EXOS Command Reference Guide for Release 15.3.2

extreme networks™

Table of Contents

1 Introduction to the ExtremeXOS Command Reference Guide

This guide provides the complete syntax for all the commands available in the currently supported versions of the ExtremeXOS® software running on switches from Extreme Networks®. Included with each command is a description, the default if applicable, usage guidelines, an example, a history of the command and platform availability.

This guide is intended for use as a reference by network administrators who are responsible for installing and setting up network equipment. It assumes knowledge of Extreme Networks switch configuration. For conceptual information and guidance on configuring Extreme Networks switches, see the ExtremeXOS Concepts Guide for your version of the ExtremeXOS software.

Using ExtremeXOS Publications Online

You can access ExtremeXOS publications at the Extreme Networks website (www.extremenetworks.com). Publications are provided in HTML, ePub, and Adobe® PDF formats.

To navigate this guide online, use the table of contents found in the navigation bar on the left. You can also use the prev | next links at the top and bottom of the page.

To download the EXOS books in PDF or ePub format, click the links below:

EXOS Commands PDF
EXOS Commands ePub

Note
To enable cross-referenced linking between the concepts and command reference guides in the PDF, we recommend that you keep both files open on your computer desktop.

Conventions

This section discusses the conventions used in this guide.

Text Conventions

The following tables list conventions that are used throughout this guide.

Table 1: Notice Icons

Icon	Notice Type	Alerts you to...
	Note	Important features or instructions.
	Caution	Risk of personal injury, system damage, or loss of data.
	Warning	Risk of severe personal injury.
	New	This command or section is new for this release.

Table 2: Text Conventions

Convention	Description
`Screen displays`	This typeface indicates command syntax, or represents information as it appears on the screen.
The words **enter** and **type**	When you see the word "enter" in this guide, you must type something, and then press the Return or Enter key. Do not press the Return or Enter key when an instruction simply says "type."
[Key] names	Key names are written with brackets, such as [Return] or [Esc]. If you must press two or more keys simultaneously, the key names are linked with a plus sign (+). Example: Press [Ctrl]+[Alt]+[Del]
Words in italicized type	Italics emphasize a point or denote new terms at the place where they are defined in the text. (Italics are also used when referring to publication titles.)

Platform-Dependent Conventions

Following are the platforms supported by ExtremeXOS software:

- BlackDiamond® X8 series switch
- BlackDiamond 8800 series switches
- Summit® family switches
- E4G-200 Cell Site Router

- E4G-400 Cell Site Aggregation Router
- SummitStack™

Each command has a separate entry for platform availability that addresses which of these platforms support the entire feature.

In many cases, although the command is available on all platforms, each platform uses specific keywords. These keywords specific to each platform are shown in the Syntax Description and discussed in the Usage Guidelines.

Terminology

When features, functionality, or operation is specific to a switch family, the family name is used. Explanations about features and operations that are the same across all product families simply refer to the product as the "switch."

Providing Feedback to Us

We are always striving to improve our documentation and help you work better, so we want to hear from you! We welcome all feedback but especially want to know about:

- Content errors or confusing or conflicting information.
- Ideas for improvements to our documentation so you can find the information you need faster.
- Broken links or usability issues.

If you would like to provide feedback to the Extreme Networks Information Development team about this document, please contact us using our short online Feedback form. You can also email us directly at internalinfodev@extremenetworks.com.

2 Command Reference Overview

Introduction

This guide provides details of the command syntax for all ExtremeXOS commands in this ExtremeXOS version.

The guide does not provide feature descriptions, explanations of the technologies, or configuration examples. For information about the various features and technologies supported by Extreme Networks switches, see the ExtremeXOS Concepts Guide.

This chapter includes the following sections:

- Audience
- Structure of this Guide
- Platforms and Required Software Versions
- Understanding the Command Syntax
- Port Numbering
- Line-Editing Keys
- Command History

Structure of this Guide

This guide documents each ExtremeXOS command.

Related commands are grouped together and organized into chapters based on their most common usage. The chapters reflect the organization of the ExtremeXOS Concepts Guide. If a specific command is relevant to a wide variety of functions and could be included in a number of different chapters, we have attempted to place the command in the most logical chapter. Within each chapter, commands appear in alphabetical order.

For each command, the following information is provided:

- Command Syntax—The actual syntax of the command. The syntax conventions (the use of braces, for example) are defined in the section Understanding the Command Syntax.
- Description—A brief (one sentence) summary of what the command does.
- Syntax Description—The definition of any keywords and options used in the command.
- Default—The defaults, if any, for this command. The default can be the default action of the command if optional arguments are not provided, or it can be the default state of the switch (such as for an enable/disable command).
- Usage Guidelines—Information to help you use the command. This may include prerequisites, prohibitions, and related commands, as well as other information.
- Example—Examples of the command usage, including output, if relevant.
- History—The version of ExtremeXOS in which the command was introduced, and version(s) where it was modified, if appropriate.
- Platform Availability—Platforms on which the command is available.

Platforms and Required Software Versions

The following table lists the Extreme Networks platforms that run ExtremeXOS software.

Table 3: ExtremeXOS Switches

Switch Series	Switches
BlackDiamond X Series	BlackDiamond X8
BlackDiamond 8800 Series	BlackDiamond 8810 BlackDiamond 8806
Mobile Backhaul Products	E4G-200 Cell Site Router E4G-400 Cell Site Aggregation Router
Summit X150 Series	Summit X150-24p Summit X150-24t Summit X150-48t
Summit X250e Series	Summit X250e-24p Summit X250e-24t Summit X250e-24tDC Summit X250e-24x Summit X250e-24xDC Summit X250e-48p Summit X250e-48t Summit X250e-48tDC
Summit X350 Series	Summit X350-24t Summit X350-48t
Summit X430 Series	Summit X430-24t Summit X430-48t
Summit X440 Series	Summit X440-8t Summit X440-8p Summit X440-24t Summit X440-24p Summit X440-24t-10G Summit X440-24p-10G Summit X440-48t Summit X440-48p Summit X440-48t-10G Summit X440-48p-10G Summit X440-L2-24t Summit X440-L2-48t
Summit X450a Series	Summit X450a-24t Summit X450a-24tDC Summit X450a-24x Summit X450a-24xDC Summit X450a-48t Summit X450a-48tDC
Summit X450e Series	Summit X450e-24p Summit X450e-24t Summit X450e-48p Summit X450e-48t

Table 3: ExtremeXOS Switches (continued)

Switch Series	Switches
Summit X460 Series	Summit X460-24x Summit X460-24t Summit X460-24p Summit X460-48x Summit X460-48t Summit X460-48p
Summit X480 Series	Summit X480-24x Summit X480-48x Summit X480-48t
Summit X650 Series	Summit X650-24t Summit X650-24x
Summit X670 Series	Summit X670-48x Summit X670V-48x Summit X670V-48t
SummitStack	All Summit family switches, except the Summit X150, Summit X350, and Summit X440-L2 model series.

Software Required

The tables in this section describe the software version required for each switch that runs ExtremeXOS software.

Note

The features available on each switch are determined by the installed feature license and optional feature packs. For more information, see Feature License Requirements

The following table lists the BlackDiamond X8 series modules and the ExtremeXOS software version required to support each module.

Table 4: BlackDiamond X8 Series Modules and Required Software

Module Series Name	Modules	Minimum ExtremeXOS Software Version
BlackDiamond X8	BDX-MM1	15.1.1
	BDXA-FM10T	15.1.1
	BDXA-FM20T	15.1.1
	BDXA-10G48X	15.1.1
	BDXA-40G12X	15.1.1
	BDXA-40G24X	15.1.1

The following table lists the BlackDiamond 8000 series modules and the ExtremeXOS software version required to support each module.

Table 5: BlackDiamond 8000 Series Modules and Required Software

Module Series Name	Modules	Minimum ExtremeXOS Software Version
MSMs	8500-MSM24 MSM-48c 8900-MSM128	ExtremeXOS 12.3 ExtremeXOS 12.1 ExtremeXOS 12.3
c-series	G24Xc G48Xc 10G4Xc 10G8Xc G48Tc S-10G1Xc S-10G2Xc S-G8Xc	ExtremeXOS 12.1 ExtremeXOS 12.1 ExtremeXOS 12.1 ExtremeXOS 12.1 ExtremeXOS 12.1 ExtremeXOS 12.5.3 ExtremeXOS 12.1
	8900-G96T-c 8900-10G24X-c	ExtremeXOS 12.3
e-series	8500-G24X-e 8500-G48T-e G48Te2	ExtremeXOS 12.3 ExtremeXOS 12.3 ExtremeXOS 12.1
xl-series	8900-G48X-xl 8900-G48T-xl 8900-10G8X-xl	ExtremeXOS 12.4
xm-series	8900-40G6X-xm	ExtremeXOS 12.6

The following guidelines provide additional information on the BlackDiamond 8000 series modules described in Table 5: BlackDiamond 8000 Series Modules and Required Software on page 62:

- The term BlackDiamond 8000 series modules refers to all BlackDiamond 8500, 8800, and 8900 series modules. Beginning with the ExtremeXOS 12.5 release, it does not include other modules formerly listed as original-series modules.
- Module names that are not preceded with 8500 or 8900 are BlackDiamond 8800 series modules.
- The c-series, e-series, xl-series, and xm-series names are used to distinguish between groups of modules that support different feature sets.

The following table lists the Summit family switches that run ExtremeXOS software and the minimum ExtremeXOS software version required.

Table 6: Summit Family Switches and Required Software

Switch Series	Switches	Minimum ExtremeXOS Software Version
Summit X150 Series	Summit X150-24t Summit X150-24p Summit X150-48t	ExtremeXOS 12.0
Summit X250e Series	Summit X250e-24t Summit X250e-24tDC Summit X250e-48t Summit X250e-48tDC Summit X250e-24p Summit X250e-48p Summit X250e-24x Summit X250e-24xDC	ExtremeXOS 12.0 ExtremeXOS 12.1 ExtremeXOS 12.0 ExtremeXOS 12.1 ExtremeXOS 12.0 ExtremeXOS 12.0 ExtremeXOS 12.0 ExtremeXOS 12.1
Summit X350 Series	Summit X350-24t Summit X350-48t	ExtremeXOS 12.1
Summit X430 Series	Summit X430-24T Summit X430-48T	ExtremeXOS 15.3.2

Table 6: Summit Family Switches and Required Software (continued)

Switch Series	Switches	Minimum ExtremeXOS Software Version
Summit X440 Series	Summit X440-24t Summit X440-24p	ExtremeXOS 15.1.1
	Summit X440-8t Summit X440-8p Summit X440-24t-10G Summit X440-24p-10G Summit X440-48t Summit X440-48p Summit X440-48t-10G Summit X440-48p-10G	ExtremeXOS 15.1.2
	Summit X440-L2-24t Summit X440-L2-48t	ExtremeXOS 15.2.1
Summit X450a Series	Summit X450a-24x Summit X450a-24xDC Summit X450a-24t Summit X450a-24tDC Summit X450a-48t Summit X450a-48tDC	ExtremeXOS 11.6 ExtremeXOS 11.6 ExtremeXOS 11.5 ExtremeXOS 11.5 ExtremeXOS 11.5 ExtremeXOS 11.6
Summit X450e Series	Summit X450e-24p Summit X450e-24t Summit X450e-48p Summit X450e-48t	ExtremeXOS 11.5 ExtremeXOS 12.5 ExtremeXOS 11.6 ExtremeXOS 11.5
Summit X460 Series	Summit X460-24x Summit X460-24t Summit X460-24p Summit X460-48x Summit X460-48t Summit X460-48p	ExtremeXOS 12.5
Summit X480 Series	Summit X480-24x Summit X480-48x Summit X480-48t	ExtremeXOS 12.4
Summit X650 Series	Summit X650-24t Summit X650-24x	ExtremeXOS 12.2.2 ExtremeXOS 12.2.1
Summit X670	Summit X670-48x Summit X670V-48x	ExtremeXOS 12.6
SummitStack	Summit family of switches except the Summit X150 and Summit X350 series.	ExtremeXOS 12.0

Beginning with the ExtremeXOS 12.5 release, the term Summit Family Switches includes the Summit X150, X250e, X350, X440, X450a, X450e, X460, X480, X650, and X670 switches. It does not include the Summit X450 switch that is sometimes referred to as the Summit X450 original switch.

A SummitStack is a combination of up to eight Summit family switches (excluding the Summit X150, Summit X350, and Summit X440-L2 series) that are connected together with stacking cables.

The mobile backhaul routers (E4G-200 and E4G-400) both require ExtremeXOS version 15.1.

Understanding the Command Syntax

This section covers the following topics:

Access Levels

When entering a command at the prompt, ensure that you have the appropriate privilege level.

Most configuration commands require you to have the administrator privilege level.

Syntax Symbols

You may see a variety of symbols shown as part of the command syntax.

These symbols explain how to enter the command, and you do not type them as part of the command itself. The following table summarizes command syntax symbols.

Note

ExtremeXOS software does not support the ampersand (&), left angle bracket (<), or right angle bracket (>), because they are reserved characters with special meaning in XML.

Table 7: Command Syntax Symbols

Symbol	Description
angle brackets < >	Enclose a variable or value. You must specify the variable or value. For example, in the syntax configure vlan <vlan_name> ipaddress <ip_address> you must supply a VLAN name for <vlan_name> and an address for <ip_address> when entering the command. Do not type the angle brackets and do not include spaces within angle brackets.
square brackets [ ]	Enclose a required value or list of required arguments. One or more values or arguments can be specified. For example, in the syntax use image [primary | secondary] you must specify either the primary or secondary image when entering the command. Do not type the square brackets.

Table 7: Command Syntax Symbols (continued)

Symbol	Description
vertical bar |	Separates mutually exclusive items in a list, one of which must be entered. For example, in the syntax configure snmp community [readonly | readwrite] <alphanumeric_string> you must specify either the read or write community string in the command. Do not type the vertical bar.
braces { }	Enclose an optional value or a list of optional arguments. One or more values or arguments can be specified. For example, in the syntax reboot {time <month> <day> <year> <hour> <min> <sec>} {cancel} {msm <slot_id>} {slot <slot-number> | node-address <node-address> | stack-topology {as-standby} } you can specify either a particular date and time combination, or the keyword cancel to cancel a previously scheduled reboot. (In this command, if you do not specify an argument, the command will prompt asking if you want to reboot the switch now.) Do not type the braces.

Syntax Helper

The CLI has a built-in syntax helper. If you are unsure of the complete syntax for a particular command, enter as much of the command as possible and press [Tab]. The syntax helper provides a list of options for the remainder of the command, and places the cursor at the end of the command you have entered so far, ready for the next option.

If the command is one where the next option is a named component, such as a VLAN, access profile, or route map, the syntax helper also lists any currently configured names that might be used as the next option. In situations where this list might be very long, the syntax helper lists only one line of names, followed by an ellipses (...) to indicate that there are more names than can be displayed.

Some values (such as the <node-address> used in Summit stack) are lengthy, but limited in number. ExtremeXOS places these values into a “namespace.” This allows command completion on these values.

The syntax helper also provides assistance if you have entered an incorrect command.

Abbreviated Syntax

Abbreviated syntax is the shortest unambiguous allowable abbreviation of a command or parameter.

Typically, this is the first three letters of the command. If you do not enter enough letters to allow the switch to determine which command you mean, the syntax helper provides a list of the options based on the portion of the command you have entered.

Note

When using abbreviated syntax, you must enter enough characters to make the command unambiguous and distinguishable to the switch.

Object Names

All named components within a category of the switch configuration, such as VLAN, must be given a unique object name.

Object names must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but they cannot contain spaces. The maximum allowed length for a name is 32 characters.

Object names can be reused across categories (for example, STPD and VLAN names). If the software encounters any ambiguity in the components within your command, it generates a message requesting that you clarify the object you specified.

Note

If you use the same name across categories, Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Reserved Keywords

Keywords such as vlan, stp, and other 2nd level keywords, are determined to be reserved keywords and cannot be used as object names. This restriction applies to the specific word (vlan) only, while expanded versions (vlan2) can be used.

A complete list of the reserved keywords for ExtremeXOS 12.4.2 and later software is displayed in the ExtremeXOS Concepts Guide. Any keyword that is not on this list can be used as an object name. Prior to 12.4.2, all keywords were reserved, that is, none of them could be used for naming user-created objects such as VLANs.

Command Shortcuts

Components are typically named using the create command.

When you enter a command to configure a named component, you do not need to use the keyword of the component. For example, to create a VLAN, enter a VLAN name:

```
create vlan engineering
```

Once you have created the VLAN with a unique name, you can then eliminate the keyword vlan from all other commands that require the name to be entered (unless you used the same name for another category such as STPD or EAPS). For example, instead of entering the modular switch command:

```
configure vlan engineering delete port 1:3,4:6
```

you could enter the following shortcut:

```
configure engineering delete port 1:3,4:6
```

Port Numbering

Commands that require you to enter one or more port numbers use the parameter <port_list> in the syntax.

The available variables differ on a stand-alone switch, modular switch, mobile backhaul routers, and SummitStack.

Note

The keyword all acts on all possible ports; it continues on all ports even if one port in the sequence fails.

Stand-alone Switch Numerical Ranges

On Summit family switches, the port number is simply noted by the physical port number (such as **5**).

Separate the port numbers by a dash to enter a range of contiguous numbers, and separate the numbers by a comma to enter a range of non-contiguous numbers:

- x-y—Specifies a contiguous series of ports on a stand-alone switch.
- x,y—Specifies a noncontiguous series of ports on a stand-alone switch.
- x-y,a,d—Specifies a contiguous series of ports and a noncontiguous series of ports on a stand-alone switch.

Modular Switch and SummitStack Numerical Ranges

On modular switches, such as the BlackDiamond 8800 series or a SummitStack, the port number is a combination of the slot number and the port number.

The nomenclature for the port number is as follows:

slot:port

Example

If an I/O module that has a total of four ports is installed in slot 2 of the chassis, the following ports are valid:

- 2:1
- 2:2
- 2:3
- 2:4

Wildcards and combinations

You can also use wildcard combinations (*) to specify multiple modular slot and port combinations. The following wildcard combinations are allowed:

- slot:*—Specifies all ports on a particular I/O module.
- slot:x-slot:y—Specifies a contiguous series of ports on a particular I/O module.

- slot:x-y—Specifies a contiguous series of ports on a particular I/O module.
- slota:x-slotb:y—Specifies a contiguous series of ports that begin on one I/O module or SummitStack node and end on another node.

Mobile Backhaul Routers

Commands operating on a <port_list> for mobile backhaul routers all use the keyword “tdm.” When the tdm keyword is present, the <port_list> is expanded to include only time division multiplexing (TDM) ports, omitting any Ethernet ports occurring within the <port_list> range.

Existing CLI commands without the tdm keyword continue to work as usual without any change, and these commands omit any TDM ports that may lie within the <port_list> range.

Line-Editing Keys

The following table describes the line-editing keys available using the CLI.

Table 8: Line-Editing Keys

Key(s)	Description
Left arrow or [Ctrl] + B	Moves the cursor one character to the left.
Right arrow or [Ctrl] + F	Moves the cursor one character to the right.
[Ctrl] + H or Backspace	Deletes character to left of cursor and shifts remainder of line to left.
Delete or [Ctrl] + D	Deletes character under cursor and shifts remainder of line to left.
[Ctrl] + K	Deletes characters from under cursor to end of line.
Insert	Toggles on and off. When toggled on, inserts text and shifts previous text to right.
[Ctrl] + A	Moves cursor to first character in line.
[Ctrl] + E	Moves cursor to last character in line.
[Ctrl] + L	Clears screen and movers cursor to beginning of line.
[Ctrl] + P or Up Arrow	Displays previous command in command history buffer and places cursor at end of command.
[Ctrl] + N or Down Arrow	Displays next command in command history buffer and places cursor at end of command.
[Ctrl] + U	Clears all characters typed from cursor to beginning of line.
[Ctrl] + W	Deletes previous word.
[Ctrl] + C	Interrupts the current CLI command execution.

Command History

ExtremeXOS “remembers” all the commands you enter.

You can display a list of these commands by using the following command:

```
history
```

If you use a command more than once, consecutively, the history will list only the first instance.

3 Commands for Accessing the Switch

clear account lockout
clear session
configure account
configure account encrypted
configure account password-policy char-validation
configure account password-policy history
configure account password-policy lockout-on-login-failures
configure account password-policy max-age
configure account password-policy min-length
configure banner
configure cli max-sessions
configure cli max-failed-logins
configure dns-client add
configure dns-client default-domain
configure dns-client delete
configure failsafe-account
configure idletimeout
configure safe-default-script
configure time
configure timezone
create account
delete account
disable cli prompting
disable cli space-completion
disable clipaging
disable idletimeout
enable cli prompting
enable cli space-completion
enable clipaging
enable idletimeout
history
ping
reboot
show accounts
show accounts password-policy

This chapter describes commands used for:

- Accessing and configuring the switch including how to set up user accounts, passwords, date and time settings, and software licenses
- Managing passwords
- Configuring the Domain Name Service (DNS) client
- Checking basic switch connectivity
- Enabling and displaying licenses
- Returning the switch to safe defaults mode

ExtremeXOS supports the following two levels of management:

- User
- Administrator

A user-level account has viewing access to all manageable parameters, with the exception of:

- User account database
- SNMP community strings

A user-level account can change the password assigned to the account name and use the ping command to test device reachability.

An administrator-level account can view and change all switch parameters. It can also add and delete users and change the password associated with any account name. The administrator can disconnect a management session that has been established by way of a Telnet connection. If this happens, the user logged on by way of the Telnet connection is notified that the session has been terminated.

The DNS client in ExtremeXOS augments certain ExtremeXOS commands to accept either IP addresses or host names. For example, DNS can be used during a Telnet session when you are accessing a device or when using the ping command to check the connectivity of a device.

The switch offers the following commands for checking basic connectivity:

- ping
- traceroute

The ping command enables you to send Internet Control Message Protocol (ICMP) echo messages to a remote IP device. The traceroute command enables you to trace the routed path between the switch and a destination endstation.

This chapter describes commands for enabling and displaying software, security, and feature pack licenses.

clear account lockout

clear account [all | *name*] lockout

Description

Re-enables an account that has been locked out (disabled) for exceeding the permitted number failed login attempts. This was configured by using the configure account password-policy lockout-on-login-failures command.

Syntax Description

all	Specifies all users.
name	Specifies an account name.

Default

N/A.

Usage Guidelines

This command applies to sessions at the console port of the switch as well as all other sessions.

You can re-enable both user and administrative accounts, once they have been disabled for exceeding the 3 failed login attempts.

Note

The failsafe accounts are never locked out.

This command only clears the locked-out (or disabled) condition of the account. The action of locking out accounts following the failed login attempts remains until you turn it off by issuing the configure account [all | <name>] password-policy lockout-on-login failures off command.

Example

The following command re-enables the account finance, which had been locked out (disabled) for exceeding 3 consecutive failed login attempts:

```
clear account finance lockout
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

clear session

clear session [**history** | *sessId* | **all**]

Description

Terminates a Telnet and/or SSH2 sessions from the switch.

Syntax Description

history	Clears the chronology of sessions that were opened.
sessId	Specifies a session number from show session output to terminate.
all	Terminates all sessions.

Default

N/A.

Usage Guidelines

An administrator-level account can disconnect a management session that has been established by way of a Telnet connection.

You can determine the session number of the session you want to terminate by using the show session command. The show session output displays information about current Telnet and/or SSH2 sessions including:

- The session number
- The login date and time
- The user name
- The type of Telnet session
- Authentication information

Depending on the software version running on your switch, additional session information may be displayed. The session number is the first number displayed in the show session output.

When invoked to the clear the session history, the command clears the information about all the previous sessions that were logged. The information about the active sessions remains intact.

Example

The following command terminates session 4 from the system:

```
clear session 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure account

configure account [**all** | *name*]

Description

Configures a password for the specified account, either user account or administrative account.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.

Default

N/A.

Usage Guidelines

You must create a user or administrative account before you can configure that account with a password.

Use the create account command to create a user account.

The system prompts you to specify a password after you enter this command. You must enter a password for this command; passwords cannot be null and cannot include the following characters: “<“, “>”, and “?”.

Note

Once you issue this command, you cannot have a null password. However, if you want to have a null password (that is, no password on the specified account), use the create account command.

Passwords can have a minimum of 0 character and can have a maximum of 32 characters. Passwords are case-sensitive. User names are not case-sensitive.

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See configure account password-policy char-validation for more information.

You must have administrator privileges to change passwords for accounts other than your own.

Example

The following command defines a new password green for the account marketing:

```
configure account marketing
```

The switch responds with a password prompt:

```
password: green
```

Your keystrokes will not be echoed as you enter the new password. After you enter the password, the switch will then prompt you to reenter it.

```
Reenter password: green
```

Assuming you enter it successfully a second time, the password is now changed.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure account encrypted

configure account [**all** | *name*] **encrypted** *e-password*

Description

Encrypts the password that is entered in plain text for the specified account, either user account or administrative account.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
e-password	Enter in plain text the string you for an encrypted password. See Usage Guidelines for more information.

Default

N/A.

Usage Guidelines

You must create a user or administrative account before you can configure that account with a password.

Use the create account account command to create a user account.

When you use this command, the following password that you specify in plain text is entered and displayed by the switch in an encrypted format. Administrators should enter the password in plain text. The encrypted password is then used by the switch once it encrypts the plain text password. The encrypted command should be used by the switch only to show, store, and load a system-generated encrypted password in configuration; this applies with the following commands: save configuration, show configuration, and use configuration.

Note

Once you issue this command, you cannot have a null password. However, if you want to have a null password (that is, no password on the specified account), use the create account command.

Passwords can have a minimum of 0 character and can have a maximum of 32 characters. Passwords are case-sensitive. User names are not case-sensitive.

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See configure account password-policy char-validation for more information.

You must have administrator privileges to change passwords for accounts other than your own.

Example

The following command encrypts the password red for the account marketing:

```
configure account marketing encrypted red
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure account password-policy char-validation

configure account [all | *name*] password-policy char-validation [none | all-char-groups]

Description

Requires that the user include an upper-case letter, a lower-case letter, a digit, and a symbol in the password.

Syntax Description

all	Specifies all users (and future users).
name	Specifies an account name.
none	Resets password to accept all formats.
all-char-groups	Specifies that the password must contain at least two characters from each of the four groups. NOTE: The password minimum length will be 8 characters if you specify this option.

Default

N/A.

Usage Guidelines

This feature is disabled by default.

Once you issue this command, each password must include at least two characters of each of the following four types:

- Upper-case A-Z
- Lower-case a-z
- 0-9
- !, @, #, $, %, ^, *, (,)

The minimum number of characters for these specifically formatted passwords is 8 characters and the maximum is 32 characters.

Use the none option to reset the password to accept all formats.

Example

The following command requires all users to use this specified format for all passwords:

```
configure account all password-policy char-validation all-char-groups
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure account password-policy history

configure account [**all** | *name*] **password-policy history** [*num_passwords* | **none**]

Description

Configures the switch to verify the specified number of previous passwords for the account. The user is prevented from changing the password on a user or administrative account to any of these previously saved passwords.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
num_passwords	Specifies the number of previous passwords the system verifies for each account. The range is 1 to 10 passwords.
none	Resets the system to not remember any previous passwords.

Default

N/A.

Usage Guidelines

Use this command to instruct the system to verify new passwords against a list of all previously used passwords, once an account successfully changes a password.

The limit is the number of previous passwords that the system checks against in the record to verify the new password.

If this parameter is configured, the system returns an error message if a user attempts to change the password to one that is saved by the system (up to the configured limit) for that account; this applies

to both user and administrative accounts. This also applies to a configured password on the default admin account on the switch.

The limit of previous passwords that the system checks for previous use is configurable from 1 to 10. Using the none option disables previous password tracking and returns the system to the default state of no record of previous passwords.

Example

The following command instructs the system to verify that the new password has not been used as a password in the previous 5 passwords for the account engineering:

```
configure account engineering password-policy history 5
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure account password-policy lockout-on-login-failures

configure account [**all** | *name*] **password-policy lockout-on-login-failures** [**on** | **off**]

Description

Disables an account after the user has 3 consecutive failed login attempts.

Syntax Description

all	Specifies all users (and future users).
name	Specifies an account name.
on	Specifies an account name.
off	Resets the password to never lockout the user.

Default

N/A.

Usage Guidelines

If you are not working on SSH, you can configure the number of failed logins that trigger lockout, using the configure cli max-failed-logins <num-of-logins> command.

This command applies to sessions at the console port of the switch as well as all other sessions and to user-level and administrator-level accounts. This command locks out the user after 3 consecutive failed login attempts; the user's account must be specifically re-enabled by an administrator.

Using the off option resets the account to allow innumerable consecutive failed login attempts, which is the system default. The system default is that 3 failed consecutive login attempts terminate the particular session, but the user may launch another session; there is no lockout feature by default.

Note

The switch does not allow to lock out of at least one administrator account.

Example

The following command enables the account finance for lockout.

After 3 consecutive failed login attempts, the account is subsequently locked out:

```
configure account finance password-policy lockout-on-login-failures on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure account password-policy max-age

configure account [**all** | *name*] **password-policy max-age** [*num_days* | **none**]

Description

Configures a time limit for the passwords for specified accounts. The passwords for the default admin account and the failsafe account do not age out.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.

num_days	Specifies the length of time that a password can be used. The range is 1 to 365 days.
none	Resets the password to never expire.

Default

N/A.

Usage Guidelines

The passwords for the default admin account and the failsafe account never expire.

The time limit is specified in days, from 1 to 365 days. Existing sessions are not closed when the time limit expires; it will not open the next time the user attempts to log in.

When a user logs into an account with an expired password, the system first verifies that the entered password had been valid prior to expiring and then prompts the user to change the password.

Note

This is the sole time that a user with a user-level (opposed to an administrator-level) account can make any changes to the user-level account.

Using the none option prevents the password for the specified account from ever expiring (it resets the password to the system default of no time limit).

Example

The following command sets a 3-month time limit for the password for the account marketing:

```
configure account marketing password-policy max-age 90
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure account password-policy min-length

configure account [**all** | *name*] **password-policy min-length** [*num_characters* | **none**]

Description

Requires a minimum number of characters for passwords.

Syntax Description

all	Specifies all accounts (and future users).
name	Specifies an account name.
num_characters	Specifies the minimum number of characters required for the password. The range is 1 to 32 characters. NOTE: If you configure the configure account password-policy char-validation parameter, the minimum length is 8 characters.
none	Resets password to accept a minimum of 0 characters. NOTE: If you configure the configure account encrypted parameter, the minimum length is 8 characters.

Default

N/A.

Usage Guidelines

Use this command to configure a minimum length restriction for all passwords for specified accounts.

This command affects the minimum allowed length for the next password; the current password is unaffected.

The minimum password length is configurable from 1 to 32 characters. Using the none option disables the requirement of minimum password length and returns the system to the default state (password minimum is 0 by default).

Note

If the account is configured to require a specific password format, the minimum is 8 characters. See configure account password-policy char-validation for more information.

Example

The following command requires a minimum of 8 letters for the password for the account management:

```
configure account management password-policy min-length 8
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure banner

configure banner { after-login | { before-login } { acknowledge } | before-login {acknowledge} save-to-configuration}

Description

Configures the banner string to be displayed for CLI screens.

Syntax Description

after-login	Specifies that a banner be displayed after login.
before-login	Specifies that a banner be displayed before login.
acknowledge	Require acknowledgement of the banner before login.
save-to-configuration	Save the before login banner to the configuration file as well as non-volatile memory.

Default

N/A.

Usage Guidelines

Use this command to configure two types of banners:

- A banner for a CLI session that displays before login
- A banner for a CLI session that displays after login

If no optional parameters are specified, the command defaults to configuring a banner that is displayed before the CLI session login prompt.

For each CLI session banner, you can enter up to 24 rows of 79-column text.

Press [Return] at the beginning of a line to terminate the command and apply the banner. To clear the banner, press [Return] at the beginning of the first line.

Note

The system does not wait for a keypress when you use SSH for access; this only applies to the serial console login sessions and Telnet sessions.

To disable the acknowledgement feature, use the configure banner command omitting the acknowledge parameter.

To display any configured banners, use the show banner command.

To unconfigure one or more configured banners, use the unconfigure banner command.

Example

```
# show banner
Before-Login banner:
****
**** configure banner before-login acknowledge
****
Acknowledge: Enabled
Save to    : Non-volatile memory only
# show banner
Before-Login banner:
****
**** configure banner before-login acknowledge save-to-configuration
****
Acknowledge: Enabled
Save to    : Configuration file and non-volatile memory
```

History

This command was first available in ExtremeXOS 10.1.

The acknowledge parameter was added in ExtremeXOS 11.5.

The after-login option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure cli max-sessions

configure cli max-sessions *num-of-sessions*

Description

Limits number of simultaneous CLI sessions on the switch.

Syntax Description

num-of-sessions	Specifies the maximum number of concurrent sessions permitted. The range is 1 to 16.

Default

The default is eight sessions.

Usage Guidelines

The value must be greater than 0; the range is 1 to 16.

Example

The following command limits the number of simultaneous CLI sessions to ten:

```
configure cli max-sessions 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure cli max-failed-logins

configure cli max-failed-logins *num-of-logins*

Description

Establishes the maximum number of failed logins permitted before the session is terminated.

Syntax Description

num-of-logins	Specifies the maximum number of failed logins permitted; the range is 1 to 10.

Default

The default is three logins.

Usage Guidelines

The value must be greater than 0; the range is 1 to 10.

Example

The following command sets the maximum number of failed logins to five:

```
configure cli max-failed-logins 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure dns-client add

configure dns-client add [**domain-suffix** *domain_name* | **name-server** *ip_address* {**vr** *vr_name*}]

Syntax Description

domain-suffix	Specifies adding a domain suffix.
domain_name	Specifies a domain name.
name-server	Specifies adding a name server.
ip_address	Specifies an IP address for the name server.
vr	Specifies use of a virtual router. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
vr_name	Specifies a virtual router.

Description

Adds a domain suffix to the domain suffix list or a name server to the available server list for the DNS client.

Default

N/A.

Usage Guidelines

The domain suffix list can include up to six items.

If the use of all previous names fails to resolve a name, the most recently added entry on the domain suffix list will be the last name used during name resolution. This command will not overwrite any exiting entries. If a null string is used as the last suffix in the list, and all other lookups fail, the name resolver will attempt to look up the name with no suffix.

Up to eight DNS name servers can be configured. The default value for the virtual router used by the DNS client option is VR-Default.

Example

The following command configures a domain name and adds it to the domain suffix list:

```
configure dns-client add domain-suffix xyz_inc.com
```

The following command specifies that the switch use the DNS server 10.1.2.1:

```
configure dns-client add name-server 10.1.2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure dns-client default-domain

configure dns-client default-domain *domain_name*

Description

Configures the domain that the DNS client uses if a fully qualified domain name is not entered.

Syntax Description

domain_name	Specifies a default domain name.

Default

N/A.

Usage Guidelines

The default domain name will be used to create a fully qualified host name when a domain name is not specified.

For example, if the default domain name is set to “food.com” then when a command like “ping dog” is entered, the ping will actually be executed as “ping dog.food.com”.

Example

The following command configures the default domain name for the server:

```
configure dns-client default-domain xyz_inc.com
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure dns-client delete

configure dns-client delete [**domain-suffix** *domain_name* | **name-server** *ip_address* {**vr** *vr_name*}]

Description

Deletes a domain suffix from the domain suffix list or a name server from the available server list for the DNS client.

Syntax Description

domain-suffix	Specifies deleting a domain suffix.
domain_name	Specifies a domain name.
name-server	Specifies deleting a name server.
ip_address	Specifies an IP address for the name server.
vr	Specifies deleting a virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
vr_name	Specifies a virtual router.

Default

N/A.

Usage Guidelines

Specifying a domain suffix removes an entry from the domain suffix list.

If the deleted item was not the last entry in the list, all items that had been added later are moved up in the list. If no entries in the list match the domain name specified, an error message will be displayed.

The default value for the virtual router used by the DNS client option is VR-Default.

Example

The following command deletes a domain name from the domain suffix list:

```
configure dns-client delete domain-suffix xyz_inc.com
```

The following command removes a DNS server from the list:

```
configure dns-client delete name-server 10.1.2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure failsafe-account

configure failsafe-account {[**deny** | **permit**] [**all** | **control** | **serial** | **ssh** {**vr** *vr-name*} | **telnet** {**vr** *vr-name*}]}

Description

Configures a name and password for the failsafe account, or restricts access to specified connection types.

Syntax Description

deny	Prohibits failsafe account usage over the specified connection type(s).
permit	Allows a failsafe account to be used over the specified connection type(s).
all	Specifies all connection types.
control	Specifies internal access between nodes in a SummitStack or between MSMs/MMs in a chassis.
serial	Specifies access over the switch console port.
ssh	Specifies access using SSH on specified or all virtual routers.
telnet	Specifies access using Telnet on specified or all virtual routers.

Default

The failsafe account is always configured.

The default connection types over which failsafe account access is permitted are the same as if “permit all” is configured.

Usage Guidelines

The failsafe account is the account of last resort to access your switch.

If you use the command with no parameters, you are prompted for the failsafe account name and prompted twice to specify the password for the account. The password does not appear on the display at any time. You are not required to know the current failsafe account and password in order to change it.

If you use the command with the permit or deny parameter, the permitted connection types are altered as specified.

The failsafe account or permitted connection types are immediately saved to NVRAM on all MSMs/MMs or active nodes in a SummitStack.

Note

The information that you use to configure the failsafe account cannot be recovered by Extreme Networks. Technical support cannot retrieve passwords or account names for this account. Protect this information carefully.

Once you enter the failsafe account name, you are prompted to enter the password. Once you successfully log in to the failsafe account, you are logged in to an admin-level account.

Example

The following example restricts usage of the failsafe account to the series console port and to access between MSMs.

- BD-8810.1 # configure failsafe-account deny all
- BD-8810.2 # configure failsafe-account permit serial
- BD-8810.3 # configure failsafe-account permit control
- BD-8810.4 #

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure idletimeout

configure idletimeout *minutes*

Description

Configures the time-out for idle console, SSH2, and Telnet sessions.

Syntax Description

minutes	Specifies the time-out interval, in minutes. Range is 1 to 240 (1 minute to 4 hours).

Default

The default time-out is 20 minutes.

Usage Guidelines

This command configures the length of time the switch will wait before disconnecting idle console, SSH2, or Telnet sessions.

The idletimeout feature must be enabled for this command to have an effect (the idletimeout feature is enabled by default).

Example

The following command sets the time-out for idle login and console sessions to 10 minutes:

```
configure idletimeout     10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure safe-default-script

configure safe-default-script

Description

Allows you to change management access to your device and to enhance security.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command runs an interactive script that prompts you to choose to enable or disable SNMP, Telnet, and enabled ports.

Refer to Use Safe Defaults Mode in the *Extreme Networks XOS Concepts Guide* for complete information on the safe default mode.

Once you issue this command, the system presents you with the following interactive script:

```
Telnet is enabled by default. Telnet is unencrypted and has been the target of
security exploits in the past.
Would you like to disable Telnet? [y/N]:
SNMP access is enabled by default. SNMP uses no encryption, SNMPv3 can be
configured to eliminate this problem.
Would you like to disable SNMP? [y/N]:
All ports are enabled by default. In some secure applications, it maybe more
desirable for the ports to be turned off.
Would you like unconfigured ports to be turned off by default? [y/N]:
Changing the default failsafe account username and password is highly
recommended.  If you choose to do so, please remember the username and
password as this information cannot be recovered by Extreme Networks.
Would you like to change the failsafe account username and password
now? [y/N]:
Would you like to permit failsafe account access via the management port?
[y/N]:
Since you have chosen less secure management methods, please remember to
increase the security of your network by taking the following actions:
* change your admin password
* change your failsafe account username and password
* change your SNMP public and private strings
* consider using SNMPv3 to secure network management traffic
```

Example

The following command reruns the interactive script to configure management access:

```
configure safe-default-script
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure time

configure time *month day year hour min sec*

Description

Configures the system date and time.

Syntax Description

month	Specifies the month. The range is 1-12.
day	Specifies the day of the month. The range is 1-31.
year	Specifies the year in the YYYY format.The range is 2003 to 2036.
hour	Specifies the hour of the day. The range is 0 (midnight) to 23 (11 pm).
min	Specifies the minute. The range is 0-59.
sec	Specifies the second. The range is 0-59.

Default

N/A.

Usage Guidelines

The format for the system date and time is as follows:

```
mm dd yyyy hh mm ss
```

The time uses a 24-hour clock format. You cannot set the year earlier than 2003 or past 2036. You have the choice of inputting the entire time/date string. If you provide one item at a time and press [Tab], the screen prompts you for the next item. Press <cr> to complete the input.

Example

The following command configures a system date of February 15, 2002 and a system time of 8:42 AM and 55 seconds:

```
configure time 02 15 2002 08 42 55
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure timezone

configure timezone {**name** *tz_name*} *GMT_offset* {**autodst** {**name** *dst_timezone_ID*} {*dst_offset*} {**begins** [**every** *floatingday* | **on** *absoluteday*] {**at** *time_of_day*} {**ends** [**every** *floatingday* | **on** *absoluteday*] {**at** *time_of_day*}}} | **noautodst**}

Description

Configures the Greenwich Mean Time (GMT) offset and Daylight Saving Time (DST) preference.

Syntax Description

tz_name	Specifies an optional name for this timezone specification. May be up to six alphabetic characters in length. The default is an empty string.
GMT_offset	Specifies a Greenwich Mean Time (GMT) offset, in + or - minutes.
autodst	Enables automatic Daylight Saving Time.
dst-timezone-ID	Specifies an optional name for this DST specification. May be up to six characters in length. The default is an empty string.
dst_offset	Specifies an offset from standard time, in minutes. Value is in the range of 1 to 60. Default is 60 minutes.
floatingday	Specifies the day, week, and month of the year to begin or end DST each year. Format is: ***week day month*** where: ***week*** is specified as [first | second | third | fourth | last] or 1-5. ***day*** is specified as [sunday | monday | tuesday | wednesday | thursday | friday | saturday] or 1-7 (where 1 is Sunday). ***month*** is specified as [january | february | march | april | may | june | july | august | september | october | november | december] or 1-12. Default for beginning is second sunday march; default for ending is first sunday november.

absoluteday	Specifies a specific day of a specific year on which to begin or end DST. Format is: ***month day year*** where: ***month*** is specified as 1-12. ***day*** is specified as 1-31. year is specified as 2003-2035. The year must be the same for the begin and end dates.
time_of_day	Specifies the time of day to begin or end Daylight Saving Time. May be specified as an hour (0-23) or as hour:minutes. Default is 2:00.
noautodst	Disables automatic Daylight Saving Time.

Default

Autodst, beginning every second Sunday in March, and ending every first Sunday in November.

Usage Guidelines

Network Time Protocol (NTP) server updates are distributed using GMT time.

To properly display the local time in logs and other timestamp information, the switch should be configured with the appropriate offset to GMT based on geographic location.

The gmt_offset is specified in +/- minutes from the GMT time.

Automatic DST changes can be enabled or disabled. The default configuration, where DST begins on the second Sunday in March at 2:00 AM and ends the first Sunday in November at 2:00 AM, applies to most of North America (beginning in 2007), and can be configured with the following syntax: configure timezone <gmt_offst> autodst.

The starting and ending date and time for DST may be specified, as these vary in time zones around the world.

- Use the every keyword to specify a year-after-year repeating set of dates (for example, the last Sunday in March every year)
- Use the on keyword to specify a non-repeating, specific date for the specified year. If you use this option, you will need to specify the command again every year.
- The begins specification defaults to every second sunday march.
- The ends specification defaults to every first sunday november.
- The ends date may occur earlier in the year than the begins date. This will be the case for countries in the Southern Hemisphere.
- If you specify only the starting or ending time (not both) the one you leave unspecified will be reset to its default.
- The time_of_day specification defaults to 2:00.
- The timezone IDs are optional. They are used only in the display of timezone configuration information in the show switch command.

To disable automatic DST changes, re-specify the GMT offset using the noautodst option: configure timezone <gmt_offst> noautodst.

Greenwich Mean Time offsets

NTP updates are distributed using GMT time. To properly display the local time in logs and other timestamp information, the switch should be configured with the appropriate offset to GMT based on geographical location. configure timezone on page 94 describes the GMT offsets.

GMT Offset in Hours	GMT Offset in Minutes	Common Time Zone References	Cities
+0:00	+0	GMT - Greenwich Mean UT or UTC - Universal (Coordinated) WET - Western European	London, England; Dublin, Ireland; Edinburgh, Scotland; Lisbon, Portugal; Reykjavik, Iceland; Casablanca, Morocco
-1:00	-60	WAT - West Africa	Cape Verde Islands
-2:00	-120	AT - Azores	Azores
-3:00	-180		Brasilia, Brazil; Buenos Aires, Argentina; Georgetown, Guyana;
-4:00	-240	AST - Atlantic Standard	Caracas; La Paz

+6:00	+360	ZP6 - Russia Zone 5	
+7:00	+420	WAST - West Australian Standard	
+8:00	+480	CCT - China Coast, Russia Zone 7	

GMT Offset in Hours	GMT Offset in Minutes	Common Time Zone References	Cities
+9:00	+540	JST - Japan Standard, Russia Zone 8	
+10:00	+600	EAST - East Australian Standard GST - Guam Standard Russia Zone 9	
+11:00	+660		
+12:00	+720	IDLE - International Date Line East NZST - New Zealand Standard NZT - New Zealand	Wellington, New Zealand; Fiji, Marshall Islands

For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command configures GMT offset for Mexico City, Mexico and disables automatic DST:

```
configure timezone -360 noautodst
```

The following four commands are equivalent, and configure the GMT offset and automatic DST adjustment for the US Eastern timezone, with an optional timezone ID of EST:

```
configure timezone name EST -300 autodst name EDT 60 begins every second
sunday march at 2:00 ends every first sunday november at 2:00
configure timezone name EST -300 autodst name EDT 60 begins every 1 1 4 at
2:00 ends every 5 1 10 at 2:00
configure timezone name EST -300 autodst name EDT
configure timezone -300 autodst
```

The following command configures the GMT offset and automatic DST adjustment for the Middle European timezone, with the optional timezone ID of MET:

```
configure timezone name MET 60 autodst name MDT begins every last sunday
march at 1 ends every last sunday october at 1
```

The following command configures the GMT offset and automatic DST adjustment for New Zealand. The ending date must be configured each year because it occurs on the first Sunday on or after March 5:

```
configure timezone name NZST 720 autodst name NZDT 60 begins every first
sunday october at 2 ends on 3/16/2002 at 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

create account

create account [**admin** | **user** | **lawful-intercept**] *account-name* {**encrypted** *password*}

Description

Creates a new user account.

Syntax Description

admin	Specifies an access level for account type admin.
user	Specifies an access level for account type user.
lawful-intercept	Specifies lawful intercept account type.
account-name	Specifies a new user account name.
encrypted	Specifies the encrypted option.
password	Specifies a user password.

Default

N/A.

User Account Levels

By default, the switch is configured with two accounts with the access levels shown in the table below.

Account Name	Access Level
admin	This user can access and change all manageable parameters. The admin account cannot be deleted.
user	This user can view (but not change) all manageable parameters, with the following exceptions: This user cannot view the user account database. This user cannot view the SNMP community strings. This user cannot view SSL settings. This user has access to the ping command.
lawful-intercept	This user has the special lawful-intercept privilege. **Note** Only a single lawful-intercept account can exist at any one time on the system.

You can use the default names (admin and user), or you can create new names and passwords for the accounts. Default accounts do not have passwords assigned to them. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Usage Guidelines

The switch can have a total of 16 user accounts.

The system must have one administrator account.

When you use the encrypted keyword, the following password that you specify in plain text is entered and displayed by the switch in an encrypted format. Administrators should not use the encrypted option and should enter the password in plain text. The encrypted option is used by the switch after encrypting the plain text password. The encrypted option should be used by the switch only to show, store, and load a system-generated encrypted password in configuration; this applies with the following commands: save configuration, show configuration, and use configuration.

The system prompts you to specify a password after you enter this command and to reenter the password. If you do not want a password associated with the specified account, press [Enter] twice.

You must have administrator privileges to change passwords for accounts other than your own. User names are not case-sensitive. Passwords are case-sensitive. User account names must have a minimum of 1 character and can have a maximum of 32 characters. Passwords must have a minimum of 0 characters and can have a maximum of 32 characters.

Note

If the account is configured to require a specific password format, the minimum is eight characters. See configure account password-policy char-validation for more information.

Example

The following command creates a new account named John2 with administrator privileges:

```
create account admin John2
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted option was added in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

delete account

delete account *name*

Description

Deletes a specified user account.

Syntax Description

name	Specifies a user account name.

Default

N/A.

Usage Guidelines

Use the show accounts command to determine which account you want to delete from the system.

The show accounts output displays the following information in a tabular format:

- The user name
- Access information associated with each user
- User login information
- Session information

Depending on the software version running on your switch and the type of switch you have, additional account information may be displayed.

You must have administrator privileges to delete a user account. The system must have one administrator account; the command will fail if an attempt is made to delete the last administrator account on the system.

To ensure security, change the password on the default account, but do not delete it. The changed password will remain intact through configuration uploads and downloads.

If you must delete the default account, first create another administrator-level account.

Example

The following command deletes account John2:

```
delete account John2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable cli prompting

disable cli prompting

Description

Disables CLI prompting for the session.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to have all CLI user prompts automatically continue with the default answer.

This applies to the current session only.

To re-enable CLI prompting for the session, use the enable cli prompting command.

To view the status of CLI prompting on the switch, use the show management command.

Example

The following command disables prompting:

```
disable cli prompting
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable cli space-completion

disable cli space-completion

Description

Disables the ExtremeXOS feature that completes a command automatically with the spacebar. If you disable this feature, the [Tab] key can still be used for auto-completion.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables using the spacebar to automatically complete a command:

```
disable cli space-completion
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable clipaging

disable clipaging

Description

Disables pausing at the end of each show screen.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The command line interface (CLI) is designed for use in a VT100 environment.

Most show command output will pause when the display reaches the end of a page. This command disables the pause mechanism and allows the display to print continuously to the screen.

CLI paging is only active on a per-shell session basis. In other words, when you enable or disable CLI paging from within the current configuration, it only affects that session. For new or existing sessions, paging is enabled by default. This setting cannot be saved.

To view the status of CLI paging on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for CLI paging.

Example

The following command disables clipaging and allows you to print continuously to the screen:

```
disable clipaging
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable idletimeout

disable idletimeout

Description

Disables the timer that disconnects idle sessions from the switch.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Timeout 20 minutes.

Usage Guidelines

When idle time-outs are disabled, console sessions remain open until the switch is rebooted or until you logoff.

Telnet sessions remain open until you close the Telnet client.

If you have an SSH2 session and disable the idle timer, the SSH2 connection times out after 61 minutes of inactivity.

To view the status of idle time-outs on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for idle time-outs.

Example

The following command disables the timer that disconnects all sessions to the switch:

```
disable idletimeout
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable cli prompting

enable cli prompting

Description

Enables CLI prompting for the session.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to enable CLI prompting from a disabled state.

To view the status of CLI prompting on the switch, use the show management command.

Example

The following command enables prompting:

```
enable cli prompting
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

enable cli space-completion

enable cli space-completion

Description

Enables the ExtremeXOS feature that completes a command automatically with the spacebar. The [Tab] key can also be used for auto-completion.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

CLI space auto completion cannot be enabled while CLI scripting is enabled with the enable cli scripting command.

Example

The following command enables using the spacebar to automatically complete a command:

```
enable cli space-completion
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable clipaging

```
enable clipaging
```

Description

Enables the pause mechanism and does not allow the display to print continuously to the screen.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The command line interface (CLI) is designed for use in a VT100 environment.

Most show command output will pause when the display reaches the end of a page.

To view the status of CLI paging on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for CLI paging.

If CLI paging is enabled and you use the show tech command to diagnose system technical problems, the CLI paging feature is disabled.

CLI paging is only active on a per-shell session basis. In other words, when you enable or disable CLI paging from within the current configuration, it only affects that session. For new or existing sessions, paging is enabled by default. This setting cannot be saved.

Example

The following command enables clipaging and does not allow the display to print continuously to the screen:

```
enable clipaging
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable idletimeout

```
enable idletimeout
```

Description

Enables a timer that disconnects Telnet, SSH2, and console sessions after a period of inactivity (20 minutes is default).

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Timeout 20 minutes.

Usage Guidelines

You can use this command to ensure that a Telnet, Secure Shell (SSH2), or console session is disconnected if it has been idle for the required length of time.

This ensures that there are no hanging connections.

To change the period of inactivity that triggers the timeout for a Telnet, SSH2, or console session, use the configure timezone command.

To view the status of idle timeouts on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for idle timeouts. You can configure the length of the timeout interval.

Example

The following command enables a timer that disconnects any Telnet, SSH2, and console sessions after 20 minutes of inactivity:

```
enable idletimeout
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

history

history

Description

Displays a list of all the commands entered on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

ExtremeXOS software “remembers” all the commands you entered on the switch.

Use the history command to display a list of these commands.

Example

The following command displays all the commands entered on the switch:

```
history
```

If you use a command more than once, consecutively, the history will only list the first instance.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

ping

ping {**count** *count* {**start-size** *start-size*} | **continuous** {**start-size** *start-size*} | {**start-size** *start-size* {**end-size** *end-size*}}} {**udp**} {**dont-fragment**} {**ttl** *ttl*} {**tos**

ping {**vlan** *vlan_name*} {**udp**} {**dont-fragment**} {**ttl** *ttl*} {**tos** *tos*} {**interval** *interval*} {**vr** *vrid*} {**ipv4** *host* | **ipv6** *host*} {**from**} {**with record-route**}

Description

Enables you to send User Datagram Protocol (UDP) or Internet Control Message Protocol (ICMP) echo messages or to a remote IP device.

Syntax Description

count	Specifies the number of ping requests to send.
start-size	Specifies the size, in bytes, of the packet to be sent, or the starting size if incremental packets are to be sent.
continuous	Specifies that UDP or ICMP echo messages to be sent continuously. This option can be interrupted by pressing [Ctrl} + C.
end-size	Specifies an end size for packets to be sent.
udp	Specifies that the ping request should use UDP instead of ICMP.
dont-fragment	Sets the IP to not fragment the bit.
ttl	Sets the TTL value.
tos	Sets the TOS value.
interval	Sets the time interval between sending out ping requests.
vr	Specifies the virtual route to use for sending out the echo message. If not specified, VR-Default is used. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
ipv4	Specifies IPv4 transport.
ipv6	Specifies IPv6 transport. NOTE: If you are contacting an IPv6 link local address, you must specify the VLAN you are sending the message from: ping **ipv6** *link-local address* %*vlan_name host*.
host	Specifies a host name or IP address (either v4 or v6).
from	Uses the specified source address. If not specified, the address of the transmitting interface is used.
with record-route	Sets the traceroute information.

Default

N/A.

Usage Guidelines

The ping command is used to test for connectivity to a specific host.

You use the ipv6 variable to ping an IPv6 host by generating an ICMPv6 echo request message and sending the message to the specified address. If you are contacting an IPv6 link local address, you must

specify the VLAN you sending the message from, as shown in the following example (you must include the % sign): ping **ipv6** *link-local address* %*vlan_name host*.

The ping command is available for both the user and administrator privilege level.

When the IPv6 host ping fails, the following error message displays:

```
Error: cannot determine outgoing interface. Link local address must be of
form LLA%vlan_name.
```

Example

The following command enables continuous ICMP echo messages to be sent to a remote host:

```
ping continuous 123.45.67.8
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 variable was added in ExtremeXOS 11.2.

IPv6 error message modified in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

reboot

For modular switches:

reboot {**time** *month day year hour min sec*} {**cancel**} {**msm** *slot_id*} {**slot** *slot-number* | **node-address** *node-address* | **stack-topology** {**as-standby**} }

For Summit series switches and SummitStack:

reboot {[**time** *mon day year hour min sec*] | **cancel**} {**slot** *slot-number* | **node-address** *node-address* | **stack-topology** {**as-standby**}}

Description

Reboots the switch, SummitStack, or the module in the specified slot at a specified date and time.

Syntax Description

time	Specifies a reboot date in mm dd yyyy format and reboot time in hh mm ss format.
cancel	Cancels a previously scheduled reboot.
msm	Specifies rebooting the MSM module. NOTE: This variable is available only on modular switches.
slot_id	Specifies the slot--A or B--for an MSM module. NOTE: This variable is available only on modular switches.
slot-number	Specifies the slot number currently being used by the active stack node that is to be rebooted NOTE: This variable is available only on SummitStack.
node-address	Specifies the MAC address of the SummitStack node to be rebooted NOTE: This variable is available only on Summit X250e and X450 series switches, and SummitStack.
stack-topology	Specifies that the entire SummitStack is to be rebooted whether or not nodes are active NOTE: This variable is available only on Summit X250e and X450 series switches and SummitStack.
as-standby	Specifies that all stack nodes that are to be rebooted are to operate as if configured to not be master-capable NOTE: This variable is available only on Summit X250e and X450 series switches and SummitStack.

Default

N/A.

Usage Guidelines

If you do not specify a reboot time, the switch will reboot immediately following the command, and any previously scheduled reboots are cancelled.

Prior to rebooting, the switch returns the following message:

```
Do you want to save configuration changes to primary and reboot?
(y - save and reboot, n - reboot without save, <cr> - cancel command)
```

To cancel a previously scheduled reboot, use the cancel option.

Modular switches only

The modules that can be rebooted are management switch fabric modules (MSM)/management modules (MM).

BlackDiamond 8800 series switches only

On the BlackDiamond 8800 series switches, if your default BootROM image becomes corrupted, you can force the MSM to boot from an alternate BootROM image by inserting a sharp object into the “A” and “R” holes on the MSM and applying slight pressure.

Refer to the hardware documentation for information on the MSM.

The reboot MSM option on the BlackDiamond 8800 series switches affects the entire module.

Summit X250e and X450 series switches and SummitStack only.

The reboot command used without any parameters on the master node reboots all members of the same active topology to which the master node belongs.

This version can only be used on the master node.

The reboot slot <slot-number> command can be used on any active node. The command will reboot the active node that is currently using the specified slot number in the same active topology as the issuing node. This variation cannot be used on a node that is not in stacking mode.

The reboot node-address <node-address> command can be used on any node whether or not the node is in stacking mode. It will reboot the node whose MAC address is supplied.

The reboot stack-topology {as-standby} command reboots every node in the stack topology. The command can be issued from any node whether or not the node is in stacking mode. If the as-standby option is used, every node in the stack topology restarts with master-capability disabled. This option is useful when manually resolving a dual master situation.

Example

The following command reboots the switch at 8:00 AM on April 15, 2005:

```
reboot time 04 15 2005 08 00 00
```

History

This command was first available in ExtremeXOS 10.1.

The alternate BootROM image was added in ExtremeXOS 11.1.

The slot, node-address, stack-topology, and as-standby options were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

show accounts

show accounts

Description

Displays user account information for all users on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You need to create a user account using the create account command before you can display user account information.

To view the accounts that have been created, you must have administrator privileges.

This command displays the following information in a tabular format:

- User Name—The name of the user. This list displays all of the users who have access to the switch.
- Access—This may be listed as R/W for read/write or RO for read only.
- Login OK—The number of logins that are okay.
- Failed—The number of failed logins.
- Accounts locked out—Account configured to be locked out after three consecutive failed login attempts (using the configure account password-policy lockout-on-login-failures command).

Note

This command does not show the failsafe account.

Example

The following command displays user account information on the switch:

```
show accounts pppuser
```

Output from this command looks similar to the following:

```
User Name      Access  LoginOK  Failed
-------------- ------- -------  ------
admin             R/W        3       1
user              RO         0       0
dbackman          R/W        0       0
ron*              RO         0       0
nocteam           RO         0       0
----------------------------------------
(*) - Account locked
```

The following command displays the lawful intercept account distinguished by the "R/L" displayed in the Access column:

```
* (Private) X250e-24t.9 # show accounts
                   User Name      Access LoginOK   Failed
-------------------------------  ------  -------  ------
```

```
admin      R/W          6       0
user        RO          0       0
myLIuser   R/L        N/A     N/A
```

History

This command was first available in ExtremeXOS 11.0.

Lawful intercept output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show accounts password-policy

show accounts password-policy

Description

Displays password policy information for all users on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

To view the password management information, you must have administrator privileges.

The show accounts password-policy command displays the following information in a tabular format:

- Global password management parameters applied to new accounts upon creation:
  - Maximum age—The maximum number of days for the passwords to remain valid.
  - History limit—The number of previous password that the switch scans prior to validating a new password.
  - Minimum length—The minimum number of characters in passwords.
  - Character validation—The passwords must be in the specific format required by the configure account password-policy char-validation command.
  - Lockout on login failures—If enabled, the system locks out users after 3 failed login attempts.
  - Accounts locked out—Number of accounts locked out.
- User Name—The name of the user. This list displays all of the users who have access to the switch.

- Password Expiry Date—Date the password for this account expires; may be blank.
- Password Max. age—The number of days originally allowed to passwords on this account; may show None.
- Password Min. length—The minimum number of characters required for passwords on this account; may show None.
- Password History Limit—The number of previous passwords the system scans to disallow duplication on this account; may show None.

Example

The following command displays the password management parameters configured for each account on the switch:

```
show accounts password-policy
```

Output from this command looks similar to the following:

```
--------------------------------------------------------------------------------
Accounts global configuration(applied to new accounts on creation)
--------------------------------------------------------------------------------
Password Max. age               : None
Password History limit          : None
Password Min. length            : None
Password Character Validation   : Disabled
Accts. lockout on login failures: Disabled
Accounts locked out             : No
--------------------------------------------------------------------------------
User Name      Password   Password Password Password Flags
Expiry     Max. age Min. len History
Date                        Limit
--------------------------------------------------------------------------------
admin              None    None     None     ---
user              None    None     None     ---
test Apr-17-2005    12       32       9     C--
--------------------------------------------------------------------------------
Flags: (C) Password character validation enabled, (L) Account locked out
(l) Account lockout on login failures enabled
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show banner

show banner { after-login | before-login }

Description

Displays the user-configured banners.

Syntax Description

after-login	Specifies the banner that is displayed after login.
before-login	Specifies the banner that is displayed before login.

Default

N/A.

Usage Guidelines

Use this command to display specific configured CLI banners.

If no keywords are specified, all configured banners are displayed. To display a specific banner, use the before-login or after-login keyword.

Example

The following command displays the configured CLI switch banners:

```
show banner
```

Output from this command varies depending on your configuration; the following is one example:

```
Before-login banner:
Extreme Networks Summit X450 Switch
############################################################
Unauthorized Access is strictly prohibited.
Violators will be prosecuted
############################################################
Acknowledge: Enabled
After-login banner:
Press any key to continue
```

History

This command was first available in ExtremeXOS 10.1.

The after-login option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show banner

show banner { after-login | before-login }

Description

Displays the user-configured banners.

Syntax Description

after-login	Specifies the banner that is displayed after login.
before-login	Specifies the banner that is displayed before login.

Default

N/A.

Usage Guidelines

Use this command to display specific configured CLI banners.

If no keywords are specified, all configured banners are displayed. To display a specific banner, use the before-login or after-login keyword.

Example

The following command displays the configured CLI switch banners:

```
show banner
```

Output from this command varies depending on your configuration; the following is one example:

```
Before-login banner:
Extreme Networks Summit X450 Switch
##########################################################
Unauthorized Access is strictly prohibited.
Violators will be prosecuted
##########################################################
Acknowledge: Enabled
After-login banner:
Press any key to continue
```

History

This command was first available in ExtremeXOS 10.1.

The after-login option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show failsafe-account

show failsafe-account

Description

Displays whether the user configured a username and password for the failsafe account or shows the configured connection type access restrictions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the failsafe account configuration.

The command shows the access permissions and whether or not the user configured a username and password. It does not show the configured username or password.

Example

The following command displays the failsafe account configuration.

```
show failsafe-account
```

Output from this command looks similar to the following when a failsafe account username and password have been configured with all connections types permitted for failsafe account access:

```
BD-8810.7 # show failsafe-account
User-Specified Failsafe Account Username and Password are in effect for these
connection types:
        - Serial Console
        - Control Fabric (inter-node)
        - Mgmt VR Telnet
        - Mgmt VR SSH
        - User VR Telnet
        - User VR SSH
BD-8810.8 #
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

show switch

show switch {detail}

Description

Displays the current switch information.

On a SummitStack, this command displays the Master and Backup node information if executed on the Master, and displays the current node and the Master node information if executed on any other node.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The show switch command displays:

- sysName, sysLocation, sysContact
- MAC address
- System type
- System health check
- Recovery mode
- Watchdog state
- Current date, time, system boot time, and time zone configuration
- Any scheduled reboot information
- System up time
- Master and Backup information (available only on modular switches and SummitStack)
- Current state (available only on stand-alone switches)
  - OPERATIONAL
  - OPERATIONAL (OverHeat)
  - FAILED
- Software image information (primary/secondary image and version)
- Configuration information (primary/secondary configuration and version)

This information may be useful for your technical support representative if you have a problem.

On a SummitStack, the System UpTime may be useful when manually resolving the dual master situation. For more information, see the “Eliminating a Dual Master Situation Manually” section in the ExtremeXOS Concepts Guide.

Depending on the software version running on your switch, additional or different switch information may be displayed.

On a stack the following additional information will be available:

- System Type
- System UpTime
- Details of Master and Backup, or current node and Master

Example

The following command displays current switch information:

```
show switch
```

Output from this command on the modular switches looks similar to the following:

```
SysName:          BD-8810Rack3
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1D:00:C0
System Type:      BD-8810
SysHealth check:  Enabled (Normal)
Recovery Mode:    All
System Watchdog:  Enabled
Current Time:     Fri Feb 13 02:25:24 1925
Timezone:         [Auto DST Disabled] GMT Offset: 0 minutes, name is UTC.
Boot Time:        Wed Feb 11 21:39:56 1925
Boot Count:       159
Next Reboot:      None scheduled
System UpTime:    1 day 4 hours 45 minutes 28 seconds
Slot:             MSM-A *                     MSM-B
------------------------     ------------------------
Current State:    MASTER                      BACKUP (In Sync)

History

This command was first available in ExtremeXOS 10.1.

This command was updated to support stacking in ExtremeXOS 12.0 and the System Type was added to the output from this version.

Platform Availability

This command is available on all platforms.

traceroute

traceroute {**vr** *vrid*} {**ipv4** *host*} {**ipv6** *host*} {**ttl** *number*} {**from** *from*} {[**port** *port*] | **icmp**}

Description

Enables you to trace the routed path between the switch and a destination endstation.

Syntax Description

vr	Specifies a virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
vrid	Specifies which virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
ipv4	Specifies IPv4 transport.
ipv6	Specifies IPv6 transport.
host	Specifies the host of the destination endstation.
ttl number	Configures the switch to trace up to the time-to-live number of the switch.
from from	Uses the specified source address in the ICMP packet. If not specified, the address of the transmitting interface is used.
port port	Specifies the UDP port number.
icmp	Configures the switch to send ICMP echo messages to trace the routed path between the switch and a destination endstation.

Default

N/A.

Usage Guidelines

Use this command to trace the routed path between the switch and a destination endstation.

Each router along the path is displayed.

Example

The following command enables the traceroute function to a destination of 123.45.67.8:

```
traceroute 123.45.67.8
```

The following is sample output that displays when the traceroute fails:

```
traceroute to 10.209.10.37, 30 hops max
1  0.0.0.0                                      * !u        * !u        * !u
--- Packet Response/Error Flags ---
(*) No response, (!N) ICMP network unreachable, (!H) ICMP host unreachable,
(!P) ICMP protocol unreachable, (!F) ICMP fragmentation needed,
(!S) ICMP source route failed, (!u) Transmit error, network unreachable,
(!f) Transmit error, fragmentation needed, (!t) General transmit error
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 variable was added in ExtremeXOS 11.2.

The display when the command fails was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

unconfigure banner

unconfigure banner { after-login | before-login }

Description

Unconfigures a specified banner from CLI screens.

Syntax Description

after-login	Specifies the banner that is displayed after login.
before-login	Specifies the banner that is displayed before login.

Default

N/A.

Usage Guidelines

Use this command to unconfigure one of two different types of banners:

- CLI session before login
- CLI session after login

If no optional parameters are specified, all configured banners are erased. To delete a specific banner, the before-login or after-login keyword must be used.

Banners can also be cleared by configuring a banner with only a <ret> or \n character.

Example

The following command clears the after-login banner, Welcome to the switch:

```
unconfigure banner after-login [Return]
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

4 Commands for Managing the Switch

configure snmpv3 add group user

disable ntp
disable ntp authentication
disable ntp broadcast-client
disable ntp broadcast-server
disable ntp vlan
enable cdp ports
enable dhcp vlan
enable network-clock ptp
enable network-clock ptp unicast-negotiation
enable network-clock ptp end-to-end transparent
enable snmp access
enable snmp access vr
enable snmp community
enable snmp traps
enable snmpv3
enable sntp-client
enable telnet
enable watchdog
enable ntp
enable ntp authentication
enable ntp broadcast-client
enable ntp broadcast-server
enable ntp vlan
exit
logout
quit
show access-list counters process
show auto-provision
show checkpoint-data
show dhcp-client state
show management
show network-clock ptp
show network-clock ptp (datasets)
show network-clock ptp (interface)
show network-clock ptp end-to-end-transparent ports
show network-clock ptp boundary unicast-master

This chapter describes commands for:

- Configuring Network Time Protocol (NTP) on the switch
- Configuring Precision Time Protocol (PTP) on the switch
- Configuring Simple Network Management Protocol (SNMP) parameters on the switch
- Managing the switch using Telnet
- Transferring files using the Trivial File Transfer Protocol (TFTP)
- Configuring system redundancy
- Displaying power management statistics on the switch
- Configuring Simple Network Time Protocol (SNTP) on the switch
- Configuring power visualization

NTP

NTP is a protocol for synchronizing clocks of servers or network entities using a TCP/IP-based network that has coherent variable latency.

It is designed particularly to resist the effects of variable latency by using a jitter buffer. NTP provides a coordinated Universal Time Clock (UTC). However, no information about time zones or daylight saving time is transmitted. NTP uses a hierarchical, semi-layered system of levels of clock sources. Each level of this hierarchy is termed a stratum and is assigned a layer number starting with 0 (zero) at the top. The stratum level defines its distance from the reference clock and exists to prevent cyclical dependencies in the hierarchy.

PTP

IEEE1588v2 (also known as Precision Time Protocol, PTP) is an industry-standard protocol that enables the precise transfer of frequency and time to synchronize clocks over packet-based Ethernet networks.

The locally available clock on each network device is synchronized with a grandmaster clock in the network. The devices are synchronized by exchange of timestamps with sub-nanoseconds granularity, to deliver very high accuracies of synchronization needed to ensure the stability of base station frequency and handovers. The timestamps between master and slave devices are exchanged through PTP event packets. The IPv4/UDP transport mechanism is used for PTP packets in ExtremeXOS 1588v2 implementation.

SNMP

Any network manager running SNMP can manage the switch, if the Management Information Base (MIB) is installed correctly on the management station.

Each network manager provides its own user interface to the management facilities.

The following SNMP parameters can be configured on the switch:

- Authorized trap receivers—An authorized trap receiver can be one or more network management stations on your network. The switch sends SNMP traps to all trap receivers. Entries in this list can

be created, modified, and deleted using the RMON2 trapDestTable MIB table, as described in RFC 2021, and the SNMPv3 tables.

- SNMP INFORM—SNMP INFORM allows for confirmation of a message delivery. When an SNMP manager receives an INFORM message from an SNMP agent, it sends a confirmation response back to the agent. If the message has not been received and therefore no response is returned, the INFORM message is resent. You can configure the number of retries to be made and the interval between retries.
- SNMP access control—This feature allows the administrator to restrict SNMP access by using the access control list (ACL) and implementing an ACL policy. The administrator can configure an ACL policy to either permit or deny a specific list of IP address and subnet masks.
- Authorized managers—An authorized manager can be either a single network management station, or a range of addresses (for example, a complete subnet) specified by a prefix and a mask.
- Community strings—The community strings allow a simple method of authentication between the switch and the remote network manager. The default read-only community string is public. The default read-write community string is private. The community strings for all authorized trap receivers must be configured on the switch for the trap receiver to receive switch-generated traps.
- System contact (optional)—The system contact is a text field that enables you to enter the name of the person(s) responsible for managing the switch.
- System name (optional)—The system name enables you to enter a name that you have assigned to this switch. The default name is the model name of the switch (for example, BD-1.2).
- System location (optional)—Using the system location field, you can find the location of the switch.

Note

If you specify volatile storage when configuring SNMP parameters, that configuration is not saved across a switch reboot.

Telnet

Telnet allows you to access the switch remotely using TCP/IP through one of the switch ports or a workstation with a Telnet facility.

If you access the switch via Telnet, you will use the command line interface (CLI) to manage the switch and modify switch configurations.

TFTP

ExtremeXOS supports the Trivial File Transfer Protocol (TFTP) based on RFC1350.

TFTP is a method used to transfer files from one network device to another. The ExtremeXOS TFTP client is a command line application used to contact an external TFTP server on the network. For example, ExtremeXOS uses TFTP to download software image files, switch configuration files, and access control lists (ACLs) from a server on the network to the switch.

System Redundancy with Dual Management Modules Installed, Modular Switches Only

If you install two MSMs/MMs in a modular switch, one assumes the role of primary and the other assumes the role of backup.

The primary MSM/MM provides all of the switch management functions including bringing up and programming the I/O modules, running the bridging and routing protocols, and configuring the switch. The primary also keeps synchronized with the backup MSM/MM in case the backup MSM/MM needs to take over the management functions if the primary MSM/MM fails.

Power Supply Management

On modular switches, ExtremeXOS monitors and manages power consumption on the switch by periodically checking the power supply units (PSUs) and testing them for failures.

To determine the health of the PSU, ExtremeXOS checks the voltage, current, and temperature of the PSU.

The power management capability of ExtremeXOS:

- Protects the system from overload conditions
- Monitors all installed PSUs, even installed PSUs that are disabled
- Enables and disables PSUs as required
- Powers up or down I/O modules based on available power and required power resources
- Logs power resource changes, including power budget, total available power, redundancy, and so on
- Detects and isolates faulty PSUs

On Summit family switches, ExtremeXOS reports when the PSU has power or has failed. Summit family switches support an internal power supply with a range of 90V to 240V AC power as well as an external redundant power supply. The Extreme Networks External Power System (EPS) allows you to add a redundant power supply to the Summit family switch to protect against a power supply failure. The EPS consists of a tray (EPS-T) that holds one or two EPS-160 power supplies. The EPS-160 provides 100V to 240V AC power. Each EPS-160 power supply provides one-to-one redundancy to an attached Summit family switch.

SNTP

ExtremeXOS supports the client portion of the Simple Network Time Protocol (SNTP) Version 3 based on RFC1769.

SNTP can be used by the switch to update and synchronize its internal clock from a Network Time Protocol (NTP) server. When enabled, the switch sends out a periodic query to the indicated NTP server, or the switch listens to broadcast NTP updates. In addition, the switch supports the configured setting for Greenwich Mean time (GMT) offset and the use of Daylight Saving Time.

clear cdp counters

configure cdp counters {ports *ports_list* **}**

Description

Clears the CDP counter statistics.

Syntax Description

ports	Specifies the ports to clear.
ports_list	Specifies the port list.

Default

N/A.

Usage Guidelines

Use this command to clear the CDP counter statistics.

Example

The following command clears the CDP ports counters:

```
clear cdp counters
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

clear cdp neighbor

clear cdp neighbor [device id *device_id* **| all]**

Description

Clears the CDP neighbor information.

Syntax Description

device id	Specifies the Device Identifier to be used in CDP.
device-id	Specifies the Device Identifier of neighbor.
all	Specifies all CDP neighbors.

Default

N/A.

Usage Guidelines

Use this command to clear the CDP neighbor information.

Example

The following command clears all CDP neighbor associations:

```
clear cdp neighbor all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

clear network-clock ptp counters

clear network-clock ptp [**boundary** | **ordinary**] **vlan** [*vlan_name* {*ipv4_address* [**unicast-master** | **unicast-slave**]} | **all**] **counters**

Description

This command clears the accumulated PTP packet counters. The clear can be performed on the following groups:

Per unicast-master or unicast-slave peer on a clock port

Peers on a clock port

Peers on all clock ports

Note

This command is available only for Boundary and Ordinary clocks.

Syntax Description

network-clock	External Clock for Ethernet synchronization
ptp	Precise Time Protocol
boundary	Boundary clock
ordinary	Ordinary clock
vlan	VLAN
all	All VLAN
ipv4_address	Peer IP address
unicast-master	IP addresses that are masters to the local clock
unicast-slave	IP addresses that are slaves to the local clock
counters	PTP message counts

Default

N/A.

Usage Guidelines

Use this command to clear the accumulated PTP packet counters.

Example

N/A.

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is only available boundary and ordinary clocks on cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack

configure cdp device-id

configure cdp device-id [*device_id* | **system-mac**]

Description

Configures the device ID only in CDP.

Syntax Description

device-id	Unique device Identifier to be used in CDP. The default is MAC Address.
system-mac	Device Identifier will be system MAC address.

Default

MAC address.

Usage Guidelines

Use this command to configure the Device ID. If you do not configure it, the MAC address is used as the Device ID. This configuration of device ID is only used in the CDP .

Example

The following command configures the device ID as the MAC address:

```
configure cdp device-id system-mac
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

configure cdp frequency

configure cdp frequency *seconds*

Description

Enables CDP on a port.

Syntax Description

seconds	Specifies the transmit frequency in seconds. The range is 5,254 seconds. The default value is 60 seconds.

Default

60 seconds.

Usage Guidelines

Example

The following command configures the CDP frequency as two minutes:

```
configure cdp frequency 120
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

configure cdp hold-time

configure cdp hold-time *seconds*

Description

Configures the hold time of the neighbor information .

Syntax Description

seconds	Duration in seconds that receiver must keep this packet. The range is 10-255 and the default is 180 seconds.

Default

60 seconds.

Usage Guidelines

Use this command to configure the hold time of the neighbor information for which a receiving device should hold information before discarding it.

Example

The following command configures the CDP hold time as two minutes:

```
configure cdp hold-time 120
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

configure node priority

configure node slot *slot_id* **priority** *node_pri*

Description

Configures the priority of the node.

Syntax Description

slot_id	Specifies the slot of the node. A is for the MSM/MM installed in slot A. B is for the MSM/MM installed in slot B.
node_pri	Specifies the priority of the node. The default 0 gives MSM-A a higher priority over MSM-B. The range is 1 to 100; 0 means you have not configured a node priority.

Default

Default node priority is 0.

Usage Guidelines

Use this command to configure the priority of the node. The lower the number, the higher the priority.

The node priority is part of the selection criteria for the primary node. The following list describes the parameters used to determine the primary node:

- Node state—The node state must be STANDBY to participate in leader election and to be selected primary. If the node is in the INIT, DOWN, or FAIL states, the node will not participate in leader election.
- Configuration priority—This is a user assigned priority. The configured priority is compared only after the node meets the minimum thresholds in each category for it to be healthy. Required processes and devices must not fail.
- Software health—This represents the percent of processes available.
- Health of secondary hardware components—This represents the health of switch components, such as the power supplies, fans, and so forth.
- Slot ID—The MSM/MM slot where the node is installed (MSM-A or MSM-B).

If you do not configure any priorities, MSM-A has a higher priority than MSM-B.

Example

The following command configures a priority of 2 for MSM-B:

```
configure node slot B priority 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

configure ntp local-clock none

configure ntp local-clock none

Description

Removes the internal local clock from the clock source list.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command removes the internal local clock from the clock source list:

```
configure ntp local-clock none
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure ntp local-clock stratum

configure ntp local-clock *stratum*

Description

Configures the internal local clock with a stratum number. The stratum number defines the distance from the reference clock. The lower the number, the closer the switch is to the reference clock.

Syntax Description

stratum_number	Specifies the distance from the reference clock from 2 through 16, with 2 being closest and 16 being the farthest away.

Default

The local clock is disabled by default.

Usage Guidelines

The internal local clock is configured as a clock source with a given stratum number. Because the local clock is not as reliable as an external clock source with GPS or CDMA, the stratum number should be higher than the stratum number of the external clock source to allow the system to acquire the most reliable clock information from the clock source lists.

Example

The following command configures the local clock with a stratum number of 3:

```
configure ntp local-clock stratum 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure ntp restrict-list

configure ntp restrict-list [**add** | **delete**] *network* {*mask*} [**permit** | **deny**]

Description

Restricts a host or block of client IP addresses from getting NTP service. When NTP is enabled over a VLAN, an NTP server is configured, or a broadcast NTP server is in a VLAN, the VLAN's IP block or NTP server's IP address is automatically added into the system with a permit action.

Syntax Description

add	Restricts a client from getting NTP service.
delete	Removes a client from the restrict list.
network	Specifies a host or block of IP addresses.
mask	Specifies the subnet mask of the network.
permit	Specifies that a particular block of client IP addresses is permitted to get NTP service.
deny	Specifies that a particular block of client IP addresses is denied NTP service.

Default

All addresses are denied by default.

Usage Guidelines

N/A.

Example

The following command restricts a block of client IP addresses from getting NTP service:

```
configure ntp restrict-list add 132.25.82.3 deny
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure ntp server/peer add

configure ntp [**server** | **peer**] **add** [*ip_address* | *host_name*] {**key** *keyid*} {**option** [**burst** | **initial-burst**]}

Description

Configures an NTP server or peer.

Syntax Description

ip_address	Specifies the IP address of the NTP server or peer.
host_name	Specifies the host name of the NTP server or peer.
keyid	Specifies the key ID as a value from 1 to 65534.
burst	Follows the same burst mechanism when an NTP server is reachable.
initial-burst	Allows the system to send six burst packets when an NTP server becomes unreachable (discovered but unreachable).

Default

N/A.

Usage Guidelines

The initial-burst option is useful when a fast time synchronization is required at the initial stage.

Example

The following command adds an NTP server named “Missouri” with key 5 and an initial burst:

```
configure ntp server add 134.20.16.35 Missouri key 5 option initial-burst
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure ntp server/peer delete

configure ntp [**server** | **peer**] **delete** [*ip_address* | *host_name*]

Description

Removes an NTP server or peer from external clock source lists.

Syntax Description

ip-address	Specifies the IP address of the NTP server or peer.
host-name	Specifies the host name of the NTP server or peer.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command removes an NTP peer from external clock source lists:

```
configure ntp peer delete
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure power led motion-detector

configure power led motion-detector [disable | enable {timeout *seconds***}]**

Description

Configures the motion detector to control LEDs depending on motion near the front of the switch.

Syntax Description

disable	Disables the motion detector.
enable	Enables motion detector.
seconds	Specifies the number of seconds before the LEDs are turned off after motion is detected. The range is 1 to 600.

Default

The default is disable

The default number of seconds is 180.

Usage Guidelines

Use this command to enable or disable the motion detector to control the port LEDs.

- When the motion detector is enabled, the LEDs are turned on only when motion is detected. The length of time in seconds that they remain turned on is configurable.
- When the motion detector is disabled, the LEDs are always turned on.

To view the status and timeout settings, use the show power led motion-detector command.

Example

The following command configures the LEDs to turn on when motion is detected and turn off 60 seconds after motion is detected:

```
configure power led motion-detector enable timeout 60
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on the Summit X670 switch.

configure power monitor

configure power monitor poll-interval [**off** | *seconds*] **change-action** [**none** | [**log** | **log-and-trap** | **trap**] **change-threshold** *watts*]

Description

Configures the power visualization, which periodically polls for input power usage.

Syntax Description

seconds	Input power usage poll interval in seconds. If zero is configured, then the input power measurement is disabled.
change-action	The action to be taken whenever the power is increased or decreased by the configured threshold power value (none, log, log-and-trap, or trap).
watts	The power value in watts for the change threshold. The default value is 2 watts.

Default

The default poll interval is 60 seconds.

The default change action is none.

The default change threshold is 2 watts.

Usage Guidelines

Use this command to configure change actions to be taken when input power usage is increased or decreased by the configured threshold power value. The polling interval is also configurable, with a default value of 60 seconds.

Note

Input power usage values are only estimates.

Example

The following command configures a polling interval of 10 seconds, a change action of log-and-trap, and a change threshold of 3 watts.

```
configure power monitor poll-interval 10 change-action log-and-trap change-
threshold 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the Summit X460 switch, the E4G-400 switch, the BlackDiamond X8 series switches, and the BlackDiamond 8800 series switches.

configure power supply

configure power supply *ps_num* {**auto** | **on**}

Description

Configures a power supply for either automatic power management, or forced on, regardless of the impact to the total available system power.

Syntax Description

ps_num	Specifies the slot number of the installed power supply unit (PSU) to which this command applies.
auto	Specifies that ExtremeXOS determines the enabled or disabled state of the PSU to maximize total system power. This is the default.
on	Specifies that the PSU be enabled even if ExtremeXOS determines it should be disabled. This action may reduce the total available system power and may result in one or more I/O modules powering down.

Default

The default setting is auto; ExtremeXOS either enables or disables the PSU in order to maximize total system power.

Usage Guidelines

If a switch has PSUs with a mix of both 220V AC and 110V AC inputs, ExtremeXOS maximizes system power by automatically taking one of two possible actions:

- If all PSUs are enabled then all PSUs must be budgeted at 110V AC to prevent overload of PSUs with 110V AC inputs.

OR

- If the PSUs with 110V AC inputs are disabled, then the PSUs with 220V AC inputs can be budgeted with a higher output per PSU.

ExtremeXOS computes the total available power using both methods and automatically uses the PSU configuration that provides the greatest amount of power to the switch. The following table lists combinations where ExtremeXOS maximizes system power by disabling the PSUs with 110V AC inputs.

Table 9: PSU Combinations Where 110V PSUs Are Disabled

Number of PSUs with 220VAC Inputs	Number of PSUs with 110VAC Inputs
2	1
3	1
3	2
4	1
4	2
5	1

Table 10: BlackDiamond X8 Series PSU Combinations Where 110V PSUs Are Disabled

Number of PSUs with 220VAC Inputs	Number of PSUs with 110VAC Inputs
1	1
2	1
3	1

Table 10: BlackDiamond X8 Series PSU Combinations Where 110V PSUs Are Disabled (continued)

Number of PSUs with 220VAC Inputs	Number of PSUs with 110VAC Inputs
3	2
4	1
4	2
4	3
5	1
5	2
5	3
6	1
6	2

For all other combinations of 220V AC and 110V AC PSUs, ExtremeXOS maximizes system power by enabling all PSUs and budgeting each PSU at 110V AC.

In addition to the PSU, you can specify the following options:

- auto—Specifies that ExtremeXOS determines the enabled or disabled state of the PSU to maximize total system power. This is the default.
- on—Specifies that the PSU be enabled even if ExtremeXOS determines it should be disabled. This action may reduce the total available system power and may result in one or more I/O modules powering down.

You can override automatic power supply management to enable a PSU with 110V AC inputs that ExtremeXOS disables if the need arises, such as for a planned maintenance of 220V AC circuits. If the combination of AC inputs represents one of those listed in in the table above, you can turn on a disabled PSU using the configure power supply <ps_num> on command.

Note

If you override automatic power supply management, you may reduce the available power and cause one or more I/O modules to power down.

To resume using automatic power supply management on a PSU, use the configure power supply <ps_num> auto command. The setting for each PSU is stored as part of the switch configuration.

To display power supply status and power budget information use the show power and show power budget commands.

Example

The following command configures the PSU in slot 1 to be forced on when either 110V AC or 220V AC power input is present, overriding automatic power management:

```
configure power supply 1 on
```

The switch displays the following message:

```
In a mixed environment of 110V and 220V AC inputs, power management may
automatically disable 110V supplies to maximize the system power budget.
By specifying 'on', you wish to override power management and enable the
specified power supply.  This may cause the system power budget to decrease
and one or more I/O cards may be powered off as a result.
Are you sure you want to continue? (y/n)
```

Enter y to continue.

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available only on modular switches.

configure snmp access-profile

configure snmp access-profile [*access_profile* {**readonly** | **readwrite**} | [[**add** *rule*] [**first** | [[**before** | **after**] *previous_rule*]]] | **delete** *rule* | **none**]

Description

Configures SNMP to use an ACL policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
readonly	Specifies that access granted by the specified policy is read only.
readwrite	Specifies that access granted by the specified policy is read/write.
add	Specifies that an ACL rule is to be added to the SNMP application.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that the named rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

SNMP access is enabled by default, with no ACL policies.

Usage Guidelines

You must be logged in as administrator to configure SNMP parameters. You can restrict SNMP access in the following ways:

- Implement an ACL policy. You create an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for SNMP. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

  In the ACL policy file for SNMP, the source-address field is the only supported match condition. Any other match conditions are ignored.

  Use the none option to remove a previously configured ACL policy.
- Add an ACL rule to the SNMP application through this command. Once an ACL is associated with SNMP, all the packets that reach an SNMP module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly, regardless of whether the ACL is configured to add counters. To display counter statistics, use the show access-list counters process snmp command.

  Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

  Match conditions

- Source-address—IPv4 and IPv6

Actions

- Permit
- Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the SNMP traffic does not match any of the rules, the default behavior is permit. To deny SNMP traffic that does not match any of the rules, add a deny all rule at the end or the rule list.

Creating an ACL Policy File

To create an ACL policy file, use the edit policy command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs in the ExtremeXOS Concepts Guide.

If you attempt to implement a policy that does not exist, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists. To confirm the existence of the policies, use the configure snmp add community command. If the policy does not exist, create the ACL policy file.

Viewing SNMP Information

To display the current management configuration, including SNMP access related information, whether SNMP access is enabled or disabled, and whether any ACL or rules are configured for SNMP, use the following command:

```
show management
```

Example

The following command applies the ACL policy file MyAccessProfile_2 to SNMP:

```
configure snmp access-profile MyAccessProfile_2
```

The following command applies the ACL rule DenyAccess to SNMP as the first rule in the list:

```
configure snmp access-profile add DenyAccess first
```

The following command deletes the ACL rule DenyAccess from the SNMP application:

```
configure snmp access-profile delete DenyAccess
```

To delete the use of all the ACL rules or a policy file by SNMP, use the following command:

```
configure snmp access-profile none
```

History

This command was first available in ExtremeXOS 11.6.

Support for individual ACL rules was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure snmp add community

configure snmp add community [**readonly** | **readwrite**] *alphanumeric_string*

Description

Adds an SNMP read or read/write community string.

Syntax Description

readonly	Specifies read-only access to the system.
readwrite	Specifies read and write access to the system.
alphanumeric_string	Specifies an SNMP community string name. See “Usage Guidelines” for more information.

Default

The default read-only community string is public. The default read/write community string is private.

Usage Guidelines

Community strings provide a simple method of authentication between a switch and a remote network manager. Read community strings provide read-only access to the switch. The default read-only community string is public. Read-write community strings provide read and write access to the switch. The default read/write community string is private. Sixteen read-only and sixteen read/write community strings can be configured on the switch, including the defaults.

An authorized trap receiver must be configured to use the correct community strings on the switch for the trap receiver to receive switch-generated traps. In some cases, it may be useful to allow multiple community strings so that all switches and trap receivers are not forced to use identical community strings. The configure snmp add community command allows you to add multiple community strings in addition to the default community string.

An SNMP community string can contain up to 32 characters.

Extreme Networks recommends that you change the defaults of the community strings. To change the value of the default read/write and read-only community strings, use the configure snmp delete community command.

Example

The following command adds a read/write community string with the value extreme:

```
configure snmp add community readwrite extreme
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmp add trapreceiver

configure snmp add trapreceiver [*ip_address* | *ipv6_address*] **community** [[**hex** *hex_community_name*] | *community_name*] {**port** *port_number*} {**from** [*src_ip_address* | *src_ipv6_address*]} {**vr** *vr_name*} {**mode** *trap_mode*}

Description

Adds the IP address of a trap receiver to the trap receiver list and specifies which SNMPv1/v2c traps are to be sent.

Syntax Description

ip_address	Specifies an SNMP trap receiver IPv4 address.
ipv6_address	Specifies an SNMP trap receiver IPv6 address
hex_community_name	Specifies that the trap receiver is to be supplied as a colon separated string of hex octets.
community_name	Specifies the community string of the trap receiver to be supplied in ASCII format.
port_number	Specifies a UDP port to which the trap should be sent. Default is 162.
src_ip_address	Specifies the IPv4 address of a VLAN to be used as the source address for the trap.
src_ipv6_address	Specifies the IPv6 address of a VLAN to be used as the source address for the trap.
vr_name	Specifies the name of the virtual router.
trap_mode	Specifies the mode of the traps:enhanced—Contains extra varbinds at the end.standard—Does not contain extra varbinds.

Default

Trap receivers are in enhanced mode by default, and the version is SNMPv2c by default.

Usage Guidelines

The IP address can be unicast, multicast, or broadcast.

An authorized trap receiver can be one or more network management stations on your network. Authorized trap receivers must be configured on the switch for the trap receiver to receive switch-generated traps. The switch sends SNMP traps to all trap receivers configured to receive the specific trap group.

To view the SNMP trap receivers configured on the switch, use the show management command. The show management command displays information about the switch including the destination and community of the SNMP trap receivers configured on the switch.

Example

The following command adds the IP address 10.101.0.100 as a trap receiver with community string purple:

```
configure snmp add trapreceiver 10.101.0.100 community purple
```

The following command adds the IP address 10.101.0.105 as a trap receiver with community string green, using port 3003:

```
configure snmp add trapreceiver 10.101.0.105 community green port 3003
```

The following command adds the IP address 10.101.0.105 as a trap receiver with community string blue, and IP address 10.101.0.25 as the source:

```
configure snmp add trapreceiver 10.101.0.105 community blue from 10.101.0.25
```

History

This command was first available in ExtremeXOS 10.1.

The virtual router parameter was added in ExtremeXOS 12.3.

IPv6 support was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure snmp delete community

configure snmp delete community [**readonly** | **readwrite**] [**all** | *alphanumeric_string*]

Description

Deletes an SNMP read or read/write community string.

Syntax Description

readonly	Specifies read-only access to the system.
readwrite	Specifies read and write access to the system.
all	Specifies all of the SNMP community stings.
alphanumeric_string	Specifies an SNMP community string name. See “Usage Guidelines” for more information.

Default

The default read-only community string is public. The default read/write community string is private.

Usage Guidelines

You must have at least one community string for SNMP access. If you delete all of the community strings on your system, you will no longer have SNMP access, even if you have SNMP enabled.

The community strings allow a simple method of authentication between the switch and the remote network manager. There are two types of community strings on the switch. Read community strings provide read-only access to the switch. The default read-only community string is public. read/write community strings provide read and write access to the switch. The default read/write community string is private. Sixteen read-only and sixteen read-write community strings can be configured on the switch, including the defaults. The community string for all authorized trap receivers must be configured on the switch for the trap receiver to receive switch-generated traps. SNMP community strings can contain up to 32 characters.

For increased security, Extreme Networks recommends that you change the defaults of the read/write and read-only community strings.

Use the configure snmp add commands to configure an authorized SNMP management station.

Example

The following command deletes a read/write community string named extreme:

```
configure snmp delete community readwrite extreme
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmp delete trapreceiver

configure snmp delete trapreceiver [[*ip_address* | *ipv6_address*] {*port_number*} | **all**]

Description

Deletes a specified trap receiver or all authorized trap receivers.

Syntax Description

ip_address	Specifies an SNMP trap receiver IPv4 address.
ipv6_address	Specifies an SNMP trap receiver IPv6 address.
port_number	Specifies the port associated with the receiver.
all	Specifies all SNMP trap receiver IP addresses.

Default

The default port number is 162.

Usage Guidelines

Use this command to delete a trap receiver of the specified IPv4 or IPv6 address, or all authorized trap receivers.

This command deletes only the first SNMPv1/v2c trap receiver whose IP address and port number match the specified value.

Example

The following command deletes the trap receiver 10.101.0.100 from the trap receiver list:

```
configure snmp delete trapreceiver 10.101.0.100
```

The following command deletes entries in the trap receiver list for 10.101.0.100, port 9990:

```
configure snmp delete trapreceiver 10.101.0.100 9990
```

Any entries for this IP address with a different community string will not be affected.

History

This command was first available in ExtremeXOS 10.1.

IPv6 support was added in ExtremeXOS 12.4

Platform Availability

This command is available on all platforms.

configure snmp sysContact

configure snmp syscontact *sysContact*

Description

Configures the name of the system contact.

Syntax Description

sysContact	An alphanumeric string that specifies a system contact name.

Default

N/A.

Usage Guidelines

The system contact is a text field that enables you to enter the name of the person(s) responsible for managing the switch. A maximum of 255 characters is allowed.

To view the name of the system contact listed on the switch, use the show switch command. The show switch command displays switch statistics including the name of the system contact.

Example

The following command defines FredJ as the system contact:

```
configure snmp syscontact fredj
```

The following output from the show switch command displays FredJ as the system contact:

```
SysName:          engineeringlab
SysLocation: englab
SysContact:       FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmp sysLocation

configure snmp syslocation *sysLocation*

Description

Configures the location of the switch.

Syntax Description

sysLocation	An alphanumeric string that specifies the switch location.

Default

N/A.

Usage Guidelines

Use this command to indicate the location of the switch. A maximum of 255 characters is allowed.

To view the location of the switch on the switch, use the show switch command. The show switch command displays switch statistics including the location of the switch.

Example

The following command configures a switch location name on the system:

```
configure snmp syslocation englab
```

The following output from the show switch command displays englab as the location of the switch:

```
SysName:          engineeringlab
SysLocation: englab
SysContact:       FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmp sysName

configure snmp sysname *sysName*

Description

Configures the name of the switch.

Syntax Description

sysName	An alphanumeric string that specifies a device name.

Default

The default sysName is the model name of the device (for example, BlackDiamond8800).

Usage Guidelines

You can use this command to change the name of the switch. A maximum of 32 characters is allowed. The sysName appears in the switch prompt. On a SummitStack, the sysName appears in the prompt of all active nodes in the stack when there is a master node present in the stack.

To view the name of the system listed on the switch, use the show switch command. The show switch command displays switch statistics including the name of the system.

Example

The following command names the switch:

```
configure snmp sysname engineeringlab
```

The following output from the show switch command displays engineeringlab as the name of the switch:

```
SysName:          engineeringlab
SysLocation: englab
SysContact:       FredJ
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmpv3 add access

configure snmpv3 add access [[**hex** *hex_group_name*] | *group_name*] {**sec-model** [**snmpv1** | **snmpv2c** | **usm**]} {**sec-level** [**noauth** | **authnopriv** | **priv**]} {**read-view** [[**hex** *hex_read_view_name*] | *read_view_name*]} {**write-view** [[**hex** *hex_write_view_name*]] | *write_view_name*]} {**notify-view** [[**hex** *hex_notify_view_nam*]] | *notify_view_name*]} {**volatile**}

Description

Creates (and modifies) a group and its access rights.

Syntax Description

hex_group_name	Specifies the group name to add or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to add or modify. The value is to be supplied in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.
authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.
read-view	Specifies the read view name:hex_read_view_name—Specifies a hex value supplied as a colon separated string of hex octetsread_view_name—Specifies an ASCII value
write-view	Specifies the write view name:hex_write_view_name—Specifies a hex value supplied as a colon separated string of hex octetswrite_view_name—Specifies an ASCII value
notify-view	Specifies the notify view name:hex_notify_view_name—Specifies a hex value supplied as a colon separated string of hex octetsnotify_view_name—Specifies an ASCII value
volatile	Specifies volatile storage.

Default

The default values are:

- sec-model—USM
- sec-level—noauth
- read view name—defaultUserView
- write view name— “”
- notify view name—defaultNotifyView
- non-volatile storage

Usage Guidelines

Use this command to configure access rights for a group. All access groups are created with a unique default context, “”, as that is the only supported context.

Use more than one character when creating unique community strings and access group names.

A number of default groups are already defined. These groups are: admin, initial, v1v2c_ro, v1v2c_rw.

- The default groups defined are v1v2c_ro for security name v1v2c_ro, v1v2c_rw for security name v1v2c_rw, admin for security name admin, and initial for security names initial, initialmd5, initialsha, initialmd5Priv and initialshaPriv.
- The default access defined are admin, initial, v1v2c_ro, v1v2c_rw, and v1v2cNotifyGroup.

Example

In the following command, access for the group defaultROGroup is created with all the default values: security model usm, security level noauth, read view defaultUserView, no write view, notify view defaultNotifyView, and storage nonvolatile.

```
configure snmpv3 add access defaultROGroup
```

In the following command, access for the group defaultROGroup is created with the values: security model USM, security level authnopriv, read view defaultAdminView, write view defaultAdminView, notify view defaultAdminView, and storage nonvolatile.

```
configure snmpv3 add access defaultROGroup sec-model usm sec-level authnopriv
read-view defaultAdminView write-view defaultAdminView notify-view
defaultAdminView
```

History

This command was first available in ExtremeXOS 10.1.

The hex_read_view_name, hex_write_view_name, and hex_notify_view_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add community

configure snmpv3 add community [[**hex** *hex_community_index*] | *community_index*] [**encrypted name** *community_name* | **name** [[**hex** *hex_community_name*] | *community_name*] {**store-encrypted**}] **user** [[**hex** *hex_user_name*] | *user_name*] {**tag** [[**hex** *transport_tag*] | *transport_tag*]} {**volatile**}

Description

Adds an SNMPv3 community entry.

Syntax Description

hex_community_index	Specifies the row index in the snmpCommunity table as a hex value supplied as a colon separated string of hex octets.
community_index	Specifies the row index in the snmpCommunity Table as an ASCII value.
hex_community_name	Specifies the community name as a hex value supplied as a colon separated string of hex octets
community_name	Specifies the community name as an ASCII value.
hex_user_name	Specifies the USM user name as a hex value supplied as a colon separated string of hex octets.
user_name	Specifies the USM user name as an ASCII value.
tag	Specifies the tag used to locate transport endpoints in SnmpTargetAddrTable. When this community entry is used to authenticate v1/v2c messages, this tag is used to verify the authenticity of the remote entity.hex_transport_tag—Specifies a hex value supplied as a colon separated string of hex octetstransport_tag—Specifies an ASCII value
volatile	Specifies volatile storage.

Default

N/A.

Usage Guidelines

Use this command to create or modify an SMMPv3 community in the community MIB.

Example

```
X450a-24t.4 # configure snmp add community readonly extreme store-encrypted
X450a-24t.7 # show snmpv3 community
Community Index  : extreme
Community Name   : hys{fnj (encrypted)
Security Name    : v1v2c_ro
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:63
Context Name     :
```

```
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
X450a-24t.8 # configure snmp add community readwrite extreme123
X450a-24t.9 show snmpv3 community
Community Index  : extreme
Community Name   : hys{fnj (encrypted)
Security Name    : v1v2c_ro
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:63
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
Community Index  : extreme123
Community Name   : extreme123
Security Name    : v1v2c_rw
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:63
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
X450a-24t.10 # show configuration "snmp"
#
# Module snmpMaster configuration.
#
configure snmpv3 add community extreme encrypted name hys{fnj user v1v2c_ro
configure snmpv3 add community extreme123 name extreme123 user v1v2c_rw
The following command creates an entry with the community index comm_index,
community name comm_public, and user (security) name v1v2c_user:
configure snmpv3 add community comm_index name comm_public user v1v2c_user
```

History

This command was first available in ExtremeXOS. 10.1.

The hex_community_index, hex_community_name, hex_user_name, and hex_transport_tag parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add filter

configure snmpv3 add filter [[**hex** *hex_profile_name*] | *profile_name*] **subtree** *object_identifier* {**/subtree_mask**} **type** [**included** | **excluded**] {**volatile**}

Description

Adds a filter to a filter profile.

Syntax Description

hex_profile_name	Specifies the filter profile that the current filter is added to. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile that the current filter is added to in ASCII format.
object identifier	Specifies a MIB subtree.
subtree_mask	Specifies a hex octet string used to mask the subtree. For example, f7a indicates 1.1.1.1.0.1.1.1.1.0.1.0.
included	Specifies that the MIB subtree defined by object identifier/mask is to be included.
excluded	Specifies that the MIB subtree defined by object identifier/mask is to be excluded.
volatile	Specifies volatile storage.

Default

The default values are:

- mask value—empty string (all 1s)
- type—included
- storage—non-volatile

Usage Guidelines

Use this command to create a filter entry in the snmpNotifyFilterTable. Each filter includes or excludes a portion of the MIB. Multiple filter entries comprise a filter profile that can eventually be associated with a target address. Other commands are used to associate a filter profile with a parameter name, and the parameter name with a target address.

This command can be used multiple times to configure the exact filter profile desired.

Example

The following command adds a filter to the filter profile prof1 that includes the MIB subtree 1.3.6.1.4.1/f0:

```
configure snmpv3 add filter prof1 subtree 1.3.6.1.4.1/f0 type included
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add filter-profile

configure snmpv3 add filter-profile [[**hex** *hex_profile_name*] | *profile_name*] **param** [[**hex** *hex_param_name*]] | *param_name*] {**volatile**}

Description

Associates a filter profile with a parameter name.

Syntax Description

hex_profile_name	Specifies the filter profile name. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile name in ASCII format.
hex_param_name	Specifies a parameter name to associate with the filter profile. The value to follow is to be supplies as a colon separated string of hex octets.
param_name	Specifies a parameter name to associate with the filter profile in ASCII format.
volatile	Specifies volatile storage.

Default

The default storage type is non-volatile.

Usage Guidelines

Use this command to add an entry to the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. The parameter name is associated with target addresses, and the filter profile is associated with a series of filters, so, in effect, you are associating a series of filters with a target address.

Example

The following command associates the filter profile prof1 with the parameter name P1:

```
configure snmpv3 add filter-profile prof1 param P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add group user

configure snmpv3 add group [[**hex** *hex_group_name*] | *group_name*] **user** [[**hex** *hex_user_name*] | *user_name*] {**sec-model** [**snmpv1**| **snmpv2c** | **usm**]} {**volatile**}

Description

Adds a user name (security name) to a group.

Syntax Description

hex_group_name	Specifies the group name to add or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to add or modify in ASCII format.
hex_user_name	Specifies the user name to add or modify. The value to follow is to be supplies as a colon separated string of hex octets.
user_name	Specifies the user name to add or modify in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
volatile	Specifies volatile storage.

Default

The default values are:

- sec-model—USM
- non-volatile storage

Usage Guidelines

Use this command to associate a user name with a group.

As per the SNMPv3 RFC, a security name is model independent while a username is model dependent. For simplicity, both are assumed to be same here. User names and security names are handled the same. In other words, if a user is created with the user name username, the security name value is the same, username.

Every group is uniquely identified by a security name and security model. So the same security name can be associated to a group name but with different security models.

Example

The following command associates the user userV1 to the group defaultRoGroup with SNMPv1 security:

```
configure snmpv3 add group defaultRoGroup user userV1 sec-model snmpv1
```

The following command associates the user userv3 with security model USM and storage type volatile to the access group defaultRoGroup:

```
configure snmpv3 add group defaultRoGroup user userV3 volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name and hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add mib-view

configure snmpv3 add mib-view [[*hex hex_view_name*] | *view_name*] *subtree object_identifier* {*subtree_mask*} {*type* [*included* | *excluded*]} {*volatile*}

Description

Adds (and modifies) a MIB view.

Syntax Description

hex_view_name	Specifies the MIB view name to add or modify. The value is to be supplies as a colon separated string of hex octets.
view_name	Specifies the MIB view name to add or modify in ASCII format.
object_identifier	Specifies a MIB subtree.
subtree_mask	Specifies a hex octet string used to mask the subtree. For example, f7a indicates 1.1.1.1.0.1.1.1.1.0.1.0.
included	Specifies that the MIB subtree defined by subtree/mask is to be included.
excluded	Specifies that the MIB subtree defined by subtree/mask is to be excluded.
volatile	Specifies volatile storage.

Default

The default mask value is an empty string (all 1s). The other default values are included and non-volatile.

Usage Guidelines

Use this command to create a MIB view into a subtree of the MIB. If the view already exists, this command modifies the view to additionally include or exclude the specified subtree.

In addition to the created MIB views, there are three default views. They are: defaultUserView, defaultAdminView, and defaultNotifyView.

Example

The following command creates the MIB view allMIB with the subtree 1.3 included as non-volatile:

```
configure snmpv3 add mib-view allMIB subtree 1.3
```

The following command creates the view extremeMib with the subtree 1.3.6.1.4.1.1916 included as non-volatile:

```
configure snmpv3 add mib-view extremeMib subtree 1.3.6.1.4.1.1916
```

The following command creates a view vrrpTrapNewMaster which excludes VRRP notification .1 and the entry is volatile:

```
configure snmpv3 add mib-view vrrpTrapNewMaster 1.3.6.1.2.1.68.0.1/ff8 type
excluded volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_view_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add notify

configure snmpv3 add notify [[**hex** *hex_notify_name*] | *notify_name*] **tag** [[**hex** *hex_tag*] | *tag*] {**type** [**trap** | **inform**]}{**volatile**}

Description

Adds an entry to the snmpNotifyTable.

Syntax Description

hex_notify_name	Specifies the notify name to add. The value is to be supplied as a colon separated string of hex octets.
notify_name	Specifies the notify name to add in ASCII format.
hex_tag	Specifies a string identifier for the notifications to be sent to the target. The value is supplied as a colon separated string of octets.
tag	Specifies a string identifier for the notifications to be sent to the target in ASCII format.
trap	Specifies an unconfirmed notification.
inform	Specifies a confirmed notification.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default storage type is non-volatile.

The default type is trap.

Usage Guidelines

Use this command to add an entry to the snmpNotifyTable. When a notification is to be sent, this table is examined. For the target addresses that have been associated with the tags present in the table, notifications are sent based on the filters also associated with the target addresses.

Example

The following command sends notifications to addresses associated with the tag type1:

```
configure snmpv3 add notify N1 tag type1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_notify_name and hex_tag parameters were added in ExtremeXOS 11.0.

The INFORM option was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

configure snmpv3 add target-addr

configure snmpv3 add target-addr [[**hex** *hex_addr_name*] | *addr_name*] **param** [[**hex** *hex_param_name*] |*param_name*] **ipaddress** [*ip_address* | **ipv4-with-mask** *ip_and_tmask*] | [*ipv6_address* | **ipv6-with-mask** *ipv6_and_tmask*]] {**transport-port** *port_number*} {**from** [*src_ip_address* | *src_ipv6_address*]} {**vr** *vr_name*} {**tag-list** *tag_list*} {**volatile**}

Description

Adds and configures an SNMPv3 target address and associates filtering, security, and notifications with that address.

Syntax Description

hex_addr_name	Specifies a string identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address in ASCII format.
hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.
ip_address	Specifies an SNMPv3 target IPv4 address.
ipv4-with-mask	Specify IPv4 address with hexadecimal mask.
ip_and_tmask	Specifies the IPv4 address and hexadecimal mask in form A.B.C.D/NN...
ipv6_address	Specifies an SNMPv3 target IPv6 address.
ipv6-with-mask	Specify IPv6 address with hexadecimal mask.
ipv6_and_tmask	Specifies an IPv6 address and hexadecimal mask in form A:B:C:D:E:F:G:H/NN...
port_number	Specifies a UDP port. Default is 162.
src_ip_address	Specifies the IPv4 address of a VLAN to be used as the source address for the trap.
src_ipv6_address	Specifies the IPv6 address of a VLAN to be used as the source address for the trap.
vr_name	Specifies the name of the virtual router.
tag-list	Specifies a list of comma separated string identifiers for the notifications to be sent to the target.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- transport-port—port 162
- non-volatile storage

If you do not specify tag-list the single tag defaultNotify, a pre-defined value in the snmpNotifyTable is used.

Usage Guidelines

Use this command to create an entry in the SNMPv3 snmpTargetAddressTable. The **param** parameter associates the target address with an entry in the snmpTargetParamsTable, which specifies security and storage parameters for messages to the target address, and an entry in the snmpNotifyFilterProfileTable, which specifies filter profiles to use for notifications to the target address. The filter profiles are associated with the filters in the snmpNotifyFilterTable.

The list of tag-lists must match one or more of the tags in the snmpNotifyTable for the trap to be sent out.

Example

The following command specifies a target address of 10.203.0.22 with the name A1, and associates it with the security parameters and target address parameter P1:

```
configure snmpv3 add target-addr A1 param P1 ipaddress 10.203.0.22
```

The following command specifies a target address of 10.203.0.22 with the name A1, and associates it with the security parameters and target address parameter P1, and the notification tags type1 and type2:

```
configure snmpv3 add target-addr A1 param P1 ipaddress 10.203.0.22 from
10.203.0.23 tag-list type1,type2
```

History

This command was first available in ExtremeXOS 10.1.

The virtual router, IP address and hexadecimal mask parameters were added in ExtremeXOS 12.3.

IPv6 support was added in ExtremeXOS 12.4.

The **IPv4-with-mask** and **IPv6-with-mask** keywords were added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

configure snmpv3 add target-params

configure snmpv3 add target-params [[**hex** *hex_param_name*] | *param_name*] **user** [[**hex** *hex_user_name*] | *user_name*] **mp-model** [**snmpv1** | **snmpv2c** | **snmpv3**] **sec-model** [**snmpv1** | **snmpv2c** | **usm**] {**sec-level** [**noauth** | **authnopriv** | **priv**]} {**volatile**}

Description

Adds and configures SNMPv3 target parameters.

Syntax Description

hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.
hex_user_name	Specifies a user name. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies a user name in ASCII format.
mp-model	Specifies a message processing model; choose from SNMPv1, SNMPv2, or SNMPv3.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).
sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.
authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- sec-level—noauth
- non-volatile storage

Usage Guidelines

Use this command to create an entry in the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

To associate a target address with a parameter name, see the command configure snmpv3 add target-addr.

Example

The following command specifies a target parameters entry named P1, a user name of guest, message processing and security model of SNMPv2c, and a security level of no authentication:

```
configure snmpv3 add target-params P1 user guest mp-model snmpv2c sec-model
snmpv2c sec-level noauth
```

History

This command was first available in ExtremeXOS 10.1.

The hex_param_name and hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 add user

configure snmpv3 add user [[**hex** *hex_user_name*] | *user_name*] {**authentication** [**md5** | **sha**] [**hex** *hex_auth_password* | *auth_password*]} {**privacy** {**des** | **3des** | **aes** {**128** | **192** | **256**}} [[**hex** *hex_priv_password*] | *priv_password*]} }{**volatile**}

Description

Adds (and modifies) an SNMPv3 user.

Syntax Description

hex_user_name	Specifies the user name to add or modify. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to add or modify in ASCII format.
MD5	Specifies RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication.
SHA	Specifies SHA authentication.
authentication	Specifies the authentication password or hex string to use for generating the authentication key for this user.
privacy	Specifies the privacy password or hex string to use for generating the privacy key for this user.
des	Specifies the use of the 56-bit DES algorithm for encryption. This is the default.

3des	Specifies the use of the 168-bit 3DES algorithm for encryption.
aes	Specifies the use of the AES algorithm for encryption.
128	Specifies the use of the 128-bit AES algorithm for encryption.
192	Specifies the use of the 192-bit AES algorithm for encryption.
256	Specifies the use of the 256-bit AES algorithm for encryption.
volatile	Specifies volatile storage. By specifying volatile storage, the configuration is not saved across a switch reboot.

Default

The default values are:

- authentication—no authentication
- privacy—no privacy
- non-volatile storage

Usage Guidelines

Use this command to create or modify an SNMPv3 user configuration.

The default user names are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv. The initial password for admin is password. For the other default users, the initial password is the user name.

If hex is specified, supply a 16 octet hex string for RSA Data Security, Inc. MD5 Message-Digest Algorithm, or a 20 octet hex string for SHA.

You must specify authentication if you want to specify privacy. There is no support for privacy without authentication.

Note

3DES, AES 192, and AES 256 bit encryptions are proprietary implementations and may not work with some SNMP managers.

Example

The following command configures the user guest on the local SNMP Engine with security level noauth (no authentication and no privacy):

```
configure snmpv3 add user guest
```

The following command configures the user authMD5 to use RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication with the password palertyu:

```
configure snmpv3 add user authMD5 authentication md5  palertyu
```

The following command configures the user authShapriv to use SHA authentication with the hex key shown below, the privacy password palertyu, and volatile storage:

```
configure snmpv3 add user authShapriv authentication sha hex
01:03:04:05:01:05:02:ff:ef:cd:12:99:34:23:ed:ad:ff:ea:cb:11 privacy palertyu
volatile
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Support for 3DES and AES was added in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure snmpv3 add user clone-from

configure snmpv3 add user [[**hex** *hex_user_name*] | *user_name*] **clone-from** [[**hex** *hex_user_name*] | *user_name*]

Description

Creates a new user by cloning from an existing SNMPv3 user.

Syntax Description

hex_user_name	Specifies the user name to add or to clone from. The value is to be supplies as a colon separated string of hex octets.
user_name	Specifies the user name to add or to clone from in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to create a new user by cloning an existing one. After you have successfully cloned the new user, you can modify its parameters using the following command:

```
        configure snmpv3 add user [[hex <hex_user_name>] | <user_name>]
{authentication [md5 | sha] [hex <hex_auth_password> | <auth_password>]}
{privacy {des | 3des | aes {128 | 192 | 256}} [[hex <hex_priv_password>] |
```

```
<priv_password>]} }{volatile}
```

Users cloned from the default users will have the storage type of non-volatile. The default names are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command creates a user cloneMD5 with same properties as the default user initalmd5. All authorization and privacy keys will initially be the same as with the default user initialmd5.

```
configure snmpv3 add user cloneMD5 clone-from initialmd5
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete access

configure snmpv3 delete access [**all-non-defaults** | {[[**hex** *hex_group_name*] | *group_name*] {**sec-model** [**snmpv1** | **snmpv2c** | **usm**] **sec-level** [**noauth** | **authnopriv** | **priv**]}}]

Description

Deletes access rights for a group.

Syntax Description

all-non-defaults	Specifies that all non-default (non-permanent) security groups are to be deleted.
hex_group_name	Specifies the group name to be deleted. The value is to be supplies as a colon separated string of hex octets.
group_name	Specifies the group name to be deleted in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).

sec-level	Specifies the security level for the group.
noauth	Specifies no authentication (and implies no privacy) for the security level.
authnopriv	Specifies authentication and no privacy for the security level.
priv	Specifies authentication and privacy for the security level.

Default

The default values are:

- sec-model—USM
- sec-level—noauth

Usage Guidelines

Use this command to remove access rights for a group. Use the all-non-defaults keyword to delete all the security groups, except for the default groups. The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

Deleting an access will not implicitly remove the related group to user association from the VACMSecurityToGroupTable. To remove the association, use the following command:

```
        configure snmpv3 delete group {[[hex <hex_group_name>] |
<group_name>]} user [all-non-defaults | {[[hex <hex_user_name>] |
<user_name>] {sec-model [snmpv1|snmpv2c|usm]}}]
```

Example

The following command deletes all entries with the group name userGroup:

```
configure snmpv3 delete access userGroup
```

The following command deletes the group userGroup with the security model snmpv1 and security level of authentication and no privacy (authnopriv):

```
configure snmpv3 delete access userGroup sec-model snmpv1 sec-level authnopriv
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete community

configure snmpv3 delete community [**all-non-defaults** | {[[**hex** *hex_community_index*] | *community_index*} | {**name** [[**hex** *hex_community_name*] | *community_name*}]

Description

Deletes an SNMPv3 community entry.

Syntax Description

all-non-defaults	Specifies that all non-default community entries are to be removed.
hex_community_index	Specifies the row index in the snmpCommunityTable. The value is to be supplied as a colon separated string of hex octets.
community_index	Specifies the row index in the snmpCommunityTable in ASCII format.
hex_community_name	Specifies the community name. The value is to be supplied as a colon separated string of hex octets.
community_name	Specifies the community name in ASCII format.

Default

The default entries are public and private.

Usage Guidelines

Use this command to delete an SMMPv3 community in the community MIB.

Example

The following command deletes an entry with the community index comm_index:

```
configure snmpv3 delete community comm_index
```

The following command creates an entry with the community name (hex) of EA:12:CD:CF:AB:11:3C:

```
configure snmpv3 delete community name hex EA:12:CD:CF:AB:11:3C
```

History

This command was first available in ExtremeXOS 10.1.

The hex_community_index and hex_community_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete filter

configure snmpv3 delete filter [**all** | [[**hex** *hex_profile_name*] | *profile_name*] {**subtree** *object_identifier*}]]

Description

Deletes a filter from a filter profile.

Syntax Description

all	Specifies all filters.
hex_profile_name	Specifies the filter profile of the filter to delete. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile of the filter to delete in ASCII format.
object_identifier	Specifies the MIB subtree of the filter to delete.

Default

N/A.

Usage Guidelines

Use this command to delete a filter entry from the snmpNotifyFilterTable. Specify all to remove all entries. Specify a profile name to delete all entries for that profile name. Specify a profile name and a subtree to delete just those entries for that filter profile and subtree.

Example

The following command deletes the filters from the filter profile prof1 that reference the MIB subtree 1.3.6.1.4.1:

```
configure snmpv3 delete filter prof1 subtree 1.3.6.1.4.1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete filter-profile

configure snmpv3 delete filter-profile [**all** |[[**hex** *hex_profile_name*] | *profile_name*] {**param**[[**hex** *hex_param_name*] | *param_name*}]]

Description

Removes the association of a filter profile with a parameter name.

Syntax Description

all	Specifies all filter profiles.
hex_profile_name	Specifies the filter profile name to delete. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile name to delete in ASCII format.
hex_param_name	Specifies to delete the filter profile with the specified profile name and parameter name. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies to delete the filter profile with the specified profile name and parameter name in ASCII format.

Default

The default storage type is non-volatile.

Usage Guidelines

Use this command to delete entries from the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. Specify all to remove all entries. Specify a profile name to delete all entries for that profile name. Specify a profile name and a parameter name to delete just those entries for that filter profile and parameter name.

Example

The following command deletes the filter profile prof1 with the parameter name P1:

```
configure snmpv3 delete filter-profile prof1 param P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete group user

configure snmpv3 delete group {[[**hex** *hex_group_name*] | *group_name*]} **user** [**all-non-defaults** | {[[**hex** *hex_user_name*] | *user_name*] {**sec-model** [**snmpv1**|**snmpv2c**|**usm**]}}]

Description

Deletes a user name (security name) from a group.

Syntax Description

hex_group_name	Specifies the group name to delete or modify. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to delete or modify in ASCII format.
all-non-defaults	Specifies that all non-default (non-permanent) users are to be deleted from the group.
hex_user_name	Specifies the user name to delete or modify. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to delete or modify in ASCII format.
sec-model	Specifies the security model to use.
snmpv1	Specifies the SNMPv1 security model.
snmpv2c	Specifies the SNMPv2c security model.
usm	Specifies the SNMPv3 User-based Security Model (USM).

Default

The default value for sec-model is USM.

Usage Guidelines

Use this command to remove the associate of a user name with a group.

As per the SNMPv3 RFC, a security name is model independent while a username is model dependent. For simplicity, both are assumed to be same here. User names and security names are handled the same. In other words, if a user is created with the user name username, the security name value is the same, username.

Every group is uniquely identified by a security name and security model. So the same security name can be associated to a group name but with different security models.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

The default users are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command deletes the user guest from the group UserGroup for the security model snmpv2c:

```
configure snmpv3 delete group UserGroup user guest sec-model snmpv2c
```

The following command deletes the user guest from the group userGroup with the security model USM:

```
configure snmpv3 delete group userGroup user guest
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name and the hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete mib-view

configure snmpv3 delete mib-view [**all-non-defaults** | {[[**hex** *hex_view_name*] | *view_name*] {**subtree** *object_identifier*}}]

Description

Deletes a MIB view.

Syntax Description

all-non-defaults	Specifies that all non-default (non-permanent) MIB views are to be deleted.
hex_view_name	Specifies the MIB view to delete. The value is to be supplied as a colon separated string of hex octets.
view_name	Specifies the MIB view name to delete in ASCII format.
object_identifier	Specifies a MIB subtree.

Default

N/A.

Usage Guidelines

Use this command to delete a MIB view. Views which are being used by security groups cannot be deleted. Use the all-non-defaults keyword to delete all the MIB views (not being used by security groups) except for the default views. The default views are: defaultUserView, defaultAdminView, and defaultNotifyView.

Use the configure snmpv3 add mib-view command to remove a MIB view from its security group, by specifying a different view.

Example

The following command deletes all views (only the permanent views will not be deleted):

```
configure snmpv3 delete mib-view all-non-defaults
```

The following command deletes all subtrees with the view name AdminView:

```
configure snmpv3 delete mib-view AdminView
```

The following command deletes the view AdminView with subtree 1.3.6.1.2.1.2

```
configure snmpv3 delete  mib-view AdminView subtree 1.3.6.1.2.1.2
```

History

This command was first available in ExtremeXOS 10.1.

The hex_view_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete notify

configure snmpv3 delete notify [{[[**hex** *hex_notify_name*] | *notify_name*]} | **all-non-defaults**]

Description

Deletes an entry from the snmpNotifyTable.

Syntax Description

hex_notify_name	Specifies the notify name to add. The value is to be supplied as a colon separated string of hex octets.
notify_name	Specifies the notify name to add in ASCII format.
all-non-defaults	Specifies that all non-default (non-permanent) notifications are to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete an entry from the snmpNotifyTable. When a notification is to be sent, this table is examined. For the target addresses that have been associated with the tags present in the table, notifications will be sent, based on the filters also associated with the target addresses.

Example

The following command removes the N1 entry from the table:

```
configure snmpv3 delete notify N1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_notify_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete target-addr

configure snmpv3 delete target-addr [{[[**hex** *hex_addr_name*] | *addr_name*]} | **all**]

Description

Deletes SNMPv3 target addresses.

Syntax Description

hex_addr_name	Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address.
all	Specifies all target addresses.

Default

N/A.

Usage Guidelines

Use this command to delete an entry in the SNMPv3 snmpTargetAddressTable.

Example

The following command deletes target address named A1:

```
configure snmpv3 delete target-addr A1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_addr_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete target-params

configure snmpv3 delete target-params [{[[**hex** *hex_param_name*] | *param_name*]} | **all**]

Description

Deletes SNMPv3 target parameters.

Syntax Description

hex_param_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name associated with the target in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to delete an entry in the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

Example

The following command deletes a target parameters entry named P1:

```
configure snmpv3 delete target-params P1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_param_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 delete user

configure snmpv3 delete user [**all-non-defaults** | [[**hex** *hex_user_name*] | *user_name*]]

Description

Deletes an existing SNMPv3 user.

Syntax Description

all-non-defaults	Specifies that all non-default (non-permanent) users are to be deleted.
hex_user_name	Specifies the user name to delete. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to delete.

Default

N/A.

Usage Guidelines

Use this command to delete an existing user.

Use the all-non-defaults keyword to delete all users, except for the default users. The default user names are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Deleting a user will not implicitly remove the related group to user association from the VACMSecurityToGroupTable. To remove the association, use the following command:

```
        configure snmpv3 delete group {[[hex hex_group_name] | group_name]}
user [all-non-defaults | {[[hex hex_user_name] | user_name] {sec-model
[snmpv1|snmpv2c|usm]}}]
```

Example

The following command deletes all non-default users:

```
configure snmpv3 delete user all-non-defaults
```

The following command deletes the user guest:

```
configure snmpv3 delete user guest
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure snmpv3 engine-boots

configure snmpv3 engine-boots *(1-2147483647)*

Description

Configures the SNMPv3 Engine Boots value.

Syntax Description

(1-2147483647)	Specifies the value of engine boots.

Default

N/A.

Usage Guidelines

Use this command if the Engine Boots value needs to be explicitly configured. Engine Boots and Engine Time will be reset to zero if the Engine ID is changed. Engine Boots can be set to any desired value but will latch on its maximum, 2147483647.

Example

The following command configures Engine Boots to 4096:

```
configure snmpv3 engine-boots 4096
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmpv3 engine-id

configure snmpv3 engine-id *hex_engine_id*

Decription

Configures the SNMPv3 snmpEngineID.

Syntax Description

hex_engine_id	Specifies the colon delimited hex octet that serves as part of the snmpEngineID (5-32 octets).

Default

The default snmpEngineID is the device MAC address.

Usage Guidelines

Use this command if the snmpEngineID needs to be explicitly configured. The first four octets of the ID are fixed to 80:00:07:7C,which represents Extreme Networks Vendor ID. Once the snmpEngineID is

changed, default users will be reverted back to their original passwords/keys, while non-default users will be reset to the security level of no authorization, no privacy.

In a chassis, the snmpEngineID will be generated using the MAC address of the MSM/MM with which the switch boots first. For MSM/MM hitless failover, the same snmpEngineID will be propagated to both of the MSMs/MMs.

Example

The following command configures the snmpEngineID to be 80:00:07:7C:00:0a:1c:3e:11:

```
configure snmpv3 engine-id 00:0a:1c:3e:11
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure snmpv3 target-addr retry

configure snmpv3 target-addr [[**hex** *hex_addr_name*] | *addr_name*] **retry** *retry_count*

Description

Configures SNMPv3 INFORM notification retries.

Syntax Description

hex_addr_name	Specifies a address name in hexadecimal format.
addr_name	Specifies the address name in ASCII format.
retry_count	Specifies the maximum number of times to resend an SNMPv3 inform.

Default

The retry default is 3.

Usage Guidelines

Use this command to configure the number of times an SNMPv3 INFORM message is to be resent to the (notification responder) manager when a response has not been received.

Example

The following command configures a retry count of 5 for the target address A1:

```
configure snmpv3 target-addr A1 retry 5
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

configure snmpv3 target-addr timeout

configure snmpv3 target-addr [[**hex** *hex_addr_name*] | *addr_name*] **timeout** *timeout_val*

Description

Configures the SNMPv3 INFORM notification timeout.

Syntax Description

hex_addr_name	Specifies the address name in hexadecimal format.
addr_name	Specifies the address name in ASCII format.
timeout_val	Specifies the number of seconds.

Default

The timeout value default is 15 seconds.

Usage Guidelines

Use this command to configure how many seconds to wait for a response before resending an SNMPv3 INFORM.

Example

The following command configures a timeout value of 20 seconds for the target address A1:

```
configure snmpv3 target-addr A1 timeout 20
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

configure sntp-client

configure sntp-client [**primary** | **secondary**] *host-name-or-ip* {**vr** *vr_name*}

Description

Configures an NTP server for the switch to obtain time information.

Syntax Description

primary	Specifies a primary server name.
secondary	Specifies a secondary server name.
host-name-or-ip	Specifies a host name or IPv4 address or IPv6 address.
vr	Specifies use of a virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
vr_name	Specifies the name of a virtual router.

Default

N/A.

Usage Guidelines

Queries are first sent to the primary server. If the primary server does not respond within 1 second, or if it is not synchronized, the switch queries the second server. If the switch cannot obtain the time, it restarts the query process. Otherwise, the switch waits for the sntp-client update interval before querying again.

Example

The following command configures a primary NTP server:

```
configure sntp-client primary 10.1.2.2
```

The following command configures the primary NTP server to use the management virtual router VR-Mgmt:

```
configure sntp-client primary 10.1.2.2 vr VR-Mgmt
```

History

This command was first available in ExtremeXOS 10.1.

The vr <vr_name> option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sntp-client update-interval

configure sntp-client update-interval *update-interval*

Description

Configures the interval between polls for time information from SNTP servers.

Syntax Description

update-interval	Specifies an interval in seconds.

Default

64 seconds.

Usage Guidelines

None.

Example

The following command configures the interval timer:

```
configure sntp-client update-interval 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure ssh2 access-profile

configure ssh2 access-profile [*access_profile* | [[**add** *rule*] [**first** | [[**before** | **after**] *previous_rule*]]] | **delete** *rule* | **none**]

Description

Configures SSH2 to use an ACL policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
add	Specifies that an ACL rule is to be added to the Telnet application
rule	Specifies an ACL rule
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule
previous_rule	Specifies an existing rule in the application
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

N/A.

Usage Guidelines

You must be logged in as administrator to configure SSH2 parameters.

- Implement an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for the SSH2 port. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

  In the ACL policy file for SSH2, the “source-address” field is the only supported match condition. Any other match conditions are ignored.

  Use the none option to remove a previously configured ACL.

  Policy files can also be configured using the following command:

  enable ssh2 {access-profile [<access_profile> | none]} {port <tcp_port_number>} {vr [<vr_name> | all | default]}

- Add an ACL rule to the SSH2 application through this command. Once an ACL is associated with SSH2, all the packets that reach an SSH2 module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the show access-list counters process ssh2 command.

  Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

  Match conditions

- Source-address—IPv4 and IPv6

Actions

- Permit
- Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the SSH2 traffic does not match any of the rules, the default behavior is permit. To deny SSH2 traffic that does not match any of the rules, add a deny all rule at the end or the rule list.

Creating an ACL Policy File

To create an ACL policy file, use the edit policy command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs in the ExtremeXOS Concepts Guide.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the configure snmp add community command. If the policy does not exist, create the ACL policy file.

Example

The following command applies the ACL MyAccessProfile_2 to SSH2:

configure ssh2 access-profile MyAccessProfile_2

The following command copies the ACL rule, DenyAccess to the SSH2 application in first place:

```
configure ssh2 access-profile add DenyAccess first
```

The following command removes the association of a single rule from the SSH2 application:

```
configure ssh2 access-profile delete DenyAccess
```

The following command removes the association of all ACL policies and rules from the SSH2 application:

```
configure ssh2 access-profile none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure telnet access-profile

configure telnet access-profile [*access_profile* | [[**add** *rule*] [**first** | [[**before** | **after**] *previous_rule*]]] | **delete** *rule* | **none**]

Description

Configures Telnet to use an ACL policy or ACL rule for access control.

Syntax Description

access_profile	Specifies an ACL policy.
add	Specifies that an ACL rule is to be added to the Telnet application.
rule	Specifies an ACL rule.
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule.
previous_rule	Specifies an existing rule in the application.
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

Telnet is enabled with no ACL policies and uses TCP port 23.

Usage Guidelines

You must be logged in as administrator to configure Telnet parameters.

You can restrict Telnet access in the following ways:

- Implement an ACL policy file that permits or denies a specific list of IP addresses and subnet masks for the Telnet port. You must create the ACL policy file before you can use this command. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

  In the ACL policy file for Telnet, the “source-address” field is the only supported match condition. Any other match conditions are ignored.

  Use the none option to remove a previously configured ACL.
- Add an ACL rule to the Telnet application through this command. Once an ACL is associated with Telnet, all the packets that reach a Telnet module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

  The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the show access-list counters process telnet command.

  Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

  Match conditions

- Source-address—IPv4 and IPv6

Actions

- Permit
- Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the Telnet traffic does not match any of the rules, the default behavior is permit. To deny Telnet traffic that does not match any of the rules, add a deny all rule at the end or the rule list.

Creating an ACL Policy File

To create an ACL policy file, use the edit policy command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs in the ExtremeXOS Concepts Guide.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the configure snmp add community command. If the policy does not exist, create the ACL policy file.

Viewing Telnet Information

To display the status of Telnet, including the current TCP port, the virtual router used to establish a Telnet session, and whether ACLs are controlling Telnet access, use the following command:

```
show management
```

Example

The following command applies the ACL policy MyAccessProfile_2 to Telnet:

```
configure telnet access-profile MyAccessProfile_2
```

The following command applies the ACL rule DenyAccess to the Telnet application in the first position in the list:

```
configure telnet access-profile add DenyAccess first
```

The following command removes the association of a single ACL rule from the Telnet application:

```
configure telnet access-profile delete DenyAccess
```

The following command removes the association of an ACL policy or all ACL rules from the Telnet application:

```
configure telnet access-profile none
```

History

This command was first available in ExtremeXOS 11.2

Support for ACL rules for Telnet was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure telnet port

configure telnet port [*portno* | **default**]

Description

Configures the TCP port used by Telnet for communication.

Syntax Description

portno	Specifies a TCP port number. The default is 23. The range is 1 through 65535. The following TCP port numbers are reserved and cannot be used for Telnet connections: 22, 80, and 1023.
default	Specifies the default Telnet TCP port number. The default is 23.

Default

The switch listens for Telnet connections on Port 23.

Usage Guidelines

You must be logged in as administrator to configure the Telnet port.

The portno range is 1 through 65535. The following TCP port numbers are reserved and cannot be used for Telnet connections: 22, 80, and 1023. If you attempt to configure a reserved port, the switch displays an error message similar to the following:

```
configure telnet port 22
Error: port number is a reserved port
```

If this occurs, select a port number that is not a reserved port.

The switch accepts IPv6 connections.

Example

The following command changes the port used for Telnet to port 85:

```
configure telnet port 85
```

The following command returns the port used for Telnet to the default port of 23:

```
configure telnet port default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 connections was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure telnet vr

configure telnet vr [**all** | **default** | *vr_name*]

Description

Configures the virtual router used on the switch for listening for Telnet connections.

Syntax Description

all	Specifies to use all virtual routers for Telnet connections.
default	Specifies to use the default virtual router for Telnet connections. The default router is VR-Mgmt.
vr_name	Specifies the name of the virtual router to use for Telnet connections. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License RequirementsDefault

The default is all.

Usage Guidelines

You must be logged in as administrator to configure the virtual router.

The switch accepts IPv6 connections.

If you specify all, the switch listens on all of the available virtual routers for Telnet connections.

The vr_name specifies the name of the virtual router to use for Telnet connections.

If you specify a virtual router name that does not exist, the switch displays an error message similar to the following:

```
configure telnet vr vr-ttt
^
%% Invalid input detected at '^' marker.
```

Example

The following command configures the switch to listen for and receive Telnet requests on all virtual routers:

```
configure telnet vr all
```

History

This command was first available in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure web http access-profile

configure web http access-profile [[[**add** *rule*] [**first** | [[**before** | **after**] *previous_rule*]]] | **delete** *rule* | **none**]

Description

Configures HTTP to use an ACL rule for access control.

Syntax Description

add	Specifies that an ACL rule is to be added to the Telnet application
rule	Specifies an ACL rule
first	Specifies that the new rule is to be added before all other rules.
before	Specifies that the new rule is to be added before a previous rule.
after	Specifies that the new rule is to be added after a previous rule
previous_rule	Specifies an existing rule in the application
delete	Specifies that one particular rule is to be deleted.
none	Specifies that all the rules or a policy file is to be deleted.

Default

N/A.

Usage Guidelines

You must be logged in as administrator to configure HTTP parameters.

Use this command to restrict HTTP access by adding an ACL rule to the HTTP application. Once an ACL is associated with HTTP, all the packets that reach a HTTP module are evaluated with this ACL and appropriate action (permit or deny) is taken, as is done using policy files.

The permit or deny counters are also updated accordingly regardless of whether the ACL is configured to add counters. To display counter statistics, use the This command is available on all platforms. http command.

Only the following match conditions and actions are copied to the client memory. Others that may be in the rule are not copied.

Match conditions

- Source-address—IPv4 and IPv6

Actions

- Permit
- Deny

When adding a new rule, use the first, before, and after previous_rule parameters to position it within the existing rules.

If the SNMP traffic does not match any of the rules, the default behavior is permit. To deny SNMP traffic that does not match any of the rules, add a deny all rule at the end or the rule list.

Example

The following command copies the ACL rule, DenyAccess to the HTTP application in first place:

```
configure web http access-profile add DenyAccess first
```

The following command removes the association of the ACL rule DenyAccess from the HTTP application:

```
configure web http access-profile delete DenyAccess
```

The following command removes the association of all ACL rules from the HTTP application:

```
configure web http access-profile none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

create network-clock ptp

create network-clock ptp [**boundary** | **ordinary**] {**domain** *domain_number*} | **end-to-end-transparent**]

Description

Creates PTP clock instance and defines the mode of operation.

Syntax Description

boundary	Create the clock instance as a boundary clock.
ordinary	Create the clock instance as an ordinary clock.
domain_number	PTP domain number (default 0, range 0 to 255).
end-to-end-transparent	Create the clock instance as an end-to-end transparent clock.

Default

The PTP domain number defaults to 0 for boundary and ordinary clock instances.

Usage Guidelines

Use this command to create a PTP clock instance, and administratively configure the mode of operation of PTP on this instance. You can provision a boundary or ordinary clock instance to synchronize the node with another node with the most precise clock. In boundary clock configuration, the device synchronizes with the grand-master, or another boundary clock, and operates as a master clock for downstream nodes. In ordinary clock configuration, the device synchronizes with the grand-master, or another boundary clock, and acts as a slave. The ordinary clock is by default in the slave-only mode of operation, and does not propagate the clock downstream. The ordinary clock cannot have more than one clock port.

The end-to-end-transparent clock can be provisioned to correct for the residence delay incurred by PTP event packets passing through the switch (referred as residence time).

Note

You can create a maximum of two clock instances in the switch—one boundary clock and one end-to-end transparent clock, or one ordinary clock and one end-to-end transparent clock. The boundary and ordinary clock instances cannot be simultaneously provisioned in the switch.

After you enable a boundary clock, you cannot create an ordinary clock. However, you can delete the boundary clock instance and create a new one in order to change the domain number. To create an ordinary clock instance in the switch that has the boundary clock instance enabled, delete the boundary clock instance, save the configuration and reboot the switch. After the reboot, you can create and enable the ordinary clock instance.

Similarly, to create and enable a boundary clock in a switch that has an ordinary clock enabled, delete the ordinary clock instance, save the configuration and reboot the switch. After the reboot you can create and enable a boundary clock.

The following message is displayed when you create the boundary clock instance in a device with no prior clock instances:

```
Warning: The ordinary clock cannot be created after enabling the boundary
clock. A delete followed by save and reboot are required to create the
ordinary clock.
```

After you enable a boundary clock instance, if you delete the instance and try to create an ordinary clock instance, the above message is displayed as an error, and the ordinary clock instance is not created.

Example

The following command creates an ordinary clock on domain 5:

```
create network-clock ptp ordinary domain 5
```

The following command creates a boundary clock on default domain (domain 0):

```
create network-clock ptp boundary domain 0
```

The following command creates an end-to-end transparent clock:

```
create network-clock ptp end-to-end-transparent
```

History

This command was first available in ExtremeXOS 15.1.

The ordinary clock parameter was added in ExtremeXOS 15.1 Revision 2.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

create ntp key

create ntp key *keyid* **md5** *key_string*

Description

Enables an NTP key for an NTP session.

Syntax Description

keyid	Specifies the key ID as a value from 1 to 65534.
key_string	Specifies an alphanumeric key string, from 5 to 32 numbers or characters, or a combination of both.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command enables an NTP key using RSA Data Security, Inc. MD5 Message-Digest Algorithm encryption on the switch:

```
enable ntp key 1 md5 oklahoma
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

create snmp trap

create snmp trap severity *severity* **event** *EventName msg*

Description

Creates and sends an SNMP trap containing the information defined in the command.

Syntax Description

severity	Specifies one of the eight severity levels defined in the ExtremeXOS software. Enter one of the following values: critical, error, warning, notice, info, debug-summary, debug-verbose, debug-data.
EventName	Specifies the event name. Enter a name using alphanumeric characters.
msg	Specifies a message. Enter the message using alphanumeric characters.

Default

N/A.

Usage Guidelines

None.

Example

The following example sends a trap of severity info for event AAA with the message user XYZ logged in:

```
create snmp trap severity info event AAA "user XYZ logged in"
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

delete network-clock ptp

delete network-clock ptp [boundary | ordinary | end-to-end-transparent]

Description

Delete a PTP clock instance.

Syntax Description

boundary	Delete the boundary clock instance.
ordinary	Delete the ordinary clock instance.
end-to-end-transparent	Delete the End-to-End transparent clock instance.

Usage Guidelines

Use this command to delete a PTP boundary, ordinary, or end-to-end transparent clock instance. We recommend that you delete the ordinary or boundary clock instance before you delete the end-to-end transparent clock instance.

Example

The following commands delete an ordinary clock, boundary clock and end-to-end transparent clock:

```
delete network-clock ptp ordinary
delete network-clock ptp boundary
delete network-clock ptp end-to-end-transparent
```

History

This command was first available in ExtremeXOS 15.1.

```
The ordinary clock parameter was added in ExtremeXOS 15.1 Revision 2.
```

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

delete ntp key

delete ntp key [*keyid* | **all**]

Description

Deletes an NTP key; it cannot be used for outgoing or incoming NTP sessions.

Syntax Description

keyid	Specifies the key ID as a value from 1 to 65534.
all	Deletes all keys.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command deletes NTP key 5 on the switch:

```
delete ntp key 5
```

The following command deletes all NTP keys on the switch:

```
delete ntp key all
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable auto-provision

disable auto-provision

Description

Disables the auto provision capability.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to disable the auto provision capability.

To display the status of auto provision on the switch, use the show auto-provision command.

Example

The following command disables the auto provision capability:

```
disable auto-provision
```

The following message is displayed:

```
X450a-24t.12 # disable auto-provision
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable cdp ports

disable cdp ports *[port_list* | **all]**

Description

Disables CDP on a port.

Syntax Description

port_list	Specifies the list of ports to disable CDP on.
all	Specifies that you disable CDP on all ports.

Default

Enabled.

Usage Guidelines

Example

The following command disables CDP on all ports on the switch:

```
disable cdp ports all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

disable dhcp vlan

disable dhcp vlan [*vlan_name* | **all**]

Description

Disables the generation and processing of DHCP packets on a VLAN to obtain an IP address for the VLAN from a DHCP server.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs

Default

Disabled for all VLANs.

Usage Guidelines

None.

Example

The following command disables the generation and processing of DHCP packets on a VLAN named accounting:

```
disable dhcp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable network-clock ptp

disable network-clock ptp [boundary | ordinary] {{vlan} *vlan_name*}

Description

Disable PTP on a particular clock instance, or on a specified vlan port (clock port) of the clock instance.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
vlan_name	vlan name.

Default

PTP is disabled by default on a clock instance.

Usage Guidelines

Use this command to disable PTP on a clock instance.

Example

The following example disables the ordinary clock:

```
disable network-clock ptp ordinary
```

The following example disables the clock port lpbk-transit on the boundary clock:

```
disable network-clock ptp boundary vlan lpbk-transit
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

disable network-clock ptp boundary unicast-negotiation

disable network-clock ptp [boundary | ordinary] unicast-negotiation {vlan} *vlan_name*

Description

Disable unicast negotiation property in the specified clock port. The unicast negotiation disabled clock port rejects the unicast signaling requests from other clock slaves.

Syntax Description

boundary	Boundary clock.
ordinary	Ordinary clock.
vlan_name	VLAN name.
all	All VLANs.

Default

N/A.

Usage Guidelines

The unicast negotiation feature is currently unsupported, and this command is retained to provide configuration compatibility to previous releases.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

disable ntp broadcast-server

disable ntp {vlan} *vlan-name* **broadcast-server**

Description

Prevents NTP from sending broadcast messages to a VLAN.

Syntax Description

vlan-name	Specifies the name of a particular VLAN.

Default

NTP does not send broadcast messages to a VLAN by default.

Usage Guidelines

N/A.

Example

The following command prevents NTP from sending broadcast messages to a VLAN called "Northwest":

```
disable ntp vlan Northwest broadcast-server
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable snmp access

disable snmp access {snmp-v1v2c | snmpv3}

Description

Selectively disables SNMP on the switch.

Syntax Description

snmp-v1v2c	Specifies SNMPv1/v2c access only.
snmpv3	Specifies SNMPv3 access only.

Default

Enabled.

Usage Guidelines

Disabling SNMP access does not affect the SNMP configuration (for example, community strings). However, if you disable SNMP access, you will be unable to access the switch using SNMP.

This command allows you to disable either all SNMP access, v1/v2c access only, or v3 access only.

To allow access, use the following command:

```
enable snmp access {snmp-v1v2c | snmpv3}
```

Example

The following command disables all SNMP access on the switch:

```
disable snmp access
```

History

This command was first available in ExtremeXOS 10.1.

SNMPv3 was added to ExtremeXOS 12.2. It was also included in ExtremeXOS 11.6.4 and 12.1.2.

Platform Availability

This command is available on all platforms.

disable snmp access vr

disable snmp access vr [*vr_name* | **all**]

Description

Selectively disables SNMP access on virtual routers.

Syntax Description

vr_name	Specifies the virtual router name.
all	Specifies all virtual routers.

Default

Enabled on all virtual routers.

Usage Guidelines

Use this command to disable SNMP access on any or all virtual routers.

When SNMP access is disabled on a virtual router, the incoming SNMP request is dropped and an EMS message is logged.

To enable SNMP access on virtual routers use the enable snmp access vr command.

To display the SNMP configuration and statistics on a specified virtual router, use the show snmp vr_name command.

Example

The following command disables SNMP access on the virtual router vr-finance:

```
disable snmp access vr vr-finance
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

disable snmp community

disable snmp community *alphanumeric-community-string*

Description

Disables SNMP community strings on the switch.

Syntax Description

alphanumeric-community-string	Specifies the SNMP community string name.

Default

N/A.

Usage Guidelines

This command allows the administrator to disable an snmp community. It sets the rowStatus of the community to NotInService. When disabled, SNMP access to the switch using the designated community is not allowed.

Example

The following command disables the community string named extreme:

```
disable snmp community extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable snmp traps

disable snmp traps

Description

Prevents SNMP traps from being sent from the switch.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command does not clear the SNMP trap receivers that have been configured. The command prevents SNMP traps from being sent from the switch even if trap receivers are configured.

To view if SNMP traps are being sent from the switch, use the show management command. The show management command displays information about the switch including the enabled/disabled state of SNMP traps being sent.

Example

The following command prevents SNMP traps from being sent from the switch to the trap receivers:

```
disable snmp traps
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable snmpv3

disable snmpv3 [default-group | default-user]

Description

Selectively disables SNMPv3 default-group or default-user access on the switch.

Syntax Description

default-group	Specifies SNMPv3 default-group.
default-user	Specifies SNMPv3 default-user.

Default

Enabled.

Usage Guidelines

This command is used to disable SNMPv3 default-group or default-user access.

Disabling SNMPv3 default-group access removes access to default-users and user-created users who are part of the default-group. The user-created authenticated SNMPv3 users (who are part of a user-created group) are able to access the switch. By disabling default-users access, the end-user is not able to access the switch/MIBs using SNMPv3 default-user.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

The default users are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command disables the default group on the switch:

```
disable snmp default-group
```

History

This command was available in ExtremeXOS 12.2.

It was also included in ExtremeXOS 11.6.4 and ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

disable sntp-client

disable sntp-client

Description

Disables the SNTP client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

SNTP can be used by the switch to update and synchronize its internal clock from a Network Time Protocol (NTP) server. After the SNTP client has been enabled, the switch sends out a periodic query to the indicated NTP server, or the switch listens to broadcast NTP updates. In addition, the switch supports the configured setting for Greenwich Mean Time (GMT) offset and the use of Daylight Savings Time (DST).

Example

The following command disables the SNTP client:

```
disable sntp-client
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable telnet

```
disable telnet
```

Description

Disables external Telnet services on the system.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You must be logged in as an administrator to enable or disable Telnet.

Note

Telnet sessions between MSMs/MMs or the nodes of a stack are not affected by this command.

Example

With administrator privilege, the following command disables external Telnet services on the switch:

```
disable telnet
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable watchdog

```
disable watchdog
```

Description

Disables the system watchdog timer.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The watchdog timer monitors the health of the switch hardware and software events. For example, the watchdog timer reboots the switch if the system cannot reset the watchdog timer. This can be caused by a long CPU processing loop, any unhandled exception, or a hardware problem with the communication channel to the watchdog. In most cases, if the watchdog timer expires, the switch captures the current CPU status and posts it to the console and the system log. In some cases, if the problem is so severe that the switch is unable to perform any action, the switch reboots without logging any system status information prior to reboot.

This command takes affect immediately.

The watchdog settings are saved in the configuration file.

To display the watchdog state of your system, use the show switch command.

Example

The following command disables the watchdog timer:

```
disable watchdog
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable auto-provision

enable auto-provision

Description

Enables the auto provision capability.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to enable the switch to obtain the IP address, gateway and config file via DHCP.

Following is the mandatory DHCP option configuration used for auto provision to work:

Standard Option:

```
IP address
Subnet mask
Gateway
Option 60:
Vendor identifier option
Option 43:
TFTP server IP address
Configuration file name
Optional DHCP option
SNMP trap receiver IP address
```

To display the status of auto provision on the switch, use the show auto-provision command.

Example

The following command enables the auto provision capability:

```
enable auto-provision
```

The following message is displayed:

```
X450a-24t.12 # enable auto-provision
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable ntp

disable ntp

Description

Disables NTP globally on the switch.

Syntax Description

N/A.

Default

NTP is disabled by default.

Usage Guidelines

N/A.

Example

The following command disables NTP globally on the switch:

```
disable ntp
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable ntp authentication

disable ntp authentication

Description

Disables NTP authentication globally on the switch.

Syntax Description

N/A.

Default

NTP authentication is disabled by default.

Usage Guidelines

If authentication is disabled, NTP will not use any authentication mechanism to a server or from clients. To use authentication for a specific server, enable NTP authentication globally and then configure an RSA Data Security, Inc. MD5 Message-Digest Algorithm key index for the specific server.

Example

The following command disables NTP authentication globally on the switch:

```
disable ntp authentication
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable ntp broadcast-client

disable ntp broadcast-client

Description

Disables an NTP broadcast client on the switch.

Syntax Description

N/A.

Default

An NTP broadcast client is enabled by default.

Usage Guidelines

If the broadcast client function is enabled, the system can receive broadcast-based NTP messages and process them only if a VLAN is enabled for NTP and the VLAN is active.

Example

The following command disables an NTP broadcast client on the switch:

```
disable ntp broadcast client
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable ntp broadcast-server

disable ntp {**vlan**} *vlan-name* **broadcast-server**

Description

Prevents NTP from sending broadcast messages to a VLAN.

Syntax Description

vlan-name	Specifies the name of a particular VLAN.

Default

NTP does not send broadcast messages to a VLAN by default.

Usage Guidelines

N/A.

