA] radius scheme rad
   ```

   # Specify the primary authentication server with IP address 10.1.1.1 and set the shared key to **expert** in plaintext form.

   ```
   [SwitchA-radius-rad] primary authentication 10.1.1.1 key simple expert
   ```

   # Exclude domain names from the usernames sent to the RADIUS server.

   ```
   [SwitchA-radius-rad] user-name-format without-domain
   [SwitchA-radius-rad] quit
   ```

   b. Configure an ISP domain:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [SwitchA] domain bbb
   ```

   # Configure the ISP domain to use RADIUS scheme **rad** for authentication and authorization of LAN users and not to perform accounting for LAN users.

   ```
   [SwitchA-isp-bbb] authentication lan-access radius-scheme rad
   [SwitchA-isp-bbb] authorization lan-access radius-scheme rad
   [SwitchA-isp-bbb] accounting lan-access none
   [SwitchA-isp-bbb] quit
   ```

   c. Configure 802.1X authentication:

   # Enable 802.1X for GigabitEthernet 1/0/1.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] dot1x
   ```

Specify **bbb** as the mandatory authentication domain for 802.1X users on the interface.

```
[SwitchA-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
[SwitchA-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[SwitchA] dot1x
```

2. Configure the RADIUS server:

Create a network access user named **dot1x**.

```
<SwitchB> system-view
[SwitchB] local-user dot1x class network
```

Configure the password as **123456** in plaintext form.

```
[SwitchB-luser-network-dot1x] password simple 123456
```

Configure VLAN 4 as the authorization VLAN.

```
[SwitchB-luser-network-dot1x] authorization-attribute vlan 4
[SwitchB-luser-network-dot1x] quit
```

Configure the IP address of the RADIUS client as 10.1.1.2 and the shared key as **expert** in plaintext form.

```
[SwitchB] radius-server client ip 10.1.1.2 key simple expert
```

Activate the RADIUS server configuration.

```
[SwitchB] radius-server activate
```

Verifying the configuration

1. On the RADIUS server, display the activated RADIUS clients and users.

```
[SwitchB] display radius-server active-client
Total 1 RADIUS clients.
Client IP: 10.1.1.2
[SwitchB] display radius-server active-user dot1x
Total 1 RADIUS users matched.
Username: dot1x
  Description: Not configured
  Authorization attributes:
    VLAN ID: 4
    ACL number: Not configured
  Validity period:
    Expiration time: Not configured
```

2. On the host, use account **dot1x** for 802.1X authentication.

   If the host runs the Windows built-in 802.1X client, configure the network connection properties as follows:

   a. Click the **Authentication** tab of the properties window.

   b. Select the **Enable IEEE 802.1X authentication for this network** option.

   c. Select MD5 challenge as the EAP type.

   d. Click **OK**.

   If the host runs the iNode client, no advanced authentication options are required. The user passes authentication after entering the correct user name and password on the authentication page or the iNode client.

IMPORTANT:

Make sure the client can update its IP address to access the resources in the authorized VLAN after passing authentication.

3. On the NAS, verify that the RADIUS server assigns the port to VLAN 4 after the user passes authentication. (Details not shown.)
4. On the NAS, display online 802.1X user information.

```
[SwitchA] display dot1x connection
```

Troubleshooting AAA

RADIUS authentication failure

Symptom

User authentication always fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the RADIUS server.
- The password entered by the user is incorrect.
- The RADIUS server and the NAS are configured with different shared keys.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the RADIUS server can ping each other.
   - The username is in the *userid@isp-name* format and the ISP domain is correctly configured on the NAS.
   - The user is configured on the RADIUS server.
   - The correct password is entered.
   - The same shared key is configured on both the RADIUS server and the NAS.
2. If the problem persists, contact H3C Support.

RADIUS packet delivery failure

Symptom

RADIUS packets cannot reach the RADIUS server.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the RADIUS server.
- The NAS is not configured with the IP address of the RADIUS server.
- The authentication and accounting UDP ports configured on the NAS are incorrect.
- The RADIUS server's authentication and accounting port numbers are being used by other applications.

Solution

To resolve the problem:

1. Verify the following items:
   - The link between the NAS and the RADIUS server works well at both the physical and data link layers.
   - The IP address of the RADIUS server is correctly configured on the NAS.
   - The authentication and accounting UDP port numbers configured on the NAS are the same as those of the RADIUS server.
   - The RADIUS server's authentication and accounting port numbers are available.
2. If the problem persists, contact H3C Support.

RADIUS accounting error

Symptom

A user is authenticated and authorized, but accounting for the user is not normal.

Analysis

The accounting server configuration on the NAS is not correct. Possible reasons include:

- The accounting port number configured on the NAS is incorrect.
- The accounting server IP address configured on the NAS is incorrect. For example, the NAS is configured to use a single server to provide authentication, authorization, and accounting services, but in fact the services are provided by different servers.

Solution

To resolve the problem:

1. Verify the following items:
   - The accounting port number is correctly configured.
   - The accounting server IP address is correctly configured on the NAS.
2. If the problem persists, contact H3C Support.

Troubleshooting HWTACACS

Similar to RADIUS troubleshooting. See "RADIUS authentication failure," "RADIUS packet delivery failure," and "RADIUS accounting error."

LDAP authentication failure

Symptom

User authentication fails.

Analysis

Possible reasons include:

- A communication failure exists between the NAS and the LDAP server.
- The LDAP server IP address or port number configured on the NAS is not correct.
- The username is not in the *userid@isp-name* format, or the ISP domain is not correctly configured on the NAS.
- The user is not configured on the LDAP server.
- The password entered by the user is incorrect.
- The administrator DN or password is not configured.

- Some user attributes (for example, the username attribute) configured on the NAS are not consistent with those configured on the server.
- No user search base DN is specified for the LDAP scheme.

Solution

To resolve the problem:

1. Verify the following items:
   - The NAS and the LDAP server can ping each other.
   - The IP address and port number of the LDAP server configured on the NAS match those of the server.
   - The username is in the correct format and the ISP domain for the user authentication is correctly configured on the NAS.
   - The user is configured on the LDAP server.
   - The correct password is entered.
   - The administrator DN and the administrator password are correctly configured.
   - The user attributes (for example, the username attribute) configured on the NAS are consistent with those configured on the LDAP server.
   - The user search base DN for authentication is specified.
2. If the problem persists, contact H3C Support.

Appendixes

Appendix A Commonly used RADIUS attributes

Commonly used RADIUS attributes are defined in RFC 2865, RFC 2866, RFC 2867, and RFC 2868.

Table 5 Commonly used RADIUS attributes

No.	Attribute	No.	Attribute
1	User-Name	45	Acct-Authentic
2	User-Password	46	Acct-Session-Time
3	CHAP-Password	47	Acct-Input-Packets
4	NAS-IP-Address	48	Acct-Output-Packets
5	NAS-Port	49	Acct-Terminate-Cause
6	Service-Type	50	Acct-Multi-Session-Id
7	Framed-Protocol	51	Acct-Link-Count
8	Framed-IP-Address	52	Acct-Input-Gigawords
9	Framed-IP-Netmask	53	Acct-Output-Gigawords
10	Framed-Routing	54	(unassigned)
11	Filter-ID	55	Event-Timestamp
12	Framed-MTU	56-59	(unassigned)
13	Framed-Compression	60	CHAP-Challenge
14	Login-IP-Host	61	NAS-Port-Type
15	Login-Service	62	Port-Limit

No.	Attribute	No.	Attribute
16	Login-TCP-Port	63	Login-LAT-Port
17	(unassigned)	64	Tunnel-Type
18	Reply-Message	65	Tunnel-Medium-Type
19	Callback-Number	66	Tunnel-Client-Endpoint
20	Callback-ID	67	Tunnel-Server-Endpoint
21	(unassigned)	68	Acct-Tunnel-Connection
22	Framed-Route	69	Tunnel-Password
23	Framed-IPX-Network	70	ARAP-Password
24	State	71	ARAP-Features
25	Class	72	ARAP-Zone-Access
26	Vendor-Specific	73	ARAP-Security
27	Session-Timeout	74	ARAP-Security-Data
28	Idle-Timeout	75	Password-Retry
29	Termination-Action	76	Prompt
30	Called-Station-Id	77	Connect-Info
31	Calling-Station-Id	78	Configuration-Token
32	NAS-Identifier	79	EAP-Message

34	Login-LAT-Service	81	Tunnel-Private-Group-ID
35	Login-LAT-Node	82	Tunnel-Assignment-id
36	Login-LAT-Group	83	Tunnel-Preference
37	Framed-AppleTalk-Link	84	ARAP-Challenge-Response
38	Framed-AppleTalk-Network	85	Acct-Interim-Interval
39	Framed-AppleTalk-Zone	86	Acct-Tunnel-Packets-Lost
40	Acct-Status-Type	87	NAS-Port-Id
41	Acct-Delay-Time	88	Framed-Pool
42	Acct-Input-Octets	89	(unassigned)
43	Acct-Output-Octets	90	Tunnel-Client-Auth-id
44	Acct-Session-Id	91	Tunnel-Server-Auth-id

Appendix B Descriptions for commonly used standard RADIUS attributes

No.	Attribute	Description
1	User-Name	Name of the user to be authenticated.
2	User-Password	User password for PAP authentication, only present in Access-Request packets when PAP authentication is used.

No.	Attribute	Description
3	CHAP-Password	Digest of the user password for CHAP authentication, only present in Access-Request packets when CHAP authentication is used.
4	NAS-IP-Address	IP address for the server to use to identify the client. Typically, a client is identified by the IP address of its access interface. This attribute is only present in Access-Request packets.
5	NAS-Port	Physical port of the NAS that the user accesses.
6	Service-Type	Type of service that the user has requested or type of service to be provided.
7	Framed-Protocol	Encapsulation protocol for framed access.
8	Framed-IP-Address	IP address assigned to the user.
11	Filter-ID	Name of the filter list. If the name starts with a digit, it indicates an ACL number.
12	Framed-MTU	MTU for the data link between the user and NAS. For example, this attribute can be used to define the maximum size of EAP packets allowed to be processed in 802.1X EAP authentication.
14	Login-IP-Host	IP address of the NAS interface that the user accesses.
15	Login-Service	Type of service that the user uses for login.
18	Reply-Message	Text to be displayed to the user, which can be used by the server to communicate information, for example, the cause of the authentication failure.
26	Vendor-Specific	Vendor-specific proprietary attribute. A packet can contain one or more proprietary attributes, each of which can contain one or more subattributes.
27	Session-Timeout	Maximum service duration for the user before termination of the session.
28	Idle-Timeout	Maximum idle time permitted for the user before termination of the session.
31	Calling-Station-Id	User identification that the NAS sends to the server. For the LAN access service provided by an H3C device, this attribute includes the MAC address of the user.
32	NAS-Identifier	Identification that the NAS uses to identify itself to the RADIUS server.
40	Acct-Status-Type	Type of the Accounting-Request packet. Possible values include: • **1**—Start. • **2**—Stop. • **3**—Interim-Update. • **4**—Reset-Charge. • **7**—Accounting-On. (Defined in the 3rd Generation Partnership Project.) • **8**—Accounting-Off. (Defined in the 3rd Generation Partnership Project.) • **9 to 14**—Reserved for tunnel accounting. • **15**—Reserved for failed.
45	Acct-Authentic	Authentication method used by the user. Possible values include: • **1**—RADIUS. • **2**—Local. • **3**—Remote.

No.	Attribute	Description
60	CHAP-Challenge	CHAP challenge generated by the NAS for MD5 calculation during CHAP authentication.
61	NAS-Port-Type	Type of the physical port of the NAS that is authenticating the user. Possible values include: • **15**—Ethernet. • **16**—Any type of ADSL. • **17**—Cable. (With cable for cable TV.) • **19**—WLAN-IEEE 802.11. • **201**—VLAN. • **202**—ATM. If the port is an ATM or Ethernet one and VLANs are implemented on it, the value of this attribute is 201.
64	Tunnel-Type	Tunneling protocols used. The value **13** represents VLAN. If the value is 13, the device interprets the Tunnel-Type, Tunnel-Medium-Type, and Tunnel-Private-Group-ID attributes as attributes to assign VLANs.
65	Tunnel-Medium-Type	Transport medium type to use for creating a tunnel. For VLAN assignment, the value must be **6** to indicate the 802 media plus Ethernet.
79	EAP-Message	Used to encapsulate EAP packets to allow RADIUS to support EAP authentication.
80	Message-Authenticator	Used for authentication and verification of authentication packets to prevent spoofing Access-Requests. This attribute is present when EAP authentication is used.
81	Tunnel-Private-Group-ID	Group ID for a tunnel session. To assign VLANs, the NAS conveys VLAN IDs by using this attribute.
87	NAS-Port-Id	String for describing the port of the NAS that is authenticating the user.
168	Framed-IPv6-Address	Server-assigned IPv6 address for the NAS to assign to the host. The address must be unique.

Appendix C RADIUS subattributes (vendor ID 25506)

Table 6 lists all RADIUS subattributes with a vendor ID of 25506. Support for these subattributes depends on the device model.

Table 6 RADIUS subattributes (vendor ID 25506)

No.	Subattribute	Description
1	Input-Peak-Rate	Peak rate in the direction from the user to the NAS, in bps.
2	Input-Average-Rate	Average rate in the direction from the user to the NAS, in bps.
3	Input-Basic-Rate	Basic rate in the direction from the user to the NAS, in bps.
4	Output-Peak-Rate	Peak rate in the direction from the NAS to the user, in bps.
5	Output-Average-Rate	Average rate in the direction from the NAS to the user, in bps.
6	Output-Basic-Rate	Basic rate in the direction from the NAS to the user, in bps.
15	Remanent_Volume	Total amount of data available for the connection, in different units for different server types.

No.	Subattribute	Description
17	ISP-ID	ISP domain where the user obtains authorization information.
20	Command	Operation for the session, used for session control. Possible values include: • **1**—Trigger-Request. • **2**—Terminate-Request. • **3**—SetPolicy. • **4**—Result. • **5**—PortalClear.
25	Result_Code	Result of the Trigger-Request or SetPolicy operation, zero for success and any other value for failure.
26	Connect_ID	Index of the user connection.
27	PortalURL	PADM redirect URL assigned to PPPoE users.
28	Ftp_Directory	FTP, SFTP, or SCP user working directory. When the RADIUS client acts as the FTP, SFTP, or SCP server, this attribute is used to set the working directory for an FTP, SFTP, or SCP user on the RADIUS client.
29	Exec_Privilege	EXEC user priority.
32	NAT-IP-Address	Public IP address assigned to the user when the source IP address and port are translated.
33	NAT-Start-Port	Start port number of the port range assigned to the user when the source IP address and port are translated.
34	NAT-End-Port	End port number of the port range assigned to the user when the source IP address and port are translated.
59	NAS_Startup_Timestamp	Startup time of the NAS in seconds, which is represented by the time elapsed after 00:00:00 on Jan. 1, 1970 (UTC).
60	Ip_Host_Addr	User IP address and MAC address included in authentication and accounting requests, in the format A.B.C.D hh:hh:hh:hh:hh:hh. A space is required between the IP address and the MAC address.
61	User_Notify	Information that must be sent from the server to the client transparently.
62	User_HeartBeat	Hash value assigned after an 802.1X user passes authentication, which is a 32-byte string. This attribute is stored in the user list on the NAS and verifies the handshake packets from the 802.1X user. This attribute only exists in Access-Accept and Accounting-Request packets.
98	Multicast_Receive_Group	IP address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
100	IP6_Multicast_Receive_Group	IPv6 address of the multicast group that the user's host joins as a receiver. This subattribute can appear multiple times in a multicast packet to indicate that the user belongs to multiple multicast groups.
101	MLD-Access-Limit	Maximum number of MLD multicast groups that the user can join concurrently.
102	local-name	L2TP local tunnel name.
103	IGMP-Access-Limit	Maximum number of IGMP multicast groups that the user can join concurrently.

No.	Subattribute	Description
105	ANCP-Profile	ANCP profile name.
135	Client-Primary-DNS	IP address of the primary DNS server.
136	Client-Secondary-DNS	IP address of the secondary DNS server.
140	User_Group	User groups assigned after the user passes authentication. Typically, a user can belong to only one user group.
144	Acct_IPv6_Input_Octets	Bytes of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
145	Acct_IPv6_Output_Octets	Bytes of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
146	Acct_IPv6_Input_Packets	Number of IPv6 packets in the inbound direction. The measurement unit depends on the configuration on the device.
147	Acct_IPv6_Output_Packets	Number of IPv6 packets in the outbound direction. The measurement unit depends on the configuration on the device.
148	Acct_IPv6_Input_Gigawords	Bytes of IPv6 packets in the inbound direction. The measurement unit is 4G bytes.
149	Acct_IPv6_Output_Gigawords	Bytes of IPv6 packets in the outbound direction. The measurement unit is 4G bytes.
155	User-Roles	List of space-separated user roles.
210	Av-Pair	User-defined attribute pair. Available attribute pairs include: • Server-assigned voice VLAN in the format of device-traffic-class=voice. • Server-assigned user role in the format of shell:role=xxx. • Server-assigned ACL in the format of url-redirect-acl=xxx. • Server-assigned IPv4 Web redirect URL in the format of url-redirect=xxx. • Server-assigned IPv6 Web redirect URL in the format of urlipv6-redirect=xxx. • Server-deployed command to reboot a port, in the format of subscriber:command=bounce-host-port. • Server-assigned port shutdown duration in the format of bounce:seconds=xxx. • Server-deployed command to shut down a port, in the format of subscriber:command=disable-host-port. • Server-assigned blackhole MAC address attribute in the format of mac:block-mac=xxx. • Server-assigned MAC authentication offline detect timer (in seconds) in the format of mac-authentication: offline-detect-time=xxx. Value 0 of xxx indicates that MAC authentication offline detection is disabled. • Server-assigned MAC authentication offline detection flag in the format of mac-authentication: offline-detect-check=x. x has the following values: ○ **0**—The device does not search for the ARP snooping entry or ND snooping entry of the MAC address. ○ **1**—The device searches for the ARP snooping entry or ND snooping entry of the MAC address. • Server-assigned dynamic ACL. For more information about the format of this attribute, see "Appendix D Format of dynamic authorization ACLs." Support for this attribute in 802.1X authentication and MAC authentication depends on the device model. If the server assigns a user both this

No.	Subattribute	Description
		attribute and the Filter-ID attribute, the device will ignore this attribute. The device does not support using CoA messages to change the content assigned by this attribute or assign another ACL to the user.
230	NAS-Port-Name	Interface through which the user is connected to the NAS.
246	Auth_Detail_Result	Accounting details. The server sends Access-Accept packets with subattributes 246 and 250 in the following situations: • **1**—The subscriber charge is overdue. The subscriber is allowed to access network resources in the whitelist. If the subscriber accesses other network resources, the device redirects it to the URL specified by subattribute 250. • **2**—The broadband lease of the subscriber expires. The device redirects the subscriber to the URL specified by subattribute 250 when the subscriber requests to access webpages for the first time.
247	Input-Committed-Burst-Size	Committed burst size from the user to the NAS, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the Input-Average-Rate attribute.
248	Output-Committed-Burst-Size	Committed burst size from the NAS to the user, in bits. The total length cannot exceed 4 bytes for this field. This subattribute must be assigned together with the Output-Average-Rate attribute.
249	authentication-type	Authentication type. The value can be: • **1**—Intranet access authentication. • **2**—Internet access authentication. If the packet does not contain this subattribute, common authentication applies.
250	WEB-URL	Redirect URL for users. In single-stack scenarios, use this attribute to assign the authorized IPv4 URL or IPv6 URL. In dual-stack scenarios, use this attribute to assign the authorized IPv4 URL and use user-defined attribute pair **urlipv6-redirect** to assign the authorized IPv6 URL.
251	Subscriber-ID	Family plan ID.
252	Subscriber-Profile	QoS policy name for the family plan of the subscriber.
255	Product_ID	Product name.

Appendix D Format of dynamic authorization ACLs

Vendor ID 25506

The server might assign a dynamic authorization ACL that contains multiple rules to a user in different ways:

- Assign only one Av-Pair subattribute to the user. In this subattribute, the dynamic ACL contains multiple rules separated by question marks (?).
- Assign multiple Av-Pair subattributes to the user. All the subattributes contain the same dynamic ACL and a different rule. Support for this method depends on the server model.

The format of a dynamic ACL rule is as follows:

aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*?protocol=*protocol-type*?counting?dst-ip=*ip-addr*?src-ip=*ip-addr*?dst-port=*port-value*?src-port=*port-value*?action=*action-type*

The fields in the rule are described in Table 7. The following is an example of a dynamic ACL rule:

aclrule?same?test?1?1?1?protocol=3?counting?dst-ip=1.1.1.1/1.1.1.1?src-ip=1.1.1.1/0?dst-port=1.2000?src-port=5.2000-3000?action=1

Table 7 Fields in a dynamic ACL rule

Field	Description	Remarks
aclrule	Indicates that the following part is information about a dynamic ACL rule.	Required
same	Indicates that the current user will inherit the dynamic ACL rules that have been successfully assigned to another authenticated user. If the server assigns one user the same dynamic ACL as another user but the rules are different for the two users, the device applies the dynamic ACL rules of the user that comes online first to the other user.	Required
acl-name	ACL name, a case-insensitive string of 1 to 63 characters. The ACL name must begin with a letter and it cannot be **all** or the same as an existing static ACL on the device.	Required
acl-type	ACL type. **1** indicates an advanced ACL. In the current software version, only advanced ACLs are supported.	Required
ver-type	IP protocol type: • **1**—IPv4. • **2**—IPv6.	Required
rule-id	ACL rule number, in the range of 0 to 65534.	Required
protocol-type	Protocol type: • **1**—IP. • **2**—ICMP. • **3**—TCP. • **4**—UDP. • **5**—ICMPv6. • **6**—IPv6.	Optional
counting	Indicates that rule match statistics is enabled. If a rule does not include this field, rule match statistics is disabled for the rule.	Optional
ip-addr	IP address information. An IPv4 address must be in the format of X.X.X.X/X.X.X.X or X.X.X.X/0. Non-host IPv4 addresses can only be in the X.X.X.X/X.X.X.X format. An IPv6 address must be in the format of X:X::X:X/M. For example, 1.1.1.1/1.1.1.1, 1.1.1.1/0, or 3::3/128. If the value is **any**, the rule matches any IP address.	Optional
port-value	TCP or UDP port information, in the *X.YYY* format. • ***X***—Operator. ○ **1**—Equal to. ○ **2**—Greater than. ○ **3**—Smaller than. ○ **4**—Not equal to. ○ **5**—In the range of. • ***YYY***—Port number information. For example, 1.3000 and 5.2000-3000.	Optional

Field	Description	Remarks
action-type	Action type: • **1**—Deny. • **2**—Permit.	Optional

The following restrictions apply to dynamic authorization ACLs:

- For the former six fields (aclrule?same?*acl-name*?*acl-type*?*ver-type*?*rule-id*) of a dynamic ACL rule, their positions are fixed. The device cannot interpret a dynamic ACL rule if the positions of the six fields are changed. For the other fields, position changes are allowed.
- The settings for all the fields in the rules must meet the configuration logic of ACL rules on the device so the device can correctly interpret the rules.
- All dynamic ACL rules in one authorization must belong to the same ACL name.
- A dynamic ACL must have rules and the format of the rules must be valid.

Vendor ID 9

The server might assign a dynamic ACL to a user by using the CISCO-AV-Pair subattribute (vendor ID 9). The formats of the subattribute are as follows:

- **CiscoSecure-Defined-ACL=#ACSACL#-IP-***name***-***number*

  The *name* argument represents the ACL name and the *number* argument represents the version number.

  For example: **CiscoSecure-Defined-ACL=#ACSACL#-IP-UACL-0**.

- **ip:inacl#***number***=***rule*

  The *number* argument represents the ACL rule number and the *rule* argument represents the rule content.

  For example: **ip:inacl#1=permit udp any any eq 21862**.

Currently, only some device models support the CISCO-AV-Pair subattribute for 802.1X and MAC authentication. If the RADIUS server assigns dynamic ACLs to a user by using both the CISCO-AV-Pair (vendor ID 9) and Av-Pair (vendor ID 25506) subattributes, the device ignores the CISCO-AV-Pair subattribute.

The server assigns a dynamic ACL to a user as follows:

1. The server assigns a dynamic ACL name to a user by using the CISCO-AV-Pair subattribute in the format of **CiscoSecure-Defined-ACL=#ACSACL#-IP-***name***-***number* after the user passes authentication.
2. The device uses the dynamic ACL name as the username of the user to initiate authentication again.
3. The server assigns one or multiple ACL rules to the user by using the CISCO-AV-Pair subattribute in the format of **ip:inacl#***number***=***rule* after the user passes authentication.
4. The device parses the ACL rules received from the server, creates the ACL and its rules, and deploys the ACL and its rules to the user.

   In the current software version, the device can parse only the dynamic ACL rules in the following formats:

   { **deny** | **permit** } *protocol* [**destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*]]

   The value for the *operator* argument can be **lt** (lower than), **gt** (greater than), **eq** (equal to), or **neq** (not equal to).

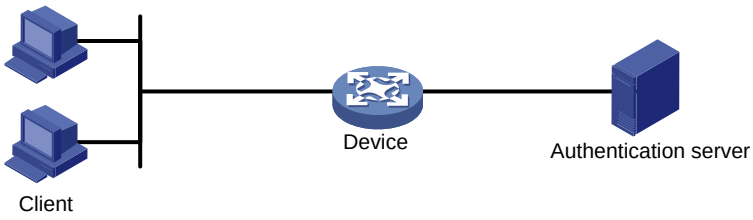
802.1X overview

About the 802.1X protocol



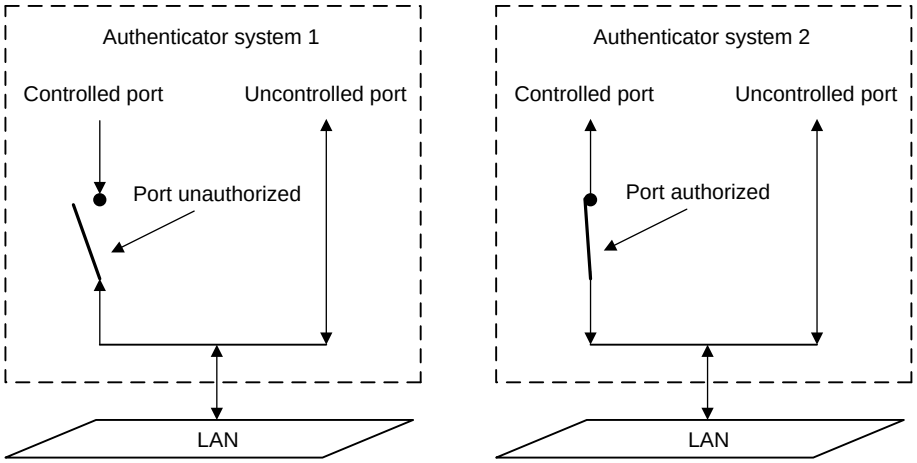
802.1X is a port-based network access control protocol widely used on Ethernet networks. The protocol controls network access by authenticating the devices connected to 802.1X-enabled LAN ports.

802.1X architecture

802.1X operates in the client/server model. As shown in Figure 1, 802.1X authentication includes the following entities:

- **Client (supplicant)**—A user terminal seeking access to the LAN. The terminal must have 802.1X software to authenticate to the access device.
- **Access device (authenticator)**—Authenticates the client to control access to the LAN. In a typical 802.1X environment, the access device uses an authentication server to perform authentication.
- **Authentication server**—Provides authentication services for the access device. The authentication server first authenticates 802.1X clients by using the data sent from the access device. Then, the server returns the authentication results to the access device to make access decisions. The authentication server is typically a RADIUS server. In a small LAN, you can use the access device as the authentication server.

Figure 1 802.1X architecture



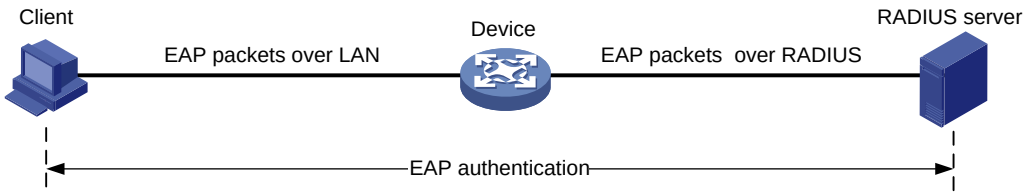
Controlled/uncontrolled port and port authorization status

802.1X defines two logical ports for the network access port: controlled port and uncontrolled port. Any packet arriving at the network access port is visible to both logical ports.

- **Uncontrolled port**—Is always open to receive and transmit authentication packets.
- **Controlled port**—Filters packets depending on the port state.
  - **Authorized state**—The controlled port is in authorized state when the client has passed authentication. The port allows traffic to pass through.
  - **Unauthorized state**—The port is in unauthorized state when the client has failed authentication. The port controls traffic by using one of the following methods:
    - Performs bidirectional traffic control to deny traffic to and from the client.
    - Performs unidirectional traffic control to deny traffic from the client. The device supports only unidirectional traffic control.

Figure 2 Authorization state of a controlled port

Packet exchange methods



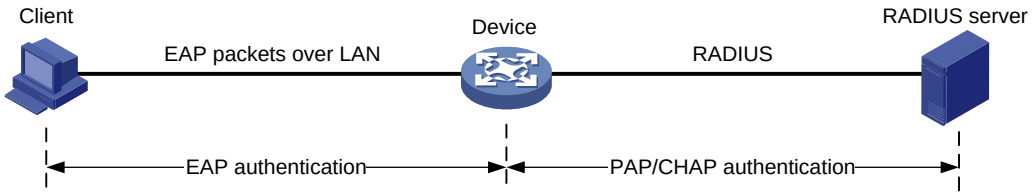
802.1X uses the Extensible Authentication Protocol (EAP) to transport authentication information for the client, the access device, and the authentication server. EAP is an authentication framework that uses the client/server model. The framework supports a variety of authentication methods, including MD5-Challenge, EAP-Transport Layer Security (EAP-TLS), and Protected EAP (PEAP).

802.1X defines EAP over LAN (EAPOL) for passing EAP packets between the client and the access device over a wired or wireless LAN. Between the access device and the authentication server, 802.1X delivers authentication information by either EAP relay or EAP termination.

EAP relay

EAP relay is defined in IEEE 802.1X. In this mode, the network device uses EAP over RADIUS (EAPOR) packets to send authentication information to the RADIUS server, as shown in Figure 3.

Figure 3 EAP relay



In EAP relay mode, the client must use the same authentication method as the RADIUS server. On the access device, you only need to use the **dot1x authentication-method eap** command to enable EAP relay.

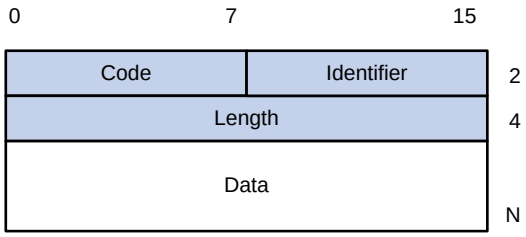
EAP termination

As shown in Figure 4, the access device performs the following operations in EAP termination mode:

1. Terminates the EAP packets received from the client.
2. Encapsulates the client authentication information in standard RADIUS packets.
3. Uses PAP or CHAP to authenticate to the RADIUS server.

Figure 4 EAP termination

Comparing EAP relay and EAP termination



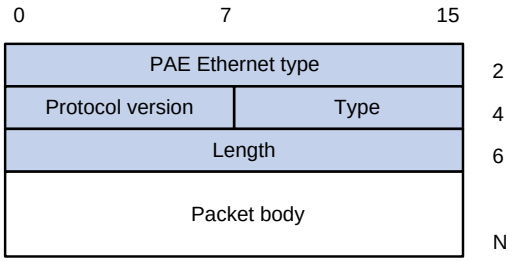
Packet exchange method	Benefits	Limitations
EAP relay	• Supports various EAP authentication methods. • The configuration and processing are simple on the access device.	The RADIUS server must support the EAP-Message and Message-Authenticator attributes, and the EAP authentication method used by the client.
EAP termination	Works with any RADIUS server that supports PAP or CHAP authentication.	• Supports only the following EAP authentication methods: ○ MD5-Challenge EAP authentication. ○ The username and password EAP authentication initiated by an iNode 802.1X client. • The processing is complex on the access device.

Packet formats

EAP packet format

Figure 5 shows the EAP packet format.

Figure 5 EAP packet format



- **Code**—Type of the EAP packet. Options include Request (1), Response (2), Success (3), or Failure (4).
- **Identifier**—Used for matching Responses with Requests.
- **Length**—Length (in bytes) of the EAP packet. The EAP packet length is the sum of the Code, Identifier, Length, and Data fields.
- **Data**—Content of the EAP packet. This field appears only in a Request or Response EAP packet. The **Data** field contains the request type (or the response type) and the type data. Type 1 (Identity) and type 4 (MD5-Challenge) are two examples for the type field.

EAPOL packet format

Figure 6 shows the EAPOL packet format.

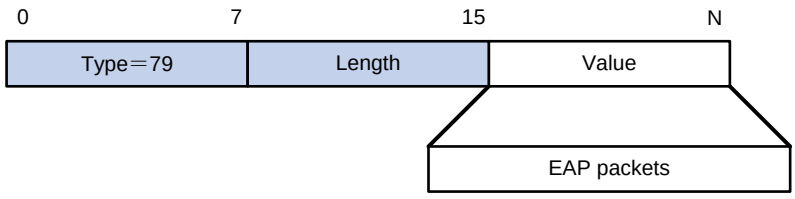
Figure 6 EAPOL packet format

- **PAE Ethernet type**—Protocol type. It takes the value 0x888E for EAPOL.
- **Protocol version**—The EAPOL protocol version used by the EAPOL packet sender.
- **Type**—Type of the EAPOL packet. Table 1 lists the types of EAPOL packets supported by the 802.1X implementation of the device.

  Table 1 Types of EAPOL packets

Value	Type	Description
0x00	EAP-Packet	The client and the access device uses EAP-Packets to transport authentication information.
0x01	EAPOL-Start	The client sends an EAPOL-Start message to initiate 802.1X authentication to the access device.
0x02	EAPOL-Logoff	The client sends an EAPOL-Logoff message to tell the access device that the client is logging off.

- **Length**—Data length in bytes, or length of the Packet body. If packet type is EAPOL-Start or EAPOL-Logoff, this field is set to 0, and no Packet body field follows.
- **Packet body**—Content of the packet. When the EAPOL packet type is EAP-Packet, the Packet body field contains an EAP packet.



EAP over RADIUS

RADIUS adds two attributes, EAP-Message and Message-Authenticator, for supporting EAP authentication. For the RADIUS packet format, see "Configuring AAA."

- EAP-Message.

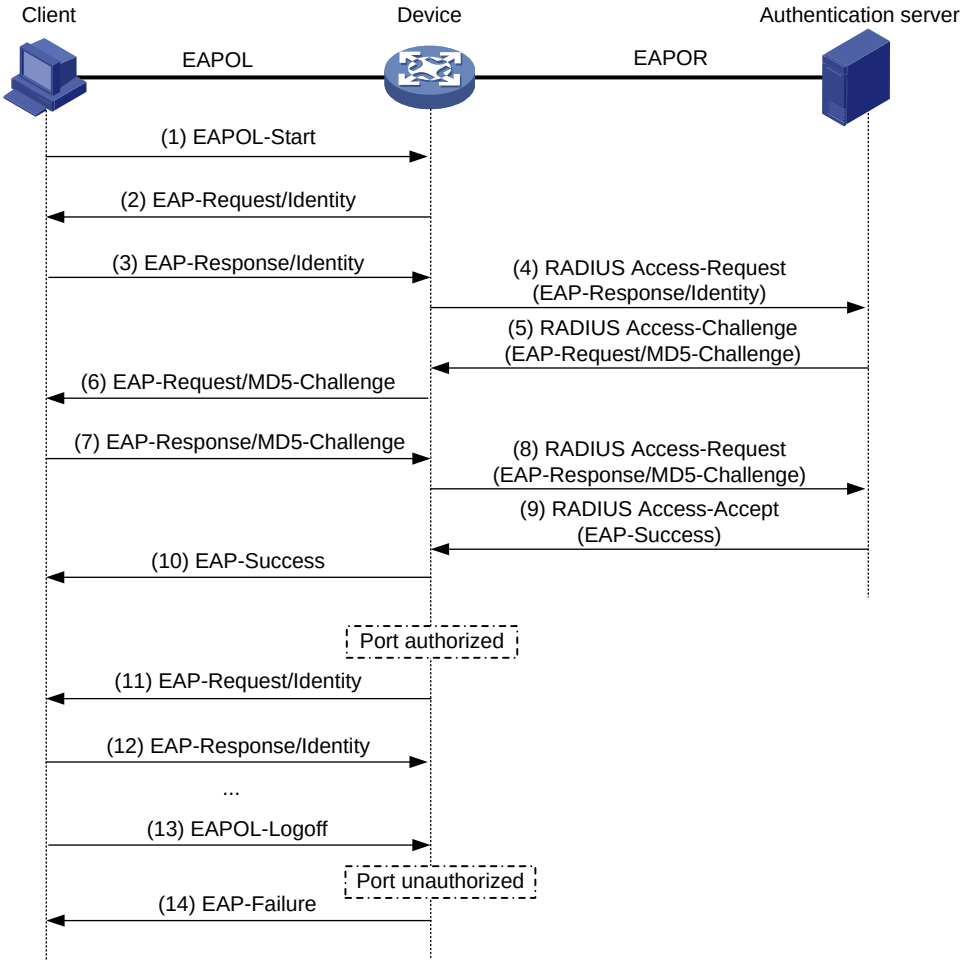
  RADIUS encapsulates EAP packets in the EAP-Message attribute, as shown in Figure 7. The Type field takes 79, and the Value field can be up to 253 bytes. If an EAP packet is longer than 253 bytes, RADIUS encapsulates it in multiple EAP-Message attributes.

  Figure 7 EAP-Message attribute format

- Message-Authenticator.

  As shown in Figure 8, RADIUS includes the Message-Authenticator attribute in all packets that have an EAP-Message attribute to check their integrity. The packet receiver drops the packet if the calculated packet integrity checksum is different from the Message-Authenticator attribute value. The Message-Authenticator prevents EAP authentication packets from being tampered with during EAP authentication.

Figure 8 Message-Authenticator attribute format



802.1X authentication procedures

802.1X authentication has two methods: EAP relay and EAP termination. You choose either mode depending on support of the RADIUS server for EAP packets and EAP authentication methods.

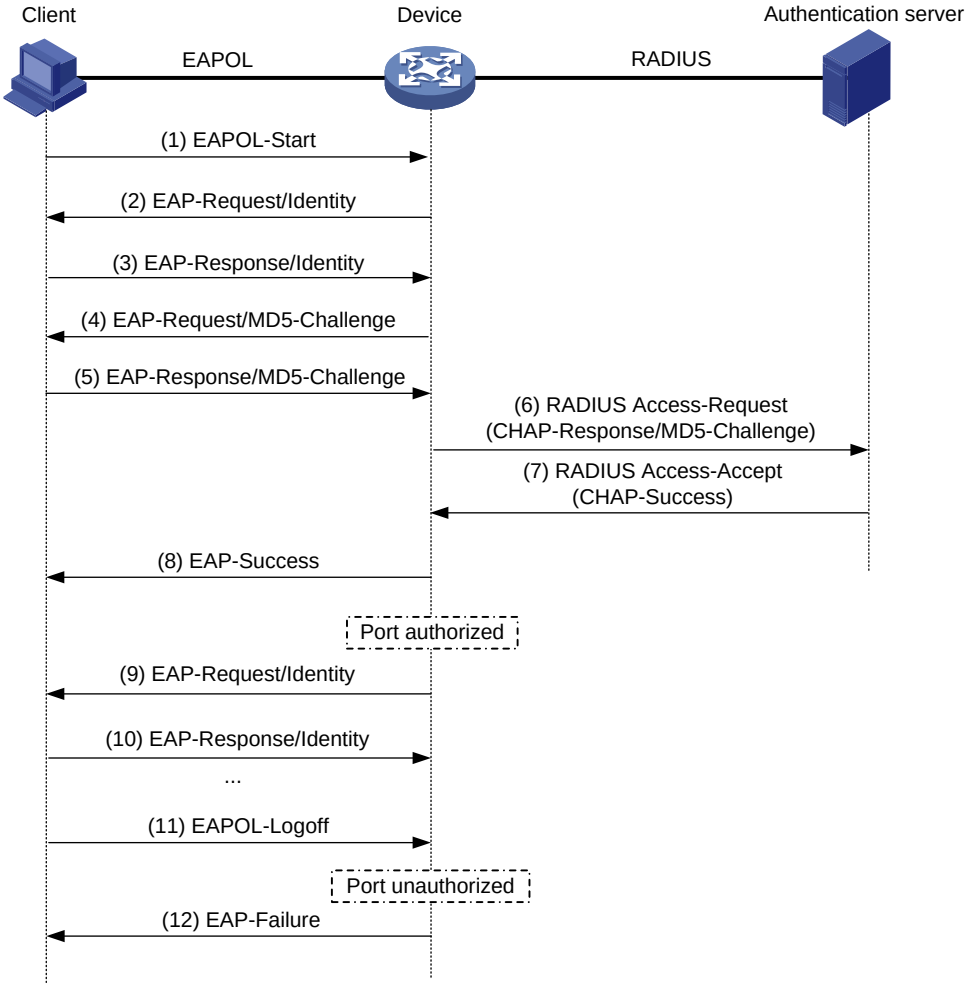
EAP relay

Figure 9 shows the basic 802.1X authentication procedure in EAP relay mode, assuming that MD5-Challenge EAP authentication is used.

Figure 9 802.1X authentication procedure in EAP relay mode

The following steps describe the 802.1X authentication procedure:

2. When a user launches the 802.1X client and enters a registered username and password, the 802.1X client sends an EAPOL-Start packet to the access device.
3. The access device responds with an EAP-Request/Identity packet to ask for the client username.
4. In response to the EAP-Request/Identity packet, the client sends the username in an EAP-Response/Identity packet to the access device.



5. The access device relays the EAP-Response/Identity packet in a RADIUS Access-Request packet to the authentication server.
6. The authentication server uses the identity information in the RADIUS Access-Request to search its user database. If a matching entry is found, the server uses a randomly generated challenge (EAP-Request/MD5-Challenge) to encrypt the password in the entry. Then, the server sends the challenge in a RADIUS Access-Challenge packet to the access device.
7. The access device transmits the EAP-Request/MD5-Challenge packet to the client.
8. The client uses the received challenge to encrypt the password, and sends the encrypted password in an EAP-Response/MD5-Challenge packet to the access device.
9. The access device relays the EAP-Response/MD5-Challenge packet in a RADIUS Access-Request packet to the authentication server.
10. The authentication server compares the received encrypted password with the encrypted password it generated at step 5. If the two passwords are identical, the server considers the client valid and sends a RADIUS Access-Accept packet to the access device.
11. Upon receiving the RADIUS Access-Accept packet, the access device performs the following operations:
    a. Sends an EAP-Success packet to the client.
    b. Sets the controlled port in authorized state.

    The client can access the network.
12. After the client comes online, the access device periodically sends handshake requests to check whether the client is still online. By default, if two consecutive handshake attempts fail, the device logs off the client.
13. Upon receiving a handshake request, the client returns a response. If the client fails to return a response after a number of consecutive handshake attempts (two by default), the access device logs off the client. This handshake mechanism enables timely release of the network resources used by 802.1X users that have abnormally gone offline.
14. The client can also send an EAPOL-Logoff packet to ask the access device for a logoff.
15. In response to the EAPOL-Logoff packet, the access device changes the status of the controlled port from authorized to unauthorized. Then, the access device sends an EAP-Failure packet to the client.

EAP termination

Figure 10 shows the basic 802.1X authentication procedure in EAP termination mode, assuming that CHAP authentication is used.

Figure 10 802.1X authentication procedure in EAP termination mode

In EAP termination mode, the access device rather than the authentication server generates an MD5 challenge for password encryption. The access device then sends the MD5 challenge together with the username and encrypted password in a standard RADIUS packet to the RADIUS server.

802.1X authentication initiation

Both the 802.1X client and the access device can initiate 802.1X authentication.

802.1X client as the initiator

The client sends an EAPOL-Start packet to the access device to initiate 802.1X authentication. The destination MAC address of the packet is the IEEE 802.1X specified multicast address 01-80-C2-00-00-03 or the broadcast MAC address. If any intermediate device between the client and the authentication server does not support the multicast address, you must use an 802.1X client that can send broadcast EAPOL-Start packets. For example, you can use the iNode 802.1X client.

Access device as the initiator

If the client cannot send EAPOL-Start packets, configure the access device to initiate authentication.

The access device supports the following modes:

- **Multicast trigger mode**—The access device multicasts EAP-Request/Identity packets to initiate 802.1X authentication at the identity request interval.

- **Unicast trigger mode**—Upon receiving a frame from an unknown MAC address, the access device sends an EAP-Request/Identity packet out of the receiving port to the MAC address. The device retransmits the packet if no response has been received within the identity request timeout interval. This process continues until the maximum number of request attempts set by using the **`dot1x retry`** command is reached.

The username request timeout timer sets both the identity request interval for the multicast trigger and the identity request timeout interval for the unicast trigger.

Access control methods

The device implements port-based access control as defined in the 802.1X protocol, and extends the protocol to support MAC-based access control.

- **Port-based access control**—Once an 802.1X user passes authentication on a port, any subsequent user can access the network through the port without authentication. When the authenticated user logs off, all other users are logged off.
- **MAC-based access control**—Each user is separately authenticated on a port. When a user logs off, no other online users are affected.

802.1X VLAN manipulation

Authorization VLAN

The authorization VLAN controls the access of an 802.1X user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port that performs port-based access control.

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 2.

Table 2 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection
VLANs by IDs VLANs by names VLAN group name	If the 802.1X-enabled port performs MAC-based access control, the device selects an authorization VLAN from the VLAN group for a user according to the following rules: • On a hybrid port with MAC-based VLAN enabled: ○ If the port does not have online users, the device selects the VLAN with the lowest ID. ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online 802.1X users, the device selects the VLAN with the lower ID. • On an access, trunk, or MAC-based VLAN disabled hybrid port: ○ If the port does not have online users, the device selects the VLAN with the lowest ID. ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails. If the 802.1X-enabled port performs port-based access control, the device selects the VLAN with the lowest ID from the VLAN group. All subsequent 802.1X users are assigned to that VLAN.
VLAN IDs with suffixes	1. The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. 2. The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on an 802.1X-enabled port

Table 3 describes how the access device handles VLANs (except for the VLANs specified with suffixes) on an 802.1X-enabled port.

Table 3 VLAN manipulation

Port access control method	Access port	Trunk port	Hybrid port
Port-based	Make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute. The device assigns the port to the first authenticated user's authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute.	If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN without changing the PVID.	If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN as an untagged member and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN as a tagged member without changing the PVID.
MAC-based	Make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute. The device assigns the port to the first authenticated user's authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute.	If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN without changing the PVID.	If the authorization VLAN has the untagged attribute, the device assigns the port to the authorization VLAN as an untagged member and sets the VLAN as the PVID. If the authorization VLAN has the tagged attribute, the device assigns the port to the VLAN as a tagged member without changing the PVID. On a hybrid port with MAC-based VLAN enabled, if an untagged VLAN is assigned to a user, the device dynamically creates a VLAN and MAC address mapping for the user, without changing the PVID of the port. On a hybrid port with MAC-based VLAN disabled, the device assigns the port to the first authenticated user's authorization VLAN and sets that VLAN as the PVID if it has the untagged attribute.
	IMPORTANT: Always assign the same untagged VLAN to users on a port if the port is an access port, trunk port, or hybrid port with MAC MAC-based VLAN disabled. You can assign different untagged VLANs to different users only on a hybrid port with MAC-based VLAN enabled. After a user passes authentication and comes online with an untagged authorization VLAN, any subsequent users will be unable to pass authentication if they are assigned a different authorization VLAN. You can assign different tagged VLANs to different users, whether or not MAC-based		

Port access control method	Access port	Trunk port	Hybrid port
	VLAN is enabled. The device allows one tagged VLAN to be assigned to only one user.		

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **`port hybrid vlan tagged`** command. Then, the VLAN has the tagged attribute on the port.

For an 802.1X authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as an untagged member in the VLAN.

On a port with periodic online user reauthentication enabled, the MAC-based VLAN feature does not take effect on a user that has been online since before this feature was enabled. The access device creates a MAC-to-VLAN mapping for the user when the following requirements are met:

- The user passes reauthentication.
- The authorization VLAN for the user is changed.

For more information about VLAN configuration and MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Guest VLAN

The 802.1X guest VLAN on a port accommodates users that have not performed 802.1X authentication. Users in the guest VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches. Once a user in the guest VLAN passes 802.1X authentication, it is removed from the guest VLAN and can access authorized network resources.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port when the port is in auto state.	The device assigns the port to the 802.1X guest VLAN. All 802.1X users on this port can access only resources in the guest VLAN. The guest VLAN assignment varies by port link mode. For more information, see "Authorization VLAN manipulation on an 802.1X-enabled port."

Authentication status	VLAN manipulation
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device assigns the port to the Auth-Fail VLAN. All users on this port can access only resources in the Auth-Fail VLAN. If no Auth-Fail VLAN is configured, the port is still in the 802.1X guest VLAN. All users on the port are in the guest VLAN. For information about the 802.1X Auth-Fail VLAN, see "Auth-Fail VLAN."
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device removes the port from the 802.1X guest VLAN and assigns the port to the authorization VLAN of the user. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial port VLAN. After the user logs off, the port is assigned to the guest VLAN again. **NOTE:** The initial PVID of an 802.1X-enabled port refers to the PVID used by the port before the port is assigned to any 802.1X VLANs.

IMPORTANT:

When the port receives a packet with a VLAN tag, the packet will be forwarded within the tagged VLAN if the VLAN is not the guest VLAN.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the 802.1X-enabled port and has not performed 802.1X authentication.	The device creates a mapping between the MAC address of the user and the 802.1X guest VLAN. The user can access only resources in the guest VLAN.
A user in the 802.1X guest VLAN fails 802.1X authentication.	If an 802.1X Auth-Fail VLAN is available, the device remaps the MAC address of the user to the Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the user is removed from the guest VLAN and added to the initial PVID.
A user in the 802.1X guest VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Auth-Fail VLAN

The 802.1X Auth-Fail VLAN on a port accommodates users that have failed 802.1X authentication because of the failure to comply with the organization's security policy. For example, the VLAN accommodates users that have entered a wrong password. Users in the Auth-Fail VLAN can access a limited set of network resources, such as a software server, to download antivirus software and system patches.

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device assigns the port to the Auth-Fail VLAN. All 802.1X users on this port can access only resources in the Auth-Fail VLAN. The Auth-Fail VLAN assignment varies by port link mode. For more information, see "Authorization VLAN manipulation on an 802.1X-enabled port."
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The port is still in the Auth-Fail VLAN, and all 802.1X users on this port are in this VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the Auth-Fail VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to the initial PVID. After the user logs off, the port is assigned to the guest VLAN. If no guest VLAN is configured, the port is assigned to the initial PVID of the port.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication.	The device maps the MAC address of the user to the 802.1X Auth-Fail VLAN. The user can access only resources in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN fails 802.1X authentication.	The user is still in the Auth-Fail VLAN.
A user in the 802.1X Auth-Fail VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN, the device remaps the MAC address of the user to the initial PVID on the port.

Critical VLAN

The 802.1X critical VLAN on a port accommodates 802.1X users that have failed authentication because none of the RADIUS servers in their ISP domain are reachable. Users in the critical VLAN can access a limited set of network resources depending on the configuration.

The critical VLAN feature takes effect when 802.1X authentication is performed only through RADIUS servers. If an 802.1X user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

The access device handles VLANs on an 802.1X-enabled port based on its 802.1X access control method.

Port-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable. A user that has passed authentication fails reauthentication because all the RADIUS servers are unreachable, and the user is logged out of the device.	The device assigns the port to the critical VLAN. The 802.1X user and all subsequent 802.1X users on this port can access only resources in the 802.1X critical VLAN. The critical VLAN assignment varies by port link mode. For more information, see "Authorization VLAN manipulation on an 802.1X-enabled port."
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The port is still in the critical VLAN.
A user in the 802.1X critical VLAN fails authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the port is assigned to the Auth-Fail VLAN. If no 802.1X Auth-Fail VLAN is configured, the port is assigned to the initial PVID of the port.
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device assigns the port to the authorization VLAN of the user, and it removes the port from the 802.1X critical VLAN. If the authentication server does not assign an authorization VLAN, the initial PVID of the port applies. The user and all subsequent 802.1X users are assigned to this port VLAN. After the user logs off, the port is assigned to the guest VLAN. If no 802.1X guest VLAN is configured, the initial PVID of the port is restored.

If the port is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the port from the critical VLAN.
2. Sends a multicast EAP-Request/Identity message out of the port to trigger authentication.

MAC-based access control

Authentication status	VLAN manipulation
A user accesses the port and fails 802.1X authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the 802.1X critical VLAN. The user can access only resources in the 802.1X critical VLAN.
A user in the 802.1X critical VLAN fails authentication because all the RADIUS servers are unreachable.	The user is still in the critical VLAN.
A user in the 802.1X critical VLAN fails 802.1X authentication for any reason other than unreachable servers.	If an 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the Auth-Fail VLAN ID. If no 802.1X Auth-Fail VLAN has been configured, the device remaps the MAC address of the user to the initial PVID.
A user in the 802.1X critical VLAN passes 802.1X authentication.	The device remaps the MAC address of the user to the authorization VLAN. If the authentication server does not assign an authorization VLAN to the user, the device remaps the MAC address of the user to the initial PVID on the port.

If a user is added to the critical VLAN because no RADIUS servers are reachable, the device performs the following operations after it detects a reachable RADIUS server:

1. Removes the user from the critical VLAN.
2. Sends a unicast EAP-Request/Identity message out of the port to the user for reauthentication.

ACL assignment

You can specify an authorization ACL for an 802.1X user on a remote server or the access device to control the user's access to network resources. After the user passes 802.1X authentication, the server or access device assigns the authorization ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules in the ACL.

The device supports assignment of static and dynamic authorization ACLs.

- **Assignment of static authorization ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, you can use one of the following methods:

  - Modify ACL rules in the authorization ACL on the access device.
  - Assign another ACL to the user as the authorization ACL from the RADIUS server or the access device.

  Static ACLs and their rules can be manually deleted from the access device.
- **Assignment of dynamic authorization ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device. Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

  If the dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

  A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

  Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **`display dot1x connection`** or **`display acl`** command.

IMPORTANT:

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, or **`logging`** keyword.

For more information about ACLs, see *ACL and QoS Command Reference*.

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server when the 802.1X-enabled port performs MAC-based access control and the port authorization state is **auto**. During authentication, the HTTP or HTTPS requests of an 802.1X user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server

records the MAC address of the user and uses a DM (Disconnect Message) to log off the user. When the user initiates 802.1X authentication again, it will pass the authentication and come online successfully.

This feature is mutually exclusive with the EAD assistant feature.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Periodic 802.1X reauthentication

Periodic 802.1X reauthentication tracks the connection status of online users and updates the authorization attributes (such as ACL and VLAN) assigned by the server.

The device reauthenticates online 802.1X users at the periodic reauthentication interval when the periodic online user reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online users only after the old timer expires and the users pass authentication.

The server-assigned session timeout timer (Session-Timeout attribute) and termination action (Termination-Action attribute) together can affect the periodic online user reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **`display dot1x connection`** command (see *Security Command Reference*).

- If the termination action is **Default** (logoff), periodic online user reauthentication on the device takes effect only when the periodic reauthentication timer is shorter than the session timeout timer.
- If the termination action is **Radius-request**, the periodic online user reauthentication settings on the device do not take effect. The device reauthenticates the online 802.1X users after the session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic 802.1X reauthentication depends on the periodic reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether 802.1X periodic reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online 802.1X users if no server is reachable for 802.1X reauthentication. The keep-online feature keeps authenticated 802.1X users online when no server is reachable for 802.1X reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

EAD assistant

Endpoint Admission Defense (EAD) is an integrated endpoint access control solution to improve the threat defensive capability of a network. The solution enables the security client, security policy server, access device, and third-party server to operate together. If a terminal device seeks to access an EAD network, it must have an EAD client, which performs 802.1X authentication.

The EAD assistant feature allows unauthenticated users to access freely accessible network segments and enables the access device to redirect the HTTP or HTTPS requests of users to a redirect URL for downloading and installing EAD clients. This feature eliminates the administrative task to deploy EAD clients.

EAD assistant is implemented by the following functionality:

- Free IP.

  A free IP is a freely accessible network segment, which has a limited set of network resources such as software and DHCP servers. To ensure security policy compliance, an unauthenticated user can access only this segment to perform operations. For example, the user can download EAD client from a software server or obtain a dynamic IP address from a DHCP server.

- Redirect URL.

  If an unauthenticated 802.1X user is using a Web browser to access the network, EAD assistant redirects the network access requests of the user to a specific URL. For example, you can use this feature to redirect the user to the EAD client software download page.

The EAD assistant feature creates an ACL-based EAD rule automatically to open access to the free segment for each unauthenticated user.

EAD rules are implemented by using ACL resources. When the EAD rule timer expires or the user passes authentication, the rule is removed. If users fail to download EAD client or fail to pass authentication before the timer expires, they must reconnect to the network to access the free segment.

Configuring 802.1X

Restrictions and guidelines: 802.1X configuration

You can configure the port security feature to perform 802.1X. Port security combines and extends 802.1X and MAC authentication. It applies to a network (a WLAN, for example) that requires different authentication methods for different users on a port. For more information about the port security feature, see "Configuring port security."

When RADIUS DAS is enabled, an M-LAG system does not support shutting down or rebooting the access ports of 802.1X users or reauthenticating the users through CoA messages. For more information about RADIUS DAS, see "Configuring AAA."

The S5200-EI-G switch series does not support M-LAG-related functions or parameters.

The S5200-EI-G switch series does not support configuring 802.1X on Layer 2 aggregate interfaces.

When you configure 802.1X settings on an interface, follow these restrictions and guidelines:

- 802.1X is supported only on Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces.
- If you add a Layer 2 Ethernet interface to an aggregation group, the 802.1X settings configured on it will not take effect until it is removed from the aggregation group.
- Do not delete a Layer 2 aggregate interface if the interface has online 802.1X users.
- Do not change the link type of a port when the 802.1X guest VLAN, Auth-Fail VLAN, or critical VLAN on the port has users.
- To ensure that online 802.1X users on a Layer 2 aggregate interface with MAC-based VLAN enabled can correctly go offline, enable MAC-based VLAN also on all member ports of the aggregate interface.
-

802.1X tasks at a glance

To configure 802.1X authentication, perform the following tasks:

1. Enabling 802.1X
2. Configuring basic 802.1X features

- Enabling EAP relay or EAP termination
- Setting the port authorization state
- Specifying an access control method
- (Optional.) Specifying a mandatory authentication domain on a port
- (Optional.) Setting the 802.1X authentication timeout timers
- (Optional.) Configuring 802.1X reauthentication
- (Optional.) Setting the quiet timer

3. (Optional.) Configuring 802.1X VLAN assignment
- Configuring an 802.1X guest VLAN
- Enabling 802.1X guest VLAN assignment delay
- Configuring an 802.1X Auth-Fail VLAN
- Configuring an 802.1X critical VLAN

4. (Optional.) Configuring an 802.1X access profile

5. (Optional.) Setting the upper limit for 802.1X parameters
- Setting the maximum number of concurrent 802.1X users on a port
- Setting the alarm threshold and alarm clear threshold for 802.1X user access ratio
- Setting the maximum number of authentication request attempts
- Setting the maximum number of 802.1X authentication attempts for MAC authenticated users

6. (Optional.) Configuring other 802.1X features
- Configuring 802.1X unauthenticated user aging
- Enabling 802.1X online user synchronization
- Configuring the authentication trigger feature

  Perform this task when 802.1X clients cannot initiate authentication.
- Sending EAP-Success packets to 802.1X clients after successful authorization
- Discarding duplicate 802.1X EAPOL-Start requests
- Configuring online user handshake
- Configuring 802.1X offline detection
- Enabling online 802.1X users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available
- Specifying supported domain name delimiters
- Removing the VLAN tags of 802.1X protocol packets sent out of a port
- Enabling 802.1X user IP freezing
- Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users
- Configuring 802.1X MAC address binding
- Configuring the EAD assistant feature
- Setting the maximum size of EAP-TLS fragments sent to the server

  Use this feature to reduce the size of authentication packets sent to the server when the device uses EAP-TLS authentication method in EAP relay mode.
- Setting the unicast-trigger quiet timer
- Logging off 802.1X users
- Enabling 802.1X user logging
- Configuring SNMP notifications for 802.1X

Prerequisites for 802.1X

Before you configure 802.1X, complete the following tasks:

- Configure an ISP domain and AAA scheme (local or RADIUS authentication) for 802.1X users.
- If RADIUS authentication is used, create user accounts on the RADIUS server.
- If local authentication is used, create local user accounts on the access device and set the service type to **lan-access**.

Enabling 802.1X

Restrictions and guidelines

For 802.1X to take effect on a port, you must enable it both globally and on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enable 802.1X globally.
   `dot1x`
   By default, 802.1X is disabled globally.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable 802.1X on a port.
   `dot1x`
   By default, 802.1X is disabled on a port.

Enabling EAP relay or EAP termination

About this task

Consider the following factors to select a proper EAP mode:

- Support of the RADIUS server for EAP packets.
- Authentication methods supported by the 802.1X client and the RADIUS server.

Restrictions and guidelines

- If EAP relay mode is used, the **`user-name-format`** command configured in RADIUS scheme view does not take effect. The access device sends the authentication data from the client to the server without any modification. For more information about the **`user-name-format`** command, see *Security Command Reference*.
- You can use both EAP termination and EAP relay in any of the following situations:
  - The client is using only MD5-Challenge EAP authentication. If EAP termination is used, you must enable CHAP authentication on the access device.
  - The client is an iNode 802.1X client and initiates only the username and password EAP authentication. If EAP termination is used, you can enable either PAP or CHAP authentication on the access device. However, for the purpose of security, you must use CHAP authentication on the access device.
- To use EAP-TLS, PEAP, or any other EAP authentication methods, you must use EAP relay. When you make your decision, see "Comparing EAP relay and EAP termination" for help.

Procedure

1. Enter system view.
   system-view
2. Configure EAP relay or EAP termination.
   dot1x authentication-method { **chap** | **eap** | **pap** }
   By default, the access device performs EAP termination and uses CHAP to communicate with the RADIUS server.

Setting the port authorization state

About this task

The port authorization state determines whether the client is granted access to the network. You can control the following authorization states of a port:

- **Authorized**—Places the port in the authorized state, enabling users on the port to access the network without authentication.
- **Unauthorized**—Places the port in the unauthorized state, denying any access requests from users on the port.
- **Auto**—Places the port initially in unauthorized state to allow only EAPOL packets to pass. After a user passes authentication, sets the port in the authorized state to allow access to the network. You can use this option in most scenarios.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port authorization state.
   dot1x port-control { **authorized-force** | **auto** | **unauthorized-force** }
   By default, the **auto** state applies.

Specifying an access control method

About this task

The device supports port-based and MAC-based access control methods.

Restrictions and guidelines

If online 802.1X users are present on a port, changing its access control method will cause the online users to go offline.

To avoid authentication anomalies, do not execute the **dot1x port-method portbased** command on an interface that is bound to a port security authentication profile.

802.1X port-based access control is mutually exclusive with MAC authentication, Web authentication and static user authentication.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Specify an access control method.

   dot1x port-method { **macbased** | **portbased** }

   By default, MAC-based access control applies.

Specifying a mandatory authentication domain on a port

About this task

You can place all 802.1X users in a mandatory authentication domain for authentication, authorization, and accounting on a port. No user can use an account in any other domain to access the network through the port. The implementation of a mandatory authentication domain enhances the flexibility of 802.1X access control deployment.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify a mandatory 802.1X authentication domain on the port.

   dot1x mandatory-domain *domain-name*

   By default, no mandatory 802.1X authentication domain is specified.

Setting the 802.1X authentication timeout timers

About this task

The network device uses the following 802.1X authentication timeout timers:

- **Client timeout timer**—Starts when the access device sends an EAP-Request/MD5-Challenge packet to a client. If no response is received when this timer expires, the access device retransmits the request to the client.
- **Server timeout timer**—Starts when the access device sends a RADIUS Access-Request packet to the authentication server. If no response is received when this timer expires, the 802.1X authentication fails.

Restrictions and guidelines

In most cases, the default settings are sufficient. You can edit the timers, depending on the network conditions.

- In a low-speed network, increase the client timeout timer.
- In a network with authentication servers of different performance, adjust the server timeout timer.

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view
2. Set the client timeout timer.

   dot1x timer supp-timeout *supp-timeout-value*

   The default is 30 seconds.
3. Set the server timeout timer.

   dot1x timer server-timeout *server-timeout-value*

   The default is 100 seconds.

Configuring 802.1X reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for 802.1X reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

After you perform a manual reauthentication, the device reauthenticates all online 802.1X users on a port regardless of the server-assigned reauthentication attribute and the periodic reauthentication feature on the port.

Modification to the mandatory authentication domain or EAP message handling method setting does not affect the reauthentication of online 802.1X users. The modified setting takes effect only on 802.1X users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view
2. Set the periodic reauthentication timer.
   - Set a global periodic reauthentication timer.

     dot1x timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.
   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     dot1x timer reauth-period *reauth-period-value*

     quit

     By default, no periodic reauthentication timer is set on a port. The port uses the global 802.1X periodic reauthentication timer.
3. Enter interface view.

   interface *interface-type interface-number*

4. Enable periodic online user reauthentication.

   dot1x re-authenticate

   By default, the feature is disabled.

5. (Optional.) Manually reauthenticate all online 802.1X users on the port.

   dot1x re-authenticate manual

6. (Optional.) Enable the keep-online feature for 802.1X users.

   dot1x re-authenticate server-unreachable keep-online

   By default, this feature is disabled. The device logs off online 802.1X users if no authentication server is reachable for 802.1X reauthentication.

   Use the keep-online feature according to the actual network condition. In a fast-recovery network, you can use the keep-online feature to prevent 802.1X users from coming online and going offline frequently.

Setting the quiet timer

About this task

The quiet timer enables the access device to wait a period of time before it can process any authentication request from a client that has failed an 802.1X authentication.

Restrictions and guidelines

You can edit the quiet timer, depending on the network conditions.

- In a vulnerable network, set the quiet timer to a high value.
- In a high-performance network with quick authentication response, set the quiet timer to a low value.

Procedure

1. Enter system view.

   system-view

2. Enable the quiet timer.

   dot1x quiet-period

   By default, the timer is disabled.

3. Set the quiet timer.

   dot1x timer quiet-period *quiet-period-value*

   The default is 60 seconds.

Configuring an 802.1X guest VLAN

Restrictions and guidelines

- You can configure only one 802.1X guest VLAN on a port. The 802.1X guest VLANs on different ports can be different.
- Assign different IDs to the port VLAN and the 802.1X guest VLAN on a port. The assignment makes sure the port can correctly process incoming VLAN-tagged traffic.
- For the 802.1X guest VLAN feature to work correctly, do not configure this feature together with EAD assistant.
- On a hybrid port, the guest VLAN can only be an untagged VLAN. If the guest VLAN is tagged, you must make it untagged, and then reconfigure it as the guest VLAN.
- When you configure multiple security features on a port, follow the guidelines in Table 4.

Table 4 Relationships of the 802.1X guest VLAN and other security features

Feature	Relationship description	Reference
802.1X Auth-Fail VLAN on a port that performs MAC-based access control	The 802.1X Auth-Fail VLAN has a higher priority than the 802.1X guest VLAN.	See "802.1X VLAN manipulation."
Port intrusion protection actions on a port that performs MAC-based access control	The 802.1X guest VLAN feature has higher priority than the block MAC action. The 802.1X guest VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure an 802.1X guest VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X guest VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the guest VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Configure the 802.1X guest VLAN on the port.
   `dot1x guest-vlan` *`guest-vlan-id`*
   By default, no 802.1X guest VLAN exists on a port.

Enabling 802.1X guest VLAN assignment delay

About this task

This feature delays assigning an 802.1X-enabled port to the 802.1X guest VLAN when 802.1X authentication is triggered on the port.

This feature applies only to situations where 802.1X authentication is triggered by EAPOL-Start packets from 802.1X clients or packets from unknown MAC addresses.

To use this feature, the 802.1X-enabled port must perform MAC-based access control. To use the new MAC-triggered 802.1X guest VLAN assignment delay, you must also configure 802.1X unicast trigger on the port.

When 802.1X authentication is triggered on a port, the device performs the following operations:

1. Sends a unicast EAP-Request/Identity packet to the MAC address that triggers the authentication.
2. Retransmits the packet if no response is received within the username request timeout interval set by using the **`dot1x timer tx-period`** command.

3. Assigns the port to the 802.1X guest VLAN after the maximum number of request attempts set by using the **dot1x retry** command is reached.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable 802.1X guest VLAN assignment delay on the port.

   dot1x guest-vlan-delay { **eapol** | **new-mac** }

   By default, 802.1X guest VLAN assignment delay is disabled on a port.

Configuring an 802.1X Auth-Fail VLAN

Restrictions and guidelines

- Assign different IDs to the port VLAN and the 802.1X Auth-Fail VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.
- You can configure only one 802.1X Auth-Fail VLAN on a port. The 802.1X Auth-Fail VLANs on different ports can be different.
- On a hybrid port, the Auth-Fail VLAN can only be an untagged VLAN.
- When you configure multiple security features on a port, follow the following guidelines:
  - On a port that performs MAC-based access control, the 802.1X Auth-Fail VLAN has a high priority over the MAC authentication guest VLAN. For more information about MAC authentication, see "Configuring MAC authentication."
  - For port intrusion protection actions on a port that performs MAC-based access control: The 802.1X Auth-Fail VLAN feature has higher priority than the block MAC action. The 802.1X Auth-Fail VLAN feature has lower priority than the shutdown port action of the port intrusion protection feature.

    For more information about port security, see "Configuring port security."

Prerequisites

Before you configure an 802.1X Auth-Fail VLAN, complete the following tasks:

- Create the VLAN to be specified as the 802.1X Auth-Fail VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the Auth-Fail VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the 802.1X Auth-Fail VLAN on the port.

   dot1x auth-fail vlan *authfail-vlan-id*

By default, no 802.1X Auth-Fail VLAN exists on a port.

Configuring an 802.1X critical VLAN

Restrictions and guidelines

- You can configure only one 802.1X critical VLAN on a port. The 802.1X critical VLANs on different ports can be different.
- Assign different IDs to the PVID and the 802.1X critical VLAN on a port. The assignment makes sure the port can correctly process VLAN-tagged incoming traffic.
- If a port configured with port-based access control is already in the 802.1X Auth-Fail VLAN, it will not move to the 802.1X critical VLAN when all authentication servers become unreachable. If all authentication servers are detected unreachable upon reauthentication initiated by a user in the Auth-Fail VLAN on a port configured with MAC-based access control, that user will remain in the Auth-Fail VLAN. The device will not move the user to the 802.1X critical VLAN.
- A port will move to the 802.1X Critical VLAN if all authentication servers are detected unreachable after it has been added to the 802.1X Guest VLAN.
- On a hybrid port, the critical VLAN can only be an untagged VLAN.

Prerequisites

Before you configure an 802.1X critical VLAN, complete the following tasks:

- Create the VLAN to be specified as a critical VLAN.
- If the 802.1X-enabled port performs MAC-based access control, perform the following operations for the port:
  - Configure the port as a hybrid port.
  - Enable MAC-based VLAN on the port. For more information about MAC-based VLANs, see *Layer 2—LAN Switching Configuration Guide*.
- If the port type is hybrid, verify that the VLAN to be specified as the critical VLAN is not in the tagged VLAN list on the port.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the 802.1X critical VLAN on the port.
   dot1x critical vlan *critical-vlan-id*
   By default, no 802.1X critical VLAN exists on a port.

Configuring an 802.1X access profile

About this task

The device uses 802.1X access profiles to manage 802.1X access settings in a unified manner. After you bind an 802.1X access profile to a port security authentication profile, the interfaces to which the port security authentication profile is applied will use the settings in the 802.1X access profile to authenticate access users.

After you bind a port security authentication profile to an interface:

- For settings that can be configured both in interface view and 802.1X access profile view (the command lines might differ in the views), the system automatically deletes the settings in

interface view regardless of whether the port security authentication profile has been bound to an 802.1X access profile. To use these settings, configure them in the 802.1X access profile bound to the port security authentication profile.

- For settings that can be configured in interface view but cannot be configured in 802.1X access profile view, they can still take effect after you apply an 802.1X access profile to that interface.

For more information about port security authentication profiles, see "Configuring port security."

Restrictions and guidelines

Deleting the 802.1X access profile bound to a port security authentication profile will cause online users to go offline abnormally if the access profile has taken effect.

An 802.1X access profile can be bound to multiple port security authentication profiles, but a port security authentication profile can bind only one 802.1X access profile. To change the 802.1X access profile bound to a port security authentication profile, you must first remove the original binding.

Procedure

1. Enter system view.

   system-view

2. Create an 802.1X access profile and enter its view.

   dot1x access-profile name *profile-name*

   By default, no 802.1X access profiles exist.

3. Configure 802.1X features in the 802.1X access profile.

   For information about the features that can be configured in an 802.1X access profile, see 802.1X commands in the command reference.

4. Enter port security authentication profile view.

   port-security authentication-profile name *profile-name*

5. Bind the 802.1X access profile to the port security authentication profile.

   dot1x access-profile *profile-name*

   By default, no 802.1X access profile is bound to a port security authentication profile.

Configuring 802.1X unauthenticated user aging

About this task

802.1X unauthenticated user aging applies to users added to an 802.1X guest, critical, or Auth-Fail VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

The 802.1X user aging mechanism on a port depends on its access control mode.

- If the port uses port-based access control, a user aging timer starts when the port is assigned to the critical or Auth-Fail VLAN. When the aging timer expires, the port is removed from the VLAN and all MAC address entries for users in the VLAN are also removed.
- If the port uses MAC-based access control, a user aging timer starts for each 802.1X user when they are assigned to the Auth-Fail, critical, or guest VLAN. When the aging timer for a user expires, the device removes that user from the VLAN.

The removed users will be unable to access any network resources until after another authentication is triggered.

Restrictions and guidelines

As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.

   system-view

2. Set the user aging timer for a type of 802.1X VLAN.

   dot1x timer user-aging { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } *aging-time-value*

   By default, the user aging timers for all applicable types of 802.1X VLANs are 1000 seconds.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable 802.1X unauthenticated user aging.

   dot1x unauthenticated-user aging enable

   By default, 802.1X unauthenticated user aging is enabled.

Sending EAP-Success packets on assignment of users to the 802.1X Auth-Fail VLAN

About this task

By default, the device sends EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X Auth-Fail VLAN on a port. However, some 802.1X clients cannot send DHCP requests for IP addresses after they receive EAP-Failure packets.

To have these clients obtain IP addresses and access resources after they are assigned to the 802.1X Auth-Fail VLAN, perform this task.

This task enables the device to send EAP-Success packets instead of EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X Auth-Fail VLAN on the port.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the device to send an EAP-Success packet to a client when the client user is assigned to the 802.1X Auth-Fail VLAN on the port.

   dot1x auth-fail eapol

   By default, the device sends an EAP-Failure packet to a client when the client user is assigned to the 802.1X Auth-Fail VLAN.

Sending EAP-Success packets on assignment of users to the 802.1X critical VLAN

About this task

By default, the device sends EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN. Some 802.1X clients cannot respond to the EAP-Request/Identity packet from the device for reauthentication if they have received an EAP-Failure packet. As a result, reauthentication for these clients will fail after the authentication server becomes reachable.

To avoid this situation, enable the device to send EAP-Success packets instead of EAP-Failure packets to 802.1X clients when the client users are assigned to the 802.1X critical VLAN.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Configure the device to send an EAP-Success packet to an 802.1X client when its client user is assigned to the critical VLAN on the port.

   `dot1x critical eapol`

   By default, the device sends an EAP-Failure packet to an 802.1X client when its client user is assigned to the critical VLAN.

Enabling 802.1X online user synchronization

About this task

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate 802.1X users.

To ensure that the RADIUS server maintains the same online 802.1X user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online 802.1X user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online 802.1X user information on a port with the RADIUS server, the device initiates 802.1X authentication in turn for each authenticated online 802.1X user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new 802.1X users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **`radius-server test-profile`** command. When you configure this feature, make sure the detection interval is shorter than the RADIUS server quiet timer configured by using the **`timer quiet`** command in RADIUS scheme view. The server

state changes to active on expiration of the quiet timer regardless of its actual reachability. Setting a shorter detection interval than the quiet timer prevents the RADIUS server status detection feature from falsely reporting the server reachability.

For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable 802.1X online user synchronization.
   dot1x server-recovery online-user-sync
   By default, 802.1X online user synchronization is disabled.

Configuring the authentication trigger feature

About this task

The authentication trigger feature enables the access device to initiate 802.1X authentication when 802.1X clients cannot initiate authentication.

This feature provides the multicast trigger and unicast trigger (see 802.1X authentication initiation in "802.1X overview").

Restrictions and guidelines

- Enable the multicast trigger on a port when the clients attached to the port cannot send EAPOL-Start packets to initiate 802.1X authentication.
- As a best practice to conserve link bandwidth, disable the multicast trigger if a lot of VLANs are configured on the port.
- Enable the unicast trigger on a port if only a few 802.1X clients are attached to the port and these clients cannot initiate authentication.
- To avoid duplicate authentication packets, do not enable both triggers on a port.
- As a best practice, do not use the unicast trigger on a port that performs port-based access control. If you do so, users on the port might fail to come online.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Set the username request timeout timer.
   dot1x timer tx-period *tx-period-value*
   The default is 30 seconds.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable an authentication trigger.
   dot1x { **multicast-trigger** | **unicast-trigger** }
   By default, the multicast trigger is enabled and the unicast trigger is disabled.

Setting the maximum number of concurrent 802.1X users on a port

About this task

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum number of concurrent 802.1X users on a port.
   dot1x max-user [**preauth-domain** | **auth-fail-domain**] *max-number*
   The default is 4294967295.

Setting the alarm threshold and alarm clear threshold for 802.1X user access ratio

About this task

The 802.1X user access ratio on an interface is the percentage of current online 802.1X users to the maximum number of concurrent 802.1X users on the interface (configured by using the **dot1x max-user** command).

After you use the **snmp-agent trap enable dot1x** command to enable SNMP notifications for 802.1X user access ratio and use the **dot1x max-user-alarm** command to set the alarm threshold and alarm clear threshold:

- If the percentage of 802.1X user access ratio on an interface reaches the specified alarm threshold for the first time, or increases to the alarm threshold from a value below or equal to the alarm clear threshold, the device sends an alarm notification.
- If the percentage of 802.1X user access ratio on the interface drops to the alarm clear threshold from a value above or equal to the alarm threshold, the device sends an alarm clear notification.

If the user access ratio on an interface has reached or exceeded the alarm threshold before SNMP notifications is enabled, the alarm is triggered in the following conditions after SNMP notifications is enabled:

- A user comes online and the alarm threshold is exceeded.
- A user goes offline and the alarm threshold is reached or exceeded.

Procedure

1. Enter system view.
   system-view
2. Set the alarm threshold and alarm clear threshold for 802.1X user access ratio in percentage.
   dot1x max-user-alarm trigger-threshold *trigger-threshold* **clear-threshold** *clear-threshold*
   By default, the alarm threshold and alarm clear threshold for 802.1X user access ratio in percentage is 100 and 50, respectively.

Setting the maximum number of authentication request attempts

About this task

The access device retransmits an authentication request if it does not receive any responses to the request from the client within a period of time. To set the time, use the **dot1x timer tx-period** *tx-period-value* command or the **dot1x timer supp-timeout** *supp-timeout-value* command. The access device stops retransmitting the request if it has made the maximum number of request transmission attempts but still receives no response.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of attempts for sending an authentication request.

   dot1x retry *retries*

   The default setting is 2.

Sending EAP-Success packets to 802.1X clients after successful authorization

About this task

By default, the device sends an EAP-Success packet to a client after it receives a RADIUS Access-Accept packet sent by the RADIUS server for the user of that client. After that, the device grants the user access to the network through the user's access port. Upon receiving the EAP-Success packet, the client immediately initiates a DHCP request to obtain an IP address. However, if the device has not yet received authorization information assigned by the RADIUS server, the client directly obtains an IP address from its access network segment. If its access network segment is different from its authorization network segment after the RADIUS server assigns the authorization information, the client will be unable to come online.

To ensure that each 802.1X client obtains an IP address from the authorization network segment, use this feature to configure the device to send EAP-Success packets to 802.1X clients after authorization for the users of the clients succeeds.

Restrictions and guidelines

When this feature is configured, authentication for some users might fail due to untimely authorization if the RADIUS server or device needs to process a large number of authentication processes, resulting in authentication response timeout. As a best practice, use this feature based on the service processing capabilities of the device and the RADIUS server in the actual application scenario.

Procedure

1. Enter system view.

   system-view

2. Configure the device to send EAP-Success packets to 802.1X clients after authorization for the users of the clients succeeds.

   dot1x eap-success post-authorization

   By default, the device sends EAP-Success packets to 802.1X clients immediately after authentication for the users of the clients succeeds.

Discarding duplicate 802.1X EAPOL-Start requests

About this task

During 802.1X authentication, the device might receive duplicate EAPOL-Start requests from an 802.1X user. By default, the device delivers the duplicate EAPOL-Start requests to the authentication server as long as they are legal. However, this mechanism might result in authentication failure if the authentication server cannot respond to duplicate EAPOL-Start requests. To resolve this issue, perform this task on the user access interface to discard duplicate EAPOL-Start requests.

Restrictions and guidelines

As a best practice, perform this task only if the server cannot respond to duplicate EAPOL-Start requests. Do not perform this task in other situations.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Discard duplicate EAPOL-Start requests on the interface.

   dot1x duplicate-eapol-start discard

   By default, the device does not discard duplicate EAPOL-Start requests on an interface if the requests are legal.

Configuring online user handshake

About this task

The online user handshake feature checks the connectivity status of online 802.1X users. The access device sends handshake requests (EAP-Request/Identity) to online users at the interval specified by the **dot1x timer handshake-period** command. If the device does not receive any EAP-Response/Identity packets from an online user after it has made the maximum handshake attempts, the device sets the user to offline state. To set the maximum handshake attempts, use the **dot1x retry** command.

Typically, the device does not reply to 802.1X clients' EAP-Response/Identity packets with EAP-Success packets. Some 802.1X clients will go offline if they do not receive the EAP-Success packets for handshake. To avoid this issue, enable the online user handshake reply feature.

If iNode clients are deployed, you can also enable the online user handshake security feature to check authentication information in the handshake packets from clients. This feature can prevent 802.1X users that use illegal client software from bypassing iNode security check, such as dual network interface cards (NICs) detection. If a user fails the handshake security checking, the device sets the user to the offline state.

Restrictions and guidelines

- If the network has 802.1X clients that cannot exchange handshake packets with the access device, disable the online user handshake feature. This operation prevents the 802.1X connections from being incorrectly torn down.
- To use the online user handshake security feature, make sure the online user handshake feature is enabled.

- The online user handshake security feature takes effect only on the network where the iNode client and IMC server are used.
- Enable the online user handshake reply feature only if 802.1X clients will go offline without receiving EAP-Success packets from the device.
- To ensure online user handshake and new user authentication when a large number of users are present, set the following parameters to a large value:
  - Handshake timer (set by using the **dot1x timer handshake-period** command).
  - Maximum number of attempts to send an authentication request to a client (set by using the **dot1x retry** command).

Procedure

1. Enter system view.

   system-view
2. (Optional.) Set the handshake timer.

   dot1x timer handshake-period *handshake-period-value*

   The default is 15 seconds.
3. Enter interface view.

   interface *interface-type interface-number*
4. Enable the online user handshake feature.

   dot1x handshake

   By default, the feature is enabled.
5. (Optional.) Enable the online user handshake security feature.

   dot1x handshake secure

   By default, the feature is disabled.
6. (Optional.) Enable the 802.1X online user handshake reply feature.

   dot1x handshake reply enable

   By default, the device does not reply to 802.1X clients' EAP-Response/Identity packets during the online handshake process.

Configuring 802.1X offline detection

About this task

The 802.1X offline detection feature monitors the online status of 802.1X users. This feature uses an offline detection timer to set the interval that the device must wait for traffic from a user before the device determines that the user is idle. If the device has not received traffic from a user before the timer expires, the device logs off that user and requests the accounting server to stop accounting for the user.

The traffic monitored by this feature includes 802.1X protocol packets sent from 802.1X clients.

This feature takes effect on both of the following types of users:

- Users in preauthentication domains, authentication domains, critical domains, and Auth-Fail domains.
- Users assigned to .

Restrictions and guidelines

The 802.1X offline detection feature takes effect only on a port that performs MAC-based access control. If you change the port access mode to port-based, the 802.1X offline detection feature cannot take effect.

If you enable 802.1X offline detection on a Layer 2 aggregate interface, delay exists for the device to log off an idle user.

For this feature to operate as expected, do not set the offline detection timer to the same value as either of the following timers:

- Handshake timer (set by using the **dot1x timer handshake-period** command).
- Periodic reauthentication timer (set by using the **dot1x timer reauth-period** command).

Procedure

1. Enter system view.
   system-view
2. Set the 802.1X offline detection timer.
   dot1x timer offline-detect *offline-detect-value*
   By default, the 802.1X offline detection timer is 300 seconds.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable 802.1X offline detection.
   dot1x offline-detect enable
   By default, 802.1X offline detection is disabled.

Enabling online 802.1X users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available

About this task

The 802.1X offline detection feature logs off an online 802.1X user if it has not detected traffic from that user before the offline-detect timer expires. To prevent online 802.1X users on a port from being forced offline by the 802.1X offline detection feature and stay online when none of the RADIUS servers in their ISP domain is reachable, perform this task.

Restrictions and guidelines

Use this feature only when RADIUS scheme authentication is configured for the 802.1X users on a port. If local or no authentication is also configured, offline detection might be undesirably disabled for the 802.1X users when they come online through local authentication or without authentication.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable online 802.1X users to escape from 802.1X offline detection and stay online when no reachable RADIUS authentication servers are available.
   dot1x auth-server-unavailable escape
   By default, online 802.1X users cannot escape from 802.1X offline detection (if enabled) when no reachable RADIUS authentication servers are available.

Specifying supported domain name delimiters

About this task

By default, the access device supports the at sign (@) as the delimiter. You can also configure the access device to accommodate 802.1X users that use other domain name delimiters. The configurable delimiters include the at sign (@), backslash (\), dot (.), and forward slash (/). Usernames that include domain names can use the format of *username@domain-name*, *domain-name******username*, *username***.***domain-name*, or *username***/***domain-name*.

If an 802.1X username string contains multiple configured delimiters, the rightmost delimiter is the domain name delimiter. For example, if you configure the backslash (\), dot (.), and forward slash (/) as delimiters, the domain name delimiter for the username string 121.123/22\@abc is the backslash (\). The username is @**abc** and the domain name is **121.123/22**.

Restrictions and guidelines

If a username string contains none of the delimiters, the access device authenticates the user in the mandatory or default ISP domain.

If you configure the access device to send usernames with domain names to the RADIUS server, make sure the domain delimiter can be recognized by the RADIUS server. For username format configuration, see the **user-name-format** command in *Security Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Specify a set of domain name delimiters for 802.1X users.

   dot1x domain-delimiter *string*

   By default, only the at sign (@) delimiter is supported.

Removing the VLAN tags of 802.1X protocol packets sent out of a port

About this task

This feature operates on a hybrid port to have it send 802.1X protocol packets with their VLAN tags removed, regardless of whether the port is a tagged or untagged member of a VLAN.

Use this feature if the 802.1X-enabled hybrid port is a tagged member of its PVID and the attached 802.1X clients cannot recognize VLAN-tagged 802.1X protocol packets.

Restrictions and guidelines

This feature removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this feature if VLAN-aware 802.1X clients are attached to the port. As a best practice, perform this task only in the described applicable scenario.

Prerequisites

Set the link type of the 802.1X-enabled port to hybrid. For more information, see VLAN configuration in *Layer 2 LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Remove the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients.

   dot1x eapol untag

   By default, whether the device removes the VLAN tags of all 802.1X protocol packets sent out of a port to 802.1X clients depends on the configuration in the VLAN module.

CAUTION:

This command removes the VLAN tags of all 802.1X protocol packets sent out of the port to 802.1X clients. Do not use this command if VLAN-aware 802.1X clients are attached to the port. As a best practice, use this command only in the described applicable scenario.

Setting the maximum number of 802.1X authentication attempts for MAC authenticated users

About this task

When a port uses both 802.1X authentication and MAC authentication, the device accepts 802.1X authentication requests from MAC authenticated users. If a MAC authenticated user passes 802.1X authentication, the user will come online as an 802.1X user. If the user fails 802.1X authentication, the user continues to make 802.1X authentication attempts depending on client configuration.

Perform this task to limit the number of 802.1X authentication attempts made by a MAC authenticated user.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the maximum number of 802.1X authentication attempts for MAC authenticated users on the port.

   dot1x after-mac-auth max-attempt *max-attempts*

   By default, the number of 802.1X authentication attempts for MAC authenticated users is not limited on a port.

Enabling 802.1X user IP freezing

About this task

This feature works with the IP source guard feature. 802.1X-based IP source guard requires that 802.1X clients support sending user IP addresses to the access device. The device uses information such as user MAC addresses and IP addresses obtained through 802.1X to generate IPSG bindings to filter out IPv4 packets from unauthenticated 802.1X users. For information about IP source guard, see "Configuring IP source guard."

This feature prevents any authenticated 802.1X users on a port from changing their IP addresses. After you enable this feature, the port does not update the IP addresses in dynamic IPSG bindings for 802.1X users. If an 802.1X user uses an IP address different from the IP address in its IPSG binding entry, the port denies the user access.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable 802.1X user IP freezing.
   dot1x user-ip freeze
   By default, 802.1X user IP freezing is disabled.

Enabling generation of dynamic IPSG binding entries for 802.1X authenticated users

About this task

IMPORTANT:
This feature must operate in conjunction with the IP source guard (IPSG) feature.

By default, the device generates a dynamic IPv4SG or IPv6SG binding entry for an 802.1X authenticated user after the user obtains a static or DHCP assigned IP address.

To allow only 802.1X users with DHCP assigned IP addresses to access the network, perform the following operations:

- Enable IPSG.
- Disable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.
- Enable DHCP snooping. The device will generate IPv4SG or IPv6SG binding entries for the users based on DHCP snooping.

For more information about IPSG, see IP source guard in *Security Configuration Guide*.

Restrictions and guidelines

This feature takes effect only on 802.1X users that come online after the feature is enabled. If the IP address of an online 802.1X user changes, the device will update the dynamic IPv4SG or IPv6SG binding entry for the user.

Disabling this feature does not delete the existing dynamic IPv4SG or IPv6SG binding entries for online 802.1X users. If the IP address of an online 802.1X user changes after the feature is disabled, the device will delete the dynamic IPv4SG or IPv6SG binding entry for the user.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users.
   dot1x { **ip-verify-source** | **ipv6-verify-source** } **enable**
   By default, generation of dynamic IPv4SG or IPv6SG binding entries for 802.1X authenticated users is enabled.

Configuring 802.1X MAC address binding

About this task

This feature can automatically bind MAC addresses of authenticated 802.1X users to the users' access port and generate 802.1X MAC address binding entries. You can also use the **dot1x mac-binding** *mac-address* command to manually add 802.1X MAC address binding entries.

802.1X MAC address binding entries never age out. They can survive a user logoff or a device reboot. If users in the 802.1X MAC address binding entries perform 802.1X authentication on another port, they cannot pass authentication.

Restrictions and guidelines

The 802.1X MAC address binding feature takes effect only when the port performs MAC-based access control.

To delete an 802.1X MAC address binding entry, use the **undo dot1x mac-binding** *mac-address* command. An 802.1X MAC address binding entry cannot be deleted when the user in the entry is online.

After the number of 802.1X MAC address binding entries reaches the upper limit of concurrent 802.1X users (set by using the **dot1x max-user** command), the following restrictions exist:

- Users not in the binding entries will fail authentication even after users in the binding entries go offline.
- New 802.1X MAC address binding entries are not allowed.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the 802.1X MAC address binding feature.
   dot1x mac-binding enable
   By default, the feature is disabled.
4. (Optional.) Manually add an 802.1X MAC address binding entry.
   dot1x mac-binding *mac-address*
   By default, no 802.1X MAC address binding entries exist on a port.

Configuring the EAD assistant feature

Restrictions and guidelines

- If you enable EAD assistant in conjunction with port security, EAD assistant cannot take effect on ports operating in autoLearn port security mode.
- To make the EAD assistant feature take effect on an 802.1X-enabled port, you must set the port authorization mode to **auto**.
- When port security is enabled, the free IPs cannot take effect.
- EAD assistant might cause malfunction of 802.1X Auth-Fail VLANs and critical VLANs. To ensure that users can correctly access Auth-Fail VLANs and critical VLANs, use the **dot1x ead-assistant permit authentication-escape** command.
- The **dot1x ead-assistant permit authentication-escape** command cannot take effect on ports in port-based access control.

- If you use free IP and Auth-Fail VLAN features together, make sure the resources in the Auth-Fail VLAN are on the free IP segments.
- The server that provides the redirect URL must be on the free IP accessible to unauthenticated users.
- If you configure both EAD assistant and 802.1X unicast trigger on a port that performs port-based access control, 802.1X unicast trigger cannot take effect.

When you use both EAD assistant and MAC authentication on the device, follow these restrictions and guidelines:

- If both EAD assistant and MAC authentication are configured, the device does not mark the MAC address of a user that has failed MAC authentication as a silent MAC address. If the user has never passed MAC authentication, packets from the user can trigger MAC authentication again only after the user's EAD entry ages out.
- As a best practice, do not configure MAC authentication guest VLANs or critical VLANs. The VLANs might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- As a best practice, do not configure the Web authentication or IP source guard feature. These features might fail to work correctly when both EAD assistant and MAC authentication are configured on the device.
- If the MAC address of a user has been marked as a silent MAC address before you enable EAD assistant, packets from the user can trigger 802.1X or MAC authentication only after the quiet timer expires.

Procedure

1. Enter system view.

   system-view

2. Enable the EAD assistant feature.

   dot1x ead-assistant enable

   By default, this feature is disabled.

3. Configure a free IP.

   dot1x ead-assistant free-ip *ip-address* { *mask-length* | *mask-address* }

   Repeat this command to configure multiple free IPs.

4. (Optional.) Configure the redirect URL if users will use Web browsers to access the network.

   dot1x ead-assistant url *url-string* [**secondary**] [**track** *track-entry-number*]

   By default, no redirect URL exists.

   By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

5. (Optional.) Set the EAD rule timer.

   dot1x timer ead-timeout *ead-timeout-value*

   The default setting is 30 minutes.

   To avoid using up ACL resources when a large number of EAD users exist, you can shorten the EAD rule timer.

6. (Optional.) Enable support for correctly using Auth-Fail VLANs and critical VLANs when 802.1X EAD assistant is enabled.

   dot1x ead-assistant permit authentication-escape

   By default, 802.1X Auth-Fail VLANs and critical VLANs cannot function correctly when 802.1X EAD assistant is enabled.

Setting the maximum size of EAP-TLS fragments sent to the server

About this task

When the device uses EAP-TLS authentication method in EAP relay mode, the RADIUS packets might exceed the maximum packet size supported by the RADIUS server. This situation typically occurs when long EAP-TLS messages are encapsulated in the EAP-Message attribute of the RADIUS packet sent to the RADIUS server.

To avoid authentication failures caused by oversized packets, fragment the EAP-TLS messages depending on the maximum RADIUS packet size supported by the remote RADIUS server.

For example, the maximum packet length allowed by the server is 1200 bytes and the length of a RADIUS packet (excluding the EAP-Message attribute) is 800 bytes. To make sure the maximum length of a RADIUS packet does not exceed 1200 bytes, you must set the maximum length of an EAP-TLS fragment to a value less than 400 bytes.

Restrictions and guidelines

802.1X EAP-TLS fragmentation takes effect only when EAP relay mode is used. For more information about enabling EAP relay, see "Enabling EAP relay or EAP termination."

Procedure

1. Enter system view.

   system-view

2. Enable 802.1X EAP-TLS fragmentation and set the maximum EAP-TLS fragment size.

   dot1x eap-tls-fragment to-server *eap-tls-max-length*

   By default, EAP-TLS messages are not fragmented.

Setting the unicast-trigger quiet timer

About this task

To suppress the unicast trigger from requesting an unknown source MAC address for 802.1X authentication after it has made the maximum number of failed attempts, perform this task.

The 802.1X unicast-trigger quiet timer sets the duration that the unicast trigger is suppressed from sending EAP-Request/Identity requests to an unknown MAC address. This timer starts when the device fails to receive a response from an unknown MAC address after the number of unicast EAP-Request/Identity requests sent to that MAC address has reached the limit. The limit is configurable with the **dot1x retry** command.

Restrictions and guidelines

The network access delay introduced by the unicast-trigger quiet timer increases as the timer value increases. When you set the unicast-trigger quiet timer, make sure its value does not introduce undesired delay for 802.1X authentication users to come online.

You cannot use the unicast-trigger quiet timer in conjunction with the guest VLAN and EAD assistant feature.

Procedure

1. Enter system view.

   system-view

2. Set the unicast-trigger quiet timer.

   dot1x timer unicast-trigger quiet-period *quiet-period-value*

By default, the unicast-trigger timer is set to 0 seconds, which indicates that the unicast-trigger timer is not enabled.

Logging off 802.1X users

About this task

Perform this task to log off specified 802.1X users and clear information about these users from the device. These users must perform 802.1X authentication to come online again.

Procedure

To log off 802.1X users, execute the following command in user view:

reset dot1x access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** } | **username** *username* | **vlan** *vlan-id*]

Enabling 802.1X user logging

About this task

This feature enables the device to generate logs about 802.1X users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive 802.1X user log entries, use this feature only if you need to analyze abnormal 802.1X user logins or logouts.

Procedure

1. Enter system view.

   system-view

2. Enable 802.1X user logging.

   dot1x access-user log enable [**abnormal-logoff** | **failed-login** | **ip-change** | **maxnum-clear-threshold** | **maxnum-trigger-threshold** | **normal-logoff** | **successful-login**] *

   By default, 802.1X user logging is disabled.

   If you do not specify any parameters, this command enables all types of 802.1X user logs.

Configuring SNMP notifications for 802.1X

About this task

This feature enables generating SNMP notifications for the following 802.1X events:

- If you specify the **dot1x-not-support** keyword, the system generates a notification when an interface does not support 802.1X.
- If you specify the **resource-not-enough** keyword, the system generates a notification when ACL resources become insufficient.
- If you specify the **unicast-not-support** keyword, the system generates a notification when an interface does not support unicast trigger.

- If you specify the **user-maxnum** keyword, the system generates a notification for a 802.1X user access ratio event.

After you enable SNMP notifications for 802.1X, the 802.1X module notifies the NMS of important module events. The notifications are sent to the device's SNMP module. For the notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP notifications, see *Network Management and Monitoring Configuration Guide*.

After you configure this feature to enable SNMP notifications for 802.1X user access ratio and use the **dot1x max-user-alarm** command to set the alarm threshold and alarm clear threshold:

- If the percentage of 802.1X user access ratio on an interface reaches the specified alarm threshold for the first time, or increases to the alarm threshold from a value below or equal to the alarm clear threshold, the device sends an alarm notification.
- If the percentage of 802.1X user access ratio on the interface drops to the alarm clear threshold from a value above or equal to the alarm threshold, the device sends an alarm clear notification.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for 802.1X.

   snmp-agent trap enable dot1x [**dot1x-not-support** | **resource-not-enough** | **unicast-not-support** | **user-maxnum**] *

   By default, SNMP notifications for 802.1X are disabled.

Display and maintenance commands for 802.1X

IMPORTANT:
The S5200-EI-G switch series does not support M-LAG-related functions or parameters.

Execute **display** commands in any view and **reset** commands in user view.

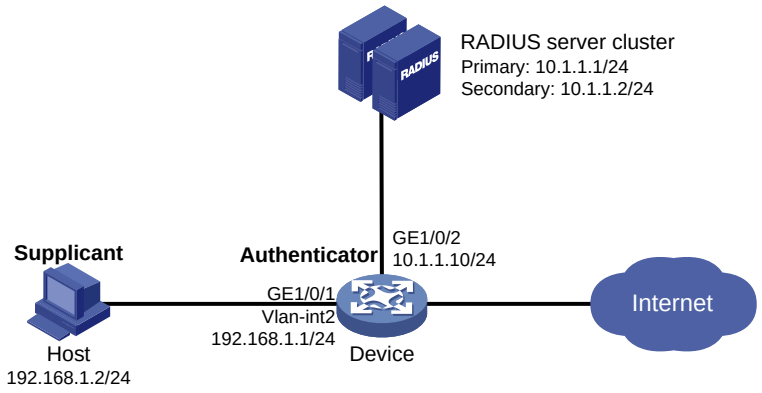
Task	Command
Display 802.1X session information, statistics, or configuration information of specified or all ports.	**display dot1x** [**sessions** | **statistics**] [**interface** *interface-type interface-number*]
Display information about 802.1X access profiles.	**display dot1x access-profile** [**name** *profile-name*]
Display online 802.1X user information.	**display dot1x connection** [**open**] [[**m-lag** [**local** | **peer**]] [**interface** *interface-type interface-number* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** } | **slot** *slot-number* | **user-name** *name-string*] | **user-mac** *mac-address*]
Display the MAC addresses of 802.1X users in a type of 802.1X VLAN.	**display dot1x mac-address** { **auth-fail-vlan** | **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Display unknown source MAC addresses in the unicast-trigger quiet period.	**display dot1x unicast-trigger quiet-mac** [**interface** *interface-type interface-number*]

Task	Command
Remove users from the 802.1X guest VLAN on a port.	**reset dot1x guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Clear 802.1X statistics.	**reset dot1x statistics** [**interface** *interface-type interface-number*]
Remove the records of unknown source MAC addresses in the unicast-trigger quiet period.	**reset dot1x unicast-trigger quiet-mac** [**interface** *interface-type interface-number* | **mac-address** *mac-address*]

802.1X authentication configuration examples

Example: Configuring basic 802.1X authentication

Network configuration



As shown in Figure 11, the access device performs 802.1X authentication for users that connect to GigabitEthernet 1/0/1. Implement MAC-based access control on the port, so the logoff of one user does not affect other online 802.1X users.

Use RADIUS servers to perform authentication, authorization, and accounting for the 802.1X users. If RADIUS authentication fails, perform local authentication on the access device.

Configure the RADIUS server at 10.1.1.1/24 as the primary authentication and accounting server, and the RADIUS server at 10.1.1.2/24 as the secondary authentication and accounting server. Assign all users to ISP domain **bbb**.

Set the shared key to **name** for packets between the access device and the authentication server. Set the shared key to **money** for packets between the access device and the accounting server.

Figure 11 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers and add user accounts for the 802.1X users. Make sure the RADIUS servers can provide authentication, authorization, and accounting services. (Details not shown.)
2. Assign an IP address to each interface. (Details not shown.)

3. Configure user accounts for the 802.1X users on the access device:

   # Add a local network access user with username **localuser** and password **123456TESTplat&!** in plaintext. (Make sure the username and password are the same as those configured on the RADIUS servers.)

   ```
   <Device> system-view
   [Device] local-user localuser class network
   [Device-luser-network-localuser] password simple 123456TESTplat&!
   ```

   # Set the service type to **lan-access**.

   ```
   [Device-luser-network-localuser] service-type lan-access
   [Device-luser-network-localuser] quit
   ```

4. Configure a RADIUS scheme on the access device:

   # Create a RADIUS scheme named **radius1** and enter RADIUS scheme view.

   ```
   [Device] radius scheme radius1
   ```

   # Specify the IP addresses of the primary authentication and accounting RADIUS servers.

   ```
   [Device-radius-radius1] primary authentication 10.1.1.1
   [Device-radius-radius1] primary accounting 10.1.1.1
   ```

   # Configure the IP addresses of the secondary authentication and accounting RADIUS servers.

   ```
   [Device-radius-radius1] secondary authentication 10.1.1.2
   [Device-radius-radius1] secondary accounting 10.1.1.2
   ```

   # Specify the shared key between the access device and the authentication server.

   ```
   [Device-radius-radius1] key authentication simple name
   ```

   # Specify the shared key between the access device and the accounting server.

   ```
   [Device-radius-radius1] key accounting simple money
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS servers.