Example

The following command prevents NTP from sending broadcast messages to a VLAN called "Northwest":

```
disable ntp vlan Northwest broadcast-server
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

disable ntp vlan

disable ntp [{**vlan**} *vlan-name* | **all**]

Description

Disables NTP on a VLAN.

Syntax Description

disable	Disables NTP on a VLAN.
vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
all	Enables or disables NTP on all VLANs.

Default

NTP is disabled on all VLANs by default.

Usage Guidelines

N/A.

Example

The following command disables NTP on all VLANs:

```
disable ntp vlan all
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

enable cdp ports

enable cdp ports *[port_list* | **all]**

Description

Enables CDP on a port.

Syntax Description

port_list	Specifies the list of ports to enable CDP on.
all	Specifies that you enable CDP on all ports.

Default

Enabled.

Usage Guidelines

Example

The following command enables CDP on all ports on the switch:

```
enable cdp ports all
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

enable dhcp vlan

enable dhcp vlan [*vlan_name* | **all**]

Description

Enables the generation and processing of DHCP packets on a VLAN to obtain an IP address for the VLAN from a DHCP server.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled for all VLANs.

Usage Guidelines

None.

Example

The following command enables the generation and processing of DHCP packets on a VLAN named accounting:

```
enable dhcp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable network-clock ptp

enable network-clock ptp [**boundary** | **ordinary**] {{**vlan**} *vlan_name*}

Description

Enable PTP on a particular clock instance, or on a specified vlan port (clock port) of the clock instance.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
vlan_name	vlan name.

Default

PTP is disabled by default on a clock instance.

Usage Guidelines

Use this command to enable PTP on the clock instance or on the specified VLAN (clock port).

Example

```
enable network-clock ptp boundary
enable network-clock ptp ordinary
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

enable network-clock ptp unicast-negotiation

enable network-clock ptp [**boundary** | **ordinary**] **unicast-negotiation** {**vlan**} *vlan_name*]

Description

Enable unicast negotiation property in the specified clock port. The unicast negotiation enabled clock port responds to the unicast signaling requests from other clock slaves.

Syntax Description

boundary	Boundary clock.
ordinary	Ordinary clock.
vlan_name	VLAN name.

Default

N/A.

Usage Guidelines

The unicast negotiation feature is currently not supported, and this command is retained to provide configuration compatibility to previous releases.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

enable network-clock ptp end-to-end transparent

[enable] network-clock ptp end-to-end-transparent ports *port_list*

Description

Enable PTP end-to-end-transparent clock functionality (1-step PHY timestamp) on the ports.

Syntax Description

port_list	List of physical ports.

Default

N/A.

Usage Guidelines

See Description.

Example

The following example enables end-to-end transparent clock on the front panel ports 1-3:

```
enable network-clock ptp end-to-end-transparent ports 1-3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

enable snmp access

enable snmp access {snmp-v1v2c | snmpv3}

Description

Selectively enables SNMP access on the switch.

Syntax Description

snmp-v1v2c	Specifies SNMPv1/v2c access only.
snmpv3	Specifies SNMPv3 access only.

Default

Enabled.

Usage Guidelines

To have access to the SNMP agent residing in the switch, at least one VLAN must have an IP address assigned to it.

Any network manager running SNMP can manage the switch for v1/v2c/v3, provided the MIB is installed correctly on the management station. Each network manager provides its own user interface to the management facilities.

For SNMPv3, additional security keys are used to control access, so an SNMPv3 manager is required for this type of access.

This command allows you to enable either all SNMP access, no SNMP access, v1/v2c access only, or v3 access only.

To prevent any SNMP access, use the following command :

```
disable snmp access {snmp-v1v2c | snmpv3}
```

ExtremeXOS 11.2 introduced the concept of safe defaults mode. Safe defaults mode runs an interactive script that allows you to enable or disable SNMP, Telnet, and switch ports. When you set up your switch for the first time, you must connect to the console port to access the switch. After logging in to the switch, you enter safe defaults mode. Although SNMP, Telnet, and switch ports are enabled by default, the script prompts you to confirm those settings.

If you choose to keep the default setting for SNMP—the default setting is enabled—the switch returns the following interactive script:

```
Since you have chosen less secure management methods, please remember to
increase the security of your network by taking the following actions:
* change your admin password
* change your SNMP public and private strings
* consider using SNMPv3 to secure network management traffic
```

In addition, you can return to safe defaults mode by issuing the following command:

```
configure safe-default-script
```

If you return to safe defaults mode, you must answer the questions presented during the interactive script.

For more detailed information about safe defaults mode, see This switch currently has all management methods enabled for convenience reasons. in the ExtremeXOS Concepts Guide.

Example

The following command enables all SNMP access for the switch:

```
enable snmp access
```

History

This command was first available in ExtremeXOS 10.1.

SNMPv3 was added to ExtremeXOS 12.2. It was also included in ExtremeXOS 11.6.4 and 12.1.2.

Platform Availability

This command is available on all platforms.

enable snmp access vr

enable snmp access vr [*vr_name* | **all**]

Description

Selectively enables SNMP access on virtual routers.

Syntax Description

vr_name	Specifies the virtual router name.
all	Specifies all virtual routers.

Default

Enabled on all virtual routers.

Usage Guidelines

Use this command to enable SNMP access on any or all virtual routers.

To disable SNMP access on virtual routers, use the disable snmp access vr command.

To display the SNMP configuration and statistics on a specified virtual router, use the show snmp vr_name command.

Example

The following command enables SNMP access on the virtual router vr-finance:

```
enable snmp access vr vr-finance
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

enable snmp community

enable snmp community *alphanumeric-community-string*

Description

Enables SNMP community strings.

Syntax Description

alphanumeric-community-string	Specifies the SNMP community string name.

Default

N/A.

Usage Guidelines

This command allows the administrator to enable an snmp community that has been disabled. It sets the rowStatus of the community to Active.

Example

The following command enables the community string named extreme:

```
enable snmp community extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable snmp traps

enable snmp traps

Description

Turns on SNMP trap support.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

An authorized trap receiver can be one or more network management stations on your network. The switch sends SNMP traps to all trap receivers.

To view if SNMP traps are being sent from the switch, use the show management command. The show management command displays information about the switch including the enabled/disabled state of SNMP traps being sent.

Example

The following command enables SNMP trap support on the switch:

```
enable snmp traps
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable snmpv3

enable snmpv3 [default-group | default-user]

Description

Selectively enables SNMPv3 default-group or default-user access on the switch.

Syntax Description

default-group	Specifies SNMPv3 default-group.
default-user	Specifies SNMPv3 default-user.

Default

Enabled.

Usage Guidelines

This command is used to enable SNMPv3 default-group or default-user access.

Enabling SNMPv3 default-group access activates the access to an SNMPv3 default-group and the user-created SNMPv3-user part of default-group. Enabling the SNMPv3 default-user access allows an end user to access the MIBs using SNMPv3 default-user. This command throws an error if the SNMPv3 access is disabled on the switch.

The default groups are: admin, initial, v1v2c_ro, v1v2c_rw.

The default users are: admin, initial, initialmd5, initialsha, initialmd5Priv, initialshaPriv.

Example

The following command enables the default users on the switch:

```
enable snmp default-user
```

History

This command was available in ExtremeXOS 12.2.

It was also included in ExtremeXOS 11.6.4 and ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

enable sntp-client

enable sntp-client

Description

Enables the SNTP client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

SNTP can be used by the switch to update and synchronize its internal clock from a Network Time Protocol (NTP) server. After the SNTP client has been enabled, the switch sends out a periodic query to the indicated NTP server, or the switch listens to broadcast NTP updates. In addition, the switch supports the configured setting for Greenwich Mean Time (GMT) offset and the use of Daylight Savings Time (DST).

Example

The following command enables the SNTP client:

```
enable sntp-client
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable telnet

enable telnet

Description

Enables external Telnet services on the system.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You must be logged in as an administrator to enable or disable Telnet.

ExtremeXOS 11.2 introduces the concept of safe defaults mode. Safe defaults mode runs an interactive script that allows you to enable or disable SNMP, Telnet, and switch ports. When you set up your switch for the first time, you must connect to the console port to access the switch. After logging in to the switch, you enter safe defaults mode. Although SNMP, Telnet, and switch ports are enabled by default, the script prompts you to confirm those settings.

If you choose to keep the default setting for Telnet—the default setting is enabled—the switch returns the following interactive script:

```
Since you have chosen less secure management methods, please remember to
increase the security of your network by taking the following actions:
* change your admin password
* change your SNMP public and private strings
* consider using SNMPv3 to secure network management traffic
```

In addition, you can return to safe defaults mode by issuing the following command:

```
configure safe-default-script
```

If you return to safe defaults mode, you must answer the questions presented during the interactive script.

For more detailed information about safe defaults mode, see Use Safe Defaults Mode in the *ExtremeXOS Concepts Guide*.

Example

With administrator privilege, the following command enables Telnet services on the switch:

```
enable telnet
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable watchdog

enable watchdog

Description

Enables the system watchdog timer.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

The watchdog timer monitors the health of the switch hardware and software events. For example, the watchdog timer reboots the switch if the system cannot reset the watchdog timer. This is caused by a long CPU processing loop, any unhandled exception, or a hardware problem with the communication channel to the watchdog. In most cases, if the watchdog timer expires, the switch captures the current CPU status and posts it to the console and the system log. In some cases, if the problem is so severe that the switch is unable to perform any action, the switch reboots without logging any system status information prior to reboot.

This command takes affect immediately.

The watchdog settings are saved in the configuration file.

To display the watchdog state of your system, use the show switch command.

Example

The following command enables the watchdog timer:

```
enable watchdog
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable ntp

enable ntp

Description

Enables NTP globally on the switch.

Syntax Description

N/A.

Default

NTP is disabled by default.

Usage Guidelines

N/A.

Example

The following command enables NTP globally on the switch:

```
enable ntp
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

enable ntp authentication

enable ntp authentication

Description

Enables NTP authentication globally on the switch.

Syntax Description

N/A.

Default

NTP authentication is disabled by default.

Usage Guidelines

If authentication is disabled, NTP will not use any authentication mechanism to a server or from clients. To use authentication for a specific server, enable NTP authentication globally and then configure an RSA Data Security, Inc. MD5 Message-Digest Algorithm key index for the specific server.

Example

The following command enables NTP authentication globally on the switch:

```
enable ntp authentication
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

enable ntp broadcast-client

enable ntp broadcast-client

Description

Enables an NTP broadcast client on the switch.

Syntax Description

N/A.

Default

An NTP broadcast client is enabled by default.

Usage Guidelines

If the broadcast client function is enabled, the system can receive broadcast-based NTP messages and process them only if a VLAN is enabled for NTP and the VLAN is active.

Example

The following command enables an NTP broadcast client on the switch:

```
enable ntp broadcast client
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

enable ntp broadcast-server

enable ntp {**vlan**} *vlan-name* **broadcast-server** {**key** *keyid*}

Description

Enables NTP to send broadcast messages with or without a key to a VLAN.

Syntax Description

vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
keyid	Specifies the key ID as a value from 1 to 65534.

Default

An NTP broadcast server is enabled by default.

Usage Guidelines

For the broadcast server function to work correctly, configure a VLAN to forward broadcast packets by using the enable ipforwarding broadcast <vlan-name> command. All broadcast clients will receive clock information from the broadcasted clock messages.

Example

The following command enables an NTP broadcast server on the switch:

```
enable ntp vlan toSW3 broadcast-server key 100
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

enable ntp vlan

enable ntp [{**vlan**} *vlan-name* | **all**]

Description

Enables NTP on a VLAN.

Syntax Description

enable	Enables NTP on a VLAN.
vlan-name	Specifies the name of a particular VLAN on which to enable or disable NTP.
all	Enables or disables NTP on all VLANs.

Default

NTP is disabled on all VLANs by default.

Usage Guidelines

N/A.

Example

The following command enables NTP on a VLAN named “Southwest”:

```
enable ntp vlan Southwest
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

exit

exit

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
exit
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

logout

logout

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
logout
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

quit

quit

Description

Logs out the session of a current user for CLI or Telnet.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to log out of a CLI or Telnet session.

When you issue this command, you are asked to save your configuration changes to the current, active configuration. Enter y if you want to save your changes. Enter n if you do not want to save your changes.

Example

The following command logs out the session of a current user for CLI or Telnet:

```
quit
```

A message similar to the following is displayed:

```
Do you wish to save your configuration changes to primary.cfg? (y or n)
```

Enter y if you want to save your changes. Enter n if you do not want to save your changes.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show access-list counters process

show access-list counters process [snmp | telnet | ssh2 | http]

Description

Displays the access-list permit and deny statistics.

Syntax Description

snmp	Specifies statistics for SNMP
telnet	Specifies statistics for Telnet
ssh2	Specifies statistics for SSH2
http	Specifies statistics for HTTP

Default

N/A.

Usage Guidelines

Use this command to display the access-list permit and deny statistics. The permit and deny counters are updated automatically regardless of whether the ACL is configured to add counters.

Example

The following command displays permit and deny statistics for the SNMP application:

```
X450e-24p.4 # sh access-list counter process snmp
```

Following is sample output for this command:

```
show access-list counter process snmp
=============================================================
Access-list     Permit Packets     Deny Packets
=============================================================
a1                          10                     0
a3                           0                              25
a2                           0                             6
=============================================================
Total Rules : 3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show auto-provision

show auto-provision {{**vr**} *vr-name*}

Description

Displays the current state of auto provision on the switch.

Syntax Description

vr_name	Specifies the virtual router. This may be VR-Default or VR-Mgmt only

Default

N/A.

Usage Guidelines

Use this command to display the current state and the statistics of the auto provision feature on the switch.

Example

The following command displays all information on the current state of auto provision:

```
show auto-provision
```

Following is sample output for the command when the auto provision is enabled. When “Enabled” the feature can be “In progress”, “Done”, or “Failed.”

```
(Auto-Provision) X450a-24t.1 # show auto-provision
--------------------------------------------------------------------------
VR-Name     Auto-Provision Status  Number of attempts
--------------------------------------------------------------------------
VR-Default  Enabled (In progress)  2
VR-Mgmt     Enabled (In progress)  1
X450a-24t.5 # show auto-provision
--------------------------------------------------------------------------
VR-Name     Auto-Provision Status  Number of attempts
--------------------------------------------------------------------------
VR-Default  Enabled (Done)         0
VR-Mgmt     Enabled (Done)         0
```

The following command displays information on the current state of auto provision on VR-Mgmt.

```
show auto-provision vr "VR-Mgmt"
```

Following is sample output for the command when auto provision is disabled:

```
X450a-24t.3 # show auto-provision vr "VR-Mgmt"
DHCP Auto-Provision       : Disabled
Number of attempts        : 0
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show checkpoint-data

show checkpoint-data {*process*}

Description

Displays the status of one or more processes being copied from the primary MSM/MM to the backup MSM/MM.

Syntax Description

process	Specifies the name of the processes being copied.

Default

N/A.

Usage Guidelines

This command displays, in percentages, the amount of internal state copying completed by each process and the traffic statistics between the process on both the primary and the backup MSMs/MMs.

This command is also helpful in debugging synchronization problems that occur at run-time. To check the status of synchronizing the MSMs/MMs, use the show switch command.

Depending on the software version running on your switch and the type of switch you have, additional or different checkpoint status information may be displayed.

Example

The following command displays the checkpointing status and the traffic statics of all of the processes between the primary and the backup MSM:

```
show checkpoint-data
```

The following is sample output from this command:

```
Process          Tx     Rx  Errors    Sent  Total     % Chkpt    Debug-info

```

To view the output for a specific process, use the process option. The following command displays detailed information for the STP process:

```
show checkpoint-data stp
```

The following is sample output from this command:

```
Process          Tx     Rx  Errors   Sent  Total     % Chkpt    Debug-info
-------------------------------------------------------------------------
stp               1      0       0      0      0    0% ON  OK   1 (000008D3)
```

History

This command was first available in ExtremeXOS 10.1.

An error count was added to the output in ExtremeXOS 11.1.

Platform Availability

This command is available only on modular switches and SummitStack.

show dhcp-client state

show dhcp-client state

Description

Displays the current DHCP/BOOTP client state for each vlan.

Syntax Description

This command has no arguments or variables.

Default

Displays the client state for all existing VLANs.

Usage Guidelines

None.

Example

The following command displays the DHCP/BOOTP status for all VLANs:

```
show dhcp-client state
```

Depending on your configurations, output from this command is similar to the following:

```
Client VLAN     Protocol Server          Current State
```

```
-------------- -------- --------------
--------------------------------------
Default         BOOTP    10.1.2.3Received IP address configured on vlan
accountingDHCP10.2.3.4DHCP state; Requesting
Mgmt            None     0.0.0.0
A total of 3 vlan(s) where displayed
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show management

show management

Description

Displays the SNMP and CLI settings configured on the switch and the SNMP statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The following management output is displayed:

- Enable/disable state for Telnet, and SNMP access
- Login statistics
  - Enable/disable state for idle timeouts
  - Maximum number of CLI sessions
- SNMP community strings
- SNMP trap receiver list

For ExtremeXOS 11.0 and later, the following management output is also displayed:

- SNMP trap receiver source IP address
- SNMP statistics counter
- SSH access states of enabled, disabled, and module not loaded

- CLI configuration logging
- SNMP access states of v1, v2c disabled and v3 enabled

  If all three types of SNMP access are enabled or disabled, SNMP access is displayed as either Enabled or Disabled.

For ExtremeXOS 11.1 and later, the following management output is also displayed:

- Enable/disable state for RMON

For ExtremeXOS 11.2 and later, the following management output is also displayed:

- Access-profile usage configured via Access Control Lists (ACLs) for additional Telnet and SSH2 security

For ExtremeXOS 11.6 and later, the following management output is also displayed:

- CLI scripting settings
  - Enable/disable state
  - Error message setting
  - Persistence mode

For ExtremeXOS 12.4 and later, the following management output is also displayed:

- Dropped SNMP packet counter.

For ExtremeXOS 12.5 and later, the following management output is also displayed:

- CLI prompting
- SNMP INFORM

Example

The following command displays configured SNMP settings on a BlackDiamond 12804 switch:

```
show management
```

The following is sample output from this command:

```
BD-12804.2 # show management
CLI idle timeout                 : Enabled (20 minutes)
CLI max number of login attempts : 3
CLI max number of sessions       : 8
CLI paging                       : Enabled (this session only)
CLI space-completion             : Disabled (this session only)
CLI configuration logging        : Disabled
CLI scripting                    : Disabled (this session only)
CLI scripting error mode         : Ignore-Error (this session only)
CLI persistent mode              : Persistent (this session only)
Telnet access                    : Enabled (tcp port 23 vr all)
: Access Profile : not set
SSH Access                       : ssh module not loaded.
Web access                       : Disabled (tcp port 80)
: Access Profile : not set
Total Read Only Communities      : 1
```

```
Total Read Write Communities     : 1
RMON                             : Disabled
SNMP access                      : Enabled
: Access Profile : not set
SNMP Traps                       : Enabled
SNMP v1/v2c TrapReceivers        :

SNMP inform:    Sent   20      Timeout   2
```

History

This command was first available in ExtremeXOS 10.1.

The trap receiver source IP address, SNMP counter statistics, SSH access, CLI logging, and SNMP access states were added to the output in ExtremeXOS 11.0.

The enabled/disabled state for RMON was added to the output in ExtremeXOS 11.1.

Additional Telnet and SSH2 information about ACL usage was added to the output in ExtremeXOS11.2.

Information about CLI scripting including, the enabled/disabled state, error mode, and persistent mode was added to the output in ExtremeXOS 11.6.

The dropped SNMP packet counter (Drops) was added to the output in ExtremeXOS 12.4.

CLI prompting was added to the output in ExtremeXOS 12.5

SNMP INFORM was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

show network-clock ptp

show network-clock ptp

Description

Show the PTP clock recovery state information. The clock recovery using PTP event messages undergoes the following servo state changes:

- Warmup - The local reference clock is in warmup state.
- Fast Loop - The local reference clock is being corrected and the correction is converging.
- Bridge - The local reference clock correction has been interrupted due to changes in the clocking information in the received PTP event messages or loss of PTP event messages.
- Holdover - Prolonged loss of PTP event messages puts the local reference clock correction to holdover state.
- Normal - The local reference clock correction has converged and the corrected clock is synchronous to the master clock information received in the PTP event messages.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

See Description.

Example

```
E4G-200.1 # show network-clock ptp
=============================================================================
Servo State Information
=============================================================================
Servo State             :  3 (Normal Loop)
Servo State Duration    :  10285 (sec)
=============================================================================
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp (datasets)

show network-clock ptp [boundary | ordinary] {parent | port | time-property}

Description

Show PTP clock and port datasets such as parent, port, default, current and time-property.

Syntax Description

boundary	Specifies boundary clock.
ordinary	Specifies ordinary clock.
parent	Parent clock data set.
port	PTP port data set.
time-property	Time properties data set.

Default

N/A.

Usage Guidelines

Show PTP clock and port datasets such as parent, port, default, current and time-property. If no options are specified, the default, current, parent and time-property datasets are shown for the configured clock instance.

Example

The following command displays network clock information on a modular switch:

```
E4G-200.1 # show network-clock ptp boundary parent
Mode            :  Boundary Clock
State           :  Enabled

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp (interface)

show network-clock ptp [**boundary** | **ordinary**] [{**vlan**} *vlan_name* | **vlan all**]

Description

Show interface information for the given clock port that is added to the specified clock instance. This command is available only for boundary and ordinary clocks.

Syntax Description

boundary	Specifies boundary clock.
ordinary	Specifies ordinary clock.

vlan	VLAN.
vlan_name	VLAN name.
vlan all	All VLANs.

Default

N/A.

Usage Guidelines

Use this command to display all the clock ports that have PTP enabled and added to the specified clock instance.

Example

The following command displays PTP clock port interface information for all VLANs:

```
show network-clock ptp boundary vlan all
VLAN Name                       :  gm1-lpbk
Acceptable Master Option        :  Disabled
Unicast Negotiation             :  Disabled
Port Type                       :  Slave (forced)
Log Announce Interval           :  1
Log Announce Timeout            :  3
Log Delay Request Interval      :  -6
Log Sync Interval               :  -6
VLAN Name                       :  ptp-s1
Acceptable Master Option        :  Disabled
Unicast Negotiation             :  Disabled
Port Type                       :  Master or Slave
Log Announce Interval           :  1
Log Announce Timeout            :  3
Log Delay Request Interval      :  -6
Log Sync Interval               :  -6
VLAN Name                       :  ptp-m1
Acceptable Master Option        :  Disabled
Unicast Negotiation             :  Disabled
Port Type                       :  Master (forced)
Log Announce Interval           :  1
Log Announce Timeout            :  3
Log Delay Request Interval      :  -6
Log Sync Interval               :  -6
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp end-to-end-transparent ports

show network-clock ptp end-to-end-transparent ports *port_list* {**detail**}

Description

Show the details of end-to-end-transparent PTP instance configured on the specified ports. Additionally, the port information detail output includes the PTP configuration, and the timestamping mode on the port.

Syntax Description

port_list	List of physical ports.
detail	Display detailed information.

Default

N/A.

Usage Guidelines

See Description.

Example

```
E4G-200.1 # show network-clock ptp end-to-end-transparent ports 1,3,5,12
================================================================================
==

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp boundary unicast-master

show network-clock ptp [boundary | ordinary] unicast-master [{vlan} *vlan_name* | vlan all]

Description

Show the unicast master table of the specified clock port or all clock ports. This command is available only for boundary and ordinary clocks.

Syntax Description

boundary	Specifies the boundary clock.
ordinary	Specifies the ordinary clock.
unicast-master	Specifies table of unicast masters.
vlan	VLAN.
vlan_name	VLAN name.
vlan all	Specifies all vlans.

Default

N/A.

Usage Guidelines

Use this command to display the unicast master table of the specified clock port or all clock ports. This command is available only for boundary and ordinary clocks.

Example

The following command displays the unicast master table for all clock ports:

```
E4G-200.1 # show network-clock ptp boundary unicast-master vlan all
VLAN Name                        IP Address       Log Query
gm1-lpbk                         1.1.1.101               3
ptp-s1                           22.55.0.2               3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp boundary unicast-slave

show network-clock ptp boundary unicast-slave [{**vlan**} *vlan_name* | **vlan all**]

Description

Show the unicast slave table of the specified clock port, or all clock ports. This command is only available for boundary clocks.

Syntax Description

boundary	Specifies the boundary clock.
unicast-slave	Specifies table of unicast masters.
vlan	VLAN.
vlan_name	VLAN name.
vlan all	Specifies all vlans.

Default

N/A.

Usage Guidelines

Use this command to display the unicast master table of the specified clock port or all clock ports. This command is only available for boundary clocks.

Example

The following command displays the unicast master table for all clock ports:

```
E4G-200.1 # show network-clock ptp boundary unicast-slave vlan all
VLAN Name                        IP Address
ptp-m1                           7.1.1.1
ptp-m1                           7.1.2.1
ptp-m1                           88.3.5.1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show network-clock ptp counters

show network-clock ptp [**boundary** | **ordinary**] **vlan** [*vlan_name* {{*ipv4_address*} [**unicast-master** | **unicast-slave**]} | **all** {**unicast-master** | **unicast-slave**}] **counters**

Description

This command displays the count of PTP packets that include event messages, signaling and management messages transmitted and received on each unicast-slave/unicast-master peers. Use the following queries for the counters:

- Per unicast-master or unicast-slave peer on a clock port
- All unicast-master or unicast-slave peers on a clock port
- Peers on a clock port
- unicast-master or unicast-slave peers on all clock ports
- Peers on all clock ports

The refresh option is not supported for the counters. This command is available only for Boundary and Ordinary clocks.

Syntax Description

network-clock	External clock for ethernet synchronization
ptp	Precise time protocol
boundary	Boundary clock
ordinary	Ordinary clock
vlan	VLAN
all	All VLANS
pv4_address	Peer IP address
unicast-master	IP addresses that are masters to the local clock
unicast-slave	IP addresses that are slaves to the local clock
counters	PTP message counts

Default

N/A.

Usage Guidelines

Use this command to display the count of PTP packets that include event messages, signaling and management messages transmitted and received on each unicast-slave/unicast-master peers.

Example

```
E4G-400.10 # show network-clock ptp boundary vlan lpbk-gm 1.1.1.101 unicast-
master counters
VLAN name:        lpbk-gm
Peer IP Address:  1.1.1.101
IN (packets)       OUT (packets)  Message Type
==================  ==================  =============
211                   0  Announce
27041                   0  Sync
0                   0  FollowUp
0               26532  DelayReq
26489                   0  DelayResp
0                   0  Management
141                 150  Signaling
0                      Rejected
E4G-400.10 # show network-clock ptp boundary vlan all unicast-slave counters
VLAN name:        lpbk-slave
Peer IP Address:  15.1.1.1
IN (packets)       OUT (packets)  Message Type
==================  ==================  =============
0                 258  Announce
0               32958  Sync
0               32958  FollowUp
0                   0  DelayReq
0                   0  DelayResp
```

```
0                    0  Management
0                    0  Signaling
0                       Rejected
VLAN name:          lpbk-slave
Peer IP Address:    15.1.1.2
IN (packets)         OUT (packets)  Message Type
==================  ==================  =============
0                  258  Announce
0                32960  Sync
0                32960  FollowUp
31569                    0  DelayReq
0                31569  DelayResp
0                    0  Management
166                    0  Signaling
0                      Rejected
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

show node

show node {detail}

Description

Displays the status of the nodes in the system as well as the general health of the system.

Syntax Description

detail	Displays the information on a per-node basis rather than in a tabular format.

Default

N/A.

Usage Guidelines

Use this command to display the current status of the nodes and the health of the system. The information displayed shows the node configurations (such as node priority) and the system and

hardware health computations. You can use this information to determine which node will be elected primary in case of a failover.

The following table lists the node statistic information collected by the switch.

Table 11: Node States

Node State	Description
BACKUP	In the backup state, this node becomes the primary node if the primary fails or enters the DOWN state. The backup node also receives the checkpoint state data from the primary.
DOWN	In the down state, the node is not available to participate in leader election. The node enters this state during any user action, other than a failure, that makes the node unavailable for management. Examples of user actions are: Upgrading the softwareRebooting the system using the reboot commandInitiating an MSM/MM failover using the run msm-failover commandSynchronizing the MSM's/MM's software and configuration in non-volatile storage using the synchronize command
FAIL	In the fail state, the node has failed and needs to be restarted or repaired. The node reaches this state if the system has a hardware or software failure.
INIT	In the initial state, the node is being initialized. A node stays in this state when it is coming up and remains in this state until it has been fully initialized. Being fully initialized means that all of the hardware has been initialized correctly and there are no diagnostic faults.
MASTER	In the primary state, the node is responsible for all switch management functions.
STANDBY	In the standby state, leader election occurs—the primary and backup nodes are elected. The priority of the node is only significant in the standby state.

Example

The following command displays the status of the node, the priority of the node, and the general health of the system:

```
show node
```

The following is sample output from this command:

```
Node   State     Priority   SwHealth   HwHealth
-----------------------------------------------
MSM-A  MASTER           0         49          7
MSM-B  BACKUP          0 49          7
```

If you specify the detail option, the same information is displayed on a per node basis rather than in a tabular format.

```
Node MSM-A information:
Node State:    MASTER
Node Priority: 0
Sw Health:     49
Hw Health:     7
Node MSM-B information:
```

```
Node State:    BACKUP
Node Priority: 0
Sw Health:     49
Hw Health:     7
```

History

This command was first available in an ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches and SummitStack.

show ntp

show ntp

Description

Displays the global NTP status of the switch.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP status of the switch:

```
Switch# show ntp
NTP                 : Enabled
Authentication      : Disabled
Broadcast-Client    : Disabled
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp association

show ntp association [{*ip_address*} | {*host_name*}]

Description

Shows all of the NTP clock source information, from a statically configured server, peer, or broadcast server. The NTP service updates the local clock from only one NTP server, with the best stability and stratum value which is considered as a system peer.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

```
The following command shows detailed information about the NTP server:
X450a-24x.6 # show ntp association  1.us.pool.ntp.org
Remote IP          : 72.18.205.156   Local IP           : 10.45.203.74
Host Mode          : Client          Peer Mode          : Server

```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp association statistics

show ntp association [{*ip_address*} | {*host_name*}] **statistics**

Description

Shows NTP-related statistics about a specific NTP server.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows NTP-related statistics about the NTP server called “1.us.pool.ntp.org”:

```
Switch# show ntp association  1.us.pool.ntp.org statistics
Remote Host         : 1.us.pool.ntp.org
Local Interface     : 10.45.203.74
Time Last Received  : 40 second
Time Until Next Send: 27 second
Reachability Change : 849 second
Packets Sent        : 18
Packets Received    : 18
Bad Authentication  : 0

show ntp key

show ntp key

Description

Shows the NTP key index number, trusted or non-trusted, authentication type, and encrypted key string.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP key index number, trusted or non-trusted, authentication type, and encrypted key string:

```
* X450a-24t.1 # show ntp key
Key Index        Trusted    Auth      Key String (encrypted)
=================================================================
100              No         MD5       67:74:7d:78:6f:6c:67:5b:33
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp restrict-list

show ntp restrict-list {user | system | all}

Description

Show the NTP access list of the current system based on the source IP blocks.

Syntax Description

user	Displays the NTP access list of the current user.
system	Displays the for the current system.
all	Displays both user and system data.

Default

Displays all by default.

Usage Guidelines

N/A.

Example

The following command displays all NTP access list information:

```
X450a-24x.38 # show ntp restrict-list all
IP Address       Mask                 Count  Type    Action
=========================================================
0.0.0.0          0.0.0.0                  0  System  Deny
10.1.1.0         255.255.255.0            0  System  Permit
10.1.1.1         255.255.255.255          0  System  Permit
10.45.200.0      255.255.252.0            0  System  Permit
10.45.203.74     255.255.255.255          0  System  Permit
69.65.40.29      255.255.255.255         37  System  Permit
110.1.1.0        255.255.255.0            0  User    Permit
127.0.0.1        255.255.255.255          0  System  Permit
127.127.1.1      255.255.255.255          0  System  Permit
173.9.142.98     255.255.255.255         37  System  Permit
173.203.122.111  255.255.255.255         36  System  Permit
216.93.242.12    255.255.255.255         35  System  Permit
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp server

show ntp server

Description

Shows the NTP servers configured on the switch, including the name, IP address, key ID, and index.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP servers configured on the switch:

```
* X450a-24t.10 # show ntp server
Name                      IP Address           Type      Flags  Key Index
================================================================================
0.us.pool.ntp.org         108.69.104.139       Server    I      -
Flags          : (I) Initial Burst, (B) Burst
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp sys-info

show ntp sys-info

Description

Shows the current system status based on the most reliable clock server or NTP server.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the current system status based on the most reliable clock server or NTP server:

```
X450a-24x.26 # show ntp sys-info
System Peer          : 0.us.pool.ntp.org
System Peer Mode     : Client
Leap Indicator       : 00
Stratum              : 3
Precision            : -20
Root Distance        : 0.09084 second
Root Dispersion      : 0.23717 second
Reference ID         : [216.93.242.12]
Reference time       : d140571d.e8389ff7  Fri, Apr  1 2011  6:52:29.907
System Flags         : Monitor, Ntp, Kernel, Stats
Jitter               : 0.004700 second
Stability            : 0.000 ppm
Broadcast Delay      : 0.007996 second
Auth Delay           : 0.000000 second
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ntp vlan

show ntp vlan

Description

Shows the NTP status of each VLAN configured on the switch.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command shows the NTP status of each VLAN configured on the switch:

```
Switch# show ntp vlan
Vlan                  NTP Status  Broadcast Server  Key Index
============================================================
internet              Enabled     Disabled          -
test                  Enabled     Disabled          -
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show odometers

show odometers

Description

Displays a counter for each component of a switch that shows how long it has been functioning since it was manufactured.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output from this command displays how long individual components in the switch have been functioning since it was manufactured. This odometer counter is kept in the EEPROM of each monitored component. On a modular switch, this means that even if you plug in the component into a different chassis, the odometer counter is available in the new switch chassis.

Monitored Components

On a modular switch, the odometer monitors the following components:

- Chassis
- MSMs/MMs
- I/O modules
- Power controllers

On the Summit family switches (whether or not included in a SummitStack), the odometer monitors the following components:

- Switch
- XGM-2xn card

Recorded Statistics

The following odometer statistics are collected by the switch:

- Service Days—The amount of days that the component has been running
- First Recorded Start Date—The date that the component was powered-up and began running

Depending on the software version running on your switch, the modules installed in your switch, and the type of switch you have, additional or different odometer information may be displayed.

Example

The following command displays how long each component of a switch has been functioning since its manufacture date:

```
show odometers
```

The following is sample output from the BlackDiamond X8 series switch:

```
BD-X8.4 # show odometers
```

```
Service  First Recorded
Field Replaceable Units                  Days     Start Date
-------------------------------------------------------------
Chassis        : BD-X8                     41  Oct-28-2011

```

History

This command was first available in ExtremeXOS 10.1.

Information about the power controller(s) for modular switches was added to the show odometers output in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show power

show power {*ps_num*} {**detail**}

Description

Displays the current status of the installed power supplies.

Syntax Description

ps_num	Specifies the slot number of the installed power supply.
detail	The detail option is reserved for future use.

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the power supplies.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects the following power supply information:

- State—Indicates the current state of the power supply. Options are:
  - Empty—There is no power supply installed.
  - Power Failed—The power supply has failed.
  - Powered Off—The power supply is off.
  - Powered On—The power supply is on and working normally.

  Modular switches only:

  Located next to the “State” of the power supply, the following information provides more detailed status information. Options are:

- Disabled for net power gain—Indicates that the power supply is disabled in order to maximize the total available system power
- Configured ON—Indicates that the user requested to enable a disabled power supply regardless of the affect on the total available system power
- Configured ON when present—Indicates that the power supply slot is currently empty, but the user requested to enable the power supply regardless of the affect on the total available system power
- Unsupported—Indicates that a 600/900 W AC PSU is inserted in a chassis other than the BlackDiamond 8806.
- PartInfo—Provides information about the power supply. Depending on your switch, options include:

  Modular switches only:

- Serial number—A collection of numbers and letters, that make up the serial number of the power supply.
- Part number—A collection of numbers and letters that make up the part number of the power supply.

Summit family switches only:

- Internal Power Supply (PowerSupply 1 information)—The Summit family switches come with one power supply pre-installed at the factory. The Summit power supply is not user-replaceable; therefore, the part information display indicates internal power supply.
- External Power Supply (PowerSupply 2-4 information)—Displays information about the optional External Power System (EPS) that allows you to add a redundant power supply to the Summit family switches to protect against a power supply failure.

On modular switches, the output also includes the following information:

- Revision—Displays the revision number of the power supply.
- Odometer—Specifies how long the power supply has been operating.
- Temperature—Specifies, in Celsius, the current temperature of the power supply.
- Input—Specifies the input voltage and the current requirements of the power supply and whether the input is AC or DC.
- Output 1 and Output 2—Specifies the output voltage and the current supplied by the power supply. The values are only displayed if known for the platform.

The Summit X460, E4G-400, BlackDiamond X8 series, and the BlackDiamond 8800 series switches include Power Usage, which is only an estimate for the input power consumed. SummitStack displays the supplies associated to each active node that is present in a slot. The supplies are represented with flags that describe whether the supply is providing power, has failed, or is providing no power, or if the supply has had its 48v power output automatically turned off because two or three external power supplies are available. For more information, see the show power (Stack Nodes Only) section in SummitStack Feature Commands

In ExtremeXOS 10.1 and earlier, use the show powersupplies {detail} command to view detailed health information about the power supplies.

Example

Modular switch example:

The following command displays the status of the power supply installed in slot 1 in a modular switch:

```
show power 1
```

The following is sample output from this command:

```
PowerSupply 1 information:
State:          Powered On
PartInfo:       PS 2336 5003J-00479 4300-00137
Revision:       2.0
Odometer:       90 days 5 hours
Temperature:    29.0 deg C
Fan 1:          6473 RPM
Fan 2:          6233 RPM
Input:          230.00 V AC
Output 1:       48.50 V,  7.25 A   (48V/1104W Max)
Output 2:       12.44 V,  0.62 A   (12V/48W Max)
```

If power management needs to disable a power supply to maximize the total available power, you see Disabled for net power gain next to the state of the power supply, as shown in the sample truncated output:

```
PowerSupply 1 information:
State:          Powered Off (Disabled for net power gain)
PartInfo:       PS 2336 0413J-00732 4300-00137
...
```

If you choose to always enable a power supply, regardless of the affect on the total available power, you see Configured ON next to the state of the power supply, as shown in the sample truncated output:

```
PowerSupply 1 information:
State:          Powered On  (Configured ON)
PartInfo:       PS 2336 0413J-00732 4300-00137
```

If you install the 600/900 W AC PSU in a chassis other than a BlackDiamond 8806, you see unsupported next to the state of the power supply, as shown in this sample truncated output:

```
PowerSupply 3 information:
State:          Unsupported
PartInfo:       PS 2431 0622J-00013 4300-00161
```

Summit family switches example:

The following command displays the status of the power supplies installed in the Summit X450 series switch:

```
show power
```

The following sample output assumes that you have not installed an EPS:

```
PowerSupply 1 information:
State:          Powered On
PartInfo:       Internal Power Supply
PowerSupply 2 information:
State:          Empty
```

The following sample output assumes that you have installed an EPS:

```
PowerSupply 1 information:
State:          Powered On
PartInfo:       Internal Power Supply
PowerSupply 2 information:
State:          Powered On
PartInfo:       External Power Supply
```

The following sample output for the Summit X450e-48p assumes a connection to an external EPS-C with three EPS-600LS modules installed:

```
show power
PowerSupply 1 information:
State:          Powered Off
PartInfo:       Internal Power Supply
Input:          0.00 V AC
PowerSupply 2 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
PowerSupply 3 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
PowerSupply 4 information:
State:          Powered On
PartInfo:       External Power Supply
Input:          0.00 V AC
```

For the BlackDiamond X8 switch, the command output is enhanced to show the power supply groupings as follows:

```
BD-X8.2 # show power
PowerSupply 1 information:
State              : Powered On
PartInfo           : H2500A2-EX  1109X-88834 800429-00
Revision           : 1.0
Odometer           : 200 days 6 hours
Temperature        : 29.0 deg C
Fan                : 8616 RPM
Input              : 220.00 V AC
Output 1           : 48.00 V,  9.10 A   (48V/2160W Max)
Power Usage        : 526.26 W
```

```
PowerSupply 2 information:
State              : Powered On
PartInfo           : H2500A2-EX  1109X-88787 800429-00
Revision           : 1.0
Odometer           : 154 days 18 hours
Temperature        : 30.0 deg C
Fan                : 8616 RPM
Input              : 220.00 V AC
Output 1           : 47.99 V,  9.47 A   (48V/2160W Max)
Power Usage        : 547.54 W
PowerSupply 3 information:
State              : Empty
PowerSupply 4 information:
State              : Empty
PowerSupply 5 information:
State              : Powered On
PartInfo           : H2500A2-EX  1121X-88454 800429-00
Revision           : 1.0
Odometer           : 85 days 8 hours
Temperature        : 46.0 deg C
Fan                : 8616 RPM
Input              : 220.00 V AC
Output 1           : 47.93 V,  9.22 A   (48V/2160W Max)
Power Usage        : 532.42 W
PowerSupply 6 information:
State              : Powered On
PartInfo           : H2500A2-EX  1121X-88598 800429-00
Revision           : 1.0
Odometer           : 72 days 20 hours
Temperature        : 47.0 deg C
Fan                : 8616 RPM
Input              : 220.00 V AC
Output 1           : 47.99 V,  8.48 A   (48V/2160W Max)
Power Usage        : 490.30 W
PowerSupply 7 information:
State              : Powered On
PartInfo           : H2500A2-EX  1109X-88765 800429-00
Revision           : 1.0
Odometer           : 135 days 18 hours
Temperature        : 46.0 deg C
Fan                : 8616 RPM
Input              : 220.00 V AC
Output 1           : 47.97 V,  9.06 A   (48V/2160W Max)
Power Usage        : 523.62 W
PowerSupply 8 information:
State              : Empty
System Power Usage : 2620.14 W
Poll Interval      : 60 s
Change Threshold   : N/A
Change Action      : N/A
Note: Input Power Sources should be split among
PSU Groups A (1-4) and B (5-8) for best redundancy.
```

For stacking systems, the power detail display is enhanced as follows:

```
* Slot-1 Stack.2 # show power
PSU-1 or  PSU-2 or
```

```

Slot-1 PowerSupply 1 information:
State              :      Powered On
PartInfo           :      PSSF751301A- 1022A-40459 800382-00-01
Power Usage        :      113.88W
Output  1          :      18.63 V,    4.37 A
Output  2          :      3 V,         3 A
Slot-1 PowerSupply 2 information:
State              :      Empty
System Power Usage :      120 W
```

History

This command was first available in an ExtremeXOS 10.1.

The syntax for this command was modified in ExtremeXOS 11.0 from show powersupplies to show power {<ps_num>} {detail}.

The output was modified to include power management details for modular switches in ExtremeXOS 11.3.

DC power output for the BlackDiamond 8800 series switches was added in ExtremeXOS 11.4.

For the BlackDiamond X8 switch, the command output was enhanced to show the power supply groupings in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

show power budget

show power budget

Description

Displays the power status and the amount of available and required power on a modular switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the amount of power available on the switch.

This status information may be useful if the show slot command displays a state of Powered OFF for any I/O module, for monitoring power, or for power planning purposes.

The first table of the show power budget command displays:

- Slot number of the power supply.
- Current state of the power supply. Options are:
  - Empty—There is no power supply installed.
  - Power Failed—The power supply has failed.
  - Power Off—The power supply is off.
  - Power On—The power supply is on.
- Watts and voltage amounts of the power supply.
- Redundant power information. Redundant power is the amount of power available if power to one PSU is lost. If a switch has PSUs with a mix of both 220V AC and 110V AC inputs, the amount of redundant power shown is based on the worst-case assumption that power to a PSU with 220V AC input is lost.

The second table of the show power budget command displays:

- Slot number and name of the component installed in the slot. Options include:
  - I/O modules
  - MSMs/MMs
  - Fan trays
- Current state of the module. Options include, among others:
  - Empty: There is no component installed.
  - Operational: The component is installed and operational.
  - Present: The component is installed but not operational.
  - Down: The module is installed, but the administrator has taken the module offline.
  - Power ON: There is sufficient system power to power up the module.
  - Powered OFF: There is insufficient system power to keep the module up and running, or there is a mismatch between the module configured for the slot and the actual module installed in the slot.
  - Booting: The module has completed downloading the software image and is now booting.
  - Initializing: The module is initializing.
- Watts and voltage amounts of the modules.
- Power Surplus or Power Shortfall.

  - If the amount of available power meets or exceeds the required port, the excess is displayed as the Power Surplus.
  - If the available power is insufficient to meet the required power, the deficit is displayed as Power Shortfall.
- Redundant power information. If the amount of redundant power meets or exceeds the required power, the system has (N+1) power.
  - Yes—The system has redundant (N+1) power.
  - No—The system does not have redundant (N+1) power.

  The information contained in this display is for planning purposes since the system operates without redundant power as long as a power surplus is shown. However, if power is lost to a single PSU when the system is not redundant, I/O modules are powered down. Please refer to the section Understanding Power Supply Management in Managing the Switch of the *ExtremeXOS Concepts Guide*.

Depending on the software version running on your switch, the modules installed in your switch, and the type of switch you have, additional or different power information may be displayed.

Example

The following command displays the distribution of power and the available power on the switch:

```
show power budget
```

This display will appear on the BlackDiamond X8 switch as follows:

```
BD-X8.36 # show power budget
Watts
PS  State                                  at 48V
-----------------------------------------------
1   Powered On                            2500.00
2   Powered On                            2500.00
3   Powered On                            2500.00
4   Powered On                            2500.00
5   Powered On                            2500.00
6   Powered On                            2500.00
7   Powered On                            2500.00
8   Powered On                            2500.00
-----------------------------------------------
Power Available:                         20000.00
N+1 Redundant Power Available:           17500.00
N+N Redundant Power Available:           10000.00
Note: Input Power Sources should be split among
PS groups A (1-4) and B (5-8) for best redundancy.
Watts
Slots     Type             State         at 48V
-----------------------------------------------

Power Surplus:                          12609.00
N+1 Redundant Power Supply(s) Present?:     Yes
N+N Redundant Power Supply(s) Present?:     Yes
BD-X8.37 #
```

History

This command was first available in ExtremeXOS 11.0.

Power over Ethernet (PoE) data (inline power) was added to the show power budget output in ExtremeXOS 11.1. PoE data is displayed when you install a G48P module in a BlackDiamond 8800 series switch.

Redundant (N+1) power information was added to the show power budget output in ExtremeXOS11.1.

Platform Availability

This command is available only on modular switches.

show power controller

show power controller {*num*}

Description

Displays the current status of the installed power supply controllers.

Syntax Description

num	Specifies the slot number of the installed power supply controller.

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the power supply controllers. Power controllers collect data about the installed power supplies and report the results to the MSM/MM.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects the following power supply controller information:

- State—Indicates the current state of the power supply controller. Options are:
  - Empty: There is no power supply controller installed.
  - Operational: The power supply controller is installed and operational.
  - Present: The power supply controller is installed.
- PartInfo—Provides information about the power supply controller including the:
  - Slot number where the power supply controller is installed.
  - Serial number, a collection of numbers and letters, that make up the serial number of the power supply controller.
  - Part number, a collection of numbers and letters that make up the part number of the power supply controller.
- Revision—Displays the revision number of the power supply controller.
- FailureCode—Specifies the failure code of the power supply controller.
- Odometer—Specifies the date and how long the power supply controller has been operating.
- Temperature—Specifies, in Celsius, the current temperature of the power supply controller.
- Status—Specifies the status of the power supply controller.

Example

The following command displays the status of the installed power supply controllers:

```
show power controller
```

The following is sample output from this command:

```
PSUCTRL-1 information:
State:          Operational
PartInfo:       PSUCTRL-1 04334-00021 450117-00-01
Revision:       1.0
FailureCode:    0
Odometer:       337 days 7 hours  since Nov-30-2004
Temperature:    32.14 deg C
Status:         PSU CTRL Mode:   Master
PSUCTRL-2 information:
State:          Empty
```

If you have two power supply controllers installed, the switch displays output about both of the power supply controllers:

```
PSUCTRL-1 information:
State:          Operational
PartInfo:       PSUCTRL-1 04334-00021 450117-00-01
Revision:       1.0
FailureCode:    0
Odometer:       17 days 5 hours 30 minutes  since Oct-19-2004
Temperature:    35.1 deg C
Status:         PSU CTRL Mode:   Master
PSUCTRL-2 information:
State:          Operational
PartInfo:       PSUCTRL-2 04334-00068 450117-00-01
Revision:       1.0
FailureCode:    0
Odometer:       4 days 13 hours  since Sep-21-2004
Temperature:    33.56 deg C
Status:         PSU CTRL Mode:   Backup
```

For the BlackDiamond X8 switch, this command shows the Power Entry Circuit (PEC) boards as follows:

```
BD-X8.41 # show power controller
PSUCTRL-1 information:
State:          Operational
PartInfo:       EV-AC-PEC 1102G-00137 450357-00-01
Revision:       1.0
PSUCTRL-2 information:
State:          Operational
PartInfo:       EV-AC-PEC 1102G-00138 450357-00-01
Revision:       1.0
Note: Power Supplies 1-4 (group A) use PSUCTRL-1 and 5-8 (group B) use
PSUCTRL-2.
BD-X8.42 #
```

Unlike the power controller on the BlackDiamond 8000 switch, the PEC is a passive board. Thus, the state shown can only be either Operational (meaning the card is present and in use) or Empty.

History

This command was first available in an ExtremeXOS 11.0.

Platform Availability

This command is available only on modular switches.

show power led motion-detector

show power led motion-detector

Description

Displays the status of the motion detector on the Summit X670 switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the status and timeout setting of the motion detector.

Example

The following command displays the status for motion detection on the switch:

```
show power led motion-detector
```

The following is sample output from this command:

```
X670-48x.1 # show power led motion-detector
Motion detector          : Enabled
Timeout                  : 180 seconds
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on the Summit X670 switch only.

show session

show session {{**detail**} {*sessID*}} {**history**}

Description

Displays the currently active Telnet and console sessions communicating with the switch.

Syntax Description

detail	Specifies more detailed session information.
sessID	Specifies a session ID number.
history	Displays a list of all sessions.

Default

N/A.

Usage Guidelines

The show session command displays the username and IP address of the incoming Telnet session, whether a console session is currently active, and the login time. Each session is numbered.

Beginning with ExtremeXOS 11.2, the switch accepts IPv6 connections. If the incoming session is from an IPv6 address, the show session output indicates IPv6.

You can specify the following options to alter the session output:

- detail—The output for all current sessions is displayed in a list format.
- sessID—The output for the specified session is displayed in a list format.
- history—Displays a list of current and previous sessions, including the user, type of session, location, and start and end time of the session.

The show session command fields are defined in the following table.

Table 12: Show Command Field Definitions

Field	Definition
#	Indicates session number.
Login Time	Indicates login time of session.
User	Indicates the user logged in for each session.
Type	Indicates the type of session, for example: console, telnet, http, https.
Auth	Indicates how the user is logged in.
CLI Auth	Indicates the type of authentication (RADIUS and TACACS) if enabled.
Location	Indicates the location (IP address) from which the user logged in. The output also indicates if the location is an IPv6 address.

Example

The following command displays the active sessions on the switch:

```
show session
```

The following is sample output from this command:

```
CLI
#       Login Time               User     Type    Auth   Auth Location
================================================================================
==
1       Thu Apr 28 20:16:56 2005 admin    console local  dis  serial
*2      Thu Apr 28 23:36:20 2005 admin    ssh2    local  dis  3001::20d:
88ff:fec5:ad40
3       Fri Apr 29 11:14:27 2005 admin    telnet  local  dis  10.255.44.55
```

The following command displays a list of current and previous sessions on the switch:

```
show session history
```

The following is sample output from this command:

```
Session History:
admin                            console    serial
Mon Jun 21 09:19:00 2004
Mon Jun 21 10:00:16 2004
admin                            console    serial
Tue Jun 22 07:28:
11 2004
Tue Jun 22 11:46:48 2004
admin                            console    serial
Wed Jun 23 10:05:44 2004
Wed Jun 23 14:11:47 2004
admin                            console    serial
Thu Jun 24 07:07:25 2004
Thu Jun 24 07:08:55 2004
admin                            console    serial
Thu Jun 24 13:30:07 2004  Active
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show snmp

show snmp [**get** | **get-next**] *object_identifier*

Description

Displays the contents of an SNMP MIB object.

Syntax Description

object_identifier	Specifies the object identifier for an SNMP MIB object.

Default

N/A.

Usage Guidelines

Use the get option to establish an index into the SNMP MIB. After the get option is executed, you can use the get next option to step through the MIB objects.

Example

The following gets the contents of SNMP object 1.3.6.1.2.1.1.5.0:

```
show snmp get 1.3.6.1.2.1.1.5.0
system.5.0 = BD-12804
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show snmp vr_name

show snmp {**vr**} *vr_name*

Description

Displays the SNMP configuration and statistics on a virtual router.

Syntax Description

vr_name	Specifies the virtual router.

Default

N/A.

Usage Guidelines

Use this command to display the SNMP configuration and statistics on a virtual router.

Example

The following command displays configuration and statistics for the virtual router VR-Default:

```
show snmp vr VR-Default
```

Following is sample output for the command:

```
SNMP access                      : Disabled
SNMP Traps                       : Enabled
SNMP v1/v2c TrapReceivers        :
Destination         Source IP Address       Flags
10.120.91.89 /162                            2E
Flags:  Version: 1=v1 2=v2c
Mode: S=Standard E=Enhanced
SNMP stats:    InPkts 300     OutPkts   300       Errors 0       AuthErrors 0
Gets   0       GetNexts  300       Sets   0       Drops      0
SNMP traps:    Sent   0       AuthTraps Enabled
show snmp vr <vr_name>
SNMP access : Enabled
SNMP ifMib ifAlias size:  Extended
SNMP Traps: Enabled
SNMP TrapReceivers: None
SNMP stats:     InPkts 0       OutPkts   0       Errors 0       AuthErrors
0
                Gets   0       GetNexts  0       Sets   0       Drops
0
SNMP traps:     Sent   0       AuthTraps Enable
```

History

This command was first available in ExtremeXOS 12.4.2.

The SNMP ifMib ifAlias size status was added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

show snmpv3 access

show snmpv3 access {[[**hex** *hex_group_name*] | *group_name*]}

Description

Displays SNMPv3 access rights.

Syntax Description

hex	Specifies that the value to follow is to be supplied as a colon separated string of hex octets.
group_name	Specifies the name of the group to display.

Default

N/A.

Usage Guidelines

The show snmpv3 access command displays the access rights of a group. If you do not specify a group name, the command will display details for all the groups.

This command displays the SNMPv3 vacmAccessTable entries.

Example

The following command displays all the access details:

```
show snmpv3 access
```

The following is sample output from this command:

```
X450a-24t.5 # show snmpv3 access

```

The following command displays the access rights for the group group1:

```
show snmpv3 access group1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show snmpv3 community

show snmpv3 community

Description

Displays information about SNMP community strings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays information about and status of the SNMP community on the switch. This information is available to Administrator Accounts.

Example

The following command displays the community:

```
show snmpv3 community
```

The following is sample output from this command.

```
X450a-24t.4 # show snmpv3 community
Community Index  : private
Community Name   : private
Security Name    : v1v2c_rw
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:7b
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
Community Index  : public
Community Name   : public
Security Name    : v1v2c_ro
Context EngineID : 80:00:07:7c:03:00:04:96:27:b6:7b
Context Name     :
Transport Tag    :
Storage Type     : NonVolatile
Row Status       : Active
Total num. of entries in snmpCommunityTable : 2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show snmpv3 context

show snmpv3 context

Description

Displays information about the SNMPv3 contexts on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the entries in the View-based Access Control Model (VACM) context table (VACMContextTable).

Example

The following command displays information about the SNMPv3 contexts on the switch:

```
show snmpv3 context
```

The following is sample output from this command:

```
VACM Context Name :
Note : This Version Supports one global context ("")
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show snmpv3 counters

show snmpv3 counters

Description

Displays SNMPv3 counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The show snmpv3 counters command displays the following SNMPv3 counters:

- snmpUnknownSecurityModels
- snmpInvalidMessages
- snmpUnknownPDUHandlers
- usmStatsUnsupportedSecLevels
- usmStatsNotInTimeWindows
- usmStatsUnknownUserNames
- usmStatsUnknownEngineIDs

- usmStatsWrongDigests
- usmStatsDecryptionErrors

Issuing the command clear counters resets all counters to zero.

Example

The following command displays all the SNMPv3 counters.

```
show snmpv3 counters
```

The following is sample output from this command:

```
snmpUnknownSecurityModels       : 0
snmpInvalidMessages             : 0
snmpUnknownPDUHandlers          : 0
usmStatsUnsupportedSecLevels    : 0
usmStatsNotInTimeWindows        : 0
usmStatsUnknownUserNames        : 0
usmStatsUnknownEngineIDs        : 0
usmStatsWrongDigests            : 0
usmStatsDecryptionErrors        : 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show snmpv3 engine-info

show snmpv3 engine-info

Description

Displays information about the SNMPv3 engine on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The following show engine-info output is displayed:

- Engine-ID—Either the ID auto generated from MAC address of switch, or the ID manually configured.
- Engine Boots—Number of times the agent has been rebooted.
- Engine Time—Time since agent last rebooted, in centiseconds.
- Max. Message Size—Maximum SNMP Message size supported by the Engine (8192).

Example

The following command displays information about the SNMPv3 engine on the switch:

```
show snmpv3 engine-info
```

The following is sample output from this command:

```
SNMP Engine-ID          : 80:0:7:7c:3:0:30:48:41:ed:97 'H'
SNMP Engine Boots       : 1
SNMP Engine Time        : 866896
SNMP Max. Message Size  : 8192
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show snmpv3 extreme-target-addr-ext

show snmpv3 extreme-target-addr-ext [[**hex** *hex_addr_name*] | *addr_name*]

Description

Displays information about SNMPv3 target addresses enhanced or standard mode.

Syntax Description

hex_addr_name	Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address.

Default

N/A.

Usage Guidelines

Use this command to display entries in the SNMPv3 extremeTargetAddressExtTable.

Example

The following command displays the entry for the target address named A1:

```
show snmpv3 extreme-target-addr-ext A1
```

The following is sample output from this command:

```
Target Addr Name        : A1
Mode                    : Enhanced
IgnoreMPModel           : No
UseEventComm            : Yes
```

History

This command was first available in ExtremeXOS 10.1.

The hex_addr_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 filter

show snmpv3 filter {[[**hex** *hex_profile_name*] | *profile_name*] {{**subtree**} *object_identifier*}

Description

Displays the filters that belong a filter profile.

Syntax Description

hex_profile_name	Specifies the filter profile to display. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile to display in ASCII format.
object_identifier	Specifies a MIB subtree.

Default

N/A.

Usage Guidelines

Use this command to display entries from the snmpNotifyFilterTable. If you specify a profile name and subtree, you will display only the entries with that profile name and subtree. If you specify only the profile name, you will display all entries for that profile name. If you do not specify a profile name, then all the entries are displayed.

Example

The following command displays the part of filter profile prof1 that includes the MIB subtree 1.3.6.1.4.1:

```
show snmpv3 filter prof1 subtree 1.3.6.1.4.1
```

The following is sample output from this command:

```
Profile Name    : prof1
Subtree         : 1.3.6.1.4.1
Mask            :
Type            : Included
Storage Type    : NonVolatile
Row Status      : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 filter-profile

show snmpv3 filter-profile {[[**hex** *hex_profile_name*] | *profile_name*]} {**param** [[**hex** *hex_param_name*] | *param_name*]}

Description

Displays the association between parameter names and filter profiles.

Syntax Description

hex_profile_name	Specifies the filter profile name. The value is to be supplied as a colon separated string of hex octets.
profile_name	Specifies the filter profile name in ASCII format.
hex_param_name	Specifies the parameter name. The values is to be supplied as a colon separated string of hex octets.
param_name	Specifies the parameter name in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to display the snmpNotifyFilterProfileTable. This table associates a filter profile with a parameter name. The parameter name is associated with target addresses, and the filter profile is associated with a series of filters, so, in effect, you are associating a series of filters with a target address.

Example

The following command displays the entry with filter profile prof1 with the parameter name P1:

```
show snmpv3 filter-profile prof1 param P1
```

The following is sample output of this command:

```
Filter Profile Params Name : p1
Name                       : prof1
Storage Type               : NonVolatile
Row Status                 : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_profile_name and hex_param_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 group

show snmpv3 group {[[**hex** *hex_group_name*] | *group_name*] {**user** [[**hex** *hex_user_name*] | *user_name*]}}

Description

Displays the user name (security name) and security model association with a group name.

Syntax Description

hex_group_name	Specifies the group name to display. The value is to be supplied as a colon separated string of hex octets.
group_name	Specifies the group name to display. The value is to be supplied in ASCII format.
hex_user_name	Specifies the user name to display. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to display. The value is to be supplied in ASCII format.

Default

N/A.

Usage Guidelines

The show snmpv3 group command displays the details of a group with the given group name. If you do not specify a group name, the command will display details for all the groups.

This command displays the SNMPv3 vacmSecurityToGroupTable.

Example

The following command displays information about all groups for every security model and user name:

```
show snmpv3 group
```

The following is sample output from this command:

```
X450a-24t.9 # sh snmpv3 group
Group Name      : v1v2c_ro
Security Name   : v1v2c_ro
Security Model  : snmpv1
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : v1v2c_rw
Security Name   : v1v2c_rw
Security Model  : snmpv1
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : v1v2c_ro
```

```
Security Name   : v1v2c_ro
Security Model  : snmpv2c
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : v1v2c_rw
Security Name   : v1v2c_rw
Security Model  : snmpv2c
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : admin
Security Name   : admin
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initial
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialmd5
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialsha
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialmd5Priv
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Group Name      : initial
Security Name   : initialshaPriv
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
Total num. of entries in vacmSecurityToGroupTable : 10
```

The following command shows information about the group testgroup and user name testuser:

```
show snmpv3 group testgroup user testuser
```

The following is sample output from this command:

```
Group Name      : testgroup
Security Name   : testuser
Security Model  : USM
Storage Type    : NonVolatile
Row Status      : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_group_name and hex_user_name parameters were added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 mib-view

show snmpv3 mib-view {[[**hex** *hex_view_name*] | *view_name*] {**subtree** *object_identifier*}}

Description

Displays a MIB view.

Syntax Description

hex_view_name	Specifies the name of the MIB view to display. The value is to be supplied as a colon separated string of hex octets.
view_name	Specifies the name of the MIB view to display. The value is to be supplied in ASCII format.
object_identifier	Specifies the object identifier of the view to display.

Default

N/A.

Usage Guidelines

The show snmpv3 mib-view command displays a MIB view. If you do not specify a view name, the command will display details for all the MIB views. If a subtree is not specified, then all subtrees belonging to the view name will be displayed.

This command displays the SNMPv3 vacmViewTreeFamilyTable.

Example

The following command displays all the view details:

```
show  snmpv3 mib-view
```

The following is sample output from this command:

```
X450a-24t.10 # sh snmpv3 mib-view
View Name       : defaultUserView
MIB Subtree     : 1
Mask            :
View Type       : Included
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultUserView
MIB Subtree     : 1.3.6.1.6.3.16
Mask            :
View Type       : Excluded
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultUserView
MIB Subtree     : 1.3.6.1.6.3.18
Mask            :
View Type       : Excluded
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultUserView
MIB Subtree     : 1.3.6.1.6.3.15.1.2.2.1.4
Mask            :
View Type       : Excluded
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultUserView
MIB Subtree     : 1.3.6.1.6.3.15.1.2.2.1.6
Mask            :
View Type       : Excluded
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultUserView
MIB Subtree     : 1.3.6.1.6.3.15.1.2.2.1.9
Mask            :
View Type       : Excluded
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultAdminView
MIB Subtree     : 1
Mask            :
View Type       : Included
Storage Type    : NonVolatile
Row Status      : Active
View Name       : defaultNotifyView
MIB Subtree     : 1
Mask            :
View Type       : Included
Storage Type    : NonVolatile
Row Status      : Active
Total num. of entries in vacmViewTreeFamilyTable : 8
```

The following command displays a view with the view name Roview and subtree 1.3.6.1.2.1.1:

```
show snmpv3 mib-view Roview subtree 1.3.6.1.2.1.1
```

History

This command was first available in ExtremeXOS 10.1.

The hex_view_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 notify

This command displays the snmpNotifyTable.

show snmpv3 notify {[[**hex** *hex_notify_name*] | *notify_name*]}

Description

Displays the notifications that are set.

Syntax Description

hex_notify_name	Specifies the parameter name associated with the target. The value is to be supplied as a colon separated string of hex octets.
notify_name	Specifies the parameter name associated with the target. The value is to be supplied in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to display entries from the SNMPv3 snmpNotifyTable. This table lists the notify tags that the agent will use to send notifications (traps).

If no notify name is specified, all the entries are displayed.

Example

The following command displays the notify table entries:

```
show snmpv3 notify
```

The following is sample output from this command:

```
BD-12804.2 # show snmpv3 notify
Notify Name     : defaultNotify
Tag             : defaultNotify
Type            : Trap
Storage Type    : NonVolatile
Row Status      : Active
Notify Name     : xyz
Tag             : xyz1
Type            : Inform
Storage Type    : NonVolatile
Row Status      : Active
Total entries in snmpNotifyTable : 2
```

History

This command was first available in ExtremeXOS 10.1.

The hex_notify_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 target-addr

show snmpv3 target-addr {[[**hex** *hex_addr_name*] | *addr_name*]}

Description

Displays information about SNMPv3 target addresses.

Syntax Description

hex_addr_name	Specifies an identifier for the target address. The value is to be supplied as a colon separated string of hex octets.
addr_name	Specifies a string identifier for the target address.

Default

N/A.

Usage Guidelines

Use this command to display entries in the SNMPv3 snmpTargetAddressTable. If no target address is specified, the entries for all the target addresses will be displayed.

To view the source IP address, use the show management command.

Example

The following command displays the entry for the target address named A1:

```
show snmpv3 target-addr A1
```

The following is sample output from this command:

```
Target Addr Name        : A1
TDomain                 : 1.3.6.1.6.1.1
TAddress                : 10.201.31.234, 162
TMask                   :
Timeout                 : 1500
Retry Count             : 0
Tag List                : defaultNotify
Params                  : v1v2cNotifyParam1
Storage Type            : NonVolatile
Row Status              : Active
Storage Type            : NonVolatile
Row Status              : Active
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 11.0 to display a list of tags if more than one was configured and to display the timeout value for the entry in the snmpTargetAddrTable. This command was also modified to support the hex_addr_name parameter.

Platform Availability

This command is available on all platforms.

show snmpv3 target-params

show snmpv3 target-params {[[**hex** *hex_target_params*] | *target_params*]}

Description

Displays the information about the options associated with the parameter name.

Syntax Description

hex_target_params	Specifies the parameter to display. The value is to be supplied as a colon separated string of hex octets.
target_params	Specifies the parameter name to display. The value is to be supplied in ASCII format.

Default

N/A.

Usage Guidelines

Use this command to display entries from the SNMPv3 snmpTargetParamsTable. This table specifies the message processing model, security level, security model, and the storage parameters for messages to any target addresses associated with a particular parameter name.

If no parameter name is specified, all the entries are displayed.

Example

The following command displays the target parameter entry named P1:

```
show snmpv3 target-params P1
```

The following is sample output from this command:

```
Target Params Name      : p1
MP Model                : snmpv2c
Security Model          : snmpv2c
User Name               : testuser
Security Level          : No-Authentication No-Privacy
Storage Type            : NonVolatile
Row Status              : Active
```

History

This command was first available in ExtremeXOS 10.1.

The hex_target_params parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show snmpv3 user

show snmpv3 user {[**hex** *hex_user_name*] | *user_name*]}

Description

Displays detailed information about the user.

Syntax Description

hex_user_name	Specifies the user name to display. The value is to be supplied as a colon separated string of hex octets.
user_name	Specifies the user name to display. The value is to be supplied in ASCII format.

Default

N/A.

Usage Guidelines

The show snmpv3 user command displays the details of a user. If you do not specify a user name, the command will display details for all the users. The authentication and privacy passwords and keys will not be displayed.

The user entries in SNMPv3 are stored in the USMUserTable, so the entries are indexed by EngineID and user name.

Example

The following command lists all user entries:

```
show snmpv3 user
```

The following is sample output from this command:

```
X450a-24t.11 # sh snmpv3 user
Engine-ID       : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name       : admin
Security Name   : admin
Authentication  : HMAC-MD5
Privacy         : DES
Storage Type    : NonVolatile
Row Status      : Active
Engine-ID       : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name       : initial
Security Name   : initial
Authentication  : No-Authentication
Privacy         : No-Privacy
Storage Type    : NonVolatile
Row Status      : Active
Engine-ID       : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name       : initialmd5
Security Name   : initialmd5
Authentication  : HMAC-MD5
```

```
Privacy          : No-Privacy
Storage Type     : NonVolatile
Row Status       : Active
Engine-ID        : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name        : initialsha
Security Name    : initialsha
Authentication   : HMAC-SHA
Privacy          : No-Privacy
Storage Type     : NonVolatile
Row Status       : Active
Engine-ID        : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name        : initialmd5Priv
Security Name    : initialmd5Priv
Authentication   : HMAC-MD5
Privacy          : DES
Storage Type     : NonVolatile
Row Status       : Active
Engine-ID        : 80:00:07:7c:03:00:04:96:27:b6:7b 'H'
User Name        : initialshaPriv
Security Name    : initialshaPriv
Authentication   : HMAC-SHA
Privacy          : DES
Storage Type     : NonVolatile
Row Status       : Active
Total num. of entries in usmUserTable : 6
```

The following command lists details for the specified user, testuser:

```
show snmpv3 user testuser
```

History

This command was first available in ExtremeXOS 10.1.

The hex_user_name parameter was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show sntp-client

show sntp-client

Description

Displays the DNS configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Displays configuration and statistics information of SNTP client.

Example

The following command displays the SNTP configuration:

```
show sntp-client
```

The following is sample output from this command:

```
SNTP client is enabled
SNTP time is valid
Primary server: 172.17.1.104
Secondary server: 172.17.1.104
Query interval: 64
Last valid SNTP update: From server 172.17.1.104, on Wed Oct 30 22:46:03 2003
SNTPC Statistics:
Packets transmitted:
to primary server:            1
to secondary server:          0
Packets received with valid time:
from Primary server:          1
from Secondary server:        0
from Broadcast server:        0
Packets received without valid time:
from Primary server:          0
from Secondary server:        0
from Broadcast server:        0
Replies not received to requests:
from Primary server:          0
from Secondary server:        0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

telnet

telnet {**vr** *vr_name*} [*host_name* | *remote_ip*] {*port*}

Description

Allows you to Telnet from the current command-line interface session to another host.

Syntax Description

vr	Specifies use of a virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
vr_name	Specifies the name of the virtual router.
host_name	Specifies the name of the host.
remote_ip	Specifies the IP address of the host.
port	Specifies a TCP port number. The default is port 23.

Default

- Telnet—enabled
- Virtual router—Uses all virtual routers on the switch for outgoing Telnet requests
- Port—23

Usage Guidelines

Only VT100 emulation is supported.

Before you can start an outgoing Telnet session, you need to configure the switch IP parameters. To open a Telnet connection, you must specify the host IP address or the host name of the device you want to connect to. Check the user manual supplied with the Telnet facility if you are unsure of how to do this. Although the switch accepts IPv6 connections, you can only Telnet from the switch to another device with an IPv4 address.

You must configure DNS in order to use the host_name option.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Virtual Router Requirements

The vr_name option specifies the name of the virtual router. The valid virtual router names at system boot-up are VR-Mgmt, VR-Control, and VR-Default; however, you can only Telnet on VR-Mgmt and VR-Default. In ExtremeXOS 10.1, the valid virtual routers are VR-0, VR-1, and VR-2 respectively, and Telnet used VR-0 by default. For more information about virtual routers, see "Virtual Routers" in the ExtremeXOS Concepts Guide.

Example

The following command starts a Telnet client communication to the host at IP address 123.45.67.8:

```
telnet 123.45.67.8
```

The following command starts a Telnet client communication with a host named sales:

```
telnet sales
```

History

This command was first available in ExtremeXOS 10.1.

Support for the following virtual routers was added in ExtremeXOS 11.0: VR-Mgmt and VR-Default.

Platform Availability

This command is available on all platforms.

telnet msm

telnet msm [a | b]

Description

Allows you to Telnet to either the primary or the backup MSM regardless of which console port you are connected to.

Syntax Description

a	Specifies the MSM installed in slot A.
b	Specifies the MSM installed in slot B.

Default

N/A.

Usage Guidelines

Use this command to access either the primary or the backup MSM regardless of which console port you are connected to. For example, if MSM A is the primary MSM and you are connected to MSM A via its console port, you can access the backup MSM installed in slot B by issuing the telnet msm b command.

Example

The following example makes the following assumptions:

- The MSM installed in slot A is the primary
- The MSM installed in slot B is the backup
- You have a console connection to MSM B

The following command accesses the primary MSM installed in slot A from the backup MSM installed in slot B:

```
My8800.6 # telnet msm b
Entering character mode
Escape character is '^]'.
telnet session telnet0 on /dev/ptyb0

================================================================================
You are connected to a Backup node.  Only a limited command set is supported.
You may use "telnet msm A" to connect to the Master node to access
the full set of commands.
Press the <tab> or '?' key at any time for completions.
Remember to save your configuration changes.
My8800.1 >
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available only on modular switches.

telnet slot

telnet slot *slot-number*

Description

Allows you to Telnet from any source node to any other target node when both nodes are in the same active topology.

Syntax Description

slot-number	Specifies the number of a slot that is currently occupied by the intended target node.

Default

N/A.

Usage Guidelines

When the target node accepts the related TCP connection, it prompts the user for a user ID and password. If the failsafe account is used, user ID and password authentication takes place on the specified node. Otherwise, authentication takes place on the master node, regardless of the source and target nodes used.

Telnet must be enabled on the SummitStack for this command to function.

Example

The following command accesses the node in slot 2:

```
Slot-1 Stack.6 # telnet slot 2
Entering character mode
Escape character is '^]'.
telnet session telnet0 on /dev/ptyb0
login: admin
password:

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on SummitStack.

tftp

tftp [*host-name* | *ip-address*] {**-v** *vr_name*} [**-g** | **-p**] [{**-l** [**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local-file*} {**-r** *remote-file*} | {**-r** *remote-file*} {**-l** [**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local-file*]}]

Description

Allows you to TFTP from the current command line interface session to a TFTP server.

Syntax Description

host-name	Specifies the name of the remote host.
ip-address	Specifies the IP address of the TFTP server.
vr_name	Specifies the name of the virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
-g	Gets the specified file from the TFTP server and copies it to the local host.
-p	Puts the specified file from the local host and copies it to the TFTP server.
internal-memory	Specifies the internal memory card.
local-file-internal	Specifies the name of the core dump file located on the internal memory card.
memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device.NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local-file-memcard	Specifies the name of the file on a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local-file	Specifies the name of the file (configuration file, policy file) on the local host.
remote-file	Specifies the name of the file on the remote host.

Default

If you do not specify a virtual router, VR-Mgmt is used.

If you do not specify the internal memory card or a removable storage device, the switch downloads or uploads the file from the switch local file system.

Usage Guidelines

NetASCII and mail file type formats are not supported.

TFTP Server Requirements

Extreme Networks recommends using a TFTP server that supports blocksize negotiation (as described in RFC 2348, TFTP Blocksize Option), to enable faster file downloads and larger file downloads. If the TFTP server does not support blocksize negotiation, the file size is limited to 32MB. Older TFTP servers that do not support blocksize negotiation have additional implementation limits that may decrease the maximum file size to only 16MB, which may be too small to install ExtremeXOS images.

If your TFTP server does not support blocksize negotiation, the switch displays a message similar to the following when you attempt a get (-g) or put (-p) operation:

```
Note: The blocksize option is not supported by the remote TFTP server.
Without this option, the maximum file transfer size is limted to 32MB.
Some older TFTP servers may be limited to 16MB file.
```

Using TFTP

Use TFTP to download a previously saved configuration file or policy file from the TFTP server to the switch. When you download a file, this command does not automatically apply it to the switch. You must specify that the downloaded file be applied to the switch. For example, if you download a configuration file, issue the use configuration command to apply the saved configuration on the next reboot. You must use the reboot command to activate the new configuration. If you download a policy file, use the refresh policy command to reprocess the text file and update the policy database.

You also use TFTP to upload a saved configuration file or policy file from the switch to the TFTP server.

If your download from the TFTP server to the switch is successful, the switch displays a message similar to the following:

```
Downloading megtest2.cfg to switch... done!
```

If your upload from the switch to the TFTP server is successful, the switch displays a message similar to the following:

```
Uploading megtest1.cfg to TFTPhost ... done!
```

Up to eight active TFTP sessions can run on the switch concurrently.

You must configure DNS in order to use the host_name option.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Local and Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local or remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

When naming a local or remote file, remember the requirements listed above.

Virtual Router Requirements

The vr_name option specifies the name of the virtual router. The valid virtual router names at system boot-up are VR-Mgmt, VR-Control, and VR-Default; however, you can only TFTP on VR-Mgmt and VR-Default. In ExtremeXOS 10.1, the valid virtual routers are VR-0, VR-1, and VR-2 respectively. For more information about virtual routers, see "Virtual Routers" in the ExtremeXOS Concepts Guide.

Internal Memory and Core Dump Files

Core dump files have a .gz file extension. The filename format is: core.<process-name.pid>.gz where process-name indicates the name of the process that failed and pid is the numerical identifier of that process. If you have a modular switch and save core dump files to the external memory card, the filename also includes the affected MSM/MM: MSM-A or MSM-B.

If you configure and enable the switch to send core dump (debug) information to the internal memory card, specify the internal-memory option to transfer those files from the internal memory card to a TFTP server.

If you specify the memorycard option, you can use TFTP to copy and transfer files to and from removable storage devices (compact flash cards or USB 2.0 storage devices) on BlackDiamond 8800 series switches and Summit X460, X480, X650, X670, and X670V switches.

If the switch has not saved any debug files, you cannot transfer other files to or from the internal memory. For example if you attempt to transfer a configuration file from the switch to the internal memory, the switch displays a message similar to the following:

```
Error: tftp transfer to internal-memory not allowed.
```

For information about configuring and sending core dump information to the internal memory card, see the configure debug core-dumps and save debug tracefiles memorycard commands.

For more detailed information about core dump files, see Troubleshooting in the ExtremeXOS Concepts Guide.

Other Useful Commands

On the Summit family switches and SummitStack, use the download bootrom command to upgrade the BootROM. This command utilizes TFTP to transfer the BootROM image file from your TFTP server to the switch. Only upgrade the BootROM when asked to do so by an Extreme Networks technical representative. For more information about this command, see download bootrom.

To upgrade the image, use the download image command. This command utilizes TFTP to transfer the software image file from your TFTP server to the switch. For more information about this command, see download image.

Example

The following command downloads the configuration file named XOS1.cfg from the TFTP server with an IP address of 10.123.45.67:

```
tftp 10.123.45.67 -v “VR-Default” -g -r XOS1.cfg
```

The following command uploads the configuration file named XOS2.cfg to the TFTP server with an IP address of 10.123.45.67:

```
tftp 10.123.45.67 -v “VR-Default” -p -r XOS2.cfg
```

The following command downloads a policy file to a removable storage device:

```
tftp 10.1.2.3 -g -l memorycard test.pol -r august23.pol
```

History

This command was first available in ExtremeXOS 10.1.

The memorycard option was added in ExtremeXOS 11.1.

The internal-memory option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

tftp get

tftp get [*host-name* | *ip-address*] {**-vr** *vr_name*} [{[**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local_file*} {*remote_file*} | {*remote_file*} {[**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local_file*]}] {**force-overwrite**}

Description

Allows you to use TFTP from the current command line interface session to copy the file from a TFTP server and copy it to a local host, including the switch, internal memory card, compact flash card, or USB 2.0 storage device.

Syntax Description

host-name	Specifies the name of the remote host.
ip-address	Specifies the IP address of the TFTP server.
vr_name	Specifies the name of the virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
internal-memory	Specifies the internal memory card.
local-file-internal	Specifies the name of the core dump file located on the internal memory card.
memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device.NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local-file-memcard	Specifies the name of the file on a removable storage device, which can be a compact flash card or a USB 2.0 storage device.NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local_file	Specifies the name of the file (configuration file, policy file) on the local host.
remote_file	Specifies the name of the file on the remote host.
force-overwrite	Specifies the switch to automatically overwrite an existing file.

Default

If you do not specify a virtual router, VR-Mgmt is used; if you transfer a file with a name that already exists on the system, the switch prompts you to overwrite the existing file.

If you do not specify the internal memory card or a removable storage device, the switch downloads or uploads the file from the switch local file system.

Usage Guidelines

NetASCII and mail file type formats are not supported.

By default, the switch prompts you to overwrite an existing file. For example, if you have a file named test.cfg on the switch and download a file named test.cfg from a TFTP server, the switch displays a message similar to the following:

```
test.cfg already exists, do you want to overwrite it? (y/n)
```

Enter y to download the file and overwrite the existing file. Enter n to cancel this action.

If you successfully download the file, the switch displays a message similar to the following:

```
Downloading test.cfg to switch... done!
```

If you cancel this action, the switch displays a message similar to the following:

```
Tftp download aborted.
```

If you specify the force-overwrite parameter, the switch automatically overwrites an existing file. For example, if you have a file named test.cfg on the switch and download a file named test.cfg from a TFTP server, the switch automatically overrides the existing file. If you successfully download the file, the switch displays a message similar to the following:

```
Downloading test.cfg to switch... done!
```

This command was introduced to simplify using TFTP to transfer configuration, policy, and if configured, core dump files from the switch to the TFTP server. You can continue to use the original tftp command introduced in ExtremeXOS 10.1.

For more information about TFTP, including:

- TFTP server requirements
- How to use TFTP
- Host name and remote IP address character restrictions
- Local and remote filename character restrictions
- Virtual router requirements
- Internal memory and core dump files
- Topics related to only modular switches
- Other useful commands

See the tftp command tftp.

Example

The following command retrieves and transfers the file test.pol from a TFTP server with an IP address of 10.1.2.3 and renames the file august23.pol when transferred to a removable storage device:

```
tftp get 10.1.2.3 vr “VR-Mgmt” test.pol memory-card august23.pol
```

The following command retrieves the configuration file named meg-upload.cfg from a TFTP server with an IP address of 10.10.10.10:

```
tftp get 10.10.10.10 vr “VR-Mgmt” meg_upload.cfg
```

History

This command was first available in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

tftp put

tftp put [*host-name* | *ip-address*] {**-vr** *vr_name*} [{[**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local_file*} {*remote_file*} | {*remote_file*} {[**internal-memory** *local-file-internal* | **memorycard** *local-file-memcard* | *local_file*]}]

Desciption

Allows you to use TFTP from the current command line interface session to copy the file from the local host, including the switch, internal memory card, compact flash card, or USB 2.0 storage device and put it on a TFTP server.

Syntax Description

host-name	Specifies the name of the remote host.
ip-address	Specifies the IP address of the TFTP server.
vr_name	Specifies the name of the virtual router.NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
internal-memory	Specifies the internal memory card.
local-file-internal	Specifies the name of the core dump file located on the internal memory card.

memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device.NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local-file-memcard	Specifies the name of the file on a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
local_file	Specifies the name of the file (configuration file, policy file) on the local host.
remote_file	Specifies the name of the file on the remote host.

Default

If you do not specify a virtual router, VR-Mgmt is used.

If you do not specify the internal memory card or a removable storage device, the switch downloads or uploads the file from the switch local file system.

Usage Guidelines

NetASCII and mail file type formats are not supported.

This command was introduced to simplify using TFTP to transfer configuration, policy, and if configured, core dump files from the switch to the TFTP server. You can continue to use the original tftp command introduced in ExtremeXOS 10.1.

For more information about TFTP, including:

- TFTP server requirements
- How to use TFTP
- Host name and remote IP address character restrictions
- Local and remote filename character restrictions
- Virtual router requirements
- Internal memory and core dump files
- Topics related to only modular switches
- Other useful commands

See the tftp command tftp.

Example

The following command transfers a saved, not currently used configuration file named XOS1.cfg from the switch to the TFTP server:

```
tftp put 10.123.45.67 vr “VR-Mgmt” XOS1.cfg
```

History

This command was first available in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

5 Commands for Managing the ExtremeXOS Software

This chapter describes commands for:

- Working with the configuration and policy files used by the switch
- Starting, stopping, and displaying information about processes on the switch
- Viewing system memory resources

Note

For information about downloading and upgrading a new software image, saving configuration changes, and upgrading the BootROM, see Configuration and Image Commands

Like any advanced operating system, ExtremeXOS gives you the tools to manage your switch and create your network configurations. With the introduction of ExtremeXOS, the following enhancements and functionality have been added to the switch operating system:

- File system administration—You can move, copy, and delete files from the switch. The file system structure allows you to keep, save, rename, and maintain multiple copies of configuration files on the switch. In addition, you can manage other entities of the switch such as policies and access control lists (ACLs).
- Configuration file management—You can oversee and manage multiple configuration files on your switch. In addition, you can upload, download, modify, and name configuration files used by the switch.
- Process control—You can stop and start processes, restart failed processes, and update the software for a specific process or set of processes.

- Memory protection—With memory protection, ExtremeXOS protects each process from every other process in the system. If one process experiences a memory fault, that process cannot affect the memory space of another process.
- CPU monitoring—You can monitor CPU utilization for Management Switch Fabric Modules (MSMs)/ Management Modules (MMs) and the individual processes running on the switch. Monitoring the workload of the CPU allows you to troubleshoot and identify suspect processes.

Note

Filenames are case-sensitive. For information on filename restrictions, please refer to the specific command in the ExtremeXOS Command Reference Guide.

cp

cp [**internal-memory** *old_name_internal* **internal-memory** *new_name_internal* | **internal-memory** *old_name_internal* **memorycard** *new_name_memorycard* | **memorycard** *old_name_memorycard* **memorycard** *new_name_memorycard* | **memorycard** *old_name_memorycard new_name* | *old_name* **memorycard** *new_name_memorycard* | *old_name new_name*]

Description

Copies an existing configuration, policy, or if configured, core dump file stored in the system.

Syntax Description

internal-memory	Specifies the internal memory card.
old_name_internal	Specifies the name of the core dump file located on the internal memory card that you want to copy.
new_name_internal	Specifies the name of the newly copied core dump file located on the internal memory card.
memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
old_name_memorycard	Specifies the name of the file you want to copy from a removable storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
new_name_memorycard	Specifies the name of the newly copied file located on a removable storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
old_name	Specifies the name of the configuration or policy file that you want to copy.
new_name	Specifies the name of the newly copied configuration or policy file.

Default

N/A.

Usage Guidelines

Use this command to make a copy of an existing file before you alter or edit the file. By making a copy, you can easily go back to the original file if needed.

When you copy a configuration or policy file, remember the following:

- XML-formatted configuration files have a .cfg file extension. The switch only runs .cfg files.
- ASCII-formatted configuration files have a .xsf file extension. See Software Upgrade and Boot Options in the ExtremeXOS Concepts Guide for more information.
- Policy files have a .pol file extension.
- Core dump files have a .gz file extension. See "Internal Memory and Core Dump Files" below.

When you copy a configuration or policy file from the system, make sure you specify the appropriate file extension. For example, when you want to copy a policy file, specify the filename and .pol.

When you copy a file on the switch, the switch displays a message similar to the following:

```
Copy config test.cfg to config test1.cfg on switch? (y/n)
```

Enter y to copy the file. Enter n to cancel this process and not copy the file.

When you enter y, the switch copies the file with the new name and keeps a backup of the original file with the original name. After the switch copies the file, use the ls command to display a complete list of files. In this example, the switch displays the original file named test.cfg and the copied file named test_rev2.cfg.

The following is sample output from the ls command:

```
...
-rw-r--r--    1 root     root       100980 Sep 23 09:16 test.cfg
-rw-r--r--    1 root     root       100980 Oct 13 08:47 test_rev2.cfg
...
```

When you enter n, the switch displays a message similar to the following:

```
Copy cancelled.
```

For the memorycard option, the source and/or destination is a compact flash card or USB 2.0 storage device. You must mount the compact flash card or USB storage device for this operation to succeed. The cp command copies a file from the switch to the compact flash card, the USB storage device, or a file already on one of those devices. If you copy a file from the switch to the removable storage device, and the new filename is identical to the source file, you do not need to re-enter the filename.

Case-sensitive Filenames

Filenames are case-sensitive. In this example, you have a configuration file named Test.cfg. If you attempt to copy the file with the incorrect case, for example test.cfg, the switch displays a message similar to the following:

```
Error: cp: /config/test.cfg: No such file or directory
```

Since the switch is unable to locate test.cfg, the file is not copied.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

Internal Memory and Core Dump Files

Core dump files have a .gz file extension. The filename format is: core.<process-name.pid>.gz where process-name indicates the name of the process that failed and pid is the numerical identifier of that process. If you have a BlackDiamond 8800 series switch and save core dump files to the compact flash card, the filename also includes the affected MSM/MM: MSM-A or MSM-B.

By making a copy of a core dump file, you can easily compare new debug information with the old file if needed.

When you configure and enable the switch to send core dump (debug) information to the internal memory card, specify the internal-memory option and associated internal-memory name options to copy an existing core dump file.

If you have an external compact flash card or a USB 2.0 storage device installed, you can copy the core dump file to that location. When you send core dump information to a removable storage device, specify the memorycard option and associated memorycard name options to copy an existing core dump file.

For information about configuring and sending core dump information to the internal memory card, see the configure debug core-dumps and save debug tracefiles memorycard commands.

For more detailed information about core dump files, see Troubleshooting in the ExtremeXOS Concepts Guide.

Modular Switches Only

This command also replicates the action from the primary MSM/MM to the backup MSM/MM. For example, when you copy a file on the primary MSM, the same file is copied to the backup MSM/MM.

Example

The following command makes a copy of a configuration file named test.cfg and gives the copied file a new name of test_rev2.cfg:

```
cp test.cfg test_rev2.cfg
```

The following command makes a copy of a configuration file named primary.cfg on the switch and stores the copy on the removable storage device with the same name, primary.cfg:

```
cp primary.cfg memorycard
```

The above command performs the same action as entering the following command:

```
cp primary.cfg memorycard primary.cfg
```

History

This command was first available in ExtremeXOS 11.0.

The memorycard option was added in ExtremeXOS 11.1.

The internal-memory option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

disable xml-mode

disable xml-mode

Description

Disables XML configuration mode on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable the XML configuration mode on the switch. XML configuration mode is not supported for end users.

See the command:

```
enable xml-mode
```

Example

The following command disables XML configuration mode on the switch:

```
disable xml-mode
```

History

This command was first available in an ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable xml-mode

enable xml-mode

Description

Enables XML configuration mode on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the XML configuration mode on the switch, however XML configuration mode is not supported for end users, and Extreme Networks strongly cautions you not to enable this mode. Use this command only under the direction of Extreme Networks.

If you inadvertently issue this command, the switch prompt will be changed by adding the text (xml) to the front of the prompt. If you see this mode indicator, please disable XML configuration mode by using the following command:

```
disable xml-mode
```

Example

The following command enables XML configuration mode on the switch:

```
enable xml-mode
```

History

This command was first available in an ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

ls

ls {[**internal-memory** | **memorycard**]} {*file_name*}

Description

Lists all configuration, policy, and if configured, core dump files in the system.

Syntax Description

internal-memory	Lists the core dump (debug) files that are present and saved in the internal memory card.
memorycard	Lists all of the files on a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
file_name	Lists all the files that match the wildcard.

Default

N/A.

Usage Guidelines

When you use issue this command without any options, the output displays all of the configuration and policy files stored on the switch.

When you configure and enable the switch to send core dump (debug) information to the internal memory card, specify the internal-memory option to display the core dump files stored on the internal memory card. For more information about core dump files, see Core Dump Files.

When you specify the memorycard option on a switch, the output displays all of the files stored on the removable storage device, including core dump files if so configured. For more information about core dump files, see Core Dump Files.

When you specify the <file-name> option, the output displays all of the files that fit the wildcard criteria.

Understanding the Output

Output from this command includes the following:

- The first column displays the file permission using the following ten place holders:
  - The first place holder displays - for a file.
  - The next three place holders display r for read access and w for write access permission for the file owner.
  - The following three place holders display r for read access permission for members of the file owner's group.
  - The last three place holders display r for read access for every user that is not a member of the file owner's group.
- The second column displays how many links the file has to other files or directories.
- The third column displays the file owner.
- The remaining columns display the file size, date and time the file was last modified, and the file name.

Core Dump Files

Core dump files have a .gz file extension. The filename format is: core.<process-name.pid>.gz where process-name indicates the name of the process that failed and pid is the numerical identifier of that process. If you have a BlackDiamond 8800 series switch and save core dump files to the compact flash card, the filename also includes the affected MSM/MM: MSM-A or MSM-B.

When the switch has not saved any debug files, no files are displayed. For information about configuring and sending core dump information to the internal memory card, compact flash card, or USB 2.0 storage device, see the configure debug core-dumps and save debug tracefiles memorycard commands.

For more detailed information about core dump files, see Troubleshooting in the ExtremeXOS Concepts Guide.

Example

The following command displays a list of all current configuration and policy files in the system:

```
ls
```

The following is sample output from this command:

```
total 424
-rw-r--r--    1 root     root            50 Jul 30 14:19 hugh.pol
-rw-r--r--    1 root     root         94256 Jul 23 14:26 hughtest.cfg
-rw-r--r--    1 root     root        100980 Sep 23 09:16 megtest.cfg
-rw-r--r--    1 root     root            35 Jun 29 06:42 newpolicy.pol
-rw-r--r--    1 root     root        100980 Sep 23 09:17 primary.cfg
-rw-r--r--    1 root     root         94256 Jun 30 17:10 roytest.cfg
```

The following command displays a list of all current configuration and policy files on a removable storage device:

```
ls memorycard
```

The following is sample output from this command:

```
-rwxr-xr-x    1 root     0        15401865 Mar 30 00:03 bd10K-11.2.0.13.xos
-rwxr-xr-x    1 root     0              10 Mar 31 09:41 test-1.pol
-rwxr-xr-x    1 root     0              10 Apr  4 09:15 test.pol
-rwxr-xr-x    1 root     0              10 Mar 31 09:41 test_1.pol
-rwxr-xr-x    1 root     0          223599 Mar 31 10:02 v11_1_3.cfg
```

The following command displays a list of all configuration and policy files with a filename beginning with the letter “a.”

```
(debug) BD-12804.1 # ls a*
```

Following is sample output from this command:

```
-rw-r--r--    1 root     0            2062 Jan  6 09:11 abc
-rw-rw-rw-    1 root     0            1922 Jan  7 02:19 abc.xsf
1k-blocks      Used Available Use%
16384       496     15888   3%
```

The following command displays a list of all .tgz files

```
(debug) BD-12804.24 # ls internal-memory  *.tgz
```

Following is sample output from this command:

```
-rwxr-xr-x    1 root     0           79076 Jan  6 09:47 old_traces.tgz
1k-blocks      Used Available Use%
49038       110     48928   0%
```

History

This command was first available in ExtremeXOS 10.1.

The memorycard option was added in ExtremeXOS 11.0.

The internal-memory option was added in ExtremeXOS 11.4.

The file-name option was added in ExtremeXOS 12.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

mv

mv [**internal-memory** *old_name_internal* **internal-memory** *new_name_internal* | **internal-memory** *old_name_internal* **memorycard** *new_name_memorycard* | **memorycard** *old_name_memorycard* **memorycard** *new_name_memorycard* | **memorycard** *new_name_memorycard new-name* | *old_name* **memorycard** *new_name_memorycard* | *old_name new_name*]

Description

Moves or renames an existing configuration, policy, or if configured, core dump file in the system.

Syntax Description

internal-memory	Specifies the internal memory card.
old_name_internal	Specifies the current name of the core dump file located on the internal memory card.
new_name_internal	Specifies the new name of the core dump file located on the internal memory card.

memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
old_name_memorycard	Specifies the current name of the file located on a removable storage device. Depending on your switch configuration, you can have configuration, policy, or cord dump files stored in this card. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
new_name_memorycard	Specifies the new name of the file located a removable storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
old_name	Specifies the current name of the configuration or policy file on the system.
new_name	Specifies the new name of the configuration or policy file on the system.

Default

N/A.

Usage Guidelines

When you rename a file with a given extension, remember the following:

- XML-formatted configuration files have the .cfg file extension. The switch only runs .cfg files.
- ASCII-formatted configuration files have the .xsf file extensions. See Software Upgrade and Boot Options in the ExtremeXOS Concepts Guide for more information.
- Policy files have the .pol file extension.
- Core dump files have the .gz file extension. See Internal Memory and Core Dump Files for more information.

Make sure the renamed file uses the same file extension as the original file. If you change the file extensions, the file may be unrecognized by the system. For example, if you have an existing configuration file named test.cfg, the new filename must include the .cfg file extension.

You cannot rename an active configuration file (the configuration currently selected to boot the switch). To verify the configuration that you are currently using, issue the show switch {detail} command. If you attempt to rename the active configuration file, the switch displays a message similar to the following:

```
Error: Cannot rename current selected active configuration file.
```

When you rename a file, the switch displays a message similar to the following:

```
Rename config test.cfg to config megtest.cfg on switch? (y/n)
```

Enter y to rename the file on your system. Enter n to cancel this process and keep the existing filename.

The memorycard option moves files between a removable storage device and the switch. If you use the memorycard option for both the old-name and the new-name, this command just renames a file on the removable storage device.

Case-sensitive Filenames

Filenames are case-sensitive. In this example, you have a configuration file named Test.cfg. If you attempt to rename the file with the incorrect case, for example test.cfg, the switch displays a message similar to the following:

```
Error: mv: unable to rename `/config/test.cfg': No such file or directory
```

Since the switch is unable to locate test.cfg, the file is not renamed.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local or remote file, remember the requirements listed above.

Internal Memory and Core Dump Files

Core dump files have a .gz file extension. The filename format is: core.<process-name.pid>.gz where process-name indicates the name of the process that failed and pid is the numerical identifier of that process. If you have a BlackDiamond 8800 series switch and save core dump files to the compact flash card, the filename also includes the affected MSM/MM: MSM-A or MSM-B.

When you configure the switch to send core dump (debug) information to the internal memory card, specify the internal-memory option to rename an existing core dump file. If you have a switch with a removable storage device installed, you can move and rename the core dump file to that location.

For information about configuring and sending core dump information to the internal memory card, see the configure debug core-dumps and save debug tracefiles memorycard commands.

Modular Switches Only

This command also replicates the action from the primary MSM/MM to the backup MSM/MM. For example, when you rename a file on the primary MSM/MM, the same file on the backup MSM/MM is renamed.

Example

The following command renames the configuration file named Testb91.cfg to Activeb91.cfg:

```
mv Testb91.cfg Activeb91.cfg
```

On a switch with a removable storage device installed, the following command moves the configuration file named test1.cfg from the switch to the removable storage device:

```
mv test1.cfg memorycard test1.cfg
```

If you do not change the name of the configuration file, you can also use the following command to move the configuration file test1.cfg from the switch to a removable storage device:

```
mv test1.cfg memorycard
```

On a switch with a removable storage device installed, the following command moves the policy file named bgp.pol from the removable storage device to the switch:

```
mv memorycard bgp.pol bgp.pol
```

History

This command was first available in ExtremeXOS 10.1.

Support for replicating information from the primary MSM to the backup MSM was introduced in ExtremeXOS 11.0.

The memorycard option was added in ExtremeXOS 11.1.

The internal-memory option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

restart process

restart process [**class** *cname* | *name* {**msm** *slot*}]

Description

Terminates and restarts the specified process during a software upgrade on the switch.

Syntax Description

cname	Specifies the name of the process to restart. With this parameter, you can terminate and restart all instances of the process associated with a specific routing protocol on all VRs.You can restart the OSPF routing protocol and associated processes.
name	Specifies the name of the process to terminate and restart. You can use this command with the following processes:bgp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)eapsexsshd (available only when you have installed the SSH module)isis (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)lldpnetLoginnetTooIsospf (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)snmpSubagentsnmpMastertelnetdthttpdtftpdvrrp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)xmld
slot	Specifies the MSM/MM where the process should be terminated and restarted. A specifies the MSM/MM installed in slot A, and B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

Use this command to terminate and restart a process during a software upgrade on the switch. You have the following options:

- cname—Specifies that the software terminates and restarts all instances of the process associated with a specific routing protocol on all VRs.
- name—Specifies the name of the process.

Depending on the software version running on your switch and the type of switch you have, you can terminate and restart different or additional processes. To see which processes you can restart during a software upgrade, enter restart process followed by [Tab]. The switch displays a list of available processes.

SummitStack Only.

You can issue this command only from the master node. If you issue this command from any other node, the following message appears:

```
Error: This command can only be executed on Master.
```

To display the status of ExtremeXOS processes on the switch, including how many times a process has been restarted, use the show process {<name>} {detail} {description} {slot <slotid>} command. The following is a truncated sample of the show process command on a Summit switch:

```
Process Name     Version  Restart    State             Start Time
-------------------------------------------------------------------------
aaa              3.0.0.2     0    Ready        Thu Sep  1 17:00:52 2005
acl              3.0.0.2     0    Ready        Thu Sep  1 17:00:54 2005
bgp              Not Started 0    No license   Not Started
```

```
cfgmgr           3.0.0.21    0    Ready        Thu Sep  1 17:00:52 2005
cli              3.0.0.22    0    Ready        Thu Sep  1 17:00:52 2005
devmgr           3.0.0.2     0    Ready        Thu Sep  1 17:00:52 2005
dirser           3.0.0.2     0    Ready        Thu Sep  1 17:00:51 2005
dosprotect       3.0.0.1     0    Ready        Thu Sep  1 17:00:56 2005
eaps             3.0.0.8     0    Ready        Thu Sep  1 17:00:53 2005
...
```

You can also use the restart process command when upgrading a software modular package. For more information, see the section Upgrade a Modular Software Package in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

Example

The following command stops and restarts the process tftpd during a software upgrade:

```
restart process tftpd
```

The following command stops and restarts all instances of the OSPF routing protocol for all VRs during a software upgrade:

```
restart process class ospf
```

History

This command was first available in ExtremeXOS 11.3.

Support for restarting the Link Layer Discovery Protocol (lldp), Open Shortest Path First (ospf), and network login (netLogin) processes was added in ExtremeXOS 11.3.

Support for Border Gateway Protocol (bgp) and Ethernet Automatic Protection Switching (eaps) was added in ExtremeXOS 11.4.

Support for MultiProtocol Label Switching (mpls) and Virtual Router Redundancy Protocol (vrrp) was added in ExtremeXOS 11.6.

Support for netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

rm

rm {**internal-memory** | **memorycard**} *file_name*

Description

Removes/deletes an existing configuration, policy, or if configured, core dump file from the system.

Syntax Description

internal-memory	Specifies the internal memory card.
memorycard	Specifies a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
file-name	Specifies the name of the configuration, policy file, or if configured, the core dump file.

Default

N/A.

Usage Guidelines

After you remove a configuration or policy file from the system, that file is unavailable to the system. For information about core dump files, see Internal Memory Card and Core Dump Files.

You cannot remove an active configuration file (the configuration currently selected to boot the switch). To verify the configuration that you are currently using, issue the show switch {detail} command. If you attempt to remove the active configuration file, the switch displays a message similar to the following:

```
Error: Cannot remove current selected active configuration file.
```

When you delete a file from the switch, a message similar to the following appears:

```
Remove testpolicy.pol from switch? (y/n)
```

Enter y to remove the file from your system. Enter n to cancel the process and keep the file on your system.

Case-sensitive Filenames

Filenames are case-sensitive. In this example, you have a configuration file named Test.cfg. If you attempt to remove a file with the incorrect case, for example test.cfg, the system is unable to remove the file. The switch does not display an error message; however, the ls command continues to display the file Test.cfg. To remove the file, make sure you use the appropriate case.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local or remote file, remember the requirements listed above.

The memorycard option removes/deletes an existing file on the removable storage device, including core dump files if configured. See the section "Internal Memory Card and Core Dump Files" for information about core dump files.

Internal Memory Card and Core Dump Files

When you delete a core dump file from the system, that file is unavailable.

When you configure the switch to send core dump (debug) information to the internal memory card, specify the internal-memory option to remove/delete the specified core dump file.

For information about configuring and sending core dump information to the internal memory card, see the configure debug core-dumps and save debug tracefiles memorycard commands.

You can use the * wildcard to delete core dump files from the internal memory card. You can also use the * wildcard to delete all of a particular file type from a removable storage device. Currently running and in-use files are not deleted.

If you configure the switch to write core dump files to the internal memory card and attempt to download a new software image, you might have insufficient space to complete the image download. When this occurs, you must decide whether to continue the software download or move or delete the core dump files from the internal memory. For example, if you have a switch with a removable storage device installed with space available, transfer the files to the storage device. Another option is to transfer the files from the internal memory card to a TFTP server. This frees up space on the internal memory card while keeping the core dump files.

Modular Switches Only

This command also replicates the action from the primary MSM/MM to the backup MSM/MM. For example, when you delete a file on the primary MSM/MM, the same file on the backup MSM/MM is deleted.

Example

The following command removes the configuration file named Activeb91.cfg from the system:

```
rm Activeb91.cfg
```

The following command removes all of the core dump files stored on the internal memory card:

```
rm internal-memory *
```

On a switch with a removable storage device installed, the following command removes the policy file named test.pol from the removable storage device:

```
rm memorycard test.pol
```

On a switch with a removable storage device installed, the following command removes all of the configuration files from the removable storage device:

```
rm memorycard *.cfg
```

History

This command was first available in ExtremeXOS 10.1.

Support for replicating information from the primary MSM to the backup MSM was introduced in ExtremeXOS 11.0.

The memorycard option was added in ExtremeXOS 11.1.

The internal-memory option was added in ExtremeXOS 11.4.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

show heartbeat process

show heartbeat process {*name*}

Description

Displays the health of the ExtremeXOS processes.

Syntax Description

name	Specifies the name of the process.

Default

N/A.

Usage Guidelines

The software monitors all of the XOS processes running on the switch. This process monitor creates and terminates XOS processes on demand (for example, when you log in or log out of the switch) and restarts processes if an abnormal termination occurs (for example, if your system crashes). The process monitor also ensures that only version-compatible processes and processes with proper licenses are started.

The show heartbeat process command is a resource for providing background system health information because you can view the health of ExtremeXOS processes on the switch.

Use this command to monitor the health of the XOS processes. The switch uses two algorithms to collect process health information: polling and reporting. Both polling and reporting measure the heartbeat of the process. Polling occurs when a HELLO message is sent and a HELLO_ACK message is received. The two counts are the same. Reporting occurs when a HELLO_ACK message is sent only. Therefore, no HELLO messages are sent and the HELLO count remains at zero.

The show heartbeat process command displays the following information in a tabular format:

- Card—The name of the module where the process is running (modular switches only).
- Process Name—The name of the process.
- Hello—The number of hello messages sent to the process.
- HelloAck—The number of hello acknowledgement messages received by the process manager.
- Last Heartbeat Time—The timestamp of the last health check received by the process manager. (Unknown specifies kernel modules and they do not participate in heartbeat monitoring.)

This status information may be useful for your technical support representative if you have a network problem.

You may find it useful to capture the process information under normal operating conditions to establish a baseline. By having a baseline, if you experience a problem, you and your technical support representative can more easily identify the problem.

Example

To display the health of all processes on your system, use the following command:

```
show heartbeat process
```

The following is sample output from a modular switch:

```
Card Process Name     Hello HelloAck     Last Heartbeat Time
-------------------------------------------------------------------------
MSM-A aaa              0        180324   Wed Dec 10 15:06:04 2003

```

History

This command was first available in an ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show memory

show memory {slot [slotid | a | b]}

Description

Displays the current system memory information.

Syntax Description

slot a	Specifies the MSM module installed in slot A. NOTE: This parameter is available only on modular switches.
slot b	Specifies the MSM module installed in slot B. NOTE: This parameter is available only on modular switches.
slotid	Specifies slot number for the node in a stack. The value can be from 1 to 8.

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. When you keep simple daily records, you see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different memory information might be displayed.

You can also use the show memory process <name> {slot <slotid>} command to view the system memory and the memory used by the individual processes.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays the current system memory information for the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays the current system memory information for the master node and the standby node in the Active Topology.

Modular Switches Only

When you issue the command without any parameters, the switch displays information about all of the MSMs/MMs installed in your system.

Reading the Output

The show memory command displays the following information in a tabular format:

- System memory information (both total and free).
- Current memory used by the individual processes.

The current memory statistics for the individual process also includes the following:

- The module (MSM A or MSM B) and the slot number of the MSM (modular switches only).
- The name of the process.

In general, the free memory count for an MSM/MM or Summit family switch decreases when one or more running processes experiences an increase in memory usage.

If you observe a continuous decrease in the free memory over an extended period of time, and you have not altered your switch configuration, please contact Extreme Networks Technical Support.

Example

The following command displays current system memory information for the MSM installed in slot A of a modular switch:

```
show memory slot a
```

The following is sample output from this command:

```
System Memory Information
-------------------------
MSM-A    Total DRAM (KB): 524288
MSM-A    System     (KB): 45912
MSM-A    User       (KB): 102264

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show memory process

show memory process *name* {**slot** *slotid*}

Description

Displays the current system memory and that of the specified process.

Syntax Description

name	Specifies the name of the process.
slotid	In a modular switch: Specifies the slot number of the MSM/MM module:A specifies the MSM installed in slot A.B specifies the MSM installed in slot B. In a SummitStack, slotid specifies the slot number of the node in the stack topology. The value can be from 1 to 8.

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. When you keep simple daily records, you see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different memory information might be displayed.

You can also use the show memory {slot [slotid | a | b]} command to view the system memory and the memory used by the individual processes, even for all processes on all MSMs/MMs installed in modular switches.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays current system memory and that of the specified process running on the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays current system memory and that of the specified process running on the master node and the standby node in the Active Topology.

Reading the Output

The show memory process command displays the following information in a tabular format:

- System memory information (both total and free).
- Current memory used by the individual processes.

The current memory statistics for the individual process also includes the following:

- The module (MSM A or MSM B) and the slot number of the MSM/MM (modular switches only).
- The name of the process.

Example

The following command displays system memory and VRRP memory usage:

```
show memory process vrrp
```

The following is sample output from a modular switch:

```
System Memory Information
-------------------------
MSM-A    Total (KB): 512508 KB
MSM-A    Free  (KB): 395796 KB
Memory Utilization Statistics
-----------------------------
Card Slot Process Name     Memory (KB)
-------------------------------------
MSM-A  9    vrrp             6596
```

The following is sample output from a Summit switch:

```
System Memory Information
-------------------------
Total DRAM (KB): 262144
System     (KB): 25852
User       (KB): 96608
Free       (KB): 139684
Memory Utilization Statistics
-----------------------------
Process Name     Memory (KB)
-----------------------------
vrrp             11184
```

The following is sample output from a SummitStack:

```
Slot-1 stacK.4 # show memory process "aaa"
System Memory Information
-------------------------
Slot-1    Total DRAM (KB): 262144
Slot-1    System     (KB): 25476
Slot-1    User       (KB): 132276
Slot-1    Free       (KB): 104392
Slot-6    Total DRAM (KB): 262144
Slot-6    System     (KB): 25476
Slot-6    User       (KB): 122820
Slot-6    Free       (KB): 113848
```

Memory Utilization Statistics

```
-----------------------------
Card Slot Process Name     Memory (KB)
-------------------------------------
Slot-1 1   aaa               2548
Slot-6 6   aaa               2440
```

History

This command was first available in an ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show process

show process {*name*} {**detail**} {**description**} {**slot** *slotid*}

Description

Displays the status of the ExtremeXOS processes.

Syntax Description

name	Specifies the name of the process.
detail	Specifies more detailed process information.

description	Describes the name of all of the processes or the specified process running on the switch.
slotid	Specifies the slot number of the MSM/MM module:A specifies the MSM installed in slot A.B specifies the MSM installed in slot B. NOTE: This parameter is available only on modular switches. In a Summit stack, slotid specifies the slot number of a node in a stack topology.

Default

N/A.

Usage Guidelines

The ExtremeXOS process manager monitors all of the XOS processes. The process manager also ensures that only version-compatible processes are started.

Using this command without the optional keywords displays summary process information. When you specify the slot keyword, summary information is displayed for that particular slot only.

The show process and show process slot <slotid> commands display the following information in a tabular format:

- Card—The name of the module where the process is running (modular switches only).
- Process Name—The name of the process.
- Version—The version number of the process. Options are:
  - Version number—A series of numbers that identify the version number of the process. This is helpful to ensure that you have version-compatible processes and if you experience a problem.
  - Not Started—The process has not been started. This can be caused by not having the appropriate license or for not starting the process.
- Restart—The number of times the process has been restarted. This number increments by one each time a process stops and restarts.
- State—The current state of the process. Options are:
  - No License—The process requires a license level that you do not have. For example, you have not upgraded to that license, or the license is not available for your platform.
  - Ready—The process is running.
  - Stopped—The process has been stopped.
- Start Time—The current start time of the process. Options are:
  - Day/Month/Date/Time/Year—The date and time the process began. When a process terminates and restarts, the start time is also updated.
  - Not Started—The process has not been started. This can be caused by not having the appropriate license or for not starting the process.

When you specify the detail keyword, more specific and detailed process information is displayed.

The show process detail and show process slot <slotid> detail commands display the following information in a multi-tabular format:

- Detailed process information
- Memory usage configurations

- Recovery policies
- Process statistics
- Resource usage

This status information may be useful for your technical support representative if you have a network problem.

Depending on the software version running on your switch or your switch model, additional or different process information might be displayed.

You may find it useful to capture the process information under normal operating conditions to establish a baseline. By having a baseline, if you experience a problem, you and your technical support representative can more easily identify the problem.

SummitStack Only

When you run the command with out any parameters:

- From the stack manager or backup node, the stack displays the status of the ExtremeXOS processes running on the master node and the back-up node in the Active Topology.
- From a standby node, the stack displays the status of the ExtremeXOS processes running on the standby node and the master node in the Active Topology.

Example

To display the processes on your system, use the following command:

```
show process
```

The following is sample output from a modular switch:

```
Card Process Name     Version    Restart   State            Start Time
-------------------------------------------------------------------------------

```

History

This command was first available in an ExtremeXOS 10.1.

The description keyword was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

start process

start process *name* {**msm** *slot*}

Description

Starts the specified process on the switch. (Used to restart a process after it has been terminated.)

Syntax Description

name	Specifies the name of the process to start. You can start the following processes: bgp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)eapsexsshd (available only when you have installed the SSH module)isis (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)lldpnetLoginnetToolsospf (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)snmpMastersnmpSubagenttelnetdthttpdtftpdvrrp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)xmld
slot	Specifies the MSM/MM where the process should be started. A specifies the MSM installed in slot A, and B specifies the MSM installed in slot B. NOTE: This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

Use this command after you have stopped a process and you want to restart it. To stop a process, use the terminate process command.

You are unable to start a process that is already running. If you try to start a currently running process, an error message similar to the following appears:

```
Error: Process  telnetd already exists!
```

Depending on the software version running on your switch and the type of switch you have, you can restart different or additional processes. To see which processes you can restart, enter start process followed by [Tab]. The switch displays a list of available processes.

To display the status of ExtremeXOS processes on the switch, including how many times a process has been restarted, use the show process {<name>} {detail} {description} {slot <slotid>} command.

You can also use the start process command when upgrading a software modular package. For more information, see the section Upgrade a Modular Software Package in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

SummitStack Only

You can issue this command only from the master node. If you issue this command from any other node, the following message appears:

```
Error: This command can only be executed on Master.
```

Note

After you stop a process, do not change the configuration on the switch until you start the process again. A new process loads the configuration that was saved prior to stopping the process. Changes made between a process termination and a process start are lost. Else, error messages can result when you start the new process.

Example

The following restarts the process tftpd:

```
start process tftpd
```

History

This command was first available in ExtremeXOS 11.0.

Support for restarting the Link Layer Discovery Protocol (lldp), Open Shortest Path First (ospf), and network login (netLogin) processes was added in ExtremeXOS 11.3.

Support for restarting the Border Gateway Protocol (bgp) was added in ExtremeXOS 11.4.

Support for restarting netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

terminate process

terminate process *name* [**forceful** | **graceful**] {**msm** *slot*}

Description

Terminates the specified process on the switch.

Syntax Description

name	Specifies the name of the process to terminate. You can terminate the following processes:bgp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)eapsexsshd (available only when you have installed the SSH module)isis (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)lldpnetLoginnetToolsospf (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)snmpMastersnmpSubagenttelnetdthttpdtftpdvrrp (not available on Summit X150, Summit X350, or Summit X440-L2 series switches)xmld
forceful	Specifies a forceful termination.
graceful	Specifies a graceful termination.
slot	For a modular chassis, specifies the MSM/MM where the process should be terminated. A specifies the MSM installed in slot A, and B specifies the MSM installed in slot B. On a SummitStack, specifies the target node's slot number. The number is a value from 1 to 8. NOTE: This parameter is available only on modular switches and SummitStack.

Default

N/A.

Usage Guidelines

If recommended by Extreme Networks Technical Support personnel, you can stop a running process.

The forceful option quickly terminates a process on demand. Unlike the graceful option, the process is immediately shutdown without any of the normal process cleanup. The status of the operation is displayed on the console. After a successful forceful termination of a process, a message similar to the following appears:

```
Forceful termination success for snmpMaster
```

The graceful option terminates the process by allowing it to close all opened connections, notify peers on the network, and other types of process cleanup. After this phase, the process is finally terminated. After a successful graceful termination of a process, a message similar to the following appears:

```
Successful graceful termination for snmpSubagent
```

SummitStack Only

You can issue this command only from the master node. If you issue this command from any other node, the following message appears:

```
Error: This command can only be executed on Master.
```

To display the status of ExtremeXOS processes on the switch, including how many times a process has been restarted, use the show process {<name>} {detail} {description} {slot <slotid>} command.

Depending on the software version running on your switch and the type of switch you have, you can terminate different or additional processes. To see which processes you can terminate, enter terminate process followed by [Tab]. The switch displays a list of available processes.

To restart a process that has been terminated, use the start process command.

Note

Do not terminate a process that was installed since the last reboot unless you have saved your configuration. If you have installed a software module and you terminate the newly installed process without saving your configuration, your module may not be loaded when you attempt to restart the process with the start process command. To preserve a process's configuration during a terminate and (re)start cycle, save your switch configuration before terminating the process. Do not save the configuration or change the configuration during the process terminate and re(start) cycle. If you save the configuration after terminating a process, and before the process (re)starts, the configuration for that process is lost.

You can also use the terminate process command when upgrading a software modular package. For more information, see the section Upgrade a Modular Software Package in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

Example

The following initiates a graceful termination of the process tftpd:

```
terminate process tftpd graceful
```

History

This command was first available in ExtremeXOS 11.0.

Support for terminating the Link Layer Discovery Protocol (lldp), network login (netLogin), and Open Shortest Path First (ospf) processes was added in ExtremeXOS 11.3.

Support for terminating the Border Gateway Protocol (bgp) and Ethernet Automatic Protection Switching (eaps) processes was added in ExtremeXOS 11.4.

Support for terminating the MultiProtocol Label Switch (mpls) and Virtual Router Redundancy Protocol (vrrp) processes was added in ExtremeXOS 11.6.

Support for terminating netTools was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

6 SummitStack Feature Commands

This chapter describes commands for:

- Configuring the SummitStack™ feature
- Enabling and disabling a stack
- Deploying a stack
- Displaying stack details

For an introduction to the SummitStack feature, see the ExtremeXOS Concepts Guide.

configure stacking alternate-ip-address

configure stacking alternate-ip-address [*ipaddress netmask* | *ipNetmask*] *gateway*
automatic configure stacking [**node-address** *node-address* | **slot** *slot_number*]
alternate-ip-address [*ipaddress netmask* | *ipNetmask*] *gateway*

Description

Configures an alternate management IP address, subnetwork, and gateway.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command. A node address or slot number is required unless the automatic keyword is specified.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.
ipaddress netmask	Specifies the unique address that exists on the Management VLAN subnet as configured on the initial master node together with the subnetwork mask specified for the Management subnetwork. Example: 66.77.88.1 255.255.255.0.
ipNetmask	Specifies the unique address that exists on the Management VLAN subnet as configured on the initial master node, followed by a slash (/) character, followed by a decimal number that represents the number of leading one bits in the subnetwork address. An example is 66.77.88.1/24.
gateway	The address of an IP router. A default route is set up to reach this gateway.

Default

No alternate IP address is configured.

Usage Guidelines

If a Management subnetwork is configured and the alternate IP subnetwork does not exactly match the configured Management subnetwork, the information configured by one of the commands specified above is not used. The previously configured alternate IP address is removed if it was installed and subsequently a Management subnetwork is configured that does not exactly match the alternate IP subnetwork. In either case, an error message is logged. The alternate IP address is used if there is no configured Management subnetwork.

To use the command with the node address, the node must be in the stack topology; and to use the command with the slot number, the node must be in the active topology. This form of the command operates only on one node at a time. There are no checks to verify that the address is the one configured in the management VLAN subnet.

The command that does not require a node address or slot number specifies the automatic keyword. Usage of this form of the command causes an alternate IP address to be assigned to every node in the stack topology. The first address is the address specified in the [<ipaddress> <netmask> | <ipNetmask>] parameter. The next address is the IP address plus one, and so on. Since there is a specified subnet mask, the address is checked to insure that the block of IP addresses fits within the specified subnet given the number of nodes in the stack topology. The range of addresses is tested to

insure that each one is a valid IP unicast address. If the test fails, no node is configured and an error message is printed. Assignment is in the order in which nodes would currently appear in the show stacking display.

The configuration takes effect after the command is successfully executed.

The alternate IP address, subnetwork, and gateway are only used when the node is operating in stacking mode.

Example

To configure an alternate IP address for every node in the stack with a single command:

```
configure stacking alternate-ip-address 10.120.1.10/24 10.120.1.1 automatic
```

To configure an alternate IP address on a single node in the stack topology:

```
configure stacking node-address 00:04:96:26:6b:ed alternate-ip-address
10.120.1.1/24 10.120.1.1
```

You may configure an alternate IP address using a slot number for a node that is currently occupying the related slot:

```
configure stacking slot 4 alternate-ip-address 10.120.1.13/24 10.120.1.1
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking easy-setup

configure stacking easy-setup

Description

This command provides an easy way to initially configure the stacking parameters of all nodes in a new stack.

Syntax Description

This command does not have additional syntax.

Default

N/A.

Usage Guidelines

This command performs the following functions:

- Informs you of the stacking parameters that will be set.
- Informs you of the number of nodes that will be configured.
- Informs you whether minimal or no redundancy will be configured, and which slot will contain the master node.
- Informs you of the slot number that will be assigned to the node on which your management session is being run.
- If applicable, warns you that the current configuration file changes will be lost and you need to save the files.
- If the stack topology is a daisy chain, warns you that you should wire the stack as a ring before running this command.
- Requires you to confirm before the operation takes place. If you proceed, the command does the following:
  - Enables stacking on all nodes.
  - Configures the stacking MAC address using the factory address of the current node.
  - Configures a slot number for each node.
  - Configures redundancy to minimal in a ring topology or none in a daisy chain topology.
  - Configures the stacking protocol.
  - Reboots the stack topology.
- Selects the enhanced stacking protocol by default on Summit X460, X480, and X650 series switches.

Stacking is enabled as if the enable stacking {node-address <node-address>} command was issued.

The stack mac-address is configured as if the configure stacking mac-address was issued on the current node.

Stack slot numbers are assigned as if the configure stacking slot-number automatic command was issued on the current node.

On a daisy chain topology, the master-capability is configured as if the configure stacking redundancy none command was issued. On a ring topology, the master-capability is configured as if the configure stacking redundancy minimal command was issued.

If you choose not to proceed with the setup, the following message is displayed:

```
Cancelled easy stack setup configuration.
```

Note

Summit Stack X440, X460, X480, X650, and X670 configured via configure stacking easy-setup use the enhanced stacking protocol by default.

Example

If you have an 8-node stack in a ring topology and have powered on all the nodes, the show stacking command shows the stack topology as a ring with all intended nodes present. If you have not changed any ExtremeXOS configuration, the command displays as follows:

```
* Switch.30 # configure stacking easy-setup
For every node in the 8-node stack, this command will:
- enable stacking
- configure a stack MAC address
- choose and configure a slot number (this node will be assigned to slot 1)
- configure redundancy to minimal (slot 1 will be the Master node)
Upon completion, the stack will automatically be rebooted into the new
configuration.
Warning: If stacking is already configured, this command will alter that
configuration.
Warning: There are unsaved configuration changes. You may wish to save them
before proceeding.
Do you wish to proceed? (y/N) y
Stacking configuration is complete. Rebooting...
```

If the 8-node stack topology is a daisy chain, and the user is logged into a node in the middle of the chain, the command output might appear as follows:

```
* Switch.30 # configure stacking easy-setup
For every node in the 8-node stack, this command will:
- enable stacking
- configure a stack MAC address
- choose and configure a slot number (this node will be assigned to slot 5)
- configure redundancy to none (slot 1 will be the master node)
Upon completion, the stack will automatically be rebooted into the new
configuration.
Warning: If stacking is already configured, this command will alter that
configuration.
Warning: This stack is a daisy chain.  It is highly recommended that the stack
be connected as a ring before running this command.
Do you wish to proceed? (y/N) Yes
Stacking configuration is complete.  Rebooting...
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking license-level

configure stacking {**node-address** *node-address* | **slot** *slot-number*} **license-level** [**core** | **advanced-edge** | **edge**]

Description

Allows you to restrict the license level at which the node operates.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot-number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.

Default

No license level restriction is configured.

Usage Guidelines

This command causes a node to operate at a lower license level than the level that was purchased for the node.

Running this command does not change the installed license level. For example, if a stackable is configured with the Advanced Edge license and you configure a license level restriction of Edge, the unit is restricted to features available in the Edge license. However, you can remove the restriction and operate at the Advanced Edge level.

If the installed license level of the target node is lower than the level you are attempting to configure, the following message appears:

```
Warning: Switch will not operate at a license level beyond that which was
purchased.
```

If the node-address or slot parameter is not specified, the command takes effect on every node in the stack topology.

This command takes effect after you restart the node. The following message appears after the command is executed:

```
This command will take effect at the next reboot of the specified node(s).
```

If you restart the node without configuring a license level restriction, the node operates at the purchased license level. To see the purchased license level of a node, run show licenses after logging in to the node.

The show licenses command displays the current license level in use as the Effective License Level:

```
Slot-2 Stack.1 # show licenses
Enabled License Level:
Advanced Edge
Enabled Feature Packs:
None
Effective License Level:
Edge
```

The show stacking configuration and show stacking {node-address <node-address> | slot <slot-number>} detail commands allow you to see the configured license level restriction and the restriction currently in use.

The Effective License Level appears only when stacking is enabled. The command is node-specific. The effective license level is the level at which the node is restricted to operate, and is not necessarily the level at which the entire stack is operating. This is because it is possible to have the restriction differ on each node, in which case one or more nodes may have failed because of the differing levels.

Example

To configure the stacking level Edge on all nodes in a stack:

```
configure stacking license-level edge
```

To configure stacking level Edge for a node:

```
configure stacking node-address 00:04:96:26:6b:ed license-level edge
```

To configure the stacking level Advanced Edge for an active node that currently occupies slot 4:

```
configure stacking slot 4 license-level advanced-edge
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking mac-address

configure stacking {**node-address** *node-address* | **slot** *slot-number*} **mac-address**

Description

Selects a node in the stack whose factory assigned MAC address is to be used to form the stack MAC address.

The formed address is then configured on every node in the stack topology.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot-number	Specifies the slot number of an active node whose factory MAC address is to be used to form the stack MAC address. To view the slot numbers, enter the show stacking command.

Default

No stack MAC selection is configured.

Usage Guidelines

You must select a node whose factory assigned MAC address can be used to form a MAC address that represents the stack as a whole. The system forms the stack MAC address by setting the Universal / Local bit in the specified MAC address. This means that the stack MAC address is a locally administered address, and not the universal MAC address assigned to the selected node.

If you do not specify any node, the stack MAC address is formed from the factory assigned MAC address of the node from which you are running the command.

This command takes effect only after you restart the node. The following message appears after you run the command:

```
This command will take effect at the next reboot of the specified node(s).
```

If a stack node that has just joined the active topology detects that its stack MAC address is not configured or is different than the stack MAC address in use, it logs the following message at the Error log level:

```
The stack MAC address is not correctly configured on this node. The stack
can not operate properly in this condition. Please correct and reboot.
```

If you have not configured (or inconsistently configured) the stack MAC address you might encounter difficulty in diagnosing the resulting problems. Whenever the master node (including itself) detects that one or more nodes in its active topology do not have the correct or any stack MAC address configured, it displays the following message to the console every five minutes until you configure a MAC address and restart the node(s):

```
The stack MAC address is either not configured or its configuration is not
consistent within the stack. The stack can not operate properly in this
condition. Please correct and reboot.
```

Example

To select the node to which you have logged in to supply the MAC address for stack MAC address formation:

```
configure stacking mac-address
```

To select a node other than the one to which you are logged in to supply the MAC address for stack MAC address formation:

```
configure stacking node-address 00:04:96:26:6b:ed mac-address
```

To select an active node to supply the MAC address for stack MAC address formation:

```
configure stacking slot 4 mac-address
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking master-capability

configure stacking [**node-address** *node_address* | **slot** *slot_number*] **master-capability** [**on** | **off**]

Description

The command configures a node to be allowed to operate as either a backup or master, or prevents a node from operating as either.

The command controls the setting on the specified node only. To set the master capability for all nodes on a stack, you can use the command configure stacking redundancy [none | minimal | maximal].

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target active node. To view the slot numbers, enter the show stacking command.

Default

Master-capability is On.

Usage Guidelines

At least one node in the stack topology must be master-capable.

If you attempt to disable the master-capability of the only master capable node in a stack topology, the attempt is denied and following message appears:

```
Error: At least one node must have Master-capability configured "on".
```

This command is used to set up master-capability manually. It can also be used to adjust the result achieved when the configure stacking redundancy [none | minimal | maximal] command is used.

The setting takes effect the next time the node reboots. When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Example

To turn on the master capability for a node:

```
configure stacking node-address 00:04:96:26:6b:ed master-capability on
```

To turn on the master capability of an active node currently occupying slot 4:

```
configure stacking slot 4 master-capability on
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking priority

configure stacking {**node-address** *node-address* | **slot** *slot_number*} **priority** [*node_pri* | **automatic**]

Description

Configures a priority value to be used to influence master and backup election.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.
node_pri	Specifies the priority as a value between 1 and 100.

Default

Automatic priority.

Usage Guidelines

The node role election priority is a value that is internally calculated by ExtremeXOS for each node. This calculated value helps determine which nodes are elected as master and backup. For more information, see Configuring the Master, Backup, and Standby Roles in the ExtremeXOS Concepts Guide.

This command allows you to configure a priority value that affects the outcome of this calculation. You can configure the priority on any node in a stack topology. You can specify an integer node-pri value between 1 and 100. The larger the value, the greater the node role election priority.

If no node address or slot is specified, the command takes effect on all nodes at the next node role election cycle. Priority configuration has no operational effect on switches that are not in stacking mode.

If configured on every node, automatic priority commands ExtremeXOS to determine the node role election priority of each active node. Currently, the automatic priority algorithm chooses the master-capable node with the lowest slot number as master and the node with the second lowest slot number as backup. Extreme networks may alter this behavior in later releases.

If you have configured a node with automatic priority and if you have configured another node to use a node-pri value, the node with automatic priority uses zero as the node-priority value during the node role election.

Example

To allow ExtremeXOS to determine node role election priority:

```
configure stacking priority automatic
```

To configure the node priority for the stackable in slot 4:

```
configure stacking slot 4 priority 50
```

To configure the automatic priority algorithm for the stackable with node address 00:04:96:26:6b:ed:

```
configure stacking node-address 00:04:96:26:6b:ed priority automatic
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking protocol

configure stacking protocol [standard | enhanced]

Description

Configures the stacking port protocol.

Syntax Description

standard	Specifies the standard protocol, which is supported on all SummitStack capable switches.
enhanced	Specifies the enhanced protocol, which is supported only on Summit X460, X480 X650, and X670 switches. The enhanced protocol is required to support MPLS.

Default

Standard

Usage Guidelines

Use this command to change the configured stacking protocol on a stack made up of Summit X460, X480, X650, or X670 switches.

Note

You must reboot the switch to activate the protocol change.

If MPLS is enabled on the switch, you must disable MPLS before you can change the stacking protocol to standard.

To display the stacking protocol configuration, enter the show stacking configuration command.

Example

To configure a switch to use the enhanced protocol, enter the following command:

```
configure stacking protocol enhanced
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on Summit X440, X460, X480, X650, and X670 switches.

configure stacking redundancy

configure stacking redundancy [none | minimal | maximal]

Description

This command sets a master-capability value for every node in the stack topology.

Syntax Description

none	Only one node has master-capability turned on and all other nodes have master-capability turned off.
minimal	Two nodes have master-capability turned on and all other nodes have master-capability turned off.
maximal	All nodes have master-capability turned on.

Default

Default value in an unconfigured stack is maximal.

Usage Guidelines

If there are more than eight nodes in the stack topology, the following message appears and the command is not executed:

```
ERROR: This command can only be used when the stack has eight nodes or less.
```

Since only eight nodes can be operational in an active topology at a time, you must disconnect the remaining nodes before configuring master-capability with this command.

If you are using the none or minimal redundancy configuration:

- The configured values of slot-number and priority decide the nodes on which the master-capability should be turned on.
- If the priority values are configured on the nodes, the highest priority node(s) are chosen.
- If the priority values of all nodes are set to automatic or to the same priority value, the node(s) with the lowest slot number(s) are chosen. Extreme Networks may change automatic priority behavior in a future release.

If there is a slot number tie or if the slot numbers were never configured, the following message appears and the command is not executed:

```
ERROR: Unique slot numbers must be configured before using this command.
```

The setting takes effect at the next restart of the node. The following message appears after the command is successfully executed:

```
This command will take effect at the next reboot of the specified node(s).
```

Redundancy configuration has no operational effect on a node that is not in stacking mode.

Example

To turn on master-capability on all nodes:

```
configure stacking redundancy maximal
```

To turn on master-capability on only one node:

```
configure stacking redundancy none
```

To turn on master-capability on two nodes:

```
configure stacking redundancy minimal
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure stacking slot-number

configure stacking slot-number automatic configure stacking node-address *node_address* **slot-number** *slot_number*

Description

Configures a slot number on one or all nodes in the stack topology.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies a number between 1 and 8 that is to be assigned as the slot number of the target node.

Default

The default slot-number for a node in stacking mode is 1.

Usage Guidelines

The configuration is stored on the affected node(s) immediately but does not take effect until the next reboot of the node(s). The configuration applies only when the node is running in stacking mode. To see the configured and active slot numbers of all nodes, use the show stacking configuration command.

If a node-address and a slot number are specified, then the node is configured with the specified slot number. There is no check for a duplicate slot number at this time; the number is simply assigned as requested.

If the automatic keyword is specified, then automatic slot number assignment is selected, and the assignment is performed on all nodes in the stack topology. If there are more than eight nodes in the stack topology, the assignment is only performed on the first eight nodes.

Automatic slot number assignment causes assignment of slot numbers starting from 1 and increasing up to 8. The nodes in the stack topology are assigned the numbers in the order in which they would appear currently in the show stacking command output. In a ring, slot number 1 is assigned to the current node, slot number 2 is assigned to the node connected to the current node's stack port 2, and so forth. In a daisy chain, slot 1 is assigned to the node at the end of the chain that begins with the node connected to the current node's stack port 1.

To see the resulting slot number assignment, run the show stacking configuration command.

Note

Failure to configure a node does not prevent configuration of the slot numbers on the other nodes, and does not affect the slot number assigned to each node.

If you enter the command with the automatic option, the following confirmation message appears:

```
Reassignment of slot numbers may make the stack incompatible with the current
configuration file.
Do you wish to continue? (y/n)
```

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Example

To configure all slot-numbers for a stack:

```
configure stacking slot-number automatic
```

To configure slot number 4 for the node with MAC address 00:04:96:26:6b:ed:

```
configure stacking node-address 00:04:96:26:6b:ed slot-number 4
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide,Feature License Requirements.

configure stacking-support stack-ports

configure stacking-support stack-port [*stack-ports* | **all**] **selection** [**native** {**V80** | **V160**} | **V320**} | **alternate**]

Description

Selects the switch ports and speed for stack communications.

Syntax Description

stack-ports	Specifies the stacking port range to be configured. Valid stacking port entries are 1, 2, 1-2, and all.
native	Selects the specified stacking port, which is the native, dedicated port that only supports stacking.
V80	Specifies that the native stacking ports on a VIM3-40G4X or VIM4-40G4X option card operate at 80 Gbps.
V160	Specifies that the native stacking ports on a VIM3-40G4X or VIM4-40G4X option card operate at 160 Gbps.
V320	Specifies that the native stacking ports on a VIM3-40G4X or VIM4-40G4X operate at 320 Gbps.
alternate	Selects the alternate (Ethernet) stacking port associated with the specified stacking port. The alternate port numbers are listed in the following table.

Default

Switches with native stack ports: Native. (This command does not apply to switches without native stack ports.)

Native stacking ports on Summit switches with a VIM3-40G4X or VIM4-40G4X option card operate as one 40 Gbps port.

Usage Guidelines

The configuration entered with this command applies to only the local node and does not become active until after the following events:

- The stacking-support option is enabled (if applicable).
- The switch restarts.

The V80, V160, and V320 keywords apply only to Summit switches with an installed VIM3-40G4X or VIM4-40G4X option card. Each speed configuration requires a specific cabling configuration. For more information, see the Summit Family Switches Hardware Installation Guide.

The stacking-support option configures the switch to use stacking protocols. This option is automatically enabled on most platforms, but some platforms require you to manually enable the stacking-support option. The following table lists the Summit family switches and option card configurations that support Stacking Port Selection Control, and it lists which platforms require manual Stacking-Support Option Control.

Table 13: Summit Family Switch Support for Alternate Stack Ports

Summit Switch Model Number	Summit Switch Option Card	Alternate Port for Stack Port1	Alternate Port for Stack Port2	Stacking-Support Option Control[1]	Stacking Port Selection Control[2]
X440-24t-10G, X440-24p-10G X440-48t-10G, X440-48p-10G X450a-24t X450a-24tDC X450a-24x X450a-24xDC X450e-24p	None None XGM2-2xf XGM2-2xn XGM2-2sf XGM2-2bt[3] None	25 49 25[4]	26 50 26c	Yes Yes No	No No Yes
X450a-48t X450a-48tDC X450e-48p	XGM2-2xf XGM2-2xn XGM2-2sf XGM2-2btb None	49C	50c	No	Yes
X460-48t X460-48p	XGM3-2sf with either the XGM3 SummitStack V80 or	S1c	S2c	No	Yes

[1] To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.

[2] The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.

[3] SummitStack-V requires XGM2-2bt version 4 or later option cards.

[4] This alternate port number requires an installed option card. You can configure the port without the option card, but the configuration does not apply until the switch restarts with the required option card.

Table 13: Summit Family Switch Support for Alternate Stack Ports (continued)

Summit Switch Model Number	Summit Switch Option Card	Alternate Port for Stack Port1	Alternate Port for Stack Port2	Stacking-Support Option Control[1]	Stacking Port Selection Control[2]
X460-24t X460-24x X460-24p	XGM3 SummitStack module or neither	S1c	S2c	No	Yes
X460-48x		S1c	S2c	No	Yes
X480-48t X480-48x	VIM2-10G4X	S3	S4	Yes	No
	VIM2-SummitStack	N/A	N/A	N/A	N/A
	VIM2-SummitStack-V80	N/A	N/A	N/A	N/A
	VIM2-SummitStack128	N/A	N/A	N/A	N/A
	None	N/A	N/A	N/A	N/A
X480-24x	VIM2-10G4X	S3	S4	Yes	No
	VIM2-SummitStack	25	26	No	Yes
	VIM2-SummitStack-V80	25	26	No	Yes
	VIM2-SummitStack128	25	26	No	Yes
	None	25	26	Yes	No
X650-24x	VIM1-10G8X	31	32	No	Yes

[1] To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.
[2] The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.
[5] SummitStack-V requires Summit X650-24t switch version 2 or later.

Table 13: Summit Family Switch Support for Alternate Stack Ports (continued)

Summit Switch Model Number	Summit Switch Option Card	Alternate Port for Stack Port1	Alternate Port for Stack Port2	Stacking-Support Option Control[1]	Stacking Port Selection Control[2]
X670-48x	None	47	48	Yes	Yes
X670V-48x	VIM4-40G4X	47	48	Yes	Yes

When the alternate stack port is selected for a native stack port and the switch is restarted, the native stack port remains visible in the CLI and can be configured. However, any configuration applied to the replaced stack port is ignored and does not affect switch operation.

An alternate stack port runs the stacking protocol and cannot operate on a link connected to a data port that is not configured as a stack port. Both ends of a stack link must be configured to use the stacking protocol. The stacking link must be directly connected to two the alternate stacking ports of two stacking switches. The direct connection is necessary because stacking protocols cannot pass through an intermediate switch.

After a data port is activated as an alternate stack port, all data port configuration commands still work, but they do not change the operation of the alternate stack port. The LEDs on an Ethernet port used as an alternate stacking port operate according to the behavior of the Ethernet port. The LEDs on the related (disabled) native stacking port remain dark.

Note

Commands that contain the stacking-support keyword operate only on the local switch; they do not apply to all switches in the stack. If an active stack topology has been formed, you can telnet to a slot elsewhere in the stack, log on to that switch, and use commands with the stacking-support keyword on that switch.

1 To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.
2 The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.
1 To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.
2 The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.
1 To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.
2 The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.
1 To operate in a stack, the enable stacking-support must be entered for switch configurations for which this column displays Yes.
2 The configure stacking-support stack-ports command is supported only on Summit switch configurations for which this column displays Yes.

Example

The following command configures the switch to use the alternate stack port for Stack Port 1 after the next switch restart:

```
configure stacking-support stack-ports 1 selection alternate
```

The following command configures the switch to use both native stacking ports after the next switch restart:

```
configure stacking-support stack-ports 1-2 selection native
```

The following command configures stack ports 1 and 2 to operate as four 10 Gbps ports:

```
configure stacking-support stack-ports 1-2 selection native V80
```

History

This command was first available in ExtremeXOS 12.5.

The V80 and V160 keywords were added in ExtremeXOS 12.6.

The V320 keyword was added in ExtremeXOS 15.1 Revision 2.

Platform Availability

This command is available on the platforms listed in the preceding table. The V80 and V160 keywords are supported only on Summit switches with the VIM3-40G4X or VIM4-40G4X option card installed.

disable stacking

disable stacking {node-address *node-address*}

Description

This command disables the stacking on one or all nodes in the stack topology.

Syntax Description

node address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.

Default

Default value is stacking disabled.

Usage Guidelines

If you do not specify the node-address, stacking is disabled on all nodes in the stack topology.

If the node-address parameter is present, stacking is disabled on the node with the specified node-address. This is the MAC address assigned to the stackable by the factory.

A node in the stack topology that is disabled for stacking does not forward the customer's data through its stacking links and does not become a member of the active topology.

A disabled node becomes its own master and processes and executes its own configuration independently.

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Use show stacking configuration command to see the current configuration of the stack. Verify the flags in show stacking configuration output to confirm that stacking is disabled on the specified node(s).

Example

The following example disables stacking on an 8 node stack:

```
* Switch.3 # disable stacking
This command will take effect at the next reboot of the specified node(s).
```

The following example disables stacking on the node with the factory assigned MAC address 00:04:96:26:6b:ed:

```
* Switch.3 # disable stacking node-address 00:04:96:26:6b:ed
This command will take effect at the next reboot of the specified node(s).
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable stacking-support

```
disable stacking-support
```

Description

This command disables the stacking-support option on a Summit X480, X650, or X670 switch with dual-purpose hardware.

Syntax Description

This command does not have additional syntax.

Default

Disabled.

Usage Guidelines

The Stacking-Support Option Control column in Table 13: Summit Family Switch Support for Alternate Stack Ports on page 380 displays Yes in the rows for switch configurations for which you can disable the stacking-support option.

After you disable the stacking-support option, you must reboot the switch to activate the configuration change.

If you disable the stacking-support option on a switch and reboot, stacking communication stops and the data ports listed in Table 13: Summit Family Switch Support for Alternate Stack Ports on page 380 will use Ethernet protocols instead of stacking protocols.

Example

To disable the stacking ports, enter the following command:

```
* X650-24x(SS).1 # disable stacking-support
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.2.

Support for the Summit X480 switch configurations listed in the “Usage Guidelines” section was added in ExtremeXOS 12.5.

Platform Availability

This command is available only on Summit X480, X650, and X670 switches.

enable stacking

enable stacking {**node-address** *node-address*}

Description

This command enables stacking on one or all nodes.

Syntax Description

node-address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.

Default

Default value is stacking disabled.

Usage Guidelines

This command enables stacking on one or all nodes. When a node is operating in stacking mode, QoS profile QP7 cannot be created.

If a node-address is not specified, this command first performs an analysis of the current stacking configuration on the entire stack. If the stack has not yet been configured for stacking operation, or if the configuration is self-inconsistent, the user is offered the option of invoking the easy setup function. The following message appears:

```
You have not yet configured all required stacking parameters.
Would you like to perform an easy setup for stacking operation? (y/N)
```

If you enter Yes, the easy setup procedure is invoked and you first see the following message:

```
Executing "configure stacking easy-setup" command...
```

If you enter No, the following message appears:

```
Stacking has been enabled as requested.
```

The following describes the operation performed if easy setup is neither offered nor selected.

If you do not enter any node-address, stacking is enabled on all nodes in the stack topology.

If the node-address parameter is present, stacking is enabled on the node with the specified node-address. This is the MAC address assigned to the stackable by the factory.

The show stacking configuration command shows the current configuration of this parameter as well as the value currently in use.

A node that is enabled for stacking attempts to join the active topology. If successful, it then negotiates a node role with the other nodes in the stack and becomes an operational node in the stack according to its role. The master node's configuration is applied to the node.

When this command is executed successfully, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Example

To enable stacking on a stack:

```
* Switch.3 # enable stacking
This command will take effect at the next reboot of the specified node(s).
```

To enable stacking on node 5, with a MAC address 00:04:96:26:6b:ed:

```
* Switch.3 # enable stacking node-address 00:04:96:26:6b:ed
This command will take effect at the next reboot of the specified node(s).
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable stacking-support

enable stacking-support

Description

This command enables a Summit X480, X650, or X670 switch with dual-purpose hardware to participate in a stack.

Syntax Description

This command does not have additional syntax.

Default

Disabled.

Usage Guidelines

The Stacking-Support Option Control column in Table 13: Summit Family Switch Support for Alternate Stack Ports on page 380 displays Yes in the rows for switch configurations for which you can enable the stacking-support option.

After you enable the stacking-support option, you must reboot the switch to activate the configuration change.

If you enable the stacking-support option on a switch and reboot, data communications on the data ports listed in Table 13: Summit Family Switch Support for Alternate Stack Ports on page 380 stops, and the ports use stacking protocols instead of Ethernet protocols.

Example

To enable the stack ports, enter the following command:

```
* X650-24x(SSns).1 # enable stacking-support
This setting will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.2.

Support for the Summit X480 switch configurations listed in the “Usage Guidelines” section was added in ExtremeXOS 12.5.

Platform Availability

This command is available only on Summit X480, X650, and X670 switches.

show power (Stack Nodes Only)

show power

Description

Displays the number of power modules present and providing power in each slot.

Syntax Description

This command has no arguments or variables.

Default

Default value

Usage Guidelines

This command is available on all platforms. However, it produces completely different output on a stack. The following table describes the flags that appear when this command is executed on an active node.

Table 14: Flag Descriptions for the show power Command

Power Supply	Flag	Meaning
Internal	F	Failed or no Power
Internal	P	Power available
Internal	O	48V powered off (48p Summits only)
External (non 48P)	-	Empty
External (non 48P)	F	Failed or no power
External (non 48P)	P	Power available
External (non 48P)		Power supply can never occupy this position
External (48P only)	-	Empty or no power to all PSUs present
External (48P only)	F	Failed or no power (at least 1 PSU has power)
External (48P only)	P	Power available

The Summit X450e-48p and X250e-48p switches accept an external power chassis that holds up to three power supplies. All other Summit family switches accept an external power chassis that holds only one power supply. For Summit family switches other than the Summit X450e-48p and X250e-48p switches, the External PSU columns are left blank.

For slots without active nodes, the slot number appears and the remainder of the row is blank.

On the X450e-48p and X250e-48p external power supply unit, ExtremeXOS cannot identify specific power slots that have power supplies installed. If one slot is empty, the right-most External PSU column shows as Empty (-). If two slots are empty, the right-most two External PSU columns show as Empty(-).

On the X450e-48p and X250e-48p, software automatically turns off the internal power supply 48 volt output when two or more external supplies are first powered on.

Example

The following are sample displays for this command:

```
Slot-2 Stack.40 # show power
Internal  External  External  External
Slots  Type          PSU       PSU       PSU       PSU
-------------------------------------------------------------
Slot-1 X450e-24p     F         P
Slot-2 X450a-24t     P         -
Slot-3 X450a-24tDC   -         P
Slot-4 X450a-48t     P         P
Slot-5 X450a-24x     P         -
```

```
Slot-6 X450a-24xDC   -         P
Slot-7 X450e-48p     P         P         F         -
Slot-8 X450a-24t     P         -
Flags : (P) Power available, (F) Failed or no power,
(O) 48V powered off when 2 or 3 external PSU are powered on,
(-) Empty
Slot-2 Stack.41 #
Slot-2 Stack250.4 # show power
Internal  External  External  External
Slots  Type          PSU       PSU       PSU       PSU
-------------------------------------------------------------
Slot-1 X250e-24p     F         P
Slot-2 X250e-24t     P         -
Slot-3 X250e-24x      P         -
Slot-4 X250e-48t     P         P
Slot-5 X250e-24x     P         -
Slot-6 X250e-48p     O         P         P         F
Slot-7
Slot-8 X250e-24x     P         -
Flags : (P) Power available, (F) Failed or no power,
(O) 48V powered off when 2 or 3 external PSUs are powered on,
(-) Empty
Slot-2 Stack250.5 #
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms, but the output described in this section is available only on nodes configured for the SummitStack feature.

show stacking

show stacking

Description

The show stacking command shows a summary of the nodes in the stack topology.

The show stacking command shows all nodes that are in the stack topology.

Syntax Description

This command has no arguments or variables.

Default

There is no default value for this command.

Usage Guidelines

The asterisk (*) that precedes the node MAC address indicates the node on which this command is being executed, that is, the node to which the user is logged in.

The node MAC address is the address that is factory assigned to the stackable.

The slot number shown is the number currently in use by the related node. Since slot number configuration only takes effect during node initialization, a change in configured value alone does not cause a change to the slot number that is in use. Slot numbers show as hyphen (-) characters on nodes that have stacking disabled.

The Stack State shows the state values.

The Role is one of the following: Master, Backup, Standby, or <none>.

In a ring topology, the node on which this command is executed is always the first node displayed. The order of the nodes shown in the display is the order of their physical connection in the ring.

Even though the stack topology can be a ring, the active topology can simultaneously be a daisy chain because it is only a proper subset of the stack topology. If the node on which this command is executed is not active, the line

```
Active Topology is a ___
```

is replaced by the line

```
This node is not in an Active Topology.
```

The daisy chain topology is displayed in the order of physical connection. The master node detects the two nodes in the stack topology that have only one operating link, and these nodes become the ends of the stack. Such nodes always display at the top and bottom of the output.

It is possible for a node to be in Stabilizing or Waiting state and still be in the active topology. This is because it is possible for an active node to move to these states when a topology change is detected. Once a node becomes active, the node remains an active node until it reboots or an overflow condition occurs.

The Flags have the following definitions:

- The C flag indicates that the related node is a candidate for membership of the same active topology to which the node on which the command is executed would belong.
- The A flag indicates that the related node is an active node in the active topology of which the node on which the command is run is also a candidate node. Being an active node is necessary but not sufficient for presence of the node in a slot. Once the node has fully initialized, the active node appears as Present in the show slot display.
- The O flag indicates that the related node is probably an active node in an active topology for which the node on which this command is being run is not a candidate.

The O flag is useful for the case where there is an inhibited link or a disabled or failed node that separates two active topologies. One active topology may contain the local node, and all other nodes in

this active topology do not have the O flag set. All nodes that are members of an active topology that is separated by an inhibited link from the active topology that contains the local node have only the O flag set. All possibly active nodes have the O flag set if the local node is not a member of any active topology. For any node for which the O flag is set, the C and A flags are not set and vice-versa.

The following information is displayed:

- Stack Topology is a ring or daisy-chain
- Active Topology is a ring or daisy-chain (or This node is not in an Active Topology.)
- For each node:
  - Node MAC address (factory assigned)
  - Slot number in use
  - Stack State:

    Disabled - Node is not configured for stacking.

    Failed - Node can't come up in the stack because it has a duplicate slot number.

    Overflow - The node has detected that there are more nodes in the stack topology than are allowed.

    Listening - Initial state when attempting to join the stack. The node is checking to see if its configured slot number duplicates that of another node. The node cannot be an active node in this state.

    Stabilizing - Node is waiting until it sees no new topology changes. The node may or may not be an active node in this state.

    Waiting - Topology has stabilized, if the active topology is to be a ring, and stacking link blocking is being performed. The node may or may not be an active node in this state.