   ```
   [Device-radius-radius1] user-name-format without-domain
   [Device-radius-radius1] quit
   ```

   NOTE:

   The access device must use the same username format as the RADIUS server. If the RADIUS server includes the ISP domain name in the username, so must the access device.

5. Configure an ISP domain on the access device:

   # Create an ISP domain named **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme **radius1** to the ISP domain, and specify local authentication as the secondary authentication method.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme radius1 local
   [Device-isp-bbb] authorization lan-access radius-scheme radius1 local
   [Device-isp-bbb] accounting lan-access radius-scheme radius1 local
   [Device-isp-bbb] quit
   ```

6. Configure 802.1X on the access device:

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   ```

   # Enable MAC-based access control on the port. By default, the port uses MAC-based access control.

   ```
   [Device-GigabitEthernet1/0/1] dot1x port-method macbased
   ```

   # Specify ISP domain **bbb** as the mandatory domain.

```
[Device-GigabitEthernet1/0/1] dot1x mandatory-domain bbb
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

7. Configure the 802.1X client. If an iNode client is used, do not select the **Carry version info** option in the client configuration. (Details not shown.)

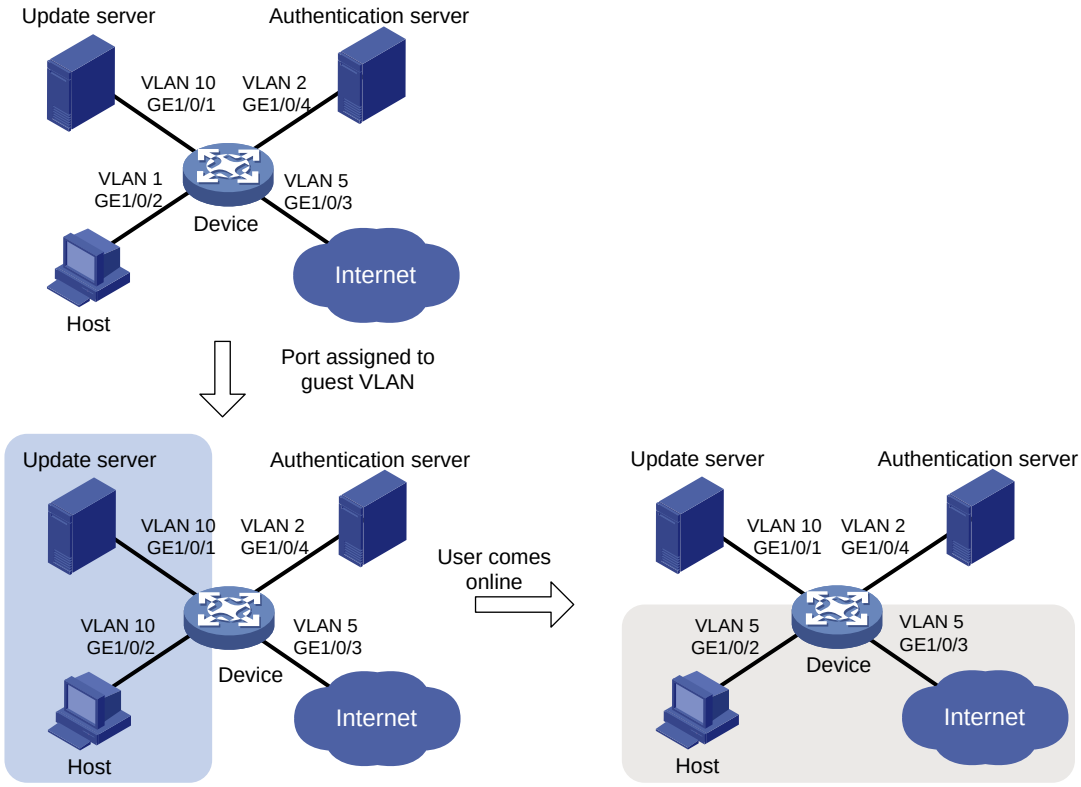
Verifying the configuration

Verify the 802.1X configuration on GigabitEthernet 1/0/1.

```
[Device] display dot1x interface gigabitethernet 1/0/1
```

Display the user connection information after an 802.1X user passes authentication.

```
[Device] display dot1x connection
```



Example: Configuring 802.1X guest VLAN and authorization VLAN

Network configuration

As shown in Figure 12:

- Use RADIUS servers to perform authentication, authorization, and accounting for 802.1X users that connect to GigabitEthernet 1/0/2. Implement port-based access control on the port.
- Configure VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2. The host and the update server are both in VLAN 10, and the host can access the update server and download the 802.1X client software.
- Configure a QoS policy to deny packets destined for the Internet (5.1.1.1) and apply the QoS policy to the outbound direction of VLAN 10. The configuration prevents users in the 802.1X guest VLAN from accessing the Internet before they pass 802.1X authentication.
- After the host passes 802.1X authentication, the access device assigns the host to VLAN 5 where GigabitEthernet 1/0/3 is. The host can access the Internet.

Figure 12 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS server to provide authentication, authorization, and accounting services. Configure user accounts and authorization VLAN (VLAN 5 in this example) for the users. (Details not shown.)
2. Create VLANs, and assign ports to the VLANs on the access device.

   NOTE:

   By default, VLAN 1 exists and all ports belong to the VLAN. You do not need to create the VLAN or assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   <Device> system-view
   [Device] vlan 10
   [Device-vlan10] port gigabitethernet 1/0/1
   [Device-vlan10] quit
   [Device] vlan 2
   [Device-vlan2] port gigabitethernet 1/0/4
   [Device-vlan2] quit
   [Device] vlan 5
   [Device-vlan5] port gigabitethernet 1/0/3
   [Device-vlan5] quit
   ```

3. Configure a QoS policy:

   # Configure advanced ACL 3000 to match packets destined for 5.1.1.1.

   ```
   [Device] acl advanced 3000
   ```

```
[Device-acl-ipv4-adv-3000] rule permit ip destination 5.1.1.1 0.0.0.255
[Device-acl-ipv4-adv-3000] quit
```

Specify advanced ACL 3000 in traffic class **classifier_1** to match traffic.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 3000
[Device-classifier-classifier_1] quit
```

Configure traffic behavior **behavior_1** to deny matching packets.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] filter deny
[Device-behavior-behavior_1] quit
```

Configure QoS policy **policy_1** to associate traffic class **classifier_1** with traffic behavior **behavior_1**.

```
[Device] qos policy policy_1
[Device-qospolicy-policy_1] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy_1] quit
```

Apply QoS policy **policy_1** to the outbound direction of VLAN 10.

```
[Device] qos vlan-policy policy_1 vlan 10 outbound
```

4. Configure a RADIUS scheme on the access device:

Create RADIUS scheme **2000** and enter RADIUS scheme view.

```
[Device] radius scheme 2000
```

Specify the server at 10.11.1.1 as the primary authentication server, and set the authentication port to 1812.

```
[Device-radius-2000] primary authentication 10.11.1.1 1812
```

Specify the server at 10.11.1.1 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.11.1.1 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain on the access device:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X on the access device:

Enable 802.1X on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] dot1x
```

Implement port-based access control on the port.

```
[Device-GigabitEthernet1/0/2] dot1x port-method portbased
```

Set the port authorization mode to **auto**. By default, the port uses the auto mode.

```
[Device-GigabitEthernet1/0/2] dot1x port-control auto
```

Specify VLAN 10 as the 802.1X guest VLAN on GigabitEthernet 1/0/2.

```
[Device-GigabitEthernet1/0/2] dot1x guest-vlan 10
[Device-GigabitEthernet1/0/2] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

7. Configure the 802.1X client. Make sure the 802.1X client can update its IP address after the access port is assigned to the guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Verify the 802.1X guest VLAN configuration on GigabitEthernet 1/0/2.

```
[Device] display dot1x interface gigabitethernet 1/0/2
```

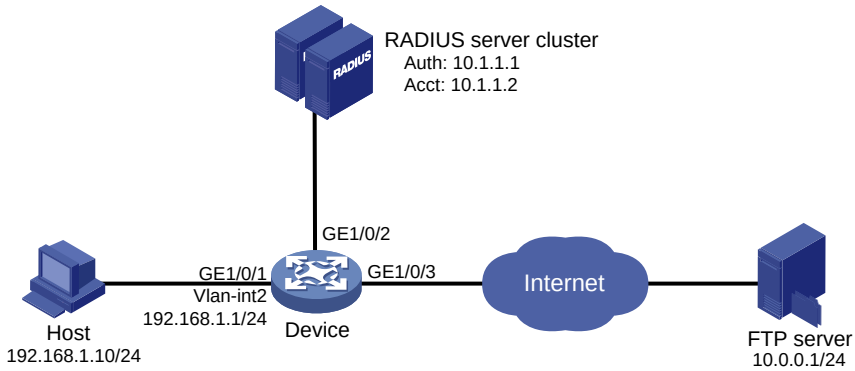
Verify that GigabitEthernet 1/0/2 is assigned to VLAN 10 before any user passes authentication on the port.

```
[Device] display vlan 10
```

After a user passes authentication, display information on GigabitEthernet 1/0/2. Verify that GigabitEthernet 1/0/2 is assigned to VLAN 5.

```
[Device] display interface gigabitethernet 1/0/2
```

Example: Configuring 802.1X with ACL assignment



Network configuration

As shown in Figure 13, the host that connects to GigabitEthernet 1/0/1 must pass 802.1X authentication to access the Internet.

Perform 802.1X authentication on GigabitEthernet 1/0/1. Use the RADIUS server at 10.1.1.1 as the authentication and authorization server, and the RADIUS server at 10.1.1.2 as the accounting server.

Configure ACL assignment on GigabitEthernet 1/0/1 to deny access of 802.1X users to the FTP server from 8:00 to 18:00 on weekdays.

Figure 13 Network diagram

Procedure

For information about the RADIUS commands used on the access device in this example, see *Security Command Reference*.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Add user accounts and specify the ACL (ACL 3000 in this example) for the users. (Details not shown.)
2. Assign an IP address to each interface, as shown in Figure 13. (Details not shown.)
3. Configure a RADIUS scheme on the access device:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   <Device> system-view
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

   # Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

   ```
   [Device-radius-2000] key authentication simple abc
   ```

   # Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

   ```
   [Device-radius-2000] key accounting simple abc
   ```

   # Exclude the ISP domain names from the usernames sent to the RADIUS server.

   ```
   [Device-radius-2000] user-name-format without-domain
   [Device-radius-2000] quit
   ```

4. Configure an ISP domain on the access device:

   # Create ISP domain **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme 2000
   [Device-isp-bbb] authorization lan-access radius-scheme 2000
   [Device-isp-bbb] accounting lan-access radius-scheme 2000
   [Device-isp-bbb] quit
   ```

5. Configure a time range named **ftp** from 8:00 to 18:00 on weekdays on the access device.

   ```
   [Device] time-range ftp 8:00 to 18:00 working-day
   ```

6. Configure ACL 3000 to deny packets destined for the FTP server at 10.0.0.1 during the specified time range on the access device.

   ```
   [Device] acl advanced 3000
   [Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0 time-range ftp
   [Device-acl-ipv4-adv-3000] quit
   ```

7. Configure 802.1X on the access device:

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

8. Configure the 802.1X client. Make sure the client is able to update its IP address after the access port is assigned to the 802.1X guest VLAN or an authorization VLAN. (Details not shown.)

Verifying the configuration

Use the user account to pass authentication. (Details not shown.)

Verify that the user cannot ping the FTP server at any time from 8:00 to 18:00 on any weekday.

```
C:\>ping 10.0.0.1

Pinging 10.0.0.1 with 32 bytes of data:

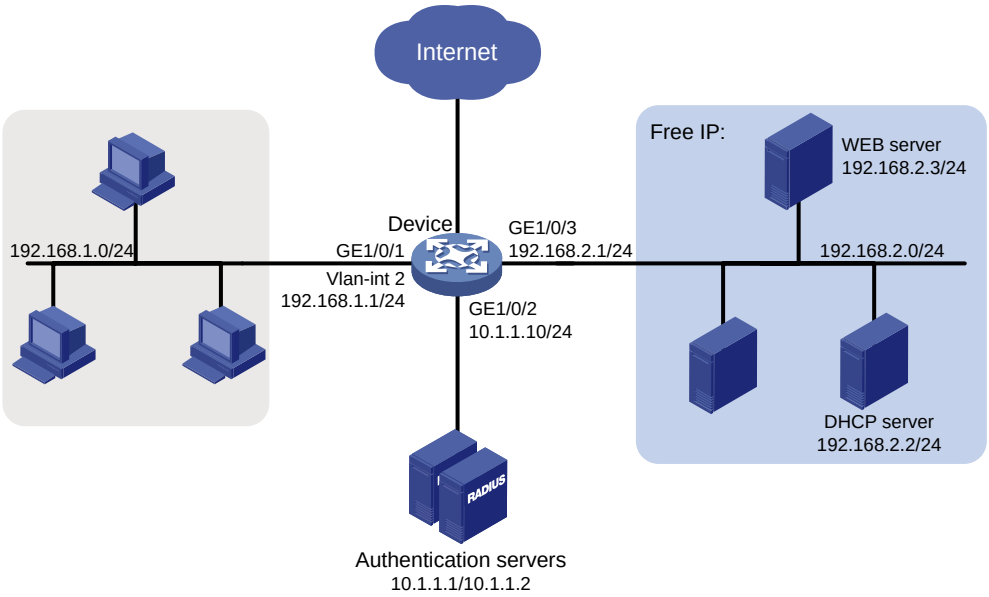
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 10.0.0.1:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

The output shows that ACL 3000 is active on the user, and the user cannot access the FTP server.

Example: Configuring 802.1X with EAD assistant (with DHCP relay agent)

Network configuration



As shown in Figure 14:

- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A DHCP server and a Web server are deployed on the 192.168.2.0/24 subnet for users to obtain IP addresses and download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can obtain IP addresses and download software.
- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 14 Network diagram

Procedure

1. Make sure the DHCP server, the Web server, and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure DHCP relay:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP relay agent on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select relay
   ```

   # Specify the DHCP server 192.168.2.2 on the relay agent interface VLAN-interface 2.

   ```
   [Device-Vlan-interface2] dhcp relay server-address 192.168.2.2
   [Device-Vlan-interface2] quit
   ```

4. Configure a RADIUS scheme:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

   # Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

   ```
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   ```

   # Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

   ```
   [Device-radius-2000] key authentication simple abc
   ```

   # Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

   ```
   [Device-radius-2000] key accounting simple abc
   ```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain:

   # Create ISP domain **bbb** and enter ISP domain view.

   ```
   [Device] domain bbb
   ```

   # Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

   ```
   [Device-isp-bbb] authentication lan-access radius-scheme 2000
   [Device-isp-bbb] authorization lan-access radius-scheme 2000
   [Device-isp-bbb] accounting lan-access radius-scheme 2000
   [Device-isp-bbb] quit
   ```

6. Configure 802.1X:

   # Configure the free IP.

   ```
   [Device] dot1x ead-assistant free-ip 192.168.2.0 24
   ```

   # Configure the redirect URL for client software download.

   ```
   [Device] dot1x ead-assistant url https://192.168.2.3
   ```

   # Enable the EAD assistant feature.

   ```
   [Device] dot1x ead-assistant enable
   ```

   # Enable 802.1X on GigabitEthernet 1/0/1.

   ```
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] dot1x
   [Device-GigabitEthernet1/0/1] quit
   ```

   # Enable 802.1X globally.

   ```
   [Device] dot1x
   ```

Verifying the configuration

Verify the 802.1X configuration.

```
[Device] display dot1x
```

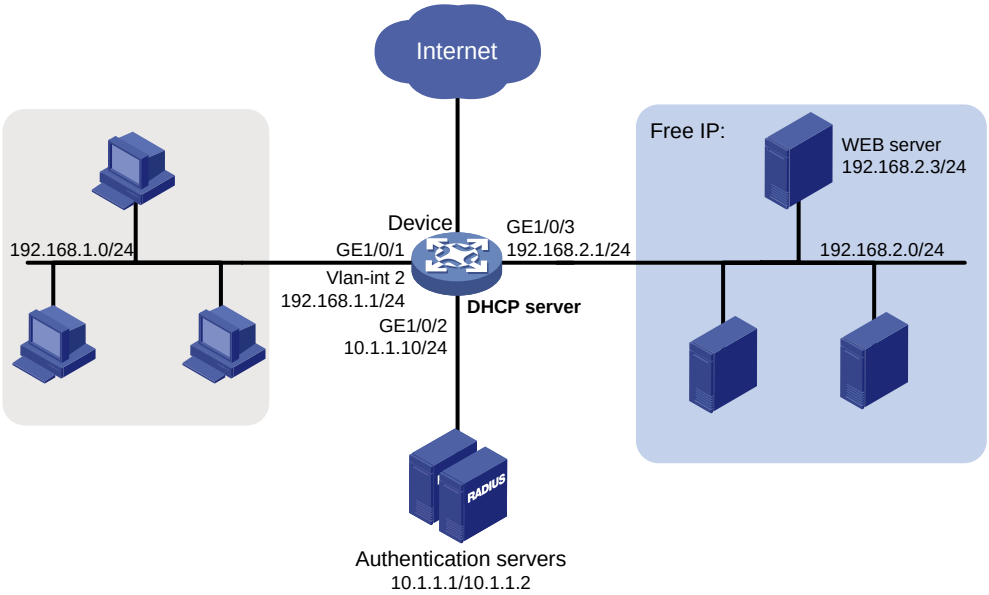
Verify that you can ping an IP address on the free IP subnet from a host before the user on the host passes 802.1X authentication. (Details not shown.)

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Example: Configuring 802.1X with EAD assistant (with DHCP server)

Network configuration

As shown in Figure 15:



- The intranet 192.168.1.0/24 is attached to GigabitEthernet 1/0/1 of the access device.
- The hosts use DHCP to obtain IP addresses.
- A Web server is deployed on the 192.168.2.0/24 subnet for users to download client software.

Deploy an EAD solution for the intranet to meet the following requirements:

- Allow unauthenticated users and users that have failed 802.1X authentication to access 192.168.2.0/24. The users can download software.

- If these users use a Web browser to access a network other than 192.168.2.0/24, redirect them to the Web server for 802.1X client downloading.
- Allow authenticated 802.1X users to access the network.

Figure 15 Network diagram

Procedure

1. Make sure the Web server and the authentication servers have been configured correctly. (Details not shown.)
2. Configure an IP address for each interface. (Details not shown.)
3. Configure the DHCP server:

   # Enable DHCP.

   ```
   <Device> system-view
   [Device] dhcp enable
   ```

   # Enable the DHCP server on VLAN-interface 2.

   ```
   [Device] interface vlan-interface 2
   [Device-Vlan-interface2] dhcp select server
   [Device-Vlan-interface2] quit
   ```

   # Create DHCP address pool **0**.

   ```
   [Device] dhcp server ip-pool 0
   ```

   # Specify subnet 192.168.1.0/24 in DHCP address pool 0.

   ```
   [Device-dhcp-pool-0] network 192.168.1.0 mask 255.255.255.0
   ```

   # Specify the gateway address 192.168.1.1 in DHCP address pool 0.

   ```
   [Device-dhcp-pool-0] gateway-list 192.168.1.1
   [Device-dhcp-pool-0] quit
   ```

4. Configure a RADIUS scheme:

   # Create RADIUS scheme **2000** and enter RADIUS scheme view.

   ```
   [Device] radius scheme 2000
   ```

   # Specify the server at 10.1.1.1 as the primary authentication server, and set the authentication port to 1812.

   ```
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   ```

Specify the server at 10.1.1.2 as the primary accounting server, and set the accounting port to 1813.

```
[Device-radius-2000] primary accounting 10.1.1.2 1813
```

Set the shared key to **abc** in plain text for secure communication between the authentication server and the device.

```
[Device-radius-2000] key authentication simple abc
```

Set the shared key to **abc** in plain text for secure communication between the accounting server and the device.

```
[Device-radius-2000] key accounting simple abc
```

Exclude the ISP domain names from the usernames sent to the RADIUS server.

```
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

5. Configure an ISP domain:

Create ISP domain **bbb** and enter ISP domain view.

```
[Device] domain bbb
```

Apply RADIUS scheme 2000 to the ISP domain for authentication, authorization, and accounting.

```
[Device-isp-bbb] authentication lan-access radius-scheme 2000
[Device-isp-bbb] authorization lan-access radius-scheme 2000
[Device-isp-bbb] accounting lan-access radius-scheme 2000
[Device-isp-bbb] quit
```

6. Configure 802.1X:

Configure the free IP.

```
[Device] dot1x ead-assistant free-ip 192.168.2.0 24
```

Configure the redirect URL for client software download.

```
[Device] dot1x ead-assistant url https://192.168.2.3
```

Enable the EAD assistant feature.

```
[Device] dot1x ead-assistant enable
```

Enable 802.1X on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] dot1x
[Device-GigabitEthernet1/0/1] quit
```

Enable 802.1X globally.

```
[Device] dot1x
```

Verifying the configuration

Verify the 802.1X configuration.

```
[Device] display dot1x
```

Verify that you can ping an IP address on the free IP subnet from a host before the user on the host passes 802.1X authentication. (Details not shown.)

Verify that you are redirected to the Web server when you enter in your Web browser an IP address not on the free IP. (Details not shown.)

Troubleshooting 802.1X

EAD assistant Web redirection failure

Symptom

Unauthenticated users are not redirected to the specified URL server after they enter external website addresses in their Web browsers.

Analysis

Redirection will not happen for one of the following reasons:

- The address is in the string format. The operating system of the host regards the string as a website name and tries to resolve the string. If the resolution fails, the operating system sends an ARP request, but the target address is not in the dotted decimal notation. The redirection feature does redirect this kind of ARP request.
- The address is within a free IP segment. No redirection will take place, even if no host is present with the address.
- The server is not in a free IP segment.
- No server is using the redirect URL, or the server with the URL does not provide Web services.

Solution

To resolve the issue:

1. Enter a dotted decimal IP address that is not in any free IP segments.
2. Verify that the access device and the server are configured correctly.
3. If the issue persists, contact H3C Support.

Configuring MAC authentication

About MAC authentication

MAC authentication controls network access by authenticating source MAC addresses on a port. The feature does not require client software, and users do not have to enter a username and password for network access. The device initiates a MAC authentication process when it detects an unknown source MAC address on a MAC authentication-enabled port. If the MAC address passes authentication, the user can access authorized network resources. If the authentication fails, the device marks the MAC address as a silent MAC address, drops the packet, and starts a quiet timer. The device drops all subsequent packets from the MAC address within the quiet time. The quiet mechanism avoids repeated authentication during a short time.

User account policies

MAC authentication supports the following user account policies:

- **Global user account policy**, which can be either of the following options:
  - **MAC-based user account policy**—One MAC-based user account for each user. As shown in Figure 1, the access device uses the source MAC addresses in packets as the usernames and passwords of users for MAC authentication. This policy is suitable for an insecure environment.

    NOTE:

    MAC-based user account policy also supports configuring a password shared by all MAC-based user accounts.

  - **Shared user account policy**—One shared user account for all users. You specify one username and password (which are not necessarily a MAC address) for all MAC authentication users on the access device, as shown in Figure 2. This policy is suitable for a secure environment.
- **MAC range-specific user account policy**—One shared user account for users in a specific MAC address range. You specify one username and password (which are not necessarily a MAC address) for users in a specific MAC address range on the access device, as shown in Figure 3. For example, you can specify a username and password for users with a specific OUI for MAC authentication.

IMPORTANT:

- You can use global and MAC range-specific user account policies together. For users in a MAC address range, the MAC range-specific user account settings have higher priority than the global user account settings.
- If a RADIUS server is used for MAC authentication, you must create the user accounts on the RADIUS server based on the user account policy on the access device.

Figure 1 MAC-based user account policy

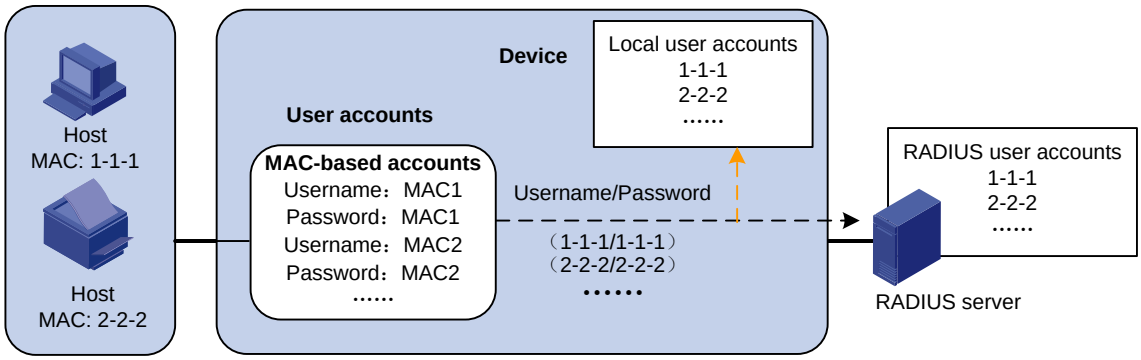

Figure 2 Shared user account policy (global)

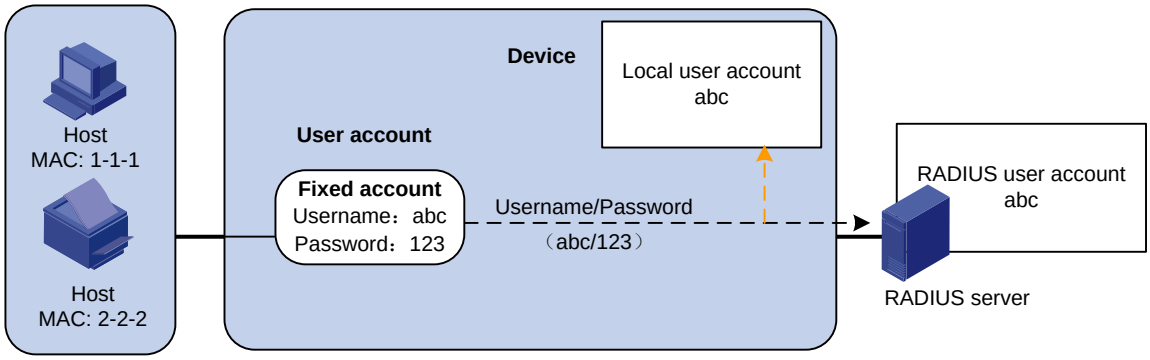

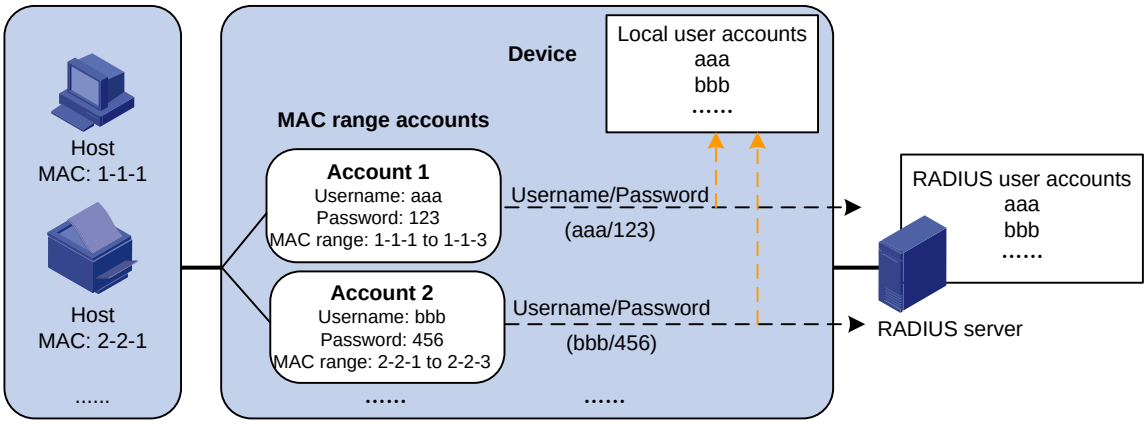

Figure 3 Shared user account policy (specific to MAC address ranges)

Authentication methods

You can perform MAC authentication on the access device (local authentication) or through a RADIUS server.

For more information about configuring local authentication and RADIUS authentication, see "Configuring AAA."

RADIUS authentication

If MAC-based accounts are used, the access device by default sends the source MAC address of a packet as the username and password to the RADIUS server for authentication. If a password is

configured for MAC-based accounts, the access device sends the configured password as the password to the RADIUS server.

If a shared account is used, the access device sends the shared account username and password to the RADIUS server for authentication.

The access device and the RADIUS server use Password Authentication Protocol (PAP) or Challenge Handshake Authentication Protocol (CHAP) for communication.

Local authentication

If MAC-based accounts are used, the access device by default uses the source MAC address of a packet as the username and password to search the local account database for a match. If a password is configured for MAC-based accounts, the device uses the configured password to search the local account database for a match.

If a shared account is used, the access device uses the shared account username and password to search the local account database for a match.

VLAN assignment

Authorization VLAN

The authorization VLAN controls the access of a MAC authentication user to authorized network resources. The device supports authorization VLANs assigned locally or by a remote server.

IMPORTANT:

Only remote servers can assign tagged authorization VLANs.

Remote VLAN authorization

In remote VLAN authorization, you must configure an authorization VLAN for a user on the remote server. After the user authenticates to the server, the server assigns authorization VLAN information to the device. Then, the device assigns the user access port to the authorization VLAN as a tagged or untagged member.

The device supports assignment of the following authorization VLAN information by the remote server:

- VLAN ID.
- VLAN name, which must be the same as the VLAN description on the access device.
- A string of VLAN IDs and VLAN names.

  In the string, some VLANs are represented by their IDs, and some VLANs are represented by their names.
- VLAN group name.

  For more information about VLAN groups, see *Layer 2—LAN Switching Configuration Guide*.
- VLAN ID with a suffix of **t** or **u**.

  The **t** and **u** suffixes require the device to assign the access port to the VLAN as a tagged or untagged member, respectively. For example, **2u** indicates assigning the port to VLAN 2 as an untagged member.

If a VLAN name or VLAN group name is assigned, the device converts the information into a VLAN ID before VLAN assignment.

IMPORTANT:

For a VLAN represented by its VLAN name to be assigned successfully, you must make sure the VLAN has been created on the device.

To assign VLAN IDs with suffixes, make sure the user access port is a hybrid or trunk port.

IMPORTANT:

To ensure a successful assignment, the authorization VLANs assigned by the remote server cannot be any of the following types:

- Dynamically learned VLANs.
- Reserved VLANs.

If the server assigns a group of VLANs, the access device selects a VLAN as described in Table 1.

Table 1 Authorization VLAN selection from a group of VLANs

VLAN information	Authorization VLAN selection
VLANs by IDs VLANs by names VLAN group name	The device selects an authorization VLAN from the VLAN group for a user according to the following rules: • On a hybrid port with MAC-based VLAN enabled: ○ If the port does not have online users, the device selects the VLAN with the lowest ID. ○ If the port has online users, the device selects the VLAN that has the fewest online users. If two VLANs have the same number of online MAC authentication users, the device selects the VLAN with the lower ID. • On an access, trunk, or MAC-based VLAN disabled hybrid port: ○ If the port does not have online users, the device selects the VLAN with the lowest ID. ○ If the port has online users, the device examines the VLAN group for the VLAN of the online users. If the VLAN is found, the VLAN is assigned to the user as the authorization VLAN. If the VLAN is not found, VLAN authorization fails.
VLAN IDs with suffixes	1. The device selects the leftmost VLAN ID without a suffix, or the leftmost VLAN ID suffixed by **u** as an untagged VLAN, whichever is more leftmost. 2. The device assigns the untagged VLAN to the port as the PVID, and it assigns the remaining as tagged VLANs. If no untagged VLAN is assigned, the PVID of the port does not change. The port permits traffic from these tagged and untagged VLANs to pass through. For example, the authentication server sends the string **1u 2t 3** to the access device for a user. The device assigns VLAN 1 as an untagged VLAN and all remaining VLANs (including VLAN 3) as tagged VLANs. VLAN 1 becomes the PVID.

Local VLAN authorization

To perform local VLAN authorization for a user, specify the VLAN ID in the authorization attribute list of the local user account for that user. For each local user, you can specify only one authorization VLAN ID. The user access port is assigned to the VLAN as an untagged member.

IMPORTANT:

Local VLAN authorization does not support assignment of tagged VLANs.

For more information about local user configuration, see "Configuring AAA."

Authorization VLAN manipulation on a MAC authentication-enabled port

Table 2 describes the way the network access device handles authorization VLANs (except for the VLANs specified with suffixes) for MAC authenticated users on a port.

Table 2 VLAN manipulation

Port type	VLAN manipulation
• Access port • Trunk port • Hybrid port with MAC-based VLAN disabled	• The device assigns the port to the first authenticated user's authorization VLAN and sets the VLAN as the PVID if that authorization VLAN has the untagged attribute. • If the authorization VLAN has the tagged attribute, the device assigns the port to the authorization VLAN without changing its PVID. **NOTE:** The tagged attribute is supported only on trunk and hybrid ports.
Hybrid port with MAC-based VLAN enabled	The device maps the MAC address of each user to its own authorization VLAN regardless of whether the port is a tagged member. The PVID of the port does not change.

IMPORTANT:

- If the users are attached to a port whose link type is access, make sure the authorization VLAN assigned by the server has the untagged attribute. VLAN assignment will fail if the server issues a VLAN that has the tagged attribute.
- When you assign VLANs to users attached to a trunk port or a MAC-based VLAN disabled hybrid port, make sure there is only one untagged VLAN. If a different untagged VLAN is assigned to a subsequent user, the user cannot pass authentication.
- As a best practice to enhance network security, do not use the **`port hybrid vlan`** command to assign a hybrid port to an authorization VLAN as a tagged member.

The VLAN assigned by the server to a user as an authorization VLAN might have been configured on the user access port but with a different tagging mode. For example, the server assigns an authorization VLAN with the tagged attribute, but the same VLAN configured on the port has the untagged attribute. In this situation, the VLAN settings that take effect on the user depend on the link type of the port.

- If the link type of the port is access or trunk, the authorization VLAN settings assigned by the server always take effect on the user as long as the user is online. After the user goes offline, the VLAN settings on the port take effect.
- If the link type of the port is hybrid, the VLAN settings configured on the port take effect. For example, the server assigns VLAN 30 with the untagged attribute to a user on the hybrid port. However, VLAN 30 has been configured on the port with the tagged attribute by using the **`port hybrid vlan tagged`** command. Then, the VLAN has the tagged attribute on the port.

For a MAC authenticated user to access the network on a hybrid port when no authorization VLAN is configured for the user, perform one of the following tasks:

- If the port receives tagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as a tagged member in the VLAN.
- If the port receives untagged authentication packets from the user in a VLAN, use the **`port hybrid vlan`** command to configure the port as an untagged member in the VLAN.

Guest VLAN

The MAC authentication guest VLAN on a port accommodates users that have failed MAC authentication for any reason other than server unreachable. For example, the VLAN accommodates users with invalid passwords entered.

You can deploy a limited set of network resources in the MAC authentication guest VLAN. For example, a software server for downloading software and system patches.

A hybrid port is always assigned to a MAC authentication guest VLAN as an untagged member. After the assignment, do not reconfigure the port as a tagged member in the VLAN.

The device reauthenticates users in the MAC authentication guest VLAN at a specific interval. Table 3 shows the way that the network access device handles guest VLANs for MAC authentication users.

Table 3 VLAN manipulation

Authentication status	VLAN manipulation
A user in the MAC authentication guest VLAN fails MAC authentication.	The user is still in the MAC authentication guest VLAN.
A user in the MAC authentication guest VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the port.

Critical VLAN

The MAC authentication critical VLAN on a port accommodates users that have failed MAC authentication because no RADIUS authentication servers are reachable. Users in a MAC authentication critical VLAN can access only network resources in the critical VLAN.

The critical VLAN feature takes effect when MAC authentication is performed only through RADIUS servers. If a MAC authentication user fails local authentication after RADIUS authentication, the user is not assigned to the critical VLAN. For more information about the authentication methods, see "Configuring AAA."

Table 4 shows the way that the network access device handles critical VLANs for MAC authentication users.

Table 4 VLAN manipulation

Authentication status	VLAN manipulation
A user fails MAC authentication because all the RADIUS servers are unreachable.	The device maps the MAC address of the user to the MAC authentication critical VLAN. The user is still in the MAC authentication critical VLAN if the user fails MAC reauthentication because all the RADIUS servers are unreachable. If no MAC authentication critical VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication guest VLAN fails authentication because all the RADIUS servers are unreachable.	The user remains in the MAC authentication guest VLAN.
A user in the MAC authentication critical VLAN fails MAC authentication for any reason other than server unreachable.	If a guest VLAN has been configured, the device maps the MAC address of the user to the guest VLAN. If no guest VLAN is configured, the device maps the MAC address of the user to the PVID of the port.
A user in the MAC authentication critical VLAN passes MAC authentication.	The device remaps the MAC address of the user to the authorization VLAN assigned by the authentication server. If no authorization VLAN is configured for the user on the authentication server, the device remaps the MAC address of the user to the PVID of the access port.

ACL assignment

You can specify an authorization ACL for a MAC authentication user on a remote server or the access device to control the user's access to network resources. After the user passes MAC authentication, the server or access device assigns the authorization ACL to the user access port. Then, the port permits or drops the matching traffic for the user depending on the rules in the ACL.

The device supports assignment of static and dynamic authorization ACLs.

- **Assignment of static authorization ACLs**—Static ACLs can be assigned by a RADIUS server or the access device. When the server or access device assigns a static ACL to a user, it assigns only the ACL number. You must manually create the ACL and configure its rules on the access device.

  To change the access permissions of a user, use one of the following methods:

  - Modify ACL rules in the authorization ACL on the access device.
  - Assign another ACL to the user as the authorization ACL from the RADIUS server or the access device.

  Static ACLs and their rules can be manually deleted from the access device.
- **Assignment of dynamic authorization ACLs**—Dynamic ACLs and their rules are automatically deployed by a RADIUS server, which are not configurable on the access device. Dynamic ACLs can only be named ACLs. After the device receives a server-deployed dynamic ACL and its rules, it automatically creates the ACL and configures its rules.

  If a dynamic ACL assigned by the server to a user has the same name as a static ACL, the dynamic ACL cannot be issued and the user cannot come online.

  A dynamic ACL and its rules are automatically deleted from the access device after all its users go offline.

  Dynamic ACLs and their rules cannot be manually modified or deleted on the access device. To display information about dynamic ACLs and their rules, use the **`display mac-authentication connection`** or **`display acl`** command.

IMPORTANT:

The supported authorization ACLs include the following types:

- Basic ACLs, which are numbered in the range of 2000 to 2999.
- Advanced ACLs, which are numbered in the range of 3000 to 3999.
- Layer 2 ACLs, which are numbered in the range of 4000 to 4999.

For an authorization ACL to take effect, make sure the ACL exists with rules and none of the rules contains the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, **`cos`**, **`dest-mac`**, **`lsap`**, or **`logging`** keyword.

For more information about ACLs, see *ACL and QoS Command Reference*.

Redirect URL assignment

The device supports the URL attribute assigned by a RADIUS server. During MAC authentication, the HTTP or HTTPS requests of a user are redirected to the Web interface specified by the server-assigned URL attribute. After the user passes the Web authentication, the RADIUS server records the MAC address of the MAC authentication user and uses a DM (Disconnect Message) to log off the user. When the user initiates MAC authentication again, it will pass the authentication and come online successfully.

By default, the device listens to port 6654 for HTTPS requests to be redirected. To change the redirect listening port number, see configuring HTTP redirect in *Layer 3—IP Services Configuration Guide*.

Blackhole MAC attribute assignment

The device supports the blackhole MAC attribute assigned by the RADIUS authentication server through CoA messages for users that have passed MAC authentication. Upon receiving a CoA message that contains the blackhole MAC attribute for a user that has passed MAC authentication, the device performs the following operations:

1. Logs off the user.
2. Marks the MAC address of the user as a silent MAC address and starts a quiet timer for the MAC address.

The quiet timer is 10 minutes and is not user configurable. The device drops all packets from the MAC address after the quiet timer starts, and it will not authenticate the MAC address until the quiet timer expires.

To display silent MAC addresses, use the **`display mac-authentication`** command.

Periodic MAC reauthentication

Periodic MAC reauthentication tracks the connection status of online users, and updates the authorization attributes assigned by the RADIUS server. The attributes include the ACL and VLAN.

The device reauthenticates online MAC authentication users at the periodic reauthentication interval when the periodic MAC reauthentication feature is enabled. The interval is controlled by a timer and the timer is user configurable. A change to the periodic reauthentication timer applies to online MAC authentication users only after the old timer expires and the MAC authentication users pass authentication.

The server-assigned RADIUS Session-Timeout (attribute 27) and Termination-Action (attribute 29) attributes together can affect the periodic MAC reauthentication feature. To display the server-assigned Session-Timeout and Termination-Action attributes, use the **`display mac-authentication connection`** command.

- If the termination action is to log off users, periodic MAC reauthentication takes effect only when the periodic reauthentication timer is shorter than the session timeout timer. If the session timeout timer is shorter, the device logs off online authenticated users when the session timeout timer expires.
- If the termination action is to reauthenticate users, the periodic MAC reauthentication configuration on the device cannot take effect. The device reauthenticates online MAC authentication users after the server-assigned session timeout timer expires.

If no session timeout timer is assigned by the server, whether the device performs periodic MAC reauthentication depends on the periodic MAC reauthentication configuration on the device. Support for the assignment of Session-Timeout and Termination-Action attributes depends on the server model.

With the RADIUS DAS feature enabled, the device immediately reauthenticates a user upon receiving a CoA message that carries the reauthentication attribute from a RADIUS authentication server. In this case, reauthentication will be performed regardless of whether periodic MAC reauthentication is enabled on the device. For more information about RADIUS DAS configuration, see "Configuring AAA."

By default, the device logs off online MAC authentication users if no server is reachable for MAC reauthentication. The keep-online feature keeps authenticated MAC authentication users online when no server is reachable for MAC reauthentication.

The VLANs assigned to an online user before and after reauthentication can be the same or different.

RESTful server-assisted MAC authentication user recovery

Applicable scenario

After online dumb terminals such as printers go offline, they cannot reauthenticate to come online until after they send a service packet. This might cause the dumb terminals to stay offline for a long time after the device or their attached interface module reboots or after their attached interfaces fail.

To avoid this situation, you can configure the device to work with the authentication server and a RESTful server to trigger MAC reauthentication for dumb terminals or retain their online state.

NOTE:

This feature is available only when you use IMC server as the authentication server and the RESTful server.

Operating mechanism

The following information describes how RESTful server-assisted MAC authentication user recovery works:

1. The authentication server includes the **shutdown-keep-online** proprietary attribute in the authorization attributes assigned to a dumb terminal after it passes authentication.
2. After receiving the authentication result from the authentication server, the device allows the dumb terminal user to come online and marks it as a dumb terminal user.
3. When a device or interface issue occurs, the device handles the dumb terminal user as follows:
   - If the device or the interface module reboots or if the interface recovers from a failure, the device obtains MAC authentication user information from the RESTful server to perform MAC reauthentication.
   - If the interface is physical down, the device retains the online state of the dumb terminal user.

Restrictions and guidelines: MAC authentication configuration

When you configure MAC authentication on an interface, follow these restrictions and guidelines:

- MAC authentication is supported only on Layer 2 Ethernet interfaces and Layer 2 aggregate interfaces.
- If you add a Layer 2 Ethernet interface to an aggregation group, the MAC authentication settings configured on it will not take effect until it is removed from the aggregation group.
- Do not delete a Layer 2 aggregate interface if the interface has online MAC authentication users.
- Do not change the link type of a port when the MAC authentication guest VLAN or critical VLAN on the port has users.

If the MAC address that has failed authentication is a static MAC address or a MAC address that has passed any security authentication, the device does not mark the MAC address as a silent address.

To ensure a successful HTTPS redirect for users who have received a server-assigned redirect URL, make sure VLAN interfaces exist for the VLANs that transport their packets.

When RADIUS DAS is enabled, an M-LAG system does not support shutting down or rebooting the access ports of MAC authentication users or reauthenticating the users through CoA messages. For more information about RADIUS DAS, see "Configuring AAA."

The S5200-EI-G switch series does not support M-LAG-related functions or parameters.

The S5200-EI-G switch series does not support configuring MAC authentication on Layer 2 aggregate interfaces.

MAC authentication tasks at a glance

To configure MAC authentication, perform the following tasks:

1. Enabling MAC authentication
2. Configure basic MAC authentication features
   - Specifying a MAC authentication method
   - Specifying a MAC authentication domain
   - Configuring user account policy
   - (Optional.) Configuring MAC authentication timers
   - (Optional.) Configuring periodic MAC reauthentication
3. (Optional.) Configuring MAC authentication VLAN assignment
   - Configuring a MAC authentication guest VLAN
   - Configuring a MAC authentication critical VLAN
4. (Optional.) Configuring a MAC authentication access profile
5. (Optional.) Configuring other MAC authentication features
   - Configuring unauthenticated MAC authentication user aging
   - Configuring MAC authentication offline detection
   - Enabling online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available
   - Enabling online user synchronization for MAC authentication
   - Setting the maximum number of concurrent MAC authentication users on a port
   - Enabling MAC authentication multi-VLAN mode on a port

     Perform this task to not reauthenticate online users when VLAN changes occur on a port.
   - Configuring MAC authentication delay
   - Including user IP addresses in MAC authentication requests
   - Enabling parallel MAC authentication and 802.1X authentication
   - Configuring RESTful server-assisted MAC authentication user recovery
   - Tracking the availability of the Web authentication server at a redirect URL
   - Configuring Web proxy ports for URL redirection in MAC authentication
   - Logging off MAC authentication users
   - Enabling MAC authentication user logging

Prerequisites for MAC authentication

Before you configure MAC authentication, complete the following tasks:

1. Make sure the port security feature is disabled. For more information about port security, see "Configuring port security."
2. Configure an ISP domain and specify an AAA method. For more information, see "Configuring AAA."
   - For local authentication, you must also create local user accounts (including usernames and passwords) and specify the **lan-access** service for local users.
   - For RADIUS authentication, make sure the device and the RADIUS server can reach each other and create user accounts on the RADIUS server. If you are using MAC-based

accounts, make sure the username and password for each account are the same as the MAC address of each MAC authentication user.

Enabling MAC authentication

Restrictions and guidelines

For MAC authentication to take effect on a port, you must enable this feature globally and on the port.

MAC authentication cannnot take effect on a port if the device has run out of ACL resources when you perform either of the following operations:

- Enable MAC authentication on the port while MAC authentication has been enabled globally.
- Enable MAC authentication globally in system while MAC authentication has been enabled on the port.

Procedure

1. Enter system view.
   `system-view`
2. Enable MAC authentication globally.
   `mac-authentication`
   By default, MAC authentication is disabled globally.
3. Enter interface view.
   `interface` *`interface-type interface-number`*
4. Enable MAC authentication on the port.
   `mac-authentication`
   By default, MAC authentication is disabled on a port.

Specifying a MAC authentication method

About this task

RADIUS-based MAC authentication supports the following authentication methods:

- **PAP**—Transports usernames and passwords in plain text. The authentication method applies to scenarios that do not require high security.
- **CHAP**—Transports usernames in plain text and passwords in encrypted form over the network. CHAP is more secure than PAP.

Restrictions and guidelines

The device must use the same authentication method as the RADIUS server.

Procedure

1. Enter system view.
   `system-view`
2. Specify an authentication method for MAC authentication.
   `mac-authentication authentication-method` { **`chap`** | **`pap`** }
   By default, the device uses PAP for MAC authentication.

Specifying a MAC authentication domain

About this task

By default, MAC authentication users are in the system default authentication domain. To implement different access policies for users, you can use one of the following methods to specify authentication domains for MAC authentication users:

- Specify a global authentication domain in system view. This domain setting applies to all ports enabled with MAC authentication.
- Specify an authentication domain for an individual port in interface view.

MAC authentication chooses an authentication domain for users on a port in this order: the port-specific domain, the global domain, and the default domain. For more information about authentication domains, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view
2. Specify an authentication domain for MAC authentication users.
   - In system view:

     mac-authentication domain *domain-name*
   - In interface view:

     interface *interface-type interface-number*

     mac-authentication domain *domain-name*

   By default, the system default authentication domain is used for MAC authentication users.

Configuring user account policy

Restrictions and guidelines

For users in a MAC address range, the MAC address range-specific user account has higher priority than the global user account settings.

You can configure a maximum of 16 MAC address ranges and must make sure the MAC address ranges do not overlap.

If you configure user account settings multiple times for the same MAC address range, the most recent configuration overwrites the previous configuration.

The MAC range-specific accounts apply only to unicast MAC addresses.

- If you specify a MAC address range that contains only multicast MAC addresses, execution of this command will fail.
- If you specify a MAC address range that contains both unicast and multicast MAC addresses, the command takes effect only on unicast MAC addresses.

The all-zero MAC address is invalid for MAC authentication. Users with the all-zero MAC address cannot pass MAC authentication.

Procedure

1. Enter system view.

   system-view
2. Configure the global MAC authentication user account policy.
   - Use one MAC-based user account for each user.

mac-authentication user-name-format mac-address [{ **with-hyphen** [**separator colon**] | **without-hyphen** } [**lowercase** | **uppercase**]] [**password** { **cipher** | **simple** } *string*]

- Use one shared user account for all users.

  mac-authentication user-name-format fixed [**account** *name*] [**password** { **cipher** | **simple** } *string*]

By default, the device uses the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation without hyphens, and letters are in lower case.

3. Specify one shared user account specific to a MAC address range.

   mac-authentication mac-range-account mac-address *mac-address* **mask** { *mask* | *mask-length* } **account** *name* **password** { **cipher** | **simple** } *string*

   By default, no username or password is configured specific to a MAC address range. The global user account policy applies to the users.

Configuring MAC authentication timers

About this task

MAC authentication uses the following timers:

- **Offline detection timer**—Sets the interval that the device must wait for traffic from a user before the device determines that the user is idle. If the device has not received traffic from a user before the timer expires, the device logs off that user and requests the accounting server to stop accounting for the user. This timer takes effect only when the MAC authentication offline detection feature is enabled.

  As a best practice, set the MAC address aging timer to the same value as the offline detection timer. This operation prevents a MAC authenticated user from being logged off within the offline detection interval because of MAC address entry expiration.
- **Quiet timer**—Sets the interval that the device must wait before the device can perform MAC authentication for a user that has failed MAC authentication. All packets from the MAC address are dropped during the quiet time. This quiet mechanism prevents repeated authentication from affecting system performance.
- **Server timeout timer**—Sets the interval that the device waits for a response from a RADIUS server before the device determines that the RADIUS server is unavailable. If the timer expires during MAC authentication, the user fails MAC authentication.
- **Aging timer for temporary MAC authentication users**—Sets the aging timer for temporary MAC authentication users. This timer starts when a user passes MAC authentication on a port operating in **macAddressAndUserLoginSecureExt** mode. If the device has not received 802.1X protocol packets from the MAC authenticated user on that port before the timer expires, the device determines that the user has failed authentication. Then, the device logs off the user. For more information about the port security mode, see "Configuring port security."

Restrictions and guidelines

To avoid forced logoff before the server timeout timer expires, set the server timeout timer to a value that is lower than or equal to the product of the following values:

- The maximum number of RADIUS packet transmission attempts set by using the **retry** command in RADIUS scheme view.
- The RADIUS server response timeout timer set by using the **timer response-timeout** command in RADIUS scheme view.

For information about setting the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer, see "Configuring AAA."

Procedure

1. Enter system view.

   system-view

2. Configure MAC authentication timers.

   mac-authentication timer { **offline-detect** *offline-detect-value* | **quiet** *quiet-value* | **server-timeout** *server-timeout-value* | **temporary-user-aging** *aging-time-value* }

   The default settings are as follows:

   - The offline detection timer is 300 seconds.
   - The quiet timer is 60 seconds.
   - The server timeout timer is 100 seconds.
   - The temporary user aging timer is 60 seconds.

Configuring periodic MAC reauthentication

Restrictions and guidelines

The device selects a periodic reauthentication timer for MAC reauthentication in the following order:

1. Server-assigned reauthentication timer.
2. Port-specific reauthentication timer.
3. Global reauthentication timer.
4. Default reauthentication timer.

Modification to the MAC authentication domain, MAC authentication method, or user account format setting does not affect the reauthentication of online MAC authentication users. The modified setting takes effect only on MAC authentication users that come online after the modification.

If periodic reauthentication is triggered for a user while that user is waiting for online synchronization, the system performs online synchronization and does not perform reauthentication for the user.

Procedure

1. Enter system view.

   system-view

2. Set the periodic MAC reauthentication timer.

   - Set a global periodic reauthentication timer.

     mac-authentication timer reauth-period *reauth-period-value*

     The default setting is 3600 seconds.

   - Execute the following commands in sequence to set a port-specific periodic reauthentication timer:

     interface *interface-type interface-number*

     mac-authentication timer reauth-period *reauth-period-value*

     quit

     By default, no periodic MAC reauthentication timer is set on a port. The port uses the global periodic MAC reauthentication timer.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable periodic MAC reauthentication.

   mac-authentication re-authenticate

By default, periodic MAC reauthentication is disabled on a port.

5. (Optional.) Enable the keep-online feature for MAC authenticated users on the port.

   mac-authentication re-authenticate server-unreachable keep-online

   By default, the keep-online feature is disabled. The device logs off online MAC authentication users if no server is reachable for MAC reauthentication.

   In a fast-recovery network, you can use the keep-online feature to prevent MAC authentication users from coming online and going offline frequently.

Configuring a MAC authentication guest VLAN

Specifying a MAC authentication guest VLAN on a port

Restrictions and guidelines

When you configure the MAC authentication guest VLAN on a port, follow the guidelines in Table 5.

Table 5 Relationships of the MAC authentication guest VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication guest VLAN feature has higher priority. When a user fails MAC authentication, the user can access the resources in the guest VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The guest VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication guest VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication guest VLAN.
- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the MAC authentication guest VLAN on the port.

   mac-authentication guest-vlan *guest-vlan-id*

   By default, no MAC authentication guest VLAN is specified on a port.

   You can configure only one MAC authentication guest VLAN on a port. The MAC authentication guest VLANs on different ports can be different.

Enabling guest VLAN reauthentication in MAC authentication

About this task

The guest VLAN reauthentication feature of MAC authentication enables the device to reauthenticate users in the MAC authentication guest VLAN on a port at reauthentication intervals.

By default, this feature is enabled. You can disable it as needed to suppress excessive authentication failure log messages, which might occur when a network issue results in a large number of reauthentication failures.

If guest VLAN reauthentication is disabled on a port, the device does not reauthenticate users in the MAC authentication guest VLAN on the port. The guest VLAN users will stay in the guest VLAN until they age out. To control guest VLAN user aging functionality, use the **mac-authentication unauthenticated-user aging enable** command. To configure the aging timer, use the **mac-authentication timer user-aging guest-vlan** *aging-time-value* command.

Restrictions and guidelines

As a best practice, set the reauthentication interval to a value greater than 30 seconds if the number of concurrent MAC authentication users on a port is likely to exceed 300.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the guest VLAN reauthentication feature of MAC authentication on the port.
   mac-authentication guest-vlan re-authenticate
   By default, the guest VLAN reauthentication feature of MAC authentication is enabled on a port.
4. Set the authentication interval for users in the MAC authentication guest VLAN.
   mac-authentication guest-vlan auth-period *period-value*
   The default setting is 30 seconds.

Configuring a MAC authentication critical VLAN

Restrictions and guidelines

When you configure the MAC authentication critical VLAN on a port, follow the guidelines in Table 6.

Table 6 Relationships of the MAC authentication critical VLAN with other security features

Feature	Relationship description	Reference
Quiet feature of MAC authentication	The MAC authentication critical VLAN feature has higher priority. When a user fails MAC authentication because no RADIUS authentication server is reachable, the user can access the resources in the critical VLAN. The user's MAC address is not marked as a silent MAC address.	See "Configuring MAC authentication timers."
Port intrusion protection	The critical VLAN feature has higher priority than the block MAC action but lower priority than the shutdown port action of the port intrusion protection feature.	See "Configuring port security."

Prerequisites

Before you configure the MAC authentication critical VLAN on a port, complete the following tasks:

- Create the VLAN to be specified as the MAC authentication critical VLAN.
- Configure the port as a hybrid port, and configure the VLAN as an untagged member on the port.
- Enable MAC-based VLAN on the port.

For information about VLAN configuration, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the MAC authentication critical VLAN on the port.

   mac-authentication critical vlan *critical-vlan-id*
   [**url-user-logoff**]

   By default, no MAC authentication critical VLAN is specified on a port.

   You can configure only one MAC authentication critical VLAN on a port. The MAC authentication critical VLANs on different ports can be different.

Configuring a MAC authentication access profile

About this task

The device uses MAC authentication access profiles to uniformly manage configurations related to MAC authentication access. After you bind a MAC authentication access profile to a port security authentication profile, the interface bound to the port security authentication profile will use the access profile's configuration to authenticate users.

After you bind a port security authentication profile to an interface:

- For settings that can be configured both in interface view and MAC authentication access profile view (the command lines might differ in the views), the system automatically deletes the settings in interface view regardless of whether the port security authentication profile has been bound to a MAC authentication access profile. To use these settings, configure them in the MAC authentication access profile bound to the port security authentication profile.
- For settings supported in interface view but not in MAC authentication access profile view, the settings in interface view still take effect.

For more information about port security authentication profiles, see "Configuring port security."

Restrictions and guidelines

If a MAC authentication access profile bound to a port security authentication profile has taken effect, deleting the access profile will cause users who have come online using this access profile to disconnect abnormally.

A MAC authentication access profile can be bound to multiple port security authentication profiles, but a port security authentication profile can be bound to only one MAC authentication access profile. To bind another MAC authentication access profile to a port security authentication profile, you must first unbind the existing one.

Procedure

1. Enter system view.

   system-view

2. Create a MAC authentication access profile and enter its view.

   mac-authentication access-profile name *profile-name*

   By default, no MAC authentication access profiles exist.

3. Configure supported MAC authentication features as needed.

   Only some MAC authentication features are supported in MAC authentication access profile view. For more information, see the command reference.

4. Enter a port security authentication profile view.

   port-security authentication-profile name *profile-name*

5. Bind the MAC authentication access profile to the port security authentication profile.

   mac-authentication access-profile *profile-name*

   By default, no MAC authentication access profile is bound to the port security authentication profile.

Configuring unauthenticated MAC authentication user aging

About this task

Unauthenticated MAC authentication user aging applies to users added to a MAC authentication guest or critical VLAN because they have not been authenticated or have failed authentication.

When a user in one of those VLANs ages out, the device removes the user from the VLAN and deletes the MAC address entry for the user from the access port.

For users in one of those VLANs on one port to be authenticated successfully and come online on another port, enable this feature. In any other scenarios, disable this feature as a best practice.

Restrictions and guidelines

Users removed from an access control segment upon aging timer expiration will be unable to access the network resources for that segment until after another authentication is triggered. As a best practice, use this feature on a port only if you want to have its unauthenticated users to be authenticated and come online on a different port.

Procedure

1. Enter system view.

   system-view

2. Set the user aging timer for a type of MAC authentication VLAN.

   mac-authentication timer user-aging { **critical-vlan** | **guest-vlan** } *aging-time-value*

   By default, the user aging timer is 1000 seconds for all applicable types of MAC authentication VLANs.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable unauthenticated MAC authentication user aging.

   mac-authentication unauthenticated-user aging enable

   By default, unauthenticated MAC authentication user aging is enabled.

Configuring MAC authentication offline detection

About this task

Enable MAC authentication offline detection to detect idle users on a port. If the port has not received traffic from a user when the offline detection timer expires, the device logs off that user and requests the accounting server to stop accounting for the users. For information about setting the offline detection timer in system view, see "Configuring MAC authentication timers."

Disabling this feature disables the device from inspecting the online user status.

In addition to port-based MAC authentication offline detection, you can configure offline detection parameters on a per-user basis, as follows:

- Set an offline detection timer specific to a user and control whether to use the ARP snooping or ND snooping table to determine the offline state of the user.
  - If the ARP snooping or ND snooping table is used, the device searches the ARP snooping or ND snooping table before it checks for traffic from the user within the detection interval. If a matching ARP snooping or ND snooping entry is found, the device resets the offline detection timer and the user stays online. If the offline detection timer expires because the device has not found a matching snooping entry for the user or received traffic from the user, the device disconnects the user.
  - If the ARP or ND snooping table is not used, the device disconnects the user if it has not received traffic from that user before the offline detection timer expires.

  When disconnecting the user, the device also notifies the RADIUS server (if any) to stop user accounting.
- Skip offline detection for the user. You can choose this option if the user is a dumb terminal. A dumb terminal might fail to come online again after it is logged off by the offline detection feature.

The device uses the offline detection settings for a user in the following sequence:

1. User-specific offline detection settings.
2. Offline detection settings assigned to the user by the RADIUS server. The settings include the offline detection timer, use of the ARP or ND snooping table in offline detection, and whether to ignore offline detection.
3. Port-based offline detection settings.

MAC authentication offline detection takes effect on both of the following types of users:

- Users in preauthentication domains, authentication domains, critical domains, and Auth-Fail domains.
- Users assigned to guest VLANs and critical VLANs.

Restrictions and guidelines

For the user-specific offline detection feature to take effect on a user, make sure the MAC authentication offline detection feature is enabled on the user's access port.

The user-specific offline detection settings take effect on the online users immediately after they are configured.

If you enable MAC authentication offline detection on a Layer 2 aggregate interface, delay exists for the device to log off an idle user.

Procedure

1. Enter system view.

   `system-view`
2. (Optional.) Configure MAC authentication offline detection for a user.

mac-authentication offline-detect mac-address *mac-address* { **ignore** | **timer** *offline-detect-value* [**check-arp-or-nd-snooping**] }

By default, offline detection settings configured on access ports take effect and the offline detection timer set in system view is used.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable MAC authentication offline detection.

   mac-authentication offline-detect enable

   By default, MAC authentication offline detection is enabled on a port.

Enabling online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available

About this task

The offline detection feature for MAC authentication logs off an online MAC authentication user if it has not detected traffic from that user before the offline-detect timer expires. To prevent online MAC authentication users on a port from being forced offline by the offline detection feature and stay online when none of the RADIUS servers in their ISP domain is reachable, perform this task.

Restrictions and guidelines

Use this feature only when RADIUS scheme authentication is configured for the MAC authentication users on a port. If local or no authentication is also configured, offline detection might be undesirably disabled for MAC authentication users that come online through local authentication or without authentication.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable online MAC authentication users to escape from offline detection and stay online when no reachable RADIUS authentication servers are available.

   mac-authentication auth-server-unavailable escape

   By default, online MAC authentication users cannot escape from offline detection (if enabled) when no reachable RADIUS authentication servers are available.

Enabling online user synchronization for MAC authentication

About this task

IMPORTANT:

This feature takes effect only when the device uses an IMC RADIUS server to authenticate MAC authentication users.

To ensure that the RADIUS server maintains the same online MAC authentication user information as the device after the server state changes from unreachable to reachable, use this feature.

This feature synchronizes online MAC authentication user information between the device and the RADIUS server when the RADIUS server state is detected having changed from unreachable to reachable.

When synchronizing online MAC authentication user information on a port with the RADIUS server, the device initiates MAC authentication in turn for each authenticated online MAC authentication user to the RADIUS server.