    Active - The node is an active node and is fully programmed to operate in the active topology.
- Node role (master, backup, standby, or other transient node state).
- Flags describing the node's membership in the active topology
- Whether or not the node is this node, that is, the node on which the command is run

Example

The following example shows the output of show stacking command:

```
Slot-1 Stack.30 # show stacking
Stack Topology is a Ring
Active Topology is a Daisy-Chain
Node MAC Address    Slot  Stack State  Role     Flags
------------------  ----  -----------  -------  ---
*00:04:96:26:60:DD  1     Stabilizing  Master   CA-
00:04:96:26:60:EE  4     Stabilizing  Standby  C--
00:04:96:26:60:FF  -     Disabled     Master   ---
00:04:96:26:60:AA  -     Disabled     Master   ---
00:04:96:26:60:88  -     Disabled     Master   ---
00:04:96:26:60:99  -     Disabled     Master   ---
00:04:96:26:60:BB  2     Stabilizing  Standby  C--
00:04:96:26:60:CC  3     Active       Backup   CA-
(*) Indicates This Node
Flags: (C) Candidate for this active topology, (A) Active node,
```

```
(0) node may be in Other active topology
Slot-1 Stack.31 #
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show stacking configuration

show stacking configuration

Description

Shows how the nodes are configured in a stack topology. The configured values shown are the ones actually stored in the remote nodes at the time you issue this command.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Some stacking parameters do not take effect until the next restart, the configured values and the values currently being used are both shown. Specifically, this applies to the slot number, whether or not stacking is enabled, the master-capable configuration, the license level restriction, and the stack MAC configuration.

The only parameters that take effect without a reboot are the node priority and the alternate management IP subnetwork and gateway.

The Stack MAC in use line can display the following values:

- If the command is executed on the master node:
  - <none> if there is no stack MAC configured
  - The stack MAC configured on the master node
- If the command is executed on a non-master node:
  - <unknown>. The stack MAC address is only known by the executing master node. In this case, the M and m flags are not set. The i flag is set if there is a stack MAC configured locally.

Identified with the asterisk, the current node is the one on which the show stacking configuration command is executed.

A node identified with the ? character indicates that timely attempts to fetch the configuration information from the node have failed. There are two possible reasons for this display:

- Communications with the node have been lost, in which case the node will probably be removed from the stack topology shortly.
- The node is too busy to respond in time.

A row that displays the ? indicator shows the last values that were received from the node. If no values were ever received, all configured values show as not configured (-) or <none>. The node MAC address and the slot number that is currently in use are still displayed.

Example

The following example:

```
Slot-1 Stack.2 # show stacking configuration
Stack MAC in use: 02:04:96:26:6b:ed
Node               Slot         Alternate          Alternate
MAC Address        Cfg Cur Prio Mgmt IP / Mask     Gateway         Flags
Lic
------------------ --- --- ---- ------------------ --------------- ---------
---
*00:04:96:26:6b:ed 1   1   Auto <none>             <none>          CcEeMm---
--
00:04:96:34:d0:b8 2   2   Auto <none>            <none>          CcEeMm--- --
* - Indicates this node
Flags:  (C) master-Capable in use, (c) master-capable is configured,
(E) Stacking is currently Enabled, (e) Stacking is configured Enabled,
(M) Stack MAC in use, (m) Stack MACs configured and in use are the same,
(N)  Stack link protocol Enhanced in use, (n) Stack link protocol Enhanced
configured,
(i) Stack MACs configured and in use are not the same or unknown,
(-) Not in use or not configured
License level restrictions: (C) Core, (A) Advanced edge, or (E) Edge in use,
(c) Core, (a) Advanced edge, or (e) Edge configured,
(-) Not in use or not configured
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show stacking detail

show stacking {**node-address** *node_address* | **slot** *slot_number*} **detail**

Description

This command displays information about a specified node.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.

Default

N/A.

Usage Guidelines

If no node is specified, the output is generated for all nodes in the stack topology. If the specified node does not exist, an error message appears. The slot parameter is available only for active nodes in the same active topology as the node on which the command is run. The node-address parameter is always available.

Current information represents stacking states and configured values that are currently in effect. Configured information is that which takes effect at node reboot only. Thus, differences between values in use and values configured can be seen here. The advantages of this command over the show stacking configuration command is that the values in use and the configured values are fully expanded without the need for flags. You can also see the port state information of the node(s).

The roles values are: Master, Backup, Standby, and <none>.

License level restrictions can be Edge, Advanced Edge, or Core.

If one of the fields in the example below is missing on your switch, you switch does not support the feature that the field represents.

Example

The following is a sample output of this command:

```
Slot-1 Stack.33 # show stacking slot 1 detail
Stacking Node 00:04:96:26:6b:ec information:
Current:
Stacking                  : Enabled
Role                      : Master
Priority                  : Automatic
```

```
Slot number               : 1
Stack state               : Active
Master capable?           : Yes

```

History

This command was first available in ExtremeXOS 12.0.

The Stacking protocol and Stack Port Selection fields were added in ExtremeXOS 12.5.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show stacking stack-ports

show stacking stack-ports

Description

This command displays the port states of each node in the stack topology and the connections between the nodes.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The slot number shown is the slot number in use on stacking enabled nodes. If the node does not have stacking enabled, a hyphen character (-) is shown instead of a number.

The Port and Node MAC Address field values in the command display identify a particular stacking port. Each node MAC address appears twice in two consecutive rows in the output because each node has two stacking ports. On all platforms, the ports are labeled with the values 1 or 2. The order in which stacking ports appear in the display is the order in which they are physically connected.

The Select field indicates whether the stacking port is using a native stacking port or an alternate 10Gbps Ethernet port. If a number appears in this column, it represents the port number printed on the switch for a 10 Gbps Ethernet port. For more information, see the description for the configure stacking-support stack-ports command.

The Port State field for each port shows one of the following states:

- Link Down – port is not receiving a signal.
- No Neighbor – the port is receiving a signal but it is not identifying a stack neighbor.
- Overflow – 17 nodes (or more) are physically connected to this port.
- Inhibited – When you connected the link, active topologies were detected on both sides, and at least one slot number was duplicated. The stack merge is blocked.
- Operational – the port is operational in the stack. This is a necessary but insufficient condition for the port to be used for control path or user data. For example, a node with stacking Failed state may still show its port states as Operational.

The Flags field contains the following flag definitions:

- C - The control path is active on this port. Note that the user data path over the stack links follows the control path.
- B - The port is blocked from transmitting traffic that is to be flooded to multiple non-stacking ports. This flag is only set in an active ring topology on two adjacent ports. In the example below, the active topology is a daisy chain, so no ports are blocked.

Identified with the asterisk, the current node is the one on which the show stacking command was executed. The stack topology is shown in a particular order. In a ring topology, the current node is always the first node, the next node is the node connected to the port 2 of the first node, and the last node is the node connected to the port 1 of the current node. In a daisy chain, the order shown depends on the connection of the node on which the command executes:

- The first node is the one at the far end of the daisy-chain connected to the current node port 1.
- The last node is the one at the far end of the daisy-chain connected to the current node port 2.
- The previous node is the one at the near end of the daisy-chain connected to the current node port 1.

- The next node is the one at the near end of the daisy-chain connected to the current node port 2.
- If there is no node connected to the current node port 1, the current node is the first node.
- If there is no node connected to the current node port 2, the current node is the last node.

The port speed is the unidirectional speed of the port.

Note

Some VIM names include speed ratings which are 4 times the unidirectional stacking port speed. For example, the actual stacking port speed for VIM1-SummitStack512 is 128 Gbps. The 512 Gbps rating for the VIM is the unidirectional rate X 2 (bidirectional) X 2 (ports).

Example

The following example shows the command output for a stack that is operating in a ring and uses both native and alternate stack ports:

```
Slot-1 Stack.9 # show stacking stack-ports
Stack Topology is a Ring
Slot Port Select Node MAC Address  Port State  Flags Speed
---- ---- ------ ----------------- ----------- ----- -----
*1   1    23     00:04:96:26:6b:ec Operational C-      10G
*1   2    Native 00:04:96:26:6b:ec Operational CB      64G
2   1    Native 00:04:96:18:7d:e8 Operational CB      64G
2   2    24     00:04:96:18:7d:e8 Operational C-      10G
3   1    23     00:04:96:27:c5:12 Operational C-      10G
3   2    Native 00:04:96:27:c5:12 Operational C-      64G
4   1    Native 00:04:96:26:6b:34 Operational C-      64G
4   2    24     00:04:96:26:6b:34 Operational C-      10G
* - Indicates this node
Flags:  (C) Control path is active, (B) Port is Blocked
Slot-1 Stack.10 #
```

The following example shows the command output for stacks that use the 512 Gbps stacking ports:

```
Slot-1 Stack.2 # show stacking stack-ports
Stack Topology is a Ring
Slot Port Select Node MAC Address  Port State  Flags Speed
---- ---- ------ ----------------- ----------- ----- -----
*1   1    Native 00:04:96:35:8b:a5 Operational C-     128G
*1   2    Native 00:04:96:35:8b:a5 Operational C-     128G
2   2    Native 00:04:96:35:a8:b0 Operational C-     128G
2   1    Native 00:04:96:35:a8:b0 Operational C-     128G
```

Note

Although the VIM1-SummitStack512 option card has four physical ports, the physical ports are grouped into two pairs, forming two logical ports. The show stacking stack-ports command displays the status of the logical ports.

History

This command was first available in ExtremeXOS 12.0.

The Select column was added in ExtremeXOS 12.5.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show stacking-support

show stacking-support

Description

This command displays the configured and current states of configuration options configured on the local node with the stacking-support keyword.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The display parameters are described in the following table:

Display Item	Description
Stack Port column	Displays rows for Stack Port 1 and Stack Port 2.
Native column	Indicates whether the switch has native stack ports. A Yes entry indicates that the switch has native stacking ports. A No entry indicates that no native stacking ports are present. An asterisk indicates that the native stack port is selected.
Alternate column	Displays the port numbers for data ports that can operate as alternate stack ports. A No entry indicates that there are no data ports that can operate as alternate stacking ports. An asterisk indicates that the data port number is selected as an alternate stack port.

Display Item	Description
Configured column	Indicates the configured state for stack ports 1 and 2, which can be Native or Alternate. This column also indicates the configured state of stacking-support option. For platform configurations with dual-purpose hardware (that supports stack ports or data ports), this column displays either Enabled (stack ports enabled) or Disabled (stack ports disabled, data ports active). For platform configurations without dual-purpose hardware, this column displays N/A, which indicates that stacking-support option cannot be disabled on this switch. This is the configuration that becomes active the next time the switch boots if the stacking-support option is enabled. For more information, see the command descriptions for the enable stacking-support and disable stacking-support commands.
Current column	Indicates the selection that is currently in effect for stack ports, which can be Native, Alternate, or N/A. N/A indicates that the port selection is not applicable to this switch hardware configuration. The column also indicates the current operating state of the stacking-support option, which can be Enabled, Disabled, or N/A. An N/A entry indicates that no option card is present. This is the configuration that is active now.

Example

The following example shows the stack port selection and stacking-support option configuration after the unconfigure stacking-support command has been executed and before a subsequent reboot has been initiated:

```
show stacking-support
Stacking Support Settings
Stack    Available Ports
Port    Native  Alternate  Configured  Current
-----   ----------------  ----------  ----------
1       Yes *   23         Native      Native
2       Yes     24 *       Native      Alternate
stacking-support:          Disabled    Enabled
Flags: * - Current stack port selection
NOTE: This node must be rebooted before the configured settings will
take effect.
```

The following example shows that the stacking-support option is disabled and will remain disabled when the switch reboots:

```
show stacking-support
Stacking Support Settings
Stack    Available Ports
Port    Native  Alternate  Configured  Current
-----   ----------------  ----------  ----------
1       No      S3         Native      N/A
2       No      S4         Native      N/A
stacking-support:          Disabled    Disabled
Flags: * - Current stack port selection
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms listed in Summit Family Switch Support for Alternate Stack Ports that support alternate stack port selection or permit disabling of the stacking-support option.

synchronize stacking

synchronize stacking {**node-address** *node_address* | **slot** *slot_number*}

Description

This command copies certain NVRAM based configuration parameters to the target node.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.

Default

N/A.

Usage Guidelines

This command synchronizes the following NVRAM-based parameters:

- Stacking mode
- Stack MAC address
- Failsafe account and password
- Failsafe account access point permissions (whether the failsafe account is allowed over the stacking links, console port, or management port)
- The selected partition

These parameters are copied from the executing node's NVRAM to the target node's NVRAM.

Note

The synchronize stacking command does not function on Summit X450a and X450e switches that are either configured to use or are currently using alternate stacking ports. Use the download image command to synchronize stacking information to the target node.

Example

Example for the synchronize stacking command output:

```
Slot-2 Stack.3 > synchronize stacking slot 3
Are you sure you want to synchronize the specified slot with this slot's
stacking configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the
specified node(s).
Slot-2 Stack.4 >
Slot-2 Stack.4 > synchronize stacking node 00:04:96:27:87:10
Are you sure you want to synchronize the specified node with this node's
stacking configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the
specified node(s).
Slot-2 Stack.5 >
Slot-2 Stack.5 > synchronize stacking
Are you sure you want to synchronize all remote nodes with this node's
stacking configuration? (y/n) Yes
Synchronized configuration will take effect at the next reboot of the
specified node(s).
Slot-2 Stack.6 >
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure stacking

unconfigure stacking {**node-address** *node_address* | **slot** *slot_number*}

Description

This command resets most stacking parameters to the default or unconfigured values.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.

Default

N/A.

Usage Guidelines

Run this command from any node. If you do not specify a target node, the stacking parameters on all nodes are reset.

This command resets the stacking parameters shown in the following table.

Table 15: Stacking Configuration Items, Time of Effect and Default Value

Configuration Item	Takes Effect	Default Value
Stacking Mode	At boot time	Disabled
Slot Number	At boot time	1
Master-Capable	At boot time	Yes
License Restriction	At boot time	Not Configured
Priority	At next master election	Automatic
Alternate IP Address	Immediately	Not Configured
Stack MAC	At boot time	Not Configured

This command does not reset the stacking parameters configured with the following commands that use the stacking-support keyword:

- configure stacking-support
- disable stacking-support
- enable stacking-support

Example

To unconfigure the stacking parameters of all nodes in the stack topology:

```
unconfigure stacking
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure stacking alternate-ip-address

unconfigure stacking {**node-address** *node_address* | **slot** *slot_number*} **alternate-ip-address**

Description

Removes the configured alternate management IP address from the specified node.

If no node is specified, the alternate management IP address is removed from every node. The change takes effect immediately for all nodes operating in stacking mode.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target active node. To view the slot numbers, enter the show stacking command.

Default

N/A.

Usage Guidelines

Run this command from any node.

Example

To unconfigure stacking alternate-ip-address on a node:

```
unconfigure stacking node-address 00:04:96:26:6b:ed alternate-ip-address
```

To unconfigure the stacking alternate IP address configured on the active node in slot 4:

```
unconfigure stacking slot 4 alternate-ip-address
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure stacking license-level

unconfigure stacking {**node-address** *node_address* | **slot** *slot_number*} **license-level**

Description

This command removes a previously configured license level restriction.

Syntax Description

node_address	Specifies the MAC address of a node in the stack. To view the MAC addresses for all nodes in a stack, enter the show stacking command.
slot_number	Specifies the slot number of the target node. To view the slot numbers, enter the show stacking command.

Default

N/A.

Usage Guidelines

If no node is specified, the licensing restriction is removed from all nodes in the stack topology.

After the command is executed, the following message appears:

```
This command will take effect at the next reboot of the specified node(s).
```

Example

To unconfigure the stacking license level on a node:

```
unconfigure stacking node-address 00:04:96:26:6b:ed license-level
```

To unconfigure the stacking license level configured on slot 4:

```
unconfigure stacking slot 4 license-level
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available with all licenses and platforms that support the SummitStack feature. For information about which licenses and platforms support the SummitStack feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure stacking-support

unconfigure stacking-support

Description

This command resets the stacking parameters configured with commands that use the stacking-support keyword.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Run this command from the local node on which you want to reset stacking-support parameters.

This command resets the stacking parameters configured with the following commands that use the stacking-support keyword:

- configure stacking-support
- disable stacking-support
- enable stacking-support

Example

To unconfigure the stacking-support parameters on the local node, use the following command:

```
unconfigure stacking-support
The stacking-support configuration has been reset.
The defaults will take effect at the next reboot of this switch.
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms listed in Summit Family Switch Support for Alternate Stack Ports that support alternate stack port selection or permit disabling of the stacking-support option.

7 Commands for Configuring Slots and Ports on a Switch

clear counters ports
clear lacp counters
clear counters edp
clear slot
configure ces add peer ipaddress
configure ces add peer ipaddress fec-id-type pseudo-wire
configure ces add peer mac-address
configure ces add service
configure ces delete peer
configure ces delete service
configure ces delete peer
configure ces filler-pattern
configure ces jitter-buffer
configure ces lops-threshold
configure ces payload-size
configure ces peer ipaddress
configure ces qosprofile
configure ces ttl
configure edp advertisement-interval
configure forwarding external-tables
configure forwarding switching-mode
configure ip-fix domain
configure ip-fix flow-key ipv4
configure ip-fix flow-key ipv6
configure ip-fix flow-key nonip
configure ip-fix ip-address
configure ip-fix ports
configure ip-fix ports flow-key ipv4 mask ipaddress
configure ip-fix ports flow-key ipv6 mask ipaddress
configure ip-fix ports record
configure ip-fix source ip-address
configure ip-mtu vlan
configure jumbo-frame-size
configure lacp member-port priority
configure mirror add ports anomaly

configure mirror add
configure mirror delete
configure mirror description
configure mirror name
configure mirror to port
configure mlag peer interval
configure mlag peer ipaddress
configure MLAG peer lacp-mac
configure mlag ports convergence-control
configure network-clock clock-source input
configure network-clock clock-source output
configure network-clock ptp (priority)
configure network-clock ptp announce interval
configure network-clock ptp announce timeout
configure network-clock ptp boundary add vlan
configure network-clock ptp boundary add unicast-slave
configure network-clock ptp boundary delete unicast-slave
configure network-clock ptp delete
configure network-clock ptp delay-request-interval
configure network-clock ptp end-to-end transparent
configure network-clock ptp ordinary add
configure network-clock ptp sync-interval
configure network-clock ptp add unicast-master
configure network-clock ptp delete unicast-master
configure network-clock sync-e
configure network-clock sync-e clock-source
configure port description-string
configure ports auto off
configure ports auto on
configure ports auto-polarity
configure ports display-string
configure ports dwdm channel
configure ports dwdm channel none
configure ports eee enable
configure ports far-end-fault-indication
configure ports isolation
configure ports mode
configure ports partition
configure ports preferred-medium
configure ports redundant
configure ports tdm cable-length
configure ports tdm clock-source

configure ports tdm display-string
configure ports tdm framing
configure ports tdm idle-code
configure ports tdm line-coding
configure ports tdm recovered-clock
configure ports tdm signaling
configure ports tdm trunk-conditioning
configure ports wan-phy clocking
configure ports wan-phy framing
configure ports wan-phy loopback
configure ports wan-phy trace-path
configure ports wan-phy trace-section
configure sharing add ports
configure sharing address-based custom
configure sharing delete ports
configure sharing health-check member-port add tcp-tracking
configure sharing health-check member-port delete tcp-tracking
configure sharing health-check member-port tcp-tracking
configure sharing lacp activity-mode
configure sharing lacp defaulted-state-action
configure sharing lacp system-priority
configure sharing lacp timeout
configure sharing port-based key
configure slot module
configure slot restart-limit
configure tdm hierarchy
configure tdm service circuit add port
configure tdm service circuit delete port
configure tdm service circuit seized-code
create ces psn
create mirror to port
create mlag peer
create tdm service circuit
delete ces
delete mirror name
delete mlag peer
delete tdm service circuit
disable ces
disable edp ports
disable flow-control ports
disable ip-fix ports
disable jumbo-frame ports

disable learning port
disable mirror
disable mlag port
disable network-clock ptp end-to-end-transparent ports
disable network-clock sync-e
disable port
disable ports tdm
configure slot module
disable slot
disable smartredundancy
disable snmp traps port-up-down ports
enable ces
enable | disable ces peer ipaddress
enable edp ports
enable flow-control ports
enable | disable ip-fix
enable ip-fix ports
enable jumbo-frame ports
enable learning port
enable mirror
enable mlag port peer id
enable network-clock ptp
enable network-clock ptp end-to-end-transparent ports
enable network-clock sync-e
enable port
enable ports tdm
enable ports tdm loopback
enable sharing grouping
enable slot
enable smartredundancy
enable snmp traps port-up-down ports
restart ports
run failover
run msm-failover
show ces
show ces clock-recovery
show ces errors
show ces peer
show dwdm channel-map
show edp
show ip-fix
show lacp

show lacp counters
show lacp lag
show lacp member-port
show mirror
show mirroring
show mlag peer
show mlag ports
show network-clock clock-source
show network-clock sync-e ports
show port eee
show ports
show ports anomaly
show ports buffer
show ports collisions
show ports configuration
show ports information
show ports ip-fix
show ports packet
show ports redundant
show ports sharing
show ports tdm alarms
show ports tdm configuration
show ports tdm errors
show ports tdm information
show ports tdm no-refresh
show ports transceiver information
show ports transceiver information detail
show ports utilization
show ports wan-phy configuration
show ports wan-phy errors
show ports wan-phy events
show ports wan-phy overhead
show sharing distribution port-based
show sharing health-check
show sharing port-based keys
show slot
show tdm hierarchy
show tdm service
unconfigure ip-fix
unconfigure ip-fix flow-key
unconfigure ip-fix ip-address
unconfigure ip-fix ports

This chapter describes commands related to:

- Enabling, disabling, and configuring individual ports.
- Configuring port speed (Fast Ethernet ports only) and half- or full-duplex mode.
- Creating link aggregation groups on multiple ports.
- Displaying port statistics.
- Configuring mirroring.
- Configuring software-controlled redundant ports and Smart Redundancy.
- Configuring Extreme Discovery Protocol.
- Configuring time division multiplexing (TDM).

By default, all ports on the switch are enabled. After you configure the ports to your specific needs, you can select which ports are enabled or disabled.

Fast Ethernet ports can connect to either 10BASE-T or 100BASE-T networks. By default, the ports autonegotiate (automatically determine) the port speed. You can also configure each port for a particular speed (either 10 Mbps or 100 Mbps).

In general Gigabit Ethernet ports with fiber interfaces are statically set, and their speed cannot be modified. However, there are two SFPs supported by Extreme Networks that can have a configured speed:

- 100 FX SFPs, which must have their speed configured to 100 Mbps.
- 100FX/1000LX SFPs, which can be configured at either speed.

The switch comes configured to use autonegotiation to determine the port speed and duplex setting for each port. You can choose to manually configure the duplex setting and the speed of 10/100 Mbps ports, and you can manually configure the duplex setting on gigabit Ethernet ports.

All ports on the switch (except gigabit Ethernet ports) can be configured for half-duplex or full-duplex operation. The ports are configured to autonegotiate the duplex setting, but you can manually configure the duplex setting for your specific needs.

Flow control is supported only on gigabit Ethernet ports. It is enabled or disabled as part of autonegotiation. If autonegotiation is set to off, flow control is disabled. When autonegotiation is turned on, flow control is enabled. See the *ExtremeXOS Concepts Guide* for more detailed information on flow control on Extreme Networks devices.

Link aggregation, or load sharing, with Extreme Network switches allows you to increase bandwidth and resilience between switches by using a group of ports to carry traffic in parallel between switches. The sharing algorithm allows the switch to use multiple ports as a single logical port. For example, VLANs see the link aggregation group (LAG) as a single logical port. The algorithm also guarantees packet sequencing between clients.

ExtremeXOS software supports two broad categories of load sharing, or link aggregation: static load sharing and dynamic load sharing.

If a port in a link aggregation group fails, traffic is redistributed to the remaining ports in the LAG. If the failed port becomes active again, traffic is redistributed to include that port.

You can view port status on the switch using the `show ports` commands. These commands, when used with specific keywords and parameters, allow you to view various issues such as collision statistics, link speed, flow control, and packet size. Beginning with ExtremeXOS software version 11.3, these port information displays show real-time statistics, or you can configure the display to show a snapshot of real-time statistics (as in earlier versions of the software).

Beginning with ExtremeXOS version 11.6 software, you can configure WAN PHY OAM on those interfaces that connect 10G Ethernet ports to the SONET/SDH network.

Commands that require you to enter one or more port numbers use the parameter <port_list> in the syntax. On a modular switch or SummitStack, a <port_list> can be a list of slots and ports. On a stand-alone switch, a <port_list> can be one or more port numbers. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview.

For synchronous Ethernet (SyncE), the following ports are supported on each platform:

- X460-24X: Input Ports 1-28, Output Ports 1 - 28.
- X460-48X: Input Ports 1-48, Output Ports 1 – 48.
- E4G-200: All Ethernet ports.
- E4G-400: All Ethernet ports including XGM3S ports if present.

The E4G-200 and E4G-400 have clock sources beyond SyncE. The clock which drives all of the ports on a switch may be selected from:

- SyncE.
- PTP – an optional 1588v2 module.
- TDM – an optional module that has multiple T1/E1 interfaces for TDM/Ethernet interworking.
- BITS – Building Integrated Timing Supply. A connector capable of receiving a timing signal provided by other building equipment.

clear counters ports

`clear counters ports`

Description

Clears the counters associated with the ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Note

If you use the clear counters command with no keyword, the system clears the counters for all applications.

This command clears the counters for the ports, including the following:

- Statistics
- Transmit errors
- Receive errors
- Collisions
- Packets

Example

The following command clears the counters on all ports:

```
clear counters ports
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

clear lacp counters

clear lacp counters

Description

Clears the counters associated with Link Aggregations Control Protocol (LACP).

Syntax Description

This command has no parameters or variables.

Default

N/A.

Usage Guidelines

This command clears the following counters for LACP; it sets these counters back to 0 for every LACP port on the device:

- LACP PDUs dropped on non_LACP ports
- Stats
  - Rx - Accepted
  - Rx - Dropped due to error in verifying PDU
  - Rx - Dropped due to LACP not being up on this port
  - Rx - Dropped due to matching own MAC
  - Tx - Sent Successfully
  - Tx - Transmit error

Example

The following command clears the LACP counters on all ports:

```
clear lacp counters
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

clear counters edp

clear counters edp {**ports** *ports*}

Description

Clears the counters associated with Extreme Discovery Protocol (EDP).

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

If you do not specify a port, the EDP counters will be cleared for all ports.

Usage Guidelines

This command clears the following counters for EDP protocol data units (PDUs) sent and received per EDP port:

- Switch PDUs transmitted
- VLAN PDUs transmitted
- Transmit PDUs with errors
- Switch PDUs received
- VLAN PDUs received
- Received PDUs with errors

Example

The following command clears the EDP counters on all ports:

```
clear counters edp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

clear slot

clear slot *slot*

Description

Clears a slot of a previously assigned module type.

Syntax Description

slot	Specifies the slot number.

Default

N/A.

Usage Guidelines

All configuration information related to the slot and the ports on the module is erased. If a module is present when you issue this command, the module is reset to default settings.

If a slot is configured for one type of module, and a different type of module is inserted, the inserted module is put into a mismatch state (where the inserted module does not match the configured slot), and is not brought online. To use the new module type in a slot, the slot configuration must be cleared or configured for the new module type. Use the enable mirroring to port tagged command to configure the slot.

Example

The following command clears slot 2 of a previously assigned module type:

```
clear slot 2
```

The following command clears slot 4 of a previously assigned module type in a stack:

```
clear slot 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on modular switches and SummitStack.

configure ces add peer ipaddress

configure ces *ces_name* **add peer ipaddress** *ipaddress* **fec-id-type pseudo-wire** *pw_id* **{static-pw transmit-label** *outgoing_pw_label* **receive-label** *incoming_pw_label*}**{lsp** *lsp_name*}

Description

Statically configures a new MPLS TDM PW for the specified CES.

Syntax Description

ces_name	Specifies the circuit emulation service (CES).
ipaddress	Specifies an IP address.
pw_id	Specifies the pseudo wire ID.
fec-id-type pseudo-wire	Specifies the ???.
static-pw transmit-label	Specifies the static pseudo wire transmit label.
outgoing_pw_label	Specifies the outgoing static label. The ***outgoing_pw_label*** must match the peer's configured incoming PW label.
receive-label	Specifies the label that you apply to the static PW on egress .
incoming_pw_label	Specifies the egress label.
lsp	Specifies the Label Switch Path through the network.
lsp_name	Specifies the name of the LSP.

Default

N/A.

Usage Guidelines

This command statically configures a new MPLS TDM PW for the specified CES. Both the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels must be specified. The peer must be similarly configured with a static PW that has the reverse PW label mappings. Locally, the ***incoming_pw_label*** must be unique and is allocated out of the static label space. The ***outgoing-_pw_label*** must match the peer's configured incoming PW label.

Optionally, you can configure the PW to use any type of tunnel LSP: LDP, RSVP-TE, or Static. In the case of RSVP-TE and LDP, those protocols must be configured and enabled, and an LSP must be established, before traffic can be transmitted over the static PW. For Static LSPs, only the MPLS ingress LSP (or outgoing LSP) is specified. Unlike signaled PWs, there is no end-to-end PW communication that is used to verify that the PW endpoint is operational, and in the case of static LSPs, that the data path to the PW endpoint is viable.

In the event of a network fault, if a secondary RSVP-TE LSP is configured or the routing topology changes such that there is an alternate LDP LSP, the static PW will automatically switch LSPs in order to maintain connectivity with the PW endpoint. Static LSPs can be protected proactively by configuring BFD to verify the static LSPs IP next hop connectivity.

Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the CES remains operationally down until the named LSP is restored.

Example

The following command adds a static pseudo wire to:

```
configure iproute add 10.1.1.0/24 lsp lsp598
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on the E4G-200 and E4G-400 platforms.

configure ces add peer ipaddress fec-id-type pseudo-wire

configure ces *ces_name* **add peer ipaddress** *ipaddress* [**fec-id-type pseudo-wire** *pw_id* {**lsp** *lsp_name*} | **udp-port local** *src_udp_port* **remote** *dst_udp_port* **vlan** *vlan_name*]

Description

This command is used to configure a new MPLS TDM PW for the specified CES. The signaled PW parameters are passed to the peer using Targeted LDP over the IP network. The peer specified identifies the endpoint of the PW. The pw_id parameter uniquely identifies PW service and cannot conflict with any other configured service in the network. The value is signaled and used to negotiate the PW labels between the two PW endpoint peers.

The PW is immediately signaled once the associated service information is known (e.g., TDM T1 Port, TDM E1 Port, Ethernet VLAN, etc.) and provided the administrative status of the CES is enabled. The enable setting for the CES peer does not affect the signaling of the PW. This setting only affects the preferred forwarding status. Configuration information associated with the service is signaled to the peer and both PW endpoints must have a compatible service attachment. If the service attachments are not compatible, the PW is not established and an error message is logged.

Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the switch signals a PW Status Code of (PSN Facing-TX Fault, Forwarding Preference-Standby). The CES remains operationally down until the named LSP is restored.

Syntax Description

ces	Circuit Emulation Service
ces_name	Alphanumeric string identifying the CES pseudo-wire.
ipaddress	Peer ipv4 address.
ipaddress	ipv4 address; type=ipv4_t

fec-id-type	FEC ID type
pseudo-wire	Pseudo-wire FEC
pw_id	Pseudo-wire VPN ID"; type="uint32_t; range="[1,4294967295]";
lsp	LSP
lsp_name	Alpha numeric string identifying LSP"; type="lspName"

Default

N/A.

Usage Guidelines

```
Use this command to configure a new MPLS TDM PW for the specified CES.
```

Example

```
create ces ces-test psn mpls
configure ces "ces-test" add peer ipaddress 1.1.1.1 fec-id-type pseudo-wire
100
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces add peer mac-address

configure ces *ces_name* **add peer mac-address** *mac_address* **ecid local** *tx_ecid* **remote** *rx_ecid* **vlan** *vlan_name*

Description

Manually adds an Ethernet (MEF-8) peer (far-end) for the specified CES pseudo-wire. The **<peer mac-address, rx_ecid>** is used to de-multiplex CES pseudo-wires in the CE-bound direction. The **<switch mac-address, tx_ecid>** parameters are used to encapsulate the packets in the PE-bound direction.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
mac_address	Peer MAC address.
tx_ecid	The local MEF-8 emulated circuit identifier of the CES pseudo-wire.
rx_ecid	The remote MEF-8 emulated circuit identifier of the CES pseudo-wire.
vlan_name	VLAN name of the layer-2 forwarding domain of the CES pseudo-wire.

Default

N/A.

Usage Guidelines

See Description.

Example

```
create ces ces-test psn mef
configure ces "ces-test" add peer mac-address 00:49:00:11:22:54 ecid local
2000 remote 3000 vlan v1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces add service

configure ces *ces_name* **add service** *service_name*

Description

Adds the TDM service to the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
service_name	Provider-provisioned CES service name.

Default

N/A.

Usage Guidelines

Structure-agnostic (SAToP) pseudo-wires are configured by adding a structure-agnostic TDM service. Structure-aware (CESoP) pseudo-wires are configured by adding a structure-aware TDM service.

Example

```
#create tdm service circuit service-test
#configure tdm service circuit service-test add port 35 unframed
#create ces ces-test psn udp
#configure ces ces-test add service service-test
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces delete peer

configure ces *ces_name* **delete peer** [**ipaddress** *ipaddress* | **mac-address** *mac_address*]

Description

Deletes the peer of the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.

Default

N/A.

Usage Guidelines

Deletes the peer of the specified CES pseudo-wire.

Example

```
#configure ces ces-test delete peer ip-address 1.1.1.1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces delete service

configure ces *ces_name* **delete service**

Description

Deletes the TDM service from the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.

Default

N/A.

Usage Guidelines

N/A.

Example

```
configure ces ces-test delete service
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces delete peer

configure ces *ces_name* **delete peer** [**ipaddress** *ipaddress* | **mac-address** *mac_address*]

Description

Deletes the peer of the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.

Default

N/A.

Usage Guidelines

Deletes the peer of the specified CES pseudo-wire.

Example

```
#configure ces ces-test delete peer ip-address 1.1.1.1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces filler-pattern

configure ces *ces_name* **filler-pattern** *byte_value*

Description

Configures the filler pattern of the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
byte_value	Filler pattern to be played out on a timeslot bound to the CES pseudo-wire. Allowed values are between 0 and 255, with a default of 255.

Default

The default value is 255.

Usage Guidelines

Note that this pattern is played out only on timeslots bound to the CES pseudo-wire. For unused timeslots, i.e., for timeslots not bound to a CES pseudo-wire, the fixed pattern of 0xff will be played out.

Example

```
E4G400#configure ces ces-test filler-pattern 100
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces jitter-buffer

configure ces *ces_name* **jitter-buffer** *min_jbf* {**max** *max_jbf*}

Description

Configures the jitter-buffer value to be used in the CE-bound direction for the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
ms	Jitter-buffer value in milliseconds between 1 and 200.

Default

E1 and T1 Unframed Min. 3 ms and max 6 ms E1 Basic Framing Min. 3 ms and max 6 ms E1 MF Min. 4 ms and max 8 ms T1 SF and ESF (without signaling) Min. 3 ms and max 6 ms T1 SF and ESF (with signaling) Min. 6 ms and max 12 ms

Usage Guidelines

The allowed values for the jitter-buffer are between 1 and 200 milliseconds.

Example

```
E4G200#configure ces ces-test jitter-buffer 2000 max 5000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces lops-threshold

configure ces *ces_name* **lops-threshold** [**entry** *num_packets_for_entry* {**exit** *num_packets_for_exit*} | **exit** *num_packets_for_exit*

Description

Configures the LOPS (loss of packet state) threshold for the specified CES pseudo-wire. The threshold can be specified for entry, for exit, or for both.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
num_packets_for_entry	The number of consecutive packet misses required to enter the LOPS. The value can be between 1 and 15, with a default of 8.
num_packets_for_exit	The number of consecutive packets required to exit the LOPS. The value can be between 1 and 10, with a default of 8.

Default

The default is 8 for both entry and exit thresholds.

Usage Guidelines

The number of consecutive packet misses required to enter the LOPS can be between 1 and 15, and the number of consecutive packets required to exit the LOPS can be between 1 and 10.

Example

```
E4G-400#configure ces "ces-test" lops-threshold entry 2 exit 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces payload-size

configure ces *ces_name* **payload-size** *bytes*

Description

Configures the payload-size value in the PE-bound direction for the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
byte	Payload size in bytes between 1 and 576 (default is 256 for E1 and 192 for T1).

Default

The default size for a CES pseudo-wire transporting structure-agnostic E1 TDM service is 256 bytes, and the default size is 192 bytes for structure-agnostic T1 TDM service.

Usage Guidelines

The allowed value for the payload size is between 1 and 512 bytes.

Example

```
E4G200#configure ces ces-test payload 512
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces peer ipaddress

configure ces *ces_mpls_name* **peer ipaddress** *ipaddress* **{fec-id-type pseudo-wire** *pw_id*} **{lsp** [*lsp_name* | **none**]}

Description

Modifies the current configuration of a pseudo-wire.

Syntax Description

ces_mpls_name	Alphanumeric string that identifies the Circuit Emulation Service (CES) object in the MPLS name space.
ipaddress	IP address.
pw_id	Unique identifier for the pseudo-wire service.
lsp_name	LSP for the pseudo-wire.

Default

N/A.

Usage Guidelines

This command allows a network administrator to modify the current configuration of a PW for the specified ces_mpls_name or vpws_name. If the pw_id is changed, the PW ID cannot match any other CES/VPWS service. Changing the PW ID forces the PW into initialization state and may be re-signaled. Changing the named LSP will modify the outbound tunnel LSP that is used to carry the PW. If the new named LSP is inactive, the switch signals a PW Status Code of (PSN Facing-TX Fault, Forwarding Preference-Standby) fault to the PW peer. If the none keyword is specified, the switch will use the tunnel LSP that follows the shortest routed patch to the peer IP address.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces qosprofile

configure ces *ces_name* **qosprofile** *qosprofile*

Description

Configures the QoS (quality of service) profile to be associated to a Circuit Emulation Service pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
qosprofile	Name of switch fabric QoS profile (default is QP1).

Default

The default QoS profile is QP1.

Usage Guidelines

Use this command to configure the QoS profile for a CES pseudo-wire.

Example

```
E4G200#configure ces ces-test qosprofile qp4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ces ttl

configure ces *ces_name* **ttl** *ttl_value*

Description

Configures the TTL (time-to-live) for the specified CES pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
ttl_value	Time-To-Live for the specified CES pseudo-wire. The TTL can be between 1 and 254, with a default of 254.

Default

The default TTL is 254.

Usage Guidelines

The following error message will be displayed if the TTL is configured for incompatible CES pseudo-wires (when the PSN type of the CES pseudo-wire is MEF-8):

```
Error: TTL option is incompatible with the configured CES pseudo-wire Packet-
switched Network (PSN) type.
```

Example

```
E4G-400#configure ces ces-test ttl 10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure edp advertisement-interval

configure edp advertisment-interval *timer* **holddown-interval** *timeout*

Description

Sets the advertisement interval and hold down interval for EDP.

Syntax Description

timer	Specifies the advertisement interval in seconds.
timeout	Specifies the hold down interval in seconds.

Default

The default setting for timer is 60 seconds, and for timeout is 180 seconds.

Usage Guidelines

Extreme Discover Protocol (EDP) is used to gather information about neighbor Extreme Networks switches. EDP-enabled ports advertise information about the Extreme switch to other switches on the interface and receive advertisements from other Extreme switches. Information about other Extreme switches is discarded after the hold down interval timeout value is reached without receiving another advertisement.

Example

The following command configures the EDP advertisement-interval to 2 minutes and the hold down interval to 6 minutes:

```
configure edp advertisement-interval 120 holddown-interval 360
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure forwarding external-tables

configure forwarding external-tables [**l3-only** {**ipv4** | **ipv4-and-ipv6** | **ipv6**} | **l2-only** | **acl-only** | **l2-and-l3** | **l2-and-l3-and-acl** | **l2-and-l3-and-ipmc** | **none**]

Description

Customizes the use of the external memory.

Syntax Description

l3-only	Programs the external lookup table to store Layer3 routes only. (Default is IPv4 only).
l3-only ipv4-and-ipv6	Program the external lookup table for IPv4 routes and hosts, and IPv6 routes.
l3-only ipv6	Program the external lookup table for IPv6 routes and hosts.
l2-only	Programs the external lookup table to store Layer2 MAC FDB only.
acl-only	Programs the external lookup table to store access-lists only.
l2-and-l3	Programs the external lookup table to store Layer2 MAC FDB and Layer3 routes (this is the default).
l2-and-l3-and-acl	Programs the external lookup table to store Layer2 MAC FDB, Layer3 routes, and access-lists.
l2-and-l3-and-ipmc	Programs the external lookup table to store Layer2 MAC FDB, Layer3 routes, and IP multicast groups.
none	Specifies that the external lookup table is not used.

Default

l2-and-l3.

Usage Guidelines

Use this command to set the use of the external forwarding table memory. This external memory can be configured in various ways to support extending either one internal table (such as, Layer2) or many internal tables (such as Layer2, Layer3, and ACL).

Following are the table limits for each of the options on the BlackDiamond 8900 xl-series modules and Summit X480 series switches:

Layer3 only (IPv4)	512K IPv4 routes
Layer 3 only (IPv4and IPv6)	464K IPv4 routes and 48K IPv6 routes prefix length 0 to 64 bits
Layer 3 only (IPv6)	240K IPv6 routes prefix length 0 to 128 bits
Layer2 only	512K MAC FDB entries
ACL only	60K ACLs
Layer2 and Layer3	256K MAC FDB entries + 256K IPv4 routes
Layer2, Layer3, and ACL	128K MAC FDB entries + 128K IPv4 routes + 56K ACLs
Layer2, Layer3, and IP multicast	128K MAC FDB entries + 128K IPv4 routes + 12000 IP multicast FDBs (SourceIP, groupIP, vlanId)
None	External tables will not be used

The configuration applies to the entire system.

Changing the use of the external memory cannot be done during runtime. After a change in configuration, a reboot is required for the change to take effect.

To display the current configuration, use the show forwarding configuration command.

Example

The following command configures the external tables to store ACLs:

```
BD-8810.1 # config forwarding external-tables acl-only
WARNING: This command will take effect after a save and reboot.
```

History

This command was first available in ExtremeXOS 12.4.

The l2-and-l3-and-ipmc option was added in ExtremeXOS 12.5.

The l3-only ipv4-and-ipv6 and l3-only ipv6 options were added in ExtremeXOS 15.2.

Platform Availability

This command is available on Summit X480 series switches and BlackDiamond 8800 series switches for the configuration of the external tables on the 8900 xl-series modules.

configure forwarding switching-mode

configure forwarding switching-mode [cut-through | store-and-forward]

Description

Configures the switching mode as either cut-through or store-and-forward.

Syntax Description

cut-through	Specifies that a packet can begin being transmitted prior to its being received in full.
store-and-forward	Specifies that a packet is transmitted only after the entire packet has been received and stored in the packet memory.

Default

Store-and-forward

Usage Guidelines

Use this command to configure the switch to begin transmitting a packet before its entire contents have been received. This reduces the forwarding latency of the switch.

Cut-through mode cannot be achieved for packet sizes that are less than or equal to 384 bytes.

To display the switch mode settings, use the show forwarding configuration command.

When issued on a BlackDiamond 8800 series switch, this command does not affect module types other than those listed in the Platform Availability section below. When issued on a SummitStack system, this command does not affect switch types other than the Summit X650 series.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on Summit X650 series switches (whether or not included in a SummitStack), BlackDiamond X8 switches, and BlackDiamond 8800 series switches with 8900-10G24X-c and 8900-MSM-128 series modules.

The BlackDiamond 8900-G96T-c I/O module supports cut-through switching only in the switching fabric and impacts cross-chip and cross-slot switching only.

configure ip-fix domain

configure ip-fix domain *domain_id*

Description

Configures an observation domain ID.

Syntax Description

domain_id	Specifies a decimal integer.

Default

Domain 0

Usage Guidelines

Use this command to set an observation domain ID that is used in the flow records sent to the collector. The collector can then use this ID to correlate records to their origin.

The entire switch operates as one domain.

Example

The following command configures a domain ID of 4 for the switch:

```
configure ip-fix domain 4
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix flow-key ipv4

configure ip-fix flow-key ipv4 {src-ip} {src-port} {dest-ip} {dest-port} {protocol} {tos}

Description

Configures the settings for the flow key(s) for IPv4.

Syntax Description

src-ip	Specifies the source IP address field as part of the flow key.
src-port	Specifies the L4 source port field as part of the low key.
dest-ip	Specifies the destination IP address field as part of the flow key.
dest-port	Specifies the L4 destination port field as part of the flow key.
protocol	Specifies the L4 protocol field as part of the flow key.
tos	Specifies the type of service field as part of the flow key.

Default

All flow keys.

Usage Guidelines

Use this command to specify which of the designated flow-keys to use. This overrides the default which is all keys. The template sent to the Collector (per the IPFIX standard) contains only the keys used. Then, on a per port basis, you can define masks for the IPv4 source and destination address fields, for instance, to aggregate flows based on subnets. (see configure ip-fix ports flow-key ipv4 mask ipaddress)

The size of the field (in bits) for each key is as follows:

- Source IP Address (32)
- Destination IP Address (32)
- L4 Source Port (16)
- L4 Destination Port (16)
- L4 Protocol (8)
- TOS (DSCP + ECN) (8)

To unconfigure, use the unconfigure ip-fix flow-key command.

To display the flow keys use the show ip-fix command.

Example

The following command configures IPv4 traffic to use the source IP address and L4 protocol:

```
configure ip-fix flow-key ipv4 src-ip protocol
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix flow-key ipv6

configure ip-fix flow-key ipv6 {src-ip} {src-port} {dest-ip} {dest-port} {next-hdr} {tos} {flow-label}

Description

Configures the settings for the flow key(s) for IPv6.

Syntax Description

src-ip	Specifies the source IP address field as part of the flow key.
src-port	Specifies the L4 source port field as part of the flow key.
dest-ip	Specifies the destination IP address field as part of the flow key.
dest-port	Specifies the L4 destination port field as part of the flow key.
next-hdr	Specifies the next header field as part of the flow key.

itos	Specifies type of service field as part of the flow key.
flow-label	Specifies IPv6 flow-label field as part of the flow key.

Default

All flow keys.

Usage Guidelines

Use this command to specify which of the designated flow-keys to use. This overrides the default which is all keys. The template sent to the Collector (per the IPFIX standard) contains only the keys used. Then, on a per port basis, you can define masks for the IPv6 source and destination address fields, for instance, to aggregate flows based on subnets.

The size of the field (in bits) for each key is as follows:

- Source IP Address (128)
- Destination IP Address (128)
- L4 Source Port (16)
- L4 Destination Port (16)
- Next Header (8)
- IPv6 Flow Label (20)
- TOS (DSCP + ECN) (8)

To unconfigure, use the unconfigure ip-fix flow-key command.

To display the configured flow keys, use the show ip-fix command.

Example

The following command configures IPv6 traffic to use the destination IP address and next header:

```
configure ip-fix flow-key ipv6 dest-ip next-hdr
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix flow-key nonip

configure ip-fix flow-key nonip {src-mac} {dest-mac} {ethertype} {vlan-id} {priority} {tagged}

Description

Configures the settings for the flow key(s) for non-IP type data.

Syntax Description

src-mac	Specifies the source MAC address field as part of the flow key.
dest-mac	Specifies the destination MAC address field as part of the flow key.
ethertype	Specifies the Ethertype field as part of the flow key.
vlan-id	Specifies the VLAN ID field as part of the flow key.
priority	Specifies the VLAN priority field as part of the flow key.
tagged	Specifies the VLAN tagged field as part of the flow key.

Default

All flow keys.

Usage Guidelines

Use this command to specify which of the designated flow-keys to use. This overrides the default which is all keys. The template sent to the Collector (per the IPFIX standard) contains only the keys used.

The size of the field (in bits) for each key is as follows:

- Source MAC Address (48)
- Destination MAC Address (48)
- Ethertype (16)
- VLAN ID (12)
- VLAN Priority (3)
- VLAN Tagged (1)

To unconfigure, use the unconfigure ip-fix flow-key command.

To display the configured flow keys, use the show ip-fix command.

Example

The following command configures non-IP traffic to use the source MAC address and VLAN ID:

```
configure ip-fix flow-key src-mac vlan-id
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix ip-address

configure ip-fix ip-address *ipaddress* {**protocol** [**sctp** | **tcp** | **udp**]} {**L4-port** *portno*} {**vr** *vrname*}

Description

Identifies the collector and how communication with it is handled.

Syntax Description

ipaddress	Specifies the IP address
sctp	Specifies SCTP
tcp	Specifies TCP
udp	Specifies UDP. This is the default
portno	Specifies the number of an L4 port. The default is 4739
vrname	Specifies a VR

Default

The protocol field will default to UDP. The L4-port field will default to 4739. The VR field will default to VR-Mgmt.

Usage Guidelines

Use this command to specify the IP address, port number, transport protocol and VR for a collector.

To unconfigure the settings, use the unconfigure ip-fix ip-address command.

To display the collector settings, use the show ip-fix command.

Example

The following command specifies a collector with an IP address of 1.1.1.1, and transport protocol of TCP:

```
configure ip-fix ip-address 1.1.1.1 protocol tcp
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix ports

configure ip-fix ports *port_list* **[ingress | egress | ingress-and-egress]**

Description

Configures metering on ingress and/or egress ports.

Syntax Description

port_list	Specifies the ports.
ingress	Specifies ingress ports only.
egress	Specifies egress ports only.
ingress-and-egress	Specifies both ingress and egress ports.

Default

Ingress

Usage Guidelines

Use this command to configure metering on ingress and/or egress ports.

Example

The following command configures metering on port 2 egress:

```
configure ip-fix ports 2 egress
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix ports flow-key ipv4 mask ipaddress

configure ip-fix ports *port_list* **flow-key ipv4 mask** [**source** | **destination**] **ipaddress** *value*

Description

Defines masks for the IPv4 source and destination address flow keys.

Syntax Description

port_list	Specifies the ports.
source	Specifies a source IP address
destination	Specifies a destination IP address
value	Specifies the IP address mask (in standard format).

Default

N/A.

Usage Guidelines

Use this command to define masks for the IPv4 source and destination address flow keys on a per port basis. For example, this can be used to minimize the information sent to the collector and aggregate flows.

Example

The following command defines a mask for source IP address flow key 255.255.0.0 on port 2.1:

```
configure ip-fix ports 2.1 flow-key ipv4 mask source ipaddress 255.25.0.0
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix ports flow-key ipv6 mask ipaddress

configure ip-fix ports *port_list* **flow-key ipv6 mask** [**source** | **destination**] **ipaddress** *value*

Description

Defines masks for the IPv6 source and destination address flow keys.

Syntax Description

port_list	Specifies the ports.
source	Specifies a source IP address
destination	Specifies a destination IP address
value	Specifies the IP address mask (in standard format).

Default

N/A.

Usage Guidelines

Use this command to define masks for the IPv6 source and destination address flow keys on a per port basis. For example, this can be used to minimize the information sent to the collector and aggregate flows.

Example

The following command defines a mask for the source IP address flow key ff::0 on port 2.1:

```
configure ip-fix ports 2.1 flow-key ipv6 mask source ipaddress ff::0
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix ports record

configure ip-fix ports *port_list* **record** [**all** | **dropped-only** | **non-dropped**]

Description

Configures metering on all, dropped only, or non dropped traffic.

Syntax Description

port_list	Specifies the ports.
all	Specifies all packets.
dropped-only	Specifies only dropped packets.
non-dropped	Specifies only non-dropped packets.

Default

All.

Usage Guidelines

Use this command to configure metering on all packets, only dropped packets, or only non-dropped packets.

Example

The following command configures metering dropped packets only:

```
configure ip-fix ports 2:1 record dropped-only
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-fix source ip-address

configure ip-fix source ip-address *ipaddress* {**vr** *vrname*}

Description

Configures the source IP address used to communicate to the collector.

Syntax Description

ipaddress	Specifies the source IP address to be used in IPFIX packets.
vrname	Specifies a virtual router name.

Default

Switch IP address of the interface the traffic egresses.

Usage Guidelines

Use this command to specify the source IP address and VR to use when sending from the switch to a given collector. Otherwise, the default is used.

There is one collector.

To reset to the default of the switch IP address, use the unconfigure ip-fix ip-address command.

Example

The following command configures an IP address of 1.1.1.1 and VR of finance:

```
configure ip-fix source ip-address 1.1.1.1 finance
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

configure ip-mtu vlan

configure ip-mtu *mtu* **vlan** *vlan_name*

Description

Sets the maximum transmission unit (MTU) for the VLAN.

Syntax Description

mtu	Specifies the IP maximum transmission unit (MTU) value. Range is from 1500 to 9194.
vlan_name	Specifies a VLAN name.

Default

The default IP MTU size is 1500.

Usage Guidelines

BlackDiamond 8000 c-, e-, and xl-series modules, BlackDiamond X8 series switches, and Summit X250e, X450a, X440, X450e, X460, X480, X650, and X670 series switches support IP fragmentation and path MTU discovery.

Note

The Summit X150 and X350 switches do not support IP fragmentation and Path-MTU due to their lack of L3 support.

Use this command to enable jumbo frame support or for IP fragmentation with jumbo frames. Jumbo frames are Ethernet frames that are larger than 1522 bytes, including 4 bytes used for CRC. Both endstations involved in the transfer must be capable of supporting jumbo frames. The switch does not perform IP fragmentation or participate in MTU negotiation on behalf of devices that do not support jumbo frames.

When enabling jumbo frames and setting the MTU size for the VLAN, keep in mind that some network interface cards (NICs) have a configured maximum MTU size that does not include the additional 4bytes of CRC included in a jumbo frame configuration. Ensure that the NIC maximum MTU is at or below the maximum MTU size configured on the switch. Frames that are larger than the MTU size configured on the switch are dropped at the ingress port.

If you use IP fragmentation with jumbo frames and you want to set the MTU size greater than 1500, all ports in the VLAN must have jumbo frames enabled.

Example

The following command sets the MTU size to 2000 for VLAN sales:

```
configure ip-mtu 2000 vlan sales
```

History

This command was available in ExtremeXOS 11.0.

Platform Availability

This command is available on BlackDiamond X8 switches, the BlackDiamond 8000 c-, e-, xl-, and xm-series modules, and the Summit X250e, X440, X450a, X450e, X460, X480, X650, X670 series switches (whether or not included in a SummitStack).

configure jumbo-frame-size

configure jumbo-frame-size *framesize*

Description

Sets the maximum jumbo frame size for the switch.

Syntax Description

framesize	Specifies a maximum transmission unit (MTU) size for a jumbo frame. The range is 1523 to 9216; the default is 9216.

Default

Jumbo frames are disabled by default. The default size setting is 9216.

Usage Guidelines

Jumbo frames are used between endstations that support larger frame sizes for more efficient transfers of bulk data. Both endstations involved in the transfer must be capable of supporting jumbo frames.

The framesize keyword describes the maximum jumbo frame size "on the wire," and includes 4 bytes of cyclic redundancy check (CRC) plus another 4 bytes if 802.1Q tagging is being used.

To enable jumbo frame support, you must configure the maximum transmission unit (MTU) size of a jumbo frame that will be allowed by the switch.

Note

Extreme Networks recommends that you set the MTU size so that fragmentation does not occur.

Some network interface cards (NICs) have a configured maximum MTU size that does not include the additional 4 bytes of CRC. Ensure that the NIC maximum MTU size is at or below the maximum MTU size configured on the switch. Frames that are larger than the MTU size configured on the switch are dropped at the ingress port.

Example

The following command configures the jumbo frame size to 5500:

```
configure jumbo-frame-size 5500
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure lacp member-port priority

configure lacp member-port *port* **priority** *port_priority*

Description

Configures the member port of an LACP to ensure the order that ports are added to the aggregator. The lower value you configure for the port's priority, the higher priority that port has to be added to the aggregator.

Syntax Description

port	Specifies the LACP member port that you are specifying the priority for.
port_priority	Specifies the priority you are applying to this member port to be assigned to the LACP aggregator. The range is from 0 to 65535; the default is 0. The lower configured value has higher priority to be added to the aggregator.

Default

The default priority is 0.

Usage Guidelines

The port must be added to the LAG prior to configuring it for LACP. The default value is 0, or highest priority.

You can configure the port priority to ensure the order in which LAG ports join the aggregator. If you do not configure this parameter, the lowest numbered ports in the LAG are the first to be added to the aggregator; if there are additional ports configured for that LAG, they are put in standby mode.

Use this command to override the default behavior and ensure the order in which LAG ports are selected. Also, if more than one port is configured with the same priority, the lowest numbered port joins the aggregator.

Example

The following command sets the port priority for the LAG port 5:1 to be 55 (which will probably put that port in standby initially):

```
configure lacp member-port 5:1 priority 55
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure mirror add ports anomaly

configure mirror add ports *port_list* **anomaly**

Description

Mirrors detected anomaly traffic to the mirror port.

Syntax Description

port_list	Specifies the list of ports.

Default

N/A.

Usage Guidelines

The command mirrors detected anomaly traffic to the mirror port. You must enable a mirror port and enable protocol anomaly protection on the slot that has the port to be monitored before using this command. After configuration, only detected anomaly traffic from these ports are dropped or mirrored to the mirror port, and legitimate traffic is not affected.

This command takes effect after enabling anomaly-protection.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure mirror add

configure mirror *mirror_name* **add [vlan** *name* **|port** *port* **{ingress | egress | ingress-and-egress | anomaly}]**

Description

Specifies mirror source filters for an instance.

Syntax Description

mirror_name	Specifies a VLAN.
vlan	Specifies a VLAN.
name	Specifies a VLAN name.
port	Specifies a port or slot and port.
port	Specifies particular ports or slots and ports.
ingress	Specifies packets be mirrored as they are received on a port.  **Note** This parameter is available only on BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches. For BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches, it is available only with port-based mirroring.
egress	Specifies packets be mirrored as they are sent from a port.  **Note** This parameter is available only on BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and the Summit family switches. For BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches, it is available only with port-based mirroring.
ingress-and-egress	Specifies all forwarded packets be mirrored. This is the default setting on BlackDiamond 8800 series switches, SummitStack, and Summit family switches for port-based mirroring.  **Note** This parameter is available only on BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches. For BlackDiamond X8 xeries switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches, it is available only with port-based mirroring.

Default

N/A.

Usage Guidelines

You must enable port-mirroring using the enable mirroring to port command before you can configure the mirroring filter definitions.

Port mirroring configures the switch to copy all traffic associated with one or more ports to a monitor port on the switch. The switch uses a traffic filter that copies a group of traffic to the monitor port.

Up to 128 mirroring filters can be configured with the restriction that a maximum of 16 of these can be configured as VLAN and/or virtual port (port + VLAN) filters.

One monitor port or 1 monitor port list can be configured. A monitor port list may contain up to 16 ports.

Frames that contain errors are not mirrored.

For general guideline information and information for various platforms, see Guidelines for Mirroring in the ExtremeXOS Concepts Guide or Usage Guidelines in the enable mirroring to port command discussion.

Example

The following example sends all traffic coming into a BlackDiamond 8800 series switch on slot 3, port 2 to the mirror port:

```
configure mirror add port 3:2 ingress
```

The following example sends all traffic coming into a switch on port 11 and the VLAN default to the mirror port:

```
configure mirror add port 11 vlan default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure mirror delete

configure mirror *mirror_name* **delete** [**all** | **vlan** *name* | **port** *port* | **vlan** *name* **port** *port* | **port***port* **vlan** *name*]

Description

Deletes mirror source filters for an instance.

Syntax Description

mirror_name	Specifies all mirroring filter definitions.
all	Specifies all mirroring filter definitions.
port	Specifies a port or a slot and port.

port	Specifies particular ports or slots and ports.
vlan	Specifies a VLAN.
name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

On a modular switch, <port_list> must be a slot and port in the form <slot>:<port>. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview

Example

The following example deletes the mirroring filter on an BlackDiamond 8800 series switch defined for slot 7, port 1:

```
configure mirroring delete ports 7:1
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was added in ExtremeXOS 11.0.

The VLAN mirroring capability was added to the BlackDiamond 8800 series switch in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure mirror description

configure mirror *mirror_name* **description** [*mirror-desc* | **none**]

Description

Creates, edits or deletes a mirroring instance description string.

Syntax Description

mirror_name	Specifies the mirror name.
description	Specifies the mirror descrption to create or edit.
none	Specifies t.

Default

Disabled.

Usage Guidelines

Use this command to create, edit or delete a mirroring instance description string.

Example

The following example ... :

```
configure mirror description
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure mirror name

configure mirror *mirror_name* **name** *new_name*

Description

Updates or specifies the "to port" definitions for a named mirroring instance .

Syntax Description

mirror_name	Specifies the mirror name.
name	Specifies the mirror name.

Default

Disabled.

Usage Guidelines

Use this command to update or specify the "to port" definitions for a named mirroring instance.

Example

```
configure mirror name
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure mirror to port

configure mirror *mirror_name* {**to** [**port** *port* | **port_list** *port_list* | **loopback port** *port*] {**remote-tag** *rtag* | **port none**}

Description

Updates or specifies the "to port" definitions for a named mirroring instance.

Syntax Description

mirror_name	Specifies the mirror name.
port	Specifies the mirror output port.
port_list	Specifies the list of ports where traffic is to be mirrored.
loopback-port	Specifies an otherwise unused port required when mirroring to a port_list. The loopback-port is not available for switching user data traffic.
port	Specifies a single loopback port that is used internally to provide this feature.
remote-tag	Specifies the value of the VLAN ID used by the mirrored packets when egressing the monitor port.
port	Specifies ? .
none	Specifies ? .

Default

Disabled.

Usage Guidelines

Use this command to update, or specify the "to port" definitions for a named mirroring instance.

Example

The following example configures a mirror instance to port 3, slot 4 :

```
configure mirror to port 3:4
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure mlag peer interval

configure mlag peer *peer_name* **interval** *msec*

Description

Configures the length of time between health check hello packets.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.
msec	Specifies an MLAG peer health-check hello interval in milliseconds. The range is 50-10000ms. The default is 1000ms.

Default

The interval default is 1000 milliseconds

Usage Guidelines

Use this command to configure the length of time between health check hello packets exchanged between MLAG peer switches. After three health check hellos are lost, the MLAG peer switch is declared to be failed, triggering an MLAG topology change.

Example

The following command sets an interval of 700 milliseconds on the switch101 peer. switch:

```
configure mlag peer switch101 interval 700
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure mlag peer ipaddress

configure mlag peer *peer_name* **ipaddress** *peer_ip_address* {**vr** *VR*}

Description

Associates an MLAG peer switch with an MLAG peer structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.
peer_ip_address	Specifies an IPv4 or IPv6 address.
VR	Specifies a virtual router.

Default

N/A.

Usage Guidelines

```
Use this command to associate an MLAG peer structure with an MLAG peer switch
IP address.
```

The specified IP address must be contained within an existing direct route. If not, the following error message is displayed:

```
ERROR: Specified IP address is not on directly attached subnet in VR.
```

The link connecting MLAG peer switches should use load sharing. If it does not, a output similar to the following is displayed:

```
Note: VLAN v1 will be used as the Inter-Switch Connection to the MLAG peer
mp1.
Warning: The VLAN v1 does not have a load share port configured yet. It is
recommended that the Inter-Switch Connection
use load sharing.
```

Example

The following command associates the MLAG peer structure switch101 with the MLAG peer switch IP address 1.1.1.1 on VR-USER:

```
configure mlag peer switch101 ipaddress 1.1.1.1 vr “VR-USER”
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure MLAG peer lacp-mac

configure mlag **peer** *peer_name* **lacp-mac** [**auto** | *lacp_mac_address*]

Description

Configures MLAG LACP MAC on each of the MLAG peer switches. This MAC address will be used as the system identifier in the LACPDUs sent over the MLAG ports.

Syntax Description

mlag	Multi-switch link aggregation used to combine remote ports and local ports to a common logical connection.
peer_name	Alphanumeric string identifying the MLAG peer.
lacp-mac	MAC address to be used as the system identifier in LACPDU for MLAG ports.
auto	System identifier in LACPDU automatically uses switch MAC of MLAG peer with higher IP address for ISC control VLAN (default).
lacp_mac_address	MAC address.

Default

Auto.

Usage Guidelines

This command is used to configure the System Identifier used in LACPDU for MLAG ports. The same value has to be configured on both the MLAG peers.

Example

```
configure mlag peer "peer1" lacp-mac auto
configure mlag peer "peer1" lacp-mac 00:01:02:03:04:05
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all platforms.

configure mlag ports convergence-control

configure mlag ports convergence-control [conserve-access-lists | fast]

Description

Sets a preference for having a fast convergence time or conserving access lists.

Syntax Description

conserve-access-lists	Specifies that conserving access lists is preferred over low traffic convergence time.
fast	Specifies that low traffic convergence time is preferred at the expense of the number of user access lists.

Default

Conserve-access-lists

Usage Guidelines

Achieving fast convergence times on local MLAG port state changes (down and up), independent of the number of FDB entries learned on the MLAG port, requires the use of ACLs. This limits the number

of ACLs you have available. This command allows you to set your preference for having either fast convergence time or conserving available access lists for your users.

Note

Configuring fast convergence-control limits the number of ACLs that can be supported by the switch. You must ensure that the system has sufficient user ACLs free when fast mode is selected. Configuring conserve-access-lists convergence-control may increase convergence times on MLAG port failures.

Fast convergence configuration has global significance in that it applies to all MLAG groups that are currently configured and those that may be configured in the future.

Example

The following command specifies a priority of conserving access lists over low traffic convergence time:

```
configure mlag ports convergence-control conserve-access-lists
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure network-clock clock-source input

configure network-clock clock-source input {[**sync-e** | **ptp** | **tdm** | [**bits-rj45** | **bits-bnc**] {**quality-level** *value*}] | **region** [**E1** | **T1**]}

Description

Configure the input network clock source as Sync-E or PTP or TDM or BITS A region can also be configured using this command.

Syntax Description

sync-e	Synchronous Ethernet (ITU-T standard) (Default).
ptp	Precision Time Protocol.
tdm	Time Division Multiplexing.
bits-rj45	External bits clock from RJ45.
bits-bnc	External bitsw clock from BNC connector.
value	Value of the quality level of the clock (T1 default QL_ST3, E1 default QL_SEC).

E1	Specifies the European and Asian clock region selection (Default).
T1	Specifies the North American clock region selection.

Default

The default input clock source is Synchronous Ethernet. The default region is E1.

Usage Guidelines

The E4G-200 and E4G-400 have clock sources beyond SyncE. The clock which drives all of the ports on a switch may be selected from:

- SyncE (Synchronous Ethernet)
- PTP – Precision Time Protocol, an optional 1588v2 module
- TDM – an optional module which has multiple T1/E1 interfaces for TDM/Ethernet interworking
- BITS – Building Integrated Timing Supply. A connector capable of receiving a timing signal provided by other building equipment.

Example

The following command configures the region as T1

```
configure network-clock clock-source input region t1
```

The following command configures the network-clock source as TDM

```
configure network-clock clock-source input tdm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on X460-24x, X460-48x E4G-200 and E4G-400 switches. On X460 platforms only Sync-E option is available as clock-source.

configure network-clock clock-source output

configure network-clock clock-source output {bits-bnc-1 [1pps | 8KHz] bits-bnc-2 [E1 | T1 | 10MHz]}

Description

Configure the output network clock source as bits bnc 1 or 2.

Syntax Description

bits-bnc-1	Bits Clock 1 BNC connector.
1pps	1pps output clock
8KHz	8 KHz output clock (default).
bits-bnc-2	Bits Clock 2 BNC connector.
E1	E1 (2.048 MHz) output clock (default).
T1	T1 (1.544 MHz) output clock.
10MHz	10 MHz output clock.

Default

The default output clock source for Bits Clock 1 BNC connector is 8 KHz, and the default for Bits Clock 2 BNC connector is E1 (2.048 MHz).

Usage Guidelines

The E4G-200 and E4G-400 have clock sources beyond SyncE. The clock which drives all of the ports on a switch may be selected from:

- SyncE (Synchronous Ethernet)
- PTP – Precision Time Protocol, an optional 1588v2 module
- TDM – an optional module which has multiple T1/E1 interfaces for TDM/Ethernet interworking
- BITS – Building Integrated Timing Supply. A connector capable of receiving a timing signal provided by other building equipment.

Example

The following command configures the region as T1

```
configure network-clock clock-source input region t1
```

The following command configures the network-clock source as TDM

```
configure network-clock clock-source input tdm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on X460-24x, X460-48x, E4G-200 and E4G-400 switches. On X460 platforms only sync-e option is available as clock-source.

configure network-clock ptp (priority)

configure network-clock ptp [boundary | ordinary] [priority1 | priority2] *priority*

Description

Assign priority1 and priority2 values for a PTP clock instance.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
priority1	Priority1 of the clock.
priority2	Priority2 of the clock.
priority	Value of priority. 0 is the highest priority. The default value is 128, the range is 0-255.

Default

The default value of the priority is 128. The range is 0-255.

Usage Guidelines

Use this command to assign priority1 and priority2 values for a PTP clock instance. This command is available only for boundary and ordinary clocks.

Example

The following example assigns priority1 and priority2 values for the boundary clock:

```
configure network-clock ptp boundary priority1 50
configure network-clock ptp boundary priority2 128
```

The following example assigns priority1 and priority2 values for ordinary clock:

```
configure network-clock ptp ordinary priority1 10
configure network-clock ptp ordinary priority2 200
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp announce interval

configure network-clock ptp [**boundary** | **ordinary**} **announce interval** *seconds_log_base_2* {**vlan**} *vlan_name*

Description

Configure the value of the PTP announce interval time on the port(s) for sending announce messages. This command is available only for boundary and ordinary clocks. The interval time is the time between successive announce messages.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
seconds_log_base_2	The log base 2 value of the seconds between successive announce messages. For example, to specify 8 seconds, use 3. The default value is 1, and the range is -2 to 4.
vlan_name	Name of the VLAN to apply the command to.

Default

The default value of the announce interval is log base 2 (1), or 2 seconds.

Usage Guidelines

Use this command to configure the value of PTP announce interval time on the port(s) for sending announce messages. The announce interval is set using log base 2 values. The range is -2 to 4. This command is available only for boundary and ordinary clocks.

Example

The following example configures announce interval to be 1/second on the clock port lpbk-gm of the ordinary clock:

```
configure network-clock ptp ordinary announce interval 0 vlan lpbk-gm
```

The following example configures announce interval to be 2/second on the clock-port lpbk-gm of the boundary clock:

```
configure network-clock ptp boundary announce interval -1 vlan lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp announce timeout

configure network-clock ptp [boundary | ordinary] announce timeout *seconds_log_base_2* **{vlan}** *vlan_name*

Description

Configure the value of the timeout for receiving PTP announce messages. This command is available only for boundary clocks and ordinary clocks.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
seconds_log_base_2	The log base 2 value of the seconds of the timeout for PTP announce messages. For example, to specify 8 seconds, use 3. The default value is 3, and the range is 2 to 8.
vlan_name	VLAN name to which the command is to be applied.

Default

The default value of the announce timeout is log base 2 (3), or 8 seconds.

Usage Guidelines

Use this command to configure the value of the timeout for PTP announce messages. The clock port should not have unicast static slaves or masters added for this configuration to be applied.

Example

The following example configures announce timeout interval to be 16 seconds on the clock port lpbk-gm of the ordinary clock:

```
configure network-clock ptp ordinary announce timeout 4 vlan lpbk-gm
```

The following example configures announce timeout interval to be 4 seconds on the clock port lpbk-gm of the boundary clock:

```
configure network-clock ptp boundary announce timeout 2 vlan lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp boundary add vlan

configure network-clock ptp boundary add {**vlan**} *vlan_name* {**one-step** | **two-step**} {**slave-only** | **master-only**}

Description

Add a VLAN to a PTP boundary clock instance as a clock port. You can configure the clock port as slave-only port or master-only port.

Syntax Description

boundary	Boundary clock instance.
vlan_name	Name of the specific VLAN to be added to or deleted from the PTP clock instance.
one-step	1-step protocol mode (default)
two-step	2-step protocol mode
slave-only	Force clock port to be slave.
master-only	Force clock port to be master.

Default

The default configuration of clock port is master or slave mode.

Usage Guidelines

Use this command to add a VLAN to a PTP boundary clock instance as a clock port. You can configure the clock port as slave-only port, or master-only port. The slave-only clock port has the PTP port state forced to slave. The slave port does not respond to signaling messages from other slaves, and Sync/DelayResponse event messages are not generated by the slave-only ports.

The master-only clock port has the PTP port state forced to master. The master port generates Sync/DelayResponse event messages to downstream slave clocks.

The default configuration of clock port is master or slave mode. In this mode, the clock port state is based on the Best Master Clock (BMC) algorithm running on the port. The BMC algorithm decides the clock port state transition to master or slave depending on the event messages received on the clock port from the associated unicast master(s)/slave(s).

The following restrictions apply on the VLAN to be added as clock port:

- The VLAN should be tagged.
- Loopback-mode should be enabled on the VLAN.
- IPv4 address should be configured and IP forwarding must be enabled on the VLAN.
- The VLAN should not have front panel ports added.

Example

The following example adds a vlan 'lpbk-gm' as a slave clock port to boundary clock:

```
configure network-clock ptp boundary add vlan lpbk-gm one-step slave-only
```

The following example adds a vlan 'lpbk-ord' as a master clock port to boundary clock in two-step protocol mode:

```
configure network-clock ptp boundary add vlan lpbk-ord two-step master-only
```

The following example adds a vlan 'lpbk-transit' as a clock port to boundary clock whose master/slave state is decided by BMCA:

```
configure network-clock ptp boundary add vlan lpbk-transit one-step
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp boundary add unicast-slave

configure network-clock ptp boundary add unicast-slave *ipv4_address* {**vlan**} *vlan_name*

Description

Add an entry to the unicast slave table for a PTP clock instance. This command is available only for boundary clocks.

Syntax Description

boundary	Boundary clock instance.
unicast-slave	IP addresses that are potential slave to the local clock.
ipv4_address	IPv4 address.
vlan	VLAN.
vlan_name	Name of the specific VLAN to add for the PTP clock instance.

Default

The default configuration of clock port is slave mode.

Usage Guidelines

Use this command to add an entry to the unicast slave table for a PTP clock instance.

Example

The following command adds a static unicast slave entry to the PTP clock port lpbk-slave in the boundary clock:

```
configure network-clock ptp boundary add unicast-slave 192.168.15.20 vlan
lpbk-slave
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp boundary delete unicast-slave

configure network-clock ptp boundary delete unicast-slave *ipv4_address* **{vlan}** *vlan_name*

Description

Deletes an entry from the unicast slave table for a PTP clock instance. This command is available only for boundary clocks.

Syntax Description

boundary	Boundary clock instance.
unicast-slave	IP addresses that are potential slave to the local clock.
ipv4_address	IPv4 address.
vlan	VLAN.
vlan_name	Name of the specific VLAN to add for the PTP clock instance.

Default

The default configuration of clock port is slave mode.

Usage Guidelines

Use this command to delete an entry from the unicast slave table for a PTP clock instance.

Example

The following command removes a static unicast master entry from boundary clock:

```
configure network-clock ptp boundary delete unicast-slave 192.168.1.1 vlan
lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp delete

configure network-clock ptp [boundary | ordinary] delete [{vlan} *vlan_name* | vlan all]

Description

Deletes a given clock port (VLAN), or all clock ports added to the specified PTP clock instance.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
vlan	VLAN.
vlan_name	Name of the specific VLAN to be added to or deleted from the PTP clock instance.
all	Add or delete all VLANs.

Default

N/A.

Usage Guidelines

Use this command to delete a given clock port (VLAN), or all clock ports added to the specified PTP clock instance.

Example

The following example deletes all clock ports from the boundary clock:

```
configure network-clock ptp boundary delete vlan all
```

The following example deletes vlan lpbk-gm from the ordinary clock:

```
configure network-clock ptp ordinary delete vlan lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp delay-request-interval

configure network-clock ptp [boundary | ordinary} delay-request-interval *seconds_log_base_2* **{vlan}** *vlan_name*

Description

Configures the value of PTP delay request interval time to send successive delay request messages when the port is in the master state.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
seconds_log_base_2	The log base 2 value of the seconds of the timeout for PTP announce messages. For example, to specify 8 seconds, use 3. The default value is -6, and the range is -7 to 5.
vlan_name	VLAN name to which the command is to be applied.

Default

The default value of the announce delay request interval is log base 2 (-6), or 64 delay request messages per second.

Usage Guidelines

Use this command to configure the value of PTP delay request interval time to send delay request messages when the port is in the master state. The clock port should not have unicast static slaves or masters added to apply the configuration.

Set the delay request interval using log base 2 values. The range is -7 to 5. This command is available only for boundary and ordinary clocks.

Example

The following command configures the delay request message rate of 32/second on the clock port lpbk-gm of the ordinary clock:

```
configure network-clock ptp ordinary delay-request-interval -5 vlan lpbk-gm
```

The following command configures the delay request message rate of 128/second on the clock port lpbk-gm of the boundary clock:

```
configure network-clock ptp boundary delay-request-interval -7 vlan lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp end-to-end transparent

configure network-clock ptp end-to-end-transparent [add | delete] ports *port_list* **{one-step}**

Description

Adds or deletes the physical port(s) to or from the end-to-end-transparent clock

Syntax Description

add	Add ports.
delete	Delete ports.
ports	Physical ports.
port_list	List of ports to be added or deleted.
one-step	One step operation.

Default

N/A.

Usage Guidelines

Use this command to add or delete the physical port(s) to, or from, the end-to-end-transparent clock. The fiber only 1G ports, 10G ports, and stack ports cannot be added to the End-to-End transparent clock.

Example

The following example configures end-to-end transparent clock on the front panel ports:

```
configure network-clock ptp end-to-end-transparent add ports 1-4 one-step
```

The following example deletes the front panel ports from the end-to-end transparent clock:

```
configure network-clock ptp end-to-end-transparent delete ports 2-4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp ordinary add

configure network-clock ptp ordinary add {**vlan**} *vlan_name* {**one-step** | **two-step**} **slave-only**

Description

Add a VLAN to a PTP ordinary clock instance as a clock port.

Syntax Description

ordinary	Ordinary clock instance.
vlan_name	Name of the specific VLAN to be added to or deleted from the PTP clock instance.
one-step	1-step protocol mode (default).
two-step	2-step protocol mode.
slave-only	Force clock port to be a slave.

Default

The default protocol mode on the clock port is one-step.

Usage Guidelines

Use this command to add a VLAN to a PTP ordinary clock instance as a clock port. The ordinary clock master (grand-master) mode of operation is not supported.

The following restrictions apply on the VLAN to be added as clock port:

- The VLAN should be tagged.
- Loopback-mode should be enabled on the VLAN.
- IPv4 address should be configured and IP forwarding must be enabled on the VLAN.
- The VLAN should not have front panel ports added.

Example

The following example adds a vlan 'lpbk-gm' as a slave clock port to ordinary clock:

```
configure network-clock ptp ordinary add vlan lpbk-gm one-step slave-only
```

The following example adds a vlan 'lpbk-gm2' as a slave clock port to ordinary clock in two-step mode:

```
configure network-clock ptp ordinary add vlan lpbk-gm2 two-step slave-only
```

History

This command was first available in ExtremeXOS 15.1 Revision 2.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp sync-interval

configure network-clock ptp [boundary | ordinary] sync-interval *seconds_log_base_2* **{vlan}** *vlan_name*

Description

Configure the value of PTP Sync message interval time to send Sync event message to the slaves when the port is in the master state.

Syntax Description

boundary	Boundary clock instance.
ordinary	Ordinary clock instance.
sync-interval	Time between successive sync messages.
seconds_log_base_2	The log base 2 value of the seconds of the timeout for PTP announce messages. For example, to specify 2 seconds, use 1. The default value is -6, and the range is -7 to 1.
vlan_name	VLAN name to which the command is to be applied.

Default

The default value of the <seconds_log_base_2> parameter is -6.

Usage Guidelines

Use this command to configure the announce message rate on the clock port. The clock port should not have unicast static slaves or masters added for this configuration to be applied.

This command is available only for boundary and ordinary clocks.

Example

The following command configures the sync message rate of 2/second on the clock port lpbk-gm of the boundary clock:

```
configure network-clock ptp boundary sync-interval -1 vlan lpbk-gm
```

The following command configures the sync message rate of 8/second on the clock port lpbk-gm of the ordinary clock:

```
configure network-clock ptp ordinary sync-interval -3 vlan lpbk-gm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp add unicast-master

configure network-clock ptp [**boundary** | **ordinary**] **add unicast-master** *ipv4_address* {**query-interval** *seconds_log_base_2*} [{**vlan**} *vlan_name*]

Description

Adds an entry to the unicast master table for a PTP clock instance. This command is available for boundary and ordinary clocks.

Syntax Description

boundary	Boundary clock.
ordinary	Ordinary clock.
add unicast-master	IP addresses that are potential master to the local clock.
ipv4_address	IPv4 address.
query-interval	Mean interval between requests from a node for a unicast Announce message
seconds_log_base_2	The log base 2 value in seconds of the mean interval between requests from a node for a unicast Announce message. For example, to specify 8 seconds between requests, use 3. The default value is 1, and the range is -2 to 4.
vlan_name	VLAN name to which the command is to be applied.

Default

The default value of the query interval is log base 2 (1), or 2 seconds mean interval between requests from the node for a unicast Announce Message.

Usage Guidelines

Use this command to add an entry to the unicast master table for a PTP clock instance. This command is available only for boundary clocks. The mean interval between requests from the node for a unicast Announce message can be configured from 1/4 second to 16 seconds, with a default of 2 seconds.

Example

The following command adds a static unicast master entry to the PTP clock port lpbk-gm in the boundary clock:

```
configure network-clock ptp boundary add unicast-master 192.168.1.1 query-
interval 0 vlan lpbk-gm
```

The following command adds a static unicast master entry to the PTP clock port lpbk-master in the ordinary clock clock:

```
configure network-clock ptp ordinary add unicast-master 192.168.15.10 vlan
lpbk-master
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock ptp delete unicast-master

configure network-clock ptp [boundary | ordinary] delete unicast-master *ipv4_address* **[{vlan}** *vlan_name*]

Description

Delete an entry from the unicast master table for a PTP clock instance. This command is available only for boundary clocks.

Syntax Description

boundary	Boundary clock.
ordinary	Ordinary clock.
ipv4_address	IPv4 address of a master to the local clock.
vlan_name	VLAN name to which the command is to be applied.

Default

N/A.

Usage Guidelines

Use this command to delete an entry from the unicast master table for a PTP clock instance. This command is available only for boundary clocks.

Example

The following command removes a static unicast master entry from boundary clock:

```
configure network-clock ptp boundary delete unicast-master 192.168.1.1 vlan
lpbk-gm
```

The following command removes a static unicast master entry from ordinary clock:

```
configure network-clock ptp ordinary delete unicast-master 192.168.15.10 vlan
lpbk-master
```

History

This command was first available in ExtremeXOS 15.1 Revision 2.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

Note

PTP commands can be used only with the Network Timing feature pack.

configure network-clock sync-e

configure network-clock sync-e [source-1 | source-2] port *port*

Description

Configures synchronous Ethernet on a particular port to be a source 1 or source 2 for synchronizing clock.

Syntax Description

source-1	Source 1 external input clock
source-2	Source 2 external input clock
port	port
port	100Mbps/1G port Copper/Fiber Ports

Default

None of the ports are source 1 or 2.

Usage Guidelines

Use this command to configure SyncE on a particular port to be a primary master or secondary master for synchronizing the clock.

The following lists the ports supported on each platform:

- X460-24X: Ports 1 - 28
- X460-48X: Ports 1 - 48
- E4G-200: All Ethernet ports
- E4G-400: All Ethernet ports including XGM3S ports if present

If you attempt to configure SyncE on a management port, the following message is displayed:

```
ERROR: Synchronous Ethernet is not supported on the Mgmt port.
```

If you attempt to configure more than one source-1 or source-2 port, the following message is displayed:

```
ERROR: Only one port can be configured as source-1/source-2.
```

If you attempt to configure SyncE on a port that is not supported, the following message is displayed:

```
ERROR: Cannot Configure Synchronous Ethernet on ports
```

To unconfigure SyncE, use the unconfigure network-clock sync-e command.

To display SyncE settings, use the show network-clock sync-e ports command.

Example

The following command configures port 2 as SyncE source.

```
configure network-clock sync-e source-1 port 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24X and X460-48X switches and on E4G-200 and E4G-400 switches.

configure network-clock sync-e clock-source

configure network-clock sync-e clock-source [**source-1**|**source-2**] {**quality-level** *value*}

Description

Configures synchronous ethernet clock-source to be a source 1 or source 2 for synchronizing clock.

Syntax Description

source-1	Source 1 external input clock
source-2	Source 2 external input clock
value	Value of the Quality level of the clock (T1 default QL_ST3, E1 default QL_SEC)

Default

None of the ports are source 1 or 2.

Usage Guidelines

Use the following command to configure "source-1" as the Synchronous Ethernet clock-source It generates ESMC messages with quality level QL_PRC.

```
configure network-clock sync-e clock-source source-1 quality-level QL_PRC
```

If no quality-level is specified , default value is used (T1 default QL_ST3, E1 default QL_SEC)

Example

```
E4G-400.33 # configure network-clock sync-e clock-source source-1 quality-
level QL_PRC
```

configure port description-string

configure ports *port_list* **description-string** *string*

Description

Configures a description string setting up to 255 characters.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
string	Specifies a port description of up to 255 characters per port. You cannot use the following characters: ‘ “ ‘, “<”, “>”, “:”, “<space>”, “&”

Default

None.

Usage Guidelines

Use this command to configure a port description of up to 255 characters per port.

In case that user configures a string longer than 64 chars, the following warning will be displayed: `Port description strings longer than 64 chars are only accessible through SNMP if the following command is issued: configure snmp ifmib ifalias size extended`

Some characters are not permitted as they have special meanings. These are: ‘ “ ‘, “<”, “>”, “:”, “<space>”, “&”. The first character should by alphanumeric. This new field is CLI accessible only via “show port info detail” but is also accessible via the SNMP ifAlias object of IfXTable from IF-MIB (RFC 2233) and the XML API. In order to access the value via SNMP the following command should be issued: `configure snmp ifmib ifalias size extended`.

Example

The following command configures the port:

```
configure ports 1:3 description-string CorporatePort_123
```

History

This command was available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure ports auto off

configure ports *port_list* {**medium** [**copper** | **fiber**]} **auto off speed** *speed* **duplex** [**half** | **full**]

Description

Manually configures port speed and duplex setting configuration on one or more ports on a switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
medium	Specifies the medium as either copper or fiber. Note: This parameter applies to combo ports only on the Summit family switches.

speed	Specifies the port speed as either 10, 100, 1000 (1 Gigabit), or 10000 (10 Gigabit) Mbps ports.
duplex [half]	Specifies half duplex; transmitting and receiving data one direction at a time.
duplex [full]	Specifies full duplex; transmitting and receiving data at the same time.

Default

Auto on for 1G ports.

Auto off for 10G ports except for ports 1-24 of the Summit X650-24t for which the default is 10G auto on.

Usage Guidelines

You can manually configure the duplex setting and the speed on 10/100 and 10/100/1000 Mbps and fiber SFP gigabit Ethernet ports.

In general, SFP gigabit Ethernet ports are statically set to 1 Gbps, and their speed cannot be modified. However, there are SFPs supported by Extreme Networks that can have a configured speed:

- 100 FX SFPs, which must have their speed configured to 100 Mbps
- 100FX/1000LX SFPs, which can be configured at either speed (available only on the BlackDiamond 8800 series switches, SummitStack, and Summit family switches)
- SFP+ optics, must have their speed configured to 10G auto off.

The 8900-10G24X-c, BDXA-10G48X, Summit X670-48x, X670V-48x, and X650-24x ports default to 10G auto off. The user is recommended to change the configuration to 1G auto on (or auto off) when a 1G SFP optic is plugged into the port. In the event, the user does not change user configuration, the port links up at 1G, but a warning message is logged for the user to take corrective action and change the user configuration. Similarly, when the port has been configured to 1G auto on (or auto off) and a SFP+ optic is inserted, the port links up with the correct speed and auto configuration, but a log message recommends that the user configuration be changed to match the optic inserted.

The Summit X650-24t ports 1-24 default to auto on. The ports will auto-negotiate to 1G or 10G speeds, full duplex. Users cannot configure the speed or duplex settings when autonegotiation is turned on for the Summit X650-24t.

In certain interoperability situations, it is necessary to turn autonegotiation off on a fiber gigabit Ethernet port. Even though a gigabit Ethernet port runs only at full duplex and gigabit speeds, the command that turns off autonegotiation must still include the duplex setting.

Gigabit Ethernet ports support flow control only when autonegotiation is turned on. When autonegotiation is turned off, flow control is not supported. (See the ExtremeXOS Concepts Guide for more detailed information on flow control on Extreme Networks devices.)

Summit Family Switches Only

When configuring combination ports you can specify the medium as copper or fiber. If the medium is not specified for combination ports then the configuration is applied to the current primary medium.

The current primary medium is displayed in the Media Primary column of the show ports configuration command output.

Note

The keyword medium is used to select the configuration medium for combination ports. If the port_list contains any non-combination ports, the command is rejected.

When upgrading a switch running ExtremeXOS 12.3 or earlier software to ExtremeXOS 12.4 or later, saved configurations from combo ports (copper or fiber) are applied only to combo ports fiber medium. When downgrading from ExtremeXOS 12.4 or later to ExtremeXOS 12.3 or earlier, saved configurations from combo ports (copper or fiber) are silently ignored. Therefore, you need to reconfigure combo ports during such an upgrade or downgrade.

Example

The following example turns autonegotiation off for slot 2, port 1 at full duplex on a modular switch:

```
configure ports 2:1 auto off speed 100 duplex full
```

The following example turns autonegotiation off for port 2 with copper medium and a port speed of 100 Mbps at full duplex:

```
configure ports 2 medium copper auto off speed 100 duplex full
```

History

This command was first available in ExtremeXOS 10.1.

The medium parameter was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure ports auto on

configure ports *port_list* **{medium [copper|fiber]} auto on {[{speed** *speed***} {duplex [half | full]}] | [{duplex [half | full]} {speed** *speed***}]}**

Description

Enables autonegotiation for the particular port type.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
medium	Specifies the medium as either copper or fiber. Note: This parameter applies to combo ports only on the Summit family switches.
speed	Specifies the port speed as either 10, 100, 1000 (1 Gigabit), or 10000 (10 Gigabit) Mbps ports.
duplex [half]	Specifies half duplex; transmitting and receiving data one direction at a time.
duplex [full]	Specifies full duplex; transmitting and receiving data at the same time.

Default

Auto on for 1 Gbps ports.

Auto off for 10 Gbps ports.

Note

Summit X650-24t 10G BaseT ports (1-24) default to auto on. They will auto-negotiate to 1G or 10G based on port characteristics of the peer port. Users cannot configure speed and duplex setting for these ports.

Usage Guidelines

The type of ports enabled for autonegotiation are 802.3u for 10/100 Mbps ports or 802.3z for gigabit Ethernet ports.

Flow control on gigabit Ethernet ports is enabled or disabled as part of autonegotiation. If autonegotiation is set to off, flow control is disabled. When autonegotiation is turned on, flow control is enabled. (See the ExtremeXOS Concepts Guide for more detailed information on flow control on Extreme Networks devices.)

Summit Family Switches Only

When configuring combo ports you can specify the medium as copper or fiber. If the medium is not specified for combination ports then the configuration is applied to the current primary medium. The current primary medium is displayed in the Media Primary column of the show ports configuration command output.

Note

The keyword medium is used to select the configuration medium for combination ports. If the port_list contains any non-combination ports, the command is rejected.

When upgrading a switch running ExtremeXOS 12.3 or earlier software to ExtremeXOS 12.4 or later, saved configurations from combo ports (copper or fiber) are applied only to combo ports fiber medium. When downgrading from ExtremeXOS 12.4 or later to ExtremeXOS 12.3 or earlier, saved configurations from combo ports (copper or fiber) are silently ignored. Therefore, you need to reconfigure combo ports during such an upgrade or downgrade.

Example

The following command configures the switch to autonegotiate for slot 1, ports 2 and 4 on a modular switch:

```
configure ports 1:2, 1:4 auto on
```

The following command configures the switch to autonegotiate for port 2, with copper medium at a port speed of 100 Mbps at full duplex:

```
configure ports 2 medium copper auto on speed 100 duplex full
```

History

This command was first available in ExtremeXOS 10.1.

The speed and duplex parameters were added in ExtremeXOS 11.6.

The medium parameter was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure ports auto-polarity

configure ports *port_list* **auto-polarity [off | on]**

Description

Configures the autopolarity detection feature on the specified Ethernet ports.

Syntax Description

port_list	Specifies one or more ports on the switch.
off	Disables the autopolarity detection feature on the specified ports.
on	Enables the autopolarity detection feature on the specified ports.

Default

Enabled.

Usage Guidelines

This feature applies to only the 10/100/1000 BASE-T ports on the switch and copper medium on Summit combination ports.

When autopolarity is disabled on one or more Ethernet ports, you can verify that status by using the following command:

```
show ports information detail
```

Example

The following command disables the autopolarity detection feature on ports 5 to 7 on a Summit series switch:

```
configure ports 5-7 auto-polarity off
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms with the following exceptions:

- The Summit X650-24T with front panel ports (10GbaseT) changes auto polarity automatically and therefore does not support this command.
- The Summit X350, X450a, and X450e switches with the XGM2-2BT card available with 12.2, do not support this command.

configure ports display-string

configure ports *port_list* **display-string** *string*

Description

Configures a user-defined string for a port or group of ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
string	Specifies a user-defined display string.

Default

The null string is the default.

Usage Guidelines

The display string can be up to 15 characters. Display strings do not need to be unique for each port—you can assign the same string to multiple ports. For example, you could give all the ports that connected to a particular department a common display string.

The string is displayed in certain commands such as the show ports information command.

Note

Do not use a port number as a display string. For example, do not assign the display string "2" to port2.

Example

The following command configures the user-defined string corporate for port 1 on a stand-alone switch:

```
configure ports 1 display-string corporate
```

The following command configures the user-defined string corporate for ports 3, 4, and 5 on slot 1 on a modular switch:

```
configure ports 1:3-5 display-string corporate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure ports dwdm channel

configure port all | *port_list* **dwdm channel** *channel_number*

Description

Selects the DWDM channel frequency for the selected ports.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.
channel_number	Specifies the channel number, which corresponds to one of 102 available channel frequencies.

Default

Channel number – 21

Usage Guidelines

The following table lists the available frequencies and the channel number you must specify to select each frequency.

Table 16: TX Wavelengths and Channel Assignments for the Tunable DWDM XFP

TX Wavelength	Channel	TX Wavelength	Channel	TX Wavelength	Channel	TX Wavelength	Channel
1568.77 nm	11	1558.17 nm	24	1547.72 nm	37	1537.40 nm	50
1568.36 nm	1150	1557.77 nm	2450	1547.32 nm	3750	1537.00 nm	5050
1567.95 nm	12	1557.36 nm	25	1546.92 nm	38	1536.61 nm	51
1567.54 nm	1250	1556.96 nm	2550	1546.52 nm	3850	1536.22 nm	5150
1567.13 nm	13	1556.55 nm	26	1546.12 nm	39	1535.82 nm	52
1566.72 nm	1350	1556.15 nm	2650	1545.72 nm	3950	1535.43 nm	5250
1566.31 nm	14	1555.75 nm	27	1545.32 nm	40	1535.04 nm	53
1565.90 nm	1450	1555.34 nm	2750	1544.92 nm	4050	1534.64 nm	5350
1565.50 nm	15	1554.94 nm	28	1544.53 nm	41	1534.25 nm	54
1565.09 nm	1550	1554.54 nm	2850	1544.13 nm	4150	1533.86 nm	5450
1564.68 nm	16	1554.13 nm	29	1543.73 nm	42	1533.47 nm	55
1564.27 nm	1650	1553.73 nm	2950	1543.33 nm	4250	1533.07 nm	5550
1563.86 nm	17	1553.33 nm	30	1542.94 nm	43	1532.68 nm	56
1563.45 nm	1750	1552.93 nm	3050	1542.54 nm	4350	1532.29 nm	5650
1563.05 nm	18	1552.52 nm	31	1542.14 nm	44	1531.90 nm	57
1562.64 nm	1850	1552.12 nm	3150	1541.75 nm	4450	1531.51 nm	5750
1562.23 nm	19	1551.72 nm	32	1541.35 nm	45	1531.12 nm	58
1561.83 nm	1950	1551.32 nm	3250	1540.95 nm	4550	1530.72 nm	5850
1561.42 nm	20	1550.92 nm	33	1540.56 nm	46	1530.33 nm	59
1561.01 nm	2050	1550.52 nm	3350	1540.16 nm	4650	1529.94 nm	5950
1560.61 nm	21	1550.12 nm	34	1539.77 nm	47	1529.55 nm	60
1560.20 nm	2150	1549.72 nm	3450	1539.37 nm	4750	1529.16 nm	6050
1559.79 nm	22	1549.32 nm	35	1538.98 nm	48	1528.77 nm	61
1559.39 nm	2250	1548.91 nm	3550	1538.58 nm	4850	1528.38 nm	6150
1558.98 nm	23	1548.51 nm	36	1538.19 nm	49		
1558.58 nm	2350	1548.11 nm	3650	1537.79 nm	4950		

The supported channel numbers are not contiguous. If you specify a channel number that is not listed in the preceding table, the following error message appears:

```
Error: DWDM Channel configuration failed. Channel number 100 is out of
configurable range. The channel range for the Optical module in port <port
number> is 11 .. 6150.
```

If the optical module in one of the ports in the specified list does not support DWDM, the following error message is displayed:

```
Error: No TDWDM Optics on port <port number>.
```

If the optical module in one of the ports in the specified port list is not an Extreme supported optical module, the following error message is displayed:

```
Error: DWDM Channel configuration failed. Optical module is not Extreme
Networks certified. For DWDM channel configuration, Extreme Network Certified
DWDM module is required.
```

To display the configuration, use the show ports configuration or the show ports information detail command.

Example

The following command configures DWDM channel 21 on a modular port 1:1:

```
configure port 1:1 dwdm channel 21
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on: BlackDiamond 8800 switches with 10G8Xc, 10G4Xc, or 8900 - 10G8X-xl modules and S-10G1Xc option cards, and Summit X480 switches with VIM2-10G4X modules.

configure ports dwdm channel none

configure port all | *port_list* **dwdm channel none**

Description

Configures the default DWDM channel number.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Channel number - 21

Usage Guidelines

Use this command to configure the default DWDM channel number to the DWDM optical module inserted in the given port. This default channel number of 21 and will be mapped to the appropriate corresponding channel number of the vendor specific channel. If a non-tunable DWDM optic is present, then the DWDM configuration is silently removed from the software.

Example

The following command configures the default DWDM channel 21 on a supported modular port 1:1:

```
configure port 1:1 dwdm channel none
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8800 switches with 10G8Xc, 10G4Xc, or 8900 - 10G8X-xl modules and S-10G1Xc option cards, and Summit X480 switches with VIM2-10G4X modules.

configure ports eee enable

Complete

configure ports *port_list* enable eee [**on** | **off**]

Description

Enables or disables EEE on the physical layer.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
on	Specifies that the port advertises to its link partner that it is EEE capable at certain speeds
off	Specifies that the port speed as either 10, 100, 1000 (1 Gigabit), or 10000 (10 Gigabit) Mbps ports.

Default

Off.

Usage Guidelines

Use this command to enable EEE on the switch. **enable on** specifies that the port advertises to its link partner that it is EEE capable at certain speeds. If both sides, during auto-negotiation, determine that they both have EEE on and are compatible speed wise, they will determine other parameters (how long it takes to come out of sleep time, how long it takes to wake up) and the link comes up. During periods of non-activity, the link will shut down parts of the port to save energy. This is called LPI for low power idle. When one side sees it must send something, it wakes up the remote and then transmits.

Example

The following example turns autonegotiation off for slot 2, port 1 at full duplex on a modular switch:

```
config port <portlist> eee enable <on | off>
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on the following platforms:

BlackDiamond 8K Aspen Combo Card (v6). The POE phys can use EEE. When the product is released, it will support EEE.

BlackDiamond X 10G48T. Note that EEE is only supported at 10G on this card.

Summit Series. 670V-48T. Note that EEE is only supported at 10G on this switch.

440 – all copper ports will support EEE.

E4G400. Note that EEE is implemented through autogrEEEn.

E4G200. Note that EEE is implemented through autogrEEEn.

configure ports far-end-fault-indication

configure ports *port_list* **far-end-fault-indication [on | off]**

Description

Enables/disables far-end-fault-indication (FEFI).

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

FEFI is disabled by default.

Usage Guidelines

Use this command to enable FEFI. When enabled, FEFI signals to the remote end on detecting single link (RX) failure/recovery.

The command is supported on non-combination SFP ports, that is, ports 1-20 on the Summit X450a-24x, ports 1-12 on the Summit X480-24x, and all ports on the Summit X480-48x. If an attempt is made to use this command on combination ports, it is rejected.

Since the SFPs can be plugged and removed, a warning message is displayed in the syslog when a media type changes from FX/LX and FX to another media type. The warning message indicates that FEFI mode is enabled but is not useful for the new media type.

The current status is displayed in the show ports information detail command.

Example

The following command enables FEFI on port 1:

```
configure ports 1 far-end-fault-indication on
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on the Summit X450a-24x, X480-24x, and X480-48x platforms.

New configure ports isolation

configure ports *port_list* **isolation**[**on**|**off**]

Description

Enables isolation mode on a per-port basis .

Syntax Description

port_list	Specifies one or more ports, or slots and ports.
isolation	Specifies that Isolated ports are not allowed to inter-communicate.
on	Turns on isolation. Isolated ports are not allowed to inter-communicate.
off	Turns off isolation. This is the default setting.

Default

Isolation is off by default.

Usage Guidelines

Use this command to enable isolation mode on a per-port basis. You can issue the command on a single port or on a master port of a load share group. If you issue the command on a non-master port of a load share group the command will fail. When a port load share group is formed, all of the member ports assume the same isolation setting as the master port.

Example

The following command enables isolation mode on slot 1, ports 2 and 4 on a modular switch:

```
configure ports 1:2, 1:4 isolation on
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure ports mode

configure ports *port_list* **mode** {**lan** | **wan-phy**}

Description

Configures the 10G port in WAN PHY or LAN mode.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
lan	Specifies LAN mode
wan-phy	Specifies WAN PHY mode.

Default

LAN mode

Usage Guidelines

Use this command to configure either LAN or WAN PHY mode on a 10G port.

Example

The following command configures the WAN PHY option on a 10G port:

```
configure ports 1:3 mode wan-phy
```

History

This command was available in ExtremeXOS 12.3.

Platform Availability

This command is available on all 10G XFP ports only on Summit X480 series switches.

configure ports partition

configure ports [*port_list* | **all**] **partition** [**4x10G** | **1x40G**]

Description

Partitions a 40G port into a 4x10G or 1x40G mode.

Syntax Description

port_list	Specifies one or more ports.
all	Specifies all ports.
4x10G	Specifies partitioning ports into four 10G ports.
1x40G	Specifies partitioning ports into one 40G port.

Default

1x40G

Usage Guidelines

Use this command to partition a 40G port into either four 10G ports or one 40G port.

After you make a configuration change, you must do one of the following to apply the change:

- For BlackDiamond X8 series switches and BlackDiamond 8900-40G6X-xm modules, you can disable and then enable the affected slot, which applies the change without affecting other modules
- For BlackDiamond X8 series switches, BlackDiamond 8900-40G6X-xm modules and Summit X650 and X670 switches you can reboot the switch

Note

A configuration change is not applied until the affected slot is disabled and enabled or the switch is rebooted. Port will be removed from all vlans including "default" vlan.

If you attempt to configure a switch that does not support this command, the system returns the following error message:

```
ERROR: Port 1:1 does not support Port Partition mode
```

Example

The following example partitions port 6:1 into 4 10G ports:

```
configure ports 6:1 partition 4x10G
Warning: Configuration will be lost on ports 6:1
No configuration changes should be made on these ports until after
the next reboot.
This command will only take effect after save configuration and either reboot
switch or disable and enable slots 6.
Are you sure you want to continue? (y/N)
```

History

This command was available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8 switches, BlackDiamond 8900-40G6X-xm modules, Summit X650 and Summit X480 switches with a VIM3-40G3X option card, and X670V switches with a VIM4-40G4X option card.

configure ports preferred-medium

configure ports *port_list* **preferred-medium** [**copper** | **fiber**] {**force**}

Description

Configures the primary uplink port to use a preferred medium.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
copper	Specifies that the port should always use the 10/100/1000 BASE-T connection whenever a link is established even when a fiber link is also present.
fiber	Specifies that the port should always use the 1 gigabit Ethernet fiber connection whenever a link is established even when a copper link is also present.
force	Disables automatic failover. (If the specified preferred medium is not present, the link does not come up even if the secondary medium is present.)

Default

The default is fiber.

Usage Guidelines

You specify either copper or fiber for the specified port. The switch evaluates the copper energy and the fiber signal at the time these ports come online. If both are present, the configured preferred medium is chosen; however, if only one is present, the switch brings up that medium and uses this medium the next time the switch is rebooted. When a failure occurs and the uplinks are swapped, the switch continues to keep that uplink assignment until another failure occurs or until the assignment is changed using the CLI.

If you use the force option, it disables automatic failover. If you force the preferred-medium to fiber and the fiber link goes away, the copper link is not used, even if available.

To display the preferred medium, use the show port information detail command (you must use the detail variable to display the preferred medium).

Example

The following establishes copper port 4 as the primary uplink on the Summit series switch and fiber port 4 as the redundant uplink port:

```
configure ports 4 preferred-medium copper
```

Copper port 4 becomes the primary uplink until a failure occurs on that link. At that time, fiber port 4 becomes the primary uplink and copper port 4 becomes the redundant port. This assignment stays in place until the next failure.

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available only on Summit family switches and SummitStack.

configure ports redundant

configure ports *primaryPort* **redundant** *secondaryPort* **{link [on | off]}**

Description

Configures a software-controlled redundant port.

Syntax Description

primaryPort	Specifies one primary port or slot and port.
redundantPort *secondaryPort*	Specifies one or redundant port or slot and port.
link	Specifies state of link: on—Specifies keeping the redundant port active, but block trafficoff—Specifies forcing the link down on the redundant port  **Note** The default value is off.

Default

N/A.

Usage Guidelines

The first port specifies the primary port. The second port specifies the redundant port.

A software-controlled redundant port is configured to back up a specified primary port; both ports are on the same device. The redundant port tracks the link state of the associated primary port, and if the link on the primary port fails, the redundant port establishes a link and becomes active. You can back up a specified Ethernet port with a redundant, dedicated Ethernet port.

You configure the redundant link to be always physically up but logically blocked or to be always physically down. The default is off, or the redundant link is down.

The following criteria must be considered when configuring a software-controlled redundant port:

- You can configure only one redundant port for each primary port.
- You cannot have any Layer2 protocols configured on any of the VLANs that are present on the ports. (You will see an error message if you attempt to configure software redundant ports on ports with VLANs running Layer2 protocols.)
- The primary and redundant port must have identical VLAN memberships.
- The master port is the only port of a load-sharing group that can be configured as either a primary or redundant port. (The entire trunk must go down before the software-controlled redundant port takes effect.)
- Only one side of the link should be configured as redundant.

Example

The following command configures a software-controlled redundant port:

```
configure ports 1:3 redundant 2:3
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure ports tdm cable-length

configure ports *port_list* **tdm cable-length** [**short-haul** [**110** | **220** | **330** | **440** | **550** | **660**] | **long-haul line-build-out** [**0db** | **75db** | **150db** | **225db**]]

Description

Configures the cable length and receiver gain used on the specified time division multiplexing (TDM) ports. This option is applicable only for T1 ports.

Syntax Description

port_list	Specifies a port or group of ports.
short-haul	Short-haul cable length (less than 660 feet).
110	110 feet (Default).
220	220 feet.
330	330 feet.
440	440 feet.
550	550 feet.

660	660 feet.
long-haul	Long-haul cable length (greater than 660 feet).
line-built-out	Receiver gain in decibels.
0db	0 decibels.
75db	-7.5 decibels.
150db	-15 decibels.
225db	-22.5 decibels.

Default

The default selection for T1 is 110 feet.

Usage Guidelines

The cable length is given in decibels (long-haul) or feet (short-haul). A short-haul cable length is less than 660 feet, while a long-haul is greater than 660 feet. For a long-haul cable, the line built-out is the receiver gain in decibels.

This option is applicable only for T1 ports:

```
Error: TDM port cable length configuration is applicable onhly to T1 TDM
hierarchy.
```

Example

```
E4G-400.34 # configure port 35 tdm cable-length long-haul line-build-out 150db
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm clock-source

configure ports *port_list* **tdm clock-source** [**line** | **network** | [**adaptive** | **differential**] **ces** *ces_name*]

Description

Configures the transmit clock source of the specified TDM port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
adaptive	Adaptive clock recovery
differential	Differential clock recovery.
line	TDM line recovered clock (clock slave mode) (Default).
network	Network clock
ces_name	Alpha-numeric string identifying Circuit Emulation Service pseudo-wire recovered clock.

Default

The default clock-source is line.

Usage Guidelines

Currently the hardware limits the CES pseudo-wire recovered clock (Adaptive/Differential) to be supplied only to the port terminating the pseudo-wire. When the [adaptive | differential] switch is used, the backend EXOS process processing the command will return the following error message if the <port_list> parameter expands to multiple ports:

```
Error: The CES pseudo-wire <ces_name> cannot be used to supply clock to
multiple ports.
```

The backend EXOS process processing the command will return the following error message if the port specified in the <port_list> parameter does not terminate the CES pseudo-wire when the [adaptive | differential] switch is used:

```
Error: CES pseudo-wire <ces_name> does not terminate on port specified for
using Adaptive or Differential clock recovery.
```

Example

```
E4G-400#configure port 40 tdm clock-source network
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

configure ports tdm display-string

configure ports *port_list* **tdm display-string** *string*

Description

Configures a user-defined stsring on the specified TDM ports.

Syntax Description

port_list	Specifies a port or group of ports.
string	Character string to be associated with the ports.

Default

The null string is the default.

Usage Guidelines

This command can be used to associate a user-defined string to one or more TDM ports.

The display string can be up to 15 characters. Display strings do not need to be unique for each port—you can assign the same string to multiple ports. For example, you could give all the ports that connected to a particular department a common display string.

The string is displayed in certain commands such as the show ports information command.

Note

Do not use a port number as a display string. For example, do not assign the display string “2” to port2.

Example

```
E4G-200#configure pot 15 tdm display-string tdm-port-15
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm framing

configure ports *port_list* **tdm framing** [**d4** | **esf** | [**basic** | **mf**] {**crc4**} | **unframed**]

Description

Configures the framing used on the specified TDM ports.

Syntax Description

port_list	Specifies a port or group of ports.
d4	T1 Super-Frame.
esf	T1 Extended Super-Frame.
basic	E1 Basic Frame.
mf	E1 Multi-Frame.
crc4	E1 Framing with CRC-4.
unframed	Unframed (Default).

Default

The default selection for framing (E1/T1) is unframed.

Usage Guidelines

If framing options configured are not compatible with the chosen TDM hierarchy, the following error message will be printed, and the configuration will be rejected.

```
Error: TDM port framing option(s) specified on port 31 is incompatible with
the configured TDM hierarchy (T1).
```

or

```
Error: TDM port framing option(s) specified on port 31 is incompatible with
the configured TDM hierarchy (E1).
```

Example

```
E4G-200#configure port 15 tdm framing basic crc4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm idle-code

configure ports *port_list* **tdm idle-code** *idle_code*

Description

Configures the idle-code to be transmitted in the 4-bits telephony line signaling coding of the TDM channel (DS0 timeslots), when the channel is not connected.

Syntax Description

port_list	Specifies a port or group of ports.
tdm	Time Division Multiplexing.
idle-code	Idle code signaled when the timeslots of a port are not connected.
idle-code	Idle code value between 0 and 15 to be transmitted in the 4-bits telephony line signaling coding of the TDM channel. The default value is 15.

Default

The default idle-code is 15.

Usage Guidelines

If the line coding options configured are not compatible with the chosen TDM hierarchy, the following error message is printed, and the configuration is rejected:

```
Error: Idle Code cannot be configured on unframed TDM ports or on framed TDM
ports with signaling disabled.
```

Example

```
E4G400#configure port 35 tdm idle-code 15
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm line-coding

configure ports *port_list* **tdm line-coding** [**b8zs** | **hdb3** | **ami**]

Description

Configures the line coding scheme used on the specified time division multiplexing (TDM) ports.

Syntax Description

port_list	Specifies a port or group of ports.
tdm	Time Division Multiplexing.
line-coding	Zero code suppression variety of TDM ports.
b8zs	T1 B8ZS line coding (default for T1).
hdb3	E1 HDB3 line coding (default for E1).
ami	E1 AMI line coding.

Default

The default selection for T1 is B8ZS, and the default selection for E1 is HDB3.

Usage Guidelines

If the line coding options configured are not compatible with the chosen TDM hierarchy, the following error message will be printed and the configuration will be rejected:

```
Error: TDM port line coding configuration is incompatible with the configured
TDM hierarchy (T1).
```

or

```
Error: TDM port line coding configuration is incompatible with the configured
TDM hierarchy (E1).
```

Example

```
E4G400#configure port 35 tdm line-coding HDB3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm recovered-clock

configure ports *port_list* **tdm recovered-clock** {**quality-level** *value*}

Description

Configures the clock recovery on the specified TDM ports.

Syntax Description

tdm	Time Division Multiplexing.
recovered-clock	Clock recovered from the port.
quality-level	Quality level of the clock (T1 default is QL_ST3, E1 default is QL_SEC).
value	Value of quality level.

Default

The T1 default is QL_ST3, E1 default is QL_SEC.

Usage Guidelines

Use this command to configure the clock recovery on the specified TDM ports.

Example

```
E4G200#configure port 20 rdm recovered-clock quality-level QL_PRC
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports tdm signaling

configure ports *port_list* **tdm signaling** [**bit-oriented** | **robbed-bit** | **none**]

Description

Configures the signaling on the specified TDM ports.

Syntax Description

tdm	Time Division Multiplexing.
signaling	Signaling mode of the TDM ports.
port_list	Specifies one or more ports or slots and ports.
bit-oriented	E1 channel associated signaling mode.
robbed-bit	T1 robbed bit signaling.
none	No signaling (default).

Default

The default is no signaling (none).

Usage Guidelines

Configures the signaling on the specified TDM ports. If an incompatible setting is attempted, an error message is displayed:

```
Error: TDM port signaling option is incompatible with the configured TDM
hierarchy (T1).
```

or

```
Error: TDM port signaling option is incompatible with the configured TDM
hierarchy (E1).
```

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

configure ports tdm trunk-conditioning

configure tdm service circuit *service_name* **trunk-conditioning** *trunk_conditioning*

Description

Configures the trunk-conditioning value to be transmitted in the TDM channel (DS0 timeslots) during alarm conditions.

Syntax Description

service_name	TDM service name.
trunk-conditioning	Trunk conditioning signal for the timeslots of a port.
trunk_conditioning	Trunk conditioning value between 0 and 255 to be transmitted in the TDM channel during alarm conditions (default is 255, the range is 0-255).

Default

The default trunk-conditioning value is 255.

Usage Guidelines

Note the following error type:

```
Error: Trunk conditioning cannot be configured on unframed TDM ports.
```

Example

```
E4G-200.45 # configure tdm ser circuit test trunk-conditioning 255
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure ports wan-phy clocking

configure ports *port_list* **wan-phy clocking** [**line** | **internal**]

Description

Configures the clocking source for the specified WAN PHY port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
line	Specifies the port clocking is recovered from the received bitstream.
internal	Specifies the port clock is an internal, free-run clock.

Default

Line.

Usage Guidelines

Each WAN PHY port can be configured for the source it will use for clocking; line clocking uses received clocking and internal clocking uses an internal clock.

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

Example

The following command configures an LW XENPAK WAN PHY port to use the free-run internal clock:

```
configure ports 1:3 wan-phy clocking internal
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on 10G XFP ports on Summit X480 series switches and the Summit X450a series switches.

configure ports wan-phy framing

configure ports *port_list* **wan-phy framing** [**sonet** | **sdh**]

Description

Configures the framing type for the specified WAN PHY port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
sonet	Specifies the port framing type as SONET.
sdh	Specifies the port framing type as SDH.

Default

SONET

Usage Guidelines

Each WAN PHY port can be configured for framing that complies with either the SONET standard or the SDH standard. (SONET is primarily a U.S. standard, and SDH is the international version.)

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

Example

The following command configures an LW XENPAK WAN PHY port to use SONET framing:

```
configure ports 1:3 wan-phy framing sonet
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on all 10G ports on 10G XFP ports only on Summit X480 series switches, and Summit X450a series switches only.

configure ports wan-phy loopback

configure ports *port_list* **wan-phy loopback [line | off]**

For Summit X480 series switches only:

configure ports *port_list* **wan-phy loopback {off | internal | line}**

Description

Configures the loopback options for the specified WAN PHY port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
line	Specifies the signal received from the optical media returns back to the transmitter.
off	Specifies no loopback.
internal	Specifies that the signal received from the system is sent back to the system instead of the optical module.  Note This parameter is available only on Summit X480 series switches.

Default

Off.

Usage Guidelines

Configuring loopback on a WAN PHY port is used for diagnostics and network troubleshooting.

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

Example

The following command configures the loopback option on an WAN PHY capable port as off:

```
configure ports 1:3 wan-phy loopback off
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on 10G XFP ports only on Summit X480 series switches, and Summit X450a series switches only.

configure ports wan-phy trace-path

configure ports *port_list* **wan-phy trace-path** *id_string*

Description

Configures the path trace identifier for the specified WAN PHY port. Path trace is a maintenance feature of WAN PHY.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
id_string	Enter an alphanumeric 16-character string.

Default

The IEEE default value, which has no string representation.

Usage Guidelines

The path trace message is used for troubleshooting. One byte of the path overhead associated with each WAN PHY interface SONET/SDH frame carries information identifying the originating path terminating equipment (PTE).

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

Example

The following command configures a patch trace ID:

```
configure ports 1:3 wan-phy trace-path bear3
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on 10G XFP ports only on Summit X480 series switches, and Summit X450a series switches only.

configure ports wan-phy trace-section

configure ports *port_list* **wan-phy trace-section** *id_string*

Description

Configures the section trace identifier for the specified WAN PHY port. Section trace is a maintenance feature of WAN PHY.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
id_string	Enter an alphanumeric 16-character string.

Default

The IEEE default value, which has no string representation.

Usage Guidelines

The section trace message is used for troubleshooting. The J0 transmit octets allow a receiver to verify its continued connection to the transmitter; the J0 octet transports a 16-octet continuously repeating section trace message.

The first transmitted section trace octet is J0 transmit 15, which contains the delineation octet; the default value is 137 (hexadecimal 89). The last transmitted section trace octet is J0 transmit 0; the default value for J0 transmit 0 through 14 is 0.

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

Example

The following command configures a section trace ID for an LW XENPAK WAN PHY port:

```
configure ports 1:3 wan-phy trace-section beta4
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on 10G XFP ports only on Summit X480 series switches, and Summit X450a series switches only.

configure sharing add ports

configure sharing *port* **add ports** *port_list*

Description

Adds ports to a load-sharing, or link aggregation, group. By using link aggregation, you use multiple ports as a single logical port. Link aggregation also provides redundancy because traffic is redistributed to the remaining ports in the link aggregation group (LAG) if one port in the group goes down.

Syntax Description

port	Specifies the logical port for a load-sharing group or link aggregation group (LAG). This number also functions as the LAG Group ID.
port_list	Specifies one or more ports or slots and ports to be grouped in the LAG.

Default

N/A.

Usage Guidelines

Use this command to dynamically add ports to a load-sharing group, or link aggregation group (LAG).

Note

You must create a LAG (or load-sharing group) before you can configure the LAG. To create a LAG, see .

VMAN ports can belong to LAGs. If any port in the LAG is enabled for VMAN, all ports in the group are automatically enabled to handle jumbo size frames. Also, VMAN is automatically enabled on all ports of the untagged LAG.

To verify your configuration, use the show ports sharing command.

Note

All ports that are designated for the LAG must be removed from all VLANs prior to configuring the LAG.

Summit family switches

The following guidelines apply to link aggregation on the Summit family switches:

- On the Summit X670 in EXOS 15.2 and later, 32 ports per LAG are supported with LACP support and custom load sharing algorithm only. Additionally, a static LAG can contain up to 16 ports and an LACP LAG can include up to 32 ports.
- One static LAG can contain up to 8 ports.
- An LACP LAG can include a maximum of 16 ports; out of these up to 8 can be selected links and the remaining 8 will be standby links.
- A Health Check LAG can contain up to 8 ports.

BlackDiamond 8800 series switch and SummitStack only

The following guidelines apply to link aggregation on the BlackDiamond 8800 series switch:

- A static LAG can include a maximum of 8 ports.
- An LACP LAG can include a maximum of 16 ports; out of these up to 8 can be selected links and the remaining 8 will be standby links.
- A Health Check LAG can include a maximum of 8 ports.

BlackDiamond X8 series switch only

The following guidelines apply to link aggregation on the BlackDiamond X8 series switch:

- "With distributed ARP mode on, the maximum number of aggregator ports on BlackDiamond X8 is 16.
- With LACP support, but with custom load sharing algorithm only, 64 ports per LAG

Example

The following example adds port 3:13 to the LAG with the logical port 3:9 on a modular switch:

```
configure sharing 3:9 add port 3:13
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure sharing address-based custom

configure sharing address-based custom [ipv4 [L3-and-L4 | source-only | destination-only | source-and-destination] | hash-algorithm [xor | crc-16]]

Description

This command configures the part of the packet examined by the switch when selecting the egress port for transmitting link aggregation, or load-sharing, data.

Syntax Description

ipv4	Specifies that the user configuration applies to IPv4 traffic.
L3-and-L4	Indicates that the switch should examine the IP source and destination address and the TCP or UDP source and destination port number.
source-only	Indicates that the switch should examine the IP source address only.
destination-only	Indicates that the switch should examine the IP destination address only.
source-and-destination	Indicates that the switch should examine the IP source and destination address.
xor	Use exclusive-OR for load sharing hash computation.
crc-16	Use CRC-16 for load sharing hash computation.

Default

Algorithm: L3-and-L4

Hash algorithm: xor

Usage Guidelines

This command specifies the part of the packet header that the switch examines to select the egress port for address-based load-sharing trunks. The address-based load-sharing setting is global and applies to all load-sharing trunks, or LAGs, that are address-based and configured with a custom algorithm. You change this setting by issuing the command again with a different option.

The addressing information examined is based on the packet protocol as follows:

- IPv4 packets—Uses the source and destination IPv4 addresses and Layer4 port numbers as specified with this command.
- IPv6 packets—Uses the source and destination IPv6 addresses and Layer4 port numbers.
- MPLS packets—Uses the top, second, and reserved labels and the source and destination IP addresses.
- Non-IP Layer2—Uses the VLAN ID, the source and destination MAC addresses, and the ethertype.

The xor hash algorithm guarantees that the same egress port is selected for traffic distribution based on a pair of IP addresses, Layer4 ports, or both, regardless of which is the source and which is the destination.

For IP-in-IP and GRE tunneled packets, the switch examines the inner header to determine the egress port.

To verify your configuration, use the show ports sharing command.

Example

The following example configures the switch to examine the source IP address:

```
configure sharing address-based custom ipv4 source-only
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure sharing delete ports

configure sharing *port* **delete ports** *port_list*

Description

Deletes ports from a link aggregation, or load-sharing, group.

Syntax Description

port	Specifies the logical port for a load-sharing group or a link aggregation group (LAG). This number also functions as the LAG Group ID.
port_list	Specifies one or more ports or slots and ports to be grouped in the LAG.

Default

N/A.

Usage Guidelines

Use this command to dynamically delete ports from a load-sharing group, or link aggregation group (LAG). This command applies to static and dynamic link aggregation.

Example

The following example deletes port 3:12 from the LAG with the logical port, or LAG Group ID, 3:9:

```
configure sharing 3:9 delete port 3:12
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure sharing health-check member-port add tcp-tracking

configure sharing health-check member-port *port* **add tcp-tracking** *IP Address* {**tcp-port** *TC* **Port> frequency** *sec* **misses** *count*}

Description

Configures monitoring for each member port of a health check LAG.

Syntax Description

port	Specifies the member port.
IP Address	Specifies the IP address to monitor.
TCP Port	Specifies the TCP port to watch. The default is port 80.
sec	Specifies the frequency in seconds at which tracking takes place. The default is 10 seconds.
count	Specifies the number of misses before a connection loss is reported. The default is 3 misses.

Default

N/A.

Usage Guidelines

To configure a health check LAG, you first create a health check type of LAG using the enable sharing grouping command. Then use this command to configure the monitoring for each member port. You can configure each member port to track a particular IP address, but only one IP address per member port.

To display the monitoring configuration for a health check LAG, use the show sharing health-check command.

To display the link aggregation configured on a switch, use the show ports sharing command.

Example

The following commands configure four different member ports:

```
# configure sharing health-check member-port 10 add track-tcp 10.1.1.1 tcp-
port 23
# configure sharing health-check member-port 11 add track-tcp 10.1.1.2 tcp-
port 23
# configure sharing health-check member-port 12 add track-tcp 10.1.1.3
# configure sharing health-check member-port 13 add track-tcp 10.1.1.4
```

When the TCP port, seconds, or counts are not specified, they default to the values described in the Syntax Description.

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on all platforms.

configure sharing health-check member-port delete tcp-tracking

configure sharing health-check member-port *port* **delete tcp-tracking** *IP Address* **{tcp-port** *TC* **Port>}**

Description

Unconfigures monitoring for each member port of a health check LAG.

Syntax Description

port	Specifies the member port.
IP Address	Specifies the IP address.
TCP Port	Specifies the TCP port.

Default

N/A.

Usage Guidelines

Use this command to remove the monitoring configuration on the ports of a health check link aggregation group. Each port must be unconfigured separately, specifying the IP address and TCP port.

Example

The following command removes the configuration setting on port 12 that monitors IP address 10.1.1.3:

```
# configure sharing health-check member-port 12 delete track-tcp 10.1.1.3
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on all platforms.

configure sharing health-check member-port tcp-tracking

configure sharing health-check member-port *port* **[disable | enable] tcp-tracking**

Description

Enables or disables configured monitoring on a member port of a health check LAG.

Syntax Description

port	Specifies the member port.

Default

N/A.

Usage Guidelines

This disables/enables monitoring on a particular member port. When monitoring is disabled, the member port is added back to the LAG if it has not already been added. This allows a member port to be added back to LAG even though connectivity to the host is down.

Example

The following command disables port 12:

```
configure sharing health-check member-port 12 disable tcp-tracking
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on all platforms.

configure sharing lacp activity-mode

configure sharing *port* **lacp activity-mode** [**active** | **passive**]

Description

Configures whether the switch sends LACPDUs periodically (active) or only in response to LACPDUs sent from the partner on the link (passive).

Syntax Description

port	Specifies the master logical port for the LAG you are setting the activity mode for.
active	Enter this value to have the switch periodically sent LACPDUs for this LAG.
passive	Enter this value to have the switch only respond to LACPDUs for this LAG.

Default

Active.

Usage Guidelines

You must enable sharing and create the LAG prior to assigning this LACP activity mode.

Note

One side of the link must be in active mode in order to pass traffic. If you configure your side in the passive mode, ensure that the partner link is in LACP active mode.

To verify the LACP activity mode, use the show lacp lag <group-id> detail command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

In ExtremeXOS version 11.3, the activity mode cannot be changed from active.

Example

The following command changes the activity mode to passive for the specified LAG group ID:

```
configure sharing 5:1 lacp activity-mode passive
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure sharing lacp defaulted-state-action

configure sharing *port* **lacp defaulted-state-action** [**add** | **delete**]

Description

Configures a defaulted LAG port to be removed from the aggregator.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the default action for.
add	Enter this value to have the switch add defaulted ports to the aggregator for this LAG.
delete	Enter this value to have the switch delete defaulted ports from the aggregator for this LAG.

Default

Delete.

Usage Guidelines

You must enable sharing and create the LAG prior to configuring this LACP parameter.

You can configure whether you want a defaulted LAG port removed from the aggregator or added back into the aggregator. If you configure the LAG to remove ports that move into the default state, those ports are removed from the aggregator and the port state is set to unselected.

Note

In ExtremeXOS version 11.3, defaulted ports in the LAG are always removed from the aggregator; this is not configurable.

If you configure the LAG to add the defaulted port into the aggregator, the system takes inventory of the number of ports currently in the aggregator:

- If there are fewer ports in the aggregator than the maximum number allowed, the system adds the defaulted port to the aggregator (port set to selected and collecting-distributing).
- If the aggregator has the maximum ports, the system adds the defaulted port to the standby list (port set to standby).

Note

If the defaulted port is assigned to standby, that port automatically has a lower priority than any other port in the LAG (including those already in standby).

To verify the LACP default action, use the show lacp lag <group-id> detail command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

To force the LACP trunk to behave like a static sharing trunk, use this command to add ports to the aggregator.

Example

The following command deletes defaulted ports from the aggregator for the specified LAG group ID:

```
configure sharing 5:1 lacp defaulted-state-action delete
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure sharing lacp system-priority

configure sharing *port* **lacp system-priority** *priority*

Description

Configures the system priority used by LACP for each LAG to establish the station on which end assumes priority in determining those LAG ports moved to the collecting/distributing state of the protocol. That end of the LAG with the lowest system priority is the one that assumes control of the determination. This is optional; if you do not configure this parameter, LACP uses system MAC values to determine priority. If you choose to configure this parameter, enter a value between 1 and 65535.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the priority for.
priority	Enter the value you want for the priority of the system for the LACP. The range is 0 to 65535; there is no default.

Default

N/A.

Usage Guidelines

The LACP uses the system MAC values to assign priority to one of the systems, and that system then determines which LAG ports move into the collecting/distributing state and exchange traffic. That end of the LAG with the lowest system priority is the one that assumes control of the determination. If you wish to override the default LACP system priority for a specific LAG, use this command to assign that LAG a specific LACP priority. Enter a value between 0 and 65535.

You must enable sharing and create the LAG prior to assigning this LACP priority.

To verify the LACP system priority, use the show lacp command.

To change the system priority you previously assigned to a specific LAG, issue the configure sharing lacp system-priority using the new priority you want. To remove the assigned system priority entirely and use the LACP priorities, issue the configure sharing lacp system-priority using a value of 0.

Example

The following command assigns LAG 10 an LACP system priority of 3:

```
configure sharing 10 lacp system-priority 3
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

configure sharing lacp timeout

configure sharing *port* **lacp timeout [long | short]**

Description

Configures the timeout used by each LAG to stop transmitting once LACPDUs are no longer received from the partner link. You can configure this timeout value to be either 90 seconds, long, or 3 seconds, short.

Syntax Description

port	Specifies the master logical port for the LAG you are setting the timeout value for.
long	Enter this value to use 90 seconds as the timeout value.
short	Enter this value to use 3 seconds as the timeout value.

Default

Long.

Usage Guidelines

You must enable sharing and create the LAG prior to assigning this LACP timeout value.

To verify the LACP timeout value, use the show lacp lag <group-id> detail command.

If you attempt to enter a port number that is different that a LAG group ID, the system returns the following error message:

```
ERROR: LAG group Id does not exist
```

Note

In ExtremeXOS version 11.3, the timeout value is set to long and cannot be changed.

Example

The following command changes the timeout value for the specified LAG group ID to short:

```
configure sharing 5:1 lacp timeout short
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure sharing port-based key

configure sharing [*load_sharing_key* | **default**] **ports** *port_list*

Description

Sets the ***load_sharing_key*** for all ports in the ***port_list***.

Syntax Description

load_sharing_key	Specifies the load sharing key. Valid load sharing keys are in the range [0-15].
default	Unconfigures and resets the load sharing keys for ports in the ***port_list*** to default values.

port	Specifies the logical port for a load-sharing group.
port_list	Specifies one or more ports or slots and ports to be grouped in the LAG.

Default

N/A.

Usage Guidelines

This command sets the ***load_sharing_key*** for all ports in the ***port_list***. **default** unconfigures and resets the load sharing keys for ports in <port_list> to default values.

Configured load sharing keys are displayed in the output of the **show configuration hal** command.

Example

The following example causes all packets received on ports in slot 1 to choose the lowest port number in all aggregators for distribution.:

```
configure sharing port-based key 0 ports 1
```

Note

If you attempts to configure a load sharing key on a BDX module that is not configured to use packet-based hashing, the following error message is displayed.

```
Error: Slot 1 is not configured for packet - based fabric hashing.
```

Use the **configure forwarding fabric hash packet slot <slot>** command before configuring load sharing keys on a slot.

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

configure slot module

configure slot *slot* **module** *module_type*

Description

Configures a slot for a particular I/O module card in a modular switch. On a stack, this command configures a slot for a particular type of node.

Syntax Description

slot	Specifies the slot number.
module_type	Specifies the type of module or node for which the slot should be configured. The list of modules you can enter will vary depending on the type of switch and version of ExtremeXOS you are running. Certain modules are supported only with specific ExtremeXOS Technology Releases. On a stack, module type will be the list of switches that support SummitStack.

Default

If a slot has not been configured for a particular type of I/O module, then any type of module is accepted in that slot, and a default port and VLAN configuration is automatically generated.

Usage Guidelines

The configure sharing lacp timeout command displays different module parameters depending on the type of modular switch you are configuring and the version of ExtremeXOS running on the switch.

You can also preconfigure the slot before inserting the module card. This allows you to begin configuring the module and ports before installing the card in the chassis.

If a slot has not been configured for a particular type of I/O module, then any type of module is accepted in that slot, and a default port and VLAN configuration is automatically generated. If a slot is configured for one type of module, and a different type of module is inserted, the inserted module is put into a mismatch state, and is not brought online. To use the new module type in a slot, the slot configuration must be cleared or configured for the new module type.

Upon powering up the chassis, or when an I/O module is hot-swapped, ExtremeXOS automatically determines the system power budget and protects the switch from any potential overpower configurations. If power is available, ExtremeXOS powers on and initializes the module. When ExtremeXOS detects that a module will cause an overpower condition, the module remains powered down, and is not initialized. An entry is made to the system log indicating the condition.

On a stack, the module type must be a switch that supports SummitStack.

Example

The following command configures slot 2 for a 10/100/1000, 60-port, copper module:

```
configure slot 2 module G60T
```

The following command configures slot 2 for a Summit X450a-24t switch on a stack:

```
configure slot 2 module X450a-24t
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches and SummitStack.

configure slot restart-limit

configure slot *slot_number* **restart-limit** *num_restarts*

Description

Configures the number of times a slot can be restarted on a failure before it is shut down.

Syntax Description

slot_number	Specifies the slot number
num_restarts	Specifies the number of times the slot can be restarted. The range is from 0 to 10,000.

Default

The default is 5.

Usage Guidelines

This command allows you to configure the number of times a slot can be restarted on a failure before it is shut down. If the number of failures exceeds the restart-limit, the module goes into a “Failed” state. If that occurs, use the disable slot and enable slot commands to restart the module.

Example

The following command configures slot 2 on the switch to be restarted up to 3 times upon a failure:

```
configure slot 2 restart-limit 3
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on modular switches and SummitStack.

configure tdm hierarchy

configure tdm hierarchy [t1 | e1]

Description

Configures the time division multiplexing (TDM) hierarchy to be used by the physical layer carrier system of the switch. This can be either the North American hierarchy (e.g., T1, T3, OC-3, etc.) or the European hierarchy (E1, E3, STM-1, etc.). The configuration of the TDM hierarchy is a global configuration affecting all TDM ports present in the switch. When the TDM hierarchy is changed, the command warns the user with the following messages if any CES is already configured:

```
Message: A save and reboot are required before the changes take effect. Upon
reboot, TDM port parameters will be reset to defaults.
Error: Cannot change TDM hierarchy with CES pseudo-wire(s) configured. All
CES pseudo-wire(s) must be deleted before changing TDM hierarchy.
Error: Cannot change TDM hierarchy with TDM service(s) configured. All TDM
service(s) must be deleted before changing TDM hierarchy.
```

Syntax Description

tdm	Time Division Multiplexing.
hierarchy	Physical layer carrier system.
t1	T1, North American digital carrier hierarchy.
e1	E1, European digital carrier hierarchy (default).

Default

The default hierarchy is E1.

Usage Guidelines

Recommended sequence of CLI commands for changing TDM hierarchy (e.g., changing E1 (default) to T1):

- Before reboot:

```
configure tdm hierarchy t1
save configuration
reboot
```

Example

```
E4G-200#delete ces all
E4G-200#delete tdm service circuit all
E4G-200#configure tdm hierarchy t1
```

```
A Save and Reboot are required to make the changes effect at the next reboot
of this switch. Upon reboot, TDM port parameters will be reset to defaults
E4G-200#save configuration
E4G-200#reboot
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure tdm service circuit add port

configure tdm service circuit *service_name* **add port** *port* {**time-slots** [*time_slot_list* | **all**]}

Description

Adds a **<port, time-slots>** or **<port>** to the specified TDM service.

Syntax Description

tdm	Time Division Multiplexing.
service	Provider provisioned TDM service.
circuit	TDM circuit service.
service_name	TDM service name.
add	Add specified TDM circuit as a service.
port	TDM port number.
time_slot_list	TDM time slot list.
all	All TDM time slots.

Default

N/A.

Usage Guidelines

A structure-aware TDM circuit can be created by adding time slots from a framed T1/E1 port to the service. A structure-agnostic TDM bit-stream is created by adding an unframed T1/E1 port to the service.

Adding an unframed TDM port to a bundle would not require the time-slots token. The command would be configure tdm service circuit <service_name> add port <port>. The time-slots token is required for framed ports only. The following error message will be displayed for T1. For E1 the error message is not required since the CLI performs the range check (range is 1-32).

```
Error: Time slot(s) specified is outside the valid range. The valid time
slots range for T1 is [1-24].
```

If the user specifies time-slot token for an unframed port, the following error is displayed.

```
Error: Time slot(s) cannot be specified for an unframed T1 port.
```

or

```
Error: Time slot(s) cannot be specified for an unframed E1 port.
```

Example

```
E4G-400#configure port 35 tdm framing basic crc
E4G-400#createt dm service circuit service-test
E4G-400#configure tdm service circuit service-test add port 35 time-slots all
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure tdm service circuit delete port

configure tdm service circuit *service_name* **delete port** *port*

Description

Deletes a **<port, time-slots>** or **<port>** to the specified TDM service.

Syntax Description

service_name	TDM service name.
delete	Delete specified TDM circuit as a service.
port	TDM port number.

Default

N/A.

Usage Guidelines

A structure-aware TDM circuit can be created by adding time slots from a framed T1/E1 port to the service. A structure-agnostic TDM bit-stream is created by adding an unframed T1/E1 port to the service.

Adding an unframed TDM port to a bundle would not require the time-slots token. The command would be configure tdm service circuit <service_name> add port <port>. The time-slots token is required for framed ports only. The following error message will be displayed for T1. For E1 the error message is not required since the CLI performs the range check (range is 1-32).

```
Error: Time slot(s) specified is outside the valid range. The valid time
slots range for T1 is [1-24].
```

If the user specifies time-slot token for an unframed port, the following error is displayed.

```
Error: Time slot(s) cannot be specified for an unframed T1 port.
```

or

```
Error: Time slot(s) cannot be specified for an unframed E1 port.
```

Example

```
E4G200#configure tdm service circuit service-test delete port 35
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure tdm service circuit seized-code

configure tdm service circuit *service_name* **seized-code** *seized_code*

Description

Configures the seized-code to be transmitted in the 4-bits telephony line signaling coding of the TDM channel (DS0 timeslots), when the channel is connected.

Syntax Description

seized_code	The seized code value between 0 and 15 to be transmitted in the 4-bits telephony line signaling coding of the TDM channel (default is 15).

Default

The default seized-code is 15.

Usage Guidelines

Note the following error type:

```
Error: Seized Code cannot be configured on unframed TDM ports or on framed
TDM ports with signaling disabled.
```

Example

```
config ports 2 tdm seized-code 12
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

create ces psn

create ces *ces_name* **psn** [**mef8** | **udp** | **mpls**]]

Description

Creates a circuit emulation service (CES) pseudo-wire with the specified name and packet switched network (PSN) tunnel type.

Syntax Description

ces	Circuit emulation service.
ces_name	Alphanumeric string identifying the CES pseudo-wire.
mef8	MEF-8 PSN tunnel for the CES pseudo-wire.
udp	IPv4/UDP PSN tunnel for the CES pseudo-wire.
mpls	MPLS tunnel for the CES pseudo-wire.

Default

N/A.

Usage Guidelines

Use this command to create a CES pseudo-wire, specifying the name and PSN tunnel type.

Example

```
#create ces ces-test psn mpls
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

create mirror to port

create mirror *mirror_name* {**to** [**port** *port* | **port_list** *port_list* **loopback-port** *port*] { **remote-tag** *rtag* }} {**description** *mirror-desc*}

Description

Creates a named mirror instance with an optional description, and optional "to port" definition.

Syntax Description

mirror_name	Specifies the mirror name.
port	Specifies the mirror output port.
port_list	Specifies the list of ports where traffic is to be mirrored.

loopback-port	Specifies an otherwise unused port required when mirroring to a port_list. The loopback-port is not available for switching user data traffic.
port	Specifies a single loopback port that is used internally to provide this feature.
remote-tag	Specifies the value of the VLAN ID used by the mirrored packets when egressing the monitor port.
description	Specifies a description of the named mirror instance.
mirror-desc	The specified mirror description.

Default

Disabled.

Usage Guidelines

Use this command to create a named mirror instance with an optional description and optional "to port" definitions. You can create 15 named instances (the instance "DefaultMirror" is created automatically).

Example

The following example creates a mirror instance on port 3, slot 4 :

```
create mirror to port 3:4
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

create mlag peer

create mlag peer *peer_name*

Description

Creates an MLAG peer switch association structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.

Default

N/A.

Usage Guidelines

This command creates an MLAG peer switch association structure.

You must use a unique name for the peer switch. If you attempt to create an MLAG peer with a name that already exists, the following error message is displayed:

```
ERROR: MLAG peer with specified name already exists
```

Example

The following command creates a peer switch structure switch101:

```
create mlag peer switch101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

create tdm service circuit

create tdm service circuit *service_name*

Description

Creates a TDM service with the specified name.

Syntax Description

service	Provider provisioned TDM service.
circuit	TDM circuit service.
service_name	TDM service name.

Default

N/A.

Usage Guidelines

Currently, only TDM circuit services are supported. A structure-aware TDM circuit can be created by adding time slots of a framed T1/E1 port to the service. A structure-agnostic TDM bit-stream is created by adding an unframed T1/E1 port to the service.

Example

```
#create tdm service circuit service-test
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

delete ces

delete ces [*ces_name* | **all**]

Description

Deletes the specified circuit emulation service (CES) pseudo-wire.

Syntax Description

ces	Circuit emulation service.
ces_name	Alphanumeric string identifying the CES pseudo-wire.
all	All CES pseudo-wires in the switch.

Default

N/A.

Usage Guidelines

Use this command to delete a specific CES pseudo-wire, or to delete all CES pseudo-wires in the switch.

Example

This example deletes all CES pseudo-wires in the switch:

```
delete ces all
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

New delete mirror name

delete mirror *mirror_name* | **all**]

Description

Deletes a user-defined mirroring instance, and unconfigures the "DefaultMirror" instance .

Syntax Description

mirror_name	Specifies a specific mirror name to delete.
all	Specifies that you delete all named mirror instances.

Default

Disabled.

Usage Guidelines

Use this command to delete a user-defined mirroring instance, and unconfigures the "DefaultMirror" instance. Mirroring instances must be in the "disabled" state in order to be deleted. The "all" command will fail if any mirroring instance is in the "enabled" state.

Example

The following example deletes all mirroring instances:

```
delete mirror all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

delete mlag peer

delete mlag peer *peer_name*

Description

Deletes a peer switch from the MLAG structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.

Default

N/A.

Usage Guidelines

This command deletes an MLAG peer switch from the association structure.

Before you delete an MLAG peer switch, you must disable it. Otherwise the following error message is displayed:

```
ERROR: MLAG ports currently associated with peer. First disable MLAG ports
using "disable mlag port <port>" before deleting MLAG peer
```

Example

The following command deletes a peer switch structure switch101:

```
delete mlag peer switch101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

delete tdm service circuit

delete tdm service circuit [*service_name* | **all**]

Description

Deletes the specified TDM service.

Syntax Description

service	Provider provisioned TDM service.
circuit	TDM circuit service.
service_name	TDM service name.
all	All TDM services.

Default

N/A.

Usage Guidelines

Use this command to delete a specific TDM service or to delete all TDM services.

Example

To delete all TDM services, enter the following command:

```
delete tdm service circuit all
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

disable ces

disable ces [*ces_name* | **all**]

Description

Disables the administrative status of the specified circuit emulation service (CES) pseudo-wire.

Syntax Description

ces	Circuit emulation service.
ces_name	Alphanumeric string identifying the CES pseudo-wire.
all	All CES pseudo-wires in the switch.

Default

The default administrative state is enable.

Usage Guidelines

Use this command to disable a specific CES pseudo-wire, or to disable all CES pseudo-wires in the switch.

Example

This example disables all CES pseudo-wires in the switch:

```
disable ces all
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

disable edp ports

disable edp ports [*ports* | **all**]

Description

Disables the Extreme Discovery Protocol (EDP) on one or more ports.

Syntax Description

ports	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

You can use the disable edp ports command to disable EDP on one or more ports when you no longer need to locate neighbor Extreme Networks switches.

Example

The following command disables EDP on slot 1, ports 2 and 4 on a modular switch:

```
disable edp ports 1:2, 1:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable flow-control ports

disable flow-control [**tx-pause** {**priority** *priority*} | **rx-pause** {**qosprofile** *qosprofile*}] **ports** [**all** | *port_list*]

Description

Disables specified flow control configurations.

Syntax Description

tx-pause	Specifies transmission pause processing.
priority	Specifies all priorities or single priorities--dot1p priority for tagged packets and internal priority for untagged packets. (Used with priority flow control only)
rx-pause	Specifies reception pause processing.

qosprofile	Specifies a QoS profile (“qp1” “qp2” “qp3” “qp4” “qp5” “qp6” “qp7” “qp8”) to pause for priority flow control packet reception. (Used with priority flow control only)
all	Specifies all ports or slots.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

IEEE 802.3x-Flow Control

Use this command to disable the processing of IEEE 802.3x pause flow control messages received from the remote partner. Disabling rx-pause processing avoids dropping packets in the switch and allows for better overall network performance in some scenarios where protocols such as TCP handle the retransmission of dropped packets by the remote partner.

To disable RX flow-control, TX flow-control must first be disabled. Refer to the disable flow-control ports command. If you attempt to disable RX flow-control with TX flow-control enabled, an error message is displayed.

IEEE 802.1Qbb-Priority Flow Control

Use this command to disable the processing of IEEE 802.1Qbb priority flow control messages received from the remote partner. Disabling TX stops the port from transmitting PFC packets for that priority, regardless of congestion. Disabling RX stops the processing of PFC packets received on that port for the specific QoS profile.

IEEE 802.3x

The following command disables the tx flow-control feature on ports 5 through 7 on a Summit switch:

disable flow-control tx-pause ports 5-7

IEEE 802.1Qbb

The following command disables TX for priority 3 on port 3 on a Summit X650 switch:

```
disable flow-control tx-pause priority 3 ports 3
```

The following command disables RX for QoS profile qp4 on port 6 of a Summit X650 switch:

```
disable flow-control rx-pause qosprofile qp4 port 6
```

History

This command was first available in ExtremeXOS 12.1.3.

The priority function (PFC) was added in ExtremeXOS 12.5.

Platform Availability

IEEE 802.3x

The basic TX-pause and RX-pause functions of this command are available on the BlackDiamond X8 switches, BlackDiamond 8000 series modules and the Summit family switches.

IEEE 802.1Qbb

The priority function (PFC) is available only on 10G ports and in some cases on specific models of the following newer platforms indicated by the part number:

BlackDiamond 8900-10G24X-c modules (manufacturing number 800397-00) BlackDiamond 8900-40G6X-xm modules, 40G ports and 10G ports when in 4x10 partition mode BlackDiamond X8 switches Summit X460 switches 10G ports Summit X650-24t switches (manufacturing number 800394-00) Summit X650-24x switches (manufacturing number 800395-00) Summit X650 VIM-10G8X (manufacturing number 800396-00) Summit X670 switches, 10G ports Summit X670V switches, 10G and 40G ports

disable ip-fix ports

disable ip-fix ports [*port_list* | **all**]

Description

Disables IPFIX metering on the port.

Syntax Description

port_list	Specifies the ports.
all	Specifies all ports.

Default

The default is disabled.

Usage Guidelines

Use this command to turn off IPFIX metering on a port.

Example

The following command disables the IPFIX metering support on the port:

```
disable ip-fix ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

disable jumbo-frame ports

disable jumbo-frame ports [**all** | *port_list*]

Description

Disables jumbo frame support on a port.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to disable jumbo frames on individual ports.

Example

The following command disables jumbo frame support on a BlackDiamond 8810 switch:

```
disable jumbo-frame ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable learning port

disable learning {drop-packets | forward-packets} port [*port_list* | **all**]

Description

Disables MAC address learning on one or more ports for security purposes.

Syntax Description

port	Specifies the port.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports and slots.
drop-packets	Specifies that packets with unknown source MAC addresses be dropped. When disable learning is configured, this is the default behavior.
forward-packets	Specifies that packets with unknown source MAC addresses be forwarded.

Default

Enabled.

Usage Guidelines

Use this command in a secure environment where access is granted via permanent forwarding databases (FDBs) per port.

Example

The following command disables MAC address learning on port 4:3 on a modular switch:

```
disable learning ports 4:3
```

History

This command was first available in ExtremeXOS 10.1.

Support for drop-packets and forward-packets options on the X150, X250, X350, and BlackDiamond 8800 switches was included in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

 disable mirror

disable mirror *mirror_name* | **all**

Description

Disables a mirror instance .

Syntax Description

mirror_name	Specifies the mirror name.
all	Specifies all mirror instance are deleted.

Default

Disabled.

Usage Guidelines

Use this command to disable mirrors. Disabling an instance only changes the state, its configuration remains as defined (a change from current operation, which loses some configuration parameters).

Example

The following example disable a mirror instance named "mirror1" :

```
disable mirror mirror1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

disable mlag port

disable mlag port *port*

Description

Removes a local port or LAG from an MLAG.

Syntax Description

port	Specifies a local member port of the MLAG group.

Default

N/A.

Usage Guidelines

Use this command to remove a local port or LAG from an MLAG.

Example

The following command binds the local member port 2 to the peer switch switch101with an identifier of 101:

```
disable mlag port 2
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable network-clock ptp end-to-end-transparent ports

disable network-clock ptp end-to-end-transparent ports *port_list*

Description

Disable PTP end-to-end-transparent clock functionality (1-step PHY timestamp) on the specified ports.

Syntax Description

port_list	Specifies a port or group of ports.

Default

N/A.

Usage Guidelines

Use this command to disable 1-step transparent clock on the specified ports.

Example

The following example disables end-to-end-transparent clock on front panel port 2:

```
disable network-clock ptp end-to-end-transparent ports 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

disable network-clock sync-e

disable network-clock sync-e port [*port_list* | **all**]

Description

Disables synchronous Ethernet (SyncE) on port(s).

Syntax Description

port_list	Specifies a port or group of ports
all	Specifies all ports

Default

Disabled.

Usage Guidelines

Use this command to disable SyncE on one or more ports.

Example

The following command disables SyncE on port 2:

```
disable network-clock sync-e port 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24X and X460-48X switches and on E4G-200 and E4G-400 switches.

disable port

disable port [*port_list* | **all**]

Description

Disables one or more ports on the switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command for security, administration, and troubleshooting purposes.

When a port is disabled, the link is brought down.

Example

The following command disables ports 3, 5, and 12 through 15 on a stand-alone switch:

```
disable ports 3,5,12-15
```

The following command disables slot 1, ports 3, 5, and 12 through 15 on a modular switch:

```
disable port 1:3,1:5,1:12-1:15
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable ports tdm

disable ports [*port_list* | **all**] **tdm**

Description

Disables the specified TDM ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Disable all TDM ports on the switch.
tdm	Indicates that command applies to time division multiplexing (TDM) ports.

Default

The default is enable.

Usage Guidelines

This command disables TDM ports only and has no effect on Ethernet ports.

```
Error: There are no valid TDM ports in the specified port list.
```

Example

```
E4G200#disable port 15 tdm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

configure slot module

configure slot *slot* **module** *module_type*

Description

Configures a slot for a particular I/O module card in a modular switch. On a stack, this command configures a slot for a particular type of node.

Syntax Description

slot	Specifies the slot number.
module_type	Specifies the type of module or node for which the slot should be configured. The list of modules you can enter will vary depending on the type of switch and version of ExtremeXOS you are running. Certain modules are supported only with specific ExtremeXOS Technology Releases. On a stack, module type will be the list of switches that support SummitStack.

Default

If a slot has not been configured for a particular type of I/O module, then any type of module is accepted in that slot, and a default port and VLAN configuration is automatically generated.

Usage Guidelines

The configure sharing lacp timeout command displays different module parameters depending on the type of modular switch you are configuring and the version of ExtremeXOS running on the switch.

You can also preconfigure the slot before inserting the module card. This allows you to begin configuring the module and ports before installing the card in the chassis.

If a slot has not been configured for a particular type of I/O module, then any type of module is accepted in that slot, and a default port and VLAN configuration is automatically generated. If a slot is configured for one type of module, and a different type of module is inserted, the inserted module is

put into a mismatch state, and is not brought online. To use the new module type in a slot, the slot configuration must be cleared or configured for the new module type.

Upon powering up the chassis, or when an I/O module is hot-swapped, ExtremeXOS automatically determines the system power budget and protects the switch from any potential overpower configurations. If power is available, ExtremeXOS powers on and initializes the module. When ExtremeXOS detects that a module will cause an overpower condition, the module remains powered down, and is not initialized. An entry is made to the system log indicating the condition.

On a stack, the module type must be a switch that supports SummitStack.

Example

The following command configures slot 2 for a 10/100/1000, 60-port, copper module:

```
configure slot 2 module G60T
```

The following command configures slot 2 for a Summit X450a-24t switch on a stack:

```
configure slot 2 module X450a-24t
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches and SummitStack.

disable slot

disable slot *slot* **| FM-1 | FM-2 | FM-3 | FM-4> {offline}**

Description

Disables slot and leaves that module in a power down state. These can be either regular slots or fabric slots (FM-1 through FM-4).