If synchronization fails for an online user, the device logs off that user unless the failure occurs because the server has become unreachable again.

Restrictions and guidelines

The amount of time required to complete online user synchronization increases as the number of online users grows. This might result in an increased delay for new MAC authentication users and users in the critical VLAN to authenticate or reauthenticate to the RADIUS server and come online.

To have this feature take effect, you must use it in conjunction with the RADIUS server status detection feature, which is configurable with the **radius-server test-profile** command. For more information about the RADIUS server status detection feature, see "Configuring AAA."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable online user synchronization for MAC authentication.
   mac-authentication server-recovery online-user-sync
   By default, online user synchronization for MAC authentication is disabled.

Setting the maximum number of concurrent MAC authentication users on a port

About this task

Perform this task to prevent the system resources from being overused.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the maximum number of concurrent MAC authentication users on the port.
   mac-authentication max-user [**preauth-domain** | **auth-fail-domain**] *max-number*
   The default setting is 4294967295.

Enabling MAC authentication multi-VLAN mode on a port

About this task

By default, MAC authentication single-VLAN mode applies on a port. In this mode, traffic from an online user cannot be sent in different VLANs on a port without service interruption. To accommodate applications that are sensitive to delay or service interruption in a multi-VLAN environment, for example, IP phones, enable MAC authentication multi-VLAN mode.

In multi-VLAN mode, the port forwards traffic from a user in different VLANs without reauthentication if the user has been authenticated and come online in any VLAN on the port. Free of reauthentication, traffic from an online user can be sent in different VLANs without delay or service interruption.

In single-VLAN mode, the port reauthenticates an online user when traffic received from that user contains a VLAN tag different from the VLAN in which the user was authenticated. The authentication process differs depending on the MAC move setting in port security and the authorization VLAN assignment status, as follows:

- If no authorization VLAN has been assigned to the online user, the device first logs off the user and then reauthenticates the user in the new VLAN.
- If the online user has been assigned an authorization VLAN, the device handles the user depending on the MAC move setting in port security.
  - If MAC move is disabled in port security, the user cannot pass authentication and come online from the new VLAN until after it goes offline from the port.
  - If MAC move is enabled in port security, the user can pass authentication on the new VLAN and come online without having to first go offline from the port. After the user passes authentication on the new VLAN, the original authentication session of the user is deleted from the port.

  To enable the port security MAC move feature, use the **port-security mac-move permit** command.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable MAC authentication multi-VLAN mode.

   mac-authentication host-mode multi-vlan

   By default, MAC authentication operates in single-VLAN mode on a port.

Configuring MAC authentication delay

About this task

When both 802.1X authentication and MAC authentication are enabled on a port, you can delay MAC authentication so that 802.1X authentication is preferentially triggered.

If no 802.1X authentication is triggered or 802.1X authentication fails within the delay period, the port continues to process MAC authentication.

Restrictions and guidelines

Do not set the port security mode to **mac-else-userlogin-secure** or **mac-else-userlogin-secure-ext** when you use MAC authentication delay. The delay does not take

effect on a port in either of the two modes. For more information about port security modes, see "Configuring port security."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable MAC authentication delay and set the delay timer.
   mac-authentication timer auth-delay *time*
   By default, MAC authentication delay is disabled.

Including user IP addresses in MAC authentication requests

About this task

IMPORTANT:
This feature can only operate in conjunction with an IMC server.

To avoid IP conflicts that result from changes to static IP addresses, use this feature on a port that has MAC authentication users with static IP addresses.

This feature adds user IP addresses to the MAC authentication requests sent to the authentication server. When MAC authentication is triggered for a user, the device checks the user's IP address for invalidity.

- If the IP address is valid, the device sends a MAC authentication request with the IP address included.
- If the IP address is not a valid host IP address or the triggering packet does not contain an IP address, the device does not initiate MAC authentication.
- If the packet is a DHCP packet with a source IP address of all zeros, the device sends a MAC authentication request without including the IP address. In this case, the IMC server does not examine the user IP address when it performs authentication.

Upon receipt of the authentication request that includes a user's IP address, the IMC server compares the user's IP and MAC addresses with its local IP-MAC mappings.

- If an exact match is found or if no match is found, the user passes MAC authentication. In the latter case, the server creates an IP-MAC mapping for the user.
- If a mapping is found for the MAC address but the IP addresses do not match, the user fails the MAC authentication.

After you specify the **exclude-ip acl** keyword, the applied ACL cannot filter out DHCP packets. If a DHCP packet that carries an invalid IP address triggers MAC authentication, user authentication will fail. To resolve this issue, you can specify the **exclude-dhcpv4** or **exclude-dhcpv6** keyword to prevent users from triggering MAC authentication through DHCP packets.

Restrictions and guidelines

Configure DHCP snooping or ARP snooping, so when users' IP addresses change, the device can quickly update the users' IP addresses and send authentication requests with correct user IP addresses to the authentication server. To configure DHCP snooping, execute the **dhcp snooping enable** and **dhcp snooping binding record** commands. To enable ARP snooping, execute the **arp snooping enable** command. For more information about DHCP snooping and ARP

snooping, see ARP configuration and DHCP configuration respectively in *Layer 3—IP Services Configuration Guide*.

Do not use this feature in conjunction with the MAC authentication guest VLAN on a port. If both features are used, the device cannot perform MAC authentication for a user once that user is added to the MAC authentication guest VLAN.

You can specify an ACL to identify source IP addresses that can or cannot trigger MAC authentication. When you configure the ACL, follow these guidelines:

- The specified ACL number represents an IPv4 ACL and an IPv6 ACL with the same number. For example, if the ACL number is 2000, you specify both IPv4 ACL 2000 and IPv6 ACL 2000. The IPv4 ACL and the IPv6 ACL will be used to process IPv4 packets and IPv6 packets, respectively.
- Use permit rules to identify source IP addresses that are valid for MAC authentication. Use deny rules to identify source IP addresses that cannot trigger MAC authentication.
- In the rules, only the action keyword (permit or deny) and the source IP match criteria can take effect.
- As a best practice, configure a deny rule to exclude the IPv6 IP addresses that start with fe80 from triggering MAC authentication.
- If you configure permit rules, add a **`deny all`** rule at the bottom of the ACL.

IMPORTANT:

If the user host is configured with IPv6, the device might receive packets that contain an IPv6 link-local address, which starts with fe80. MAC authentication failure or incorrect MAC-IP binding will occur if this address is used in MAC authentication. To avoid these issues, configure an ACL to exclude the IPv6 IP addresses that start with fe80.

Procedure

1. Enter system view.

   `system-view`
2. Enter interface view.

   `interface` *`interface-type interface-number`*
3. Include user IP addresses in MAC authentication requests.

   `mac-authentication carry user-ip` [**`exclude-ip acl`** *`acl-number`*] [**`exclude-dhcpv4`**] [**`exclude-dhcpv6`**]

   By default, a MAC authentication request does not include the user IP address.

Enabling parallel MAC authentication and 802.1X authentication

About this task

This feature enables a port to perform MAC authentication in parallel with 802.1X authentication when it receives a packet from an unknown MAC address.

This feature applies to the following situation in which MAC authentication can be performed only after 802.1X authentication is completed:

- The port is configured with both 802.1X authentication and MAC authentication and performs MAC-based access control for 802.1X authentication.
- The port is enabled with the 802.1X unicast trigger.

With parallel authentication enabled, the port performs MAC authentication while sending a unicast EAP-Request/Identity packet to trigger 802.1 authentication when it receives a packet from an unknown MAC address.

If MAC authentication succeeds before 802.1X authentication is completed, the port is assigned to the MAC authentication authorization VLAN. When 802.1X authentication completes, the device manipulates VLAN assignment depending on the authentication result, as follows:

- If 802.1X authentication fails, the MAC authentication result takes effect.
- If 802.1X authentication succeeds, the device manipulates VLAN assignment based on the 802.1X authentication result.

For the port to perform MAC authentication before it is assigned to the 802.1X guest VLAN, you must also enable new MAC-triggered 802.1X guest VLAN assignment delay. For information about new MAC-triggered 802.1X guest VLAN assignment delay, see "Configuring 802.1X."

Restrictions and guidelines

To configure both 802.1X authentication and MAC authentication on a port, use one of the following methods:

- Enable the 802.1X and MAC authentication features separately on the port.
- Enable port security on the port. The port security mode must be **userlogin-secure-or-mac** or **userlogin-secure-or-mac-ext**.

  For information about port security mode configuration, see "Configuring port security."

For the parallel authentication feature to work correctly, do not enable MAC authentication delay on the port. This feature will delay MAC authentication after 802.1X authentication is triggered.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable parallel MAC authentication and 802.1X authentication on the port.

   mac-authentication parallel-with-dot1x

   By default, this feature is disabled.

Configuring RESTful server-assisted MAC authentication user recovery

About this task

RESTful server-assisted MAC authentication user recovery supports the following methods:

- **Automatic recovery**—The device automatically obtains MAC authentication user information and performs a reauthentication after the device or an interface module reboots or after an interface recovers from a failure. This feature recovers the online state of MAC authenticated users quickly without waiting for packets from the MAC authentication users to trigger a reauthentication. It is helpful when the network has a large number of dumb terminals or the operation of dumb terminals is important for services.
- **Manual recovery**—You trigger a recovery manually. Then, the device obtains MAC authentication user information from the RESTful server and performs reauthentication. This method is helpful when automatic recovery fails to recover the online state of all MAC authenticated users because of link flapping.

With this feature, you can configure a maximum of 16 profiles for MAC authentication user recovery. Each profile contains a set of parameters for accessing a RESTful server and the URI from which you obtain MAC authentication user information.

Restrictions and guidelines

To use this feature, you must use an IMC server to act as both authentication and RESTful servers.

This feature is mutually exclusive with the RADIUS accounting-on feature. Do not use the two features together. For more information about the RADIUS accounting-on feature, see "Configuring AAA."

To ensure that the MAC authentication user entries obtained from the RESTful server contain user IP addresses, configure the device to include user IP addresses in the MAC authentication requests sent to the authentication server. For more information about this feature, see "Including user IP addresses in MAC authentication requests."

Procedure

1. Enter system view.

   system-view

2. Configure a MAC authentication user-recovery profile:

   a. Create a profile for MAC authentication user recovery and enter its view.

      mac-authentication user-recovery-profile *profile-name*

   b. Configure the IP address and port number of the RESTful server.

      server-address { **ip** *ipv4-address* | **ipv6** *ipv6-address* } [**port** *port-number*] [**vpn-instance** *vpn-instance-name*]

      By default, no RESTful servers are configured.

   c. Configure the username and password for accessing the RESTful server.

      login-name *username* [**password** { **cipher** | **simple** } *string*]

      By default, no username or password is configured for accessing the RESTful server.

   d. Configure the NAS IP address used by the device to communicate with the RESTful server.

      nas-ip { *ipv4-address* | **ipv6** *ipv6-address* }

      By default, no NAS IP address is configured for the device to communicate with the RESTful server.

      The NAS IP address must be the same as that configured in the authentication RADIUS scheme for the MAC authentication users.

   e. Specify the URI for obtaining MAC authentication user information from the RESTful server.

      uri *uri-string*

      By default, no URIs are specified.

      The URI can only be **imcrs/uam/online/notAgingMuteTerminal**. Other URIs cannot take effect.

3. Return to system view.

   quit

4. Enable automatic MAC authentication user recovery.

   mac-authentication auto-recover-user profile *profile-name*

   By default, automatic MAC authentication user recovery is disabled.

5. Return to user view.

   quit

6. (Optional.) Manually recover MAC authentication users.

   mac-authentication recover-user profile *profile-name* [**interface** *interface-type interface-number*

Tracking the availability of the Web authentication server at a redirect URL

About this task

By default, the device does not track the availability of the Web authentication server at the redirect URL assigned to MAC authentication users. On the device, the state of the Web authentication server will always be active, regardless of its availability. To have the MAC authentication module log off MAC authentication users that have been assigned a redirect URL promptly when the Web authentication server at that URL becomes unavailable, associate that redirect URL with a track entry to detect its connectivity.

As a best practice, configure the track entry associated with the redirect URL to collaborate with an HTTP NQA operation for detection. For more information about Track, see *High Availability Configuration Guide*. For more information about NQA, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Associate a redirect URL for MAC authentication users with a track entry.

   mac-authentication redirect-url *url-string* **track** *track-entry-number*

   By default, no redirect URLs for MAC authentication users are associated with a track entry.

Configuring Web proxy ports for URL redirection in MAC authentication

About this task

By default, the device redirects the HTTP or HTTPS requests from a MAC authenticated user to the authorized URL only if the requests are sent from a browser with Web proxy disabled. The device discards these requests if they are sent from a browser configured with a Web proxy.

To prevent the HTTP or HTTPS requests from being discarded, add the TCP port numbers of the Web proxy for HTTP and HTTPS to the device. These TCP port numbers are called Web proxy ports in this document.

Restrictions and guidelines

You can configure a maximum of 64 Web proxy ports for MAC authenticated users.

Specify different Web proxy port numbers for HTTP and HTTPS requests.

Adding or removing a Web proxy port will cause the device to log off all online MAC authenticated users that have been assigned an authorization redirect URL.

Procedure

1. Enter system view.

   system-view

2. Specify a Web proxy port used by MAC authentication users for HTTP or HTTPS.

   mac-authentication web-proxy { **http** | **https** } **port** *port-number*

   By default, no Web proxy ports are specified.

Logging off MAC authentication users

About this task

Perform this task to log off specified MAC authentication users and clear information about these users from the device. These users must perform MAC authentication to come online again.

Procedure

To log off MAC authentication users, execute the following command in user view:

reset mac-authentication access-user [**interface** *interface-type interface-number* | **mac** *mac-address* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** | **url-unavailable-domain** } | **username** *username* | **vlan** *vlan-id*]

Enabling MAC authentication user logging

About this task

This feature enables the device to generate logs about MAC authentication users and send the logs to the information center. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

To prevent excessive MAC authentication user log entries, use this feature only if you need to analyze abnormal MAC authentication user logins or logouts.

Procedure

1. Enter system view.

   system-view

2. Enable MAC authentication user logging.

   mac-authentication access-user log enable [**failed-login** | **ip-change** | **logoff** | **successful-login**] *

   By default, MAC authentication user logging is disabled.

   If you do not specify any parameters, this command enables all types of MAC authentication user logs.

Display and maintenance commands for MAC authentication

IMPORTANT:

The S5200-EI-G switch series does not support M-LAG-related functions or parameters.

Execute **display** commands in any view and **reset** commands in user view.

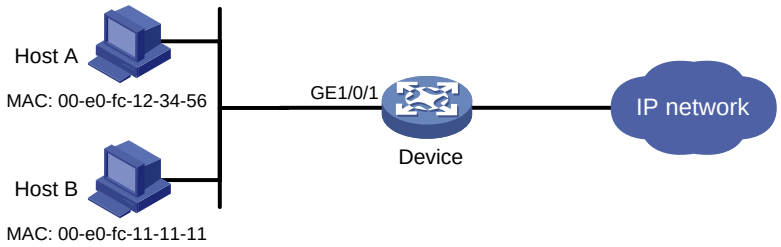
Task	Command
Display MAC authentication information.	**display mac-authentication** [**interface** *interface-type interface-number*]

Task	Command
Display configuration information for MAC authentication access profiles.	**display mac-authentication access-profile** [**name** *profile-name*]
Display MAC authentication connections.	**display mac-authentication connection** [**open**] [[**m-lag** [**local** | **peer**]] [**interface** *interface-type interface-number* | **online-type** { **auth-fail-domain** | **critical-domain** | **preauth-domain** | **success** | **url-unavailable-domain** } | **slot** *slot-number* | **user-name** *user-name*] | **user-mac** *mac-address*]
Display the MAC addresses of MAC authentication users in a type of MAC authentication VLAN.	**display mac-authentication mac-address** { **critical-vlan** | **guest-vlan** } [**interface** *interface-type interface-number*]
Clear MAC authentication statistics.	**reset mac-authentication statistics** [**interface** *interface-type interface-number*]
Remove users from the MAC authentication critical VLAN on a port.	**reset mac-authentication critical vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]
Remove users from the MAC authentication guest VLAN on a port.	**reset mac-authentication guest-vlan interface** *interface-type interface-number* [**mac-address** *mac-address*]

MAC authentication configuration examples

Example: Configuring local MAC authentication

Network configuration



As shown in Figure 4, the device performs local MAC authentication on GigabitEthernet 1/0/1 to control Internet access of users.

Configure the device to meet the following requirements:

- Detect whether a user has gone offline every 180 seconds.
- Deny a user for 180 seconds if the user fails MAC authentication.
- Authenticate all users in ISP domain **bbb**.

- Use the MAC address of each user as both the username and password for authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

Figure 4 Network diagram

Procedure

Add a network access local user. In this example, configure both the username and password as Host A's MAC address 08-00-27-12-34-56.

```
<Device> system-view
[Device] local-user 08-00-27-12-34-56 class network
[Device-luser-network-08-00-27-12-34-56] password simple 08-00-27-12-34-56
```

Specify the LAN access service for the user.

```
[Device-luser-network-08-00-27-12-34-56] service-type lan-access
[Device-luser-network-08-00-27-12-34-56] quit
```

Configure ISP domain **bbb** to perform local authentication for LAN users.

```
[Device] domain bbb
[Device-isp-bbb] authentication lan-access local
[Device-isp-bbb] quit
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Specify ISP domain **bbb** as the MAC authentication domain.

```
[Device] mac-authentication domain bbb
```

Configure MAC authentication timers.

```
[Device] mac-authentication timer offline-detect 180
[Device] mac-authentication timer quiet 180
```

Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Display MAC authentication settings and statistics to verify your configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                        : Enabled
   Authentication method                     : PAP
   M-LAG member configuration conflict       : Unknown
   User name format                       : MAC address in lowercase(xx-xx-xx-xx-xx-xx)
```

```
          Username                            : mac
          Password                            : Not configured
  Offline detect period                       : 180 s
  Quiet period                                : 180 s
  Server timeout                              : 100 s
  Reauth period                               : 3600 s
  User aging period for critical VLAN         : 1000 s
  User aging period for guest VLAN            : 1000 s
  User aging period for critical microsegment: 1000 s

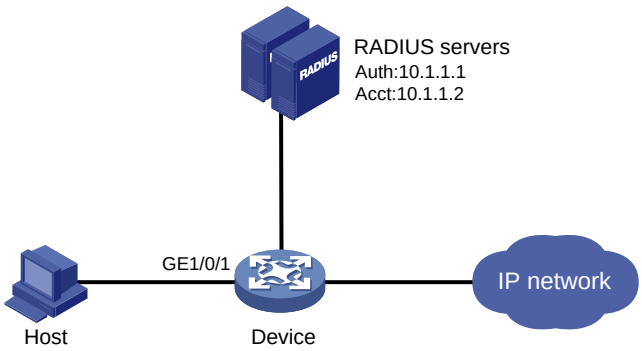
  Critical voice VLAN                         : Disabled
  Host mode                                   : Single VLAN
  Offline detection                           : Enabled
  Authentication order                        : Default
  Unauthenticated-user aging                  : Enabled
  Server-recovery online-user-sync            : Enabled

  Critical microsegment ID                    : Not configured
  URL user logoff                             : No
  Auto-tag feature                            : Disabled
  VLAN tag configuration ignoring             : Disabled
  Max online users                            : 4294967295
  Max online preauth-domain users             : 4294967295
  Max online Auth-Fail-domain users           : 4294967295
  Auth-server-unavailable escape              : Enabled
  Authentication attempts                     : successful 1, failed 0
  Current online users                        : 1
          MAC address       Auth state
          0800-2712-3456    Authenticated
```

The output shows that Host A has passed MAC authentication and has come online. Host B failed MAC authentication and its MAC address is marked as a silent MAC address.

Example: Configuring RADIUS-based MAC authentication



Network configuration

As shown in Figure 5, the device uses RADIUS servers to perform authentication, authorization, and accounting for users. The RADIUS servers use the CHAP authentication method.

To control user access to the Internet by MAC authentication, perform the following tasks:

- Enable MAC authentication globally and on GigabitEthernet 1/0/1.
- Configure the device to use CHAP for MAC authentication.
- Configure the device to detect whether a user has gone offline every 180 seconds.
- Configure the device to deny a user for 180 seconds if the user fails MAC authentication.
- Configure all users to belong to ISP domain **bbb**.
- Use a shared user account for all users, with username **aaa** and password **123456**.

Figure 5 Network diagram

Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers to provide authentication, authorization, and accounting services. Create a shared account with username **aaa** and password **123456** for MAC authentication users. (Details not shown.)
2. Configure RADIUS-based MAC authentication on the device:

   # Configure a RADIUS scheme.

   ```
   <Device> system-view
   [Device] radius scheme 2000
   [Device-radius-2000] primary authentication 10.1.1.1 1812
   [Device-radius-2000] primary accounting 10.1.1.2 1813
   [Device-radius-2000] key authentication simple abc

Example: Configuring ACL assignment for MAC authentication

Network configuration

As shown in Figure 6, configure the device to meet the following requirements:

- Use RADIUS servers to perform authentication, authorization, and accounting for users.
- Perform MAC authentication on GigabitEthernet 1/0/1 to control Internet access.
- Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.
- Use an ACL to deny authenticated users to access the FTP server at 10.0.0.1.

Figure 6 Network diagram

Procedure

Make sure the RADIUS servers and the access device can reach each other.

1. Configure the RADIUS servers:

   # Configure the RADIUS servers to provide authentication, authorization, and accounting services. (Details not shown.)

   # Add a user account with **08-00-27-12-34-56** as both the username and password on each RADIUS server. (Details not shown.)

   # Specify ACL 3000 as the authorization ACL for the user account. (Details not shown.)

2. Configure ACL 3000 to deny packets destined for 10.0.0.1 on the device.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 deny ip destination 10.0.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

3. Configure RADIUS-based MAC authentication on the device:

   # Configure a RADIUS scheme.

```
[Device] radius scheme 2000
[Device-radius-2000] primary authentication 10.1.1.1 1812
[Device-radius-2000] primary accounting 10.1.1.2 1813
[Device-radius-2000] key authentication simple abc
[Device-radius-2000] key accounting simple abc
[Device-radius-2000] user-name-format without-domain
[Device-radius-2000] quit
```

   # Apply the RADIUS scheme to an ISP domain for authentication, authorization, and accounting.

```
[Device] domain bbb
[Device-isp-bbb] authentication default radius-scheme 2000
[Device-isp-bbb] authorization default radius-scheme 2000
[Device-isp-bbb] accounting default radius-scheme 2000
[Device-isp-bbb] quit
```

   # Specify the ISP domain for MAC authentication.

```
[Device] mac-authentication domain bbb
```

   # Use the MAC address of each user as both the username and password for MAC authentication. The MAC addresses are in hexadecimal notation with hyphens, and letters are in lower case.

```
[Device] mac-authentication user-name-format mac-address with-hyphen lowercase
```

Enable MAC authentication on GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] mac-authentication
[Device-GigabitEthernet1/0/1] quit
```

Enable MAC authentication globally.

```
[Device] mac-authentication
```

Verifying the configuration

Verify the MAC authentication configuration.

```
[Device] display mac-authentication
 Global MAC authentication parameters:
   MAC authentication                          : Enable
   Authentication method                       : PAP

Configuring portal authentication

About portal authentication

Portal authentication controls user access to networks. Portal authenticates a user by the username and password the user enters on a portal authentication page. Typically, portal authentication is deployed on the access layer and vital data entries.

In a portal-enabled network, users can actively initiate portal authentication by visiting the authentication website provided by the portal Web server. Or, they are redirected to the portal authentication page for authentication when they visit other websites.

The device supports Portal 1.0, Portal 2.0, and Portal 3.0.

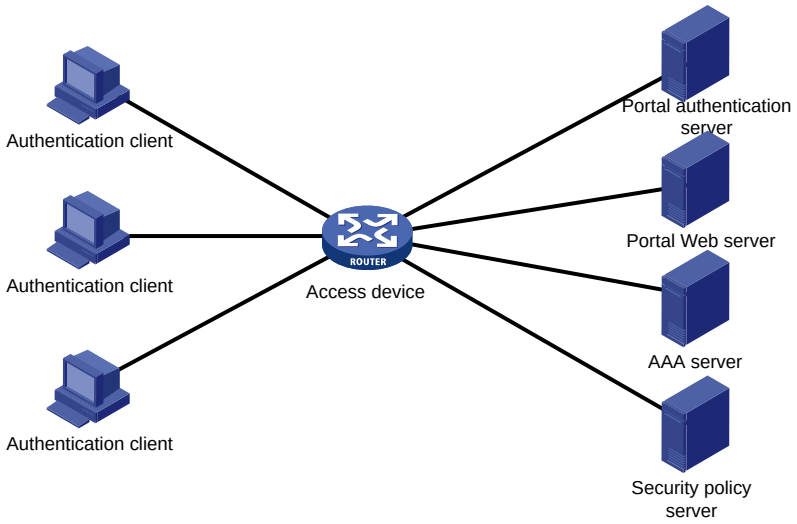
Advantages of portal authentication

Portal authentication has the following advantages:

- Allows users to perform authentication through a Web browser without installing client software.
- Provides ISPs with diversified management choices and extended functions. For example, the ISPs can place advertisements, provide community services, and publish information on the authentication page.
- Supports multiple authentication modes. For example, re-DHCP authentication implements a flexible address assignment scheme and saves public IP addresses. Cross-subnet authentication can authenticate users who reside in a different subnet than the access device.

Extended portal functions

By forcing patching and anti-virus policies, extended portal functions help hosts to defend against viruses. Portal supports the following extended functions:



- **Security check**—Detects after authentication whether or not a user host installs anti-virus software, virus definition file, unauthorized software, and operating system patches.
- **Resource access restriction**—Allows an authenticated user to access certain network resources such as the virus server and the patch server. Users can access more network resources after passing security check.

Security check must cooperate with the IMC security policy server and the iNode client.

Portal system

A typical portal system consists of these basic components: authentication client, access device, portal authentication server, portal Web server, AAA server, and security policy server.

Figure 1 Portal system

Authentication client

An authentication client is a Web browser that runs HTTP/HTTPS or a user host that runs a portal client. Security check for the user host is implemented through the interaction between the portal client and the security policy server. Only the iNode client is supported.

Access device

An access device provides access services. It has the following functions:

- Redirects all HTTP or HTTPS requests of unauthenticated users to the portal Web server.
- Interacts with the portal authentication server and the AAA server to complete authentication, authorization, and accounting.
- Allows users that pass portal authentication to access authorized network resources.

Portal server

A portal server collectively refers to a portal authentication server and portal Web server.

The portal Web server pushes the Web authentication page to authentication clients and forwards user authentication information (username and password) to the portal authentication server. The portal authentication server receives authentication requests from authentication clients and interacts with the access device to authenticate users. The portal Web server is typically integrated with the portal authentication server and it can also be an independent server.

AAA server

The AAA server interacts with the access device to implement authentication, authorization, accounting for portal users. In a portal system, a RADIUS server can perform authentication, authorization, accounting for portal users, and an LDAP server can perform authentication for portal users.

Security policy server

The security policy server interacts with the portal client and the access device for security check and authorization for users. Only hosts that run portal clients can interact with the security policy server.

Portal authentication using a remote portal server

The components of a portal system interact as follows:

1. An unauthenticated user initiates authentication by accessing an Internet website through a Web browser. When receiving the HTTP or HTTPS request, the access device redirects it to the

Web authentication page provided by the portal Web server. The user can also visit the authentication website to log in. The user must log in through the iNode client for extended portal functions.

2. The user enters the authentication information on the authentication page/dialog box and submits the information. The portal Web server forwards the information to the portal authentication server. The portal authentication server processes the information and forwards it to the access device.
3. The access device interacts with the AAA server to implement authentication, authorization, accounting for the user.
4. If security policies are not imposed on the user, the access device allows the authenticated user to access networks.

   If security policies are imposed on the user, the portal client, the access device, and the security policy server interact to check the user host. If the user passes the security check, the security policy server authorizes the user to access resources based on the check result.

Local portal service

System components

As shown in Figure 2, a local portal system consists of an authentication client, access device, and AAA server. The access device acts as both the portal Web server and the portal authentication server to provide the local portal Web service for the authentication client. The authentication client can only be a Web browser, and it cannot be a user host that runs a portal client. Therefore, extended portal functions are not supported and no security policy server is required.

Figure 2 System components

Portal page customization

The portal system pushes different authentication pages to portal users at different stages. The local portal service supports portal page customization. You can customize one or more sets of authentication pages, compress each set of authentication pages to a .zip file, and upload the compressed files to the storage medium of the device.

For more information about authentication page customization, see "Customizing authentication pages."

Portal authentication modes

Portal authentication has three modes: direct authentication, re-DHCP authentication, and cross-subnet authentication. In direct authentication and re-DHCP authentication, no Layer 3 forwarding devices exist between the authentication client and the access device. In cross-subnet authentication, Layer 3 forwarding devices can exist between the authentication client and the access device.

Direct authentication

A user manually configures a public IP address or obtains a public IP address through DHCP. Before authentication, the user can access only the portal Web server and predefined authentication-free websites. After passing authentication, the user can access other network resources. The process of direct authentication is simpler than that of re-DHCP authentication.

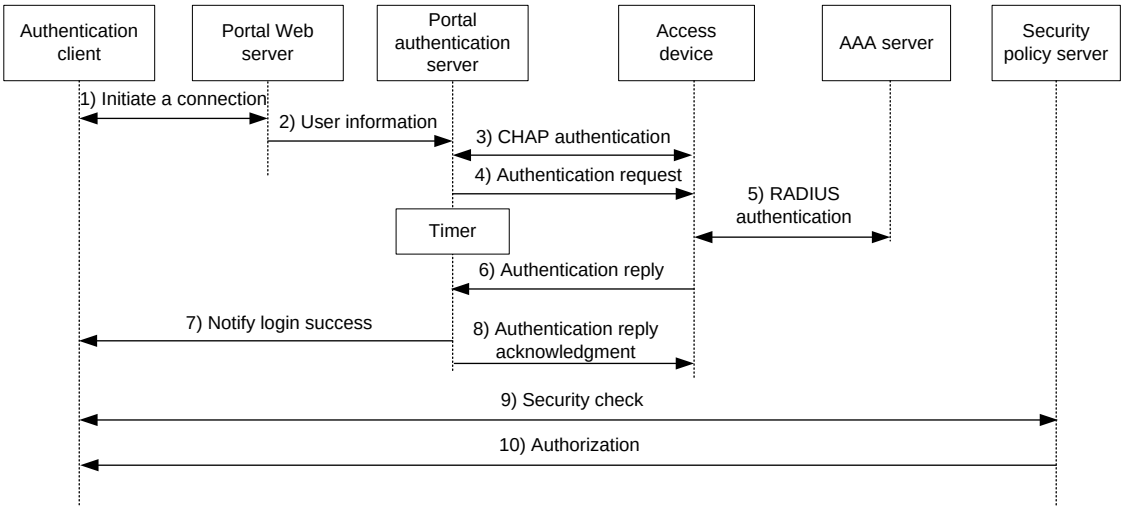
Re-DHCP authentication

Before a user passes authentication, DHCP allocates an IP address (a private IP address) to the user. The user can access only the portal Web server and predefined authentication-free websites. After the user passes authentication, DHCP reallocates an IP address (a public IP address) to the user. The user then can access other network resources. No public IP address is allocated to users who fail authentication. Re-DHCP authentication saves public IP addresses. For example, an ISP can allocate public IP addresses to broadband users only when they access networks beyond the residential community network.

Only the iNode client supports re-DHCP authentication. IPv6 portal authentication does not support the re-DHCP authentication mode.

Cross-subnet authentication

Cross-subnet authentication is similar to direct authentication, except it allows Layer 3 forwarding devices to exist between the authentication client and the access device.



In direct authentication, re-DHCP authentication, and cross-subnet authentication, a user's IP address uniquely identifies the user. After a user passes authentication, the access device generates an ACL for the user based on the user's IP address to control forwarding of the packets from the user. Because no Layer 3 forwarding device exists between authentication clients and the access device in direct authentication and re-DHCP authentication, the access device can learn the user MAC addresses. The access device can enhance its capability of controlling packet forwarding by using the learned MAC addresses.

Portal authentication process

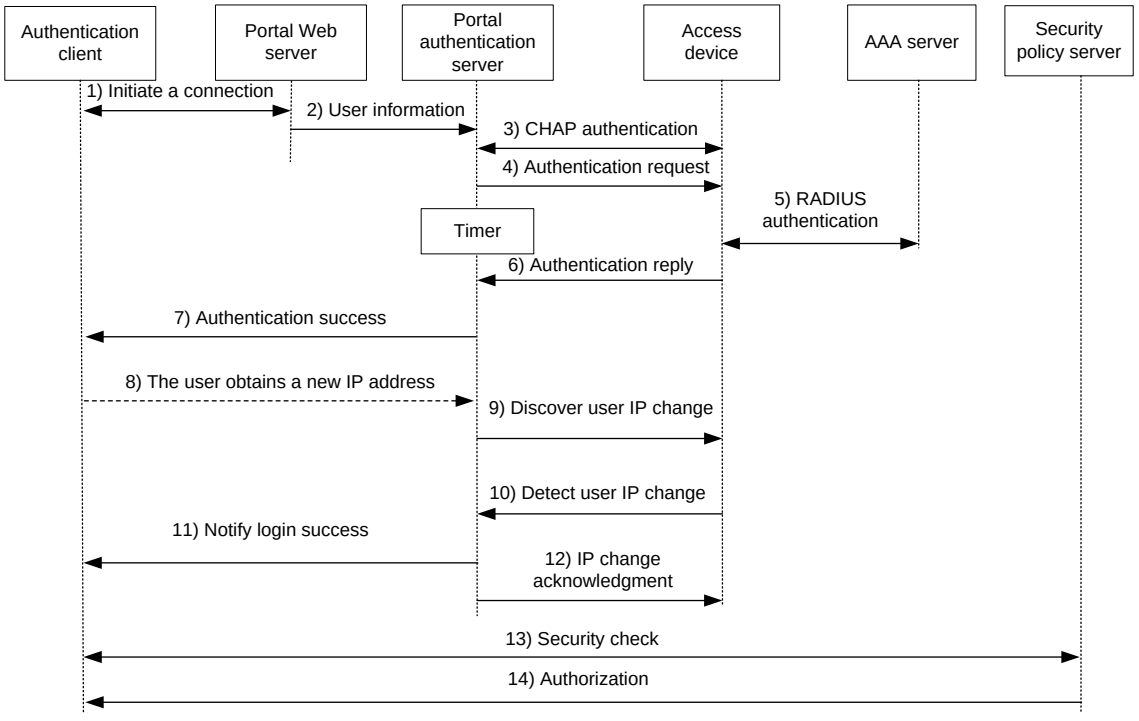
Direct authentication and cross-subnet authentication share the same authentication process. Re-DHCP authentication has a different process as it has two address allocation procedures.

Direct authentication/cross-subnet authentication process (with CHAP/PAP authentication)

Figure 3 Direct authentication/cross-subnet authentication process

The direct/cross-subnet authentication process is as follows:

2. A portal user access the Internet through HTTP or HTTPS, and the HTTP or HTTPS packet arrives at the access device.



- If the packet matches a portal free rule, the access device allows the packet to pass.
- If the packet does not match any portal-free rule, the access device redirects the packet to the portal Web server. The portal Web server pushes the Web authentication page to the user for him to enter his username and password.

3. The portal Web server submits the user authentication information to the portal authentication server.
4. The portal authentication server and the access device exchange CHAP messages. This step is skipped for PAP authentication. The portal authentication server decides the method (CHAP or PAP) to use.
5. The portal authentication server adds the username and password into an authentication request packet and sends it to the access device. Meanwhile, the portal authentication server starts a timer to wait for an authentication reply packet.
6. The access device and the RADIUS server exchange RADIUS packets.
7. The access device sends an authentication reply packet to the portal authentication server to notify authentication success or failure.
8. The portal authentication server sends an authentication success or failure packet to the client.
9. If the authentication is successful, the portal authentication server sends an authentication reply acknowledgment packet to the access device.

   If the client is an iNode client, the authentication process includes step 9 and step 10 for extended portal functions. Otherwise the authentication process is complete.
10. The client and the security policy server exchange security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
11. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.

Re-DHCP authentication process (with CHAP/PAP authentication)

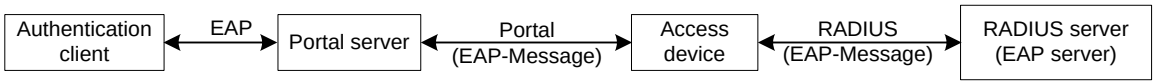
Figure 4 Re-DHCP authentication process

The re-DHCP authentication process is as follows:

Step 1 through step 7 are the same as those in the direct authentication/cross-subnet authentication process.

2. A portal user access the Internet through HTTP or HTTPS, and the HTTP or HTTPS packet arrives at the access device.
    - If the packet matches a portal free rule, the access device allows the packet to pass.
    - If the packet does not match any portal-free rule, the access device redirects the packet to the portal Web server. The portal Web server pushes the Web authentication page to the user for him to enter his username and password.
3. The portal Web server submits the user authentication information to the portal authentication server.
4. The portal authentication server and the access device exchange CHAP messages. This step is skipped for PAP authentication. The portal authentication server decides the method (CHAP or PAP) to use.
5. The portal authentication server adds the username and password into an authentication request packet and sends it to the access device. Meanwhile, the portal authentication server starts a timer to wait for an authentication reply packet.
6. The access device and the RADIUS server exchange RADIUS packets.
7. The access device sends an authentication reply packet to the portal authentication server to notify authentication success or failure.
8. The portal authentication server sends an authentication success or failure packet to the client.
9. After receiving the authentication success packet, the client obtains a public IP address through DHCP. The client then notifies the portal authentication server that it has a public IP address.
10. The portal authentication server notifies the access device that the client has obtained a public IP address.
11. The access device detects the IP change of the client through DHCP and then notifies the portal authentication server that it has detected an IP change of the client IP.
12. After receiving the IP change notification packets sent by the client and the access device, the portal authentication server notifies the client of login success.
13. The portal authentication server sends an IP change acknowledgment packet to the access device.
14. The client and the security policy server exchanges security check information. The security policy server detects whether or not the user host installs anti-virus software, virus definition files, unauthorized software, and operating system patches.
15. The security policy server authorizes the user to access certain network resources based on the check result. The access device saves the authorization information and uses it to control access of the user.

Step 13 and step 14 are for extended portal functions.



Portal support for EAP

To use portal authentication that supports EAP, the portal authentication server and client must be the IMC portal server and the iNode portal client. Local portal authentication does not support EAP authentication.

Compared with username and password based authentication, digital certificate-based authentication ensures higher security.

The Extensible Authentication Protocol (EAP) supports several digital certificate-based authentication methods, for example, EAP-TLS. Working together with EAP, portal authentication can implement digital certificate-based user authentication.

Figure 5 Portal support for EAP working flow diagram

As shown in Figure 5, the authentication client and the portal authentication server exchange EAP authentication packets. The portal authentication server and the access device exchange portal authentication packets that carry the EAP-Message attributes. The access device and the RADIUS server exchange RADIUS packets that carry the EAP-Message attributes. The RADIUS server that supports the EAP server function processes the EAP packets encapsulated in the EAP-Message attributes, and provides the EAP authentication result.

The access device does not process but only transports EAP-Message attributes between the portal authentication server and the RADIUS server. Therefore, the access device requires no additional configuration to support EAP authentication.

Portal filtering rules

The access device uses portal filtering rules to control user traffic forwarding.

Basic rules

Based on the configuration and authentication status of portal users, the device generates the following categories of portal filtering rules:

- **Category 1**—The rule permits user packets that are destined for the portal Web server and packets that match the portal-free rules to pass through.
- **Category 2**—For an authenticated user not authorized with any ACL, the rule allows the user to access any destination network resources. For an authenticated user with an ACL authorized, the rule allows users to access resources permitted by the ACL. The device adds the rule when a user comes online and deletes the rule when the user goes offline.

  The device supports the following types of authorization ACLs:

  - Basic ACLs (ACL 2000 to ACL 2999).
  - Advanced ACLs (ACL 3000 to ACL 3999).
  - Layer 2 ACLs (ACL 4000 to ACL 4999).
  - User-defined ACLs (ACL 5000 to ACL 5999).

  For an authorization ACL to take effect, make sure the ACL exists and has ACL rules excluding rules configured with the **`counting`**, **`established`**, **`fragment`**, **`source-mac`**, **`source-ip`**, or **`logging`** keyword. For more information about ACL rules, see ACL commands in *ACL and QoS Command Reference*.
- **Category 3**—The rule redirects all HTTP or HTTPS requests from unauthenticated users to the portal Web server.
- **Category 4**—For direct authentication and cross-subnet authentication, the rule forbids any user packets to pass through. For re-DHCP authentication, the device forbids user packets with private source addresses to pass.

After receiving a user packet, the device compares the packet against the filtering rules from category 1 to category 4. Once the packet matches a rule, the matching process completes.

MAC-based quick portal authentication

MAC-based quick portal authentication is applicable to scenarios where users access the network frequently. It allows users to pass authentication without entering a username and password. MAC-based quick portal authentication is also called MAC-trigger authentication or MAC-based transparent authentication.

A MAC binding server is required for MAC-trigger authentication. The MAC binding server records the MAC-to-account bindings of portal users for authentication. The account contains the portal authentication information of the user, including username and password.

Only direct authentication supports MAC-based quick portal authentication.

The authentication is implemented as follows:

1. When a user accesses the network for the first time, the access device generates a MAC-trigger entry that records the user's MAC address and access interface. The user can access the network without performing portal authentication if the user's network traffic is below the free-traffic threshold.
2. When the user's network traffic reaches the threshold, the access device sends a MAC binding query to the MAC binding server.
3. The MAC binding server checks whether the MAC address of the user is bound with a portal user account.
   - If a matching MAC-account binding exists, the MAC binding server sends the user authentication information to the access device to initiate portal authentication. The user is authenticated without entering the username and password.
     - If the user fails portal authentication, an authentication failure message is returned to the user. The MAC-trigger entry of the user on the access device is deleted when the entry ages out.
     - If the user passes portal authentication, the access device deletes the MAC-trigger entry of the user.
   - If no matching MAC-account binding exists, the MAC binding server notifies the access device to perform normal portal authentication for the user.
     - If the user fails portal authentication, an authentication failure message is returned to the user. The whole process is finished.
     - If the user passes portal authentication, the access device sends the user's MAC address and authentication information to the MAC binding server for MAC-account binding. Additionally, the access device deletes the MAC-trigger entry of the user.

NOTE:

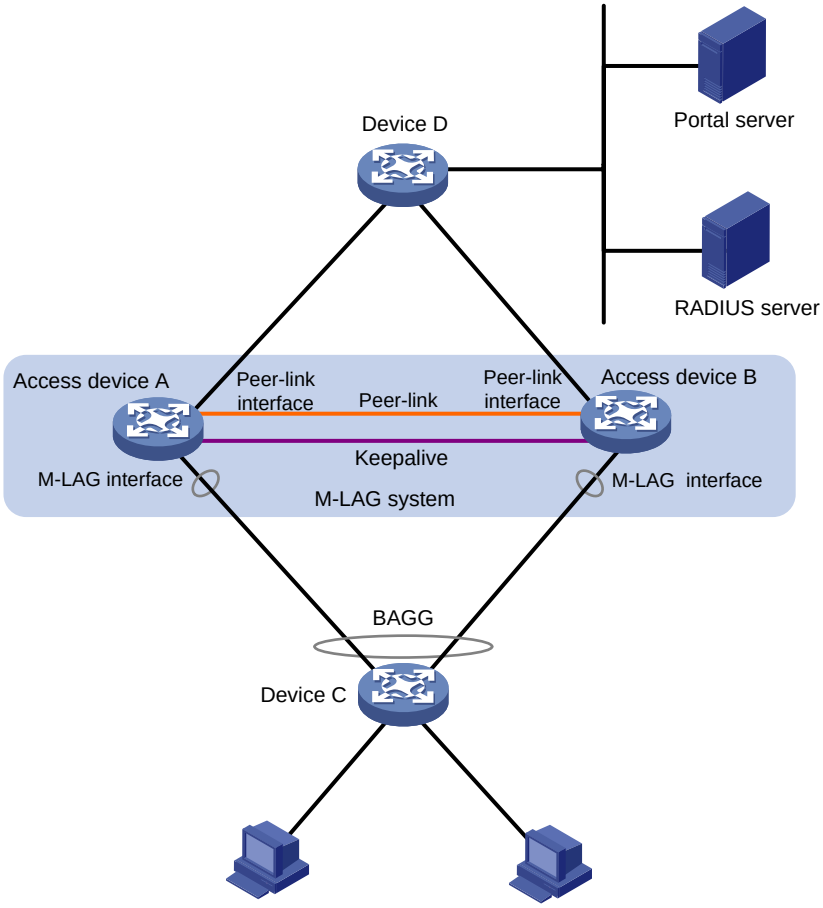
For information about MAC binding server configuration, see the user manual of the server.

IP-based quick portal authentication

IP-based quick portal authentication is applicable to scenarios where users access the network frequently. It allows users to pass authentication without entering a username and password. IP-based quick portal authentication is also called IP-trigger authentication or IP-based transparent authentication.

After IP-based quick portal authentication is enabled, the device adds an IP-trigger entry for a user on receiving user traffic that matches the IP-trigger ACL. The IP-trigger entry records the user's IP address, access interface, VLAN ID, and the entry aging time. The device sends the user's authentication credentials (using the user IP address as both the username and password) to the RADIUS server for authentication. In this way, the device provides portal authentication transparently to the user.

Only direct authentication and cross-subnet authentication support IP-based quick portal authentication.



Portal support for M-LAG

Portal authentication supports M-LAG to improve high availability of the access device.

As shown in Figure 6, Device A and Device B form an M-LAG system. The M-LAG system acts as an access device to provide redundancy and load sharing. For more information about M-LAG, see *Layer 2—LAN Switching Configuration Guide*.

In an M-LAG system, after portal users pass authentication on an M-LAG member device, the M-LAG member device will synchronize data of the users to the peer member device for backup. When the M-LAG member device fails, the peer member device can use the backup user data to process services for the portal users. This ensures user service continuity.

Figure 6 Support of portal for M-LAG

Restrictions and guidelines: Portal configuration

In portal authentication, the device can redirect users' HTTPS requests to the portal Web server. You can use one of the following local certificates for the HTTPS redirect service according to the security requirements and the configuration complexity:

- **Self-signed certificate**—Using this type of certificate is simple in configuration but has low security. You do not need to associate an SSL server policy with the HTTPS redirect service and the default SSL parameters are used. However, a self-signed certificate is not trusted by the browser. When the device redirects HTTPS requests to the portal Web server, a certificate security warning prompt might appear on the browser. If you accept the security risks stated in the prompt, you can ignore the prompt to browse the page.
- **CA-signed certificate**—Using this type of certificate is complex in configuration but has high security. You must obtain a CA certificate, request a local certificate from the CA, create an SSL server policy (with policy name of **https_redirect**), and associate the SSL server policy with the HTTPS redirect service.

For more information about digital certificates, see "Configuring PKI". For more information about the SSL server policy configuration, see "Configuring SSL".

Portal authentication through Web does not support security check for users. To implement security check, the client must be the iNode client.

Portal authentication supports NAT traversal whether it is initiated by a Web client or an iNode client. NAT traversal must be configured when the portal client is on a private network and the portal server is on a public network.

If the portal clients and the portal server belong to different VPNs, the Rule ARP entry feature will cause the portal clients to go offline abnormally. To avoid this issue, execute the **`undo portal refresh arp enable`** command to disable the Rule ARP entry feature for portal clients.

The S5200-EI-G switch series does not support M-LAG-related features and parameters.

Portal authentication tasks at a glance

To configure portal authentication, perform the following tasks:

1. Configuring a remote portal service

   Perform this task if the access device does not act as a portal authentication server or portal Web server.

   - Configuring a remote portal authentication server
   - Configuring a portal Web server
2. Configuring a local portal service

   Perform this task if the access device acts as a portal authentication server and portal Web server.

   - Configuring local portal service features
   - Configuring a portal Web server
3. Enabling portal authentication and specifying a portal Web server
   - Enabling portal authentication on an interface
   - Specifying a portal Web server on an interface
   - Enabling portal to support IPv4/IPv6 dual stack

     Perform this task if dual-stack portal users exist on the network.
4. (Optional.) Configure parameters for preauthentication portal users
   - Configuring a portal preauthentication domain
   - Specifying a preauthentication IP address pool
5. (Optional.) Specifying a portal authentication domain
6. (Optional.) Controlling portal user access
   - Configuring a portal-free rule
   - Configuring an authentication source subnet
   - Configuring an authentication destination subnet
   - Configuring support of Web proxy for portal authentication
   - Checking the issuing of category-2 portal filtering rules
   - Setting the maximum number of portal users
   - Enabling strict-checking on portal authorization information
   - Allowing only users with DHCP-assigned IP addresses to pass portal authentication
   - Enabling portal roaming
   - Configuring the portal fail-permit feature

7. (Optional.) Configuring portal detection features
   - Configuring online detection of portal users
   - Configuring portal authentication server detection
   - Configuring portal Web server detection
   - Configuring portal user synchronization
8. (Optional.) Configuring attributes for portal packets and RADIUS packets
   - Configuring portal packet attributes

     You can configure the BAS-IP or BAS-IPv6 attribute for portal packets and specify the device ID.
   - Configuring attributes for RADIUS packets

     You can configure the NAS-Port-Id and NAS-Port-Type attributes and apply a NAS-ID profile to an interface.
9. (Optional.) Configuring MAC-based quick portal authentication
   a. Configuring a MAC binding server
   b. Specifying a MAC binding server on an interface
   c. Configuring cloud MAC-trigger authentication
10. (Optional.) Configuring IP-based quick portal authentication
11. (Optional.) Configuring portal authentication to support M-LAG
12. (Optional.) Configuring online and offline related features for portal users
    - Logging out online portal users
    - Enabling portal user login/logout logging
13. (Optional.) Configuring extended portal authentication features
    - Disabling the Rule ARP or ND entry feature for portal clients
    - Configuring Web redirect
14. Obtaining user access information from ARP or ND entries

    This task is required in a remote Web authentication network.

Prerequisites for portal authentication

The portal feature provides a solution for user identity authentication and security check. To complete user identity authentication, portal must cooperate with RADIUS.

Before you configure portal, you must complete the following tasks:

- The portal authentication server, portal Web server, and RADIUS server have been installed and configured correctly.
- To use the re-DHCP portal authentication mode, make sure the DHCP relay agent is enabled on the access device, and the DHCP server is installed and configured correctly.
- The portal client, access device, and servers can reach each other.
- To use the remote RADIUS server, configure usernames and passwords on the RADIUS server, and configure the RADIUS client on the access device. For information about RADIUS client configuration, see "Configuring AAA."
- To implement extended portal functions, install and configure IMC EAD. Make sure the ACLs configured on the access device correspond to the isolation ACL and the security ACL on the security policy server. For installation and configuration about the security policy server, see *IMC EAD Security Policy Help*.

Configuring a remote portal authentication server

About this task

With portal authentication enabled, the device searches for a portal authentication server for a received portal request packet according to the source IP address and VPN information of the packet.

- If a matching portal authentication server is found, the device regards the packet valid and sends an authentication response packet to the portal authentication server. After a user logs in to the device, the user interacts with the portal authentication server as needed.
- If no matching portal authentication server is found, the device drops the packet.

Restrictions and guidelines

Do not delete a portal authentication server in use. Otherwise, users authenticated by that server cannot log out correctly.

Procedure

1. Enter system view.

   system-view

2. Create a portal authentication server and enter its view.

   portal server *server-name*

   You can create multiple portal authentication servers.

3. Specify the IP address of the portal authentication server.

   IPv4:

   ip *ipv4-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

   IPv6:

   ipv6 *ipv6-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

4. (Optional.) Set the destination UDP port number used by the device to send unsolicited portal packets to the portal authentication server.

   port *port-number*

   By default, the UDP port number is 50100.

   This port number must be the same as the listening port number specified on the portal authentication server.

5. (Optional.) Specify the portal authentication server type.

   server-type { **cmcc** | **imc** }

   By default, the portal authentication server type is IMC.

   The specified server type must be the same as the type of the portal authentication server actually used.

6. (Optional.) Configure the device to periodically register with the portal authentication server.

   server-register [**interval** *interval-value*]

   By default, the device does not register with a portal authentication server.

Configuring a portal Web server

Portal Web server tasks at a glance

To configure a portal Web server, perform the following tasks:

1. Configure basic parameters for a portal Web server
2. (Optional.) Enabling the captive-bypass feature
3. (Optional.) Configuring a match rule for URL redirection
4. (Optional.) Configuring unescaped special characters for portal Web server URLs redirected to users

Configure basic parameters for a portal Web server

1. Enter system view.
   system-view
2. Create a portal Web server and enter its view.
   portal web-server *server-name*
   You can create multiple portal Web servers.
3. Specify the VPN instance to which the portal Web server belongs.
   vpn-instance *vpn-instance-name*
   By default, the portal Web server belongs to the public network.
4. Specify the URL of the portal Web server.
   url *url-string*
   By default, no URL is specified for a portal Web server.
5. Configure the parameters to be carried in the URL when the device redirects it to users.
   url-parameter *param-name* { **original-url** | **source-address** | **source-mac** [**format section** { **1** | **3** | **6** } { **lowercase** | **uppercase** }] [**encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **value** *expression* }
   By default, no redirection URL parameters are configured.
6. (Optional.) Specify the portal Web server type.
   server-type { **cmcc** | **imc** | **ise** | **oauth** }
   By default, the portal Web server type is IMC.
   This configuration is applicable to only to the remote portal service.
   The specified server type must be the same as the type of the portal Web server actually used.

Enabling the captive-bypass feature

About this task

Typically, when iOS mobile devices or some Android mobile devices are connected a portal-enabled network, the device pushes the authentication page to the mobile devices.

The captive-bypass feature enables the device to push the portal authentication page to the iOS and Android devices only when the users access the Internet by using a browser. If the users do not perform authentication but press the home button to return to the desktop, the Wi-Fi connection is terminated. To maintain the Wi-Fi connection in such cases, you can enable the optimized captive-bypass feature.

When optimized captive-bypass is enabled, the portal authentication page is automatically pushed to iOS mobile devices after they connects to the network. Users can perform authentication on the page or press the home button to return to the desktop without performing authentication, and the Wi-Fi connection is not terminated.

When an iOS client is connected to a network, it automatically sends a server reachability detection packet to determine whether the Apple server is reachable. If the server is reachable, the Wi-Fi connection displays connected. If the server is not reachable, the Wi-Fi connection is terminated.

When the network condition is poor, the device cannot detect a server reachability detection packet from an iOS mobile client within the captive-bypass detection timeout time. The client cannot receive a response for the server reachability detection packet, and therefore it determines the server to be unreachable and terminates the Wi-Fi connection. To avoid Wi-Fi disconnections caused by server reachability detection failure, set a longer captive-bypass detection timeout time when the network condition is poor.

Procedure

1. Enter system view.

   system-view
2. Enter portal Web server view.

   portal web-server *server-name*
3. Enable the captive-pass feature.

   captive-bypass [**android** | **ios** [**optimize**]] **enable**

   By default, the captive-bypass feature is disabled. The device automatically pushes the portal authentication page to iOS mobile devices and some Android mobile devices when they are connected to a portal-enabled network.
4. (Optional.) Set the captive-bypass detection timeout time.
   a. Return to system view.

      quit
   b. Set the captive-bypass detection timeout time.

      portal captive-bypass optimize delay *seconds*

      By default, the captive-bypass detection timeout is 6 seconds.

Configuring a match rule for URL redirection

About this task

A URL redirection match rule matches HTTP or HTTPS requests by user-requested URL or User-Agent information, and redirects the matching requests to the specified redirection URL. Therefore, URL redirection match rules allow for more flexible URL redirection than the **url** command. The **url** command is only used to redirect HTTP or HTTPS requests from unauthenticated users to the portal Web server for authentication.

Restrictions and guidelines

For a user to successfully access a redirection URL, configure a portal-free rule to allow HTTP or HTTPS requests destined for the redirection URL to pass. For information about configuring portal-free rules, see the **portal free-rule** command.

If both the **url** and **if-match** commands are executed, the **if-match** command takes priority to perform URL redirection.

Procedure

1. Enter system view.

   system-view

2. Enter portal Web server view.

   portal web-server *server-name*

3. Configure a match rule for URL redirection.

   if-match { **original-url** *url-string* **redirect-url** *url-string* [**url-param-encryption** { **aes** | **des** } **key** { **cipher** | **simple** } *string*] | **user-agent** *string* **redirect-url** *url-string* }

Configuring unescaped special characters for portal Web server URLs redirected to users

About this task

By default, the device escapes all special characters in the portal Web server URL redirected to users. This practice converts special characters to a secure form to prevent the clients from misinterpreting them as syntax symbols or instructions.

However, a portal Web server might be unable to recognize the escape characters for certain special characters in URLs. In this case, you must configure the device to not escape these special characters so the portal Web server can correctly deliver the Web authentication page to users.

Prerequisites

Before you specify unescaped special characters, identify the escape characters that the portal Web server cannot recognize.

Procedure

1. Enter system view.

   system-view

2. Specify unescaped special characters for portal Web server URLs redirected to users.

   portal url-unescape-chars *character-string*

   By default, the device escapes all special characters in portal Web server URLs redirected to users.

Configuring local portal service features

About the local portal service

After a local portal service is configured, the device acts as the portal Web server and portal authentication server to perform portal authentication on users. The portal authentication page file is saved in the root directory of the device.

Restrictions and guidelines for configuring local portal service features

For an interface to use the local portal service, the URL of the portal Web server specified for the interface must meet the following requirements:

- The IP address in the URL must be the IP address of a Layer 3 interface (except 127.0.0.1) on the device, and the IP address must be reachable to portal clients.
- The URL must be ended with **/portal/**. For example: **https://1.1.1.1/portal/**.

The device provides a default authentication page file. To use customized authentication pages, you must edit the authentication pages, compress them to a file, and then upload the file to the device. On the device, specify the file as the default authentication page file.

Customizing authentication pages

About this task

Authentication pages are HTML files. Local portal authentication requires the following authentication pages:

- Logon page
- Logon success page
- Logon failure page
- Online page
- System busy page
- Logoff success page

You must customize the authentication pages, including the page elements that the authentication pages will use, for example, **back.jpg** for authentication page **Logon.htm**.

Follow the authentication page customization rules when you edit the authentication page files.

File name rules

The names of the main authentication page files are fixed (see Table 1). You can define the names of the files other than the main authentication page files. File names and directory names are case insensitive.

Table 1 Main authentication page file names

Main authentication page	File name
Logon page	logon.htm
Logon success page	logonSuccess.htm
Logon failure page	logonFail.htm
Online page Pushed after the user gets online for online notification	online.htm
System busy page Pushed when the system is busy or the user is in the logon process	busy.htm
Logoff success page	logoffSuccess.htm

Page request rules

The local portal Web server supports only Get and Post requests.

- **Get requests**—Used to get the static files in the authentication pages and allow no recursion. For example, if file **Logon.htm** includes contents that perform Get action on file **ca.htm**, file **ca.htm** cannot include any reference to file **Logon.htm**.
- **Post requests**—Used when users submit username and password pairs, log in, and log out.

Post request attribute rules

1. Observe the following requirements when editing a form of an authentication page:
   - An authentication page can have multiple forms, but there must be one and only one form whose action is **logon.cgi**. Otherwise, user information cannot be sent to the access device.

- The username attribute is fixed as **PtUser**. The password attribute is fixed as **PtPwd**.
- The value of the **PtButton** attribute is either **Logon** or **Logoff**, which indicates the action that the user requests.
- A logon Post request must contain **PtUser**, **PtPwd**, and **PtButton** attributes.
- A logoff Post request must contain the **PtButton** attribute.

2. Authentication pages **logon.htm** and **logonFail.htm** must contain the logon Post request.

   The following example shows part of the script in page **logon.htm**.