Syntax Description

slot	Specifies the slot to be disabled.
offline	Specifies that the slot be disabled offline. **Note** This variable is supported only on the BlackDiamond 8800 series switches; that is, those modular switches that support offline diagnostics.

Default

Enabled.

Usage Guidelines

This command allows the user to disable a slot. When the user types this command, the I/O card in that particular slot number is brought down, and the slot is powered down. The LEDs on the card go OFF.

When a fabric slot (e.g., FM-1) is disabled, it is powered off and the bandwidth it provides is unavailable. Disabling an active fabric slot reroutes the switch fabric traffic before powering off the inserted FM blade. Thus, if there are four active fabric modules when one is disabled, there should be no traffic loss.

A disabled slot can be re-enabled using the enable slot command. When the slot is re-enabled, the software on the I/O module is updated to match the software on the primary MSM/MM.

The show slot command, if invoked after the user disables the slot, shows this slot state as “Power Off/Disabled.”

If there is no I/O card present in a slot when the user disables the slot, the slot still goes to the “Disable” state. If a card is inserted in a slot that has been disabled, the card does not come up and stays in the “Power Off/Disabled” state until the slot is enabled by using the enable slot command. below.

If you do not save the configuration before you do a switch reboot, the slot will be re-enabled upon reboot. If you save the configuration after disabling a slot, the slot will remain disabled after a reboot.

On Power over Ethernet (PoE) modules, disabling a slot also disables any inline power that in flowing to that slot.

BlackDiamond 8800 series switch only

This command applies only to the data, or I/O ports on slots holding an MSM. The slots holding an MSM on the BlackDiamond 8810 switch are 5 and possibly 6; the slots holding an MSM on the BlackDiamond 8806 switch are 3 and possibly 4. Use the offline parameter to run the diagnostics offline.

Example

The following command disables slot 5 on the switch:

```
disable slot 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

disable smartredundancy

disable smartredundancy *port_list*

Description

Disables the Smart Redundancy feature.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

The Smart Redundancy feature works in concert with the software-controlled redundant feature. When Smart Redundancy is disabled, the switch attempts only to reset the primary port to active if the redundant port fails. That is, if you disable Smart Redundancy, the traffic does not automatically return to the primary port once it becomes active again; the traffic continues to flow through the redundant port even after the primary port comes up again.

Example

The following command disables the Smart Redundancy feature on ports 1:1 to 1:4 on a modular switch:

```
disable smartredundancy 1:1-4
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable snmp traps port-up-down ports

disable snmp traps port-up-down ports [*port_list* | **all**]

Description

Disables port up/down trap reception for specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command to stop receiving SNMP trap messages when a port transitions between being up and down.

Example

The following command stops ports 3, 5, and 12 through 15 on a stand-alone switch from receiving SNMP trap messages when the port goes up/down:

```
disable snmp traps port-up-down ports 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.6.

Platform Availability

This command is available on all platforms.

enable ces

enable ces [*ces_name* | **all**]

Description

Enables the administrative status of the specified circuit emulation service (CES) pseudo-wire.

Syntax Description

ces_name	Alphanumeric string identifying the CES pseudo-wire.
all	All CES pseudo-wires in the switch.

Default

The default administrative state is enable.

Usage Guidelines

Use this command to enable a specific CES pseudo-wire, or to enable all CES pseudo-wires in the switch.

Example

This example enables all CES pseudo-wires in the switch:

```
enable ces all
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

enable | disable ces peer ipaddress

[enable | disable] ces *ces_name* **peer ipaddress** *ipaddress*

Description

Enables/disables an IPv4 peer (far-end) for the specified CES pseudo-wire. This command only supports to MPLS PSN transport CES pseudo-wires.

This command enables or disables a specific PW configured for the specified ces_name. By default, the PW is enabled when it is configured. When a PW is disabled, the switch signals preferred forwarding status of Standby to the PW peer and the switch ceases transmitting or receiving data packets over the PW. The PW label is not withdrawn. Packets may still be sent and received over the PW's G-ACh. When the PW is re-enabled, the switch signals preferred forwarding status Active to the PW peer.

Syntax Description

ces	Circuit Emulation Service
ces_name	Alphanumeric string identifying the CES pseudo-wire.
peer	Enalbe/disable the peer of the CES pseudo-wire.
ipaddress	IPv4 Address; type=ipv4_t

Default

The default administrative state is enable.

Usage Guidelines

Use this command to enable/disable an IPv4 peer (far-end) for the specified CES pseudo-wire. This command only supports to MPLS PSN transport CES pseudo-wires.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

enable edp ports

enable edp ports [*ports* | **all**]

Description

Enables the Extreme Discovery Protocol (EDP) on one or more ports.

Syntax Description

ports	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

On a modular switch or SummitStack, <ports> can be a list of slots and ports. On a stand-alone switch, <ports> can be one or more port numbers. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview

EDP is useful when Extreme Networks switches are attached to a port.

The EDP is used to locate neighbor Extreme Networks switches and exchange information about switch configuration. When running on a normal switch port, EDP is used to by the switches to exchange topology information with each other. Information communicated using EDP includes the following:

- Switch MAC address (switch ID)
- Switch software version information
- Switch IP address
- Switch VLAN information
- Switch port number
- Switch port configuration data: duplex, and speed

Example

The following command enables EDP on slot 1, port 3 on a modular switch:

```
enable edp ports 1:3
```

History

This command was first available in ExtremeXOS 10.1.

The port configuration data was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable flow-control ports

enable flow-control [**tx-pause** {**priority** *priority*} | **rx-pause** {**qosprofile** *qosprofile*}] **ports** [**all** | *port_list*]

Description

Enables flow control or priority flow control (PFC) on the specified ports.

Syntax Description

tx-pause	Specifies transmit pause frames.
priority	Specifies all priorities or single priorities--dot1p priority for tagged packets and internal priority for untagged packets. (Used with priority flow control only)
rx-pause	Specifies received pause frames.
qosprofile	Specifies a QoS profile (“qp1” “qp2” “qp3” “qp4” “qp5” “qp6” “qp7” “qp8”) to pause for priority flow control packet reception. (Used with priority flow control only)
all	Specifies all ports or slots.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

With autonegotiation enabled, the Summit family switches and the BlackDiamond 8800 series switches advertise the ability to support pause frames. This includes receiving, reacting to (stopping transmission), and transmitting pause frames. However, the switch does not actually transmit pause frames unless it is configured to do so.

IEEE 802.3x-Flow Control

IEEE 802.3x flow control provides the ability to configure different modes in the default behaviors.

Use this command to configure the switch to transmit link-layer pause frames when congestion is detected. This stops all traffic on the configured port when there is buffer congestion for any traffic type. Use it also to configure the switch to return to the default behavior of processing received pause frames.

To enable TX flow-control, RX flow-control must first be enabled. If you attempt to enable TX flow-control with RX flow-control disabled, an error message is displayed.

IEEE 802.1Qbb-Priority Flow Control

IEEE 802.1Qbb priority flow control provides the ability to configure the switch to transmit link-layer pause frames to stop only a portion of the traffic when congestion is detected.

When IEEE 802.1Qbb priority flow control is enabled on a port, IEEE 802.3x pause functionality is no longer available on that port.

Priority is established for reception of PFC packets with a QoS profile value on the ExtremeXOS switch and for transmission with a priority value added to the PFC packet.

- QoS profile—Ingress traffic is associated with a QoS profile for assignment to one of eight hardware queues in the system that define how the traffic flows with respect to bandwidth, priority, and other parameters. By default, there are two QoS profiles (QP1 and QP8) defined in these supported platforms and PFC works with this default. To segregate the ingress traffic with more granularity, you will want to define other QoS profiles.
- Priority—The traffic that is paused is based on the priority bits in the VLAN header for tagged packets. You can specify this transmit priority independently from the QoS profile to associate it with the reception of a PFC packets thus giving flexibility in the configuration of the network.

It is suggested that the priority in the VLAN header match the QoS profile priority when traffic ingresses at the edge of the network so that the traffic can be more easily controlled as it traverses through the network.

Note

On Summit X670 and X670V switches, the PFC feature does not support fabric flow control messages on alternate stack ports or SummitStack-V80 native stack ports.

IEEE 802.3x

The following command enables the TX flow-control feature on ports 5 through 7 on a Summit switch:

```
enable flow-control tx-pause ports 5-7
```

IEEE 802.1Qbb

The following command enables the priority flow control feature on a Summit switch:

```
enable flow-control tx-pause priority 3 ports 2
```

History

This command was first available in ExtremeXOS 12.1.3.

IEEE 802.1Qbb priority flow control (PFC) was added in ExtremeXOS 12.5.

Platform Availability

IEEE 802.3x

The basic TX-pause and RX-pause functions of this command are available on BlackDiamond X8 switches, BlackDiamond 8000 series modules and Summit family switches.

IEEE 802.1Qbb

The priority function (PFC) is available only on 10G ports and on specific models of the following newer platforms indicated by the part number:

- BlackDiamond X8 switches
- BlackDiamond 8900-10G24X-c modules (manufacturing number 800397-00)
- BlackDiamond 8900-40G6X-xm modules, 40G ports and 10G ports when in 4x10 partition mode
- Summit X460 switches 10G ports
- Summit X650-24t switches (manufacturing number 800394-00)
- Summit X650-24x switches (manufacturing number 800395-00)
- Summit X650 VIM-10G8X (manufacturing number 800396-00)
- Summit X670 switches, 10G ports
- Summit X670V switches, 10G and 40G ports

enable | disable ip-fix

```
[enable | disable] ip-fix
```

Description

Enables or disables IPFIX globally.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to enable or disable IPFIX globally. When used, it overrides the individual port enable command. It is provided to simplify debugging.

Example

The following command enables IPFIX globally on the switch.

```
enable ip-fix
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

enable ip-fix ports

enable ip-fix ports [*port_list* | **all**] {**ipv4** | **ipv6** | **non-ip** | **all_traffic**}

Description

Enables IPFIX on the ports.

Syntax Description

port_list	Specifies the ports.
all	Specifies all ports.
ipv4	Meter IPv4 traffic.
ipv6	Meter IPv6 traffic.
non-ip	Meter non-IP layer 2 traffic.
all_traffic	Meter IPv4, IPv6, and non-IP traffic. This is the default.

Default

The default is disabled. When enabled, the default is all_traffic.

Usage Guidelines

In addition to enabling IPFIX support of the port, use this command to check that the port being enabled has hardware support for IPFIX.

If the port does not support IPFIX, an error message similar to the following is displayed:

```
Error: IPFIX is not supported by hardware on port <slot>:<port>
```

The port specified must be either a physical port that is not part of a trunk LAG, or it must be the LAG master port. When it is neither of these, the following message is displayed:

```
Error: Master port 3:1 is enabled for IPFIX but Member port 5:2 is not
capable.
```

When the specified port is the LAG master port, all ports in that LAG must support the IPFIX feature in hardware. If one or more ports in the LAG do not support IPFIX, the following error messages is displayed:

```
Error: IPFIX is not supported on port 5:1.
```

Example

The following command enables IPFIX metering of IPv6 traffic on port 2:1:

```
enable ip-fix ipv6 ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

enable jumbo-frame ports

enable jumbo-frame ports [**all** | *port_list*]

Description

Enables support on the physical ports that will carry jumbo frames.

Syntax Description

all	Specifies ports.
port_list	Specifies one or more slots and ports.

Default

Disabled.

Usage Guidelines

Increases performance to back-end servers or allows for VMAN 802.1Q encapsulations.

You can configure the maximum size of a jumbo frame if you want to use a different size than the default value of 9216. Use the configure jumbo-frame-size command to configure the size.

This setting is preserved across reboots.

Example

The following command enables jumbo frame support on a BlackDiamond 8810 switch:

```
enable jumbo-frame ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable learning port

enable learning port [**all** | *port_list*]

Description

Enables MAC address learning on one or more ports.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

N/A.

Example

The following command enables MAC address learning on slot 1, ports 7 and 8 on a modular switch:

```
enable learning ports 1:7-8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

 enable mirror

enable mirror *mirror_name*

Description

Enables a mirror instance.

Syntax Description

mirror_name	Specifies the mirror name.

Default

Disabled.

Usage Guidelines

Use this command to enable a mirror instance. An instance may be enabled without source filters defined (per current function), but no traffic will be mirrored until source filters are added.

Example

The following example enables a mirror instance named "mirror1" :

```
enable mirror mirror1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

enable mlag port peer id

enable mlag port *port* **peer** *peer_name* **id** *identifier*

Description

Binds a local port or LAG to an MLAG.

Syntax Description

port	Specifies a local member port of the MLAG group.
peer_name	Specifies an alpha numeric string identifying the MLAG peer.
identifier	Specifies a unique MLAG identifier value. The range is 1 to 65000.

Default

N/A.

Usage Guidelines

Use this command to bind a local port or LAG to an MLAG that is uniquely identified by the MLAG ID value. The MLAG ID can be any number from 1 to 65000.

The specified port number may be a single port or the master port of a load sharing group but may not be a load sharing member port. If it is, a message similar to the following is displayed:

```
ERROR: Port 2 is a member of a load share group.  Use the load share master
port (10) instead.
```

A port can be part of only one MLAG, If you try to add it to another MLAG, a message similar to the following is displayed:

```
ERROR: Port 2 is already part of an MLAG Id 101
```

Once the MLAG group binding is made, any change to load sharing on MLAG ports is disallowed.

The MLAG peer must exist or the command will fail.

Example

The following command binds the local member port 2 to the peer switch switch101with an identifier of 101:

```
enable mlag port 2 peer switch101 id 101
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

enable network-clock ptp

[enable | disable] network-clock ptp [boundary | ordinary] {{vlan} *vlan_name***}**The following example enables end-to-end transparent clock on the front panel ports 1-3:

Description

Use this command to enable PTP on the clock instance or on the specified VLAN (clock port).

Syntax Description

boundary	Boundary clock.
ordinary	Ordinary clock.
vlan	VLAN.
vlan_name	VLAN name.

Default

N/A.

Usage Guidelines

Use this command to enable PTP on the clock instance or on the specified VLAN (clock port).

Example

The following example enables the ordinary clock:

```
disable network-clock ptp ordinary
```

The following example enables the clock port lpbk-transit on the boundary clock:

```
disable network-clock ptp boundary vlan lpbk-transit
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

enable network-clock ptp end-to-end-transparent ports

enable network-clock ptp end-to-end-transparent ports *port_list*The following example enables end-to-end transparent clock on the front panel ports 1-3:

Description

Enables PTP end-to-end-transparent clock functionality (1-step PHY timestamp) on the specified ports.

Syntax Description

port_list	Specifies a port or a group of ports.

Default

N/A.

Usage Guidelines

Use this command to enable 1-step transparent clock on the specified ports.

Example

The following example enables end-to-end transparent clock on the front panel ports 1-3:

```
enable network-clock ptp end-to-end-transparent ports 1-3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

enable network-clock sync-e

enable network-clock sync-e port [*port_list* | **all**]

Description

Enables synchronous Ethernet (SyncE) on port(s).

Syntax Description

port_list	Specifies a port or group of ports
all	Specifies all ports

Default

Disabled.

Usage Guidelines

Use this command to enable SyncE on one or more ports.

The following lists the individual platforms and the ports supported on each platform:

- X460-24X: Ports 1 - 28
- X460-48X: Ports 1 - 48
- E4G-200: All Ethernet ports
- E4G-400: All Ethernet ports including XGM3S 10G ports if present

If you attempt to enable SyncE on a port or ports that are not supported, one of the following messages is displayed:

```
ERROR: Cannot enable Synchronous Ethernet on ports
ERROR: Cannot enable Synchronous Ethernet on some/all ports
```

To disable SyncE, use the disable network-clock sync-e command.

To display SyncE settings, use the show network-clock sync-e ports command.

Example

The following command enables SyncE on port 2:

```
enable network-clock sync-e port 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24X and X460-48X switches and on E4G-200 and E4G-400 switches.

enable port

enable port [*port_list* | **all**]

Description

Enables a port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

All ports are enabled.

Usage Guidelines

Use this command to enable the port(s) if you disabled the port(s) for security, administration, or troubleshooting purposes.

Example

The following command enables ports 3, 5, and 12 through 15 on the stand-alone switch:

```
enable ports 3,5,12-15
```

The following command enables slot 1, ports 3, 5, and 12 through 15 on the modular switch:

```
enable port 1:3, 1:5, 1:12-1:15
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable ports tdm

enable ports [*port_list* | **all**] **tdm**

Description

Enables the specified TDM ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Enable all TDM ports on the switch.
tdm	Indicates that command applies to time division multiplexing (TDM) ports.

Default

The default is enable.

Usage Guidelines

This command enables TDM ports only and has no effect on Ethernet ports.

```
Error: There are no valid TDM ports in the specified port list.
```

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

enable ports tdm loopback

enable ports *port_list* **tdm loopback** [**local** | **network** [**line** | **payload**]]

Description

Enables the local or network loopback mode used on the specified time division multiplexing (TDM) ports.

Syntax Description

tdm	Time Division Multiplexing.
loopback	Loopback mode.
port_list	Specifies a port or group of ports.
local	Local loopback.
network	Network loopback (transmit received data).
line	Loopback framing and data received from the far end.
payload	Loopback data received from the far end.

Default

The loopback is disabled by default.

Usage Guidelines

Use this command to enable local or network loopback mode on the specified TDM ports.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

enable sharing grouping

enable sharing *port* **grouping** *port_list* **{algorithm [address-based {L2 | L3 | L3_L4 | custom} | }]} {lacp | health-check}**

Description

Enables the switch to configure port link aggregation, or load sharing. By using link aggregation, you use multiple ports as a single logical port. Link aggregation also provides redundancy because traffic is

redistributed to the remaining ports in the LAG if one port in the group goes down. LACP allows the system to dynamically configure the LAGs.

Syntax Description

port	Specifies the master logical port for a load-sharing group or link aggregation group (LAG).
port_list	Specifies one or more ports or slots and ports to be grouped to the logical port.
address-based	Specifies link aggregation by address-based algorithm.
L2	Specifies address-based link aggregation by Layer2. This is the default value. NOTE: This parameter is available only on BlackDiamond 8800 series switches, SummitStack, and Summit family switches.
L3	Specifies address-based link aggregation by Layer3. NOTE: The L3 algorithm will be deprecated. Selection of L3 behaves the same as L3_L4. The inclusion of Layer4 ports for distribution is not available on a per group basis. The inclusion of Layer4 ports for distribution is controlled globally for all LAGs in a switch via the "configure forwarding sharing [L3 | L3_L4]" command.
L3_L4	Specifies address-based link aggregation by Layer3 IP plus Layer4 port. NOTE: The inclusion of Layer4 ports for distribution is not available on a per group basis. The inclusion of Layer4 ports for distribution is controlled globally for all LAGs in a switch via the "configure forwarding sharing [L3 | L3_L4]" command.
custom	Selects the custom link aggregation algorithm configured with the following command: configure sharing address-based custom [ipv4 [L3-and-L4 | source-only | destination-only | source-and-destination] | hash-algorithm [xor | crc-16]]. The configuration of the custom option applies to all LAGs on the switch. This option is supported only on BlackDiamond X8, 8900 c- and xl-series modules, Summit X460, X480, X650, and X670 switches, and a SummitStack that hosts at least one of these supported Summit switches.
lacp	Specifies dynamic link aggregation, or load sharing, using the LACP.
health-check	Specifies a health check type of link aggregation group.

Default

Disabled.

Example

The following example defines a static link aggregation group (LAG) on a modular switch that contains ports 9 through 12 on slot 3, ports 7 through 10 on slot 5, and uses port 3:9 as the logical port

```
enable sharing 3:9 grouping 3:9-3:12, 5:7-5:10
```

In this example, logical port 3:9 represents physical ports 3:9 through 3:12 and 5:7 through 5:10.

The following example defines a dynamic LAG on a stand-alone switch containing ports 10 through 15, with port 10 being the logical port:

```
enable sharing 10 grouping 10-15 lacp
```

The following example selects the custom option on a BlackDiamond 8810 switch:

```
BD-8810.1 # enable sharing 2:1 grouping 2:1-2 algorithm address-based custom
```

The following example defines a health check LAG containing ports 10 through 13 with port 10 as the master logical port and specifies address-based link aggregation by Layer3 IP plus Layer4 port:

```
enable sharing 10 grouping 10,11,12,13 algorithm address L3_L4 health-check
```

To configure a health-check LAG, refer to the configure sharing health-check member-port add tcp-tracking command.

History

This command was first available in ExtremeXOS 10.1.

The address-based algorithm was added in ExtremeXOS 11.0.

The L2 and L3 optional parameters were added in ExtremeXOS 11.1.

IPv6-compatibility was added in ExtremeXOS 11.2.

Dynamic link aggregation, using LACP, was added in ExtremeXOS 11.3.

The L3_L4 optional parameter was added in ExtremeXOS 11.5.

SummitStack functionality was added in ExtremeXOS 12.0.

Health-check link aggregation was added in ExtremeXOS 12.1.3.

The custom keyword was added in ExtremeXOS 12.3.

LACP support with custom load sharing algorithm only:

- 64 ports per LAG for BlackDiamond X8 - was added in ExtremeXOS 15.2.
- 32 ports per LAG for X670 - was added in ExtremeXOS 15.2

Platform Availability

This command is available on all platforms.

enable slot

enable slot *slot* **| FM-1 | FM-2 | FM-3 | FM-4>**

Description

Enables slots. These can be either regular slots or fabric slots (FM-1 through FM-4).

Syntax Description

slot	Specifies the slot to be enabled.

Default

Enabled.

Usage Guidelines

This command allows the user to enable a slot that has been previously disabled using the disable slot command.

Note

On the BlackDiamond 8800 series switch, this command only applies to the data, or I/O, ports on slots holding an MSM (slot 5 and possibly 6 on the BlackDiamond 8810; slot 3 and possibly 4 on the BlackDiamond 8806 switch).

When the user enters the enable command, the disabled I/O card in the specified slot is brought up, and the slot is made operational, if possible, or goes to the appropriate state as determined by the card state machine. The LEDs on the card are brought ON as usual. When the slot is enabled, the software on the I/O module is updated to match the software on the primary MSM/MM.

After the user enables the slot, the show slot command shows the state as “Operational” or will display the appropriate state if the card could not be brought up successfully. Note that there is no card state named “Enable” and the card goes to the appropriate states as determined by the card state machine when the enable slot command is invoked.

Only slots that have their state as “disabled” can be enabled using this command. If this command is used on slots that are in states other than “disabled,” the card state machine takes no action on these slots.

To enable inline power to a slot, the slot must be enabled as well as inline power for that slot. Use the enable inline-power command to enable inline power.

Note

If your chassis has an inline power module and there is not enough power to supply a slot, that slot will not be enabled; the slot will not function in data-only mode without enough power for inline power.

Example

The following command enables slot 5 on the switch:

```
enable slot 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

enable smartredundancy

enable smartredundancy *port_list*

Description

Enables the Smart Redundancy feature on the primary port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

You must configure the software-controlled redundant port using the configure ports redundant command prior to enabling Smart Redundancy.

The Smart Redundancy feature works in concert with the software-controlled redundant port feature. With Smart Redundancy enabled on the switch, when the primary port becomes active the switch redirects all traffic to the primary port and blocks the redundant port again. (If you disable Smart Redundancy, the primary port is blocked because traffic is now flowing through the redundant, port.)

Example

The following command enables the Smart Redundancy feature on slot 1, port 4 on a modular switch:

```
enable smartredundancy 1:4
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable snmp traps port-up-down ports

enable snmp traps port-up-down ports [*port_list* | **all**]

Description

Enables port up/down trap reception for specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled.

Usage Guidelines

Use this command to begin receiving SNMP trap messages when a port transitions between being up and down.

Example

The following command enables ports 3, 5, and 12 through 15 on a stand-alone switch to receive SNMP trap messages when the port goes up/down:

```
enable snmp traps port-up-down ports 3,5,12-15
```

History

This command was first available in ExtremeXOS 10.6.

Platform Availability

This command is available on all platforms.

restart ports

restart ports [**all** | *port_list*]

Description

Resets autonegotiation for one or more ports by resetting the physical link.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command resets autonegotiation on slot 1, port 4 on a modular switch:

```
restart ports 1:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

run failover

run failover {**force**}

Description

Causes a user-specified node failover.

Syntax Description

force	Force failover to occur.

Default

N/A.

Usage Guidelines

Use this command to cause the primary MSM/MM to failover to the backup MSM/MM on modular switches, or the Master node to failover to the Backup node in SummitStack.

Before you initiate failover, use the show switch {detail} command to confirm that the nodes are in sync and have identical software and switch configurations. If the output shows MASTER and BACKUP (InSync), the two MSMs/MMs or nodes are in sync.

If the MSM/MM's software and configuration are not in sync, and both MSMs/MMs are running ExtremeXOS 11.0 or later, or the master and backup SummitStack nodes software and configuration are not in sync and are running ExtremeXOS 12.0 or later, use the synchronize command to get the two MSMs/MMs or nodes in sync. This command ensures that the backup has the same software in flash as the master.

Note

Both the backup and the master MSMs or nodes must be running ExtremeXOS 11.0 or later to use the synchronize command.

If the MSMs/MMs are not in sync, and one MSM/MM is running ExtremeXOS 10.1 or earlier, specify the force option of the run failover command. By specifying force, failover occurs regardless of the version of software running on the MSMs/MMs.

Example

The following command causes a failover on a modular switch or SummitStack:

```
run failover
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on modular switches and SummitStack.

run msm-failover

run msm-failover {force}

Description

Causes a user-specified node failover. This command is not supported on a SummitStack. To do a failover on a stack, use the command run **failover**.

Syntax Description

force	Force failover to occur.

Default

N/A.

Usage Guidelines

This command is being replaced with the run failover command. For usage guidelines, see the description for the run failover command.

Example

The following command causes a user-specified MSM failover:

```
run msm-failover
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

show ces

show ces {*ces_name*} **{detail}**

Description

Displays the specified circuit emulation services (CES) pseudo-wire parameters.

Syntax Description

ces	Circuit Emulation Service
ces_name	Alphanumeric string identifying CES pseudo-wire.
detail	Displays detailed information.

Default

The default is no detail.

Usage Guidelines

Use this command to display the CES pseudo-wire parameters.

Example

```
Switch.1 # show ces

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ces clock-recovery

show ces {*ces_name*} **clock-recovery**

Description

Displays the CES pseudo-wire clock recovery information.

Syntax Description

ces	Circuit Emulation Service.
ces_name	Alphanumeric string identifying CE.
clock-recovery	Displays clock recovery information.

Default

N/A.

Usage Guidelines

Use this command to display the CES pseudo-wire clock recovery information.

Example

```
CES PW Clock Master  :  ces_1
Timed TDM port(s)    :  39
Algorithm            :  Adaptive
Recovery state       :  Free Running
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ces errors

show ces {*ces_name*} **errors** {**total** | **intervals** | **day-intervals** | **current** {**no-refresh**}}

Description

Displays the specified circuit emulation services (CES) pseudo-wire error counters.

Syntax Description

ces	Circuit Emulation Service.
ces_name	Alphanumeric string identifying the CES pseudo-wire.
errors	Displays errors.
intervals	Displays errors for 15-minute intervals.
day-intervals	Displays errors for 1-day intervals.
current	Displays current 15-minute interval errors (default).
no-refresh	Page by page display without auto-refresh.

Default

The default displays current error statistics.

Usage Guidelines

The current switch displays the error statistics of the ongoing 15-minute interval. The total switch displays the cumulative error statistics.

Example

Only one space is given between the first and second field to accommodate the output within 80 characters.

```
E4G-400.3 # show ces {<ces_name>} errors current

show ces peer

show ces peer [**ipaddress** *ipaddress* | **mac-address** *mac_address*]

Description

Displays the specified circuit emulation services (CES) peer information.

Syntax Description

ces	Curcuit Emulation Service.
peer	Displays CES peer information.
ipaddress	Peer IPV4 address.
ipaddress	IPv4 address.
mac-address	Peer MAC address.
mac_address	MAC address; type=mac_t.

Default

N/A.

Usage Guidelines

Use this command to display the CES peer information.

Example

```
Switch.1 # show ces peer ipaddress 11.100.100.219
CES Name   Pseudowire  CES       Service    Peer Addr

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show dwdm channel-map

show dwdm channel-map { *channel_first* { **-** *channel_last* } } {**port** *port_num*}

Description

Displays the channel scheme adopted for mapping the DWDM wavelengths.

Syntax Description

channel_first	Specifies the starting channel number.
channel_last	Specifies the ending channel number.
port_num	Specifies the port for which the status is to be displayed.

Default

N/A.

Usage Guidelines

Use this command to display the wavelength and the supportability of the channel by the optical module in the port.

Example

The following command displays information for channels 50 through 60 on port 3:1:

```
show dwdm channel-map 50 - 60 port 3:1
```

The following is sample output for this command:

```
================================================
Channel #     Wavelength (nm)    Port 3:1
================================================
50           1537.40         Supported
51           1536.61         Supported
52           1535.82         Supported
…            ……                 ……
```

```
58          1531.12         Supported

60          1529.55         Supported
```

History

This command was first available in ExtremeXOS 12.6

Platform Availability

This command is available on BlackDiamond X8 switches, BlackDiamond 8800 switches with 10G8Xc, 10G4Xc, 8900-10G8X-xl modules or S-10G1Xc option cards, and Summit X480 switches with XGM2-2xf option cards or VIM2-10G4X modules.

show edp

show edp {**ports** [**all** | *ports*] {**detail**}}

Description

Displays connectivity and configuration information for neighboring Extreme Networks switches.

Syntax Description

ports	Specifies one or more ports or slots and ports.
all	Specifies all ports.
detail	Show detailed information.

Default

N/A.

Usage Guidelines

On a modular switch, <ports> can be a list of slots and ports. On a stand-alone switch, <port_list> can be one or more port numbers. For a detailed explanation of port specification, see Port Numbering in Command Reference Overview To clear the counters, use the clear lacp counters command.

The neighbor-ID value is eight bytes. The first two bytes are always set to 00:00; the last six bytes are set to the neighbor's system MAC address.

Use the show edp command to display neighboring switches and configurations. This is most effective with Extreme Networks switches.

Example

The following command displays the configuration of the switch:

```
show edp
```

Following is sample output from this command:

```
EDP advert-interval     :60 seconds
EDP holddown-interval   :180 seconds
EDP enabled on ports    :1:1  1:2  1:3  1:4  1:5  1:6  3:1  3:2  3:3  3:4
```

Following is sample output from the show edp ports 1:1 command:

```
Port   Neighbor                        Neighbor-ID Remote  Age    Num
Port         Vlans
================================================================================
1:1    Oban                      00:00:00:30:48:41:ed:97   1:1    54     1
================================================================================
```

The following command displays the connectivity and configuration of neighboring Extreme Networks switches:

```
show edp ports 1:1 detail
```

Following is sample output from this command:

```
================================================================================
Port 1:1: EDP is Enabled
Tx stats: sw-pdu-tx=2555       vlan-pdu-tx=1465       pdu-tx-err=0
Rx stats: sw-pdu-rx=2511       vlan-pdu-rx=2511       pdu-rx-err=0
Time of last transmit error: None
Time of last receive error:  None
Remote-System:          Oban                        Age = 41
Remote-ID:              00:00:00:30:48:41:ed:97
Software version:       11.1.0.19
Remote-Port:            1:1
Port Type:              Ethernet
Auto Negotiation:       OFF
Flow Control:           SYMMETRIC/ASYMMETRIC
Duplex Speed:           Configured = HALF       Actual = HALF
Port Speed (MB):        Configured = ERROR      Actual = 100 Mbps
Remote-Vlans:
```

```
test (4094)  Age = 41
================================================================================
```

Note

The output differs if the port is connected to a port running ExtremeWare® software; the output shown above is displayed when both connected ports are running ExtremeXOS software.

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show ip-fix

show ip-fix

Description

Displays IPFIX information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display IPFIX information regarding the global state, collector information and which ports are enabled.

Example

The following command displays IPFIX information:

```
show ip-fix
```

Following is sample output on a BlackDiamond 8800 switch:

```
BD-8810.2 # show ip-fix
Global IPFIX State: Enabled
Domain:             0
Source (Exporter) IP:   Default(Switch IP)      Virtual Router:         "VR-
Mgmt"
Collector IP:           10.66.9.32
Transport Protocol/Port/State:  SCTP, Port 4739, NA
Flow Keys:
IPv4:   "Source-IP"  "Source L4 Port"  "Dest-IP"  "Dest L4 Port"  "L4
Protocol"  "TOS"
Unused:
IPv6:   "Source-IP"  "Source L4 Port"  "Dest-IP"  "Dest L4 Port"  "Next
Header"  "TOS"  "Flow Label"
Unused:
Non-IP: "Source MAC"  "Dest MAC"  "Ethertype"  "VLAN ID"  "Priority"  "Tagged"
Unused:
IPFIX Enabled on Port(s):    3:1, 4:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

show lacp

show lacp

Description

Displays LACP, or dynamic link aggregation, settings on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following information about the LACP LAGs configured on the switch:

- Up or Down
- Enabled or disabled (not configurable)
- System MAC
  - MAC address for the system, which is used for LACP priority in the absence of a specifically configured priority.
- LACP PDUs dropped on non-LACP ports
- LAG
  - Identifies the particular LAG. This number comes from logical port assigned to the LAG and is the LAG group ID.
- Actor Sys-Pri
  - Shows the system priority for that LAG.
  - If this number is lower than the number displayed for the Partner Sys-Pri, the system you are working on is the controlling partner in the LAG.
- Actor Key
  - Automatically generated LACP key.
- Partner MAC
  - Identifies the MAC address for the system connecting to the LAG on the remote end.
- Partner Sys-Pri
  - Shows the system priority for that LAG on the remote end.
  - If this number is lower than the number displayed for the Actor Sys-Pri, the system at the remote end is the controlling partner in the LAG.
- Partner Key
  - LACP key automatically generated by the system to which this aggregator is connected.
  - If this number is lower than the number displayed for the Actor Key, the partner system is the controlling partner in the LAG.
- Agg Count
  - Identifies the number of ports added to the aggregator for that LAG.

Example

The following command displays the LACP LAGs on the switch:

```
show lacp
```

The following is sample output from this command on a modular switch:

```
LACP Up                             : Yes
LACP Enabled                        : Yes
System MAC                          : 00:04:96:10:33:60
LACP PDUs dropped on non-LACP ports : 0
Lag        Actor    Actor   Partner            Partner  Partner  Agg
Sys-Pri  Key     MAC               Sys-Pri  Key      Count
------------------------------------------------------------------------------
--
2:1          90    0x07d1  00:01:30:f9:9c:30    601    0x1391   2
4:5         100    0x0fa5  00:01:30:f9:9c:30    321    0x1f47   16
4:9         677    0x0fa9  00:01:30:f9:9c:30     87    0x0fa9   8
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

show lacp counters

show lacp counters

Description

Displays all LACP, or dynamic link aggregation, counters for all member ports in the system.

Syntax Description

This command has no parameters or variables.

Default

N/A.

Usage Guidelines

This command displays the following information for all link aggregation groups (LAGs):

- LACP PDUs dropped on non-LACP ports
- LACP bulk checkpointed messages sent
- LACP bulk checkpointed messages received
- LACP PDUs checkpointed sent
- LACP PDUs checkpointed received
- LAG group ID
- Member port
- Packets received
- Packets dropped from PDU error
- Packets dropped because LACP is not enabled on this port
- Packets dropped because sender's system MAC address matches that of receiver
- Packets successfully transmitted
- Packets with errors during transmission

Example

The following command displays LACP counters:

```
show lacp counters
```

The following is sample output from this command on a modular switch:

```
LACP PDUs dropped on non-LACP ports : 519392
LACP Bulk checkpointed msgs sent    : 1
LACP Bulk checkpointed msgs recv    : 0
LACP PDUs checkpointed sent         : 575616
LACP PDUs checkpointed recv         : 0
Lag         Member     Rx       Rx Drop  Rx Drop  Rx Drop  Tx       Tx
Group       Port       Ok       PDU Err  Not Up   Same MAC Sent Ok  Xmit Err
--------------------------------------------------------------------------------
--
1:1         1:1        2169     0        0        0        2170     0
1:2         2169     0        0        0        2170     0
1:3         2169     0        0        0        2170     0
1:4         2169     0        0        0        2170     0
1:5         2169     0        0        0        2170     0
1:6         2169     0        0        0        2170     0
1:7         2169     0        0        0        2170     0
1:8         2168     0        0        0        2169     0
================================================================================
==
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show lacp lag

show lacp lag *group-id* {**detail**}

Description

Displays LACP, or dynamic link aggregation, settings for the specified LAG.

Syntax Description

group-id	Specifies the LAG group ID you want to display. This is the number of the port you configured as the logical port of the LAG.
detail	Show detailed information.

Default

N/A.

Usage Guidelines

This command displays the following information about the specified LACP LAG:

- LAG
  - Identifies the particular LAG. This number comes from logical port assigned to the LAG and is the LAG group ID.
- Actor Sys-Pri
  - Shows the system priority for that LAG.
  - If this number is lower than the number displayed for the Partner Sys-Pri, the system you are working on is the controlling partner in the LAG.
- Actor Key
  - Automatically generated LACP key.
- Partner MAC
  - Identifies the MAC address for the system connecting to the LAG on the remote end.
- Partner Sys-Pri
  - Shows the system priority for that LAG on the remote end.
  - If this number is lower than the number displayed for the Actor Sys-Pri, the system at the remote end is the controlling partner in the LAG.
- Partner Key
  - LACP key automatically generated by the system to which this aggregator is connected.
  - If this number is lower than the number displayed for the Actor Key, the partner system is the controlling partner in the LAG.
- Agg Count
  - Identifies the number of ports added to the aggregator for that LAG.
- Member port
- Port priority
- Rx State—Receiving state of the port
  - Idle
  - Initialized
  - Current—Receiving LACP PDUs
  - Expired
  - Defaulted
- Sel Logic—Selection state of the port
  - Selected—Ports with a matching admin key on the remote end.
  - Unselected—Ports that failed to meet with a matching admin key on the remote end.
  - Standby—Ports that exceed the number of ports that can be active in the LAG simultaneously. These ports can be moved into selected mode if one of the currently selected ports in the LAG goes down.
- Mux State—Ability to transmit and collect data of the port
  - Waiting—Selected port that is waiting for LACP to determine if it can join the aggregator.
  - Attached—Ports ready to be added to the aggregator.
  - Collecting-Dist—Ports that are added to the aggregator and are transferring data.
  - Detached—Ports that cannot be added to the aggregator.
- Actor Flag—Mux state of the port

    - A—Activity
    - T—Timeout
    - G—Aggregation
    - S—Synchronization
    - C—Collecting
    - D—Distributing
    - F—Defaulted
    - E—Expired
- Partner Port
    - The operational value of the port number assigned to this link by partner.
- Up—Yes or no
- Enabled—Yes or no
- Unack count
- Wait-for-count
- Current timeout
- Activity mode
- Defaulted action
- Receive state
- Transmit state
- Selected count—Number of selected ports in the LAG
- Standby count—Number of standby ports in the LAG
- LAG Id flag
    - S—Displays information on controlling partner of LAG.
    - T—Displays information on controlled partner of LAG.

Example

The following command displays information on the specified LACP LAG:

```
show lacp lag 4:9
```

The following is sample output from this command on a modular switch:

```
Lag         Actor    Actor   Partner            Partner  Partner  Agg    Actor
            Sys-Pri  Key     MAC                Sys-Pri  Key      Count  Mac

Platform Availability

This command is available on all platforms.

show lacp member-port

show lacp member-port *port* {**detail**}

Description

Displays LACP, or dynamic link aggregation, settings for the specified port that is a member of any LAG.

Syntax Description

port	Specifies the port number.
detail	Show detailed information.

Default

N/A.

Usage Guidelines

This command displays the following information about the specified port:

- Member Port
- Port Priority
- Rx State—Receiving state of the port
  - Idle
  - Initialized
  - Current—Receiving LACP PDUs
  - Expired
  - Defaulted
- Sel Logic—Selection state of the port
  - Selected—Ports with a matching admin key on the remote end.
  - Unselected—Ports that failed to meet with a matching admin key on the remote end.
  - Standby—Ports that exceed the number of ports that can be active in the LAG simultaneously. These ports can be moved into selected mode if one of the currently selected ports in the LAG goes down.
- Mux State—Ability to transmit and collect data of the port
  - Waiting—Selected port that is waiting for LACP to determine if it can join the aggregator.
  - Attached—Ports ready to be added to the aggregator.
  - Collecting-Dist—Ports that are added to the aggregator and are transferring data.
  - Detached—Ports that cannot be added to the aggregator.
- Actor Flag
  - A—Activity
  - T—Timeout
  - G—Aggregation
  - S—Synchronization
  - C—Collecting
  - D—Distributing
  - F—Defaulted
  - E—Expired
- Partner Port
  - The operational value of the port number assigned to this link by partner.
- Up or Down—LACP protocol running or not on specified port
- Enabled or disabled (not configurable)

- Link State—Link state on this port up or down
- Actor Churn—True or false
- Partner Churn—True or false
- Ready_N—Ready to be added to aggregator.
- Wait pending
- Ack pending
- LAG Id
  - S—Displays information on controlling partner of LAG.
  - T—Displays information on controlled partner of LAG.
- Stats
  - Rx - Accepted
  - Rx - Dropped due to error in verifying PDU
  - Rx - Dropped due to LACP not being up on this port
  - Rx - Dropped due to matching own MAC
  - Tx - Sent Successfully
  - Tx - Transmit error

Example

The following command displays LACP information on the specified port:

```
show lacp member-port 4:9
```

The following is sample output from this command on a modular switch:

```
Member     Port      Rx          Sel          Mux           Actor
Partner
Port       Priority  State       Logic        State         Flags     Port
-------------------------------------------------------------------------
--
4:9        300       Current     Selected     Collect-Dist  A-GSCD--  4009
=========================================================================
==
Actor Flags: A-Activity, T-Timeout, G-Aggregation, S-Synchronization
C-Collecting, D-Distributing, F-Defaulted, E-Expired
```

The following command displays detailed LACP information on the specified port:

```
show lacp member-port 4:9 detail
```

The following is sample output from this command on a modular switch:

```
Member     Port      Rx          Sel          Mux           Actor
Partner
Port       Priority  State       Logic        State         Flags     Port
-------------------------------------------------------------------------
```

```
--
4:9        300       Current      Selected     Collect-Dist   A-GSCD--  4009
Up            : Yes
Enabled       : Yes
Link State    : Up
Actor Churn   : False
Partner Churn : False
Ready_N       : Yes
Wait pending  : No
Ack pending   : No
LAG Id:
S.pri:2110, S.id:00:01:30:f9:9c:30, K:0x0fa9, P.pri:300 , P.num:4009
T.pri:2110, T.id:00:04:96:10:33:60, L:0x0fa9, Q.pri:300 , Q.num:4009
Stats:
Rx - Accepted                                      : 2174
Rx - Dropped due to error in verifying PDU         : 0
Rx - Dropped due to LACP not being up on this port : 0
Rx - Dropped due to matching own MAC               : 0
Tx - Sent successfully                             : 2175
Tx - Transmit error                                : 0
================================================================================

Actor Flags: A-Activity, T-Timeout, G-Aggregation, S-Synchronization
C-Collecting, D-Distributing, F-Defaulted, E-Expired
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

show mirror

show mirror *mirror_name* | *mirror_name_li* | **all** | **enabled**

Description

Displays various show output for mirror instances.

Syntax Description

mirror_name	Displays the mirror name.
mirror_name_li	Mirror instance name for Lawful Intercept account.
all	Displays all mirror instances.
enabled	Displays only enabled mirror instances.

Default

N/A.

Usage Guidelines

Use this command to display mirror statistics and determine if mirroring is enabled or disabled on the switch.

Example

The following command displays switch mirroring statistics:

```
show mirror all
Mirror MyDebugMirror (Disabled)
    Description: This mirror sends traffic to PC-based Wireshark
    Mirror to ports: 4-5 Loopback port: 6
  Number of Mirroring filters:7
  Mirroring filters configured:
    Port number 7 in all vlans  (ingress)
    Port number 8 in vlan Default  (ingress-and-egress)
    Port number 9 in all vlans   (egress)
    Port number 10 in all vlans   (ingress-and-egress)
    Port number 11 in vlan Default    (ingress)
    Port number 12 in vlan Default    (ingress)
    Port number 13 in vlan Default    (ingress)
    Active ACL target action:  Yes

Mirror DefaultMirror (Enabled)
  Description: This mirror is used for debugging VRRP
  Mirror to port: 15 is up
  Number of Mirroring filters:1
  Mirroring filters configured:
    Port number 17 in vlan to_oslo  (ingress)
  Active ACL target action:  Yes
```

The following example displays output when executed by the lawful intercept user session:

```
* X460-24p.9 > show mirror
DefaultMirror   (Disabled)
    Description:    Default Mirror Instance, created automatically
    Mirror to port: -

law_mirror   (Enabled)
    Description:    first spy user for lawful intercept
    Mirror to port: 3
    Source filter instances used :  2
        Port 7, all vlans, ingress only
        Port 8, all vlans, ingress only

main_mirror   (Enabled)
    Description:
        Mirror instance for Admin
        Mirror to port: 2
        Source filter instances used :  1
        Port 10, all vlans, ingress only
```

```
Mirrors defined:          3
Mirrors enabled:          2 (0 with egress filters)
HW filter instances used: 3 (Maximum 128)
```

History

This command was first available in ExtremeXOS 15.3.

The ***mirror_name_li*** variable was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show mirroring

show mirroring

Description

Displays the port-mirroring configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You must enable mirroring on the switch prior to configuring mirroring, and you must configure mirroring to display mirroring statistics. Use the enable mirroring to port command to enable mirroring and the configure mirroring add command to configure mirroring.

You can use this command to display mirroring statistics and determine if mirroring is enabled or disabled on the switch.

Example

The following command displays switch mirroring statistics:

```
show mirroring
```

BlackDiamond 8800 series switches and Summit family switches only

Following is sample output from this command for a BlackDiamond 8810 switch or SummitStack that is configured for port-based mirroring for single monitor ports:

```
Mirror port: 3:15 is up
Number of Mirroring filters: 3
Mirror Port configuration:
    Port number 3:12 in  all vlans ingress only
    Port number 5:4 in  all vlans egress only
    Port number 8:30 in  all vlans
```

Following is sample output from this command on a Summit series switch that is configured for mirroring a virtual port:

```
Mirror port: 12 is down
Number of Mirroring filters: 1
Mirror Port configuration:
             Port number 3 in vlan peggy.
```

Following is a sample output from this command for a Summit switch as enabled for multiple monitor ports.

```
Mirror ports: 5-7 Loopback port: 3
Number of Mirroring filters: 2
Mirror Port configuration:
            Port number 1 in all vlans
            Port number 2 in all vlans
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show mlag peer

show mlag peer {*peer_name*}

Description

Displays information about an MLAG.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer switch.

Default

N/A.

Usage Guidelines

Use this command to display configured items, MLAG peer switch state, MLAG group count, and health-check statistics.

Example

The following command displays information for an MLAG peer switch:

```
BD-8810.5 # show mlag peer
```

Following is sample output for the command:

```
Multi-switch Link Aggregation Peers:

MLAG Peer          : leftBD8k
VLAN               : isc             Virtual Router     : VR-Default
Local IP Address   : 1.1.1.2         Peer IP Address    : 1.1.1.1
MLAG ports         : 2               Tx-Interval        : 1000 ms
Checkpoint Status  : Up              Peer Tx-Interval   : 1000 ms
Rx-Hellos          : 184             Tx-Hellos          : 184
Rx-Checkpoint Msgs : 12              Tx-Checkpoint Msgs : 12
Rx-Hello Errors    : 0               Tx-Hello Errors    : 0
Hello Timeouts     : 1               Checkpoint Errors  : 0
Up Time            : 0d:0h:0m:10s    Peer Conn.Failures : 1
Local MAC :00:04:96:11:22:44 Peer MAC  :00:04:96:11:22:33
Config'd LACP MAC  :None     Current LACP MAC:00 :04:96:11:22:33
Multi-switch Link Aggregation Peers:

MLAG Peer          : rightBD8k
VLAN               : isc             Virtual Router      : VR-Default
Local IP Address   : 1.1.1.1         Peer IP Address     : 1.1.1.2
MLAG ports         : 2               Tx-Interval         : 1000 ms
Checkpoint Status  : Up              Peer Tx-Interval    : 1000 ms
Rx-Hellos          : 167             Tx-Hellos           : 167
Rx-Checkpoint Msgs : 12              Tx-Checkpoint Msgs  : 12
Rx-Hello Errors    : 0               Tx-Hello Errors     : 0
Hello Timeouts     : 1               Checkpoint Errors   : 0
Up Time            : 0d:0h:0m:7s     Peer Conn.Failures  : 1
Local MAC          :00:04:96:11:22:44  Peer MAC              :
00:04:96:11:22:33
Config'd LACP MAC  :None               Current LACP MAC      :
00:04:96:11:22:33
```

Following is sample output when an MLAG peer has been created but the IP address is yet to be configured:

```
* (debug) X450a-48t.1 # show mlag peer switch101

Multi-switch Link Aggregation Peers:

MLAG peer                       : switch101
VLAN                            :                    Virtual
Router                            :
Local IP address                :                    Peer IP
address                           :
MLAG groups                     : 0                  Tx-
Interval                                 : N/A
Checkpoint Status               : Down               Peer Tx-
Interval                          : N/A
Rx-Hellos                       : 0                  Tx-
Hellos                                   : 0
Rx-Checkpoint Msgs              : 0                  Tx-Checkpoint
Msgs                         : 0
Rx-Hello Errors                 : 0                  Tx-Hello
Errors                           : 0
Hello Timeouts                  : 0                  Checkpoint
Errors                         : 0
Up Time: N/A                    : 0                  Peer
Conn.Failures                          : 0
Local MAC          :00:04:96:11:22:44  Peer MAC             :
00:04:96:11:22:33
Config'd LACP MAC  :None               Current LACP MAC     :
00:04:96:11:22:33
```

Following is sample output displaying LACP MAC for a MLAG peer:

```
* (debug) X450a-48t.1 # show mlag peer switch101

Multi-switch Link Aggregation Peers:

MLAG Peer          :S2
VLAN               :isc                Virtual Router       :VR-Default
Local IP Address   :1.1.1.1            Peer IP Address      :1.1.1.2
MLAG ports         :0                  Tx-Interval          :1000 ms
Checkpoint Status  :Up                 Peer Tx-Interval     :1000 ms
Rx-Hellos          :153379             Tx-Hellos            :153895
Rx-Checkpoint Msgs :6                  Tx-Checkpoint Msgs   :14
Rx-Hello Errors    :0                  Tx-Hello Errors      :0
Hello Timeouts     :0                  Checkpoint Errors    :0
Up Time            :1d:17h:45m:8s      Peer Conn. Failures  :0
Local MAC          :00:04:96:11:22:44  Peer MAC             :
00:04:96:11:22:33
Config'd LACP MAC  :None               Current LACP MAC     :
00:04:96:11:22:33                   Config'd LACP MAC
```

is the configured LACP MAC using the

```
configure {mlag peer} <peer_name> lacp-mac <lacp_mac_address>
```

command.

If no MAC is configured,

`Config'd LACP MAC`

is shown as None.

If same LACP MAC is configured on both the switches, the current LACP MAC will be the same as

`Config'd LACP MAC.`

If LACP MAC is not configured on any of the MLAG peers or if a different MAC is configured on the peers,

`Current LACP MAC`

is different from

`Config'd LACP MAC`

and is selected from Local MAC/Peer MAC combination.

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show mlag ports

show mlag ports {*port_list*}

Description

Displays information about each MLAG group.

Syntax Description

port_list	Specifies one or more ports.

Default

N/A.

Usage Guidelines

Use this command to display information about each MLAG group including local port number, local port status, remote MLAG port state, MLAG peer name, MLAG peer status, local port failure count, remote MLAG port failure count, and MLAG peer failure count.

Local and remote link state and fail counts reflect the status of the entire LAG when a LAG is used in conjunction with an MLAG. For example, if 1 and 2 ports in a local LAG on the switch associated with an MLAG is down, the local link state will still show as active and the associated local fail count will be incremented. The remote fail count shown at MLAG neighboring switch will also be incremented.

Example

The following command displays information for an MLAG group:

```
BD-8810.5 # show mlag ports
```

Following is sample output for the command:

```
Local                                                Local   Remote
MLAG    Local   Link     Remote                              Peer    Fail    Fail
Id      Port    State    Link    Peer                        Status  Count
Count
================================================================================
==
2       1:1     A        Up      leftBD8K                    Up          0
0
1       1:2     A        Up      leftBD8K                    Up          0
0
================================================================================
==
Local Link State: A - Active, D - Disabled, R - Ready, NP - Port not present
Remote Link     : Up - One or more links are active on the remote switch,
Down - No links are active on the remote switch,
N/A - The peer has not communicated link state for this MLAG
port
Number of Multi-switch Link Aggregation Groups  : 2
Convergence control                             : Fast
```

The following command displays information about an MLAG group on ports 1 and 2:

```
show mlag port 1,2
```

Following is sample output for the command:

```
Local                                       Local   Remote
MLAG  Local  Link     Remote                    Peer      Fail    Fail
Id     Port   State    Link   Peer               Status    Count   Count
================================================================================
100    1      A        Up     switch101          Up            0       2
101    2      A        Down   switch101          Up            0       1
================================================================================
Local Link State: A - Active, D - Disabled, R - Ready, NP - Port not present
Remote Link: Up - One or more links are active on the remote switch,
Down - No links are active on the remote switch,
N/A - The peer has not communicated link state for this MLAG
group
```

```
Number of Multi-switch Link Aggregation Groups: 2
Convergence Control                     : Conserve Access Lists
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show network-clock clock-source

show network-clock clock-source

Description

Displays the configured network clock source information.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

The E4G-200 and E4G-400 have clock sources beyond SyncE. The clock which drives all of the ports on a switch may be selected from:

- SyncE (Synchronous Ethernet)
- PTP – Precision Time Protocol, an optional 1588v2 module
- TDM – an optional module which has multiple T1/E1 interfaces for TDM/Ethernet interworking
- BITS – Building Integrated Timing Supply. A connector capable of receiving a timing signal provided by other building equipment.

Example

The following is an example for an E4G-400 switch:

```
E4G-400.1 # show network-clock clock-source
Input Clock Source              :  Sync-E
Input Quality Level             :  QL-SEC (11)
Input Region                    :  E1
Input Clock Status              :  LOCAL CLOCK
```

```
Output Bits BNC 1 Clock Source :  8KHz
Output Bits BNC 2 Clock Source :  E1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on X460-24X, X480-48X, E4G-200 and E4G-400 switches.

show network-clock sync-e ports

show network-clock sync-e port [*port_list*] {**details**}

Description

Displays information about synchronous Ethernet (SyncE).

Syntax Description

port_list	Specifies the port(s)
details	Show additional details.

Default

N/A.

Usage Guidelines

Use this command to display the SyncE configuration and port state on one or more ports. The following command will display the SyncE configuration and port state for all ports:

```
show network-clock sync-e ports
```

Example

The following command displays SyncE information for ports 1 - 12 on a Summit X460-48x switch:

```
show network-clock sync-e ports 1-12
```

Following is sample output:

```
================================================================
```

```
Port  Flags    Input        Configured    Output        Source
Clock Quality Clock Quality Clock Quality (Port Number)

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24x and X460-48x switches and on E4G-200 and E4G-400 switches.

show port eee

show port *port_list* **eee**

Description

Displays the packet buffer organization for the specified ports.

Syntax Description

port_list	Optionally specifies the list of ports, or slots and ports, for which EEE information is displayed. .

Default

N/A.

Usage Guidelines

This command shows various EEE statistics for the specified ports.

Example

The following command displays EEE information:

```
show port <portlist> eee
Port EEE Statistics Monitor                              Sat Dec 29 04:10:53
2012

      EEE State: E-Enabled, D-Disabled, NA-Not Available
      0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support EEE.

show ports

show ports {*port_list* | **tag** *tag*} {**no-refresh**}

Description

Displays port summary statistics.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of the data.

Default

N/A.

Usage Guidelines

Use this command to display the port number, display string, and some of the port states in tabular form.

The VLAN name is displayed only if that port contains a single VLAN. If the port contains more than one VLAN, then the number of VLANs is displayed.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays on slot 2-3 on port 1 and slot 12 on port 10 on a modular switch:

```
show ports 1:2-3,10:12
```

Following is sample output from this command:

```
show ports 1:2-3,10:12
Port Summary Monitor                        Thu Feb 14 14:19:50 2008
Port  Display         VLAN Name          Port  Link  Speed  Duplex
#     String          (or # VLANs)       State State Actual Actual
=================================================================
1:2   2nd-Floor-Lab   Lab-Backbone       E     A     1000   FULL
1:3                   Building2          E     A D
10:12 AllBackboneLANs (34)               E     R             FULL
=================================================================
Port State: D-Disabled, E-Enabled
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback,
D-ELSM enabled but not up
U->page up  D->page down  ESC->exit
```

Restricted optics will show similarly to unsupported optics (!) in the `show ports` command by use of a '$'. Additionally, when a 3rd party license has been installed, previously restricted optics are shown using a '%', because those optics are un-restricted by means of the license. Here is an example output:

```
show port 2:*        conf
Port Configuration Monitor                              Wed Sep  5   20:35:54
2012
Port    Virtual    Port  Link  Auto   Speed      Duplex   Flow  Load
```

History

This command was first available in ExtremeXOS 12.1.

The tag value was added in ExtremeXOS 12.4.4.

Show output for 3rd party restricted optics support was added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

show ports anomaly

show ports {*port_list* | **tag** *tag*} **anomaly** {**no-refresh**}

Description

Displays statistics of anomaly violation events in real time.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

N/A.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, statistics are displayed for all ports. To clear the counters, use the clear counters ports command. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

This command takes effect after enabling anomaly-protection.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays real-time anomaly statistics on slot 2, all ports on a modular switch:

```
show ports 2:* anomaly
```

Following is sample output from this command:

```
Port Statistics Thu Nov  9 22:44:31 2006

0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 12.0.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

show ports buffer

show ports *port_list* **buffer**

Description

Displays the packet buffer organization for the specified ports.

Syntax Description

port_list	Optionally specifies the list of ports, or slots and ports, for which packet buffer information is displayed. If the ***port_list*** is omitted then packet buffer information is displayed for all ports in the system.

Default

N/A.

Usage Guidelines

This command shows the packet buffer organization for the specified ports.

The port_list can span multiple ranges. The packet buffer description for each such port range is displayed.

Since ports and packet buffer are grouped by the hardware, the command displays the range of ports that share the same packet buffer.

The Total Packet Buffer Size for the port range is displayed in bytes, along with an indication of whether or not the user has configured over-commitment of the packet buffer (not overcommitted by default).

The amount of Reserved Buffer allocated to each port and QoS Profile is shown for the ports in the user-specified port_list. To configure the reserved buffer, use the configure qosprofile ***qosprofile*** maxbuffer ***percentage*** ports ***port_list*** command.

The Total Shared Buffer Size displayed is the Total Packet Buffer Size minus the total Reserved Buffer allocated to all ports and QoS profiles in the port range. Note that some packet buffer is also reserved to internal ports.

For each port, the maximum of the Total Shared Buffer Size that the port is allowed to use (Max Shared Buffer Usage) is shown both as an absolute number of bytes and as a percentage of the Total Shared Buffer Size. A port's Max Shared Buffer Usage may be configured using the command configure ports {<port_list>} shared-packet-buffer <percentage>

Note the configured percentage may be different than the displayed percentage. This is because more recent hardware can only allocate shared packet buffer in steps, while older hardware can precisely allocate the requested percentage.

The more recent hardware dynamically adjusts each port's shared buffer usage limit based on simultaneous usage by multiple ports and QoS profiles, automatically providing fair usage of the shared buffer among the ports and QoS profiles that are currently demanding buffer space. This allows larger packet buffer usage bursts on a port when other ports are not using shared buffer. This dynamic adjustment cannot be observed with this command since only the maximum possible limits are displayed. .

The VLAN name is displayed only if that port contains a single VLAN. If the port contains more than one VLAN, then the number of VLANs is displayed.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays on slot 2-3 on port 1 and slot 12 on port 10 on a modular switch:

```
   BD-X8.34 # show ports 1:1,2:1-2 buffer
Packet Buffer Allocation for ports in range 1:1-12,1:25-36
 Total Packet Buffer Size: 9584640 bytes, Not Overcommitted
 Total Shared Buffer Size: 9051328
  Port 1:1  Max Shared Buffer Usage: 8055632 bytes (89%)
   QP1: Reserved Buffer: 3328 bytes
   QP8: Reserved Buffer: 1664 bytes
   MCQ: Reserved Buffer: 1664 bytes
Packet Buffer Allocation for ports in range 2:1-12,2:25-36
 Total Packet Buffer Size: 9584640 bytes, Not Overcommitted
```

```
  Total Shared Buffer Size: 9051328
   Port 2:1  Max Shared Buffer Usage: 1810224 bytes (20%)
    QP1: Reserved Buffer: 3328 bytes
    QP8: Reserved Buffer: 1664 bytes
    MCQ: Reserved Buffer: 1664 bytes
   Port 2:2  Max Shared Buffer Usage: 1810224 bytes (20%)
    QP1: Reserved Buffer: 3328 bytes
    QP8: Reserved Buffer: 1664 bytes
    MCQ: Reserved Buffer: 1664 bytes
BD-X8.35 #
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

show ports collisions

show ports {**mgmt** | *port_list* |**tag** *tag*} **collisions** {**no-refresh**}

Description

Displays real-time collision statistics.

Syntax Description

mgmt	Specifies the management port.
port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, statistics are displayed for all ports. To clear the counters, use the clear counters ports command. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

Example

The following command displays real-time collision statistics on slot 1, ports 1 and 2 on a modular switch:

```
show ports 1:1-2 collisions
```

Following is sample output from this command:

```
Port Collision Monitor
Port        Link           Collision Histogram
State 1   2   3   4   5   6   7   8   9  10  11  12  13  14  15  16
================================================================================
==
1:1     A      0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0
1:2     R      0   0   0   0   0   0   0   0   0   0   0   0   0   0   0   0
================================================================================
==
Link State: A-Active R-Ready, NP-Port not present, L-Loopback
```

The numbers 1 to 16 represent the number of collisions encountered prior to successfully transmitting the packet; this is applicable only for half-duplex links.

History

This command was first available in ExtremeXOS 10.1.

The no-refresh variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

show ports configuration

show ports {**mgmt** | *port_list* | **tag** *tag*} **configuration** {**no-refresh**}

Description

Displays port configuration statistics, in real time or snapshot.

Syntax Description

mgmt	Specifies the management port.
port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, configuration statistics are displayed for all ports. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

This command displays port configuration, which includes:

- Virtual router
- Port state
- Link state
- Autonegotiation information
- Link speed
- Duplex mode
- Flow control
- Load sharing information
- Link media information

Note

On 10 Gbps ports, the Media Primary column displays NONE when no module is installed, and SR, LR, or ER depending on the module installed when there is one present. Combination ports on Summit X150, X250e, X350, X450a, X450e, X460, X480, X650, and X670 series switches display Autonegotiation, Link speed, and Duplex mode information only for the current primary medium.

Example

The following command displays the port configuration for all ports on a Summit family switch:

```
show ports configuration
Port Configuration Monitor                              Fri Apr 13 10:22:29
```

================================================================================
==
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
Port State:  D-Disabled E-Enabled, Media:!-Unsupported Optic Module
0->Clear Counters U->page upD->page downESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

The Port not present and Media variables were added in ExtremeXOS 11.2.

The no-refresh variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

show ports information

show ports {**mgmt** | **port_list** | **tag** *tag*} **information** {**detail**}

Description

Displays detailed system-related information.

Syntax Description

mgmt	Specifies the management port.
port_list	Specifies one or more ports of slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
detail	Specifies detailed port information.

Default

N/A.

Usage Guidelines

This command displays information, including the following:

- Port number
- Port configuration
  - Virtual router
  - Type of port
  - Admin state
  - Link state and speed
  - Link Up/Down Transition
  - VLAN configuration
  - STP configuration
  - Trunking, or load sharing
  - EDP
  - ELSM (disabled; or if enabled, the ELSM link state is shown as well)
  - Load balancing
  - Learning

- Egress flooding
- Jumbo frames
- Link port up/down traps
- Port isolation status
- QoS profiles
- VMAN status
- Smart Redundancy status
- SRP status
- Additional platform-specific information
- LW XENPAK WAN PHY ports—Summit X450a series switches only

  - Framing

  - Clocking

  - Trace section

  - Trace path

If you do not specify a port number, range of ports, or tag value, detailed system-related information is displayed for all ports. The data is displayed in a table format.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

The detail parameter is used to provided more specific port information. The data is called out with written explanations versus displayed in a table format.

Note

The keyword detail displays slightly different information depending on the platform and configuration you are working with.

The link filter counter displayed with the detail keyword is calculated at the middle layer on receiving an event. The link filter up indicates the number of link transitions from down to up at the middle layer filter.

Example

The following command displays port system-related information on a BlackDiamond 8810 switch:

```
show port 1:5-7 information
Port      Flags              Link           Link Num Num   Num    Jumbo QOS
Load
State     ELSM UPS  STP VLAN Proto Size  profile Master

Summit X450a series switches (including SummitStack) with LW XENPAK ports only

The following command displays more specific information for the WAN PHY port on the LW XENPAK in port 1 of the Summit X450a -24t switch:

```
Port:   1
Framing: SONET
Clocking: Line
LoopBack: Off
Trace Section: alpha4
Trace Path:    delta6
```

The following is an example of the output when a port supports SyncE, but it is not enabled or configured for SyncE:

```
E4G-400.1 # show ports 1 information detail
Port:   1
Virtual-router: VR-Default
Type:           UTP
Random Early drop:      Unsupported
Admin state:    Enabled with  auto-speed sensing  auto-duplex
Link State:     Active, 1Gbps, full-duplex
Link Ups:       1        Last: Tue Jun 05 04:54:47 2012
Link Downs:     0        Last: --
VLAN cfg:
Name: Default, Internal Tag = 1, MAC-limit = No-limit, Virtual router: VR-
Default
```

```
STP cfg:
s0(disable), Tag=(none), Mode=802.1D, State=FORWARDING
Protocol:
Name: Default      Protocol: ANY      Match all protocols.
Trunking:       Load sharing is not enabled.
EDP:            Enabled
ELSM:           Disabled
Ethernet OAM:           Disabled
Learning:       Enabled
Unicast Flooding:       Enabled
Multicast Flooding:     Enabled
Broadcast Flooding:     Enabled
Jumbo:          Disabled
Flow Control:   Rx-Pause: Enabled       Tx-Pause: Disabled
Priority Flow Control: Disabled
Reflective Relay:       Disabled
Link up/down SNMP trap filter setting:  Enabled
Egress Port Rate:       No-limit
Broadcast Rate:         No-limit
Multicast Rate:         No-limit
Unknown Dest Mac Rate:  No-limit
QoS Profile:    None configured
Ingress Rate Shaping :          Unsupported
Ingress IPTOS Examination:      Disabled
Ingress 802.1p Examination:     Enabled
Ingress 802.1p Inner Exam:      Disabled
Egress IPTOS Replacement:       Disabled
Egress 802.1p Replacement:      Disabled
NetLogin:                       Disabled
NetLogin port mode:             Port based VLANs
Smart redundancy:               Enabled
Software redundant port:        Disabled
IPFIX:   Disabled               Metering:  Ingress, All Packets, All Traffic
IPv4 Flow Key Mask:     SIP: 255.255.255.255            DIP: 255.255.255.255
IPv6 Flow Key Mask:     SIP: ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff
DIP: ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff
auto-polarity:                  Enabled
Shared packet buffer:           default
VMAN CEP egress filtering:      Disabled
PTP Configured:                 Disabled
Time-Stamping Mode:             None
Synchronous Ethernet:           Disabled
```

Whent the port is enabled for SyncE and not configured as a source:

```
Synchronous Ethernet:           Enabled
```

When the port is configured as source 1 but not enabled for SyncE:

```
Synchronous Ethernet:           Disabled, Configured (Source 1)
```

When the port is enabled and configured as source 1 for SyncE:

```
Synchronous Ethernet:           Enabled, Configured (Source 1)
```

When the port does not support SyncE:

```
Synchronous Ethernet:           Unsupported
```

The following example displays the SNMP ifMib ifAlias accessible string size information:

```
show port info detail
Port:   1:10(CUST1):
Description String: "customer1!@#$%^*()10102020lotsoftext"
Virtual-router:    VR-Default
Type:           BASET
Random Early drop:      Unsupported
Admin state:    Enabled with 10G full-duplex
Link State:     Active, 1Gbps, full-duplex
Link Ups:       1   Last: Wed Aug 22 20:58:26 2012
Link Downs:     0   Last: --
VLAN cfg:
        Name: v1, 802.1Q
        Tag = 20, MAC-limit = 1000, Virtual router: VR
STP cfg:
Protocol:
Trunking:       Load sharing is not enabled.
EDP:            Enabled
ELSM:           Disabled
Ethernet OAM:   Disabled
Learning:       Enabled
Unicast Flooding:       Enabled
Multicast Flooding:     Enabled
```

Note

The above bold line will not display if there is no description-string configured.

History

This command was first available in ExtremeXOS 10.1.

Information on ingress rate shaping was added in ExtremeXOS 11.0.

Network Login, Smart Redundancy, and rate limiting were added in ExtremeXOS 11.1.

Information on unicast, multicast, and broadcast flooding; the Port not present parameter; and autopolarity status were added in ExtremeXOS 11.2.

The netlogin parameters were added in ExtremeXOS 11.3.

Information on WAN PHY ports on the LW XENPAK modules on the Summit X450a series switches was added in ExtremeXOS 11.6.

The output command was modified in ExtremeXOS 12.1 so that when learning is disabled with the disabled learning port command, a new w flag appears in the output.

Link Ups and Link Downs information was added to the output and the tag value was added to the command syntax in ExtremeXOS 12.4.4.

Industrial Temperature detail added to Type field in ExtremeXOS 15.1.2.

Note

The Industrial Temperature detail is only displayed only when detail is used. Without it, the output is compressed and the optic type is not displayed.

The show output was enhanced to display the SNMP ifMib ifAlias accessible string size information.

Platform Availability

This command is available on all platforms.

Information on WAN PHY ports is available only on Summit X450a and Summit X480 series switches, whether or not included in a SummitStack.

show ports ip-fix

show ports {*port_list* | **tag** *tag*} **ip-fix** {**detail** | **no-refresh**}

Description

Displays IPFIX information on specified port(s).

Syntax Description

port_list	Specifies the port(s)
tag	Specifies an 802.1Q or 802.1ad tag value.
detail	Specifies display in detailed format.
no-refresh	Specifies a static page by page display of the data without auto-refresh.

Default

N/A.

Usage Guidelines

Use this command to display IPFIX information regarding the global state, collector information, and which ports are enabled.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays IPFIX information for port 3:1:

```
show port 3:1 ip-fix no-refresh
```

Following is sample output on a BlackDiamond 8800 switch:

```
BD-8810.1 # show port 3:1 ip-fix no
Port IPFIX Metering
Port      Link   IPFIX           Byte        Pkt Flow Record   Premature
State  State           Count      Count       Count     Exports
================================================================================
==
3:1       A      E                  0          0           0           0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback
IPFIX State: D-Disabled E-Enabled
IPFIX Enabled on Port(s):    3:1
```

Flow Record Count—how many flow records have been sent from this port.

Premature Exports—the result of a hash bucket being full and the hardware having to export a flow prematurely to make room for a new flow.

History

This command was first available in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

show ports packet

show ports {**mgmt** | *port_list* | **tag** *tag*} **packet** {**no-refresh**}

Complete

Displays a snapshot or real-time histogram of packet statistics.

Syntax Description

mgmt	Specifies the management port.
port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time statistics.

Usage Guidelines

If you do not specify a port number, range of ports, or tag value, the system displays information for all ports; if you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command. To clear the counters, use the clear counters ports command.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

The following packet statistics are displayed:

- Port number
- Link state
- Packet size

Example

The following command displays packet statistics for slot 1, port 1, slot 2, port 1, and slot 5, ports 1 through 8 on a modular switch:

```
show ports 1:1, 2:1, 5:1-5:8 packet
```

Following is sample output from this command:

```
Port   Link                              Packet Sizes
State   0-64    65-127   128-255   256-511   512-1023   1024-1518   Jumbo
================================================================================
==
1:1  A       0        0         0         0        0           0         0
2:1  R       0        0         0         0        0           0         0
5:1  R       0        0         0         0        0           0         0
5:2  R       0        0         0         0        0           0         0
5:3  R       0        0         0         0        0           0         0
5:4  R       0        0         0         0        0           0         0

5:6  R       0        0         0         0        0           0         0
5:7  R       0        0         0         0        0           0         0
```

```
5:8  R       0        0          0         0        0           0         0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
```

History

This command was first available in ExtremeXOS 10.1.

The Port Not Present variable was added in ExtremeXOS 11.2.

The no-refresh variable was added in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

show ports redundant

show ports redundant

Description

Displays detailed information about redundant ports.

Syntax

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information on software-controlled redundant ports on the switch:

```
show ports redundant
```

Following is sample output from this command:

```
Primary: *1:1           Redundant: 3:1, Link on/off option: OFF
Flags: (*)Active, (!) Disabled, (g) Load Share Group
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show ports sharing

show ports sharing

Description

Displays port load-sharing groups, or link aggregation groups (LAGs).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Output from this command displays the following information:

- Config Master—The port that is configured as the master logical port of the link aggregation group (LAG). This number is also the LAG group ID.
- Current Master—In LACP, this is the port that is currently the LAG group ID, or master logical port for the LAG.
- Agg Control—This is the aggregation control for the specified LAG; it can be either static, LACP or health-check. In LACP, it is the aggregation control for the specified LAG.
- Ld Share Algorithm—The algorithm used for the link aggregation. The available link aggregation algorithms vary among platforms; see the ExtremeXOS Concepts Guide for more information.
- Ld Share Group—The specific ports that belong to each LAG, or the port numbers in the trunk. A port can belong to only one LAG, either static or dynamic.
- Agg Mbr—In LACP, this shows whether the port has been added to the aggregator or not; it will be either Y for yes or - for no.

- Link State—This is the current status of the link
- Link Up transitions—Number of times the link has cycled through being up, then down, then up.

Example

Following is sample outlook displaying link aggregation on a Summit series switch:

```
show ports sharing
Load Sharing Monitor
Config    Current    Agg       Ld Share    Ld Share  Agg   Link    Link Up
Master    Master     Control   Algorithm   Group     Mbr   State transitions
================================================================================
    1 1hlth-chk  L2          1          Y     A        1
L2          1          -     A        1
L2          1          Y     A        1
5           5        LACP    L2       5          Y      A        3
L2          6          Y      A        3
L2          7          Y      A        3
L2          8          Y      A        3
L2          9          -      A        3
L2          10         -      A        3
12               Static    L2          12         -      R        0
L2          13         -      R        0
================================================================================
Link State: A-Active, D-Disabled, R-Ready, NP-Port not present, L-Loopback
Load Sharing Algorithm: (L2) Layer2 address based, (L3) Layer3 address based,
(L3_L4) Layer3 address and Layer4 port based
Number of load sharing trunks: 3
```

Following is sample outlook for a Summit X650 switch that uses a custom load sharing algorithm:

```
X650-24t(SSns).1 # show port sharing
Load Sharing Monitor
Config    Current    Agg       Ld Share    Ld Share  Agg   Link    Link Up

3:1    3:1        Static    L3_L4       3:1       Y     A       1
L3_L4       3:2        Y      A        1
4:1    4:1        Static    custom      4:1       Y     A       1
custom      4:2        Y      A        1
================================================================================
Link State: A-Active, D-Disabled, R-Ready, NP-Port not present, L-Loopback
Load Sharing Algorithm: (L2) Layer2 address based, (L3) Layer3 address based
(L3_L4) Layer3 address and Layer4 port based
(custom) User-selected address-based configuration
Custom Algorithm Configuration: ipv4 source-only, xor

 The 'custom' algorithm is not used for traffic ingressing on current
slot 1, 2, 3, 5 and 10. Refer to XOS Command Reference.
Number of load sharing trunks: 3
```

History

This command was first available in ExtremeXOS 10.1.

The LACP feature was added in ExtremeXOS 11.3.

The Health Check LAG was added in ExtremeXOS 12.1.3

The round-robin algorithm was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show ports tdm alarms

show ports {*port_list*} **tdm alarms** {**no-refresh**}

Description

Displays the TDM port alarms.

Syntax Description

tdm	Time Division Multiplexing.
alarms	Display the alarms for the tdm ports.
no-refresh	Page by page display without auto-refresh.

Default

N/A.

Usage Guidelines

Use this command to display the TDM port alarms.

Example

```
E4G-400.2 # sh ports {<port_list>} tdm alarms
TDM Alarms                                              Wed Apr 4 15:45:52 2011
Port     Tx RAI    Rx RAI    Tx AIS  Rx AIS  LOF    LOS

================================================================================
==
1        None      None      Alarm   None    Alarm  Alarm
2        None      None      None    None    None   None
================================================================================
==
> indicates Port Display Name truncated past 8 characters
U->page up  D->page down ESC->exit
Legend: AIS - Alarm Indication Signal, LOF - Loss of Frame,
LOS - Loss of Signal, RAI - Remote Alarm Indication
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ports tdm configuration

show ports {*port_list*} **tdm configuration** {**no-refresh**}

Description

Displays the specified TDM port configuration.

Syntax Description

tdm	Time Division Multiplexing.
configuration	Displays TDM ports configuration.
no-refresh	Page by page display without auto-refresh.

Default

N/A.

Usage Guidelines

The configured cable length column will be displayed only if the hierarchy selected is T1/ANSI.

Example

```
E4G-400.2 # sh ports {<port_list>} tdm configuration
TDM Port Configuration Monitor                          Wed Apr 4 15:56:34 2011

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ports tdm errors

show ports {*port_list*} **tdm errors** {**near-end**} {**total** | **intervals** | **current** {**no-refresh**}}

Description

Displays the specified TDM port error counters. The current switch lists the error statistics of the on-going 15-minute interval. The intervals switch displays the error statistics for the last 96 instances of 15-minute intervals. The total switch displays the cumulative error statistics.

Syntax Description

tdm	Time Division Multiplexing.
errors	Displays errors.
near-end	Displays near-end errors (Default).
total	Displays cumulative errors.
intervals	Displays errors for 15-minute intervals.
current	Displays current 15-minute interval errors (Default).
no-refresh	Page by page display without auto-refresh.

Default

The default will display near-end current error statistics.

Usage Guidelines

Use the current switch lists the error statistics of the on-going 15-minute interval. The intervals switch displays the error statistics for the last 96 instances of 15-minute intervals. The total switch displays the cumulative error statistics.

Example

Only one space is given between the first and second field to accommodate the output within 80 characters.

```
E4G-400.3 # show port {port_list} tdm errors near-end current
Port Statistics                                        Tue Jul 31 10:20:56 2012

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ports tdm information

show ports {*port_list*} **tdm information** {**detail**}

Description

Displays the specified TDM port information.

Syntax Description

tdm	Time Division Multiplexing.
information	Displays TDM ports information.
detail	Display detailed TDM ports information.

Default

N/A.

Usage Guidelines

Use this command to display general or detailed information on a specified list of TDM ports.

Example

```
E4G-400.3 # sh port {port_list} tdm information

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ports tdm no-refresh

show ports {*port_list*} **tdm** {**no-refresh**}

Description

Displays the specified TDM port information.

Syntax Description

tdm	Time Division Multiplexing.
no-refresh	Page by page display without auto-refresh.

Default

N/A.

Usage Guidelines

Use this command to display the specified TDM port information in a page-by-page display without auto-refresh.

Example

```
E4G-400.2 # show ports tdm no-refresh
Port Summary
Port  Display    Service Name    Port   Link
#     String     (or #Services)  State  State
================================================================================
==
1                serBundle1      E      R
2                26              E      R
================================================================================
==
Port State: D-Disabled, E-Enabled
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
E4G-400.2 # show ports tdm
Port Summary Monitor                      Tue Dec 13 11:51:26 2011
Port  Display    Service Name    Port   Link
#     String     (or #Services)  State  State
================================================================================
==
1                serBundle1      E      R
2                26              E      R
================================================================================
==
Port State: D-Disabled, E-Enabled

================================================================================
==
Port State: D-Disabled, E-Enabled
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show ports transceiver information

show ports {*port_list* | **tag** *tag*} **transceiver information**

Description

Displays basic information about the optical transceiver.

Syntax Description

port_list	Specifies the port number(s).
tag	Specifies an 802.1Q or 802.1ad tag value.

Default

N/A.

Usage Guidelines

Digital Diagnostic Monitoring Interface (DDMI) provides critical system information about the installed optical modules. Use this command to monitor the condition of XFP, SFP, and SFP+ optical transceiver modules.

The tag value may be associated with either a VMAN or a VLAN.

If you try to execute this command on one of the ports in the port list that is non-compliant with DDMI, the following error message is displayed and the command does not go through:

```
Port 3:1 This command is not supported on this port. All ports and
transceiver of the ports requested in the command need to support DDMI.
```

If you try to execute this command on one of the ports in the port list on which the transceiver is non-compliant with DDMI, the following error message is displayed:

```
Port 3:1 This media/transceiver does not support enhanced digital diagnostic
monitoring interface (DDMI). All ports and transceiver of the ports requested
in the command need to support DDMI.
```

For more detailed information, use the show ports transceiver information detail command.

Example

The following display shows output for port 1:1-2 on a BlackDiamond 8810 switch:

```
BD-8810.2 # sh port 1:1-2 transceiver information
Port      Temp    TxPower  RxPower  TxBiasCurrent  Voltage-Aux1  Voltage-Aux2
(Celcius)   (dBm)    (dBm)     (mA)         (Volts)       (Volts)
================================================================================
==
1:1      30.60     -25.20   -18.70    0.40          5.09          5.07
1:2      30.60     -25.20   -18.70    0.40          5.09          N/A
================================================================================
==
N/A indicates that the parameter is not applicable
to the optics connected to the port
```

The following display shows output for port 25 on a Summit X480 switch:

```
X480-24x(10G4X).1 # sh ports 25 transceiver information
Port      Temp                                TxPower
RxPower             TxBiasCurrent     Voltage-Aux1     Voltage-Aux2
            (Celsius)                 (dBm)             (dBm)
(mA)
(Volts)                                                 (Volts)
================================================================================
===
25             32.00                  -3.35             -2.68
7.67                      3.35                                      N/A
================================================================================
===
```

History

This command was first available in ExtremeXOS 12.4.

Support for the Summit switches was added in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

Support for SFP and SFP+ optics was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on the following platforms:

- BlackDiamond 8800—10G8Xc, 10G4Xc modules and S-10G1Xc option cards with 10G XFP optics
- BlackDiamond 8900—10G8X-xl modules and S-10G1Xc option cards with 10G XFP optics
- Summit X250e switches—SFP ZX and LX200 optics
- Summit X450a, X450e switches—SFP ZX and LX100 optics
- Summit X460 switch—SFP ZX and LX100 optics
- Summit X480 switches and X480 VIM2-10G4X—XFP and SFP ZX and LX100 optics
- Summit X650 switches—SFP ZX and LX100 optics

—SFP+ optics ER/LR

- Summit X670 switches—SFP ZX and LX100 1G optics

—SFP+ 10G optics

show ports transceiver information detail

show ports {*port_list* | **tag** *tag*} **transceiver information detail**

Description

Displays detailed information about the optical transceiver.

Syntax Description

port_list	Specifies the port number(s).
tag	Specifies an 802.1Q or 802.1ad tag value.

Default

N/A.

Usage Guidelines

Digital Diagnostic Monitoring Interface (DDMI) provides critical system information about the installed optical modules. Use this command to monitor the condition of XFP, SFP, and SFP+ optical transceiver modules.

The tag value may be associated with either a VMAN or a VLAN.

If you try to execute this command on one of the ports in the port list that is non-compliant with DDMI, the following error message is displayed and the command does not go through:

```
Port 3:1 This command is not supported on this port. All ports and
transceiver of the ports requested in the command need to support DDMI.
```

If you try to execute this command on one of the ports in the port list on which the transceiver is non-compliant with DDMI, the following error message is displayed:

```
Port 3:1 This media/transceiver does not support enhanced digital diagnostic
monitoring interface (DDMI). All ports and transceiver of the ports requested
in the command need to support DDMI.
```

Example

```
BD-8810.2 # show port 2:* conf

History

This command was first available in ExtremeXOS 12.4.

Support for the Summit switches was added in ExtremeXOS 12.5.

The tag value was added in ExtremeXOS 12.4.4.

Support for SFP and SFP+ optics was added in ExtremeXOS 12.5.3.

Show output was updated in 15.3.

Platform Availability

This command is available on the following platforms:

- BlackDiamond 8800—10G8Xc, 10G4Xc modules and S-10G1Xc option cards with 10G XFP optics
- BlackDiamond 8900—10G8X-xl modules and S-10G1Xc option cards with 10G XFP optics
- Summit X250e switches—SFP ZX and LX200 optics
- Summit X450a, X450e switches—SFP ZX and LX100 optics
- Summit X460 switch—SFP ZX and LX100 optics
- Summit X480 switches and X480 VIM2-10G4X—XFP and SFP ZX and LX100 optics
- Summit X650 switches—SFP ZX and LX100 optics

—SFP+ optics ER/LR

- Summit X670 switches—SFP ZX and LX100 1G optics

—SFP+ 10G optics

show ports utilization

show ports {**mgmt** | *port_list* | **tag** *tag* | **stack-ports** *stacking-port_list*}
utilization {**bandwidth** | **bytes** | **packet**}

Description

Displays real-time port utilization information. The total utilization displays as real-time information, constantly refreshing. and the parameter displays show a snapshot of the activity on the port when you issue the command.

Syntax Description

mgmt	Specifies the management port.
port_list	Specifies one or more ports or slots and ports.
tag	Specifies an 802.1Q or 802.1ad tag value.
stacking-port_list	Specifies one or more stacking slots and ports.
bandwidth	Specifies port utilization as percentage of bandwidth.
bytes	Specifies port utilization in bytes per second.
packets	Specifies port utilization in packets per second.

Default

N/A.

Usage Guidelines

The software continuously monitors port utilization and calculates bandwidth as a function of each port's maximum link capacity.

The total utilization display presents real-time statistics. Use the <spacebar> to toggle the real-time displayed information for packets, bytes, and bandwidth in that order. When you use a parameter (packets, bytes, or bandwidth) with the command, the display for the specified type shows a snapshot per port when you issued the command. When the show ports utilization command is run with the bandwidth, bytes, or packets options, the command may need to be repeated a few times in order for the ExtremeXOS software to gather enough statistics to calculate appropriate values.

If you do not specify a port number, range of ports, or tag value, port utilization information is displayed for all ports.

The tag value may be associated with either a VMAN or a VLAN.

This status information may be useful for your technical support representative if you have a network problem.

Example

The following command displays utilization statistics for port 1 on a stand-alone switch:

```
show ports 1 utilization
```

The following command displays utilization statistics for slot 3, port 1 on a modular switch:

```
show ports 3:1 utilization
```

The following example shows sample output from the show ports utilization packets command:

```
Link Utilization Averages                              Mon Oct  6 22:38:25 2008
Port     Link    Rx              Peak Rx          Tx               Peak Tx
State   pkts/sec        pkts/sec         pkts/sec         pkts/sec

History

This command was first available in ExtremeXOS 11.3.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms. The stack-ports option is available only on SummitStack.

show ports wan-phy configuration

show ports {*port_list* | **tag** *tag*} **wan-phy configuration**

Description

Displays the configuration of the specified WAN PHY port.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
tag	Specifies an 802.1Q or 802.1ad tag value.

Default

Real-time information.

Usage Guidelines

This command displays the configuration for the specified WAN PHY ports. This command displays:

- Port number
- Link
- Framing
- Clocking
- Loopback
- Section trace
- Path trace

If you do not specify a port number, range of ports, or tag value, the configuration is displayed for all WAN PHY ports. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays the configuration for all LW XENPAK WAN PHY ports:

```
show ports wan-phy configuration
```

Following is sample output from this command:

```
WAN PHY Port Configuration
Port Link Framing Clocking LoopBack  SectionTrace   PathTrace

6A   SONET     Internal  Line     abcdefghijklmn    01234567890
7R   SDH     Line     Line     abcdefghijklmn    01234567890
================================================================
```

History

This command was available in ExtremeXOS 11.6.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all 10G XFP ports only on the Summit X480 series switches and the Summit X450a series switches only.

show ports wan-phy errors

show ports {*port_list* | **tag** *tag*} **wan-phy errors** {**no-refresh**}

Description

Displays the error information of the specified WAN PHY port.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time information.

Usage Guidelines

This command displays the counters associated with parity errors for the specified WAN PHY ports. The display shows the following:

- Port number
- B1, B2, and B3
- Far end path block error count
- Far end line BIP error count

If you do not specify a port number, range of ports, or tag value, the errors are displayed for all WAN PHY ports. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays the errors for the LW XENPAK WAN PHY ports 1 to 4:

```
show ports 1-4 wan-phy errors
```

Following is sample output from this command:

```
WAN PHY Port Errors
Port     B1          B2         B3     FELBE          FEPLE

     4        0123456789 0123456789    0123456789 0123456789   0123456789
================================================================================
===
    0->Clear Counters  U->page up  D->page down ESC->exit
    FELBE = Far End Path Block Error Count
    FEPBE = Far End Line BIP Error Count
```

History

This command was available in ExtremeXOS 11.6.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all 10G ports on 10G XFP ports only on the Summit X480 series switches and the Summit X450a series switches only.

show ports wan-phy events

show ports {*port_list* | **tag** *tag*} **wan-phy events** {**no-refresh**}

Description

Displays the events information of the specified WAN PHY port.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time information.

Usage Guidelines

This command displays the events for the specified WAN PHY ports. The display shows whether each parameter is in the alarm or normal state; the alarm state includes alarm, warning, and error states.

This command displays notices for the following events:

- LOS: loss of signal
- SEF: Severely Error Frame
- LOF: loss of frame
- LOP: loss of pointer
- AIS-L: alarm indication signal, line
- AIS-P: alarm indication signal, path
- RDI-L: remote defection indication, line
- FarEnd PLM-P/LCD-P: Far end path label mismatch / loss of code-group delineation
- FarEnd AIS-P/LCD-P: Far end path alarm indication signal / path loss of pointer

- PLM-P: Path label mismatch
- LCD-P: path loss of code-group delineation

If you do not specify a port number, range of ports, or tag value, the errors are displayed for all WAN PHY ports. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays the events for the LW XENPAK WAN PHY ports 5 to 6:

```
show ports 5-6 wan-phy events
```

Following is sample output from this command:

```
WAN PHY Port Events:
Port LOS SEF LOF LOP AIS-L AIS-P RDI-L  FarEnd       FarEnd    PLM-P LCD-P
       PLM-P/LCD-P  AIS-P/LOP-P
================================================================================
5A   NA   N    N     N     N     N      N    N   A
6N   N   A   N    N     N     N    A      N      A     N
================================================================================
Event Status: A-Alarm N-Normal
```

History

This command was available in ExtremeXOS 11.6.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on 10G XFP ports only on the Summit X480 series switches and the Summit X450a series switches only.

show ports wan-phy overhead

show ports {*port_list* | **tag** *tag*} **wan-phy overhead** {**no-refresh**}

Description

Displays selected WAN PHY OAM overhead information for the specified WAN PHY port.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
tag	Specifies an 802.1Q or 802.1ad tag value.
no-refresh	Specifies a static snapshot of data.

Default

Real-time information.

Usage Guidelines

This command displays selected WAN PHY OAM overhead for the specified WAN PHY ports. The overhead number comes directly from the WAN PHY framing; for each overhead, both transmit and receive numbers are displayed.

Note

Overhead values display in hexadecimal format.

If you do not specify a port number, range of ports, or tag value, the errors are displayed for all WAN PHY ports. The default display is a constantly refreshing real-time display. If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

The tag value may be associated with either a VMAN or a VLAN.

Example

The following command displays the events for the LW XENPAK WAN PHY ports 5 to 6:

```
show ports 5-6 wan-phy overhead
```

Following is sample output from this command:

```
WAN PHY Port Overhead Info
Port      C2    G1    K1    K2    M1       J0(0-15)          J1(0-15)
Rx    Rx    Rx    Rx    Rx         Rx                  Rx
================================================================================
5        0     0     0     0     F8  abcdefghijklmn     ExtremeNetworks
6        1A    0     0     0     F8  ExtremeNetworks    abcdefghijklmn
================================================================================
Overhead values for C2, G1, K1, K2, and M1 are displayed in hexadecimal
representation.
Overhead values for J0 and J1 are displayed in ascii alphanumeric
representation with a dot representing a non-alphanumeric character.
```

History

This command was available in ExtremeXOS 11.6.

The tag value was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on 10G XFP ports only on the Summit X480 series switches and the Summit X450a series switches only.

show sharing distribution port-based

show sharing distribution *port* port-based {**ports** *port_list*}

Description

Displays the load sharing distribution to member ports in the group specified by ***port*** for traffic received on ports in ***port_list***.

Syntax Description

port	Specifies the group of member ports to display for the load sharing.
port_list	Specifies the group of ports from which traffic is received.

Default

N/A.

Usage Guidelines

Use this command to display the load sharing distribution to member ports in the group specified by ***port*** for traffic received on ports in ***port_list***. The selected member ports displayed are the results of the calculation using the keys for the ports in the ***port_list***, and the list of aggregator ports for the load sharing group. This command serves as port-based load sharing calculator for convenience.

Example

The following output shows the egress member ports selected for distribution in a load sharing group with master port 5:1, and aggregator ports 5:1 and 6:1 for packets received on ports 1:1-1:8, with default keys as shown.

```
BD-X8.4 # show sharing port-based keys ports 1:1-8
 1:1:   0    1:2:  1    1:3:  2    1:4:  3    1:5:   4    1:6:  5    1:7:
6    1:8:  7

BD-X8.5 # show sharing distribution 5:1 port-based keys ports 1:1-8
```

```
1:1 ->  5:1
1:2 ->  6:1
1:3 ->  5:1
1:4 ->  6:1
1:5 ->  5:1
1:6 ->  6:1
1:7 ->  5:1
1:8 ->  6:1
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

show sharing health-check

show sharing health-check

Description

Displays the configured health check LAGs on a switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the health-check LAGs that have been configured on the switch.

Example

The following is sample output from this command:

```
(debug) BD-8810.1 # show sharing health-check

This command was first available in ExtremeXOS 12.13.

Platform Availability

This command is available on all platforms.

show sharing port-based keys

show sharing port-based keys {**ports** *port_list*}

Description

Displays the load sharing key values for all ports in the ***port_list***. These values may be either default values, or configured values.

Syntax Description

port	Specifies the ports for the load sharing.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Use this command to display the health-check LAGs that have been configured on the switch.

Example

The following output shows the default load sharing key values on a BlackDiamondf-X8 switch with a BDXA-10G48X module in slot 1 and a BDXA-40G24X module in slot 4 where slots 1 and 4 have not been

configured to use a packet-based fabric hash. Keys assigned for port-based fabric hashing are displayed so that you can consider whether or not these keys are acceptable for a given application.

```
BD-X8.1 # show sharing
        port-based keysSlot 1 keys fixed for fabric
        hashing.Use “configure forwarding
        fabric hash packet slot 1” to configure.  1:1:  0
        1:2:  1   1:3:  2   1:4:  3   1:5:  4   1:6:  5   1:7:  6   1:8:  7
        1:9:  8   1:10:  9  1:11: 10  1:12: 11  1:13:  0  1:14:  1  1:15:  2
1:16:  3
        1:17:  4  1:18:  5  1:19:  6  1:20:  7  1:21:  8  1:22:  9  1:23: 10
1:24: 11
        1:25:  0   1:26:  1  1:27:  2  1:28:  3  1:29:  4  1:30:  5  1:31:
6  1:32:  7
        1:33:  8  1:34:  9  1:35: 10  1:36: 11  1:37:  0  1:38:  1  1:39:  2
1:40:  3
        1:41:  4  1:42:  5  1:43:  6  1:44:  7  1:45:  8  1:46:  9  1:47: 10
1:48: 11
        Slot 4 keys fixed for fabric hashing.
        Use “configure forwarding fabric hash packet slot 4” to configure.
        4:1:  0   4:5:  1   4:9:  2  4:13:  3  4:17:  4  4:21:  5  4:25:  0
4:29:  1
        4:33:  2  4:37:  3  4:41:  4  4:45:  5  4:49:  0  4:53:  1  4:57:  2
4:61:  3
        4:65:  4  4:69:  5  4:73:  0  4:77:  1  4:81:  2  4:85:  3  4:89:  4
4:93:  5
```

The following output shows the default load sharing key values on a BlackDiamond-X8 switch with a BDXA-10G48X module in slot 1, and a BDXA-40G24X module in slot 4, where slots 1 and 4 have been configured to use a packet-based fabric hash. Note the assignment of consecutive values in the allowable range [0-15] to consecutive available ports in a slot.

```
BD-X8.3 # show sharing port-based keys
  1:1:  0  1:2:  1   1:3:  2   1:4:  3   1:5:  4   1:6:  5   1:7:  6   1:8:
7

```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms.

show slot

show slot {*slot* **{detail}** | **detail** }

Description

Displays the slot-specific information.

Syntax Description

slot	Specifies a slot on a modular switch or SummitStack.
detail	Specifies detailed port information.

Default

N/A.

Usage Guidelines

The show slot command displays the following information:

- The slot number
- The type of module installed in the slot
- The type of module configured for the slot
- The state of the module, whether the power is down, if the module is operational, if a diagnostic being run, if there is a mismatch between the slot configuration and the module in the slot
- The number of ports on the module
- The current number of times the module has been restarted after a failure and the configured restart-limit.

Note

You may see slightly different information displayed depending on the platform and configuration you are using.

If you do not specify a slot number, information for all slots is displayed.

The display also includes a notice of insufficient power, should that arise.

The show slot command displays the following states, among others:

- Empty (BlackDiamond 8800 series switch only—This also displays if you have a module in the chassis that is unsupported by the current software you are running.)
- Down
- Power ON

- Powered OFF
- Booting
- Initializing
- VLAN sync
- FDB sync
- ACL sync
- RT sync
- Operational

Show slot command on a SummitStack

The output of the show slot command is different for a SummitStack. The output of this command displays eight rows. If a node in the Active Topology is not assigned a slot number, the state of the slot is shown as Empty. A node that shows as a slot has successfully joined the active topology. This means, ExtremeXOS software can communicate with this node and does not mean that the node has been successfully brought up. The card state in the display indicates whether the slot was successfully started. If the card state is Operational, then the node is being used in the stack to carry user data as configured.

The output of the command displays the slot number, type of the Summit in that slot, state of the slot, and the number of ports.

The number of ports does not include the stacking links. It includes the option card ports regardless of whether the option card is installed.

This command is not available on Summit family switches operating in non stacking mode.

Example

You see slightly different displays, depending on the platform.

BlackDiamond X8 Switch

The following example displays output for a BlackDiamond X8 switch:

```
BD-X8.2 # show slot
Slots    Type                 Configured           State       Ports  Flags
-------------------------------------------------------------------------------
-
Slot-1   BDXA-10G48X          BDXA-10G48X          Operational   48   MB
Slot-2   BDXA-10G48X                               Operational   48   MB
Slot-3                                             Empty          0
Slot-4                                             Empty          0
Slot-5                                             Empty          0
Slot-6   BDXA-40G24X                               Operational   96   MB
Slot-7   BDXA-40G24X                               Operational   96   MB
Slot-8   BDXA-40G24X                               Operational   96   MB
FM-1     BDXA-FM20T                                Operational    0   MB
FM-2     BDXA-FM20T                                Operational    0   MB
FM-3     BDXA-FM20T                                Operational    0   MB
```

```
FM-4     BDXA-FM20T                                  Operational    0   MB
MM-A     BDX-MM1                                     Operational    0
MM-B     BDX-MM1                                     Operational    0
Flags : M - Backplane link to Master is Active
B - Backplane link to Backup is also Active
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
```

Like management modules, the fabric modules on the BlackDiamond X8 switch are not configured and thus always show blank in the Configured column. The fabric modules do not have backplane links to the Master or Backup management module and so never show the M or B flag. They can be disabled, and there might be insufficient power to bring them up. None of the flags ever show up for the management modules, since there is always sufficient power to bring them up at the start of the day, and if power should become insufficient later on, the switch will have rebooted.

Here is an example of the detail slot display:

```
BD-X8.6 # show slot fm-4
FM-4 information:
State:               Failed
Download %:          0
Flags:
Last Error:          Wrong FM Type for Current Mode
Restart count:       6 (limit 5)
Serial number:       800434-00-00 00000000000
Hw Module Type:      BDXA-FM480
Configured Type:
Ports available:     0
Recovery Mode:       Reset
Debug Data:          Peer=Power ON
Flags : M - Backplane link to Master is Active
B - Backplane link to Backup is also Active
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
BD-X8.7 #
```

The above display shows a fabric module slot that has failed due to incompatibility with the current fabric module mode. In this case the Last Error field appears and shows the following message:

```
Wrong FM Type for Current Mode
```

In the case of an I/O blade that has failed because there is no available switch fabric, the Last Error would contain the following:

```
No Fabric Module Is Available
```

In the case of an I/O blade that is incompatible with the current fabric mode, the Last Error would contain:

```
I/O Card Incompatible with Fabric Mode
```

Switches on a SummitStack

The following example displays module information for all slots in a stack:

```
* Slot-7 Stack.1 # show slot
Slots    Type                Configured          State       Ports
-------------------------------------------------------------------
Slot-1   SummitX450-24x      SummitX450-24x      Operational   26
Slot-2   X450a-48t           X450a-48t           Operational   50
Slot-3   X450a-24t           X450a-24t           Operational   26
Slot-4   SummitX450-24x      SummitX450-24x      Operational   26
Slot-5   X450e-24p           X450e-24p           Operational   26
Slot-6   X450e-24p           X450e-24p           Operational   26
Slot-7   X450e-24p           X450e-24p           Operational   26
Slot-8                                           Empty          0
```

The following example displays module information for a specific slot on the stack:

```
* Slot-7 Stack.91 # show slot 1 detail
Slot-1 information:
State:               Operational
Download %:          100
Restart count:       0 (limit 5)

Slot-8   G48P                                      Operational    48   M
Slot-9   10G4X                10G4X                Powered OFF     4      I
Slot-10                                            Empty           0
MSM-A    MSM-48C                                   Operational     0      SMSM-
B                                                 Empty          0
Flags : M - Backplane link to Master MSM is Active
B - Backplane link to Backup MSM is also Active
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
```

The following example displays module information for a specified slot on a BlackDiamond 8810 switch:

```
BD-8810.3 # show slot 2
Slot-2 information:
State:               Operational
Download %:          100
Flags:               MB
Restart count:       0 (limit 5)
Serial number:       800114-00-04 04364-00013
Hw Module Type:      G48P
SW Version:          12.1.0.56
SW Build:            v1210b56
Configured Type:     G48P
Ports available:     48
Recovery Mode:       Reset
Flags : M - Backplane link to Master is Active
B - Backplane link to Backup is also Active
```

```
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
```

History

This command was first available in ExtremeXOS 10.1.

This command was first available on SummitStack in ExtremeXOS 12.0.

Platform Availability

This command is available only on modular switches and SummitStack.

show tdm hierarchy

show tdm hierarchy

Description

Displays the TDM hierarchy (T1/E1).

Syntax Description

tdm	Time Division Multiplexing.
hierarchy	Physical Layer Carrier System.

Default

N/A.

Usage Guidelines

Use this command to display the TDM hierarchy.

Example

```
Booted    :  E1
Selected  :  E1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

show tdm service

show tdm service {**circuit**} {*service_name*}

Description

Displays the specified TDM service interface information.

Syntax Description

tdm	Time Division Multiplexing.
service	Provider provisioned TDM service.
circuit	TDM circuit service.
service_name	TDM service name.

Default

N/A.

Usage Guidelines

Use this command to display the TDM service interface information.

Example

```
Switch.1 # show tdm service
Service    CES PW     Flags
Name       Name
================================================================================
==
serBun10   cesop10    EAt-----
serBun11   satop11    DRt-----
================================================================================
==
Flags: (A) Active, (D) Admin Disabled, (E) Admin Enabled, (R) Ready,
(t) TDM Circuit
Number of TDM Service(s): 2
Switch.1 # show tdm service circuit
TDM Circuit Service Name: serBun10
Admin State         :  Enabled
Oper State          :  Enabled
Seized Code         :  0xa
Trunk Conditioning  :  0xc8
Framing             :  Unframed
```

```
Idle Pattern        :  0xff
Ports               :  39*
CES PW Name         :  c1
Flags: (*) Active
TDM Circuit Service Name: serBun11
Admin State         :  Enabled
Oper State             :  Disabled
Seized Code         :  0xa
Trunk Conditioning  :  0xc8
Framing             :  Unframed
Idle Pattern        :  0xff
Ports               :  31
CES PW Name         :  satop11
Flags: (*) Active
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

unconfigure ip-fix

unconfigure ip-fix

Description

Unconfigures IPFIX globally.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure IPFIX globally by removing all port and collector configuration and disabling IPFIX on all ports.

Example

The following command removes all IPFIX configuration:

```
unconfigure ip-fix
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure ip-fix flow-key

unconfigure ip-fix flow-key

Description

Unconfigures IPFIX flow key configuration and resets to the default.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to remove the flow-key settings that were configured using the following commands and reset to all the available keys:

```
configure ip-fix flow-key ipv4
configure ip-fix flow-key ipv6
configure ip-fix flow-key nonip
```

Example

The following command removes IPFIX flow key settings:

```
unconfigure ip-fix flow-key
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure ip-fix ip-address

unconfigure ip-fix ip-address

Description

Unconfigures the collector settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the collector settings and reset to the default.

Example

The following command returns to the default:

```
unconfigure ip-fix ip-address
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure ip-fix ports

unconfigure ip-fix ports *port_list*

Description

Unconfigures IPFIX on a port or group of ports.

Syntax Description

port_list	Specifies the ports.

Default

N/A.

Usage Guidelines

Use this command to unconfigure IPFIX on a port or group of ports. This restores the configuration to the defaults for those ports. The global enable/disable of IPFIX is not affected by this command.

Example

The following command unconfigures IPFIX on port 2:

```
unconfigure ip-fix ports 2
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure ip-fix ports flow-key mask

unconfigure ip-fix ports *port_list* **flow-key mask**

Description

Unconfigures the IPv4 and IPv6 masks.

Syntax Description

port_list	Specifies the ports.

Default

N/A.

Usage Guidelines

Use this command to remove masks for the IPv4 and IPv6 source and destination address fields on ports. These masks were defined using one or more of the following commands:

```
configure ip-fix ports flow-key ipv4 mask ipaddress
configure ip-fix ports flow-key ipv6 mask ipaddress
```

Example

The following command removes a mask on port 2:1:

```
unconfigure ip-fix ports 2:1 flow-key mask
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure ip-fix source ip-address

unconfigure ip-fix source ip-address

Description

Unconfigures the source IP address used to communicate to the collector.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the collector and reset to the default.

Example

The following command returns to the default:

```
unconfigure ip-fix source ip-address
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond 8900 G96Tc, G48T-xl, G48X-xl, and 10G8X-xl modules and Summit X460 and X480 switches.

unconfigure mlag peer interval

unconfigure mlag peer *peer_name* **interval**

Description

Unconfigures the length of time between health check hello packets.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.

Default

The interval default is 1000 milliseconds

Usage Guidelines

```
Use this command to unconfigure the length of time between health check hello
packets exchanged between MLAG peer switches and reset to the default.
```

Example

The following command unconfigures the interval on the switch101 peer. switch:

```
unconfigure mlag peer switch101 interval
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure mlag peer ipaddress

unconfigure mlag peer *peer_name* **ipaddress**

Description

Unconfigures an MLAG peer switch IP address from an MLAG structure.

Syntax Description

peer_name	Specifies an alpha numeric string identifying the MLAG peer.

Default

N/A.

Usage Guidelines

```
Use this command to disassociate an MLAG peer structure with an MLAG peer
switch IP address.
```

Example

The following command disassociates the MLAG peer structure switch101 with the MLAG peer switch IP address:

```
unconfigure mlag peer switch101 ipaddress
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure network-clock sync-e

unconfigure network-clock sync-e [**port** *port*]

Description

Unconfigures synchronous Ethernet on a particular port to be a source 1 or source 2 for synchronizing clock.

Syntax Description

source-1	Source 1 external input clock
source-2	Source 2 external input clock
port	port
port	100Mbps/1G port Copper/Fiber Ports

Default

N/A.

Usage Guidelines

Use this command to unconfigure SyncE on a particular port.

Example

The following command unconfigures SyncE as a primary master on port 2:

```
unconfigure network-clock sync-e port 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24X and X460-48X switches and on E4G-200 and E4G-400 switches.

unconfigure network-clock sync-e clock-source

unconfigure network-clock sync-e clock-sourceunconfigure network-clock sync-e clock-source

Description

Unconfigures the ethernet clock-source that is configured.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the clock-source which was previously configured as source-1 or source-2.

Example

The following command unconfigures the Sync-E clock source configured earlier

```
unconfigure network-clock sync-e clock-source
```

History

This Command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on Summit X460-24X and X460-48X switches and on E4G-200 and E4G-400 switches.

unconfigure port description-string

unconfigure ports *port_list* **description string**

Description

Unconfigures a description string setting.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Use this command to unconfigure a port description.

Example

The following command unconfigures the port description string:

```
unconfigure ports 1:3
```

History

This command was available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

unconfigure ports display string

unconfigure ports *port_list* **display-string**

Description

Clears the user-defined display string from one or more ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

This command removes the display string that you configured using the configure ports display-string command.

Example

The following command clears the user-defined display string from slot 2, port 4 on a modular switch:

```
unconfigure ports 2:4 display-string
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure ports redundant

unconfigure ports *port_list* **redundant**

Description

Clears a previously configured software-controlled redundant port.

Syntax Description

port_list	This refers to the primary port of the redundant pair and specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

The list of port numbers or the port display string specifies the primary port(s).

Example

The following command unconfigures a software-controlled redundant port on a modular switch:

```
unconfigure ports 2:3 redundant
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

unconfigure ports tdm display string

unconfigure ports *port_list* **tdm display-string**

Description

Clears the user-defined display string from one or more ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
tdm	Indicates a time division multiplexing (TDM) port.

Default

N/A.

Usage Guidelines

Use this command to clear a user defined display string from TDM ports.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers E4G-200 and E4G-400.

unconfigure ports tdm recovered-clock

unconfigure ports *port_list* **tdm recovered-clock**

Description

Unconfigures the clock recovery from the specified TDM ports.

Syntax Description

tdm	Time Division Multiplexing.
recovered-clock	Clock recovered from the port.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the clock recovery from the specified TDM ports.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

unconfigure ports wan-phy

unconfigure ports [*port_list* | **all**] **wan-phy**

Description

Resets the configuration parameters of the specified WAN PHY port to default values.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
all	Specified all WAN PHY ports.

Default

N/A.

Usage Guidelines

XFP ports must be in WAN PHY mode. To configure the mode, use the configure ports <port_list> mode {lan | wan-phy} command.

When the all option is used, the command constructs a port_list of all applicable ports—LW-XENPAK ports and/or XFP ports that have been WAN-PHY enabled.

The default configurable WAN PHY OAM parameters are as follows:

- Framing—SONET
- Clock source—line
- Section trace—the IEEE default value, which has no string representation.
- Path trace—the IEEE default value, which has no string representation.
- Loopback—off

Example

The following command unconfigures the configurable WAN PHY OAM parameters on a single LW XENPAK port on a modular switch:

```
unconfigure ports 2:1 wan-phy
```

History

This command was available in ExtremeXOS 11.6.

Platform Availability

This command is available on all 10G ports on 10G XFP ports only on the Summit X480 series switches, and the Summit X450a series switches only.

unconfigure slot

unconfigure slot *slot*

Description

Clears a slot of a previously assigned module type.

Syntax Description

slot	Specifies a slot on a modular switch.

Default

N/A.

Usage Guidelines

If you issue the unconfigure ports wan-phy command on a slot containing a module with any ports configured for software-controlled redundancy, this command wipes away all software-controlled redundancy on both ports; both ports return to normal. Refer to ExtremeXOS Concepts Guide for more information on software-controlled redundant ports.

Example

The following command clears slot 4 of a previously assigned module type:

```
unconfigure slot 4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches and SummitStack.

8 Universal Port Management Commands

This chapter describes commands for:

- Configuring universal port profiles and triggers
- Managing profiles and triggers

For an introduction to universal port features, see the ExtremeXOS Concepts Guide.

configure log target upm filter

configure log target upm {*upm_profile_name*} **filter** *filter-name* {**severity** [[*severity*] {**only**}]}

Description

Configures a log target to receive events that conform to a specific EMS filter and severity level requirements.

Syntax Description

upm_profile_name	Specifies a UPM log target to configure.
filter-name	Assigns an EMS filter to the specified log target.
severity	Specifies the minimum severity level for events sent to the log target.
only	Specifies that only events at the specified severity are sent to the log target.

Default

N/A.

Usage Guidelines

Events that meet the criteria established in the EMS filter and the optional severity requirements are forwarded to the UPM log target profile. You can further restrict the forwarded events with the command: configure log target upm {<upm_profile_name>} match {any | <regex>}.

Example

The following example configures UPM log target testprofile1 to receive events that meet the criteria defined in EMS filter testfilter1:

```
configure log target upm testprofile1 filter testfilter1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure log target upm match

configure log target upm {*upm_profile_name*} **match** {**any** | *regex*}

Description

Configures a log target to receive only those events that meet the specified match criteria.

Syntax Description

upm_profile_name	Specifies the UPM log target to be configured.
any	Matches any event. Use this option to remove a limitation configured with the *regex* option.
regex	Specifies an expression that must be contained in all forwarded events.

Default

N/A.

Usage Guidelines

This command further restricts the events selected by the command: configure log target upm {*upm_profile_name*} filter *filter-name* {severity [[*severity*] {only}]}.

Example

The following example configures UPM log target testprofile1 to receive events that meet the criteria contain the text warning:

```
configure log target upm testprofile1 match warning
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure upm event

configure upm event *upm-event* **profile** *profile-name* **ports** *port_lis*

Description

Configures a pre-defined event that triggers the named profile.

Syntax Description

upm-event	Specifies a pre-defined event type: device-detect, device-undetected, user-authenticate, user-unauthenticated
profile-name	Specifies the profile to be configured.
port-list	Attaches the UPM profile to the specified port(s).

Default

N/A.

Usage Guidelines

This command configures a profile to be executed when the specified event occurs on the specified port(s).

You can configure multiple user profiles on the same port(s).

Example

The following example shows how to configure a profile on port 1:1, called “profile 1” that is triggered by the event “device-detect”:

```
# configure upm event device-detect profile "p1" ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure upm profile maximum execution-time

configure upm profile *profile-name* **maximum execution-time** *seconds*

Description

Defines a maximum execution period for a profile.

Syntax Description

seconds	Defines the execution period in seconds. The range is 2 to 4294967295 seconds.

Default

30 seconds.

Usage Guidelines

If you make a mistake while configuring a profile and the profile loops, it will loop until the end of the maximum execution period. While testing new profiles, consider configuring a relatively short execution time so that any accidental loops do not create long delays during testing.

Example

The following example sets the execution period to 10 seconds:

```
# configure upm profile test maximum execution-time 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure upm timer after

configure upm timer *timer-name* **after** *time-in-secs* {**every** *seconds*}

Description

Creates and names a UPM timer that is activated after the specified time in seconds.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.
time-in-secs	Configures the interval after which the UPM timer is activated.
seconds	Configures the UPM timer to be activated after every instance of the specified interval.

Default

N/A.

Usage Guidelines

Use this command to configure a timer that activates after the specified time. This is useful for deployment in CLI scripts, because you do not know what the current time will be when the script executes.

When a switch configuration is saved or restored, the UPM timers are activated only at the predetermined timings that were originally configured with the start time.

The periodic timer configured with the every keyword and the one-time timer configured with only the after keyword have a maximum range of one year in seconds (31,622,400 seconds).

Example

The following example configures the UPM timer “A” to be activated every 10 seconds, after an interval of 20 seconds:

```
# configure upm  timer "timerA" after 20 every 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure upm timer at

configure upm timer *timer-name* **at** *month day year hour min secs* {**every** *seconds*}

Description

Use this command to configure the time setting on a UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.
month	Configures the month when the UPM timer is activated.
day	Configures the day when the UPM timer is activated.
year	Configures the year when the UPM timer is activated.
hour	Configures the hour when the UPM timer is activated.
min	Configures the minute when the UPM timer is activated.
secs	Configures the second when the UPM timer is activated.
seconds	Configures the UPM timer to be activated at every instance of the specified interval.

Default

N/A.

Usage Guidelines

Use this command to when you know the exact time you want an event to execute. If you use this command without the every keyword, the timer is activated once at the specified time. The every keyword configures a periodic timer that is activated at every instance of the time specified in seconds.

When a switch configuration is saved or restored, the UPM timers are activated only at the predetermined timings that were originally configured with the start time.

Example

The following example shows how to configure a timer, T1, that is activated every 10 seconds beginning at 1400 hours on October 16, 2006:

```
# configure upm timer "t1" at 10 16 2006 14 00 00 every 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

configure upm timer profile

configure upm timer *timer-name* **profile** *profileName*

Description

Associates a profile with a UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be associated with the named profile.
profileName	Specifies the name of the profile to be associated with the UPM timer.

Default

N/A.

Usage Guidelines

Each timer can be attached to only one profile. Once a timer is configured to a profile, it must be unconfigured from that profile before it can be configured to a different profile.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

create log target upm

create log target upm {*upm_profile_name*}

Description

Creates a new UPM target profile.

Syntax Description

upm_profile_name	Specifies the name of an existing UPM profile.

Default

N/A.

Usage Guidelines

After configuration, a UPM log target links an EMS filter with a UPM profile. This command creates the UPM log target.

The default configuration for a new log target binds the target to the EMS filter defaultFilter, which is used for all system events. To configure the log target, use the command: configure log target upm {<upm_profile_name>} filter <filter-name> {severity [[<severity>] {only}]}.

The default status of a new UPM log target is disabled. To enable the log target, use the command: enable log target upm {<upm_profile_name>}.

To view the log target, use the command: show log configuration target upm {<upm_profile_name>}.

Example

The following example creates a new UPM log target named testprofile1:

```
create log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

create upm profile

create upm profile *profile-name*

Description

Creates a new profile of a specified type.

Syntax Description

profile-name	Specifies the UPM profile to be created.

Default

N/A.

Usage Guidelines

Use this command to create a profile and name it. The maximum profile size is 5000 characters.

A UPM profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

There is a limited capability to edit the profile with this command. If you enter a period (.) as the first and the only character on a line, you terminate the editing of the file. Use the command: edit upm profile <profile-name> for block mode capability.

Example

The following example shows how to create a profile named “P2”:

```
# create upm profile p2
enab por 2:
dis por 3:1
.
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

create upm timer

create upm timer *timer-name*

Description

Creates and names a UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be created.

Default

N/A.

Usage Guidelines

You can create UPM timers with a name. A profile can be associated with eight timers, but a timer can be bound to only one profile at any point in time. You can create a maximum of 32 timers. A name space for the timers is available to help when you are typing the commands.

A UPM timer name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

delete log target upm

delete log target upm {*upm_profile_name*}

Description

Deletes the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be deleted.

Default

N/A.

Usage Guidelines

This command deletes the log target and any configurations applied to that target. To disable a target and retain the target configuration, use the command: disable log target upm {<upm_profile_name>}.

Example

The following command deletes the UPM log target testprofile1:

```
delete log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

delete upm profile

delete upm profile *profile-name*

Description

Deletes the specified profile.

Syntax Description

profile-name	Specifies the UPM profile to be deleted.

Default

N/A.

Example

The following command deletes a UPM profile called sample_1:

```
delete upm profile sample_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

delete upm timer

delete upm timer *timer-name*

Description

Deletes the specified UPM timer.

Syntax Description

timer-name	Specifies the name of the UPM timer to be deleted.

Default

N/A.

Usage Guidelines

You can delete a UPM timer by specifying its name.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

disable log target upm

disable log target upm {*upm_profile_name*}

Description

Disables the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be disabled.

Default

N/A.

Usage Guidelines

This command disables the log target and retains any configurations applied to that target. To delete a target and any configuration applied to the target, use the command: delete log target upm {<upm_profile_name>}.

Example

The following command disables the UPM log target testprofile1:

```
disable log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

disable upm profile

disable upm profile *profile-name*

Description

Disables the use of the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be disabled.

Default

A UPM profile is enabled by default.

Example

The following command disables a UPM profile called sample_1 on the switch:

```
disable upm profile sample_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

edit upm profile

edit upm profile *profile-name*

Description

Allows you to edit the specified profile.

Syntax Description

profile-name	Specifies the UPM profile to be edited.

Default

N/A.

Usage Guidelines

Use the command to have VI-like editor features for editing the profile. Changes appear when you close the file for editing, not when you save it.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

enable log target upm

enable log target upm {*upm_profile_name*}

Description

Enables the specified UPM log target.

Syntax Description

upm_profile_name	Specifies the name of the UPM log target to be enabled.

Default

N/A.

Usage Guidelines

UPM log targets are disabled when they are created.

Example

The following command enables the UPM log target testprofile1:

```
enable log target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

enable upm profile

enable upm profile *profile-name*

Description

Enables the use of the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be enabled.

Default

A UPM profile is enabled by default.

Example

The following command enables a UPM profile called example on the switch:

```
enable upm profile example
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

run upm profile

run upm profile *profile-name* {**event** *event-name*} {**variables** *variable-string*}

Description

Executes the specified Universal Port profile on the switch.

Syntax Description

profile-name	Specifies the UPM profile to be run.
event-name	Specifies an event type for the specified profile. Valid event types are device-detect, device-undetect, user-authenticate, and user-unauthenticated.
variable-string	Specifies a string of variable names and the assigned variable values to be used in the profile. The format is: *var_name1*=*value_1*; *var_name2*=*value_2*; *var_name3*=*value_3*. Each variable name is followed by the equal sign (=), the variable value, and a semicolon (;).

Default

N/A.

Example

The following command runs a UPM profile called example on the switch:

```
run upm profile example
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show log configuration target upm

show log configuration target upm {*upm_profile_name*}

Description

Displays a UPM target profile configuration.

Syntax Description

upm_profile_name	Specifies the name of the UPM target profile you want to view.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays the configuration for the UPM log target named testprofile1:

```
show log configuration target upm testprofile1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show upm events

show upm events *event-type*

Description

Displays UPM events of the specified type.

Syntax Description

event-type	Displays events of the specified type for all profiles. Valid values for event-type are:device-detectdevice-removeuser-authenticateuser-unauthenticated

Default

N/A.

Usage Guidelines

Use this command to display the following types of events:

- device-detect
- device-remove
- user-authenticate
- user-unauthenticated

Example

The following command displays device-detect events:

```
show upm event device-detect
```

The output of the command is similar to the following:

```
-------------------------------------------------------------------
UPM Profile                   PortList
-------------------------------------------------------------------
profile1                        3
-------------------------------------------------------------------
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show upm history

show upm history {**profile** *profile-name* | **event** *upm-event* | **status** [**pass** | **fail**] | **timer** *timer-name* | **detail**}

Description

Displays (in a tabular column) a list of UPM profile events executed on the switch.

Syntax Description

profile-name	Displays UPM events for the specified profile.
upm-event	Displays UPM events that were triggered by the specified event.
status [pass | fail]	Displays UPM events that meet the specified status, which is either pass or fail.
timer-name	Displays UPM events that were triggered by the specified timer.
detail	Displays additional detail on UPM events.

Default

N/A.

Usage Guidelines

This is useful for trouble shooting and testing

Example

The following example shows what appears when no UPM events have been triggered:

```
* VLAB-R3-BD8808.2 # show upm history
--------------------------------------------------------------------------------
--
Exec   Event/              Profile          Port Status Time Launched
Id     Timer/ Log filter
--------------------------------------------------------------------------------
--
--------------------------------------------------------------------------------
--
Number of UPM Events in Queue for execution: 0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show upm history exec-id

show upm history exec-id *number*

Description

Displays information about an instance of a UPM profile executed on the switch.

Syntax Description

number	Specifies the execution identifier for the event you want to view.

Default

N/A.

Usage Guidelines

To view the execution identifiers for which you can display information, enter the show upm history command.

Example

The following example shows information for the event identified as 8006:

```
* BD-8808.4 # show upm history exec 8006
UPM Profile: p1
Event:  User Request    , Time run: 2006-10-18 11:56:15
Execution Identifier: 8006      Execution Status: Pass
Execution Information:
1 # enable cli scripting
2 # set var EVENT.NAME USER-REQUEST
3 # set var EVENT.TIME 1161172575
4 # set var EVENT.PROFILE p1
5 # enable por 1:1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show upm profile

show upm profile *name*

Description

Displays a list of the UPM profiles on the system and some of their configuration information, or the contents of a specified profile.

Syntax Description

name	Displays the contents of the specified profile.

Default

N/A.

Usage Guidelines

To see a list of all UPM profiles on a switch, use the command without the name option. The resulting display shows the names of the profiles on the system and their status, active or disabled.

Use the name option to see the contents of a specific profile.

Example

The output of the command is similar to the following:

```
* BD-8808.36 # show upm profile
================================================================================
==
UPM Profile Events Ports Flags
================================================================================
==
p1 UPM Timer(t1) e
p1 device detect 1:1 e
p2 e
================================================================================
==
Number of UPM Profiles: 2
Number of UPM Events in Queue for execution: 0
Flags: d - disabled, e - enabled
Event name: log-message(Log filter name) - Truncated to 20 chars
* BD-8808.37 # show upm profile "p1"
Created at : 2010-04-11 04:07:41
Last edited at : 2010-04-11 04:07:41
************Profile Contents Begin************
ena por 1:1
************Profile Contents Ends*************

============================================================
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

show upm timers

show upm timers

Description

Displays a list of the UPM timers on the system and some of their configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to see a list of all UPM timers on a switch. The resulting display shows timer configurations, the associated profile, and flags to indicate the timer status. Flags are defined below:

- a - active
- d - disabled
- p - periodic

Example

This command displays UPM timer configuration:

```
show upm timers
```

The output of this command is similar to the following:

```
* BD-8808.43 # show upm timers
Current Time: 2006-10-16 14:03:55
--------------------------------------------------------------------------------
--
UPM Profile Flags Next Execution
Timer Name time
--------------------------------------------------------------------------------
--
```

```
t1 p1 ep 2006-10-16 14:04:00(Every 10 secs)
timerA
--------------------------------------------------------------------------------
--
Flags: e - Profile is enabled, d: Profile is disabled
o -Timer is non-periodic, p - Timer is periodic
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

unconfigure upm event

unconfigure upm event *upm-event* **profile** *profile-name* **ports** *port_list*

Description

Unconfigures the event from the specified profile and port list.

Syntax Description

upm-event	Specifies the type of event to be unconfigured.
profile-name	Specifies the profile from which the event is unconfigured.
port-list	Unconfigures the UPM profile from the specified port list.

Default

N/A.

Usage Guidelines

This command removes an event from the specified profile and port list.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

unconfigure upm timer

unconfigure upm timer *timer-name* **profile** *profile-name*

Description

Removes a UPM profile from a UPM timer.

Syntax Description

timer-name	Unconfigures the specified UPM timer and deactivates any running timer.
profile-name	Removes the specified profile from the UPM timer.

Default

N/A.

Usage Guidelines

Use this command to unconfigure a timer setting. This command does not delete the timer.

Note

The specified timer is stopped by this command, even if it has been activated.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Universal Port feature, see the ExtremeXOS Concepts Guide, Universal Port Management Commands

9 CLI Scripting Commands

This chapter describes commands for:

- Enabling and disabling CLI scripting
- Managing script variables
- Creating conditional loops

For an introduction to CLI scripting features, see the ExtremeXOS Concepts Guide.

configure cli mode

```
configure cli mode [persistent | non-persistent]
```

Description

Configures the persistent nature of command execution for non-persistent commands.

Syntax Description

persistent	Configures command execution to be persistent.
non-persistent	Configures command execution to be not persistent.

Default

The default mode is non-persistent.

Usage Guidelines

All ExtremeXOS commands can operate in persistent mode, and a subset of the ExtremeXOS command set can operate in non-persistent mode. Commands that are executed in persistent mode become part of the saved switch configuration that persists when the switch is rebooted. Commands that are executed in non-persistent mode configure temporary changes that are not saved in the switch configuration and do not persist when the switch is rebooted.

Most commands operate only in persistent mode. The subset of commands that operate in non-persistent mode are called non-persistent-capable commands. The Universal Port feature uses the non-persistent-capable commands to configure temporary changes that could create security issues if the switch were rebooted or reset. The use of non-persistent-capable commands in scripts and Universal Port profiles allows you to make temporary configuration changes without affecting the default configuration the next time the switch is started.

The configure cli mode command affects only the non-persistent-capable commands, which are listed in the Universal Port chapter in the Extreme XOS Concepts Guide. By default, all commands operate in persistent mode with the following exceptions:

- In Universal Port dynamic profiles, the non-persistent-capable commands operate in non-persistent mode unless preceded by the configure cli mode persistent command in the profile.
- In the CLI, CLI scripts, and static profiles, the non-persistent-capable commands operate in non-persistent mode only when preceded by the configure cli mode non-persistent command.

You can use the configure cli mode persistent command and the configure cli mode non-persistent command to change the mode of operation for non-persistent-capable commands multiple times within a script, profile, or configuration session.

Example

The following example sets command execution to be persistent:

```
configure cli mode persistent
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure cli mode scripting

configure cli mode scripting [abort-on-error | ignore-error]

Description

Configures the error handling process for CLI scripting on the switch.

Syntax Description

abort-on-error	Configures Cli scripts to be aborted if a CLI error occurs.
ignore-error	Configures the script to be executed when CLI errors occur.

Default

CLI: ignore-error Static profiles: abort-on-error Dynamic profiles: abort-on-error

Usage Guidelines

You can change the error-handling options within the scripts.

Example

The following command configures the switch to ignore syntax errors in CLI scripts:

```
configure cli mode scripting ignore-error
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure cli script timeout

configure cli script timeout *timeout*

Description

Configures the maximum time a script can run.

Syntax Description

timeout	Defines the timeout period in seconds.

Default

Regular script: no time limit default.xsf: 500 seconds autoexec.xsf: 500 seconds

Usage Guidelines

This command configures the maximum run time for all scripts, including default.xsf and autoexec.xsf, which are described in Software Upgrade and Boot Options in the ExtremeXOS Concepts Guide. If no timeout period is configured, regular scripts do not timeout, and the default.xsf and autoexec.xsf scripts time out after 500 seconds.

If a script does not finish running in the configured time, command execution stops and an error message is logged. If the timer expires while a command is executing, the command execution continues and all following commands are not executed.

If the timer command is executed inside a script, the timer is reset. If the command is issued more than once inside a script the last timer command executed resets the timer. The timer is valid only for that session. The use of nested scripts does not extend the execution period. When the parent script reaches the timeout value, the parent script and all nested scripts terminate.

To configure a different timeout value for autoexec.xsf or default.xsf, the configure cli script timeout command should be the first command in the script.

When a script timeout value is configured, the following variables are created: $CLI.SCRIPT_TIMEOUT and $CLI.SCRIPT_TIME_REMAINING. If no timeout value is configured for a session, the variables are not created.

You can use the $CLI.SCRIPT_TIMEOUT variable to adjust the timeout value. The $CLI.SCRIPT_TIME_REMAINING variable returns the time remaining. When a timeout value is configured, the variable values are as follows:

- If no script is running, both $CLI.SCRIPT_TIME_REMAINING and $CLI.SCRIPT_TIMEOUT show the configured timeout value.
- If a script is aborted due to timeout, the $CLI.SCRIPT_TIME_REMANING variable returns the value0.
- If a script finishes execution (before the timeout value is reached) the $CLI.SCRIPT_TIME_REMANING variable returns the remaining time.

Example

The following command configures the switch to terminate a script after 120 seconds:

```
configure cli script timeout 120
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

delete var

delete var *varname*

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Deletes a variable.

Syntax Description

varname	Specifies the name of the scripting variable to be deleted.

Default

N/A.

Usage Guidelines

The format of a local variable (case insensitive) is: $VARNAME

Example

The following example deletes local variable x:

```
delete var x
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

delete var key

delete var key *key*

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Deletes the variables that have been saved using a key.

Syntax Description

key	Specifies that variables associated with the specified key must be deleted.

Default

N/A.

Usage Guidelines

CLI scripting must be enabled to use this command. The user is responsible for generating unique keys for each variable. The system has a limited amount of memory to store these variables.

Example

The following command deletes all variables associated with the key “red:”

```
delete var key red
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

disable cli scripting

```
disable cli scripting {permanent}
```

Description

Disables the use of the CLI scripting commands. When used without the permanent option, it disables the CLI scripting commands for the current session and is a per session setting. The permanent option affects new sessions only and is saved across switch reboots.

Syntax Description

permanent	Disables the CLI scripting commands for new sessions only; this setting is saved across switch reboots.

Default

CLI scripting commands are disabled by default.

Usage Guidelines

You can disable the CLI scripting commands for the session only after this feature has been enabled.

Example

The following command disables the CLI scripting commands for the current session:

```
disable cli scripting
```

History

This command was first available in ExtremeXOS 11.6.

The permanent option was added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

disable cli scripting output

disable cli scripting output

Description

Disables the display of CLI commands and responses during script operation.

Syntax Description

This command has no arguments or variables.

Default

During interactive script sessions: CLI scripting output enabled.

During load script command operation: CLI scripting output disabled.

Usage Guidelines

When the CLI scripting output is disabled, the only script output displayed is the show var {<varname>} command and its output. All other commands and responses are not displayed.

When the load script <filename> {arg1} {arg2} ... {arg9} command is entered, the software disables CLI scripting output until the script is complete, and then CLI scripting output is enabled. Use the enable cli scripting output and disable cli scripting output commands to control what a script displays when you are troubleshooting.

Example

The following command disables CLI scripting output for the current session or until the enable cli scripting output command is entered:

```
disable cli scripting output
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

ELSE

ELSE

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Command block to be executed if the condition specified in the associated IF statement is not met.

Syntax Description

statements	Actions to be executed when the conditions specified in the associated IF statement are not met.

Default

N/A.

Usage Guidelines

CLI scripting must be enabled before using this command.

This command must be preceded by IF <_expression> THEN <statements> and followed by ENDIF.

You can insert comments by using a number sign (#).

Example

The following example executes the show switch command if the value of the variable x is greater than 2, and execute the show vlan command otherwise:

```
IF ($x > 2) THEN
    show switch
ELSE
    show vlan
ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

enable cli scripting

enable cli scripting {permanent}

Description

Enables the use of CLI scripting commands. When used without the permanent option, it enables the CLI scripting commands for the current session and is a per session setting. The permanent option enables the CLI scripting commands for new sessions only and is saved across switch reboots.

Syntax Description

permanent	Enables the CLI scripting commands for new sessions only; this setting is saved across switch reboots.

Default

The CLI scripting commands are disabled by default.

Usage Guidelines

You must enable the CLI scripting commands on the switch to use the scripting keywords in the script, and before you can configure or execute a script.

Note

CLI scripting commands cannot be enabled when CLI space auto completion is enabled with the enable cli space-completion command.

Example

The following command enables the CLI scripting commands for the current session:

```
enable cli scripting
```

History

This command was first available in ExtremeXOS 11.6.

The permanent option was added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

enable cli scripting output

enable cli scripting output

Description

Enables the display of CLI commands and responses during script operation.

Default

During interactive script sessions: CLI scripting output enabled.

During load script command operation: CLI scripting output disabled.

Usage Guidelines

When the CLI scripting output is enabled, all script commands and responses are displayed.

When the load script <filename> {arg1} {arg2} ... {arg9} command is entered, the software disables CLI scripting output until the script is complete, and then CLI scripting output is enabled. Use the enable cli scripting output and disable cli scripting output commands to control what a script displays when you are troubleshooting.

Example

The following command enables CLI scripting output for the current session or until the disable cli scripting output command is entered:

```
enable cli scripting output
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

ENDIF

ENDIF

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Causes the IF construct to be terminated.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The ENDIF command should be used after the IF <_expression> THEN <statement(s)> command.

You can insert comments by using a number sign (#). CLI scripting must be enabled to use this command.

Example

The following example executes the show switch command if the value of the variable is greater than 2 and execute the show vlan command otherwise:

```
IF ($x > 2) THEN
        show switch
ELSE
        show vlan
ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

ENDWHILE

ENDWHILE

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Causes the WHILE construct to be terminated.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The ENDWHILE command must be used after a corresponding WHILE <_expression> DO <statement(s)> command.

You can insert comments by using a number sign (#). CLI scripting must be enabled to use this command.

Example

This example creates 10 VLANs, named x1 to x10:

```
set var x 1
WHILE ($x <= 10) DO
        create vlan v$x
        set var x ($x + 1)
ENDWHILE
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

IF ... THEN

IF (_expression) THEN

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Optionally executes a code block based on the condition supplied.

Syntax Description

expression	Specifies the condition for which the statements should be executed.
statements	Actions to be executed when the specified conditions are met.

Default

N/A.

Usage Guidelines

This command is usually followed by statements that are executed if the condition evaluates to true.

It can also be followed by an ELSE block, which is executed if the condition evaluates to false.

The IF construct should be terminated by an ENDIF command.

The _expression must be enclosed in parentheses.

The IF construct can be nested inside other IF and WHILE constructs. Nesting is supported up to five levels. If there is incorrect nesting of IF conditions, an error message is displayed. If a user tries to execute more than five nested IF conditions, an error message is displayed.

The operators mentioned in Using Operators can be used in an _expression in an IF condition.

You can insert comments by using a number sign (#).

Example

The following example executes the show switch command if the value of the variable is greater than 2 and executes the show vlan command otherwise:

```
IF ($x > 2) THEN
    show switch
ELSE
    show vlan
```

```
ENDIF
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

load var key

load var key *key* [*var1 var2* …]

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Imports the specified set of variables associated with a key into the current session.

Syntax Description

key	Specifies the key associated with the variables to be imported.
var1 var2	Specifies the variables to be imported. The first variable is mandatory, up to four more optional variables can be specified.

Default

N/A.

Usage Guidelines

The specified key should have created by the user. Also, the variables specified should have been saved using that key.

Attempting to use this command with a non-existent key results in an error message being displayed.

Example

The following example imports the variables “username,” “ipaddr,” and “vlan” from the key “blue:”

```
load var key blue username ipaddr vlan
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

return

return *statusCode*

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Exits the current script and sets the $STATUS variable.

Syntax Description

statusCode	Specifies a integer value to which the $STATUS variable is set.

Default

N/A.

Usage Guidelines

When used in nested scripts, this command allows you to terminate the current script, set the $STATUS variable, return to the parent script, and evaluate the $STATUS variable in the parent script. For more information on the $STATUS variable, see Using CLI Scripting in the ExtremeXOS Concepts Guide.

Example

The following example exits the current script and sets the $STATUS variable to -200:

```
return -200
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

save var key

save var key *key* [*var1 var2* …]

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Saves the specified variables to the specified key.

Syntax Description

key	Specifies the key to which the specified variables are saved.
var1 var2	Specifies the variables to save, The first variable is mandatory, up to four more optional variables can be specified.

Default

N/A.

Usage Guidelines

The variables saved by the SAVE VAR command are represented by the specified key and can be retrieved and restored in the context in which this profile was applied. They are available to rollback events like user-unauthenticate and device-undetect. The key option allows the user to save data for a unique key and retrieve the saved data based on this key. The user is responsible for generating unique keys for each variable. The system has a limited amount of memory to store these variables.

Example

The following example saves the variables “username,” “ipaddr,” and “vlan” to the key “blue:”

```
save var key blue username ipaddr vlan
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

set var

set var *varname _expression*

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Creates and sets the CLI scripting variable to the desired value.

Syntax Description

varname	Specifies the name of the CLI scripting variable. Valid format is $VARNAME (case insensitive, character string up to 32 characters).
_expression	Specifies the _expression whose value should be evaluated and used to set the variable.

Default

N/A.

Usage Guidelines

The format of a local variable (case insensitive) is: $VARNAME.

An error message is displayed if the user attempts to use a variable name with a length greater than 32 characters.

If a variable already exists, it is overwritten. No error message is displayed.

Example

The following examples show some ways you can manipulate variables:

```
Set var x 100
Set var x ($x + 2)
Set var y ($x - 100)
Set var y ($(x) – 100)
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show var

show var {*varname*}

Note

This is a script command and operates only in scripts or on the command line when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Displays the current session variables or the named variable.

Syntax Description

varname	Displays the variable specified, if present.

Default

N/A.

Usage Guidelines

Use this command to see the list of current session variables. The display includes the variable name and value.

Example

The output of this command is similar to the following:

```
Switch.7 # show var
----------------------------------------
Count : 4
----------------------------------------

-------------------------------------------------------------------
variableName                    variableValue
------------------------------  -------------------------------
CLI.SESSION_TYPE                serial
CLI.USER                        admin
STATUS                          0
```

```
x                                   66
-------------------------------------------------------------------
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

WHILE ... DO

WHILE (_expression) DO

Note

This is a script command and operates only in scripts when scripting is enabled with the following command: enable cli scripting {permanent}.

Description

Executes a code block while the specified condition is true.

Syntax Description

expression	Specifies the condition for which the statements should be executed while the condition is true.
statements	Set of statements to be executed while the condition is true.

Default

N/A.

Usage Guidelines

This command is usually followed by statements to be executed while the condition is true and the entire construct is terminated by an ENDWHILE command.

The _expression must be enclosed in parentheses.

Nesting is supported up to five levels. An error message is displayed if there is incorrect nesting of WHILE conditions. An error message is displayed if a user tries to execute more than five WHILE conditions.

Ctrl-C can be used to break out of a WHILE loop(s). Breaking out of any number of WHILE loops always clears all the WHILE loops .

The operators mentioned in Using Operators can be used in an _expression in a WHILE condition.

You can insert comments by using a number sign (#).

Example

This example creates 10 VLANs, named x1 to x10:

```
set var x 1

WHILE ($x <= 10) DO
    create vlan v$x
    set var x ($x + 1)
ENDWHILE
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

10 Commands for Configuring LLDP

clear lldp neighbors
configure lldp med fast-start repeat-count
configure lldp ports management-address
configure lldp ports port-description
configure lldp ports system-capabilities
configure lldp ports system-description
configure lldp ports system-name
configure lldp ports vendor-specific avaya-extreme call-server
configure lldp ports vendor-specific avaya-extreme dot1q-framing
configure lldp ports vendor-specific avaya-extreme file-server
configure lldp ports vendor-specific avaya-extreme poe-conservation-request
configure lldp ports vendor-specific dot1 port-vlan-ID
configure lldp ports vendor-specific dot1 port-protocol-vlan-ID
configure lldp ports vendor-specific dot1 vlan-name
configure lldp ports vendor-specific dot3 link-aggregation
configure lldp ports vendor-specific dot3 mac-phy
configure lldp ports vendor-specific dot3 max-frame-size
configure lldp ports vendor-specific dot3 power-via-mdi
configure lldp ports vendor-specific med capabilities
configure lldp ports vendor-specific med location-identification
configure lldp ports vendor-specific med policy application
configure lldp ports vendor-specific med power-via-mdi
configure lldp reinitialize-delay
configure lldp snmp-notification-interval
configure lldp transmit-delay
configure lldp transmit-hold
configure lldp transmit-interval
disable lldp ports
disable snmp traps lldp
disable snmp traps lldp-med
enable lldp ports
enable snmp traps lldp
enable snmp traps lldp-med
show lldp
show lldp neighbors
show lldp statistics
unconfigure lldp

This chapter describes commands for doing the following:

- Configuring LLDP
- Managing LLDP
- Displaying LLDP information

For an introduction to LLDP, see the ExtremeXOS Concepts Guide.

Note

Data Center Bridging Exchange (DCBX) commands that contain the lldp keyword are described in Data Center Solution Commands

clear lldp neighbors

clear lldp neighbors [**all** | **port** *port_list*]

Description

Clears the LLDP neighbor information collected for one or all ports on the switch.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

LLDP neighbor information for each port is automatically cleared after the period defined by the TTL TLV if no update LLDP protocol data unit (LLDPDU) is received. This command immediately clears the LLDP neighbor information for the specified ports.

Example

The following command clears the LLDP information collected for all ports on the switch:

```
clear lldp neighbors all
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

configure lldp med fast-start repeat-count

configure lldp med fast-start repeat-count *count*

Description

The fast-start feature is automatically enabled when you enable the LLDP MED capabilities TLV. This command configures how many times, from 1 to 10, the switch sends out an LLDP MED packet with an interval of 1 second.

Syntax Description

count	Specifies the number of times the switch transmits LLDP MED TLVs each second (once it detects a neighbor transmitting LLDP MED TLVs). The range is 1 to 10.

Default

3.

Usage Guidelines

When the switch detects a MED-capable device, this count determines how many times the switch sends a LLDP MED TLVs with an interval of 1 second. The fast-start feature enables the MED-capable device to quickly learn information; this command changes the value from the default 3. The fast-start feature is automatically enabled when you enable the LLDP MED capabilities TLV.

Note

After you configure the LLDP MED capability TLV, the fast-start feature automatically runs. To configure the LLDP MED capability TLV, use the configure lldp ports [all | <port_list>] [advertise | no-advertise] vendor-specific med capabilities command.

Example

The following command configures fast learning on the switch to a value of 2:

```
configure lldp med fast-start repeat-count 2
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports management-address

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **management-address**

Description

Configures the LLDP port to advertise or not to advertise management address information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

With ExtremeXOS, you can only add one management address TLV per LLDPDU and the information must be the IP address configured on the management VLAN. If no IP address is assigned to the management VLAN, the system sends the system MAC address. LLDP does not send out IPv6 addresses in this field.

Example

The following command advertises the management address information for port 1:5:

```
configure lldp ports 1:5 advertise management-address
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports port-description

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **port-description**

Description

Configures the LLDP port to advertise or not advertise port description information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

N/A.

Example

The following command configures port 1:7 to not advertise the port description information to neighbors:

```
configure lldp ports 1:7 no-advertise port-description
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports system-capabilities

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **system-capabilities**

Description

Configures the LLDP port to advertise or not to advertise its system capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When at least one VLAN exists with more than two ports, bridging is sent to enabled.

When at least one VLAN on the switch has IP forwarding enabled, the system automatically sets the router bit.

Example

The following command configures all ports to advertise system capability information to neighbors:

```
configure lldp ports all advertise system-capabilities
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports system-description

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **system-description**

Description

Configures the LLDP port to advertise or not to advertise its system description to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

Advertise.

Usage Guidelines

Although not mandatory according to the standard, this TLV is included in the LLDPU by default when you enable LLDP.

When enabled, the system sends the following image (from the show version command) in the system description TLV:

```
ExtremeXOS version 11.2.0.12 v1120b12 by release-manager
on Fri Mar 18 16:01:08 PST 2005
```

Example

The following command configures port 1:4 through port 1:8 to not advertise the system description information to neighbors:

```
configure lldp ports 1:4 - 1:8 no-advertise system-description
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports system-name

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **system-name**

Default

Configures the LLDP port to advertise or not to advertise its system name to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

N/A.

Example

The following command configures port 1:6 to advertise the system name to neighbors:

```
configure lldp ports 1:4 - 1:8 advertise system-name
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific avaya-extreme call-server

The Avaya phone uses this proprietary LLDP TLV to learn the IP address(es) of the call server(s) to use.

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific avaya-extreme call-server** *ip_address_* {*ip_address_2* {*ip_address_3* {*ip_address_4* {*ip_address_5* {*ip_address_6* {*ip_address_7* {*ip_address_8*}}}}}}}

Description

Configures the LLDP port to advertise or not advertise up to 8 call server IP addresses to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ip_address_1....8	Specifies IP address of up to 8 call servers.  Note NOTE: This parameter does not apply when you configure the no-advertise parameter.

Default

No advertise.

Usage Guidelines

The Avaya phone uses this proprietary LLDP TLV for addressing information. You can configure the IP address for up to 8 call servers in a single TLV.

Example

The following command configures ports 1-5 to advertise two call server IP addresses to neighbors:

```
configure lldp ports 1-5 advertise vendor-specific avaya-extreme call-server
10.10.10.10 10.11.10.10
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific avaya-extreme dot1q-framing

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific avaya-extreme dot1q-framing** [**tagged** | **untagged** | **auto**]

Description

Configures the LLDP port to advertise or not advertise the 802.1q framing configuration to its neighbors. The Avaya phone uses this proprietary LLDP TLV information. In addition to this LLDP TLV, you must enable LLLDP as well as configure both the LLDP MED capabilities TLV and the LLDP network policy TLV.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
tagged	Specifies to use tagging. NOTE: This parameter applies only when you use the advertise parameter.
untagged	Specifies not to use tagging. NOTE: This parameter applies only when you use the advertise parameter.
auto	Specifies following a predetermined sequence (see Usage Guidelines below). NOTE: This parameter applies only when you use the advertise parameter.

Default

No advertise.

Usage Guidelines

Before configuring this LLDP TLV, you must take the following steps:

- Enable LLDP using the enable lldp ports command.
- Enable the LLDP MED capabilities TLV using the configure lldp ports vendor-specific med capabilities command.
- Enable the LLDP MED network policy TLV using the configure lldp ports vendor-specific med policy application command.

This TLV is used to exchange information about Layer2 priority tagging between the network connectivity device (switch) and the Avaya phone.

If you configure the TLV to advertise tagging, the phone uses tagging information, which it retrieves from the configure lldp ports vendor-specific med policy application command. If you configure the TLV to advertise untagged, the phone does not use any tagging, including 802.1q priority tagging.

If you configure the TLV to advertise auto, the phone cycles through the following sequence until an action is successful:

- Uses the configuration advertised by the LLDP MED network policy TLV, as configured by the configure lldp ports vendor-specific med policy application command.
- Uses the priority tagged frames configured by the phone's server.
- Sends the traffic untagged.

Example

The following command configures al ports to advertise the dot1q framing as untagged to neighbors:

```
configure lldp ports all advertise vendor-specific avaya-extreme dot1q-
framing untagged
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific avaya-extreme file-server

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific avaya-extreme file-server** *ip_address_1* {*ip_address_2* {*ip_address_3* {*ip_address_4*}}}

Description

Configures the LLDP port to advertise or not advertise up to 4 file server IP addresses to its neighbors. The Avaya phone uses this proprietary LLDP TLV to learn the IP address(es) of the file server(s) to use.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ip_address_1...4	Specifies IP address of up to 4 file servers. NOTE: This parameter does not apply when you configure the no-advertise parameter.

Default

No advertise.

Usage Guidelines

The Avaya phone uses this proprietary LLDP TLV for addressing information. You can configure the IP address for up to 4 file servers in a single TLV.

Example

The following command configures all ports to advertise two file server IP addresses to neighbors:

```
configure lldp ports 1-5 advertise vendor-specific avaya-extreme call-server
10.20.10.10 10.12.10.10
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific avaya-extreme poe-conservation-request

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific avaya-extreme poe-conservation-request**

Description

Configures the LLDP port to advertise or not advertise a requested conservation level. By default, the requested conservation value on this proprietary LLDP TLV is 0, which is no power conservation. This LLDP TLV is sent out only on PoE-capable Ethernet ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

The switch sends this proprietary LLDP TLV to request a PD to go into a certain power conservation level or request the PD to go to the maximum conservation level. This LLDP TLV is transmitted only on PoE-capable ports.

When configured to advertise, the switch sends this TLV with a requested conservation power level of 0, which requests no power conservation. To temporarily change this conservation level, use the SNMP lldpXAvExLocPortXPoEPSEPortReqLevel object to set a new value; the reconfigured value is not saved over a reboot. (This SNMP object can be set from 0 to 243 or 255.)

Example

The following command configures all ports to advertise the currently requested conservation level to neighbors:

```
configure lldp ports all advertise vendor-specific avaya-extreme poe-
conservation-request
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot1 port-vlan-ID

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot1 port-vlan-ID**

Description

Configures the LLDP port to advertise or not advertise port vlan ID information to its neighbors. This allows a VLAN bridge port to advertise the port VLAN identifier that is associated with untagged or priority-tagged frames.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

The port VLAN ID TLV allows the port to transmit the VLAN ID associated with untagged VLANs. There can be only one port VLAN ID in each LLPDU.

If no untagged VLANs are configured on the specified port, the TLV is not added to the LLPDU, even if you configured this to advertise.

Example

The following command configures all ports to advertise port vlan ID information to neighbors:

```
configure lldp ports all advertise vendor-specific dot1 port-vlan-ID
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot1 port-protocol-vlan-ID

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot1 port-protocol-vlan-ID** {**vlan** [**all** | *vlan_name*]}

Description

Configures the LLDP port to advertise or not advertise port VLAN information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
all	Specifies all VLANs on the port.
vlan_name	Specifies the VLAN on the port that you want to advertise.

Default

No advertise.

Usage Guidelines

When configured to advertise, the switch inserts a port and protocol VLAN ID TLV for each VLAN configured on the ports. The port and protocol VLAN ID TLV allows the port to advertise if it supports protocol and/or tagged VLANs, along with the associated tagged values. A separate TLV is sent for each VLAN that you want to advertise.