```
<form action=logon.cgi method = post >
<p>User name:<input type="text" name = "PtUser" style="width:160px;height:22px"
maxlength=64>
<p>Password :<input type="password" name = "PtPwd" style="width:160px;height:22px"
maxlength=32>
<p><input type=SUBMIT value="Logon" name = "PtButton" style="width:60px;"
onclick="form.action=form.action+location.search;">
</form>
```

3. Authentication pages **logonSuccess.htm** and **online.htm** must contain the logoff Post request.

   The following example shows part of the script in page **online.htm**.

```
<form action=logon.cgi method = post >
<p><input type=SUBMIT value="Logoff" name="PtButton" style="width:60px;">
</form>
```

Page file compression and saving rules

You must compress the authentication pages and their page elements into a standard zip file.

- The name of a zip file can contain only letters, numbers, and underscores.
- The authentication pages must be placed in the root directory of the zip file.
- Zip files can be transferred to the device through FTP or TFTP and must be saved in the root directory of the device.

  Examples of zip files on the device:

```
<Sysname> dir
Directory of flash:
   1     -rw-      1405  Feb 28 2008 15:53:20   ssid1.zip
   0     -rw-      1405  Feb 28 2008 15:53:31   ssid2.zip
   2     -rw-      1405  Feb 28 2008 15:53:39   ssid3.zip
   3     -rw-      1405  Feb 28 2008 15:53:44   ssid4.zip
2540 KB total (1319 KB free)
```

Redirecting authenticated users to a specific webpage

To make the device automatically redirect authenticated users to a specific webpage, do the following in logon.htm and logonSuccess.htm:

1. In logon.htm, set the target attribute of Form to **_blank**.

   See the contents in gray:

```
<form method=post action=logon.cgi target="_blank">
```

2. Add the function for page loading pt_init() to LogonSuccess.htm.

   See the contents in gray:

```
<html>
<head>
<title>LogonSuccess</title>
```

```
    <script type="text/javascript" language="javascript"
src="pt_private.js"></script>
    </head>
    <body onload="pt_init();" onbeforeunload="return pt_unload();">
    ... ...
    </body>
</html>
```

Configuring a local portal Web service

Prerequisites

Before you configure an HTTPS-based local portal Web service, you must complete the following tasks:

- Configure a PKI policy, obtain the CA certificate, and request a local certificate. For more information, see "Configuring PKI."
- Configure an SSL server policy, and specify the PKI domain configured in the PKI policy.

  During SSL connection establishment, the user browser might display a message that it cannot verify server identity by certificate. For users to perform portal authentication without checking such a message, configure an SSL server policy to request a client-trusted certificate on the device. The name of the policy must be **https_redirect**. For more information about SSL server policy configuration, see "Configuring SSL."

Procedure

1. Enter system view.

   system-view
2. Enable HTTP- or HTTPS-based local portal Web service and enter its view.

   portal local-web-server { **http** | **https ssl-server-policy** *policy-name* [**tcp-port** *port-number*] }
3. Specify the default authentication page file for the local portal Web service.

   default-logon-page *filename*

   By default, the default authentication page file for a local portal Web service is file **defaultfile.zip**.
4. (Optional.) Configure the HTTP or HTTPS listening TCP port for the local portal Web service.

   tcp-port *port-number*

   By default, the HTTP service listening port number is 80 and the HTTPS service listening port number is the TCP port number set by the **portal local-web-server** command.
5. (Optional.) Bind the endpoint name to an authentication page file.

   logon-page bind device-name *device-name* **file** *file-name*

   By default, no endpoint name is bound to an authentication page file.

Enabling portal authentication on an interface

Restrictions and guidelines

When you enable portal authentication on an interface, follow these restrictions and guidelines:

- Cross-subnet authentication mode (**layer3**) does not require Layer 3 forwarding devices between the access device and the portal authentication clients. However, if a Layer 3 forwarding device exists between the authentication client and the access device, you must use the cross-subnet portal authentication mode.

- You can enable both IPv4 portal authentication and IPv6 portal authentication on an interface.

When you configure re-DHCP portal authentication on an interface, follow these restrictions and guidelines:

- Make sure the interface has a valid IP address before you enable re-DHCP portal authentication on the interface.
- With re-DHCP portal authentication, configure authorized ARP on the interface as a best practice to make sure only valid users can access the network. With authorized ARP configured on the interface, the interface learns ARP entries only from the users who have obtained a public address from DHCP.
- For successful re-DHCP portal authentication, make sure the BAS-IP or BAS-IPv6 attribute value is the same as the device IP address specified on the portal authentication server. To configure the attribute, use the **portal** { **bas-ip** | **bas-ipv6** } command.
- An IPv6 portal server does not support re-DHCP portal authentication.

Portal authentication supports both HTTP redirect and HTTPS redirect. The default HTTPS redirect listening port number on the device is 6654. To change the HTTPS redirect listening port number, see HTTP redirect configuration in *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Enable portal authentication.

   IPv4:

   portal enable method { **direct** [**shared**] | **layer3** | **redhcp** [**shared**] }

   IPv6:

   portal ipv6 enable method { **direct** [**shared**] | **layer3** }

   By default, portal authentication on an interface is disabled.

Specifying a portal Web server on an interface

About this task

With a portal Web server specified on an interface, the device redirects the HTTP requests of portal users on the interface to the portal Web server.

You can specify both an IPv4 portal Web server and an IPv6 portal Web server on an interface.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify a portal Web server on the interface.

   portal [**ipv6**] **apply web-server** *server-name* [**fail-permit** | **secondary**]

   By default, no portal Web servers are specified on an interface.

Enabling portal to support IPv4/IPv6 dual stack

About this task

When portal is enabled to support IPv4/IPv6 dual stack, dual-stack portal users can access both IPv4 and IPv6 networks after passing one type (IPv4 or IPv6) of portal authentication.

The following describes the mechanism of how portal supports IPv4/IPv6 dual stack:

1. A portal user passes portal authentication of one IP stack (the first stack, IPv4 or IPv6). The user can access network resources of this IP stack.
2. The device records the user's MAC address and IP address in the portal user entry for the user.
3. Upon receiving a packet of the other IP stack (the second stack, IPv6 or IPv4) from the user, the device compares the source MAC address with that in the portal user entry for the user.
   - If the MAC addresses are the same, the device allows the user to access network resources of the second stack without reauthentication.
   - If the MAC addresses are different, the user needs to perform portal authentication of the second stack.

Restrictions and guidelines

This configuration takes effect on an interface only when both direct IPv4 portal authentication and direct IPv6 portal authentication are enabled on the interface.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Enable portal to support IPv4/IPv6 dual stack.

   portal dual-stack enable

   By default, portal support for IPv4/IPv6 dual stack is disabled. Dual-stack portal users can access only one type (IPv4 or IPv6) of network after passing that type of portal authentication.

Configuring a portal preauthentication domain

About this task

A portal preauthentication domain defines user attributes assigned to preauthentication portal users on a portal-enabled interface after the users obtain IP addresses. Before the preauthentication users pass portal authentication, they have limited access to the network based on the assigned user attributes (such as ACL). After the users pass portal authentication, they are assigned new attributes by the AAA server. After the users go offline, they are re-assigned user attributes in the preauthentication domain.

Restrictions and guidelines

The portal preauthentication domain takes effect only on portal users with IP addresses obtained through DHCP or DHCPv6.

The portal preauthentication domain does not take effect on interfaces enabled with cross-subnet portal authentication.

Make sure you specify an existing ISP domain as a portal preauthentication domain. If the specified ISP domain does not exist, the device might operate incorrectly.

You must delete a preauthentication domain (by using the **undo portal** [**ipv6**] **pre-auth domain** command) and reconfigure it in the following situations:

- You create the ISP domain after specifying it as the preauthentication domain.
- You delete the specified ISP domain and then re-create it.

For the authorization ACL in the preauthentication domain, the following rules apply:

- If the traffic of preauthentication users matches a rule in the ACL, the device processes the traffic based on the permit or deny statement of the rule.
- If the ACL does not exist or the permitted destination address of a rule in the ACL is set to **any**, the device does not control user access. Users can access any network resources without passing portal authentication.
- If the ACL does not have any rules, all user accesses are restricted. The device allows users to access network resources only after they pass authentication.
- If the traffic of preauthentication users does not match any rule in the ACL, the device pushes the authentication page to the users. The users can access the network resources after passing authentication.
- If the ACL contains rules that specify a source address, users might not be able to get online. Do not specify a source IPv4, IPv6 or MAC address when you configure a rule in the ACL.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Specify a portal preauthentication domain.

   portal [**ipv6**] **pre-auth domain** *domain-name*

Specifying a preauthentication IP address pool

About this task

You must specify a preauthentication IP address pool on a portal-enabled interface in the following situation:

- Portal users access the network through a subinterface of the portal-enabled interface.
- The subinterface does not have an IP address.
- Portal users need to obtain IP addresses through DHCP.

After a user connects to a portal-enabled interface, the user uses an IP address for portal authentication according to the following rules:

- If the interface is configured with a preauthentication IP address pool, the user uses the following IP address:
  - If the client is configured to obtain an IP address automatically through DHCP, the user obtains an address from the specified IP address pool.
  - If the client is configured with a static IP address, the user uses the static IP address.
- If the interface has an IP address but no preauthentication IP pool specified, the user uses the static IP address or the IP address obtained from a DHCP server.
- If the interface has no IP address or preauthentication IP pool specified, the user cannot perform portal authentication.

After the user passes portal authentication, the AAA server authorizes an IP address pool for re-assigning an IP address to the user. If no authorized IP address pool is deployed, the user continues using the previous IP address.

Restrictions and guidelines

This configuration takes effect only when the direct IPv4 portal authentication is enabled on the interface.

Make sure the specified IP address pool exists and is complete. Otherwise, the user cannot obtain the IP address and cannot perform portal authentication.

If the portal user does not perform authentication or fails to pass authentication, the assigned IP address is still retained.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Specify a preauthentication IP address pool on the interface.
   portal [**ipv6**] **pre-auth ip-pool** *pool-name*
   By default, no preauthentication IP address pool is specified on an interface.

Specifying a portal authentication domain

About portal authentication domains

An authentication domain defines a set of authentication, authorization, and accounting policies. Each portal user belongs to an authentication domain and is authenticated, authorized, and accounted in the domain.

With an authentication domain specified on an interface, the device uses the authentication domain for AAA of portal users. This allows for flexible portal access control.

Restrictions and guidelines for specifying a portal authentication domain

The device selects the authentication domain for a portal user in this order:

1. ISP domain specified for the interface.
2. ISP domain carried in the username.
3. System default ISP domain.

If the chosen domain does not exist on the device, the device searches for the ISP domain configured to accommodate users assigned to nonexistent domains. If no such ISP domain is configured, user authentication fails. For information about ISP domains, see "Configuring AAA."

For the authorization ACL in the authentication domain, the following rules apply:

- If the user traffic matches a rule in the ACL, the device processes the traffic based on the permit or deny statement of the rule.
- If the user traffic does not match any rule in the ACL, the device permits the traffic. To deny such traffic, configure the last rule in the ACL to deny all packets by using the **rule deny ip** command.
- If the ACL contains rules that specify a source address, users might not be able to get online. Do not specify a source IPv4, IPv6, or MAC address when you configure a rule in the ACL.

Specifying a portal authentication domain on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Specify an portal authentication domain on the interface.

   portal [**ipv6**] **domain** *domain-name*

   By default, no portal authentication domain is specified on an interface.

   You can specify both an IPv4 portal authentication domain and an IPv6 portal authentication domain on an interface.

Controlling portal user access

Configuring a portal-free rule

About this task

A portal-free rule allows specified users to access specified external websites without portal authentication.

The matching items for a portal-free rule include the host name, source/destination IP address, TCP/UDP port number, source MAC address, access interface, and VLAN. Packets matching a portal-free rule will not trigger portal authentication, so users sending the packets can directly access the specified external websites.

Restrictions and guidelines for configuring a portal-free rule

If you specify both a VLAN and an interface, the interface must belong to the VLAN. If the interface does not belong to the VLAN, the portal-free rule does not take effect.

You cannot configure two or more portal-free rules with the same filtering criteria. Otherwise, the system prompts that the rule already exists.

Regardless of whether portal authentication is enabled or not, you can only add or remove a portal-free rule. You cannot modify it.

Configuring an IP-based portal-free rule

1. Enter system view.

   system-view

2. Configure an IP-based portal-free rule.

   IPv4:

   portal free-rule *rule-number* { **destination ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ip** { *ipv4-address* { *mask-length* | *mask* } | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

   IPv6:

   portal free-rule *rule-number* { **destination ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-numbe*r | **udp** *udp-port-number*] | **source ipv6** { *ipv6-address prefix-length* | **any** } [**tcp** *tcp-port-number* | **udp** *udp-port-number*] } * [**interface** *interface-type interface-number*]

Configuring a source-based portal-free rule

1. Enter system view.

   system-view

2. Configure a source-based portal-free rule.

   portal free-rule *rule-number* **source** { **interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *

   The **vlan** *vlan-id* option takes effect only on portal users that access the network through VLAN interfaces.

Configuring a destination-based portal-free rule

1. Enter system view.

   system-view

2. Configure a destination-based portal-free rule.

   portal free-rule *rule-number* **destination** *host-name*

   Before you configure destination-based portal-free rules, make sure a DNS server is deployed on the network.

Configuring an authentication source subnet

About this task

By configuring authentication source subnets, you specify that only HTTP or HTTPS packets from users on the authentication source subnets can trigger portal authentication. HTTP or HTTPS packets from users not in authentication source subnets will be discarded if the packets do not match any portal-free rules.

Restrictions and guidelines

Authentication source subnets are used only for cross-subnet authentication.

In direct or re-DHCP portal authentication mode, a portal user and its access interface (portal-enabled) are on the same subnet. It is not necessary to specify the subnet as the authentication source subnet.

- In direct mode, the access device regards the authentication source subnet as any source IP address.
- In re-DHCP mode, the access device regards the authentication source subnet on an interface as the subnet to which the private IP address of the interface belongs.

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication source subnets. If the source subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure a portal authentication source subnet.

   IPv4:

   portal layer3 source *ipv4-network-address* { *mask-length* | *mask* }

   IPv6:

portal ipv6 layer3 source *ipv6-network-address prefix-length*.

By default, no portal authentication source subnets are configured, and users from any subnets can trigger portal authentication.

Configuring an authentication destination subnet

About this task

After authentication destination subnets are configured, the device performs portal authentication on portal users only when they access the specified subnets (excluding the destination IP addresses and subnets specified in portal-free rules). Users can access other subnets without portal authentication.

Restrictions and guidelines

If both authentication source subnets and destination subnets are configured on an interface, only the authentication destination subnets take effect.

You can configure multiple authentication destination subnets. If the destination subnets overlap, the subnet with the largest address scope (with the smallest mask or prefix) takes effect.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure a portal authentication destination subnet.

   IPv4:

   portal free-all except destination *ipv4-network-address* { *mask-length* | *mask* }

   IPv6:

   portal ipv6 free-all except destination *ipv6-network-address prefix-length*

   By default, no authentication destination subnets are configured, and users accessing any subnets must pass portal authentication.

Configuring support of Web proxy for portal authentication

About this task

To allow HTTP requests proxied by a Web proxy server to trigger portal authentication, specify the port number of the Web proxy server on the device. If a Web proxy server port is not specified on the device, HTTP requests proxied by the Web proxy server are dropped, and portal authentication cannot be triggered.

Restrictions and guidelines

If a user's browser uses the Web Proxy Auto-Discovery (WPAD) protocol to discover Web proxy servers, you must perform the following tasks on the device:

- Specify port numbers of the Web proxy servers.
- Configure portal-free rules to allow user packets destined for the WPAD server to pass without authentication.

If portal users enable Web proxy in their browsers, the users must add the IP address of the portal authentication server as a proxy exception in their browsers. Thus, HTTP packets that the users send to the portal authentication server will not be sent to Web proxy servers.

You cannot specify Web proxy server port 443 on the device.

You can execute this command multiple times to specify multiple port numbers of Web proxy servers.

Procedure

1. Enter system view.

   system-view

2. Specify the port number of a Web proxy server.

   portal web-proxy port *port-number*

   By default, no port numbers of Web proxy servers are specified. Proxied HTTP requests are dropped.

Checking the issuing of category-2 portal filtering rules

About this task

Category-2 portal filtering rules permit authenticated users to access authorized network resources. By default, the device allows an authenticated user to come online as long as a member device has issued a category-2 portal filtering rule for the user. Users coming online from global interfaces might fail to access network resources because some member ports might not have category-2 rules for the users. To resolve this issue, enable the device to check the issuing of category-2 portal filtering rules. Then, the device allows users to come online only when all member devices have issued category-2 portal filtering rules for the users.

As a best practice, perform this task when portal authentication is enabled on a global interface.

Procedure

1. Enter system view.

   system-view

2. Enable the device to check the issuing of category-2 portal filtering rules.

   portal user-rule assign-check enable

   By default, the device does not check the issuing of category-2 portal filtering rules.

Setting the maximum number of portal users

About this task

Perform this task to control the total number of portal users in the system, and the maximum number of IPv4 or IPv6 portal users on an interface.

Restrictions and guidelines for setting the maximum number of portal users

Make sure the maximum combined number of IPv4 and IPv6 portal users specified on all interfaces does not exceed the global maximum number. Otherwise, the exceeding number of portal users will not be able to log in to the device.

Make sure the sum of the maximum number of portal users for IPv4 and IPv6 on an interface does not exceed the maximum number of all portal users set on the interface. Otherwise, the exceeding number of portal users cannot come online from the interface.

You can set the maximum number of portal users in interface view or system view. The maximum number of portal users allowed on an interface is the smallest value among the following items:

- Maximum number of IPv4 or IPv6 portal users allowed on the interface.
- Maximum number of all portal users allowed on the interface.
- Global maximum number of portal users.

Setting the global maximum number of portal users

1. Enter system view.

   system-view

2. Set the global maximum number of portal users.

   portal max-user *max-number*

   By default, no limit is set on the global number of portal users.

   If you set the global maximum number smaller than the number of current online portal users on the device, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in.

Setting the maximum number of portal users on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Set the maximum number of portal users.

   portal { **ipv4-max-user** | **ipv6-max-user** | **max-user** } *max-number*

   By default, no limit is set on the number of portal users on an interface.

   If you set the maximum number smaller than the current number of portal users on an interface, this configuration still takes effect. The online users are not affected but the system forbids new portal users to log in from the interface.

Enabling strict-checking on portal authorization information

About this task

The strict checking feature allows a portal user to stay online only when the authorization information for the user is successfully deployed.

Enabling strict checking on portal authentication information on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Enable strict checking on portal authorization information.

   portal authorization acl strict-checking

CAUTION:

- The device logs out a portal user if the authorized ACL does not exist on the device or fails to be deployed.

By default, strict checking on portal authorization information is disabled on an interface. Portal users stay online even when the authorized ACL does not exist or fails to be deployed.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication

About this task

This feature allows only users with DHCP-assigned IP addresses to pass portal authentication. Use this feature to ensure that only users with valid IP addresses can access the network.

Restrictions and guidelines

This feature takes effect only when the device acts as both the access device and the DHCP server.

Configuration of this feature does not affect the online portal users.

Allowing only users with DHCP-assigned IP addresses to pass portal authentication on an interface

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Allow only users with DHCP-assigned IP addresses to pass portal authentication.

   portal [**ipv6**] **user-dhcp-only**

CAUTION:

- Users with static IP addresses cannot pass portal authentication to come online.
- If this feature is configured, to ensure that IPv6 users can pass portal authentication, disable the temporary IPv6 address feature on terminal devices. Otherwise, IPv6 users will use temporary IPv6 addresses to access the IPv6 network and will fail portal authentication.

By default, both users with IP addresses obtained through DHCP and users with static IP addresses can pass authentication to come online.

Enabling portal roaming

About this task

If portal roaming is enabled on a VLAN interface, an online portal user can access resources from any Layer 2 port in the VLAN without re-authentication.

If portal roaming is disabled, to access external network resources from a Layer 2 port different from the current access port in the VLAN, the user must do the following:

1. Logs out from the current port.
2. Re-authenticates on the new Layer 2 port.

Restrictions and guidelines

Portal roaming takes effect only on portal users logging in from VLAN interfaces. It does not take effect on portal users logging in from common Layer 3 interface.

You cannot enable portal roaming when online portal users or preauthentication portal users exist on the device.

For portal roaming to take effect, you must disable the Rule ARP or ND entry feature by using the **undo portal refresh** { **arp** | **nd** } **enable** command.

Procedure

1. Enter system view.

system-view

2. Enable portal roaming.

   portal roaming enable

   By default, portal roaming is disabled.

Configuring the portal fail-permit feature

About this task

Perform this task to configure the portal fail-permit feature on an interface. When the access device detects that the portal authentication server or portal Web server is unreachable, it allows users on the interface to have network access without portal authentication.

If you enable fail-permit for both a portal authentication server and a portal Web server on an interface, the interface does the following:

- Disables portal authentication when either server is unreachable.
- Resumes portal authentication when both servers are reachable.

After portal authentication resumes, unauthenticated users must pass portal authentication to access the network. Users who have passed portal authentication before the fail-permit event can continue accessing the network.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Enable portal fail-permit for a portal authentication server.

   portal [**ipv6**] **fail-permit server** *server-name*

   By default, portal fail-permit is disabled for a portal authentication server.

4. Enable portal fail-permit for portal Web servers.

   portal [**ipv6**] **fail-permit web-server**

   By default, portal fail-permit is disabled for portal Web servers.

Configuring portal detection features

Configuring online detection of portal users

About this task

Use the online detection feature to quickly detect abnormal logouts of portal users. Configure ARP or ICMP detection for IPv4 portal users. Configure ND or ICMPv6 detection for IPv6 portal users.

If the device receives no packets from a portal user within the idle time, the device detects the user's online status as follows:

- **ICMP or ICMPv6 detection**—Sends ICMP or ICMPv6 requests to the user at configurable intervals to detect the user status.
  - If the device receives a reply within the maximum number of detection attempts, it considers that the user is online and stops sending detection packets. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the device receives no reply after the maximum number of detection attempts, the device logs out the user.

- **ARP or ND detection**—Sends ARP or ND requests to the user and detects the ARP or ND entry status of the user at configurable intervals.
  - If the ARP or ND entry of the user is refreshed within the maximum number of detection attempts, the device considers that the user is online and stops detection. Then the device resets the idle timer and repeats the detection process when the timer expires.
  - If the ARP or ND entry of the user is not refreshed after the maximum number of detection attempts, the device logs out the user.

Restrictions and guidelines

ARP detection and ND detection apply only to direct and re-DHCP portal authentication. ICMP detection applies to all portal authentication modes.

Procedure

1. Enter system view.

   system-view
2. Enter Layer 3 interface view.

   interface *interface-type interface-number*
3. Configure online detection of portal users.

   IPv4:

   portal user-detect type { **arp** | **icmp** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]

   IPv6:

   portal ipv6 user-detect type { **icmpv6** | **nd** } [**retry** *retries*] [**interval** *interval*] [**idle** *time*]

   By default, online detection is disabled for portal users on an interface.

Configuring portal authentication server detection

About this task

During portal authentication, if the communication between the access device and portal authentication server is broken, new portal users are not able to log in. Online portal users are not able to log out normally.

To address this problem, the access device needs to be able to detect the reachability changes of the portal server quickly and take corresponding actions to deal with the changes.

The portal authentication server detection feature enables the device to periodically detect portal packets sent by a portal authentication server to determine the reachability of the server. If the device receives a portal packet within a detection timeout (**timeout** *timeout*) and the portal packet is valid, the device considers the portal authentication server to be reachable. Otherwise, the device considers the portal authentication server to be unreachable.

Portal packets include user login packets, user logout packets, and heartbeat packets. Heartbeat packets are periodically sent by a server. By detecting heartbeat packets, the device can detect the server's actual status more quickly than by detecting other portal packets.

Restrictions and guidelines

The portal authentication server detection feature takes effect only when the device has a portal-enabled interface.

Only the IMC portal authentication server supports sending heartbeat packets. To test server reachability by detecting heartbeat packets, you must enable the server heartbeat feature on the IMC portal authentication server.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a log message, which contains the name, the current state, and the original state of the portal authentication server.
- Enabling portal fail-permit. When the portal authentication server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."
- Make sure the detection timeout configured on the device is greater than the server heartbeat interval configured on the portal authentication server.

Procedure

1. Enter system view.

   system-view
2. Enter portal authentication server view.

   portal server *server-name*
3. Configure portal authentication server detection.

   server-detect [**timeout** *timeout*] **log**

   By default, portal authentication server detection is disabled.

Configuring portal Web server detection

About this task

A portal authentication process cannot complete if the communication between the access device and the portal Web server is broken. To address this problem, you can enable portal Web server detection on the access device.

With the portal Web server detection feature, the access device simulates a Web access process to initiate a TCP connection to the portal Web server. If the TCP connection can be established successfully, the access device considers the detection successful, and the portal Web server is reachable. Otherwise, it considers the detection to have failed.

You can configure the following detection parameters:

- **Detection interval**—Interval at which the device detects the server reachability.
- **Maximum number of consecutive failures**—If the number of consecutive detection failures reaches this value, the access device considers that the portal Web server is unreachable.

You can configure the device to take one or more of the following actions when the server reachability status changes:

- Sending a log message, which contains the name, the current state, and the original state of the portal Web server.
- Enabling portal fail-permit. When the portal Web server is unreachable, the portal fail-permit feature on an interface allows users on the interface to have network access. When the server recovers, it resumes portal authentication on the interface. For more information, see "Configuring the portal fail-permit feature."

Restrictions and guidelines

The portal Web server detection feature takes effect only when the URL of the portal Web server is specified and the device has a portal-enabled interface.

Procedure

1. Enter system view.

   system-view

2. Enter portal Web server view.

   portal web-server *server-name*

3. Configure portal Web server detection.

   server-detect [**interval** *interval*] [**retry** *retries*] **log**

   By default, portal Web server detection is disabled.

Configuring portal user synchronization

About this task

Once the access device loses communication with a portal authentication server, the portal user information on the access device and that on the portal authentication server might be inconsistent after the communication resumes. To address this problem, the device provides the portal user synchronization feature. This feature is implemented by sending and detecting portal synchronization packets, as follows:

1. The portal authentication server sends the online user information to the access device in a synchronization packet at the user heartbeat interval.

   The user heartbeat interval is set on the portal authentication server.

2. Upon receiving the synchronization packet, the access device compares the users carried in the packet with its own user list and performs the following operations:
   - If a user contained in the packet does not exist on the access device, the access device informs the portal authentication server to delete the user. The access device starts the synchronization detection timer (**timeout** *timeout*) immediately when a user logs in.
   - If the user does not appear in any synchronization packet within a synchronization detection interval, the access device considers the user does not exist on the portal authentication server and logs the user out.

Restrictions and guidelines

Portal user synchronization requires a portal authentication server to support the portal user heartbeat function. Only the IMC portal authentication server supports the portal user heartbeat function. To implement the portal user synchronization feature, you also need to configure the user heartbeat function on the portal authentication server. Make sure the user heartbeat interval configured on the portal authentication server is not greater than the synchronization detection timeout configured on the access device.

Deleting a portal authentication server on the access device also deletes the user synchronization configuration for the portal authentication server.

Procedure

1. Enter system view.

   system-view

2. Enter portal authentication server view.

   portal server *server-name*

3. Configure portal user synchronization.

   user-sync timeout *timeout*

   By default, portal user synchronization is disabled.

Configuring portal packet attributes

Configuring the BAS-IP or BAS-IPv6 attribute

About this task

If the device runs Portal 2.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP attribute. If the device runs Portal 3.0, the unsolicited packets sent to the portal authentication server must carry the BAS-IP or BAS-IPv6 attribute.

After this attribute is configured, the source IP address for unsolicited notification portal packets the device sends to the portal authentication server is the configured BAS-IP or BAS-IPv6 address. If the attribute is not configured, the source IP address of the portal packets is the IP address of the packet output interface.

Restrictions and guidelines

During a re-DHCP portal authentication or mandatory user logout process, the device sends portal notification packets to the portal authentication server. For the authentication or logout process to complete, make sure the BAS-IP/BAS-IPv6 attribute is the same as the device IP address specified on the portal authentication server.

You must configure the BAS-IP or BAS-IPv6 attribute on a portal authentication-enabled interface if the following conditions are met:

- The portal authentication server is an IMC server.
- The portal device IP address specified on the portal authentication server is not the IP address of the portal packet output interface.

Configuring the BAS-IP or BAS-IPv6 attribute on an interface

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure the BAS-IP or BAS-IPv6 attribute.

   IPv4:

   portal bas-ip *ipv4-address*

   By default, the BAS-IP attribute of an IPv4 portal reply packet is the source IPv4 address of the packet. The BAS-IP attribute of an IPv4 portal notification packet is the IPv4 address of the packet's output interface.

   IPv6:

   portal bas-ipv6 *ipv6-address*

   By default, the BAS-IPv6 attribute of an IPv6 portal reply packet is the source IPv6 address of the packet. The BAS-IPv6 attribute of an IPv6 portal notification packet is the IPv6 address of the packet's output interface.

Specifying the device ID

About this task

The portal authentication server uses device IDs to identify the devices that send protocol packets to the portal server.

Restrictions and guidelines

Make sure the configured device ID is different than any other access devices communicating with the same portal authentication server.

Procedure

1. Enter system view.
   system-view
2. Specify the device ID.
   portal device-id *device-id*
   By default, a device is not configured with a device ID.

Configuring attributes for RADIUS packets

Specifying a format for the NAS-Port-Id attribute

About this task

RADIUS servers from different vendors might require different formats of the NAS-Port-Id attribute in the RADIUS packets. You can specify the NAS-Port-Id attribute format as required.

The device supports predefined formats (format 1, 2, 3, and 4). For more information about the formats, see portal commands in *Security Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Specify the format for the NAS-Port-Id attribute.
   portal nas-port-id format { **1** | **2** | **3** | **4** }
   By default, the format for the NAS-Port-Id attribute is format 2.

Configuring the NAS-Port-Type attribute

About this task

The NAS-Port-Type attribute in a RADIUS request represents the type of a user's access interface.

The access device might not be able to correctly obtain the type of users' access interfaces when multiple network devices exist between the access device and the portal client. For the access device to send the correct access interface type to the RADIUS server, perform this task to configure the NAS-Port-Type attribute.

Restrictions and guidelines

This configuration takes effect only on portal users that newly come online.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure the NAS-Port-Type attribute carried in outgoing RADIUS requests on the interface.
   portal nas-port-type { **802.11** | **adsl-cap** | **adsl-dmt** | **async** | **cable** | **ethernet** | **g.3-fax** | **hdlc** | **idsl** | **isdn-async-v110** | **isdn-async-v120**

| **isdn-sync** | **piafs** | **sdsl** | **sync** | **virtual** | **wireless-other** | **x.25** | **x.75** | **xdsl** }

By default, the NAS-Port-Type carried in outgoing RADIUS requests is Ethernet (attribute value 15).

Applying a NAS-ID profile to an interface

About this task

By default, the device sends its device name in the NAS-Identifier attribute of all RADIUS requests.

A NAS-ID profile enables you to send different NAS-Identifier attribute strings in RADIUS requests from different VLANs. The strings can be organization names, service names, or any user categorization criteria, depending on the administrative requirements.

For example, map the NAS-ID **companyA** to all VLANs of company A. The device will send **companyA** in the NAS-Identifier attribute for the RADIUS server to identify requests from any Company A users.

Restrictions and guidelines

You can apply a NAS-ID profile to a portal-enabled interface. If no NAS-ID profile is specified on the interface or no matching NAS-ID is found in the specified profile, the device uses the device name as the interface NAS-ID.

Procedure

1. Enter system view.

   system-view

2. Create a NAS-ID profile and enter NAS-ID profile view.

   aaa nas-id profile *profile-name*

   For more information about this command, see *Security Command Reference*.

3. Configure a NAS ID and VLAN binding in the profile.

   nas-id *nas-identifier* **bind vlan** *vlan-id*

   For more information about this command, see *Security Command Reference*. Portal access matches only the inner VLAN ID of QinQ packets. For more information about QinQ, see *Layer 2—LAN Switching Configuration Guide*.

4. Specify the NAS-ID profile on the interface.

   a. Return to system view.

      quit

   b. Enter Layer 3 interface view.

      interface *interface-type interface-number*

   c. Specify the NAS-ID profile on the interface.

      portal nas-id-profile *profile-name*

      By default, no NAS-ID profile is specified for an interface.

Configuring MAC-based quick portal authentication

Restrictions and guidelines for configuring MAC-based quick portal authentication

Only direct portal authentication supports MAC-based quick portal authentication.

For MAC-based quick portal authentication to take effect on an interface configured with a portal preauthentication policy, set the free-traffic threshold to 0 bytes.

Configuring a MAC binding server

About this task

You can configure multiple MAC binding servers on the device.

Perform this task to configure MAC binding server parameters, such as the server's IP address, VPN instance, port number, and the pre-shared key for communication between the access device and the server.

Procedure

1. Enter system view.

   system-view

2. Create a MAC binding server and enter its view.

   portal mac-trigger-server *server-name*

   By default, no MAC binder servers exist.

3. Configure a MAC binding server.
   - Specify the IP address of the MAC binding server.

     IPv4:

     ip *ipv4-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

     IPv6:

     ipv6 *ipv6-address* [**vpn-instance** *vpn-instance-name*] [**key** { **cipher** | **simple** } *string*]

     By default, no MAC binding server address is specified.
   - (Optional.) Set the UDP port number on which the MAC binding server listens for MAC binding query packets.

     port *port-number*

     By default, the MAC binding server listens for MAC binding query packets on UDP port 50100.
   - (Optional.) Set the maximum number of attempts and the interval for sending MAC binding queries to the MAC binding server.

     binding-retry { *retries* | **interval** *interval* } *

     By default, the maximum number of query attempts is 3 and the query interval is 1 second.
   - (Optional.) Specify the type of the MAC binding server.

     server-type { **cmcc** | **imc** }

     By default, the type of a MAC binding server is IMC.

4. (Optional.) Set the free-traffic threshold.

   free-traffic threshold *value*

   By default, the free-traffic threshold is 0 bytes.

5. (Optional.) Set the NAS-Port-Type value carried in RADIUS requests sent to the RADIUS server.

   nas-port-type *value*

   By default, the NAS-Port-Type value carried in RADIUS requests is 0.

6. (Optional.) Specify the version of the portal protocol.

   version *version-number*

   By default, the version of the portal protocol is 1.

7. (Optional.) Set the timeout the device waits for portal authentication to complete after receiving the MAC binding query response.

   authentication-timeout *minutes*

   By default, the portal authentication timeout time is 3 minutes.

8. (Optional.) Set the aging time for MAC-trigger entries.

   aging-time *seconds*

   By default, the aging time for MAC-trigger entries is 300 seconds.

Specifying a MAC binding server on an interface

About this task

After a MAC binding server is specified on an interface, the device can implement MAC-based quick portal authentication for portal users on the interface.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Specify a MAC binding server on the interface.

   portal [**ipv6**] **apply mac-trigger-server** *server-name*

   By default, no MAC binding server is specified on an interface.

Configuring cloud MAC-trigger authentication

About this task

This feature enables the cloud portal server to act as a MAC binding server to perform cloud MAC-trigger authentication on portal users.

Procedure

1. Enter system view.

   system-view

2. Create a MAC binding server and enter its view.

   portal mac-trigger-server *server-name*

3. Enable cloud MAC-trigger authentication.

   cloud-binding enable

By default, cloud MAC-trigger authentication is disabled.

4. Specify the URL of the cloud portal authentication server.

   cloud-server url *url-string*

   By default, the cloud portal authentication server URL is not specified. The device uses the URL of the portal Web server as the URL of the cloud portal authentication server.

Configuring IP-based quick portal authentication

Prerequisites

Before configuring IP-based quick portal authentication on the device, configure user accounts on the RADIUS server for IP-trigger authentication. Each of the accounts uses the user's IP address as both the username and password.

Restrictions and guidelines

Only direct authentication and cross-subnet authentication support IP-based quick portal authentication.

If both IP-based and MAC-based quick portal authentication modes are enabled on an interface, the MAC-based mode has a higher priority. The device will perform MAC-based quick portal authentication for a user if it can obtain both the MAC address and IP address of the user.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 interface view.

   interface *interface-type interface-number*

3. Configure IP-based quick portal authentication.

   IPv4:

   portal enable method { **direct** | **layer3** } [**ip-trigger** [**acl** *acl-number*]]

   IPv6:

   portal ipv6 enable method { **direct** | **layer3** } [**ip-trigger** [**acl** *acl-number*]]

   By default, IP-based quick portal authentication is disabled.

4. (Optional.) Configure the IP-trigger entry aging time.

   portal ip-trigger aging-time *seconds*

   By default, the IP-trigger entry aging time is 300 seconds.

Configuring portal authentication to support M-LAG

Prerequisites

Before you configure portal authentication to support M-LAG, you must complete the following tasks on both the primary and secondary M-LAG member devices:

- Enable portal authentication.
- Configure IPv4 portal authentication or IPv6 portal authentication.

- Set the portal authentication mode.
- Enable or disable MAC-based quick portal authentication.
- Set the free-traffic threshold.
- Enable portal fail-permit for a portal authentication server.
- Configure the URL of the portal Web server.
- Configure portal user roaming.
- Enable or disable portal authentication to support IPv4/IPv6 dual stack.

Make sure the above configuration on both the primary and secondary M-LAG member devices are the same.

Setting the authentication load sharing mode for portal users on M-LAG interfaces

About this task

By default, the primary M-LAG member device authenticates portal users on all M-LAG interfaces in an M-LAG system. If a large number of portal users exist, perform this task to set the authentication load sharing mode to improve authentication efficiency.

Restrictions and guidelines

Do not set the same distribution criterion for the distributed authentication load sharing mode on both the M-LAG member devices. A violation might cause that portal users fail to come online.

If online portal users already exist on the M-LAG network, do not change the authentication load sharing mode.

Procedure

1. Enter system view.

   system-view

2. Set the authentication load sharing mode for portal users on M-LAG interfaces.

   portal m-lag load-sharing-mode { **centralized** | **distributed** { **even-ip** | **odd-ip** } }

   By default, the authentication load sharing mode is centralized for portal users on M-LAG interfaces.

Configure traffic backup for portal users on M-LAG interfaces

About this task

In an M-LAG system, the M-LAG member devices synchronize traffic of portal users with each other. A M-LAG member device can periodically back up traffic of portal users to the peer device at the specified interval. It can also back up portal user traffic to the peer device if the amount of incremental traffic it has received since the last backup reaches the backup threshold.

Perform this task to decrease the frequency of traffic backup among M-LAG member devices.

Procedure

1. Enter system view.

   system-view

2. Set the traffic backup interval and threshold for portal users on M-LAG interfaces.

   portal m-lag traffic backup { **interval** *interval-value* | **threshold** *threshold-value* } *

By default, the traffic backup interval is 10 minutes and the traffic backup threshold is 50 MB for portal users on M-LAG interfaces.

Logging out online portal users

About this task

This feature deletes users that have passed portal authentication and terminates ongoing portal authentications.

Restrictions and guidelines

When the number of online users exceeds 2000, executing the **portal delete-user** command takes a few minutes.

To ensure successful logout of online users, do not disable portal authentication or perform master/subordinate device switchover on the portal-enabled interface during the command execution.

Procedure

1. Enter system view.

   system-view

2. Log out online portal users.

   portal delete-user { *ipv4-address* | **all** | **auth-type** { **cloud** | **local** | **normal** } | **interface** *interface-type interface-number* | **ipv6** *ipv6-address* | **mac** *mac-address* }

Enabling portal user login/logout logging

About this task

This feature logs information about user login and logout events. The information includes the username, user IP address and MAC address, user access interface, VLAN, and login result. The logs are sent to the information center of the device. For the logs to be output correctly, you must also configure the information center on the device. For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable portal user login/logout logging.

   portal log enable

   By default, portal user login/logout logging is disabled.

Disabling the Rule ARP or ND entry feature for portal clients

About this task

When the Rule ARP or ND entry feature is enabled for portal clients, ARP or ND entries for portal clients are Rule entries after the clients come online. After the portal clients go offline, the Rule ARP or ND entries are converted into dynamic entries and deleted when they age out.

Restrictions and guidelines

Enabling or disabling of this feature does not affect existing Rule/dynamic ARP or ND entries.

If the portal clients and the portal server belong to different VPNs, the Rule ARP entry feature will cause the portal clients to go offline abnormally. To avoid this issue, execute the **undo portal refresh arp enable** command to disable the Rule ARP entry feature for portal clients.

Procedure

1. Enter system view.
   system-view
2. Disable the Rule ARP or ND entry feature for portal clients.
   undo portal refresh { **arp** | **nd** } **enable**
   By default, the Rule ARP or ND entry feature is enabled for portal clients.

Configuring Web redirect

About this task

Web redirect is a simplified portal feature. With Web redirect, a user does not perform portal authentication but is directly redirected to the specified URL on the first Web access attempt in a browser. After the specified redirect interval, the user is redirected from the visiting website to the specified URL again.

Web redirect can provide ISPs with extended services. For example, the ISPs can place advertisements and publish information on the redirected webpage.

Restrictions and guidelines

The Web redirect feature takes effect only on HTTP packets that use the default port number 80.

If the device supports Etherchannel interfaces, you can enable both Web redirect and portal authentication on interfaces that support these features. If the device does not support Etherchannel interfaces, Web redirect does not work when both Web redirect and portal authentication are enabled on an interface.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 3 interface view.
   interface *interface-type interface-number*
3. Configure Web redirect.
   web-redirect [**ipv6**] **url** *url-string* [**interval** *interval*]
   By default, Web redirect is disabled.

Setting the user synchronization interval for portal authentication using OAuth

About this task

If portal authentication uses OAuth, the device periodically reports user information to the portal authentication server for user synchronization on the server. To disable user synchronization from the device to the portal authentication server, set the user synchronization interval to 0 seconds on the device.

Procedure

1. Enter system view.
   system-view
2. Set the user synchronization interval for portal authentication using OAuth.
   portal oauth user-sync interval *interval*
   By default, the user synchronization interval is 60 seconds.

Obtaining user access information from ARP or ND entries

About this task

In a remote Web authentication network, the device cannot obtain user access information from FIB entries upon receiving portal packets from the portal authentication server. This will cause users to fail Web authentication.

To resolve this issue, you can perform this task on the device. When this feature is enabled, the device first attempts to obtain user access information from ARP or ND entries during Web authentication.

Procedure

1. Enter system view.
   system-view
2. Configure the device to obtain user information from ARP or ND entries.
   portal access-info trust { **arp** | **nd** }
   By default, the device obtains user information from FIB entries.

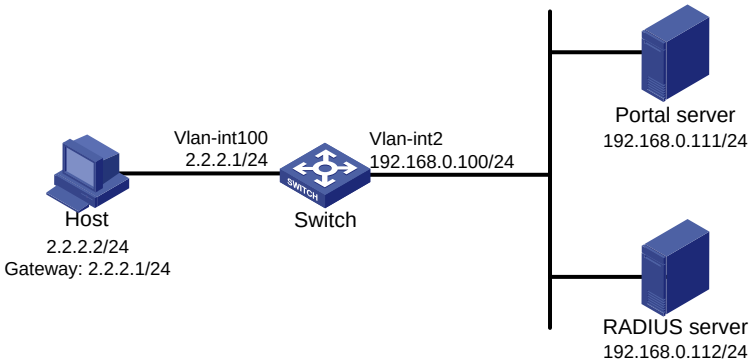
Display and maintenance commands for portal

Execute **display** commands in any view and the **reset** command in user view.

Task	Command
Display portal configuration and portal running state.	**display portal interface** *interface-type interface-number*
Display packet statistics for portal captive-bypass.	**display portal captive-bypass statistics** [**slot** *slot-number*]
Display information about MAC binding servers.	**display portal mac-trigger-server** { **all** | **name** *server-name* }
Display packet statistics for portal authentication servers.	**display portal packet statistics** [**extend-auth-server cloud** | **server** *server-name*]
Display portal rules.	**display portal rule** { **all** | **dynamic** | **static** } **interface** *interface-type interface-number* [**slot** *slot-number*]
Display portal authentication server information.	**display portal server** [*server-name*]
Display session information for portal users	**display portal session user-type**

Task	Command
or portal-based Web authentication users.	{ **portal** | **web-auth** }
Display portal user information.	**display portal user** { **all** | **auth-type** { **cloud** | **local** | **normal** } | **interface** *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address* | **mac** *mac-address* | **pre-auth** [**interface** *interface-type interface-number* | **ip** *ipv4-address* | **ipv6** *ipv6-address*] | **username** *username* } [**brief** | **verbose**]
Display portal Web server information.	**display portal web-server** [*server-name*]
Display Web redirect rule information.	**display web-redirect rule interface** *interface-type interface-number* [**slot** *slot-number*]
Clear packet statistics for portal captive-bypass.	**reset portal captive-bypass statistics** [**slot** *slot-number*]
Clear packet statistics for portal authentication servers.	**reset portal packet statistics** [**extend-auth-server cloud** | **server** *server-name*]

Portal configuration examples



Example: Configuring direct portal authentication

Network configuration

As shown in Figure 7, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. An IMC server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure direct portal authentication, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.

Figure 7 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and servers and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.
- Configure the portal service on the IMC server, including setting portal server parameters, adding access devices, creating user IP address groups, and configuring device port groups to associate with IP address groups. This ensures coordinated implementation of portal authentication with the device.

Configuring the switch

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
     Max users     : Not configured

     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: 2.2.2.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
```

```
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                     Action
        --             --                              --
    Layer3 source network:
        IP address                                     Prefix length

    Destination authenticate subnet:
        IP address                                     Prefix length
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
 Total portal users: 1
  Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```

Example: Configuring re-DHCP portal authentication

Network configuration

As shown in Figure 8, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure re-DHCP portal authentication. Before passing the authentication, the host is assigned a private IP address. After passing the authentication, the host gets a public IP address and can access network resources.

Figure 8 Network diagram

Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.
- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 8 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.113
   [Switch-radius-rs1] primary accounting 192.168.0.113
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure DHCP relay and authorized ARP:

Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A

     Layer3 source network:
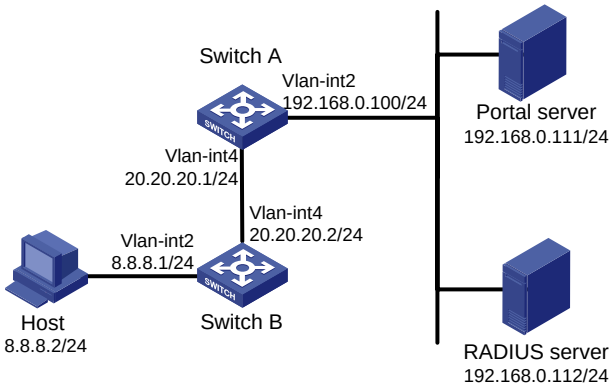
         IP address                                          Prefix length
```

```
    Destination authenticate subnet:
        IP address                                          Prefix length
```

Before passing the authentication, a user that uses the iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC                IP                  VLAN    Interface
  0015-e9a6-7cfe     20.20.20.2          100     Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring cross-subnet portal authentication

Network configuration

As shown in Figure 9, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure Switch A for cross-subnet portal authentication. Before passing the authentication, the host can access only the portal Web server. After passing the authentication, the user can access other network resources.

Figure 9 Network diagram

Restrictions and guidelines

Make sure the IP address of the portal device added on the portal authentication server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 9 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<SwitchA> system-view
[SwitchA] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[SwitchA-radius-rs1] primary authentication 192.168.0.112
[SwitchA-radius-rs1] primary accounting 192.168.0.112
[SwitchA-radius-rs1] key authentication simple radius
[SwitchA-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[SwitchA-radius-rs1] user-name-format without-domain
[SwitchA-radius-rs1] quit
```

Enable RADIUS session control.

```
[SwitchA] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[SwitchA] domain dm1
```

Configure AAA methods for the ISP domain.

```
[SwitchA-isp-dm1] authentication portal radius-scheme rs1
[SwitchA-isp-dm1] authorization portal radius-scheme rs1
[SwitchA-isp-dm1] accounting portal radius-scheme rs1
[SwitchA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 4.

```
[SwitchA] interface vlan-interface 4
[SwitchA–Vlan-interface4] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 4.

```
[SwitchA–Vlan-interface4] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

```
[SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
[SwitchA–Vlan-interface4] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
     Max users     : Not configured

     User detection:  Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured(active)
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
```

```
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max users: Not configured
    Bas-ipv6: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                     Action
        --             --                              --
    Layer3 source network:
        IP address                                     Prefix length

    Destination authenticate subnet:
        IP address                                     Prefix length
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
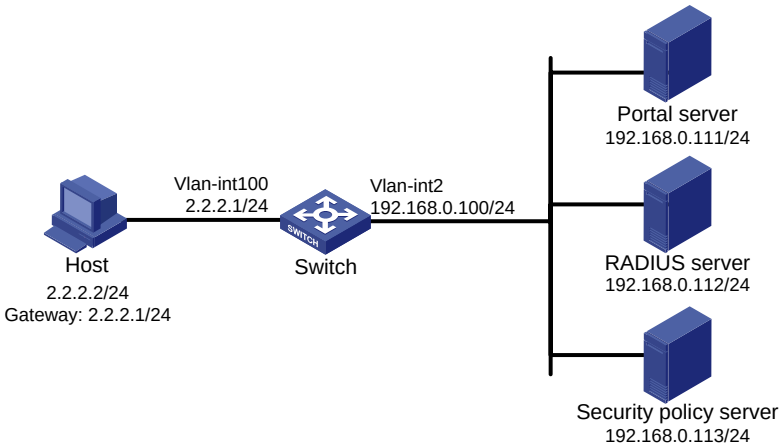
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0000-0000-0000    8.8.8.2           4      Vlan-interface4
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring extended direct portal authentication

Network configuration

As shown in Figure 10, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure extended direct portal authentication. If the host fails security check after passing identity authentication, it can access only subnet 192.168.0.0/24. After passing security check, the host can access other network resources.

Figure 10 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and servers as shown in Figure 10 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key accounting simple radius
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

```
[Switch] radius session-control client ip 192.168.0.112 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named dm1 and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain dm1 as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
     Max users     : Not configured
 IPv4:
     Portal status: Enabled
     Portal authentication method: Direct    authentication shared mode: Disabled
     Portal web server: newpt(active)
     Secondary portal Web server: Not configured
```

```
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: 2.2.2.1
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                      Action
         --             --                               --
     Layer3 source network:
         IP address                                      Prefix length

     Destination authenticate subnet:
         IP address                                      Prefix length
```

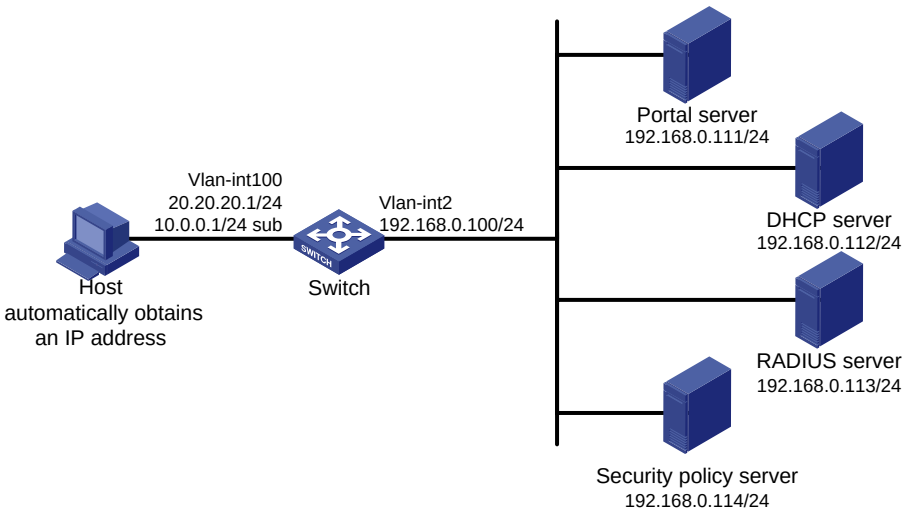
Before passing portal authentication, a user that uses the iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.
- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
```

```
Portal server: newpt
State: Online
VPN instance: N/A
MAC               IP              VLAN   Interface
0015-e9a6-7cfe    2.2.2.2         100    Vlan-interface100
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL: 3001
  Inbound CAR: N/A
  Outbound CAR: N/A
  Microsegment ID: N/A
```



Example: Configuring extended re-DHCP portal authentication

Network configuration

As shown in Figure 11, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure extended re-DHCP portal authentication. Before passing portal authentication, the host is assigned a private IP address. After passing portal identity authentication, the host obtains a public IP address and accepts security check. If the host fails the security check, it can access only subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 11 Network diagram

Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.

- The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.

- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 11 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<Switch> system-view
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.113
[Switch-radius-rs1] primary accounting 192.168.0.113
[Switch-radius-rs1] key accounting simple radius
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.113 and shared key 12345 in plaintext form.

```
[Switch] radius session-control client ip 192.168.0.113 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[Switch] acl advanced 3000
[Switch-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3000] rule deny ip
[Switch-acl-ipv4-adv-3000] quit
[Switch] acl advanced 3001
```

```
[Switch-acl-ipv4-adv-3001] rule permit ip
[Switch-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure DHCP relay and authorized ARP:

   # Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

   # Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

5. Configure portal authentication:

   # Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

   # Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

   # Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method redhcp
```

   # Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

   # Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface100
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
```

```
    Max users     : Not configured
 IPv4:
    Portal status: Enabled

        IP address                                      Prefix length

    Destination authenticate subnet:
        IP address                                      Prefix length
```

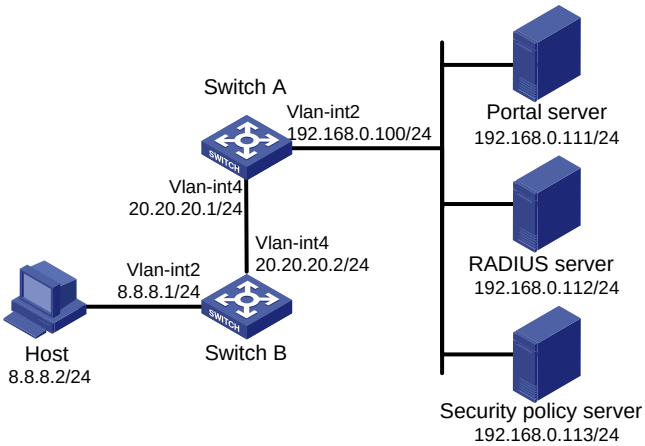
Before passing portal authentication, a user that uses the iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.

- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC                IP                 VLAN    Interface
  0015-e9a6-7cfe     20.20.20.2         100     Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: 3001 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring extended cross-subnet portal authentication

Network configuration

As shown in Figure 12, Switch A supports portal authentication. The host accesses Switch A through Switch B. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure Switch A for extended cross-subnet portal authentication. Before passing portal authentication, the host can access only the portal server. After passing portal identity authentication, the host accepts security check. If the host fails the security check it can access only the subnet 192.168.0.0/24. After passing the security check, the host can access other network resources.

Figure 12 Network diagram

Restrictions and guidelines

Make sure the IP address of the portal device added on the portal server is the IP address (20.20.20.1) of the switch's interface connecting the host. The IP address group associated with the portal device is the subnet of the host (8.8.8.0/24).

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 12 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<SwitchA> system-view
[SwitchA] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[SwitchA-radius-rs1] primary authentication 192.168.0.112
[SwitchA-radius-rs1] primary accounting 192.168.0.112
[SwitchA-radius-rs1] key accounting simple radius
[SwitchA-radius-rs1] key authentication simple radius
[SwitchA-radius-rs1] user-name-format without-domain
```

Enable RADIUS session control.

```
[SwitchA] radius session-control enable
```

Specify a session-control client with IP address 192.168.0.112 and shared key 12345 in plaintext form.

```
[SwitchA] radius session-control client ip 192.168.0.112 key simple 12345
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[SwitchA] domain dm1
```

Configure AAA methods for the ISP domain.

```
[SwitchA-isp-dm1] authentication portal radius-scheme rs1
[SwitchA-isp-dm1] authorization portal radius-scheme rs1
[SwitchA-isp-dm1] accounting portal radius-scheme rs1
[SwitchA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure ACL 3000 as the isolation ACL and ACL 3001 as the security ACL.

```
[SwitchA] acl advanced 3000
[SwitchA-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.0 0.0.0.255
[SwitchA-acl-ipv4-adv-3000] rule deny ip
[SwitchA-acl-ipv4-adv-3000] quit
[SwitchA] acl advanced 3001
[SwitchA-acl-ipv4-adv-3001] rule permit ip
[SwitchA-acl-ipv4-adv-3001] quit
```

NOTE:

Make sure you specify ACL 3000 as the isolation ACL and ACL 3001 as the security ACL on the security policy server.

4. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 4.

```
[SwitchA] interface vlan-interface 4
[SwitchA–Vlan-interface4] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 4.

```
[SwitchA–Vlan-interface4] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 4 to the portal authentication server.

```
[SwitchA–Vlan-interface4] portal bas-ip 20.20.20.1
[SwitchA–Vlan-interface4] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[SwitchA] display portal interface vlan-interface 4
 Portal information of Vlan-interface4
     NAS-ID profile: Not configured
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization : Strict checking
     ACL           : Disabled
     User profile  : Disabled
     Max users     : Not configured

     Authentication domain: Not configured
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: 20.20.20.1
     User detection:  Not configured
     Action for server detection:
```

```
        Server type    Server name                          Action
        --             --                                   --
    Layer3 source network:
        IP address              Mask

    Destination authenticate subnet:
        IP address              Mask
IPv6:
    Portal status: Disabled
    Portal authentication method: Disabled    authentication shared mode: Disabled
    Portal web server: Not configured(active)
    Secondary portal Web server: Not configured
    Portal mac-trigger-server: Not configured
    Authentication domain: Not configured
    Pre-auth domain: Not configured
    User-dhcp-only: Disabled
    Pre-auth IP pool: Not configured
    Max users: Not configured
    Bas-ip: Not configured
    User detection: Not configured
    Action for server detection:
        Server type    Server name                          Action
        --             --                                   --
    Layer3 source network:
        IP address                                          Prefix length

    Destination authenticate subnet:
        IP address                                          Prefix length
```

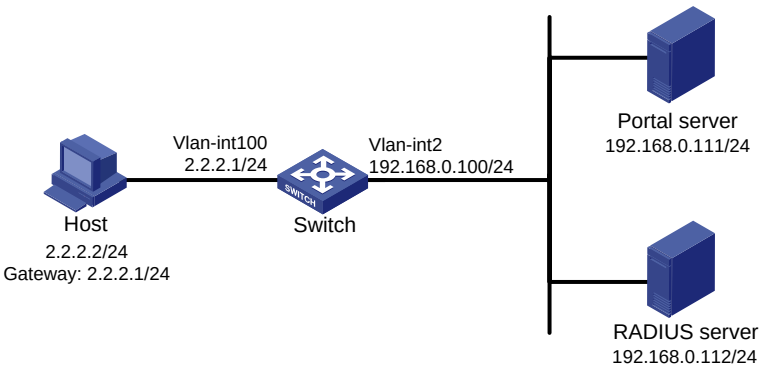
Before passing portal authentication, a user that uses the iNode client can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page.

- The user can access the resources permitted by ACL 3000 after passing only identity authentication.
- The user can access network resources permitted by ACL 3001 after passing both identity authentication and security check.

After the user passes identity authentication and security check, use the following command to display information about the portal user.

```
[SwitchA] display portal user interface vlan-interface 4
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    8.8.8.2           4    Vlan-interface4
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
```

```
ACL number: 3001 (active)
Inbound CAR: N/A
Outbound CAR: N/A
Microsegment ID: N/A
```



Example: Configuring portal server detection and portal user synchronization

Network configuration

As shown in Figure 13, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. An IMC server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

- Configure direct portal authentication on the switch, so the host can access only the portal server before passing the authentication and access other network resources after passing the authentication.
- Configure the switch to detect the reachability state of the portal authentication server, send log messages upon state changes, and disable portal authentication when the authentication server is unreachable.
- Configure the switch to synchronize portal user information with the portal server periodically.

Figure 13 Network diagram

Prerequisites

- Configure IP addresses for the switch and servers and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.
- Configure the portal service on the IMC server, including setting portal server parameters, adding access devices, creating user IP address groups, and configuring device port groups to associate with IP address groups. This ensures coordinated implementation of portal authentication with the device.

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
```

Configure reachability detection of the portal authentication server: set the server detection interval to 40 seconds, and send log messages upon reachability status changes.

```
[Switch-portal-server-newpt] server-detect timeout 40 log
```

NOTE:

The value of **timeout** must be greater than or equal to the portal server heartbeat interval.

Configure portal user synchronization with the portal authentication server, and set the synchronization detection interval to 600 seconds.

```
[Switch-portal-server-newpt] user-sync timeout 600
[Switch-portal-server-newpt] quit
```

NOTE:

The value of **timeout** must be greater than or equal to the portal user heartbeat interval.

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Enable portal fail-permit for the portal authentication server **newpt**.

```
[Switch–Vlan-interface100] portal fail-permit server newpt
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

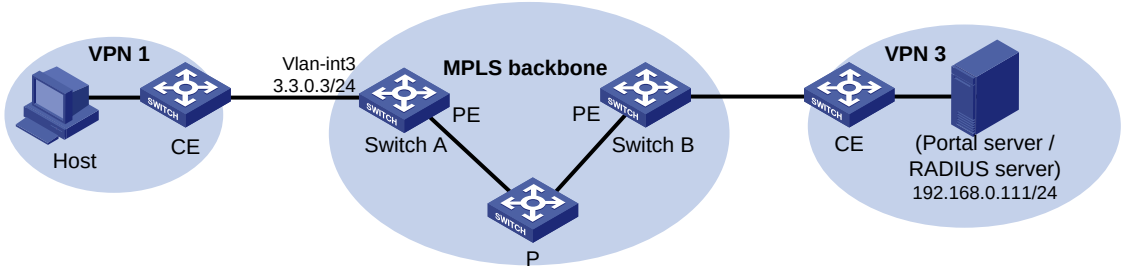
```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Use the following command to display information about the portal authentication server.

```
[Switch] display portal server newpt
Portal server: newpt
  Type                  : IMC
  IP                    : 192.168.0.111
  VPN instance          : Not configured
  Port                  : 50100
  Server Detection      : Timeout 40s  Action: log
  User synchronization  : Timeout 600s
  Status                : Up
```

The **Up** status of the portal authentication server indicates that the portal authentication server is reachable. If the access device detects that the portal authentication server is unreachable, the **Status** field in the command output displays **Down**. The access device generates a server unreachable log "Portal server newpt turns down from up." and disables portal authentication on the access interface, so the host can access the external network without authentication.



Example: Configuring cross-subnet portal authentication for MPLS L3VPNs

Network configuration

As shown in Figure 14, the PE device Switch A provides portal authentication for the host in VPN 1. A portal server in VPN 3 acts as the portal authentication server, portal Web server, and RADIUS server.

Configure cross-subnet portal authentication on Switch A, so the host can access network resources after passing identity authentication.

Figure 14 Network diagram

Prerequisites

- Before enabling portal authentication, configure MPLS L3VPN and specify VPN targets for VPN 1 and VPN 3 so that VPN 1 and VPN 3 can communicate with each other. This example describes only the access authentication configuration on the user-side PE. For information

about MPLS L3VPN configurations, see MPLS L3VPN configuration in *MCE Configuration Guide*.

- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<SwitchA> system-view
[SwitchA] radius scheme rs1
```

For the RADIUS scheme, specify the VPN instance that is bound to the interface connected to the portal/RADIUS server. This example uses VPN instance **vpn3**. (For information about the VPN instance, see the MPLS L3VPN configuration on Switch A.)

```
[SwitchA-radius-rs1] vpn-instance vpn3
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[SwitchA-radius-rs1] primary authentication 192.168.0.111
[SwitchA-radius-rs1] primary accounting 192.168.0.111
[SwitchA-radius-rs1] key accounting simple radius
[SwitchA-radius-rs1] key authentication simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[SwitchA-radius-rs1] user-name-format without-domain
```

Specify the source IP address for RADIUS packets to be sent as 3.3.0.3. This address must be the same as that of the portal device specified on the portal authentication server to avoid authentication failures.

```
[SwitchA-radius-rs1] nas-ip 3.3.0.3
[SwitchA-radius-rs1] quit
```

Enable RADIUS session control.

```
[SwitchA] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[SwitchA] domain dm1
```

Configure AAA methods for the ISP domain.

```
[SwitchA-isp-dm1] authentication portal radius-scheme rs1
[SwitchA-isp-dm1] authorization portal radius-scheme rs1
[SwitchA-isp-dm1] accounting portal radius-scheme rs1
[SwitchA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[SwitchA] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[SwitchA] portal server newpt
[SwitchA-portal-server-newpt] ip 192.168.0.111 vpn-instance vpn3 key simple portal
[SwitchA-portal-server-newpt] port 50100
[SwitchA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[SwitchA] portal web-server newpt
[SwitchA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
```

```
[SwitchA-portal-websvr-newpt] vpn-instance vpn3
[SwitchA-portal-websvr-newpt] quit
```

Enable cross-subnet portal authentication on VLAN-interface 3.

```
[SwitchA] interface vlan-interface 3
[SwitchA–Vlan-interface3] portal enable method layer3
```

Specify portal Web server **newpt** on VLAN-interface 3.