By default, once you configure this TLV, the system sends all protocol-based VLANs on the port. However, the LLDPDU cannot exceed 1500 bytes, so you should configure the port to advertise only the specified VLANs.

Note

The total LLPDU size is 1500 bytes; any TLVs after that limit are dropped.

This TLV does not send information on the type of protocol that the VLAN has enabled; it just says whether the port is enabled or disabled for protocol-based VLANs. As Extreme Networks devices are always capable of supporting protocol-based VLANs, once you configure this TLV, the system always advertises support for these VLANs.

Example

The following command configures all ports to advertise port and protocol VLAN information to neighbors for all VLANs on all ports:

```
configure lldp ports all advertise vendor-specific dot1 port-protocol-vlan-id
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot1 vlan-name

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot1 vlan-name** {**vlan** [**all** | *vlan_name*]}

Description

Configures the LLDP port to advertise or not advertise VLAN name information to its neighbors. Use this TLV to advertise information for the tagged VLANs you want to specify on the port. This allows an IEEE 802.1Q-compatible 802 LAN station to advertise the assigned name of any VLAN with which it is configured.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

vlan	Specifies all VLANs on the port.
vlan_name	Specifies the VLAN on the port that you want to advertise.

Default

No advertise.

Usage Guidelines

The VLAN name TLV sends the VLAN name and the tag used; it associates a name to a tag for the specified VLAN. This allows an IEEE 802.1Q-compatible 802 LAN station to advertise the assigned name of any VLAN with which it is configured.

You can enable this TLV for tagged and untagged VLANs. When you enable this TLV for tagged VLANs, the TLV advertises the IEEE 802.1Q tag for that VLAN. (For untagged VLANs, the internal tag is advertised.) You can specify exactly which VLANs to advertise.

When configured to advertise, the switch inserts a VLAN name TLV for every VLAN configured on the ports. By default, once you configure this TLV, the system sends all VLAN names on the port. However, each VLAN name can require up to 32 bytes and the LLDPDU cannot exceed 1500 bytes, so you should configure the port to advertise only the specified VLANs, using the keyword vlan_name.

Note

The total LLPDU size is 1500 bytes; any TLVs after that limit are dropped.

Example

The following command configures all ports to not advertise VLAN name information to neighbors:

```
configure lldp ports all no-advertise vendor-specific dot1 vlan-name
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot3 link-aggregation

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot3 link-aggregation**

Description

Configures the LLDP port to advertise or not advertise link-aggregation capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When configured, this TLV is added to each LLDP port LLDPDU indicating the link-aggregation capabilities, status, and value of the master port of the load-sharing group.

Example

The following command configures port 1:12 to not advertise link-aggregation capabilities to neighbors:

```
configure lldp ports 1:12 no-advertise vendor-specific dot3 link-aggregation
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot3 mac-phy

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot3 mac-phy**

Description

Configures the LLDP port to advertise or not advertise MAC and physical layer capabilities to its neighbors. The capabilities include duplex and bit rate.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When configured, the system advertises information about the speed capabilities, as well as autonegotiation support and status, of the LLDP port.

Example

The following command configures all ports to advertise MAC/PHY capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific dot3 mac-phy
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot3 max-frame-size

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot3 max-frame-size**

Description

Configures the LLDP port to advertise or not advertise its maximum frame size to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When jumbo frames are not enabled on the specified port, the TLV reports a value of 1518 once you configure it to advertise. If jumbo frames are enabled, the TLV inserts the configured value for the jumbo frames.

Example

The following command configures ports 1:12 and 1:13 to advertise the maximum frame size to neighbors:

```
configure lldp ports 1:12 - 1:13 advertise vendor-specific dot3 max-frame-size
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dot3 power-via-mdi

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dot3 power-via-mdi** {**with-classification**}

Description

Configures the LLDP port to advertise or not advertise Power over Ethernet (PoE) capabilities to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.

no-advertise	Specifies not to send the information to neighbors.
with-classification	Specifies to use LLDP for Data Link Layer Classification. This option is available only on PoE+ ports.

Default

No advertise.

Usage Guidelines

When configured, the system includes this TLV. Extreme Networks recommends enabling this TLV only on PoE-capable ports.

The following information is transmitted for LLDP ports with this TLV:

- Support PoE or not
- Port class
  - Power sourcing equipment (PSE)
  - Powered device (PD)
- Power pairs used to supply power
  - Signal
  - Spare
- Power status
- Support pairs control or not
- Power class
  - Class0
  - Class1
  - Class2
  - Class2
  - Class3
  - Class4

Data link layer classification allows fine-grained dynamic re-allocation of power based on changing needs. This feature is enabled by enabling LLDP (transmit and receive) and configuring transmission of the power-via-MDI TLV. The ExtremeXOS software sends an LLDPDU containing a power-via-MDI TLV within 10 seconds of DLL classification being enabled. A PD may request a new power value using an LLDPDU. The allocated power might be changed if a request is received and approved after a power review. The software responds with an allocated power value within 10 seconds of receipt of an LLDPDU with a different requested power from a PD. Power allocation can be controlled to a granularity of 0.1 watts. When DLL classification is enabled, it takes precedence over physical classification.

Note

For more information on advertising power support, see the configure lldp ports vendor-specific med power-via-mdi command.

Example

The following command configures all ports to advertise power capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific dot3 power-via-mdi
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific med capabilities

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific med capabilities**

Description

Configures the LLDP port to advertise or not advertise MED capabilities. This TLV must be enabled before any of the other MED TLVs can be enabled. Also, this TLV must be set to no-advertise after all other MED TLVs are set to no-advertise.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

This command enables the LLDP media endpoint discovery (MED) capabilities TLV, which allows LLDP-MED network connectivity devices to definitively determine that particular endpoints support LLDP MED, and if so, to discover which LLDP MED TLVs the particular endpoint devices are capable of supporting and to which specific device class the device belongs to.

This TLV must be enabled before any of the other MED TLVs can be enabled; and this TLV must be set to no-advertise after all other MED TLVs are set to no-advertise.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Note

Network connectivity devices wait to detect LLDP MED TLVs from endpoints before they send out LLDP MED TLVs; so L2 network connectivity devices do not exchange LLDP MED messages.

The following information is included in the LLDP MED capabilities TLV when it is transmitted:

- The supported LLDP MED TLVs—For Extreme Networks devices, these are capabilities, network policy, location, and extended power (extended power only advertised only on PoE-capable ports).
- The MED device type—For Extreme Networks devices, this is advertised as a network connectivity device (set to 4).

Example

The following command configures all ports to advertise MED capabilities to neighbors:

```
configure lldp ports all advertise vendor-specific med capabilities
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific med location-identification

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific med location-identification** [**coordinate-based** *hex_value* | **civic-based** *hex_value* | **ecs-elin** *elin*]

Description

Configures the LLDP port to advertise or not advertise MED location information. You configure up to 3 different location identifiers.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.

advertise	Specifies to send the information to neighbors.
coordinate-based	Specifies using the coordinate-based location identifier. This value is exactly 16 bytes long; see RFC 3825 for details.
hex_value	Enter a hexadecimal value with each byte separated by a colon. Or, you can obtain this value from a network management application. NOTE: This parameter is not used when the no-advertise parameter is configured.
civic-based	Specifies using the civic-based location identifier. This value must have a minimum length of 6 bytes; see RFC3825 for details.
ecs-elin	Specifies using the ecs location identifier. (Emergency Call Service, as defined in the TIA-TSB-146.)
elin	Enter a numerical string; the range is 10 to 25 characters. Or, you can obtain this value from a network management application. (See the TIA-TSB-146 standard for a definition of these numbers; also, the network management application must be able to handle the LLDP MED MIB.) NOTE: This parameter is not used when the no-advertise parameter is configured.

Default

No advertise.

Usage Guidelines

You might need to use a specific format for your specific VoIP implementation; see the VoIP manufacturer's manual for details.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the configure lldp ports [all | <port_list>] [advertise | no-advertise] vendor-specific med capabilities command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Example

The following command configures all ports to advertise MED location information to neighbors using the ECS format:

```
configure lldp ports all advertise vendor-specific med location-
identification ecs-elin 423233455676
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific med policy application

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific med policy application** [**voice** | **voice-signaling** |**guest-voice** | **guest-voice-signaling** | **softphone-voice** | **video-conferencing** | **streaming-video** | **video-signaling**] **vlan** *vlan_name* **dscp** *dscp_value* {**priority-tagged**}

Description

Configures the LLDP port to advertise or not advertise MED network policy TLVs. This TLV advertises VLAN configuration and associated Layer2 and Layer3 attributes that apply for a set of specific applications on that port. You can advertise up to 8 TLVs, each for a specific application, per port/VLAN. Each application type can exist only once per port. This TLV tells the endpoint the specific VLAN to use for the specific application, along with its unique priority.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
advertise	Specifies to send the information to neighbors.
voice	Specifies voice application on specified port/VLAN(s).
voice-signaling	Specifies voice signaling application on specified port/VLAN(s).
guest-voice	Specifies guest voice application on specified port/VLAN(s).
guest-voice-signaling	Specifies guest voice signaling application on specified port/VLAN(s).
softphone-voice	Specifies soft phone voice application on specified port/VLAN(s).
video-conferencing	Specifies videoconferencing application on specified port/VLAN(s).
streaming-video	Specifies streaming video application on specified port/VLAN(s).
video-signaling	Specifies video signaling application on specified port/VLAN(s).
vlan_name	Specifies the VLAN the specified application is using. NOTE: This parameter does not apply when the no-advertise parameter is configured.
dscp_value	Specifies the DSCP value for the specified application. This is a 6-bit value from 0 to 63. NOTE: This parameter does not apply when the no-advertise parameter is configured.
priority-tagged	Use this if you want priority tagging, and the VLAN is configured as untagged on the port. (The endpoint sends out frames for the specified application with a tag of 0.) NOTE: This parameter does not apply when the no-advertise parameter is configured.

Default

No advertise.

Usage Guidelines

This command enables the LLDP MED network policy TLV, which allows network connectivity devices and endpoint devices to advertise VLAN configuration and associated Layer2 and Layer3 attributes that apply for a set of specific application on that port. This TLV can be enabled on a per port/VLAN basis. Each application type can exist only once on a port.

You can enable the transmission of a TLV policy for each application. A maximum of 8 TLVs can be enabled, and each can have a unique DSCP value and/or priority tagging.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the configure lldp ports [all | <port_list>] [advertise | no-advertise] vendor-specific med capabilities command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

The following information is transmitted for LLDP ports with this TLV:

- Application type

  Used as configured.
- Unknown policy flag

  Set to 0.
- Tagged flag

  Set to tagged for tagged VLANs; set to untagged for untagged VLANs. By default, set to 0.
- VLAN ID

  Copied from the VLAN. However, if you configure the priority-tagged parameter, this value is set to 0.
- Layer2 priority

  Copied from the VLAN priority.
- DSCP value

  Uses the value configured in the dscp parameter.

Note

See the documentation provided by the manufacturer of connected devices regarding values.

Example

The following command configures all ports to advertise videoconferencing on the VLAN video with a DSCP of 7 to neighbors:

```
configure lldp ports all advertise vendor-specific med policy application
video-conferencing vlan video dscp 7
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific med power-via-mdi

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific med power-via-mdi**

Description

Configures the LLDP port to advertise or not advertise MED power requirement details. This TLV can only be enabled on a PoE-capable port and is used for advanced power management between the MED network connectivity and endpoint devices.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.

Default

No advertise.

Usage Guidelines

When enabled, this LLDP MED TLV advertises fine-grained power requirement details about PoE settings and support. This TLV can be enabled only on a PoE-capable port; the switch returns an error message if this TLV is configured for a non-PoE-capable port.

You must configure the LLDP MED capabilities TLV before configuring this TLV. Configure the LLDP MED capabilities TLV using the configure lldp ports [all | <port_list>] [advertise | no-advertise] vendor-specific med capabilities command.

As with all the LLDP MED TLVs, the switch sends this TLV only after it detects a MED-capable device on the port. The switch does not automatically send this TLV after it is enabled; the switch must first detect a MED-capable device on the port.

Note

For additional information on power support, see the configure lldp ports vendor-specific dot3 power-via-mdi command.

The following information is transmitted for LLDP MED PoE-capable ports with this TLV:

- Power type

  Set to PSE.
- Power source

  Set to primary power source.
- Power priority

  Taken from PoE port configuration.
- Power value

  Taken from PoE port configuration.

Example

The following command configures all ports to advertise MED power information to neighbors:

```
configure lldp ports all advertise vendor-specific med power-via-mdi
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure lldp reinitialize-delay

configure lldp reinitialize-delay *seconds*

Description

Configures the delay before the receive state machine is reinstalled once the LLDP transmit mode has been disabled.

Syntax Description

seconds	Specifies the delay that applies to the reinitialization attempt. The range is 1 to 10 seconds.

Default

2 seconds.

Usage Guidelines

N/A.

Example

The following command configures a reinitialization delay of 10 seconds:

```
configure lldp reinitialize-delay 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp snmp-notification-interval

configure lldp snmp-notification-interval *seconds*

Description

Configures the allowed interval at which Simple Network Management Protocol (SNMP) notifications are sent.

Syntax Description

seconds	Specifies the interval at which LLDP SNMP notifications are sent. The range is 5 to 3600 seconds.

Default

5 seconds.

Usage Guidelines

This is a global timer. If one port sends a notification, no notifications for other ports go out for the configured interval.

Example

The following command configures an interval of 60 seconds for LLDP SNMP notifications:

```
configure lldp snmp-notification-interval 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp transmit-delay

configure lldp transmit-delay [**auto** | *seconds*]

Description

Configures the delay time between successive frame transmissions initiated by a value change or status change in any of the LLDP local systems Management Information Base (MIB).

The auto option uses a formula (0.25 * transmit-interval) to calculate the number of seconds.

Syntax Description

auto	Uses the formula (0.25 * transmit-interval) to calculate the seconds.
seconds	Specifies the interval at which LLDP notifications are sent. The range is 1 to 8291.

Default

2 seconds.

Usage Guidelines

This is the timer between triggered updates.

Example

The following command configures the delay between LLDP frame transmissions for triggered updates to be automatically calculated:

```
configure lldp transmit-delay auto
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp transmit-hold

configure lldp transmit-hold *hold*

Description

Calculates the actual time-to-live (TTL) value used in the LLDPDU messages.

The formula is transmit-interval * transmit-hold; by default the TTL value is (30*4) 120 seconds.

Syntax Description

hold	Used to calculate the TTL value; the range is 2 to 10.

Default

4.

Usage Guidelines

N/A.

Example

The following command configures the transmit-hold value (which is used to calculate the TTL of the LLDP packets) to 5:

```
configure lldp transmit-hold 5
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure lldp transmit-interval

configure lldp transmit-interval *seconds*

Description

Configures the periodic transmittal interval for LLDPDUs.

Syntax Description

seconds	Specifies the time between LLDPDU transmissions. The range is 5 to 32768.

Default

30 seconds.

Usage Guidelines

N/A.

Example

The following command configures a transmittal interval of 20 seconds for LLDPDUs.

```
configure lldp transmit-interval 20
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable lldp ports

disable lldp ports [**all** | *port_list*] {**receive-only** | **transmit-only**}

Description

Disables LLDP transmit mode, receive mode, or transmit and receive mode on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
receive-only	Specifies that only the receive mode for LLDP is disabled.
transmit-only	Specifies that only the transmit mode for LLDP is disabled.

Default

Disabled.

Usage Guidelines

If you do not specify an option, both LLDP modes (transmit and receive) are disabled.

Example

The following example disables the LLDP receive mode on ports 1:2 to 1:6.

```
disable lldp ports 1:2-1:6 receive-only
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable snmp traps lldp

disable snmp traps lldp {**ports** [**all** | *port_list*]}

Description

Disables the sending of LLDP-specific SNMP traps on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system stops sending LLDP traps from all ports on the switch.

Example

The following example disables sending LLDP SNMP traps on all switch ports:

```
disable snmp traps lldp ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable snmp traps lldp-med

disable snmp traps lldp-med {**ports** [**all** | *port_list*]}

Description

Disables the sending of LLDP MED-specific SNMP traps on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system stops sending LLDP MED traps from all ports on the switch.

Example

The following example disables sending LLDP MED SNMP traps on all switch ports:

```
disable snmp traps lldp-med ports all
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

enable lldp ports

enable lldp ports [**all** | *port_list*] {**receive-only** | **transmit-only**}

Description

Enables LLDP transmit mode, receive mode, or transmit and receive mode. If the transmit-only or receive-only option is not specified, both transmit and receive modes are enabled.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
receive-only	Specifies that the port only receives LLDP messages.
transmit-only	Specifies that the port only transmits LLDP messages.

Default

Disabled.

Usage Guidelines

If you do not specify an option, the port is enabled to both transmit and receive LLDP messages.

Once the port is enabled for LLDP in one mode and you issue another enable lldp ports command for another mode, that second mode replaces the original mode. For example, you might originally enable several ports to only receive LLDP messages and then want those ports to both receive and transmit LLDP messages. In that case, you issue the enable lldp ports command with no variables (and the receive-and-transmit mode replaces the receive-only mode).

To verify the port setting for LLDP, use the show lldp {port [all | <port_list>]} {detailed} command.

Example

The following example enables LLDP transmit and receive mode on port 1:4.

```
enable lldp port 1:4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable snmp traps lldp

enable snmp traps lldp {ports [all | *port_list*]}

Description

Enables the transmission of LLDP SNMP trap notifications.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

Note

To enable SNMP traps for LLDP MED TLVs, you must issue a separate command; use the enable snmp traps lldp-med {ports [all | <port_list>]}.

If you do not specify any ports, the system sends LLDP traps for all ports.

Note

The Avaya-Extreme proprietary TLVs do not send traps.

Example

The following command enables LLDP SNMP traps for all ports:

```
enable snmp traps lldp ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable snmp traps lldp-med

enable snmp traps lldp-med {**ports** [**all** | *port_list*]}

Description

Enables the transmission of LLDP SNMP trap notifications related to LLDP MED extension TLVs.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

If you do not specify any ports, the system sends LLDP-MED traps for all ports.

Example

The following command enables LLDP-MED SNMP traps for all ports:

```
enable snmp traps lldp-med ports all
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

show lldp

show lldp {**port** [**all** | *port_list*]} {**detailed**}

Description

Displays LLDP configuration information for the specified port or ports.

Use the detailed keyword to display the configured VLANs on the port and the enabled VLAN-specific TLVs.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
detailed	Shows information on the configured VLANs on the port.

Default

N/A.

Usage Guidelines

Use the detailed variable to display information regarding configured VLANs on the ports and any enabled VLAN-specific TLVs.

Example

The following example displays LLDP configuration information for the switch:

```
# show lldp
```

```
LLDP transmit interval           : 30 seconds
LLDP transmit hold multiplier    : 4  (used TTL = 120 seconds)
LLDP transmit delay              : 2 seconds
LLDP SNMP notification interval  : 5 seconds
LLDP reinitialize delay          : 2 seconds
LLDP-MED fast start repeat count : 4
LLDP Port Configuration:

History

This command was first available in ExtremeXOS 11.2.

The information on fast-start repeat count, MED, AvEx, and notification was added in ExtremeXOS 11.5.

An additional flag was added for PoE+ in ExtremeXOS 12.5.

The display was updated for DCBX in ExtremeXOS 12.6

Platform Availability

This command is available on all platforms.

show lldp neighbors

show lldp {**port** [**all** | *port_list*]} **neighbors** {**detailed**}

Description

Displays the information related to the LLDP neighbors detected on the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
detailed	Shows detailed information on the neighbors.

Default

N/A.

Usage Guidelines

You must use the detailed parameter to display detailed information about the received LLDP TLVs.

Example

The following example displays LLDP neighbor information for all switch ports:

```
# show lldp port all neighbors
Port     Neighbor Chassis ID        Neighbor Port ID           TTL     Age
================================================================================
1:2      00:04:96:26:A4:70          1:1                        120     7
2:6      (5.1)10.201.41.146         00:04:0D:EC:EA:5C          120     3
2:7      (5.1)10.201.41.147         00:04:0D:ED:41:9B          120     3
2:10     00:01:30:F9:9E:80          8:10                       120     15
================================================================================
NOTE: The Chassis ID and/or Port ID might be truncated to fit the screen.
```

The following command lists detailed LLDP neighbor information for all switch ports:

```
# show lldp all neighbors detailed

```

History

This command was first available in ExtremeXOS 11.2. Information on the LLDP MED extension and Avaya-Extreme proprietary TLVs was added in ExtremeXOS 11.5.

Additional PoE+ information can appear when present in a Power via MDI TLV received from a neighbor starting in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show lldp statistics

show lldp {**port** [**all** | *port_list*]} **statistics**

Description

Displays statistical counters related to the specified port or ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

The following counters are presented with the standard command (taken from the IEEE 802.1ab MIB definition):

- Last table change time: Last time an entry in the LLDP database was added, changed or deleted.
- Number of table inserts: The number of times the complete set of information advertised by a particular neighbor has been inserted into tables.
- Number of table deletes: The number of times the complete set of information advertised by a particular neighbor has been deleted from tables.
- Number of table drops: The number of times the complete set of information advertised by a particular neighbor could not be stored in memory because of insufficient resources.
- Number of table age outs: The number of times the complete set of information advertised by a particular neighbor has been deleted from tables because the information timeliness interval has expired.
- Tx Total: The number of LLDP frames transmitted by this switch on the indicated port.
- Tx Total Length Exceeded: The number of LLDP frames sent out on this port that could not hold all the information configured because the total frame length would exceed the maximum LDDPDU size of 1500 bytes.
- Rx Total: The number of valid LLDP frames received by this switch on the indicated port, while this LLDP agent is enabled.
- Rx Discarded: The number of LLDP frames received by this switch on the indicated port, and then discarded for any reason.
- Rx Errors: The number of invalid LLDP frames received by this switch on the indicated port, while this LLDP agent is enabled.
- TLVs Discarded: The number of LLDP TLVs discarded for any reason by this switch on the indicated port.
- TLVs Unrecognized: The number of LLDP TLVs received on the given port that are not recognized by the switch.

Example

The following example lists statistical counters for all ports on the switch:

```
# show lldp port all statistics
Last table change time   : Fri Dec 17 10:42:33 2004
Number of Table Inserts  : 3
Number of Table Deletes  : 0
Number of Table Drops    : 0
Number of Table Age Outs : 0
Port     Tx         Tx LengthRx Rx          Rx         TLVs        TLVs
Total      Exceeded TotalDiscarded   Errors     Discarded   Unrecogn.
================================================================================
=====
1:1      189        05654       0           0          0           0
2:2      188        0565        0           0          0           0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

unconfigure lldp

unconfigure lldp {ports [all | *port_list*]}

Description

Leaves LLDP enabled and configured; restores the LLDP timer default values.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

When you issue the global unconfigure lldp, only the LLDP timers are reset to default values. All the configured TLVs remain on the ports remain, and LLDP remains enabled.

When you use the keyword ports, the TLVs for each port are returned to the five default TLVs. LLDP remains enabled.

Example

The following command restores LLDP factory default TLVs for ports 1:4 to 1:8:

```
unconfigure lldp ports 1:4 - 1:8
```

History

This command was first available in ExtremeXOS 11.2.

The keyword port was changed to ports in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

11 Commands for OAM

clear counters bfd
clear counters cfm segment <segment_name>
clear counters cfm segment all
clear counters cfm segment all frame-delay
clear counters cfm segment all frame-loss
clear counters cfm segment frame-delay
clear counters cfm segment frame-loss
clear counters cfm segment frame-loss mep
clear ethernet oam counters
configure bfd vlan
configure bfd vlan authentication
configure cfm domain add association integer
configure cfm domain add association string
configure cfm domain add association vlan-id

configure cfm domain association add
configure cfm domain association add remote-mep
configure cfm domain association delete
configure cfm domain association delete remote-mep
configure cfm domain association destination-mac-type
configure cfm domain association end-point add group
configure cfm domain association ports end-point ccm
configure cfm domain association end-point delete group
configure cfm domain association ports end-point mepid
configure cfm domain association ports end-point sender-id-ipaddress
configure cfm domain association end-point transmit-interval
configure cfm domain association ports end-point
configure cfm domain association remote-mep mac-address
configure cfm domain delete association
configure cfm domain md-level
configure cfm group add rmep
configure cfm group delete rmep
configure cfm segment add domain association
configure cfm segment delete domain association
configure cfm segment dot1p
configure cfm segment frame-delay dot1p
configure cfm segment frame-delay/frame-loss transmit interval

configure cfm segment frame-delay window
configure cfm segment frame-loss dot1p
configure cfm segment frame-loss window
configure cfm segment frame-loss mep
configure cfm segment frame-loss consecutive
configure cfm segment frame-loss ses-threshold
configure cfm segment threshold
configure cfm segment timeout
configure cfm segment transmit-interval
configure cfm segment window
create cfm domain dns md-level
create cfm domain mac md-level
create cfm domain string md-level
create cfm segment destination
delete cfm domain
delete cfm segment
disable cfm segment frame-delay measurement
disable cfm segment frame-loss measurement mep
disable ethernet oam ports link-fault-management
enable/disable bfd vlan
enable cfm segment frame-delay measurement
enable cfm segment frame-loss measurement mep
enable ethernet oam ports link-fault-management
ping mac port
show bfd
show bfd counters
show bfd session client
show bfd session counters vr all
show bfd session detail vr all
show bfd session vr all
show bfd vlan
show bfd vlan counters
show cfm
show cfm detail
show cfm groups
show cfm segment
show cfm segment frame-delay
show cfm segment frame-delay/frame-loss mep id
show cfm segment frame-delay statistics
show cfm segment frame-loss
show cfm segment frame-loss statistics
show cfm segment mep

Operation, Administration, and Maintenance (OAM) includes functions used to detect network faults, measure network performance and distribute fault-related information.

This chapter describes commands that are part of the following features.

Connectivity Fault Management (CFM)—This feature, discussed in the emerging IEEE 802.1ag specification, allows you to detect, verify, and isolate connectivity failures in virtual bridged LANs. Part of this specification is a toolset to manually check connectivity, which is sometimes referred to as Layer2 ping.

Hierarchical networks, or domains, and test connectivity within that domain are created by sending Layer2 messages, known as Connectivity Check Messages (CCMs). You use these domains to send loopback messages and link trace messages.

Y.1731 Compliant Frame Delay and Delay Variance Measurement—This feature is based on the ITU-T Y. 1731 standard and deals with the Ethernet Delay Measurement (ETH-DM) function.

ExtremeXOS software supports:

- Two-way delay measurement—Delay Measurement Message (DMM) and Delay Measurement Reply (DMR).
- Continuous (proactive) measurement of frame delay and frame-delay variation
- On-demand measurement of frame delay and frame-delay variation.

EFM OAM—Unidirectional Link Fault Management—IEEE 802.3ah, the Ethernet in the First Mile (EFM) standard, includes mechanisms for network OAM to facilitate metro Ethernet network operation and troubleshooting to match traditional carrier network technologies. This section covers that portion of EFM that deals with the unidirectional link fault indication on a 1G link that has the capability to transmit and receive independently.

Bidirectional Forwarding Detection (BFD)—This feature is a hello protocol that provides rapid detection of failures in the path and informs the clients (routing protocols) to initiate the route convergence. It is independent of media, routing protocols and data protocols.

clear counters bfd

```
clear counters bfd {session | interface}
```

Description

Clears the counters associated with BFD specific settings.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to clear the counters in the BFD session or interface (VLAN). If neither session or interface are specified, the command clears all counters in BFD.

Example

The following command clears all counters in BFD:

```
clear counters bfd
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

clear counters cfm segment <segment_name>

clear counters cfm segment *segment_name*

Description

This command clears both frame-delay and frame-loss information for segment with given segment name.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to clear both frame-delay and frame-loss information for segment with given segment name. .

Example

```
E4G-200.56 # clear co cfm seg cs2
E4G-200.57 #
E4G-200.57 # sho cfm seg cs2

clear counters cfm segment frame-loss mep

clear counters cfm segment *segment_name* **frame-loss mep** *mep_id*

Description

This command clears only frame-loss information for the given MEP in segment with given segment name.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to clear only frame-loss information for the given MEP in segment with given segment name

Example

```
E4G-200.24 # clear counters cfm segment "cs2" frame-loss mep 3
E4G-200.25 #
E4G-200.25 #

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

clear ethernet oam counters

clear ethernet oam {**ports** [*port_list*} **counters**

Description

Clears Ethernet OAM counters.

Syntax Description

port_list	Specifies the particular port(s).

Default

N/A

Usage Guidelines

Use this command to clear the Ethernet OAM counters on one or more specified ports. If you do not specify the port(s), counters for all ports are cleared.

When operating as a stack master, the Summit X450e switch can process this command for ports on supported platforms.

Example

The following command clears Ethernet OAM counters on port 2:

```
clear ethernet oam ports 2 counters
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the Summit X450a series switch only.

configure bfd vlan

configure bfd vlan *vlan_name* [{**detection-multiplier** *multiplier*} {**receive-interval** *rx_interval*} {**transmit-interval** *tx_interval*}]

Description

Configures BFD transmit (TX) and receive (RX) intervals and multipliers on the VLAN.

Syntax Description

vlan_name	Specifies the VLAN.
multiplier	Specifies the detection multiplier. The range is 1 to 255.
rx_interval	Specifies the receive interval for control packets in milliseconds. The range is 100 to 4294967 ms.
tx_interval	Specifies the transmit interval for control packets in milliseconds. The range is 100 to 4294967 ms.

Default

The default value for RX and TX intervals is 1000 ms.

The default value for the detection-multiplier is 3.

Usage Guidelines

Use this command to configure BFD.

Use the show bfd vlan command to display the current settings.

Example

The following command configures a transmit and receive interval of 2000 ms and a detection multiplier of 2 on the VLAN vlan1:

```
configure bfd vlan vlan1 detection-multiplier 2 receive-interval 2000
transmit-interval 2000
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure bfd vlan authentication

configure bfd vlan *vlan_name* **authentication** [**none** | **simple-password** {**encrypted**} *password*]]

Description

Configures authentication for BFD on a VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.
none	Specifies that no authentication is to be used. (Default)
password	Specifies a simple password to use to authenticate.
encrypted	Indicates that the password is already encrypted.

Default

The authentication default is none.

Usage Guidelines

Use this command to configure authentication for BFD on a VLAN using a password or specify that none is required.

Use the show bfd vlan command to display the authentication setting.

The encrypted keyword is primarily for the output of the show configuration command, so that the password is not revealed in the command output. Do not use it to set the password

Example

The following command configures authentication using the password password:

```
configure bfd vlan vlan1 authentication simple-password password
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure cfm domain add association integer

configure cfm domain *domain_name* **add association integer** *int* [**vlan** *vlan_name*|**vman** *vman_name*]

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the 2-octet integer MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
int	Enter an integer to name the MA. The range is 0 to 65535.
vlan_name	Specifies the VLAN you want to assign to this MA. Each MA contains only one VLAN, VMAN, BVLAN or SVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates a 2-octet integer MA (350) that associates the domain brazil and the VLAN admin:

```
configure cfm domain brazil add association integer 350 vlan admin
```

History

This command was first available in ExtremeXOS 11.4.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure cfm domain add association string

configure cfm domain *domain_name* **add association string** *name* [**vlan** *vlan_name*|**vman** *vman_name*]

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the character string MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
string	Enter up to 45 alphanumeric characters to name the MA.
vlan_name	Specifies the VLAN you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates an MA named service that associates the MD spain and the VLAN finance:

```
configure cfm domain service add association string spain vlan finance
```

History

This command was first available in ExtremeXOS 11.4.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure cfm domain add association vlan-id

configure cfm domain *domain_name* **add association vlan-id** *vlanid* [**vlan** *vlan_name*| **vman** *vman_name*]

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the VLAN ID MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
vlanid	Specifies the VLAN ID.
vlan_name	Specifies the VLAN you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA.

You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

History

This command was first available in ExtremeXOS 12.1.

The SVLAN option was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure cfm domain add association vpn-id oui index

configure cfm domain *domain_name* **add association vpn-id oui** *oui* **index** *index* **[vlan** *vlan_name*|**vman** *vman_name*]

Description

Creates a maintenance association (MA) related to a specified maintenance domain (MD). This command supports the RFC 2685 VPN ID MA format.

Syntax Description

domain_name	Specifies the domain you want to associate with this MA.
oui	Enter a virtual private network (VPN) Organizational Unique Identifier (OUI) in the format XX:XX:XX as part of the name for the MA.
index	Enter the 32-bit VPN index you want to append to the OUI to name the MA. The range is 0 to 4294967295.
vlan_name	Specifies the VLAN you want to assign to this MA. Each MA contains only one VLAN, VMAN, or BVLAN.
vman_name	Specifies the VMAN you want to assign to this MA.

Default

N/A.

Usage Guidelines

All ports configured on the specified VLAN are now CFM ports in the specified MA. You add the MA, or association, to the domain, and the MA uses the MD level assigned to the domain. Each MA can belong to only one domain, but several MAs can belong to a given domain. The MA is unique within a given domain.

Example

The following command creates an MA with the VPN ID of 11:22:33 50 that associates the domain spain and the VLAN accounting:

```
configure cfm domain spain add association vpn-id oui 11:22:33 index 50 vlan
accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm domain association add

configure cfm domain *domain_name* **association** *association_name* [**ports** *port_list* **add** [[**end-point** [**up**|**down**] *mepid* { **group** *group_name* }] | [**intermediate-point**]]

Description

This command allows you to create an up MEP, down MEP, intermediate-point (MIP) on a maintenance association, a group. You can also combine different maintenance points.

Combining different Maintenance points is restricted per the following:

- Up MEP and Down MEP in a single association is not allowed.
- Down MEP and MIP in a single association is not allowed.
- More than one Up MEP in a single association is not allowed.
- Up MEP and MIP in a single association is allowed.
- More than one Down MEP in a single association is allowed.
- A group can be created while creating a MEP.
- With CFM Support over VPLS, this command is used to associate pseudo wires of a VPLS service instance to an association & domain.
- Portlist can have only one port configured for a MEP configuration but can have multiple ports in MIP configuration, when Hwaoam is supported on the system.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are configuring a MIP.
port_list	Specifies the port number(s).
up	Enter the port to be the UP port of the MA; this MEP sends CCM messages to all ports—other than the sending switch port—in this MA on this switch.
down	Enter the port to be the DOWN port of the MA; this MEP sends CCM messages out of the configured physical port.
mepid	Specifies a value for this MEP. The range is 1 to 8191. NOTE: On each MA, each MEPID must be unique.
group	CFM group that binds an LMEP to RMEPS. If not specified, the client does not receive events from the respective RMEPs.
group_name	Group name, maximum of 31 characters.

Default

N/A.

Usage Guidelines

These ports must already be in the MA (VLAN or VMAN) prior to assigning a MEP function to them. If you try to assign a port not in the MA as an end-point, the system returns the following message:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

You can also combine different maintenance points. The following are CLI restrictions on MP combinations:

- DOWN and UP MEP cannot be present on the same association
- DOWN MEP and MIP cannot be present on the same association
- UP MEP and MIP can be present on the same association
- Only one UP MEP is allowed in an association
- Multiple DOWN MEPs are allowed in an association

You can configure a total of 32 MIPs on a single switch.

Use the show cfm command to verify your configuration.

Example

The following command configures port 1:20 as a MIP on the 350 association in the spain domain:

```
configure cfm domain spain association 350 ports 1:20 add intermediate-point
```

The following command configures port 5:10 to be the UP MEP on the test association in the brazil domain, with an mepid of 500:

```
configure cfm domain brazil association test ports 5:10 add end-point up 500
```

History

This command was first available in ExtremeXOS 11.4.

This command was updated in ExtremeXOS 15.2 to include the optional group parameter.

Platform Availability

This command is available on all platforms.

configure cfm domain association add remote-mep

configure cfm domain *domain-name* **association** *association_name* **add remote-mep** *mepid* { **mac-address** *mac_address* }

Description

Allows you to add a remote MEP with the given MEP ID and MAC address to an existing association.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are adding a remote MEP.
mepid	Enter the MEP ID of the remote MEP being added. The range is 1 to 8191.
mac_address	Specifies the MAC address for the remote MEP being added.

Default

N/A.

Usage Guidelines

Use this command to add a remote MEP with given MEP ID and MAC address to an existing association. Use the show cfm detail command to verify your configuration.

Note

Since the Summit X460 does not support unicast CCM generation, creating an RMEP with unicast MAC address is not meaningful. Therefore it is an optional parameter on E4G400, E4G200, and Summit X460 platforms.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure cfm domain association delete

configure cfm domain *domain_name* **association** *association_name* **[ports** *port_list* **delete [[end-point [up|down]] | [intermediate-point]]]**

Description

Deletes a maintenance end point (MEP) or maintenance intermediate point (MIP) from that MA.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are deleting an MIP.
port_list	Specifies the port number(s).
up	Specifies that an UP MEP is to be deleted.
down	Specifies that a DOWN MEP is to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete an MEP or MIP.

If the VPLS option is chosen then the CFM deletes all the VPLS-based MIPs.

Use the show cfm command to verify your configuration.

Example

The following command deletes port 5:12 as an MIP on the test association in the brazil domain:

```
configure cfm domain brazil association test ports 5:12 delete intermediate-
point
```

The following command deletes an UP MEP on port 5:10 on the test association in the brazil domain:

```
configure cfm domain brazil association test ports 5:10 delete end-point up
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm domain association delete remote-mep

configure cfm domain *domain-name* **association** *association_name* **delete remote-mep** *mepid*

Description

Allows you to delete a remote MEP for a specific MEP ID and MAC address.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are changing an MEP ID.
mepid	Enter the MEP ID of the remote MEP that is to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete a remote MEP of an MA for a specific MEP ID.

Use the show cfm detail command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure cfm domain association destination-mac-type

configure cfm domain *domain-name* **association** *association_name* **destination-mac-type** [**unicast** | **multicast**]

Description

Allows you to choose the destination MAC type for sending CFM PDUs for an MA.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are changing the MAC type.
unicast	CFM PDUs are sent to the unicast MAC address configured in static remote MEP creation.
multicast	CFM PDUs are sent to the standard multicast destination address.

Default

Multicast.

Usage Guidelines

Use this command to change the MAC type on a previously configured MA. If multicast is selected, CFM PDUs are sent to the standard multicast destination. If unicast is selected, CFM PDUs are sent to the unicast MAC address configured in static remote MEP creation.

Use the show cfm command to verify your configuration.

E4G400, E4G200, and Summit X460 do not support unicast CCM (Continuity Check Message) generation. When the user configures the destination MAC type as unicast, the following message appears:

```
Error: IEEE 802.1ag PDUs can be sent only to standard multicast address on
this platform
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure cfm domain association end-point add group

configure cfm domain *domain-name* **association** *association-name* **ports** *port-list* **end-point** [**up** | **down**] **add group** *group_name*

Description

This command allows you to create a group for an existing local end-point.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are configuring an MEP.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.
delete	Delete configuration from the association

Default

N/A

Usage Guidelines

```
Use this command to add a group to the association.
```

Example

```
configure cfm domain "MD1" association "MD1v1" ports 17 end-point down add
group "eapsCfmGrp"
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure cfm domain association ports end-point ccm

configure cfm domain *domain_name* **association** *association_name* **ports** *port_list* **end-point** [**up** | **down**] **ccm** [**disable** | **enable**]

Description

This command is used to enable or disable sending CCMs on a given MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are configuring an MEP.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.

Default

Enabled.

Usage Guidelines

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

These ports must already be in the MA (VLAN or VMAN) prior to assigning a MEP function to them. If you try to assign a port not in the MA as an end-point, the system returns the following message:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Use the show cfm command to verify your configuration.

Example

configure cfm domain "MD1" association "MD1v1" ports 17 end-point down delete group "eapsCfmGrp"

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm domain association end-point delete group

configure cfm domain *domain_name* **association** *association_name* **ports** *port_list* **end-point** [**up**|**down**] **delete group** [*group_name* | **all**]

Description

This command allows you to delete one or all groups.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are configuring an MEP.
port_list	Enter the port number you want to configure as either an UP or DOWN MEP.
delete	Delete configuration from the association

Default

N/A

Usage Guidelines

Use this command to delete one or all groups from the association.

Example

```
configure cfm domain "MD1" association "MD1v1" ports 17 end-point down delete
group "eapsCfmGrp"
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure cfm domain association ports end-point mepid

configure cfm domain *domain-name* **association** *association_name* **ports** *port_list* **end-point** [**up** | **down**] **mepid** *mepid*

Description

Allows you to change the MEP ID for a previously configured MEP. Each MEP within a single MA must have a unique MEP ID.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are changing an MEP ID.
port_list	Enter the port number you want to change the MEP ID.
up	Enter this variable if you are changing the MEP ID on an UP MEP.
down	Enter this variable if you are changing the MEP ID on a DOWN MEP.
mepid	Enter the new value for this MEP. The range is 1 to 8191. NOTE: On each MA, each MEPID must be unique.

Default

N/A.

Usage Guidelines

Use this command to change the MEPID on a previously configured UP or DOWN MEP. If you attempt to change the MEPID on a port that is either not an MEP or having wrong MEP type, the system returns an error message.

Use the show cfm command to verify your configuration.

Example

The following command changes the MEP ID to 75 on the previously configured port 2:4 UP MEP on the 350 association in the finance domain:

```
configure cfm domain finance association 350 ports 2:4 end-point up mepid 75
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm domain association ports end-point sender-id-ipaddress

configure cfm domain *domain_name* **association** *association_name* **ports** *port_list* **end-point** [**up** | **down**] **sender-id-ipaddress** [**disable** | **enable** *ip-address*]

Description

This command is used to disable or enable configuring the sender-id-ipaddress on a given MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are configuring an MEP.
port_list	Enter the port number.
ip-address	Specifies the IP address that is sent in the sender-id TLV of the CFM PDUs.

Default

Disable.

Usage Guidelines

Each MA needs at least two MEPs that can reach each other to exchange CCM messages.

Note

Ensure that you assigned the port number correctly to the UP MEP and to the DOWN MEP, or the CCM messages go in the wrong direction.

You must create the MEP for which the configuration is being made before changing the configuration. Otherwise, the following error message is displayed:

```
The following port(s) <portlist> are not part of the associations VLAN.
```

Use the show cfm command to verify your configuration.

Note

E4G400, E4G200, and Summit X460 do not support this option. When the user configures a sender-id-ipaddress on an end-point, the following message appears: “Error: Sender ID IP Address configuration is not supported on this platform”.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms except E4G400, E4G200, and Summit X460.

configure cfm domain association end-point transmit-interval

configure cfm domain *domain_name* **association** *association_name* {**ports** *port_list* **end-point** [**up** | **down**]} **transmit-interval** [**3**|**10**|**100**|**1000**|**10000**|**60000**|**600000**]

Description

Allows you to change time interval for an MEP to send out a CCM. Extreme Networks recommends configuring this value as at least 1 second.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Enter the name of the MA for which you are changing the time interval an MEP sends out CCM.
port_list	Enter the port number of the MEP on which you are changing the time interval it sends out a CCM.
up	Enter this variable if you are changing the time interval for sending a CCM on an UP MEP.
down	Enter this variable if you are changing the time interval for sending a CCM on a DOWN MEP.

Default

1000 ms.

Usage Guidelines

Use this command to change the time interval between sending out CCMs on a previously configured UP or DOWN MEP. If you attempt to change the interval on a port that is either not an MEP or having wrong MEP type, the system returns an error message.

Note

Extreme Networks recommends that you use a transmit interval of at least 1 second (1000 ms).

The receiving system also uses this value multiplied by 3.5 to determine when the MEP is no longer alive.

Use the show cfm command to verify your configuration and the show cfm detail command to display the configured lifetime.

Note

The transmit interval value “3” is 3.3 msec. The values 3 and 10 are supported on platforms x460, E4G400 and E4G200 only for down MEPS. Also, the values 60000 and 600000 are supported in hardware.

Example

The following command changes the interval the UP MEP (previously configured on port 2:4) uses to send CCM messages on the 350 association in the finance domain to 10 seconds:

```
configure cfm domain finance association 350 ports 2:4 end-point up transmit-
interval 10000
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm domain association ports end-point

configure cfm domain *domain_name* **association** *association_name* **ports** *port_list* **end-point** [**up** | **down**] [**enable** | **disable**]

Description

Enables or disables an MEP.

Syntax Description

domain_name	Specifies the domain name.
association_name	Specifies the MA name.
port_list	Specifies the ports to configure.
up	Specifies that the end point is up.
down	Specifies that the end point is down.

Default

MEP is enabled by default.

Usage Guidelines

Use this command to enable or disable an MEP.

Use the show cfm command to verify your configuration.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm domain association remote-mep mac-address

configure cfm domain *domain-name* **association** *association_name* **remote-mep** *mepid* **mac-address** *mac_address*

Description

Allows you to modify the MAC address of an existing MEP.

Syntax Description

domain_name	Enter the domain associated with the MA you are configuring.
association_name	Specifies the name of the MA for which you are modifying a remote MEP.
mepid	Specifies the MEP ID of the remote MEP being modified. The range is 1 to 8191.
mac_address	Specifies the MAC address for the remote MEP being modified.

Default

N/A.

Usage Guidelines

Use this command to modify a remote MEP with given MEP ID and MAC address in an existing association. Use the show cfm detail command to verify your configuration.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure cfm domain delete association

configure cfm domain *domain_name* **delete association** *association_name*

Description

Deletes a maintenance association (MA), including all its configured values, from the switch.

Syntax Description

domain_name	Enter the domain associated with the MA you are deleting.
association_name	Enter the name of the MA you are deleting.

Default

N/A.

Usage Guidelines

When you delete an association, or MA, you also remove all its configured values from the switch. These values include all configured MEPs, MIPs, and static remote MEPs.

Example

The following command deletes the MA test, in the domain of brazil, from the switch, along with all its configured MIPs, MEPs, and static remote MEPs:

```
configure cfm domain brazil delete association test
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm domain md-level

configure cfm domain *domain_name* **md-level** *level*

Description

Changes a previously configured MD level for the specified domain.

Syntax Description

domain_name	Enter the name of the domain for which you want to change the MD level.
level	Specifies the new MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level. Thus, a given MD level exists only once one a switch.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command changes the MD level of a previously created domain extreme to 2:

```
configure cfm domain extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure cfm group add rmep

configure cfm group *group_name* **add rmep** *mepid*

Description

This command allows you to create and associate an RMEP to a group.

Syntax Description

mepid	Specifies the MEP ID of the remote MEP being created. The range is 1 to 8191.

Default

N/A.

Usage Guidelines

Use this command to create and associate an RMEP to a group.

Example

```
configure cfm group “eapsCfmGroup” add rmep 2
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure cfm group delete rmep

configure cfm group *group_name* **delete rmep** [*mepid* | **all**]

Description

This command allows you to delete one or all RMEPs from a group.

Syntax Description

mepid	Specifies the MEP ID of the remote MEP being created. The range is 1 to 8191.

Default

N/A.

Usage Guidelines

Use this command to delete one or all RMEPs from a group.

Example

```
configure cfm group “eapsCfmGroup” delete rmep 2
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure cfm segment add domain association

configure cfm segment *segment_name* **add domain** *domain_name* **association** *association_name*

Description

Adds a CFM domain and association to a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
domain_name	Specifies the IEEE 802.1ag maintenance domain.
association_name	Specifies the IEEE 802.1ag association name.

Default

N/A

Usage Guidelines

Use this command to add a CFM domain and an association to a CFM segment. It is used to enable DMM/DMR in the association that is configured in the CFM domain.

Example

The following command adds the domain cfm3 and the association as3 to the segment s2.

```
configure cfm segment s2 add domain cfm3 association as3
```

To delete the domain and/or association, use the command, configure cfm segment delete domain association.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment delete domain association

configure cfm segment *segment_name* **delete domain association**

Description

Deletes a CFM domain from a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to delete a CFM domain from a CFM segment.

Example

The following command deletes the domain and association from the segment s2.

```
configure cfm segment s2 delete domain association
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment dot1p

configure cfm segment *segment_name* **dot1p** *dot1p_priority*

Description

Configures the priority for the segment.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

The default is “6.”

Usage Guidelines

Use this command to configure the dot1p priority that a DMM/DMR frame can get.

Example

The following command configures a dot1p priority of 3 for segment s2.

```
configure cfm segment s2 dot1p 3
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-delay dot1p

configure cfm segment *segment_name* **frame-delay dot1p** *dot1p_priority*

Description

This command configures the class of service for a particular cfm segment. This value is used to fill the dot1p priority bit in the Ethernet header during transmission.

If the optional keyword **frame-delay** is not specified, the same value of Dot1p will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

N/A

Usage Guidelines

Use this command to configure the class of service for a particular cfm segment.

Example

```
configure cfm segment frame-delay dot1p 4
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-delay/frame-loss transmit interval

configure cfm segment *segment_name* {**frame-delay** | **frame-loss**} **transmit-interval** *interval*

Description

Configures the delay between two consecutive DMM/LMM frames.

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
frame-delay	Y.1731 Ethernet frame delay measurement.
frame-loss	Y.1731 Ethernet frame loss measurement.
<interval>	Trasmit interval in seconds, with a range of 1 to 90.

Default

N/A

Usage Guidelines

Configures the delay between two consecutive DMM/LMM frames. The configured delay would be for both continuous and on-demand transmission. This command is optional, and if not configured, the default interval would be 10 seconds.

If the optional keyword frame-delay or frame-loss is not specified, the same value of transmit-interval will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Example

```
configure cfm segment cs2  frame-delay transmit-interval 10
configure cfm segment cs2  frame-loss  transmit-interval 10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-delay window

configure cfm segment *segment_name* **frame-delay window** *window_size*

Description

This command is used to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM. This window size denotes the total number of recent frames for which the threshold values will be measured.

If the optional keyword frame-delay or frame-loss is not specified, the same value of window size will be used for both DMM and LMM. The optional keyword allows configuring values for DMM and LMM.

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
frame-delay	Y.1731 Ethernet frame delay measurement.
window size	Window size for delay measurement; number of frames 1-1800 to be used.

Default

60

Usage Guidelines

Use this command to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM.

Example

```
configure cfm segment cs2  frame-delay window 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-loss dot1p

configure cfm segment *segment_name* **frame-loss dot1p** *dot1p_priority*

Description

This command configures the class of service for a particular cfm segment. This value is used to fill the dot1p priority bit in the Ethernet header during transmission.

If the optional keyword frame-loss is not specified, the same value of Dot1p will be used for both DMM and LMM. The optional keyword allows configuring different values for DMM and LMM.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
dot1p_priority	Priority value that is set in the DMM/DMR. The range is 0 to 7.

Default

N/A

Usage Guidelines

Use this command to configure the class of service for a particular cfm segment.

Example

```
configure cfm segment frame-loss dot1p 4
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-loss window

configure cfm segment *segment_name* **frame-loss window** *window_size*

Description

This command is used to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM. This window size denotes the total number of recent frames for which the threshold values will be measured.

If the optional keyword frame-delay or frame-loss is not specified, the same value of window size will be used for both DMM and LMM. The optional keyword allows configuring values for DMM and LMM.

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.
window size	Window size for loss measurement; number of frames 1-1800 to be used.

Default

1200

Usage Guidelines

Use this command to configure the window size for calculating the alarm/clear threshold values for DMM and Severely Errored Second (SES) threshold for LMM.

Example

```
configure cfm segment cs2  frame-loss  window 900
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-loss mep

configure cfm segment *segment_name* **frame-loss** [**add**|**delete**] **mep** *mep_id*

Description

This command is used to add/delete the local MEP for a given CFM segment.

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.

Default

N/A

Usage Guidelines

The MEP with the given MEP ID should already be created in the system. The domain and association for the segment should be configured before executing this command. If the domain and association are not configured, the command throws an error.

Configuring of local MEP is mandatory to start the Frame Loss measurements.

Example

```
configure cfm segment cs2  add mep 3
configure cfm segment cs2  delete mep 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-loss consecutive

configure cfm segment *segment_name* **frame-loss consecutive** *frames*

Description

This command is used to configure the number of consecutive measurements to be used to determine the availability status of a CFM segment.

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
frame-loss	Y.1731 Ethernet frame loss measurement.

Default

10.

Usage Guidelines

This configuration is optional.

Example

```
configure cfm segment cs2  frame-loss   consecutive 10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment frame-loss ses-threshold

configure cfm segment *segment_name* **frame-loss ses-threshold** *percent*

Description

This command is used to configure the percentage of frames lost in a measurement period for it to be marked as SES (Severely errored second).

Syntax Description

<segment_name>	Alphanumeric string identifying the segment name.
ses	Severely errored second
frame-loss	Y.1731 Ethernet frame loss measurement.

Default

30%.

Usage Guidelines

This configuration is optional.

Example

```
configure cfm segment cs2  frame-loss  ses-threshold .02
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure cfm segment threshold

configure cfm segment *segment_name* [**alarm-threshold** | **clear-threshold**] *value*

Description

Configures the alarm threshold and clear threshold.

Syntax Description

alarm-threshold	Specifies the minimum threshold percentage.
clear-threshold	Specifies the maximum threshold percentage.
value	Specified the threshold percentage in a range of 1-99%.

Default

Alarm threshold is 10% of the total frames received during the current window.

Clear-threshold is 95% of the total frames received during the current window.

Usage Guidelines

Use this command to configure the alarm and clear threshold value for a CFM segment. Upon reaching the alarm threshold, an error message is generated and displayed once, and the state is maintained until the threshold reaches the clear threshold value.

This command is optional, and if not configured the default intervals are used.

Example

The following commands configure an alarm threshold of 15% and a clear-threshold of 90% for segment-first.

```
configure cfm segment segment-first alarm-threshold 15
configure cfm segment segment-first clear-threshold 90
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment timeout

configure cfm segment *segment_name* **timeout** *msec*

Description

Configures the timeout for a segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
msec	Specifies the number of milliseconds. The range is 1 to 65535.

Default

50 milliseconds.

Usage Guidelines

Use this command to configure the timeout value for the reception of a DMR frame. If a DMR frame is not received within this specified time, that frame is considered as an errored frame, and if the number of errored frames reaches the alarm threshold of the current window size, an alarm is generated.

This command is optional, and if not configured, timeout is set to the default.

Example

The following command configures a timeout value of 45 milliseconds for the s4 segment:

```
configure cfm segment s4 timeout 45
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment transmit-interval

configure cfm segment *segment_name* { **frame-delay** | **frame loss** }**transmit-interval** *interval*

Description

Configures the transmission interval of DMM frames.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
frame-delay	Y.1731 Ethernet Frame Delay Measurement.
frame-loss	Y.1731 Ethernet Frame Loss Measurement.
interval	Specifies the transmit interval in seconds. The range is 1 to 90.

Default

Ten seconds.

Usage Guidelines

Use this command to configure the delay between two consecutive DMM frames. The configured delay is for both continuous and on-demand transmission. This command is optional, and if not configured the default interval is used.

Example

The following command configures a transmission interval of 5 seconds for segment s2.

```
configure cfm segment s2 transmit-interval 5
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

configure cfm segment window

configure cfm segment *segment_name* **window** *size*

Description

Configures the measurement window size.

Syntax Description

segment-name	An alpha numeric string identifying the segment name.
size	Specifies the number of frames to be used for delay measurement. The range is 1 to 1800.

Default

60 frames

Usage Guidelines

Use this command to configure the window size to be used for calculating the threshold values. This window size denotes the total number of recent frames for which the threshold values are to be measured.

This is an optional command and if not configured, the lower of either the default value or the total number of frames sent is used.

Note

MEPs with intervals 3 and 10 cannot be created in this domain as the domain name format is of dns type.

Example

The following command configures the measurement window size for the CFM segment segment-first at 55:

```
configure cfm segment segment-first window 55
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

create cfm domain dns md-level

create cfm domain dns *name* **md-level** *level*

Description

Creates a maintenance domain (MD) in the DNS name format and assigns an MD level to that domain.

Syntax Description

name	Assigns the name you want for this domain, using the DNS name format. Enter alphanumeric characters for this format; the maximum is 43 characters.
level	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Note

MEPs with intervals 3 and 10 cannot be created in this domain as the domain name format is of dns type.

Example

The following command creates a domain, using the DNS name format, named extreme and assigns that domain an MD level of 2:

```
create cfm domain dns extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

create cfm domain mac md-level

create cfm domain mac *mac-addr int* **md-level** *level*

Description

Creates a maintenance domain (MD) in the MAC address + 2-octet integer format and assigns an MD level to that domain.

Syntax Description

mac-addr	Enter a MAC address in the format XX:XX:XX:XX:XX:XX to specify part of the domain name.
int	Enter the 2-octet integer you want to append to the MAC address to specify the domain name.
level	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command creates a domain, using the MAC + 2-octet integer format, with the MAC address of 11:22:33:44:55:66 and an integer value of 63; it also assigns that domain an MD level of 2:

```
create cfm domain mac 11:22:33:44:55:66 63 md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

create cfm domain string md-level

create cfm domain string *str_name* **md-level** *level*

Description

Creates a maintenance domain (MD) in the string name format and assigns an MD level to that domain.

Syntax Description

str_name	Enter a character string to specify part of the domain name. The maximum length is 43 characters.
level	Specifies the MD level you are assigning to this domain. Enter a value between 0 and 7.

Default

N/A.

Usage Guidelines

You can have up to 8 domains on a switch, and each one must have a unique MD level.

You assign each domain a maintenance domain (MD) level, which function in a hierarchy for forwarding CFM messages. The levels are from 0 to 7; with the highest number being superior in the hierarchy.

The IEEE standard 801.2ag specifies different levels for different network users, as follows:

- 5 to 7 for end users
- 3 and 4 for Internet service providers (ISPs)
- 0 to 2 for operators (entities carrying the information for the ISPs)

Example

The following command creates a domain, using the string format having a value of extreme; it also assigns that domain an MD level of 2:

```
create cfm domain string extreme md-level 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

create cfm segment destination

create cfm segment *segment_name* **destination** *mac_addr* {**copy** *segment_name_to_copy*}

Description

Creates a CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mac_addr	Specifies the MAC address.
segment_name_to_copy	Specifies the CFM segment whose configuration is to be copied.

Default

N/A.

Usage Guidelines

Use this command to explicitly create a CFM segment where the segment name is a 32-byte long alpha-numeric character string.

Example

The following command creates a CFM segment named segment-new using MAC address 00:11:22:11:33:11 and copying segment-old:

```
create cfm segment segment-new destination 00:11:22:11:33:11 copy segment-old
```

Here, the "copy <existing cfm segment>" is an optional parameter, and if used, the following configurations from the existing CFM segment are copied to the newly created segment:

- DMM transmission interval
- Class of service
- Threshold values
- Measurement window size
- Timeout value

Note

The copy option is not shown in "show config" as it is used only for copying the existing values when creating a segment.

If you later configure any of the above mentioned information in segment-new, the old value(s) which were copied from segment-old, will be overwritten with the new one in segment-new, as is done for any other commands. The same will not be true on the reverse case. If you modify the values of segment-old, the modified value will NOT be propagated to the CFM segments which use segment-old's configurations. In other words, the configurations of segment-old that are at the time of creating segment-new will alone be copied and not any other changes that are made to segment-old later on.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

delete cfm domain

delete cfm domain *domain*

Description

Deletes the specified maintenance domain (MD) from the switch, as well as all configuration setting related to this MD.

Syntax Description

domain	Enter the name of the domain you want to delete.

Default

N/A.

Usage Guidelines

This command deletes all configuration settings related to the domain—for example, all MAs, MIPs, and MEPs—as well as the domain itself.

Example

The following command deletes the domain atlanta (as well as all settings related to this domain):

```
delete cfm domain atlanta
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

delete cfm segment

delete cfm segment [*segment_nam* | **all**]

Description

Deletes one or all CFM segments.

Syntax Description

segment_name	An alpha-numeric string identifying the segment name.
all	Specifies all CFM segments.

Default

N/A.

Usage Guidelines

Use this command to delete one or all CFM segments.

Example

The following command deletes the CFM segment named segment-new:

```
delete cfm segment segment-new
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

disable cfm segment frame-delay measurement

disable cfm segment frame-delay measurement *segment_name*

Description

Stops DMM frame transmission.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

Use this command to stop transmission of DMM frames for a selected CFM segment. This command stops transmission that has been triggered using the command enable cfm segment frame-delay measurement.

This stops the transmission for both continuous and on-demand mode.

Example

The following command stops frame transmission on the CFM segment segment-first:

```
disable cfm frame-delay measurement segment-first
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

disable cfm segment frame-loss measurement mep

This stops the transmission for both continuous and on-demand mode.

disable cfm segment frame-loss measurement *segment_name* **mep** *mep_id*

Description

This command stops the transmission of the LMM frames for a particular cfm segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A.

Usage Guidelines

This below command stops the transmission of the LMM frames for a particular cfm segment. This stops the transmission for both continuous and on-demand mode.

Example

```
disable cfm segment cs2 frame-loss measurement mep 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

disable ethernet oam ports link-fault-management

disable ethernet oam ports [*port_list* | **all**] **link-fault-management**

Description

Disables Ethernet OAM on ports.

Syntax Description

port_list	Specifies the particular ports.
all	Specifies all fiber ports.

Default

Ethernet OAM is disabled on all ports.

Usage Guidelines

Use this command to disable Ethernet OAM on one or more specified ports or on all fiber ports.

When operating as a stack master, the Summit X450e switch can process this command for ports on supported platforms.

Example

The following command disables Ethernet OAM on port 1:

```
disable ethernet oam ports 1 link-fault-management
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the Summit X450a series switch only.

enable/disable bfd vlan

[enable | disable] bfd vlan *vlan_name*

Description

Enables or disables BFD on a VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A

Usage Guidelines

Use this command to enable or disable BFD on a VLAN.

Example

The following command enables the bfd on the VLAN named finance:

```
enable bfd vlan finance
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

enable cfm segment frame-delay measurement

Description

Triggers DMM frame transmission.

Syntax Description

segment-_name	An alpha numeric string identifying the segment name.
continuous	Specifies that frames are to be sent continuously until stopped.
count	Specifies that a number of frames are to be sent.
value	Specifies the number of frames to send. The range is 1 to 4294967295.

Default

N/A

Usage Guidelines

Use this command to trigger DMM frames at the specified transmit interval configured using the command configure cfm segment transmit-interval.

Continuous transmission continues until it is stopped with the command disable cfm segment frame-delay measurement or delete cfm segment.

Note

If you try to trigger the DMM frames for a segment that is not completely configured, the frames are not transmitted for that segment, and an error message is displayed on the console.

Example

The following command triggers continuous frame transmission on the CFM segment segment-first:

```
enable cfm frame-delay measurement segment-first continuous
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

enable cfm segment frame-loss measurement mep

If the user specifies the mode as continuous, the LMM transmission will continue till it is stopped by the user.

enable cfm segment frame-loss measurement *segment_name* **mep** *mep_id* **[continuous | count** *frames*]

Description

This command is used to trigger LMM frames at the configured transmit-interval.

Syntax Description

segment-_name	An alpha numeric string identifying the segment name.
continuous	Specifies that frames are to be sent continuously until stopped.
count	Specifies that a number of frames are to be sent.
value	Specifies the number of frames to send. The range is 1 to 4294967295.

Default

N/A

Usage Guidelines

This command is used to trigger LMM frames at the configured transmit-interval. If the user specifies the mode as continuous, the LMM transmission will continue till it is stopped by the user.

Note

If the user tries to trigger the LMM frames for a segment which is not completely configured, the frames will not be transmitted for that segment, and an error message will be thrown.

Example

```
enable cfm segment cs2 frame-loss measurement mep 3 count 10
enable cfm segment cs2 frame-loss measurement mep 3 continuous
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

enable ethernet oam ports link-fault-management

enable ethernet oam ports [*port_list* | **all**] **link-fault-management**

Description

Enables Ethernet OAM on ports.

Syntax Description

port_list	Specifies the particular ports.
all	Specifies all fiber ports.

Default

Ethernet OAM is disabled on all ports.

Usage Guidelines

Use this command to enable Ethernet OAM on one or more specified ports or on all fiber ports. Unidirectional link fault management is supported only on fiber ports.

Before enabling Ethernet OAM, autonegotiation must be turned off. The link should be a full duplex link.

If some ports cannot be enabled because, for instance, autonegotiation is not turned off, the command is executed for those ports that can be enabled and reasons for the failed ports are displayed.

To display the Ethernet OAM configuration, use the show ethernet oam command.

When operating as a stack master, the Summit X450e switch can process this command for ports on supported platforms.

Example

The following command enables Ethernet OAM on all fiber ports:

```
enable ethernet oam ports all link-fault-management
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the Summit X450a series switches only.

ping mac port

The ping, or loopback message (LBM), goes from the MEP configured on the port toward the given MAC address.

ping mac *mac* **port** *port* {**domain**} *domain_name* {**association**} *association_name*

Description

Allows you to ping on the Layer2 level throughout the specified domain and MA.

Syntax Description

mac	Enter the unique system MAC address on the device you want to reach. Enter this value in the format XX:XX:XX:XX:XX:XX.
port	Enter the port number of the MEP from which you are issuing the ping.
domain	Enter this keyword.
domain_name	Enter the name of the domain from which you are issuing the ping.
association	Enter this keyword.
association_name	Enter the name of the association from which you are issuing the ping.

Default

N/A.

Usage Guidelines

You must have CFM parameters configured prior to issuing a Layer2 ping.

In order to send a Layer2 ping, you must specify the port (MEP), the domain, and the MA from which you are issuing the ping. An UP MEP sends the ping to all ports (except the sending port) on the VLAN that is assigned to the specified MA, and a DOWN MEP sends the ping out from that port from that MA toward the specified MAC address.

All MIPs along the way forward the LBM to the destination. The destination MP responds back to the originator with a loopback reply (LBR).

This command sends out a ping from the MEP configured on the specified port toward the specified MAC address. If you attempt to send a ping message from a port that is not configured as a MEP, the system returns an error message. If the specified MAC address is not present in the Layer2 forwarding table (FDB), the system cannot send the ping (applies to UpMEP, not DownMEP).

Example

The following command sends a Layer2 ping to the unique system MAC address 00:04:96:1F:A4:31 from the previously configured UP MEP (port 2:4) in the speed association in the atlanta domain:

```
ping mac 00:04:96:1F:A4:31 port 2:4 atlanta speed
```

The following is sample output from the Layer2 ping command:

```
BD-12802.48 # ping mac 00:04:96:1e:14:70 port 2:12 "extreme" 100
Send L2 Ping from Down MEP on 2:12, waiting for responses [press Ctrl-C to
```

```
abort].
42 bytes from 00:04:96:1e:14:70, seq=4 time=17 ms
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show bfd

show bfd

Description

Displays information on existing BFD sessions.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to show the status of the current BFD sessions.

The following session states are displayed:

- Init—The state when BFD is establishing the session
- Down—The state when BFD detects that the session is down.
- Admin Down—The state when the user disables BFD on that interface.
- Up—The state when the BFD session is established.

Example

The following command displays information on current BFD sessions:

```
show bfd
```

Following is sample output from this command:

```
Number of  sessions           : 2
Sessions in Init State        : 0
Sessions in Down State        : 0
Sessions in Admin Down State  : 1
Sessions in Up State          : 1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show bfd counters

show bfd counters

Description

Displays the readings of the global BFD counters.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to display global BFD counters.

To clear the counters, use the clear counters bfd command.

Example

The following command displays BFD global counters:

```
show bfd counters
```

Following is sample output from this command:

```
Valid Tx Pkt                    : 177       Valid Rx Pkt                    :
177
Rx Invalid TTL                  : 0         Rx Invalid UDP SrcPort          :
0
Interface Not found             : 0         Rx Invalid Version              :
0
Rx Invalid Length Pkt           : 0         Rx Invalid Multiplier           :
0
Rx Invalid Demand Mode          : 0         Rx Poll & Final set             :
0
Rx Invalid My Discriminator     : 0         Rx Invalid Your Discriminator   :
0
Rx Invalid Auth Length          : 0         Rx session Not Found            :
6
Auth Type Fails                 : 0         Authentication Fails            :
0
Tx Fails                        : 0         Rx Discarded Pkt                :
0
```

Note

The Rx session Not Found counter is incremented when the BFD session corresponding to the received BFD packet is not found. The Rx Discarded Pkt counter is incremented when the neighbor state indicated in the BFD packet is not one of the expected/allowed states.

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show bfd session client

show bfd session client [**mpls | ospf** {**ipv4 | ipv6**} | **static** {**ipv4 | ipv6**}] {**vr** [*vrname* | **all**]}

Description

Displays the BFD session information for a specified client.

Syntax Description

static	Specifies a static route.
ospf	OSPF Protocol.
mpls	Specifies an MPLS client.

ipv4	Displays sessions requested by IPv4 version client, e.g. OSPFv2 (Default)
ipv6	Displays sessions requested by IPv6 version client, e.g. OSPFv3
vr_name	Specifies the name of the virtual router.

Default

IPv4.

Usage Guidelines

Use this command to display session information for a specified client.

Example

The following command displays the BFD sessions for an MPLS client on all VRs:

```
show bfd session client mpls vr all
```

Following is sample output from this command:

```
Neighbor     Interface      Detection   Status
---------     --------       ---------   -----
10.10.10.2    vlan10      3000        Up
================================================
NOTE: All timers in milliseconds.
```

History

This command was first available in ExtremeXOS 12.4.

Support for BFD protected static route was added in ExtremeXOS 12.5.3.

The **ospf** keyword was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show bfd session counters vr all

show bfd session {**ipv4** | **ipv6**} {*ipaddress*} counters {vr [**vrname** | **all**]}

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays sessions in specified VR.

Default

Displays all IPv4 sessions counters by default if IPv4 or IPv6 is not specified.

Usage Guidelines

Use this command to display BFD session counters.

To clear the counters, use the clear counters bfd command.

Example

The following command displays the session counters:

```
show bfd session counters vr all
```

Following is sample output from this command:

```
Neighbor : 10.10.10.1     Interface : vlan10Vr-Name :   bfd_vr10
Valid Rx Pkt          : 87
Total Tx Pkt          : 87
Auth Type Fails       : 0
Authentication Fails : 0
Discarded Pkt         : 0
```

History

This command was first available in ExtremeXOS 12.4.

IPv6 version of this command was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show bfd session detail vr all

show bfd session {**ipv4** | **ipv6**} {*ipaddress* } detail {vr [**vrname** | **all**]}

Description

Displays detailed information about a BFD session.

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays sessions in specified VR.
vrname	Displays sessions in specified VR

Default

Displays all IPv4 sessions by default if ipv4 or ipv6 is not specified.

Usage Guidelines

Use this command to display BFD session information in detail.

Example

The following command displays the BFD session information in detail:

```
show bfd session detail vr all
```

Following is sample output from this command:

```
Neighbor       : 10.10.10.1          Local       : 10.10.10.2
Vr-Name        : bfd_vr10            Interface   : vlan10
Session Type   : Single Hop          State       : Up
Detect Time    : 3000 mc             Age         : 250 ms
Discriminator (local/remote)    : 1 / 1
Demand Mode (local/remote)      : 0 / 0
Poll (local/remote)             : 0 / 0

Last Valid Packet Rx            : 12:27:36.464105
Last Packet Tx                  : 12:27:19.34236
```

History

This command was first available in ExtremeXOS 12.4.

IPv6 version was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show bfd session vr all

show bfd session {**ipv4** | **ipv6**} {*ipaddress* } { vr [**vrname** |**all**] }

Description

Displays general information about a BFD session.

Syntax Description

ipv4	Displays all IPv4 sessions.
ipv6	Displays all IPv6 sessions.
ipaddress	Displays session that has specified address as destination address.
vrname	Displays sessions in specified VR

Default

Displays all IPv4 sessions by default if ipv4 or ipv6 keyword is not specified.

Usage Guidelines

Use this command to display general information about a BFD session.

Example

The following command displays general information about the BFD session:

```
show bfd session vr all
```

Following is sample output from this command:

```
Neighbor        Interface       Clients  Detection  Status       VR
================================================
30.30.30.2      bfdVlan         ----s      0        Down         VR-Default
================================================
Clients Flag: m - MPLS, o - OSPF, s - Static
NOTE: All timers in milliseconds.
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show bfd vlan

show bfd vlan {*vlan_name*}

Description

Displays the BFD settings for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A

Usage Guidelines

Use this command to display the BFD settings on a specified VLAN.

Example

The following command displays the BFD settings for the VLAN vlan10:

```
show bfd vlan vlan10
```

Following is sample output from this command:

```
VLAN                 : vlan10
BFD                  : Enabled
Tx Interval          : 1000
Rx Interval          : 1000
Detection Multiplier : 3
Authentication       : None
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show bfd vlan counters

show bfd vlan {*vlan_name*} **counters**

Description

Displays BFD counters on a specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A

Usage Guidelines

Use this command to display counter readings for a specified VLAN.

Example

The following command displays the counter readings for the VLAN vlan10:

```
show bfd vlan vlan10 counters
```

Following is sample output from this command:

```
VLAN                                                    : vlan10
Valid Rx Pkt              : 144
Total Tx Pkt              : 144
Auth Type Fails           : 0
Authentication Fails      : 0
Discarded Pkt             : 0
Rx session Not Found      : 6
```

Note

The Discarded Pkt counter is incremented when the neighbor state indicated in the BFD packet is not one of the expected/allowed states. The Rx session Not Found counter is incremented when the BFD session corresponding to the received BFD packet is not found.

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show cfm

```
show cfm { <domain_name> { <association_name> {{ports <port_list>
{[intermediate-point | [end-point [up|down]]]}}}
```

Description

Displays the current CFM configuration on the switch.

Syntax Description

domain_name	Enter the name of the domain you want to display.
association_name	Enter the name of the association you want to display.
port_list	Enter the ports in the domain and association you want to display.
up	Enter this to display the UP MEP for the specified MA.

down	Enter this to display the DOWN MEP for the specified MA.
intermediate-point	Enter this to display the MIPs for the specified MA.

Default

N/A.

Usage Guidelines

This command displays the following information:

- Domain names
- MA levels
- Association names
- VLAN names
- Transmit Interval
- UP MEPs
- MEPIDs
- MEP transmit intervals
- MEP State
- DOWN MEPs
- Intermediate points (MIPs)
- Total number of CFM ports on the switch
- Destination MAC Type
- VPLS-based MPs
- Sender ID information
- ISID Intermediate Point

See Supported Instances for CFM for the number of domains, ports, MEPs, MIPs, and associations supported on the switch.

Example

The following command displays the current CFM configuration on the switch:

```
show cfm
```

The following is sample output from this command:

```
* (debug) switch # show cfm

Domain: "sVlanDom5", MD Level: 5

Association: "sVlanAssoc", Destination MAC Type: Multicast, SVLAN "s1" with 2
cfm ports

Transmit Interval: 60000 ms

port 1:5; Intermediate Point ( Dynamic )

port 1:8; Up End Point,  mepid: 1, transmit-interval: 60000 ms (from
association),

MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV: Disabled

ISID Intermediate Point;

Domain: "vplsDom6", MD Level: 6

Association: "vplsAssoc1", Destination MAC Type: Multicast, VLAN "v1" with 1
cfm ports

and VPLS MIP; Transmit Interval: 1000 ms

port 1:3; Up End Point,  mepid: 1, transmit-interval: 1000 ms (from
association),

MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV: Disabled

vpls name: vp101; Intermediate Point; Link Trace Encoding : VPLS-Name:System-
Name

Association: "vplsAssoc2", Destination MAC Type: Multicast, VLAN "v2" with 1
cfm ports

and VPLS MIP; Transmit Interval: 1000 ms

port 1:2; Up End Point,  mepid: 1, transmit-interval: 1000 ms (from
```

```
association),

MEP State: Enabled, CCM Message: Enabled, Send SenderId TLV: Disabled

vpls name: vp100; Intermediate Point; Link Trace Encoding :VPLS-Name:Private-
IP

Total Number of Domain             : 2

Total Number of Association        : 3

Total Number of Up MEP             : 3

Total Number of Down MEP           : 0

Total Number of MIP                : 4

Total Number of Number of CFM port : 8

Total Number of VPLS MIP(Static/Up): 2 / 4
```

History

This command was first available in ExtremeXOS 11.4.

Transmit Interval and MEP State were added in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show cfm detail

show cfm {*domain_name* {*association_name* {**ports** *port_list*} {[**end-point** [**up** | **down**]]}}}} **detail**

Description

Displays the MEP CCM database.

Syntax Description

domain_name	Enter the name of the domain for which you want to display the MEP CCM databases.
association_name	Enter the name of the association for which you want to display the MEP CCM databases.
port_list	Enter the ports in the domain/association for which you want to display the CCM databases.
up	Enter this to display the CCM database on the UP MEP for the specified MA.
down	Enter this to display the CCM database on the DOWN MEP for the specified MA.

Default

N/A.

Usage Guidelines

If you do not specify any parameters or variables, the system displays information on all CCM databases on the switch.

This command displays the following items of the CCM database:

- The name of the domain and association
- Port number
- MP and type
- MAC address of remote end points
- MEP IDs
- Lifetime for CCM messages from each remote end point
- Actual age of CCM messages

Note

The TTL for the CCM messages from the MP you are working on is 3.5 times the transmission interval.

Example

The following command displays the CCM databases on the switch:

```
show cfm detail
```

The following is sample output from this command:

```
BD-12802.48 # sh cfm detail
Domain/       Port    MP  Remote End-Point  Remote End-Point MEP
Life          Flags
Association                MAC Address       IP Address     ID    time    Age
```

```

```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show cfm groups

The information contains group name, grop status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

show cfm groups {*group_name*}

Description

This command displays the details of specified or all groups.

Syntax Description

group_name	Group name, maximum of 31 characters.

Default

N/A

Usage Guidelines

Use this command to display the details of specified or all groups. The information contains group name, grop status, LMEP id, the physical port of the LMEP, RMEP ids, registered clients, domain and association names.

Example

```
X480-48t.1 # sh cfm groups
Group : eapsCfmGrp1     Status : UP
Local MEP       : 11    port  : 41
Remote MEPs     : 10
Client(s)       : eaps
Domain          : MD1
Association     : MD1v2
Group : eapsCfmGrp2     Status : UP
Local MEP       : 12    port  : 31
Remote MEPs     : 13
Client(s)       : eaps
Domain          : MD1
Association     : MD1v2
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

show cfm segment

```
show cfm segment {<segment_name>}
```

Description

Displays information for CFM segments.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to display information for the selected CFM segment.

If a segment name is not specified, the information for all of the segments that are currently configured are displayed.

Example

The following command displays information for an active CFM segment that is configured to transmit with a specific count:

```
show cfm segment s2
CFM Segment Name                : s2
Domain Name                     : pbt-d2
Association                     : pbt-d2-protecting
MD Level                        : 2
Destination MAC                 : 00:04:96:1e:14:70
DMM Transmission                : In Progress
Transmission mode               : Continuous
Frames Transmitted              : 2
Frames Received                 : 2
DMM TX Interval                 : 2secs
DMR RX Timeout                  : 10 msec
Alarm Threshold                 : 10 %
Clear Threshold                 : 95 %
Measurement Window Size         : 60
Class of Service                : 0
Tx Start Time                   : Sun Apr 19 21:18:58 2009
Min Delay                       : Sun Apr 19 21:18:58 2009
Max Delay                       : Sun Apr 19 21:19:00 2009
Last Alarm Time                 : None
Alarm State                     : Not Set
Lost Frames in Current window   : 0
-----------------------------------------------------
Total Configured Segments       : 2
Total Active Segments           : 1
```

The following command displays information for a disabled segment

```
BD-12804.1 # sh cfm seg s2
CFM Segment Name                : s2
Domain Name                     : pbt-d2
Association                     : pbt-d2-protecting
MD Level                        : 2
Destination MAC                 : 00:04:96:1e:14:70
DMM Transmission                : Disabled
Frames Transmitted              : 10
Frames Received                 : 10
DMM TX Interval                 : 2secs
DMR RX Timeout                  : 10 msec
Alarm Threshold                 : 10 %
Clear Threshold                 : 95 %
Measurement Window Size         : 60
Class of Service                : 0
Tx Start Time                   : Sat Apr 18 05:39:54 2000
Min Delay                       : Sat Apr 18 05:40:12 2000
Max Delay                       : Sat Apr 18 05:39:56 2000
Last Alarm Time                 : None
Alarm State                     : Not Set
Lost Frames in Current window   : 1
-----------------------------------------------------
```

```
Total Configured Segments       : 2
Total Active Segments           : 0
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show cfm segment frame-delay

show cfm segment frame-delay {*segment_name*]}

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show cfm segment frame-delay/frame-loss mep id

```
show cfm segment {{<segment_name>} | {frame-delay {<segment_name>}} | {frame-
loss {<segment_name> {mep <mep_id>}}}}
```

Description

This command is used to display the current status and configured values of a cfm segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to display the current status and configured values of a cfm segment.

Note

In this command, the row “pending frames” will be displayed only for on-demand mode of transmission.

A segment is considered as active if any of the MEPs in the segment is enabled for Frame Loss measurement. Active Segment count will be incremented by one only even if there are multiple MEPs enabled for Frame Loss. For example, assume that there are 3 segments created - seg1, seg2 and seg3. Segment "seg1" is enabled for Frame Delay measurement. Segment "seg3" has 10 MEPs added with 4 enabled for Frame Loss measurement, the following are the valid counts. Switch wide "Total Configured Segments" will be 3 and "Total Active Segments" will be 2. For Segments "seg1" and "seg2", "Total Configured MEPs" and "Total Active MEPs" will be 0. For segment "seg3", "Total Configured MEPs" will be 10 and "Total Active MEPs" will be 4.

By default, both the Frame Delay and Frame Loss sections are displayed for all the CFM segments. The user has option to filter out based on Segment Name or Frame Delay / Frame Loss.

The behavior for each of the optional parameters is explained below:

- Show cfm segment: Displays frame-delay and frame-loss information for all the CFM segments.
- Show cfm segment <segment_name>: Displays frame-delay and frame-loss information for the given CFM segment.
- Show cfm segment frame-delay: Displays frame-delay information for all the CFM segments.
- Show cfm segment frame-delay <segment_name>: Displays frame-delay information for the given CFM segment.
- Show cfm segment frame-loss: Displays frame-loss information for all the CFM segments (and all the MEPs under each of the segment).

- Show cfm segment frame-loss <segment_name>: Displays frame-loss information for the given CFM segment (and all the MEPs under the given segment).
- Show cfm segment frame-loss <segment_name> mep <mep_id>: Displays frame-loss information for the given CFM segment - MEP ID combination.

Example

```
Switch#show cfm segment sc-rtp

CFM Segment Name                    : sc-rtp

Domain Name                         : pbt-d2

Association                         : pbt-d2-protecting

MD Level                            : 2

Destination MAC                     : 00:04:96:1e:14:70

Frame Delay:

DMM Transmission                 : In Progress

Transmission mode                : Continuous

Frames Transmitted               : 24

Frames Received                  : 15

DMM Tx Interval                  : 2 secs

DMR Rx Timeout                   : 10 msec

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show cfm segment frame-delay statistics

show cfm segment frame-delay statistics {*segment-name*} {**mep** *mep_id*}

Description

This command displays frame-delay information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.
mep	Maintenance association End Point.
mep_id	MEP-ID. The range is 1-8191.

Default

N/A

Usage Guidelines

Use this command to display the delay for the last received frame, the minimum, maximum and average delay, and the delay variance during the current transmission. When the segment name is not specified, only the segments which have valid statistics alone are displayed. When the segment name is specified, that particular segment's information, although not present, is displayed.

Example

The following command displays the frame delay statistics for the CFM segment:

```
show cfm segment frame-delay statistics
```

Following is sample output for this command:

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show cfm segment frame-loss

show cfm segment frame-loss {*segment_name*}

Description

This command displays frame-loss information for the given CFM segment.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment.

Example

```
sho cfm seg frame-loss

CFM Segment Name                : cs2

Domain Name                     : dom2

Association                     : a2

MD Level                        : 2

Destination MAC                 : 00:04:96:52:a7:64

Frame Loss:

LMM Tx Interval              : 10 secs

SES Threshold                : 1.000000e-02

Consecutive Available Count  : 4

Measurement Window Size      : 1200

Class of Service             : 6

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms

show cfm segment frame-loss statistics

```
show cfm segment frame-loss statistics {<segment-name>}
```

Description

Displays shows frame-loss statistics.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

The below output is an example for displaying the frame-loss stats for the cfm segments. This command shows the recent, minimum, maximum and average near-end and far-end frame loss ratios during the current transmission. The stats for a particular segment will be preserved till the user triggers the next LMM transmission or until it does a clear counter.

Example

The following command displays the frame loss statistics for the CFM segment:

```
LEFT.93 # show cfm segment frame-loss statistics
-----------------------------------------------------------------

```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

show cfm segment mep

show cfm segment {*segment_name*} {**mep** *mep_id* }

Description

This command displays frame-delay information for the given CFM segment – MEP ID combination.

Syntax Description

segment_name	An alpha numeric string identifying the segment name.

Default

N/A

Usage Guidelines

Use this command to display frame-delay information for the given CFM segment – MEP ID combination.

Example

```
Switch#showcfm segment sc-rtp
CFM Segment Name                : sc-rtp

Platform Availability

This command is available on all platforms.

show ethernet oam

```
show ethernet oam {ports [<port_list>} {detail}
```

Description

Displays Ethernet OAM information.

Syntax Description

port_list	Specifies the particular ports.
detail	Specifies that detailed information be displayed.

Default

N/A

Usage Guidelines

Use this command to display basic Ethernet OAM information for specified ports on the switch. If you do not specify the port(s), information for all ports is displayed.

Use the detail option for additional information.

When operating as a stack master, the Summit X450e switch can process this command for ports on supported platforms.

Example

The following command displays basic Ethernet OAM information for all ports:

```
show ethernet oam
```

Following is sample output from the command:

```
X450a-24x.13 # show ethernet oam

================================================

```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the Summit X450a series switch only.

traceroute mac port

```
traceroute mac <mac> {up-end-point} port <port> {domain} <domain_name>
{association} <association_name> {ttl <ttl>}
```

Description

Allows you to send out a Link Trace Message (LTM) for the specified MA from the MEP configured on the port for the specified MAC address to the end of the MA.

Syntax Description

mac	Enter the unique system MAC address on the port configured as a MEP for the specified MA. Enter this value in the format XX:XX:XX:XX:XX:XX.
up-end-point	Use this keyword to force the LTM to be send from an UP MEP if both a DOWN MEP and an UP MEP are configured on the same port.
port	Enter the port number of the MEP from which you are issuing the LTM.
domain	Enter this keyword.
domain_name	Enter the name of the domain from which you are issuing the ping.

association	Enter this keyword.
association_name	Enter the name of the association from which you are issuing the ping.
ttl	Enter this keyword.
ttl	Enter the upper limit of MIPs the LTM can pass prior to reaching its destination.

Default

TTL default value is 64.

Usage Guidelines

Use this command to send an LTM from the MEP on the port for the given MAC address. If no MEP is configured on the port, the system returns an error message.

If both an UP and DOWN MEP are configured on the same port, the system uses the DOWN MEP. If you want to use the UP MEP in this situation, enter the up-end-point keyword. After you issue the command, the system prints out the route the LTM message took.

Each MIP along the route passes the LTM along only in the direction of the path and sends a packet back to the originating MAC notifying that it passed the LTM. If the destination MAC type is configured as unicast on the association to which this MEP belongs to, link trace replies will not be received from any of the MIPs configured on the intermediate switches. If there is a MIP on the switch that originated the trace route, the MIP sends a link trace reply.

Example

The following commands send an LTM:

1. A trace route invoked from a customer device CE1 to another customer device CE3 connected through an MPLS cloud (MTU1 -' PE1 'PE3), where a VPLS MIP is configured to encode a system-name, will have a response as follows:

```
(debug) Switch # traceroute mac 00:04:96:28:02:15 port 1 "extr_cfm5" "extr_ma"

Send out Link Trace Message(LTM), collecting responses [press Ctrl-C to
abort].

```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

unconfigure bfd vlan

unconfigure bfd vlan *vlan_name*

Description

Unconfigures BFD settings from a specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

Use this command to unconfigure BFD settings from a specified VLAN.

Example

The following command unconfigures the BFD settings on the VLAN named vlan1:

```
unconfigure bfd vlan vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

unconfigure cfm domain association end-point transmit-interval

```
unconfigure cfm domain <domain_name> association <association_name> {ports
<port_list> end-point [up | down]} transmit-interval
```

Description

Unconfigures the CCM interval of the association or MEP to the default interval.

Syntax Description

domain_name	Specifies the domain associated with the MA.
association_name	Specifies the name of the MA.
ports_list	Specifies the ports to unconfigure.

up	Enter this variable if you are changing the time interval for sending a CCM on an UP MEP.
down	Enter this variable if you are changing the time interval for sending a CCM on a DOWN MEP.

Default

1000 ms.

Usage Guidelines

Use this command to revert the CCM interval of either the association or the MEP back to the default CCM interval.

Example

The following command changes the interval the UP MEP (previously configured on port 2:4) uses to send CCM messages on the 350 association in the finance domain to the default of 1000 ms:

```
unconfigure cfm domain finance association 350 ports 2:4 end-point up
transmit-interval
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

12 PoE Commands

Power over Ethernet (PoE) is an effective method of supplying 48 VDC power to certain types of powered devices (PDs) through Category 5 or Category 3 twisted pair Ethernet cables. PDs include wireless access points, IP telephones, laptop computers, web cameras, and other devices. With PoE, a single Ethernet cable supplies power and the data connection, reducing costs associated with separate power cabling and supply. PoE for ExtremeXOS includes a method of detection to assure that power is

delivered to devices that meet the IEEE 802.3af specification for PoE, as well as to many legacy devices.

Extreme Networks PoE Devices

Following is a list of the Extreme Networks devices that support PoE and the minimum required software:

- 8500-G48T-e module (with daughter card) for the BlackDiamond 8800 series switch—ExtremeXOS 12.3 and higher
- G48Tc module (with daughter card) for the BlackDiamond 8800 series switch—ExtremeXOS 12.1 and higher
- G48Te2 module (with daughter card) for the BlackDiamond 8800 series switch—ExtremeXOS 12.1 and higher
- 8900-G48T-xl module (with daughter card) for the BlackDiamond 8800 series switch—ExtremeXOS 12.4 and higher
- Summit X150-24p switch—ExtremeXOS 12.1 and higher
- Summit X250e-48p switch—ExtremeXOS 12.0 and higher
- Summit X250e-24p switch—ExtremeXOS 12.0 and higher
- Summit X450e-24p switch—ExtremeXOS 11.5 and higher
- Summit X450e-48p switch—ExtremeXOS 11.6 and higher

Following is a list the Extreme Networks devices that support PoE+ and the minimum required software:

- Summit X460-24p switch—ExtremeXOS 12.5 and later
- Summit X460-48p switch—ExtremeXOS 12.5 and later
- Summit X440-24p switch—ExtremeXOS 15.1.1 and later
- Summit X440-L2-24t—ExtremeXOS 15.2.1 and later
- Summit X440-L2-48t—ExtremeXOS 15.2.1 and later

Summary of PoE Software Features

The Extreme Networks PoE devices support the following PoE software features:

- Configuration and control of the power distribution for PoE at the system, slot, and port levels
- Real-time discovery and classification of 802.3af-compliant PDs and many legacy (non-standard) devices
- Monitor and control of PoE fault conditions
- Support for configuring and monitoring PoE status at the system, slot, and port levels
- LED control for indicating the port's PoE inline power state
- Management of an over-subscribed power budget
- Support for hitless failover in a chassis with two MSMs
- Support for failover in a SummitStack

For more information about configuring and managing PoE, see the ExtremeXOS Concepts Guide.

clear inline-power stats ports

clear inline-power stats ports [**all** | *port_list*]

Description

Clears the inline statistics for the selected port to zero.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Use this command to clear all the information displayed by the show inline-power stats ports <port_list> command.

Example

The following command clears the inline statistics for ports 1-8 on slot 3 on a modular switch:

```
clear inline-power stats ports 3:1-3:8
```

The following command displays cleared inline power configuration information for ports 1-8 in slot 3:

```
show inline-power stats ports 3:1-3:8
```

Following is sample output from this command:

```
STATISTICS COUNTERS
Port  State       Class     Absent  InvSig   Denied    OverCurrent   Short
3:1   delivering  class3         0       0        0              0       0
3:2   delivering  class3         0       0        0              0       0
3:3   searching   class0         0       0        0              0       0
3:4   searching   class0         0       0        0              0       0
3:5   searching   class0         0       0        0              0       0
3:6   searching   class0         0       0        0              0       0
3:7   searching   class0         0       0        0              0       0
3:8   searching   class0         0       0        0              0       0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

configure inline-power budget

configure inline-power budget *num_watts* {**slot** *slot*}

Description

Sets the reserved power on the switch or specified slot to the specified watts.

Syntax Description

num_watts	Specifies the number of watts to reserve for specified switch or slot for inline power. Enter an integer. The minimum value is 37, or 0 if the slot is disabled; the maximum is 768; and the default value is 50.
slot	Specifies a slot. The slot must be configured to hold a PoE module.

Default

50 W.

Usage Guidelines

This command sets the budgeted power reserved for all PDs connected to the switch or specified slot in Watts. On a modular switch, none of the power budget on a specified slot can be used to power other slots or PDs on other slots.

On a modular switch, if you specify a slot that is not configured to hold a PoE module, the system returns the following error message:

```
Error: Slot 2 is not capable of inline-power.
```

You can modify the power budget without disabling the switch or slot.

If the power consumption of the PDs on the switch or a specified slot exceeds this configured power budget, the system disconnects the lowest priority ports. (Refer to configure inline-power priority ports for information on configuring this parameter.)

If you attempt to configure this power budget for a value that the system cannot safely provide, the system returns an error message. To display inline power settings, use the command show inline-power; to display the power for the entire switch, use the command show power budget.

Note

You must disable inline power for the switch or the specified slot using the disable inline-power slot command prior to setting the budget to 0.

To reduce the chances of ports fluctuating between powered and non-powered states, newly inserted PDs are not powered when the actual delivered power for the module is within approximately 19 W of the configured inline power budget for that switch or slot. However, actual aggregate power can be delivered up to the configured inline power budget for the switch or slot (for example, when delivered power from ports increases or when the configured inline power budget for the switch or slot is reduced).

Each Summit family switch has its own PSU and the power budget for each Summit switch is determined by the internal/external PSUs connected to that Summit switch. So, configure inline-power budget <num_watts> {slot <slot>} is not applicable to Summit family switches or SummitStack.

Example

The following command sets the power for slot 4 to 150 W on a modular switch:

```
configure inline-power budget 150 slot 4
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices.

configure inline-power disconnect-precedence

configure inline-power disconnect-precedence [deny-port | lowest-priority]

Description

Configures the disconnect precedence priority for the switch when a new PD is detected and the measured inline power for that switch or specified slot is within 19 W of the switch's or slot's PoE power budget.

Syntax Description

deny-port	Specifies power be denied to PD requesting power, regardless of priority.
lowest-priority	Specifies power be withdrawn from lowest-priority port(s) when next PD requesting power connects.

Default

Deny-port.

Usage Guidelines

You configure this parameter for the switch and for the entire modular switch; you cannot configure this per slot or per port.

If the power supplied to the PDs on a switch or specified slot exceeds the power that was budgeted for that switch or specified slot, the system disconnects power to one or more ports to prevent power overload. Refer to configure inline-power budget for information on configuring and modifying the power budgeted for each switch or specified slot.

You configure the switch to either deny power to the next PD that requests power on that switch or slot, regardless of the priority, or to disconnect those PDs on ports with lower priorities until there is enough power for the new PD. If you select this last argument and you did not configure port priorities or if several ports have the same priority, the switch withdraws power (or disconnects) those ports with the highest port number (s). Refer to configure inline-power priority ports for information on configuring the PoE priority for the ports.

The default value is deny-port. So, if you do not change the default value and the switch's or slot's power is exceeded, the next PD requesting power will not be connected.

When the setting is lowest priority, the switch continues dropping ports with the lowest configured PoE port priorities, or the highest port number in the case of equal PoE port priorities, until there is enough power for the requesting PD.

Example

The following command sets the switch to withdraw power from the lowest-priority port(s):

```
configure inline-power disconnect-precedence lowest-priority
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on:

- The following modules on BlackDiamond 8800 series switches

- 8500-G48T-e module (with daughter card)—ExtremeXOS 12.3 and higher
- G48P module—ExtremeXOS 11.1 and higher
- G48Pe module—ExtremeXOS 11.5 and higher
- G48Tc module (with daughter card)—ExtremeXOS 12.1 and higher
- G48Te2 module (with daughter card)—ExtremeXOS 12.1 and higher
- 8900-G48T-xl module (with daughter card)—ExtremeXOS 12.4.2 and higher

- Summit X250e-48p switches—ExtremeXOS 12.0 and higher
- Summit X450e-48p switches—ExtremeXOS 11.6 and higher
- Summit X460-24p and X460-48p switches—ExtremeXOS 12.5 and higher

configure inline-power label ports

configure inline-power label *string* **ports** *port_list*

Description

Lets you create your own label for a specified PoE port or group of PoE ports.

Syntax Description

string	Specifies a name up to 15 characters in length to identify the specified power port(s).
port_list	Specifies one or more ports or slots and ports.

Default

No label.

Usage Guidelines

Use the show inline-power configuration ports command, as shown in the following example, to display inline power configuration information, including the label (if any) for each port:

```
show inline-power configuration port 3:1-10
```

Following is sample output from this command on a modular switch:

```
Port   Config   Operator Limit   Priority   Label
3:1    Enabled     16000 mW      Low        finance
3:2    Enabled     15000 mW      Low        finance
3:3    Enabled     15000 mW      Low
3:4    Enabled     15000 mW      Low
3:5    Enabled     15000 mW      Low
3:6    Enabled     15000 mW      Low        marketing
3:7    Enabled     15000 mW      Low        marketing
3:8    Enabled     15000 mW      Low        marketing
```

```
3:9    Enabled     15000 mW      Low
3:10   Enabled     15000 mW      Low
```

Example

The following command assigns the name “alpha-test_1” to port 1 on slot 4:

```
config inline-power label alpha-test_1 ports 4:1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

configure inline-power operator-limit ports

configure inline-power operator-limit *milliwatts* **ports** [**all** |*port_list*]

Description

Sets the power limit allowed for PDs connected to the specified ports.

Syntax Description

milliwatts	An integer specifying the maximum allowed power in milliwatts
port_list	Specifies one or more ports or slots and ports.

Default

PoE—15400 mW.

PoE+—30000 mW.

Usage Guidelines

This command sets the power limit that a PD can draw on the specified ports. For PoE, the range is 3000 to 16800mW and the default value is 15400 mW. For PoE+, the range is 3000 to 30000 mW and the default value is 30000 mW.

If the measured power for a specified port exceeds the port’s operator limit, the power is withdrawn from that port and the port moves into a fault state.

If you try to set an operator-limit outside the accepted range, the system returns the following error message:

```
Error: Invalid operator-limit value. Must be in the range of 3000-16800 mW
```

Example

The following command sets the limit for legacy PDs on ports 3 – 6 of slot 5 on a modular switch to 10000 mW:

```
configure inline-power operator-limit 10000 ports 5:3-5:6
```

History

This command was first available in ExtremeXOS 11.1.

PoE+ was added in ExtremeXOS 12.5.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

configure inline-power priority ports

configure inline-power priority [**critical** | **high** | **low**] **ports** *port_list*

Description

Sets the PoE priority on the specified ports.

Syntax Description

critical | high | low	Sets the PoE priority for the specified ports.
port_list	Specifies one or more ports or slots and ports.

Default

Low.

Usage Guidelines

The system allocates power to those ports with the highest priorities first. This command can also be used in conjunction with the configure inline-power disconnect-precedence command. If you configure

the disconnect precedence as lowest priority, then newly detected PDs will be powered if that port has higher priority than the existing powered ports.

If there are multiple ports at the same priority level (either configured or by default) and one of the ports must have power withdrawn because of excessive power demands, those ports with the lower port number are powered first. The higher port numbers have power withdrawn first in the case of equal PoE port priorities.

Example

The following command assigns a critical PoE priority on ports 4 – 6 on slot 3 on a modular switch:

```
configure inline-power priority critical ports 3:4-3:6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on:

- The following modules on BlackDiamond 8800 series switches
  - 8500-G48T-e module (with daughter card)—ExtremeXOS 12.3 and higher
  - G48P module—ExtremeXOS 11.1 and higher
  - G48Pe module—ExtremeXOS 11.5 and higher
  - G48Tc module (with daughter card) —ExtremeXOS 12.1 and higher
  - G48Te2 module (with daughter card)—ExtremeXOS 12.1 and higher
  - 8900-G48T-xl module (with daughter card)—ExtremeXOS 12.4.2 and higher
- Summit X250e-48p switches—ExtremeXOS 12.0 and higher
- Summit X450e-48p switches—ExtremeXOS 11.6 and higher
- Summit X460-24p and X460-48p switches—ExtremeXOS 12.5 and higher

configure inline-power usage-threshold

configure inline-power usage-threshold *threshold*

Description

Sets the inline power usage SNMP event threshold.

Syntax Description

threshold	Specifies the percentage of budgeted power used on any PoE module or stand-alone switch that causes the system to send an SNMP event and create a log message. The range 1 to 99; the default value is 70.

Default

70.

Usage Guidelines

This command sets the threshold for generating an SNMP event and an Event Management System (EMS) message. On a modular switch, this threshold is when the measured power for a PoE module compared to the budgeted power for that slot exceeds a certain value. On stand-alone switches, this threshold applies to the total power available to the entire switch. The configured threshold value initiates the event and message once that percentage of the budgeted power is being used.

On a modular switch, the PoE threshold applies only to the percentage per slot of measured to budgeted power use; it does not apply systemwide.

The system generates an additional SNMP event and EMS message once the power usage falls below the threshold again; once the condition clears.

Example

The following command sets the inline power usage alarm threshold at 75%:

```
configure inline-power usage-threshold 75
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

disable inline-power

disable inline-power

Description

Shuts down PoE power currently provided on all ports on all slots.

Syntax Description

This command has no arguments or variables

Default

Enable.

Usage Guidelines

You can control whether inline power is provided to the system by using the disable inline-power command and the enable inline-power command. Using the disable inline-power command shuts down inline power currently provided on the entire switch or to specified ports and slots. Disabling inline power to a switch, port, or slot immediately removes power to any connected PDs. By default, inline power provided to all ports is enabled.

Note

Disabling inline power using the disable inline-power command does not affect the data traffic traversing the port. And, disabling the port using the disable port command does not affect the inline power supplied to the port.

On modular switches, disabling inline power does not allow PoE power reserved for slots to be allocated to other slots that may be needing more power to become operational. However, when you issue the command disable slot on a slot holding a PoE module, the inline power is also disabled; that slot is totally offline.

Note

Inline power cannot be delivered to connected PDs unless the Summit family switch or BlackDiamond 8800 chassis and module are powered on.

Example

The following command shuts down inline power currently provided to all ports and all slots:

```
disable inline-power
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

disable inline-power legacy

disable inline-power legacy

Description

Disables the non-standard (or capacitance) power detection mechanism for the switch.

Syntax Description

This command has no arguments or variables

Default

Disable.

Usage Guidelines

This command disables the non-standard power-detection mechanism on the switch. Legacy PDs do not conform to the IEEE 802.3af standard but may be detected by the switch through a capacitance measurement.

However, measuring the power through capacitance is used only if this parameter is enabled and after an unsuccessful attempt to discover the PD using the standard resistance measurement method. The default for legacy is disabled.

The reason legacy detection is configurable is that it is possible for a normal (non-PoE) device to have a capacitance signature that causes the device to be detected as a legacy PoE device and have power delivered to it, potentially causing damage to the device.

Example

The following command disables capacitance detection of PDs on the switch:

```
disable inline-power legacy
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on the Summit family switches listed in Extreme Networks PoE Devices.

disable inline-power legacy slot

disable inline-power legacy slot *slot*

Description

Disables the non-standard (or capacitance) power detection mechanism for the specified slot.

Syntax Description

slot	Disables non-standard power detection for specified slot on a modular switch.

Default

Disable.

Usage Guidelines

This command disables the non-standard power-detection mechanism on the switch or specified slot. Legacy PDs do not conform to the IEEE 802.3af standard but may be detected by the switch through a capacitance measurement.

However, measuring the power through capacitance is used only if this parameter is enabled and after an unsuccessful attempt to discover the PD using the standard resistance measurement method. The default for legacy is disabled.

The reason legacy detection is configurable is that it is possible for a normal (non-PoE) device to have a capacitance signature that causes the device to be detected as a legacy PoE device and have power delivered to it, potentially causing damage to the device.

On a stack if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command disables capacitance detection of PDs on slot 3 of a modular switch:

```
disable inline-power legacy slot 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices, and it is available on SummitStack when the stack contains Summit family switches listed in Extreme Networks PoE Devices.

disable inline-power ports

disable inline-power ports [**all** | *port_list*]

Description

Shuts down PoE power currently provided to all ports or to specified ports.

Syntax Description

all	Disables inline power to all ports on the switch.
port_list	Disables inline power to the specified ports.

Default

Enable.

Usage Guidelines

Disabling inline power to ports immediately removes power to any connected PDs. By default, the capability to provide inline power to all ports is enabled.

Note

Disabling inline power using the disable inline-power command does not affect the data traffic traversing the port. And, disabling the port using the disable port command does not affect the inline power supplied to the port.

Disabling inline power to a port providing power to a PD immediately removes power to the PD.

Note

On a modular switch, PoE power removed from ports using this command can be used by other ports on the same module.

Example

The following command shuts down inline power currently provided to ports 4 and 5 on slot 3 on a modular switch:

```
disable inline-power ports 3:4-5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

disable inline-power slot

disable inline-power slot *slot*

Description

Shuts down PoE power currently provided to the specified slot.

Syntax Description

slot	Disables inline power to specified slot.

Default

Enable.

Usage Guidelines

Disabling inline power to a slot immediately removes power to any connected PDs. By default, the capability to provide inline power to a slot is enabled.

Disabling a slot using this command does not change the power budgeted to a specified slot using the configure inline-power budget command; nor can that power be used by PDs connected to any other slot.

Note

You can set the reserved power budget to 0 for a slot if, and only if, you first issue this command.

On a stack if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command removes power to all PDs on slot 3:

```
disable inline-power slot 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

enable inline-power

enable inline-power

Description

Enables PoE power to all ports; on a modular switch, this is all ports on all slots.

Syntax Description

This command has no arguments or variables.

Default

Enable.

Usage Guidelines

You can control whether inline power is provided to the system by using the disable inline-power command and the enable inline-power command. By default, inline power provided to all ports is enabled.

Enabling inline power starts the PoE detection process used to discover, classify, and power remote PDs.

Note

When you are working on a modular switch, if your chassis has an inline power module and there is not enough power to supply a slot, that slot will not be powered on; the slot will not function in data-only mode without enough power for inline power.

Disabling inline power using the disable inline-power command does not affect the data traffic traversing the port. And, disabling the port using the disable port command does not affect the inline power supplied to the port.

However, when you issue the command disable slot for a modular switch on a slot holding a PoE module, the inline power is also disabled; that slot is totally offline.

Note

Inline power cannot be delivered to connected PDs unless the Summit family switch or BlackDiamond 8800 chassis and module are powered on.

Example

The following command enables inline power currently provided to all ports and all slots:

```
enable inline-power
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

enable inline-power legacy

```
enable inline-power legacy
```

Description

Enables the non-standard (or capacitance) power detection mechanism for the switch.

Syntax Description

This command has no arguments or variables

Default

Disable.

Usage Guidelines

This command disables the non-standard power-detection mechanism on the switch. Legacy PDs do not conform to the IEEE 802.3af standard but may be detected by the switch through a capacitance measurement.

However, measuring the power through capacitance is used only if this parameter is enabled and after an unsuccessful attempt to discover the PD using the standard resistance measurement method. The default for legacy is disabled.

Caution

A normal (non-PoE) device may have a capacitance signature that causes the device to be detected as a legacy PoE device (and have power supplied), potentially causing damage to the device.

Example

The following command enables capacitance detection of PDs on the switch:

```
enable inline-power legacy
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on the Summit family switches listed in Extreme Networks PoE Devices.

enable inline-power legacy slot

enable inline-power legacy slot *slot*

Description

Enables non-standard (or capacitance) power detection mechanism for the specified slot on a modular switch.

Syntax Description

slot	Enables non-standard power detection for specified slot on a modular switch.

Default

Disable.

Usage Guidelines

This command enables the non-standard power-detection mechanism on the specified slot. Legacy PDs do not conform to the IEEE 802.3af standard but may be detected by the switch through a capacitance measurement.

However, measuring the power through capacitance is used only if this parameter is enabled and after an unsuccessful attempt to discover the PD using the standard resistance measurement method. The default for legacy is disabled.

Caution

A normal (non-PoE) device may have a capacitance signature that causes the device to be detected as a legacy PoE device (and have power supplied), potentially causing damage to the device.

On stack, if you do not specify a slot number, the command operates on all active nodes. The command operates only on nodes in the active topology.

Example

The following command enables capacitance detection of PDs on slot 3 on a modular switch:

```
enable inline-power legacy slot 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices, and it is available on SummitStack when the stack contains Summit family switches listed in Extreme Networks PoE Devices.

enable inline-power ports

enable inline-power ports [**all** | *port_list*]

Description

Enables PoE power currently provided to all ports or to specified ports.

Syntax Description

all	Enables inline power to all ports on the switch.
port_list	Enables inline power to the specified ports.

Default

Enable.

Usage Guidelines

Disabling inline power to a port immediately removes power to any connected PD. By default, inline power provided to all ports is enabled.

On modular switches, to deliver inline power to ports with connected PDs, you must also reserve power for the slot with the PDs using the configure inline-power budget command. If you do not have enough reserved power for the port, that port moves into a Denied state.

Note

On modular switches, if your chassis has an inline power module and there is not enough power to supply a slot, that slot will not be powered on; the slot will not function in data-only mode without enough power for inline power.

Disabling inline power using the disable inline-power command does not affect the data traffic traversing the port. And, disabling the port using the disable port command does not affect the inline power supplied to the port.

Example

The following command enables inline power to ports 4 and 5 on slot 3 on a modular switch:

```
enable inline-power ports 3:4-5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

enable inline-power slot

enable inline-power slot *slot*

Description

Enables PoE power to the specified slot on modular switches.

Syntax Description

slot	Enables inline power to specified slot.

Default

Enable.

Usage Guidelines

Disabling inline power to a slot immediately removes power to any connected PDs. By default, inline power provided to all slots is enabled.

To deliver inline power to slots, you must reserve power for that slot using the configure inline-power budget command. By default, each PoE module has 50 W of power reserved for inline power.

Note

If your chassis has an inline power module and there is not enough power to supply a slot, that slot will not be powered on; the slot will not function in data-only mode without enough power for inline power.

Disabling inline power using the disable inline-power command does not affect the data traffic traversing the slot. And, disabling the slot using the disable slot command does not affect the inline power supplied to the slot.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command makes inline power available to slot 3:

```
enable inline-power slot 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices, and it is available on SummitStack when the stack contains Summit family switches listed in Extreme Networks PoE Devices.

reset inline-power ports

reset inline-power ports *port_list*

Description

Power cycles the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports for which power is to be reset.

Default

N/A.

Usage Guidelines

This command power cycles the specified ports. Ports are immediately disabled and then re-enabled, allowing remote PDs to be power-cycled.

This command affects only inline power; it does not affect network connectivity for the port(s).

Example

The following command resets power for port 4 on slot 3 on a modular switch:

```
reset inline-power ports 3:4
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

show inline-power

show inline-power

Description

Displays inline power status information for the specified PoE switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output varies depending on the PoE device you are using.

On the Summit X450e-24p and the Summit X450e-48p switch, the output indicates the following inline power status information:

- Inline power status—The status of inline power. The status conditions are:
  - Enabled
  - Disabled
- Power usage threshold
- Disconnect precedence
- Firmware status—The operational status of the slot. The status conditions are:
  - Operational
  - Not operational

  - Disabled
  - Subsystem failure
- Measured power—The amount of power, in watts, that currently being used by the switch.
- Legacy—The status of the legacy mode, which allows detection of many non-standard PDs.

On the Summit X450e-48p switch, the output indicates the following inline power status information:

Note

For additional information on inline power parameters, refer to the show power budget command.

Example

The following command displays inline power status for the switch:

```
show inline-power
```

Following is sample output from this command for the Summit X450e-24p switch:

```
Inline Power System Information
Configured                 : Enabled
Power Usage Threshold      : 70 percent
Firmware Status    Power (Watts)  Power (Watts)   Legacy
Operational         405 W           0 W           Disabled
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the Summit family switches listed in Extreme Networks PoE Devices.

show inline-power configuration ports

show inline-power configuration ports *port_list*

Description

Displays inline power configuration information for the specified ports.

Syntax Description

port_list	Specifies one or more ports.

Default

N/A.

Usage Guidelines

The output displays the following inline power configuration information for the specified ports:

- Config—Indicates whether the port is enabled to provide inline power:
  - Enabled: The port can provide inline power.
  - Disabled: The port cannot provide inline power.
- Operator Limit—Displays the configured limit, in milliwatts, for inline power on the port.
- Label—Displays a text string, if any, associated with the port.

The following also displays for this command on modular PoE devices and the Summit X450e-48p switch:

- Priority—Displays inline power priority of the port, which is used when the disconnect precedence is set to lowest priority:
  - Low
  - High
  - Critical

Example

The following command displays inline power configuration information for ports 1 to 10 in slot 3 on a modular switch:

```
show inline-power configuration port 3:1-10
```

Following is sample output from this command:

```
Port   Config   Operator Limit   Priority   Label
3:1    Enabled     15000 mW      Low
3:2    Enabled     15000 mW      Low
3:3    Enabled     15000 mW      Low
3:4    Enabled     15000 mW      Low
3:5    Enabled     15000 mW      Low
3:6    Enabled     15000 mW      Low
3:7    Enabled     15000 mW      Low
3:8    Enabled     15000 mW      Low
3:9    Enabled     15000 mW      Low
3:10   Enabled     15000 mW      Low
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

show inline-power info ports

show inline-power info {detail} ports *port_list*

Description

Displays inline power information for the specified ports.

Syntax Description

port_list	Specifies one or more ports.

Default

N/A.

Usage Guidelines

Note

Ports in the denied or faulted state periodically display the searching state as the hardware retests the PD state.

You can use this command to generate a summary report or a detailed report.

Summary output displays the following inline power information for the specified ports:

- State—Displays the port power state:
  - Disabled
  - Searching
  - Delivering
  - Faulted
  - Disconnected
  - Other
  - Denied
- PD's power class—Displays the class type of the connected PD:
  - "-----": disabled or searching
  - "class0": class 0 device
  - "class1": class 1 device
  - "class2": class 2 device
  - "class3": class 3 device
  - "class4": class 4 device

- Volts—Displays the measured voltage. A value from 0 to 2 is valid for ports that are in a searching state.
- Curr—Displays the measured current, in milliamperes, drawn by the PD.
- Power—Displays the measured power, in watts, supplied to the PD.
- Fault—Displays the fault value:
  - None
  - UV/OV fault
  - UV/OV spike
  - Over current
  - Overload
  - Undefined
  - Underload
  - HW fault
  - Discovery resistance fail
  - Operator limit violation
  - Disconnect
  - Discovery resistance, A2D failure
  - Classify, A2D failure
  - Sample, A2D failure
  - Device fault, A2D failure
  - Force on error

The detail command lists all inline power information for the selected ports.

Detail output displays the following information:

- Configured Admin State—Displays the port's configured state; Enabled or Disabled.
- Inline Power State—Displays the port power state.
- MIB Detect Status—Displays the port state as reported by SNMP; valid values are as follows:
  - disabled
  - searching
  - delivering
  - fault
  - test
  - otherFault
  - denyLowPriority
- Label—Displays the port's configured label.
- Operator Limit—Displays the port's configured operator limit value.
- PD Class—Displays the class type of connected PD:
- Max Allowed Power—Displays the amount of maximum allowed power for a device of this class.
- Measured Power—Displays the measured power, in watts, supplied to the PD.
- Line Voltage—Displays the measured voltage. A value from 0 to 2 is valid for ports in a searching state.
- Current—Displays the measured current, in milliamperes, drawn by the PD.

- Fault Status—Displays the fault value.
- Detailed Status

The following information displays only with modular PoE devices and the Summit X450e-48p switch:

- Priority—Displays the port's configured PoE priority value, as follows:
  - Critical
  - High
  - Low

Example

The following command displays summary inline power information for ports 1 to 3 on slot 3 on a modular switch:

```
show inline-power info ports 3:1-3
```

Following is sample output from this command:

```
Port  State         Class      Volts   Curr    Power     Fault
(mA)   (Watts)
3:1   delivering    class3     48.3    192      9.300    None
3:2   delivering    class3     48.3    192      9.300    None
3:3   searching     ------      0.0      0      0.0      None
```

The following command displays detail inline power information for port 1 on slot 3:

```
show inline-power info detail port 3:1
```

Following is sample output from this command:

```
Port 3:1
Configured Admin State: enabled
Inline Power State    : delivering
MIB Detect Status     : delivering
Label                 :
Operator Limit        : 16800 milliwatts
PD Class              : class3
Max Allowed Power     : 15.400 W
Measured Power        : 9.400 W
Line Voltage          : 48.3 Volts
Current               : 193 mA
Fault Status          : None
Detailed Status       :
```

The following command displays detail inline power information for port 3 on a Summit X460 switch:

```
show inline-power info detail ports
```

Following is sample output from this command:

```
Port 3
Configured Admin State: enabled
Inline Power State    : delivering
MIB Detect Status     : delivering
Label                 :
Operator Limit        : 30000 milliwatts
PD Class              : class4
Max Allowed Power     : 30.0 W
Measured Power        : 28.400 W
Line Voltage          : 54.3 Volts
Current               : 523 mA
Fault Status          : None
Detailed Status       : Delivering power to IEEE PD
Priority              : low
The Detailed Status field, when available, will be one of the following
strings for PoE+.
Delivering power to IEEE PD
Delivering power to Pre-standard PD
Fault - Maintain Power Signature (MPS) absent
Fault - Short
Fault - Overload
Fault - Thermal shutdown
Fault - Startup failure
Fault - Classification failure
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

show inline-power slot

show inline-power slot *slot*

Description

Displays inline power information for the specified slot on modular switches.

Syntax Description

slot	Specifies the slot.

Default

N/A.

Usage Guidelines

On modular switches, the output indicates the following inline power status for each system:

- Configured power
  - Enabled
  - Disabled
- System power surplus
- Redundant power surplus
- Power usage threshold
- Disconnect precedence
- Legacy—The status of the legacy mode, which allows detection of many non-standard PDs.

On modular switches, the output indicates the following inline power status information for each slot:

- Inline power status—The status of inline power. The status conditions are:
  - Enabled
  - Disabled
- Firmware status—The operational status of the slot. The status conditions are:
  - Operational
  - Not operational
  - Disabled
  - Subsystem failure
  - Card not present
  - Slot disabled
- Budgeted power—The amount of power, in watts, that is available to the slot.
- Measured power—The amount of power, in watts, that currently being used by the slot.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command displays inline power information for slot 3 on a modular switch:

```
show inline-power slot 3
```

Following is sample output from this command on a modular switch:

```
Inline Power System Information
Configured                  : Enabled
System Power Surplus        : 1500 Watts available for budgeting
Redundant Power Surplus     :  465 Watts available for budgeting to maintain N
+1
Power Usage Threshold       : 70 percent (per slot)
Disconnect Precedence       : lowest-priority
Legacy Mode                 : Disabled
Budgeted       Measured
Slot  Inline-Power  Firmware Status    Power (Watts)  Power (Watts)
```

```
3     Enabled       Operational          50 W           9 W
4     Enabled       Card Not Present   ( 50 W)          n/a
7     Enabled       Operational          50 W           0 W
Note: A budget value in parentheses is not allocated from the system power
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices, and it is available on SummitStack when the stack contains Summit family switches listed in Extreme Networks PoE Devices.

show inline-power stats

show inline-power stats

Description

Displays inline power statistics for the specified switch.

Syntax Description

There are no variables or parameters for this command.

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the switch. Unlike the values displayed with the show inline-power stats ports command, these values are current readings; not cumulative counters.

Example

The following command displays inline power statistics information for the Summit X450e-24p switch:

```
show inline-power stats
```

Following is sample output from this command:

```
Inline-Power Slot Statistics
Firmware status               : Operational
Firmware revision             : 292b1
Total ports powered           : 7
Total ports awaiting power    : 17
Total ports faulted           : 0
Total ports disabled          : 0
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on the Summit family switches listed in Extreme Networks PoE Devices.

show inline-power stats ports

show inline-power stats ports *port_list*

Description

Displays inline power statistics for the specified ports.

Syntax Description

port_list	Specifies one or more slots and ports.

Default

N/A.

Usage Guidelines

The output displays the following inline power statistics for the specified ports:

- State—Displays the port power state:
  - Disabled
  - Searching
  - Delivering
  - Faulted
  - Disconnected

    - Other
    - Denied
- PD's power class—Displays the class type of the connected PD:
    - "-----": disabled or searching
    - "class0": class 0 device
    - "class1": class 1 device
    - "class2": class 2 device
    - "class3": class 3 device
    - "class4": class 4 device
- Absent—Displays the number of times the port was disconnected.
- InvSig—Displays the number of times the port had an invalid signature.
- Denied—Displays the number of times the port was denied.
- Over-current—Displays the number of times the port entered an overcurrent state.
- Short—Displays the number of times the port entered undercurrent state.

Example

The following command displays inline power configuration information for ports 1 to 10 in slot 3 on a modular switch:

```
show inline-power stats ports 3:1-10
```

Following is sample output from this command:

```
STATISTICS COUNTERS
Port  State       Class     Absent  InvSig   Denied    OverCurrent   Short
3:1   delivering  class3         0       0        0             18       0
3:2   delivering  class3         0       0        0              0       0
3:3   searching   class0         0       0        0              0       0
3:4   searching   class0         0       0        0              0       0
3:5   searching   class0         0       0        0              0       0
3:6   searching   class0         0       0        0              0       0
3:7   searching   class0         0       0        0              0       0
3:8   searching   class0         0       0        0              0       0
3:9   searching   class0         0       0        0              0       0
3:10  searching   class0         0       0        0              0       0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

show inline-power stats slot

show inline-power stats slot *slot*

Description

Displays inline power statistics for the specified slot on modular switches.

Syntax Description

slot	Specifies the slot.

Default

N/A.

Usage Guidelines

Use this command to produce a report that shows the firmware status and version plus how many ports are currently faulted, powered, and waiting for power for the selected slots. Unlike the values displayed with the show inline-power stats ports command, these values (displayed with the show inline-power stats slot command) are current readings; not cumulative counters.

On a stack, if you do not specify a slot number, the command operates on all active nodes. This command operates only on nodes in the active topology.

Example

The following command displays inline power statistics information for slot 3 on a modular switch:

```
show inline-power stats slot 3
```

Following is sample output from this command:

```
Inline-Power Slot Statistics
Slot:  3
Firmware status               : Operational
Firmware revision             : 292b1
Total ports powered           : 7
Total ports awaiting power    : 41
Total ports faulted           : 0
Total ports disabled          : 0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices, and it is available on SummitStack when the stack contains Summit family switches listed in Extreme Networks PoE Devices.

unconfigure inline-power budget slot

unconfigure inline-power budget slot *slot*

Description

Unconfigures the inline reserved power on modular switches on the specified slot and returns the power budget on that slot to the default value of 50 W.

Syntax Description

slot	Specifies the slot.

Default

50 W.

Usage Guidelines

This command unconfigures any previously configured power budget for the specified slot and resets the budgeted power reserved for all PDs connected to this slot to 50 W. The rest of the previously configured power budget on this slot cannot be used to power other slots or PDs on other slots (unless you explicitly reconfigure the power budget for other slots).

If you specify a slot that does not have a PoE module, the system returns the following error message:

```
Error: Slot 2 is not capable of inline-power.
```

Example

The following command resets the power for slot 4 to 50 W:

```
unconfigure inline-power budget slot 4
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond 8000 series modules listed in Extreme Networks PoE Devices.

unconfigure inline-power disconnect-precedence

```
unconfigure inline-power disconnect-precedence
```

Description

On a modular switch and the Summit X450e-48p switch, unconfigures the disconnect precedence setting and returns the switch to the default disconnect precedence value of deny port.

Syntax Description

This command has no arguments or variables.

Default

Deny-port.

Usage Guidelines

You configure this parameter for the entire switch; you cannot configure this per slot or per port.

Unconfigures the PoE disconnect precedence previously set for the Summit X450e-48p switch or modular switch and returns the disconnect precedence to the default value of deny port. Deny port denies power to the next PD that requests inline power from the slot when the inline power budget for the switch or slot is reached, regardless of the inline power port priority.

Example

The following command resets the switch to the PoE disconnect precedence value, which is deny port:

```
unconfigure inline-power disconnect-precedence
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

unconfigure inline-power operator-limit ports

unconfigure inline-power operator-limit ports [**all** |*port_list*]

Description

Unconfigures the PoE operator limit setting and resets the power limit allowed for PDs connected to the specified ports to the default values.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more slots and ports.

Default

PoE—15400 mW.

PoE+—30000 mW.

Usage Guidelines

This command unconfigures any previously configured operator limit for the specified ports. It resets the maximum power that any PD can draw to 15400 mW for PoE and 30000 mW for PoE+.

Example

The following command resets the limit on ports 3 to 6 of slot 5 on a modular switch to the default value of 15400 mW:

```
unconfigure inline-power operator-limit ports 5:3-5:6
```

History

This command was first available in ExtremeXOS 11.1.

PoE+ was added in ExtremeXOS 12.5.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

unconfigure inline-power priority ports

unconfigure inline-power priority ports [**all** | *port_list*]

Description

On modular switches and the Summit X450e-48p switch, unconfigures the PoE priority on the specified ports, and returns the ports to the default PoE port priority value of low.

Syntax Description

all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Low.

Usage Guidelines

Use this to reset the PoE port priority on specified ports on modular switches and the Summit X450e-48p switch to the default value of low.

If there are multiple ports on the modular switch or the Summit X450e-48p switch at the same priority level (either configured, or by default) and one of the ports must have power withdrawn because of excessive power demands, those ports with the lower port number are powered first. The higher port numbers have power withdrawn first in the case of equal PoE port priorities.

Example

The following command resets the PoE priority on ports 4 – 6 on slot 3 to low:

```
unconfigure inline-power priority ports 3:4-3:6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

unconfigure inline-power usage-threshold

unconfigure inline-power usage-threshold

Description

Unconfigures the inline power usage alarm threshold and returns threshold to the default value of 70%.

Syntax Description

This command has no arguments or variables.

Default

70.

Usage Guidelines

This command unconfigures the PoE usage threshold setting for initiating SNMP event and EMS messages and returns the switch's inline power usage threshold for to 70%. The system initiates an event and message once that percentage of the budgeted power is being used.

On stand-alone switches, this PoE threshold applies to the entire switch. On modular switches, the threshold applies only to the percentage per slot of measured to budgeted power use; the threshold does not apply to the entire switch.

The system generates an additional SNMP event and EMS message once the power usage falls below the threshold again; once the condition clears.

Example

The following command resets the inline power usage alarm threshold to 70%:

```
unconfigure inline-power usage-threshold
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on the PoE devices listed in Extreme Networks PoE Devices.

13 Commands for Status Monitoring and Statistics

Event Management System
Extreme Link Status Monitoring
sFlow Statistics
RMON
clear counters
clear counters xml-notification
clear cpu-monitoring
clear elsm ports auto-restart
clear elsm ports counters
clear log
clear log counters
clear sys-recovery-level
configure elsm ports hellotime
configure elsm ports hold-threshold
configure elsm ports uptimer-threshold
configure log display
configure log filter events
configure log filter events match
configure log target filter
configure log target format
configure log target match
configure log target severity
configure log target syslog
configure log target xml-notification filter
configure ports monitor vlan
configure sflow agent ipaddress
configure sflow collector ipaddress
configure sflow max-cpu-sample-limit
configure sflow poll-interval
configure sflow ports sample-rate
configure sflow sample-rate
configure sys-health-check all level
configure sys-health-check interval
configure sys-recovery-level
configure sys-recovery-level slot

configure sys-recovery-level switch
configure syslog add
configure syslog delete
configure xml-notification target
configure xml-notification target add/delete
create log filter
create log target xml-notification
create xml-notification target url
delete log filter
delete log target xml-notification
delete xml-notification target
disable cli-config-logging
disable cpu-monitoring
disable elsm ports
disable elsm ports auto-restart
disable log display
disable log target
disable log target xml-notification
disable rmon
disable sflow
disable sflow ports
disable sys-health-check
disable syslog
enable cli-config-logging
enable cpu-monitoring
enable elsm ports
enable elsm ports auto-restart
enable log display
enable log target
enable log target xml-notification
enable rmon
enable sflow
enable sflow ports
enable sys-health-check
enable syslog
enable/disable xml-notification
show configuration “xmlc”
show cpu-monitoring
show elsm
show elsm ports
show fans
show log

This chapter describes commands for:

- Configuring and managing the Event Management System/Logging
- Configuring and monitoring system health and statistics
- Enabling, disabling, and configuring the Extreme Link Status Monitoring (ELSM) protocol
- Enabling and disabling the collection of remote monitoring (RMON) statistics on the switch
- Enabling, disabling, and configuring sFlow® statistics collection
- Monitoring CPU utilization

Event Management System

When an event occurs on a switch, the Event Management System (EMS) allows you to send messages generated by these events to a specified log target. You can send messages to the memory buffer, NVRAM, the console display, the current session, to a syslog host, or to the other Management Switch

Fabric Module (MSM) or Management Module (MM). The log messages contain configuration and fault information pertaining to the device. You can format the log messages to contain various items of information, but typically a message consists of:

- Timestamp—The timestamp records when the event occurred.
- Severity level:
  - Critical—A desired switch function is inoperable. The switch may need to be reset.
  - Error—A problem is interfering with normal operation.
  - Warning—An abnormal condition exists that may lead to a function failure.
  - Notice—A normal but significant condition has been detected; the system is functioning as expected.
  - Info—Actions and events that are consistent with expected behavior.
  - Debug-Summary, Debug-Verbose, and Debug-Data—Information that is useful when performing detailed trouble shooting procedures.

  By default, log entries that are assigned a critical, error, or warning level are considered static entries and remain in the NVRAM log target after a switch reboot.
- Component—The component refers to the specific functional area to which the error refers.
- Message—The message contains the log information with text that is specific to the problem.

The switch maintains a configurable number of messages in its internal (memory-buffer) log (1000 by default). You can display a snapshot of the log at any time. In addition to viewing a snapshot of the log, you can configure the system to maintain a running real-time display of log messages on the console display or telnet session. In addition to maintaining an internal log, the switch supports remote logging by way of the UNIX syslog host facility.

Beginning with ExtremeXOS 11.2, EMS supports IPv6 as a parameter for filtering events.

Extreme Link Status Monitoring

ExtremeXOS 11.4 introduces support for the Extreme Link Status Monitoring (ELSM) protocol. ELSM is an Extreme Networks proprietary protocol that monitors network health by detecting CPU and remote link failures. ELSM is available only on Extreme Networks devices and operates on a point-to-point basis. You configure ELSM on the ports that connect to other network devices and on both sides of the peer connection.

ELSM monitors network health by exchanging various hello messages between two ELSM peers. ELSM uses an open-ended protocol, which means that an ELSM-enabled port expects to send and receive hello messages from its peer. The Layer2 connection between ports determines the peer connection. Peers can be either directly connected or separated by one or more hubs. If there is a direct connection between peers, they are considered neighbors.

If ELSM detects a a failure, the ELSM-enabled port responds by blocking traffic on that port. For example, if a peer stops receiving messages from its peer, ELSM brings down that connection. ELSM does this by blocking all incoming and outgoing data traffic on the port and notifying applications that the link is down.

In some situations, a software or hardware fault may prevent the CPU from transmitting or receiving packets, thereby leading to the sudden failure of the CPU. If the CPU is unable to process or send

packets, ELSM isolates the connections to the faulty switch from the rest of the network. If the switch fabric sends packets during a CPU failure, the switch may appear healthy when it is not. For example, if hardware forwarding is active and software forwarding experiences a failure, traffic forwarding may continue. Such failures can trigger control protocols such as Extreme Standby Router Protocol (ESRP) or Ethernet Automatic Protection Switching (EAPS) to select different devices to resume forwarding. This recovery action, combined with the CPU failure, can lead to loops in a Layer2 network.

Configuring ELSM on Extreme Networks devices running ExtremeXOS is backward compatible with Extreme Networks devices running ExtremeWare.

sFlow Statistics

sFlow® is a technology for monitoring traffic in data networks containing switches and routers.

It relies on statistical sampling of packets from high-speed networks, plus periodic gathering of the statistics. A User Datagram Protocol (UDP) datagram format is defined to send the information to an external entity for analysis. sFlow consists of a (Management Information Base) MIB and a specification of the packet format for forwarding information to a remote agent. Details of sFlow specifications can be found in RFC 3176 and at the following website:www.sflow.org

ExtremeXOS allows you to collect sFlow statistics on a per port basis. An agent, residing locally on the switch, sends data to a collector that resides on another machine. You configure the local agent, the address of the remote collector, and the ports of interest for sFlow statistics gathering. You can also modify default values for how frequently on average a sample is taken, how often the data is sent to the collector, and the maximum load allowed on the CPU before throttling the statistics gathering.

Licensing

For information about software licensing, including how to obtain and upgrade your license, see Feature License Requirements.

RMON

RMON is the common abbreviation for the Remote Monitoring Management Information Base (MIB) system defined by the Internet Engineering Task Force (IETF) documents RFC 1757 and RFC2021, which allows you to monitor LANs remotely. Using the RMON capabilities of the switch allows network administrators to improve system efficiency and reduce the load on the network.

The IETF defines nine groups of Ethernet RMON statistics. The switch supports the following four of these groups, as defined in RFC1757:

- Statistics
- History
- Alarms
- Events

The switch also supports the following parameters for configuring the RMON probe and the trap destination table, as defined in RFC2021:

- probeCapabilities
- probeSoftwareRev
- probeHardwareRev
- probeDateTime
- probeResetControl
- trapDestTable

clear counters

clear counters

Description

Clears all switch statistics and port counters, including port packet statistics, bridging statistics, IP statistics, and log event counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You should view the switch statistics and port counters before you clear them. Use the show ports command to view port statistics. Use the show log counters command to show event statistics.

The CLI also provides a number of options that you can specify with the clear counters command. If you specify an option, the switch only clears the statistics for that option. For example, if you want to clear, reset only the STP statistics and counters, use the clear counters stp command. Please refer to the specific chapter in the ExtremeXOS Command Reference Guide for more detailed information about those commands.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period you are monitoring.

Example

The following command clears all switch statistics and port counters:

```
clear counters
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

clear counters xml-notification

clear counters xml-notification {**all** | *target*}

Description

Clears the statistics counters.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to unconfigure and reset all statistics counters.

Example

The following command clears all of the xml-notification statistics counters:

```
clear counters xml-notification all
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamondX8, BlackDiamond 8000 series modules, and Summit Family switches.

clear cpu-monitoring

clear cpu-monitoring {**process** *name*} {**slot** *slotid*}

Description

Clears, resets the CPU utilization history and statistics stored in the switch.

Syntax Description

name	Specifies the name of the process.
slotid	Specifies the slot number of the MSM/MM module: A specifies the MSM installed in slot A. B specifies the MSM installed in slot B. **Note** This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

When you do not specify any keywords, this command clears the CPU utilization history for the entire switch, including processes, and resets the statistics to zero (0). On modular switches, this command also clears the CPU utilization history of the installed MSMs/MMs.

When you specify process, the switch clears and resets the CPU utilization history for the specified process.

Modular Switches Only

When you specify slot, the switch clears and resets the CPU utilization history for the specified MSM/MM.

Example

The following command resets the CPU history and resets the statistics to 0 for the TFTP process running on the MSM/MM installed in slot A of a modular switch:

```
clear cpu-monitoring process tftpd slot A
```

The following command resets the CPU history and resets statistics to 0 for the TFTP process running on a Summit family switch:

```
clear cpu-monitoring process tftpd
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

clear elsm ports auto-restart

clear elsm ports *port_list* **auto-restart**

Description

Clears one or more ELSM-enabled ports that are in the Down-Stuck state.

Syntax Description

port_list	Specifies the ELSM-enabled ports that are permanently in the Down-Stuck state.

Default

N/A.

Usage Guidelines

If you do not have automatic restart enabled, use this command to transition ELSM-enabled ports that are permanently in the Down-Stuck state to the Down state. You can also use the enable elsm ports <port_list> auto-restart command to transition a port from the Down-Stuck state to the Down state.

For information about the ELSM-enabled ports states, see the command show elsm ports show elsm ports.

If automatic restart is enabled (this is the default behavior), automatic restart automatically transitions the ports from the Down-Stuck state to the Down state. For more information, see the command enable elsm ports auto-restart enable elsm ports auto-restart.

Example

The following command transitions the ports from the Down-Stuck state to the Down state:

```
clear elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

clear elsm ports counters

clear elsm {ports *port_list*} **counters**

Description

Clears the statistics gathered by ELSM for the specified ports or for all ports.

Syntax Description

port_list	Specifies the ELSM-enabled ports for which ELSM statistics are being cleared.

Default

N/A.

Usage Guidelines

You should view the ELSM statistics and counters before you clear them. To view ELSM-specific counter information, use the show elsm ports <all | port_list> command. To view summary ELSM information, including the ports configured for ELSM, use the show elsm command.

Use this command to clear only the ELSM-related counters. To clear all of the counters on the switch, including those related to ELSM, use the clear counters command.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counter, you can see fresh statistics for the time period you are monitoring.

Example

The following command clears the statistics gathered by ELSM for slot 2, ports 1-2:

```
clear elsm ports 2:1-2:2 counters
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

clear log

clear log {error-led | static | messages [memory-buffer | nvram]}

Description

Clears the log messages in memory and NVRAM, and clears the ERR LED on the MSM/MM.

Syntax Description

error-led	Clears the ERR LED on the MSM/MM.
static	Specifies that the messages in the NVRAM and memory-buffer targets are cleared, and the ERR LED on the MSM/MM is cleared.
memory-buffer	Clears entries from the memory buffer.
nvram	Clears entries from NVRAM.

Default

N/A.

Usage Guidelines

The switch log tracks configuration and fault information pertaining to the device.

By default, log entries that are sent to the NVRAM remain in the log after a switch reboot. The clear log and clear log messages memory-buffer commands remove entries in the memory buffer target; the clear log static and clear log messages nvram commands remove messages from the NVRAM target. In addition, the clear log static command will also clear the memory buffer target.

On modular switches and SummitStack, there are three ways to clear the ERR LED: clear the log, reboot the switch, or use the clear log error-led command. To clear the ERR LED without rebooting the switch or clearing the log messages, use the clear log error-led command.

Execution of these commands on a backup or standby node results in the clearing of that node's information only. Execution of these commands on the master node results in the clearing of information on all nodes in the system.

Example

The following command clears all log messages, from the NVRAM:

```
clear log static
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

clear log counters

clear log counters [*event-condition* | [**all** | *event-component*] {**severity** *severity* {**only**}}]

Description

Clears the incident counters for events.

Syntax Description

event-condition	Specifies the event condition counter to clear.
all	Specifies that all events counters are to be cleared.
event-component	Specifies that all the event counters associated with a particular component should be cleared.
severity	Specifies the minimum severity level of event counters to clear (if the keyword only is omitted).
only	Specifies that only event counters of the specified severity level are to be cleared.

Default

If severity is not specified, then the event counters of any severity are cleared in the specified component.

Usage Guidelines

This command sets the incident counters to zero for each event specified. To display event counters, use the following command:

```
show log counters
```

See the command show log show log for more information about severity levels.

To get a listing of the event conditions in the system, use the following command:

```
show log events {detail}
```

To get a listing of the components present in the system, use the following command:

```
show log components
```

In a SummitStack, execution of these commands on a backup or standby node results in the clearing of that node's information only. Execution of these commands on the master node results in the clearing of information on all nodes in the system.

Example

The following command clears the event counters for event conditions of severity error or greater in the component BGP:

```
clear log counters "BGP" severity error
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

clear sys-recovery-level

clear sys-recovery-level

Description

If configured and the switch detects a hardware fault and enters the shutdown state, this command clears the shutdown state and renders the switch, I/O, or MSM/MM module(s) operational.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

If you configure the switch or one or more modules to shutdown upon detecting a hardware fault, and the switch or module enters the shutdown state, you must explicitly clear the shutdown state and reset the switch or the affected modules for the switch to become operational.

To clear the shutdown state, use the following command:

```
clear sys-recovery-level
```

The switch prompts you to confirm this action. The following is a sample confirmation message:

```
Are you sure you want to clear sys-recovery-level? (y/n)
```

Enter y to confirm this action and clear the shutdown state. Enter n or press [Enter] to cancel this action.

Modular Switches Only

On a modular switch, after using the clear sys-recovery-level command, you must reset each affected module.

If you configured only a few I/O modules to shutdown, reset each affected I/O module as follows:

Disable the slot using the disable slot <slot> command.

Re-enable the slot using the enable slot <slot> command.

Note

You must complete this procedure for each module that enters the shutdown state.

If you configured all I/O modules or one or more MSMs/MMs to shut down, use the reboot command to reboot the switch and reset all affected modules.

After you clear the shutdown state and reset the affected module, each port is brought offline and then back online before the module and the entire system is operational.

Summit Family Switches Only

On a Summit family switch, after you clear the shutdown state, use the reboot command to bring the switch and ports back online. After you use the reboot command, the switch is operational.

Differences in the Command Line Prompt

When an exclamation point (!) appears in front of the command line prompt , it indicates that one or more slots of a modular switch or the entire stand-alone switch is shut down as a result of your hardware recovery configuration and a switch error.

The following is truncated sample output of the command line prompt for a modular switch:

```
The I/O modules in the following slots are shut down: 1,3
Use the "clear sys-recovery-level" command to restore I/O modules
! BD-8810.1 #
```

The following is sample output for a Summit switch:

```
All switch ports have been shut down.
Use the "clear sys-recovery-level" command to restore all ports.
! SummitX450-24x.1 #
```

Example

The following command clears the shutdown state:

```
clear sys-recovery-level
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

configure elsm ports hellotime

configure elsm ports *port_list* **hellotime** *hello_time*

Description

Configures the ELSM hello timer by specifying the time between consecutive hello messages for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which the ELSM hello timer should be configured.
hello_time	Specifies the time in seconds between consecutive hello messages. Use the same value for the hello interval on peer ports. The default value is 1 second, and the range is 1 to 128 seconds.

Default

The default is 1 second.

Usage Guidelines

ELSM works between two connected ports, and each ELSM instance is based on a single port.

When you enable ELSM on the specified ports, the ports participate in ELSM with their peers and begin exchanging ELSM hello messages.

ELSM uses two types of hello messages to communicate the health of the network to other ELSM ports:

- Hello+ — The ELSM-enabled port receives a hello message from its peer and no problem is detected.
- Hello- — The ELSM-enabled port does not receive a hello message from its peer.

ELSM also has hello transmit states. The hello transmit states display the current state of transmitted ELSM hello messages. For more information about the hello transmit states, see the show elsm ports command.

A high hello timer value can increase the time it takes for the ELSM-enabled port to enter the Up state. The down timer is (2 + hold threshold) * hello timer. Assuming the default value of 2 for the hold threshold, configuring a hello timer of 128 seconds creates a down timer of (2 + 2) 128, or 512 seconds. In this scenario it would take 512 seconds for the port to transition from the Down to the Up state.

If you modify the hello timer on one port, Extreme Networks recommends that you use the same hello timer value on its peer port.

Example

The following command specifies 5 seconds between consecutive ELSM hello messages for slot 2, ports 1-2 on the switch:

```
configure elsm ports 2:1-2:2 hellotime 5
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure elsm ports hold-threshold

configure elsm ports *port_list* **hold-threshold** *hold_threshold*

Description

Configures the number of Hello+ messages required by the specified ELSM-enabled ports to transition from the Down-Wait state to the Up state.

Syntax Description

port_list	Specifies the port or ports for which the ELSM hold threshold should be configured.
hold_threshold	Specifies the number of Hello+ messages required to transition from the Down-Wait state to the Up state. The default is 2 messages, and the range is 1 to 40 messages.

Default

The default is 2 Hello+ messages.

Usage Guidelines

The port begins in the Down state, so the first received Hello+ message transitions the ELSM-enabled port from the Down state to the Down-Wait state. After that transition, the configured hold-threshold value determines the number of Hello+ messages required to transition from Down-Wait state to the Up state.

The ELSM hold threshold determines the number of Hello+ messages the ELSM peer port must receive to transition from the Down-Wait state to the Up state. For example, a threshold of 1 means the ELSM port must receive at least one Hello+ message to transition from the Down-Wait state to the Up state.

After the down timer expires, the port checks the number of Hello+ messages against the hold threshold. If the number of Hello+ messages received is greater than or equal to the configured hold threshold, the ELSM receive port moves from the Down-Wait state to the Up state.

If the number of Hello+ messages received is less than the configured hold threshold, the ELSM receive port moves from the Down-Wait state back to the Down state and begins the process again.

If you modify the hold threshold on one port, Extreme Networks recommends that you use the same hold threshold value on its peer port.

You configure the hold threshold on a per-port basis, not on a per-switch basis.

Example

The following command specifies that two Hello+ messages are required for the ELSM receive ports configured on slot 2, ports 1-2, to transition from the Down-Wait state to the Up state:

```
configure elsm hold-threshold 2 ports 2:1-2:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure elsm ports uptimer-threshold

configure elsm ports *port_list* **uptimer-threshold** *uptimer_threshold*

Description

Configures the number of Hello+ messages required by the specified ELSM-enabled ports to transition from the Up state to the Down state.

Syntax Description

port_list	Specifies the port or ports for which the ELSM hold threshold should be configured.
uptimer_threshold	Specifies the number of Hello+ messages required to transition from the Up-state to the Down state. The default is 6messages, and the range is 3 to 60 messages.

Default

The default is 6 Hello+ messages.

Usage Guidelines

The ELSM up timer begins when the ELSM-enabled port enters the UP state. Each time the port receives a Hello+ message, the timer restarts. Up timer is Uptimer_threshold * hello timer. When the Up timer expires, it transits from UP state to DOWN state.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure log display

configure log display *severity* {**only**}

Description

Configures the real-time log-level message to display.

Syntax Description

severity	Specifies a message severity. Severities include critical, error, warning, notice, info, debug-summary, debug-verbose, and debug-data.
only	Specifies only log messages of the specified severity level.

Default

If not specified, messages of all severities are displayed on the console display.

Usage Guidelines

You must enable the log display before messages are displayed on the log display. Use the enable log display command to enable the log display. This allows you to configure the system to maintain a running real-time display of log messages on the console.

Severity filters the log to display messages with the selected severity or higher (more critical). Severities include critical, error, warning, info, notice, debug-summary, debug-verbose, and debug-data.

You can also control log data to different targets. The command equivalent to configure log display is the following:

```
configure log target console-display severity <severity>
```

To display the current configuration of the log display, use the following command:

```
show log configuration target console-display
```

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Example

The following command configures the system log to maintain a running real-time display of log messages of critical severity or higher:

```
configure log display critical
```

The following command configures the system log to maintain a running real-time display of only log messages of critical severity:

```
configure log display critical only
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure log filter events

configure log filter *name* [**add** | **delete**] {**exclude**} **events** [*event-condition* | [**all** | *event-component*] {**severity** *severity* {**only**}}]

Description

Configures a log filter to add or delete detailed feature messages based on a specified set of events.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

name	Specifies the filter to configure.
add	Add the specified events to the filter
delete	Remove the specified events from the filter
exclude	Events matching the specified events will be excluded
event-condition	Specifies an individual event.
all	Specifies all components and subcomponents.
event-component	Specifies all the events associated with a particular component.
severity	Specifies the minimum severity level of events (if the keyword only is omitted).
only	Specifies only events of the specified severity level.

Default

If the exclude keyword is not used, the events will be included by the filter. If severity is not specified, then the filter will use the component default severity threshold (see the note note: If no severity is specified when delete or exclude is specified, severity all is used when delete or exclude is specified).

Usage Guidelines

This command controls the incidents that pass a filter by adding, or deleting, a specified set of events. If you want to configure a filter to include or exclude incidents based on event parameter values (for example, MAC address or BGP Neighbor) see the command configure log filter events match configure log filter events match.

When the add keyword is used, the specified event name is added to the beginning of the filter item list maintained for this filter. The new filter item either includes the events specified, or if the exclude keyword is present, excludes the events specified.

The delete keyword is used to remove events from the filter item list that were previously added using the add command. All filter items currently in the filter item list that are identical to, or a subset of, the set of events specified in the delete command will be removed.

Event Filtering Process

From a logical standpoint, the filter associated with each enabled log target is examined to determine whether a message should be logged to that particular target. The determination is made for a given filter by comparing the incident with the most recently configured filter item first. If the incident matches this filter item, the incident is either included or excluded, depending on whether the exclude keyword was used. Subsequent filter items on the list are compared if necessary. If the list of filter items has been exhausted with no match, the incident is excluded.

Events, Components, and Subcomponents

As mentioned, a single event can be included or excluded by specifying the event's name. Multiple events can be added or removed by specifying an ExtremeXOS component name plus an optional severity. Some components, such as BGP, contain subcomponents, such as Keepalive, which is specified as BGP.Keepalive. Either components or subcomponents can be specified. The keyword all in place of a component name can be used to indicate all ExtremeXOS components.

Severity Levels

When an individual event name is specified following the events keyword, no severity value is needed since each event has pre-assigned severity. When a component, subcomponent, or the all keyword is specified following the events keyword, a severity value is optional. If no severity is specified, the severity used for each applicable subcomponent is obtained from the pre-assigned severity threshold levels for those subcomponents. For example, if STP were specified as the component, and no severity is specified for the add of an include item, then only messages with severity of error and greater would be passed, since the threshold severity for the STP component is error. If STP.InBPDU were specified as the component, and no severity is specified, then only messages with severity of warning and greater would be passed, since the threshold severity for the STP.InPBDU subcomponent is warning. Use the show log components command to see this information.

The severity keyword all can be used as a convenience when delete or exclude is specified. The use of delete (or exclude) with severity all deletes (or excludes) previously added events of the same component of all severity values.

Note

If no severity is specified when delete or exclude is specified, severity all is used

If the only keyword is present following the severity value, then only the events in the specified component at that exact severity are included. Without the only keyword, events in the specified component at that severity or more urgent are included. For example, using the option severity warning implies critical, error, or warning events, whereas the option severity warning only implies warning events only. Severity all only is not a valid choice.

Any EMS events with severity debug-summary, debug-verbose, or debug-data will not be logged unless debug mode is enabled. See the command enable log debug-mode enable log debug-mode.

Filter Optimization

Each time a configure log filter command is issued for a given filter name, the events specified are compared against the current configuration of the filter to try to logically simplify the configuration.

For example, if the command:

```
configure log filter bgpFilter1 add events bgp.keepalive severity error only
```

were to be followed by the command:

```
configure log filter bgpFilter1 add events bgp severity info
```

the filter item in the first command is automatically deleted since all events in the BGP.Keepalive subcomponent at severity error would be also included as part of the second command, making the first command redundant.

More Information

See the command show log show log for more information about severity levels.

To get a listing of the components present in the system, use the following command:

```
show log components
```

To get a listing of event condition definitions, use the following command:

```
show log events
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {<filter name>}
```

Example

The following command adds all STP component events at severity info to the filter mySTPFilter:

```
configure log filter myStpFilter add events stp severity info
```

The following command adds the STP.OutBPDU subcomponent, at the pre-defined severity level for that component, to the filter myStpFilter:

```
configure log filter myStpFilter add events stp.outbpdu
```

The following command excludes one particular event, STP.InBPDU.Drop, from the filter:

```
configure log filter myStpFilter add exclude events stp.inbpdu.drop
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure log filter events match

configure log filter *name* [**add** | **delete**] {**exclude**} **events** [*event-condition* | [**all** | *event-component*] {**severity** *severity* {**only**}}] [**match** | **strict-match**] *type value*

Description

Configures a log filter to add or delete detailed feature messages based on a specified set of events and match parameter values.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

name	Specifies the filter to configure.
add	Add the specified events to the filter.
delete	Remove the specified events from the filter.
exclude	Events matching the filter will be excluded.
event-condition	Specifies the event condition.
all	Specifies all events.
event-component	Specifies all the events associated with a particular component.
severity	Specifies the minimum severity level of events (if the keyword only is omitted).
only	Specifies only events of the specified severity level.
match	Specifies events whose parameter values match the ***type value*** pair.
strict-match	Specifies events whose parameter values match the ***type value*** pair, and possess all the parameters specified.
type	Specifies the type of parameter to match. For more information about types and values see Types and Values.
value	Specifies the value of the parameter to match. For more information about types and values see Types and Values.

Default

If the exclude keyword is not used, the events will be included by the filter. If severity is not specified, then the filter will use the component default severity threshold (see the note on note: If no severity is specified when delete or exclude is specified, severity all is used when delete or exclude is specified).

Usage Guidelines

This command controls the incidents that pass a filter by adding, or deleting, a specified set of events that match a list of <type> <value> pairs. This command is an extension of the command configure log filter events, and adds the ability to filter incidents based on matching specified event parameter values to the event.

See the configure log filter events command configure log filter events for more information on specifying and using filters, on event conditions and components, and on the details of the filtering process. The discussion here is about the concepts of matching <type> <value> pairs to more narrowly define filters.

Types and Values

Each event in ExtremeXOS is defined with a message format and zero or more parameter types. The show log events command show log events can be used to display event definitions (the event text

and parameter types). The syntax for the parameter types (represented by <type> in the command syntax above) is:

```
[address-family [ipv4-multicast | ipv4-unicast | ipv6-multicast | ipv6-
unicast]
| bgp-neighbor <ip address>
| bgp-routerid <ip address>
| eaps <eaps domain name>
| {destination | source} [ipaddress <ip address> | L4-port | mac-address ]
| esrp <esrp domain name>
| {egress | ingress} [slot <slot number> | ports <port_list>]
| ipaddress <ip address>
| L4-port <L4-port>
| mac-address <mac_address>
| netmask <netmask>
| number <number>
| port <port_list>
| process <process name>
| slot <slotid>
| string <exact string to be matched>
| vlan <vlan name>
| vlan tag <vlan tag>]
```

Note

The slot parameters are available only on modular switches.

Beginning with ExtremeXOS 11.2, you can specify the ipaddress type as IPv4 or IPv6, depending on the IP version. The following examples show how to configure IPv4 addresses and IPv6 addresses:

- IPv4 address

  To configure an IP address, with a mask of 32 assumed, use the following command:

configure log filter myFilter add events all match ipaddress 12.0.0.1

To configure a range of IP addresses with a mask of 8, use the following command:

```
configure log filter myFilter add events all match ipaddress 12.0.0.0/8
```

- IPv6 address

  To configure an IPv6 address, with a mask of 128 assumed, use the following command:

  - configure log filter myFilter add events all match ipaddress 3ffe::1
  - To configure a range of IPv6 addresses with a mask of 16, use the following command:
  - configure log filter myFilter add events all match ipaddress 3ffe::/16

- IPv6 scoped address

  IPv6 scoped addresses consist of an IPv6 address and a VLAN. The following examples identify a link local IPv6 address.

To configure a scoped IPv6 address, with a mask of 128 assumed, use the following command:

Note

In the previous example, if you specify the VLAN name, it must be a full match; wild cards are not allowed.

The <value> depends on the parameter type specified. As an example, an event may contain a physical port number, a source MAC address, and a destination MAC address. To allow only those incidents with a specific source MAC address, use the following in the command:

```
configure log filter myFilter add events aaa.radius.requestInit secerity
notice match source mac-address 00:01:30:23:C1:00
configure log filter myFilter add events bridge severity notice match source
mac-address 00:01:30:23:C1:00
```

The string type is used to match a specific string value of an event parameter, such as a user name. The exact string is matched with the given parameter and no regular expression is supported.

Match Versus Strict-Match

The match and strict-match keywords control the filter behavior for incidents whose event definition does not contain all the parameters specified in a configure log filter events match command. This is best explained with an example. Suppose an event in the XYZ component, named XYZ.event5, contains a physical port number, a source MAC address, but no destination MAC address. If you configure a filter to match a source MAC address and a destination MAC address, XYZ.event5 will match the filter when the source MAC address matches regardless of the destination MAC address, since the event contains no destination MAC address. If you specify the strict-match keyword, then the filter will never match, since XYZ.event5 does not contain the destination MAC address.

In other words, if the match keyword is specified, an incident will pass a filter so long as all parameter values in the incident match those in the match criteria, but all parameter types in the match criteria need not be present in the event definition.

More Information

See the command show log show log for more information about severity levels.

To get a listing of the components present in the system, use the following command:

```
show log components
```

To get a listing of event condition definitions, use the following command:

```
show log events
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {<filter name>}
```

Example

By default, all log targets are associated with the built-in filter, DefaultFilter. Therefore, the most straightforward way to send additional messages to a log target is to modify DefaultFilter. In the following example, the command modifies the built-in filter to allow incidents in the STP component, and all subcomponents of STP, of severity critical, error, warning, notice and info. For any of these events containing a physical port number as a match parameter, limit the incidents to only those occurring on physical ports 3, 4 and 5 on slot 1, and all ports on slot 2:

```
configure log filter DefaultFilter add events stp severity info match ports
1:3-1:5, 2:*
```

If desired, issue the unconfigure log DefaultFilter command to restore the DefaultFilter back to its original configuration.

History

This command was first available in ExtremeXOS 10.1.

New parameter <type> values, including esrp and eaps were added in ExtremeXOS 11.0 and 11.1.

Support for IPv6 addresses was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure log target filter

configure log target [**console** | **memory-buffer** | **primary-msm** | **primary-node** | **backup-msm** | **backup-node** | **nvram** | **session** | **syslog** [**all** | *ipaddress* | *ipPort* {**vr** *vr_name*} [**local0...local7**]]] **filter** *filter-name*{**severity** *severity* {**only**}}

Description

Associates a filter to a target.

In a stack, this command is applicable only to Master and Backup nodes. This command is not applicable to standby nodes.

Syntax Description

target	Specifies the device to send the log entries.
console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
primary-msm	Specifies the primary MSM.  Note This parameter is available only on modular switches.
primary-node	Specifies the primary node in a stack.
backup-msm	Specifies the backup MSM.  Note This parameter is available only on modular switches.
backup-node	Specifies the backup node in a stack.
nvram	Specifies the switch NVRAM.
session	Specifies the current session (including console display).
syslog	Specifies a syslog remote server.
all	Specifies all of the syslog remote servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  Note User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
filter-name	Specifies the filter to associate with the target.
severity	Specifies the minimum severity level to send (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be sent.

Default

If severity is not specified, the severity level for the target is left unchanged. If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command associates the specified filter and severity with the specified target. A filter limits messages sent to a target.

Although each target can be configured with its own filter, by default, all targets are associated with the built-in filter, DefaultFilter. Each target can also be configured with its own severity level. This provides the ability to associate multiple targets with the same filter, while having a configurable severity level for each target.

A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified. By default, the memory buffer, NVRAM, primary MSM/MM, and backup MSM/MM targets are enabled. For other targets, use the command enable log target . The following table describes the default characteristics of each type of target.

Table 17: Default target log characteristics

Target	Enabled	Severity Level
console display	no	info
memory buffer	yes	debug-data
NVRAM	yes	warning
primary MSM/MM	yes	warning
backup MSM/MM	yes	warning
session	no	info
syslog	no	debug-data

The built-in filter, DefaultFilter, and a severity level of info are used for each new telnet session. These values may be overridden on a per-session basis using the configure log target filter command and specify the target as session. Use the following form of the command for per-session configuration changes:

```
configure log target session filter <filtername> {severity <severity> {only}}
```

Configuration changes to the current session target are in effect only for the duration of the session, and are not saved in FLASH memory. The session option can also be used on the console display, if the changes are desired to be temporary. If changes to the console-display are to be permanent (saved to FLASH memory), use the following form of the command:

```
configure log target console filter <filtername> {severity <severity> {only}}
```

Modular Switches Only

If the condition for the backup-msm target is met by a message generated on the primary, the event is sent to the backup MSM/MM. When the backup MSM/MM receives the event, it will see if any of the local targets (nvram, memory, or console) are matched. If so it gets processed. The session and syslog targets are disabled on the backup MSM/MM, as they are handled on the primary. If the condition for the primary-msm target is met by a message generated on the backup, the event is sent to the primary MSM.

Note that the backup-msm target is only active on the primary MSM/MM, and the primary-msm target is only active on the backup MSM/MM.

SummitStack only

The backup-node target is only active on the primary-node, and the primary-node target is active on backup-node and standby-nodes.

Example

The following command sends log messages to the previously syslog host at 10.31.8.25, port 8993, and facility local3, that pass the filter myFilter and are of severity warning and above:

```
configure log target syslog 10.31.8.25:8993 local3 filter myFilter severity
warning
```

The following command sends log messages to the current session, that pass the filter myFilter and are of severity warning and above:

```
configure log target session filter myFilter severity warning
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure log target format

For console display, session, memory buffer, and NVRAM targets

configure log target [**console** | **session** | **memory-buffer** | **nvram**] **format** [**timestamp** [**seconds** | **hundredths** | **none**]] [**date** [**dd-Mmm-yyyy** | **yyyy-mm-dd** | **Mmm-dd** | **mm-dd-yyyy** | **mm/dd/yyyy** | **dd-mm-yyyy** | **none**]] {**event-name** [**component** | **condition** | **none**]} {**process-name**} {**process-slot**} {**severity**} {**source-line**} {**host-name**}

For syslog targets

configure log target syslog [[**all** | [*ipaddress*|*ipPort*]] {**vr** *vr_name*} {*local*}] **format** [**timestamp** [**seconds** | **hundredths** | **none**]] [**date** [**dd-Mmm-yyyy** | **yyyy-mm-dd** | **Mmm-dd** | **mm-dd-yyyy** | **mm/dd/yyyy** | **dd-mm-yyyy** | **none**]] {**event-name**

[component | condition | none]} {process-slot} {severity} {priority} {host-name} {source-line} {tag-id} {tag-name}

Description

Configures the formats of the displayed message, on a per-target basis.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

console	Specifies the console display.
session	Specifies the current session (including console display).
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
syslog	Specifies a syslog target.
all	Specifies all remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
timestamp	Specifies a timestamp formatted to display seconds, hundredths, or none.
date	Specifies a date formatted as specified, or none.
event-name	Specifies how detailed the event description will be. Choose from none, component or condition.
host-name	Specifies whether to include the syslog host name.
priority	Specifies whether to include the priority.
process-name	Specifies whether to include the internal process name.
process-slot	Specifies which slot number the message was generated. **Note** This parameter is available only on modular switches.
severity	Specifies whether to include the severity.
source-line	Specifies whether to include the source file name and line number.
tag-id	Specifies whether to include the tag ID.
tag-name	Specifies whether to include the tag name.

Default

The following defaults apply to console display, memory buffer, NVRAM, and session targets:

- timestamp—hundredths
- date—mm-dd-yyyy
- event-name—condition
- process-name—off
- process-slot—off (modular switches only)
- severity—on
- source-line—off
- host-name—off

The following defaults apply to syslog targets (per RFC 3164):

- timestamp—seconds
- date—mmm-dd
- event-name—none
- process-slot—off (modular switches only)
- severity—on
- priority—on
- host-name—off
- source-line—off
- tag-id—off
- tag-name—on

If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command configures the format of the items that make up log messages. You can choose to include or exclude items and set the format for those items, but you cannot vary the order in which the items are assembled.

When applied to the targets console or session, the format specified is used for the messages sent to the console display or telnet session. Configuration changes to the session target, be it either a telnet or console display target session, are in effect only for the duration of the session, and are not saved in FLASH.

When this command is applied to the target memory-buffer, the format specified is used in subsequent show log and upload log commands. The format configured for the internal memory buffer can be overridden by specifying a format on the show log and upload log commands.

When this command is applied to the target syslog, the format specified is used for the messages sent to the specified syslog host.

Timestamps

Timestamps refer to the time an event occurred, and can be output in either seconds as described in RFC 3164 (for example, “13:42:56”), hundredths of a second (for example, “13:42:56.98”), or suppressed

altogether. To display timestamps as hh:mm:ss, use the seconds keyword, to display as hh:mm:ss.HH, use the hundredths keyword, or to suppress timestamps altogether, use the none keyword. Timestamps are displayed in hundredths by default.

Date

The date an event occurred can be output as described in RFC 3164. Dates are output in different formats, depending on the keyword chosen. The following lists the date keyword options, and how the date “March 26, 2005” would be output:

- Mmm-dd—Mar 26
- mm-dd-yyyy—03/26/2005‘
- dd-mm-yyyy—26-03-2005
- yyyy-mm-dd—2005-03-26
- dd-Mmm-yyyy—26-Mar-2005

Dates are suppressed altogether by specifying none. Dates are displayed as mm-dd-yyyy by default.

Event Names

Event names can be output as the component name only by specifying event-name component and as component name with condition mnemonic by specifying event-name condition, or suppressed by specifying event-name none. The default setting is event-name condition to specify the complete name of the events.

Host Name

The configured SNMP name of the switch can be output as HOSTNAME described in RFC 3164 by specifying host-name. The default setting is off.

Process Name

For providing detailed information to technical support, the (internal) ExtremeXOS task names of the applications detecting the events can be displayed by specifying process-name. The default setting is off.

Process Slot

For providing detailed information to technical support, the slot from which the logged message was generated can be displayed by specifying process-slot. The default setting is off. This is available only on modular switches.

Severity

A four-letter abbreviation of the severity of the event can be output by specifying severity on or suppressed by specifying severity off. The default setting is severity on. The abbreviations are: Crit, Erro, Warn, Noti, Info, Summ, Verb, and Data. These correspond to: Critical, Error, Warning, Notice, Informational, Debug-Summary, Debug-Verbose, and Debug-Data.

Source Line

For providing detailed information to technical support, the application source file names and line numbers detecting the events can be displayed by specifying source-line. The default setting is off. You must enable debug mode using the enable log debug-mode command to view the source line information. For messages generated prior to enabling debug mode, the source line information is not displayed.

Tag ID

The process-id of the (internal) ExtremeXOS process that generated the event that resulted in the log message can be displayed by specifying tag-id. The default setting is off.

Tag Name

The name of the log component to which the generated event belongs can be displayed by specifying tag-name. The default setting is on. The tag name would be the same as the output of event-name component.

Example

In the following example, the switch generates the identical event from the component SNTP, using three different formats.

Using the default format for the session target, an example log message might appear as:

```
05/29/2005 12:15:25.00 <Warn:SNTP.RslvSrvrFail> The SNTP server parameter
value (TheWrongServer.example.com) can not be resolved.
```

If you set the current session format using the following command:

```
configure log target session format timestamp seconds date mm-dd-yyyy event-
name component
```

The same example would appear as:

```
05/29/2005 12:16:36 <Warn:SNTP> The SNTP server parameter value
(TheWrongServer.example.com) can not be resolved.
```

To provide some detailed information to technical support, you set the current session format using the following command:

```
configure log target session format timestamp hundredths date mmm-dd event-
name condition source-line process-name
```

The same example would appear as:

```
May 29 12:17:20.11 SNTP: <Warn:SNTP.RslvSrvrFail> tSntpc: (sntpcLib.c:606)
The SNTP server parameter value (TheWrongServer.example.com) can not be
resolved.
```

History

This command was first available in ExtremeXOS 10.1.

The ipPort and host-name parameters were first introduced in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure log target match

configure log target [**console** | **memory-buffer** | **nvram** | **primary-msm** | **primary-node**| **backup-msm** | **backp-node** | **session** | **syslog** [**all** | *ipaddress* | *ipPort* {**vr** *vr_name*}[**local0 ... local7**]]] **match** [**any** |*match-expression*]

Description

Associates a match expression to a target.

In a stack, this command is applicable only on a Master and Backup nodes. This command is not applicable for standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-msm	Specifies the primary MSM.  Note This parameter is available only on modular switches.
primary-node	Specifies the primary node in a stack.
backup-msm	Specifies the backup MSM.  Note This parameter is available only on modular switches.
backup-node	Specifies the backup-node in a stack.

session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
any	Specifies that any messages will match. This effectively removes a previously configured match expression.
match-expression	Specifies a regular expression. Only messages that match the regular expression will be sent.

Default

By default, targets do not have a match expression. If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command configures the specified target with a match expression. The filter associated with the target is not affected. A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified.

See the command show log show log for a detailed description of simple regular expressions. By default, targets do not have a match expression.

Specifying any instead of match-expression effectively removes a match expression that had been previously configured, causing any message to be sent that has satisfied all of the other requirements.

To see the configuration of a target, use the following command:

```
show log configuration target {console | memory-buffer | nvram |
primary-msm | primary-node | backup-msm | backup-node | session | syslog
{<ipaddress> | <ipPort> | vr <vr_name>} {[local0 ... local7]}}
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {<filter name>}
```

Example

The following command sends log messages to the current session, that pass the current filter and severity level, and contain the string user5:

```
configure log target session match user5
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure log target severity

configure log target [**console** | **memory-buffer** | **nvram** | **primary-msm** | **primayr-node** | **backup-msm** | **backup-node** | **session** | **syslog** [**all** | *ipaddress* | *ipPort* {**vr** *vr_name*} [**local0...local7**]]] {**severity** *severity* {**only**}}

Description

Sets the severity level of messages sent to the target.

In a stack, this command is applicable only to Master and Backup nodes. You cannot run this command on standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-msm	Specifies the primary MSM.  Note This parameter is available only on modular switches.
primary-node	Specifies the primary node in a stack.

backup-msm	Specifies the backup MSM.  Note This parameter is available only on modular switches.
backup-node	Specifies the backup node in a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  Note User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
severity	Specifies the least severe level to send (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be sent.

Default

By default, targets are sent messages of the following severity level and above:

- console display—info
- memory buffer—debug-data
- NVRAM—warning
- session—info
- syslog—debug-data
- primary MSM/MM—warning (modular switches only)
- backup MSM/MM—warning (modular switches only)
- primary node—warning (stack only)
- backup node—warning (stack only)

If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command configures the specified target with a severity level. The filter associated with the target is not affected. A message is sent to a target if the target has been enabled, the message passes the associated filter, the message is at least as severe as the configured severity level, and the message output matches the regular expression specified.

See the command show log show log for a detailed description of severity levels.

To see the current configuration of a target, use the following command:

```
show log configuration target {console | memory-buffer | nvram |
primary-msm | primary-node | backup-msm | backup-node | session | syslog
{<ipaddress> | <ipPort> | vr <vr_name>} {[local0 ... local7]}}
```

To see the current configuration of a filter, use the following command:

```
show log configuration filter {<filter name>}
```

Example

The following command sends log messages to the current session, that pass the current filter at a severity level of info or greater, and contain the string user5:

```
configure log target session severity info
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure log target syslog

configure log target syslog [**all** | *ipaddress* | *ipPort*] {**vr** *vr_name*} {**local0...local7**} **from** *source-ip-address*

Description

Configures the syslog server's IP address for one or all syslog targets.

Syntax Description

syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog server's IP address.

ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
source-ip-address	Specifies the local source IP address to use.

Default

If a virtual router is not specified, the following virtual routers are used:

- ExtremeXOS 10.1—VR-0
- ExtremeXOS 11.0 and later—VR-Mgmt

Usage Guidelines

Use this command to identify and configure the syslog server's IP address. By configuring a source IP address, the syslog server can identify from which switch it received the log message.

Options for configuring the remote syslog server include:

- all—Specifies all of the remote syslog server hosts.
- ipaddress—The IP address of the remote syslog server host.
- ipPort—The UDP port.
- vr_name—The virtual router that can reach the syslog host.
- local0-local7—The syslog facility level for local use.
- from—The local source IP address.

If you do not configure a source IP address for the syslog target, the switch uses the IP address in the configured VR that has the closed route to the destination.

Example

The following command configures the IP address for the specified syslog target named orange:

```
configure log target syslog orange from 10.234.56.78
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure log target xml-notification filter

configure log target xml-notification *xml_target_name* **filter** *filter-name* **{severity** [[*severity*] **{only}]}**

Description

Configures a Web server target with an EMS filter.

Syntax Description

xml_target_name	Specifies the name of the xml notification target.
filter-name	Specifies the name of the EMS filter.
severity	Specifies the least severe level to send (if the keyword only is omitted).

Default

N/A.

Usage Guidelines

Use this command to configure a Web server target with an EMS filter. All EMS filters can be applied.

Example

The following command configures the Web server target test2 with EMS filter filtertest2:

```
configure log target xml-notification test filter filtertest2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit family switches.

configure ports monitor vlan

configure ports [*port_list*|**all**] **monitor vlan** *vlan_name* **{rx-only | tx-only}**

Description

Starts counting VLAN statistics on a port or a group of ports.

Syntax Description

port_list	Specifies one or more ports. May be in the form: 1, 2, 3-5, 2:5, 2:6-2:8.
all	Specifies all ports.
vlan_name	Specifies a VLAN name.
rx-only	Specifies receive statistics. (BlackDiamond X8 series switches, BlackDiamond 8000 series modules and Summit family switches only)
tx-only	Specifies transmit statistics. (BlackDiamond X8 series switches, BlackDiamond 8900 series modules and Summit X460, X480, X650, and X670 switches only)

Default

N/A.

Usage Guidelines

Use this command to configure access to VLAN statistics per port.

The rx-only and tx-only parameters are intended for, but not restricted to, use on ports that support both receive and transmit statistics. Ports on slots that do not support transmit statistics do not require explicit use of the rx-only keyword. In the absence of specifying either rx-only or tx-only, both RX and TX VLAN statistics are gathered if both are supported on the configured port.

When both receive and transmit statistics are configured and resources for either receive or transmit are not available, neither receive nor transmit statistics will be configured.

On BlackDiamond 8000 series modules and Summit family switches, the number of VLANs that can be monitored is dependent on filtering resources on the involved module or switch.

When per-port monitoring is configured, the following commands display the latest statistics directly from the hardware in real time. This information is not logged.

To display VLAN statistics at the port level, use the following command:

```
show ports {<port_list>} vlan statistics {no-refresh}
```

To display VLAN statistics at the VLAN level, use the following command:

```
show vlan {<vlan_name>} statistics {no-refresh}
```

Example

The following command configures per-port monitoring of transmit statistics for a set of ports for the VLAN named finance on a Summit X480 switch:

```
configure ports 2,3 monitor vlan finance tx-only
```

History

This command was first available in ExtremeXOS 12.0.

Support for BlackDiamond 8000 series modules, SummitStack, and Summit family switches was added in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, SummitStack and Summit family switches.

configure sflow agent ipaddress

configure sflow agent {ipaddress} *ipaddress*

Description

Configures the sFlow agent's IP address.

Syntax Description

ipaddress	Specifies the IP address from which sFlow data is sent on the switch.

Default

The default configured IP address is 0.0.0.0, but the effective IP address is the management port IP address.

Usage Guidelines

This command allows you to configure the IP address of the sFlow agent. Typically, you would set this to the IP address used to identify the switch in the network management tools that you use. The agent address is stored in the payload of the sFlow data, and is used by the sFlow collector to identify each agent uniquely. The default configured value is 0.0.0.0, but the switch will use the management port IP address if it exists.

Both the commands unconfigure ports monitor vlan and unconfigure sflow agent will reset the agent parameter to the default.

Example

The following command sets the sFlow agent's IP address to 10.2.0.1:

```
configure sflow agent ipaddress 10.2.0.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sflow collector ipaddress

configure sflow collector {**ipaddress**} *ipaddress* {**port** *udp-port-number*} {**vr** *vr_name*}

Description

Configures the sFlow collector IP address.

Syntax Description

ipaddress	Specifies the IP address to send the sFlow data.
udp-port-number	Specifies the UDP port to send the sFlow data.
vr_name	Specifies from which virtual router to send the sFlow data. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

The following values are the defaults for this command:

- UDP port number—6343
- Virtual router—VR-Mgmt (previously called VR-0).

Usage Guidelines

This command allows you to configure where to send the sFlow data. You must specify an IP address for the sFlow data collector, and you may specify a particular UDP port, if your collector uses a non-standard port. You may also need to specify from which virtual router to send the data.

You can configure up to four sFlow collectors. Each unique IP address/UDP port/virtual router combination identifies a collector.

Both the commands unconfigure ports monitor vlan and unconfigure sflow collector will reset the collector parameters to the default.

Example

The following command specifies that sFlow data should be sent to port 6343 at IP address 192.168.57.1 using the virtual router VR-Mgmt:

```
configure sflow collector ipaddress 192.168.57.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sflow max-cpu-sample-limit

configure sflow max-cpu-sample-limit *rate*

Description

Configures the maximum number of sFlow samples handled by the CPU per second.

Syntax Description

rate	Specifies the maximum sFlow samples per second.

Default

The default value is 2000 samples per second.

Usage Guidelines

This command configures the maximum number of samples sent to the CPU per second. If this rate is exceeded, the internal sFlow CPU throttling mechanism kicks in to limit the load on the CPU.

Every time the limit is reached, the sample rate is halved (the value of number in the configure sflow sample-rate <number> or configure sflow ports <port_list> sample-rate <number> command is doubled) on the slot (modular switch) or ports (stand-alone switch) on which maximum number of packets were received during the last snapshot.

This effectively halves the sampling frequency of all the ports on that slot or stand-alone switch with a sub-sampling factor of 1. The sampling frequency of ports on that slot or stand-alone switch with a sub-sampling factor greater than 1 will not change; the sub-sampling factor is also halved so the that the same rate of samples are sent from that port.

The maximum CPU sample rate is based on the total number of samples received from all the sources. The valid range is 100 to 200000 samples per second.

Example

The following command specifies that the sFlow maximum CPU sample rate should be set to 4000 samples per second:

```
configure sflow max-cpu-sample-limit 4000
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sflow poll-interval

configure sflow poll-interval *seconds*

Description

Configures the sFlow counter polling interval.

Syntax Description

seconds	Specifies the number of seconds between polling each counter. The value can range from 0 to 3600 seconds.

Default

The default polling interval is 20 seconds.

Usage Guidelines

Each sFlow statistics counter is polled at regular intervals, and this data is then sent to the sFlow collector. This command is used to set the polling interval. To manage CPU load, polling for sFlow enabled ports are distributed over the polling interval, so that all ports are not polled at the same

instant. For example, if the polling interval is 20 seconds and there are twenty counters, data is collected successively every second.

Specifying a poll interval of 0 (zero) seconds disables polling.

Example

The following command sets the polling interval to 60 seconds:

```
configure sflow poll-interval 60
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sflow ports sample-rate

configure sflow ports *port_list* **sample-rate** *number*

Description

Configures the sFlow per-port sampling rate.

Syntax Description

port_list	Specifies a list of ports.
number	Specifies the fraction (1/number) of packets to be sampled.

Default

The default number is 8192, unless modified by the configure sflow sample-rate command.

Usage Guidelines

This command configures the sampling rate on a particular set of ports, and overrides the system-wide value set in the configure sflow sample-rate command. The rate is rounded off to the next power of two, so if 400 is specified, the sample rate is configured as 512. The valid range is 256 to 536870912.

Summit Family Switches and BlackDiamond 8000 c-, e-, xl-, and xm-Series Modules, BlackDiamond X8 Series Switches

All ports on the switch or same I/O module are sampled individually.

Example

The following command sets the sample rate for the ports 4:6 to 4:10 to one packet out of every 16384:

```
configure sflow ports 4:6-4:10 sample-rate 16384
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sflow sample-rate

configure sflow sample-rate *number*

Description

Configures the sFlow default sampling rate.

Syntax Description

number	Specifies the fraction (1/number) of packets to be sampled.

Default

The default number is 8192.

Usage Guidelines

This command configures the default sampling rate. This is the rate that newly enabled sFlow ports will have their sample rate set to. Changing this rate will not affect currently enabled sFlow ports. The rate is rounded off to the next power of two, so if 400 is specified, the sample rate is configured as 512. The valid range is 256 to 536870912.

Configuring a lower number for the sample rate means that more samples will be taken, increasing the load on the switch. Do not configure the sample rate to a number lower than the default unless you are sure that the traffic rate on the source is low.

Summit Family Switches, BlackDiamond X8 Series Switches, BlackDiamond 8000 c-, e-, xl-, and xm-Series Modules Only

The minimum rate that these platforms sample is 1 out of every 256 packets. If you configure a rate to be less than 256, the switch automatically rounds up the sample rate to 256.

Example

The following command sets the sample rate to one packet out of every 16384:

```
configure sflow sample-rate 16384
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sys-health-check all level

configure sys-health-check all level [normal | strict]

Description

Configures how the ExtremeXOS software handles faults for BlackDiamond X8 and BlackDiamond 8800 series switches and Summit family switches.

Syntax Description

normal	Upon a fault detection, the switch only sends a message to the syslog. This is the default setting.
strict	Upon a fault detection, the switch takes the action configured by the configure sys-recovery-level slot or the command.

Default

The default setting is normal.

Usage Guidelines

On a BlackDiamond X8 series switch or a BlackDiamond 8800 series switch, use this command in conjunction with the configure sys-recovery-level slot [all | <slot_number>] [none | reset | shutdown] command to implement your network's fault handling strategy.

On the Summit family switches, use this command in conjunction with the configure sys-recovery-level switch [none | reset | shutdown] command to implement your network's fault handling strategy.

ExtremeXOS 11.5 enhances the number of switch-fabric tests completed and monitored by the polling module of the system health checker. Additionally with ExtremeXOS 11.5, you can now configure how ExtremeXOS handles a detected fault based on the configuration of the configure sys-recovery-level slot [all | <slot_number>] [none | reset | shutdown] or the configure sys-recovery-level switch [none | reset | shutdown] command.

If you configure the strict parameter, the switch takes the action configured by the configure sys-recovery-level slot or the configure sys-recovery-level switch command, which can include logging only or restarting, rebooting, or shutting down the suspect device.

To maintain a smooth upgrade for devices running ExtremeXOS 11.4 and earlier, the switch-fabric tests introduced in ExtremeXOS 11.5 are set to only log error messages ('normal mode') by default. However, Extreme Networks recommends that you configure 'strict mode' so the system can attempt to recover by utilizing the action configured in the configure sys-recovery-level slot or the configure sys-recovery-level switch command (which by default is reset).

System Behavior for the BlackDiamond X8 Series Switches and BlackDiamond 8800 Series Switches

Depending on your switch configuration, the following table shows how the BlackDiamond X8 series switches and BlackDiamond 8800 series switches behave when the ExtremeXOS software detects a fault:

Table 18: System behavior for the BlackDiamond X8 and 8800 series switches

Fault Handling Configuration	Module Recovery Configuration	Behavior
configure sys-health-check all level normal	configure sys-recovery-level slot none	The switch sends messages to the syslog.
Same as above.	configure sys-recovery-level slot reset	Same as above.
Same as above.	configure sys-recovery-level slot shutdown	Same as above.
configure sys-health-check all level strict	configure sys-recovery-level slot none	Same as above.
Same as above.	configure sys-recovery-level slot reset	ExtremeXOS reboots the affected switch or module.
Same as above.	configure sys-recovery-level slot shutdown	ExtremeXOS shuts down the affected switch or module.

System Behavior for Summit Family Switches

Depending on your switch configuration, the following table shows how Summit family switches behave when the ExtremeXOS software detects a fault:

Table 19: System behavior for Summit family switches

Fault Handling Configuration	Hardware Recovery Configuration	Behavior
configure sys-health-check all level normal	configure sys-recovery-level switch none	The switch sends messages to the syslog.
Same as above.	configure sys-recovery-level switch reset	Same as above.
Same as above.	configure sys-recovery-level switch shutdown	Same as above.
configure sys-health-check all level strict	configure sys-recovery-level switch none	Same as above.
Same as above.	configure sys-recovery-level switch reset	ExtremeXOS reboots the affected switch.
Same as above.	configure sys-recovery-level switch shutdown	ExtremeXOS shuts down the affected switch.

Displaying the System Health Check Setting

To display the system health check setting, including polling and how ExtremeXOS handles faults on the switch, use the following command:

```
show switch
```

The system health check setting, displayed as SysHealth check, shows the polling setting and how ExtremeXOS handles faults. The polling setting appears as Enabled, and the fault handling setting appears in parenthesis next to the polling setting. In the following truncated output from a BlackDiamond 8810 switch, the system health check setting appears as SysHealth check: Enabled (Normal):

```
SysName:          TechPubs Lab
SysName:          BD-8810Rack3
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1F:A2:60
SysHealth check:  Enabled (Normal)
Recovery Mode:    None
System Watchdog:  Enabled
```

If you use the strict parameter, which configures the switch to take the action configured by the configure sys-recovery-level slot or the configure sys-recovery-level switch command, (Strict) would appear next to Enabled.

Example

On a BlackDiamond 8800 series switch, the following command configures the switch to forward faults to be handled by the level set by the configure sys-recovery-level slot command:

```
configure sys-health-check all level strict
```

On Summit family switches, the following command configures the switch to forward faults to be handled by the level set by the configure sys-recovery-level switch command:

```
configure sys-health-check all level strict
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available only on the BlackDiamond X8 and 8800 series switches, SummitStack, and Summit family switches.

configure sys-health-check interval

configure sys-health-check interval *interval*

Description

Configures the frequency of sending backplane diagnostic packets.

Syntax Description

interval	BlackDiamond X8 and BlackDiamond 8800 series switches—Specifies the frequency of sending backplane diagnostic packets.If backplane diagnostic packets are enabled on a particular slot, the default value for sending diagnostic packets is 5 seconds on that slot.If only polling occurs (this is the system default), the default value is 5seconds. (The polling interval is not a user-configured parameter, and polling always occurs.)

Default

Depending upon your platform, the following defaults apply:

- BlackDiamond X8 and BlackDiamond 8800 series switches:
  - If backplane diagnostics are enabled on a particular slot, the default for sending packets is 5 seconds on that slot.
  - The polling interval is always 5 seconds (this is a not a user-configured parameter).

Usage Guidelines

Use this command with the guidance of Extreme Networks Technical Support personnel.

The system health checker tests I/O modules and the backplane by forwarding backplane diagnostic packets. Use this command to configure the amount of time it takes for the packets to be forwarded and returned to the MSM.

To enable backplane diagnostic packets, use the enable sys-health-check slot <slot> command. With backplane diagnostic packets enabled on a specific slot, the interval option of the configure sys-health-check interval command specifies the frequency of sending backplane diagnostic packets. For example, if you specify an interval of 9, backplane diagnostic packets are sent every 9 seconds on only the enabled slot.

Note

Extreme Networks does not recommend configuring an interval of less than the default interval. Doing this can cause excessive CPU utilization.

BlackDiamond X8 and BlackDiamond 8800 Series Switches Only

By default, the system health checker always polls the control plane health between MSMs/MMs and I/O modules, monitors memory levels on the I/O module, monitors the health of the I/O module, and checks the health of applications and processes running on the I/O module. If the system health checker detects an error, the health checker notifies the MSM/MM.

You must enable the backplane diagnostic packets feature to send backplane diagnostic packets. If you enable this feature, the system health checker tests the data link for a specific I/O module every 5 seconds by default. The MSM/MM sends and receives diagnostic packets from the I/O module to determine the state and connectivity. If you disable backplane diagnostics, the system health checker stops sending backplane diagnostic packets.

Example

The following examples assume that you enabled backplane diagnostic packets on a specific I/O slot.

On the BlackDiamond 8800 series switches, the following command configures the backplane diagnostic packet interval to 8 seconds:

```
configure sys-health-check interval 8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on the BlackDiamond X8 and BlackDiamond 8800 series switches.

configure sys-recovery-level

configure sys-recovery-level [all | none]

Description

Configures a recovery option for instances where a software exception occurs in ExtremeXOS.

Syntax Description

all	Configures ExtremeXOS to log an error into the syslog and reboot the system after any software task exception occurs.
none	Configures the recovery level to none. No action is taken when a software task exception occurs; there is no system reboot, which can cause unexpected switch behavior. **Note** Use this parameter only under the guidance of Extreme Networks Technical Support personnel.

Default

The default setting is all.

Usage Guidelines

If the software fails, the switch automatically reboots or leaves the system in its current state. You must specify one of the following parameters for the system to respond to software failures:

- all—The system will send error messages to the syslog and reboot if any software task exception occurs.

  On modular switches, this command sets the recovery level only for the MSMs/MMs. The MSM/MM should reboot only if there is a software exception that occurs on the MSM/MM. The MSM/MM should not reboot if a software exception occurs on an I/O module.

  To set the recovery level for all slots (MSM/MM and I/O) use the configure sys-recovery-level slot command.
- none—No action is taken when a software task exception occurs. The system does not reboot, which can cause unexpected switch behavior.

  Note
  Use the none parameter only under the guidance of Extreme Networks Technical Support personnel.

The default setting and behavior is all. Extreme Networks strongly recommends using the default setting.

Displaying the System Recovery Setting

To display the software recovery setting on the switch, use the following command:

```
show switch
```

This command displays general switch information, including the software recovery level. The following truncated output from a Summit switch displays the software recovery setting (displayed as Recovery Mode):

```
SysName:          TechPubs Lab
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:20:B4:13
SysHealth check:  Enabled (Normal)
Recovery Mode:    All
System Watchdog:  Enabled
```

Note

All platforms display the software recovery setting as Recovery Mode.

Example

The following command configures a switch to not take an action when any software task exception occurs:

```
configure sys-recovery-level none
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure sys-recovery-level slot

configure sys-recovery-level slot [**all** | *slot_number*] [**none** | **reset** | **shutdown**]

Description

Configures a recovery option for instances where an exception occurs on the specified MSM/MM or I/O module.

Syntax Description

all	Specifies all slots of the MSM/MM and I/O module.
slot_number	Specifies the slot of the MSM/MM or I/O module. A and B—Indicate an MSM/MM1 through 10—Indicate an I/O module
none	Configures the MSM/MM or I/O module to maintain its current state regardless of the detected hardware fault. The offending MSM/MM or I/O module is not reset. For more information about the states of an MSM/MM or I/O module see the show slot command.
reset	Configures the offending MSM/MM or I/O module to reset upon a hardware fault detection. For more detailed information, see the Usage Guidelines described below.
shutdown	Configures the switch to shut down all slots/modules configured for shutdown upon fault detection. On the modules configured for shutdown, all ports in the slot are taken offline in response to the reported errors; however, the MSMs/MMs remain operational for debugging purposes only. ExtremeXOS logs fault, error, system reset, system reboot, and system shutdown messages to the syslog.

Default

The default setting is reset.

Usage Guidelines

Use this command for system auto-recovery upon detection of hardware problems. You can configure the MSMs/MMs or I/O modules installed in a modular switch to take no action, automatically reset, shutdown, or if dual MSMs/MMs are installed, failover to the other MSM/MM, if the switch detects a faulty MSM/MM or I/O module. This enhanced level of recovery detects faults in the ASICs as well as packet buses.

You must specify one of the following parameters for the system to respond to MSM/MM or I/O module failures:

- none—Configures the MSM/MM or I/O module to maintain its current state regardless of the detected fault. The offending MSM/MM or I/O module is not reset. ExtremeXOS logs fault and error messages to the syslog and notifies you that the errors are ignored. This does not guarantee that the module remains operational; however, the switch does not reboot the module.
- reset—Configures the offending MSM/MM or I/O module to reset upon fault detection. ExtremeXOS logs fault, error, system reset, and system reboot messages to the syslog.
- shutdown—Configures the switch to shut down all slots/modules configured for shutdown upon fault detection. On the modules configured for shutdown, all ports in the slot are taken offline in response to the reported errors; however, the MSMs/MMs remain operational for debugging purposes only. You must save the configuration, using the save configuration command, for it to take effect. ExtremeXOS logs fault, error, system reset, system reboot, and system shutdown messages to the syslog.

Depending on your configuration, the switch resets the offending MSM/MM or I/O module if fault detection occurs. An offending MSM/MM is reset any number of times, and the MSM/MM is not permanently taken offline. On the BlackDiamond 8800 series switches, an offending I/O module is reset

a maximum of five times. After the maximum number of resets, the I/O module is permanently taken offline.

Messages Displayed

If you configure the hardware recovery setting to either none (ignore) or shutdown, the switch prompts you to confirm this action. The following is a sample shutdown message:

```
Are you sure you want to shutdown on errors? (y/n)
```

Enter y to confirm this action and configure the hardware recovery level. Enter n or press [Enter] to cancel this action.

Taking Ports Offline

Beginning with ExtremeXOS 11.5, you can configure the switch to shut down one or more modules upon fault detection by specifying the shutdown option. If you configure one or more slots to shut down and the switch detects a hardware fault, all ports in all of the configured shut down slots are taken offline in response to the reported errors. (MSMs are available for debugging purposes only.)

The affected module remains in the shutdown state across additional reboots or power cycles until you explicitly clear the shutdown state. If a module enters the shutdown state, the module actually reboots and the show slot command displays the state of the slot as Initialized; however, the ports are shut down and taken offline. For more information about clearing the shutdown state, see the clear sys-recovery-level command.

Module Recovery Actions—BlackDiamond 8800 Series Switches Only

The following table describes the actions module recovery takes based on your module recovery setting. For example, if you configure a module recovery setting of reset for an I/O module, the module is reset a maximum of five times before it is taken permanently offline.

From left to right, the columns display the following information:

- Module Recovery Setting—This is the parameter used by the configure sys-recovery-level slot command to distinguish the module recovery behavior.
- Hardware—This indicates the hardware that you may have in your switch.
- Action Taken—This describes the action the hardware takes based on the module recovery setting.

Table 20: Module Recovery Actions for the BlackDiamond X8 Series Switches and BlackDiamond 8800 Series Switches

Module Recovery Setting	Hardware	Action Taken
none		
	Single MSM	The MSM remains powered on in its current state. This does not guarantee that the module remains operational; however, the switch does not reboot the module.

Table 20: Module Recovery Actions for the BlackDiamond X8 Series Switches and BlackDiamond 8800 Series Switches (continued)

Module Recovery Setting	Hardware	Action Taken
	Dual MSM	The MSM remains powered on in its current state. This does not guarantee that the module remains operational; however, the switch does not reboot the module.
	I/O Module	The I/O module remains powered on in its current state. The switch sends error messages to the log and notifies you that the errors are ignored. This does not guarantee that the module remains operational; however, the switch does not reboot the module.
reset		
	Single MSM	Resets the MSM.
	Dual MSM	Resets the primary MSM and fails over to the backup MSM.
	I/O Module	Resets the I/O module a maximum of five times. After the fifth time, the I/O module is permanently taken offline.
shutdown		
	Single MSM	The MSM is available for debugging purposes only (the I/O ports also go down); however, you must clear the shutdown state using the clear sys-recovery-level command for the MSM to become operational. After you clear the shutdown state, you must reboot the switch. For more information see the clear sys-recovery-level command.
	Dual MSM	The MSM is available for debugging purposes only (the I/O ports also go down); however, you must clear the shutdown state using the clear sys-recovery-level command for the MSM to become operational. After you clear the shutdown state, you must reboot the switch. For more information see the clear sys-recovery-level command.
	I/O Module	Reboots the I/O module. When the module comes up, the ports remain inactive because you must clear the shutdown state using the clear sys-recovery-level command for the I/O module to become operational. After you clear the shutdown state, you must reset each affected I/O module or reboot the switch. For more information see the clear sys-recovery-level command.

Displaying the Module Recovery Setting

To display the module recovery setting, use the following command:

```
show slot
```

Beginning with ExtremeXOS 11.5, the show slot output has been modified to include the shutdown configuration. If you configure the module recovery setting to shutdown, the output displays an “E” flag

that indicates any errors detected on the slot disables all ports on the slot. The “E” flag appears only if you configure the module recovery setting to shutdown.

Note

If you configure one or more slots for shut down and the switch detects a hardware fault on one of those slots, all of the configured slots enter the shutdown state and remain in that state until explicitly cleared.

If you configure the module recovery setting to none, the output displays an “e” flag that indicates no corrective actions will occur for the specified MSM/MM or I/O module. The “e” flag appears only if you configure the module recovery setting to none.

The following sample output displays the module recovery action. In this example, notice the flags identified for slot 2:

```
Slots    Type                 Configured           State       Ports  Flags
--------------------------------------------------------------------------------
-
Slot-1   8900-G96T-c          8900-G96T-c          Operational   96   MB
Slot-2   8900-10G24X-c        8900-10G24X-c        Operational   24   MB   E
Slot-3   8900-40G6X-xm        8900-40G6X-xm        Operational   24   MB
Slot-4   G48Xc                G48Xc                Operational   48   MB
Slot-5   G8Xc                 G8Xc                 Operational    8   MB
Slot-6                                            Empty          0
Slot-7   G48Te2(PoE)          G48Te2(PoE)          Operational   48   MB
Slot-8   G48Tc                G48Tc                Operational   48   MB
Slot-9   10G4Xc               10G4Xc               Operational    4   MB
Slot-10                                           Empty          0
MSM-A    8900-MSM128                              Operational    0
MSM-B    8900-MSM128                              Operational    0
Flags : M - Backplane link to Master is Active
B - Backplane link to Backup is also Active
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
e - Errors on slot will be ignored (no corrective action initiated)
E - Errors on slot will disable all ports on slot
```

Note

In ExtremeXOS 11.4 and earlier, if you configure the module recovery setting to none, the output displays an “E” flag that indicates no corrective actions will occur for the specified MSM or I/O module. The “E” flag appears only if you configure the module recovery setting to none.

Displaying Detailed Module Recovery Information

To display the module recovery setting for a specific port on a module, including the current recovery mode, use the following command:

```
show slot <slot>
```

In addition to the information displayed with show slot, this command displays the module recovery setting configured on the slot. The following truncated output displays the module recovery setting (displayed as Recovery Mode) for the specified slot:

```
Slot-2 information:
State:               Operational
Download %:          100
Flags:               MB   E
Restart count:       0 (limit 5)
Serial number:       800264-00-01 0907G-00166
Hw Module Type:      8900-10G24X-c
SW Version:          15.2.0.26
SW Build:            v1520b26
Configured Type:     8900-10G24X-c
Ports available:     24
Recovery Mode:       Shutdown
Debug Data:          Peer=Operational
Flags : M - Backplane link to Master is Active
B - Backplane link to Backup is also Active
D - Slot Disabled
I - Insufficient Power (refer to "show power budget")
e - Errors on slot will be ignored (no corrective action initiated)
E - Errors on slot will disable all ports on slot
```

Troubleshooting Module Failures

If you experience an I/O module failure, use the following troubleshooting methods when you can bring the switch offline to solve or learn more about the problem:

- Restarting the I/O module—Use the disable slot <slot> command followed by the enable slot <slot> command to restart the offending I/O module. By issuing these commands, the I/O module and its associated fail counter is reset. If the module does not restart, or you continue to experience I/O module failure, please contact Extreme Networks Technical Support.
- Running diagnostics—Use the run diagnostics normal <slot> command to run operational diagnostics on the offending I/O module to ensure that you are not experiencing a hardware issue. If the module continues to enter the failed state, please contact Extreme Networks Technical Support.

If you experience an MSM/MM failure, please contact Extreme Networks Technical Support.

Example

The following command configures a switch to not take an action if a hardware fault occurs:

```
configure sys-recovery-level slot none
```

History

This command was first available in ExtremeXOS 11.3.

The shutdown parameter was added in ExtremeXOS 11.5.

Platform Availability

This command is available only on modular switches.

configure sys-recovery-level switch

configure sys-recovery-level switch [none | reset | shutdown]

Description

Configures a recovery option for instances where a hardware exception occurs on Summit family switches.

Syntax Description

none	Configures the switch to maintain its current state regardless of the detected fault. The switch does not reboot or shutdown. ExtremeXOS logs fault and error messages to the syslog.
reset	Configures the switch to reboot upon detecting a hardware fault. ExtremeXOS logs fault, error, system reset, and system reboot messages to the syslog.
shutdown	Configures the switch to shut down upon detecting a hardware fault. All ports are taken offline in response to the reported errors; however, the management port remains operational for debugging purposes only. If the switch shuts down, it remains in this state across additional reboots or power cycles until you explicitly clear the shutdown state.

Default

The default setting is reset.

Usage Guidelines

Use this command for system auto-recovery upon detection of hardware problems. You can configure Summit family switches to take no action, automatically reboot, or shutdown if the switch detects a hardware fault. This enhanced level of recovery detects faults in the CPU.

You must specify one of the following parameters for the switch to respond to hardware failures:

- none—Configures the switch to maintain its current state regardless of the detected fault. The switch does not reboot or shutdown.
- reset—Configures the switch to reboot upon detecting a hardware fault.
- shutdown—Configures the switch to shutdown upon fault detection. All ports are taken offline in response to the reported errors; however, the management port remains operational for debugging purposes only.

Messages Displayed

If you configure the hardware recovery setting to either none (ignore) or shutdown, the switch prompts you to confirm this action by displaying a message similar to the following:

```
Are you sure you want to shutdown on errors? (y/n)
```

Enter y to confirm this action and configure the hardware recovery level. Enter n or press [Enter] to cancel this action.

Displaying the Hardware Recovery Setting

To display the hardware recovery setting, use the following command:

```
show switch
```

If you change the hardware recovery setting from the default (reset) to either none (ignore) or shutdown, the Recovery Mode output is expanded to include a description of the hardware recovery mode. If you keep the default behavior or return to reset, the Recovery Mode output lists only the software recovery setting.

The following truncated output from a Summit switch displays the software recovery and hardware recovery settings (displayed as Recovery Mode):

```
SysName:          TechPubs Lab
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1F:A5:71
Recovery Mode:    All, Ignore
System Watchdog:  Enabled
```

If you configure the hardware recovery setting to none, the output displays “Ignore” to indicate that no corrective actions will occur on the switch. “Ignore” appears only if you configure the hardware recovery setting to none.

If you configure the hardware recovery setting to shutdown, the output displays “Shutdown” to indicate that the switch will shutdown if fault detection occurs. “Shutdown” appears only if you configure the hardware recovery setting to shutdown.

If you configure the hardware recovery setting to reset, the output displays only the software recovery mode.

Example

The following command configures the switch to not take an action if a hardware fault occurs:

```
configure sys-recovery-level switch none
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available only on the Summit family switches.

configure syslog add

configure syslog add [*ipaddress* | *ipPort*] {**vr** *vr_name*} [**local0...local7**]

Description

Configures the remote syslog server host address, and filters messages to be sent to the remote syslog target.

Syntax Description

ipaddress	Specifies the remote syslog server IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.

Default

If a virtual router is not specified, VR-Mgmt is used. If UDP port is not specified, 514 is used.

Usage Guidelines

Options for configuring the remote syslog server include:

- ipaddress—The IP address of the remote syslog server host.
- ipPort—The UDP port.
- vr_name—The virtual router that can reach the syslog host.
- local0-local7—The syslog facility level for local use.

The switch log overwrites existing log messages in a wrap-around memory buffer, which may cause you to lose valuable information once the buffer becomes full. The remote syslog server does not overwrite log information, and can store messages in non-volatile files (disks, for example).

The enable syslog command must be issued in order for messages to be sent to the remote syslog server(s). Syslog is disabled by default. A total of four syslog servers can be configured at one time.

When a syslog server is added, it is associated with the filter DefaultFilter. Use the configure log target filter command to associate a different filter.

The syslog facility level is defined as local0 – local7. The facility level is used to group syslog data.

Example

The following command configures the remote syslog server target:

```
configure syslog 123.45.67.78 local1
```

History

This command was first available in ExtremeXOS 10.1.

The ipPort parameter was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure syslog delete

configure syslog delete [**all** | *ipaddress* | *ipPort*] {**vr** *vr_name*} {**local0...local7** }

configure syslog delete *host name/ip* {: *udp-port*} [**local0...local7**]

Description

Deletes a remote syslog server address.

Syntax Description

all	Specifies all remote syslog servers.
ipaddress	Specifies the remote syslog server IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.

Default

If a virtual router is not specified, VR-Mgmt is used.

If a UDP port number is not specified, 514 is used.

Usage Guidelines

This command is used to delete a remote syslog server target.

Example

The following command deletes the remote syslog server with an IP address of 10.0.0.1:

```
configure syslog delete 10.0.0.1 local1
```

History

This command was first available in ExtremeXOS 10.1.

The ipPort parameter was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure xml-notification target

configure xml-notification target *target* [**url** *url* {**vr** *vr_name*} | **user** [**none** | *user*] | [**encrypted-auth** *encrypted-auth*] | [**queue-size** *queue-size*]]

Description

Configures the Web server target in the XML client.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.
url	Specifies the Web server URL.
vr_name	Specifies the virtual router over which the XML client process can connect to a Web server to send push notifications.
user	Specifies the alpha numeric string identifying the Web server user.
encrypted-auth	Specifies the encrypted user authentication string.
queue-size	Specifies in numeric format, the size of the buffer that stores incoming events from ExtremeXOS software.

Default

N/A.

Usage Guidelines

Use this command to configure the Web server target in XML client process.

Example

The following command configures the target target2 for the user admin:

```
configure xml-notification target target2 user admin
```

History

This command was first available in ExtremeXOS 12.4.

The virtual router option was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

configure xml-notification target add/delete

configure xml-notification target *target* [**add** | **delete**] *module*

Description

Adds or deletes an EXOS module to or from the Web server target.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.
module	Specifies the name of the ExtremeXOS module.

Default

N/A.

Usage Guidelines

Use the add option to attach a module to the Web server target in order to receive events from that application and send them to the targeted Web server. There is no limitation to the number of modules that can be attached.

Only Identity Management and EMS are supported targets.

Use the delete option to detach ExtremeXOS modules from the Web server target in order to stop receiving events from that module.

Example

The following command deleted the target test2 from EMS.

```
configure xml-notification target test2 ems
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

create log filter

create log filter *name* {**copy** *filter_name*}

Description

Creates a log filter with the specified name.

Syntax Description

name	Specifies the name of the filter to create.
copy	Specifies that the new filter is to be copied from an existing one.
filter_name	Specifies the existing filter to copy.

Default

N/A.

Usage Guidelines

This command creates a filter with the name specified. A filter is a customizable list of events to include or exclude, and optional parameter values. The list of events can be configured by component or subcomponent with optional severity, or individual condition, each with optional parameter values. See the commands configure log filter events and configure log filter events match for details on how to add items to the filter.

The filter can be associated with one or more targets using the configure log target filter command to control the messages sent to those targets. The system has one built-in filter named DefaultFilter, which itself may be customized. Therefore, the create log filter command can be used if a filter other than DefaultFilter is desired. As its name implies, DefaultFilter initially contains the default level of logging in which every ExtremeXOS component and subcomponent has a pre-assigned severity level.

If another filter needs to be created that will be similar to an existing filter, use the copy option to populate the new filter with the configuration of the existing filter. If the copy option is not specified, the new filter will have no events configured and therefore no incidents will pass through it.

The total number of supported filters, including DefaultFilter, is 20.

Example

The following command creates the filter named fdb2, copying its configuration from the filter DefaultFilter:

```
create log filter fdb2 copy DefaultFilter
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

create log target xml-notification

create log target xml-notification [*target_name* | *xml_target_name*]

Description

Creates a Web server XML-notification target name.

Syntax Description

target_name	Specifies the name of a non-existing XML notification target.
xml_target_name	Specifies the name of an already existing XML notification target.

Default

N/A.

Usage Guidelines

Use this command to create a Web server XML-notification target name for EMS.

Example

The following command creates the target name test2:

```
create log target xml-notification text2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

create xml-notification target url

create xml-notification target *new-target* **url** *url* {**vr** *vr_name*} {**user** [**none** | *user*]} {**encrypted-auth** *encrypted-auth*} {**queue-size** *queue-size*}

Description

Creates the Web server target in the XML client.

Syntax Description

new-target	Specifies a name for the target being created.
url	Specifies the Web server URL.
vr_name	Specifies the name of the virtual router over which the XML client process can connect to the Web server.
user	Specifies the name of the user.
encrypted-auth	Specifies the encrypted user authentication string.
queue-size	Specifies, in numeric format, the size of the buffer that stores incoming events from ExtremeXOS.

Default

N/A.

Usage Guidelines

Use this command to create the Web server target in the XML client process.

Note

You cannot enter a password in the CLI directly. It is a two-step process similar to creating a user account in ExtremeXOS.

Example

The following command creates a target target2 on http://10.255.129.22:8080/xos/webservice with a queue size of 100:

create xml-notification target target2 url http://10.255.129.22:8080/xos/webservice queue-size 100

History

This command was first available in ExtremeXOS 12.4.

The virtual router option was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

delete log filter

Deletes a log filter with the specified name.

delete log filter [*filter_name* | **all**]

Syntax Description

filter_name	Specifies the filter to delete.
all	Specifies that all filters, except DefaultFilter, are to be deleted

Default

N/A.

Usage Guidelines

This command deletes the specified filter, or all filters except for the filter DefaultFilter. The specified filter must not be associated with a target. To remove that association, associate the target with DefaultFilter instead of the filter to be deleted, using the following command:

```
configure log target <target> filter DefaultFilter
```

Example

The following command deletes the filter named fdb2:

```
delete log filter fdb2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

delete log target xml-notification

delete log target xml-notification *xml_target_name*

Description

Deletes a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml notification target.

Default

N/A.

Usage Guidelines

Use this command to delete a Web server target.

Example

The following command deleted the Web server target target2:

```
delete log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

delete xml-notification target

delete xml-notification target *target*

Description

Deletes the Web server target on the XML client process.

Syntax Description

target	Specifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to delete the Web server target on the XML client process.

Example

The following command deletes the target test2:

```
delete xml-notification target test2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

disable cli-config-logging

```
disable cli-config-logging
```

Description

Disables the logging of CLI configuration commands to the switch Syslog.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Every command is displayed in the log window which allows you to view every command executed on the switch.

The disable cli-config-logging command discontinues the recording of all switch configuration changes and their sources that are made using the CLI via Telnet or the local console. After you disable configuration logging, no further changes are logged to the system log.

To view the status of configuration logging on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for configuration logging.

Example

The following command disables the logging of CLI configuration command to the Syslog:

```
disable cli-config-logging
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable cpu-monitoring

disable cpu-monitoring

Description

Disables CPU monitoring on the switch.

Syntax Description

This command has no arguments or variables.

Default

CPU monitoring is enabled and occurs every 5 seconds.

Usage Guidelines

Use this command to disable CPU monitoring on the switch.

This command does not clear the monitoring interval. Therefore, if you altered the CPU monitoring interval, this command does not return the CPU monitoring interval to 5 seconds. To return to the default frequency level, use the enable cpu-monitoring {interval <seconds>} {threshold <percent>} and specify 5 for the interval.

Example

The following command disables CPU monitoring on the switch:

```
disable cpu-monitoring
```

History

This command was first available in an ExtremeXOS 11.2.

The default value shown began in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable elsm ports

disable elsm ports *port_list*

Description

Disables the ELSM protocol for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM should be disabled.

Default

The default is disabled.

Usage Guidelines

ELSM works between two connected ports, and each ELSM instance is based on a single port. When you disable ELSM on the specified ports, the ports no longer send ELSM hello messages to their peers and no longer maintain ELSM states.

When you enable ELSM on the specified ports, the ports participate in ELSM with their peers and begin exchanging ELSM hello messages. To enable ELSM, use the following command:

```
enable elsm ports <port_list>
```

For more information about ELSM, see the command enable elsm ports enable elsm ports.

Example

The following command disables ELSM for slot 2, ports 1-2 on the switch:

```
disable elsm ports 2:1-2:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

disable elsm ports auto-restart

disable elsm ports *port_list* **auto-restart**

Description

Disable ELSM automatic restart for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM auto-restart is being disabled.

Default

The default is enabled.

Usage Guidelines

If you disable ELSM automatic restart, the ELSM-enabled port can transition between the following states multiple times: Up, Down, and Down-Wait. When the number of state transitions is greater than or equal to the sticky threshold, the port enters and remains in the Down-Stuck state.

The ELSM sticky threshold specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.

If the port enters the Down-Stuck state, you can clear the stuck state and have the port enter the Down state by using one of the following commands:

```
clear elsm ports <port_list> auto-restart
           enable elsm ports <port_list> auto-restart
```

If you use the enable elsm ports <port_list> auto-restart command, automatic restart is always enabled; you do not have to use the clear elsm ports <port_list> auto-restart command to clear the stuck state.

Enabling Automatic Restart

To enable ELSM automatic restart, you must explicitly configure this behavior on each ELSM-enabled port. If you enable ELSM automatic restart and an ELSM-enabled port goes down, ELSM bypasses the Down-Stuck state and automatically transitions the down port to the Down state, regardless of the number of times the port goes up and down.

To enable automatic restart, use the following command:

```
enable elsm ports <port_list> auto-restart
```

If you configure automatic restart on one port, Extreme Networks recommends that you use the same configuration on its peer port.

Example

The following command disables ELSM automatic restart for slot 2, ports 1-2 on the switch:

```
disable elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

disable log display

disable log display

Description

Disables the sending of messages to the console display.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If the log display is disabled, log information is no longer written to the serial console.

This command setting is saved to FLASH and determines the initial setting of the console display at boot up.

You can also use the following command to control logging to different targets:

```
disable log display
```

The disable log display command is equivalent to disable log target console-display command.

Example

The following command disables the log display:

```
disable log display
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable log target

disable log target [**console** | **memory-buffer** | **nvram** | **primary-msm** | **primary-node** | **backup-msm** | **backup-node** | **session** | **syslog** [**all** | *ipaddress* | *ipPort*] {**vr** *vr_name*} [**local0 ... local7**]]]

Description

Stops sending log messages to the specified target.

In a stack, this command is applicable only to Master and Backup nodes and not applicable to the standby nodes.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-msm	Specifies the primary MSM. NOTE: This parameter is available only on modular switches.
primary-node	Specifies the primary node in a stack.
backup-msm	Specifies the backup MSM. NOTE: This parameter is available only on modular switches.
backup-node	Specifies the backup node in a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog host name or IP address.
ipPort	Specifies the UDP port number for the syslog target.

vr_name	Specifies the virtual router that can reach the server IP address. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.

Default

Enabled, for memory buffer, NVRAM, primary MSM, and backup MSM/MM; all other targets are disabled by default.

Usage Guidelines

This command stops sending messages to the specified target. By default, the memory buffer, NVRAM, primary MSM/MM, and backup MSM/MM targets are enabled. Other targets must be enabled before messages are sent to those targets.

Configuration changes to the session target are in effect only for the duration of the console display or telnet session, and are not saved in FLASH. Changes to the other targets are saved to FLASH.

You can also use the following command to disable displaying the log on the console:

```
disable log display
```

The disable log display command is equivalent to disable log target console-display command.

Modular Switches Only

Note that the backup-msm target is only active on the primary MSM/MM, and the primary-msm target is only active on the backup MSM/MM.

Example

The following command disables log messages to the current session:

```
disable log target session
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable log target xml-notification

disable log target xml-notification *xml_target_name*

Description

Disables a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml-notification target.

Default

N/A.

Usage Guidelines

Use this command to disable a Web server EMS target.

Example

The following command disables the Web server target target2:

```
disable log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

disable rmon

disable rmon

Description

Disables the collection of RMON statistics on the switch.

Syntax Description

This command has no arguments or variables.

Default

By default, RMON is disabled. However, even in the disabled state, the switch responds to RMON queries and sets for alarms and events.

Usage Guidelines

The switch supports four out of nine groups of Ethernet RMON statistics. In a disabled state, the switch continues to respond queries of statistics. Collecting of history, alarms, and events is stopped; however, the switch still queries old data.

To view the status of RMON polling on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for RMON polling.

To view the RMON memory usage statistics for a specific memory type (for example, statistics, events, logs, history, or alarms) or for all memory types, use the following command:

```
show rmon memory {detail | <memoryType>}
```

Example

The following command disables the collection of RMON statistics on the switch:

```
disable rmon
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable sflow

disable sflow

Descriptin

Globally disables sFlow statistical packet sampling.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables sFlow globally on the switch. When you disable sFlow globally, the individual ports are also put into the disabled state. If you later enable the global sFlow state, individual ports return to their previous state.

Example

The following command disables sFlow sampling globally:

```
disable sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable sflow ports

disable sflow ports *port_list*

Description

Disables sFlow statistical packet sampling and statistics gathering on a particular list of ports.

Syntax Description

port_list	Specifies a list of ports.

Default

Disabled.

Usage Guidelines

This command disables sFlow on a particular list of ports. Once sFlow is disabled on a port, sampling and polling will stops. If sFlow is disabled globally, all sampling and polling stops

Use the following command to disable sFlow globally:

```
disable sflow
```

Example

The following command disables sFlow sampling on port 3:1:

```
disable sflow ports 3:1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable sys-health-check

disable sys-health-check slot *slot*

Description

Discontinues sending backplane diagnostic packets on modular switches.

Syntax Description

slot	Specifies the slot to disable sending backplane diagnostic packets.

Default

Polling is enabled, backplane diagnostic packets are disabled.

Depending upon your platform, when disabling backplane diagnostic packets, the following defaults apply:

- BlackDiamond 8800 series switches—By default, the system health checker discontinues sending backplane diagnostic packets to the specified slot. Only polling is enabled.

Usage Guidelines

When you use this command, backplane diagnostic packets are disabled and no longer sent by the system health checker.

BlackDiamond 8800 Series Switches Only

If you modify the interval in the configure sys-health-check interval <interval> command and later disable backplane diagnostics, the configured interval for sending backplane diagnostic packets remains. The next time you enable backplane diagnostic packets, the health checker sends backplane diagnostics packets at the configured interval. For example, if you configure an interval of 8seconds, the system health checker sends backplane diagnostic packets every 8seconds.

To return to the "default" interval of 5seconds, configure the frequency of sending backplane diagnostic packets to 5 seconds using the following command:

```
configure sys-health-check interval 5
```

Example

On the BlackDiamond 8800 series switches, the following example assumes that you did not modify the interval option in the configure sys-health-check interval <interval> command.

The following command disables backplane diagnostics on slot 3, polling is always enabled and occurs every 5 seconds.

```
disable sys-health-check slot 3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

disable syslog

disable syslog

Description

Disables logging to all remote syslog server targets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Disables logging to all remote syslog server targets, not to the switch targets. This setting is saved in FLASH, and will be in effect upon boot up.

Example

The following command disables logging to all remote syslog server targets:

```
disable syslog
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable cli-config-logging

enable cli-config-logging

Description

Enables the logging of CLI configuration commands to the Syslog for auditing purposes.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

ExtremeXOS allows you to record all configuration changes and their sources that are made using the CLI by way of Telnet or the local console. The changes are logged to the system log. Each log entry includes the user account name that performed the changes and the source IP address of the client (if Telnet was used). Configuration logging applies only to commands that result in a configuration change.

To view the status of configuration logging on the switch, use the show management command. This command displays information about the switch including the enable/disable state for configuration logging.

Example

The following command enables the logging of CLI configuration commands to the Syslog:

```
enable cli-config-logging
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable cpu-monitoring

enable cpu-monitoring {**interval** *seconds*} {**threshold** *percent*}

Description

Enables CPU monitoring on the switch.

Syntax Description

seconds	Specifies the monitoring interval, in seconds. The default is 5 seconds, and the range is 5 to 60 seconds.
threshold	Specifies the CPU threshold value. CPU usage is measured in percentages. The default is 90%, and the range is 0% to 100%.

Default

CPU monitoring is enabled and occurs every 5 seconds. The default CPU threshold value is 90%.

Usage Guidelines

CPU monitoring allows you to monitor the CPU utilization and history for all of the processes running on the switch. By viewing this history on a regular basis, you can see trends emerging and identify processes with peak utilization. Monitoring the workload of the CPU allows you to troubleshoot and identify suspect processes before they become a problem.

To specify the frequency of CPU monitoring, use the interval keyword. Extreme Networks recommends the default setting for most network environments.

CPU usage is measured in percentages. By default, the CPU threshold value is 90%. When CPU utilization of a process exceeds 90% of the regular operating basis, the switch logs an error message specifying the process name and the current CPU utilization for the process. To modify the CPU threshold level, use the threshold keyword. The range is 0% to 100%.

Example

The following command enables CPU monitoring every 30 seconds:

```
enable cpu-monitoring interval 30
```

History

This command was first available in ExtremeXOS 11.2.

The default values shown began in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable elsm ports

enable elsm ports *port_list*

Description

Enables the ELSM protocol for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM should be enabled.

Default

The default is disabled.

Usage Guidelines

The ELSM protocol allows you to detect CPU and remote link failures in the network. ELSM operates on a point-to-point basis; you only configure ELSM on the ports that connect to other devices within the network, but you must configure ELSM on both sides of the peer connections.

The Layer2 connection between the ports determines the peer. You can have a direct connection between the peers or hubs that separate peer ports. In the first instance, the peers are also considered neighbors. In the second instance, the peer is not considered a neighbor.

An Extreme Networks device with ELSM enabled detects CPU and remote link failures by exchanging hello messages between two ELSM peers. If ELSM detects a failure, the ELSM-enabled port responds by blocking traffic on that port. For example, if a peer stops receiving messages from its peer, ELSM brings down that connection by blocking all incoming and outgoing data traffic on the port and notifying applications that the link is down.

Configuring and enabling ELSM on Extreme Networks devices running ExtremeXOS is backward compatible with Extreme Networks devices running ExtremeWare.

When you enable ELSM on a port, ELSM immediately blocks the port and it enters the Down state. When the port detects an ELSM-enabled peer, the peer ports exchange ELSM hello messages. At this point, the ports enter the transitional Down-Wait state. If the port receives Hello+ messages from its peer and does not detect a problem, the peers enter the Up state. If a peer detects a problem or there is no peer port configured, the port enters the Down state.

For more information about the types of ELSM hello messages, see the configure elsm ports hellotime command.

Note

ELSM and mirroring are mutually exclusive. You can enable either ELSM, or mirroring, but not both.

If you try to enable ELSM on a port that is already configured as a mirrored port, the switch displays messages similar to the following:

- Stand-alone switch

  Cannot enable ELSM on port 1. Port is configured as mirror monitor port
- Modular switch

  Cannot enable ELSM on port 1:1. Port is configured as mirror monitor port

  Configuration failed on backup MSM, command execution aborted!

Configuring the Hello Timer Interval

ELSM ports use hello messages to communicate information about the health of the network to its peer port. You can also configure the interval by which the ELSM-enabled ports sends hello messages. For more information about configuring the hello interval, see the command configure elsm ports hellotime configure elsm ports hellotime.

Disabling ELSM

ELSM works between two connected ports, and each ELSM instance is based on a single port. When you disable ELSM on the specified ports, the ports no longer send ELSM hello messages to their peers and no longer maintain ELSM states. To disable ELSM, use the following command:

```
disable elsm ports <port_list>
```

Example

The following command enables ELSM for slot 2, ports 1-2 on the switch:

```
enable elsm ports 2:1-2:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

enable elsm ports auto-restart

enable elsm ports *port_list* **auto-restart**

Description

Enables ELSM automatic restart for the specified ports.

Syntax Description

port_list	Specifies the port or ports for which ELSM auto-restart is being enabled.

Default

The default is enabled.

Usage Guidelines

You must explicitly configure this behavior on each ELSM-enabled port; this is not a global command.

By default, ELSM automatic restart is enabled. If an ELSM-enabled port goes down, ELSM bypasses the Down-Stuck state and automatically transitions the down port to the Down state, regardless of the number of times the port goes up and down.

If you disable ELSM automatic restart, the ELSM-enabled port can transition between the following states multiple times: Up, Down, and Down-Wait. When the number of state transitions is greater than or equal to the sticky threshold, the port enters the Down-Stuck state.

The ELSM sticky threshold specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.

If the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

```
clear elsm ports <port_list> auto-restart
```

```
enable elsm ports <port_list> auto-restart
```

If you use the enable elsm ports <port_list> auto-restart command, automatic restart is always enabled; you do not have to use the clear elsm ports <port_list> auto-restart command to clear the stuck state.

To disable automatic restart, use the following command:

```
disable elsm ports <port_list> auto-restart
```

If you configure automatic restart on one port, Extreme Networks recommends that you use the same configuration on its peer port.

Example

The following command enables ELSM automatic restart for slot 2, ports 1-2 on the switch:

```
enable elsm ports 2:1-2:2 auto-restart
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

enable log display

enable log display

In a stack, this command is applicable only to Master and Backup nodes. You cannot run this command on standby nodes.

Description

Enables a running real-time display of log messages on the console display.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If you enable the log display on a terminal connected to the console port, your settings will remain in effect even after your console session is ended (unless you explicitly disable the log display).

You configure the messages displayed in the log using the configure log display, or configure log target console-display commands.

You can also use the following command to control logging to different targets:

```
enable log display
```

The enable log display command is equivalent to enable log target console-display command.

To change the log filter association, severity threshold, or match expression for messages sent to the console display, use the configure log target console-display command

Example

The following command enables a real-time display of log messages:

```
enable log display
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable log target

enable log target [**console** | **memory-buffer** | **nvram** | **primary-msm** |**primary-node**| **backup-msm** | **backup-node**| **session** | **syslog** [**all** | *ipaddress* | *ipPort*] {**vr** *vr_name*} [**local0...local7**]]]

Description

Starts sending log messages to the specified target.

Syntax Description

console	Specifies the console display.
memory-buffer	Specifies the switch memory buffer.
nvram	Specifies the switch NVRAM.
primary-msm	Specifies the primary MSM.  Note This parameter is available only on modular switches.
primary-node	Specifies the primary node of a stack.
backup-msm	Specifies the backup MSM.  Note This parameter is available only on modular switches.
backup-node	Specifies the backup node of a stack.
session	Specifies the current session (including console display).
syslog	Specifies a syslog target.
all	Specifies all of the remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  Note User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.

Default

Enabled, for memory buffer and NVRAM; all other targets are disabled by default.

Usage Guidelines

This command starts sending messages to the specified target. By default, the memory-buffer, NVRAM, primary MSM/MM, and backup MSM/MM targets are enabled. Other targets must be enabled before messages are sent to those targets.

Configuration changes to the session target are in effect only for the duration of the console display or Telnet session, and are not saved in FLASH. Others are saved in FLASH.

You can also use the following command to enable displaying the log on the console:

```
enable log display
```

The enable log display command is equivalent to the enable log target console-display command.

Modular Switches Only

Note that the backup-msm target is only active on the primary MSM/MM, and the primary-msm target is only active on the backup MSM/MM.

Example

The following command enables log messages on the current session:

```
enable log target session
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable log target xml-notification

enable log target xml-notification *xml_target_name*

Description

Enables a Web server target.

Syntax Description

xml_target_name	Specifies the name of the xml-notification target.

Default

N/A.

Usage Guidelines

Use this command to enable a Web server target for EMS.

Example

The following command enables the Web server target target2:

```
enable log target xml-notification target2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

enable rmon

enable rmon

Description

Enables the collection of RMON statistics on the switch.

Syntax Description

This command has no arguments or variables.

Default

By default, RMON is disabled. However, even in the disabled state, the switch responds to RMON queries and sets for alarms and events. By enabling RMON, the switch begins the processes necessary for collecting switch statistics.

Usage Guidelines

The switch supports four out of nine groups of Ethernet RMON statistics. In an enabled state, the switch responds to the following four groups:

- Statistics—The RMON Ethernet Statistics group provides traffic and error statistics showing packets, bytes, broadcasts, multicasts, and errors on a LAN segment or VLAN.
- History—The History group provides historical views of network performance by taking periodic samples of the counters supplied by the Statistics group. The group features user-defined sample intervals and bucket counters for complete customization of trend analysis.

- Alarms—The Alarms group provides a versatile, general mechanism for setting threshold and sampling intervals to generate events on any RMON variable. Both rising and falling thresholds are supported, and thresholds can be on the absolute value of a variable or its delta value. In addition, alarm thresholds may be auto calibrated or set manually.
- Events—The Events group creates entries in an event log and/or sends SNMP traps to the management workstation. An event is triggered by an RMON alarm. The action taken can be configured to ignore it, to log the event, to send an SNMP trap to the receivers listed in the trap receiver table, or to both log and send a trap. The RMON traps are defined in RFC 1757 for rising and falling thresholds.

The switch also supports the following parameters for configuring the RMON agent, as defined in RFC2021:

- probeCapabilities—If you configure the probeCapabilities object, you can view the RMON MIB groups supported on at least one interface by the probe.
- probeSoftwareRev—If you configure the probeSoftwareRev object, you can view the current software version of the monitored device.
- probeHardwareRev—If you configure the probeHardwareRev object, you can view the current hardware version of the monitored device.
- probeDateTime—If you configure the probeDateTime object, you can view the current date and time of the probe.
- probeResetControl—If you configure the probeResetControl object, you can restart a managed device that is not running normally. Depending on your configuration, you can do one of the following:
  - Warm boot—A warm boot restarts the device using the current configuration saved in non-volatile memory.
  - Cold boot—A cold boot causes the device to reset the configuration parameters stored in non-volatile memory to the factory defaults and then restarts the device using the restored factory default configuration.

Note

You can only use the RMON features of the system if you have an RMON management application and have enabled RMON on the switch.

RMON requires one probe per LAN segment, and stand-alone RMON probes have traditionally been expensive. Therefore, the approach taken by Extreme Networks has been to build an inexpensive RMON probe into the agent of each system. This allows RMON to be widely deployed around the network without costing more than traditional network management. The switch accurately maintains RMON statistics at the maximum line rate of all of its ports.

For example, statistics can be related to individual ports. Also, because a probe must be able to see all traffic, a stand-alone probe must be attached to a nonsecure port. Implementing RMON in the switch means that all ports can have security features enabled.

To view the status of RMON polling on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for RMON polling.

To view the RMON memory usage statistics for a specific memory type (for example, statistics, events, logs, history, or alarms) or for all memory types, use the following command:

```
show rmon memory {detail | <memoryType>}
```

Example

The following command enables the collection of RMON statistics on the switch:

```
enable rmon
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable sflow

enable sflow

Description

Globally enables sFlow statistical packet sampling.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables sFlow globally on the switch.

Note

On BlackDiamond 8000 c-, e-, xl-, and xm-series modules, and Summit X150, X250e, X350, X450a, X450e, X460, X480, X650, and X670 series switches (whether or not included in a SummitStack), sFlow and mirroring are not mutually exclusive. You can enable sFlow and mirroring at the same time.

Any traffic grouping using QP2 may encounter unexpected results when sFlow is enabled. For more information about QoS, see QoS in the ExtremeXOS Concepts Guide.

Example

The following command enables sFlow sampling globally:

```
enable sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable sflow ports

enable sflow ports *port_list* **{ingress | egress | both }**

Description

Enables sFlow statistical packet sampling on a particular list of ports.

Syntax Description

port_list	Specifies a list of ports.
ingress	Enables ingress sFlow on a per-port basis.
egress	Enables egress sFlow on a per-port basis.
both	Enables sFlow on both ingress and egress on a per-port basis.

Default

Ingress.

Usage Guidelines

This command enables sFlow on a particular list of ports. Both Ingress and Egress sampling can be enabled simultaneously on a port. You also need to enable sFlow globally in order to gather statistics and send the data to the collector. Once sFlow is enabled globally, and on the ports of interest, sampling and polling begins.

Use the following command to enable sFlow globally:

```
enable sflow
```

Note

On BlackDiamond 8000 c-, e-, xl-, and xm-series modules, and Summit family switches (whether or not included in a SummitStack), sFlow and mirroring are not mutually exclusive. You can enable sFlow and mirroring at the same time.

For more information about mirroring, see Configuring Slots and Ports on a Switch in the ExtremeXOS Concepts Guide.

Example

The following command enables sFlow sampling on the port 3:1:

```
enable sflow ports 3:1
```

History

This command was first available in ExtremeXOS 11.0.

The **ingress**, **egress**, and **both** keywords were added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

enable sys-health-check

enable sys-health-check slot *slot*

Description

Enables backplane diagnostic packets on the specified slot.

Syntax Description

slot	Specifies the slot to participate in sending backplane diagnostic packets.

Default

Polling is enabled, backplane diagnostic packets are disabled.

Depending upon your platform, when enabling diagnostic packets, the following defaults apply:

- BlackDiamond 8800 series switches—The system health checker tests the data link every 5 seconds for the specified slot.

Usage Guidelines

Configure the system health checker with guidance from Extreme Networks Technical Support personnel.

The system health checker tests I/O modules and the backplane by sending diagnostic packets. By isolating faults to a specific module or backplane connection, the system health checker notifies you of a possible hardware failure.

System health check errors are reported to the syslog. Syslog output includes the slot number where the problem occurred, the loopback packet ID number, and a notification that the MSM/MM did not receive the last packet. If you see an error, please contact Extreme Networks Technical Support.

Note

Enabling backplane diagnostic packets increases CPU utilization and competes with network traffic for resources.

The system health checker continues to periodically forward test packets to failed components.

To configure the frequency of the backplane diagnostic packets on the BlackDiamond 8800 series switches, use the configure sys-health-check interval command.

Displaying the System Health Check Setting

To display the system health check polling setting on the switch, use the following command:

```
show switch
```

As previously described, polling is always enabled on the switch, which is why you see the system health check setting as Enabled. The following truncated output from a BlackDiamond 8810 switch displays the system health check setting (displayed as SysHealth check):

```
SysName:          TechPubs Lab
SysName:          BD-8810Rack3
SysLocation:
SysContact:       support@extremenetworks.com, +1 888 257 3000
System MAC:       00:04:96:1F:A2:60
SysHealth check:  Enabled
Recovery Mode:    None
System Watchdog:  Enabled
```

Example

The following command enables backplane diagnostic packets on slot 6:

```
enable sys-health-check slot 6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available only on modular switches.

enable syslog

enable syslog

Description

Enables logging to all remote syslog host targets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

To enable remote logging, you must do the following:

- Configure the syslog host to accept and log messages.
- Enable remote logging by using the enable syslog command.
- Configure remote logging by using the configure syslog command.

When you use the enable syslog command, the exporting process of the syslog begins. This command also determines the initial state of an added remote syslog target.

Example

The following command enables logging to all remote syslog hosts:

```
enable syslog
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable/disable xml-notification

[enable|disable] xml-notification [all | *target*]

Description

Enables or disables Web server target(s).

Syntax Description

target	wSpecifies the configured target.

Default

By default, the target Web server is not enabled for xml-notifications. You have to explicitly enable it, and the display value is “no.”

Usage Guidelines

Use the enable option to enable Web server target(s) in order to receive events from ExtremeXOS modules and to send out events to the targeted Web server(s).

Use the disable option to disable the Web server target(s).

Example

The following command enables all of the configured targets

```
enable xml-notification all
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

show configuration “xmlc”

show configuration "xmlc" {detail | non-persistent {detail}}

Description

Displays the configuration of an XMLC module.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Displays the configuration of an XMLC module.

When the detail option is chosen, all configuration data including the default is displayed. Otherwise the default would not be displayed.

When the non-persistent option is chosen, UPM non-persistent configuration data is displayed.

Example

The following command displays the xmlc configuration:

```
show configuration “xmlc” detail
```

Following is sample output from this command:

```
Module xmlc configuration.
#
create xml-notification target test url http://10.255.42.73:9080/axis/
services/eventPort
configure xml-notification test queue-size 100
disable xml-notification test
create xml-notification target test2 url http://10.255.42.48:9080/axis/
services/eventPort
configure xml-notification test2 queue-size 100
enable xml-notification test2
create xml-notification target epicenter-target url http://
10.255.42.48:8080/xos/webservice
configure xml-notification target epicenter-target user admin encrypted-auth
YWRtaW46ZXBpY2VudGVy
configure xml-notification epicenter-target queue-size 100
enable xml-notification epicenter-target
```

```
configure xml-notification target test add idMgr
configure xml-notification target test2 add idMgr
configure xml-notification target epicenter-target add idMgr
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit family switches.

show cpu-monitoring

show cpu-monitoring {**process** *name*} {**slot** *slotid*}

Description

Displays the CPU utilization history of one or more processes.

Syntax Description

name	Specifies the name of the process.
slotid	Specifies the slot number of the MSM/MM module: "A" specifies the MSM installed in slot A. "B" specifies the MSM installed in slot B. **Note** This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

Viewing statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. This way, statistics can help you get the best out of your network.

By default, CPU monitoring is enabled and occurs every 5 seconds. The default CPU threshold value is 90%.

This information may be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch or your switch model, additional or different CPU and process information might be displayed.

SummitStack Only

When you issue the command with out any parameters:

- From the stack manager or backup node, the stack displays CPU utilization history for all the processes running on the master node and the backup node in the Active Topology.
- From the stack manager or a standby node, the stack displays CPU utilization history for all the processes running on the master node and the standby node in the Active Topology.

Modular Switches Only

When you issue the command without any parameters, the switch displays CPU utilization history for all of the processes running on the MSMs/MMs installed in your system.

Reading the Output

The show cpu-monitoring command is helpful for understanding the behavior of a process over an extended period of time. The following information appears in a tabular format:

- Card—The location (MSM A or MSM B) where the process is running on a modular switch.
- Process—The name of the process.
- Range of time (5 seconds, 10 seconds, and so forth)—The CPU utilization history of the process or the system. The CPU utilization history goes back only 1 hour.
- Total User/System CPU Usage—The amount of time recorded in seconds that the process spends occupying CPU resources. The values are cumulative meaning that the values are displayed as long as the system is running. You can use this information for debugging purposes to see where the process spends the most amount of time: user context or system context.

Example

The following command displays CPU utilization on the switch:

```
show cpu-monitoring
```

The following is sample truncated output from a modular switch:

```
CPU Utilization Statistics - Monitored every 5 seconds

History

This command was first available in an ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show elsm

show elsm

Description

Displays summary information for all of the ELSM-enabled ports on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the operational state of ELSM on the configured ports.

If no ports are configured for ELSM, the switch does not display any information.

For ELSM-enabled ports, this command displays the following information in a tabular format:

- Port—The port number of the ELSM-enabled port.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
  - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

    If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state.
  - Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

    If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.
  - Down-Wait—Indicates a transitional state.

If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hello threshold (by default 2 messages), the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.

- Down-Stuck—Indicates that the port is down and requires user intervention.

  If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

  By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command enable elsm ports auto-restart enable elsm ports auto-restart for more information.

  If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

  clear elsm ports <port_list> auto-restart

  enable elsm ports <port_list> auto-restart

- Hello time —The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.

Additional show Command

You can also use the show ports {<port_list>} information {detail} command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags
  - L—Indicates that ELSM is enabled on the switch
  - - —Indicates that ELSM is disabled on the switch
- ELSM
  - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
  - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch)
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.

  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM
  - Enabled—Indicates that ELSM is enabled on the switch
  - Disabled—Indicates that ELSM is disabled on the switch

Example

The following command displays summary configuration information for all of the ELSM-enabled ports on the switch:

```
show elsm
```

The following is sample output from this command:

```
Port   ELSM State   Hello Time
====   ==========   ==========
5:14   Up 1 (second)
5:18   Down         1 (second)
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show elsm ports

show elsm ports all | *port_list*

Description

Displays detailed information for one or more ELSM-enabled ports.

Syntax Description

all	Displays detailed ELSM information for all ports.
port_list	Displays detailed ELSM information for one or more ports.

Default

N/A.

Usage Guidelines

Use this command to display detailed information about the operational state of ELSM on the configured ports.

This command displays in a tabular format the following ELSM data for one or more ELSM-enabled ports on the switch:

- Port—The port number of the ELSM-enabled port.
- Link State—The state of the link between ELSM-enabled (peer) ports. The link state can be one of the following:
  - Ready—Indicates that the port is enabled but there is no link.
  - Active—Indicates that the port is enabled and the physical link is up.
- ELSM Link State—The current state of the ELSM logical link on the switch. The ELSM link state can be one of the following:
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM State—The current state of ELSM on the port. The ELSM state can be one of the following:
  - Up—Indicates a healthy remote system and this port is receiving Hello+ messages from its peer.

    If an ELSM-enabled port enters the Up state, the up timer begins. Each time the port receives a Hello+ message from its peer, the up timer restarts and the port remains in the Up state. The up timer is 6* hello timer, which by default is 6 seconds.
  - Down—Indicates that the port is down, blocked, or has not received Hello+ messages from its peer.

    If an ELSM-enabled port does not receive a hello message from its peer before the up timer expires, the port transitions to the Down state. When ELSM is down, data packets are neither forwarded nor transmitted out of that port.
  - Down-Wait—Indicates a transitional state.

    If the port enters the Down state and later receives a Hello+ message from its peer, the port enters the Down-Wait state. If the number of Hello+ messages received is greater than or equal to the hold threshold, the port transitions to the Up state. If the number of Hello+ messages received is less than the hold threshold, the port enters the Down state.
  - Down-Stuck—Indicates that the port is down and requires user intervention.

    If the port repeatedly flaps between the Up and Down states, the port enters the Down-Stuck state. Depending on your configuration, there are two ways for a port to transition out of this state:

By default, automatic restart is enabled, and the port automatically transitions out of this state. See the command enable elsm ports auto-restart enable elsm ports auto-restart for more information.

If you disabled automatic restart, and the port enters the Down-Stuck state, you can clear the stuck state and enter the Down state by using one of the following commands:

clear elsm ports <port_list> auto-restart

enable elsm ports <port_list> auto-restart

- Hello Transmit State—The current state of ELSM hello messages being transmitted. The transmit state can be one of the following:
  - HelloRx(+)—Specifies that the ELSM-enabled port is up and receiving Hello+ messages from its peer. The port remains in the HelloRx+ state and restarts the HelloRx timer each time it receives a Hello+ message. If the HelloRx timer expires, the hello transmit state enters HelloRX(-). The HellotRx timer is 6 * hello timer, which by default is 6 seconds.
  - HelloRx(-)—Specifies that the ELSM-enabled port either transitions from the initial ELSM state or is up and not receiving hello messages because there is a problem with the link or the peer is missing.
- Hello time—The current value of the hello timer, which by default is 1 second. The hello timer indicates the number of seconds between consecutive hello messages.
- Hold Threshold—The number of Hello+ messages required by the ELSM-enabled port to transition from the Down-Wait state to the Up state within the hold threshold.
- UpTimer Threshold—The number of hello times that span without receiving Hello+ packets before a port changes its ELSM state from Up to Down.
- Auto Restart—The current state of ELSM automatic restart on the port. The state of Auto Restart can be one of the following:
  - Enabled—If an ELSM-enabled port goes down, ELSM automatically brings up the down port. This is the default behavior.
  - Disabled If an ELSM-enabled port goes down, the port enters and remains in the Down-Stuck state until you clear the stuck state.

  For more information about automatic restart, see the command enable elsm ports auto-restart enable elsm ports auto-restart.
- Sticky Threshold—Specifies the number of times a port can transition between the Up and Down states. The sticky threshold is not user-configurable and has a default value of 1. That means a port can transition only one time from the Up state to the Down state. If the port attempts a subsequent transition from the Up state to the Down state, the port enters the Down-Stuck state.
- Sticky Threshold Counter—The number of times the port transitions from the Up state to the Down state.
- Down Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Down to Up. When ELSM is enabled on a port and it is in a Down state, before it changes its ELSM state from Down to Up, it expects to receive at least a “Hold Threshold” number of Hello+ packets during the Down Timeout period after it receives the first Hello+ packet from its peer. It is equal to [Hello Time * (Hold Threshold+2)].
- Up Timeout—The actual waiting time (msecs or secs) before a port changes its ELSM state from Up to Down after receiving the last Hello+ packets. When a port is in an Up state, it expects to receive a Hello+ packet from its peer every “Hello Time” period to maintain its Up state. When it does not

receive a Hello+ packet after an “Up Timeout” period, it changes its ELSM state from Up to Down. It is equal to [Hello Time * UpTimer Threshold].

The remaining output displays counter information. Use the counter information to determine the health of the ELSM peers and how often ELSM has gone up or down. The counters are cumulative.

- RX Hello+—The number of Hello+ messages received by the port.
- Rx Hello- —The number of Hello- messages received by the port.
- Tx Hello+—The number of Hello+ messages sent by the port.
- Tx Hello- —The number of Hello- messages sent by the port.
- ELSM Up/Down Count—The number of times ELSM has been up or down.

To clear, reset the counters, use either the clear elsm {ports <port_list>} counters or the clear counters command.

Additional show Command

You can also use the show ports {<port_list>} information {detail} command to display ELSM information.

If you do not specify the detail parameter, the following columns display the current state of ELSM on the switch:

- Flags
  - L—Indicates that ELSM is enabled on the switch
  - - —Indicates that ELSM is disabled on the switch
- ELSM
  - up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - dn—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
  - - —Indicates that ELSM is disabled on the switch.

If you specify the optional detail parameter, the following ELSM output is called out in written explanations versus displayed in a tabular format:

- ELSM Link State (displayed only if ELSM is enabled on the switch)
  - Up—Indicates that ELSM is enabled and the ELSM peer ports are up and communicating; the ELSM link state is up. In the up state, the ELSM-enabled port sends and receives hello messages from its peer.
  - Down—Indicates that ELSM is enabled, but the ELSM peers are not communicating; the ELSM link state is down. In the down state, ELSM transitions the peer port on this device to the down state. ELSM blocks all incoming and outgoing switching traffic and all control traffic except ELSM PDUs.
- ELSM
  - Enabled—Indicates that ELSM is enabled on the switch
  - Disabled—Indicates that ELSM is disabled on the switch

Example

The following command displays detailed ELSM information for all configured ports on the switch:

```
show elsm ports all
```

The following is sample output from this command:

```
ELSM Info Port 4:4
Link State                : Active
ELSM Link State           : Up
ELSM State                : Up
Hello Transmit State      : HelloRx(+)
Hello Time                : 100 msec
Hold Threshold            : 2
UpTimer Threshold         : 6
Auto Restart              : Enabled
Down Timeout              : 400 msec
Up Timeout                : 600 msec
Rx Hello+                 : 667960
Rx Hello-                 : 0
Tx Hello+                 : 667958
Tx Hello-                 : 0
ELSM Up/Down Count        : UP: 0    DOWN: 0
ELSM Info Port 4:4

Tx Hello-                 : 0
ELSM Up/Down Count        : UP: 0    DOWN: 0
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show fans

show fans {detail}

Description

Displays the status of the fans in the system.

Syntax Description

detail	The detail option is reserved for future use.

Default

N/A.

Usage Guidelines

Use this command to view detailed information about the health of the fans.

This status information may be useful for your technical support representative if you have a network problem.

The switch collects and displays the following fan information:

- State—The current state of the fan. Options are:
  - Empty: There is no fan installed.
  - Failed: The fan failed.
  - Operational: The fan is installed and working normally.
- NumFan—The number of fans in the fan tray.
- Fan Name, displayed as Fan-1, Fan-2, and so on (modular switches also include a description of the location, for example, Upper or Upper-Right)—Specifies the individual state for each fan in a fan tray and its current speed in revolutions per minute (rpm).

On modular switches, the output also includes the following information:

- PartInfo—Information about the fan tray, including the:
  - Serial number—A collection of numbers and letters, that make up the serial number of the fan. This is the first series of numbers and letters in the display.
  - Part number—A collection of numbers and letters, that make up the part number of the fan. This is the second series of numbers and letters in the display.
- Revision—The revision number of the fan.

- Odometer—Specifies the power-on date and how long the fan tray has been operating since it was first powered-on.

> **Note**
>
> For the X440 platform, "show fans" output does not display current speed and the displayed value is range of RPM at which the fans spin during its operation. The "show fans" output displays 11000 RPM if the fan status is good, and 0 RPM if the fan status is bad.

Example

The following command displays the status of the installed fans. If a fan is not installed, the state of the fan is Empty.

```
show fans
```

The following is sample output from a BlackDiamond 8800 series switch:

```
FanTray information:
State:                  Operational
NumFan:                 9
PartInfo:               0404X-00015 450102-00-01
Revision:               1.0
Odometer:               111 days 16 hours 30 minutes  since Oct-13-2004
Upper-Left   Fan-1:     Operational at 2880 RPM
Middle-Left  Fan-2:     Operational at 2820 RPM
Lower-Left   Fan-3:     Operational at 2820 RPM
Upper-Center Fan-4:     Operational at 2820 RPM
Center       Fan-5:     Operational at 2820 RPM
Lower-Center Fan-6:     Operational at 2880 RPM
Upper-Right  Fan-7:     Operational at 2880 RPM
Middle-Right Fan-8:     Operational at 2820 RPM
Lower-Right  Fan-9:     Operational at 2880 RPM
```

The following is sample output from a BlackDiamond X8 switch:

```
BD-X8.8 # show fans

History

This command was first available in an ExtremeXOS 10.1.

Information about the location of the fan tray for the BlackDiamond 8810 switch (upper-left, middle left, lower-left, upper- lower-center, upper-right, middle-right, and lower-right) was added to the show fans output in ExtremeXOS 11.1.

Information about the current speed in rpm for the Summit family switches was added to the show fans output in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

show log

show log {**messages** [**memory-buffer** | **nvram**]} {**events** {*event-condition* | *event-component*]} {**severity** *severity* {**only**}} {**starting** [**date** *date* **time** *time* | **date** *date*

| time *time*]} {**ending** [**date** *date* **time** *time* | **date** *date* | **time** *time*]} {**match** *regex*} {**chronological**}

Description

Displays the current log messages.

Syntax Description

messages	Specifies the target location from which to display the log messages.
memory-buffer	Show messages stored in volatile memory (default).
nvram	Show messages stored in NVRAM.
events	Show event messages.
event-condition	Specifies the event condition to display.
event-component	Specifies the event component to display.
severity	Specifies the minimum severity level to display (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be displayed
starting	Show messages with timestamps equal to or greater than that specified
date	Specifies the date, where date is *month (1-12)* / *day (1-31)* {/ *year (yyyy)*}.
time	Specifies the time, where time is *hour (0-23)* {: *minute (0-59)* {: *seconds (0-59)* {. *hundredths*}}}
ending	Show messages with timestamps equal to or less than that specified.
regex	Specifies a regular expression. Only messages that match the regular expression will be displayed.
chronological	Specifies displaying log messages in ascending chronological order (oldest to newest).

Default

The following defaults apply:

- messages—memory buffer
- event—no restriction (displays user-specified event)
- severity—none (displays everything stored in the target)
- starting, ending—if not specified, no timestamp restriction
- match—no restriction
- chronological—if not specified, show messages in order from newest to oldest

Usage Guidelines

Switch configuration and fault information is filtered and saved to target logs, in a memory buffer, and in NVRAM. Each entry in the log contains the following information:

- Timestamp—records the month and day of the event, along with the time (hours, minutes, seconds, and hundredths).
- Severity Level—indicates the urgency of a condition reported in the log. Table 21: Severity Levels Assigned by the Switch on page 1050Table describes the severity levels assigned to events.
- Component, Subcomponent, and Condition Name—describes the subsystem in the software that generates the event. This provides a good indication of where a fault might lie.
- Message—a description of the event occurrence. If the event was caused by a user, the user name is also provided.

This command displays the messages stored in either the internal memory buffer or in NVRAM. The messages shown can be limited by specifying a severity level, a time range, or a match expression. Messages stored in the target have already been filtered as events occurred, and specifying a severity or match expression on the show log command can only further limit the messages shown.

If the messages keyword is not present, the messages stored in the memory-buffer target are displayed. Otherwise, the messages stored in the specified target are displayed.

If the only keyword is present following the severity value, then only the events at that exact severity are included. Without the only keyword, events at that severity or more urgent are displayed. For example, severity warning implies critical, error, or warning, whereas severity warning only implies only warning.

Messages whose timestamps are equal or later than the starting time and are equal or earlier than the specified ending time will be shown if they also pass the severity requirements and match expression, if specified.

If a match phrase is specified, the formatted message must match the simple regular expression specified by match-expression for it to be shown.

A simple regular expression is a string of single characters including the dot character (.), which are optionally combined with quantifiers and constraints. A dot matches any single character while other characters match only themselves (case is significant). Quantifiers include the star character (*) that matches zero or more occurrences of the immediately preceding character or dot. Constraints include the caret character (^) that matches at the beginning of a message, and the currency character ($) that matches at the end of a message. Bracket expressions are not supported. There are a number of sources available on the Internet and in various language references describing the operation of regular expressions.

If the chronological keyword is specified, messages are shown from oldest to newest; otherwise, messages are displayed newest to oldest.

Severity Level

The severity levels are critical, error, warning, notice, and info, plus three severity levels for extended debugging, debug-summary, debug-verbose, and debug-data. In log messages, the severity levels are shown by four letter abbreviations. The abbreviated forms are:

- Critical—Crit
- Error—Erro
- Warning—Warn
- Notice—Noti

- Info—Info
- Debug-Summary—Summ
- Debug-Verbose—Verb
- Debug-Data—Data

The three severity levels for extended debugging, debug-summary, debug-verbose, and debug-data, require that debug mode be enabled (which may cause a performance degradation). See the command enable log debug-mode enable log debug-mode. The following table describes the security levels.

Table 21: Severity Levels Assigned by the Switch

Level	Description
Critical	A serious problem has been detected that is compromising the operation of the system and that the system cannot function as expected unless the situation is remedied. The switch may need to be reset.
Error	A problem has been detected that is interfering with the normal operation of the system and that the system is not functioning as expected.
Warning	An abnormal condition, not interfering with the normal operation of the system, has been detected that may indicate that the system or the network in general may not be functioning as expected.
Notice	A normal but significant condition has been detected, which signals that the system is functioning as expected.
Info (Informational)	A normal but potentially interesting condition has been detected, which signals that the system is functioning as expected and simply provides information or confirmation about the condition.
Debug-Summary	A condition has been detected that may interest a developer determining the reason underlying some system behavior.
Debug-Verbose	A condition has been detected that may interest a developer analyzing some system behavior at a more verbose level than provided by the debug summary information.
Debug-Data	A condition has been detected that may interest a developer inspecting the data underlying some system behavior.

Messages stored in NVRAM are in encoded format. To restore the ASCII text of a message, the version of ExtremeXOS loaded must be able to interpret the data written prior to reboot. When the encoded format for a particular message cannot be interpreted by the version of ExtremeXOS currently loaded, the messages are displayed in the following format:

```
03/21/2005 17:15:37.36 : NO MESSAGE DECODE; Missing component "epm" v24.2
DUMP-10: 00 14 C3 C1 00 11 00 1C 01 FF 00 08 65 70 6D 00 '............epm.'
DUMP-20: 08 FF 00 0C 00 18 00 02 65 70 6D 00 '........epm.'
```

Log entries remain in the NVRAM log after a switch reboot. Issuing a clear log command does not remove these static entries. To remove log entries from NVRAM, use the following command:

```
clear log messages nvram
```

Example

The following command displays messages with a critical severity:

```
show log severity critical
```

The following command displays messages with warning, error, or critical severity:

```
show log severity warning
```

The following is sample output from a modular switch:

```
11/12/2004 00:38:10.30 <Warn:dm.Warn> MSM-A: Insufficient Power to power-on
Slot-7
11/12/2004 00:38:08.77 <Warn:dm.Warn> MSM-A: Slot-7 being Powered OFF due to
insuf
ficient power
11/12/2004 00:36:23.77 <Warn:dm.Warn> MSM-A: Slot-7 being Powered OFF due to
insuf
ficient power
...
A total of 83 log messages were displayed.
```

The following command displays messages containing the string “slot 2”:

```
show log match "slot 2"
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show log components

show log components {*event component* } {**version**}

Description

Displays the name, description and default severity for all components.

Syntax Description

event component	Specifies the component to display.
version	Specifies the version number of the component.

Default

N/A.

Usage Guidelines

This command displays the name, description, and default severity defined for the specified components or subcomponents.

Depending on the software version running on your switch or your switch model, additional or different component information might be displayed.

Example

The following command displays the log components:

```
show log components
```

The following is sample output from this command:

```
Severity
Component           Title                                          Threshold

A total of 143 component(s) were displayed.
```

The following command displays the version number of the VRRP component:

```
show log components vrrp version
```

The following is sample output from this command:

```
Component           Title                                          Version
------------------- ---------------------------------------------- -------
VRRP                Config/State messages                            2.4
Advert      Subsystem description                          3.1
System      System/Library messages                        3.2
A total of 3 component(s) were displayed.
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show log configuration

show log configuration

Description

Displays the log configuration for switch log settings, and for certain targets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the log configuration for all targets. The state of the target, enabled or disabled is displayed. For the enabled targets, the associated filter, severity, match expression, and format is displayed. The debug mode state of the switch is also displayed.

Example

The following command displays the configuration of all the log targets and all existing filters:

```
show log configuration
```

The following is sample output from this command:

```
Debug-Mode: Enabled
Log Target      : memory-buffer
Enabled ?   : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Debug-Data (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condit
ion>
Buffer size : 1000 messages
Log Target      : nvram
Enabled ?   : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Warning (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condit
ion>
Log Target      : console
Enabled ?   : no
Filter Name : DefaultFilter
Match regex : Any
Severity    : Info (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh
<Severity:Component.SubComponent.Condition>
Log Filter Name: DefaultFilter
I/                                          Severity
E  Comp.   Sub-comp.   Condition            CEWNISVD
-  ------- ----------- ---------------------- --------
I  All                                      --------
Log Filter Name: myFilter
I/                                          Severity
E  Comp.   Sub-comp.   Condition            CEWNISVD
```

```
-  ------- ----------- ---------------------- --------
I  STP                                        --------
Include/Exclude: I - Include,  E - Exclude
Component Unreg: * - Component/Subcomponent is not currently registered
Severity Values: C - Critical,  E - Error,  W - Warning,  N - Notice,  I -
Info
Debug Severity : S - Debug-Summary,  V - Debug-Verbose,  D - Debug-Data
+ - Debug Severities, but log debug-mode not enabled
If Match parameters present:
Parameter Flags: S - Source,  D - Destination, (as applicable)
I - Ingress,  E - Egress,  B - BGP
Parameter Types: Port - Physical Port list,  Slot - Physical Slot #
MAC  - MAC address,  IP - IP Address/netmask,  Mask - Netmask
VID  - Virtual LAN ID (tag),  VLAN - Virtual LAN name
L4   - Layer-4 Port #,  Num  - Number,  Str  - String
Nbr  - Neighbor, Rtr  - Routerid, EAPS - EAPS Domain
Proc - Process Name
Strict Match   : Y - every match parameter entered must be present in the
event
N - match parameters need not be present in the event
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show log configuration filter

show log configuration filter {*filter_name*}

Description

Displays the log configuration for the specified filter.

Syntax Description

filter_name	Specifies the filter to display.

Default

If no options are specified, the command displays the configuration for all filters.

Usage Guidelines

This command displays the configuration for filters.

Example

The following command displays the configuration for the filter, myFilter:

```
show log configuration filter myFilter
```

The following is sample output from this command:

```
Log Filter Name: myFilter
I/                                                Severity
E  Comp.   Sub-comp.   Condition                  CEWNISVD
-  ------- ----------- ---------------------- --------
I  STP                                            --------
I  aaa                                            --------
Include/Exclude: I - Include,  E - Exclude
Component Unreg: * - Component/Subcomponent is not currently registered
Severity Values: C - Critical,  E - Error,  W - Warning,  N - Notice,  I -
Info
* - Pre-assigned severities in effect for specified component
Debug Severity : S - Debug-Summary,  V - Debug-Verbose,  D - Debug-Data
+ - Debug Severities, but log debug-mode not enabled
If Match parameters present:
Parameter Flags: S - Source,  D - Destination, (as applicable)
I - Ingress,  E - Egress,  B - BGP
Parameter Types: Port - Physical Port list,  Slot - Physical Slot #
MAC  - MAC address,  IP - IP Address/netmask,  Mask - Netmask
VID  - Virtual LAN ID (tag),  VLAN - Virtual LAN name
L4   - Layer-4 Port #,  Num  - Number,  Str  - String
Nbr  - Neighbor, Rtr  - Routerid, EAPS - EAPS Domain
Proc - Process Name
Strict Match   : Y - every match parameter entered must be present in the
event
N - match parameters need not be present in the event
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show log configuration target

show log configuration target {**console** | **memory-buffer** | **nvram** | **primary-msm** | **primary-node** | **backup-msm** | **backup-node** | **session** | **syslog** {*ipaddress* | *ipPort* | **vr** *vr_name*} {[**local0...local7**]}}

Description

Displays the log configuration for the specified target.

Syntax Description

console	Show the log configuration for the console display.
memory-buffer	Show the log configuration for volatile memory.
nvram	Show the log configuration for NVRAM.
primary-msm	Specifies the primary MSM.  Note This parameter is available only on modular switches.
primary-node	Specifies the primary node in a stack.
backup-msm	Specifies the backup MSM.  Note This parameter is available only on modular switches
backup-node	Specifies the backup-node in a stack.
session	Show the log configuration for the current session (including console display).
syslog	Show the configuration for the specified syslog target.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address.  Note User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.

Default

If no options are specified, the command displays the configuration for the current session and console display.

If a virtual router is not specified, VR-Mgmt is used.

Usage Guidelines

This command displays the log configuration for the specified target. The associated filter, severity, match expression, and format is displayed.

Example

The following command displays the log configuration:

```
show log configuration target
```

The following is sample output from this command:

```
Log Target      : memory-buffer
Enabled ?   : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Debug-Data (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condit
ion>
Buffer size : 1000 messages
Log Target      : nvram
Enabled ?   : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Warning (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condit
ion>
Log Target      : console
Enabled ?   : no
Filter Name : DefaultFilter
Match regex : Any
Severity    : Info (through Critical)
Format      : MM/DD/YYYY HH:MM:SS.hh <Severity:Component.SubComponent.Condit
ion>
Log Target      : primary-msm
Enabled     : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Warning (through Critical)
Log Target      : backup-msm
Enabled     : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Warning (through Critical)
```

History

This command was first available in ExtremeXOS 10.1.

The primary-msm and backup-msm options were first available in ExtremeXOS 11.0.

The ipPort parameter was first available in ExtremeXOS 11.0.

The local0 ... local7 keywords were made optional in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show log configuration target xml-notification

show log configuration target xml-notification {*xml_target_name*}

Description

Displays XML target information.

Syntax Description

xml_target_name	Specifies the configured xml notification target.

Default

N/A.

Usage Guidelines

Use this command to display XML target information.

Example

The following command displays XML target information for all targets:

```
show log configuration target xml-notification
```

Following is sample output from the command:

```
Log Target      : xml-notification (sqa)
Enabled     : yes
Filter Name : DefaultFilter
Match regex : Any
Severity    : Info (through Critical)
Log Target      : xml-notification (epi)
Enabled     : yes
Filter Name : xmlc_filter_epi
Match regex : Any
Severity    : Info (through Critical)
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

show log counters

show log counters {*even condition* | [**all** | *even component*]} {**include** | **notified** | **occurred**} {**severity** *severity* {**only**}}

Description

Displays the incident counters for events.

Syntax Description

event condition	Specifies the event condition to display.
all	Specifies that all events are to be displayed.
event component	Specifies that all the events associated with a particular component or subcomponent should be displayed.
include	Specifies if one or more targets should be included in this event.
notified	Specifies the number of times this event has occurred.
occurred	Specifies the number of times this event has occurred since the last clear or reboot.
severity	Specifies the minimum severity level of events to display (if the keyword only is omitted).
only	Specifies that only events of the specified severity level are to be displayed

Default

If severity is not specified, then events of all severity are displayed.

Usage Guidelines

This command displays the incident counters for each event specified. Two incident counters are displayed. One counter displays the number of times an event has occurred, and the other displays the number of times that notification for the event was made to the system (an incident record was injected into the system for further processing). Both incident counters reflect totals accumulated since reboot or since the counters were cleared using the clear log counters or clear counters command, regardless of whether it was filtered or not.

The keywords include, notified, and occurred only display events with non-zero counter values for the corresponding counter.

This command also displays a reference count (the column titled Rf in the output). The reference count is the number of enabled targets receiving notifications of this event.

See the command show log show log for more information about severity levels.

To get a listing of the event conditions in the system, use the following command:

```
show log events
```

To get a listing of the components present in the system, use the following command:

```
show log components
```

Example

The following command displays the event counters for event conditions of severity debug-summary or greater in the component STP.InBPDU:

```
show log counters stp.inbpdu severity debug-summary
```

The following is sample output from this command:

```
Comp    SubComp     Condition               Severity      Occurred  In
Notified
------- ----------- ----------------------- ------------ --------  --
--------
STP     InBPDU      Drop                    Error                0  Y
0
STP     InBPDU      Ign                     Debug-Summary        0  N
0
STP     InBPDU      Mismatch                Warning              0  Y
0
Occurred  : # of times this event has occurred since last clear or reboot
Flags     : (*) Not all applications responded in time with there count values
In(cluded): Set to Y(es) if one or more targets filter includes this event
Notified  : # of times this event has occurred when 'Included' was Y(es)
```

The following command displays the event counters for the event condition PDUDrop in the component STP.InBPDU:

```
show log counters "STP.InBPDU.Drop"
```

The following is sample output from this command:

```
Comp    SubComp     Condition               Severity      Occurred  In
Notified
------- ----------- ----------------------- ------------ --------  --
--------
STP     InBPDU      Drop                    Error                0  Y
```

```
0
Occurred  : # of times this event has occurred since last clear or reboot
Flags     : (*) Not all applications responded in time with there count values
In(cluded): Set to Y(es) if one or more targets filter includes this event
Notified  : # of times this event has occurred when 'Included' was Y(es)
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show log events

show log events [*event condition* | [**all** | *event component*] {**severity** *severity* {**only**}}] {**details**}

Description

Displays information about the individual events (conditions) that can be logged.

Syntax Description

event condition	Specifies the event condition to display.
all	Specifies that all events are to be displayed.
event component	Specifies that all the events associated with a particular component should be displayed.
severity	Specifies the minimum severity level of events to display (if the keyword only is omitted).
only	Specifies that only events of the specified severity level are to be displayed.
details	Specifies that detailed information, including the message format and parameter types, be displayed.

Default

If severity is not specified, then events of all severity are displayed. If detail is not specified, then summary only information is displayed.

Usage Guidelines

This command displays the mnemonic, message format, severity, and parameter types defined for each condition in the event set specified.

See the command show log show log for more information about severity levels.

When the detail option is specified, the message format is displayed for the event conditions specified. The message format parameters are replaced by the value of the parameters when the message is generated.

To get a listing of the components present in the system, use the following command:

```
show log components
```

Example

The following command displays the event conditions of severity debug-summary or greater in the component STP.InBPDU:

```
show log events stp.inbpdu severity debug-summary
```

The following is sample output from this command:

```
Comp    SubComp     Condition               Severity      Parameters
------- ----------- ----------------------- ------------- ----------
STP     InBPDU      Drop                    Error          2 total
STP     InBPDU      Ign                     Debug-Summary  2 total
STP     InBPDU      Mismatch                Warning        2 total
```

The following command displays the details of the event condition PDUTrace in the component STP.InBPDU:

```
show log events stp.inbpdu.pdutrace details
```

The following is sample output from this command:

```
Comp    SubComp     Condition               Severity      Parameters
------- ----------- ----------------------- ------------- ----------
STP     InBPDU      Trace                   Debug-Verbose  2 total
0 - string
1 - string (printf)
Port=%0%: %1%
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show ports rxerrors

show ports {*port_list* | **stack-ports** *stacking-port-list*} **rxerrors** {**no-refresh**}

Description

Displays real-time receive error statistics. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
stacking-port-list	Specifies one or more stacking ports or slots. Applies to SummitStack and the Summit family switches only.
no-refresh	Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the receive errors at the time the command is issued. This setting is not saved.

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, receive error statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time receive error statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port receive errors.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Receive Error Information

The switch collects the following port receive error information:

- Port Number
- Link State—The current state of the link. Options are:
  - Active (A)—The link is present at this port.
  - Ready (R)—The port is ready to accept a link.
  - Not Present (NP)—The port is configured, but the module is not installed in the slot (modular switches only).
  - Loopback (L)—The port is in Loopback mode.

- Receive Bad CRC Frames (RX CRC)—The total number of frames received by the port that were of the correct length, but contained a bad FCS value.
- Receive Oversize Frames (RX Over)—The total number of good frames received by the port greater than the supported maximum length of 1,522 bytes.
- Receive Undersize Frames (RX Under)—The total number of frames received by the port that were less than 64 bytes long.
- Receive Fragmented Frames (RX Frag)—The total number of frames received by the port were of incorrect length and contained a bad FCS value.
- Receive Jabber Frames (RX Jabber)—The total number of frames received by the port that was of greater than the support maximum length and had a Cyclic Redundancy Check (CRC) error.
- Receive Alignment Errors (RX Align)—The total number of frames received by the port that occurs if a frame has a CRC error and does not contain an integral number of octets.
- Receive Frames Lost (RX Lost)—The total number of packets dropped due to the memory queue being full.

Port Monitoring Display Keys

For information about the available port monitoring display keys, see the show ports statistics command.

Example

The following command displays receive error statistics for slot 5, ports 4 through 7 on a modular switch with auto-refresh disabled:

```
show ports 5:4-5:7 rxerrors no-refresh
```

The following is sample output from this command:

```
Port Rx Error monitor
Port         Link    Rx      Rx      Rx       Rx     Rx         Rx       Rx
State   Crc    Over    Under    Frag   Jabber      Align    Lost
================================================================================
==
5:4           R       0       0       0       0       0         0         0
5:5           R       0       0       0       0       0         0         0
5:6           R       0       0       0       0       0         0         0
5:7           R       0       0       0       0       0         0         0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
```

The following command displays receive error statistics for all ports on the Summit family switches with auto-refresh enabled (the default behavior):

```
show ports rxerrors
```

The following is sample truncated output from this command:

```
Port Rx Error Monitor Tue Jul  5 15:07:13 UTC 2005
Port     Link     Rx      Rx      Rx        Rx      Rx         Rx         Rx
State    Crc    Over    Under     Frag    Jabber      Align      Lost
================================================================================
==

================================================================================
==
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

Platform Availability

This command is available on all platforms.

The stack-ports option is available only on SummitStack and the Summit family switches.

show ports statistics

show ports {*port_list* | **stack-ports** *stacking-port-list*} **statistics** {**no-refresh**}

Description

Displays real-time port statistic information. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

stacking-port-list	Specifies one or more stacking slots and ports. Applies to SummitStack and the Summit family switches only.
port_list	Specifies one or more ports or slots and ports.
no-refresh	Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the port statistics at the time the command is issued. This setting is not saved.

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time port statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port statistics.

Jumbo frame statistics are displayed for switches only that are configured for jumbo frame support.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Statistics

The switch collects the following port statistic information:

- Port Number
- Link State—The current state of the link. Options are:
  - Active (A)—The link is present at this port.
  - Ready (R)—The port is ready to accept a link.
  - Not Present (NP)—The port is configured, but the module is not installed in the slot (modular switches only).
  - Loopback (L)—The port is in Loopback mode.
- Transmitted Packet Count (Tx Pkt Count)—The number of packets that have been successfully transmitted by the port.
- Transmitted Byte Count (Tx Byte Count)—The total number of data bytes successfully transmitted by the port.
- Received Packet Count (RX Pkt Count)—The total number of good packets that have been received by the port.
- Received Byte Count (RX Byte Count)—The total number of bytes that were received by the port, including bad or lost frames. This number includes bytes contained in the Frame Check Sequence (FCS), but excludes bytes in the preamble.
- Received Broadcast (RX Bcast)—The total number of frames received by the port that are addressed to a broadcast address.

Note

On Summit switches, when a broadcast jumbo frame is sent, the RX Bcast counter is not updated. The RX Pkt counter is updated to reflect the received broadcast jumbo frames.

- Received Multicast (RX Mcast)—The total number of frames received by the port that are addressed to a multicast address.

Port Monitoring Display Keys

The following table describes the keys used to control the display that appears if auto-refresh is enabled (the default behavior).

Table 22: Port Monitoring Display Keys with Auto-Refresh Enabled

Key(s)	Description
U	Displays the previous page of ports.
D	Displays the next page of ports.
[Esc]	Exits from the screen.
0	Clears all counters.

The following table describes the keys used to control the display that appears if you auto-refresh is disabled.

Table 23: Port Monitoring Displays Keys with Auto-Refresh Disabled

Key	Description
Q	Exits from the screen.
[Space]	Displays the next page of ports.

Example

The following command displays port statistics for slot 1, ports 1 through 2 on a modular switch with auto-refresh disabled:

```
show ports 1:1-1:2 statistics no-refresh
```

The following is sample output from this command:

```
Port Statistics
Port     Link      Tx Pkt    Tx Byte     Rx Pkt    Rx Byte       Rx       Rx
State     Count     Count       Count     Count         Bcast    Mcast
================================================================================
==
1:1         A       7241    2722608      14482    3968068          0
0
1:2         R          0          0          0          0          0
0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
```

The following command displays port statistics for all ports on the Summit family switches with auto-refresh enabled (the default behavior):

```
show ports statistics
```

The following is truncated sample output from this command:

```
Port Statistics                                  Tue Jul  5 14:18:34 UTC 2005
Port     Link        Tx Pkt     Tx Byte       Rx Pkt     Rx Byte   Rx      Rx
State       Count      Count         Count      Count     Bcast   Mcast
================================================================================
==

16              R           0           0           0           0
0       0
17              R           0           0           0           0
0       0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down ESC->exitPort Statistics
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

Platform Availability

This command is available on all platforms.

The stack-ports option is available on SummitStack and the Summit Family switches only.

show ports txerrors

show ports {*port_list* | **stack-ports** *stacking-port-list*} **txerrors** {**no-refresh**}

Description

Displays real-time transmit error statistics. The switch automatically refreshes the output unless otherwise specified.

Syntax Description

stacking-port-list	Specifies one or more stacking slot ports for display. Applies to SummitStack and Summit family switches only.
port_list	Specifies one or more ports or slots and ports.
no-refresh	Specifies that auto-refresh is disabled. The output provides a real-time snapshot of the transmit errors at the time the command is issued. This setting is not saved.

Default

The switch automatically refreshes the output.

Usage Guidelines

If you do not specify a port number or range of ports, error statistics are displayed for all ports.

If you do not specify the no-refresh parameter, the switch automatically refreshes the output (this is the default behavior).

If you specify the no-refresh parameter, the output provides a snapshot of the real-time transmit error statistics at the time you issue the command and displays the output in page-by-page mode (this was the default behavior in ExtremeXOS 11.2 and earlier). This setting is not saved; therefore, you must specify the no-refresh parameter each time you want a snapshot of the port transmit errors.

This status information may be useful for your technical support representative if you have a network problem.

Collected Port Transmit Error Information

The switch collects the following port transmit error information:

- Port Number
- Link State—The current state of the link. Options are:
  - Active (A)—The link is present at this port.
  - Ready (R)—The port is ready to accept a link.
  - Not Present (NP)—The port is configured, but the module is not installed in the slot (modular switches only).
  - Loopback (L)—The port is in Loopback mode.
- Transmit Collisions (TX Coll)—The total number of collisions seen by the port, regardless of whether a device connected to the port participated in any of the collisions.
- Transmit Late Collisions (TX Late Coll)—The total number of collisions that have occurred after the port's transmit window has expired.
- Transmit Deferred Frames (TX Deferred)—The total number of frames that were transmitted by the port after the first transmission attempt was deferred by other network traffic.
- Transmit Errored Frames (TX Errors)—The total number of frames that were not completely transmitted by the port because of network errors (such as late collisions or excessive collisions).

- Transmit Lost Frames (TX Lost)—The total number of transmit frames that do not get completely transmitted because of buffer problems (FIFO underflow).
- Transmit Parity Frames (TX Parity)—The bit summation has a parity mismatch.

Port Monitoring Display Keys

For information about the available port monitoring display keys, see the show ports statistics command.

Example

The following command displays transmit error statistics for slot 5, ports 4 through 7 on a modular switch with auto-refresh disabled:

```
show ports 5:4-5:7 txerrors no-refresh
```

The following is sample output from this command:

```
Port Transmission errors
Port         Link    Tx      Tx          Tx          Tx        Tx     Tx
State   Coll    Late coll   Deferred    Errors    Lost   Parity
================================================================================
==
5:4         R        0        0          0         0        0       0
5:5         R        0        0          0         0        0       0
5:6         R        0        0          0         0        0       0
5:7         R        0        0          0         0        0       0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port not present, L-Loopback
```

The following command displays transmit error statistics for all ports on a Summit switch:

```
show ports txerrors
```

The following is a truncated sample output from this command:

```

0          0
17              R          0            0            0          0
0          0
================================================================================
==
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->Clear Counters  U->page up  D->page down ESC->exitPort Tx Error
```

History

This command was first available in ExtremeXOS 10.1.

The link state information was updated to include NP-Port not present in ExtremeXOS 11.2.

Support for the auto-refresh functionality and the no-refresh parameter were added in ExtremeXOS 11.3. Auto-refresh continually updates the display. The no-refresh parameter takes a real-time snapshot of the display at the time you issue the command.

Platform Availability

This command is available on all platforms.

show ports vlan statistics

show ports {*port_list*} **vlan statistics** {**no-refresh**}

Description

Displays VLAN statistics at the port level.

Syntax Description

port_list	Specifies one or more ports or slots and ports. Can be one or more port numbers. May be in the form: 1, 2, 3-5, 1:*, 1:5, 1:6-1:8.
no-refresh	Specifies that there is no continuous refresh. The prompt comes back to the user after fetching statistics once.

Default

N/A.

Usage Guidelines

This command is used in conjunction with the configure ports [<port_list>|all] monitor vlan <vlan_name> {rx-only | tx-only} command.

Example

The following command displays statistics for the ports 1-2 on slot 5 of a BlackDiamond 12804 switch:

```
show ports 5:1-2 vlan stats
Displays the vlan statistics in a real time countinous refresh mode or no-
refresh mode.
* (debug) BD-12804.31 # show ports 5:1-2 vlan stat
Port VLAN Statistics                                    Wed Mar 28 10:52:59 2007
Port    Vlan      Rx Frames          Rx Byte         Tx Frame        Tx Byte
Count          Count            Count          Count
================================================================================
==
5:1      Default  318750522     20400046784        318750588      20400051672
5:2      Default  292811491     18739948736        292811975      18739980504
0->Clear Counters  U->page up  D->page down ESC->exit
```

For ports that do not support transmit statistics, a '-' will be displayed. For ports that do not support transmit byte counters, a '-' will be displayed for that row and column. Similarly, configuration using rx-only or tx-only will result in the display of "-"'s in the appropriate rows and columns.

History

This command was first available in ExtremeXOS 12.0.

Support for BlackDiamond 8000 series modules, SummitStack, and Summit family switches was added in ExtremeXOS 12.5.

Support for BlackDiamond X8 series switches was added in ExtremeXOS 15.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, SummitStack, and Summit family switches.

show rmon memory

show rmon memory {**detail** | *memoryType*}

Description

Displays RMON specific memory usage and statistics.

Syntax Description

detail	Displays detailed information.
memoryType	Specifies the type of memory usage and statistics to display.

Default

N/A.

Usage Guidelines

If you do not specify the detailed keyword or a enter a specific RMON memory type, the output contains usage information for all memory types.

Example

The following command displays RMON memory statistics:

```
show rmon memory
```

The following is sample output from this command:

```
RMON Memory Information

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show sflow configuration

show sflow {configuration}

Description

Displays the current sFlow configuration.

Syntax Description

This command has no arguments or variables

Default

N/A.

Usage Guidelines

This command displays the sFlow configuration of your system.

The following fields are displayed:

- Global Status—sFlow is globally enabled or disabled
- Polling interval—How often the hardware is polled for statistics, in seconds
- Sampling rate—Packets are sampled, on average, once for every rate-number of packets
- Maximum cpu sample limit—Maximum number of packets per second sampled before sample throttling takes effect
- Agent IP—IP address inserted into the sFlow data packets to identify the sFlow switch
- Collectors—To which IP address and port, and from which virtual router, the sFlow packets are sent
- Port Status—Enabled or disabled for statistics gathering
- Port Sample-rate—Shows the sampling rate configured for the port and the actual rate if CPU throttling has taken effect
- Port Subsampling factor—See the command configure sflow ports sample-rate for details

Example

To display the sFlow configuration on your system, use the following command:

```
show sflow
```

The following is an example of the show sflow configuration command :

```
SFLOW Global Configuration
Global Status: enabled
Polling interval: 20
Sampling rate: 8192
Maximum cpu sample limit: 200000
SFLOW Configured Agent IP: 0.0.0.0
Operational Agent IP: 10.127.11.88
Collectors

SFLOW Port Configuration
Port  Status           Sample-rate         Subsampling   Sflow-type

                       Config / Actual        factor      Ingress / Egress
5:21   enabled           8192 / 8192            1        Disabled / Enabled
```

History

This command was first available in an ExtremeXOS 11.0.

The output for the ingress and egress keywords was added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

show sflow statistics

show sflow statistics

Description

Displays sFlow statistics.

Syntax Description

This command has no arguments or variables

Default

N/A.

Usage Guidelines

This command displays sFlow statistics for your system.

The following fields are displayed:

- Received frames—Number of frames received on sFlow enabled ports
- Sampled Frames—Number of packets that have been sampled by sFlow
- Transmitted Frames—Number of UDP packets sent to remote collector(s)
- Broadcast Frames—Number of broadcast frames received on sFlow enabled ports
- Multicast Frames—Number of multicast frames received on sFlow enabled ports
- Packet Drops—Number of samples dropped

Example

To display sFlow statistics for your system, use the following command:

```
show sflow statistics
```

The output from this command is similar to the following:

```
SFLOW Statistics

Received frames     : 1159044921
Sampled Frames      : 104944
Transmitted Frames  : 10518
Broadcast Frames    : 0
```

```
Multicast Frames    : 1055652
Packet Drops        : 0
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show temperature

show temperature

Description

Depending on the platform, this command displays the current temperature of the I/O modules, management modules, power supply controllers, XGM-2xn card, and the switch.

On a stack, the command displays the current temperature of the modules in each slot.

Syntax Description

This command has no arguments or variables

Default

N/A.

Usage Guidelines

Depending on the software version running on your switch or your switch model, additional or different temperature information might be displayed.

Modular Switches Only

Use this command to display the temperature in Celsius and the current status of the following installed components in the switch:

- Management modules (MSM/MM)
- I/O modules
- Power controllers

The switch monitors the temperature of each component and generates a warning if the temperature exceeds the normal operating range. If the temperature exceeds the minimum/maximum limits, the switch shuts down the overheated module.

Summit Family Switches Only

Use this command to display the temperature in Celsius and the current status of the following components:

- Switch
- XGM-2xn card

SummitStack Only.

Use this command to display the temperature in Celsius and the current status of the following components:

- All switches in the stack
- XGM-2xn cards if present

The switch monitors its temperature and generates a warning if the temperature exceeds the normal operating range. If the temperature exceeds the maximum limit, the show switch output indicates the switch in an OPERATIONAL (Overheat) mode, and the show temperature output indicates an error state due to overheat.

Displaying the Temperature of Other Installed Components—Modular Switches Only

You can also view the temperature of the power supplies and the fan trays in the switch.

To view the temperature of the power supplies installed in a modular switch, use the following command:

```
show power {<ps_num>} {detail}
```

Example

Depending on the platform, the following command displays the temperature of various switch components:

```
show temperature
```

In the BlackDiamond X8 switch, the temperature shown is the adjusted maximum of all temperatures from all monitored devices on the card. This is due to the fact that individual device temperature sensors are monitored within the device's operating temperature range. The following is sample output from a BlackDiamond X8 switch:

```
BD-X8.3 # show temperature
Field Replaceable Units               Temp (C)   Status   Min  Normal   Max
-------------------------------------------------------------------------
Slot-1         : BDXA-10G48X            71.00    Normal     0   25-100  107
Slot-2         : BDXA-10G48X            71.00    Normal     0   25-100  107
Slot-3         :
```

```
Slot-4          :
Slot-5          :
Slot-6          : BDXA-40G24X            86.00    Normal     0   25-100  107
Slot-7          : BDXA-40G24X            86.00    Normal     0   25-100  107
Slot-8          : BDXA-40G24X            90.00    Normal     0   25-100  107
FM-1            : BDXA-FM20T             85.00    Normal     0   25-100  107
FM-2            : BDXA-FM20T             83.00    Normal     0   25-100  107
FM-3            : BDXA-FM20T             88.00    Normal     0   25-100  107
FM-4            : BDXA-FM20T             88.00    Normal     0   25-100  107
MM-A            : BDX-MM1                79.00    Normal     0   25-100  105
MM-B            : BDX-MM1                88.00    Normal     0   25-100  105
```

The following is sample output from a BlackDiamond 8810 switch:

```
BD-8810.7 # show temperature
Field Replaceable Units               Temp (C)   Status   Min  Normal  Max
-------------------------------------------------------------------------
Slot-1          : 8900-10G24X-c          37.00    Normal   -10    0-55  65
Slot-2          : 10G8Xc                 33.00    Normal   -10    0-50  60
Slot-3          :
Slot-4          :
Slot-5          : G8Xc                   31.50    Normal   -10    0-50  60
Slot-6          :
Slot-7          :
Slot-8          : 10G4Xa                 26.00    Normal   -10    0-50  60
Slot-9          :
Slot-10         : 8900-G96T-c            38.50    Normal   -10    0-55  65
MSM-A           : 8900-MSM128            31.00    Normal   -10    0-55  65
MSM-B           : 8900-MSM128            31.00    Normal   -10    0-55  65
PSUCTRL-1       :                        34.04    Normal   -10    0-50  60
PSUCTRL-2       :                        35.79    Normal   -10    0-50  60
```

The following is sample output from a Summit X150 series switch:

```
X150-24p.3 # show temperature
Field Replaceable Units               Temp (C)   Status   Min  Normal  Max
-------------------------------------------------------------------------
Switch          : X150-24p               30.00    Normal   -10    0-52  57
```

The following is sample output from a SummitStack of 8 nodes:

```
Slot-3 Stack.1 # show temperature
Field Replaceable Units               Temp (C)   Status   Min  Normal  Max
-------------------------------------------------------------------------
Slot-1          :
Slot-2          : X250e-48t              34.50    Normal   -10    0-54  59
Slot-3          : X450a-48t              36.50    Normal   -10    0-66  67
Slot-4          :
Slot-5          :
Slot-6          :
Slot-7          :
Slot-8          :
Slot-3 Stack.2 #
```

History

This command was first available in an ExtremeXOS 10.1.

Information about the power controller(s), a component status column, and the minimum, normal, and maximum temperature ranges of the components was added to the show temperature output in ExtremeXOS 11.0.

Information about the XGM-2xn card was added to the show temperature output in ExtremeXOS 11.2.

Support for stacking was added to show temperature output in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

show version

show version {**detail** | **process** *name* | **images** {**partition** *partition*} {**slot** *slotid*} }

Description

Displays the hardware serial and version numbers, the software version currently running on the switch, and (if applicable) the software version running on the modules and power controllers.

Syntax Description

detail	Specifies display of slot board name and chassis or platform name.
process	Specifies display of all of the processes on the switch.
name	Specifies display of a specific process on the switch.
images	Specifies the display of installed images.
partition	Specifies display of a specific partition (primary or secondary).
slotid	Specifies display of an MSM/MM in a specific slot (A or B).  Note This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

The following describes the information displayed when you execute the show version or show version detail commands:

- Part Number—A collection of numbers and letters that make up the part number of the switch and when applicable the hardware components installed in a modular switch.
- Serial Number—A collection of numbers and letters that make up the serial number of the switch and when applicable the hardware components installed in a modular switch.

Note

For information about the physical location of the serial number on your switch, refer to the section that describes your specific switch model in the hardware documentation.

- Image—The ExtremeXOS software version currently running on the switch. If you have two software images downloaded on the switch, only the currently running ExtremeXOS version information is displayed. The information displayed includes the major version number, minor version number, a specific patch release, and the build number. The software build date is also displayed.
- BootROM—The BootROM version currently running on the switch.
- Diagnostics—For BlackDiamond 8800 series switches, this is the version number of operational diagnostics software that runs on the I/O module included in the particular version of ExtremeXOS. For BlackDiamond X8 switches, this is the version number of operational diagnostics software that runs either on the Management Module (MM) or the I/O and Fabric Modules (FM), respectively, included in the particular version of ExtremeXOS.
- FPGA—The field-programmable gate array firmware version currently running on the module (BlackDiamond X8 switches only).

Depending on the model of your switch and the software running on your switch, different version information may be displayed.

Note

The information displayed does not include the I/O version number on the BlackDiamond 8800 series switch. The I/O version number includes the major, minor, and I/O version number, not the patch and build numbers.

If you use the process option, you will see the following information about the processes running on the switch:

- Card—The location (MSM/MM) where the process is running on a modular switch.
- Process Name—The name of the process.
- Version—The version number of the process.
- BuiltBy—The name of the software build manager.
- Link Date—The date the executable was linked.

Example

The following command displays the hardware and software versions currently running on the switch:

```
show version
```

The following is sample output from a BlackDiamond X8 switch:

```
BD-X8.5 # show version
Chassis     : 800427-00-01 1135G-02182 Rev 1.0

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show vlan statistics

show vlan {*vlan_name*} **statistics** {**no-refresh**}

Description

Displays VLAN statistics at the VLAN level.

Syntax Description

vlan_name	Specifies to display VLAN statistics from the VLAN with this name.
no-refresh	Specifies that there is no continuous refresh. The prompt comes back to the user after fetching statistics once.

Default

N/A.

Usage Guidelines

This command displays statistics based on the sum of the statistics for individual ports. Use it to display the VLAN statistics monitored using the configure ports [<port_list>|all] monitor vlan <vlan_name> {rx-only | tx-only} command.

Example

The following command displays VLAN statistics:

```
* (debug) BD-12804.17 # show vlan statistics no-refresh
Vlan                        Rx Total                    Rx
Byte                        Tx Total                Tx Byte
                     Frames
Count                        Frames                    Count
================================================================================
=
Default                       30251013
7326296                                          22034
901840
================================================================================
=
```

If the VLAN contains ports that do not support a certain type of VLAN statistic, such as transmit statistics or byte counters, then a dash character ('-') will be displayed in that column.

History

This command was first available in ExtremeXOS 12.0.

Support for BlackDiamond 8000 series modules, SummitStack, and Summit family switches was added in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond X8, BlackDiamond 8000 series modules, SummitStack, and Summit family switches.

show xml-notification configuration

show xml-notification configuration {*target*}

Description

Displays the configuration of the Web server target.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to display information about the configuration of the Web server target. If a target is not specified, all configured targets are displayed.

Example

The following command displays the configuration of the configured targets:

```
show xml-notification configuration
```

The following is sample output from this command:

```
Target Name          : sqa
**Server URL           : http://10.255.129.22:8080/xos/webservice (VR-Mgmt)
```

```
Server User Name     : admin
Enabled              : yes
Queue Size           : 100
Connection Status    : connected
Configured Modules   : ems,idmgr
Target Name          : epi
**Server URL           : http://10.255.59.6:8080/xos/webservice (VR-Finance)
Server User Name     : admin
Enabled              : yes
Queue Size           : 100
Connection Status    : connected
Configured Modules   : ems
Target Name          : test3
**Server URL           : https://10.120.91.64:8443/xos/webservice (VR-Mgmt)
Server User Name     : admin
Enabled              : yes
Queue Size           : 100
Connection Status    : not connected
Configured Modules   : ems
Target Name          : testingcorrect
**Server URL           : http://10.66.254.211:8080/xos/webservice (VR-Mgmt)
Server User Name     : admin
Enabled              : no
Queue Size           : 100
Connection Status    : not connected
Configured Modules   : idMgr,ems
```

Note

When a particular VR has been specified in the configuration process, that VR is displayed next to the URL. When no VR is specified since the parameter is optional, the default VR supplied by the XML client is VR-Mgmt. When you are using a version released before the virtual router option was added, VR-Mgmt is displayed.

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

show xml-notification statistics

show xml-notification statistics {*target*}

Description

Displays statistics for of the Web server target.

Syntax Description

target	Specifies an alpha numeric string that identifies the configured target.

Default

N/A.

Usage Guidelines

Use this command to display the connection status, enable status and event statistics of the Web server target. If a target is not specified, all configured targets are displayed.

Example

The following command displays statistics for all of the configured targets:

```
show xml-notification statistics
```

The following is sample output from this command:

```
Target Name             : epi
Server URL              : http://10.255.129.22:8080/xos/webservice
Server Queue Size       : 100
Enabled                 : yes
Connection Status       : connected
Events Received         : 450
Connection Failures     : 0
Events Sent Success     : 450
Events Sent Fail        : 0
Events Dropped          : 0
Target Name             : epi
Server URL              : http://10.255.59.6:8080/xos/webservice
Server Queue Size       : 100
Enabled                 : yes
Connection Status       : fail
Events Received         : 31
Connection Failures     : 3
Events Sent Success     : 2
Events Sent Fail        : 29
Events Dropped          : 0
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure log filter

unconfigure log filter *filter_name*

Description

Resets the log filter to its default values; removes all filter items.

Syntax Description

filter_name	Specifies the log filter to unconfigure.

Default

N/A.

Usage Guidelines

If the filter name specified is DefaultFilter, this command restores the configuration of DefaultFilter back to its original settings.

If the filter name specified is not DefaultFilter, this command sets the filter to have no events configured and therefore, no incidents will pass. This is the configuration of a newly created filter that was not copied from an existing one.

See the delete log filter command for information about deleting a filter.

Example

The following command sets the log filter myFilter to stop passing any events:

```
unconfigure log filter myFilter
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available all platforms.

unconfigure log target format

unconfigure log target [**console** | **memory-buffer** | **nvram** | **session** | **syslog** [**all** | *ipaddress* | *ipPort* {**vr** *vr_name*} [**local0...local7**]]] **format**

Description

Resets the log target format to its default values.

Syntax Description

console	Specifies the console display format.
memory-buffer	Specifies the switch memory buffer format.
nvram	Specifies the switch NVRAM format.
session	Specifies the current session (including console display) format.
syslog	Specifies a syslog target format.
all	Specifies all remote syslog servers.
ipaddress	Specifies the syslog IP address.
ipPort	Specifies the UDP port number for the syslog target.
vr_name	Specifies the virtual router that can reach the server IP address. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
local0 ... local7	Specifies the local syslog facility.
format	Specifies that the format for the target will be reset to the default value.

Default

When a target format is unconfigured, it is reset to the default values.

The following defaults apply to console display, memory buffer, NVRAM, and session targets:

- timestamp—hundredths
- date—mm-dd-yyyy
- severity—on
- event-name—condition
- host-name—off
- sequence-number—off
- process-name—off
- process-slot—on (modular switches only)
- process-id—off
- source-line—off

The following defaults apply to syslog targets (per RFC 3164):

- timestamp—seconds
- date—mmm-dd
- severity—on
- event-name—none

- host-name—off
- sequence-number—off
- process-name—off
- process-slot—on (modular switches only)
- process-id—off
- source-line—off

Usage Guidelines

Use this command to reset the target format to the default format.

Example

The following command sets the log format for the target session (the current session) to the default:

```
unconfigure log target session format
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure ports monitor vlan

unconfigure ports [*port_list* |**all**] **monitor vlan** *vlan_name*

Description

Stops counting VLAN statistics on a port or group of ports.

Syntax Description

port_list	Specifies one or more ports. May be in the form: 1, 2, 3-5, 2:5, 2:6-2:8.
vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

None

Example

The following command removes monitoring for ports on a supported modular switch on the VLAN named accounting:

```
unconfigure ports 8:1-8:6 monitor vlan accounting
```

History

This command was first available in ExtremeXOS 12.0.

Support for BlackDiamond 8000 series modules, SummitStack, and Summit family switches was added in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond X8, BlackDiamond 8000 series modules, SummitStack and Summit family switches.

unconfigure sflow

unconfigure sflow

Description

Resets all the sFlow values to the default values.

Syntax Description

This command has no arguments or variables

Default

The default values for sFlow are as follows:

- sFlow agent IP address—0.0.0.0
- sampling frequency—sample one every 8196 packets
- polling interval—20 seconds
- maximum CPU sample limit—2000 samples per second

sFlow is unconfigured and disabled on all ports.

Usage Guidelines

This command resets sFlow values to the default values, and removes any port configurations, and any sFlow collectors configured on the switch.

Example

The following command unconfigures sFlow:

```
unconfigure sflow
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure sflow agent

unconfigure sflow agent

Description

Resets the sFlow agent's IP address to the default value.

Syntax Description

This command has no arguments or variables.

Default

The default IP address is 0.0.0.0.

Usage Guidelines

This command resets the sFlow agent IP address to its default value.

Example

The following command resets the agent IP back to the management IP address:

```
unconfigure sflow agent
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure sflow collector

unconfigure sflow collector {**ipaddress**} *ipaddress* {**port** *udp-port-number*} {**vr** *vr_name*}

Description

Unconfigures the sFlow collector.

Syntax Description

ipaddress	Specifies the IP address of the collector to reset.
udp-port-number	Specifies the UDP port.
vr_name	Specifies which virtual router.  **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

The following values are the defaults for this command:

- UDP port number—6343
- Virtual router—VR-Mgmt (previously called VR-0).

Usage Guidelines

This command allows you to reset the specified sFlow collector parameters to the default values.

Both the commands unconfigure ports monitor vlan and unconfigure sflow collector will reset the collector parameters to the default.

Example

The following command removes the collector at IP address 192.168.57.1:

```
unconfigure sflow collector ipaddress 192.168.57.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure sflow ports

unconfigure sflow ports *port_list*

Description

Removes the specified ports from the sFlow configuration, and stops sampling them.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

This command removes the specified ports from the sFlow configuration, and stops sampling them.

Example

The following command unconfigures sFlow on the ports 2:5-2:7:

```
unconfigure sflow ports 2:5-2:7
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure xml-notification

unconfigure xml-notification

Description

Unconfigures the XML notification client.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the XML client process including the associated log target configuration.

Example

The following command unconfigures the xml-notification client:

```
unconfigure xml-notification
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, and Summit Family switches.

upload log

upload log *ipaddress* {**vr** *vr_name*} *filename* {**messages** [**memory-buffer** | **nvram**] {**events** {*event-condition* | *event_component*}}} {**severity** *severity* {**only**}} {**match** *regex*} {**chronological**}

Description

Uploads the current log messages to a TFTP server.

Syntax Description

ipaddress	Specifies the ipaddress of the TFTP server.
vr_name	Specifies the virtual router that can reach the TFTP server.  **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
filename	Specifies the file name for the log stored on the TFTP server.
messages	Specifies the location from which to display the log messages.
memory-buffer	Show messages stored in volatile memory.
nvram	Show messages stored in NVRAM
events	Show event messages.
event-condition	Specifies the event condition to display.
event-component	Specifies the event component to display.
severity	Specifies the minimum severity level to display (if the keyword only is omitted).
only	Specifies that only the specified severity level is to be displayed.
regex	Specifies a regular expression. Only messages that match the regular expression will be displayed.
chronological	Specifies uploading log messages in ascending chronological order (oldest to newest).

Default

The following defaults apply:

- messages—memory buffer
- severity—none (displays everything stored in the target)
- match—no restriction
- chronological—if not specified, show messages in order from newest to oldest

Usage Guidelines

This command is similar to the show log command, but instead of displaying the log contents on the command line, this command saves the log to a file on the TFTP server you specify. For more details on most of the options of this command, see the command show log show log.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)

- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a local or remote file, remember the requirements listed above.

Example

The following command uploads messages with a critical severity to the filename switch4critical.log on TFTP server at 10.31.8.25:

```
upload log 10.31.8.25 switch4critical.log critical
```

The following command uploads messages with warning, error, or critical severity to the filename switch4warn.log on TFTP server at 10.31.8.25:

```
upload log 10.31.8.25 switch4warn.log warning
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

14 VLAN Commands

This chapter describes commands for configuring and managing:

- VLANs
- Private VLANs (PVLANs)
- VLAN translation

For an introduction to VLAN features, see the ExtremeXOS Concepts Guide.

configure private-vlan add network

configure private-vlan *name* **add network** *vlan_name*

Description

Adds the specified VLAN as the network VLAN on the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN to which the VLAN is added.
vlan_name	Specifies a VLAN to add to the PVLAN.

Default

N/A.

Usage Guidelines

The VLAN must be created and configured with a tag before it is added to the PVLAN.

Example

The following command adds VLAN sharednet as the network VLAN for the PVLAN named companyx:

```
configure private-vlan companyx add network sharednet
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure private-vlan add subscriber

configure private-vlan *name* **add subscriber** *vlan_name* {**non-isolated**} {**loopback-port** *port*}

Description

Adds the specified VLAN as a subscriber VLAN on the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN to which the VLAN is added.
vlan_name	Specifies a VLAN to add to the PVLAN.
non-isolated	Configures the subscriber VLAN as a non-isolated subscriber VLAN.
port	Specifies the port that serves as the loopback port.

Default

If the non-isolated option is omitted, this command adds the specified VLAN as an isolated subscriber VLAN.

Usage Guidelines

The VLAN must be created and configured with a tag before it is added to the PVLAN. If the non-isolated option is omitted, the VLAN is added as an isolated subscriber VLAN. If the non-isolated option is included, the VLAN is added as an non-isolated subscriber VLAN.

The loopback-port <port> option is available only on BlackDiamond 8000 series modules and Summit family switches, whether or not included in a SummitStack. If two or more subscriber VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the subscriber VLANs with overlapping ports must have a dedicated loopback port.

Example

The following command adds VLAN restricted as a subscriber VLAN for the PVLAN named companyx:

```
configure private-vlan companyx add subscriber restricted isolated
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure private-vlan delete

configure private-vlan *name* **delete** [**network** | **subscriber**] *vlan_name*

Description

Deletes the specified VLAN from the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN from which the VLAN is deleted.
network	Specifies that the VLAN to be deleted is a network VLAN.
subscriber	Specifies that the VLAN to be deleted is a subscriber VLAN.
vlan_name	Specifies the VLAN to delete from the PVLAN.

Default

N/A.

Usage Guidelines

This command deletes a VLAN from a PVLAN, but it does not delete the VLAN from the system—it just breaks the link between the VLAN and the PVLAN. You can use this command to delete both network and subscriber VLANs.

Example

The following command deletes network VLAN sharednet from the PVLAN named companyx:

```
configure private-vlan companyx delete network sharednet
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure protocol add

configure protocol *name* **add** [**etype** | **llc** | **snap**] *hex* {[**etype** | **llc** | **snap**] *hex*}

Description

Configures a user-defined protocol filter.

Syntax Description

name	Specifies a protocol filter name.
hex	Specifies a four-digit hexadecimal number between 0 and FFFF that represents: The Ethernet protocol type taken from a list maintained by the IEEE.The DSAP/SSAP combination created by concatenating a two-digit LLC Destination SAP (DSAP) and a two-digit LLC Source SAP (SSAP).The SNAP-encoded Ethernet protocol type.

Default

N/A.

Usage Guidelines

Supported protocol types include:

- etype – IEEE Ethertype.
- llc – LLC Service Advertising Protocol.
- snap – Ethertype inside an IEEE SNAP packet encapsulation.

A maximum of 15 protocol filters, each containing a maximum of six protocols, can be defined.

The protocol filter must already exist before you can use this command. Use the create protocol command to create the protocol filter.

No more than seven protocols can be active and configured for use.

Note

Protocol based VLAN for Etype from 0x0000 to 0x05ff are not classifying as per filter. When traffic arrive with these Etypes, it is classifed to native VLAN rather protocol based vlan.

Example

The following command configures a protocol named Fred by adding protocol type LLC SAP with a value of FFEF:

```
configure protocol fred add llc 0xfeff
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure protocol delete

configure protocol *name* **delete** [**etype** | **llc** | **snap**] *hex* {[**etype** | **llc** | **snap**] *hex*} **...**

Description

Deletes the specified protocol type from a protocol filter.

Syntax Description

name	Specifies a protocol filter name.
hex	Specifies a four-digit hexadecimal number between 0 and FFFF that represents: The Ethernet protocol type taken from a list maintained by the IEEE.The DSAP/SSAP combination created by concatenating a two-digit LLC Destination SAP (DSAP) and a two-digit LLC Source SAP (SSAP).The SNAP-encoded Ethernet protocol type.

Default

N/A.

Usage Guidelines

Supported protocol types include:

- etype – IEEE Ethertype.
- llc – LLC Service Advertising Protocol.
- snap – Ethertype inside an IEEE SNAP packet encapsulation.

Example

The following command deletes protocol type LLC SAP with a value of FEFF from protocol fred:

```
configure protocol fred delete llc feff
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure vlan add ports

configure {**vlan**} *vlan_name* **add ports** [*port_list* | **all**] {**tagged** | **untagged**} {{**stpd**} *stpd_name*} {**dot1d** | **emistp** | **pvst-plus**}}

Description

Adds one or more ports in a VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies a list of ports or slots and ports.
all	Specifies all ports.
tagged	Specifies the ports should be configured as tagged.
untagged	Specifies the ports should be configured as untagged.
stpd_name	Specifies an STP domain name.
dot1d | emistp | pvst-plus	Specifies the BPDU encapsulation mode for these STP ports.

Default

Untagged.

Usage Guidelines

The VLAN must already exist before you can add (or delete) ports: use the create vlan command to create the VLAN.

If the VLAN uses 802.1Q tagging, you can specify tagged or untagged port(s). If the VLAN is untagged, the ports cannot be tagged.

Untagged ports can only be a member of a single VLAN. By default, they are members of the default VLAN (named Default). In order to add untagged ports to a different VLAN, you must first remove them from the default VLAN. You do not need to do this to add them to another VLAN as tagged ports. if you attempt to add an untagged port to a VLAN prior to removing it from the default VLAN, you see the following error message:

```
Error: Protocol conflict when adding untagged port 1:2. Either add this
port as tagged or assign another protocol to this VLAN.
```

Note

This print is not displayed if keyword “all” is used as port_list.

The ports that you add to a VLAN and the VLAN itself cannot be explicitly assigned to different virtual routers (VRs). When multiple VRs are defined, consider the following guidelines while adding ports to a VLAN:

- A VLAN can belong (either through explicit or implicit assignment) to only one VR.
- If a VLAN is not explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to a single VR.
- If a VLAN is explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to the same VR or to no VR.
- If a port is added to VLANs that are explicitly assigned to different VRs, the port must be explicitly assigned to no VR.

Note

User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements. On switches that do not support user-created VRs, all VLANs are created in VR-Default and cannot be moved.

Refer to STP Commands for more information on configuring Spanning Tree Domains.

Note

If you use the same name across categories (for example, STPD and EAPS names), Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Beginning with ExtremeXOS version 11.4, the system returns the following message if the ports you are adding are already EAPS primary or EAPS secondary ports:

```
WARNING: Make sure Vlan1 is protected by EAPS, Adding EAPS ring ports to a
VLAN could cause a loop in the network.
Do you really want to add these ports? (y/n)
```

Example

The following command assigns tagged ports 1:1, 1:2, 1:3, and 1:6 to a VLAN named accounting:

```
configure vlan accounting add ports 1:1, 1:2, 1:3, 1:6 tagged
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure vlan add ports private-vlan translated

Translation from network VLAN tag to each subscriber VLAN tag is done by default in a private VLAN.

configure {**vlan**} *vlan_name* **add ports** *port_list* **private-vlan translated**

Description

Adds the specified ports to the specified network VLAN and enables tag translation for all subscriber VLAN tags to the network VLAN tag.

Syntax Description

vlan_name	Specifies the network VLAN to which the ports are added.
port_list	Specifies the ports to be added to the network VLAN.

Default

N/A.

Usage Guidelines

This command is allowed only when the specified VLAN is configured as a network VLAN on a PVLAN.

Example

The following command adds port 2:1 to VLAN sharednet and enables VLAN translation on that port:

```
configure sharednet add ports 2:1 private-vlan translated
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure vlan add ports tagged private-vlan end-point

configure {vlan} *vlan_name* **add ports** *port_list* **tagged private-vlan end-point**

Description

Adds the specified ports as tagged end points on the specified network VLAN.

Syntax Description

vlan_name	Specifies the network VLAN to which the ports are added.
port_list	Specifies the ports to be added to the network VLAN.

Default

N/A.

Usage Guidelines

This command is allowed only when the specified VLAN is configured as a network VLAN on a PVLAN.

An end point port defines the PVLAN boundary. The end point port can connect to other devices, but cannot be used to extend the PVLAN to other switches.

Example

The following command adds port 2:1 as a tagged end point on VLAN sharednet:

```
configure sharednet add ports 2:1 tagged private-vlan end-point
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure vlan delete ports

configure {vlan} *vlan_name* **delete ports [all |** *port_list***]**

Description

Deletes one or more ports in a VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all ports.
port_list	A list of ports or slots and ports.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes ports 1:1, 1:2, 4:3, and 5:6 on a modular switch from a VLAN named accounting:

```
configure accounting delete port 1:1, 1:2, 4:3, 5:6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure vlan description

configure {**vlan**} *vlan_name* **description** [*vlan-description* | **none**]

Description

Configures a description for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.
vlan-description	Specifies a VLAN description (up to 64 characters) that appears in show vlan commands and can be read from the ifAlias MIB object for the VLAN.
none	This keyword removes the configured VLAN description.

Default

No description.

Usage Guidelines

The VLAN description must be in quotes if the string contains any space characters. If a VLAN description is configured for a VLAN that already has a description, the new description replaces the old description.

Example

The following command assigns the description Campus A to VLAN vlan1:

```
configure vlan vlan1 description “Campus A”
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

configure vlan ipaddress

configure {**vlan**} *vlan_name* **ipaddress** [*ipaddress* {*ipNetmask*} | **ipv6-link-local** | {**eui64**} *ipv6_address_mask*]

Description

Assigns an IPv4 address and an optional subnet mask or an IPv6 address to the VLAN. Beginning with ExtremeXOS version 11.2, you can specify IPv6 addresses. You can assign either an IPv4 address, and IPv6 address, or both to the VLAN. Beginning with ExtremeXOS software version 11.3, you can use this command to assign an IP address to a specified VMAN and enable multicasting on that VMAN.

Syntax Description

vlan_name	Specifies a VLAN name.
ipaddress	Specifies an IPv4 address.
ipNetmask	Specifies an IPv4 subnet mask in dotted-quad notation (for example, 255.255.255.0).
ipv6-link-local	Specifies IPv6 and configures a link-local address generated by combining the standard link-local prefix with the automatically generated interface in the EUI-64 format. Using this option automatically generates an entire IPv6 address; this address is only a link-local, or VLAN-based, IPv6 address, that is, ports on the same segment can communicate using this IP address and do not have to pass through a gateway.
eui64	Specifies IPv6 and automatically generates the interface ID in the EUI-64 format using the interface's MAC address. Once you enter this parameter, you must add the following variables: <ipv6_address_mask>. Use this option when you want to enter the 64-bit prefix and use a EUI-64 address for the rest of the IPv6 address.
ipv6_address_mask	Specify the IPv6 address in the following format: x:x:x:x:x:x:x:x/prefix length, where each x is the hexadecimal value of one of the 8 16-bit pieces of the 128-bit wide address.

Default

N/A.

Usage Guidelines

Note

You can also use this command to assign an IP address to a VMAN on all platforms that support the VMAN feature. For information on which software licenses and platforms support the VMAN feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

The VLAN must already exist before you can assign an IP address: use the create vlan command to create the VLAN (also the VMAN must already exist).

Note

If you plan to use the VLAN as a control VLAN for an EAPS domain, do NOT configure the VLAN with an IP address.

See IP Unicast Commands for information on adding secondary IP addresses to VLANs.

Beginning with ExtremeXOS software version 11.2, you can specify IPv6 addresses. See IPv6 Unicast Routing for information on IPv6 addresses.

Beginning with ExtremeXOS software version 11.3, you can assign an IP address (including IPv6 addresses) to a VMAN. Beginning with version 11.4, you can enable multicasting on that VMAN.

To enable multicasting on the specified VMAN once you assigned an IP address, take the following steps:

- Enable IP multicast forwarding.
- Enable and configure multicasting.

Note

You must upgraded to an Advanced Edge license to use VMAN functionality on a Summit X450e series switch.

Example

The following commands are equivalent; both assign an IPv4 address of 10.12.123.1 to a VLAN named accounting:

```
configure vlan accounting ipaddress 10.12.123.1/24
```

```
configure vlan accounting ipaddress 10.12.123.1 255.255.255.0
```

The following command assigns a link local IPv6 address to a VLAN named management:

```
configure vlan accounting ipaddress ipv6-link-local
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameters were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure vlan name

configure {vlan} *vlan_name* **name** *name*

Description

Renames a previously configured VLAN.

Syntax Description

vlan_name	Specifies the current (old) VLAN name.
name	Specifies a new name for the VLAN.

Default

N/A.

Usage Guidelines

You cannot change the name of the default VLAN "Default."

For information on VLAN name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide.

Note

If you use the same name across categories (for example, STPD and EAPS names), Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

Example

The following command renames VLAN vlan1 to engineering:

```
configure vlan vlan1 name engineering
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure vlan protocol

configure {**vlan**} *vlan_name* **protocol** *protocol_name*

Description

Configures a VLAN to use a specific protocol filter.

Syntax Description

vlan_name	Specifies a VLAN name.
protocol_name	Specifies a protocol filter name. This can be the name of a predefined protocol filter, or one you have defined. The following protocol filters are predefined: IPIPv6IPXNetBIOSDECNetIPX_8022IPX_SNAPAppleTalk any indicates that this VLAN should act as the default VLAN for its member ports.

Default

Protocol any.

Usage Guidelines

If the keyword any is specified, all packets that cannot be classified into another protocol-based VLAN are assigned to this VLAN as the default for its member ports.

Use the configure protocol command to define your own protocol filter.

Protocol Filters on BlackDiamond 8800 Series Switches, SummitStack, and the Summit Family Switches Only

These devices do not forward packets with a protocol-based VLAN set to AppleTalk. To ensure that AppleTalk packets are forwarded on the device, create a protocol-based VLAN set to “any” and define other protocol-based VLANs for other traffic, such as IP traffic. The AppleTalk packets pass on the “any” VLAN, and the other protocols pass traffic on their specific protocol-based VLANs.

Example

The following command configures a VLAN named accounting as an IP protocol-based VLAN:

```
configure accounting protocol ip
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameter was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure vlan tag

configure {**vlan**} *vlan_name* **tag** *tag* {**remote-mirroring**}

Description

Assigns a unique 802.1Q tag to the VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.
tag	Specifies a value to use as an 802.1Q tag. The valid range is from 2 to 4095.
remote-mirroring	Specifies that the tagged VLAN is for remote mirroring.

Default

The default VLAN uses an 802.1Q tag (and an internal VLANid) of 1.

Usage Guidelines

If any of the ports in the VLAN use an 802.1Q tag, a tag must be assigned to the VLAN. The valid range is from 2 to 4094 (tag 1 is assigned to the default VLAN, and tag 4095 is assigned to the management VLAN).

The 802.1Q tag is also used as the internal VLANid by the switch.

You can specify a value that is currently used as an internal VLANid on another VLAN; it becomes the VLANid for the VLAN you specify, and a new VLANid is automatically assigned to the other untagged VLAN.

Example

The following command assigns a tag (and internal VLANid) of 120 to a VLAN named accounting:

```
configure accounting tag 120
```

History

This command was first available in ExtremeXOS 10.1.

The remote-mirroring option was added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure vlan-translation add loopback-port

configure {vlan} *vlan_name* **vlan-translation add loopback-port** *port*

Description

Adds the specified port as a loopback port for the specified member VLAN.

Syntax Description

vlan_name	Specifies the name of the member VLAN to which you want to add the loopback port.
port	Specifies the port that serves as the loopback port.

Default

N/A.

Usage Guidelines

The loopback-port <port> option is available only on BlackDiamond 8000 series modules and Summit family switches, whether or not included in a SummitStack. If two or more member VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the member VLANs with overlapping ports must have a dedicated loopback port.

The loopback port can be added to the member VLAN when the member VLAN is created, or you can use this command to add the loopback port at a later time.

Example

The following command adds port 2:1 as a loopback port for the member VLAN leafvlan:

```
configure leafvlan vlan-translation add loopback-port 2:1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure vlan-translation add member-vlan

configure {**vlan**} *vlan_name* **vlan-translation add member-vlan** *member_vlan_name* {**loopback-port** *port*}

Description

Adds a member VLAN to a translation VLAN.

Syntax Description

vlan_name	Specifies the name of the translation VLAN to which you want to add the member VLAN.
member_vlan_name	Specifies the member VLAN to be added to the translation VLAN.
port	Specifies the port that serves as the loopback port.

Default

N/A.

Usage Guidelines

This command configures VLAN tag translation between the two VLANs specified. The member VLAN is added to the list maintained by translation VLAN. A translation VLAN can have multiple member VLANs added to it.

The loopback-port <port> option is available only on BlackDiamond 8000 series modules and Summit family switches, whether or not included in a SummitStack. If two or more member VLANs have overlapping ports (where the same ports are assigned to both VLANs), each of the member VLANs with overlapping ports must have a dedicated loopback port.

Example

The following command adds member VLAN leafvlan to the translation VLAN branchvlan:

```
configure branchvlan vlan-translation add member-vlan leafvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure vlan-translation delete loopback-port

configure {vlan} *vlan_name* **vlan-translation delete loopback-port**

Description

Deletes the loopback port from the specified member VLAN.

Syntax Description

vlan_name	Specifies the name of the member VLAN from which you want to delete the loopback port.

Default

N/A.

Usage Guidelines

This command disables and deletes the loopback port from the specified member VLAN. This command does not delete the member VLAN.

Example

The following command deletes the loopback port from the member VLAN leafvlan:

```
configure leafvlan vlan-translation delete loopback-port
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

configure vlan-translation delete member-vlan

configure {vlan} *vlan_name* **vlan-translation delete member-vlan** [*member_vlan_name* **| all]**

Description

Deletes one or all member VLANs from a translation VLAN.

Syntax Description

vlan_name	Specifies the name of the translation VLAN from which you want to delete the member VLAN.
member_vlan_name	Specifies the member VLAN to be deleted from the translation VLAN.
all	Deletes all member VLANs from the specified translation VLAN.

Default

N/A.

Usage Guidelines

This command removes the link between the translation VLAN and the specified member VLANs, but it does not remove the VLANs from the switch.

Example

The following command deletes member VLAN leafvlan from the translation VLAN branchvlan:

```
configure branchvlan vlan-translation delete member-vlan leafvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the VLAN Translation feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

create private-vlan

create private-vlan *name* {**vr** *vr_name*}

Description

Creates a PVLAN framework with the specified name.

Syntax Description

name	Specifies a name for the new PVLAN.
vr_name	Specifies the VR in which the PVLAN is created.

Default

N/A.

Usage Guidelines

The PVLAN is a framework that links network and subscriber VLANs; it is not an actual VLAN.

A private VLAN name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For private VLAN naming guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

If no VR is specified, the PVLAN is created in the default VR context.

Example

The following command creates a PVLAN named companyx:

```
create private-vlan companyx
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

create protocol

create protocol *name*

Description

Creates a user-defined protocol filter.

Syntax Description

name	Specifies a protocol filter name. The protocol filter name can have a maximum of 31 characters.

Default

N/A.

Usage Guidelines

Protocol-based VLANs enable you to define packet filters that the switch can use as the matching criteria to determine if a particular packet belongs to a particular VLAN.

After you create the protocol, you must configure it using the configure protocol command. To assign it to a VLAN, use the configure {vlan} <vlan_name> protocol <protocol_name> command.

Example

The following command creates a protocol named fred:

```
create protocol fred
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

create vlan

create vlan *vlan_name* {**description** *vlan-description*} {**vr** *name*}

Description

Creates a named VLAN.

Syntax Description

vlan_name	Specifies a VLAN name (up to 32 characters).
name	Specifies a VR or virtual routing and forwarding (VRF) instance in which to create the VLAN. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements On switches that do not support user-created VRs, all VLANs are created in VR-Default and cannot be moved.
vlan-description	Specifies a VLAN description (up to 64 characters) that appears in show vlan commands and can be read from the ifAlias MIB object for the VLAN.

Default

A VLAN named Default exists on all new or initialized Extreme switches:

- It initially contains all ports on a new or initialized switch, except for the management port(s), if there are any.
- It has an 802.1Q tag of 1.
- The default VLAN is untagged on all ports.
- It uses protocol filter any.

A VLAN named Mgmt exists on switches that have management modules or management ports:

- It initially contains the management port(s) the switch.
- It is assigned the next available internal VLANid as an 802.1Q tag.

If you do not specify the VR, the VLAN is created in the current VR.

If the VLAN description contains one or more space characters, you must enclose the complete name in double quotation marks.

Usage Guidelines

A newly-created VLAN has no member ports, is untagged, and uses protocol filter any until you configure it otherwise. Use the various configure vlan commands to configure the VLAN to your needs.

Internal VLANids are assigned automatically using the next available VLANid starting from the high end (4094) of the range.

The VLAN name can include up to 32 characters. VLAN names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VLAN names cannot match reserved keywords. For more information on VLAN name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide.

Note

If you use the same name across categories (for example, STPD and EAPS names), Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

VLAN names are locally significant. That is, VLAN names used on one switch are only meaningful to that switch. If another switch is connected to it, the VLAN names have no significance to the other switch.

You must use mutually exclusive names for:

- VLANs
- VMANs
- Ipv6 tunnels
- BVLANs
- SVLANs
- CVLANs

Note

The VLAN description is stored in the ifAlias MIB object.

If you do not specify a VR when you create a VLAN, the system creates that VLAN in the default VR (VR-Default). The management VLAN is always in the management VR (VR-Mgmt).

Once you create VRs, ExtremeXOS software allows you to designate one of these as the domain in which all your subsequent configuration commands, including VLAN commands, are applied. If you create VRs, ensure that you are creating the VLANs in the desired virtual-router domain.

Note

User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Appendix A, “ExtremeXOS Software Licenses.” On switches that do not support user-created VRs, all VLANs are created in VR-Default and cannot be moved.

Example

The following command creates a VLAN named accounting on the current VR:

```
create vlan accounting description “Accounting Dept”
```

History

This command was first available in ExtremeXOS 10.1.

The VR option vr, was added in ExtremeXOS 11.0.

The VLAN description option was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

delete private-vlan

delete private-vlan *name*

Description

Deletes the PVLAN framework with the specified name.

Syntax Description

name	Specifies the name of the PVLAN to be deleted.

Default

N/A.

Usage Guidelines

The PVLAN is a framework that links network and subscriber VLANs; it is not an actual VLAN.

This command deletes the PVLAN framework, but it does not delete the associated VLANs. If the ports in the network VLAN were set to translate, they are changed to tagged.

Example

The following command deletes the PVLAN named companyx:

```
delete private-vlan companyx
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

delete protocol

delete protocol *name*

Description

Deletes a user-defined protocol.

Syntax Description

name	Specifies a protocol name.

Default

N/A.

Usage Guidelines

If you delete a protocol that is in use by a VLAN, the protocol associated with than VLAN becomes none.

Example

The following command deletes a protocol named fred:

```
delete protocol fred
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

delete vlan

delete vlan *vlan_name*

Description

Deletes a VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If you delete a VLAN that has untagged port members and you want those ports to be returned to the default VLAN, you must add them back explicitly using the configure svlan delete ports command.

Note

The default VLAN cannot be deleted. Before deleting an ISC VLAN, you must delete the MLAG peer.

Example

The following command deletes the VLAN accounting:

```
delete accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable loopback-mode vlan

disable loopback-mode vlan *vlan_name*

Description

Disallows a VLAN to be placed in the UP state without an external active port. This allows (disallows) the VLANs routing interface to become active.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to specify a stable interface as a source interface for routing protocols. This decreases the possibility of route flapping, which can disrupt connectivity.

Example

The following command disallows the VLAN accounting to be placed in the UP state without an external active port:

```
disable loopback-mode vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable vlan

disable vlan *vlan_name*

Description

Use this command to disable the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN you want to disable.

Default

Enabled.

Usage Guidelines

This command allows you to administratively disable specified VLANs. The following guidelines apply to working with disabling VLANs:

- Disabling a VLAN stops all traffic on all ports associated with the specified VLAN.
- You cannot disable a VLAN that is running Layer2 protocol control traffic for protocols such as EAPS, STP, and ESRP.

  When you attempt to disable a VLAN running Layer2 protocol control traffic, the system returns a message similar to the following:

VLAN accounting cannot be disabled because it is actively use by an L2 Protocol

- You can disable the default VLAN; ensure that this is necessary prior to disabling the default VLAN.
- You cannot disable the management VLAN.
- You cannot bind Layer2 protocols to a disabled VLAN.
- You can add ports to and delete ports from a disabled VLAN.

Example

The following command disables the VLAN named accounting:

```
disable vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

The ability to add ports to a disabled VLAN was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

enable loopback-mode vlan

enable loopback-mode vlan *vlan_name*

Description

Allows a VLAN to be placed in the UP state without an external active port. This allows (disallows) the VLANs routing interface to become active.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to specify a stable interface as a source interface for routing protocols. This decreases the possibility of route flapping, which can disrupt connectivity.

Example

The following command allows the VLAN accounting to be placed in the UP state without an external active port:

```
enable loopback-mode vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable vlan

enable vlan *vlan_name*

Description

Use this command to re-enable a VLAN that you previously disabled.

Syntax Description

vlan_name	Specifies the VLAN you want to disable.

Default

Enabled.

Usage Guidelines

This command allows you to administratively enable specified VLANs that you previously disabled.

Example

The following command enables the VLAN named accounting:

```
enable vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show private-vlan

show private-vlan

Description

Displays information about all the PVLANs on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

If the PVLAN is incomplete because it does not have a network or any subscriber VLAN configured, [INCOMPLETE] appears next to the PVLAN name.

Example

The following command displays all the PVLANs on the switch:

```
* (debug) BD-8808.1 # show private-vlan
--------------------------------------------------------------------------------
--------
Name            VID  Protocol Addr        Flags                Proto  Ports

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

show private-vlan <name>

show {**private-vlan**} *name*

Description

Displays information about the specified PVLAN.

Syntax Description

name	Specifies the name of the PVLAN to display.

Default

N/A.

Usage Guidelines

If the PVLAN is incomplete because it does not have a network or any subscriber VLAN configured, [INCOMPLETE] appears next to the PVLAN name.

Example

The following command displays information for the companyx PVLAN:

```
* (debug) BD-8808.1 # show private-vlan "Engineering"
--------------------------------------------------------------------------------
--------
Name            VID  Protocol Addr        Flags                Proto  Ports

```

```
(l) MPLS Enabled, (m) IPmc Forwarding Enabled, (n) IP Multinetting Enabled,
(N) Network LogIn vlan, (o) OSPF Enabled, (p) PIM Enabled,
(P) EAPS protected vlan, (r) RIP Enabled,
(T) Member of STP Domain, (V) VPLS Enabled, (v) VRRP Enabled
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms that support the Private VLAN feature. The features and the platforms that support them are listed in Appendix A, “Feature License Requirements” in the ExtremeXOS Concepts Guide.

show protocol

show protocol {*name*}

Description

Displays protocol filter definitions.

Syntax Description

name	Specifies a protocol filter name.

Default

Displays all protocol filters.

Usage Guidelines

Displays the defined protocol filter(s) with the types and values of its component protocols.

Example

The following is an example of the show protocol command:

```
Protocol Name                        Type    Value
-------------------------------------------------
IP                                 etype   0x0800
etype   0x0806
ANY                                  ANY   0xffff
ipx                                etype   0x8137
decnet                             etype   0x6003
etype   0x6004
```

```
netbios                                 llc   0xf0f0
llc   0xf0f1
ipx_8022                                llc   0xe0e0
ipx_snap                               snap   0x8137
appletalk                              snap   0x809b
snap   0x80f3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show vlan

show vlan {**virtual-router** *vr-name*}**show** {**vlan**} *vlan_name* {**ipv4** | **ipv6**}**show vlan** [**tag** *tag* | **detail**] {**ipv4** | **ipv6**}**show vlan ports**

Description

Displays information about one or all VLANs.

Syntax Description

vr-name	Specifies a VR name for which to display summary information for all VLANs. If no VR name is specified, the software displays summary information for all VLANs in the current VR context. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements On switches that do not support user-created VRs, all VLANs are created in VR-Default and cannot be moved.
vlan_name	Specifies a VLAN name for which to display detailed VLAN information.
tag	Specifies the 802.1Q tag of a VLAN for which to display detailed VLAN information.
detail	Specifies that detailed information should be displayed for all VLANs.
ipv4	Specifies IPv4.
ipv6	Specifies IPv6.
ports	Displays VLAN ports information.

Default

Summary information for all VLANs on the device.

Usage Guidelines

Note

To display IPv6 information, you must issue either the show vlan detail command or show vlan command with the name of the specified VLAN.

Unlike many other VLAN-related commands, the keyword vlan is required in all forms of this command except when requesting information for a specific VLAN.

Use the command show vlan to display summary information for all VLANs. It shows various configuration options as a series of flags (see the example below). VLAN names, descriptions, and protocol names may be abbreviated in this display.

Use the command show vlan detail to display detailed information for all VLANs. This displays the same information as for an individual VLAN, but shows every VLAN, one-by-one. After each VLAN display you can elect to continue or quit.

Protocol none indicates that this VLAN was configured with a user-defined protocol that has subsequently been deleted.

Note

The BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches display the Mgmt VLAN in VR-Mgmt.

When an IPv6 address is configured for the VLAN, the system may display one of the following two address types in parentheses after the IPv6 address:

- Tentative
- Duplicate

Note

See the ExtremeXOS Concepts Guide for information on IPv6 address types.

You can display additional useful information on VLANs configured with IPv6 addresses by issuing the show ipconfig ipv6 vlan <vlan_name>.

When a displayed VLAN is part of a PVLAN, the display includes the PVLAN name and type (which is network, non-isolated subscriber, or isolated subscriber).

When the displayed VLAN is configured for VLAN translation, the display provides translation VLAN information. If the displayed VLAN is a translation VLAN, a list of translation VLAN members appears. If the displayed VLAN is a member VLAN, the display indicates the translation VLAN to which the member VLAN belongs.

Example

The following is an example of the show vlan command on a switch where PTP and CES are configured (for example, an E4G-200 or E4G-400):

```
E4G-400.15 # sh vlan
```

```

```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 information was added in ExtremeXOS 11.2.

The netlogin information was added in ExtremeXOS 11.3.

The VR and administratively enabled/disabled information was added in ExtremeXOS 11.4.

The tag option was added in ExtremeXOS 12.4.4.

The OpenFlow status feature was added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

Information on MAC-based ports is available only on the Summit family of switches, SummitStack, and the BlackDiamond 8800 series switch.

show vlan description

show vlan description

Description

Displays a list of VLANs and VLAN descriptions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the descriptions for all VLANs:

```
* Switch.4 # show vlan description
--------------------------------------------------------------------------------
Name            VID  Description
--------------------------------------------------------------------------------
ctrl1           11   Control Vlan
ctrl2           102  Control Vlan 2
Default         1
v1              60   vlan 1
vplsVlan        3296 L2 VPN to home office
--------------------------------------------------------------------------------
Total number of VLAN(s) : 5
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

unconfigure vlan description

unconfigure {**vlan**} *vlan_name* **description**

Description

Removes the description for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN name.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the description from VLAN vlan1:

```
unconfigure vlan vlan1 description
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

unconfigure vlan ipaddress

unconfigure {**vlan**} *vlan_name* **ipaddress** {*ipv6_address_mask*}

Description

Removes the IP address of the VLAN or a VMAN. With no parameters, the command removes the primary IPv4 address on the specified VLAN. Using the IPv6 parameters, you can remove specified IPv6 addresses from the specified VLAN.

Syntax Description

vlan_name	Specifies a VLAN or VMAN name.
ipv6_address_mask	Specifies an IPv6 address using the format of IPv6-address/prefix-length, where IPv6 is the 128-bit address and the prefix length specifies the number of leftmost bits that comprise the prefix.

Default

Removes the primary IPv4 address from the specified VLAN or VMAN.

Usage Guidelines

Note

With IPv6, you cannot remove the last link local IPv6 address until all global IPv6 addresses are removed. For MLAG configurations, you cannot remove an IP address from a VLAN until after you delete the MLAG peer.

Example

The following command removes the primary IPv4 address from the VLAN accounting:

```
unconfigure vlan accounting ipaddress
```

The following command removes an IPv6 addresses from the VLAN finance:

```
unconfigure vlan finance ipaddress 3ffe::1
```

History

This command was first available in ExtremeXOS 10.1.

The IPv6 parameters were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

15 VMAN (PBN) Commands

This chapter describes commands for managing the following Layer2 feature:

- Provider bridge networks (PBNs—also known as VMANs)

Note

The "VMAN" term is an Extreme Networks term that became familiar to Extreme Networks customers before the PBN standard was complete. The VMAN term is used in the ExtremeXOS software and also in this book to support customers who are familiar with this term. The PBN term is also used in this guide to establish the relationship between this industry standard technology and the Extreme Networks VMAN feature.

For an introduction to these features, see the ExtremeXOS Concepts Guide.

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on the platforms listed for the PBN feature in Feature License Requirements

configure port ethertype

configure port *port_list* **ethertype** {**primary** | **secondary**}

Description

Assigns the primary or secondary ethertype value to the specified ports.

Syntax Description

port_list	Specifies the list of ports to be configured.
primary	Assigns the primary ethertype value to the specified ports.
secondary	Assigns the secondary ethertype value to the specified ports.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures port 2:1 to use the secondary ethertype:

```
configure port 2:1 ethertype secondary
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure vman add ports

configure vman *vman-name* **add ports** [**all** | *port_list*] {**untagged** { **port-cvid** *port_cvid*} | **tagged**}

Description

Adds one or more ports to a VMAN.

Syntax Description

vman-name	Specifies the VMAN to configure.
all	Specifies all switch ports.
port_list	Specifies a list of ports.
untagged	Configures the specified ports as Customer Network Ports (CNPs).
tagged	Configures the specified ports as Provider Network Ports (PNPs), which are also called VMAN network ports.
port_cvid	Port's CVID used for untagged packets. If unspecified, untagged packets will be single tagged with the VMAN's SVID. If specified, untagged packets will be double tagged with the VMAN's SVID and the port's CVID.

Default

If you do not specify a parameter, the default value is untagged, which creates a CNP.

Usage Guidelines

This command adds ports as either CNPs or PNPs. To add a port to a VMAN as a CEP, use the following command:

```
configure vman <vman_name> add ports <port_list> cep cvid
<cvid_first> {- <cvid_last>} {translate <cvid_first_xlate> {-
<cvid_last_xlate>}}
```

The VMAN must already exist before you can add (or delete) ports. VMAN ports can belong to load-sharing groups.

When a port is configured serve as a CNP for one VMAN and A PNP for another VMAN, it inspects the VMAN ethertype in received packets. Packets with a matching ethertype are treated as tagged and switched across the associated PNP VMAN. Packets with a non-matching ethertype are treated as untagged and forwarded into the associated CNP VMAN.

When a port is configured only as a CNP (an untagged VMAN member), whether the VMAN ethertype is 0x8100 or otherwise, all received packets ingress the associated VMAN regardless of the packet's tagging.

Note

If you use the same name across categories (for example, STPD and EAPS names), we recommend that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system may return an error message.

The following guidelines apply to all platforms:

- You must enable or disable jumbo frames before configuring VMANs. You can enable or disable jumbo frames on individual ports or modules, or on the entire switch. See Configuring Slots and Ports on a Switch in the ExtremeXOS Concepts Guide for more information on configuring jumbo frames.

- Each port can serve in only one VMAN role per VMAN. When multiple roles are configured on a port, each role must be configured for a different VMAN.
- Multiple VMAN roles can be combined on one port with certain VLAN types as shown in the following table.

Table 24: Port Support for Combined VMAN Roles and VLANs

Platform	Combined CNP, CEP, and Tagged VLAN[6, 7]	Combined PNP, CNP, and CEP[a, b, 8]	Combined PNP and Tagged VLAN	Combined PNP and Untagged VLAN
Summit X150, X250e, X350, X450a, and X450e	X	X	X[9]	X
Summit X440, X460, X480, X650, and X670	X	X	X[10]	X
BlackDiamond 8500 and 8800 c-, and e-series modules	X	X	Xd	X
BlackDiamond X8 series switches and BlackDiamond 8900 c-, xl-, and xm-series modules	X	X	Xe	X

Note

If you already configured VLANs and VMANs on the same module or stand-alone switch using ExtremeXOS 11.4, you cannot change the VMAN ethertype from 0X8100 without first removing either the VLAN or VMAN configuration.

Example

The following command assigns ports 1:1, 1:2, 1:3, and 1:6 to a VMAN named accounting:

```
configure vman accounting add ports 1:1, 1:2, 1:3, 1:6 tag 100
```

History

This command was first available in ExtremeXOS 11.0.

The svid keyword was added in ExtremeXOS 12.2.

6 Subsets of this group are also supported. That is, any two of these items are supported.
7 When a CNP is combined with a CEP or tagged VLAN, any CVIDs not explicitly configured for a CEP or tagged VLAN are associated with the CNP.
8 A PNP (tagged VMAN) and a CNP (untagged VMAN) or CEP cannot be combined on a port for which the selected VMAN ethertype is 0x8100.
9 The VMAN ethertype must be set to 0x8100, which is different from the default value (0x88a8).
10 If the secondary VMAN ethertype is selected for the port, it must be set to 0x8100.
6 Subsets of this group are also supported. That is, any two of these items are supported.
7 When a CNP is combined with a CEP or tagged VLAN, any CVIDs not explicitly configured for a CEP or tagged VLAN are associated with the CNP.
8 A PNP (tagged VMAN) and a CNP (untagged VMAN) or CEP cannot be combined on a port for which the selected VMAN ethertype is 0x8100.

The cvid keyword was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

configure vman add ports cep

configure vman *vman_name* **add ports** *port_list* **cep cvid** *cvid_first* {**-** *cvid_last*} {**translate** *cvid_first_xlate* {**-** *cvid_last_xlate*}}

Description

Adds one or more switch ports to the specified VMAN as Customer Edge Ports (CEPs), and configures the CVIDs on those ports to map to the VMAN.

Syntax Description

vman-name	Specifies the VMAN to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a CVLAN ID (CVID) or the first in a range of CVIDs that the CEP will accept and map to the specified VMAN. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that the CEP will accept and map to the VMAN. Valid values are 1-4095.
translate	Enables translation of the specified CEP CVID range to the specified VMAN CVID range.
cvid_first_xlate	Specifies a VMAN CVID or the first in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095.
cvid_last_xlate	Specifies the last in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095. The number of VMAN CVIDs in this range must equal the number of CEP CVIDs specified in this command.

Default

N/A.

Usage Guidelines

If you specify only one CVID or a range of CVIDs without translation, the specified CVIDs are mapped to the specified VMAN and appear unchanged in the VMAN.

If you specify CVID translation, the CEP CVIDs map to different VMAN CVIDs. The number of CEP CVIDs specified must equal the number of VMAN CVIDs specified. The first CEP CVID in the specified range maps to the first CVID in the range specified for the VMAN. The difference between cvid_first and cvid_first_xlate establishes an offset N that maps CEP CVIDs to VMAN CVIDs. (Offset N =

cvid_first_xlate - cvid_first.) The translated VMAN CVID that corresponds to a CEP CVID can be determined as follows:

VMAN CVID = CEP CVID + N

Note

CVID translation can reduce the number of CVIDs that can be mapped to VMANs.

After you enable and configure a CEP with this command, you can use the following command to map additional CVIDs on the port to the VMAN:

```
configure vman <vman_name> ports <port_list> add cvid <cvid_first> {-
<cvid_last>} {translate <cvid_first_xlate> {- <cvid_last_xlate>}}
```

When this command specifies multiple ports, each port gets an independent CVID map; the ports do not share a common map. Changes to the CVID map affect only the ports specified in the configuration command. For example, consider the following commands:

```
configure vman vman1 add port 1-2 cep cvid 10
configure vman vman1 port 1 add cvid  11
```

After these commands are entered, port 1 maps CVIDs 10 and 11 to VMAN vman1, and port 2 maps only CVID 10 to vman1.

You can add the same port as a CEP to multiple VMANs. A port can also support multiple VMANs in different roles as shown in Table 24: Port Support for Combined VMAN Roles and VLANs on page 1151.

To view the CEP CVID configuration for a port, use the show vman command.

Example

The following command configures port 1 as a CEP for VMAN vman1 and specifies that CEP CVID 5 maps to CVID 5 on the VMAN:

```
configure vman vman1 add port 1 cep cvid 5
```

The following command configures port 1 as a CEP for VMAN vman1 and enables the port to translate CEP CVIDs 10-19 to VMAN CVIDs 20-29:

```
configure vman vman1 add port 1 cep cvid 10 - 19 translate 20 - 29
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches

The CVID translation feature is available only on BlackDiamond X8, BlackDiamond 8900 c-, xl-, and xm-series modules and Summit X440, X460, X480, X650, and X670 series switches.

configure vman delete ports

configure vman *vman-name* **delete ports** [**all** | *port_list*]

Description

Deletes one or more ports from a VMAN.

Syntax Description

vman_name	Specifies a VMAN name.
all	Specifies all ports in the VMAN.
port_list	Specifies a list of ports.

Default

N/A.

Usage Guidelines

The VMAN must already exist before you can delete ports.

Example

The following command deletes ports 1:1, 1:2, 1:3, and 1:6 on a modular switch for a VMAN named accounting:

```
configure vman accounting delete ports 1:1, 1:2, 1:3, 1:6
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure vman ethertype

configure vman ethertype *value* [**primary** | **secondary**]

Description

Changes the default ethertype for the VMAN header.

Syntax Description

value	Specifies an ethertype value in the format of 0xffff.
primary	Assigns the ethertype as the primary Ethernet value.
secondary	Assigns the ethertype as the secondary Ethernet value.

Default

Ethertype value of 0x88a8 and type primary.

Usage Guidelines

The software supports two VMAN ethertype values, a primary value and a secondary value. By default, the primary ethertype applies to all VMANs. To use the secondary ethertype, define the ethertype with this command, and then assign the secondary ethertype to ports with the following command:

```
configure port <port_list> ethertype {primary | secondary}
```

If your VMAN transits a third-party device (other than an Extreme Networks device), you must configure the ethertype for the VMAN tag as the ethertype that the third-party device uses. If you configure both primary and secondary ethertypes, you can connect to devices that use either of the two values assigned.

The system supports all VMAN ethertypes, including the standard ethertype of 0x8100.

Example

The following command changes the VMAN ethertype value to 8100:

```
configure vman ethertype 0x8100
```

History

This command was first available in ExtremeXOS 11.0.

Support for a secondary ethertype was added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure vman ports add cvid

configure vman *vman_name* **ports** *port_list* **add cvid** *cvid_first* {**-** *cvid_last*} {**translate** *cvid_first_xlate* {**-** *cvid_last_xlate*}}

Description

Adds one or more CVIDs to a CEP.

Syntax Description

vman-name	Specifies the VMAN to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a Customer VLAN ID (CVID) or the first in a range of CVIDs that the CEP will accept and map to the specified VMAN. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that the CEP will accept and map to the VMAN. Valid values are 1-4095.
translate	Enables translation of the specified CEP CVID range to the specified VMAN CVID range.
cvid_first_xlate	Specifies a VMAN CVID or the first in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095.
cvid_last_xlate	Specifies the last in a range of VMAN CVIDs to which the CEP CVIDs will map. Valid values are 1-4095. The number of VMAN CVIDs in this range must equal the number of CEP CVIDs specified in this command.

Default

N/A.

Usage Guidelines

Before you can add CVIDs to CEPs, you must configure the target physical ports as CEPs using the following command:

```
        configure vman <vman_name> add ports <port_list> cep cvid
<cvid_first> {- <cvid_last>} {translate <cvid_first_xlate> {-
<cvid_last_xlate>}}
```

If you specify only one CVID or a range of CVIDs without translation, the specified CVIDs are mapped to the specified VMAN and appear unchanged in the VMAN.

If you specify CVID translation, the CEP CVIDs map to different VMAN CVIDs. The number of CEP CVIDs specified must equal the number of VMAN CVIDs specified. The first CEP CVID in the specified range maps to the first CVID in the range specified for the VMAN. The difference between cvid_first and cvid_first_xlate establishes an offset N that maps CEP CVIDs to VMAN CVIDs. (Offset N = cvid_first_xlate - cvid_first.) The translated VMAN CVID that corresponds to a CEP CVID can be determined as follows:

VMAN CVID = CEP CVID + N

Note

CVID translation can reduce the number of CVIDs that can be mapped to VMANs.

When this command specifies multiple ports, each port gets an independent CVID map; the ports do not share a common map. Changes to the CVID map affect only the ports specified in the configuration command. For example, consider the following commands:

```
configure vman vman1 add port 1-2 cep cvid 10
configure vman vman1 port 1 add cvid  11
```

After these commands are entered, port 1 maps CVIDs 10 and 11 to VMAN vman1, and port 2 maps only CVID 10 to vman1.

To view the CEP CVID configuration for a port, use the show vman command.

Example

The following command adds CVIDs 20-29 to port 1 and VMAN vman1 and enables translation to CVIDs 30-39:

```
configure vman vman1 port 1 add cvid 20 - 29 translate 30 - 99
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8800 series switches and Summit family switches.

The CVID translation feature is available only on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules and Summit X440, X460, X480, X650, and X670 series switches.

configure vman ports delete cvid

configure vman *vman_name* **ports** *port_list* **delete cvid** *cvid_first* {**-** *cvid_last*}

Description

Deletes one or more CVIDs from a CEP.

Syntax Description

vman-name	Specifies the VMAN to configure.
port_list	Specifies a list of ports.
cvid_first	Specifies a CVID or the first in a range of CVIDs that are to be deleted. Valid values are 1-4095.
cvid_last	Specifies the last in a range of CVIDs that are to be deleted. Valid values are 1-4095.

Default

N/A.

Usage Guidelines

Each CEP has its own CVID map, and this command deletes CVIDs only from the ports specified with this command.

If all the CVIDs are deleted from a CEP, the CEP is deleted from the VMAN.

To view the CEP CVID configuration for a port, use the show vman command.

Example

The following command deletes CVID 15 on port 1 from VMAN vman1:

```
configure vman vman1 port 1 delete cvid 15
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8800 series switches and Summit family switches.

configure vman tag

configure vman *vman-name* **tag** *tag*

Description

Assigns a tag to a VMAN.

Syntax Description

vman_name	Specifies a VMAN name.
tag	Specifies a value to use as the VMAN tag. The valid range is from 2 to 4094.

Default

N/A.

Usage Guidelines

Every VMAN requires a unique tag.

You can specify a value that is currently used as an internal VLAN ID on another VLAN; it becomes the VLAN ID for the VLAN you specify, and a new VLAN ID is automatically assigned to the other untagged VLAN.

Example

The following command assigns a tag of 120 to a VMAN named accounting:

```
configure vman accounting tag 120
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

create vman

create vman *vman-name* {**learning-domain**} {**vr** *vr_name*}

Description

Creates a VMAN.

Syntax Description

vman-name	Specifies a VMAN name using up to 32 characters.
learning-domain	Specifies that this VMAN is a learning domain, which supports inter-VMAN forwarding.
vr	Specifies a virtual router.
vr_name	Specifies a virtual router name. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements On switches that do not support user-created VRs, all VMANs are created in VR-Default and cannot be moved.

Default

N/A.

Usage Guidelines

For information on VMAN name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide. You must use mutually exclusive names for:

- VLANs
- VMANs
- IPv6 tunnels

The keyword learning-domain enables you to create a VMAN that serves as a learning domain for inter-VMAN forwarding.

If you do not specify the virtual router, the VMAN is created in the current virtual router.

After you create the VMAN, you must configure the VMAN tag and add the ports that you want.

Example

The following command creates a VMAN named fred:

```
create vman fred
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

delete vman

delete vman *vman-name*

Description

Deletes a previously created VMAN.

Syntax Description

vman-name	Specifies a VMAN name.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VMAN accounting:

```
delete vman accounting
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable dot1p examination inner-tag ports

disable dot1p examination inner-tag ports [**all** | *port_list*]

Description

Used with VMANs, and instructs the switch to examine the 802.1p value of the outer tag, or added VMAN header, to determine the correct egress queue on the egress port.

Syntax Description

all	Specifies all ports.
port_list	Specifies a list of ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to instruct the system to refer to the 802.1p value contained in the outer tag, or VMAN encapsulation tag, when assigning the packet to an egress queue at the egress port of the VMAN.

Note

See QoS Commands for information on configuring and displaying the current 802.1p and DiffServ configuration for the inner, or original header, 802.1p value.

Example

The following command uses the 802.1p value on the outer tag, or VMAN encapsulation, to put the packet in the egress queue on the VMAN egress port:

```
disable dot1p examination inner-tag port 3:2
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and Summit family switches.

disable vman cep egress filtering ports

disable vman cep egress filtering ports {*port_list* | **all**}

Description

Disables the egress filtering of CVIDs that are not configured in the CVID map for a CEP.

Syntax Description

port_list	Specifies a list of ports.
all	Specifies all switch ports.

Default

Egress CVID filtering is disabled.

Usage Guidelines

To view the configuration setting for the egress CVID filtering feature, use the show ports information command.

Note

When CVID egress filtering is enabled, it reduces the maximum number of CVIDs supported on a port. The control of CVID egress filtering applies to fast-path forwarding. When frames are forwarded through software, CVID egress filtering is always enabled.

Example

The following command disables egress CVID filtering on port 1:

```
disable vman cep egress filtering port 1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on the BlackDiamond X8, BlackDiamond 8900 c-, xl-, and xm-series modules. This command is also available on Summit X440, X460, X480, X650, and X670 series switches.

enable dot1p examination inner-tag port

enable dot1p examination inner-tag port [**all** | *port_list*]

Description

Used with VMANs, and instructs the switch to examine the 802.1p value of the inner tag, or header of the original packet, to determine the correct egress queue on the egress port.

Syntax Description

all	Specifies all ports.
port_list	Specifies a list of ports or slots and ports.

Default

Disabled.

Usage Guidelines

Use this command to instruct the system to refer to the 802.1p value contained in the inner, or original, tag when assigning the packet to an egress queue at the egress port of the VMAN.

Note

See QoS Commands for information on configuring and displaying the current 802.1p and DiffServ configuration for the inner, or original header, 802.1p value.

Example

The following command puts the packets in the egress queue of the VMAN egress port according to the 802.1p value on the inner tag:

```
enable dot1p examination inner-tag port 3:2
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches.

enable vman cep egress filtering ports

enable vman cep egress filtering ports {*port_list* | **all**}

Description

Enables the egress filtering of frames based on their CVIDs on ports configured as CEPs.

Syntax Description

port_list	Specifies a list of ports.
all	Specifies all switch ports.

Default

Egress CVID filtering is disabled.

Usage Guidelines

For a given VMAN and a port configured as a CEP for that VMAN, only frames with CVIDs that have been mapped from the CEP to the VMAN are forwarded from the VMAN and out the CEP.

To view the configuration setting for the egress CVID filtering feature, use the show ports information command.

Note

CVID egress filtering is available only on switches that support this feature, and when this feature is enabled, it reduces the maximum number of CVIDs supported on a port. The control of CVID egress filtering applies to fast-path forwarding. When frames are forwarded through software, CVID egress filtering is always enabled.

Example

The following command enables egress CVID filtering on port 1:

```
enable vman cep egress filtering port 1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on the BlackDiamond X8 series switches and the BlackDiamond 8900 c-, xl-, and xm-series modules. This command is also available on Summit X440, X460, X480, X650, and X670 series switches.

show vman

show vman show {vman} *vman_name* **{ipv4 | ipv6} show vman [tag** *tag* **| detail] {ipv4 | ipv6}**

Description

Displays information about one or all VMANs.

Note

The information displayed for this command depends on the platform and configuration you are using.

Syntax Description

vman_name	Specifies that information is displayed for the specified VMAN.
tag	Specifies a VMAN using the 802.1Q tag.
detail	Specifies that all information is displayed for each VMAN.
ipv4	Specifies IPv4.
ipv6	Specifies IPv6.

Default

Summary information for all VMANs on the switch.

Usage Guidelines

The information displayed with this command depends on the platform and configuration you are using.

Example

The following example displays a list of all the VMANs on the switch:

```
* BD-12804.17 # show vman
--------------------------------------------------------------------------------
--------
Name            VID  Protocol Addr        Flags                Proto  Ports
Virtual
Active router
/Total
--------------------------------------------------------------------------------
--------
le1             4091 ------------------ ----------------a    ANY    2 /2   VR-
Default
le2             4090 ------------------ ----------------a    ANY    0 /0   VR-
Default
vm1             4089 ------------------ ----------------     ANY    0 /0   VR-
Default
--------------------------------------------------------------------------------
--------
Flags : (a) Learning Domain (C) EAPS Control vlan, (E) ESRP Enabled,
(f) IP Forwarding Enabled, (i) ISIS Enabled, (I) IP Forwarding lpm-routing
Enabled,
```

```
(L) Loopback Enabled, (m) IPmc Forwarding Enabled,
(n) IP Multinetting Enabled, (N) Network LogIn vlan,
(o) OSPF Enabled, (p) PIM Enabled,
(P) EAPS protected vlan, (r) RIP Enabled, (T) Member of STP Domain,
(v) VRRP Enabled, (B) 802.1ah Backbone VMAN, (S) 802.1ah Service VMAN
Total number of vman(s) : 3
```

The following example displays information on a single VMAN named vman1:

```
# show vman blue
VMAN Interface with name vman1 created by user
Admin State:    Enabled         Tagging:        802.1Q Tag 100
Virtual router: VR-Default
IPv4 Forwarding: Disabled
IPv6 Forwarding: Disabled
IPv6:           None
STPD:           None
Protocol:       Match all unfiltered protocols
Loopback:       Disabled
NetLogin:       Disabled
QosProfile:     None configured
Egress Rate Limit Designated Port: None configured
Flood Rate Limit QosProfile:       None configured
Ports:   2.       (Number of active ports=0)
Tag:        *1,     *2
CEP:        *3: CVID 20-29
            *4: CVID 10-19 translate 20-29
            *5: CVID 10-19 translate 20-29,CVID 30
Flags:    (*) Active, (!) Disabled, (g) Load Sharing port
(b) Port blocked on the vlan, (m) Mac-Based port
(a) Egress traffic allowed for NetLogin
(u) Egress traffic unallowed for NetLogin
(t) Translate VLAN tag for Private-VLAN
(s) Private-VLAN System Port, (L) Loopback port
(e) Private-VLAN End Point Port
(x) VMAN Tag Translated port
(G) Multi-switch LAG Group port
```

The Port CVID output was added in the display of `show vman` *`vlan_name`* `|` **`detail`** in ExtremeXOS 15.3.2:

```
VMAN Interface with name vm1 created by user
  Admin State: Enabled                  Tagging:            802.1Q Tag
1000
  Description: None
  Virtual router: VR-Default
  IPv4 Forwarding: Disabled
  IPv6 Forwarding: Disabled
  IPv6:           None
  STPD:           None
  Protocol:       Match all unfiltered protocols
  Loopback:       Disabled
  NetLogin:       Disabled
  QosProfile:     None configured
  Egress Rate Limit Designated Port: None configured
```

```
Flood Rate Limit QosProfile:       None configured
Ports:    3.        (Number of active ports=3)
   Untag:       *21: Port CVID 5,
                *24: Port CVID 7,
   Tag:         *22
Flags:        (*) Active, (!) Disabled, (g) Load Sharing port
              (b) Port blocked on the vlan, (m) Mac-Based port
              (a) Egress traffic allowed for NetLogin
              (u) Egress traffic unallowed for NetLogin
              (t) Translate VLAN tag for Private-VLAN
              (s) Private-VLAN System Port, (L) Loopback port
              (x) VMAN Tag Translated port
              (G) Multi-switch LAG Group port
```

The show vman detail command shows all the information shown in the show vman <vlan_name> command, but displays information for all configured VMANs.

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

The tag option was added in ExtremeXOS 12.4.4.

Port CVID output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

CEP information is displayed only on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

show vman eaps

show {**vman**} *vman_name* **eaps**

Description

Displays the EAPS domains to which the VMAN belongs.

Syntax Description

vman_name	Specifies the name of the VMAN for which EAPS information is to be displayed.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays a list of EAPS domains for the campus1 VMAN:

```
* BD-12804.17 # show vman campus1 eaps
```

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show vman ethertype

show vman etherType

Description

Displays the ethertype information for VLANs, VMANs, and PBBNs.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the display from the show vman etherType command on switches that support only VMANs:

```
vMan Ethertype: 0x88a8
```

The following example shows the display from the show vman etherType command on switches that support PBBNs:

```
BlackDiamond 12804.41 # show vman etherType
vman EtherType : 0x88a8
bvlan EtherType: 0x88b5
```

The following example shows the display from the show vman etherType command when a secondary ethertype is configured:

```
BD-12804.3 # show vman ethertype
Vman Primary EtherType    : 0x9100
Vman Secondary EtherType  : 0x8100
BVlan EtherType           : 0x88b5
Secondary EtherType ports : 6:2g 6:3
```

The letter g in the port list indicates that the port is a LAG/Trunk port, the details of which can be seen using the show port sharing command.

History

This command was first available in ExtremeXOS 11.0.

Information on IEE 802.1ah was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

unconfigure vman ethertype

unconfigure vman ethertype {**secondary**}

Description

Restores the default primary VMAN ethertype value of 0x88A8 or deletes the secondary ethertype value.

Syntax Description

secondary	Deletes the secondary ethertype value.

Default

N/A.

Usage Guidelines

When you enter this command without the secondary option, the primary VMAN ethertype returns to the default value of 0x88A8. If you specify the secondary option, the secondary VMAN ethertype value is deleted (no value is assigned).

Note

Before unconfiguring the secondary VMAN ethertype, any secondary VMAN port must be changed to the primary VMAN ethertype; otherwise this command fails.

Example

The following command restores the primary VMAN ethertype to the default value:

```
unconfigure vman ethertype
```

The following command restores the secondary VMAN ethertype to the default value:

```
unconfigure vman ethertype secondary
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

16 FDB Commands

This chapter describes commands for:

- Configuring FDB entries
- Displaying FDB entries
- Managing the MAC tracking feature

For an introduction to FDB features, see the ExtremeXOS Concepts Guide.

clear counters fdb mac-tracking

```
clear counters fdb mac-tracking [<mac_addr> | all]
```

Description

Clears the event counters for the FDB MAC-tracking feature.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes.
all	Clears the counters for all tracked MAC addresses.

Default

N/A.

Usage Guidelines

The clear counters command also clears the counters for all tracked MAC addresses.

Example

The following command example clears the counters for all entries in the MAC address tracking table:

```
Switch.1 #  clear counters fdb mac-tracking all
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

clear fdb

clear fdb {*mac_addr* | **ports** *port_list* | **vlan** *vlan_name* | **blackhole**}

Description

Clears dynamic FDB entries that match the filter.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes.
port_list	Specifies one or more ports or slots and ports.
vlan_name	Specifies a VLAN name.
blackhole	Specifies the blackhole entries.

Default

Clears all dynamic FDB entries.

Usage Guidelines

This command clears FDB entries based on the specified criteria. When no options are specified, the command clears all dynamic FDB entries.

Example

The following command clears any FDB entries associated with ports 4:3-4:5 on a modular switch:

```
clear fdb ports 4:3-4:5
```

The following command clears any FDB entries associated with VLAN corporate:

```
clear fdb vlan corporate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure fdb mac-tracking ports

configure fdb mac-tracking {[**add**|**delete**]} **ports** [*port_list*|**all**]

Description

Enables or disables MAC address tracking for all MAC addresses on the specified ports.

Syntax Description

add	Enables MAC address tracking for the specified ports.
delete	Disables MAC address tracking for the specified ports.
port_list	Specifies a list of ports on which MAC address tracking is to be enabled or disabled.
all	Specifies that MAC address tracking is to be enabled or disabled on all ports.

Default

No ports are enabled for MAC address tracking.

Usage Guidelines

MAC address tracking events on enabled ports generate EMS messages and can optionally generate SNMP traps.

Note

When a MAC address is configured in the tracking table, but detected on a MAC tracking enabled port, the per MAC address statistical counters are not updated.

Example

The following command enables MAC address tracking for all MAC addresses on port 2:1:

```
configure fdb mac-tracking add ports 2:1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure fdb static-mac-move packets

configure fdb static-mac-move packets *count*

Description

Configures the number of EMS and SNMP reports that can be generated each second for MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

count	Specifies the number of duplicate MAC address events that are reported each second. The range is 1 to 25.

Default

2.

Usage Guidelines

None.

Example

The following command configures the switch to report up to 5 duplicate MAC address events per second:

```
configure fdb static-mac-move packets 5
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on the Summit family switches.

create fdbentry vlan ports

create fdbentry *mac_addr* **vlan** *vlan_name* [**ports** *port_list* | **blackhole**]

Description

Creates a permanent static FDB entry.

Syntax Description

mac_addr	Specifies a device MAC address, using colon-separated bytes.
vlan_name	Specifies a VLAN name associated with a MAC address.
port_list	Specifies one or more ports or slots and ports associated with the MAC address.
interface-list	Specifies one or more interfaces to associate with the MAC address.
blackhole	Enables the blackhole option. Any packets with either a source MAC address or a destination MAC address matching the FDB entry are dropped.

Default

N/A.

Usage Guidelines

Permanent entries are retained in the database if the switch is reset or a power off/on cycle occurs. A permanent static entry can either be a unicast or multicast MAC address. After they have been created, permanent static entries stay the same as when they were created. If the same MAC address and VLAN is encountered on another virtual port that is not included in the permanent MAC entry, it is handled as a blackhole entry. The static entry is not updated when any of the following take place:

- A VLAN identifier (VLANid) is changed.
- A port is disabled.
- A port enters blocking state.
- A port goes down (link down).

A permanent static FDB entry is deleted when any of the following take place:

- A VLAN is deleted.
- A port mode is changed (tagged/untagged).
- A port is deleted from a VLAN.

Permanent static entries are designated by spm in the flags field of the show fdb output. You can use the show fdb command to display permanent FDB entries.

If the static entry is for a PVLAN VLAN that requires more than one underlying entry, the system automatically adds the required entries. For example, if the static entry is for a PVLAN network VLAN, the system automatically adds all required extra entries for the subscriber VLANs.

You can create FDB entries to multicast MAC addresses and list one or more ports. If more than one port number is associated with a permanent MAC entry, packets are multicast to the multiple destinations.

IGMP snooping rules take precedence over static multicast MAC addresses in the IP multicast range (01:00:5e:xx:xx:xx) unless IGMP snooping is disabled.

Note

When a multiport list is assigned to a unicast MAC address, load sharing is not supported on the ports in the multiport list.

Example

The following command adds a permanent, static entry to the FDB for MAC address 00 E0 2B 12 34 56, in VLAN marketing on slot 2, port 4 on a modular switch:

```
create fdbentry 00:E0:2B:12:34:56 vlan marketing port 2:4
```

The following example creates a multiport unicast FDB entry, in VLAN black, on slot 1, ports 1, 2, and 4, on the BlackDiamond 8800 family of switches:

```
create fdbentry 01:00:00:00:00:01 vlan black port 1:1, 1:2, 1:4
```

History

This command was first available in ExtremeXOS 10.1.

The ability to create a multicast FDB with multiple entry ports was added in ExtremeXOS 11.3.

The ability to create a unicast FDB with multiple entry ports was added for the Summit X450 a- and e-series switches in ExtremeXOS 12.0.2.

The blackhole option was first available on the Summit X450 a- and e-series switches in ExtremeXOS 12.0.2.

The blackhole option was first available for all platforms in ExtremeXOS 12.1.

The ability to create a unicast FDB with multiple entry ports was available for the BlackDiamond 8000 c-, and e-series modules and the Summit X150, X250e, X350, and X450 a- and e-series switches in ExtremeXOS 12.1. This feature is supported on all later platforms when introduced.

Platform Availability

This command is available on all platforms.

delete fdb mac-tracking entry

delete fdb mac-tracking entry [*mac_addr* | **all**]

Description

Deletes a MAC address from the MAC address tracking table.

Syntax Description

mac_addr	Specifies a device MAC address, using colon-separated bytes.
all	Specifies that all MAC addresses are to be deleted from the MAC address tracking table.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following command deletes a MAC address from the MAC address tracking table:

```
delete fdb mac-tracking entry 00:E0:2B:12:34:56
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

delete fdbentry

delete fdbentry [**all** | *mac_address* [**vlan** *vla* **name>**]

Description

Deletes one or all permanent FDB entries.

Syntax Description

all	Specifies all FDB entries.
mac_address	Specifies a device MAC address, using colon-separated bytes.
vlan_name	Specifies the specific VLAN name.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes a permanent entry from the FDB:

```
delete fdbentry 00:E0:2B:12:34:56 vlan marketing
```

The following example deletes all permanent entries from the FDB:

```
delete fdbentry all
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable fdb static-mac-move

disable fdb static-mac-move

Description

Disables EMS and SNMP reporting of discovered MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables this feature:

```
disable fdb static-mac-move
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on Summit family switches.

disable flooding ports

With the BlackDiamond 8800 series switch, SummitStack, and the Summit family of switches, you can further identify the type of packets for which to block flooding.

disable flooding [**all_cast** | **broadcast** | **multicast** | **unicast**] **ports** [*port_list* | **all**]

Description

Disables Layer2 egress flooding on one or more ports.

Syntax Description

all_cast	Specifies disabling egress flooding for all packets on specified ports.
broadcast	Specifies disabling egress flooding only for broadcast packets.
multicast	Specifies disabling egress flooding only for multicast packets.
unicast	Specifies disabling egress flooding only for unknown unicast packets.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled for all packet types.

Usage Guidelines

Note

If an application requests specific packets on a specific port, those packets are not affected by the disable flooding ports command.

You might want to disable egress flooding to do the following:

- enhance security
- enhance privacy
- improve network performance

This is particularly useful when you are working on an edge device in the network. The practice of limiting flooded egress packets to selected interfaces is also known as upstream forwarding.

Note

If you disable egress flooding with static MAC addresses, this can affect many protocols, such as IP and ARP.

The following guidelines apply to enabling and disabling egress flooding:

- Disabling multicasting egress flooding does not affect those packets within an IGMP membership group at all; those packets are still forwarded out. If IGMP snooping is disabled, multicast packets are not flooded.
- Egress flooding can be disabled on ports that are in a load-sharing group. In a load-sharing group, the ports in the group take on the egress flooding state of the master port; each member port of the load-sharing group has the same state as the master port.
- On all platforms FDB learning takes place on ingress ports and is independent of egress flooding; either can be enabled or disabled independently.

- Disabling unicast or all egress flooding to a port also stops packets with unknown MAC addresses to be flooded to that port.
- Disabling broadcast or all egress flooding to a port also stops broadcast packets to be flooded to that port.

BlackDiamond X8 Series switches, BlackDiamond 8800 family of switches, SummitStack, and the Summit switch only

You can disable egress flooding for unicast, multicast, or broadcast MAC addresses, as well as for all packets on the ports of the BlackDiamond 8800 family of switches, SummitStack, and the Summit switch. The default behavior for the BlackDiamond 8800 family of switches, SummitStack, and the Summit is enabled egress flooding for all packet types.

The following command disables unicast flooding on ports 10-12 on a Summit series switch:

```
disable flooding unicast port 10-27
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on BlackDiamond X8 and 8800 series switches, SummitStack, and Summit family switches.

disable learning iparp sender-mac

disable learning iparp {**vr** *vr_name*} **sender-mac**

Description

Disables MAC address learning from the payload of IP ARP packets.

Syntax Description

vr_name	Specifies a virtual router.

Default

Disabled.

Usage Guidelines

To view the configuration for this feature, use the following command:

```
show iparp
```

Example

The following command disables MAC address learning from the payload of IP ARP packets:

```
disable learning iparp sender-mac
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all Summit family switches, SummitStack, and BlackDiamond 8800 series switches.

disable learning port

disable learning {**drop-packets** | **forward-packets**} **port** [*port_list* | **all**]

Description

Disables MAC address learning on one or more ports for security purposes.

Syntax Description

port	Specifies the port.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports and slots.
drop-packets	Specifies that packets with unknown source MAC addresses be dropped. If you do not specify the forward-packets option, this option is used.
forward-packets	Specifies that packets with unknown source MAC addresses be forwarded.

Default

Enabled.

Usage Guidelines

Use this command in a secure environment where access is granted via permanent forwarding database (FDB) entries per port.

Example

The following command disables MAC address learning on port 4:3:

```
disable learning ports 4:3
```

History

This command was first available in ExtremeXOS 10.1.

The drop packets and forward packets options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on all Summit family switches, SummitStack, and BlackDiamond X8 and 8800 series switches.

disable snmp traps fdb mac-tracking

disable snmp traps fdb mac-tracking

Description

Disables SNMP trap generation when MAC-tracking events occur for a tracked MAC address.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables SNMP traps for MAC-tracking events:

```
disable snmp traps fdb mac-tracking
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

enable fdb static-mac-move

enable fdb static-mac-move

Description

Enables EMS and SNMP reporting of discovered MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables reporting only. All packets that arrive from a duplicate MAC address on another port (other than the statically configured port) are dropped.

The switch reports the source MAC address, port, and VLAN for each duplicate MAC address.

Example

The following command enables this feature:

```
enable fdb static-mac-move
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on Summit family switches.

enable flooding ports

enable flooding [**all_cast** | **broadcast** | **multicast** | **unicast**] **ports** [*port_list* | **all**]

Description

Enables egress flooding on one or more ports. With the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches, you can further identify the type of packets to flood on the specified ports.

Syntax Description

all_cast	Specifies enabling egress flooding for all packets on specified ports.
broadcast	Specifies enabling egress flooding only for broadcast packets. NOTE: This parameter is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches.
multicast	Specifies enabling egress flooding only for multicast packets. NOTE: This parameter is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches.
unicast	Specifies enabling egress flooding only for unknown unicast packets. NOTE: This parameter is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches.
port_list	Specifies one or more ports or slots and ports.
all	Specifies all ports on the switch.

Default

Enabled for all packet types.

Usage Guidelines

Use this command to re-enable egress flooding that you previously disabled using the disable flooding ports command.

The following guidelines apply to enabling and disabling egress flooding:

- Disabling multicasting egress flooding does not affect those packets within an IGMP membership group at all; those packets are still forwarded out. If IGMP snooping is disabled, multicast packets are not flooded.
- Egress flooding can be disabled on ports that are in a load-sharing group. If that is the situation, the ports in the group take on the egress flooding state of the master port; each member port of the load-sharing group has the same state as the master port.
- FDB learning is independent of egress flooding. FDB learning and egress flooding can be enabled or disabled independently.
- Disabling unicast or all egress flooding to a port also stops packets with unknown MAC addresses to be flooded to that port.
- Disabling broadcast or all egress flooding to a port also stops broadcast packets to be flooded to that port.

BlackDiamond X8, 8800 series switches, SummitStack, and the Summit family of switches only

You can disable egress flooding for unicast, multicast, or broadcast MAC addresses, as well as for all packets on the ports of the BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches. The default behavior for the BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches is enabled egress flooding for all packet types.

Example

The following command enables unicast flooding on ports 13-17 on a Summit series switch:

```
enable flooding unicast port 13-17
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on BlackDiamond X8 and BlackDiamond 8800 series switches, SummitStack, and Summit family switches.

enable learning iparp sender-mac

enable learning iparp {**request** | **reply** | **both-request-and-reply**} {**vr** *vr_name*} **sender-mac**

Description

Enables MAC address learning from the payload of IP ARP packets.

Syntax Description

request	Enables learning only for IP ARP request packets.
reply	Enables learning only for IP ARP reply packets.
both-request-and-reply	Enables learning for both request and reply packets.
vr_name	Specifies a virtual router.

Default

Disabled.

Usage Guidelines

To view the configuration for this feature, use the following command:

```
show iparp
```

Example

The following command enables MAC address learning from the payload of reply IP ARP packets:

```
enable learning iparp reply sender-mac
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all Summit family switches, SummitStack, and BlackDiamond X8 and BlackDiamond 8800 series switches.

enable learning port

enable learning {**drop-packets**} **ports** [**all** | *port_list*]

Description

Enables MAC address learning on one or more ports.

Syntax Description

drop-packets	Forwards EDP packets, and drops all unicast, multicast, and broadcast packets from a source address not in the FDB. No further processing occurs for dropped packets. NOTE: This parameter is available only on BlackDiamond X8, 8800 series switches, SummitStack, and the Summit family switches.
all	Specifies all ports.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

Use this command to enable MAC address learning on one or more ports.

Example

The following command enables MAC address learning on slot 1, ports 7 and 8 on a modular switch:

```
enable learning ports 1:7-8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all Summit family switches, SummitStack, and BlackDiamond X8 and BlackDiamond 8800 series switches.

enable snmp traps fdb mac-tracking

enable snmp traps fdb mac-tracking

Description

Enables SNMP trap generation when MAC-tracking events occur for a tracked MAC address.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables SNMP traps for MAC-tracking events:

```
enable snmp traps fdb mac-tracking
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show fdb

show fdb {**blackhole** {**netlogin** [**all** | **mac-based-vlans**]} | **netlogin** [**all** | **mac-based-vlans**] | **permanent** {**netlogin** [**all** | **mac-based-vlans**]} | *mac_addr* {**netlogin** [**all** | **mac-based-vlans**]} | **ports** *port_list* {**netlogin** [**all** | **mac-based-vlans**]} | **vlan** *vlan_name* {**netlogin** [**all** | **mac-based-vlans**]} | {{**vpls**} {*vpls_name*}}}

Description

Displays FDB entries.

Syntax Description

blackhole	Displays the blackhole entries. (All packets addressed to these entries are dropped.)
slot	Specifies a slot in the switch.
num_entries	Specifies the maximum number of hardware entries to display. The range is 1 to 25.
netlogin all	Displays all FDBs created as a result of the netlogin process.
netlogin mac-based-vlans	Displays all netlogin MAC-based VLAN FDB entries. NOTE: This parameter is supported only for Summit family switches, SummitStack, and the BlackDiamond 8800 series switches. See Network Login Commands for more information on netlogin.

permanent	Displays all permanent entries, including the ingress and egress QoS profiles.
mac_addr	Specifies a MAC address, using colon-separated bytes, for which FDB entries should be displayed.
port_list	Displays the entries for one or more ports or ports and slots.
vlan_name	Displays the entries for a specific VLAN.
vpls_name	Specifies a specific VPLS for which to display entries.

Default

All.

Usage Guidelines

The pulling of MAC addresses for display purposes is given a lower priority to the actual data path learning. Eventually all the MAC addresses are learned in a quiescent system.

The show fdb command output displays the following information:

Mac	The MAC address that defines the entry.
Vlan	The PVLAN or VLAN for the entry.
Age	The age of the entry, in seconds (does not appear if the keyword permanent is specified). The age parameter does not display for the backup MSM/MM on modular switches. On BlackDiamond 8900 xl-series and Summit X480 switches, the Age is always 000 and the h flag is set for entries that are hardware aged.
Flags	Flags that define the type of entry: b - Ingress BlackholeB - Egress BlackholeD - Drop entry for an isolated subscriber VLANd - Dynamich - Aged in hardware (Applies to BlackDiamond 8900 xl-series and Summit X480 switches)i - an entry also exists in the IP FDBl - lockdown MACL - lockdown-timeout MACm - MACM - Mirrorn - NetLogino - IEEE 802.1ah backbone MACP - PVLAN created entryp - Permanents - Staticv - NetLogin MAC-Based VLAN (only supported on the Summit switch, SummitStack, and the BlackDiamond 8800 family of switches)x - an entry also exists in the IPX FDBs
Port List	The ports on which the MAC address has been learned.

Example

The following command example shows how the FDB entries appear for all options except the hardware option:

```
# show fdb
Mac                     Vlan       Age  Flags       Port / Virtual Port List
-------------------------------------------------------------------------------
00:0c:29:4b:34:cf       v101(0101) 0041 d m       D  1:2
00:0c:29:4b:34:cf       v100(0100) 0041 d m       P  1:2
00:0c:29:d2:2d:48       v102(0102) 0045 d m          1:3
00:0c:29:d2:2d:48       v100(0100) 0045 d m       P  1:3
```

```
00:0c:29:f1:f2:f5       v100(0100) 0045 d m          1:1
00:0c:29:f1:f2:f5       v102(0102) 0045 d m       P  1:1
00:0c:29:f1:f2:f5       v101(0101) 0045 d m       P  1:1
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
        Blackhole,
b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN
        translation,
D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC.
Total: 3 Static: 0  Perm: 0  Dyn: 3  Dropped: 0  Locked: 0  Locked with
Timeout: 0
FDB Aging time: 300
FDB VPLS Aging time: 300
```

The show fdb command displays blackhole output under the b and B flags. The following command displays FDB information on a Summit X450 a-series switch:

```
X450a-48t.12 # show fdb
Mac                     Vlan       Age  Flags       Port / Virtual Port List
------------------------------------------------------------------------------
00:00:00:11:22:33    Default(0001) 0000 spm  Bb
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, L - lockdown-timeout MAC, M- Mirror, B - Egress
        Blackhole,
b - Ingress Blackhole, v - MAC-Based VLAN, P - Private VLAN, T - VLAN
        translation,
D - drop packet, h - Hardware Aging, o - IEEE 802.1ah Backbone MAC.
Total: 1 Static: 1  Perm: 1  Dyn: 0  Dropped: 0  Locked: 0  Locked with
Timeout: 0
FDB Aging time: 300
FDB VPLS Aging time: 300
```

History

This command was first available in ExtremeXOS 10.1.

The stats and netlogin parameters were first available in ExtremeXOS 11.3.

The blackhole output under the b and B flags was first available on the Summit X450 a- and e-series switches in ExtremeXOS 12.0.2.

The blackhole output under the b and B flags was first available for all platforms in ExtremeXOS 12.1.

The o flag was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show fdb mac-tracking configuration

show fdb mac-tracking configuration

Description

Displays configuration information for the MAC address tracking feature.

Syntax Description

This command has no arguments or variables.

Default

The MAC address tracking table is empty.

Usage Guidelines

None.

Example

The following command example displays the contents of the MAC address tracking table:

```
Switch.8 # show fdb mac-tracking configuration
MAC-Tracking enabled ports: 1-3,10,20
SNMP trap notification    : Enabled
MAC address tracking table (4 entries):
00:30:48:72:ee:88
00:21:9b:0e:ca:32
00:12:48:82:9c:56
00:30:48:84:d4:16
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show fdb mac-tracking statistics

show fdb mac-tracking statistics {*mac_addr*} {**no-refresh**}

Description

Displays statistics for the MAC addresses that are being tracked.

Syntax Description

mac_addr	Specifies a MAC address, using colon-separated bytes, for which FDB entries should be displayed.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.

Default

N/A.

Usage Guidelines

Use the keys listed below the display to clear the statistics counters or page up or down through the table entries.

Example

The following command example displays statistics for the entries in the MAC address tracking table:

```
Switch.1 #  show fdb mac-tracking statistics
MAC Tracking Statistics      Fri Mar 20 15:25:01 2009
Add         Move        Delete
MAC Address        events      events      events
=====================================================
00:00:00:00:00:01           0           0           0
00:00:00:00:00:02           0           0           0
00:00:00:00:00:03           0           0           0
00:00:00:00:00:04           0           0           0
00:00:00:00:00:05           0           0           0
00:00:00:00:00:06           0           0           0
00:00:00:00:00:07           0           0           0
00:00:00:00:00:08           0           0           0
00:00:00:00:00:09           0           0           0
00:00:00:00:00:10           0           0           0
00:00:00:00:00:11           0           0           0
00:00:00:00:00:12           0           0           0
00:00:00:00:00:13           0           0           0
00:00:00:00:00:14           0           0           0
00:00:00:00:00:15           0           0           0
00:00:00:00:00:16           0           0           0
00:00:00:00:00:17           0           0           0
00:00:00:00:00:18           0           0           0
=====================================================
0->Clear Counters  U->page up  D->page down ESC->exit
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show fdb static-mac-move configuration

show fdb static-mac-move configuration

Description

Displays the configuration for the feature that reports the discovery of MAC addresses that are duplicates of statically configured MAC addresses.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example shows the command display:

```
Switch.37 # show fdb static-mac-movement configuration
Static MAC Movement Notification: Enabled
MAC learning Packets Count      : 5
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on Summit family switches.

show fdb stats

show fdb stats {{**ports** {**all** | *port_list*} | **vlan** {**all**} | {**vlan**} *vlan_name* } {**no-refresh**}}

Description

Displays FDB entry statistics for the specified ports or VLANs in either a dynamic or a static report.

Syntax Description

all	Requests statistics for all ports or all VLANs.
port_list	Specifies which ports are to be included in the statistics display.
vlan_name	Specifies a single VLAN to be included in the statistics display.
no-refresh	Specifies a static display, which is not automatically updated.

Default

Summary FDB statistics for the switch.

Usage Guidelines

The dynamic display remains visible and continues to update until you press <Esc>.

The show fdb stats command output displays the following information:

Port	When you chose to display statistics for ports, this column displays port numbers.
Link State	When you chose to display statistics for ports, this column displays the link states, which are described at the bottom of the display.
VLAN	When you chose to display statistics for VLANs, this column displays VLAN names.
MAC Addresses	This column displays the total number of MAC addresses for each port or VLAN.
Dynamic	This column displays the total number of MAC addresses that were learned dynamically for each port or VLAN.
Static	This column displays the total number of MAC addresses that are configured on this switch for each port or VLAN.
Dropped	This column displays the total number of dynamic MAC addresses that were discovered, but not stored in the FDB. Discovered MAC addresses might be dropped because a configured learning limit is reached, the FDB is in lockdown, or a port forwarding state is in transition. Some conditions that lead to dropped MAC addresses can produce log messages or SNMP traps.

Example

The following command example displays summary FDB statistics for the switch:

```
torino1.1 # show fdb stats
Total: 4 Static: 3 Perm: 3 Dyn: 1 Dropped: 0
FDB Aging time: 300
```

```
FDB VPLS Aging time: 300
torino1.2 #
```

The following command example displays FDB statistics for ports 1 to 16 on slot 1:

```
# show fdb stats ports 1:1-1:16
FDB Stats                                          Mon Mar 15 15:30:49 2010
Port        Link   MAC
State   Addresses      Dynamic       Static      Dropped
=============================================================================
1:1           A         2394         2389            5            2
1:2           A           37           37            0            0
1:3           A          122          121            1          452
1:4           R            0            0            0            0
1:5           R            0            0            0            0
1:6           A           43           43            0            0
1:7           A          118          118            0            0
1:8           R            0            0            0            0
1:9           R            0            0            0            0
1:10          A            8            8            0            0
1:11          A         2998         2990            8            1
1:12          A          486          486            0            0
1:13          R            0            0            0            0
1:14          A           42           42            0            0
1:15          A          795          795            0            0
1:16          A           23           23            0            2
=============================================================================
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
U->page up  D->page down ESC->exit
```

The following command example displays FDB statistics for all VLANs:

```
# show fdb stats vlan all
FDB Stats                                             Mon Mar 15 15:30:49 2010
VLAN                        MAC Addresses     Dynamic     Static     Dropped
=============================================================================
SV_PPPOE                             2394        2389          5           2
NV_PPPOE                              122         121          1         452
=============================================================================
U->page up  D->page down  ESC->exit
```

History

The dynamic display for this command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

17 Data Center Solution Commands

show vm-tracking repository
configure fip snooping add vlan
configure fip snooping add fcf
configure fip snooping delete vlan
configure fip snooping delete fcf
configure fip snooping fcf-update
configure fip snooping fcmap
configure fip snooping port location
configure lldp ports dcbx add application
configure lldp ports dcbx delete application
configure lldp ports vendor-specific dcbx
configure port reflective-relay
configure vlan dynamic-vlan uplink-ports
configure vm-tracking authentication database-order
configure vm-tracking blackhole
configure vm-tracking local-vm
configure vm-tracking nms
configure vm-tracking nms timeout
configure vm-tracking repository
configure vm-tracking timers
configure vm-tracking vpp add
configure vm-tracking vpp delete
configure vm-tracking vpp vlan-tag
configure vm-tracking vpp counters
create vm-tracking local-vm
create vm-tracking vpp
delete vm-tracking local-vm
delete vm-tracking vpp
disable fip snooping
disable vm-tracking
disable vm-tracking dynamic-vlan ports
disable vm-tracking ports
enable fip snooping
enable vm-tracking
enable vm-tracking dynamic-vlan ports
enable vm-tracking ports
run vm-tracking repository

This chapter describes commands for:

- Managing The Extreme Network Virtualization (XNV) feature
- Managing the Direct Attach feature
- Using FIP Snooping

For an introduction to Data Center Solutions, see the ExtremeXOS Concepts Guide.

show vm-tracking repository

show vm-tracking repository {primary | secondary}

Description

Displays the FTP file synchronization configuration for NVPP and VMMAP files.

Syntax Description

primary | secondary	Specifies the whether you are displaying the primary or secondary FTP server configuration.

Default

If you do not specify primary or secondary, the default action is to display both the primary and secondary FTP server configurations.

Usage Guidelines

None.

Example

The following command displays the configuration for the primary and secondary FTP servers:

```
show vm-tracking repository
Primary VM-Map FTP server:
Server name:
IP address      :  10.100.1.200
VR Name         :  VR-Mgmt
Refresh-interval:  600 seconds
Path Name       : /pub (default)
User Name       : anonymous (default)
Secondary vm-map FTP server: Unconfigured
Last sync        : 16:35:15        Last sync server  : Primary
Last sync status : Successful
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure fip snooping add vlan

configure fip snooping add {**vlan**} *vlan_name*

Description

FIP Snooping must be configured to operate.

When a VLAN is added to FIP Snooping using this command, a record containing all FIP configuration information is created for that VLAN with default settings for all configuration elements. If the configuration is saved, the record persists across reboots. The user can see the record when using the “show fip snooping vlan”command to see FIP Snooping information for a VLAN. If the record does not exist, no information appears.

Syntax Description

add	Allows use of FIP Snooping on the VLAN
vlan	Optional VLAN keyword

Default

- Feature is disabled on the specified VLAN.
- Port locations default to “perimeter”.
- FCF-update mode is “automatic”.
- No FCFs exist in the configuration.
- The FC-MAP prefix is 0e:fc:00.
- There are no ACLs.
- There are no ENodes.
- There are no virtual links.
- All counters contain zero.

Usage Guidelines

This command creates the FIP Snooping configuration record for the specified VLAN. All default settings are in effect.

Example

```
configure fip snooping add vlan v3
```

History

This command was first available in ExtremeXOS 15.1.

configure fip snooping add fcf

configure fip snooping {**vlan**} *vlan_name* **add fcf** *mac_addr* **port** *port*

Description

This command is used to add an FCF to a FIP Snooping VLAN port when in manual fcf-update mode.

If the fcf-update mode is manual, this command adds a new FCF MAC to the list of FCFs. The command does not allow the same FCF MAC to be added to multiple ports in the same VLAN.

When a new FCF is added, ACLs are added to accept FIP frames from the new FCF.

An FCF can only be configured on a FIP Snooping VLAN port that has port location FCF-to-Enode or All configured.

If the fcf-update mode is automatic and this command is executed, the “add” is not allowed and the user is informed.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping on FIP frames
vlan_name	Name of a FIP Snooping VLAN where fcf-update is configured to be in manual mode
add	Add to the list of FCoE forwarders
mac_addr	MAC address of the FCoE Forwarder specified in the format of hh:hh:hh:hh:hh:hh
port	Port through which the FCF is reachable

Default

N/A.

Usage Guidelines

This command is used to add an FCF to a FIP Snooping VLAN port when in manual fcf-update mode. The command does not allow the same FCF MAC to be added to multiple ports in the same VLAN.

Example

```
configure fip snooping v3 add fcf aa:bb:cc:dd:00:00 port 1:2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x

configure fip snooping delete vlan

configure fip snooping delete [{**vlan**} *vlan_name* | **all**]

Description

This command deletes the FIP Snooping configuration record for the specified VLAN. If “all” is specified, all FIP Snooping configuration information is removed from the system after the user confirms this request:

```
Warning: This command will remove all FIP Snooping configuration for all
VLANs. Do you want to continue? (y/N)
```

If FIP Snooping is enabled on an affected VLAN it is first disabled causing the removal of related ACL and FDB information from the system. Also removed are any virtual links, Enodes, and FCFs.

Note

A VLAN cannot be deleted when FIP Snooping is configured. For example: * BDX8.60 # delete vlan v1 Error: Failed to delete VLAN v1; FIP Snooping is configured on this VLAN. Configuration failed on backup MM, command execution aborted! * BDX8.61 # configure fip snooping delete vlan v1 * BDX8.62 # delete vlan v1 * BDX8.63 #

Syntax Description

delete	Remove use of FIP Snooping from the VLAN.
vlan	Optional VLAN keyword

Default

N/A.

Usage Guidelines

Use this command to delete the FIP Snooping configuration record for the specified VLAN.

Example

```
configure fip snooping delete vlan v3
```

History

This command was first available in ExtremeXOS 15.1.

configure fip snooping delete fcf

configure fip snooping {**vlan**} *vlan_name* **delete fcf** *mac_addr* **port** *port*

Description

This command is used to remove an FCF from a FIP Snooping VLAN port when in manual fcf-update mode.

If the fcf-update mode is manual, this command removes the FCF MAC from the list of FCFs configured on the FIP Snooping VLAN. When an FCF is removed from the list, the ACLs referencing the FCF (including virtual links) are removed.

If the fcf-update mode is automatic and this command is executed, the remove is not allowed and the user is informed.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of a FIP Snooping VLAN where the specified FCF MAC address has been configured
delete	Delete from the list of FCoE forwarders
fcf	The list of FCoE forwarders in the VLAN
mac_addr	MAC address of the FCoE Forwarder specified in the format of hh:hh:hh:hh:hh:hh
port	Port through which the FCF is reachable

Default

N/A.

Usage Guidelines

This command is used to remove an FCF from a FIP Snooping VLAN port when in manual fcf-update mode. The fcf-update mode must be “manual”.

Example

```
configure fip snooping v3 delete fcf aa:bb:cc:dd:00:00 port 1:2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x

configure fip snooping fcf-update

configure fip snooping {vlan} *vlan_name* **fcf-update [auto | manual]**

Description

This command configures the update mode of the list of FCFs per FIP Snooped VLAN. The default mode is auto.

The list of FCFs to which ENodes establish FCoE virtual links is updated either administratively or dynamically via snooped FIP frames. This command selects the method of updating the list of FCFs per VLAN. When the updating method changes, the following events occur.

- FDB entries of FCFs' MACs are removed.
- ACLs checking the FCFs' MACs are removed.

In automatic mode, the list of FCFs is automatically constructed through observation of FCF discovery advertisement packets. An attempt to configure an FCF while in automatic mode is rejected.

In manual mode the list of FCFs is configured by the user. Use the following commands to configure the list of FCFs:

- configure fip snooping add fcf
- configure fip snooping delete fcf
- configure fip snooping fcf-update

When the fcf-update mode is changed from manual to automatic, all configured FCFs are removed.

Syntax Description

vlan_name	Name of a FIP Snooping VLAN where the fcf-update mode is to be configured
auto	Learn the list of FCoE forwarders from snooped FIP frames
manual	FCoE forwarders are configured manually using the "configure fip snooping *vlan* add fcf" command

Default

Auto.

Usage Guidelines

This command configures the update mode of the list of FCFs per FIP Snooped VLAN. In automatic mode, the list of FCFs is automatically constructed through observation of FCF discovery advertisement packets. An attempt to configure an FCF while in automatic mode is rejected. In manual mode the list of FCFs is configured by the user. When the fcf-update mode is changed, all FCFs are removed.

Example

```
configure fip snooping vlan v3 fcf-update manual
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x

configure fip snooping fcmap

configure fip snooping {**vlan**} *vlan_name* **fcmap** *mac_prefix*

Description

An FCF and an Enode negotiate whether the FCF or the Enode will provide a VN_Port MAC address for each virtual link. The Enode (also called a server) can provide a Server Provided MAC Address (SPMA), or the FCF can provide a Fabric Provided MAC Address (FPMA). An individual FPMA is assigned by the FibreChannel fabric to the VN_Port during fabric login. An FPMA address begins with the 24-bit FC-MAP prefix. The default value of the FC-MAP prefix is 0E:FC:00 but can be changed. The low order three octets of the FPMA will contain the FibreChannel fabric-assigned FibreChannel ID (also called a VN_Port_ID) for the virtual link.

This command configures the expected MAC address prefix (used when in FPMA mode) of all FPMA used on the FIP Snooping VLAN. The FPMA for a VN_Port is assigned by the FCF using its configured FC-MAP prefix to construct the VN_Port FPMA. Therefore the FC-MAP prefix configured on the switch must be the same as that configured on the FCF for the VLAN. The default value of ***mac_prefix*** is 0E:FC:00:00:00:00.

The mac_prefix value must be between 0e:fc:00 and 0e:fc:ff and the lower three MAC octets must be specified as zero or the following message will be displayed:

```
Error: Invalid FC-MAP, use 0e:fc:xx:00:00:00 where xx is a two-digit
hexadecimal value.
```

The user should not use the same FIP Snooping VLAN for connection to more than one FibreChannel fabric or storage area network. Duplicate FPMA could be assigned by the different fabrics causing connectivity issues.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN for which the FC-MAP prefix is to be changed
fcmap	24 prefix for MAC address assigned to VN Port in an FPMA mode
mac_prefix	24bit prefix of MAC followed by 24 zeros formatted as 0e:fc:xx:00:00:00 where xx is a two-digit hexadecimal number

Default

The default value of ***mac_prefix*** is 0E:FC:00:00:00:00.

Usage Guidelines

This command configures the expected MAC address prefix (used when in FPMA mode) of all FPMA used on the FIP Snooping VLAN.

Example

```
configure fip snooping vlan v3 fcmap 0e:fc:01:00:00:00
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM

- Summit X650-24t
- Summit X650-24x

configure fip snooping port location

configure fip snooping {**vlan**} *vlan_name* **ports** *port_list* {**location** [**perimeter** | **enode-to-fcf** | **fcf-to-enode** | **all**]}

The default ACLs on the port are changed to be consistent with the new location.

Description

This command configures the port location for a member of a VLAN that is configured to perform FIP Snooping. The default port location type is perimeter. If no FIP Snooping configuration record was previously created for the VLAN, this command causes its creation with defaults (except for the particular port's location as specified) set.

The acceptable FIP frames differ per port location. The command specifies the port location and guides the switch to install different ACLs. The default port location, i.e. port type, is perimeter, where the port is expected to be connected toENodes. The change of the port type triggers the following events.

If FIP Snooping is enabled:

- All FDB entries previously stored for the VLAN on the specified port are removed, except for those related to manually configured FCFs.
- All virtual links are removed.
- All knowledge of Enodes (if any) learned on this port is removed.
- All knowledge of discovered FCFs (if any) learned on this port is removed.

Syntax Description

vlan-name	Name of the VLAN whose port(s) will have the location changed
port_list	A port or a list of ports
perimeter	Port is directly connected to Enodes. Per virtual link ACLs are installed providing the most security.
enode-to-fcf	Port sees packets from FCoE nodes to FCoE forwarders only
fcf-to-enode	Port sees packets from FCoE forwarders to FCoE nodes only
all	Port sees packets both from FCoE forwarders and FCoE nodes

Default

Perimeter.

Usage Guidelines

This command configures the port location for a member of a VLAN that is to perform FIP Snooping.

Example

```
configure fip snooping vlan "v3" port 1:1 location fcf-to-enode
```

History

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x

configure lldp ports dcbx add application

configure lldp ports [**all** | *port_list*] **dcbx add application** [**name** *application_name* | **ethertype** *ethertype_value* | **L4-port** *port_number* | **tcp-port** *port_number* | **udp-port** *port_number*] **priority** *priority_value*

Description

Configures an application priority to be advertised to DCBX end stations.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
application_name	Specifies an application. Supported values are: • fcoe—Fiber Channel Over Ethernet (FCoE) • fip—FCoE Initiation Protocol (FIP) • iscsi—Internet Small Computer System Interface (iSCSI)
ethertype_value	Specifies an ethertype value in the range of 1536 to 65535.
L4-port*port_number*	Specifies a Layer 4 port number in the range of 0 to 65535. Supported Layer4 protocols include TCP, SCTP, UDP, and DCCP.
tcp-port *port_number*	Specifies a TCP port number in the range of 0 to 65535.
udp-port*port_number*	Specifies a UDP port number in the range of 0 to 65535.
priority_value	Specifies a priority in the range of 0 to 7.

Default

N/A.

Usage Guidelines

This command configures the switch to advertise the priority that an end station should use for the specified application or port number. The priority number is mapped to an 802.1p value, which determines how the switch manages traffic from that application or port.

The switch supports a maximum of 8 DCBX applications per port. If an application configuration already exists on the specified port or ports, the priority is updated to the new value. If the maximum number of applications for a port is exceeded, the switch logs an error message.

Example

The following command configures the switch to advertise priority 4 for the iSCSI application on ports1 to 24:

```
configure lldp ports 1-24 dcbx add application name iscsi priority 4
```

The following command configures the switch to advertise priority 3 for ethertype value 34525 on port1:

```
configure lldp ports 1 dcbx add application ethertype 34525 priority 3
```

The following command configures the switch to advertise priority 6 for Layer 4 port 992 on port1:

```
configure lldp ports 1 dcbx add application L4-port 992 priority 6
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure lldp ports dcbx delete application

configure lldp ports [**all** | *port_list*] **dcbx delete application** [**all-applications** | **name** *application_name* | **ethertype** *ethertype_value* | **L4-port** *port_number* | **tcp-port** *port_number* | **udp-port** *port_number*]

Description

Removes the priority configuration for one or all applications from the specified ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
application_name	Specifies an application. Supported values are: • fcoe—Fiber Channel Over Ethernet (FCoE) • fip—FCoE Initiation Protocol (FIP) • iscsi—Internet Small Computer System Interface (iSCSI)
ethertype_value	Specifies an ethertype value in the range of 1536 to 65535.
L4-port *port_number*	Specifies a Layer 4 port number in the range of 0 to 65535. Supported Layer4 protocols include TCP, SCTP, UDP, and DCCP.
tcp-port *port_number*	Specifies a TCP port number in the range of 0 to 65535.
udp-port *port_number*	Specifies a UDP port number in the range of 0 to 65535.

Default

N/A.

Usage Guidelines

This command configures the switch to advertise the priority that an end station should use for the specified application or port number. The priority number is mapped to an 802.1p value, which determines how the switch manages traffic from that application or port.

If an application configuration already exists on the specified port or ports, the priority is updated to the new value.

Example

The following command removes the priority configuration for Layer 4 port 30 on port 23:

```
configure lldp ports 23 dcbx delete application L4-port 30
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure lldp ports vendor-specific dcbx

configure lldp ports [**all** | *port_list*] [**advertise** | **no-advertise**] **vendor-specific dcbx** {**ieee**|**baseline**}

Description

Configures the LLDP port to advertise or not to advertise Data Center Bridging Exchange (DCBX) information to its neighbors.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
advertise	Specifies to send the information to neighbors.
no-advertise	Specifies not to send the information to neighbors.
ieee	Specifies the DCBX protocol defined in IEEE 802.1Qaz.
baseline	Specifies the DCBX protocol known as Baseline Version 1.01, which was defined before IEEE 802.1Qaz.

Default

No advertisement for both DCBX protocols.

Usage Guidelines

If you do not specify a protocol with this command, the advertise option enables advertisement for the IEEE 802.1Qaz protocol, and the no-advertise option disables advertisement for both protocols.

Example

The following command advertises DCBX information according to IEEE 802.1Qaz for port 1:5:

```
configure lldp ports 1:5 advertise vendor specific dcbx
```

The following command advertises DCBX information according to Baseline Version 1.01 for port 2:1:

```
configure lldp ports 2:1 advertise vendor specific dcbx baseline
```

The following command disables advertisement of DCBX information on all ports:

```
configure lldp ports all no-advertise vendor specific dcbx
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure port reflective-relay

configure port *port* **reflective-relay [on | off]**

Description

Enables the direct attach feature on the specified port.

Syntax Description

port	Specifies a single port on which to enable the direct attach feature.

Default

Off.

Usage Guidelines

You should only enable the direct attach feature on ports that directly connect to a VM server running VEPA software.

This feature requires installation of the Direct Attach feature pack. For more information, see Feature Pack Features.

Example

The following command enables the direct attach feature on port 2:1:

```
configure port 2:1 reflective-relay on
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all Summit family switches and BlackDiamond X8, BlackDiamond 8000 series modules.

configure vlan dynamic-vlan uplink-ports

configure vlan dynamic-vlan uplink-ports [add {ports} <port_list> **| delete {ports} [***port_list* **| all]]**

Description

Statically provisions uplink ports for all dynamically created VLANs.

Syntax Description

dynamic-vlan	Configuration options for dynamically created VLANs.
uplink-ports	Tagged uplink ports for VLANs created by EXOS.
add	Add ports to dynamic VLAN uplink port list.
delete	Remove ports from dynamic VLAN uplink port list.
ports	Ports to be configured as uplink ports.
port_list	List of ports separated by a commoa or -." ;type=portlist_t";
all	Clear the dynamic VLAN uplink port list.

Default

N/A.

Usage Guidelines

Use this command to statically provision uplink ports for dynamically created VLANs.

Example

```
X460-48p.3 # conf vlan dynamic-vlan uplink-ports add ports 16-18X460-48p.4 #
conf vlan dynamic-vlan uplink-ports add 20,22,24X460-48p.5 # configure vlan
dynamic-vlan uplink-ports delete ports 22X460-48p.7 # configure vlan dynamic-
vlan uplink-ports delete 16-18X460-48p.8 # configure vlan dynamic-vlan uplink-
ports delete all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure vm-tracking authentication database-order

configure vm-tracking authentication database-order [[**nms**] | [**vm-map**] | [**local**] | [**nms local**] | [**local nms**] | [**nms vm-map**] | [**vm-maplocal**] | [**local vm-map**] | [**nms vm-map local**] | [**localnmsvm-map**]]

Description

Configures the authentication database options and sequence for VM authentication.

Syntax Description

nms	Specifies the configured Network Management System (NMS).
vm-map	Specifies the configured VMMAP file.
local	Specifies the configured local database.

Default

nms vm-map local.

Usage Guidelines

The switch attempts VM authentication in the sequence specified. For example, in the default configuration, the switch attempts NMS authentication first, VMMAP authentication second, and local authentication third. If nms is specified, the switch always attempts NMS authentication before attempting VMMAP file authentication.

Example

The following command configures the database authentication order:

```
configure vm-tracking authentication database-order local nms vm-map
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure vm-tracking blackhole

configure vm-tracking blackhole [**policy** *policy_name* | **dynamic-rule** *rule_name* | **none**]

Description

Specifies a policy file or dynamic ACL rule to apply to VMs during periods that are outside of the approved time slot for that VM.

Syntax Description

policy_name	Specifies the name of a policy file to apply to the VM authentication request.
rule_name	Specifies the name of an ACL rule to apply to the VM authentication request.

Default

N/A.

Usage Guidelines

This command is not supported in this software release. It will be supported in a future release.

The none option applies no policy name or ACL rule during periods that are outside of the approved time slot for that VM.

Note

This command is provided to support future identity management features. It serves no practical purpose in this release.

Example

The following command applies no policy name or ACL rule during periods that are outside of the authorized authentication period:

```
configure vm-tracking blackhole none
```

History

This command was first visible in ExtremeXOS 12.5, but it is not supported in this release. This command will be supported in a future release.

Platform Availability

This command is available on all platforms.

configure vm-tracking local-vm

configure vm-tracking local-vm mac-address *mac* [**name** *name* | **ip-address** *ipaddress* | **vpp** *vpp_name*] | **vlan-tag** *tag* {**vr** *vr_name*}]

Description

Configures the parameters associated with a local VM database entry to be used for VM MAC local authentication.

Syntax Description

mac	Specifies the MAC address for the VM database entry you want to configure.
name	Specifies a name to represent this VM in show vm-tracking command display.
ipaddress	Specifies the IP address for the VM. This must match the IP address configured on the VM.
vpp_name	Specifies the name of a VPP to apply to the local VM.
tag	VLAN tag between 1 and 4094.
vr_name	Virtual router name.

Default

N/A.

Usage Guidelines

Before you configure a VM entry in the local VM database, you must create the entry with the create vm-tracking local-vm command.

Before you assign an VPP to a VM entry in the local VM database, you must create the VPP with the create vm-tracking vpp command.

Example

The following command configures an IP address for the VM entry specified by the MAC address:

```
configure vm-tracking local-vm mac-address 00:E0:2B:12:34:56 ip-address
10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress-vpp and egress-vpp options were replaced with the vpp option in ExtremeXOS 12.6.

The vlan-tag and vr-name options were added in 15.3.

Platform Availability

This command is available on all platforms.

configure vm-tracking nms

configure vm-tracking nms [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {*udp_port*} **client-ip** *client_ip* **shared-secret** {**encrypted**} *secret* {**vr** *vr_name*}

Description

Configures the switch RADIUS client to an NMS for VM authentication.

Syntax Description

primary | secondary	Specifies the whether you are configuring the primary or secondary NMS.
ipaddress	Specifies the NMS IP address.
hostname	Specifies the NMS DNS hostname.
udp_port	Specifies the UDP port number of the NMS application.
client_ip	Specifies the client IP address, which is the switch IP address on the interface leading to the NMS.
encrypted	Specifies that the secret key for communications with the NMS is encrypted.
secret	Specifies a key or password for communications with the NMS.
vr_name	Specifies the VR that is used to access the NMS.

Default

N/A.

Usage Guidelines

The NMS is a RADIUS server such as the one provided with Ridgeline.

Example

The following command configures the switch to authenticate VMs through the primary NMS server Ridgeline using the password password:

```
configure vm-tracking nms primary server Ridgeline client-ip 10.10.3.3 shared-
secret password
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure vm-tracking nms timeout

configure vm-tracking nms timeout *seconds*

Description

Configures the timeout period for authentication attempts with the configured NMS servers.

Syntax Description

seconds	Specifies the timeout period in seconds.

Default

3 seconds.

Usage Guidelines

None.

Example

The following command configures the switch to allow 1 minute for successful authentication of a VM with the NMS server:

```
configure vm-tracking nms timeout 60
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure vm-tracking repository

configure vm-tracking repository [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {**vr** *vr_name*} {**refresh-interval** *seconds*} {**path-name** *path_name*} {**user** *user_name* {**encrypted**} *password*}

Description

Configures FTP file synchronization for NVPP and VMMAP files.

Syntax Description

primary | secondary	Specifies the whether you are configuring the primary or secondary FTP server.
ipaddress	Specifies the FTP server IP address.
vr_name	Specifies the VR that is used to access the FTP server.
seconds	Specifies how often the switch updates the local files that are synchronized with the FTP server. The range is 40 to 3600 seconds.
path_name	Specifies the path to the repository server files from the FTP server root directory. The default directory for repository server files is: pub.
user_name	Specifies a user name for FTP server access. If no username is specified, the switch uses user name anonymous.
encrypted	This keyword indicates that the specified password is encrypted.
password	Specifies the password for the specified user name.

Default

Refresh interval: 600 seconds.

Usage Guidelines

Some jitter is added to the refresh interval period to prevent all switches from downloading files at the same time.

Example

The following command configures the switch to refresh the VMMAP and NVPP files from primary FTP server ftp1 every 5 minutes:

```
configure vm-tracking repository primary server ftp1 refresh-interval 300
```

History

This command was first available in ExtremeXOS 12.5.

Support for specifying an FTP user name was added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure vm-tracking timers

configure vm-tracking timers reauth-period *reauth_period*

Description

Configures the RADIUS reauthentication period for VM MAC addresses.

Syntax Description

reauth_period	Specifies the reauthentication period in seconds. The ranges are 0 and 30-7200 seconds.

Default

0 seconds.

Usage Guidelines

One way to periodically apply Virtual Port Profiles (VPPs) to VM MAC addresses is to configure a reauthentication period. At the end of each reauthentication period, the switch reauthenticates each VM MAC address and applies any updated VPPs.

This command applies to only those VMs that authenticate through RADIUS. Reauthentication is disabled when the reauthentication period is set to 0 seconds. When reauthentication is disabled, the VM MAC address remains authenticated until the FDB entry for that VM expires.

Example

The following command enables RADIUS server reauthentication at 2 minute intervals:

```
configure vm-tracking timers reauth-period 120
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure vm-tracking vpp add

configure vm-tracking vpp *vpp_name* **add** [**ingress** | **egress**] [**policy** *policy_name* | **dynamic-rule** *rule_name*] {**policy-order** *policy_order*}

Description

Configures an LVPP to use the specified policy or ACL rule.

Syntax Description

vpp_name	Specifies the name of an existing LVPP.
add	Specifies whether the LVPP should start using the specified policy or rule.
ingress	Specifies that the policy mapped to the LVPP is for ingress traffic.
egress	Specifies that the policy mapped to the LVPP is for egress traffic.
policy_name	Specifies a policy to add to or delete from the LVPP.
rule_name	Specifies a dynamic ACL rule to add to or delete from the LVPP.

Default

N/A.

Usage Guidelines

Multiple ACL or policy files can be mapped to each LVPP. A maximum of 8 ingress and 4 egress ACL or policies are available to be mapped to each LVPP. If the policy file or dynamic rule specified in this command fails to bind, then the CLI command is rejected.

Before you can configure an LVPP, you must first create it with the create vm-tracking vpp command.

Example

The following command configures LVPP vpp1 to use the dynamic ACL rule named rule1 for ingress traffic:

```
configure vm-tracking vpp vpp1 add ingress dynamic-rule rule1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress and egress keywords were added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure vm-tracking vpp delete

configure vm-tracking vpp *vpp_name* **delete** [**ingress** | **egress**] [**policy** *policy_name* | **dynamic-rule** *rule_name*] {**policy-order** *policy_order*}

Description

Specifies that the LVPP should stop using the specified policy or rule.

Syntax Description

vpp_name	Specifies the name of an existing LVPP.
add	Specifies whether the LVPP should stop using the specified policy or rule.
ingress	Specifies that the policy mapped to the LVPP is for ingress traffic.
egress	Specifies that the policy mapped to the LVPP is for egress traffic.
policy_name	Specifies a policy to add to or delete from the LVPP.
rule_name	Specifies a dynamic ACL rule to add to or delete from the LVPP.

Default

N/A.

Usage Guidelines

Multiple ACL or policy files can be mapped to each LVPP. A maximum of 8 ingress and 4 egress ACL or policies are available to be mapped to each LVPP. If the policy file or dynamic rule specified in this command fails to bind, then the CLI command is rejected.

Before you can configure an LVPP, you must first create it with the create vm-tracking vpp command.

Example

The following command configures LVPP vpp1 to use the dynamic ACL rule named rule1 for ingress traffic:

```
configure vm-tracking vpp vpp1 add ingress dynamic-rule rule1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress and egress keywords were added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

New configure vm-tracking vpp vlan-tag

configure vm-tracking vpp *vpp_name* **vlan-tag** *tag* {**vr** *vr_name*}

Description

This command configures the VLAN tag and VR name for VPP. If the detected VM MAC uses this VPP, then the port in which the VM MAC is detected will be placed on this VR/VLAN.

Syntax Description

vpp_name	Specifies a name for the LVPP to delete.
tag	
vr_name	

Default

N/A.

Usage Guidelines

Use this command to configure the VLAN tag and VR name for VPP. If the detected VM MAC uses this VPP, then the port in which the VM MAC is detected will be placed on this VR/VLAN.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

configure vm-tracking vpp counters

configure vm-tracking vpp *vpp_name* **counters [ingress-only | egress-only | both | none]**

Description

Configures whether counters need to be installed for Virtual Machine MAC which receives this VPP mapping.

Syntax Description

ingress-only	Only counts packets ingressing the switch whose source MAC address matches VM MAC.
egress-only	Only counts packets egressing the switch whose source MAC address matches VM MAC.
both	Counts packets ingressing and egressing the switch whose source MAC address matches VM MAC.
none	No packets will be counted.

Default

N/A.

Usage Guidlines

Use this command to configure whether counters need to be installed for Virtual Lachine MAC which receives this VPP mapping.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that support egress ACLs.

create vm-tracking local-vm

create vm-tracking local-vm mac-address *mac* {**name** *name* | **ipaddress** *ipaddress* **vpp** *vpp_name* | **vlan-tag** *tag* {**vr** *vr_name*}}

Description

Creates a local VM database entry to be used for VM MAC local authentication, with optional parameters.

Syntax Description

mac	Specifies the MAC address for the VM. This must match the MAC address configured on the VM and be unique among the locally configure VM addresses.
name	Specifies a name to represent this VM in show vm-tracking command display.
ipaddress	Specifies the IP address for the VM. This must match the IP address configured on the VM.
vpp_name	Specifies the virtual port profile to apply for the local VM.
tag	VLAN tag between 1 and 4094.
vr_name	Virtual router name.

Default

N/A.

Usage Guidelines

A VM name can include up to 32 characters. VM names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VM names cannot match reserved keywords. For more information on VM name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide.

The following command creates a VM entry named VM1 in the local VM database:

```
create vm-tracking local-vm mac-address 00:E0:2B:12:34:56 name VM1
```

The following command creates a VM entry and assigns IP address 10.10.2.2 to the entry:

```
create vm-tracking local-vm mac-address 00:E0:2B:12:34:57 ip-address 10.10.2.2
```

The following command creates a VM entry and assigns VPP vpp1 to it:

```
create vm-tracking local-vm mac-address 00:E0:2B:12:34:58 vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

The ingress-vpp and egress-vpp options were replaced with the vpp option in ExtremeXOS 12.6.

The vlan-tag and vr-name options were added in 15.3.

Platform Availability

This command is available on all platforms.

create vm-tracking vpp

create vm-tracking vpp *vpp_name*

Description

Creates a Local VPP (LVPP).

Syntax Description

vpp_name	Specifies a name for the new VPP.

Default

N/A.

Usage Guidelines

A VPP name can include up to 32 characters. VPP names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. VPP names cannot match reserved keywords. For more information on VPP name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide.

Example

The following command creates a VPP named vpp1:

```
create vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

delete vm-tracking local-vm

delete vm-tracking local-vm {**mac-address** *mac*}

Description

Deletes the specified VM entry in the local VM database.

Syntax Description

mac	Specifies the MAC address for a VM entry to delete.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VM entry for MAC address 00:E0:2B:12:34:56 in the local VM database:

```
delete vm-tracking local-vm mac-address 00:E0:2B:12:34:56
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

delete vm-tracking vpp

delete vm-tracking vpp {*vpp_name*}

Description

Deletes the specified LVPP.

Syntax Description

vpp_name	Specifies a name for the LVPP to delete.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VPP named vpp1:

```
delete vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable fip snooping

disable fip snooping {**vlan**} *vlan_name*}

Description

This command disables FIP Snooping on one VLAN, or on all VLANS on which FIP Snooping is currently enabled.

Disabling FIP Snooping on a VLAN causes the following changes on that VLAN:

- All ACLs installed for the VLAN for FIP Snooping operation are removed.
- All FDB entries for the VLAN are removed.

Note

Depending on the activity of connected devices, some dynamic FDB entries may appear.

- All Enodes and virtual links learned on the VLAN are removed.
- If the fcf-update mode is automatic, all FCFs learned on the VLAN are removed.
- FDB learning is turned on for the VLAN.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN on which FIP Snooping is to be disabled.

Default

Disabled.

Usage Guidelines

Use this command to disable FIP Snooping in the VLAN. This command has no effect if executed on a VLAN for which no configuration record has been created. If a <vlan_name> is not specified, the command disables FIP Snooping on all VLANS on which it is enabled.

Example

```
disable fip snooping vlan v3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x
- Summit X650-24x

disable vm-tracking

disable vm-tracking

Description

Disables the Extreme Network Virtualization (XNV) feature on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the XNV feature, which tracks virtual machines (VMs) that connect to the switch.

Note

When the VM tracking feature is disabled, file synchronization with the FTP server stops.

Example

The following command disables the XNV feature:

```
disable vm-tracking
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable vm-tracking dynamic-vlan ports

disable vm-tracking dynamic-vlan ports *port_list*

Description

This command disables VM-tracking dynamic VLAN on specific ports.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable VM-tracking dynamic VLAN on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should not be enabled on a switch's uplink port.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

disable vm-tracking ports

disable vm-tracking ports *port_list*

Description

Disables the XNV feature on the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

This command disables VM tracking on the specified ports.

Example

The following command disables VM tracking on port 2:1:

```
disable vm-tracking ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

enable fip snooping

enable fip snooping {**vlan**} *vlan_name*}

Description

This command enables FIP Snooping in the VLAN. If no VLAN is specified, FIP Snooping is enabled on all VLANs that have been added using the configure fip snooping add {vlan} <vlan_name> command.

A FIP Snooping VLAN is disabled by default.

Once FIP Snooping is enabled on a VLAN, the following events occur:

- FDB learning is turned off for the VLAN.
- All FDB entries of the VLAN are removed. If FCFs are manually configured FDB entries are added for each such FCF.
- ACLs are installed to block most FIP and FCoE frames.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the vlan on which FIP Snooping is to be enabled.

Default

Disabled.

Usage Guidelines

This command enables FIP Snooping in the VLAN.

Example

```
enable fip snooping vlan v3
```

History

This command was first available in ExtremeXOS 15.1

Platform Availability

This command is available on the following platforms:

- BlackDiamond X8
- BlackDiamond 8800 series BD8900-40G6X-c
- Summit X670
- Summit X650 40G VIM
- Summit X650-24t
- Summit X650-24x
- Summit X650-24x

enable vm-tracking

enable vm-tracking

Description

Enables the XNV feature on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the XNV feature, which tracks VMs that connect to the switch.

This command does not enable XNV on any ports. To start tracking VMs, you must enable VM tracking on one or more ports using the enable vm-tracking ports command.

Example

The following command enables the XNV feature:

```
enable vm-tracking
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

enable vm-tracking dynamic-vlan ports

enable vm-tracking dynamic-vlan ports *port_list*

Description

This command enables VM-tracking dynamic VLAN on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should never be enabled on a switch's uplink port.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to enable VM-tracking dynamic VLAN on specific ports. The ALL option is not supported because VM-tracking dynamic VLAN should not be enabled on a switch's uplink port.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

enable vm-tracking ports

enable vm-tracking ports *port_list*

Description

Enables the XNV feature on the specified ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

Disabled.

Usage Guidelines

You must enable VM tracking on the switch with the enable vm-tracking command before you can use this command. This command enables VM tracking on the specified ports. You should enable VM tracking only on ports that connect directly to a server that hosts VMs that you want to track. You should never enable VM tracking on a switch uplink port.

Example

The following command enables VM tracking on port 2:1:

```
enable vm-tracking ports 2:1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

run vm-tracking repository

```
run vm-tracking repository sync-now
```

Description

Manually starts FTP file synchronization for NVPP and VMMAP files.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Before you can manually start FTP file synchronization, you must configure FTP servers using the configure vm-tracking repository command.

Example

The following command starts file synchronization with the configured FTP server:

```
run vm-tracking repository sync-now
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show fip snooping access-list

show fip snooping {**vlan**} *vlan_name* **access-list** {[**fcf** *mac_addr* | **virtual-link** *mac_addr* | **all**]}

Description

The command lists all the FCoE ACLs meeting the criteria.

The list can be shortened by specifying the MAC of an FCF or the VN_Port MAC assigned to a virtual link in the VLAN. The ACL with higher priority appears first.

By default, the command lists all the ACLs installed by the VLAN. The example below shows the output of the command followed by the default ACLs installed when fip-snooping is enabled on the VLAN.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN for which the access-list is shown.
fcf	List FCoE access-lists matching the FCoE forwarder's MAC.
mac_addr	MAC address of the FCoE forwarder
virtual-link	List FCoE access-lists matching FCoE virtual link's MAC.
all	All FCoE access-lists in the VLAN.
mac_addr	MAC address assigned to a VN-Port in the form xx:xx:xx:xx:xx:xx where xx is a pair of hexadeximal digits.

Default

N/A.

Usage Guidelines

The command lists all the FCoE ACLs meeting the criteria.

Example

```
BDXA.112 # show fip snooping vlan v3

VLAN         : v3
FIP Snooping : Enabled
FCF Update   : Auto
FC-MAP       : 0e:fc:00:00:00:00

Port   Location
------ ---------------
1:1    Perimeter
1:2    FCF-to-Enode

- Summit X650-24x

show fip snooping counters

show fip snooping {**vlan**} *vlan_name* **counters**

Description

This command shows the number of FIP frames snooped per type.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN for which the counters are shown.
counters	Number and types of FIP frames snooped on the VLAN

Default

N/A.

Usage Guidelines

The command shows the number of FIP frames snooped per type.

Example

```
BDX8.62 # show fip snooping vlan v1 counters

VLAN : v1

FIP Frame type                                          Snooped
------------------------------------------------------ ----------
Solicited Discovery Request                                     0
Unsolicited Discovery Request                                   1

show fip snooping enode

show fip snooping {**vlan**} *vlan_name* **enode**

Description

This command shows the list of ENodes that are learned from FIP protocol packets on the specified VLAN.

The maximum FCoE size is in the snooped FIP discovery request from the ENode.

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN for which the ENodes are shown.
enode	FCoE node. A Fiber Channel node that isable to transmit FCoE frames using one or more ENode MACs.

Default

N/A.

Usage Guidelines

This command shows the list of Enodes that are learned from FIP protocol packets on the specified VLAN.

Example

```
BDX8.92 # show fip snooping vlan v2 enode
VLAN : v2
Max
FCoE
ENode MAC           Port  Location        Age  Size
------------------- ----- --------------- ---- ---------------

show fip snooping fcf

show fip snooping {vlan} *vlan_name* **fcf**

Description

This command shows the list of FCFs in a VLAN on each member port. If the FCFs are added manually, the age is set to 0.

Syntax Description

fip	FCoE Initializaton Protocol
snooping	Snooping on FIP frames
vlan_name	Name of the VLAN for which the FCFs are shown.
fcf	FCoE forwarder. A Fiber Channel switching element that is able to forward FCoE frames.

Default

N/A.

Usage Guidelines

This command shows the list of FCFs in a VLAN on each member port. If the FCFs are added manually, the age is set to 0.

Example

```
BDX8.74 # show fip snooping vlan v2 fcf
VLAN       : v2
FCF Update : Manual
FCF MAC             Port  Location        Age
------------------- ----- --------------- ----
e2:ee:00:00:00:01   1:2   FCF-to-Enode       0

show fip snooping virtual-link

show fip snooping {**vlan**} *vlan_name* **virtual-link** {[**enode** *mac_addr* | **fcf** *mac_addr*]}

Description

This command lists the virtual links established in the VLAN. The list can be narrowed down to per ENode or per FCF where the ending point of the virtual link resides. The display shows all virtual links on the VLAN (as limited by the specification of enode or fcf) regardless of whether they are using SPMA or FPMA. Virtual links are differentiated within a VLAN by the VN_Port_ID (which is also contained in the low-order three octets of an FPMA MAC address, but not that of an SPMA MAC address).

Syntax Description

fip	FCoE Initialization Protocol
snooping	Snooping FIP frames
vlan_name	Name of the VLAN for which the FCFs are shown.
virtual-link	FCoE virtual link
enode	Show virtual links related to the specified ENode only.
mac_addr	MAC of FCoE node originating the virtual link
fcf	Show virtual links related to the specified FCF only.
mac_addr	MAC address of FCoE forwarder ending the virtual linkin the form xx:xx:xx:xx:xx:xx where xx is a pair of hexadecimal digits

Default

N/A.

Usage Guidelines

This command lists the virtual links established in the VLAN.

Example

```
BDX8.93 # show fip snooping v1 virtual-link
VLAN  : v1
Port   ENode MAC          VN_Port MAC        VNPortId  FCF MAC            Age
-----  -----------------  -----------------  --------  -----------------
-----
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:01  01:00:01  aa:bb:cd:00:00:00
2856
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:02  01:00:02  aa:bb:cd:00:00:00
3106
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:03  01:00:03  aa:bb:cd:00:00:00
3106
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:04  01:00:04  aa:bb:cd:00:00:00
3106
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:05  01:00:05  aa:bb:cd:00:00:00
3106
1:1    aa:bb:cc:00:00:00  0e:fc:00:01:00:06  01:00:06  aa:bb:cd:00:00:00
3106
VN_Port : Virtual N_Port instantiated on successful completion of
FIP FLOGI or FIP NPIV FDISC Exchange
Age     : The time in seconds since last FIP frame from the VN_Port
Total number of Virtual Link : 6
BDX8.94 #
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the following platforms:

BlackDiamond X8

BlackDiamond 8800 series BD8900-40G6X-c

Summit X650-24x

Summit X650-24x

show fip snooping vlan

show fip snooping {**vlan**} *vlan_name*

Description

This command shows the FIP-snooping configuration status in the VLAN.

Syntax Description

vlan_name	Name of the VLAN for which the FIP Snooping configuration is shown.

Default

N/A.

Usage Guidelines

Use this command to show the FIP-snooping configuration status in the VLAN.

Example

```
BDX8.73 # show fip snooping vlan v2
VLAN         : v2
FIP Snooping : Disabled
FCF Update   : Manual
FC-MAP       : 0e:fc:00:00:00:00
Port   Location
------ ---------------
1:1    Perimeter
1:2    FCF-to-Enode
1:3    Enode-to-FCF
```

```
1:4    All
----------------------
BDX8.74 #
```

show lldp dcbx

show lldp {**port** [**all** | *port_list*]} **dcbx** {**ieee**|**baseline**} {**detailed**}

Description

Displays DCBX configuration and statistics information for one or all ports.

Syntax Description

all	Specifies all ports on the switch.
port_list	Specifies one or more ports or slots and ports.
ieee	Specifies IEEE 802.1Qaz information only.
baseline	Specifies Baseline v1.01 information only.
detailed	Shows information on the configured VLANs on the port.

Default

N/A.

Usage Guidelines

The summary display (without the detailed option) displays the status for each DCBX TLV on each port. For each TLV, the status is reported as shown in the following table.

DISABLED	DCBX is disabled on the port. This port status appears only in the summary display when DCBX is enabled for one version and disabled for the other. In the detailed display, ports on which DCBX are disabled are not shown.
OK	This TLV has been received by the peer, and either the configuration matches, or the peer is reporting that it is in willing mode and is not reporting an explicit error.
UNKNOWN	This TLV has not been received by the peer since the port has been active.
EXPIRED	This TLV has been received by the peer, but the time to live has expired.
ERROR	Either a mismatch exists between the local and remote configuration and the peer is not willing, or the peer is reporting an error.
MULTIPLE PEERS	More than one LLDP peer has been detected on the link.

When you specify a port or the detailed option, local TLV information includes the information that will be contained in the next TLV that is sent, and if the configuration hasn't changed, this is the same information that was sent in the last TLV. Peer TLV information displays the information from the last TLV that has been received. For each TLV, statistics are reported as follows:

- Sent: Total number of TLVs sent since port has been operational.
- Received: Total number of TLVs received since port has been operational.
- Errors: Total number of mal-formed TLVs received since port has been operational.

You can clear the statistics using the clear counters command.

Table 25: IEEE 802.1Qaz DCBX TLVs on page 1248 describes the IEEE 802.1Qaz DCBX TLVs that can be displayed. Table 26: Baseline v1.01 DCBX TLVs on page 1250 describes the Baseline v1.01 DCBX TLVs.

Table 25: IEEE 802.1Qaz DCBX TLVs

TLV/Description	Contents/Description
ETS TLV Advertises the ETS configuration of the local port and the configuration recommended to/by the peer for the specified port, respectively.	Willing—Whether or not the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. The Willing bit does not apply to the ETS Recommendation TLV, and should always be zero. CBS—Whether the device supports the credit-based shaper algorithm. Zero(0) means No, and one (1) means Yes. Max TCs— Maximum number of traffic classes that the node can support. Priority Assgn—Priority Assignment Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the TC ID to which packets with an 802.1p priority of N are mapped. **Note** For Extreme Networks products, a traffic class (TC) is synonymous with a QoS Profile (QP), except that TCs are zero-based, and QPs are one-based, so TC 1 maps to QP 0. TC Bwdth—TC Bandwidth Table. Indicates the percentage of bandwidth allocated for each traffic class. The table is laid out as follows: TC%-0 : TC%-1 : TC%-2 : TC%-3 : TC%-4 : TC%-5 : TC%-6 : TC%-7 The value in the TC%-N position indicates the percentage of the link bandwidth allocated to TC N. The total of all positions must equal 100. TSA—Transmission Selection Algorithm (TSA) Assignment Table. The table is laid out as follows: TC-0 : TC-1 : TC-2 : TC-3 : TC-4 : TC-5 : TC-6 : TC-7 The value in the TC-N position indicates the TSA used by TC N, which is one of the following: S - Strict priority (TSA 0)C - Credit-based shaper (TSA 1)E - Enhanced Transmission Selection (TSA 2)V - Vendor-specific Transmission Selection algorithm (TSA 255) **Note** TSA values 3 to 254 are reserved for future standardization.
Common Feature TLVs TLVs common to the Priority Group, PFC, and Application TLVs	Oper Vers—Operating version of the feature. Max Vers—Highest feature version supported by the system. Enabled—Locally administered parameter that indicates whether the DCB feature is enabled. Zero (0) means No, and one (1) means Yes. Willing—Indicates whether the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. Error—Indicates whether an error has occurred during the configuration exchange with the peer. Zero (0) means No, and one (1) means Yes.

Table 25: IEEE 802.1Qaz DCBX TLVs (continued)

TLV/Description	Contents/Description
Priority Group TLV Advertises priority to priority group mapping, priority group bandwidth and the scheduling algorithm.	PG IDs—Priority Allocation Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the PG ID to which packets with an 802.1p priority of N are mapped. If the value is in the range of 0 to 7, this is the actual PG. If the value is equal to 15, this priority is mapped to a non-ETS group. In the case of Extreme Networks products, this would be a strict priority group. **Note** For Extreme Networks products, a priority group (PG) is synonymous with a QoS Profile (QP), except that PGs are zero-based, and QPs are one-based, so PG1 maps to QP 0. PG%—Priority Group Allocation Table. Indicates the percentage of bandwidth allocated for each priority group. The table is laid out as follows: PG%-0 : PG%-1 : PG%-2 : PG%-3 : PG%-4 : PG%-5 : PG%-6 : PG%-7 The value in the PG%-N position indicates the percentage of the link bandwidth allocated to PG N. The total of all positions must equal 100. Num TCs—Maximum number of priority groups that the node can support.
PFC TLV Describes the PFC configuration for the given port.	Willing—Whether or not the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. MBC—MACsec Bypass Capability. If set to zero (0), the device is capable of bypassing MACsec processing when MACsec is disabled. If set to one (1), the sending station is not capable of bypassing MACsec processing when MACsec is disabled. PFC Cap—PFC Capability. The maximum number of classes on which the device may simultaneously support PFC. PFC Enable—List of priorities on which PFC is enabled.
Application TLV Displays the priority the device expects to be used for the specified application.	Priority—The priority to be used for the given protocol. Application—Specifies one of the following: • FCoE • FIP • iSCSI • EtherType: <ethertype> • TCP/UDP Port: <port number> • TCP Port: <port number> • TCP Port: <port number>

Table 26: Baseline v1.01 DCBX TLVs

TLV/Description	Contents/Description
Control TLV Contains general information about the DCBX session.	Oper Vers—Operating version of the DCBX protocol. Max Vers—Highest DCBX protocol version supported by the system. Seq No—A value that changes each time an exchanged parameter in one or more of the DCB feature TLVs changes. Ack No—The SeqNo value from the most recent peer DCBX TLV that has been handled. This value acknowledges to the peer that a specific SeqNo has been received.
Common Feature TLVs TLVs common to the Priority Group, PFC, and Application TLVs	Oper Vers—Operating version of the feature. Max Vers—Highest feature version supported by the system. Enabled—Locally administered parameter that indicates whether the DCB feature is enabled. Zero (0) means No, and one (1) means Yes. Willing—Indicates whether the device is willing to accept configuration from its DCBX peer. Zero (0) means No, and one (1) means Yes. Error—Indicates whether an error has occurred during the configuration exchange with the peer. Zero (0) means No, and one (1) means Yes.
Priority Group TLV Advertises priority to priority group mapping, priority group bandwidth and the scheduling algorithm.	PG IDs—Priority Allocation Table. A priority group (PG) table describing how 802.1p priorities are assigned to PGs. The table is laid out as follows: Priority-0 : Priority-1 : Priority-2 : Priority-3 : Priority-4 : Priority-5 : Priority-6 : Priority-7 The value in the Priority-N position indicates the PG ID to which packets with an 802.1p priority of N are mapped. If the value is in the range of 0 to 7, this is the actual PG. If the value is equal to 15, this priority is mapped to a non-ETS group. In the case of Extreme Networks products, this would be a strict priority group. **Note** For Extreme Networks products, a priority group (PG) is synonymous with a QoS Profile (QP), except that PGs are zero-based, and QPs are one-based, so PG1 maps to QP 0. PG%—Priority Group Allocation Table. Indicates the percentage of bandwidth allocated for each priority group. The table is laid out as follows: PG%-0 : PG%-1 : PG%-2 : PG%-3 : PG%-4 : PG%-5 : PG%-6 : PG%-7 The value in the PG%-N position indicates the percentage of the link bandwidth allocated to PG N. The total of all slots must equal 100. Num TCs—Maximum number of priority groups that the node can support.
PFC TLV Describes the PFC configuration for the given port.	PFC Enable—List of priorities on which PFC is enabled. Num TC PFCs—The maximum number of classes on which the device may simultaneously support PFC.
Application TLV Displays the priority the device expects to be used for the specified application.	Priority—The priority to be used for the given protocol. Application—Specifies one of the following: • FCoE • FIP • iSCSI • EtherType: <ethertype> • TCP/UDP Port: <port number>

```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

show vlan dynamic-vlan

show vlan dynamic-vlan

Description

Displays the configuration related to dynamically created VLANs.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays configuration related to dynamically created VLANs.

```
X460-48p.7 # sh vlan dynamic-vlan
Uplink Ports    : 12-15, 18-20
X460-48p.8 #
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

show vm-tracking

show vm-tracking

Description

Displays the XNV feature configuration and the authenticated VM information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the XNV configuration and the authenticated VMs:

```
* Switch.51 # sh vm-tracking

-------------------------------------------------------------
VM Tracking Global Configuration
-------------------------------------------------------------
VM Tracking                     : Enabled
VM Tracking authentication order: nms vm-map local
VM Tracking nms reauth period   : 0 (Re-authentication disabled)
VM Tracking blackhole policy    : none
-------------------------------------------------------------

Port                          : 1:20

Platform Availability

This command is available on all platforms.

show vm-tracking local-vm

show vm-tracking local-vm {**mac-address** *mac*}

Description

Displays one or all of the VM entries in the local VM database.

Syntax Description

mac	Specifies the MAC address of a VM database entry that you want to display.

Default

N/A.

Usage Guidelines

If you do not enter a MAC address with this command, the command displays all entries in the local VM database.

Example

The following command displays the local database VMs:

```
* Switch.52 # show vm-tracking local-vm

MAC Address        IP Address       Type              Value
-------------------------------------------------------------
00:00:00:00:00:21                   VM
                                    VLAN Tag          100
                                    VR Name           VR-Default
                                    VPP               vpp1
-------------------------------------------------------------
Number of Local VMs: 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vm-tracking network-vm

show vm-tracking network-vm

Description

Displays all of the VM entries in the network VM database.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the configuration for all entries in the network VM database:

```
* Switch.52 # show vm-tracking network-vm

MAC Address         IP Address       Type         Value
-------------------------------------------------------------
00:00:00:00:00:11   192.168.100.200  VM           KVM-VM-#101
                                     VPP          vpp300
00:01:02:03:04:06   192.168.100.201  VM           VM #200
                                     VPP          vpp201

Number of Network VMs: 2
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vm-tracking nms

show vm-tracking nms server {primary | secondary}

Description

Displays the RADIUS client configuration and operating statistics for one or both NMS servers.

Syntax Description

primary | secondary	Specifies whether you are displaying the primary or secondary NMS server information.

Default

If you do not specify primary or secondary, the default action is to display both the primary and secondary NMS server configurations.

Usage Guidelines

None.

Example

The following command displays the RADIUS client information for the primary and secondary NMS servers:

```
show vm-tracking nms server
VM Tracking NMS (RADIUS): enabled
VM Tracking Radius server connect time out: 3 seconds
Primary VM Tracking NMS server:
Server name   :
IP address    :  10.127.5.221
Server IP Port:  1812
Client address:  10.127.10.173 (VR-Mgmt)
Shared secret :  pmckmtpq

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vm-tracking port

show vm-tracking port *port_list*

Description

Displays the XNV feature configuration for the specified port and information for all VMs authenticated on the port.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the XNV configuration for port 1:20 and the authenticated VMs:

```
* (Private) Slot-1 Access3.14 # sh vm-tracking port 1:20
-------------------------------------------------------
      VM Tracking Global Configuration
-------------------------------------------------------
VM Tracking                         : Enabled
VM Tracking authentication order    : nms vm-map local
VM Tracking nms reauth period       : 0 (Re-authentication disabled)
VM Tracking blackhole policy        : none
-------------------------------------------------------
Port                            : 1:20
VM Tracking                     : Enabled
```

```
VM Tracking Dynamic VLAN        : Enabled

                  Flags
MAC               AP      IP Address     Type        Value
-------------------------------------------------------------
00:00:00:00:00:11 LBI    255.255.255.255 VM
                                         VLAN Tag    100
                                         VR Name     VR-Default
                                         VPP         lvpp1
                                         IEP
                                         EEP
-------------------------------------------------------------
Flags :

Number of Network VMs Authenticated: 0
Number of Local VMs Authenticated  : 1
Number of VMs Authenticated        : 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vm-tracking repository

show vm-tracking repository {primary | secondary}

Description

Displays the FTP file synchronization configuration for NVPP and VMMAP files.

Syntax Description

primary | secondary	Specifies the whether you are displaying the primary or secondary FTP server configuration.

Default

If you do not specify primary or secondary, the default action is to display both the primary and secondary FTP server configurations.

Usage Guidelines

None.

Example

The following command displays the configuration for the primary and secondary FTP servers:

```
show vm-tracking repository
Primary VM-Map FTP server:
Server name:
IP address      :  10.100.1.200
VR Name         :  VR-Mgmt
Refresh-interval:  600 seconds
Path Name       : /pub (default)
User Name       : anonymous (default)
Secondary vm-map FTP server: Unconfigured
Last sync        : 16:35:15        Last sync server  : Primary
Last sync status : Successful
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vm-tracking vpp

show vm-tracking vpp {*vpp_name*}

Description

Displays the configuration of one or all VPPs.

Syntax Description

vpp_name	Specifies the name of an existing local VPP.

Default

All

Usage Guidelines

You can only specify local VPPs with this command. If you do not enter a VPP name with this command, the command displays all local and network VPPs.

Example

The following command displays the configuration of all VPPs:

```
* (Private) Slot-1 Access3.14 # sh vm-tracking vpp
VPP Name                          Type              Value
-------------------------------------------------------------------------------
-----
nvpp1                             origin            network
                                  counters          ingress-only
                                  VLAN Tag          200
                                  VR Name           VR-Default
                                  ingress           ingLocal1.pol(1)
                                                    ingLocal2.pol(2)
                                  egress            egrLocal1.pol(1)
                                                    egrLocal2.pol(2)

lvpp1                             origin            local
                                  counters          egress-only
                                  VLAN Tag          100
                                  VR Name           VR-Default
                                  ingress           ing1.pol(1)
                                  egress            egr1.pol(1)
                                                    egr2.pol(2)
Number of Local VPPs  : 1
Number of Network VPPs: 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure vm-tracking local-vm

unconfigure vm-tracking local-vm mac-address *mac* [**name** | **ip-address** | **vpp** | **vlan-tag**]

Description

Unconfigures the parameters associated with a local VM database entry to be used for VM MAC local authentication.

Syntax Description

mac	Specifies the MAC address for the local VM database entry you want to unconfigure.
name	Removes the name configured for the VM database entry.

ipaddress	Removes the IP address configured for the VM database entry.
vpp	Removes the VPP configured for the VM database entry.
vlan-tag	Removes the VLAN tag configured for the VM database entry.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the IP address configuration for the VM entry specified by the MAC address:

```
unconfigure vm-tracking local-vm mac-address 00:E0:2B:12:34:56 ip-address
```

History

This command was first available in ExtremeXOS 12.5.

The ingress-vpp and egress-vpp options were replaced with the vpp option in ExtremeXOS 12.6.

The VLAN-tag option was added in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

unconfigure vm-tracking repository

unconfigure vm-tracking repository {primary | secondary}

Description

Removes the configuration for FTP file synchronization for NVPP and VMMAP files.

Syntax Description

primary | secondary	Specifies the whether you are unconfiguring the primary or secondary FTP server.

Default

If you do not specify primary or secondary, the default action is to remove both the primary and secondary FTP server configurations.

Usage Guidelines

None.

Example

The following command removes the configuration for the primary and secondary FTP servers:

```
unconfigure vm-tracking repository
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure vm-tracking vpp vlan-tag

unconfigure vm-tracking vpp *vpp_name* **vlan-tag**

Description

Unconfigures the VLAN tag of VPP.

Syntax Description

vpp_name	Specifies a name of the VPP.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the VLAN tag of VPP.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

unconfigure vm-tracking vpp

unconfigure vm-tracking vpp *vpp_name*

Description

Removes the association of a policy or ACL rule to an LVPP.

Syntax Description

vpp_name	Specifies the name of an existing LVPP.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the configuration of LVPP vpp1:

```
unconfigure vm-tracking vpp vpp1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure vm-tracking nms

unconfigure vm-tracking nms {server [primary | secondary]}

Description

Removes the configuration for one or both NMS servers.

Syntax Description

primary | secondary	Specifies the whether you are unconfiguring the primary or secondary NMS.

Default

N/A.

Usage Guidelines

If you do not specify primary or secondary, this command removes the configuration for both NMS servers.

Example

The following command removes the configuration for the secondary NMS server:

```
unconfigure vm-tracking nms server secondary
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

18 AVB Commands

clear msrp counters
clear mvrp counters
clear network-clock gptp counters

enable mvrp ports
enable network-clock gptp
enable network-clock gptp ports
show avb
show mrp ports
show msrp
show msrp listeners

This chapter describes commands for managing the Audio Video Bridging (AVB) feature and its associated protocols including Multiple Registration Protocol (MRP), Multiple VLAN Registration Protocol (MVRP), Multiple Stream Registration Protocol (MSRP) and Generalized Precision Time Protocol (gPTP).

clear msrp counters

clear msrp counters {**ports** [*port_list* | **all**]}

Description

Clears both the PDU and attribute event counters per port.

Syntax Description

msrp	Multiple Stream Registration Protocol
counters	MSRP packet and attribute event counters.
port_list	Port list separated by a comma or "-".
all	All ports.

Default

N/A.

Usage Guidelines

Use this command to clear both the PDU and attribute event counters per port.

Example

```
clear msrp counters
clear msrp counters ports 1-5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

clear mvrp counters

clear mvrp counters {**event** | **packet**} {**ports** [*port_list* | **all**]}

Description

Clears MVRP statistics.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
event	MVRP event counters
packet	MVRP packet counters

Default

Clears both event and packet counters if none of the options are specified.

Usage Guidelines

Use this command to clear MVRP statistics. The default behavior clears both event and packet counters if none of the options are specified. The statistics that are reset are the number of failed registrations on that port, number of MVRPDUs sent, number of MVRPDUs received with error and without error for packet counters and different MVRP events rx/tx counters for event counters. If no port is specified, MVRP statistics of all ports are reset.

Example

The following command clears event counters:

```
clear mvrp event counters
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all platforms.

clear network-clock gptp counters

clear network-clock gptp ports counters {**ports** [*port_list* | **all**]}

Description

Clears gPTP port counters.

Syntax Description

gptp	IEEE 802.1AS Generalized Precision Time Protocol.
counters	gPTP port counters.
port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

N/A.

Usage Guidelines

Use this command to clear gPTP port counters. The command `clear counters` also clears the gPTP port counters (along with all other counters).

Example

```
clear network-clock gptp counters
```

```
clear network-clock gptp counters ports 2-4
```

```
clear network-clock gptp counters ports all
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

configure mrp ports timers

configure mrp ports [*port_list* | **all**] **timers** [{extended-refresh [*extended_refresh_msec* | **off**} {**join** *join_msec*} {**leave** *leave_msec*} {**leave-all** *leave_all_msec*} {periodic [*periodic_msec* | **off**]}]

Description

This command sets the join, leave, leave all, periodic, and extended-refresh timer values for a list of ports. The unit value is in milliseconds. The join timer, leave all timer, and periodic timer are started for each MRP application per port. The leave timer is started for each state machine that is in LV (leave) state. The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Syntax Description

mrp	Multiple Registration Protocol
ports	Ports
port_list	Port list separated by a comma or -" type="portlist_t"
all	All ports
timers	Multiple Registration Protocol timers.
extended refresh	Timer value to use in place of regular leave timer, only in cases when leave-all is received or sent.
extended_refresh_msec	Extended refresh timer value in milliseconds (range is 600 ms to 300000 ms, default is 10000 ms); type="uint32_t".
join	The time interval to delay sending MRP advertisements.
join_msec	Join timer value in milliseconds (range is 0 ms to 500 ms, default is 200 ms).
leave	The time interval to wait in the leaving state before transitioning to the empty state.
leave_msec	Leave timer value in milliseconds (range is 600 ms to 3000 ms, default is 600 ms).
leave-all	The time interval used to control the frequency of "leave all" messages.
leave_all_msec	Leave All timer value in milliseconds (range is 5000 ms to 20000 ms, default is 10000 ms).
periodic	The time interval between two periodic events.

periodic_msec	Periodic timer value in milliseconds (range is 1000ms to 300000 ms, default is 1000 ms); type="uint32_t".
off	Turn off timer.

Default

The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Usage Guidelines

This command is used to set the join, leave, and leave-all timer values for a list of ports. The unit value is in milliseconds. The join timer and leave all timer are started for each MRP application per port. The leave timer is started for each state machine that is in LV (leave) state. The default values for these timers are 200, 600, and 10000, respectively.

Example

```
configure mrp ports 4 timers join 300
configure mrp ports all timers leave-all 15000
configure mrp ports all timers join 300 leave-all 15000
```

History

The extended-refresh and period timer options were added in 15.3.2.

Platform Availability

This command is available on all platforms.

configure msrp latency-max-frame-size

configure msrp latency-max-frame-size *frame_size* **| [igonore-latency-changes | talker-vlan-pruning] [on | off]**

Description

This command configures the system-wide MSRP variables.

Syntax Description

msrp	Multiple Stream Registration Protocol
latency-max-frame-size	Maximum size of interfering frame (used in latency calculations).
frame_size	The maximum frame size in bytes (range 64 to 2000, default is 1522).
ignore-latency-changes	Ignore accumulated latency changes when evaluating first value change.

talker-vlan-pruning	Talker propagation is filtered on ports where VLAN does not exist.
on	Turn on.
off	Turn off.

Default

1522.

Usage Guidelines

Use this command to configure the system-wide MSRP variables.

Example

```
configure msrp latency-max-frame-size 100
```

History

The ignore-latency-changes, talker-vlan-pruning, and on | off options were added in 15.3.2.

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

 configure msrp ports sr-pvid

configure msrp ports [*port_list* | **all**] **sr-pvid** *vlan_tag*

Description

Specifies the default VLAN ID on the port for MSRP data stream. The sr-pvid serves as a recommendation to connected AVB devices; AVB devices may still use other VLAN IDs if they are configured to do so.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	List of ports in the switch.
all	All the ports in the switch.
sr-pvid	Default VLAN Identifier for stream-related traffic.
vlan_tag	VLAN ID ranging from 1 to 4094 (default is 2).

Default

2.

Usage Guidelines

Use this command to specify the default VLAN ID on the port for MSRP data streams. The sr-pvid serves as a recommendation to connected AVB devices; AVB devices may still use other VLAN IDs if they are configured to do so.

Example

```
configure msrp ports 1,2,3 sr-pvid 2
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

New configure msrp ports traffic-class delta-bandwidth

configure msrp ports [*port_list* | **all**] **traffic-class** [**A** | **B**] **delta-bandwidth** *percentage*

Description

Configures delta-bandwidth value per traffic class per MSRP port.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	List of ports in the switch.
traffic-class	Traffic class
A	Traffic class A.
B	Traffic class B.
delta-bandwidth	Delta-bandwidth percentage (range 0 to 100, default 75 for class A, 0 for class B).

Default

Class A: 75, Class B: 0.

Usage Guidelines

The delta bandwidth configuration limits the amount of bandwidth that can be used by the given stream reservation class. Each class is allowed to use a maximum of its delta bandwidth plus the detlta bandwidth configured for each of the higher classes. So, for example, if the delta bandwidth for classes A and B are configured to 10 and 10, respectively, class A streams can use up to 10 percent of the link bandwidth, and class B streams can us up to 20 percent of the link bandwidth. The sum of the class A and B delta bandwidth values must be less than 100 percent.

Example

```
configure msrp ports all traffic-class A delta-bandwidth 50

configure msrp ports 1-5 traffic-class B delta-bandwidth 0
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

New configure msrp timers first-value-change-recovery

```
configure msrp timers first-value-change-recovery [first_value_change_msec | off]
```

Description

???

Syntax Description

msrp	Multiple Stream Registration Protocol
timers	Multiple Stream Registration Protocol timers
first-value-change-recovery	The time interval to wait to allow recovery of stream from first value change failure.
first_value_change_msec	First Value Change Recovery time in milliseconds (range is 10000 ms to 5400000 ms, default is 30000 ms); type="uint32_t"; range="[10000, 5400000]"
off	Turn off first value change recovery timer, and do not recover from first value change failure.

Default

30000 ms.

Usage Guidelines

???

Example

???

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

 configure mvrp stpd

configure mvrp stpd *stpd_name*

Description

Configures the STP domain to use for dynamically created VLANs.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
stpd	The STP domain used for MVRP.
stpd_name	Name of the STP domain used for MVRP.

Default

s0.

Usage Guidelines

Use this command to configure the STP domain used for MVRP.

Example

The following example configures the default STP domain for MVRP to "stpd2":

```
configure mvrp stpd stpd2
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

configure mvrp tag ports registration

configure mvrp tag *vlan_tag* **ports [** *port_list* **| all] registration [forbidden | normal]**

Description

???

Syntax Description

mvrp	Multiple VLAN Registration Protocol
tag	The 802.1Q VLAN ID
vlan_tag	VLAN ID ranging from 1 to 4094; type=uint16_t"; range="[1,4094]"
ports	Ports.
port_list	Port list separated by a comma or -"; type="portlist_t";
all	All ports
registration	Whether port can be added dynamically to the VLAN.
forbidden	Port cannot be added dynamically to the VLAN.
normal	Port can be added dynamically to the VLAN.

Default

Normal.

Usage Guidelines

?????

Example

```
???
```

History

The registration option, and forbidden and normal keywords were added in 15.3.2.

Platform Availability

This command is available on all commands.

 configure mvrp tag ports transmit

configure mvrp tag *vlan_tag* **ports** [*port_list* | **all**] **transmit** [**on** | **off**]

Description

Controls whether the given VLAN ID may be advertised in MVRP messages transmitted on the given set of ports.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
tag	The 802.1Q VLAN ID
transmit	When enabled, MVRP message are sent on the ports.
on	Transmission of MVRP messages are enabled on the port(s) for the given tag.
off	Transmission of the MVRP messages are disabled on the port(s) for the given tag.

Default

Transmit on.

Usage Guidelines

Use this command to control whether the given VLAN ID may be advertised in MVRP messages transmitted on the given set of ports.

Example

The following command configures transmit off for VLAN ID 100 on all MVRP ports.:

```
configure mvrp tag 100 ports all transmit off
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

configure mvrp vlan auto-creation

configure mvrp vlan auto-creation [on | off]

Description

Enables or disables the dynamic VLAN creation feature of MVRP.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
auto-creation	When enabled, results in VLANs added dynamically on the switch through MVRP.
on	Enable auto-creation
off	Disable auto-creation

Default

Enabled.

Usage Guidelines

Use this command to enable or disable the dynamic VLAN creation of MVRP. By default, auto creation is enabled. If disabled, the switch may participate in the MVRP protocol, and advertised static VLANs, but will not dynamically create VLANs.

Example

The following command enables MVRP VLAN auto creation:

```
configure mvrp vlan auto-creation on
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

configure mvrp vlan registration

configure mvrp vlan registration **forbidden | normal**

Description

This command is a global system setting. If global registration is forbidden, ports cannot be added to any VLAN dynamically.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
vlan	VLAN
registration	Whether all ports can be added to new dynamic VLANs. This can be overridden by static port addition to VLAN.
forbidden	Ports cannot be added dynamically to the VLAN. This can be overridden by static port addition.
normal	Ports can be added dynamically to the VLAN (default).

Default

Normal.

Usage Guidelines

Use this command to set global registration. If global registration is forbidden, ports cannot be added to any VLAN dynamically.

Example

The following command allows ports to be added dynamically to the VLAN:

```
configure mvrp vlan registration normal
```

History

This command was first available in ExtremeXOS 15.3.

The **registration** keyword was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

configure network-clock gptp default-set

configure network-clock gptp default-set [{**priority1** *priority1_value*} {**priority2** *priority2_value*}]

Description

This command configures the switch's default-set parameters, specifically its grandmaster clock priority values that are used to elect the grandmaster clock in the network.

Syntax Description

priority1_value	The switch's grandmaster clock priority1 value. This is the most significant parameter used to select the grandmaster clock in the network. Lower values indicate higher priority, and 255 prevents the switch from becoming the grandmaster clock.
priority2_value	The switch's grandmaster clock priority2 value. This is one of the least significant parameters used to select the grandmaster clock in the network. Lower values indicate higher priority.

Default

- Priority1_value = 246 (from 802.1AS 8.6.2.1)
- Priority2_value = 248 (from 802.1AS 8.6.2.5)

Usage Guidelines

Use this command to configure the switch's default-set parameters, specifically its grandmaster clock priority values that are used to elect the grandmaster clock in the network. The Best Master Clock Algorithm uses six parameters from each time-aware system in the network to select the grandmaster clock in the network. priority1 is the highest precedence value; it allows users to preemptively configure which systems they prefer to be the grandmaster clock. priority2 is a lower precedence value; it allows users to configure tiebreaker priorities.

The default priority1 values defined by IEEE 802.1AS-2011 clause 8.6.2.1 give preference to network infrastructure systems such as Extreme switches.

Example

```
configure network-clock gptp default-set priority1 248

configure network-clock gptp default-set priority2 100

configure network-clock gptp default-set priority1 248 priority2 100
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

configure network-clock gptp ports announce

configure network-clock gptp ports [*port_list* | **all**] **announce** [**initial-interval** *log_2_interval* | **receipt-timeout** *timeout_count*]

Description

Configures gPTP Announce parameters on the specified ports. Announce messages are used to elect the Grandmaster Clock and determine the time-synchronous spanning tree.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.
log_2_interval	The interval between Announce messages used by the switch on the port when the port is initialized or when the switch receives a message interval request TLV with announceInterval value 126. This value is in $\log_2$ seconds. The valid range of values is -3 (2^{-3} = 0.125 seconds) to 17 (2^{17} = 131072 seconds).
timeout_count	On a gPTP slave port, the number of announce intervals to wait without receiving an Announce message before assuming the master is no longer sending Announce messages.

Default

- log_2_interval = 0 (1 second; 802.1AS-2011 10.6.2.2)
- timeout_count = 3 (802.1AS-2011 10.6.3.2)

Usage Guidelines

Use this command to configure gPTP Announce parameters on the specified ports. Announce messages are used to elect the Grandmaster Clock and determine the time-synchronous spanning tree. Announce selects the grandmaster in the network and establishes the tree from the grandmaster to all other time-aware systems in the network.

initial-interval corresponds to 802.1AS parameter initialLogAnnounceInterval.

receipt-timeout corresponds to 802.1AS parameter announceReceiptTimeout.

Example

```
configure network-clock gptp ports 1-2 announce initial-interval 127

configure network-clock gptp ports all announce receipt-timeout 5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

configure network-clock gptp ports peer-delay

configure network-clock gptp ports [*port_list* | **all**] **peer-delay** [{**allowed-lost-responses** *lost_responses_value*} {**initial-req-interval** *log_2_interval*} {[**asymmetr** *asymmetry_time* [**nanoseconds** | **microseconds** | **milliseconds** | **seconds**] | **neighbor-thresh** [**auto** | *neighbor_thresh_time* [**nanoseconds** | **microseconds** | **milliseconds** | **seconds**]]}]

Description

Configures gPTP peer delay parameters on the specified ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.
lost_responses_value	The number of consecutive Peer Delay RequestPdelay_Req messages that the switch must send on a port without receiving a valid response before it considers the port not to be exchanging Ppeer Ddelay messages with its neighbor.
log_2_interval	The interval between Peer Delay RequestPdelay_Req messages sent by the switch on the port when the port is initialized or when the switch receives on the port a message interval request TLV with linkDelayInterval value 126. This value is in log2 seconds. The valid range of values is -3 (2-3 = 0.125 seconds) to 17 (217 = 131072 seconds).

asymmetry_time	The time that the propagation delay from this switch to the neighbor is less than the estimated one-way propagation delay between the switch and its neighbor (which is also the time that the propagation delay from the neighbor to this switch is greater than the estimate). This value is negative if the propagation delay to the neighbor is greater than the estimate. It can be in nanoseconds, microseconds, milliseconds, or seconds. The maximum value is 4,294,967,295 nanoseconds (approximately 4.3 seconds). Let tIR be the propagation delay from this switch (initiator) to the neighbor (responder), tRI be the propagation delay from the neighbor to this switch, and meanPathDelay be the estimated one-way propagation delay. Then: • meanPathDelay = (tIR + tRI) / 2 • tIR = meanPathDelay – asymmetry_time • tRI = meanPathDelay + asymmetry_time
neighbor_thresh_time	The maximum measured mean of the propagation delay between this switch and the neighbor above which the switch considers the port unable to run gPTP. This value can be in nanoseconds, microseconds, milliseconds, or seconds.
auto	Use a media specific default value for the neighbor_thresh_time: • Copper: 800 nanoseconds. This category includes short range copper cables such as SFP+ Direct Attach and QSRP+ Passive Copper. • Multi-mode fiber: 11 microseconds. This category includes the QSFP+ Active Optical cables. 11 microseconds allows 10 microseconds for 100BASE-FX 2 km plus 10% tolerance.) • Single-mode fiber: 550 microseconds. This allows 500 microseconds for our “LX100” transceiver plus 10% tolerance. **Note** These values may change. A draft of the 802.1AS corrigendum (P802.1AS-Cor-1/D1.1) specifies 800 ns for 100BASE-TX and 1000BASE-T.

Default

- Lost_responses_value = 3 (802.1AS 11.5.3)
- Log_2_interval = 0 (1 second; not specified in 802.1AS)
- Asymmetry_time = 0 (802.1AS 10.2.4.8)
- Neighbor_thresh_time = Copper media: 800 nanoseconds, fiber media: 4,294,967,295 nanoseconds

Usage Guidelines

Peer Delay messages determine whether a neighboring system is gPTP capable and measure the propagation delay on the link between the switch and a neighboring gPTP capable system.

- **allowed-lost-responses** corresponds to 802.1AS parameter allowedLostResponses.
- **initial-req-interval** corresponds to 802.1AS parameter initialLogPdelayReqInterval.
- **asymmetry** corresponds to 802.1AS parameter delayAsymmetry.
- **neighbor-thresh** corresponds to 802.1AS parameter neighborPropDelayThresh.

Example

```
configure network-clock gptp ports 1-3 peer-delay allowed-lost-responses 5
configure network-clock gptp ports 1-2 peer-delay initial-log-interval -3
configure network-clock gptp ports 1-2 peer-delay neighbor-thresh 3
nanoseconds
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

 configure network-clock gptp ports sync

configure network-clock gptp ports [*port_list* | **all**] **sync** [**initial-interval** *log_2_interval* **receipt-timeout** *timeout_count*]

Description

Configures gPTP synchronization parameters on the specified ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.
log_2_interval	The interval between Sync messages used by the switch for the port when the port is initialized or when the switch receives a message interval request TLV with timeSyncInterval value 126. This value is in log2 seconds. The valid range of values is -3 (2-3 = 0.125 seconds) to 17 (217 = 131072 seconds).
timeout_count	On a gPTP slave port, the number of sync intervals to wait without receiving a Sync message before assuming the adjacent master port is no longer sending Sync messages.

Default

- log_2_interval = -3 (0.125 second; 802.1AS 11.5.2.3)
- timeout_count = 3 (802.1AS 10.6.3.1)

Usage Guidelines

Synchronization distributes the time from the grandmaster to all other time-aware systems in the networks.

initial-interval corresponds to 802.1AS parameter **initialLogSyncInterval**.

receipt-timeout corresponds to 802.1AS parameter **syncReceiptTimeout**.

Example

```
configure network-clock gptp ports 1-2 sync initial-interval -1
```

```
configure network-clock gptp ports all sync receipt-timeout 5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

disable avb

disable avb

Description

This command is a macro command that can be used to disable all AVB protocols globally on the switch. It is equivalent to issuing the following three commands:

```
disable mvrp
```

```
disable msrp
```

```
disable network-clock gptp
```

Syntax Description

avb	Audio Video Bridging

Default

Disabled.

Usage Guidelines

Use this command to disable all AVB protocols globally on the switch.

Example

```
disable avb
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

disable avb ports

disable avb ports [*port_list* | **all**]

Description

This command is a macro command that can be used to disable all AVB protocols on the given ports. It is equivalent to issuing the following three commands:

```
disable mvrp ports [port_list | all]
```

```
disable msrp ports [port_list | all]
```

```
disable network-clock gptp ports [port_list | all]
```

Syntax Description

avb	Audio Video Bridging
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable all AVB protocols on the given ports.

Example

```
disable avb ports all
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

 disable msrp

disable msrp

Description

Disable MSRP on the switch.

Syntax Description

msrp	Multiple Stream Registration Protocol

Default

Disabled.

Usage Guidelines

Use this command to disable MSRP on a switch.

Example

The following command disables MSRP:

```
disable msrp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

 disable msrp ports

disable msrp ports [*port_list* | **all**]

Description

Disables MSRP on the ports listed in the command after the keyword, “ports”.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable MSRP in the ports listed or all ports.

Example

```
disable msrp ports all
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

disable mvrp

disable mvrp

Description

Disable MVRP globally on a switch.

Syntax Description

mvrp	Multiple VLAN Registration Protocol

Default

Disabled.

Usage Guidelines

Use this command to disable MVRP globally on a switch. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default, MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets are forwarded transparently.

Example

The following command disables MVRP:

```
disable mvrp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

 disable mvrp ports

disable mvrp ports [*port_list* | **all**]

Description

Disable MVRP on a given set of ports.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
port_list	Port(s) on which MVRP is to be enabled.
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to disable MVRP on given set of ports. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets will be forwarded transparently.

Example

The following command disables MVRP on ports 4 and 5:

```
disable mvrp ports 4-5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

 disable network-clock gptp

disable network-clock gptp

Description

Disables gPTP on the switch.

Syntax Description

network-clock	Network clock.
gptp	IEEE 802.1AS Generalized Precision Time Protocol (gPTP).

Default

Disabled.

Usage Guidelines

Use this command to disable gPTP after having enabled it.

Example

```
disable network-clock gptp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

disable network-clock gptp ports

disable network-clock gptp ports [*port_list* | **all**]

Description

Disables gPTP on one or more ports.

Syntax Description

port_list	Specifies one or more the the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

Disabled.

Usage Guidelines

Use this command to configure on which ports gPTP runs. gPTP runs on no ports if it is not enabled in the switch by `enable network-clock gptp`.

Example

```
disable network-clock gptp ports 1-3
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable avb

enable avb

Description

This command is a macro command that can be used to enable all AVB protocols globally on the switch. It is equivalent to issuing the following three commands:

```
enable mvrp
enable msrp
enable network-clock gptp
```

Syntax Description

avb	Audio Video Bridging

Default

Disabled.

Usage Guidelines

Use this command to globally enable all AVB protocols globally on the switch.

Example

```
enable avb
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable avb ports

enable avb ports [*port_list* | **all**]

Description

This command is a macro command that can be used to enable all AVB protocols on the switch. It is equivalent to issuing the following three commands:

```
enable mvrp

enable msrp

enable network-clock gptp
```

Syntax Description

avb	Audio Video Bridging
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable all AVB protocols on the given ports.

Example

```
enable avb ports 1-5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable msrp

```
enable msrp
```

Description

Enables MSRP globally on the switch.

Syntax Description

msrp	Multiple Stream Registration Protocol

Default

Disabled.

Usage Guidelines

Use this command to enable MSRP globally on a switch.

Example

The following command enables MSRP:

```
enable msrp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable msrp ports

enable msrp ports [*port_list* | **all**]

Description

Enables MSRP in the ports listed in the command after the keyword, “ports”.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	Port list separated by a comma or "-".
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable MSRP in the ports listed or all ports.

Example

```
enable msrp ports 1-3
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable mvrp

enable mvrp

Description

Enable MVRP globally on a switch.

Syntax Description

mvrp	Multiple VLAN Registration Protocol

Default

Disabled.

Usage Guidelines

Use this command to enable MVRP globally on a switch. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default, MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets are forwarded transparently.

Example

The following command enables MVRP globally on the switch:

```
enable mvrp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

enable mvrp ports

enable mvrp ports [*port_list* | **all**]

Description

Enable MVRP on a given set of ports.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
port_list	Port(s) on which MVRP is to be enabled.
all	All ports.

Default

Disabled.

Usage Guidelines

Use this command to enable MVRP on given set of ports. MVRP is run on the MVRP enabled ports only if the global setting is enabled. By default MVRP is disabled globally and on individual ports. When MVRP is disabled globally, all MVRP packets will be forwarded transparently.

Example

The following command enables MVRP on ports 4 and 5:

```
enable mvrp ports 4-5
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

enable network-clock gptp

enable network-clock gptp

Description

Enables gPTP in the switch.

Syntax Description

network-clock	Network clock.
gptp	IEEE 802.1AS Generalized Precision Time Protocol (gPTP).

Default

Disabled.

Usage Guidelines

Use this command to enable gPTP.

Example

```
enable network-clock gptp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

enable network-clock gptp ports

enable network-clock gptp ports [*port_list* | **all**]

Description

Enables gPTP on one or more ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

Disabled.

Usage Guidelines

Use this command to configure on which ports gPTP runs. gPTP runs on no ports if it is not enabled in the switch by **enable network-clock gptp**.

Example

```
enable network-clock gptp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show avb

show avb

Description

Displays a summaty of MSRP, MVRP, and gPTP configuration on the switch.

Syntax Description

avb	Audio Video Bridging

Default

N/A.

Usage Guidelines

Use this command to display a summary of MSRP, MVRP, and gPTP configuration and status on the switch.

Example

```
#show avb
gPTP status         : Enabled
gPTP enabled ports  : *17d    *19d

MSRP status         : Enabled
MSRP enabled ports  : !3      *17ab     *19a

MVRP status         : Enabled
MVRP enabled ports  : *17     *19

Flags:        (*) Active,                   (!) Administratively disabled,

              (a) SR Class A allowed,       (b) SR Class B allowed,

              (d) Disabled gPTP port role, (m) Master gPTP port role,

              (p) Passive gPTP port role,  (s) Slave gPTP port role.
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show mrp ports

show mrp ports {*port_list*}

Description

Shows the MRP timers configured on the given list of ports on the switch.

Syntax Description

mrp	Multiple Registration Protocol
port_list	Ports on which MRP timers are configured or unconfigured.

Default

N/A.

Usage Guidelines

Use this command to view MRP timers configured on the given list of ports on the switch.

Example

```
X250e-24p.1 # show mrp ports 1, 4, 5
-------------------------------------------------------------------------------
-----------------------------------------------------
Ports      Join Time (ms)            Leave Time (ms)           Leave All
Time (ms)           Periodoc (ms)           Extended

                                        Refresh (ms)
-------------------------------------------------------------------------------
-----------------------------------------------------
    1                 200                       600
10000                     1000                10000
    4                 300                       800
10000                     1000                10000
    5                 200                       600
10000                     1000                10000
-------------------------------------------------------------------------------
-----------------------------------------------------
```

History

This command was first available in ExtremeXOS 15.3.

Output for periodic and extended refresh timers added in 15.3.2.

Platform Availability

This command is available on all commands.

show msrp

show msrp

Description

Displays the MSRP configuration on the switch.

Syntax Description

msrp	Multiple Stream Registration Protocol

Default

N/A.

Usage Guidelines

Use this command to display MSRP configuration on the switch.

Example

```
# show msrp
MSRP Status                              : Enabled
MSRP Max Latency Frame Size              : 1522
MSRP Max Fan-in Ports                    : No limit
MSRP First Value Change Recovery Time    : 10000 (ms)
MSRP Ignore Latency Changes              : On
MSRP Talker VLAN Pruning                 : On
MSRP Enabled Ports                       : *17ab       *19a    !5
Total MSRP streams                       : 4
Total MSRP reservations                  : 2
Flags:    (*) Active,             (!) Administratively disabled,
          (a) SR Class A allowed, (b) SR Class B allowed.
```

History

This command was first available in ExtremeXOS 15.3.

The MSRP First Value Change Recovery Time, MSRP Ignore Latency Change, and MSRP Talker VLAN Pruning example outputs were added in 15.3.2.

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp listeners

show msrp listeners {**egress** | **ingress** | **ingress-and-egress**} {**port** *port_num*} {**source-mac-addr** *source_mac_addr* | **stream-id** *stream_id*}

Description

Shows MSRP listener information.

Syntax Description

msrp	Multiple Stream Registration Protocol
listeners	Listener attributes.

egress	Display egress listeners only.
ingress	Display ingress listeners only (default).
ingress-and-egress	Display all listeners.
port_num	Filter based on ingress port number of the stream.
source-mac-addr	Filter based on source MAC address of a data stream.
stream-id	Filter based on stream ID of a data stream.

Default

N/A.

Usage Guidelines

Use this comand to show MSRP listener information. The output can be filtered based on the stream id, source MAC or port number on which the listener is registered.

Example

```
X460-24t.1 # show msrp listeners
    Stream Id            Port  Dec       Dir      State       Stream Age

                                                  App  Reg  (days, hr:mm:ss)
----------------------  -----  -------  -------  ---  --- ----------------
00:50:c2:4e:d3:2d:00:00     19  Ready    Ingress  VO   IN       0, 00:58:12
00:50:c2:4e:d3:2d:00:01     19  Ready    Ingress  VO   IN       0, 00:58:12
00:50:c2:4e:d3:2d:00:02     19  Ready    Ingress  VO   IN       0, 00:58:12
--------------------------------------------------------------------------------
-
App      : Applicant State,               Dec     : MSRP Declaration
Types,
Dir      : Direction of MSRP attribute,   Reg     : Registrar State

MSRP Declaration Types:
AskFail : Listener Asking Failed,         RdyFail : Listener Ready Failed,
Ready   : Listener Ready

Applicant States:
   AA   : Anxious active,                 AN      : Anxious new,

   MT   : Empty - Not Registered
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp ports

show msrp ports {*port_list*}{**detail**}

Description

Displays the MSRP configured port information.

Syntax Description

msrp	Multiple Stream Registration Protocol
ports	Ports
port_list	Port list separated by a comma or "-".
detail	Port information with more detail.

Default

N/A.

Usage Guidelines

Displays the MSRP configured port information. Specifying "detail" displays port information with more detail.

Example

```
# show msrp ports
        Port  Enabled   Oper    Port   Dplx  Jumbo  Jumbo  Cls  Bndry

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp ports bandwidth

show msrp ports {*port_list*} **bandwidth**

Description

Displays bandwidth information of an MSRP port.

Syntax Description

msrp	Multiple Stream Registration Protocol
ports	Ports
port_list	Port list separated by a comma or "-".
bandwidth	Bandwidth information per port per traffic-class.

Default

N/A.

Usage Guidelines

Use this command to display bandwidth information of an MSRP port.

Example

```
# show msrp ports bandwidth
Port      Port   Class    Delta    Maximum    Reserved  Available
          Speed                    Effective
------  -------  -----  ---------  ---------  ---------  ---------
    5ab      0 M  A         75.00%      0.00%      0.00%      0.00%

                  B          0.00%      0.00%      0.00%      0.00%
  *21ab   1000 M  A         75.00%     75.00%      0.00%     75.00%

                  B          0.00%     75.00%      0.00%     75.00%

Flags:  (*) Active,              (!) Administratively disabled,
        (a) SR Class A allowed,  (b) SR Class B allowed.
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp ports counters

show msrp ports {*port_list*} **counters** {**event** | **packet**}

Description

Shows PDU or event counters per port.

Syntax Description

msrp	Multiple Stream Registration Protocol
ports	Ports
port_list	Port list separated by a comma or "-".
counters	MSRP packet and attribute event counters.
event	MSRP attribute event counters.
packet	MSRP packet counters (default).

Default

N/A.

Usage Guidelines

Use this commanf to display PDU or event counters per port. The counters count the received attributes from talkers and listeners per attribute event, or the number of PDUs received. "`show msrp counters`" by itself displays PDU counters.

Example

```
#show msrp ports 17 counters packet
Port     Streams    Reservations    Rx Pkt     Rx Error     Tx Pkt
----- ------------  ------------  ----------  ----------  ----------
  17             0             0           2           0           2

#show msrp ports 17 counters event
Port : 17
    MRP Attribute Events       Rx          Tx
   ----------------------  ----------  ----------
  In                            250          56

  Lv                              0           0
  Mt                              0         152
  New                             0           0

    MSRP Declarations
  ----------------------  ----------  ----------
  Listener Asking Failed            0           0
  Listener Ready                   56           8
  Listener Ready Failed             0           0
  Talker Advertise                  8          56
  Talker Failed                     0           3

--------------------------------------------------------------------------------

In     : Not declared, but registered
JoinIn : Declared and Registered
JoinMt : Declared, but not registered
Lv     : Previously registered, but now withdrawn
Mt     : Not declared, and not registered
New    : Newly declared, and possibly not previously
         registered
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp streams

show msrp streams {**detail** | **propagation**} {**port** *port_num*} {**source-mac-addr** *source_mac_addr* | **stream-id** *stream_id*}{**destination-mac-addr** *destination_mac_addr*}

Description

Shows the MSRP stream information collected from the Talker's attributes.

Syntax Description

msrp	Multiple Stream Registration Protocol
streams	Data streams advertising QoS specification using MSRP.
detail	Show stream information with more detail,
propagation	Show stream propagation through switch.
port	Filter based on ingress port number of the stream.
source-mac-addr	Filter based on source MAC address of a data stream.
stream-id	Filter based on stream ID of a data stream.
destination-mac-addr	Filter based on destination MAC address of a data stream.

Default

N/A.

Usage Guidelines

Use this command to show the MSRP stream information collected from the Talker's attributes. The output can be filtered based on the stream id, source MAC, destination MAC or port number on which the stream is registered.

Example

```
# show msrp streams
    Stream Id               Destination     Port  Dec   VID  Cls/Rn     BW

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show msrp talkers

show msrp talkers {**egress** | **ingress** | **ingress-and-egress**} {**port** *port_num*}{**source-mac-addr** *source_mac_addr* | **stream-id** *stream_id*}

Description

Shows MSRP talker attributes.

Syntax Description

msrp	Multiple Stream Registration Protocol
talkers	Talker attributes
egress	Display egress talkers only (default).
ingress	Display ingress talkers only.
port	Filter based on ingress port number of the stream.
source-mac-addr	Filter based on source MAC address of a data stream.
stream-id	Filter based on stream ID of a data stream.

Default

N/A.

Usage Guidelines

Use this command to shows MSRP talker attributes. The output can be filtered based on the stream id, source MAC or port number on which the talker is registered.

Example

```
  X460-24t.1 # show msrp talkers
      Stream Id            Port  Dec     Dir     State         Failure Code

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show mvrp

show mvrp

Description

Shows MVRP settings.

Syntax Description

mvrp	Multiple VLAN Registration Protocol

Default

N/A.

Usage Guidelines

Use this command to show the MVRP settings.

Example

```
X460-24t.3 # show mvrp
MVRP enabled               : Enabled
MVRP dynamic VLAN creation : Enabled
MVRP VLAN registration     : Forbidden
MVRP default STP domain    : s0
MVRP enabled ports         : 9    *11    *13
Flags: (*) Active, (!) Administratively disabled.
```

History

This command was first available in ExtremeXOS 15.3.

MRVP VLAN registration output was added in 15.3.2.

Platform Availability

This command is available on all commands.

show mvrp ports counters

show mvrp ports {*port_list*} **counters** {**event** | **packet**}

Description

Shows the port MVRP statistics. The statistics for packet or event counters are displayed as per input.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
ports	Ports
port_list	List of ports in the switch separated by a comma or "-".
counters	MVRP packet and attribute event counters.
event	MVRP attribute event counters.
packet	MVRP packet counters (default).

Default

Packet counters.

Usage Guidelines

This command is to show the port MVRP statistics. The statistics for packet or event counters will be displayed as per input. The default is packet counters. The packet counters include Number of VLANs registered on the port, Number of Failed Registrations, Number of MVRPDUs received, Number of MVRPDUs sent, Number of erroneous MVRPDUs received and the source address of the MVRP message last received by the port. The event counters include the number of different events received/ transmitted.

Example

```
X460-24t.5 # show mvrp ports 9,11,13 counters packet
Port    VLANs    Failed    Rx Pkt  Rx Error   Tx Pkt     Last Source
        Regs     Regs      Count   Count      Count      Address
-----   -----    ------   --------  --------  --------  -----------------

    9      2          0         0         0        64   00:00:00:00:00:00
```

```
    11     2          0    806836         0    433754   00:22:97:00:41:e7

    13     2          0    784176         0    404794   00:22:97:00:41:e8

-------------------------------------------------------------------
Regs: Registrations

X460-24t.7 # show mvrp ports 9 counters event
Port :  17
    MRP Attribute Events       Rx          Tx
  ----------------------  ----------  ----------
  In                            250          56
  JoinIn                          0           0
  JoinMt                        224         386
  LeaveAll                        5           0
  Lv                              0           0
  Mt                              0         152
  New
-------------------------------------------------------------------------
In       : Not declared, but registered
JoinIn   : Declared and Registered
JoinMt   : Declared, but not registered
LeaveAll : All registrations will shortly be deregistered
Lv       : Previously registered, but now withdrawn
Mt       : Not declared, and not registered
New      : Newly declared, and possibly not previously registered
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

show mvrp tag

show mvrp tag *vlan_tag* {**ports** {*port_list*}}

Description

Shows the port specific applicant and registrar states and the configured control values for all MVRP enabled ports.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
tag	The 802.1Q VLAN ID

vlan_tag	VLAN ID ranging from 1 to 4094 (default is 2).
port_list	Port list separated by comma or "-".

Default

N/A.

Usage Guidelines

Use this command to show the port specific applicant and registrar states and the configured control values for all MVRP enabled ports. The registrar control value is derived as follows:

- Normal = Dynamically ordered port.
- Fixed = Statically added port.
- Forbidden = VLAN is configured to be forbidden on the port.

Example

```
X460-24t.4 # show mvrp tag 2

Port    Applicant     Applicant     Registrar    Registrar
        State         Control       State        Control
        -----         ---------     ---------    ---------     ---------

            9         VN            On            MT           Normal
            11        QA            On            IN            Normal
            13        QA            On            IN            Normal

Applicant States:
        AA     : Anxious active,        AN       : Anxious new,
        AO     : Anxious observer,      AP       : Anxious passive,
        LA     : Leaving active,        LO       : Leaving observer,
        QA     : Quiet active,          QO       : Quiet
observer,
        QP     : Quiet passive,         VN       : Very anxious
new,
        VO     : Very anxious observer, VP       : Very anxious passive

Registrar States:
        IN     : In – Registered,       LV        : Leaving - Timing out,

        MT     : Empty - Not Registered
Applicant Control:
        On     : Transmit On,          Off       : Transmit Off

Registrant Control:
        Fixed  : Statically added,     Forbidden : Forbidden VLAN,
        Normal : Dynamically added
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

show network-clock gptp

show network-clock gptp {default-set | current-set | parent-set | time-properties-set}

Description

Displays global gPTP configuration and data.

Syntax Description

default-set	Displays this switch's native time capabilities.
current-set	Displays this switch's state relative to the grandmaster system.
parent-set	Displays the upstream (i.e., toward the grandmaster) system's parameters.
time-properties-set	Displays the grandmaster's parameters.

Default

N/A.

Usage Guidelines

Use this command to display whether gPTP is enabled in the switch and the ports on which gPTP is enabled.

Example

```
# show network-clock gptp
gPTP status:     Enabled
gPTP enabled ports:  *1m,    *2s,    *3p,    *4d,    !5d,
                          11d     12d     13d    14d     *15d
                         *16d    17d    18d   19d    20d
                          21d    22d    23d   24d    25d
                          26d    27d    28d   29d    30d
                          31d    32d    33d     34d
Flags:         (*) Active, (!) Administratively disabled,
               (d) Disabled gPTP port role, (m) Master gPTP port role,
               (p) Passive gPTP port role, (s) Slave gPTP port role

# show network-clock gptp default-set
```

```

```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

show network-clock gptp ports

show network clock gptp ports [*port_list* | **all**] {**counters**}

Description

Displays gPTP port parameters and counters.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

N/A.

Usage Guidelines

show network-clock gptp port displays the specified port's gPTP parameters:

Physical port number	The switch's number for this physical port.
gPTP port status	Indicates whether gPTP is enabled on this port.
Clock Identity	This switch's gPTP Clock Identity.
gPTP Port Number	gPTP number for this physical port.
IEEE 802.1AS Capable	Indicates whether this switch and the neighboring systemdevice connected via this port can interoperate via gPTP.
Port Role	The port's gPTP role: • Disabled (3) • Master (6) • Passive (7) • Slave (9)
Announce Initial Interval	The initial announce interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 0 = 1 second.
Announce Current Interval	The current announce interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 1 = 2 seconds.
Announce Receipt Timeout	The number of announce intervals a slave port waits without receiving an Announce message before it assumes the master port is no longer sending Announce messages and the BMCA needs to be run.
Sync Initial Interval	The initial time-synchronization transmission interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, -1 = 500 milliseconds.
Sync Current Interval	The current time-synchronization transmission sync interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, -2 = 250 milliseconds.

Sync Receipt Timeout	The number of time-synchronization transmission intervals a slave port waits without receiving a Sync message before it assumes the master port is no longer sending Sync messages and the BMCA needs to be run.
Sync Receipt Timeout Interval	Sync Receipt Timeout in time units.
Peer Delay Initial Interval	The initial Peer Delay Request interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 2 = 4 seconds.
Peer Delay Current Interval	The current Peer Delay Request interval on this port. The interval is represented as the log base 2 of the interval in seconds; for example, 3 = 8 seconds.
Peer Delay Allowed Lost Responses	The number of consecutive Peer Delay Request messages that the switch must send on this port without receiving a valid response before it considers the port not to be exchanging Peer Delay messages with its neighbor.
Measuring Propagation Delay	Indicates whether this port is measuring its link's propagation delay.
Mean Propagation Delay	The link's estimated one-way propagation delay. The peer delay protocol measures the sum of the link's propagation delays in each direction, and this is that sum divided by two, which is accurate only if the link is symmetrical.
Mean Propagation Delay Threshold	The propagation delay above which the switch considers this port unable to run gPTP.
Propagation Delay Asymmetry	The configured time that the propagation delay from this switch to the neighbor is less than the estimated one-way propagation delay between the switch and its neighbor (which is also the time that the propagation delay from the neighbor to this switch is greater than the estimate). This value is negative if the propagation delay to the neighbor is greater than the estimate. Let tIR be the propagation delay from this switch (initiator) to the neighbor (responder), tRI be the propagation delay from the neighbor to this switch, and meanPathDelay be the estimated one-way propagation delay. Then: meanPathDelay = (tIR + tRI) / 2 tIR = meanPathDelay – asymmetry_time tRI = meanPathDelay + asymmetry_time
Neighbor Rate Ratio	The estimated ratio of the frequency of the local clock in the neighboring systemdevice connected via this port, to this switch's local clock's frequency. The ratio is represented as the ratio minus 1, multipled by 2^{41}: (ratio – 1) * 2^{41}
PTP Version	The PTP version number used on this port. Always 2.

`show network-clock gptp port counters` displays the specified port's gPTP counters:

Physical port number	The switch's number for this physical port.
gPTP port status	Indicates whether gPTP is enabled on this port.
Announce	The number of Announce messages received and sent.
Sync	The number of Sync messages received and sent.
Follow Up	The number of Follow Up messages received and sent.
Peer Delay Request	The number of Peer Delay Request messages received and sent.
Peer Delay Response	The number of Peer Delay Response messages received and sent.
Peer Delay Response Followup	The number of Peer Delay Response Follow Up messages received and sent

gPTP packet discards	The number of received gPTP packets discarded or lost for one of the following reasons (from 802.1AS-2011 14.7.8): • Announce message from this switch • Announce message with stepsRemoved >= 255 • Announce message with a Path Trace TLV that includes this switch • Follow Up message not received following Sync message received • Peer Delay Response message not received following Peer Delay Request message sent • Peer Delay Response Follow Up message not received following Peer Delay Request message sent
Announce Receipt Timeout Count	The number of Announce Receipt timeouts.
Sync Receipt Timeout Count	The number of Sync Receipt timeouts.
Peer Delay Allowed Lost Responses Exceeded Count	The number of times the number of consecutive Peer Delay Request messages sent without receiving a valid response exceeded the Peer Delay Allowed Lost Responses.

Example

```
# show network-clock gptp ports 2
Physical port number               : 2
gPTP port status                   : Enabled
Clock Identity                     : 00:04:96:FF:FE:52:2C:BE
gPTP Port Number                   : 2
IEEE 802.1AS Capable               : Yes
Port Role                          : 9 (Slave)
Announce Initial Interval          : 0 (1 second)
Announce Current Interval          : 1 (2 seconds)
Announce Receipt Timeout           : 3
Sync Initial Interval              : -3 (125 milliseconds)
Sync Current Interval              : -2 (250 milliseconds)
Sync Receipt Timeout               : 3
Sync Receipt Timeout Interval      : 750 milliseconds
Peer Delay Initial Interval        : 2 (4 seconds)
Peer Delay Current Interval        : 4 (8 seconds)
Peer Delay Allowed Lost Responses  : 3
Measuring Propagation Delay        : Yes
Mean Propagation Delay             : 1000 nanoseconds
Mean Propagation Delay Threshold   : 10000 nanoseconds
Propagation Delay Asymmetry        : 0
Neighbor Rate Ratio                : 200
PTP Version                        : 2

# show network-clock gptp ports 3 counters
Physical port number                              : 3
gPTP port status                                  : Enabled
-----------------------------------------------------------
Parameter                              Receive        Transmit
-----------------------------------------------------------
Announce                                  1000            2000
Sync                                      1000             500
Follow Up                                 2000            2500
Peer Delay Request                        3000            1000
```

```
Peer Delay Response                    500             1500
Peer Delay Response Follow Up          200             1000
gPTP packet discards                   2000               -
-------------------------------------------------------------
Announce Receipt Timeout Count                    : 1000
Sync Receipt Timeout Count                        : 500
Peer Delay Allowed Lost Responses Exceeded Count : 2000
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

unconfigure avb

unconfigure avb

Description

This command is a macro command that can be used to unconfigure all AVB protocols globally on the switch. It is equivalent to issuing the following four commands:

```
unconfigure mvrp

unconfigure msrp

unconfigure network-clock gptp

unconfigure mrp ports all
```

Syntax Description

avb	Audio Video Bridging

Default

N/A.

Usage Guidelines

Use this command to unconfigure all AVB protocols globally on the switch.

Example

```
unconfigure avb
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

unconfigure mrp ports timers

unconfigure mrp ports [*port_list* | **all**] {**timers** {**extended-refresh**} {**join**} {**leave**} {**leave-all**} {**periodic**}}

Description

Unconfigure MRP timers, or only reset the MRP timer values to default if the "timer" keyword is specified.

Syntax Description

mrp	Multiple Registration Protocol
ports	Ports on which MRP timers are to be configured.
all	All ports.
timers	Multiple Registration Protocol timers.
extended-refresh	Timer value to use in place of regular leave timer, only in cases when leave-all is received or sent.
join	The time interval to delay sending MRP advertisements.
leave	The time interval to wait in the leaving state before transitioning to the empty state.
leave-all	The time interval used to control the frequency of "leave all" messages.
periodic	The time interval between two periodic events.

Default

The default values for join, leave, leave-all, periodic and extended-refresh timers are 200, 600, 10000, 1000, and 0 milliseconds, respectively.

Usage Guidelines

Use this command to unconfigure MRP timers, or only reset the MRP timer values to default if the "timer" keyword is specified. If none of the timers are specified, this command resets all three timers to the default values. The default values for the join, leave, and leave-all timers are 200, 600, and 10000 ms respectively.

Example

```
unconfigure mrp ports all
unconfigure mrp ports all timers
unconfigure mrp ports all timers join
```

History

This command was first available in ExtremeXOS 15.3.

The extended-refresh and periodic timer options were added in 15.3.2.

Platform Availability

This command is available on all commands.

unconfigure msrp

unconfigure msrp {**ports** [*port_list* | **all**]}

Description

Disables MSRP and removes all configuration. If a list of ports is specified, MSRP is disabled and the related configuration is removed only on the ports and the system-wide MSRP configuration stays intact.

Syntax Description

msrp	Multiple Stream Registration Protocol
port_list	List of ports in the switch.
all	All the ports in the switch.

Default

N/A.

Usage Guidelines

Use this command disable MSRP and remove all configuration. If a list of ports is specified, MSRP is disabled and the related configuration is removed only on the ports and the system-wide MSRP configuration stays intact.

Example

```
unconfigure msrp
```

```
unconfigure msrp ports all
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

unconfigure mvrp

unconfigure mvrp

Description

Unconfigures MVRP on a switch. This command unconfigures all MVRP port and bridge settings.

Syntax Description

mvrp	Multiple VLAN Registration Protocol

Default

N/A.

Usage Guidelines

Use this command to unconfigure MVRP on a switch. This command unconfigures all MVRP port and bridge settings.

Example

The following command unconfigures MVRP:

```
unconfigure mvrp
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

unconfigure mvrp stpd

unconfigure mvrp stpd

Description

Resets the MVRP STP domain.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
stpd	The STP domain the VLAN is to be associated with. All ports of the domain will be advertised when this VLAN is registered.

Default

s0.

Usage Guidelines

Use this command to reset the STP domain associated with a particular VLAN or all VLANs to default. If a VLAN is specified, the specific VLAN will be associated to the default STP which is configured using the "configure mvrp stpd <stpd_name> default" command. If VLAN is not specified, all VLANs are associated to STP domain s0.

Example

The following are examples of unconfigure mvrp stpd commands:

```
unconfigure mvrp stpd
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

unconfigure mvrp tag

unconfigure mvrp tag *vlan_tag*

Description

Resets all MVRP settings for the given VLAN id. The STP domain, the registrar state machine settings, applicant state machine settings for the given VLAN are reset to default values.

Syntax Description

mvrp	Multiple VLAN Registration Protocol
tag	The 802.1Q VLAN ID

Default

N/A.

Usage Guidelines

Use this command to reset all MVRP settings for the given VLAN id. The STP domain, the registrar state machine settings, applicant state machine settings for the given VLAN are reset to default values. All dynamically added ports of the VLAN are removed. If the VLAN was created dynamically, it is removed. If VLAN is not specified, MVRP settings for all VLANs are reset and the dynamic VLAN creation feature is reset to “enabled”.

Example

The following command unconfigures MVRP:

```
unconfigure mvrp tag 100
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all commands.

unconfigure network-clock gptp ports

unconfigure network-clock gptp ports [*port_list* | **all**]

Description

Restores all configuration parameters on the specified ports to their default values. This command does not disable gPTP on the ports.

Syntax Description

port_list	Specifies one or more of the switch's physical ports.
all	Specifies all of the switch's physical ports.

Default

N/A.

Usage Guidelines

Use this command to restore all configuration parameters on the specified ports to their default values.

Example

```
unconfigure network-clock gptp ports all
```

```
unconfigure network-clock gptp ports 1,2
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on Summit X440, X460, and X670 switches if the AVB feature pack license is installed on the switch.

19 Commands for Virtual Routers

This chapter describes commands for:

- Creating and deleting a virtual router (VR) or virtual router forwarding instance (VRF)
- Configuring and managing VRs and VRFs
- Displaying information about VRs and VRFs

Note
In this chapter, "VR" refers to all types of VR (User VR, VRF, Default VR, etc.). If there is a distinction, it is clarified in the command.

For an introduction to VRs and VRFs, see the ExtremeXOS Concepts Guide.

clear counters vr

clear counters {**vr**} *vpn-vrf-name*

Description

Clears statistics information for a VPN Virtual Routing and Forwarding instance (VPN VRF).

Syntax Description

vpn-vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

This command can help to debug control path issues for a VPN VRF.. Issuing a global XOS “clear counter” command will also clear VRF counters. This command clears the following counters:

- Route add operation count
- Route delete operation count
- Routes dropped count

This command is supported only on VPN VRFs.

Example

The following command clears the counters for VPN VRF red:

```
Switch.19 # clear counters vr red
```

History

This command was first introduced in XOS Release 15.3.

Platform Availability

This command is available on BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

configure vr add ports

configure vr *vr-name* **add ports** *port_list*

Description

Assigns a list of ports to the VR specified.

Syntax Description

vr-name	Specifies the name of the VR.
port_list	Specifies the ports to add to the VR.

Default

By default, all ports are assigned to the VR, VR-Default.

Usage Guidelines

When a new VR is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added. Use this command to assign ports to a VR. Since all ports are initially assigned to VR-Default, you might need to delete the desired ports first from the VR where they reside, before you add them to the desired VR.

If you plan to assign VR ports to a VLAN, be aware that the ports that you add to a VLAN and the VLAN itself cannot be explicitly assigned to different VRs. When multiple VRs are defined, consider the following guidelines while adding ports to a VR:

- A VLAN can belong (either through explicit or implicit assignment) to only one VR.
- If a VLAN is not explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to a single VR.
- If a VLAN is explicitly assigned to a VR, then the ports added to the VLAN must be explicitly assigned to the same VR or to no VR.
- If a port is added to VLANs that are explicitly assigned to different VRs, the port must be explicitly assigned to no VR.

Example

The following command adds all the ports on slot 2 to the VR vr-acme:

```
configure vr vr-acme add ports 2:*
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

configure vr add protocol

configure vr *vr_name* **[add | delete] protocol [ospf | ospf3 | rip | ripng | bgp | isis | pim]**

Description

Starts a Layer3 protocol instance for a VR or VRF.

Syntax Description

vr_name	Specifies the name of a VR or a VRF.
protocol	Specifies a Layer3 protocol that you can add or delete.
name	Specifies the name of a VR or a VRF. The following protocols are supported on VRs: RIP, RIPng, OSPF, OSPFv3,BGP,PIM. IS-IS, and MPLS. The following protocols are supported on VRFs: BGP.
add	Adds a routing protocol to VRF for PE – CE communication .
delete	Specifies the name of a VR or a VRF.

Default

By default, none of the dynamic protocols are added to a User VR or a VRF.

Usage Guidelines

When a new VR or VRF is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added.

MPLS is the only protocol that you can add to or delete from the VR-Default VR. When MPLS is enabled on a switch, the default configuration adds MPLS to VR-Default. You cannot add or delete any other protocols from VR-Default, and you cannot add or delete any protocols from the other system VRs, VR-Mgmt and VR-Control.

Note

You must delete the MPLS protocol from VR-Default before you can add it to a user VR. MPLS can be active on only one VR within a switch.

When you add a protocol to a VRF, the parent VR starts that protocol, if it was not already running, and adds a protocol instance to support the VRF.

If a previously configured protocol instance is deleted, the CE routes imported from that protocol into the VRF RIB is removed.

Example

The following command starts RIP on the VR vr-acme:

```
configure vr vr-acme add protocol rip
```

The following command starts a BGP protocol instance for VRF vr-widget:

```
configure vr vr-widget add protocol bgp
```

History

This command was first available in ExtremeXOS 11.0.

MPLS protocol support was added in ExtremeXOS 12.4.

Support for the OSPFv3 and RIPng protocols on user VRs was added in ExtremeXOS 12.5.

Support for the BGP protocol on VRFs was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

configure vr delete ports

configure vr *vr-name* **delete ports** *port_list*

Description

Removes a list of ports from the VR specified.

Syntax Description

vr-name	Specifies the name of the VR.
port_list	Specifies the ports to remove from the VR.

Default

By default, all ports are assigned to the VR, VR-Default.

Usage Guidelines

When a new VR is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added. Use this command to remove ports from a VR. Since all ports are initially assigned to VR-Default, you might need to delete the desired ports first from the VR where they reside, before you add them to the desired VR.

Example

The following command removes all the ports on slot 2 from the VR vr-acme:

```
configure vr vr-acme delete ports 2:*
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

configure vr delete protocol

configure vr *vr-name* **delete protocol** *protocol-name*

Description

Stops and removes a Layer3 protocol instance for a VR or VRF.

Syntax Description

vr-name	Specifies the name of the VR.
protocol-name	Specifies the Layer3 protocol. The following protocols are supported on VRs: RIP, RIPng, OSPF, OSPFv3,BGP,PIM. IS-IS, and MPLS. The following protocols are supported on VRFs: BGP.

Default

N/A.

Usage Guidelines

MPLS is the only protocol that you can add to or delete from the VR-Default VR. When MPLS is enabled on a switch, the default configuration adds MPLS to VR-Default. You cannot add or delete any other protocols from VR-Default, and you cannot add or delete any protocols from the other system VRs, VR-Mgmt and VR-Control.

Note

You must delete the MPLS protocol from VR-Default before you can add it to a user VR. MPLS can be active on only on VR within a switch.

When you delete a protocol from a VRF, the protocol instance is deleted on the parent VR and the CE routes imported from that protocol into the VRF Routing Information Base (RIB) are removed. The parent VR continues to run the protocol until that protocol is removed from the VR.

Example

The following command shutdowns and removes RIP from the VR vr-acme:

```
configure vr vr-acme delete protocol rip
```

The following command deletes the BGP protocol instance for VRF vr-widget:

```
configure vr vr-widget delete protocol bgp
```

History

This command was first available in ExtremeXOS 11.0.

MPLS protocol support was added in ExtremeXOS 12.4.

Support for the OSPFv3 and RIPng protocols on user VRs was added in ExtremeXOS 12.5.

Support for the BGP protocol on VRFs was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

configure vr description

configure vr *vr_name description string*

Description

Use this command to configure a description for the specified VR or VRF.

Syntax Description

vr_vrf_name	Specifies the name of a user VR or a VRF.
string	Specifies a text string to describe the VR. If the text string contains space characters, the entire string must be enclosed with double quote characters (" ").

Default

No description.

Usage Guidelines

This command allows you to add comments about a VRF/VR entity. Entering a NULL string on the CLI will unconfigure the description string for the VRF/VR. If the description string has spaces in it, then the string must be enclosed with in double quotes (“”).

This text message appears in the show virtual-router command display when the command specifies a VR name. For VPN VRFs, this message is returned for a mplsL3VPN MIB query of the MIB variable mplsL3VpnVrfDescription.

Example

The following command configures a description for the VRF named ***corporate***:

```
configure vr corporate description "VRF for the corporate intranet"
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

New configure vr rd

configure vr *vrf_name rd* [*2_byte_as_num*:*4_byte_number* | *ip_address*:*2_byte_number* | *4_byte_as_num*:*2_byte_number*]

Description

Use this command to configure a route-distinguisher (RD) for a VPN VRF.

Syntax Description

vrf-name	Specifies the name of a VPN VRF.
rd	Specifies a Route distinguisher for a VRF. It can be either ASN-related, where it is represented as ***2-byte AS number***:***4-byte num***. It can be IP-address based where it is represented as ***4-byte IP address***:***2-byte number***.
2_byte_as_num	Specifies a 2-byte Autonomous System (AS) number.

4_byte_number	Specifies a 4-byte number to further identify the RD. This number can be chosen by organization that configures the RD, and this number does not need to match any other network configuration parameters.
ip_address	Specifies an IP address to include as part of the RD.
4_byte_as_num	Specifies a 4-byte AS number.
2_byte_number	Specifies a 2-byte number to further identify the RD. This number can be chosen by the organization that configures the RD, and this number does not need to match any other network configuration parameters.

Default

N/A.

Usage Guidelines

The RD can be specified in the following formats:

- *2_byte_as_num:4_byte_number*

  Here is an example: 9643:7000
- *ip_address:2_byte_number*

  Here is an example: 10.203.134.5:324
- *4_byte_as_num:2_byte_number*

Note

Although route distinguisher is 8-bytes wide, this CLI accepts only 6 bytes value. The first two bytes (“type” field) is deduced from the values entered on the CLI, so it is redundant to set the type field on the CLI too. If *2-byte as-num:4-byte num*is entered on the CLI, the type field is automatically set to 0. If *ip_address:2_byte_number* is entered on the CLI, the type field is automatically set to 1. Type 2 (4-bytes AS number) Route Distinguisher is not supported.

Route distinguisher is a mandatory parameter for a VRF. Without this parameter, a VRF cannot be active and local VPN routes cannot be advertised across the SP’s backbone to the remote VPN sites.

Use this command to configure or change the RD for a VPN VRF. If you use this command to change the RD, the Layer 3 VPN associated with that VPN VRF is reset by automatically disabling and re-enabling the VRF.

RD is added to the beginning of the VPN customer’s IPv4 prefix to make globally unique VPNv4 prefixes. You must configure RD for a VRF to be functional. This command is not applicable for a heavy-weight traditional VR.

Example

The following examples configure RDs using the two of the supported formats:

```
configure vr corporate-extreme rd 10.203.134.5:324

configure vr corporate-guest rd 9643:7000
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, and Summit X460, X480, and X670 switches.

configure vr route-target

configure vr *vrf_name* **route-target** [import | export | both] [add | delete] [*route_target_extended_community*]

Description

Use this command to add or delete entries in the import and export lists for route target extended communities for a specified VPN VRF.

Syntax Description

vrf-name	Specifies the name of a VPN VRF.
import	Specifies that the specified route target extended community is to be added to or deleted from the import list for the VRF.
export	Specifies that the specified route target extended community is to be added to or deleted from the export list for the VRF.
both	Specifies that the specified route target extended community is to be added to or deleted from both the import and export lists for the VRF.
add	Specifies that the specified route target extended community is to be added to the specified list for the VRF.
delete	Specifies that the specified route target extended community is to be deleted from the specified list for the VRF.
route_target_extended_community	Specifies the route target extended community. It can be represented in two formats. ASN-related or IP-Address-related.

Default

No default route targets. If you do not specify the **import**, or **export** options at the CLI, by default, **both** is assumed.

Usage Guidelines

This command creates lists of import and export route target extended communities for the specified VRF. Route Target attributes are used to control the VPNv4 route distribution by BGP. Learned routes (from the PE) that carry a specific route target extended community are imported into all VRFs configured with that extended community as an import target. Routes learned from a VRF site are labeled with export route target extended communities configured for that VRF. This is used to control the VRFs into which the route is imported.

A route target extended community can be specified in the following formats:

- *2_byte_as_num:4_byte_number*
- *ip_address:2_byte_number*
- *4_byte_as_num:2_byte_number*

To configure multiple route target extended communities in import or export lists, execute this command with **add** option multiple times, once for each extended community. Use the **delete** option to remove an extended community from an import or export list. You cannot use this command for a heavy-weight traditional VR.

Example

The following examples configure route target extended communities using the two supported formats:

```
configure vr corporate-extreme route-target both add 172.16.186.230:9823
configure vr corporate-guest route-target both add 9643:7002
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, and Summit X460, X480, and X670 switches.

configure vr vpn-id

```
configure vr vrf_name vpn-id 3_byte_oui:4_vpn_index
```

Description

This command configures a globally unique identifier for a VPN VRF.

Syntax Description

vrf-name	Specifies the name of a VPN VRF.
3_byte_oui	Specifies an organizationally unique identifier (OUI). The IEEE organization assigns this identifier to companies. The OUI is restricted to three bytes and must be entered in hexadecimal format.
4_vpn_index	Identifies the VPN within a company. This VPN index is restricted to 4 bytes and must be entered in hexadecimal format.

Default

VPN ID is not configured for VRFs.

Usage Guidelines

The VPN ID uniquely identifies a VPN. This command is only applicable for a VPN VRF. Each VRF configured in a PE router can have a VPN ID. Use the same VPN ID for the VRFs on other PE routers that belong to the same VPN. Ensure that the VPN ID is unique for each VPN in the Service Provider network.

The *oui* and *vpn index* parameters must be entered on the CLI in hex format.

Example

The following example assigns VPN ID ac:9f3c8 to a VRF named *corporate-extreme*:

```
configure vr
corporate-extreme
vpn-id ac:9f3c8
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, BlackDiamond 20800 series switches, and Summit X460, X480, and X670 switches.

create virtual-router

```
create virtual-router name {type [vrf | vpn-vrf {vr parent_vr_name}]}
```

Description

Use the create virtual-router command to create a user VR or VRF.

Syntax Description

type	Specifies the type of virtual router you are creating.
vrf	Specifies that you are creating a new L3 or IP routing domain .
vpn-vrf	Specifies that you are creating a new L3 or IP routing domain that supports L3VPNs .
parent_vr_name	Specifies the parent VR that supports the VRF you are creating.

Default

If no **type** is specified, then the default is to create a user virtual router. A virtual router creates separate L3 Routing Domains.

If *parent_vr_name* parameter is not specified, the VRF will be created under the VR of the current CLI context. Default is VR-Default.

Usage Guidelines

All VRFs are created under default VR or a user created VR. VPN-VRFs can be created in any VR but for L3VPNs to work VPN-VRFs should be created under a parent VR where MPLS is configured. There is a single namespace maintained by XOS configuration manager and it contains VRs and VRFs. Hence name for a VR or a VRF must be unique in EXOS.

A VR or VRF name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 31 characters. The name must be unique among the object names on the switch, and the name is case insensitive. For information on VR and VRF name guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

When a new VR is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added. A protocol process is started in the parent VR when a protocol instance is added to a VRF. If you do not specify a VR type, this command creates a user VR.

VRFs are supported as children of user VRs or VR-Default. If a ***parent_vr_name*** is specified when a VRF is created, the new VRF is created under that parent, provided that the parents supports VRFs. If no parent is specified, the VRF is assigned to the VR for the current VR context, or to VR-Default if the current VR context does not support VRFs.

Note
To support Layer 3 VPNs, a VPN VRF must be created under the VR that supports MPLS. The software supports MPLS on only one VR.

Example

The following command creates the VR vr-acme:

```
create virtual-router vr-acme
```

The following command creates the non-VPN VRF vrf1:

```
create virtual-router vrf1 type vrf
```

History

This command was first available in ExtremeXOS 11.0.

Support for non-VPNVRFs was added in ExtremeXOS 12.5.

Support for VPN VRFs was added in ExtremeXOS 12.6.0-BGP.

Support for L3 VPN VRFs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

delete virtual-router

delete virtual-router *vr-name*

Description

This command deletes a VR or VRF.

Syntax Description

vr-name	Specifies the name of the VR or VRF.

Default

N/A.

Usage Guidelines

Only user VRs and VRFs can be deleted.

Before you delete a user VR, you must delete all VLANs and protocols assigned to the VR, and you must delete any child VRFs. All of the ports assigned to a deleted VR are made available to assign to other VRs.

Before you delete a VRF, you must delete all VLANs and stop all protocols that are assigned to that VRF. All of the ports assigned to a deleted VRF are deleted and made available to assign to other VRs and VRFs. Any routing protocol instance that is assigned to the VRF is deleted gracefully.

Example

The following command deletes the VR vr-acme:

```
delete virtual-router vr-acme
```

The following command deletes the VRF vrf1:

```
delete virtual-router vrf1
```

History

This command was first available in ExtremeXOS 11.0.

Support fornon-VPNVRFs was added in ExtremeXOS 12.5.

Support for VPN VRFs was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

disable snmp trap l3vpn

disable snmp trap l3vpn {**vr** *name*}

Description

This command disables Layer 3 VPN MIB notification traps for the child VPN VRFs of the specified VR.

Syntax Description

vr-name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If vr-*name* is not provided, then this command is applied to the VR in the current context.

Default

Disabled.

Usage Guidelines

None.

Example

The following example disables SNMP traps for Layer 3 VPNs on the default VR:

```
disable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, BlackDiamond 20800 series switches, and Summit X460, X480, and X670 switches.

disable virtual-router

disable virtual-router *vrf-name*

Description

Disables a VRF.

Note

This command is only applicable for VRFs.

Syntax Description

vrf-name	Specifies the name of the VRF.

Default

Enabled.

Usage Guidelines

When you disable a VRF, the software does the following:

- Disables Layer 3 protocols
- Marks static routes as inactive and removes them from the hardware forwarding tables
- Flushes the IP ARP and IPv6 neighbor-discovery caches

Example

The following command disables VRF vrf1:

```
disable virtual-router vrf1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

 enable snmp trap l3vpn

enable snmp trap l3vpn {*vr name*}

Description

This command enables Layer 3 VPN MIB notification traps for the child VPN VRFs of the specified VR.

Syntax Description

vr-name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If vr- ***name*** is not provided, then this command is applied to the VR in the current context.

Default

Disabled.

Usage Guidelines

This command enables generation of the following Layer 3 VPN SNMP traps:

- mplsL3VpnVrfUp—Sent when the first IP VLAN becomes active and the administrative state is enabled.
- mplsL3VpnVrfDown—Sent when the last active IP VLAN becomes inactive, or the administrative state is disabled.

Example

The following example enables SNMP traps for Layer 3 VPNs on the default VR:

```
enable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, BlackDiamond 20800 series switches, and Summit X460, X480, and X670 switches.

enable virtual-router

enable virtual-router *vrf-name*

Description

Enables a VRF.

Note

This command does not affect virtual routers.

Syntax Description

vrf-name	Specifies the name of the VR or VRF instance.

Default

Enabled.

Usage Guidelines

This command is used to administratively enable or disable a VRF. The VRF specific commands are still accepted and retained by the switch. This configuration has an operational impact on the VRF.

When you enable a VRF, the software does the following:

- Enables Layer 3 protocols for the VRF.
- Marks static routes as active and adds them to the hardware forwarding tables.

Example

The following command enables VRF vrf1:

```
enable virtual-router vrf1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

show counters vr

show counters vr {*vpn-vrf-name*}

Description

Displays statistics information about VPN VRF operation.

Syntax Description

vpn-vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

This command displays counters that show:

- The total number of IP unicast and multicast routes
- Route add operation count
- Route delete operation count
- Routes dropped count

Note

The total route count displayed for this command can exceed the total route count displayed by the show iproute command because the show iproute command displays either unicast or multicast routes, but not both.

This command is supported only on VPN VRFs.

Example

The following command displays the counters for VPN VRF red:

```
Switch.19 # show counters vr red
Num of Current Routes: 4                  Num of Routes Dropped: 0
Num of Route Add:      12                 Num of Route Del:      6
Num of Current Routes:  10           Num of Routes Dropped: 0
Num of Route Add:      5             Num of Route Del:      2
```

History

This command was introduced in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond 10808, 12800, and 20800 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

show virtual-router

show virtual-router {*name*}

Description

Displays information about VRs and VRFs.

Syntax Description

name	Specifies the name of a VR or VRF.

Default

N/A.

Usage Guidelines

The output display differs for the following options:

- show virtual-router—displays information about all VRs and VRFs.
- show virtual-router <vr_name>—displays information about a user VR or VR-Default.
- show virtual-router <vrf_name>—displays information about the named VRF.

Example

The following command displays the VR and VRF configurations on the switch:

```
Switch.19 # show virtual-router
-------------------------------------------------------------------
Virtual               Number of    Number of    Flags
Router                Vlans        Ports
-------------------------------------------------------------------
VR-Control             0            0           --------S46
VR-Default             32           18          boprimORS46
xvr                    1            0           b-------F46
VR-Mgmt                1            0           --------S46
-------------------------------------------------------------------
Flags : Virtual Router Type(
          S) System, (U) User, (F) Non-VPN VRF, (N) VPN  VRF
        : Virtual Router Admin State
          (-) Disabled (4) IPv4 Enabled, (6) IPv6 Enabled
        : Routing protocols configured on the virtual router
          (b) BGP, (i) ISIS, (m) MPLS, (o) OSPF, (p) PIM, (r) RIP,
          (O) OSPFv3, (R) RIPng
System Totals         :

History

A command similar to this command was available in ExtremeXOS 10.1 (show vr).

This command was first available in ExtremeXOS 11.0.

Support fornon-VPNVRFs was added in ExtremeXOS 12.5.

The show output for **max-gateways** was added in ExtremeXOS 15.3.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

unconfigure vr description

unconfigure vr *name* **description**

Description

Removes a description for the specified VR or VRF.

Syntax Description

name	Specifies the name of a user VR or a VRF.

Default

No description.

Usage Guidelines

None.

Example

The following command removes a description for the VRF named corporate:

```
unconfigure vr corporate description
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

unconfigure vr rd

unconfigure vr *vrf_name* **rd**

Description

This command removes the configuration for a VPN VRF RD.

Syntax Description

vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following examples unconfigure RDs using the two of the supported formats:

```
unconfigure vr corporate-extreme rd
unconfigure vr corporate-guest rd
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, BlackDiamond 20800 series switches, and Summit X460, X480, and X670 switches.

unconfigure vr vpn-id

unconfigure vr *vrf_name* **vpn-id**

Description

This command removes the configuration for a globally unique identifier for a VPN VRF.

Syntax Description

vrf-name	Specifies the name of a VPN VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following example removes VPN ID ac:9f3c8 from the VRF named corporate-extreme:

```
unconfigure vr corporate-extreme vpn-id
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond8900 xl- and xm-series modules, BlackDiamond 20800 series switches, and Summit X460, X480, and X670 switches.

virtual-router

virtual-router {*vr-name*}

Description

Changes the VR context.

Syntax Description

vr-name	Specifies the name of the VR.

Default

N/A.

Usage Guidelines

Use this command to change the VR context for subsequent commands. When you issue the command, the prompt changes to reflect the VR domain. Configuration commands for Layer3 routing protocols, creating VLANs, and deleting VLANs apply only to the current VR context.

Use this command with no name, or use the name VR-Default to return to the default configuration domain.

Under a VR configuration domain, any VR commands are applied only to that VR. The VR commands consist of all the BGP, OSPF, PIM and RIP commands, and the commands listed in the following table.

Table 27: VR Commands

[enable | disable] ipforwarding
clear iparp [11]
clear counters iparp [a]
configure iparp [a]
configure iparp [add | delete] [a]
[enable | disable] iparp [a]
show iparp [a]
configure iproute [add | delete] [a]
show iproute [a]
show ipstats [a]
rtlookup
create [vlan | vman] <vlan-name>
[enable | disable] igmp
[enable | disable] igmp snooping [a]
[enable | disable] ipmcforwarding
show igmp

[11] Other commands are available with these listed.

Table 27: VR Commands (continued)

show igmp snooping
show igmp group
show igmp snooping cache
[enable | disable] mld
[enable | disable] mld snooping
show mld
show mld snooping
show mld group

The VR context simplifies configuration because you do not have to specify the VR for each individual protocol configuration command. The current VR context is indicated in the command line interface (CLI) prompt.

For example, if you wish to configure OSPF for the user VR vr-manufacturing, you would change the VR context to that of vr-manufacturing. All the subsequent OSPF commands would apply to that VR, unless the context is changed again.

A VR is identified by a name (up to 32 characters long). The name must be unique among the VLAN and VR names on the switch. For backward compatibility, you cannot name a virtual router VR-0, VR-1, or VR-2. VR names are case insensitive.

When a new VR is created, by default, no ports are assigned, no VLAN interface is created, and no support for any routing protocols is added.

Example

The following command changes the VR context to vr-acme:

```
virtual-router vr-acme
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond8000 c-, xl-, and xm-series modules, and Summit X460, X480, X650, and X670 switches.

20 Policy Manager Commands

This chapter describes commands for:

- Creating and configuring policy files for IP access lists (ACLs)
- Creating and configuring policy files for routing policies

Policies are a generalized category of features that impact forwarding and route forwarding decisions. Access policies are used primarily for security and quality of service (QoS) purposes.

IP access lists (also referred to as Access Lists or ACLs) consist of IP access rules and are used to perform packet filtering and forwarding decisions on traffic traversing the switch. Each packet on an interface is compared to the access list in sequential order and is either forwarded to a specified QoS profile or dropped. Additionally, for the BlackDiamond 8800 series and Summit family switches only, packets can be metered using ACLs. Using access lists has no impact on switch performance.

Access lists are typically applied to traffic that crosses Layer3 router boundaries, but it is possible to use access lists within a Layer2 VLAN. Extreme products are capable of performing this function with no additional configuration.

Routing policies are used to control the advertisement or recognition of routes from routing protocols, such as RIP, OSPF, IS-IS, or BGP. Routing policies can be used to 'hide' entire networks or to trust only specific sources for routes or ranges of routes. The capabilities of routing policies are specific to the type of routing protocol involved, but are sometimes more efficient and easier to implement than access lists.

Note

Although ExtremeXOS does not prohibit mixing ACL and routing type entries in a policy file, it is strongly recommended that you do not mix the entries, and you use separate policy files for ACL and routing policies.

check policy

check policy *policy-name* {**access-list**}

Description

Checks the syntax of the specified policy.

Syntax Description

policy-name	Specifies the policy to check.
access-list	Specifies that an access list specific check is performed.

Default

N/A.

Usage Guidelines

Use this command to check the policy syntax before applying it. If any errors are found, the line number and a description of the syntax error are displayed. A policy that contains syntax errors will not be applied.

This command can only determine if the syntax of the policy file is correct and can be loaded into the policy manager database. Since a policy can be used by multiple applications, a particular application may have additional constraints on allowable policies.

Example

The following example checks the syntax of the policy zone5:

```
check policy zone5
```

If no syntax errors are discovered, the following message is displayed:

```
Policy file check successful.
```

History

This command was available in ExtremeXOS 10.1.

The success message and the access-list keyword was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

check policy attribute

check policy attribute {*attr*}

Description

Displays the syntax of the specified policy attribute.

Syntax Description

attr	Specifies the attribute check.

Default

N/A.

Usage Guidelines

Use this command to display the syntax of policy attributes. The command displays any additional keywords to use with this attribute, and the types of values expected.

Policy attributes are used in the rule entries that make up a policy file.

For each attribute, this command displays which applications use the attribute, and whether the attribute is a match condition or a set (action, action modifier) condition.

The current applications are:

- ACL—access-lists
- RT—routing profiles, route maps
- CLF—CLEAR-Flow

The syntax display does not show the text synonyms for numeric entries. For example, the icmp-type match condition allows you to specify either an integer or a text synonym for the condition. Specifying icmp-type 8 or icmp-type echo-request are equivalent, but the syntax display shows only the numeric option.

Note

The syntax displayed is used by the policy manager to verify the syntax of policy files. The individual applications are responsible for implementing the individual attributes. Inclusion of a particular policy attribute in this command output does not imply that the attribute has been implemented by the application. See the documentation of the particular application for detailed lists of supported attributes.

Example

The following example displays the syntax of the policy attribute icmp-type:

```
check policy attribute icmp-type
```

The following is sample output for this command:

```
( match ) ( ACL )
icmp-type <uint32 val>
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

edit policy

edit policy *filename*

Description

Edits a policy text file.

Syntax Description

filename	Specifies the filename of the policy text file.

Default

N/A.

Usage Guidelines

This command edits policy text files that are on the switch. All policy files use ".pol" as the filename extension, so to edit the text file for the policy boundary use boundary.pol as the filename. If you specify the name of a file that does not exist, you will be informed and the file will be created.

This command spawns a VI-like editor to edit the named file. For information on using VI, if you are not familiar with it, do a web search for "VI editor basic information", and you should find many resources. The following is only a short introduction to the editor.

Edit operates in one of two modes; command and input. When a file first opens, you are in the command mode. To write in the file, use the keyboard arrow keys to position your cursor within the file, then press one of the following keys to enter input mode:

- i - To insert text ahead of the initial cursor position
- a- To append text after the initial cursor position

To escape the input mode and return to the command mode, press the Escape key.

There are several commands that can be used from the command mode. The following are the most commonly used:

- dd - To delete the current line
- yy - To copy the current line
- p - To paste the line copied
- :w - To write (save) the file

- :q - To quit the file if no changes were made
- :q! - To forcefully quit the file without saving changes
- :wq - To write and quit the file

Refresh Policy

After you have edited the text file for a policy that is currently active, you will need to refresh the policy if you want the changes to be reflected in the policy database. When you refresh the policy, the text file is read, the syntax is checked, the policy information is added to the policy manager database, and the policy then takes effect. Use the following command to refresh a policy:

```
refresh policy <policy-name>
```

If you just want to check to be sure the policy contains no syntax errors, use the following command:

```
check policy <policy-name> {access-list}
```

Example

The following command allows you to begin editing the text file for the policy boundary:

```
edit policy boundary.pol
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

refresh policy

refresh policy *policy-name*

Description

Refreshes the specified policy.

Syntax Description

policy-name	Specifies the policy to refresh.

Default

N/A.

Usage Guidelines

Use this command when a new policy file for a currently active policy has been downloaded to the switch, or when the policy file for an active policy has been edited. This command reprocesses the text file and updates the policy database.

Before 12.6.1 there was no support to refresh the policies that are associated to the local VPP. For network VPP, you can achieve policy refresh by changing the policy timestamp file. Beginning in release 11.4, the policy manager uses Smart Refresh to update the ACLs. When a change is detected, only the ACL changes needed to modify the ACLs are sent to the hardware, and the unchanged entries remain. This behavior avoids having to blackhole packets because the ACLs have been momentarily cleared. Smart Refresh works well for minor changes, however, if the changes are too great, the refresh reverts to the earlier behavior. To take advantage of Smart Refresh, disable access-list refresh blackholing by using the command:

```
disable access-list refresh blackhole
```

If you attempt to refresh a policy that cannot take advantage of Smart Refresh, you will receive a message similar to the following if blackholing is enabled:

```
Incremental refresh is not possible given the configuration of policy <name>.
Note, the current setting for Access-list Refresh Blackhole is Enabled.
Would you like to perform a full refresh? (Yes/No) [No]:
```

and if blackholing is not enabled:

```
Incremental refresh is not possible given the configuration of policy <name>.
Note, the current setting for Access-list Refresh Blackhole is Disabled.
WARNING: If a full refresh is performed, it is possible packets that should
be denied may be forwarded through the switch during the time the access list
is being installed.
Would you like to perform a full refresh? (Yes/No) [No]:
```

If you attempt to refresh a policy that is not currently active, you will receive an error message.

For an ACL policy, the command is rejected if there is a configuration error or hardware resources are not available.

Example

The following example refreshes the policy zone5:

```
refresh policy zone5
```

History

This command was first available in ExtremeXOS 11.0.

Smart Refresh was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show policy

show policy {*policy-name* | **detail**}

Description

Displays the specified policy.

Syntax Description

policy-name	Specifies the policy to display.
detail	Show the policy in detail.

Default

If no policy name is specified, all policies are shown

Usage Guidelines

Use this command to display which clients are using the specified policy. The detail option displays the rules that make up the policy.

Example

The following example displays all policies on the switch:

```
show policy
```

The following is sample output for the command:

```
Switch # sh policy
Policies at Policy Server:
PolicyName                      ClientUsage     Client          BindCount
-------------------------------------------------------------------------
p1                              1               acl             1
p2                              1               acl             1
vlanV1                          1               acl             1
```

```
--------------------------------------------------------------------------------
Total Policies : 3
```

History

This command was available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show access-list usage acl-range port
show access-list usage acl-rule port
show access-list usage acl-slice port
show access-list width
show flow-redirect
unconfigure access-list

This chapter describes commands for:

- Creating and configuring IP access lists (ACLs)

IP access lists (also referred to as Access Lists or ACLs) consist of IP access rules and are used to perform packet filtering and forwarding decisions on traffic traversing the switch. Each packet on an interface is compared to the access list in sequential order and is either forwarded to a specified QoS profile or dropped. Additionally, for the BlackDiamond X8 series switches, BlackDiamond 8800 series, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches only, packets can be metered using ACLs. Using access lists has no impact on switch performance.

Access lists are typically applied to traffic that crosses Layer3 router boundaries, but it is possible to use access lists within a Layer2 VLAN. Extreme products are capable of performing this function with no additional configuration.

Note

Although ExtremeXOS does not prohibit mixing ACL and routing type entries in a policy file, it is strongly recommended that you do not mix the entries, and you use separate policy files for ACL and routing policies.

- clear access-list counter
- clear access-list meter
- configure access-list
- configure access-list add
- configure access-list delete
- configure access-list network-zone
- configure access-list rule-compression port-counters
- configure access-list vlan-acl-precedence
- configure access-list width
- configure access-list zone
- configure flow-redirect add nexthop
- configure flow-redirect delete nexthop
- configure flow-redirect health-check
- configure flow-redirect nexthop
- configure flow-redirect vr
- create access-list
- create access-list zone
- create access-list network-zone

- create flow-redirect
- delete access-list
- delete access-list network-zone
- delete access-list zone
- delete flow-redirect
- disable access-list permit to-cpu
- disable access-list refresh blackhole
- refresh access-list network-zone
- show access-list
- show access-list configuration
- show access-list dynamic
- show access-list dynamic counter
- show access-list dynamic rule
- show access-list interface
- show access-list network-zone
- show access-list usage acl-mask port
- show access-list usage acl-range port
- show access-list usage acl-rule port
- show access-list usage acl-slice port
- show access-list width
- show flow-redirect
- unconfigure access-list

clear access-list counter

clear access-list {**dynamic**} **counter** {*countername*} {**any** | **ports** *port_list* | **vlan** *vlan_name*} {**ingress** | **egress**}

Description

Clears the specified access list counters.

Syntax Description

dynamic	Specifies that the counter is from a dynamic ACL.
countername	Specifies the ACL counter to clear.
any	Specifies the wildcard ACL.
port_list	Specifies to clear the counters on these ports.
vlan_name	Specifies to clear the counters on the VLAN.

ingress	Clear the ACL counter for packets entering the switch on this interface.
egress	Clear the ACL counter for packets leaving the switch from this interface (BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only).

Default

The default direction is ingress; the default ACL type is non-dynamic.

Usage Guidelines

Use this command to clear the ACL counters. If you do not specify an interface, or the any option, you will clear all the counters.

Example

The following example clears all the counters of the ACL on port 2:1:

```
clear access-list counter port 2:1
```

The following example clears the counter counter2 of the ACL on port 2:1

```
clear access-list counter counter2 port 2:1
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was first available in ExtremeXOS 11.0.

The egress and dynamic options were first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, the E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

clear access-list meter

clear access-list meter {*meter_name*} [**any** | **ports** *port_list* | **vlan** *vlan_name*]

Description

Clears the specified access list meters.

Syntax Description

meter_name	Specifies the ACL meter to clear.
port_list	Specifies to clear the counters on these ports.
vlan_name	Specifies to clear the counters on the VLAN.

Default

N/A.

Usage Guidelines

Use this command to clear the out-of-profile counters associated with the meter configuration.

Example

The following example clears all the out-of-profile counters for the meters of the ACL on port 2:1:

```
clear access-list meter port 2:1
```

The following example clears the out-of-profile counters for the meter meter2 of the ACL on port 2:1

```
clear access-list meter meter2 port 2:1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on the BlackDiamond X8 series switches, BlackDiamond 8000 series modules, SummitStack, the E4G-200 and E4G-400 switches, and the Summit family of switches.

configure access-list

configure access-list *aclname* [**any** | **ports** *port_list* | **vlan** *vlan_name*] {**ingress** | **egress**}

Description

Configures an access list to the specified interface.

Syntax Description

aclname	Specifies the ACL policy file name.
any	Specifies that this ACL is applied to all interfaces as the lowest precedence ACL.
port_list	Specifies the ingress or egress port list on which the ACL is applied.
vlan_name	Specifies the VLAN on which the ACL is applied.
ingress	Apply the ACL to packets entering the switch on this interface.
egress	Apply the ACL to packets leaving the switch from this interface. (BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only)

Default

The default direction is ingress.

Usage Guidelines

The access list applied in this command is contained in a text file created either externally to the switch or using the edit policy command. The file is transferred to the switch using TFTP before it is applied to the ports. The ACL name is the file name without its ".pol" extension. For example, the ACL blocknetfour would be in the file blocknetfour.pol. For more information on policy files, see the ExtremeXOS Concepts Guide.

Specifying the keyword any applies the ACL to all the ports, and is referred to as the wildcard ACL. This ACL is evaluated for ports without a specific ACL applied to it, and is also applied to packets that do not match the ACL applied to the interface.

Example

The following command configures the ACL policy test to port 1:2 at ingress:

```
configure access-list test ports 1:2
```

The following command configures the ACL mydefault as the wildcard ACL:

```
configure access-list mydefault any
```

The following command configures the ACL policy border as the wildcard egress ACL:

```
configure access-list border any egress
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was first available in ExtremeXOS 11.0.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress options are available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

configure access-list add

configure access-list add *dynamic_rule* [[[**first** | **last**] {**priority** *p_number*} {**zone** *zone*}] | [[**before** | **after**] *rule*] | [**priority** *p_number* {**zone** *zone*}]] [**any** | **vlan** *vlan_name* | **ports** *port_list*] {**ingress** | **egress**}

Description

Configures a dynamic ACL rule to the specified interface and sets the priority and zone for the ACL.

Syntax Description

dynamic_rule	Specifies a dynamic ACL rule.
first	Specifies that the new dynamic rule is to be added as the first rule.
last	Specifies that the new dynamic rule is to be added as the last rule.
priority	Priority of rule within a zone.
p_number	Specifies the priority number of the rule within a zone. The range is from 0 (highest priority) to 7 (lowest priority).
zone	Specifies the ACL zone for the rule.
before *rule*	Specifies that the new dynamic rule is to be added before an existing dynamic rule.
after *rule*	Specifies that the new dynamic rule is to be added after an existing dynamic rule.
any	Specifies that this ACL is applied to all interfaces.
vlan_name	Specifies the VLAN on which this ACL is applied.
port_list	Specifies the ports on which this ACL is applied.

ingress	Apply the ACL to packets entering the switch on this interface.
egress	Apply the ACL to packets leaving the switch from this interface (BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only).

Default

The default direction is ingress.

Usage Guidelines

The dynamic rule must first be created before it can be applied to an interface. Use the following command to create a dynamic rule:

```
        create access-list <dynamic-rule> <conditions> <actions> {non-
permanent}
```

When a dynamic ACL rule is applied to an interface, you will specify its precedence among any previously applied dynamic ACLs. All dynamic ACLs have a higher precedence than any ACLs applied through ACL policy files.

Specifying the keyword any applies the ACL to all the ports, and is referred to as the wildcard ACL. This ACL is evaluated for ports without a specific ACL applied to them, and is also applied to packets that do not match the ACL applied to the interface.

The priority keyword can be used to specify a sub-zone within an application's space. For example, to place ACLs into three sub-zones within the CLI application, you can use three priority numbers, such as 2, 4, and 7.

Configuring priority number 1 is the same as configuring first priority. Configuring priority number 8 is the same as configuring last priority.

Example

The following command applies the dynamic ACL icmp-echo as the first (highest precedence) dynamic ACL to port 1:2 at ingress:

```
configure access-list add icmp-echo first ports 1:2
```

The following command applies the dynamic ACL udpdacl to port 1:2, with a higher precedence than rule icmp-echo:

```
configure access-list add udpacl before icmp-echo ports 1:2
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

configure access-list delete

configure access-list delete *ruleName* **[any | vlan** *vlan_name* **| ports** *port_list* **| all] {ingress | egress}**

Description

Removes a dynamic ACL rule from the specified interface.

Syntax Description

ruleName	Specifies a dynamic ACL rule name.
any	Deletes this ACL as the wildcard ACL.
vlan_name	Specifies the VLAN on which this ACL is deleted.
port_list	Specifies the ports on which this ACL is deleted.
all	Deletes this ACL from all interfaces.
ingress	Deletes the ACL for packets entering the switch on this interface.
egress	Deletes the ACL for packets leaving the switch from this interface (BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only).

Default

The default direction is ingress.

Usage Guidelines

Specifying the keyword all removes the ACL from all interfaces it is used on.

Example

The following command removes the dynamic ACL icmp-echo from the port 1:2:

```
configure access-list delete icmp-echo ports 1:2
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

configure access-list network-zone

configure access-list network-zone *zone_name* [**add** | **delete**] [**mac-address** *macaddress* {*macmask*} | **ipaddress** [*ipaddress* {*netmask*} | *ipNetmask* | *ipv6_address_mask*]]

Description

Adds or removes IP and MAC addresses to and from the network-zone.

Syntax Description

network-zone	Logical group of remote devices.
zone_name	Specifies the network-zone name.
add	Adds a logical group of entities to the network-zone.
delete	Deletes a logical group of entities to the network-zone.
mac-address	MAC address.
macaddress	Specifies the MAC address to be added/removed to/from the network-zone.
macmask	Specifies the MAC Mask. Example FF:FF:FF:00:00:00.
ipaddress	Specifies IPv4 address.
ipaddress	Specifies the IP address.
netmask	Specifies IP netmask.
ipNetmask	Specifies the IP address/Netmask.
ipv6_address_mask	Specifies IPv6 address/IPv6 prefix length.

Default

N/A.

Usage Guidelines

Use this command to to add or remove IP/MAC addresses to/from the network-zone.

Example

The following command adds an IPv6 IP address to network-zone “zone1”:

```
Switch# configure access-list network-zone zone1 add ipaddress
11.1.1.1/32
```

If you try to add the same IP/MAC with the same or narrow mask, the configuration is rejected, with the following error message.

```
Switch #configure access-list network-zone "zone1" add ipaddress 11.1.1.1/24
Error:  Network Zone "zone1" - Zone already has the same entity value with
same or wider mask.
```

If you try to add more than eight attributes to a network-zone, the following error message is printed.

```
Switch #configure access-list network-zone "zone1" add ipaddress 11.1.1.1/24
Error:  Network Zone "zone1" - Reached maximum number of attributes. Unable
to add more.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure access-list rule-compression port-counters

configure access-list rule-compression port-counters [**shared** | **dedicated**]

Description

Switches between ACL configuration modes.

Syntax Description

shared	Sharing is “on” for counter rules.
dedicated	Sharing is “off” for counter rules.

Default

Dedicated.

Usage Guidelines

Use this command to switch between two ACL configuration modes. In the first mode, “port-counters shared”, similar port-based ACL rules with counters are allowed to share the same hardware entry. This uses less space but provides an inaccurate counter value. In the second mode, “port-counters dedicated”, similar port-based ACL rules with counters are not allowed to share the same hardware entry, thereby consuming more entries but providing a precise count.

Only ACLs that are entered after this command is entered are affected. The command does not affect any ACLs that are already configured.

To configure all ACLs in shared mode, configure access-list rule-compression port-counters shared must be entered before any ACLs are configured or have been saved in the configuration when a switch is booted.

This is a global setting for the switch; that is, the option does not support setting some ACL rules with shared counters and some with dedicated counters.

To view the results of the configuration use the show access-list configuration command.

Example

The following command configures ACL rules with counters to share the same hardware entry:

```
configure access-list rule-compression port-counters shared
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, and the Summit series switches.

configure access-list vlan-acl-precedence

configure access-list vlan-acl-precedence [dedicated | shared]

Description

Configures precedence mode for policy-file based ACLs that are applied on a VLAN.

Syntax Description

dedicated	Allocates exclusive precedence for VLAN-based ACLs.
shared	VLAN-based ACLs share the precedence with other ACLs.

Default

Dedicated.

Usage Guidelines

The following feature applies to only policy-file based ACLs that are applied on a VLAN. Use this command to switch between two VLAN-based ACL configuration modes. In the shared vlan-acl-precedence mode, VLAN-based ACL rules share the same precedence with other types of ACL rules. This is the default mode and provides the same behavior as in the previous software releases. In the dedicated vlan-acl-precedence mode, VLAN-based ACL rules have different precedence compared to other types of ACL rules. The dedicated mode yields improved installation performance for VLAN-based access-lists but may affect hardware rule utilization in some configurations.

After configuring, you are prompted to reboot the system for the changes to take effect.

Example

The following command allocates exclusive precedence for VLAN-based static ACL rules:

```
configure access-list vlan-acl-precedence dedicated
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on the BlackDiamond X8 series switches, BlackDiamond 8800 e-series modules, E4G-200 and E4G-400 switches, and Summit X450a, X450e, and X460 series switches only.

configure access-list width

configure access-list width [**double** | **single**] [**slot** *slotNo* | **all**]

Description

Configures the TCAM width of a module or switch.

Syntax Description

double	Specifies a double wide ACL TCAM. Provides double wide ACL key with additional qualifiers
single	Specifies a single wide ACL TCAM.
slotNo	Specifies the slot to configure.
all	Specifies all slots.

Default

Single.

Usage Guidelines

Use this feature to configure the width of the ACL TCAM key of a slot or switch to be either double wide or single wide.

The switch must be rebooted for the configuration change to take effect.

If you attempt to configure a double wide mode on a slot or switch that does not support it, an error message is displayed.

To display the configured mode, use the show access-list width command.

Example

The following command configures slot 1 to use double wide mode:

```
configure access-list width double slot 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modulesE4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches whether or not included in a SummitStack.

configure access-list zone

configure access-list zone *name* **zone-priority** *number*

configure access-list zone *name* **move-application** *appl_name* **to-zone** *name* **application-priority** *number*

configure access-list zone *name* {**add**} **application** *appl_name* **application_priority** *number*

configure access-list zone *name* **delete application** *appl_name*

Description

Configures the priority of a zone; moves an application from one zone to another at a specified priority; adds an application to a zone with a specified priority, or changes the priority of an application within a zone; deletes an application from a zone.

Syntax Description

name	Specifies a a zone name.
zone-priority number	Sets the priority of the zone.
move-application*appl_name*	Specifies the name of an application to be moved.
to-zone name	Specifies the zone to which the application is moved.
application-priority*number*	Sets the priority of the application within the zone. The range is from 0 (highest priority) to 7 (lowest priority).
add	Adds an application to a zone at a specified priority.
application *appl_name*	Specifies the application to be added to the zone.
application_priority number*number*	Sets the priority of a new or existing application within a zone. The range is from 0 (highest priority) to 7 (lowest priority).

Default

N/A.

Usage Guidelines

To configure the priority of a specific zone, use the syntax:

```
configure access-list zone <name> zone-priority <number>
```

To move an application from one zone to another, and set its priority in the new zone, use the syntax:

```
configure access-list zone <name> move-application <appl-name> to-zone <name>
application-priority <number>
```

To add an application to a zone and specify its priority or to change the priority of an application within a zone, use the syntax:

```
configure access-list zone <name> {add} application <appl-name>
application_priority <number>
```

To delete an application from a zone, use the syntax:

```
configure access-list zone <name> delete application <appl-name>
```

Example

The following command adds the CLI application to the zone myzone at a priority of 6:

```
configure access-list zone myzone add cli application-priority 6
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure flow-redirect add nexthop

configure flow-redirect *flow_redirect_name* **add nexthop** *ipaddress* **priority** *number*

Description

Adds a nexthop for the named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ipaddress	Specifies the IPv4 or IPv6 address of a new nexthop
number	Specifies the priority value for the nexthop.

Default

N/A.

Usage Guidelines

Use this command to add a new nexthop for the named flow redirection policy. You can specify an IPv4 address or an IPv6 unicast IP address (IPv6 multicast addresses are not supported). After you enter an IP address, the redirection policy only accepts addresses from the same family as the first address specified. For example, if the first IP address added is an IPv6 unicast address, you cannot add an IPv4 address to the policy.

The priority value can range from a low of "1" to a high of "254." The nexthop with the highest priority among multiple ones is preferred as the working nexthop. When each added nexthop has the same priority, the first one configured is preferred.

Example

The following command adds a nexthop 10.1.1.1 for the flow redirection policy flow10 with a priority of 100:

```
configure flow-redirect flow10 add nexthop 10.1.1.1 priority 100.
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements.

configure flow-redirect delete nexthop

configure flow-redirect *flow_redirect_name* **delete nexthop** {*ipaddress* | **all** }

Description

Deletes a single or all nexthops for the named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ipaddress	Specifies the IPv4 or IPv6 address of the nexthop.
all	Specifies that all configured nexthps are to be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete a nexthop for the named flow redirection policy. If the deleted nexthop is the working nexthop for the policy-based routing entry, another is selected from the remaining active next hops, based on priority.

Example

The following command deletes the nexthop 10.1.1.1 from the flow redirection policy flow10:

```
configure flow-redirect flow10 delete nexthop 10.1.1.1
```

The following command deletes all configured nexthop's from the flow redirection policy exflow:

```
configure flow-redirect exflow delete nexthop all
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements

configure flow-redirect health-check

configure flow-redirect *flow_redirect_name* **health-check [ping | arp | neighbor-discovery]**

Description

Configures health checking for a specific flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ping	Specifies ping health checking.

arp	Specifies ARP health checking for IPv4.
neighbor-discovery	Specifies Neighbor Discovery health checking for IPv6.

Default

Ping is the default.

Usage Guidelines

Use this command to configure health checking for a specific named flow redirection policy.

Example

The following command specifies arp health checking for the flow redirection policy flow10

```
configure flow-redirect flow10 health-check arp
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements

configure flow-redirect nexthop

configure flow-redirect *flow_redirect_name* **nexthop** *ip_address* **ping health-check interval** *seconds* **miss** *number*

Description

Configures the ping interval and miss count for a nexthop in the flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
ipaddress	Specifies the IPv4 or IPv6 address of the nexthop.
seconds	Specifies the number of seconds between pings. The default is “2”.
number	Specifies the number of misses allowed. The default is “2”.

Default

N/A.

Usage Guidelines

Use this command to set a ping interval and miss count. When the ping response is not received within the interval seconds * (number +1), the nexthop is considered to be dead and a new candidate is selected from the remaining active nexthops.

Example

The following command configures a ping interval of 3 and miss count of 3 for the nexthop 10.1.1.1 in the flow redirection policy flow 3:

```
configure flow-redirect flow3 nexthop 10.1.1.1 ping interval 3 miss 3
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements .

configure flow-redirect no-active

configure flow-redirect *flow_redirect_name* **no-active** [**drop**|**forward**]

Description

Configures packets to either follow the normal routing table or be dropped.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
drop	Specifies that the packets are to be dropped.
forward	Specifies that the packets are to follow the normal routing table.

Default

The default is forward.

Usage Guidelines

Use this command to set a drop or forward configuration for packets to be applied when all configured next hops become unreachable.

Example

The following command configures packets of the flow redirection policy flow3 to be dropped when all configured next hops become unreachable:

```
configure flow-redirect flow3 no-active drop
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements.

configure flow-redirect vr

configure flow-redirect *flow_redirect_name* **vr** *vr_name*

Description

Configures a virtual router for a flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.
vr_name	Specifies the name of the virtual router

Default

The default virtual router is VR-Default.

Usage Guidelines

Because ACLs do not recognize the virtual router concept, one policy-based routing can be used for multiple virtual routing entries when a VLAN-based virtual router is used for one port. This configuration of a VR into a flow-redirect makes a policy-based routing work for a specific VR.

Example

The following command configures virtual router mgmt for flow redirection policy flow3:

```
configure flow-redirect flow3 vr mgmt
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements .

create access-list

create access-list *dynamic_rule conditions actions* **{non_permanent}**

Description

Creates a dynamic ACL

Syntax Description

dynamic_rule	Specifies the dynamic ACL name. The name can be from 1-32 characters long.
conditions	Specifies the match conditions for the dynamic ACL.
actions	Specifies the actions for the dynamic ACLs.
non_permanent	Specifies that the ACL is not to be saved.

Default

By default, ACLs are permanent.

Usage Guidelines

This command creates a dynamic ACL rule. Use the configure access-list add command to apply the ACL to an interface.

The conditions parameter is a quoted string of match conditions, and the actions parameter is a quoted string of actions. Multiple match conditions or actions are separated by semi-colons. A complete listing of the match conditions and actions is in the ExtremeXOS Concepts Guide, in ACLs .

Dynamic ACL rule names must be unique, but can be the same as used in a policy-file based ACL. Any dynamic rule counter names must be unique. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

By default, ACL rules are saved when the save command is executed, and persist across system reboots. Configuring the optional keyword non-permanent means the ACL will not be saved.

Example

The following command creates a dynamic ACL that drops all ICMP echo-request packets on the interface:

```
create access-list icmp-echo “protocol icmp;icmp-type echo-request” “deny”
```

The created dynamic ACL will take effect after it has been configured on the interface. The previous example creates a dynamic ACL named icmp-echo that is equivalent to the following ACL policy file entry:

```
entry  icmp-echo {
    if  {
        protocol  icmp;
        icmp-type  echo-request;
    } then {
        deny;
    }
```

The following command creates a dynamic ACL that accepts all the UDP packets from the 10.203.134.0/24 subnet that are destined for the host 140.158.18.16, with source port 190 and a destination port in the range of 1200 to 1250:

```
create access-list udpacl “source-address 10.203.134.0/24;destination-address
140.158.18.16/32;protocol  udp;source-port 190;destination-port  1200 -
1250;” “permit”
```

The previous example creates a dynamic ACL entry named udpacl that is equivalent to the following ACL policy file entry:

```
entry  udpacl {
if  {
        source-address 10.203.134.0/24;
        destination-address 140.158.18.16/32;
        protocol  udp;
        source-port 190;
        destination-port  1200 - 1250;
    } then {
        permit;
    }
}
```

History

This command was first available in ExtremeXOS 11.3.

The non-permanent option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

create access-list zone

create access-list zone *name* **zone-priority** *number*

Description

Creates a dynamic ACL zone, and sets the priority of the zone.

Syntax Description

name	Specifies the dynamic ACL zone name. The name can be from 1-32 characters long.
zone-priority *number*	Specifies priority of the zone. The range is from 1 (highest priority) to 4294967295 (lowest priority).

Default

The denial of service, system, and security zones are configured by default, and cannot be deleted.

Usage Guidelines

This command creates a dynamic ACL zone. You can configure the priority of the zone in relation to the default zones or to other configured zones.

Example

The following command creates a new zone, called myzone, with a priority of 2:

```
create access-list myzone zone-priority 2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

create access-list network-zone

create access-list network-zone *zone_name*

Description

Creates a network-zone with a specified name.

Syntax Description

access-list	Access list
network-zone	Network zone
zone_name	Network zone name

Default

N/A.

Usage Guidelines

Use this command to create a network-zone with a specified name. The network-zone can then be associated with the policy file using either the "source-zone" or "destination-zone" attribute.

Example

```
Switch# create access-list network-zone zone1
```

If the user tries to create a network-zone that was already created, the following error message will be displayed on the console, and the command will be rejected.

```
Switch#create access-list network-zone zone1
Error:  Network Zone "zone1" already exists.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

create flow-redirect

create flow-redirect *flow_redirect_name*

Description

Creates a named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

Use this command to create a named flow redirection policy to which nexthop information can be added.

For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates a flow redirection policy names flow3:

```
create flow-redirect flow3
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, Summit X250e, X450a, X450e, X460, X480, X650, and X670 series switches, and SummitStack.

delete access-list

delete access-list *dynamic_rule*

Description

Deletes a dynamic ACL.

Syntax Description

dynamic_rule	Specifies the dynamic ACL name.

Default

N/A.

Usage Guidelines

This command deletes a dynamic ACL rule. Before you delete a dynamic ACL, it must be removed from any interfaces it is applied to. Use the configure access-list delete command to remove the ACL from an interface.

Example

The following command deletes the dynamic ACL icmp-echo:

```
delete access-list icmp-echo
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

delete access-list network-zone

delete access-list network-zone *zone_name*

Description

This command is used to delete a network-zone and all configurations that belong to that zone.

Syntax Description

zone_name	Network-zone name

Default

N/A.

Usage Guidelines

Use this command to delete a network-zone and all configurations belonging to that zone.

Example

```
Switch# delete access-list network-zone zone1
```

If the user tries to delete a network-zone that is bound with one or more policy files, the following error message will be displayed, and the command will be rejected.

```
Switch # delete access-list network-zone zone1
Error:  Network Zone "zone1" - Unable to delete zone. Zone has one
or more policies.
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

delete access-list zone

delete access-list zone *name*

Description

Deletes an ACL zone.

Syntax Description

name	Specifies the zone name.

Default

N/A.

Usage Guidelines

This command deletes an ACL zone. You must remove all applications from a zone before you can delete the zone. To delete an application from a zone, use the command configure access-list zone <name> delete application <appl-name> .

You cannot delete the default zones.

Example

The following command deletes the zone my_zone:

```
delete access-list zone my_zone
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

delete flow-redirect

delete flow-redirect *flow_redirect_name*

Description

Deletes the named flow redirection policy.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

Use this command to delete a named flow-redirection policy. Before it can be deleted, all nexthop information must be deleted, otherwise an error message is displayed.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, Summit X250e, X450a, X450e, X480, X650, and X670 series switches, and SummitStack.

disable access-list permit to-cpu

```
disable access-list permit to-cpu
```

Description

Allows special packets to be blocked by low priority ACLs.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows ACLs to deny certain special packets from reaching the CPU, even if the packets match ACLs that would otherwise deny them. The special packets include STP and EAPS BPDUs, and ARP replies for the switch.

When this feature is disabled, these same packets will be denied if an ACL is applied that contains a matching entry that denies the packets. Contrary to expectations, the packets will still be denied if there is a higher precedence entry that permits the packets.

To enable this feature, use the following command:

```
enable access-list permit to-cpu
```

Example

The following command enables ACLs to deny STP BPDU packets from reaching the switch CPU:

```
disable access-list permit to-cpu
```

History

This command was first available in ExtremeXOS 11.3.2.

Platform Availability

This command is available only on the BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit X450 series switches.

disable access-list refresh blackhole

disable access-list refresh blackhole

Description

Disables blackholing of packets during ACL refresh.

Syntax Description

This command has no arguments or variables.

Default

The feature is enabled.

Usage Guidelines

When access control lists (ACLs) are refreshed, this feature provides that any packets arriving during the refresh will be blackholed.

If you disable this feature, the ACLs will be refreshed as described in the refresh policy command.

To enable this feature, use the following command:

```
enable access-list refresh blackhole
```

Example

The following command disables dropping of packets during an ACL refresh:

```
disable access-list refresh blackhole
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable access-list permit to-cpu

enable access-list permit to-cpu

Description

Enables control packets to reach CPU, even if an ACL would deny them.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows control packets to reach the CPU, even if the packets match ACLs that would otherwise deny them. The control packets include STP and EAPS BPDUs, and ARP replies for the switch.

If this feature is disabled, these same packets will be denied if an ACL is applied that contains a matching entry that denies the packets. Contrary to expectations, when this feature is disabled, the packets will still be denied if there is a higher precedence entry that permits the packets.

To disable this feature, use the following command:

```
disable access-list permit to-cpu
```

Example

The following command enables STP BPDU packets to reach the switch CPU, despite any ACL:

```
enable access-list permit to-cpu
```

History

This command was first available in ExtremeXOS 11.3.2.

Platform Availability

This command is available only on the BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and the Summit X450 series switches.

enable access-list refresh blackhole

Enables blackholing of packets during ACL refresh.

enable access-list refresh blackhole

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When access control lists (ACLs) are refreshed, this command provides that any packets arriving during the refresh will be blackholed. As the ACL is being refreshed, packets may arrive while the ACL is in an indeterminate state, and packets may be permitted that otherwise are dropped. This feature protects the switch during an ACL refresh.

To disable this feature, use the following command:

```
disable access-list refresh blackhole
```

Example

The following command enables dropping of packets during an ACL refresh:

```
enable access-list refresh blackhole
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

refresh access-list network-zone

refresh access-list network-zone [*zone_name* | **all**]

Description

This command is used to refresh a specific network zone, or all the network zones.

Syntax Description

network-zone	Specifies the logical group of remote devices.
zone_name	Specifies the network_zone name.
all	Refresh all the network-zones.

Default

N/A.

Usage Guidelines

Use this command to refresh a specific network zone, or all the network zones.

When you issue the command to refresh a network-zone, or all network-zones, it can take a long time to clear the CLI because each individual policy must be converted before it is refreshed. The command succeeds, or fails, only after it receives a response for all policy refresh results from the hardware.

If the refresh fails for a specific zone, the following error message will be printed on the console.

```
Switch # refresh access-list network-zone zone1
ERROR: Refresh failed for network-zone "zone1".
```

Example

The following example refreshes all policies in “zone1”:

```
refresh access-list network-zone zone1
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

show access-list

show access-list {**any** | **ports** *port_list* | **vlan** *vlan_name*} {**ingress** | **egress**}

Description

Displays the ACLs configured on an interface.

Syntax Description

aclname	Specifies the ACL name. The name can be from 1-32 characters long.
any	Specifies the wildcard ACL.
port_list	Specifies which ports' ACLs to display.
vlan_name	Specifies which VLAN's ACL to display.
ingress	Display ingress ACLs.
egress	Display egress ACLs (BlackDiamond X8 series switches, BlackDiamond 8000 c- and xl-series modules, E4G-200 and E4G-400 switches, and Summit X480 and X650 series switches only).

Default

The default is to display all interfaces, ingress.

Usage Guidelines

The ACL with the port and VLAN displayed as an asterisk (*) is the wildcard ACL.

If you do not specify an interface, the policy names for all the interfaces are displayed, except that dynamic ACL rule names are not displayed. To display dynamic ACLs use the following commands:

```
show access-list dynamic
            show access-list dynamic rule <rule> {detail}
```

If you specify an interface, all the policy entries, and dynamic policy entries are displayed.

Example

The following command displays all the interfaces configured with an ACL:

```
show access-list
```

The output from this command is similar to:

```
Vlan Name    Port   Policy Name          Dir      Rules  Dyn Rules
=================================================================
*            3:6    TCP_flag             ingress  3      2
*            3:8    qos_hongkong         ingress  3      0
*            2:1    tc_2.4               ingress  4      0
*            2:7    tcp                  ingress  1      0
```

```
v1          *      tcp                  ingress  1      0
*           *      firewall1            ingress  2      1
```

The following command displays the ingress access list entries configured on the VLAN v1006:

```
show access-list v1006 ingress
```

The output from this command is similar to the following:

```
# RuleNo 1
entry dacl13 {       #Dynamic Entry
if match all {
ethernet-destination-address 00:01:05:00:00:00 ;
} then {
count c13 ;
redirect 1.1.5.100 ;
} }
# RuleNo 2
entry dacl14 {       #Dynamic Entry
if match all {
ethernet-source-address 00:01:05:00:00:00 ;
} then {
count c14 ;
qosprofile qp7 ;
} }
# RuleNo 3
entry dacl13 {
if match all {
ethernet-destination-address 00:01:05:00:00:00 ;
} then {
count c13 ;
redirect 1.1.5.100 ;
} }
```

History

This command was first available in ExtremeXOS 10.1.

The <aclname> option was removed in ExtremeXOS 11.1.

The ingress, egress, any, ports, and vlan options were added in ExtremeXOS 11.3

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X480, X650, and X670 series switches.

show access-list configuration

show access-list configuration

Description

Displays the ACL configuration.

Syntax Description

There are no arguments or variables for this command.

Default

N/A.

Usage Guidelines

This command displays the state of the ACL configuration, set by the following commands:

```
enable access-list refresh blackhole
            enable access-list permit to-cpu
            configure access-list rule-compression port-counters
            configure access-list vlan-acl-precedence
```

Example

The following command displays the state of the ACL configuration:

```
show access-list configuration
```

On BlackDiamond X8 series switches, E4G-200 and E4G-400 switches, and BlackDiamond 8800 and Summit series switches, the output from this command is similar to the following:

```
Access-list Refresh Blackhole: Enabled
Access-list Permit To-CPU: Enabled
Access-list configured vlan-acl precedence mode: Dedicated or Shared
Access-list operational vlan-acl-precedence mode: Dedicated or Shared
Access-list Rule-compression Port-counters: Dedicated or Shared
```

History

This command was first available in ExtremeXOS 11.0.

The Access-list Permit to CPU configuration was added in ExtremeXOS 11.3.2

The Access-list Rule-compression Port Counters configuration was added in ExtremeXOS 12.3.

The Access-list Configured VLAN-ACL Precedence Mode configuration was added in ExtremeXOS 12.3.

Platform Availability

This command is available on all platforms.

show access-list counter

show access-list counter {*countername*} {**any** | **ports** *port_list* | **vlan** *vlan_name*} {**ingress** | **egress**}

Description

Displays the specified access list counters.

Syntax Description

countername	Specifies the ACL counter to display.
port_list	Specifies to display the counters on these ports.
vlan_name	Specifies to display the counters on the VLAN.
ingress	Specifies to display ingress counters.
egress	Specifies to display egress counters (BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules, E4G-200 andn E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only).

Default

The default direction is ingress.

Usage Guidelines

Use this command to display the ACL counters.

Example

The following example displays all the counters for all ACLs:

```
show access-list counter
```

On a BlackDiamond 8000 c-, e-, xl-, or xm-series module, the output of this command is similar to the following:

```
Policy Name       Vlan Name        Port   Direction
Counter Name                   Packet Count         Byte Count
=====================================================================
```

```
don1                *                2:1 ingress
source1111                                                    0
source2222
             0
```

History

This command was first available in ExtremeXOS 10.1.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

show access-list dynamic

show access-list dynamic

Description

Displays the names of existing dynamic ACLs and a count of how many times each is used.

Syntax Description

There are no arguments or variables for this command.

Default

N/A.

Usage Guidelines

This command displays the names of existing dynamic ACLs, and how many times the ACL is used (bound to an interface).

To see the conditions and actions for a dynamic ACL, use the following command:

```
show access-list dynamic rule <rule> {detail}
```

Example

The following command displays names of all the dynamic ACLs:

```
show access-list dynamic
```

The following is sample output for this command:

```
Dynamic Rules:
Udpacl                          Bound to 1 interfaces
icmp-echo                       Bound to 1 interfaces
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

show access-list dynamic counter

show access-list dynamic counter {{*countername*} **any** | {*countername*} **ports** *port_list* | {*countername*} **vlan** *vlan_name*} {**ingress** | **egress**}

Description

Displays the dynamic ACL counters.

Syntax Description

countername	Display the counter.
any	Specifies the wildcard ACL.
port_list	Specifies which ports' ACLs to display.
vlan_name	Specifies which VLAN's ACL to display.
ingress	Display ingress ACLs.
egress	Display egress ACLs (BlackDiamond X8 series switches, BlackDiamond 8000 c- or xl-series modules, E4G-200 and E4G-400 switches, and Summit X480 and X650 series switches only).

Default

The default is to display all interfaces, ingress.

Usage Guidelines

None.

Example

The following command displays all the dynamic ACL counters:

```
show access-list dynamic counter
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress option is available on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

show access-list dynamic rule

show access-list dynamic rule [*rule* | *rule_li*] **detail**

Description

Displays the syntax of a dynamic ACL.

Syntax Description

rule	Specifies the rule to display.
rule_li	Dynamic rule name for Lawful Intercept account.
detail	Specifies to display where the ACL has been applied.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the syntax of the dynamic ACL udpacl:

```
show access-list dynamic rule updacl
```

The output of the command is similar to the following:

```
entry udpacl {
if match all {
source-address 10.203.134.0/24 ;
destination-address 140.158.18.16/32 ;
protocol udp ;
source-port 190 ;
destination-port 1200 - 1250 ;
} then {
permit  ;
} }
```

The following command displays where the dynamic ACL udpacl has been applied:

```
show access-list dynamic rule updacl
```

The output of the command is similar to the following:

```
Rule updacl has been applied to the following interfaces.
Vlan Name    Port   Direction
================================
*            1      ingress
```

The lawful intercept user can display the names of the existing dynamic ACLs and a count of how many times each is used when the following command is issued:

```
* (pacman debug) X460-24p.1 > show access-list dynamic
Dynamic Rules: ((*)- Rule is non-permanent )
(*)hclag_arp_0_4_96_51_fe_b2  Bound to 0 interfaces for application
HealthCheckLAG
(*)idmgmt_def_blacklist       Bound to 0 interfaces for application
IdentityManager
(*)idmgmt_def_whitelist       Bound to 0 interfaces for application
IdentityManager
(*)mirror-data                Bound to 2 interfaces for application CLI
```

Use the following command to see the conditions and actions for a dynamic ACL:

```
* (pacman debug) X460-24p.2 > show access-list dynamic rule "mirror-data"
entry mirror-data {
if match all {
    source-address 10.66.9.8/24 ;
    protocol udp ;
} then {
    permit ;
    mirror law_mirror ;
} }
```

History

This command was first available in ExtremeXOS 11.3.

The **detail** keyword was added in ExtremeXOS 11.4.

The *rule_li* variable was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

show access-list interface

show access-list {**rule** *rule* {*start*} } [**any** | **port** *port* | **vlan** *vlan_name*] {**zone** *zone_name* { **appl-name** *appl_name* {**priority** *number* }}} {**ingress** | **egress**} {**detail**}

Description

Displays the specified ACL zones, including their priority, applications, and the application priorities.

Syntax Description

any	Displays all zones on the specified interface.
port *port*	Displays all ACLs associated with the specified ports.
vlan *vlan_name*	Displays all ACLs associated with the specified VLAN.
zone_name	Specifies a zone to be displayed.
appl-name *appl_name*	Displays information by application within a zone.
priority *number*	Displays ACLs of the specified priority only, within an application area.
ingress	Displays ACLs applied to traffic in the ingress direction.
egress	Displays ACLs applied to traffic in the egress direction.
detail	Displays all ACLs applied to the specified interface.

Default

N/A.

Usage Guidelines

Use this command to display the ACL zones, applications, and priorities.

Specifying a zone will show all the ACLs installed in the particular zone. Specifying a priority within a zone will show all the ACLs installed at a particular priority within a zone.

Use the detail keyword to display all ACLs installed on a given interface.

Example

The following example displays the detailed view of the ACLs on port 1:1:

```
show access-list port 1:1 detail
```

The output of this command is similar to the following:

```
* BD-PC.1 # show access-list port 1:1  detail
RuleNo      Application    Zone        Sub Zone
=================================
    1    CLI        myZone    1
entry mac1 {
if match all {
ethernet-source-address 00:0c:29:e5:94:c1 ;
destination-address 192.168.11.144/32 ;
} then {
count mac1 ;
} }
    2    CLI        myZone    5
entry mac51 {
if match all {
ethernet-source-address 00:0c:29:e5:94:51 ;
} then {
count mack51;
} }
    3    CLI        myZone    5
entry mac52 {
if match all {
ethernet-source-address 00:0c:29:e5:94:52 ;
} then {
count mac52 ;
} }
```

The following example displays the detailed view of the priority 5 ACLs in the zone myzone on port 1:1:

```
* BD-PC.2 # show access-list port 1:1  zone myZone priority 5  detail
RuleNo      Application    Zone        Sub Zone
=================================
    2    CLI        myZone    5
 entry mac51 {
if match all {
ethernet-source-address 00:0c:29:e5:94:51 ;
} then {
count mack51;
} }
    3    CLI        myZone    5
entry mac52 {
if match all {
ethernet-source-address 00:0c:29:e5:94:52 ;
} then {
count mac52 ;
} }
```

The following example displays the priority 5 ACLs in the zone myzone on port 1:1:

```
BD-PC.2 # show access-list port 1:1  zone myZone priority 5
#Dynamic Entries  ((*)- Rule is non-perminent )
RuleNo      Name                                Application     Zone
Sub-Zone
1          mac51                CLI            myZone         5
2          mac52                CLI            myZone         5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show access-list network-zone

show access-list network-zone {*zone_name*}

Description

Displays the network-zones configured, the number of attributes configured, and the number of policy files that have the specified zones in it.

Syntax Description

network-zone	Specifies the logical group of remote devices.
zone_name	Specifies the network-zone neme.

Default

N/A.

Usage Guidelines

Use this command to display detailed information about a particular network-zone, the attibutes configured in the zone, and the policies bound to the zone.

Example

The following example displays network-zone statistics for all configured zones:

```
Switch # sh access-list network-zone
=============================================================
```

```
Network Zone                          No. of    No. of Policies
Entities       Bound
============================================================
zone1                                   5              2
zone2                                   3              1
zone3                                   0              0
============================================================
Total Network Zones : 3
```

This example displays statistics for the specified zones, “zone1”, and “zone2”:

```
Switch #show access-list network-zone zone1
Network-zone     : zone1
Total Attributes : 3
Attributes       : 10.1.1.1 / 32
10.1.1.1 / 30
10.1.1.0 / 24
No. of Policies  : 1
Policies         : test
Switch # sh access-list network-zone zone2
Network-zone    : zone2
No. of Entities : 3
Entities        : 00:00:00:00:00:22 / ff:ff:ff:ff:ff:ff
00:00:00:00:00:23 / ff:ff:ff:ff:00:00
00:00:00:00:00:24 / ff:ff:ff:ff:ff:00
No. of Policies : 0
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

show access-list usage acl-mask port

show access-list usage acl-mask port *port*

Description

Displays the number of ACL masks consumed by the ACLs on a particular port.

Syntax Description

port	Specifies to display the usage on this port.

Default

N/A.

Usage Guidelines

Use this command to display how many masks are currently consumed on a port.

Example

The following example displays the ACL mask usage on port 1:1:

```
Switch.8 # show access-list usage acl-mask port 1:1
Used: 3  Available: 12
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on the BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches only.

show access-list usage acl-range port

show access-list usage acl-range port *port*

Description

Displays the number of Layer 4 port ranges consumed by the ACLs on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage for the slices that support this port.

Default

N/A.

Usage Guidelines

The BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, and xl-series modules, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches can support a total of 16 Layer4 port ranges among the slices that support each group of 24 ports.

Use this command to display how many of these Layer4 ranges are currently consumed by the ACLs on the slices that support a particular port. The output of this command also displays which ports share the same slices as the specified port.

Example

The following example displays the Layer4 range usage on port 9:1:

```
Switch.3 # show access-list usage acl-range port 9:1
Ports 9:1-9:12, 9:25-9:36
L4 Port Ranges:  Used: 4  Available: 12
```

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.

show access-list usage acl-rule port

show access-list usage acl-rule port *port*

Description

Displays the number of ACL rules consumed by the ACLs on a particular port or on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage on this port.

Default

N/A.

Usage Guidelines

Use this command to display the rules used per slice, and also display the rule usage of the specified port.

The slice support for the BlackDiamond X8 series switches, BlackDiamond 8000 series modules, E4G-200 and E4G-400 switches, and Summit family switches that use this mechanism is as follows:

- Summit X450a series switches—Each group of 24 ports has 16 slices with each slice having enough memory for 128 ingress rules and actions.
- Summit X150, X250e, X350, and X450e series switches and BlackDiamond 8800 e-series modules—Each group of 24 ports has 8 slices with each slice having enough memory for 128 ingress rules and actions.
- Summit X460 series switches and E4G-200 and E4G-400 switches—
  - Each group of 24 ports has 4 slices with each slice having enough memory for 128 egress rules.
  - Each group of 24 ports has 16 slices with each slice having enough memory for 256 ingress rules.
- Summit X480 series switches—
  - Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.
  - Each group of 48 ports has 16 internal slices with each slice having enough memory for 512 ingress rules plus the external slice.
- Summit X650 series switches—
  - Each group of 12 ports has 4 slices with each slice having enough memory for 128 egress rules.
  - Each group of 12 ports has 12 slices; the first 8 slices hold 128 ingress rules each, and the last 4 slices hold 256 ingress rules each, which adds up to 2048 ingress rules.
- Summit X670 switches and BlackDiamond X8 series switches—
  - Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.
  - Each group of 48 ports has 10 slices; the first 4 (0-3) slices hold 128 ingress rules each, and the last 6 (4-9) slices hold 256 ingress rules each, which adds up to 2048 ingress rules.
- BlackDiamond 8000 c- and xl-series modules—
  - 10G1Xc—

    Its single port has 4 slices with each slice having enough memory for 128 egress rules.

    Its single port has 16 slices with each slice having enough memory for 256 ingress rules.
  - G8Xc—

    Its 8 ports have 4 slices with each slice having enough memory for 128 egress rules.

    Its 8 ports have 16 slices with each slice having enough memory for 256 ingress rules.
  - 10G4Xc/10G8Xc—

    Each group of 2 ports has 4 slices with each slice having enough memory for 128 egress rules.

    Each group of 2 ports has 16 slices with each slice having enough memory for 256 ingress rules.
  - 10G24X-c—

    Each group of 12 ports has 4 slices with each slice having enough memory for 128 egress rules.

    Each group of 12 ports has 12 slices with each of the first 8 slices having enough memory for 128 ingress rules and each of the last 4 slices having enough memory for 256 ingress rules, which adds up to 2048 ingress rules.
  - G96T-c—

    Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.

    Each group of 48 ports has 16 slices with each slice having enough memory for 512 ingress rules.
  - G48Tc/G48Xc/G24Xc—

Each group of 24 ports has 4 slices with each slice having enough memory for 128 egress rules.

Each group of 24 ports has 16 slices with each slice having enough memory for 256 ingress rules.

- G48X-xl/G48T-xl—

  Its 48 ports have 4 slices with each slice having enough memory for 256 egress rules.

  Its 48 ports have 16 slices with each slice having enough memory for 512 ingress rules.

- 10G8X-xl—

  Each group of 4 ports has 4 slices with each slice having enough memory for 256 egress rules.

  Each group of 4 ports has 16 slices with each slice having enough memory for 512 ingress rules.

- 40G6X-xm—

  Each group of 24 ports has 4 slices with each slice having enough memory for 256 egress rules.

  Each group of 24 ports has 10 slices with each slice having enough memory for 256 ingress rules.

Note

Egress ACLs are supported on BlackDiamond X8 series switches, BlackDiamond 8000 c- xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

Example

The following example displays the ACL rule usage on port 5:

```
Switch.3 # show access-list usage acl-rule port 5
Ports 1-12, 25-36
Total Rules:     Used: 34  Available: 990
```

The following example displays the ACL ingress and egress rule usage on port 5:1:

```
Switch.4 # show access-list usage acl-rule port 5:1
Ports 5:1-5:48
Total Ingress/Egress Rules:
Used: 11  Available: 8181
Used: 1  Available: 1023
```

History

This command was first available in ExtremeXOS 11.4.

This command was modified to support BlackDiamond 8000 e-series modules and Summit X450a and X450e switches (whether or not included in a SummitStack) in ExtremeXOS 11.5.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, E4G-200 and E4G-400 switches, and Summit family switches, whether or not included in a SummitStack.

show access-list usage acl-slice port

show access-list usage acl-slice port *port*

Description

Displays the number of ACL slices and rules consumed by the ACLs on the slices that support a particular port.

Syntax Description

port	Specifies to display the usage for the slices that support this port.

Default

N/A.

Usage Guidelines

Use this command to display how many slices and how many rules per each slice are currently consumed by the ACLs on the slices that support a particular port. This command also displays which ports share the same slices as the specified port.

The slice support for the BlackDiamond X8 series switches, BlackDiamond 8000 series modules, E4G-200 and E4G-400 switches, and Summit family switches that use this mechanism is as follows:

- Summit X450a series switches—Each group of 24 ports has 16 slices with each slice having enough memory for 128 ingress rules and actions.
- Summit X150, X250e, X350, and X450e series switches and BlackDiamond 8800 e-series modules—Each group of 24 ports has 8 slices with each slice having enough memory for 128 ingress rules and actions.
- Summit X460 series switches and E4G-200 and E4G-400 switches—
  - Each group of 24 ports has 4 slices with each slice having enough memory for 128 egress rules.
  - Each group of 24 ports has 16 slices with each slice having enough memory for 256 ingress rules.
- Summit X480 series switches—
  - Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.
  - Each group of 48 ports has 16 internal slices with each slice having enough memory for 512 ingress rules plus the external slice.
- Summit X650 series switches—
  - Each group of 12 ports has 4 slices with each slice having enough memory for 128 egress rules.

- Each group of 12 ports has 12 slices; the first 8 slices hold 128 ingress rules each, and the last 4 slices hold 256 ingress rules each, which adds up to 2048 ingress rules.

- Summit X670 switches and BlackDiamond X8 series switches—
  - Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.
  - Each group of 48 ports has 10 slices; the first 4 (0-3) slices hold 128 ingress rules each, and the last 6 (4-9) slices hold 256 ingress rules each, which adds up to 2048 ingress rules.
- BlackDiamond 8000 c- and xl-series modules—
  - 10G1Xc—

    Its single port has 4 slices with each slice having enough memory for 128 egress rules.

    Its single port has 16 slices with each slice having enough memory for 256 ingress rules.
  - G8Xc—

    Its 8 ports have 4 slices with each slice having enough memory for 128 egress rules.

    Its 8 ports have 16 slices with each slice having enough memory for 256 ingress rules.
  - 10G4Xc/10G8Xc—

    Each group of 2 ports has 4 slices with each slice having enough memory for 128 egress rules.

    Each group of 2 ports has 16 slices with each slice having enough memory for 256 ingress rules.
  - 10G24X-c—

    Each group of 12 ports has 4 slices with each slice having enough memory for 128 egress rules.

    Each group of 12 ports has 12 slices with each of the first 8 slices having enough memory for 128 ingress rules and each of the last 4 slices having enough memory for 256 ingress rules, which adds up to 2048 ingress rules.
  - G96T-c—

    Each group of 48 ports has 4 slices with each slice having enough memory for 256 egress rules.

    Each group of 48 ports has 16 slices with each slice having enough memory for 512 ingress rules.
  - G48Tc/G48Xc/G24Xc—

    Each group of 24 ports has 4 slices with each slice having enough memory for 128 egress rules.

    Each group of 24 ports has 16 slices with each slice having enough memory for 256 ingress rules.
  - G48X-xl/G48T-xl—

    Its 48 ports have 4 slices with each slice having enough memory for 256 egress rules.

    Its 48 ports have 16 slices with each slice having enough memory for 512 ingress rules.
  - 10G8X-xl—

    Each group of 4 ports has 4 slices with each slice having enough memory for 256 egress rules.

    Each group of 4 ports has 16 slices with each slice having enough memory for 512 ingress rules.
  - 40G6X-xm—

Each group of 24 ports has 4 slices with each slice having enough memory for 256 egress rules.

Each group of 24 ports has 10 slices with each slice having enough memory for 256 ingress rules.

Note

Egress ACLs are supported on BlackDiamond X8 series switches, BlackDiamond 8000 c, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

Beginning with ExtremeXOS 12.5, you can reserve or allocate a slice for a specific feature such that rules for the feature will not share a slice with other components. A text string has been added at the end of the output for each slice that indicates which feature, if any, is reserving the slice. See the example below.

Example

The following example displays the ACL slice usage on port 8:1:

```
Switch.3 # show access-list usage acl-slice port 8:1
Ports 8:1-8:12, 8:25-8:36
Slices:          Used: 3 Available: 5
Slice 5 Rules:   Used: 9 Available: 119
Slice 6 Rules:   Used: 1 Available: 127
Slice 7 Rules:   Used: 24 Available: 104
```

The following example displays the ACL ingress and egress slice usage on port 4:1:

```
Switch.4 # show access-list usage acl-slice port 4:1
Ports 4:1-4:48
Stage: INGRESS
Slices:          Used: 2  Available: 14
Slice 0 Rules:   Used: 0  Available: 512
Slice 1 Rules:   Used: 0  Available: 512
Slice 2 Rules:   Used: 0  Available: 512
Slice 3 Rules:   Used: 0  Available: 512
Slice 4 Rules:   Used: 0  Available: 512
Slice 5 Rules:   Used: 0  Available: 512
Slice 6 Rules:   Used: 0  Available: 512
Slice 7 Rules:   Used: 0  Available: 512
Slice 8 Rules:   Used: 0  Available: 512
Slice 9 Rules:   Used: 0  Available: 512
Slice 10 Rules:   Used: 0  Available: 512
Slice 11 Rules:   Used: 0  Available: 512
Slice 12 Rules:   Used: 0  Available: 512
Slice 13 Rules:   Used: 0  Available: 512 For: user/other
Slice 14 Rules:   Used: 1  Available: 511 Reserved for: <feature name>
Slice 15 Rules:   Used: 10  Available: 502 For: system
Stage: EGRESS
Slices:          Used: 1  Available: 3
Slice 0 Rules:   Used: 0  Available: 256
Slice 1 Rules:   Used: 0  Available: 256
```

```
Slice 2 Rules:   Used: 0  Available: 256
Slice 3 Rules:   Used: 1  Available: 255 Reserved for: <feature name>
Stage: LOOKUP
Slices:          Used: 1  Available: 3
Slice 0 Rules:   Used: 0  Available: 512
Slice 1 Rules:   Used: 0  Available: 512
Slice 2 Rules:   Used: 0  Available: 512
Slice 3 Rules:   Used: 49  Available: 463
Stage: EXTERNAL
Slices:          Used: 0  Available: 0
```

In this example, selected slices are allocated or reserved as follows:

- For: user/other—The slice is used by user ACLs and/or other switch features.
- Reserved for: <feature name>—The slice is reserved for the named feature, for instance VLAN statistics. Rules for this feature may not share a slice with other features or user ACLs.
- For: system—The slice contains only rules used for certain specific switch features. User ACLs may not share a slice with a system slice.

History

This command was first available in ExtremeXOS 11.5.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, E4G-200 and E4G-400 switches, and Summit family switches, whether or not included in a SummitStack.

show access-list width

show access-list width [**slot** *slotNo* | **all**]

Description

Displays the wide ACL mode configured on the supported switch or slot.

Syntax Description

slotNo	Specifies the slot to display.
all	Specifies all slots.

Default

N/A.

Usage Guidelines

Use this feature to display the width of the ACL TCAM key configured on a module or switch as being double wide or single wide.

Example

The following command displays the wide key mode on all slots:

```
show access-list width slot all
```

Following is sample output for this command:

```
show access-list width {slot <slotNo|all>}
Slot  Type                    Width (Configured)
----  ----------------       ---------------------
1     G48Ta                    single
2     8900-G96T-c                                                    single
3     G8X                                          single
4
5     G48Xc                                          single
6     8900-10G8X-xl                                         double
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches only whether or not included in a SummitStack.

show flow-redirect

show flow-redirect {*flow_redirect_name*}

Description

Displays nexthop ipaddresses, up/down status, health-checking (ping/ARP/ND) and ACL bindings.

Syntax Description

flow_redirect_name	Specifies the name of the flow redirection policy.

Default

N/A.

Usage Guidelines

None.

Example

The following example displays information for all redirection policies:

```
Switch.1 # show flow-redirect
Name          Nexthop  Active          VR Name     Inactive  Health
Count    IP Address                 Nexthops  Check
=================================================================
pkh           2        2001:400::100   VR-Default  Forward   PING
ND: Neighbor Discovery
```

The next example displays an IPv6 redirection policy for a longer IPv6 address, which causes a two-line display for the related redirection policy:

```
Switch.13 # sh flow-redirect
Name          Nexthop  Active            VR Name     Inactive  Health
Count    IP address                    Nexthops  Check
=================================================================
pbr1          2        2004:1000:1000:1000::10
VR-Default  Forward   PING
ND: Neighbor Discovery
```

This example displays information for a specified IPv6 redirection policy:

```
* Switch.14 # show flow-redirect "pbr1"
Name             : pbr1                 VR Name          : VR-Default
Inactive Nexthops: Forward              Health Check     : PING
Nexthop Count    : 2
Active IP Address : 2004:1000:1000:1000::10
Index    State      Priority  IP Address          Status Interval Miss
=================================================================
0        Disabled   200       2003::10            DOWN   2        2
1        Enabled    100       2004:1000:1000:1000::10
UP     2        2
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 flow-redirection policies was added in ExtremeXOS 12.7.

Platform Availability

This command is available for IPv4 and IPv6 flow-redirection policies on the platforms listed for the Policy Based Routing feature in Feature License Requirements

unconfigure access-list

unconfigure access-list *policy_name* {**any** | **ports** *port_list* | **vlan** *vlan_name*} {**ingress** | **egress**}

Description

Removes a policy file ACL from the specified interface.

Syntax Description

policy_name	Specifies the ACL policy name. The name can be from 1-32 characters long.
aclname	Specifies the ACL name.
port_list	Specifies the ingress or egress port list on which the ACL is applied.
vlan_name	Specifies the VLAN on which the ACL is applied.
ingress	Remove the ACL for packets entering the switch on this interface.
egress	Remove the ACL for packets leaving the switch from this interface (BlackDiamond X8 series switches, BlackDiamond 8000 c- and xl-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only).

Default

The default direction is ingress.

Usage Guidelines

This command removes ACLs that are contained in ACL policy files. To remove dynamic ACLs, use the following command:

```
        configure access-list delete <ruleName> [ any | vlan <vlan_name> |
ports <port_list> | all] {ingress | egress}
```

To remove all non-dynamic ACLs from all interfaces, do not specify any ports or VLANs.

Example

The following command removes the ACL from port 1:2:

```
unconfigure access-list ports 1:2
```

The following command removes the ACLs from ports 1:2-6:3 and 7:1:

```
unconfigure access-list ports 1:2-6:3,7:1
```

The following command removes the wildcard ACL:

```
unconfigure access-list any
```

The following command removes all ACLs from all the interfaces, including the wildcard ACL:

```
unconfigure access-list
```

History

This command was first available in ExtremeXOS 10.1.

The VLAN option was first available in ExtremeXOS 11.0.

The egress option was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

The egress options are available on BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 series switches only.

22 QoS Commands

clear counters wred
configure diffserv examination code-point qosprofile
configure diffserv replacement code-point
configure dot1p type
configure meter
configure port shared-packet-buffer
configure ports qosprofile
configure ports rate-limit egress
configure qosprofile

enable diffserv replacement ports
enable dot1p examination ports
enable dot1p replacement ports
show access-list meter
show diffserv examination
show diffserv replacement
show dot1p
show meter
show ports congestion
show ports qosmonitor
show ports qosmonitor {congestion}
show ports wred
show qosprofile
show wredprofile
unconfigure diffserv examination
unconfigure diffserv replacement

unconfigure qosprofile
unconfigure qosprofile wred

This chapter describes commands for:

- Configuring Quality of Service (QoS) profiles
- Creating traffic groupings and assigning the groups to QoS profiles
- Configuring, enabling, and disabling explicit class-of-service traffic groupings (802.1p and DiffServ)
- Configuring traffic grouping priorities
- Metering using ACLs—BlackDiamond 8800 series switches, SummitStack, and Summit family switches only
- Verifying configuration and performance
- Egress traffic rate limiting—BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches only

For an introduction to QoS features, see the ExtremeXOS Concepts Guide.

clear counters wred

clear counters wred

Description

Clears weighted random early detection (WRED) statistics for all ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following example clears the WRED statistics for all ports:

```
* Switch.20 # clear counters wred
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

configure diffserv examination code-point qosprofile

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, E4G-200 and E4G-400 switches, and Summit family switches is:

configure diffserv examination code-point *code_point* **{qosprofile}** *qosprofile*

Description

Configures the default ingress DiffServ code point (DSCP) to QoS profile mapping.

Syntax Description

code-point	Specifies a DiffServ code point (a 6-bit value in the IP-TOS byte in the IP header). Supported values are 0 to 63.
qosprofile	Specifies the QoS profile to which the DiffServ code point is mapped.

Default

See Table 28: Default DiffServ Code Point-to-QoS Profile Mapping on page 1426 below.

Usage Guidelines

You can specify up to 64 different code points for each port. Code point values are grouped and assigned to the default QoS profiles as shown in the following table.

Table 28: Default DiffServ Code Point-to-QoS Profile Mapping

Code Point	BlackDiamond X8 Series Switches, BlackDiamond 8800 Series Switches, E4G-200 and E4G-400 Switches, SummitStack, and Summit Family Switches QoSProfile
0-7	QP1
8-15	QP1
16-23	QP1
24-31	QP1
32-39	QP1
40-47	QP1

Table 28: Default DiffServ Code Point-to-QoS Profile Mapping (continued)

Code Point	BlackDiamond X8 Series Switches, BlackDiamond 8800 Series Switches, E4G-200 and E4G-400 Switches, SummitStack, and Summit Family Switches QoSProfile
48-55	QP1
56-63	QP8

Example

The following command specifies that code point 25 be assigned to QP2:

```
configure diffserv examination code-point 25 qosprofile qp2
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

configure diffserv replacement code-point

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches is:

configure diffserv replacement [{**qosprofile**} *qosprofile* | **priority** *priority*] **code-point** *code_point*

Description

Configures the egress Diffserv replacement mapping for either a QoS profile or an 802.1p priority value.

Syntax Description

qosprofile	Specifies a QoS profile.
value	Specifies an 802.1p priority value to map to a code point.
code_point	Specifies a 6-bit value to be used as the replacement DSCP in the IPv4 or IPv6 header.

Default

N/A.

Usage Guidelines

Note

Extreme Networks recommends that you use the qosprofile <qosprofile> value to configure this parameter.

Egress packets contain the DSCP assigned to the QoS profile, which can be selected by the 802.1p code point or by an ACL. The default 802.1p priority value to QoS profile to DSCP mapping is shown in the following table.

Table 29: Default QoS Profile-to-802.1p Priority Value-to-Code Point

802.1p Priority Value	BlackDiamond X8 Series Switches, BlackDiamond 8800 Series Switches, E4G-200 and E4G-400 Switches, SummitStack, and Summit Family Switches QoS Profile	DSCP
0	QP1	0
1	QP1	8
2	QP1	16
3	QP1	24
4	QP1	32
5	QP1	40
6	QP1	48
7	QP8	56

Example

The following command specifies that a code point value of 5 should be used to replace the DiffServ (TOS) bits in packets in QP2:

```
configure diffserv replacement qosprofile qp2 code-point 5
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

configure dot1p type

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches is:

configure dot1p type *dot1p_priority* {**qosprofile**} *qosprofile*

Description

Configures an 802.1p priority to QoS profile mapping for the specified ports.

Syntax Description

dot1p_priority	Specifies the 802.1p priority value. The value is an integer between 0 and 7.
qosprofile	Specifies a specific QoS profile. The value range is QP1 to QP8.

Default

The default mapping of each 802.1p priority value to QoS profile is shown in the following table.

Table 30: Default 802.1p Priority Value-to-QoS Profile Mapping

802.1p Priority Value	BlackDiamond X8 Series Switches, BlackDiamond 8800 Series Switches, E4G-200 and E4G-400 Switches, SummitStack, and Summit Family Switches Default QoS Profile
0	QP1
1	QP1
2	QP1
3	QP1
4	QP1
5	QP1
6	QP1
7	QP8

Usage Guidelines

An 802.1p priority value seen on ingress can be mapped to a particular QoS profile and with specific bandwidth management and priority behavior.

BlackDiamond X8 Series Switches, BlackDiamond 8800 Series Switches, E4G-200 and E4G-400 Switches, SummitStack, and Summit Family Switches Only

You must create the QoS profile first, using the create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7] command, to map the 802.1p information to QoS profile 2 through 7.

SummitStack only.

You must create the QoS profile first, using the create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7], to map the 802.1p information to QoS profile 2 through 6. You cannot create QP7 in a SummitStack.

Example

The following commands reassign (from the default) the QoS profiles associated with 802.1p priority values 1 and 2:

```
configure dot1p type 2 qosprofile qp2
configure dot1p type 1 qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure meter

configure meter *metername* {**committed-rate** *cir* [**Gbps** | **Mbps** | **Kbps**]} {**max-burst-size** *burst-size* [**Kb** | **Mb**]} {**out-actions** [**drop** | **set-drop-precedence** {**dscp** [**none** | *dscp-value*]}}

Description

Configures an ACL meter to provide ingress traffic rate shaping on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches. On BlackDiamond c-, xl-, and xm-series modules, and Summit X650 switches, you can use this command to configure meters for ingress and egress rate limiting.

Syntax Description

metername	Specifies the ACL meter name.
max-burst-size	Specifies the maximum burst size or peak burst size in kilobits (Kb) or megabits (Mb) on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.
committed-rate	Specifies the committed information rate in gigabits per second (Gbps), megabits per second (Mbps), or kilobits per second (Kbps).
out-actions	Specifies actions to take if traffic exceeds the profile.
drop	Specifies to drop out of profile traffic on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.

set-drop-precedence	Specifies to mark packet for high drop precedence on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.
dscp	Specifies to set DSCP on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.
none	Specifies to leave the DSCP value unchanged on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.

Default

By default, a newly committed meter has no maximum burst size, no committed rate, and a default action of drop.

Usage Guidelines

The meter configured with this command is associated with an ACL rule by specifying the meter name using the meter action modifier within the rule.

The committed-rate keyword specifies the traffic rate allowed for this meter, and the configured rate operates as described in Table 31: Rate Configuration Notes on page 1431 below. The rate you specify is rounded up to the next granularity increment value. For example, if you configure a 1 Mbps committed rate for a platform with a 64Kbps granularity increment, this value falls between the increment values of 960 Kbps and 1024 Kbps, so the effective committed rate is set to 1024 Kbps. Also, note that some platforms listed below require an adjustment to the expected rate to calculate the configured rate.

Table 31: Rate Configuration Notes

Platform	Granularity	Notes
BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit family switches	64Kbps	Specify the traffic rate in Kbps, Mbps, or Gbps. The range is 64Kbps to 1 Gbps for GE ports and 1Mbps to 10 Gbps for 10GE ports. Add 20 bytes per frame to the expected rate to determine the configured rate.

The max-burst-size keyword specifies the maximum number of consecutive bits that are allowed to be in-profile at wire-speed. The max-burst-size parameter can be specified in Kb, Mb, or Gb. The specified max-burst-size is rounded down to the nearest supported size. The max-burst-size range on BlackDiamond X8 series switches, BlackDiamond 8000 series switches, E4G-200 and E4G-400 switches, and Summit switches is 32Kb to 128Mb.

The keyword out-actions specifies the action that is taken when a packet is out-of-profile. The supported actions include dropping the packet, marking the drop precedence for the packet, or setting the DSCP value in the packet. The keyword drop indicates that any out-of-profile packet is immediately dropped. The keyword set-drop-precedence marks out-of-profile packets with high drop precedence. If the optional keyword set-dscp is specified, the DSCP value, as specified by the parameter <dscp-value>, is written into the out-of-profile packet. Setting the DSCP value to none leaves the DSCP value in the packet unchanged.

On BlackDiamond X8 series switches, BlackDiamond 8900 xm-series modules and Summit X670 series switches, the meters behave as follows:

- QP1-4 support one unicast queue and one multicast queue for each QoS profile. The metering configuration for each of these QoS profiles applies to both the unicast and the multicast traffic for the profile.
- Configuration of maximum bandwidth metering on QP5-8 causes the configuration of the maximum meter on the supporting multicast queue to be set to the maximum bandwidth configured on QP5-8.

Example

The following command configures the ACL meter maximum_bandwidth, assigns it a rate of 10 Mbps, and sets the out of profile action to drop:

```
configure meter maximum_bandwidth committed-rate 10 Mbps out-action drop
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure port shared-packet-buffer

configure port *port_list* **shared-packet-buffer** [*percent* | **default**]

Description

Configures the maximum amount of the shared packet buffer to be used by the specified ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
percent	Specifies the maximum portion of the shared packet buffer to allot. The range is 0 to 100 percent.

Note

On some platforms or I/O modules, the hardware provides a limited number of settings. In these cases, ranges of percentage values achieve the same setting.

Note

You can view the configured percentage value using the **show ports <port-list> info detail** command.

Note

You can view the effect of this command using the **show ports <port-list> buffer** command.

Default

Platform	Percentage
BlackDiamond 8000 e-series modules BlackDiamond 8800 c-series modules Summit X150, X250, X350, X450a, and X450e series switches	25%
BlackDiamond 8900 xl- and xm-series modules BlackDiamond 8900-G96T-c modules E4G-200 and E4G-400 switches BlackDiamond X8 series switches Summit X460, X480 series switches	20%
BlackDiamond 8900-10G24X-c modules Summit X650 series switches	50%

Usage Guidelines

It is possible to overcommit the shared packet buffer using this command.

Example

The following command sets the shared packet buffer for port 1:1 to 50%:

```
configure port 1:1 shared-packet-buffer 50
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e- xl-, and xm-series modules, E4G-200 and E4G-400 switches, Summit family switches, and SummitStack.

configure ports qosprofile

configure ports *port_list* {**qosprofile**} *qosprofile*

Description

Creates a port-based traffic group, which configures one or more ingress ports to use a particular egress QoS profile.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
qosprofile	Specifies a QoS profile.

Default

All ingress ports have the default qosprofile of QP1.

Usage Guidelines

This command assigns traffic ingressing the specified port to a specified egress QoS profile. Extreme switches support eight egress QoS profiles (QP1 to QP8) for each port. SummitStack does not permit configuration of QP7.

Example

The following command configures port 5 on slot 5 of a modular switch to use QoS profile QP3:

```
configure ports 5:5 qosprofile QP3
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure ports rate-limit egress

configure ports *port_list* **rate-limit egress** [**no-limit** | *cir-rate* [**Kbps** | **Mbps** | **Gbps**] {**max-burst-size** *burst-size* [**Kb** | **Mb**]}]

Description

Configures an egress traffic rate limit for a port or groups of ports.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
no-limit	Specifies traffic be transmitted without limit; use to reconfigure or unconfigure previous rate-limiting parameters.
cir-rate	Specifies the desired rate limit in Kbps, Mbps, or Gbps.
max-burst-size	Specifies the maximum burst size or peak burst size in kilobits (Kb) or megabits (Mb).

Default

No-limit.

Usage Guidelines

Port speed limits the egress traffic, as follows:

- 1 Gbps port—64 Kbps increments
- 10 Gbps port—1 Mbps increments

If the specified egress limit (cir-rate) is not a multiple of 64 Kbps for a 1 Gbps port or 1 Mbps for a 10Gbps port, the specified value is rounded down to the nearest appropriate multiple based on the port type.

Use the no-limit parameter to:

- Unconfigure egress rate limiting on the port(s)
- Reconfigure existing egress rate limiting on the port(s)

The max-burst-size parameter is the amount of traffic above the value in the cir-rate parameter that is allowed to burst from the port(s) for a short duration.

Example

The following command configures egress rate-limiting on slot 3 port 1 on a modular switch for 3 Mbps and a maximum burst size or 5 M bits:

```
configure port 3:1 rate-limit egress 3 Mbps max-burst-size 5 Mb
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure qosprofile

BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches:

configure qosprofile egress *qosprofile* [{**minbw** *minbw_number*} {**maxbw** *maxbw_number*} | {**peak_rate** *peak_bps* [**K** | **M**]}] [**ports** [*port_list* | **all**]]**configure qosprofile** *qosprofile* [{**minbw** *minbw_number*} {**maxbw** *maxbw_number*} | {{**committed_rate** *committed_bps* [**K** | **M**]} {**peak_rate** *peak_bps* [**K** | **M**]} | [**ports** [*port_list* | **all**]] **configure** {**qosprofile**} *qosprofile* [[{**maxbuffer***buffer_percentage*} {**use-strict-priority**}] | [**maxbuffer** *buffer_percentage* **ports** [*port-list* | **all**]]]

Description

Modifies the default egress QoS profile parameters.

Syntax Description

buffer_percentage	When used without a port-list, specifies the percentage of the total buffer you are reserving for this QoS profile on all ports for which an override has not been configured. The range is 1 to 100; the default setting is 100. When used with a port-list, specifies a percentage override of the maxbuffer setting for the QoS profile specified. The range is 1-10000; the default is 100 (i.e., no override). Setting 100% is equivalent to unconfiguring the maxbuffer override. Available only on BlackDiamond 8800 series chassis, Summit series switches and SummitStack.
committed_rate	Specifies a committed information rate in Kbps (k) bits or Mbps (m).
maxbw	The maximum bandwidth (maxbw) option specifies the peak rate as a percentage of the maximum port speed. The range is 0 to 100%, and the default value is 100. When autonegotiation is off, the peak rate is the specified percentage of the configured port speed. When autonegotiation is on, the peak rate is the specified percentage of the maximum port speed (the switch does not detect the negotiated port speed).
minbw	The minimum bandwidth (minbw) option specifies the committed information rate as a percentage of the maximum port speed. The range is 0 to 100%, and the default value is 0. When autonegotiation is off, the CIR is the specified percentage of the configured port speed. When autonegotiation is on, the CIR is the specified percentage of the maximum port speed.
peak_rate	Specifies a peak rate in Kbps (k) bits or Mbps (m).
port_list	Specifies a list of slots and ports to which the parameters apply. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
qosprofile	Specifies a QoS profile name.

use-strict-priority	When the global qosscheduler configuration (configure qosscheduler command) is set to weighted-round-robin, this option overrides the global configuration for the specified QoS profile, so that it operates in strict-priority-mode. This enables hybrid strict-priority and weighted-round-robin scheduling operation.This option is available only on BlackDiamond 8800 series switches, Summit family switches, and SummitStack.
weight-value	Specifies the weight value used for queue service weighting in the weighted-round-robin scheduler for this QoS profile. Range is 1-15 or 1-127 depending on hardware type. 0=strict-priority. Default is 1. This command enables the user to input a weight for queues in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler. The weight of both WRR and WDRR algorithms have been extended to 1-127 on the following hardware: X650,X480,X460,E4G-400,X440,E4G-200,8900-G96T-c,8900-10G24X-c, 8900-MSM128,8900-G48T-xl,8900-G48X-xl,8900-10G8X-xl,X670,8900-40G6X-xm,BDX-MM1,BDXA-FM960,BDXA-FM480,BDXA-40G24X,BDXA-40G12X, X250e,X450e,X450a,G48Ta,G48Xa, 10G4Xa,10G4Ca,G48Te2,G24Xc,G48Xc,G48Tc,10G4Xc,10G8Xc,MSM-48,S-G8Xc,S-10G1Xc,8500-G24X-e,8500-G48T-e,S-10G2Xc This option is available only on BlackDiamond 8800 series switches, Summit family switches, and SummitStack.
all	Specifies this applies to all ports on the device.

Default

- QoS profiles—QP1 and QP8 on SummitStack and Summit family switches; QP1 through QP8 on all other switches.
- Minimum bandwidth—0%
- Maximum bandwidth—100%
- Maximum buffer—100%
- Maxbuffer override—100% (no override)
- Weight—1
- Priority—By default, each qosprofile is assigned a different priority level:
  - QP1 - 1, Low (the lowest priority)
  - QP2 - 2, LowHi
  - QP3 - 3, Normal
  - QP4 - 4, NormalHi
  - QP5 - 5, Medium
  - QP6 - 6, MediumHi
  - QP7 - 7, High
  - QP8 - 8, HighHi (highest priority)

Usage Guidelines

Note

You can view the effect of setting the buffer-percentage using the `show ports <port-list> buffer` command.

Note

You can view the configured buffer-percentage value using the `show qosprofile` or `show qosprofile ports <port-list>` commands, respectively.

The maximum bandwidth value can be configured as either:

- an absolute percentage of the total maximum link speed, regardless of the currently configured or negotiated speed

  OR

- an absolute peak rate in Mbps or Kbps

On BlackDiamond X8 series switches, BlackDiamond 8800, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches, QoS profiles QP1 and QP8 are preconfigured. If you want to use a QoS profile in the range of QP2 through QP7, you must first create the QoS profile. QoS profile QP7 is reserved on SummitStack for stack management and cannot be created or modified.

When specified without a port-list, the maxbuffer parameter can configure a reduction in the maximum amount of packet buffer space allotted to the specified QoS profile. If you reduce the allotment below the default value of 100%, the reduction releases packet buffer space to the shared packet buffer. Regardless of the setting for this parameter, the system does not drop any packets as long as reserved packet buffer memory for the port and QOS profile or shared packet memory for the port remains available.

Note

The configuration defined by the maxbuffer attribute in this command can be overridden on a per-port basis if the port is specified along with the maxbuffer parameter.

When specified with a port-list, the maxbuffer setting overrides the system-wide reduction of packet buffer reservation set with the configure qosprofile maxbuffer command for the specified QoS profile. If the packet buffer reservation is reduced to 75 percent for the entire QoS profile, the specified ports are allotted 75% of the allotment for the specified QoS profile. If for specified ports the maxbuffer is set to 200 percent, the packet buffer reservation will be set to 200 percent of the normal packet buffer reservation for those ports, thus overriding the maxbuffer percentage set for the QoS profile.

Note

The packet buffer configuration feature is provided for expert users who fully understand the impact of buffer configuration changes. Improper buffer configuration can stop traffic flow through QoS profiles and ports for which no direct configuration change was made.

A range of ports has its own packet buffer pool. The maxbuffer override capability allows you to overcommit the packet buffer pool for the port range. When a packet buffer pool is overcommitted by more than 20%, the following message appears in the system log:

```
Warning: Packet memory is overcommitted by <percentage> for ports in range
<port-range>
```

It is also possible to configure maxbuffer overrides such that the size of the shared portion of the buffer pool is reduced to zero. If some port and QoS profile in the port range for that buffer pool does not have sufficient reserved packet memory to accommodate larger packets, it will be impossible for that port and QoS profile to transmit any packets of the larger size. In this case, the following message appears in the system log:

```
Warning: At least one port and QoS profile in port range <port-range> cannot
transmit packets larger than <packet-size> because of packet memory
configuration.
```

The weight-value parameter does not apply when the switch is configured for strict priority scheduling, which is the default configuration. To configure the type of scheduling you want to use for the entire switch, use the configure qosscheduler [strict-priority | weighted-round-robin | weighted-deficit-round-robin] command.

The weight-value parameter configures the relative weighting for each QoS profile. Because each QoS profile has a default weight of 1, all QoS profiles have equal weighting. If you configure a QoS profile with a weight of 4, that specified QoS profile is serviced 4 times as frequently as the remaining QoS profiles, which still have a weight of 1. If you configure all QoS profiles with a weight of 16, each QoS profile is serviced equally but for a longer period.

When the switch is configured for weighted-round-robin mode, the use-strict-priority option overrides the switch configuration for the specified QoS profile on all ports. Among QoS profiles configured with the use-strict-priority-option, QoS profile QP8 has the highest priority and QP1 has the lowest priority. All strict-priority QoS profiles are serviced first according to their priority level, and then all other QoS profiles are serviced based on their configured weight.

Note

If you specify use-strict-priority, lower-priority queues and weighted-round-robin queues are not serviced at all as long as higher-priority queues have any remaining packets.

Example

On a BlackDiamond X8 series switch, BlackDiamond 8800 series switch, E4G-200 or E4G-400 switch, or a Summit family switch, the following command overrides the maximum buffer setting configured on QoS profile qp1 for port1:1:

```
configure qosprofile qp1 maxbuffer 75 port 1:1
```

History

This command was first available in ExtremeXOS 10.1.

Committed and peak rates were added in ExtremeXOS 11.0. Also in ExtremeXOS 11.0, ports were made mandatory.

Support for Summit X450a and X450e switches and the BlackDiamond 8000 e-series modules was added in ExtremeXOS 11.6.

Support for SummitX150, X250e, X350, X440, X460, X480, X650, and X670 series switches and BlackDiamond 8000 c-, xl-, and xm-series modules was added in the respective platform introduction releases.

The use-strict-priority option was added in ExtremeXOS 12.3.

The ability to configure a maxbuffer override was added in ExtremeXOS 12.5.

Support for the BlackDiamond X8 series switches and E4G-200 and E4G-400 switches was added in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms with specific parameter exceptions as noted in the Syntax Description above.

configure qosprofile qp8 weight

configure qosprofile qp8 weight *weight_value*

Description

This command enables the user to input a weight value for queue service weighting in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler for this QoS profile. The weight value of both WRR and WDRR algorithms have been extended to 1-127 on this supported hardware (refer to the Concepts Guide for supported hardware).

Syntax Description

weight_value	Range is 1-15 or 1-127 depending on hardware type.

Default

Strict priority.

Usage Guidelines

Use this command to input a weight value for queue service weighting in the weighted-round-robin scheduler or weighted-deficit-round-robin scheduler for this QoS profile. The weight value of both

WRR and WDRR algorithms have been extended to 1-127 on this supported hardware (refer to the Concepts Guide for supported hardware).

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

configure qosprofile wred

configure {**qosprofile**} {**egress**} *qosprofile* [**wred** [{**color** [**tcp** [**green** | **red**] | **non-tcp** [**any**|**red**]] [{**min-threshold** *min_thresh*} {**max-threshold** } {**max-drop-rate** *max_drop_rate*}]} | **avg-weight** *avg_weight*]] **ports** [*port-list* | **all**]

Description

Configures WRED on the specified QoS profile for the specified port.

Syntax Description

all	Specifies that this command applies to all ports on the device.
avg_weight	Specifies the weight constant for calculating the average queue size for the specified QoS profile. The range is 1 to 15.
color	Specifies the WRED color to be configured. Valid colors for BlackDiamond 8900 c- and xl-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, and X650 switches are: TCP green, TCP red, and non-TCP any. Valid colors for BlackDiamond X8 series switches, BlackDiamond 8900-40G6X-xm modules and Summit X670 switches are: TCP green, TCP red, non-TCP any, and non-TCP red.
egress	This optional parameter specifies an egress QoS profile.
green	Specifies that the WRED configuration applies to TCP traffic that is marked green.
max_drop_rate	Specifies the maximum drop rate for the specified WRED color. The range is 1 to 100 percent.
max_thresh	Specifies the maximum threshold for the specified WRED color. The range is 1 to 100 percent.

min_thresh	Specifies the minimum threshold for the specified WRED color. The range is 1 to 100 percent.
port_list	Specifies a list of slots and ports to which the parameters apply. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
qosprofile	Specifies a QoS profile name. Valid names are QP1 to QP8.  Note On Summit X670 and BlackDiamond X8 switches, QoS profiles QP5 to QP8 do not support WRED.
red	Specifies that the WRED configuration applies to TCP traffic that is marked red.
non-tcp any	Specifies that the WRED configuration applies to any non-TCP traffic.
non-tcp red	Specifies that the WRED configuration applies to non-TCP traffic that is marked red.

Default

- Minimum threshold—100%
- Maximum threshold—100%
- Maximum drop rate—100%
- Average weight—4

Usage Guidelines

The max_drop_rate, min_threshold, and max_threshold parameters apply to the specified color. The avg_weight parameter applies to all colors on the specified QoS profile. Increasing the avg_weight value reduces the probability that traffic is dropped. Conversely, decreasing the avg_weight value increases the probability that traffic is dropped.

Example

The following example configures WRED settings for port 2:1, QoS profile qp3, color green:

```
* Switch.24 # configure qosprofile qp3 wred color tcp green min-threshold 80
max-threshold 95 max-drop-rate 75 ports 2:1
```

The following example configures the average weight for port 2:1, QoS profile qp2:

```
* Switch.26 # configure qosprofile qp2 wred avg-weight 4 ports 2:1
```

The following example configures WRED settings for non-TCP traffic on port 4, QoS profile qp3:

```
* Switch.2 # configure qosprofile qp3 wred color non-tcp any min-threshold 10
ports 4
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

configure qosscheduler weighted-deficit-round-robin

configure qosscheduler [strict-priority | weighted-round-robin | weighted-deficit-round-robin]

Description

This command specifies the scheduling algorithm that the switch uses to service QoS profiles on Black Diamond X8, Black Diamond 8K, and Summit platforms.

Syntax Description

strict-priority	Specifies the switch services the higher-priority QoS profiles first.
weighted-round-robin	Specifies the switch services all QoS profiles based on the configured weighting for each QoS profile.
weighted-deficit-round-robin	Allows you to use a credit-based algorithm in order to sample the size of the packet while scheduling various queues

Default

Strict-priority.

Usage Guidelines

The configured QoS scheduling algorithm applies to all switch ports, but you can override this configuration for a QoS profile using the following command:

```
configure qosprofile qosprofile use-strict-priority
```

In strict-priority mode, QoS profile QP8 has the highest priority and QP1 has the lowest priority.

Note

Queues are serviced using the configured scheduling algorithm until all of the minBws are satisfied, then all queues are serviced using the configured scheduling algorithm until all of the maxBws are satisfied.

Example

The following command configures the switch for weighted-round-robin servicing:

```
configure qosscheduler weighted-round-robin
```

The following command configures the switch for weighted-deficit-round-robin servicing:

```
configure qosscheduler weighted-deficit-round-robin
```

This command specifies the scheduling algorithm the switch uses to service QoS profiles on BD8K, Summit and BDX8 platforms. Weighted-deficit-round-robin mode of scheduling allows you to use a credit based algorithm in order to sample in the size of the packet while scheduling various queues.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on X650, X480, X460, E4G-400, X440, E4G-200, 8900-G96T-c, 8900-10G24X-c, 8900-MSM128, 8900-G48T-xl, 8900-G48X-xl, 8900-10G8X-xl, X670, 8900-40G6X-xm, BDX-MM1, BDXA-FM960, BDXA-FM480, BDXA-40G24X, BDXA-40G12X, X250e, X450e, X450a, G48Ta, G48Xa, 10G4Xa,10G4Ca, G48Te2, G24Xc, G48Xc, G48Tc,10G4Xc,10G8Xc, MSM-48, S-G8Xc, S-10G1Xc, 8500-G24X-e, 8500-G48T-e, S-10G2Xc, BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and the Summit family switches.

create meter

create meter *meter-name*

Description

On BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches, this command creates a meter for ingress traffic rate limiting. On BlackDiamond c-, xl-, and xm-series modules, and Summit X650 switches, you can use this command to create meters for ingress and egress rate limiting.

Syntax Description

meter-name	Specifies the meter name.

Default

N/A.

Usage Guidelines

Meter names must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but they cannot contain spaces. The maximum allowed length for a name is 32 characters. For meter name guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates the meter maximum_bandwidth:

```
create meter maximum_bandwidth
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on BlackDiamond X8 series, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.

create qosprofile

create qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]

Description

Creates a QoS profile.

Syntax Description

QP2....QP7	Specifies the QoS profile you want to create.

Default

N/A.

Usage Guidelines

The BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches allow dynamic creation and deletion of QoS profiles QP2 to QP7. Creating a QoS profile dynamically does not cause loss of traffic.

QoS profiles QP1 and QP8 are part of the default configuration and cannot be deleted. You must create a QoS profile in the range of QP2 to QP7 before you can configure it or assign it to traffic groups.

Qos profile QP7 cannot be created in a SummitStack; this queue is reserved for control traffic.

Note

The sFlow application uses QP2 to sample traffic on SummitStack and Summit family switches; any traffic grouping using QP2 can encounter unexpected results when sFlow is enabled on these specific devices.

Example

The following command creates QoS profile QP3:

```
create qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

delete meter

delete meter *meter-name*

Description

Deletes a meter.

Syntax Description

meter-name	Specifies the meter name.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the meter maximum_bandwidth:

```
delete meter maximum_bandwidth
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, E4G-200 and E4G-400 switches, SummitStack, and Summit family switches.

delete qosprofile

delete qosprofile [QP2| QP3 | QP4 | QP5 | QP6 | QP7]

Description

Deletes a user-created QoS profile.

Syntax Description

QP2....QP7	Specifies the user-created QoS profile you want to delete.

Default

N/A.

Usage Guidelines

You cannot delete the default QoS profiles of QP1 and QP8. On a SummitStack, you also cannot delete QoS profile QP7. If you attempt to delete QoS profile QP7, the system returns an error.

All configuration information associated with the specified QoS profile is removed.

Example

The following command deletes the user-created QoS profile QP3:

```
delete qosprofile qp3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms..

disable diffserv examination ports

disable diffserv examination ports [*port_list* | **all**]

Description

Disables the examination of the DiffServ field in an IP packet.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that DiffServ examination should be disabled for all ports.

Default

Disabled.

Usage Guidelines

The diffserv examination feature is disabled by default.

Example

The following command disables DiffServ examination on the specified ports:

```
disable diffserv examination ports 5:3,5:5,6:6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable diffserv replacement ports

disable diffserv replacement ports [*port_list* | **all**]

Description

Disables the replacement of DiffServ code points in packets transmitted by the switch.

Syntax Description

port_list	Specifies a list of ports or slots and ports on which Diffserv replacement will be disabled.
all	Specifies that DiffServ replacement should be disabled for all ports.

Default

N/A.

Usage Guidelines

The DiffServ replacement feature is disabled by default.

Example

The following command disables DiffServ replacement on selected ports:

```
disable diffserv replacement ports 1:2,5:5,6:6
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable dot1p examination ports

disable dot1p examination ports [*port_list* | **all**]

Description

Prevents examination of the 802.1p priority field as part of the QoS configuration.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
all	Specifies that dot1p replacement should be disabled for all ports.

Default

Enabled.

Usage Guidelines

The 802.1p examination feature is enabled by default. To free ACL resources, disable this feature whenever another QoS traffic grouping is configured. (See ACLs for information on available ACL resources.)

Note

If you disable this feature when no other QoS traffic grouping is in effect, 802.1p priority enforcement of 802.1q tagged packets continues.

SummitStack Only.

dot1p examination cannot be disabled for priority values 5 and 6. However, the precedence of the examination is lowered so that all other traffic grouping precedences are higher. The mappings you configure with the configure dot1p type command remain in effect.

Example

The following command disables 802.1p value examination on ports 1 to 5:

```
disable dot1p examination ports 1-5
```

History

This command was available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

disable dot1p replacement ports

disable dot1p replacement ports [*port_list* | **all**]

Description

Disables the ability to overwrite 802.1p priority values for a given set of ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that 802.1p replacement should be disabled for all ports.

Default

N/A.

Usage Guidelines

The dot1p replacement feature is disabled by default.

Beginning with ExtremeXOS version 11.4 on the 1 Gigabit Ethernet ports, 802.1p replacement always happens when you configure the DiffServ traffic grouping.

Example

The following command disables 802.1p value replacement on all ports:

```
disable dot1p replacement ports all
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable diffserv examination ports

enable diffserv examination ports [*port_list* | **all**]

Description

Enables the DiffServ field of an IP packet to be examined in order to select a QoS profile.

Syntax Description

port_list	Specifies a list of ports or slots and ports to which the parameters apply.
all	Specifies that DiffServ examination is enabled for all ports.

Default

Disabled.

Usage Guidelines

The Diffserv examination feature is disabled by default.

If you are using DiffServ for QoS parameters, Extreme Networks recommends that you also configure 802.1p or port-based QoS parameters to ensure that high-priority traffic is not dropped prior to reaching the MSM/MM on modular switches.

Example

The following command enables DiffServ examination on selected ports:

```
enable diffserv examination ports 1:1,5:5,6:2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable diffserv replacement ports

enable diffserv replacement ports [*port_list* | **all**]

Description

Enables the DiffServ code point to be overwritten in IP packets transmitted by the switch.

Syntax Description

port_list	Specifies a list of ingress ports or slots and ports on which to enable Diffserv replacement.
all	Specifies that DiffServ replacement should be enabled for all ports.

Default

N/A.

Usage Guidelines

The Diffserv replacement feature functions for IPv4 and IPv6 traffic and is disabled by default.

Note

The port in this command is the ingress port.

This command affects only that traffic in traffic groupings based on explicit packet class of service information and physical/logical configuration.

Example

The following command enables DiffServ replacement on specified ports:

```
enable diffserv replacement ports 5:3,5:5,6:2
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable dot1p examination ports

enable dot1p examination ports [*port_list* | **all**]

Description

Enables egress QoS profile selection based on the 802.1p bits in the incoming frame.

Syntax Description

port_list	Specifies a list of ports on which to enable the dot1p examination feature.
all	Specifies that dot1p examination should be enabled for all ports.

Default

Enabled.

Usage Guidelines

To increase available ACLs, you can disable the 802.1p examination feature if you are not running QoS or are running QoS using DiffServ. See ExtremeXOS Concepts Guide for information on ACL limitations on these platforms.

Use this command to re-enable the 802.1p examination feature.

Example

The following command enables dot1p examination on ports 1 to 5:

```
enable dot1p examination ports 1-5
```

History

This command was available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

enable dot1p replacement ports

enable dot1p replacement ports [*port_list* | **all**]

Description

Allows the 802.1p priority field to be overwritten on egress according to the QoS profile to 802.1p priority mapping for a given set of ports.

Syntax Description

port_list	Specifies a list of ports or slots and ports.
all	Specifies that dot1p replacement should be enabled for all ports.

Default

N/A.

Usage Guidelines

The dot1p replacement feature is disabled by default.

By default, 802.1p priority information is not replaced or manipulated, and the information observed on ingress is preserved when transmitting the packet.

Note

The port in this command is the ingress port.

If 802.1p replacement is enabled, the 802.1p priority information that is transmitted is determined by the hardware queue that is used when transmitting the packet.

Note

This command affects only that traffic in traffic groupings based on explicit packet class of service information and physical/logical configuration.