```
[SwitchA–Vlan-interface3] portal apply web-server newpt
```

Configure the BAS-IP as 3.3.0.3 for portal packets sent from VLAN-interface 3 to the portal authentication server.

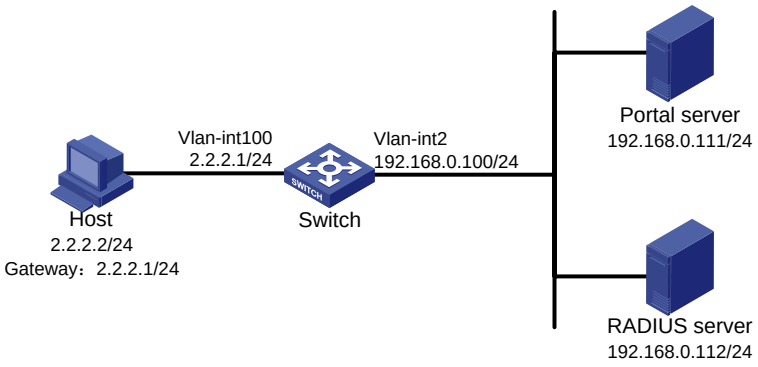
```
[SwitchA–Vlan-interface3] portal bas-ip 3.3.0.3
[SwitchA–Vlan-interface3] quit
```

Verifying the configuration

Verify the portal configuration by executing the **display portal interface** command. (Details not shown.)

After the user passes authentication, execute the **display portal user** command to display the portal user information.

```
[SwitchA] display portal user all
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: vpn3
  MAC               IP                VLAN   Interface
  000d-88f7-c268    3.3.0.1           3      Vlan-interface3
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring direct portal authentication with a preauthentication domain

Network configuration

As shown in Figure 15, the host is directly connected to the switch (the access device). The host is assigned a public IP address through DHCP. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure direct portal authentication, so the host can access only subnet 192.168.0.0/24 before passing the authentication and access other network resources after passing the authentication.

Figure 15 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and servers as shown in Figure 15 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a preauthentication IP address pool:

   # Configure DHCP address pool **pre** to assign IP addresses and other configuration parameters to clients on subnet 2.2.2.0/24.

   ```
   <Switch> system-view
   [Switch] dhcp server ip-pool pre
   [Switch-dhcp-pool-pre] gateway-list 2.2.2.1
   [Switch-dhcp-pool-pre] network 2.2.2.0 24
   [Switch-dhcp-pool-pre] quit
   ```

   # Enable the DHCP server on VLAN-interface 100.

   ```
   [Switch] interface vlan-interface 100
   [Switch–Vlan-interface100] dhcp select server
   [Switch–Vlan-interface100] quit
   ```

2. Configure a portal preauthentication domain:

   # Create an ISP domain named **abc**.

   ```
   [Switch] domain abc
   ```

   # Specify user attribute ACL 3010 in the ISP domain.

   ```
   [Switch-isp-abc] authorization-attribute acl 3010
   [Switch-isp-abc] quit
   ```

   # In ACL 3010, configure a rule to permit access to the subnet 192.168.0.0/24.

   ```
   [Switch] acl advanced 3010
   [Switch-acl-ipv4-adv-3010] rule 1 permit ip destination 192.168.0.0 0.0.0.255
   [Switch-acl-ipv4-adv-3010] quit
   ```

   # Specify ISP domain **abc** as the portal authentication domain on VLAN-interface 100.

   ```
   [Switch] interface vlan-interface 100
   [Switch–Vlan-interface100] portal pre-auth domain abc
   [Switch–Vlan-interface100] quit
   ```

3. Configure portal authentication:

   # Configure a portal authentication server.

   ```
   [Switch] portal server newpt
   ```

```
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

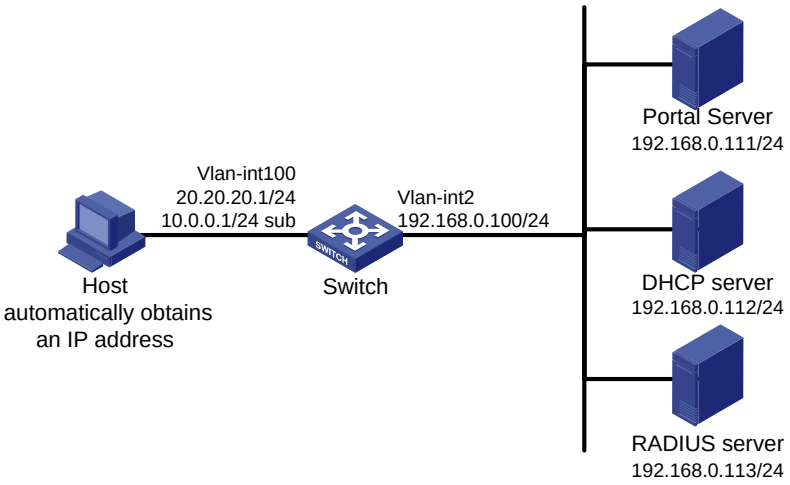
```
[Switch–Vlan-interface100] portal bas-ip 2.2.2.1
[Switch–Vlan-interface100] quit
```

Verifying the configuration

Verify the portal configuration by executing the **`display portal interface`** command. (Details not shown.)

Display information about preauthentication portal users.

```
[Switch] display portal user pre-auth interface vlan-interface 100
MAC               IP                VLAN   Interface
0015-e9a6-7cfe    10.10.10.4        100     Vlan-interface100
  State: Online
  VPN instance: N/A
  Authorization information:
    User profile: N/A
    Session group profile: N/A
    ACL number: 3010 (active)
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring re-DHCP portal authentication with a preauthentication domain

Network configuration

As shown in Figure 16, the host is directly connected to the switch (the access device). The host obtains an IP address through the DHCP server. A portal server acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure re-DHCP portal authentication. Before passing the authentication, the host is assigned a private IP address and can access only the subnet 192.168.0.0/24. After passing the authentication, the host gets a public IP address and can access other network resources.

Figure 16 Network diagram

Restrictions and guidelines

- For re-DHCP portal authentication, configure a public address pool (20.20.20.0/24) and a private address pool (10.0.0.0/24) on the DHCP server. (Details not shown.)
- For re-DHCP portal authentication:
  - The switch must be configured as a DHCP relay agent.
  - The portal-enabled interface must be configured with a primary IP address (a public IP address) and a secondary IP address (a private IP address).

  For information about DHCP relay agent configuration, see *Layer 3—IP Services Configuration Guide*.
- Make sure the IP address of the portal device added on the portal server is the public IP address (20.20.20.1) of the switch's interface connecting the host. The private IP address range for the IP address group associated with the portal device is the private subnet 10.0.0.0/24 where the host resides. The public IP address range for the IP address group is the public subnet 20.20.20.0/24.
- If you have configured a preauthentication IP address pool on portal-enabled interfaces, configure a DHCP relay address pool with the same name on the device. For the DHCP relay address pool, specify the subnet address where the unauthenticated users reside (with the **`export-router`** keyword specified) and the DHCP server address.

Prerequisites

- Configure IP addresses for the switch and servers as shown in Figure 16 and make sure the host, switch, and servers can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a portal preauthentication domain:

Create an ISP domain named **abc**.

```
<Switch> system-view
[Switch] domain abc
```

Specify user attribute ACL 3010 in the ISP domain.

```
[Switch-isp-abc] authorization-attribute acl 3010
[Switch-isp-abc] quit
```

In ACL 3010, configure a rule to permit access to the subnet 192.168.0.0/24.

```
[Switch] acl advanced 3010
```

```
[Switch-acl-ipv4-adv-3010] rule 1 permit ip destination 192.168.0.0 0.0.0.255
[Switch-acl-ipv4-adv-3010] quit
```

Specify ISP domain **abc** as the portal authentication domain on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal pre-auth domain abc
[Switch–Vlan-interface100] quit
```

2. Configure DHCP relay and authorized ARP.

Configure DHCP relay.

```
[Switch] dhcp enable
[Switch] dhcp relay client-information record
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] ip address 20.20.20.1 255.255.255.0
[Switch–Vlan-interface100] ip address 10.0.0.1 255.255.255.0 sub
[Switch-Vlan-interface100] dhcp select relay
[Switch-Vlan-interface100] dhcp relay server-address 192.168.0.112
```

Enable authorized ARP.

```
[Switch-Vlan-interface100] arp authorized enable
[Switch-Vlan-interface100] quit
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable re-DHCP portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal enable method redhcp
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 20.20.20.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch–Vlan-interface100] portal bas-ip 20.20.20.1
[Switch–Vlan-interface100] quit
```

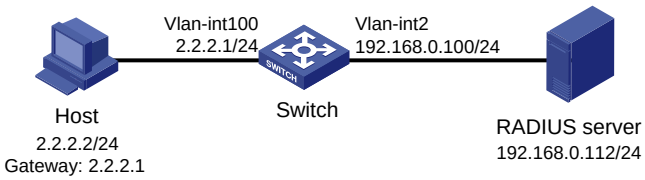
Verifying the configuration

Verify the portal configuration by executing the **`display portal interface`** command. (Details not shown.)

Display information about preauthentication portal users.

```
[Switch] display portal user pre-auth interface vlan-interface 100
MAC               IP                VLAN   Interface
0015-e9a6-7cfe    10.10.10.4        100     Vlan-interface100
  State: Online
  VPN instance: N/A
  Authorization information:
```

```
User profile: N/A
Session group profile: N/A
ACL number: 3010 (active)
Inbound CAR: N/A
Outbound CAR: N/A
Microsegment ID: N/A
```



Example: Configuring direct portal authentication using a local portal Web service

Network configuration

As shown in Figure 17, the host is directly connected to the switch (the access device). The host is assigned a public IP address either manually or through DHCP. The switch acts as both a portal authentication server and a portal Web server. A RADIUS server acts as the authentication and accounting server.

Configure direct portal authentication on the switch. Before a user passes portal authentication, the user can access only the portal Web server. After passing portal authentication, the user can access other network resources.

Figure 17 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and server as shown in Figure 17 and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.

Procedure

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   [Switch] radius scheme rs1
   ```

   # Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

   ```
   [Switch-radius-rs1] primary authentication 192.168.0.112
   [Switch-radius-rs1] primary accounting 192.168.0.112
   [Switch-radius-rs1] key authentication simple radius
   [Switch-radius-rs1] key accounting simple radius
   ```

   # Exclude the ISP domain name from the username sent to the RADIUS server.

   ```
   [Switch-radius-rs1] user-name-format without-domain
   [Switch-radius-rs1] quit
   ```

   # Enable RADIUS session control.

   ```
   [Switch] radius session-control enable
   ```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal Web server named **newpt** and specify **http://2.2.2.1:2331/portal** as the URL of the portal Web server. The IP address in the URL must be the IP address of a Layer 3 interface reachable to portal clients or a loopback interface (except 127.0.0.1) on the device.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://2.2.2.1:2331/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch–Vlan-interface100] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[Switch–Vlan-interface100] portal apply web-server newpt
[Switch–Vlan-interface100] quit
```

Create an HTTP-based local portal Web service and enter its view.

```
[Switch] portal local-web-server http
```

Specify file **defaultfile.zip** as the default authentication page file for the local portal Web service. (Make sure the file exists under the root directory of the switch.)

```
[Switch–portal-local-websvr-http] default-logon-page defaultfile.zip
```

Set the HTTP listening port number to 2331 for the local portal Web service.

```
[Switch–portal-local-webserver-http] tcp-port 2331
[Switch–portal-local-websvr-http] quit
```

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[Switch] display portal interface vlan-interface 100
 Portal information of Vlan-interface 100
     M-LAG group ID: N/A
     M-LAG role    : N/A
     Authorization                  Strict checking
     ACL                            Disabled
     User profile                   Disabled
 IPv4:
     Portal status: Enabled
     Portal authentication method: Direct    authentication shared mode: Disabled
     Portal web server: newpt(active)
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
```

```
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ip: Not configured
     User detection:  Not configured
     Action for server detection:
         Server type    Server name                         Action
         --             --                                  --
     Layer3 source network:
         IP address              Mask

     Destination authenticate subnet:
         IP address              Mask
IPv6:
     Portal status: Disabled
     Portal authentication method: Disabled    authentication shared mode: Disabled
     Portal web server: Not configured
     Secondary portal Web server: Not configured
     Portal mac-trigger-server: Not configured
     Authentication domain: Not configured
     Pre-auth domain: Not configured
     User-dhcp-only: Disabled
     Pre-auth IP pool: Not configured
     Max users: Not configured
     Bas-ipv6: Not configured
     User detection: Not configured
     Action for server detection:
         Server type    Server name                         Action
         --             --                                  --
     Layer3 source network:
         IP address                                         Prefix length

     Destination authenticate subnet:
         IP address                                         Prefix length
```

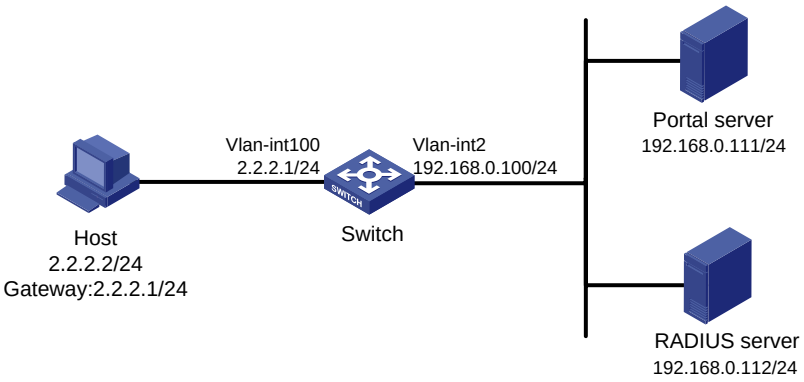
A user can perform portal authentication through a Web page. Before passing the authentication, the user can access only the authentication page **http://2.2.2.1:2331/portal** and all Web requests will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, use the following command to display information about the portal user.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: abc
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100     Vlan-interface100
```

```
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL number: N/A
  Inbound CAR: N/A
  Outbound CAR: N/A
  Microsegment ID: N/A
```

Example: Configuring MAC-based quick portal authentication



Network configuration

As shown in Figure 18, the host accesses the network through the switch. The host is assigned a public IP address either manually or through DHCP.

An IMC server acts as a portal server (portal authentication server and portal Web server) and a MAC binding server. A RADIUS server acts as the authentication and accounting server.

Configure direct portal authentication, so the host can access only the portal Web server before passing the authentication and can access other network resources after passing the authentication.

Figure 18 Network diagram

Prerequisites

- Configure IP addresses for the host, switch, and servers and make sure they can reach each other.
- Configure the RADIUS server correctly to provide authentication and accounting functions.
- Configure the portal service on the IMC server, including setting portal server parameters, adding access devices, creating user IP address groups, and configuring device port groups to associate with IP address groups. This ensures coordinated implementation of portal authentication with the device.
- Configure the MAC binding server on the IMC server, including adding access policies, configuring access services and access users, setting system parameters (such as MAC-based quick portal authentication and terminal aging policy), and manually activate these parameters to apply them to the system. This helps achieve MAC address binding and MAC-based quick portal authentication for terminals.

Configuring the switch

1. Configure a RADIUS scheme:

   # Create a RADIUS scheme named **rs1** and enter its view.

   ```
   <Switch> system-view
   ```

```
[Switch] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[Switch-radius-rs1] primary authentication 192.168.0.112
[Switch-radius-rs1] primary accounting 192.168.0.112
[Switch-radius-rs1] key authentication simple radius
[Switch-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[Switch-radius-rs1] user-name-format without-domain
[Switch-radius-rs1] quit
```

Enable RADIUS session control.

```
[Switch] radius session-control enable
```

2. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[Switch] domain dm1
```

Configure AAA methods for the ISP domain.

```
[Switch-isp-dm1] authentication portal radius-scheme rs1
[Switch-isp-dm1] authorization portal radius-scheme rs1
[Switch-isp-dm1] accounting portal radius-scheme rs1
[Switch-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[Switch] domain default enable dm1
```

3. Configure portal authentication:

Configure a portal authentication server.

```
[Switch] portal server newpt
[Switch-portal-server-newpt] ip 192.168.0.111 key simple portal
[Switch-portal-server-newpt] port 50100
[Switch-portal-server-newpt] quit
```

Configure a portal Web server.

```
[Switch] portal web-server newpt
[Switch-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[Switch-portal-websvr-newpt] quit
```

Enable direct authentication on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal enable method direct
```

Specify the portal Web server **newpt** on VLAN-interface 100.

```
[Switch-Vlan-interface100] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[Switch-Vlan-interface100] portal bas-ip 2.2.2.1
[Switch-Vlan-interface100] quit
```

4. Configure MAC-based quick portal authentication:

Create the MAC binding server **mts**.

```
[Switch] portal mac-trigger-server mts
```

Set the free-traffic threshold for portal users to 1024000 bytes.

```
[Switch-portal-mac-trigger-server-mts] free-traffic threshold 1024000
```

Specify the IP address of the MAC binding server as 192.168.0.111.

```
[Switch-portal-mac-trigger-server-mts] ip 192.168.0.111
[Switch-portal-mac-trigger-server-mts] quit
```

Specify the MAC binding server **mts** on VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal apply mac-trigger-server mts
[Switch-Vlan-interface100] quit
```

Verifying the configuration

Display information about the MAC binding server.

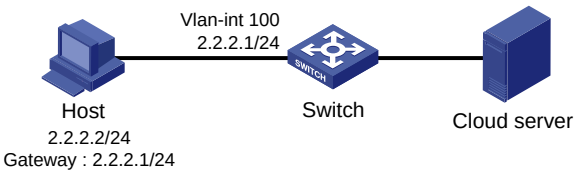
```
[Switch] display portal mac-trigger-server name mts
Portal mac trigger server name: mts
  Version                    : 1.0
  Server type                : IMC
  IP                         : 192.168.0.111
  Port                       : 50100
  VPN instance               : Not configured
  Aging time                 : 300 seconds
  Free-traffic threshold     : 1024000 bytes
  NAS-Port-Type              : Not configured
  Binding retry times        : 3
  Binding retry interval     : 1 seconds
  Authentication timeout     : 3 minutes
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

For the first portal authentication, the user is required to enter the username and password. When the user goes offline and then accesses the network again, the user does not need to enter the authentication username and password.

Display portal user information.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: Client1
  Portal server: newpt
  State: Online
  VPN instance: N/A
  MAC               IP                VLAN   Interface
  0015-e9a6-7cfe    2.2.2.2           100    Vlan-interface100
  Authorization information:
    DHCP IP pool: N/A
    User profile: N/A
    Session group profile: N/A
    ACL number: N/A
    Inbound CAR: N/A
    Outbound CAR: N/A
    Microsegment ID: N/A
```



Example: Configuring cloud MAC-trigger authentication

Network configuration

As shown in Figure 19, the host accesses the network through the switch. The host is assigned a public IP address either manually or through DHCP. A cloud server acts as a portal server (portal authentication server and portal Web server) and a MAC binding server.

Configure MAC-trigger authenticaiton (MAC-based quick portal authentication) that uses the cloud server, so the user can access only the portal Web server before passing the authentication and can access other network resources after passing the authentication. The user can pass portal authentication without entering a username or password when the user tries to come online again.

Figure 19 Network diagram

Configuring the cloud server

On the Oasis platform, enable **Auth free for reconnect** on the authentication template for the AC. (Details not shown.)

Configuring the switch

1. Configure IP addresses for the host, switch, and server and make sure they can reach each other. (Details not shown.)
2. Configure basic network functions:

   # Create VLAN 100. The host will use this VLAN to access the network.

   ```
   <Switch> system-view
   [Switch] vlan 100
   [Switch-vlan100] quit
   ```

   # Assign an IP address to the VLAN interface. (Details not shown.)

   # Enable DNS proxy.

   ```
   [Switch] dns proxy enable
   ```
3. Configure an authentication domain:

   # Create an ISP domain named **cloud** and enter its view.

   ```
   [Switch] domain cloud
   ```

   # Configure AAA methods for portal users in the ISP domain as none.

   ```
   [Switch-isp-cloud] authentication portal none
   [Switch-isp-cloud] authorization portal none
   [Switch-isp-cloud] accounting portal none
   [Switch-isp-cloud] quit
   ```
4. Configure cloud MAC-trigger authentication:

   # Configure a portal Web server named **wbs**.

   ```
   [Switch] portal web-server wbs
   [Switch-portal-websvr-wbs] url http://oasisauth.h3c.com
   [Switch-portal-websvr-wbs] server-type oauth
   [Switch-portal-websvr-wbs] url-parameter nas_id value
   cm-0-554212-210235A2G1B205000009
   [Switch-portal-websvr-wbs] url-parameter template_id value 4291
   ```

Create an HTTP-based local portal Web service and enter its view.

```
[Switch] portal local-web-server http
```

Enable cloud MAC-trigger authentication.

```
[Switch] portal mac-trigger-server abc
[Switch-portal-extend-auth-server-abc] cloud-binding enable
```

Specify **https://oasisauth.h3c.com** as the URL of the cloud portal authentication server.

```
[Switch-portal-extend-auth-server-abc] cloud-server url http://oasisauth.h3c.com
[Switch-portal-extend-auth-server-abc] quit
```

Enable direct portal authentication on interface VLAN-interface 100.

```
[Switch] interface vlan-interface 100
[Switch-Vlan-interface100] portal enable method direct
```

Specify the authentication domain, portal Web server, and MAC binding server on interface VLAN-interface 100.

```
[Switch-Vlan-interface100] portal domain cloud
[Switch-Vlan-interface100] portal apply web-server cloud
[Switch-Vlan-interface100] portal apply mac-trigger-server abc
```

Verifying the configuration

Display packet statistics for the cloud portal authentication server.

```
[Switch] display portal packet statistics extend-auth-server cloud
Extend-auth server : cloud
  Pkt-Type           Success      Error      Timeout      Conn-failure
  REQ_ACCESSTOKEN    1            0          0            0
  REQ_USERINFO       1            0          0            0
  RESP_ACCESSTOKEN   1            0          0            0
  RESP_USERINFO      1            0          0            0
  POST_ONLINEDATA    10           0          0            0
  RESP_ONLINEDATA    10           0          0            0
  POST_OFFLINEUSER   1            0          0            0
  REPORT_ONLINEUSER  2            0          0            0
  REQ_CLOUDBIND      2            0          0            0
  ESP_CLOUDBIND      2            0          0            0
  REQ_BINDUSERINFO   1            0          0            0
  RESP_BINDUSERINFO  1            0          0            0
  AUTHENTICATION     2            0          0            0
```

Before passing portal authentication, a user can access only the portal authentication page **http://oasisauth.h3c.com**. All Web requests from the user will be redirected to the portal authentication page. After passing portal authentication, the user can access other network resources.

The user needs to enter the username and password for the first authentication. If the user goes offline and then tries to come online, the user can directly access the network resources without entering the username and password.

Display information about portal users.

```
[Switch] display portal user interface vlan-interface 100
Total portal users: 1
Username: Client1
  Portal server: newpt
  State: Online
  VPN instance: N/A
```

```
MAC               IP                VLAN   Interface
0015-e9a6-7cfe    2.2.2.2           --     vlan-interface 100
Authorization information:
  DHCP IP pool: N/A
  User profile: N/A
  Session group profile: N/A
  ACL number: N/A
  Inbound CAR: N/A
  Outbound CAR: N/A
  Microsegment ID: N/A
```

Example: Configuring portal authentication to support M-LAG

Network configuration

As shown in Figure 20, the hosts access the network through Device C (Layer 2 device). Each host is assigned a public IP address either manually or through DHCP.

An IMC server acts as a portal server (portal authentication server and portal Web server). A RADIUS server acts as the authentication and accounting server.

Configure the devices as follows:

- Configure direct portal authentication, so the hosts can access only the portal server before passing the authentication and access other network resources after passing the authentication.
- Configure Device A and Device B to form an M-LAG system to load share traffic. When a device fails, the other device can take over to ensure service continuity.
- Set the authentication load sharing mode to distributed if a large number of portal users exist.

Figure 20 Network diagram

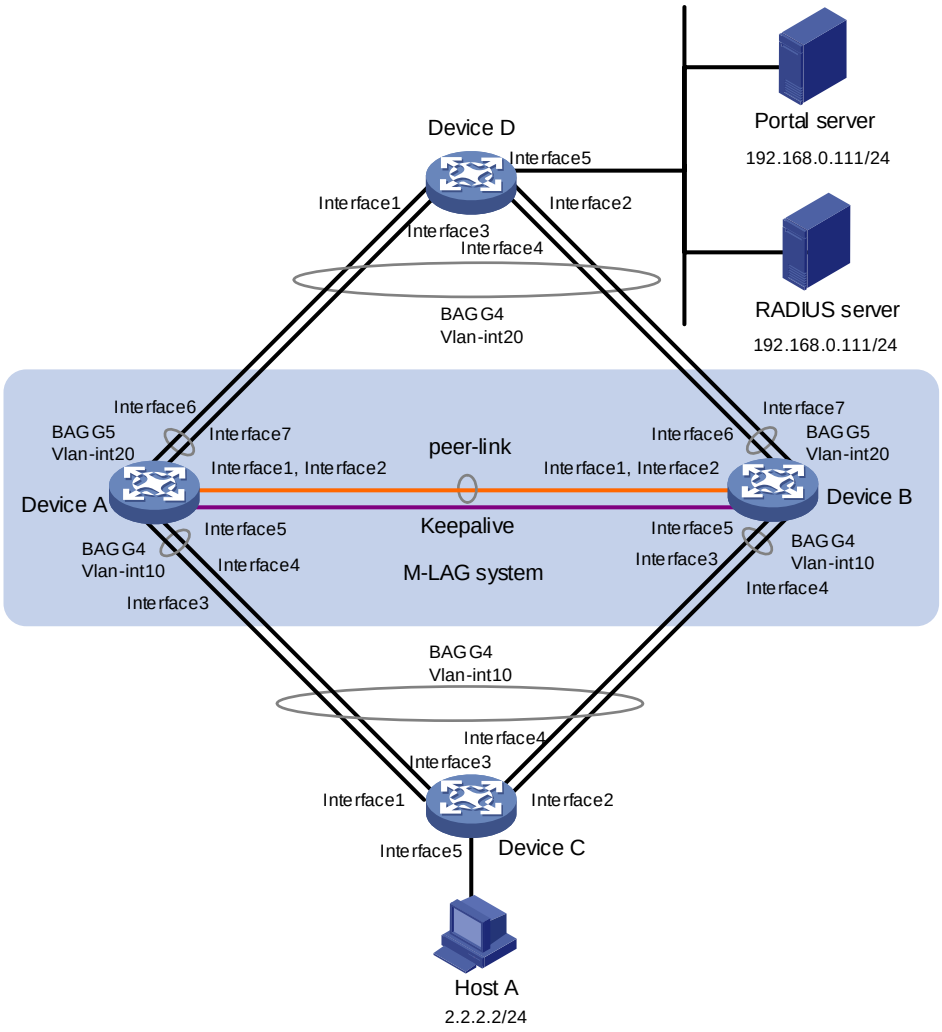


Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4
Interface5	GigabitEthernet1/0/5
Interface6	GigabitEthernet1/0/6
Interface7	GigabitEthernet1/0/7

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Device A	Vlan-int10	2.2.2.1/24	Device B	Vlan-int10	2.2.2.1/24
Device A	Vlan-int20	3.3.3.1/24	Device B	Vlan-int20	3.3.3.1/24
Device A	GE1/0/3	1.1.1.1/24	Device B	GE1/0/3	1.1.1.2/24
Device C	Vlan-int10	2.2.2.3/24	Device D	Vlan-int10	3.3.3.3/24

Prerequisites

1. Configure IP addresses for the host, switch, and servers as shown in Figure 20 and make sure they can reach each other.
2. Configure the RADIUS server correctly to provide authentication and accounting functions.
3. Configure the portal service on the IMC server, including setting portal server parameters, adding access devices, creating user IP address groups, and configuring device port groups to associate with IP address groups. This ensures coordinated implementation of portal authentication with the device.

Configuring the M-LAG system

1. Configure Device A.

   # Configure M-LAG system settings.

   ```
   <DeviceA> system-view
   [DeviceA] m-lag system-mac 1-1-1
   [DeviceA] m-lag system-number 1
   [DeviceA] m-lag system-priority 123
   ```

   # Configure the destination and source IP addresses of keepalive packets.

   ```
   [DeviceA] m-lag keepalive ip destination 1.1.1.1 source 1.1.1.2
   ```

   # Configure port GigabitEthernet 1/0/3 to operate in Layer 3 mode and configure the source IP address of keepalive packets as the IP address of this port.

   ```
   [DeviceA] interface gigabitethernet 1/0/3
   [DeviceA-GigabitEthernet1/0/3] port link-mode route
   [DeviceA-GigabitEthernet1/0/3] ip address 1.1.1.2 24
   [DeviceA-GigabitEthernet1/0/3] quit
   ```

   # Exclude GigabitEthernet 1/0/5 (keepalive interface) from being shut down upon detection of multi-active collisions.

   ```
   [DeviceA] m-lag mad exclude interface gigabitethernet 1/0/5
   ```

   # Create Layer 2 aggregate interface Bridge-Aggregation 3 and set the aggregation mode to dynamic.

   ```
   [DeviceA] interface bridge-aggregation 3
   [DeviceA-Bridge-Aggregation3] link-aggregation mode dynamic
   [DeviceA-Bridge-Aggregation3] quit
   ```

   # Assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to aggregation group 3.

   ```
   [DeviceA] interface gigabitethernet 1/0/1
   [DeviceA-GigabitEthernet1/0/1] port link-aggregation group 3
   [DeviceA-GigabitEthernet1/0/1] quit
   [DeviceA] interface gigabitethernet 1/0/2
   [DeviceA-GigabitEthernet1/0/2] port link-aggregation group 3
   [DeviceA-GigabitEthernet1/0/2] quit
   ```

   # Configure Layer 2 aggregate interface Bridge-Aggregation 3 as a trunk port, add the interface to VLAN 10 and VLAN 20, and configure the interface as a peer-link interface.

   ```
   [DeviceA] interface bridge-aggregation 3
   [DeviceA-Bridge-Aggregation3] port link-type trunk
   [DeviceA-Bridge-Aggregation3] port trunk permit vlan 10 20
   [DeviceA-Bridge-Aggregation3] port m-lag peer-link 1
   [DeviceA-Bridge-Aggregation3] quit
   ```

   # Allow packets from the peer-link interface to prevent packets from the peer end from being discarded due to portal deny rules.

   ```
   [DeviceA] portal free-rule 1 source interface bridge-aggregation 3
   ```

Create Layer 2 aggregate interface Bridge-Aggregation 4 and set the aggregation mode to dynamic.

```
[DeviceA] interface bridge-aggregation 4
[DeviceA-Bridge-Aggregation4] link-aggregation mode dynamic
[DeviceA-Bridge-Aggregation4] quit
```

Assign GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 to aggregation group 4.

```
[DeviceA] interface gigabitethernet 1/0/3
[DeviceA-GigabitEthernet1/0/3] port link-aggregation group 4
[DeviceA-GigabitEthernet1/0/3] quit
[DeviceA] interface gigabitethernet 1/0/4
[DeviceA-GigabitEthernet1/0/4] port link-aggregation group 4
[DeviceA-GigabitEthernet1/0/4] quit
```

Add Layer 2 aggregate interface Bridge-Aggregation 4 to VLAN 10, and configure the interface as an M-LAG interface.

```
[DeviceA] interface bridge-aggregation 4
[DeviceA-Bridge-Aggregation4] port access vlan 10
[DeviceA-Bridge-Aggregation4] port m-lag group 4
[DeviceA-Bridge-Aggregation4] quit
```

Create Layer 2 aggregate interface Bridge-Aggregation 5 and set the aggregation mode to dynamic.

```
[DeviceA] interface bridge-aggregation 5
[DeviceA-Bridge-Aggregation5] link-aggregation mode dynamic
[DeviceA-Bridge-Aggregation5] quit
```

Assign GigabitEthernet 1/0/6 and GigabitEthernet 1/0/7 to aggregation group 5.

```
[DeviceA] interface gigabitethernet 1/0/6
[DeviceA-GigabitEthernet1/0/6] port link-aggregation group 5
[DeviceA-GigabitEthernet1/0/6] quit
[DeviceA] interface gigabitethernet 1/0/7
[DeviceA-GigabitEthernet1/0/7] port link-aggregation group 5
[DeviceA-GigabitEthernet1/0/7] quit
```

Add Layer 2 aggregate interface Bridge-Aggregation 5 to VLAN 10, and configure the interface as an M-LAG interface.

```
[DeviceA] interface bridge-aggregation 5
[DeviceA-Bridge-Aggregation5] port access vlan 20
[DeviceA-Bridge-Aggregation5] port m-lag group 5
[DeviceA-Bridge-Aggregation5] quit
```

2. Configure Device B in the same way Device A is configured.

3. Configure Device C.

Create Layer 2 aggregate interface Bridge-Aggregation 4 and set the aggregation mode to dynamic.

```
<DeviceC> system-view
[DeviceC] interface bridge-aggregation 4
[DeviceC-Bridge-Aggregation4] link-aggregation mode dynamic
[DeviceC-Bridge-Aggregation4] quit
```

Assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to aggregation group 4.

```
[DeviceC] interface range gigabitethernet 1/0/1 to gigabitethernet 1/0/4
[DeviceC-if-range] port link-aggregation group 4
[DeviceC-if-range] quit
```

Add Layer 2 aggregate interface Bridge-Aggregation 4 to VLAN 100.

```
[DeviceC] interface bridge-aggregation 4
[DeviceC-Bridge-Aggregation4] port access vlan 10
[DeviceC-Bridge-Aggregation4] quit
```

Add GigabitEthernet 1/0/5 through GigabitEthernet 1/0/7 to VLAN 10.

```
[DeviceC] interface range gigabitethernet 1/0/5 to gigabitethernet 1/0/7
[DeviceC-if-range] port access vlan 10
[DeviceC-if-range] quit
```

4. Configure Device D in the same way Device C is configured.

Configuring portal authentication

1. Configure Device A.

a. Configure a RADIUS scheme:

Create a RADIUS scheme named **rs1** and enter its view.

```
<DeviceA> system-view
[DeviceA] radius scheme rs1
```

Specify the primary authentication server and primary accounting server, and configure the keys for communication with the servers.

```
[DeviceA-radius-rs1] primary authentication 192.168.0.112
[DeviceA-radius-rs1] primary accounting 192.168.0.112
[DeviceA-radius-rs1] key authentication simple radius
[DeviceA-radius-rs1] key accounting simple radius
```

Exclude the ISP domain name from the username sent to the RADIUS server.

```
[DeviceA-radius-rs1] user-name-format without-domain
[DeviceA-radius-rs1] quit
```

b. Configure an authentication domain:

Create an ISP domain named **dm1** and enter its view.

```
[DeviceA] domain dm1
```

Configure AAA methods for the ISP domain.

```
[DeviceA-isp-dm1] authentication portal radius-scheme rs1
[DeviceA-isp-dm1] authorization portal radius-scheme rs1
[DeviceA-isp-dm1] accounting portal radius-scheme rs1
[DeviceA-isp-dm1] quit
```

Configure domain **dm1** as the default ISP domain. If a user enters the username without the ISP domain name at login, the authentication and accounting methods of the default domain are used for the user.

```
[DeviceA] domain default enable dm1
```

c. Configure portal authentication:

Configure a portal authentication server.

```
[DeviceA] portal server newpt
[DeviceA-portal-server-newpt] ip 192.168.0.111 key simple portal
[DeviceA-portal-server-newpt] port 50100
[DeviceA-portal-server-newpt] quit
```

Configure a portal Web server.

```
[DeviceA] portal web-server newpt
[DeviceA-portal-websvr-newpt] url http://192.168.0.111:8080/portal
[DeviceA-portal-websvr-newpt] quit
```

Enable direct portal authentication on VLAN-interface 100.

```
[DeviceA] interface vlan 10
[DeviceA–Vlan-interface10] portal enable method direct
```

Specify portal Web server **newpt** on VLAN-interface 100.

```
[DeviceA–Vlan-interface10] portal apply web-server newpt
```

Configure the BAS-IP as 2.2.2.1 for portal packets sent from VLAN-interface 100 to the portal authentication server.

```
[DeviceA–Vlan-interface10] portal bas-ip 2.2.2.1
[DeviceA–Vlan-interface10] quit
```

Set the authentication load sharing mode to distributed and set the distribution criterion to even-IP.

```
[DeviceA] portal m-lag load-sharing-mode distributed even-ip
```

2. Configure Device B.

Set the authentication load sharing mode to distributed and set the distribution criterion to odd-IP.

```
[DeviceB] portal m-lag load-sharing-mode distributed odd-ip
```

Configure other configuration on Device B in the same way Device A is configured.

Verifying the configuration

Verify that the portal configuration has taken effect.

```
[DeviceA] display portal interface vlan-interface 10
 Portal information of Vlan-interface10
     NAS-ID profile: Not configured
     M-LAG Group ID : 4
     M-LAG role     : Master

        IP address                                      Prefix length

    Destination authentication subnet:
        IP address                                      Prefix length
```

A user can perform portal authentication by using the iNode client or through a Web browser. Before passing the authentication, the user can access only the authentication page **http://192.168.0.111:8080/portal**. All Web requests from the user will be redirected to the authentication page. After passing the authentication, the user can access other network resources.

After the user passes authentication, display information about the portal user on Device A.

```
[DeviceA] display portal user interface vlan-interface 10 verbose
Total portal users: 1
Basic:
  Current IP address: 2.2.2.2
  Original IP address: 2.2.2.2
  Username: 11
  User ID: 0x10000012
  Access interface: Vlan-interface10

```

Troubleshooting portal

No portal authentication page is pushed for users

Symptom

When a user is redirected to the IMC portal authentication server, no portal authentication page or error message is prompted for the user. The login page is blank.

Analysis

The key configured on the portal access device and that configured on the portal authentication server are inconsistent. As a result, packet verification fails, and the portal authentication server refuses to push the authentication page.

Solution

Use the **display this** command in portal authentication server view on the access device to check whether a key is configured for the portal authentication server.

- If no key is configured, configure the right key.
- If a key is configured, use the **ip** or **ipv6** command in the portal authentication server view to correct the key, or correct the key configured for the access device on the portal authentication server.

Cannot log out portal users on the access device

Symptom

You cannot use the **portal delete-user** command on the access device to log out a portal user, but the portal user can log out by clicking the **Disconnect** button on the portal authentication client.

Analysis

When you execute the **portal delete-user** command on the access device to log out a user, the access device sends an unsolicited logout notification message to the portal authentication server. The destination port number in the logout notification is the listening port number of the portal authentication server configured on the access device. If this listening port number is not the actual listening port number configured on the server, the server cannot receive the notification. As a result, the server does not log out the user.

When a user uses the **Disconnect** button on the authentication client to log out, the portal authentication server sends an unsolicited logout request message to the access device. The

access device uses the source port in the logout request as the destination port in the logout ACK message. As a result, the portal authentication server can definitely receive the logout ACK message and log out the user.

Solution

1. Use the **display portal server** command to display the listening port of the portal authentication server configured on the access device.
2. Use the **portal server** command in system view to change the listening port number to the actual listening port of the portal authentication server.

Cannot log out portal users on the RADIUS server

Symptom

The access device uses the IMC server as the RADIUS server to perform identity authentication for portal users. You cannot log out the portal users on the RADIUS server.

Analysis

The IMC server uses session control packets to send disconnection requests to the access device. On the access device, the listening UDP port for session control packets is disabled by default. Therefore, the access device cannot receive the portal user logout requests from the RADIUS server.

Solution

On the access device, execute the **radius session-control enable** command in system view to enable the RADIUS session control function.

Users logged out by the access device still exist on the portal authentication server

Symptom

After you log out a portal user on the access device, the user still exists on the portal authentication server.

Analysis

When you execute the **portal delete-user** command on the access device to log out a user, the access device sends an unsolicited logout notification to the portal authentication server. If the BAS-IP or BAS-IPv6 address carried in the logout notification is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the logout notification. When sending of the logout notifications times out, the access device logs out the user. However, the portal authentication server does not receive the logout notification successfully, and therefore it regards the user is still online.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

Re-DHCP portal authenticated users cannot log in successfully

Symptom

The device performs re-DHCP portal authentication for users. A user enters the correct username and password, and the client successfully obtains the private and public IP addresses. However, the authentication result for the user is failure.

Analysis

When the access device detects that the client IP address is changed, it sends an unsolicited portal packet to notify of the IP change to the portal authentication server. The portal authentication server notifies of the authentication success only after it receives the IP change notification from both the access device and the client.

If the BAS-IP or BAS-IPv6 address carried in the portal notification packet is different from the portal device IP address specified on the portal authentication server, the portal authentication server discards the portal notification packet. As a result, the portal authentication server considers that the user has failed the authentication.

Solution

Configure the BAS-IP or BAS-IPv6 attribute on the interface enabled with portal authentication. Make sure the attribute value is the same as the portal device IP address specified on the portal authentication server.

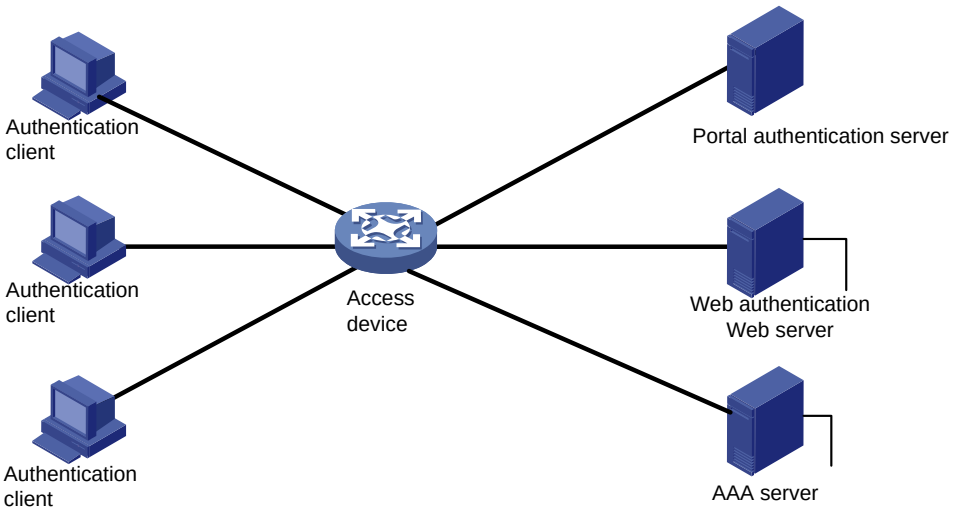
Configuring Web authentication

About Web authentication

Web authentication is deployed on Layer 2 interfaces of the access device to control user access to networks. The access device redirects unauthenticated users to the specified website. The users can access the resources on the website without authentication. If the users want to access other network resources, they must pass authentication.

Advantages of Web authentication



Web authentication has the following advantages:
