Beginning with ExtremeXOS version 11.4 on the 1 Gigabit Ethernet ports, 802.1p replacement always happens when you configure the DiffServ traffic grouping.

Note

Enabling dot1p replacement on all ports may take some time to complete.

Example

The following command enables dot1p replacement on all ports:

```
enable dot1p replacement ports all
```

History

This command was available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show access-list meter

show access-list meter {*meter-name*} [**any** | **ports** *port_list* | **vlan** *vlan_name*]

Description

Displays the specified access list meter statistics and configurations.

Syntax Description

meter-name	Specifies the ACL meter to display.
port_list	Specifies to display the meters on these ports.
vlan_name	Specifies to display the meters on the VLAN.

Default

N/A.

Usage Guidelines

Use this command to display the ACL meters.

Example

The following example displays access list meter information for port 7:1

```
Switch.8 # show access-list meter mtr1 port 7:1
Policy Name      Vlan Name        Port
Committed   Committed Burst Peak Rate  Peak Burst
Out-of-Profile
Meter       Rate (Kbps) Size (Kb)      (Kbps)      Size(kb)     Packet
Count
================================================================================
=
irl1             *               7:1
a.        mtr1            10          20           10         20          0
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show diffserv examination

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches is:

show diffserv examination

Description

Displays the DiffServ-to-QoS profile mapping.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the “->” in the display (shown below) becomes “* >”.

Example

Because the BlackDiamond X8 series switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches have 2 default QoS profiles, you see different displays depending on the platform.

The following is sample output from a BlackDiamond 8810 switch:

```
show diffserv examination
CodePoint->QOSProfile mapping:
00->QP1 01->QP1 02->QP1 03->QP1 04->QP1 05->QP1 06->QP1 07->QP1
08->QP1 09->QP1 10->QP1 11->QP1 12->QP1 13->QP1 14->QP1 15->QP1
16->QP1 17->QP1 18->QP1 19->QP1 20->QP1 21->QP1 22->QP1 23->QP1
24->QP1 25->QP1 26->QP1 27->QP1 28->QP1 29->QP1 30->QP1 31->QP1
32->QP1 33->QP1 34->QP1 35->QP1 36->QP1 37->QP1 38->QP1 39->QP1
40->QP1 41->QP1 42->QP1 43->QP1 44->QP1 45->QP1 46->QP1 47->QP1
48->QP1 49->QP1 50->QP1 51->QP1 52->QP1 53->QP1 54->QP1 55->QP1
56->QP8 57->QP8 58->QP8 59->QP8 60->QP8 61->QP8 62->QP8 63->QP8
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show diffserv replacement

These values are placed in egress packets when DiffServ replacement is enabled.

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches is:

show diffserv replacement

Description

Displays the DiffServ replacement code-point values assigned to each QoS profile.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Once you alter the default mappings, the "->" in the display (shown below) becomes "* >".

Example

The following is sample output from a BlackDiamond 8810 switch:

```
show diffserv replacement
QOSProfile->CodePoint mapping:
QP1->00
QP8->56
```

History

This command was first available in ExtremeXOS 10.1.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show dot1p

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches is:

show dot1p

Description

Displays the 802.1p-to-QoS profile mappings.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

N/A.

Example

The BlackDiamond X8 series switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches have 2 default QoS profiles.

Following is sample output from the show dot1p command on the BlackDiamond 8810 switch:

```
show dot1p
802.1p Priority Value     QOS Profile
0                 QP1
1                 QP1
2                 QP1
3                 QP1
4                 QP1
5                 QP1
6                 QP1
7                 QP8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show meter

show meter *meter_name*

Description

Displays the configured meters.

Syntax Description

meter_name	Specifies the meter name

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays meters on the switch:

```
show meter
```

The following is sample output from this command:

```
----------------------------------------
Name   Committed Rate(Kbps) Peak Rate(Kbps)
----------------------------------------
peggy               1000000--
```

Note

When you are using a BlackDiamond 8800 series switches, SummitStack, or Summit family switches, you configure a peak rate for QoS meters using the configure meter <metername> {committed-rate <cir> [Gbps | Mbps | Kbps]} {max-burst-size <burst-size> [Kb | Mb]} {out-actions [drop | set-drop-precedence {dscp [none | <dscp-value>]}} command.

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

show ports congestion

show ports *port_list* **congestion** {**no-refresh**}

Description

Displays the port egress congestion statistics (dropped packets) for the specified ports on the front panel.

Syntax Description

port_list	Specifies one or more slots and ports.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.

Default

Displays the port congestion statistics for all ports in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, you can clear the counters or page up or down through the list of ports.

Note

If you are displaying congestion statistics in real time and another CLI session resets the counters for a port you are monitoring, the counters displayed in your session for that port are also reset.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

Note

Packets can be dropped at multiple locations along the path through the hardware. The per-port congestion counters count all dropped packets for all ports.

If you do not specify a port number or range in the command, dropped packet counts are displayed for all ports.

Note

To display the congestion statistics for the QoS profiles on a port, use the show ports <port_list> qosmonitor {congestion} {no-refresh} command.

On BlackDiamond 8900 xm-series modules and Summit X670 series switches, QP1-4 support one unicast and one multicast queue for each QoS profile. The congestion counters for QP1-4 tally the unicast and multicast traffic for these QoS profiles. Congestion counters for QP5-8 tally only the unicast traffic for these QoS profiles.

Example

The following example shows the packets dropped due to congestion for all ports in real time:

```
BD-8810.1 # show ports congestion
Port Congestion Monitor                                  Tue May 27 13:02:37
2008
Port      Link      Packet
State     Drop
================================================================================
==
1:1       R         0
1:2       R         0
1:3       A         96
1:4       R         0
2:1       R         0
2:2       A         28513
2:3       R         0
2:4       R         0
2:5       R         0
2:6       R         0
2:7       R         0
2:8       R         0
```

```
3:1       R         0
3:2       R         0
3:3       R         0
3:4       R         0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
0->clear counters  U->page up  D->page down ESC->exit
```

The following example shows a snapshot display of the packets dropped due to congestion for all ports:

```
BD-8810.1 # show ports congestion no-refresh
Port      Link      Packet
State     Drop
================================================================================
==
1:1       R         0
1:2       R         0
1:3       A         96
1:4       R         0
2:1       R         0
2:2       A         28513
2:3       R         0
2:4       R         0
2:5       R         0
2:6       R         0
2:7       R         0
2:8       R         0
3:1       R         0
3:2       R         0
3:3       R         0
3:4       R         0
5:1       R         0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Link State: A-Active, R-Ready, NP-Port Not Present, L-Loopback
```

History

This command was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show ports qosmonitor

show ports *port_list* **qosmonitor {ingress | egress} {bytes | packets} {no-refresh}**

Note

This description describes command operation on BlackDiamond X8 and BlackDiamond 8800 series switches. For a description of a similar command for operation on BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches, see the command description for show ports qosmonitor {congestion}.

Description

Displays egress traffic counts or ingress traffic counts for each QoS profile on the specified ports.

Syntax Description

port_list	Specifies one or more slots and ports.
egress	Specifies the display of egress traffic counts. Default.
bytes	Specifies to display ingress or egress traffic counts in bytes.
packets	Specifies to display ingress or egress traffic counts in packets.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.

Default

Displays egress packet counts in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the spacebar toggles the display between QoS traffic counts in either packets or bytes.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

If you do not specify a port number or range of ports when displaying ingress or egress traffic counts, traffic counts are displayed for all ports.

Example

The following example shows the egress packet counts for the specified ports:

```
# show ports 1:1-1:2 qosmonitor
Qos Monitor Req Summary                                  Thu Mar  2 10:58:23
2006
Port      QP1      QP2      QP3      QP4      QP5      QP6      QP7      QP8
Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt
Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts
================================================================================
==
```

```
1:1         0         0         0         0         0         0         0         0
1:2         0         0         0         0         0         0         0         0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

The following example shows the ingress packet counts for the specified ports:

```
# show ports 1:1-1:2 qosmonitor ingress
Qos Monitor Req Summary                                  Thu Mar  2 10:59:28
2006

Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt
Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts
================================================================================
==
1:1         0         0         0         0         0         0         0         0
1:2         0         0         0         0         0         0         0         0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

The ingress information was added in ExtremeXOS 11.0

Also, you must specify the ports in ExtremeXOS 11.0.

The egress and no-refresh keywords were added in ExtremeXOS 11.3.

The bytes and packets keywords, as well as the toggling functionality, were added in ExtremeXOS 11.4.

Platform Availability

This command is available on BlackDiamond X8 and 8800.

show ports qosmonitor {congestion}

show ports *port_list* **qosmonitor** {**congestion**} {**no-refresh**}

Note

This description describes command operation on the BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches.

Description

Displays egress packet counts or dropped-traffic counts for each QoS profile on the specified ports.

Syntax Description

port_list	Specifies one or more slots and ports.
congestion	Specifies the display of packets dropped at ingress due to port congestion.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.

Default

Displays egress packet counts in real-time.

Usage Guidelines

The bottom line in the real-time display shows keys that you can press to change the display. For example, the spacebar toggles the display between egress packet counts and ingress dropped-packet counts.

Note

This command does not work properly if another CLI session is displaying congestion statistics in real time.

If you specify the no-refresh parameter, the system displays a snapshot of the data at the time you issue the command.

Note

Packets can be dropped at multiple locations along the path through the hardware. Due to hardware limitations, the dropped-packet counters for QoS profiles cannot count dropped packets from all possible locations. Because of these limitations, the sum of all dropped packets for all QoS profiles can be less than the per port count displayed with the command: show ports <port_list> congestion {no-refresh}.

On BlackDiamond X8 series switches, and BlackDiamond 8500 and 8800 c-, and e-series modules, you can display packet counts for one port per slot or module at a time. You can simultaneously display packet counts for multiple ports, but they must be from different slots or modules. The dropped packet display is limited to the 8 most-significant digits. This limitation does not apply to BlackDiamond 8900 series modules.

When you display the packet counts for a port, this action configures the hardware to monitor that port. If the slot or module hardware was previously configured to monitor a different port, the counters are reset for the new port. If the selected port is the last port displayed on the module, the counters are

not reset. The exception to this behavior is the Summit X650 switch, which does not reset the packet counters when you display counters for a different port.

Note

On BlackDiamond X8 series switches, BlackDiamond 8900 xm-series modules and Summit X670 series switches, QP1-4 support one unicast and one multicast queue for each QoS profile. The QoS monitor counters for QP1-4 tally the unicast and multicast traffic for these QoS profiles. QoS monitor counters for QP5-8 tally only the unicast traffic for these QoS profiles.

Example

The following example shows the egress packet counts for the specified ports:

```
# show ports 2:1, 3:6 qosmonitor
Qos Monitor Req Summary                                  Thu Mar  2 10:58:23
2006
Port      QP1      QP2      QP3      QP4      QP5      QP6      QP7      QP8
Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt
Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts     Xmts
================================================================================
==
2:1         0        0        0        0        0        0        0        0
3:6         0        0        0        0        0        0        0        0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters  U->Page up  D->Page down ESC->exit
```

The next example shows the dropped packet counts for the specified ports:

```
# show ports 2:1, 3:6 qosmonitor congestion
QoS Monitor Req Summary                                 Thu Jun 12 01:17:14 2008
Port    QP1      QP2      QP3      QP4      QP5      QP6      QP7      QP8
Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt      Pkt
Cong     Cong     Cong     Cong     Cong     Cong     Cong     Cong
================================================================================
==
2:1     0        0        0        0        0        0        0        0
3:6     8745     0        129      0        0        0        0        0
================================================================================
==
> indicates Port Display Name truncated past 8 characters
Spacebar->Toggle screen 0->Clear counters U->Page up D->Page down ESC->exit
```

History

This command was first available in ExtremeXOS 10.1.

You must specify the ports in ExtremeXOS 11.0.

The no-refresh keyword was added in ExtremeXOS 11.3.

The congestion keyword was added in ExtremeXOS 12.2, and the toggling functionality was modified to switch between egress packets and dropped packets.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, SummitStack, and Summit family switches.

show ports wred

show ports *port_list* **wred** {**no-refresh**}

Description

Displays WRED statistics for the specified ports or all ports.

Syntax Description

port_list	Specifies a list of slots and ports to display. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
no-refresh	Specifies a static snapshot of data instead of the default dynamic display.

Default

N/A.

Usage Guidelines

If no port or port list is specified, this command displays the WRED statistics for all ports. If WRED is not configured on a port, the statistics for that port display as 0.

The drop counters in the display represent packets that were dropped based on the WRED congestion avoidance algorithm. The Green Pkt Drop column counts in-profile TCP and non-TCP packets that have been dropped. The Red Pkt Drop column counts out-of-profile TCP and non-TCP packets that have been dropped.

Note

The values in the Yellow Pkt Drop column are always 0 in this release because the yellow traffic color is not supported at this time. For Summit X460, X480, and X650 switches and E4G-200 and E4G-400 switches, the values in the Green Pkt Drop column are always 0 because the hardware does not provide a drop counter for the green traffic color.

Example

The following example displays the WRED statistics for port list 2:1-9:

```
* Switch.243 # show ports 2:1-9 wred no-refresh
Port WRED Stats Monitor
================================================================
Port      Link      Green     Yellow    Red
State     Pkt Drop  Pkt Drop  Pkt Drop
================================================================
2:1       A         0         0         0
2:2       R         0         0         0
2:3       R         0         0         0
2:4       R         0         0         0
2:5       R         0         0         0
2:6       R         0         0         0
2:7       R         0         0         0
2:8       R         0         0         0
2:9       R         0         0         0
================================================================
Link State: A-Active, R-Ready, NP-Port Not Present L-Loopback
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

show qosprofile

show qosprofile [**all** | *port_list*]

Description

Displays QoS information on the switch.

Syntax Description

ports	Specifies to display information for specified ports.  **Note** This parameter is available only on BlackDiamond c-, e-, xl-, and xm-series modules, and Summit X450a, X450e, X460, X480, X650, and X670 series switches.
all	Specifies all ports.  **Note** This parameter is available only on BlackDiamond c-, e-, xl-, and xm-series modules, and Summit X450a, X450e, X460, X480, X650, and X670 series switches.
port_list	Specifies a list of slots and ports.  **Note** This parameter is available only onBlackDiamond c-, e-, xl-, and xm-series modules, and Summit X450a, X450e, X460, X480, X650, and X670 series switches.

Default

Displays egress QoS information for all ports.

Usage Guidelines

The displayed QoS profile information differs depending on the platform you are running on. The following section shows examples for different platforms.

Example

The display varies depending on your platform.

All Summit series, BD8K, BDX, BlackDiamond X8 Series Switches, BlackDiamond 8800 Modules, E4G only, whether or not included in a SummitStack

The following shows the information that appears when you omit the optional port parameter:

```
BD-8810Rack3.3 # show qosprofile
QP1    Weight =  1     Max Buffer Percent = 100
QP2    Weight =  1     Max Buffer Percent = 100
QP8    Weight =  1     Max Buffer Percent = 100
```

The following example shows how the display appears when the switch is configured for weighted-round-robin mode and some QoS profiles are configured for strict priority mode:

```
BD-8810.7 # show qosprofile
```

```
QP1    Weight =  1     Max Buffer Percent = 100
QP2    Weight =  1     Max Buffer Percent = 100
QP3    Weight =  1     Max Buffer Percent = 100
QP5    Strict-Priority Max Buffer Percent = 100
QP8    Strict-Priority Max Buffer Percent = 100
```

All Summit series, BD8K, BDX, BlackDiamond X8 Series Switches, BlackDiamond 8800 Modules, E4G only, whether or not included in a SummitStack

When you add the optional port parameter, the switch displays the following sample output:

```
Switch.6 # show qosprofile ports 1:1-2
Port: 1:1
QP1  MinBw =    20% MaxBw =    50% MaxBuf =   100%
QP8  MinBw =     0% MaxBw =   100% MaxBuf =  1000%
Port: 1:2
QP1  MinBw =     0% MaxBw =   100% MaxBuf =   100%
QP8  MinBw =     0% MaxBw =   100% MaxBuf =   100%
```

Note

This last sample output is not available on the XGS2 ports.

History

This command was first available in ExtremeXOS 10.1.

The ingress information was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

The ports parameter is available on all Summit series, BD8K, BDX, BlackDiamond X8 Series Switches, BlackDiamond 8800 Modules, and E4G whether or not included in a SummitStack.

show wredprofile

show wredprofile {ports [*port-list* | **all**]}

Description

Displays WRED configuration data for the specified ports or all ports.

Syntax Description

port_list	Specifies a list of slots and ports to display. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
all	Specifies that this command applies to all ports on the device.

Default

N/A.

Usage Guidelines

If no port or port list is specified, this command displays the default WRED configuration values.

Example

The following example displays the WRED settings for port 2:

```
* Switch.9 # show wredprofile ports 2
Port: 2
WRED configuration parameters
=========================================================
QoS      Packet          Min     Max     Max         Avg.
Profile  Type    Color   Thresh  Thresh  Drop-Rate   Weight
=========================================================
QP1    TCP     Green    100%    100%       100%     4
QP1    TCP     Red      100%    100%       100%     4
QP1    non-TCP Any      100%    100%       100%     4
QP1    non-TCP Red      100%    100%       100%     4
QP3    TCP     Green     10%     20%       100%     4
QP3    TCP     Red      100%    100%       100%     4
QP3    non-TCP Any      100%    100%       100%     4
QP3    non-TCP Red      100%    100%       100%     4
QP8    TCP     Green    100%    100%       100%     4
QP8    TCP     Red      100%    100%       100%     4
QP8    non-TCP Any      100%    100%       100%     4
QP8    non-TCP Red      100%    100%       100%     4
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

unconfigure diffserv examination

The syntax for BlackDiamond 8800, SummitStack, and Summit family switches is:

unconfigure diffserv examination

Description

Disables DiffServ traffic groups.

Syntax Description

N/A.

Default

Disabled.

Usage Guidelines

Use this command to disable DiffServ code point examination.

Example

The following command disables DiffServ code point examination:

```
unconfigure diffserv examination
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure diffserv replacement

The syntax for BlackDiamond X8 series switches, BlackDiamond 8800, SummitStack, and Summit family switches is:

unconfigure diffserv replacement

Description

Resets all DiffServ replacement mappings to the default values.

Syntax Description

N/A.

Default

N/A

Usage Guidelines

Use this command to resest all DiffServ replacement mappings to default values.

Example

The following command resets the DiffServ replacement mappings to their default values:

```
unconfigure diffserv examination
```

History

This command was first available in ExtremeXOS 11.0.

The ports keyword was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

unconfigure qosprofile

unconfigure qosprofile {**ports** [*port_list*|**all**]}

Description

Returns the rate-shaping parameters for all QoS profiles on the specified ports to the default values.

Syntax Description

port_list	Specifies the ports on which to unconfigure QoS profiles. **Note** This parameter is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit X450a, X450e, X460, X480, and X650 series switches, whether or not included in a SummitStack.
all	Specifies that this command applies to all ports on the device. **Note** This parameter is available only on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit X450a, X450e, X460, X480, and X650 series switches, whether or not included in a SummitStack.

Default

The default values for egress bandwidth on all supported platforms are:

- Minimum bandwidth—0%
- Maximum bandwidth—100%

The default values for egress priority and ingress QoS profiles differ by platform as described in the following sections.

The platform-specific default values for the two default egress QoS profiles (QP1 and QP8) on the BlackDiamond 8800 series switches, SummitStack, and Summit family switches are:

- Maximum buffer—100% (as set by the configure qosprofile command)
- Maximum buffer override—100% (as set by the configure qosprofile command)
- Weight—1
- WRED—See the configure qosprofile wred command description.

Usage Guidelines

None.

Example

The following command resets the QoS profiles for all ports to default settings:

```
unconfigure qosprofile
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

The egress and ports parameters are available only on the BlackDiamond X8 series switches, BlackDiamond c-, e-, xl-, and xm-series modules, and Summit X250e, X450a, X450e, X460, X480, X650, and X670 series switches, whether or not included in a SummitStack.

unconfigure qosprofile wred

unconfigure qosprofile wred {**ports** [*port_list* | **all**]}

Description

Removes the WRED configuration for all QoS profiles on the specified port or all ports.

Syntax Description

port_list	Specifies a list of slots and ports from which the WRED configuration is removed. Specify ports in the following formats: 3-5, 2:5, 2:6-2:8.
all	Specifies that this command applies to all ports on the device.

Default

N/A.

Usage Guidelines

None.

Example

The following example removes the WRED configuration for port 3:

```
* Switch.24 # unconfigure qosprofile wred port 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8900 c-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X460, X480, X650, and X670 switches.

23 Network Login Commands

clear netlogin state
configure netlogin add mac-list
configure netlogin add proxy-port
configure netlogin agingtime
configure netlogin allowed-refresh-failures
configure netlogin authentication database-order
configure netlogin authentication failure vlan
configure netlogin authentication service-unavailable vlan
configure netlogin banner
configure netlogin base-url
configure netlogin delete mac-list
configure netlogin delete proxy-port
configure netlogin dot1x eapol-transmit-version
configure netlogin dot1x guest-vlan
configure netlogin dot1x timers
configure netlogin dynamic-vlan
configure netlogin dynamic-vlan uplink-ports
configure netlogin local-user
configure netlogin local-user security-profile
configure netlogin mac timers reauth-period
configure netlogin move-fail-action
configure netlogin port allow egress-traffic
configure netlogin ports mode
configure netlogin ports no-restart
configure netlogin ports restart
configure netlogin redirect-page
configure netlogin session-refresh
configure netlogin vlan
configure vlan netlogin-lease-timer
create netlogin local-user
delete netlogin local-user
disable netlogin
disable netlogin authentication failure vlan ports
disable netlogin authentication service-unavailable vlan ports
disable netlogin dot1x guest-vlan ports
disable netlogin logout-privilege
disable netlogin ports

This chapter describes commands for configuring network login.

Network login is a feature designed to control the admission of user packets into a network by giving network access only to users that have been properly authenticated. Network login is controlled by an administrator on a per port, per VLAN basis and uses an integration of DHCP, user authentication over the web interface, user authentication by MAC address, or 802.1x client software, and a RADIUS server to provide a user database or specific configuration details.

Network login has two modes of operation:

- Campus mode, used when a port in a VLAN will move to another VLAN when authentication has been completed successfully. This mode is for the roaming user who will not always be using the same port for authentication. Campus mode requires a DHCP server and a RADIUS server configured for Extreme Network Login.
- ISP mode, used when the port and VLAN used will remain constant. All network settings are configured for that VLAN.

A DHCP server is included to support network login functionality.

clear netlogin state

clear netlogin state {port *port_list***}**

Description

Clears and initializes the network login sessions on a VLAN port.

Syntax Description

port_list	Specifies the ports to clear.

Default

None.

Usage Guidelines

Clear the states of every MAC learned on this VLAN port and put the port back to unauthenticated state. The port will be moved to its original VLAN if configured in campus mode.

Example

The following command clears the Network Login state of port 2:9:

```
clear netlogin state port 2:9
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin add mac-list

configure netlogin add mac-list [*mac* {*mask*} | **default**] {**encrypted**} {*password*} {**ports** *port_list*}

Description

Adds an entry to the MAC address list for MAC-based network login.

Syntax Description

mac	Specifies the MAC address to add.
mask	Specifies the number of bits to use for the mask.
default	Specifies the default entry.
encrypted	Used to display encrypted form of password in configuration files. Do not use.
password	Specifies the password to send for authentication.
ports	Specifies the port or port list to use for authentication.

Default

If no password is specified, the MAC address will be used.

Usage Guidelines

Use this command to add an entry to the MAC address list used for MAC-based network login.

If no match is found in the table of MAC entries, and a default entry exists, the default will be used to authenticate the client. All entries in the list are automatically sorted in longest prefix order.

Associating a MAC Address to a Port

You can configure the switch to accept and authenticate a client with a specific MAC address. Only MAC addresses that have a match for the specific ports are sent for authentication. For example, if you associate a MAC address with one or more ports, only authentication requests for that MAC addresses received on the port(s) are sent to the RADIUS server. The port(s) block all other authentication requests that do not have a matching entry. This is also known as secure MAC.

To associate a MAC address with one or more ports, specify the ports option when using the configure netlogin add mac-list [<mac> {<mask>} | default] {encrypted} {<password>} {ports <port_list>} command.

You must enable MAC-based network login on the switch and the specified ports before using this command. If MAC-based network login is not enabled on the specified port(s), the switch displays a warning message similar to the following:

```
WARNING: Not all specified ports have MAC-Based NetLogin enabled.
```

If this occurs, make sure to enable MAC-based network login.

Example

The following command adds the MAC address 10:20:30:40:50:60 with the password foo to the list:

```
configure netlogin add mac-list 10:20:30:40:50:60 password foo
```

The following command associates MAC address 10:20:30:40:50:70 with ports 2:2 and 2:3. This means authentication requests from MAC address 10:20:30:40:50:70 are only accepted on ports 2:2 and 2:3:

```
configure netlogin add mac-list mac 10:20:30:40:50:70 ports 2:2-2:3
```

History

This command was first available in ExtremeXOS 11.1.

The ports option was added in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

configure netlogin add proxy-port

configure netlogin add proxy-port *tcp_port* {**http | https**}

Description

Configure the ports that will be hijacked and redirected for HTTP or HTTPS traffic.

Syntax Description

tcp_port	Specifies the port to be hijacked.

Default

HTTP traffic.

Usage Guidelines

This command allows you to configure the ports that will be hijacked and redirected for HTTP or HTTPS traffic. For each hijacked proxy port, you must specify whether the port is to be used for HTTP or HTTPS traffic.

No more than 5 such ports are supported in addition to ports 80 and ports 443. Attempts to add more than 5 ports generate an error.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin agingtime

configure netlogin agingtime *minutes*

Description

Lets you configure network login aging.

Syntax Description

minutes	Specifies the aging time in minutes.

Default

The default value is 5.

Usage Guidelines

Use this command to configure the aging time for network login. The aging time is the time after which learned clients that failed authentication or did not attempt to authenticate are removed from the system. This prevents the switch from keeping all clients ever seen on a network-login-enabled port.

The range can be from 0 to 3000, where 0 indicates no age out.

Example

The following command specifies an aging time of 15 minutes:

```
configure netlogin agingtime 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin allowed-refresh-failures

configure netlogin allowed-refresh-failures *num_failures*

Description

Sets the number refresh failures.

Syntax Description

num_failures	Specifies the number of refresh failures. The range is from 0 to 5.

Default

The default is 0.

Usage Guidelines

This command allows you to set the number of refresh failures allowed. You can set the number of failures to be from between 0 to 5. The default value is 0.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin authentication database-order

configure netlogin [mac | web-based] authentication database-order [[radius] | [local] | [radius local] | [local radius]]

Description

Configures the order of database authentication protocols to use.

Syntax Description

mac	Specifies MAC-based authentication.
web-based	Specifies Web-based authentication.
radius	Specifies an authentication order from only the RADIUS database.
local	Specifies an authentication order from only the local database.
radius local	Specifies an authentication order of RADIUS database first, followed by local.
local radius	Specifies an authentication order of local database first, followed by RADIUS.

Default

By default, the authentication order is RADIUS, local-user database.

Usage Guidelines

Use this command in situations where, when both a network login RADIUS server and a local-user database are configured, you want to have control over which database to use first. If one authentication fails, the other database is tried; if that authentication is successful, the switch authenticates the network login user.

Example

The following command sets the database authentication order to local-user database, RADIUS:

```
configure netlogin mac authentication database-order local radius
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure netlogin authentication failure vlan

configure netlogin authentication failure vlan *vlan_name* {**ports** *port_list*}

Description

Configures authentication failure VLAN on network login enabled ports.

Syntax Description

vlan_name	Specifies the name of the authentication failure VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Default

By default, authentication failure VLAN is configured on all network login enabled ports if no port is specifically configured.

Usage Guidelines

Use this command to configure authentication failure VLAN on network login enabled ports. When a supplicant fails authentication, it is moved to the authentication failure VLAN and is given limited access until it passes the authentication either through RADIUS or local. Depending on the authentication database order for that particular network login method (MAC, web or dot1x), the other database is used to authenticate the client. If the final result is an authentication failure and if the authentication failure VLAN is configured and enabled on that port, the client is moved to that location.

There four different authentication orders which can be configured per authentication method currently. They are:

- RADIUS
- local
- RADIUS, local
- local, RADIUS

In each case, you must consider the end result in deciding whether to authenticate the client in authentication failure VLAN or authentication service unavailable VLAN (if configured).

For example, when netlogin mac authentication database order is local, radius, if the authentication of a MAC client fails through a local database, RADIUS is used for authentication. If RADIUS also fails authentication, the client is moved to authentication failure VLAN. The same is true for all authentication database orders (radius,local; local,radius; radius; local).

If authentication through local fails but passes through RADIUS, the client is moved to the appropriate destination VLAN.

If the local authentication fails and the RADIUS server is not available, the client is not moved to authentication failure VLAN.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin authentication service-unavailable vlan

configure netlogin authentication service-unavailable vlan *vlan_name* {**ports** *port_list*}

vlan_name	Specifies the name of the service-unavailable VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Description

Configures authentication service unavailable VLAN on network login enabled ports.

Syntax Description

Default

Defaults to all network login enabled ports.

Usage Guidelines

This command configures authentication service unavailable VLAN on the specified network login enabled ports. Authentication service unavailable VLAN is configured on all the network login enabled ports, if no port is specifically mentioned. When an authentication service is not available to authenticate the network login clients, they are moved to the authentication service-unavailable VLAN and are given limited access until the authentication service is available either through RADIUS or local. Depending on the authentication database order for that particular network login method (MAC, web or dot1x), the other database is used to authenticate the client. If the final result is an authentication failure and if the authentication failure VLAN is configured and enabled on that port, the client is moved to that location.

Note

The local database can be configured for MAC and Web authentication method only, not for dot1x.

There are four different authentication orders which can be configured per authentication method currently. They are:

- RADIUS
- Local
- RADIUS, local
- Local, RADIUS

In each case, you must consider the end result in deciding whether to authenticate the client in authentication failure VLAN or authentication service unavailable VLAN (if configured).

For example, when netlogin mac authentication database order is local, radius, if the authentication of a MAC client fails through a local database, RADIUS is used for authentication. If RADIUS also fails authentication, the client is moved to authentication failure VLAN. The same is true for all authentication database orders (radius,local; local,radius; radius; local).

If authentication through local fails but passes through RADIUS, the client is moved to appropriate destination VLAN.

If the local authentication fails and the RADIUS server is not available, the client is not moved to authentication failure VLAN.

Authentication service is considered to be unavailable in the following cases:

- For local authentication if the user entry is not present in the local database.

- For RADIUS in the following cases:
  - the RADIUS server is not running.
  - the RADIUS server is not configured on the switch
  - the RADIUS server is configured but not enabled on the switch.

> **Note**
>
> 
>
> If web is enabled on a port where dot1x or MAC are also enabled, the authentication failure/service-unavailable VLAN configuration is not applicable to those clients where dot1x or MAC clients which fail authentication or where authentication service is not available.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin banner

configure netlogin banner *banner*

Description

Configures the network login page banner.

Syntax Description

banner	Specifies the HTML code for the banner.

Default

The default banner is the Extreme Networks logo.

Usage Guidelines

The banner is a quoted, HTML string, that will be displayed on the network login page. The string is limited to 1024 characters.

This command applies only to the web-based authentication mode of network login.

Example

The following command configures the network login page banner:

```
configure netlogin banner "<html><head>Please Login</head></html>"
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin base-url

configure netlogin base-url *url*

Description

Configures the base URL for network login.

Syntax Description

url	Specifies the base URL for network login.

Default

The base URL default value is “network-access.com.”

Usage Guidelines

When you login using a web browser, you are redirected to the specified base URL, which is the DNS name for the switch.

You must configure a DNS name of the type “www.xx...xx.xxx” or “xx...xx.xxx”.

This command applies only to the web-based authentication mode of network login.

Example

The following command configures the network login base URL as access.net:

```
configure netlogin base-url access.net
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin delete mac-list

configure netlogin delete mac-list [*mac* {*mask*} | **default**]

Description

Deletes an entry from the MAC address list for MAC-based network login.

Syntax Description

mac	Specifies the MAC address to delete.
mask	Specifies the number of bits to use for the mask.
default	Specifies the default entry.

Default

N/A.

Usage Guidelines

Use this command to delete an entry from the MAC address list used for MAC-based network login.

Example

The following command deletes the MAC address 10:20:30:40:50:60 from the list:

```
configure netlogin delete mac-list 10:20:30:40:50:60
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin delete proxy-port

configure netlogin delete proxy-port *tcp_port*

Description

Configure the ports that are to be hijacked and redirected for HTTP or HTTPS traffic.

Syntax Description

tcp_port	Specifies the port to be hijacked.

Default

N/A.

Usage Guidelines

This command allows you to unconfigure the ports that will be hijacked and redirected for HTTP or HTTPS traffic.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin dot1x eapol-transmit-version

configure netlogin dot1x eapol-transmit-version *eapol-version*

Description

Configures the default EAPOL version sent in transmitted packets for network login.

Syntax Description

eapol-version	Specifies the EAPOL version. Choices are "v1" or "v2".

Default

The default is "v1".

Usage Guidelines

Although the ExtremeXOS software supports EAPOL version 2, some clients do not yet accept the version 2 EAPOL packets. The packet format for the two versions is the same.

Example

The following command changes the EAPOL version to 2:

```
configure netlogin dot1x eapol-transmit-version v2
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin dot1x guest-vlan

configure netlogin dot1x guest-vlan *vlan_name* {**ports** *port_list*}

Description

Configures a guest VLAN for 802.1x authentication network login.

Syntax Description

vlan_name	Specifies the name of the guest VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Default

N/A.

Usage Guidelines

This command configures the guest VLAN for 802.1x on the current virtual router (VR).

Note

Beginning with ExtremeXOS 11.6, you can configure guest VLANs on a per port basis, which allows you to configure more than one guest VLAN per VR. In ExtremeXOS 11.5 and earlier, you can only configure guest VLANs on a per VLAN basis, which allows you to configure only one guest VLAN per VR.

If you do not specify any ports, the guest VLAN is configured for all ports.

Each port can have a different guest VLAN.

A guest VLAN provides limited or restricted network access if a supplicant connected to a port does not respond to the 802.1x authentication requests from the switch. A port always moves untagged into the guest VLAN.

Keep in mind the following when configuring guest VLANs:

- You must create a VLAN and configure it as a guest VLAN before enabling the guest VLAN feature.
- Configure guest VLANs only on network login ports with 802.1x enabled.
- Movement to guest VLANs is not supported on network login ports with MAC-based or web-based authentication.
- 802.1x must be the only authentication method enabled on the port for movement to guest VLAN.
- No supplicant on the port has 802.1x capability.
- You configure only one guest VLAN per virtual router interface.

Note

The supplicant does not move to a guest VLAN if it fails authentication after an 802.1x exchange; the supplicant moves to the guest VLAN only if it does not respond to an 802.1x authentication request.

Modifying the Supplicant Timer

By default, the switch attempts to authenticate the supplicant every 30 seconds for a maximum of three tries. If the supplicant does not respond to the authentication requests, the client moves to the guest VLAN. The number of authentication attempts is not a user-configured parameter.

To modify the supplicant response timer, use the following command and specify the supp-resp-timeout parameter:

```
configure netlogin dot1x timers [{server-timeout <server_timeout>}
{quiet-period <quiet_period>} {reauth-period <reauth_period> {reauth-max
<max_num_reauths>}} {supp-resp-timeout <supp_resp_timeout>}]
```

If a supplicant on a port in the guest VLAN becomes 802.1x-capable, the switch starts processing the 802.1x responses from the supplicant. If the supplicant is successfully authenticated, the port moves from the guest VLAN to the destination VLAN specified by the RADIUS server.

Enabling Guest VLANs

To enable the guest VLAN, use the following command:

```
enable netlogin dot1x guest-vlan ports [all | <ports>]
```

Example

The following command creates a guest VLAN for 802.1x named guest for all ports:

```
configure netlogin dot1x guest-vlan guest
```

The following command creates a guest VLAN named guest for ports 2 and 3:

```
configure netlogin dot1x guest-vlan guest ports 2,3
```

History

This command was first available in ExtremeXOS 11.2.

The ports option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure netlogin dot1x timers

configure netlogin dot1x timers [{**server-timeout** *server_timeout*} {**quiet-period** *quiet_period*} {**reauth-period** *reauth_period* {**reauth-max** *max_num_reauths*}} {**supp-resp-timeout** *supp_resp_timeout*}]

Description

Configures the 802.1x timers for network login.

Syntax Description

server-timeout	Specifies the timeout period for a response from the RADIUS server. The range is 1 to 120 seconds.
quiet-period	Specifies the time for which the switch will not attempt to communicate with the supplicant after authentication has failed. The range is 0 to 65535 seconds.

reauth-period	Specifies time after which the switch will attempt to re-authenticate an authenticated supplicant. The range is 0, 30 to 7200 seconds.
reauth-max	Specifies the maximum reauthentication counter value. The range is 1 to 10.
supp-resp-timeout	Specifies the time for which the switch will wait for a response from the supplicant. The range is 1 to 120 seconds.

Default

The defaults are as follows:

- server-timeout—30 seconds
- quiet-period—60 seconds
- reauth-period—3600 seconds
- reauth-max—3
- supp-resp-timeout—30 seconds

Usage Guidelines

To disable re-authentication, specify 0 for the reauth-period parameter. (If reauth-period is set to 0, reauth-max value doesn't apply.)

If you attempt to configure a timer value that is out of range (not supported), the switch displays an error message. The following is a list of sample error messages:

- server-timeout—`ERROR: RADIUS server response timeout out of range (1..120 sec)`
- quiet-period—`%% Invalid number detected at '^' marker. %% Input number must be in the range [0, 65535].`
- reauth-period—`ERROR: Re-authentication period out of range (0, 30..7200 sec)`
- reauth-counter—`ERROR: Re-authentication counter value out of range (1..10)`
- supp-resp-timeout—`ERROR: Supplicant response timeout out of range (1..120 sec)`

To display the 802.1x timer settings, use the show netlogin and show netlogin dot1x commands.

Example

The following command changes the 802.1x server-timeout to 10 seconds:

```
configure netlogin dot1x timers server-timeout 10
```

History

This command was first available in ExtremeXOS 11.1.

The reauth-max keyword was added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin dynamic-vlan

configure netlogin dynamic-vlan [disable | enable]

Description

Configures the switch to automatically and dynamically create a VLAN after receiving authentication requests from one or more supplicants (clients).

Syntax Description

disable	Specifies that the switch does not automatically create dynamic VLANs. This is the default behavior.
enable	Specifies that the switch automatically create dynamic VLANs.

Default

The default is disabled.

Usage Guidelines

Use this command to configure the switch to dynamically create a VLAN. If configured for dynamic VLAN creation, the switch automatically creates a supplicant VLAN that contains both the supplicant's physical port and one or more uplink ports.

A dynamically created VLAN is only a Layer2 bridging mechanism; this VLAN does not work with routing protocols to forward traffic. After the switch unauthenticates all of the supplicants from the dynamically created VLAN, the switch deletes that VLAN.

Note

Dynamically created VLANs do not support the session refresh feature of web-based network login because dynamically created VLANs do not have an IP address. Also, dynamic VLANs are not supported on ports when STP and network login are both configured on the ports.

By dynamically creating and deleting VLANs, you minimize the number of active VLANs configured on your edge switches. In addition, the RADIUS server forwards VSA information to dynamically create the VLAN thereby simplifying switch management. A key difference between dynamically created VLANs and other VLANs is that the switch does not save dynamically created VLANs. Even if you use the save command, the switch does not save a dynamically created VLAN.

Supported Vendor Specific Attributes

To prevent conflicts with existing VLANs on the switch, the RADIUS server uses Vendor Specific Attributes (VSAs) to forward VLAN information, including VLAN ID, to the switch. The following list specifies the supported VSAs for configuring dynamic network login VLANs:

- Extreme: Netlogin-VLAN-ID (VSA 209)
- IETF: Tunnel-Private-Group-ID (VSA 81)
- Extreme: Netlogin-Extended-VLAN (VSA 211)

Note

If the ASCII string only contains numbers, it is interpreted as the VLAN ID. Dynamic VLANs only support numerical VLAN IDs; VLAN names are not supported.

The switch automatically generates the VLAN name in the following format: SYS_NLD_<TAG> where <TAG> specifies the VLAN ID. For example, a dynamic network login VLAN with an ID of 10 has the name SYS_NLD_0010. >

Specifying the Uplink Ports

To specify one or more ports as tagged uplink ports that are added to the dynamically created VLAN, use the following command:

```
configure netlogin dynamic-vlan uplink-ports [<port_list> | none]
```

The uplink ports send traffic to and from the supplicants from the core of the network.

By default the setting is none. For more information about this command, see the usage guidelines for configure netlogin dynamic-vlan uplink-ports.

Viewing Status Information

To display summary information about all of the VLANs on the switch, including any dynamic VLANs currently operating on the switch, use the following command:

```
show vlan
```

If the switch dynamically creates a VLAN, the VLAN name begins with SYS_NLD_ and the output contains a d flag for the dynamically created VLAN.

To display the status of dynamic VLAN configuration on the switch, use the following command:

```
show netlogin
```

The switch displays the current state of dynamic VLAN creation (enabled or disabled) and the uplink port(s) associated with the dynamic VLAN.

Example

The following command automatically adds ports 1:1-1:2 to the dynamically created VLAN as uplink ports:

```
configure netlogin dynamic-vlan uplink-ports 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure netlogin dynamic-vlan uplink-ports

configure netlogin dynamic-vlan uplink-ports [*port_list* | **none**]

Description

Specifies which port(s) are added as tagged, uplink ports to the dynamically created VLANs for network login.

Syntax Description

port_list	Specifies one or more ports to add to the dynamically created VLAN for network login.
none	Specifies that no ports are added. This is the default setting.

Default

The default setting is none.

Usage Guidelines

Use this command to specify which port(s) are used as uplink ports and added to the dynamically created VLAN for network login. The uplink ports send traffic to and from the supplicants from the core of the network.

Uplink ports should not be configured for network login (network login is disabled on uplink ports). If you specify an uplink port with network login enabled, the configuration fails and the switch displays an error message similar to the following:

```
ERROR: The following ports have NetLogin enabled: 1, 2
```

If this occurs, select a port with network login disabled.

Enabling Dynamic Network Login VLANs

To configure the switch to dynamically create a VLAN upon receiving an authentication response, use the following command:

```
configure netlogin dynamic-vlan [disable | enable]
```

By default, the setting is disabled. For more detailed information about this command, see the usage guidelines configure netlogin dynamic-vlan uplink-ports.

Viewing Status Information

To display summary information about all of the VLANs on the switch, including any dynamic VLANs currently operating on the switch, use the following command:

```
show vlan
```

If the switch dynamically creates a VLAN, the VLAN name begins with SYS_NLD_ and the output contains a d flag for the dynamically created VLAN.

To display the status of dynamic VLAN configuration on the switch, use the following command:

```
show netlogin
```

The switch displays the current state of dynamic VLAN creation (enabled or disabled) and the uplink port(s) associated with the dynamic VLAN.

Example

The following command configures the switch to add ports 1:1-1:2 to the dynamically created network login VLAN:

```
configure netlogin dynamic-vlan uplink-ports 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure netlogin local-user

configure netlogin local-user *user-name* {**vlan-vsa** [[{**tagged** | **untagged**} [*vlan_name* | *vlan_tag*]] | **none**]}

Description

Configures an existing local network login account.

Syntax Description

user-name	Specifies the name of an existing local network login account.
tagged	Specifies that the client be added as tagged.
untagged	Specifies that the client be added as untagged.
vlan_name	Specifies the name of the destination VLAN.
vlan_tag	Specifies the VLAN ID, tag, of the destination VLAN.
none	Specifies that the VSA 211 wildcard (*) is applied, only if you do not specify tagged or untagged

Default

N/A.

Usage Guidelines

Use this command to modify the attributes of an existing local network login account. You can update the following attributes associated with a local network login account:

- Password of the local network login account
- Destination VLAN attributes including: adding clients tagged or untagged, the name of the VLAN, and the VLAN ID

Note

Passwords are case-sensitive and must have a minimum of 1 character and a maximum of 32 characters.

You must create a local network login account before using this command. To create a local network login user name and password, use the following command:

```
create netlogin local-user <user-name> {encrypted} {<password>} {vlan-
vsa [[{tagged | untagged} [<vlan_name>] | <vlan_tag>]]} {security-profile
<security_profile>}
```

If the switch displays a message similar to the following:

```
* Switch # configure netlogin local-user purplenet
^
%% Invalid input detected at '^' marker.
```

You might be attempting to modify a local network login account that is not present or the switch, or you might have incorrectly entered the account name. To confirm the names of the local network login accounts on your switch, use the following command:

```
show netlogin local-users
```

Additional Requirements

This command applies only to the web-based and MAC-based modes of network login. 802.1x network login does not support local database authentication.

You must have administrator privileges to use this command. If you do not have administrator privileges, the switch displays a message similar to the following:

```
This user does not have permissions for this command.
```

Passwords are case-sensitive. Passwords must have a minimum of 0 characters and a maximum of 32 characters. If you attempt to create a password with more than 32 characters, the switch displays the following message after you re-enter the password:

```
Password cannot exceed 32 characters
```

Example

This section contains the following examples:

- Updating the password
- Modifying destination VLAN attributes

Updating the Password

The following command updates the password of an existing local network login account:

```
configure netlogin local-user megtest
```

After you enter the local network login user name, press [Enter]. The switch prompts you to enter a password; however, the switch does not display the password. At the prompt enter the new password:

```
password:
```

After you enter the new password, press [Enter]. The switch then prompts you to re-enter the password:

```
Reenter password:
```

Updating VLAN Attributes

You can add a destination VLAN, change the destination VLAN, or remove the destination from an existing local network login account. This example changes the destination VLAN for the specified local network login account:

```
configure netlogin local-user megtest vlan-vsa green
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

configure netlogin local-user security-profile

configure netlogin local-user *user-name* **security-profile** *security_profile*

Description

Changes a previously associated security profile.

Syntax Description

user-name	Specifies the name of an existing local network login account.
security_profile	Specifies a security profile string during account creation.

Default

N/A.

Usage Guidelines

Use this command to change any previously associated security profiles on the switch.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin mac timers reauth-period

configure netlogin mac timers reauth-period *reauth_period*

Description

Configures the reauthentication period for network login MAC-based authentication.

Syntax Description

reauth-period	Specifies time after which the switch will attempt to re-authenticate an authenticated supplicant. The range is 0, 30 to 7200 seconds.

Default

The default is 0 (disabled).

Usage Guidelines

This command allows you to configure the reauth-period for network login MAC-based authentication. The session-timeout configuration on the RADIUS server overrides the reauth-period if it has been configured.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin move-fail-action

configure netlogin move-fail-action [authenticate | deny]

Description

Configures the action network login takes if a VLAN move fails. This can occur if two clients attempt to move to an untagged VLAN on the same port.

Syntax Description

authenticate	Specifies that the client is authenticated.
deny	Specifies that the client is not authenticated. This is the default setting.

Default

The default setting is deny.

Usage Guidelines

Use this command to specify how network login behaves if a VLAN move fails. Network login can either authenticate the client on the current VLAN or deny the client.

The following describes the parameters of this command if two clients want to move to a different untagged VLAN on the same port:

- authenticate—Network login authenticates the first client that requests a move and moves that client to the requested VLAN. Network login authenticates the second client but does not move that client to the requested VLAN. The second client moves to the first client's authenticated VLAN.
- deny—Network login authenticates the first client that requests a move and moves that client. Network login does not authenticate the second client.

To view the current move-fail-action setting on the switch, use the show netlogin command.

Example

The following command configures network login to authenticate the client on the current VLAN:

```
configure netlogin move-fail-action authenticate
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure netlogin port allow egress-traffic

configure netlogin ports [*port_list* | **all**] **allow egress-traffic** [**none** | **unicast** | **broadcast** | **all_cast**]

Description

Configures the egress traffic in an unauthenticated state.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.
none	Specifies that no traffic is sent out if if no authenticated clients exist on the VLAN.
unicast	Specifies that the unicast flooding traffic for the VLANs on the network login enabled port be sent.
broadcast	Specifies that the broadcast traffic for the VLANs on the network login enabled port be sent.
all_cast	Specifies that the broadcast and unicast flooding traffic for the VLANs on the network login enabled port be sent.

Default

The default is none.

Usage Guidelines

This command allows you to configure the egress traffic in an unauthenticated state on a per-port basis.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin ports mode

configure netlogin ports [**all** | *port_list*] **mode** [**mac-based-vlans** | **port-based-vlans**]

Description

Configures the network login port's mode of operation.

Syntax Description

all	Specifies all netlogin ports.
port_list	Specifies one or more network login ports.
mac-based-vlans	Allows more than one untagged VLAN.
port-based-vlans	Allows only one untagged VLAN. This is the default behavior.

Default

The default setting is port-based-vlans.

Usage Guidelines

Use this command to configure network login MAC-based VLANs on a network login port.

If you modify the mode of operation to mac-based-vlans and later disable all network login protocols on that port, the mode of operation automatically returns to port-based-vlans.

When you change the network login port's mode of operation, the switch deletes all currently known supplicants from the port and restores all VLANs associated with that port to their original state. In addition, by selecting mac-based-vlans, you are unable to manually add or delete untagged VLANs from this port. Network login now controls these VLANs.

With network login MAC-based operation, every authenticated client has an additional FDB flag that indicates a translation MAC address. If the supplicant's requested VLAN does not exist on the port, the switch adds the requested VLAN.

Important Rules and Restrictions

This section summarizes the rules and restrictions for configuring network login MAC-based VLANs:

- If you attempt to configure the port's mode of operation before enabling network login, the switch displays an error message similar to the following:

  ```
  ERROR: The following ports do not have NetLogin enabled; 1
  ```

  To enable network login on the switch, use the following command to enable network login and to specify an authentication method (for example, 802.1x—identified as dot1.x in the CLI):

  enable netlogin dot1x

  To enable network login on the ports, use the following command to enable network login and to specify an authentication method (for example, 802.1x—identified as dot1.x in the CLI):

  enable netlogin ports 1:1 dot1x

- On ExtremeXOS versions prior to 12.0 on switches other than the Summit family, 10 Gigabit Ethernet ports such as those on the 10G4X I/O module and the uplink ports on Summit family switches do not support network login MAC-based VLANs.

  If you attempt to configure network login MAC-based VLANs on 10 Gigabit Ethernet ports, the switch displays an error message similar to the following:

```
ERROR: The following ports do not support the MAC-Based VLAN mode; 1,
2, 10
```

In ExtremeXOS version 12.0, Summit X450a, X450e, and BlackDiamond 8800 10G4Xa modules support MAC-based VLANs on 10 Gigabit Ethernet ports. The BlackDiamond 8800 10G4X 10 Gigabit Ethernet ports do not support MAC-based VLANs.

- You can have a maximum of 1,024 MAC addresses per I/O module or per Summit family switch.

Displaying FDB Information

To view network login-related FDB entries, use the following command:

```
show fdb netlogin [all | mac-based-vlans]
```

The following is sample output from the show fdb netlogin mac-based-vlans command:

```
Mac                    Vlan          Age     Use    Flags      Port List
-------------------------------------------------------------------------
00:04:96:10:51:80      VLONE(0021)   0086    0000   n m      v 1:11
00:04:96:10:51:81      VLTWO(0051)   0100    0000   n m      v 1:11
00:04:96:10:51:91      VLTWO(0051)   0100    0000   n m      v 1:11
Flags : d - Dynamic, s - Static, p - Permanent, n - NetLogin, m - MAC, i - IP,
x - IPX, l - lockdown MAC, M - Mirror, B - Egress Blackhole,
b - Ingress Blackhole, v - NetLogin MAC-Based VLAN.
```

The flags associated with network login include:

- v—Indicates the FDB entry was added because the port is part of a MAC-based virtual port/VLAN combination.
- n—Indicates the FDB entry was added by network login.

Displaying Port and VLAN Information

To view information about the VLANs that are temporarily added in MAC-based mode for network login, use the following command

```
show ports <port_list> information detail
```

The following is sample output from this command:

```
Port:   1
Virtual-router: VR-Default
Type:           UTP
Random Early drop:      Disabled
Admin state:    Enabled with  auto-speed sensing  auto-duplex
Link State:     Active, 100Mbps, full-duplex
Link Counter: Up        1 time(s)
VLAN cfg:
Name: Default, Internal Tag = 1(MAC-Based), MAC-limit = No-limit
...<truncated output>
```

```
Egress 802.1p Replacement:      Disabled
NetLogin:                       Enabled
NetLogin authentication mode:   Mac based
NetLogin port mode:             MAC based VLANs
Smart redundancy:               Enabled
Software redundant port:        Disabled
auto-polarity:                  Enabled
```

The added output displays information about the mode of operation for the network login port.

- VLAN cfg—The term MAC-based appears next to the tag number.
- Netlogin port mode—This output was added to display the port mode of operation. Mac based appears as the network login port mode of operation.

To view information about the ports that are temporarily added in MAC-based mode for network login, due to discovered MAC addresses, use the following command:

```
show vlan detail
```

The following is sample output from this command:

```
VLAN Interface with name Default created by user
Tagging:        802.1Q Tag 1
Priority:       802.1P Priority 0
Virtual router: VR-Default
STPD:           s0(Disabled,Auto-bind)
Protocol:       Match all unfiltered protocols
Loopback:       Disable
NetLogin:       Disabled
Rate Shape:     Disabled
QosProfile:     None configured
Ports:   26.      (Number of active ports=2)
Untag:    *1um, *2,     3,     4,     5,     6,     7,
8,        9,    10,    11,    12,    13,    14,
15,       16,    17,    18,    19,    20,    21,
22,       23,    24,    25,    26
Flags: (*) Active, (!) Disabled, (g) Load Sharing port
(b) Port blocked on the vlan, (a) Authenticated NetLogin Port
(u) Unauthenticated NetLogin port, (m) Mac-Based port
```

The flags associated with network login include:

- a—Indicates an authenticated network login port.
- u—Indicates an unauthenticated network login port.
- m—Indicates that the network login port operates in MAC-based mode.

Example

The following command configures the network login ports mode of operation:

```
configure netlogin ports 1:1-1:10 mode mac-based-vlans
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

configure netlogin ports no-restart

configure netlogin ports [**all** | *port_list*] **no-restart**

Description

Disables the network login port restart feature.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.

Default

The default setting is no-restart; the network login port restart feature is disabled.

Usage Guidelines

Use this command to disable the network login port restart feature on a network login port.

Configure network login port restart on ports with directly attached supplicants. If you use a hub to connect multiple supplicants, only the last unauthenticated supplicant causes the port to restart.

Displaying the Port Restart Configuration

To display the network login settings on the port, including the configuration for port restart, use the following command:

```
show netlogin port <port_list>
```

Output from this command includes the enable/disable state for network login port restart.

Example

The following command disables network login port restart on port 1:1:

```
configure netlogin ports 1:1 no-restart
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure netlogin ports restart

configure netlogin ports [**all** | *port_list*] **restart**

Description

Enables the network login port restart feature.

Syntax Description

all	Specifies all network login ports.
port_list	Specifies one or more network login ports.

Default

The default setting is no-restart; the network login port restart feature is disabled.

Usage Guidelines

Use this command to enable the network login port restart feature on a network login port. This allows network login to restart specific network login-enabled ports when the last authenticated supplicant releases, regardless of the configured protocols on the port.

Configure network login port restart on ports with directly attached supplicants. If you use a hub to connect multiple supplicants, only the last unauthenticated supplicant causes the port to restart.

Displaying the Port Restart Configuration

To display the network login settings on the port, including the configuration for port restart, use the following command:

```
show netlogin port <port_list>
```

Output from this command includes the enable/disable state for network login port restart.

Example

The following command enables network login port restart on port 1:1:

```
configure netlogin ports 1:1 restart
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure netlogin redirect-page

configure netlogin redirect-page *url*

Description

Configures the redirect URL for Network Login.

Syntax Description

url	Specifies the redirect URL for Network Login.

Default

The redirect URL default value is “http://www.extremenetworks.com”; the default port value is 80.

Usage Guidelines

In ISP mode, you can configure network login to be redirected to a base page after successful login using this command. If a RADIUS server is used for authentication, then base page redirection configured on the RADIUS server takes priority over this configuration.

You must configure a complete URL starting with http:// or https://Security

You can also configure a specific port location at a specific target URL location. For example, you can configure a target port 8080 at extremenetworks.com with the following command:

```
configure netlogin redirect-page "www.extremenetworks.com:8080"
```

To support https, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. For more information about SSH2, see Security in the ExtremeXOS Concepts Guide. For information about installing the SSH module, see Software Upgrade and Boot Options in the ExtremeXOS Concepts Guide.

This command applies only to the web-based authentication mode of Network Login.

Example

The following command configures the redirect URL as http://www.extremenetworks.com/support:

```
configure netlogin redirect-page http://www.extremenetworks.com/support
```

History

This command was first available in ExtremeXOS 11.1.

Support for HTTPS was introduced in ExtremeXOS 11.2.

Target port support was introduced in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin session-refresh

configure netlogin session-refresh {*refresh_seconds*}

Description

Configures network login session refresh.

Syntax Description

refresh_seconds	Specifies the session refresh time for network login in seconds.

Default

Enabled, with a value of 180 seconds for session refresh.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the Logout link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to 360 seconds by default. The value can range from 1 to 3600 seconds. When you configure the network login session refresh for the logout window, ensure that the FDB aging timer is greater than the network login session refresh timer.

This command applies only to the web-based authentication mode of network login.

Example

The following command enables network login session refresh and sets the refresh time to 100 seconds:

```
configure netlogin session-refresh 100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure netlogin vlan

configure netlogin vlan *vlan_name*

Description

Configures the VLAN for Network Login.

Syntax Description

vlan	Specifies the VLAN for Network Login.

Default

N/A.

Usage Guidelines

This command will configure the VLAN used for unauthenticated clients. One VLAN needs to be configured per VR. To change the VLAN, network login needs to be disabled. Network login can only be enabled when a VLAN is assigned (and no ports are configured for it).

By default no VLAN is assigned for network login.

Example

The following command configures the VLAN login as the network login VLAN:

```
configure netlogin vlan login
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure vlan netlogin-lease-timer

configure vlan *vla* **name> netlogin-lease-timer** *seconds*

Description

Configures the timer value returned as part of the DHCP response for clients attached to networklogin-enabled ports.

Syntax Description

vlan name	Specifies the VLAN to which this timer value applies.
seconds	Specifies the timer value, in seconds.

Default

10 seconds.

Usage Guidelines

The timer value is specified in seconds.

This command applies only to the web-based authentication mode of network login.

Example

The following command sets the timer value to 15 seconds for VLAN corp:

```
configure vlan corp netlogin-lease-timer 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

create netlogin local-user

create netlogin local-user *user-name* {**encrypted**} {*password*} {**vlan-vsa** [[{**tagged** | **untagged**} [*vlan_name*] | *vlan_tag*]]} {**security-profile** *security_profile*}

Description

Creates a local network login user name and password.

Syntax Description

user-name	Specifies a new local network login user name. User names must have a minimum of 1 character and a maximum of 32 characters.
encrypted	The encrypted option is used by the switch to encrypt the password. Do not use this option through the command line interface (CLI).
password	Specifies a local network login user password. Passwords must have a minimum of 0 characters and a maximum of 32 characters.
tagged	Specifies that the client be added as tagged.
untagged	Specifies that the client be added as untagged.
vlan_name	Specifies the name of the destination VLAN.
vlan_tag	Specifies the VLAN ID, tag, of the destination VLAN.
security_profile	Specifies a security profile string during account creation.

Default

N/A.

Usage Guidelines

Use this command to create a local network login account and to configure the switch to use its local database for network login authentication. This method of authentication is useful in the following situations:

- If both the primary and secondary (if configured) RADIUS servers timeout or are unable to respond to authentication requests.
- If no RADIUS servers are configured.
- If the RADIUS server used for network login authentication is disabled.

If any of the above conditions are met, the switch checks for a local user account and attempts to authenticate against that local account.

Extreme Networks recommends creating a maximum of 64 local accounts. If you need more than 64 local accounts, Extreme Networks recommends using RADIUS for authentication. For more information about RADIUS authentication, see the ExtremeXOS Concepts Guide.

You can also specify the destination VLAN to enter upon a successful authentication.

Note

If you do not specify a password or the keyword encrypted, you are prompted for one.

Additional Requirements

This command applies only to the web-based and MAC-based modes of network login. 802.1x network login does not support local database authentication.

You must have administrator privileges to use this command. If you do not have administrator privileges, the switch displays a message similar to the following:

```
This user does not have permissions for this command.
```

User names are not case-sensitive. Passwords are case-sensitive. User names must have a minimum of 1 character and a maximum of 32 characters. Passwords must have a minimum of 0 characters and a maximum of 32 characters. If you use RADIUS for authentication, Extreme Networks recommends that you use the same user name and password for both local authentication and RADIUS authentication.

If you attempt to create a user name with more than 32 characters, the switch displays the following messages:

```
%% Invalid name detected at '^' marker.
%% Name cannot exceed 32 characters.
```

If you attempt to create a password with more than 32 characters, the switch displays the following message after you re-enter the password:

```
Password cannot exceed 32 characters
```

Modifying an Existing Account

To modify an existing local network login account, use the following command:

```
configure netlogin local-user user-name {vlan-vsa [[{tagged |
untagged} [vlan_name | vlan_tagw]] | none]}
```

Displaying Local Network Login Accounts

To display a list of local network login accounts on the switch, including VLAN information, use the following command:

```
show netlogin local-users
```

Example

The following command creates a local network login user name and password:

```
create netlogin local-user megtest
```

After you enter the local network login user name, press [Enter]. The switch prompts you to enter a password (the switch does not display the password):

```
password:
```

After you enter the password, press [Enter]. The switch then prompts you to re-enter the password:

```
Reenter password:
```

The following command creates a local network login user name, password, and associates a destination VLAN with this account:

```
create netlogin local-user accounting vlan-vsa blue
```

As previously described, the switch prompts you to enter and confirm the password.

History

This command was first available in ExtremeXOS 11.2.

The vlan-vsa parameter and associated options were added in ExtremeXOS 11.3.

The security-profile parameter was added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

delete netlogin local-user

delete netlogin local-user *user-name*

Description

Deletes a specified local network login user name and its associated password.

Syntax Description

user-name	Specifies a local network login user name.

Default

N/A.

Usage Guidelines

Use the show netlogin local-users command to determine which local network login user name you want to delete from the system. The show netlogin local-users output displays the user name and password in a tabular format.

This command applies only to web-based and MAC-based modes of network login. 802.1x network login does not support local database authentication.

You must have administrator privileges to use this command.

Example

The following command deletes the local network login megtest along with its associated password:

```
delete netlogin local-user megtest
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable netlogin

disable netlogin [{dot1x} {mac} {web-based}]

Description

Disables network login modes.

Syntax Description

dot1x	Specifies 802.1x authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All types of authentication are disabled.

Usage Guidelines

Any combination of authentication types can be disabled on the same switch. To enable an authentication mode, use the following command:

```
enable netlogin [{dot1x} {mac} {web-based}]
```

Example

The following command disables MAC-based network login:

```
disable netlogin mac
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable netlogin authentication failure vlan ports

disable netlogin authentication failure vlan ports [*ports* | **all**]

Description

Disables the configured authentication failure VLAN on the specified ports.

Syntax Description

all	Specifies all ports included in the authentication failure VLAN.
ports	Specifies one or more ports or slots and ports on which the authentication failure VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to disable the configured authentication failure VLAN on either the specified ports, or all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable netlogin authentication service-unavailable vlan ports

disable netlogin authentication service-unavailable vlan ports [ports | all]

Description

Disable the configured authentication service-unavailable VLAN on the specified ports.

Syntax Description

all	Specifies all ports included in the authentication service-unavailable VLAN.
ports	Specifies one or more ports or slots and ports on which the authentication service-unavailable VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to disable the configured authentication service-unavailable VLAN on the specified ports, or on all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms .

disable netlogin dot1x guest-vlan ports

disable netlogin dot1x guest-vlan ports [**all** | *ports*]

Description

Disables the guest VLAN on the specified 802.1x network login ports.

Syntax Description

all	Specifies all ports included in the guest VLAN.
ports	Specifies one or more ports included in the guest VLAN.

Default

Disabled.

Usage Guidelines

Use this command to disable the guest VLAN feature.

Enabling Guest VLANs

To enable the guest VLAN, use the following command:

```
enable netlogin dot1x guest-vlan ports [all | <ports>]
```

Example

The following command disables the guest VLAN on all ports:

```
disable netlogin dot1x guest-vlan ports all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable netlogin logout-privilege

disable network login logout-privilege

Description

Disables network login logout window pop-up.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command controls the logout window pop-up on the web-based network client. This command applies only to the web-based authentication mode of network login. When disabled, the logout window pop-up will no longer appear. However, if session refresh is enabled, the login session will be terminated after the session refresh timeout.

Example

The following command disables network login logout-privilege:

```
disable netlogin logout-privilege
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable netlogin ports

disable netlogin ports *ports* **[{dot1x} {mac} {web-based}]**

Description

Disables network login on a specified port for a particular method.

Syntax Description

ports	Specifies the ports for which network login should be disabled.
dot1x	Specifies 802.1x authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

Network login is disabled by default.

Usage Guidelines

Network login must be disabled on a port before you can delete a VLAN that contains that port.

This command applies to the MAC-based, web-based, and 802.1x mode of network login. To control which authentication mode is used by network login, use the following commands:

```
enable netlogin [{dot1x} {mac} {web-based}]
disable netlogin [{dot1x} {mac} {web-based}]
```

Example

The following command disables dot1x and web-based network login on port 2:9:

```
disable netlogin ports 2:9 dot1x web-based
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable netlogin reauthenticate-on-refresh

disable netlogin reauthenticate-on-refresh

Description

Disables network login reauthentication on refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The web-based Netlogin client's session is periodically refreshed by sending an HTTP request which acts as a keep-alive without actually re-authenticating the user's credentials with the back-end RADIUS server or local database. If reauthenticate-on-refresh is enabled, re-authentication occurs with the session refresh.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable netlogin redirect-page

disable netlogin redirect-page

Description

Disables the network login redirect page function.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command disables the network login redirect page so that the client is sent to the originally requested page.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable netlogin session-refresh

disable netlogin session-refresh

Description

Disables network login session refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the LogOut link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to three minutes by default.

This command applies only to the web-based authentication mode of network login.

Example

The following command disables network login session refresh:

```
disable netlogin session-refresh
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable netlogin

enable netlogin [{dot1x} {mac} {web-based}]

Description

Enables network login authentication modes.

Syntax Description

dot1x	Specifies 802.1x authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All types of authentication are disabled.

Usage Guidelines

Any combination of types of authentication can be enabled on the same switch. At least one of the authentication types must be specified on the command line.

To disable an authentication mode, use the following command:

```
disable netlogin [{dot1x} {mac} {web-based}]
```

Example

The following command enables web-based network login:

```
enable netlogin web-based
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable netlogin authentication failure vlan ports

enable netlogin authentication failure vlan ports [*ports* | **all**]

Description

Enables the configured authentication failure VLAN on the specified ports.

Syntax Description

all	Specifies all ports included in the authentication failure VLAN.
ports	Specifies one or more ports or slots and ports on which the authentication failure VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to enable the configured authentication failure VLAN on either the specified ports, or all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable netlogin authentication service-unavailable vlan ports

enable netlogin authentication service-unavailable vlan ports [ports | all]

Description

Enables the configured authentication service-unavailable VLAN on the specified ports.

Syntax Description

all	Specifies all ports included in the service-unavailable VLAN.
ports	Specifies one or more ports or slots and ports on which the service-unavailable VLAN is enabled.

Default

All ports.

Usage Guidelines

Use this command to enable the configured authentication service-unavailable VLAN on the specified ports, or on all ports.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable netlogin dot1x guest-vlan ports

enable netlogin dot1x guest-vlan ports [all | *ports*]

Description

Enables the guest VLAN on the specified 802.1x network login ports.

Syntax Description

all	Specifies all ports included in the guest VLAN.
ports	Specifies one or more ports or slots and ports on which the guest VLAN is enabled.

Default

Disabled.

Usage Guidelines

A guest VLAN provides limited or restricted network access if a supplicant connected to a port does not respond to the 802.1x authentication requests from the switch. A port always moves untagged into the guest VLAN.

Modifying the Supplicant Timer

By default, the switch attempts to authenticate the supplicant every 30 seconds for a maximum of three tries. If the supplicant does not respond to the authentication requests, the client moves to the guest VLAN. The number of authentication attempts is a user-configured parameter with allowed values in the range of 1 to 10.

To modify the supplicant response timer, use the following command and specify the supp-resp-timeout parameter:

```
configure netlogin dot1x timers [{server-timeout <server_timeout>}
{quiet-period <quiet_period>} {reauth-period <reauth_period> {reauth-max
<max_num_reauths>}} {supp-resp-timeout <supp_resp_timeout>}]
```

Creating the Guest VLAN

Before you can enable the guest VLAN on the specified ports, you must create the guest VLAN. To create the guest VLAN, use the following command:

```
configure netlogin dot1x guest-vlan <vlan_name> {ports <port_list>}
```

Example

The following command enables the guest VLAN on all ports:

```
enable netlogin dot1x guest-vlan ports all
```

The following command enables the guest VLAN on ports 2 and 3:

```
enable netlogin dot1x guest-vlan ports 2,3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable netlogin logout-privilege

enable netlogin logout-privilege

Description

Enables network login logout pop-up window.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command controls the logout window pop-up on the web-based network client. This command applies only to the web-based authentication mode of network login.

Example

The following command enables network login logout-privilege:

```
enable netlogin logout-privilege
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable netlogin ports

enable netlogin ports *ports* **[{dot1x} {mac} {web-based}]**

Description

Enables network login on a specified port for a particular authentication method.

Syntax Description

ports	Specifies the ports for which network login should be enabled.
dot1x	Specifies 802.1x authentication.
mac	Specifies MAC-based authentication.
web-based	Specifies web-based authentication.

Default

All methods are disabled on all ports.

Usage Guidelines

For campus mode network login with web-based clients, the following conditions must be met:

- A DHCP server must be available, and a DHCP range must be configured for the port or ports in the VLAN on which you want to enable Network Login.
- The switch must be configured as a RADIUS client, and the RADIUS server must be configured to enable the network login capability.

For ISP mode login, no special conditions are required. A RADIUS server must be used for authentication.

Network login is used on a per port basis. A port that is tagged can belong to more than one VLAN. In this case, network login can be enabled on one port for each VLAN.

Windows authentication is not supported via network login.

Example

The following command configures network login on port 2:9 using web-based authentication:

```
enable netlogin ports 2:9 web-based
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable netlogin reauthentication-on-refresh

enable netlogin reauthentication-on-refresh

Description

Enables network login reauthentication on refresh.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The web-based Netlogin client's session is periodically refreshed by sending a HTTP request which acts as a keep-alive without actually re-authenticating the user's credentials with the back-end RADIUS server or local database. If reauthenticate-on-refresh is enabled, re-authentication occurs with the session refresh.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable netlogin redirect-page

enable netlogin redirect-page

Description

Enables the network login redirect page function.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command enables the network login redirect page so that the client is sent to the redirect page rather than the original page.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable netlogin session-refresh

enable netlogin session-refresh {*refresh_minutes*}

Description

Enables network login session refresh.

Syntax Description

refresh_minutes	Specifies the session refresh time for network login in minutes.

Default

Enabled, with a value of three minutes for session refresh.

Usage Guidelines

Network login sessions can refresh themselves after a configured timeout. After the user has been logged in successfully, a logout window opens which can be used to close the connection by clicking on the Logout link. Any abnormal closing of this window is detected on the switch and the user is logged out after a time interval as configured for session refresh. The session refresh is enabled and set to three minutes by default. The value can range from 1 to 255 minutes. When you configure the network login session refresh for the logout window, ensure that the FDB aging timer is greater than the network login session refresh timer.

This command applies only to the web-based authentication mode of network login.

To reset the session refresh value to the default behavior, use this command without the minutes parameter.

Example

The following command enables network login session refresh and sets the refresh time to ten minutes:

```
enable netlogin session-refresh 10
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show banner netlogin

show banner netlogin

Description

Displays the user-configured banner string for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the banner that is displayed on the network login page.

Example

The following command displays the network login banner:

```
show banner netlogin
```

If a custom banner web page exists, show banner netlogin generates the following output:

```
********** Testing NETLOGIN BANNER at <system name>**********
NOTE: Banner is not in use. Overridden since custom login page
"netlogin_login_page.html" is present.
```

If a custom banner web page does not exist, show banner netlogin generates the following output:

```
********** Testing NETLOGIN BANNER at <system name>**********
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show netlogin

show netlogin {**port** *port_list* **vlan** *vlan_name*} {**dot1x** {**detail**}} {**mac**} {**web-based**}

Description

Shows status information for network login.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
vlan_name	Specifies the name of a VLAN.
dot1x	Specifies 802.1x information.
mac	Specifies MAC-based information.
web-based	Specifies web-based information.
detail	Shows detailed information.

Default

N/A.

Usage Guidelines

Depending on your configuration, software version, and the parameters you choose to display, the information reported by this command may include some or all of the following:

- Whether network login is enabled or disabled.
- The base-URL.
- The default redirect page.
- The logout privileges setting.
- The network login session-refresh setting and time.
- The MAC and IP address of supplicants.

- The type of authentication, 802.1x, MAC-based, or HTTP (web-based).
- The guest VLAN configurations, if applicable.
- The dynamic VLAN state and uplink ports, if configured.
- Whether network login port restart is enabled or disabled.
- Which order of authentication protocols is currently being used.

If you do not specify the authentication method, the switch displays information for all network login authentication methods.

Example

The following command shows the summary network login information:

```
show netlogin
```

The following is sample output from this command:

```
NetLogin Authentication Mode : web-based ENABLED;  802.1x ENABLED;  mac-based

RADIUS server timeout           : 30
EAPOL MPDU version to transmit  : v1
Guest VLAN                      : destVlan
-----------------------------------------------
Port: 1:1,  Vlan: Default,  State: Enabled,  Authentication: 802.1x, Guest
Vlan: destVlan
MAC
00:00:86:53:c3:14   : IP=0.0.0.0         Auth=Yes User= testUser
: AuthPAE state=AUTHENTICATED BackAuth state=IDLE
: ReAuth time left=3595       ReAuth count=1
: Quiet time left=37
00:02:03:04:04:05   : IP=0.0.0.0         Auth=No  User=
: AuthPAE state=CONNECTING    BackAuth state=IDLE
: ReAuth time left=0          ReAuth count=2
: Quiet time left=37
-----------------------------------------------
```

For 802.1x, if re-authentication is disabled, the re-authentication period appears as follows:

```
Re-authentication period        : 0 (Re-authentication disabled)
```

The following command:

```
show netlogin port 5:4 dot1x
```

Generates the following sample output:

```
Port                          : 5:4
Port Restart                          : Disabled
Vlan                          : corp
Authentication                           : 802.1x
Port State                             : Enabled
Guest Vlan                           : Enabled
MACIP addressAuthenticatedTypeReAuth-TimerUser
00:10:dc:92:53:2d10.201.31.119Yes,Radius802.1x14md5isp4
-----------------------------------------------
```

The following command:

```
sh netlogin port 5:4 dot1x detail
```

Generates the following sample output:

```
Port: 5:4
Port Restart: Disabled
Vlan: corp
Authentication: 802.1x
Port State: Enabled
Guest Vlan: Enabled
MAC
00:10:dc:92:53:2d   : IP=10.201.31.119   Auth=Yes  User=md5isp4
: AuthPAE state=AUTHENTICATED BackAuth state=IDLE
: ReAuth time left=8       ReAuth count=0
: Quiet time left=0
-----------------------------------------------
```

History

This command was first available in ExtremeXOS 11.1.

Information about the guest VLAN was added in ExtremeXOS 11.2.

Information about the configured port MAC list was added in ExtremeXOS 11.3.

Information about dynamic VLANs and network login port restart was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show netlogin authentication failure vlan

show netlogin authentication failure vlan {*vlan_name*}

Description

Displays the authentication failure VLAN related configuration details.

Syntax Description

vlan_name	Specifies the name of a failure VLAN.

Default

N/A.

Usage Guidelines

Use this command to display configuration details for the authentication failure VLAN.

Example

The following command displays :

```
show netlogin authentication failure vlan
```

The following is sample output from this command:

```
--------------------------------------------------------------------------------
Authentication Service unavailable
Vlan
port                     Status
--------------------------------------------------------------------------------
corp
1:2                      Disabled
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show netlogin authentication service-unavailable vlan

show netlogin authentication service-unavailable vlan {*vlan_name*}

Description

Displays the authentication service-unavailable VLAN related configuration details.

Syntax Description

vlan_name	Specifies the name of the authentication service-unavailable VLAN.

Default

N/A.

Usage Guidelines

Use this command to display configuration details for the service-unavailable VLAN.

Example

The following command displays:

```
show netlogin authentication service-unavailable vlan
```

The following is sample output from this command:

```
--------------------------------------------------------------------------------
---
server-unavailable Vlanport                    Status
--------------------------------------------------------------------------------
---
xyz 2:1                      Disabled
abc3:1                      Enabled
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show netlogin banner

```
show netlogin banner
```

Description

Displays the user-configured banner string for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to view the banner that is displayed on the network login page.

Example

The following command displays the network login banner:

```
show netlogin banner
```

If a custom banner web page exists, show banner netlogin generates the following output:

```
********** Testing NETLOGIN BANNER at <system name>**********
NOTE: Banner is not in use. Overridden since custom login page
"netlogin_login_page.html" is present.
```

If a custom banner web page does not exist, nothing is displayed.

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show netlogin guest-vlan

show netlogin guest-vlan {vlan_name}

Description

Displays the configuration for the guest VLAN feature.

Syntax Description

vlan_name	Specifies the name of a guest VLAN.

Default

N/A.

Usage Guidelines

Use this command to display the guest VLANs configured on the switch.

If you specify the vlan_name, the switch displays information for only that guest VLAN.

The output displays the following information in a tabular format:

- Port—Specifies the 802.1x enabled port configured for the guest VLAN.
- Guest-vlan—Displays the enabled/disabled state of the guest VLAN feature.
- Vlan—Specifies the name of the guest VLAN.

Example

The following command displays the local network login list:

```
show netlogin guest-vlan
```

The following is sample output from this command:

```
Port      Guest-vlan      Vlan
--------------------------------------
5:1      Disabledgvl1
5:2      Enabledgvl2
5:3      Disabledgvl3
5:4      Enabledgvl4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show netlogin local-users

show netlogin local-users

Description

Displays the local network login users configured on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the list of local network login users and associated VLANs.

If you associated a VLAN with a local network login user, the output displays the name of the VLAN. If you have not associated a VLAN with a local network login user, the output displays not configured.

The Extended-VLAN VSA column displays the name of the VLAN and the following information:

- <not configured>—Specifies that you have not associated a VLAN with a local network login user.
- *—Specifies the movement based on the incoming port's traffic. For example, the VLAN behaves like VSA 203 if identified with a VLAN name or VSA 209 if identified with a VLAN ID.
- T—Specifies a tagged client.
- U—Specifies an untagged client.

In addition, this output is useful to determine which local network login user you want to modify or delete from the system.

Example

The following command displays the local network login list:

```
show netlogin local-users
```

The following is sample output from this command:

```
Netlogin Local User Name  Password (encrypted)          Extended-VLAN VSA
------------------------  ----------------------------  --------------------
```

```
000000000012              Iqyydz$MP7AG.VAmwOoqiKX2u13H1  U hallo
00008653C314              BoO28L$oRVvKv8.wmxcorhhXxQY40  * default
megtest                   w7iMbp$lBL34/dLx4G4M8aAdiCvI <not configured>
testUser                  /Jhouw$iHE15steebwhOibgj6pZq.  T testVlan
```

History

This command was first available in ExtremeXOS 11.2.

The output was modified to include VLAN information in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

show netlogin mac-list

show netlogin mac-list

Description

Displays the MAC address list for MAC-based network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the MAC address list used for MAC-based network login.

MAC-based authentication is VR aware, so there is one MAC list per VR.

Example

The following command displays the MAC address list:

```
show netlogin mac-list
```

The following is sample output from this command:

```
MAC Address/Mask      Password (encrypted)    Port(s)
```

```
--------------------  ----------------------  -------------
00:00:00:00:00:10/48  <not configured>        1:1-1:5
00:00:00:00:00:11/48  <not configured>        1:6-1:10
00:00:00:00:00:12/48  <not configured>        any
00:01:30:70:0C:00/48yaquany
00:01:30:32:7D:00/48ravdqsrany
00:04:96:00:00:00/24<not configured>any
```

History

This command was first available in ExtremeXOS 11.1.

Information about the configured port MAC list was added in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

unconfigure netlogin allowed-refresh-failures

unconfigure netlogin allowed-refresh-failures

Description

Restores the number refresh failures to the default value.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command allows you to restore the number of refresh failures allowed to the default value of 0.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure netlogin authentication database-order

unconfigure netlogin [mac | web-based] authentication database-order

Description

Restores the default order of database authentication protocols to use.

Syntax Description

mac	Specifies the MAC address to add.
mask	Specifies the number of bits to use for the mask.
default	Specifies the default entry.
encrypted	Used to display encrypted form of password in configuration files. Do not use.
password	Specifies the password to send for authentication.
ports	Specifies the port or port list to use for authentication.

Default

By default, the authentication order is RADIUS, local-user database.

Usage Guidelines

Use this command to restore the default configuration order for the database authentication protocols. For for details see Feature License Requirements.

Example

The following command sets the database authentication order to RADIUS, local user database for MAC-based authentication:

```
unconfigure netlogin mac authentication database-order
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

unconfigure netlogin authentication failure vlan

unconfigure netlogin authentication failure vlan *vlan_name* {**ports** *port_list*}

vlan_name	Specifies the name of the authentication failure VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Description

Disables authentication failure VLAN on network login enabled ports.

Syntax Description

Default

N/A.

Usage Guidelines

Use this command to disable authentication failure VLAN on network login enabled ports. When a supplicant fails authentication, it is moved to the authentication failure vlan and is given limited access until it passes the authentication.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure netlogin authentication service-unavailable vlan

unconfigure netlogin authentication service-unavailable vlan *vlan_name* {**ports** *port_list*}

Description

Unconfigures authentication service unavailable VLAN on network login enabled ports.

Syntax Description

vlan_name	Specifies the name of the authentication service-unavailable VLAN.
port_list	Specifies one or more ports or slots and ports. If the ports keyword is not used, the command applies to all ports.

Default

Defaults to all network login enabled ports.

Usage Guidelines

This command unconfigures authentication service unavailable VLAN on the specified network login enabled ports. Authentication service unavailable VLAN is unconfigured on all the network login enabled ports, if no port is specifically mentioned.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure netlogin banner

unconfigure netlogin banner

Description

Unconfigures the network login page banner.

Syntax Description

This command has no arguments or variables.

Default

The default banner is the Extreme Networks logo.

Usage Guidelines

Use this command to unconfigure a netlogin banner.

After the command is issued, the configured banner specified is no longer displayed.

Example

The following command unconfigures the network login page banner:

```
unconfigure netlogin banner
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

unconfigure netlogin dot1x guest-vlan

unconfigure netlogin dot1x guest-vlan {**ports** *port_list* | *vlan_name*}

Description

Unconfigures the guest VLAN feature for 802.1x authentication.

Syntax Description

ports_list	Specifies one or more ports included in the guest VLAN.
vlan_name	Specifies all ports included in the guest VLAN.

Default

N/A.

Usage Guidelines

Use this command to unconfigure the guest VLAN for 802.1x authentication.

If you do not specify one or more ports or the VLAN name, this command unconfigures all of the 802.1x ports configured for the guest VLAN feature.

If you specify one or more ports, this command unconfigures the specified 802.1x ports for the guest VLAN feature.

If you specify the VLAN name, this command unconfigures all of the 802.1x ports configured for the specified guest VLAN.

Example

The following command unconfigures the guest VLAN feature for 802.1x authentication:

```
unconfigure netlogin dot1x guest-vlan
```

History

This command was first available in ExtremeXOS 11.2.

The ports option was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

unconfigure netlogin local-user security-profile

unconfigure netlogin local-user *user-name* **security-profile**

Description

Clears a previously associated security profile.

Syntax Description

user-name	Specifies the name of an existing local network login account.

Default

N/A.

Usage Guidelines

Use this command to clear any previously associated security profiles on the switch.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure netlogin session-refresh

unconfigure netlogin session-refresh

Description

Restores the session refresh value to the default.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command allows you to restore the session refresh to the default value of 180 seconds.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure netlogin vlan

unconfigure netlogin vlan

Description

Unconfigures the VLAN for network login.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command unconfigures the VLAN used for unauthenticated clients. One VLAN needs to be configured per VR. To change the VLAN, network login needs to be disabled.

Example

The following command unconfigures the network login VLAN:

```
unconfigure netlogin vlan
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

24 Commands for Identity Management

clear counters identity-management
configure identity-management access-list
configure identity-management blacklist
configure identity-management database memory-size
configure identity-management detection
configure identity-management greylist
configure identity-management kerberos snooping aging time
configure identity-management kerberos snooping force-aging time
configure identity-management kerberos snooping forwarding
configure identity-management kerberos snooping server
configure identity-management list-precedence
configure identity-management ports
configure identity-management role add child-role
configure identity-management role add dynamic-rule
configure identity-management role add policy
configure identity-management role delete child-role
configure identity-management role delete dynamic-rule
configure identity-management role delete policy
configure identity-management role match-criteria inheritance
configure identity-management role priority
configure identity-management stale-entry aging-time
configure identity-management whitelist
configure ldap domain
configure ldap domain add server
configure ldap domain base-dn
configure ldap domain bind-user
configure ldap domain delete server
configure ldap domain netlogin
create identity-management role
create ldap domain
configure ldap hierarchical-search-oid
delete identity-management role
delete ldap domain
disable identity-management
disable snmp traps identity-management

This chapter describes commands for:

- Role-based user management
- Enabling and disabling identity management
- Configuring and unconfiguring identity management
- Managing kerberos snooping with identity management
- Displaying identity management information
- Clearing the identity management counters

clear counters identity-management

clear counters identity-management

Description

Clears the identity management feature counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears the following identity management statistics counters:

- High memory usage level reached count
- Critical memory usage level reached count
- Max memory usage level reached count
- Normal memory usage level trap sent
- High memory usage level trap sent
- Critical memory usage level trap sent
- Max memory usage level trap sent
- Event notification sent

You can view these counters with the show identity-management statistics command.

Note

The clear counters command also clears these counters. The following counters relate to active entries and are not cleared: Total number of users logged in, Total number of login instances, and Total memory used.

Example

The following command clears the identity management feature counters:

```
Switch.4 # clear counters identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management access-list

configure identity-management access-list source-address [mac | ip]

Description

Configures the access-list source-address type.

Syntax Description

mac	Specifies MAC addresses.
ip	Specifies IP addresses.

Default

MAC addresses.

Usage Guidelines

The identity management feature can install ACLs for identities based on the source MAC or source IP address. By default the MAC address of the identity is used to install the ACLs. Every network entity has a MAC address, but not all network devices have an IP address, so Extreme Networks recommends that you use the default mac selection to install ACLs for network entities based on the source MAC address.

You must disable the identity management feature with the disable identity-management command before you use this command.

Example

The following command configures the identity management feature to use MAC-based ACLs:

```
* Switch.4 # configure identity-management access-list source-address mac
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure identity-management blacklist

configure identity-management blacklist add [**mac** *mac_address* {*macmask*} | **ip** *ip_address* {*netmask*} | *ipNetmask*] | **user** *user_name*] **configure identity-management blacklist delete** [**all** | **mac** *mac_address* {*macmask*} | **ip** *ip_address* {*netmask*} | *ipNetmask*] | **user** *user_name*]

Description

Adds or deletes an entry in the identity manager blacklist.

Syntax Description

add	Adds the specified identity to the blacklist.
delete	Deletes the specified identity from the blacklist.
all	Specifies that all identities are to be deleted from the blacklist. This option is available only when the delete attribute is specified.
mac_address	Specifies an identity by MAC address.

macmask	Specifies a MAC address mask. For example: FF:FF:FF:00:00:00.
ip_address	Specifies an identity by IP address.
netmask	Specifies a mask for the specified IP address.
ipNetmask	Specifies an IP network mask.
user_name	specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in the blacklist. When you add an identity to the blacklist, the switch searches the whitelist for the same identity. If the identity is already in the whitelist, the switch displays an error.

It is possible to configure an identity in both lists by specifying different attributes in each list. For example, you can add an identity username to the blacklist and add the MAC address for that user's laptop in the whitelist. Because the blacklist has priority over the whitelist, the username is denied access to the switch from all locations.

If you add a new blacklist entry that is qualified by a MAC or IP address, the identity manager does the following:

- Reviews the identities already known to the switch. If the new blacklist entry is an identity known on the switch, all existing ACLs (based on user roles or whitelist configuration) for the identity are removed.
- When a blacklisted MAC-based identity is detected or already known, a Deny All ACL is programmed for the identity MAC address for the port on which the identity is detected.
- When a blacklisted IP-based identity is detected or already known, a Deny All ACL is programmed for the identity IP address for the port on which the identity is detected.
- The ACL for blacklisted MAC and IP addresses precedes any ACLs based on user names (including Kerberos snooping) that may have been previously configured on the port. This ensures that a Kerberos exchange cannot complete when initiated for blacklisted identities.

If you add a new blacklist entry that is qualified by a username (with or without a domain name), the identity manager does the following:

- Reviews the identities already known to the switch. If the new blacklist entry is an identity known on the switch, a Deny All ACL is programmed for the identity MAC address on all ports to which the identity is connected.
- When a new blacklisted username-based identity accesses the switch, a Deny All ACL is programmed for the identity MAC address on the port on which the identity was detected.

- The ACL for a blacklisted username follows any ACLs based on Kerberos snooping. This ensures that a Kerberos exchange for another user can complete when initiated from the same MAC address.

Note

Identity manager programs ingress ACLs. Blacklisted devices can receive traffic from the network, but they cannot send traffic into the network

Deny All ACLs for blacklisted entries exist as long as the identity remains in the identity manager database.

If you delete an identity from the blacklist, identity manager checks to see if the identity is in the local database. If the identity is known to the switch, the switch does the following:

- Removes the Deny All ACL from the port to which the identity connected.
- Initiates the role determination procedure for the switch port to which the known identity connected. This ensures that the appropriate role is applied to the identity that is no longer blacklisted.

Note

The role determination process can trigger an LDAP refresh to collect identity attributes for role determination.

Example

The following command adds a MAC address to the blacklist:

```
* Switch.4 # configure identity-management blacklist add mac 00:01:05:00:03:18
```

The following command deletes a user name from the blacklist:

```
* Switch.5 # configure identity-management blacklist delete user
bill_jacob@b.com
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure identity-management database memory-size

configure identity-management database memory-size *Kbytes*

Description

Configures the maximum amount of memory that is allocated to the identity management database.

Syntax Description

Kbytes	Specifies the maximum amount of memory to be used for maintaining identity information. The range is 64 to 49152 KB.

Default

512 KB.

Usage Guidelines

If the current memory usage is higher than the memory size specified in the configure identity-management database memory-size command, the command is not successful and a warning message appears. The message indicates that the current memory usage level is higher than the configured level and that the memory can be freed only when existing identities log out or disconnect.

Example

The following command allocates 4096 kilobytes to the identity management database:

```
* Switch.4 # configure identity-management database memory-size 4096
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management detection

configure identity-management detection [**on** | **off**] [**fdb** | **iparp** |**ipsecurity** | **kerberos** | **lldp** | **netlogin** | **all**] **ports** [*port_list* | **all**]

Description

This command provides the administrator a way to enable/disable the detection of the identities that are triggered through any of the following protocols:

- FDB
- IPARP
- IPSecurity DHCP Snooping

- LLDP
- Netlogin
- Kerberos

Syntax Description

detection	Detection of the identities
on	Detection of identities on
off	Detection of identities off
fdb	FDB identities
iparp	IPARP identities
ipsecurity	Identities detected through DHCP snooping entries
kerberos	Kerberos identities
lldp	LLDP identities
all	All identities

Default

On.

Usage Guidelines

The identity manager detects the identities using the following protocols:

- FDB
- IPARP
- IPSecurity DHCP Snooping
- LLDP
- Netlogin
- Kerberos

By default, Identity Management detects identities through all the above mentioned protocols.

This feature provides the administrator a way to enable/disable the detection of the identities that are triggered through any of the above said protocols. The administrator can control the identity detection through any of the protocol trigger at the port level. This configuration can be applied to identity management enabled ports only. EXOS displays an error if this configuration is applied for the identity management disabled ports.

Note

All types of Netlogin identity will not be detected if the netlogin detection is disabled.

Enabling Kerberos identity detection will not create identities for the previously authenticated Kerberos clients.

Example

```
* Slot-1 Stack.1 # configure identity-management detection off fdb ports 1:3-6
* Slot-1 Stack.2 # configure identity-management detection off ipsecurity
ports 1:3-6
* Slot-1 Stack.3 # configure identity-management detection off kerberos ports
1:1, 2:5-8
* Slot-1 Stack.4 # configure identity-management detection off netlogin ports
1:1-24, 2:1-24
The effect of these commands can be seen by issuing the show identity-
management command
* Slot-1 Stack.5 # show identity-management
Identity Management : Enabled
Stale entry age out (effective) : 180 Seconds (180 Seconds)
Max memory size : 512 Kbytes
Enabled ports : 1:1-24, 2:1-24
FDB Detection Disabled ports : 1:3-6
IPARP Detection Disabled ports : None
IPSecurity Detection Disabled ports : 2:1
Kerberos Detection Disabled ports : 1:1, 2:5-8
LLDP Detection Disabled ports : None
Netlogin Detection Disabled ports : 1:1-24, 2:1-24
SNMP trap notification : Enabled
Access list source address type : IP
Kerberos aging time (DD:HH:MM) : 00:08:00
Kerberos force aging time (DD:HH:MM) : None
Valid Kerberos servers : none configured(all valid)
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure identity-management greylist

configure identity-management greylist add user *username* **identity-management greylist delete** [**all** | **user** *username*]

Description

This command enables a network administrator to choose usernames whose identity is not required to be maintained. These user names are added to greylist. Identity Management module does not create an identity when greylist users log in.

Syntax Description

user name	Specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in greylist. Administrator can configure username as part of greylist. When such configuration takes place, identity manager takes following action.

- checks if the same entry is present in blacklist/ whitelist. If yes, command is rejected with appropriate error message
- checks if this entry is in-effective because of existing entries in blacklist/whitelist. During this check, precedence of greylist is also taken into account.
  - E.g: New entry being configured into greylist is: Richard@corp. Assume blacklist has higher precedence and it has an entry "Richard". In this case, new entry is ineffective and the configuration is rejected giving the details.
- If no conflict is found, greylist is updated.
- IDM checks if any existing identity matches the new entry in greylist. If match is found, location/ identity will be deleted and unknown identity is created with the same MAC.

If greylist user is the only user logged into the device, unknown identity is created and user is kept in unauthenticated role. However if actual user is present along with greylist user, no additional policy is applied for greylist user. Greylist user will get access permissions same as that of actual user logged in.

When user deletes an entry from greylist, identity manager will

1. Delete the entry and updates the list.

2. User identity is constructed based on NetLogin details, if deleted username is found in NetLogin authenticated user database.

Example

The following command adds an username to the greylist:

```
configure identity-management greylist add user Richard@corp
```

The following command deletes an username from the greylist:

```
configure identity-management greylist del user Richard@corp
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure identity-management kerberos snooping aging time

configure identity-management kerberos snooping aging time *minutes*

Description

Specifies the aging time for Kerberos snooping entries.

Syntax Description

minutes	Specifies the aging time in minutes. The range is 1 to 65535 minutes.

Default

N/A.

Usage Guidelines

Kerberos does not provide any service for un-authentication or logout. Kerberos does provide a ticket lifetime, but that value is encrypted and cannot be detected during snooping.

To enable the aging and removal of snooped Kerberos entries, this timer defines a maximum age for the snooped entry. When a MAC address with a corresponding Kerberos entry in Identity Manager is aged out, the Kerberos snooping timer starts. If the MAC address becomes active before the Kerberos snooping timer expires, the timer is reset and the Kerberos entry remains active. If the MAC address is inactive when the Kerberos snooping timer expires, the Kerberos entry is removed.

Example

The following command configures the aging time for 600 minutes:

```
* Switch.4 # configure identity-management kerberos snooping aging time 600
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management kerberos snooping force-aging time

configure identity-management kerberos snooping force-aging time [**none** | *minutes*]

Description

Configures the switch to remove all Kerberos snooping entries after the specified time expires.

Syntax Description

minutes	Specifies the aging time in minutes. The range is 1 to 65535 minutes.
none	Disables the Kerberos force-aging feature.

Default

N/A.

Usage Guidelines

If Kerberos force aging is enabled, Extreme Networks recommends that the Kerberos snooping force aging time be set to the same value as the Kerberos ticket lifetime.

Example

The following command removes all Kerberos snooping entries after 600 minutes:

```
* Switch.4 # configure identity-management kerberos snooping force-aging time
600
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure identity-management kerberos snooping forwarding

configure identity-management kerberos snooping forwarding [**fast-path** | **slow-path**]

Description

When identity management is enabled on a port, kerberos packets are software-forwarded. With this command, you can report if shared folder access via identity management-enabled ports is slow if there exists other CPU-bound traffic.

Syntax Description

forwarding	Configure how customer kerberos authentication packets are forwarded by this system.
fast-path	Forward customer snooped kerberos packets in hardware (default).
slow-path	Forward customer snooped kerberos packets in software. This option is recommended only for systems with low CPU-bound traffic.

Default

Fast-path.

Usage Guidelines

Use this command to report if shared folder access via identity management-enabled ports is slow if there exists other CPU-bound traffic.

Example

The following show command displays the modified kerberos information:

```
X460-48p.14 # sh identity-management
Identity Management                    : Enabled
Stale entry age out (effective)        : 180 Seconds (180 Seconds)
Max memory size                        : 512 Kbytes
Enabled ports                          : 1
SNMP trap notification                 : Enabled
Access list source address type        : MAC
Kerberos aging time (DD:HH:MM)         : None
Kerberos force aging time (DD:HH:MM)   : None
Kerberos snooping forwarding           : Fast path
Kerberos snooping forwarding           : Slow path
Valid Kerberos servers                 : none configured(all valid)
LDAP Configuration:
-------------------
LDAP Server     : No LDAP Servers configured
Base-DN         : None
Bind credential : anonymous

LDAP Configuration for Netlogin:
  dot1x         : Enabled
  mac           : Enabled
  web-based     : Enabled
```

History

This command was first available in ExtremeXOS 15.1.3.

Platform Availability

This command is available on all platforms.

configure identity-management kerberos snooping server

configure identity-management kerberos snooping add server *ip_address*

configure identity-management kerberos snooping delete server [*ip_address* |**all**]

Description

Adds or deletes a Kerberos server to the Kerberos server list.

Syntax Description

ip_address	Specifies a Kerberos server IP address to add or delete.
all	Specifies that all Kerberos server list entries are to be deleted.

Default

No servers are in the Kerberos server list.

Usage Guidelines

When no servers are configured in the Kerberos server list, the Kerberos snooping feature processes responses from all Kerberos servers, which can expose the system to simulated logins. To avoid this exposure, you can configure a list of up to 20 valid Kerberos servers. When the Kerberos server list contains one or more entries, the switch only processes responses from the Kerberos servers in the list.

Example

The following command adds the Kerberos server at IP address 10.10.10.1 to the Kerberos server list:

```
* Switch.4 # configure identity-management kerberos snooping add server
10.10.10.1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management list-precedence

configure identity-management list-precedence *listname1 listname2 listname3*

Description

This command allows you to configure the precedence of list types. You must specify the list-names in the desired order of precedence. Listname1 will take precedence of all lists (i.e., highest precedence). Listname2 will take precedence over Listname3. When the user/device logs in, entries present in Listname1 will be searched at first to find matching role. Entries present in Listname2 will be searched after Listname1 and entries in Listname3 will be searched at last.

Syntax Description

listname1	Specifies the list type which has precedence over all list types.
listname2	Specifies the list type which has next precedence, after listname1.
listname3	Specifies the list type which has least precendence of all.

Default

greylist, blacklist, whitelist

Usage Guidelines

Greylist entries have higher precedence over Blacklist & Whitelist entries, by default.

This means that IDM consults with greylist first upon detection of user, and then decides if identity needs to be created. If there is a greylist entry matching the incoming username, user identity is not created. If there is no matching greylist entry, IDM proceeds with role identification for the user. However, greylist precedence is configurable. Following are three possibilities for greylist precedence configuration.

1. greylist, blacklist, whitelist

2. blacklist, greylist, whitelist

3. blacklist, whitelist, greylist

It is important to notice that blackist always has higher precedence over whitelist for EXOS 15.1.2. In order to change the list precedence, Identity Management should be disabled first. Disabling IDM is required since there may be many users/devices already mapped to some roles and policies/ACLs applied. Considering the processing load of unmapping the roles and removing policies, changing precedence isn't allowed when IDM is enabled. When precedence configuration is changed, each entry present in the list with lower precedence (new precedence) is checked with each entry present in all the lists with higher precedence.

Example

Following example instructs that blacklist has precedence over all lists. Greylist has precedence over whitelist. Whitelist has least precedence.

```
configure identity-management list-precedence blacklist greylist whitelist
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

configure identity-management ports

configure identity-management {**add** | **delete**} **ports** [*port_list* | **all**]

Description

Adds or deletes identity management for the specified ports.

Syntax Description

add	Enables identity management on the specified port list.
delete	Disables identity management on the specified port list.
port_list	Specifies the ports to which this command applies.
all	Specifies that this command applies to all ports.

Default

No ports are in the identity management enabled port list.

Usage Guidelines

If neither the add nor the delete keyword is entered, identity management is enabled on the specified port list, and the new port list overrides any previous port list.

If identity management is enabled on a port and a user or device is connected to it, information about the user or device is present in the identity management database. If this port is removed from the identity-management enabled port list, the user or device information remains in the data base until the

user logs out or the device disconnects. However, once a port is deleted from enabled port list, no new information is added to the identity management database for that port.

Note

Kerberos identities are not detected when both server and client ports are added to identity management.

Example

The following command enables identity management on ports 2:3 and 2:5:

```
configure identity-management add ports 2:3,2:5
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management role add child-role

configure identity-management role *role_name* **add child-role** *child_role*

Description

Adds a child role to the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
child-role	Specifies a name for the new child role (up to 32 characters).

Default

N/A.

Usage Guidelines

The child role name can include up to 32 characters. Role names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. Role names cannot match reserved keywords. For more information on role name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide.

The following guidelines apply to child roles:

- A child role inherits all the policies applied to its parent and any higher levels above the parent.
- The software supports 5 levels of hierarchy.
- Each role can have a maximum of 8 child roles.
- Each child role can have only 1 parent role.

Example

The following example configures a child role named East for the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" add child-role
East
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure identity-management role add dynamic-rule

configure identity-management role *role_name* [**add dynamic-rule** *rule_name* { **first** | **last** | { [**before** | **after**] *ref_rule_name*}}]

Description

Adds a dynamic ACL rule for the specified role and specifies the order.

Syntax Description

role_name	Specifies the name of an existing role.
rule_name	Specifies the name of a dynamic ACL rule to add to the specified role.

Default

The order of the dynamic rule is last if the order is not explicitly specified.

Usage Guidelines

The maximum number of policies or ACL rules that can be applied to a particular role is restricted to 8. This count does not include the policies and rules inherited from a parent role. Since the maximum hierarchy depth is 5, the maximum number of policies and rules supported for a role at the maximum hierarchy depth is 40 (8 x 5).

When a dynamic ACL rule is added to a role, it is immediately installed for all identities mapped to that role and roles below it in the role hierarchy.

Example

The following example configures the role named India-Engr to use the ACL rule named india-Engr-rule:

```
* Switch.55 # configure identity-management role "India-Engr" add dynamic-
rule india-Engr-rule
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in EXOS 15.2.1 to specify order.

Platform Availability

This command is available on all platforms.

configure identity-management role add policy

configure identity-management role *role_name* **add policy** *policy-name* {**first** | **last** {[**before** | **after**] *ref_policy_name*}}

Description

Adds a policy for the specified role and specifies the order.

Syntax Description

role_name	Specifies the name of an existing role.
policy-name	Specifies the name of a policy to add to the specified role.

Default

The order of the policy is last if the order is not explicitly specified.

Usage Guidelines

The maximum number of policies or ACL rules that can be applied to a particular role is restricted to 8. This count does not include the policies and rules inherited from a parent role. Since the maximum hierarchy depth is 5, the maximum number of policies and rules supported for a role at the maximum hierarchy depth is 40 (8 x 5).

When a policy is added to a role, it is immediately installed for all identities mapped to that role and all roles below it in the role hierarchy.

Example

The following example configures the role named India-Engr to use the policy named india-Engr-policy:

```
* Switch.44 # configure identity-management role "India-Engr" add policy
india-Engr-policy
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in EXOS 15.2.1 to specify order.

Platform Availability

This command is available on all platforms.

configure identity-management role delete child-role

configure identity-management role *role_name* **delete child-role** [*child_role* | **all**]

Description

Deletes one or all child roles from the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
child-role	Specifies a name for a child role to delete.
all	Specifies that all child roles are to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes the child role named East from the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" delete child-
role East
```

The following command deletes all child roles from the existing role named India-Engr:

```
* Switch.66 # configure identity-management role "India-Engr" delete child-
role all
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure identity-management role delete dynamic-rule

configure identity-management role *role_name* **delete dynamic-rule** [*rule_name* | **all**]

Description

Deletes one or all dynamic ACL rules for the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
rule_name	Specifies the name of a dynamic ACL rule to delete from the specified role.
all	Specifies that all dynamic ACL rules are to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes all dynamic rules from the role named India-Engr:

```
* Switch.55 # configure identity-management role "India-Engr" delete dynamic-
rule all
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure identity-management role delete policy

configure identity-management role *role_name* **delete policy** [*policy-name* | **all**]

Description

Deletes one or all policies for the specified role.

Syntax Description

role_name	Specifies the name of an existing role.
policy-name	Specifies the name of a policy to delete from the specified role.
all	Specifies that all policies are to be deleted from the specified role.

Default

N/A.

Usage Guidelines

None.

Example

The following example deletes the policy named india-Engr-policy from the role named India-Engr:

```
* Switch.44 # configure identity-management role "India-Engr" delete policy
india-Engr-policy
```

History

This command was first available in ExtremeXOS 12.5.

The all option was added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

configure identity-management role match-criteria inheritance

configure identity-management role match-criteria inheritanceconfigure identity-management role match-criteria inheritance [on | off]

Description

This command enables or disables the match-criteria inheritance support.Check the current status by performing the "show identity-management" command.

Syntax Description

role	User role
match-criteria	Match criteria for the role
inheritance	Inheriting match criteria from parent role to child role
on | off	Specifies whether match criteria inheritance is on or off.

Default

Off.

Usage Guidelines

From EXOS 15.2, child roles can inherit the match criteria of the parent role. This helps the user since the match criteria need not be duplicated in all levels of hierarchy.

When match-criteria inheritance is on, for a user to be classified under a child role, he has to satisfy the match criteria of the child role and also all parent roles in the hierarchy.

Match criteria inheritance helps users in avoiding the need to duplicate match-criteria entries in the hierarchy.

Example

For example, there are roles called Employee, USEmployee and USSales in an organization hierarchy of a company XYZCorp.com. Till EXOS 15.1 (or with match-criteria inheritance off), the user has to create three roles like this:

```
* Switch.1 # create identity-management role Employee match-criteria “company
== XYZCorp.com;”
* Switch.2 # create identity-management role USEmployee match-criteria
“company == XYZCorp.com; AND country == USA;”
* Switch.3 # create identity-management role USSales match-criteria “company
== XYZCorp.com; AND country == USA; AND department = Sales”
* Switch.4 # configure identity-management role "Employee" add child-role
"USEmployee"
* Switch.5 # configure identity-management role "USEmployee" add child-role
"USSales"
```

Now this can be simplified into this since child role inherits parent role’s match criteria.

```
* Switch.1 # configure identity-management role match-criteria inheritance on
* Switch.2 # create identity-management role Employee match-criteria “company
== XYZCorp.com;”
* Switch.3 # create identity-management role USEmployee match-criteria
“country == USA;”
* Switch.4 # create identity-management role USSales match-criteria
“department = Sales”
* Switch.5 # configure identity-management role "Employee" add child-role
"USEmployee"
* Switch.6 # configure identity-management role "USEmployee" add child-role
"USSales"
```

History

This command was first available in ExtremeXOS 15.2

Platform Availability

This command is available on all platforms.

configure identity-management role priority

configure identity-management role *role_name* **priority** *pri_value*

Description

Configures a priority value for the specified role.

Syntax Description

role_name	Specifies the name of an existing role that you want to configure.
pri_value	Specifies the role priority; the lower the priority number, the higher the priority. The range of values is 1 to 255. Value 1 represents the highest priority, and value 255 represents the lowest priority.

Default

Priority=255

Usage Guidelines

The role priority determines which role a user is mapped to when the user's attributes match the match-criteria of more than 1 role. If the user's attributes match multiple roles, the highest priority (lowest priority value) role applies. If the priority is the same for all matching roles, the role for which the priority was most recently set or modified is used.

Example

The following example configures the role named India-Engr to use the highest priority:

```
* Switch.33 # configure identity-management role "India-Engr" priority 1
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure identity-management stale-entry aging-time

configure identity-management stale-entry aging-time *seconds*

Description

Configures the stale-entry aging time for event entries in the identity management database.

Syntax Description

seconds	Specifies the period (in seconds) at which event entries are deleted. The range is 60 to 1800 seconds.

Default

180 seconds.

Usage Guidelines

The identity management database contains active entries, which correspond to active users and devices, and event entries, which record identity management events such as user logout or device disconnect. The active entries are automatically removed when a user logs out or a device disconnects. The event entries are automatically removed after a period defined by the stale-entry aging time.

Note

To capture active and event entries before they are deleted, you can use external management software such as Ridgeline®, which can access the switch using XML APIs. Extreme Networks recommends that the external client(s) that poll the identity management database be configured for polling cycles that are between one-third and two-thirds of the stale-aging time. This ensures that a new database entry or event does not age out before the next polling cycle.

The stale-entry aging time defines when event entries become stale. To preserve memory, the software periodically uses a cleanup process to remove the stale entries. You can configure the stale-entry aging time. The cleanup interval is defined by the software.

When memory usage is high, the software reduces both the stale-entry aging time and the cleanup interval to keep memory available for new entries. The following table shows how the database is managed as memory usage increases.

Table 32: Identity Management Database Usage Levels

Database Memory Usage Level	Database Memory Usage Level (Percent)	Effective Stale-Entry Aging Time	Description
Normal	Up to 80%	Configured stale-entry aging time	New identities and associated information (VLAN and IP addresses) are added to or updated in the database. Events are also added to the database. Events are deleted from the database after the configured stale-entry aging time.
High	Above 80% to 90%	The lower value of the following: 90 seconds or 50% of the configured stale-entry aging time	Identities and events are added to the database as for the normal usage level, but the effective stale-entry aging time is reduced to delete events sooner and free memory.

Table 32: Identity Management Database Usage Levels (continued)

Database Memory Usage Level	Database Memory Usage Level (Percent)	Effective Stale-Entry Aging Time	Description
Critical	Above 90%	15 seconds	The effective stale-entry aging time is further reduced to delete events sooner and free memory. No new identities are added to the database at this usage level, but updates (such as the addition or deletion of a VLAN or IP address) continue. At this level, the database might be missing active entries.
Maximum	Above 98%	15 seconds	At this level, the software does not process additions or updates to the database. The software only processes deletions. At this level, the database might be missing active entries.

Whenever the database usage level changes, an EMS message is logged, and if enabled, an SNMP trap is sent. If the switch changes the stale-entry aging time, the SNMP trap contains the new stale-entry aging time.

Note

If the database level regularly reaches the high usage level, or if it reaches the critical or maximum levels, it is time to investigate the cause of the issue. The solution might be to increase the database memory size.

External clients should be capable of adjusting the polling cycles. Because the aging cycle is shorter when memory is low, it is best if external clients can adjust their polling cycles in response to SNMP traps that announce a change in the stale-entry aging time.

Example

The following command configures the stale-entry aging time for 90 seconds:

```
* Switch.4 # configure identity-management stale-entry aging-time 90
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure identity-management whitelist

configure identity-management whitelist add [**mac** *mac_address* {*macmask*} | **ip** *ip_address* {*netmask*} | *ipNetmask*] | **user** *user_name*]**configure identity-management whitelist delete** [**all** | **mac** *mac_address* {*macmask*} | **ip** *ip_address* {*netmask*} | *ipNetmask*] | **user** *user_name*]

Description

Adds or deletes an identity in the identity manager whitelist.

Syntax Description

add	Adds the specified identity to the whitelist.
delete	Deletes the specified identity from the whitelist.
all	Specifies that all identities are to be deleted from the whitelist. This option is available only when the delete attribute is specified.
mac_address	Specifies an identity by MAC address.
macmask	Specifies a MAC address mask. For example: FF:FF:FF:00:00:00.
ip_address	Specifies an identity by IP address.
netmask	Specifies a mask for the specified IP address.
ipNetmask	Specifies an IP network mask.
user_name	Specifies an identity by user name.

Default

N/A.

Usage Guidelines

The software supports up to 512 entries in the whitelist. When you add an identity to the whitelist, the switch searches the blacklist for the same identity. If the identity is already in the blacklist, the switch displays an error.

It is possible to configure an identity in both lists by specifying different attributes in each list. For example, you can add an identity username to the whitelist and add the MAC address for that user's laptop in the blacklist. Because the blacklist has priority over the whitelist, identity access is denied from the user's laptop, but the user can access the switch from other locations.

If you add a new whitelist entry that is qualified by a MAC or IP address, the identity manager does the following:

- Reviews the identities already known to the switch. If the new whitelist entry is blacklisted (by specifying a different identity attribute), no action is taken.
- If the identity is not blacklisted and is known on the switch, all existing ACLs for the identity are removed.

- When a whitelisted MAC-based identity is detected or already known, an Allow All ACL is programmed for the identity MAC address for the port on which the identity is detected.
- When a whitelisted IP-based identity is detected or already known, an Allow All ACL is programmed for the identity IP address for the port on which the identity is detected.

If you add a new whitelist entry that is qualified by a username (with or without a domain name), the identity manager does the following:

- Reviews the identities already known to the switch. If the new whitelist entry is an identity known on the switch, an Allow All ACL is programmed for the identity MAC address on all ports to which the identity is connected.
- When a new whitelisted username-based identity accesses the switch, an Allow All ACL is programmed for the identity MAC address on the port on which the identity is detected.
- The ACL for a whitelisted username follows any ACLs based on Kerberos snooping.

Allow All ACLs for whitelisted entries exist as long as the identity remains in the identity manager database.

If you delete an identity from the whitelist, identity manager checks to see if the identity is in the local database. If the identity is known to the switch, the switch does the following:

- Removes the Allow All ACL from the port to which the identity connected.
- Initiates the role determination procedure for the switch port to which the known identity connected. This ensures that the appropriate role is applied to the identity that is no longer whitelisted.

Note

The role determination process can trigger an LDAP refresh to collect identity attributes for role determination.

Example

The following command adds an IP address to the whitelist:

```
* Switch.4 # configure identity-management whitelist add ip 10.0.0.1
```

The following command deletes a user name from the whitelist:

```
* Switch.5 # configure identity-management whitelist delete user john
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

configure ldap domain

configure ldap domain *domain_name* [**default** | **non-default**]

Description

This command is used to configure a previously added LDAP domain as default or non-default. If a domain is configured as default, older default domain, if any, will no longer be default since once only one domain can be default at a time.

Syntax Description

domain_name	Name of domain to be configured.

Default

N/A

Usage Guidelines

Use this command to configure an LDAP domain as default or non-default.

Example

This command marks the LDAP domain sales.XYZCorp.com as the default domain.

```
configure ldap domain sales.XYZCorp.com default
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure ldap domain add server

configure {**identity-management**} **ldap** {**domain** *domain_name*} **add server** [*host_ipaddr* | *host_name*] {*server_port*} {**client-ip** *client_ipaddr*} {**vr** *vr_name*} {**encrypted sasl digest-md5**}

Description

This command adds an LDAP server under an LDAP domain and configures the parameters for contacting the server.

Syntax Description

domain_name	Specifies the LDAP domain under which this server should be added.
host_ipaddr	Specifies a IP address for an LDAP server to add.
host_name	Specifies a DNS hostname for an LDAP server to add.
server_port	Specifies a port number for the LDAP service. The default port number is 389.
client_ipaddr	Specifies the LDAP client IP address, which should be set to the IP address of the interface that will connect to the LDAP server.
vr_name	Specifies the VR name for the interface that will connect to the LDAP server. The default VR for LDAP client connections is VR-Mgmt.
encrypted sasl digest-md5	Specifies that the LDAP client uses Digest RSA Data Security, Inc. MD5 Message-Digest Algorithm encryption over SASL (Simple Authentication and Security Layer) to communicate with the LDAP server. Note that this mechanism encrypts only the password credentials, and the LDAP information exchange uses plain text. **Note** To support Digest RSA Data Security, Inc. MD5 Message-Digest Algorithm over SASL, the LDAP client (bind user) password must be stored using 'reverse encryption,' and the host_name should be configured as the fully-qualified host name for the LDAP server.

Default

client-ipaddr is optional. If client-ipaddr is not specified, the LDAP client looks up the interface through which the LDAP server can be reached.

If vr_name is not specified, the LDAP client assumes it to be VR-Mgmt.

If "encrypted sasl digest-md5' is not specified, the LDAP client talks to the LDAP server using plain text.

Usage Guidelines

You can configure up to 8 LDAP servers under one LDAP domain. The LDAP servers are contacted in the order of configuration. If the first server does not respond before the timeout period expires, the second server is contacted. This process continues until an LDAP server responds, and then the

responding server marked as 'active'. Subsequent LDAP requests for that LDAP domain are sent to the 'active' server.

Note

If the switch cannot resolve the host name using a DNS server, the switch rejects the command and generates an error message.

As of 15.2, the "identity-management" keyword is now optional in this command.

Example

The following command configures LDAP client access to LDAP server LDAP1 using encrypted authentication:

```
* Switch.6 # configure identity-management ldap add server LDAP1 client-ip
10.10.2.1
encrypted sasl digest-md5
```

The following command adds the LDAP server LDAPServer1.sales.XYZCorp.com under the domain sales.XYZCorp.com and configures the LDAP client to contact it over VR-Default. It also configures the LDAP client to communicate with the server using digest-md5 encryption over SASL.

```
configure ldap domain sales.XYZCorp.com add server
LDAPServer1.sales.XYZCorp.com vr VR-Default encrypted sasl digest-md5
```

The following command adds the LDAP server 192.168.1.1 under the domain sales.XYZCorp.com and also configures the LDAP client to contact it through the interface 10.10.10.1 over VR-Mgmt.

```
configure ldap domain sales.XYZCorp.com add server 192.168.1.1 client-ip
10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2 to make the identity management keyword optional.

Platform Availability

This command is available on all platforms.

configure ldap domain base-dn

configure {**identity-management**} **ldap** {**domain** [*domain_name*|**all**]} **base-dn** [*base_dn* | **none** | **default**

Description

Configures the LDAP base-dn to be used while searching an user under an LDAP domain.

Syntax Description

domain_name	Specifies the LDAP domain for which this base-dn is to be configured.
base_dn	Specifies the LDAP base domain under which the users are to be searched.
none	Specifies the LDAP root domain as the location under which the users are to be searched.
default	Restores the base_dn to it default value i.e., same as the domain name

Default

By default base-dn is assumed to be the same as the domain name unless configured otherwise.

If a domain is not specified, the base-dn is configured for the default domain.

Usage Guidelines

LDAP base-dn is the LDAP directory root under which the users are to be searched. By default base-dn is assumed to be the same as the domain name.

For users upgrading from EXOS 15.1 and older versions, a domain is created with the same name as the base-dn in the older configuration. This domain is marked as the default domain. This can be changed later if required.

Example

The following commands configure the base-dn for the domain sales.XYZCorp.com.

The base-dn configured as XYZCorp.com means that XYZCorp.com is the base location to search for user information.

```
* Switch.11 # configure ldap domain sales.XYZCorp.com base-dn XYZCorp.com
```

The base-dn configured as none means that the directory root is the base location to search for user information.

```
* Switch.12 # configure ldap domain sales.XYZCorp.com base-dn none
```

History

This command was first available in ExtremeXOS 12.5.

This command was modified in ExtremeXOS 15.2 to add the {domain [<domain_name> | all]}

option.

Platform Availability

This command is available on all platforms.

configure ldap domain bind-user

configure {identity-management} ldap {domain [*domain_name*|all]} bind-user [*user_name* {encrypted} *password* | anonymous]

Description

Configures the LDAP client credentials required for the switch to access an LDAP server.

Syntax Description

domain_name	Specifies the LDAP domain for which this bind-user is to be configured.
user_name	Specifies the user name for LDAP server access.
encrypted	Indicates that the specified password is encrypted.
password	Specifies the user password for LDAP server access. **Note** To support Digest RSA Data Security, Inc. MD5 Message-Digest Algorithm over SASL, the password must be stored using 'reverse encryption.'
anonymous	Specifies user anonymous for LDAP server access.

Default

If no domain is specified, the bind-user is configured for the default domain.

Usage Guidelines

The bind-user is an LDAP user who has read access to user information in the LDAP directory.

On many newer directory servers "anonymous" access is disabled. You may also find that though the LDAP bind succeeds, the anonymous user might be denied read access to user information.

Example

The following command configures the LDAP bind user as jsmith with password Extreme for the domain sales.XYZCorp.com

```
* Switch.14 # configure ldap domain sales.XYZCorp.com bind-user jsmith
password Extreme
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure ldap domain delete server

configure { **identity-management** } **ldap** {**domain** [*domain_name*|**all**]} **delete server** [*host_ipaddr* | *host_name*] {*server_port*} {**vr** *vr_name*}

Description

This command is used to delete one or all LDAP servers from one or all LDAP domains.

Syntax Description

domain_name	Specifies the LDAP domain from which this server is to be deleted.
all	Specifies that all configured LDAP servers are to be deleted.
host_ipaddr	Specifies the IP address of the LDAP server to delete.
host_name	Specifies a DNS hostname of the LDAP server to delete.
server_port	Specifies a port number for the LDAP service to delete. The default port number is 389.

Default

If a domain is not specified, the server(s) under default domain is deleted.

Usage Guidelines

None.

Example

The following command deletes the LDAP server LDAPServer1.sales.XYZCorp.com from the domain sales.XYZCorp.com

```
* Switch.8 # configure ldap domain sales.XYZCorp.com delete server
LDAPServer1.sales.XYZCorp.com
```

The following command deletes all LDAP servers from all LDAP domains

```
* Switch.8 # configure ldap domain all delete server all
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure ldap domain netlogin

configure {**identity-management**} **ldap** { **domain** [*domain_name* | **all**] } [**enable**| **disable**] **netlogin** [**dot1x** | **mac** | **web-based**]

Description

Enables or disables LDAP queries for the specified type of network login users.

Syntax Description

domain_name	Specifies the LDAP doman for which this configuraton is to be applied.
dot1x	Enables or disables LDAP queries for dot1x network login.
mac	Enables or disables LDAP queries for MAC network login.
web-based	Enables or disables LDAP queries for web-based network login.

Default

LDAP queries are enabled for all types of network login.

Usage Guidelines

It may be necessary nt to disable LDAP queries for specific type of netlogin user, for example, netlogin mac users, whose username is the same as mac address. The LDAP directory might not contain useful information about these type of users and unnecessary LDAP queries can be avoided.

Note

LDAP queries are not sent for locally authenticated network login users.

Example

The following command enables LDAP queries for MAC network login:

```
* Switch.99 # configure identity-management ldap enable netlogin mac
```

The following command disables LDAP queries for dot1x network login:

```
* Switch.99 # configure identity-management ldap disable netlogin dot1x
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

create identity-management role

create identity-management role *role_name* **match-criteria** *match_criteria* {**priority** *pri_value*}

Description

Creates and configures an identity management role.

Syntax Description

role_name	Specifies a name for the new role (up to 32 characters).
match_criteria	Specifies an expression that identifies the users to be assigned to the new role.
pri_value	Specifies the role priority; the lower the priority number, the higher the priority. The range of values is 1 to 255. Value 1 represents the highest priority, and value 255 represents the lowest priority.

Default

Priority=255

Usage Guidelines

The identity management feature supports a maximum of 64 roles.

The role name can include up to 32 characters. Role names must begin with an alphabetical letter, and only alphanumeric, underscore (_), and hyphen (-) characters are allowed in the remainder of the name. Role names cannot match reserved keywords, or the default role names reserved by identity manager. For more information on role name requirements and a list of reserved keywords, see Object Names of the ExtremeXOS Concepts Guide. The role names reserved by identity manager are:

- authenticated
- blacklist
- unauthenticated
- whitelist

The match-criteria is an expression or group of expressions consisting of identity attributes, operators and attribute values. The maximum number of attribute value pairs in a role match criteria is 16. The variables in the match criteria can be matched to attributes retrieved for the identity from an LDAP server, or the can be matched to attributes learned locally by identity manager.

Table 33: LDAP Match Criteria Attributes on page 1589 lists match criteria attributes that can be retrieved from an LDAP server.

Table 34: Locally Learned Match Criteria Attributes on page 1590 lists locally learned attributes that can be used for match criteria.

Table 35: Match Criteria Operators on page 1590 lists the match criteria operators.

Table 33: LDAP Match Criteria Attributes

LDAP Attribute Name	Value Type
l or location	String
company	String
co or country	String
department	String
employeeID	String
st or state	String
title	String
mail or email	String
memberOf	String

Table 34: Locally Learned Match Criteria Attributes

Attribute Description	Attribute Name	Value Type	Example
LLDP device name	device-model	String	device-name == Avaya4300
LLDP device capabilities	device-capability	String: OtherRepeaterBridgeWLAN access portRouterPhoneDOCSIS cable deviceStation only	device-capability == Telephone
LLDP device manufacturer name	device-manufacturer-name	String	device-manufacturer-name == Avaya
LLPD system description	device-description	String	device-description==Dell EqualLogic Storage Array
MAC address	mac	MAC	mac == 00:01:e6:00:00:00/ff:ff:ff:00:00:00
MAC OUI	mac-oui	MAC	mac-oui == 00:04:96
IP address	ip-address	IP	ip-address == 10.1.1.0/20
User name	username	String	userName == adam
Port list	ports	Portlist	ports == 1,5-8

Table 35: Match Criteria Operators

Operator	Description
==	Equal. Creates a match when the value returned for the specified attribute matches the value specified in the role.
!=	Not equal. Creates a match when the value returned for the specified attribute does not match the value specified in the role.
AND	And. Creates a match when the two expressions joined by this operator are both true.
contains	Contains. Creates a match when the specified attribute contains the text specified in the role definition.
;	Semicolon. This delimiter separates expressions within the match criteria.

The role priority determines which role a user is mapped to when the user's attributes match the match-criteria of more than 1 role. If the user's attributes match multiple roles, the highest priority (lowest numerical value) role applies. If the priority is the same for all matching roles, the role for which the priority was most recently set or modified is used.

Example

The following examples create roles for the conditions described in the comments that precede the commands:

```
# Creates a role named "India-Engr" that matches employees from the
```

```
Engineering
# department who work in India
* Switch.22 # create identity-management role "India-Engr" match-criteria
"country==India; AND department==Engineering;"
# Creates a role named “US-Engr” that matches employees whose title is
Engineer and
# who work in United States
* Switch.23 # create identity-management role US-Engr match-criteria "title
contains Engineer; AND country == US;" priority 100
# Creates a role named "Avaya4300Device" for Avaya phones of type 4300 that
are
# manufactured by Avaya
* Switch.24 # create identity-management role "Avaya4300Device" match-
criteria "device-capability == Phone; AND device-name == Avaya4300; AND
device-manufacturer-name == Avaya;"
# Creates a role for all Extreme Networks switches with MAC-OUI "00:04:96"
* Switch.25 # create identity-management role "ExtremeSwitch" match-criteria
"mac-oui == 00:04:96;"
# Creates a role for all identities with IP address 1.2.3.1 - 1.2.3.255
* Switch.26 # create identity-management role "EngineeringDomain" match-
criteria "ip-Address == 1.2.3.0/255.255.255.0;"
# Creates a role for all phone devices with MAC_OUI of "00:01:e6"
* Switch.27 # create identity-management role "Printer" match-criteria "mac
== 00:01:e6:00:00:00/ff:ff:ff:00:00:00; device-capability == Phone;"
# Creates a role for the user name "adam" when he logs in from IP address
1.2.3.1 -
# 1.2.3.255.
* Switch.28 # create identity-management role "NotAccessibleUser" match-
criteria "userName == adam; AND "ip-Address == 1.2.3.0/24;"
# Creates a role named "secureAccess" for users who log in on ports 1, 5, 6,
7, and 8
# with IP addresses in the range of 10.1.1.1 to 10.1.1.255
create identity-management role "SecureAccess" match-criteria "ports ==
1,5-8; AND ip-address == 10.1.1.0/20;"
# Creates a role named “Prod-Engineers” for all the engineers who are under
LDAP group 'Production'.
Create identity-management role “Prod-Engineers” match-criteria
“title==Engineer; AND memberOf==Production;”
```

History

This command was first available in ExtremeXOS 12.5.

Support for matching locally learned attributes was added in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

create ldap domain

create ldap domain *domain_name* {**default**}

Description

This command is used to add an LDAP domain. The new domain can be added as the default. Older default domains, if any, will no longer be the default since once only one domain can be default at a time.

Syntax Description

domain_name	Name of new LDAP domain to be added

Default

N/A.

Usage Guidelines

Use this command to add an LDAP domain.

You can see the LDAP domains added by using the show ldap domain command.

Supporting multiple domains gives EXOS the capabilty to send LDAP queries to gather information about users belonging to different domains but connected to the same switch.

You can add upto 8 LDAP domains.

Example

```
The following command creates an LDAP domain with the name
"sales.XYZCorp.com" and marks it as the default domain.
create ldap domain sales.XYZCorp.com default
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

configure ldap hierarchical-search-oid

configure ldap {**domain** [*domain_name*|**all**]} **hierarchical-search-oid** [**ldap-matching-rule-in-chain** | *oid* | **none**]

Description

Configures an OID to perform a hierarchical search if the LDAP server requires it.

Syntax Description

domain_name	Domain name on which to configure ldap.
all	All domains.
oid	Object identifier.
ldap-matching-rule-in-chain	Configures the OID 1.2.840.113556.1.4.1941.
none	Specifies that LDAP query should not include any OID for hierarchical search.

Default

N/A.

Usage Guidelines

Use this command to configure an OID to perform a hierarchical search if the LDAP requires it. The OID supplied with this command will be used to form the LDAP query. If a server does not require extended control OID, the none option can be selected.

Example

```
configure ldap domain abc.com hierarchical-search-oid
ldap_matching_rule_in_chain
```

History

This command was first available in ExtremeXOS 15.3

Platform Availability

This command is available on all platforms.

delete identity-management role

delete identity-management role {*role_name* | **all**}

Description

Deletes one or all roles.

Syntax Description

role_name	Specifies a name of an existing role to delete.
all	Specifies that all roles are to be deleted.

Default

N/A.

Usage Guidelines

Any policy applied to users of a deleted role gets reverted. The users are placed under one of the other roles based on their attributes. Parent and child relationships to other roles are also deleted. For example, all child roles under the deleted role become orphans and hence they and their descendants no longer inherit the policies of the deleted role.

Example

The following example deletes the role named India-Engr:

```
* Switch.99 # delete identity-management role "India-Engr"
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

delete ldap domain

delete ldap domain [*domain_name* | **all**]

Description

This command is used to delete one or all LDAP domains.

When an LDAP domain is deleted, all LDAP servers added under that domain are also deleted. Also all LDAP configurations done for that domain are deleted.

Syntax Description

domain_name	Name of the LDAP domain that wil be deleted.

Default

N/A.

Usage Guidelines

Use this command to delete one or all LDAP domains.

When an LDAP domain is deleted, all LDAP servers added under that domain are also deleted. All LDAP configurations for that domain are also deleted.

Example

This command deletes the LDAP domain sales.XYZCorp.com

```
delete ldap domain sales.XYZCorp.com
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

disable identity-management

disable identity-management

Description

Disables the identity management feature, which tracks users and devices that connect to the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Only admin-level users can execute this command.

Note

If the identity management feature is running and then disabled, all identity management database entries are removed and cannot be retrieved. If identity management is enabled later, the identity management feature starts collecting information about currently connected users and devices.

Example

The following command disables the identity management feature:

```
disable identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

disable snmp traps identity-management

disable snmp traps identity-management

Description

Disables the identity management feature to send SNMP traps for low memory conditions.

Syntax Description

This command has no arguments or variables.

Default

No traps are sent.

Usage Guidelines

None.

Example

The following command disables the identity management SNMP trap feature:

```
disable snmp traps identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

enable identity-management

enable identity-management

Description

Enables the identity management feature, which tracks users and devices that connect to the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Only admin-level users can execute this command.

After identity management is enabled, the software creates two dynamic ACL rules named idm_black_list and idm_white_list. These rules are removed if identity management is disabled.

Note

FDB entries are flushed on identity management enabled ports when this command is executed.

Example

The following command enables the identity management feature:

```
enable identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

enable snmp traps identity-management

enable snmp traps identity-management

Description

Enables the identity management feature to send SNMP traps for low memory conditions.

Syntax Description

This command has no arguments or variables.

Default

No traps are sent.

Usage Guidelines

The low memory conditions are described in the description for the configure identity-management stale-entry aging-time <seconds> command.

Example

The following command enables the identity management SNMP trap feature:

```
enable snmp traps identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

refresh identity-management role

refresh identity-management role user [*user_name* {**domain** *domain_name*} | **all** {**role** *role_name*}]

Description

Refreshes the role evaluation for the specified user, for all users, or for all users currently under the specified role.

Syntax Description

user_name	Specifies a user name for which role evaluation will be refreshed.
domain_name	Specifies a domain name for the specified user.
all	Specifies a refresh for all users associated with the specified role.
role_name	Specifies a a role name for which all users will be refreshed.

Default

N/A.

Usage Guidelines

It may be necessary to refresh the role of a user due to a new role which might be better suited for the user or due to a change in LDAP attributes of the user which in turn might result in the user being classified under a different role. This command can be used in all such cases.

Example

The following example refreshes the role for user Tony:

```
* Switch.22 # refresh identity-management role user “Tony”
```

The following example refreshes the role for all users who are currently classified under the Marketing role:

```
* Switch.22 # refresh identity-management role all “Marketing”
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show identity-management

show identity-management

Description

Displays the identity management feature configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identity management feature configuration:

```
X450a-24t.2 # show identity-management
Identity Management                    : Enabled
Stale entry age out (effective)        : 180 Seconds (180 Seconds)
Max memory size                        : 512 Kbytes
Enabled ports                          : 1-26
FDB Detection Disabled ports           : None
IPARP Detection Disabled ports         : None
IPSecurity Detection Disabled ports    : None
Kerberos Detection Disabled ports      : None
LLDP Detection Disabled ports          : None
Netlogin Detection Disabled ports      : None
SNMP trap notification                 : Enabled
Match Criteria Inheritance             : On
Access list source address type        : MAC
Kerberos aging time (DD:HH:MM)         : None
Kerberos force aging time (DD:HH:MM)   : None
Valid Kerberos servers                 : none configured(all valid)
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging Time information was added in ExtremeXOS 12.6.

Platform Availability

This command is available on all platforms.

show identity-management blacklist

show identity-management blacklist

Description

Displays the identities in the identity manager blacklist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the blacklist:

```
* Switch.93 # show identity-management blacklist
-------------------------------------------
Type      BlackList Entry
-------------------------------------------
MAC       01:02:03:04:05:06/ff:ff:ff:00:00:00
IP        1.2.3.4/255.255.255.0
User      john@mydomain.com
-------------------------------------------
> indicates entry value truncated past 35 characters
Number of BlackList Entries     : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show identity-management entries

show identity-management entries {**user** *id_name*} {**domain** *domain*} {**ports** *port_list*} {**mac** *mac_address*} {**vlan** *vlan_name*} {**ipaddress** *ip_address*} {**detail**}

Description

Displays the entries in the identity management database.

Syntax Description

id_name	Limits the display to entries that contain the specified user ID.
domain	Limits the display to entries for the specified domain.
port_list	Limits the display to entries for the specified ports.
mac_address	Limits the display to entries that contain the specified MAC address.
vlan_name	Limits the display to entries that contain the specified VLAN name.
ip_address	Limits the display to entries that contain the specified IP address.
detail	Expands the display to include more information about identity management entries.

Default

N/A.

Usage Guidelines

Only admin-level users can execute this command.

The displayed ID Name is the actual user name when Network Login or Kerberos Snooping is enabled. For unknown users, the software creates a user name using the format: User_xxxxxxxxxxxxxxxx. The number in the user name is a 16-bit hash number that is generated using the user's port, MAC address, and IP address numbers.

The displayed Domain Name is displayed only if the client is discovered through Kerberos snooping or Dot1x and the domain name is supplied in the form of <domain>\<user>). The NetBIOS hostname is only displayed if this information was present in the Kerberos packets.

When the role is shown as multiple, the identity is connected through multiple ports/locations and different roles apply to each device.

Example

The following command displays all entries in the identity management database:

```
* Switch.4 # show identity-management entries
ID Name/          Flags  Port        MAC/          VLAN            Role
Domain Name                          IP

```

The following command example shows that you can specify multiple options, such as the user name and ports:

```
show identity-management entries user eelco ports 2:2
```

History

This command was first available in ExtremeXOS 12.4.

Kerberos Force Aging TTL and Inactive Aging TTL information was added in ExtremeXOS 12.6.

Support for multiple roles for a single identity was added in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show identity-management greylist

show identity-management greylist

Description

Displays the identities in the identity manager greylist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the identities in the identity manager greylist.

Example

```
* Switch.94 # show identity-management greylist
-------------------------------------------
Type      GreyList Entry
-------------------------------------------
User      june@mydomain.com
User                Richard@corp.acme.com
-------------------------------------------
> indicates entry value truncated past 35 characters
Number of GreyList Entries     : 2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

show identity-management list-precedence

show identity-management list-precedence

Description

This command displays the order of list-precedence. The default list-precedence is: greylist blacklist whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to display the order of list-precedence.

Example

```
 * Switch.97 # show identity-management list-precedence
List Precedence:
1.    Greylist
2.    Blacklist
3.    Whitelist
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

show identity-management role

show identity-management role {*role_name*} {**detail**}

Description

Displays summary or detailed configuration information for one or all roles.

Syntax Description

role_name	Specifies a name of an existing role to display.
all	Specifies that all roles are to be displayed.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays all roles that are configured on the switch:

```
* Switch.95 # show identity-management role
-------------------------------------------------------------------
Role Name               Priority    Child Roles       # Identities
*authenticated          255                                 0
*unauthenticated        255                                 0
extr-empl               255         extr-engr               2
extr-engr               255                                 0
*whitelist              0                                   0
*blacklist              0                                   3
-------------------------------------------------------------------
Flags : * - Default Roles
-------------------------------------------------------------------
Total number of role(s) configured : 6
```

The following command displays detailed information for all roles that are configured on the switch:

```
* Switch.96 # show identity-management role detail
Role name : extr-empl
Child  Roles : engr
Match Criteria : "company==Extreme;"
Policies : extrPol
Identities : john_smith@d.com; MAC: 00:16:23:51:77:99; Port:8
bob_craig@e.com; MAC: 00:18:23:51:77:99; Port:9
Role name : engr
Child  Roles : india-engr
Match Criteria : "department==Engineering;"
Policies : engrPol, extrPol
Identities : joe_hardy@b.com; MAC: 00:12:23:51:77:99; Port:10
Role name : india-engr
Child  Roles : -
```

```
Match Criteria : "country=India; AND department=Engineering;"
Policies : indEngrPol, engrPol, extrPol
Identities : bill_jacob@b.com; MAC: 00:12:33:51:77:99; Port:11
Role name : marketing
Child  Roles : -
Match Criteria : "department=Marketing;"
Policies : markrPol, extrPol
Identities : will_smith@a.com; MAC: 00:11:33:51:77:99; Port:14
Role Name: whitelist (Default Role)
Child Roles : ---
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 0
Identities : --
Role Name: blacklist(Default Role)
Child Roles : ---
Priority : 0
Match Criteria : "Not Applicable"
Policies : --
Identities # : 3
Identities : Unknown_00:11:22:33:44:55; MAC: 00:11:22:33:44:55; Port:1
johndoe@extremenetworks.com; MAC: 00:01:02:03:04:05; Port:2
janedoe@extremenetworks.com; MAC: 00:02:04:06:08:10; Port:3
```

The next two examples display detailed information for a single role:

```
* Switch.97 # show identity-management role extr-empl detail
Role name : extr-empl
Child  Roles : engr
Match Criteria : "company=Extreme;"
Policies : extrPol
Identities : johnsmith@extreme.com; MAC: 00:11:33:55:77:99; Port:4
bobcraig@extreme.com; MAC: 00:01:03:05:07:09; Port:5
* Switch.98 # show identity-management role NotAccessibleUser detail
Role name : NotAccessibleUser
Child  Roles : engr
Match Criteria : "UserName = adam; AND IP-Address == 1.2.3.0/24; AND port ==
1;"
Policies : extrPol
Identities : adam; MAC: 00:00:11:22:33:44; Port: 1
```

History

This command was first available in ExtremeXOS 12.5.

MAC addresses were added to the displays for the detail option in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show identity-management statistics

show identity-management statistics

Description

Displays operation statistics for the identity management feature.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

A user can login from multiple machines or ports, so the total number of login instances can be more than the number of unique users logged in.

Example

The following command displays the identity management feature statistics:

```
Switch.4 # show identity-management statistics
Total number of users logged in          :    2
Total number of login instances          :    2
Total memory used                        :    1 Kbytes
Total memory used by events              :    0 Kbytes
Total memory available                   :  511 Kbytes
High memory usage level reached count    :    0
Critical memory usage level reached count:    0
Max memory usage level reached count     :    0
Current memory usage level               : Normal
Normal memory usage level trap sent      :    0
High memory usage level trap sent        :    0
Critical memory usage level trap sent    :    0
Max memory usage level trap sent         :    0
Event notification sent                  :    0
Total number of roles configured         :    3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show identity-management whitelist

show identity-management whitelist

Description

Displays the identities in the identity manager whitelist.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the identities in the whitelist:

```
* Switch.94 # show identity-management whitelist
-------------------------------------------
Type      WhiteList Entry
-------------------------------------------
MAC       04:32:13:44:25:06/ff:ff:ff:00:00:00
IP        11.12.13.14/255.255.255.0
User      jane@mydomain.com
-------------------------------------------
> indicates entry value truncated past 35 characters
Number of WhiteList Entries     : 3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on all platforms.

show ldap domain

show ldap domain {*domain_name* | **all**}

Description

This command displays the LDAP servers and other LDAP configuration details of one or all LDAP domains.

Syntax Description

domain_name	Displays the details of the specified domain.
all	Displays the details for all domains.

Default

N/A.

Usage Guidelines

Use this command to display the LDAP servers and other LDAP configuration details of one or all LDAP domains. The summary version (show ldap domain) displays the list of LDAP domains configured.

Example

```
X450a-24t.1 # show ldap domain
-------------------------------------------------------------
LDAP Domains
-------------------------------------------------------------
XYZCorp.com (Default)
engg.XYZCorp.com
mktg.XYZCorp.com
sales.XYZCorp.com
-------------------------------------------------------------
```

If no default domain is configured, this note appears at the bottom:

```
Note: No default domain configured
X450a-24t.2 # show ldap domain all
-------------------------------------------------------------
Domain(default) : XYZCorp.com
-------------------------------------------------------------
Base-DN         : XYZCorp.com

```

If the server was specified as a host name and the IP address was not resolved, this is shown:

```
LDAP Server1   : server1.domain.com(IP address unresolved)
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

show ldap statistics

show ldap statistics

Description

This command displays LDAP packet statistics per LDAP domain.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show all LDAP related statistics per LDAP domain.

Example

```
Switch.21 # show ldap statistics
-------------------------------------------------------------
Domain          : XYZCorp.com (default)
-------------------------------------------------------------
LDAP Server  1  : 192.168.2.101
Server Port  : 389
Client VR    : VR-Mgmt
Status       : Active
Requests     : 12
Responses    : 12
Errors       : 0
LDAP Server  2  : 192.168.2.102
Server Port  : 389

Domain          : sales.XYZCorp.com
-------------------------------------------------------------
LDAP Server     : No LDAP Servers configured
```

History

This command was first available in ExtremeXOS 15.2

Platform Availability

This command is available on all platforms.

unconfigure identity-management

unconfigure identity-management {[[database memory-size] | [stale-entry aging-time] | [ports] | [kerberos snooping {aging time}]]}

Description

Sets the specified identity management configuration parameter to the default values.

Syntax Description

database memory-size	Sets the identity management database size to the default value.
stale-entry aging-time	Sets the stale-entry aging-time to the default value.
ports	Removes all ports from the identity management port list.
kerberos snooping aging time	Sets the kerberos snooping aging time to the default value (none).

Default

N/A.

Usage Guidelines

If no configuration parameters are specified, all configuration parameters are set to the default values.

Example

The following command sets all identity management configuration parameters to the default values:

```
* Switch.4 # unconfigure identity-management
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

unconfigure identity-management list-precedence

unconfigure identity-management list-precedence

Description

This command allows you to restore the order of list-precedence to factory defaults. The default list-precedence is: greylist blacklist whitelist.

Syntax Description

This command has no arguments or variables.

Default

greylist, blacklist, whitelist

Usage Guidelines

Use this command to restore the order of list-precedence to factory defaults. The default list-precedence is: greylist blacklist whitelist.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms.

unconfigure ldap domains

unconfigure ldap domains

Description

This command deletes all LDAP domains, and thereby all LDAP servers and other LDAP configurations done for those domains.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to delete all LDAP related configuration from the switch.

Example

The following command deletes all LDAP configurations, LDAP servers and LDAP domains.

```
Switch.25 # unconfigure ldap domains
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

25 Security Commands

configure radius-accounting server client-ip

This chapter describes commands for:

- Managing the switch using SSH2
- Configuring switch user authentication through a RADIUS client
- Configuring switch user authentication through TACACS+
- Protecting the switch from Denial of Service attacks

SSH

Secure Shell 2 (SSH2) is a feature of ExtremeXOS that allows you to encrypt session data between a network administrator using SSH2 client software and the switch. Configuration and policy files may also be transferred to the switch using the Secure Copy Program 2 (SCP2).

User Authentication

Remote Authentication Dial In User Service (RADIUS, RFC 2138) is a mechanism for authenticating and centrally administrating access to network nodes. The ExtremeXOS RADIUS client implementation allows authentication for SSH2, Telnet or console access to the switch.

Extreme switches are also capable of sending RADIUS accounting information. You can configure RADIUS accounting servers to be the same as the authentication servers, but this is not required.

Terminal Access Controller Access Control System Plus (TACACS+) is a mechanism for providing authentication, authorization, and accounting on a centralized server, similar in function to the RADIUS client. The ExtremeXOS version of TACACS+ is used to authenticate prospective users who are attempting to administer the switch. TACACS+ is used to communicate between the switch and an authentication database.

Note

You cannot use RADIUS and TACACS+ at the same time.

Denial of Service

You can configure ExtremeXOS to protect your Extreme switches in the event of a denial of service attack. During a typical denial of service attack, the CPU on the switch gets flooded with packets from multiple attackers, potentially causing the switch to fail. To protect against this type of attack, you can configure the software so that when the number of packets received is more than the configured threshold limit of packets per second, a hardware ACL is enabled.

clear ip-security anomaly-protection notify cache

clear ip-security anomaly-protection notify cache {**slot** [*slot* | **all**]}

Description

Clear the local protocol anomaly event cache.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

N/A.

Usage Guidelines

This command clears the local protocol anomaly event cache.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available only on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, E4G-200 and E4G-400 switches, and the BlackDiamond X8 series switches and BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

clear ip-security arp validation violations

clear ip-security arp validation violations

Description

Clears the violation counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears the ARP validation violation counters.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

clear ip-security dhcp-snooping entries

clear ip-security dhcp-snooping entries { vlan } *vlan_name*

Description

Clears the DHCP binding entries present on a VLAN.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server.

Default

N/A.

Usage Guidelines

Use this command to clear the DHCP binding entries present on a VLAN. When an entry is deleted, all its associated entries (such as source IP lockdown, secured ARP, and so on) and their associated ACLs, if any, are also deleted.

Example

The following command clears the DCHP binding entry temporary from the VLAN:

```
clear ip-security dhcp-snooping entries temporary
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

clear ip-security source-ip-lockdown entries ports

clear ip-security source-ip-lockdown entries ports [*ports* **| all]**

Description

Clears locked-down source IP addresses on a per-port basis.

Syntax Description

ports	Specifies the port or ports to be cleared.
all	Specifies that all ports are to be cleared.

Default

N/A.

Usage Guidelines

Use this command to clear locked-down source IP addresses on a per port basis. This command deletes the entries on the indicated ports and clears the associated ACLs.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

clear vlan dhcp-address-allocation

clear vlan *vlan_name* **dhcp-address-allocation** [[**all** {**offered** | **assigned** | **declined** | **expired**}] | *ipaddress*]

Description

Removes addresses from the DHCP allocation table.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server.
all	Specifies all IP addresses, or all IP addresses in a particular state.
offered	Specifies IP addresses offered to clients.
assigned	Specifies IP addresses offered to and accepted by clients.
declined	Specifies IP addresses declined by clients

expired	Specifies IP addresses whose lease has expired and not renewed by the DHCP server.
ipaddress	Specifies a particular IP address.

Default

N/A.

Usage Guidelines

You can delete either a single entry, using the IP address, or all entries. If you use the all option, you can additionally delete entries in a specific state.

Example

The following command removes all the declined IP addresses by hosts on the VLAN temporary:

```
clear vlan temporary dhcp-address-allocation all declined
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure dos-protect acl-expire

configure dos-protect acl-expire *seconds*

Description

Configures the denial of service protection ACL expiration time.

Syntax Description

seconds	Specifies how long the ACL is in place.

Default

The default is 5 seconds.

Usage Guidelines

This command configures how long the DoS protection ACL remains in place.

Example

This example sets the ACL expiration time to 15 seconds:

```
configure dos-protect acl-expire 15
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure dos-protect interval

configure dos-protect interval *seconds*

Description

Configures the denial of service protection interval.

Syntax Description

seconds	Specifies how often the DoS protection counter is monitored.

Default

The default is one second.

Usage Guidelines

This command configures how often the DoS protection counter is monitored.

Example

This example sets the interval to 5 seconds:

```
configure dos-protect interval 5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure dos-protect trusted ports

configure dos-protect trusted-ports [**ports** [*ports* | **all**] | **add-ports** [*ports-to-add* | **all**] | **delete-ports** [*ports-to-delete* | **all**]]

Description

Configures the list of trusted ports.

Syntax Description

ports	Specifies the trusted ports list.
ports-to-add	Specifies the ports to add to the trusted ports list.
all	Specifies all the ports.
ports-to-delete	Specifies the ports to delete from the trusted ports list.

Default

N/A.

Usage Guidelines

Traffic from trusted ports will be ignored when DoS protect counts the packets to the CPU. If we know that a machine connected to a certain port on the switch is a safe "trusted" machine, and we know that we will not get a DoS attack from that machine, the port where this machine is connected to can be configured as a trusted port, even though a large amount of traffic is going through this port.

Example

This example sets the trusted port list to 3:1-3:7:

```
configure dos-protect trusted-ports ports 3:1-3:7
```

This example adds the trusted port 3:8 to the current list (use this command with a network administrator machine not connected to the internet that is attached to port 3:8):

```
configure dos-protect trusted-ports add-ports 3:8
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure dos-protect type l3-protect alert-threshold

configure dos-protect type l3-protect alert-threshold *packets*

Description

Configures the denial of service protection alert threshold.

Syntax Description

packets	Specifies how many packets in an interval will cause an alert.

Default

The default is 4000 packets.

Usage Guidelines

This command configures how many packets received in an interval will cause a DoS protection alert. When an alert occurs, the packets are analyzed, and a temporary ACL is applied to the switch.

Example

This example sets the alert threshold to 8000 packets:

```
configure dos-protect type l3-protect alert-threshold 8000
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure dos-protect type l3-protect notify-threshold

configure dos-protect type l3-protect notify-threshold *packets*

Description

Configures the denial of service protection notification threshold.

Syntax Description

packets	Specifies how many packets in an interval will cause a notification.

Default

The default is 3500 packets.

Usage Guidelines

This command configures how many packets received in an interval will cause a DoS protection notification.

Example

This example sets the notification threshold to 7500 packets:

```
configure dos-protect type l3-protect notify-threshold 7500
```

History

This command was first available in ExtremeXOS 11.1

Platform Availability

This command is available on all platforms.

configure ip-security anomaly-protection icmp ipv4-max-size

configure ip-security anomaly-protection icmp ipv4-max-size *size* {**slot** [*slot* | **all**]}

Description

Configures the maximum IPv4 ICMP allowed size.

Syntax Description

size	Specifies the size of the IPv4 ICMP in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default size is 512 bytes.

Usage Guidelines

This command configures the IPv4 ICMP allowed size. The absolute maximum is 1023 bytes.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection icmp ipv6-max-size

configure ip-security anomaly-protection icmp ipv6-max-size *size* {**slot** [*slot* | **all**]}

Description

Configures the maximum ipv6 ICMP allowed size.

Syntax Description

size	Specifies the size of the IPv6 ICMP in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default size is 512 bytes.

Usage Guidelines

This command configures the IPv6 ICMP allowed size. The absolute maximum is 16K bytes.

You can use this command to configure the maximum IPv6 ICMP packet size for detecting IPv6 ICMP anomalies. If the next header in the IPv6 ICMP packet is not 0x3A:ICMP, this anomaly is not detected. For example, an IPv6 ICMP packet with packet header 0x2c: Fragment Header is not detected.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection notify cache

configure ip-security anomaly-protection notify cache *size* {**slot** [*slot* | **all**]}

Description

Configures the size of local notification cache.

Syntax Description

size	Specifies the size of the local notification cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1000 events.

Usage Guidelines

This command configures the size of local notification cache. Cached events are stored in local memory. The range is between 1 and 1000 events per second. If the cache is full, newer events replace older events.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection notify rate limit

configure ip-security anomaly-protection notify rate limit *value* {**slot** [*slot* | **all**]}

Description

Configures the rate limiting for protocol anomaly notification.

Syntax Description

value	Specifies the period of the rate limit.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 10 events per second.

Usage Guidelines

This is a paired command with configure ip-security anomaly-protection notify rate window that configures the rate limiting for protocol anomaly notification. When the anomaly notification is enabled, in order to avoid overloading CPU, the system generates only the number of limited notifications in a period of window seconds. The range is from 1 to 100 events.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection notify rate window

configure ip-security anomaly-protection notify rate window *value* {**slot** [*slot* | **all**]}

Description

Configures the rate limiting for protocol anomaly notification.

Syntax Description

value	Specifies the period of the rate limit.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1 second.

Usage Guidelines

This is a paired command with configure ip-security anomaly-protection notify rate limit that configures the rate limiting for protocol anomaly notification. When the anomaly notification is enabled, in order to avoid overloading CPU, the system generates only the number of limited notifications in a period of window seconds. The range is between 1 and 300 seconds.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and on the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection notify trigger off

configure ip-security anomaly-protection notify trigger off *value* {**slot** [*slot* | **all**]}

Description

Configures an anomaly rate-based notification feature.

Syntax Description

value	Specifies the number of events for the trigger.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1.

Usage Guidelines

This is a paired command with configure ip-security anomaly-protection notify trigger on that configures an anomaly rate-based notification feature. The anomaly notification is automatically triggered if the rate of anomaly events is greater than the configured ON value, and the notification is disabled if the rate falls below the value set in the configure ip-security anomaly-protection notify trigger off command.

The command takes effects after the anomaly notification is enabled.

Note

The value set in ON must be greater than or equal to the value set in OFF.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection notify trigger on

configure ip-security anomaly-protection notify trigger on *value* {**slot** [*slot* | **all**]}

Description

Configures an anomaly rate-based notification feature.

Syntax Description

value	Specifies the number of events for the trigger.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is 1.

Usage Guidelines

This is a paired command with configure ip-security anomaly-protection notify trigger off that configures an anomaly rate-based notification feature. The anomaly notification is automatically triggered if the rate of anomaly events is greater than the configured ON value, and the notification is disabled if the rate falls below the value set in the configure ip-security anomaly-protection notify trigger off command.

The command takes effects after the anomaly notification is enabled.

Note

The value set in ON must be greater than or equal to the value set in OFF.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security anomaly-protection tcp

configure ip-security anomaly-protection tcp min-header-size *size* {**slot** [*slot* | **all**]}

Description

Configures the minimum TCP header allowed.

Syntax Description

size	Specifies the size of the header in bytes.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default value is 20 bytes.

Usage Guidelines

This command configures the minimum TCP header allowed. It takes effect for both IPv4 and IPv6 TCP packets.

The range of the minimum TCP header may be between 8 and 255 bytes.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

configure ip-security dhcp-snooping information check

configure ip-security dhcp-snooping information check

Description

Enables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) checking in the server-originated packets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command enables the checking of the server-originated packets for the presence of option 82. In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to prevent DHCP reply packets with invalid or missing relay agent options from being forwarded to the client. With checking enabled, the following checks and actions are performed:

- When the option 82 is present in the packet, the MAC address specified in the remote-ID sub-option is the switch system MAC address. If the check fails, the packet is dropped.
- When option 82 is not present in the packet, the DHCP packet is forwarded with no modification.

To disable this check, use the following command:

```
unconfigure ip-security dhcp-snooping information check
```

Example

The following command enables DHCP relay agent option checking:

```
configure ip-security dhcp-snooping information check
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-snooping information circuit-id port-information port

configure ip-security dhcp-snooping information circuit-id port-information *port_info* **port** *port*

Description

Configures the port information portion of the circuit ID.

Syntax Description

port_info	Specifies the circuit ID port information in the format of ***VLAN Info*** - ***Port Info***; maximum length is 32 bytes.
port	Specifies the port for which DHCP Snooping should be enabled.

Default

The default value is the ASCII representation of the ingress port's SNMP ifIndex.

Usage Guidelines

This command allows you to configure the port information portion of the circuit ID whose format is <vlan info> - <port info> for each port. The parameter <port info> is a string of up to 32 bytes in length. When a specific value is not configured for port information, the port_info defaults to the ASCII representation of the ingress ports's SNMP ifIndex.

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-snooping information circuit-id vlan-information

configure ip-security dhcp-snooping information circuit-id vlan-information *vlan_info* {**vlan**} [*vlan_name* | **all**]

Description

Configures the VLAN info portion of the circuit ID of a VLAN.

Syntax Description

vlan_info	Specifies the circuit ID VLAN information for each VLAN in the format of *VLAN Info-Port Info*; maximum length is 32 bytes.
vlan_name	Specifies the VLAN for which DHCP should be enabled.
all	Specifies all VLANs.

Default

The default value is the ASCII representation of the ingress VLAN's ID.

Usage Guidelines

This command allows you to configure the VLAN information portion of the circuit ID of a VLAN. The VLAN info is a string of characters of up to 32 bytes in length, and is entered in the format of <VLAN Info><Port Info>. When a specific value is not configured for a VLAN, vlan_info defaults to the ASCII representation of the ingress VLAN's ID.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-snooping information option

configure ip-security dhcp-snooping information option

Description

Enables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

The default is unconfigured.

Usage Guidelines

This command enables the DHCP relay agent option (option 82), which is inserted into client-originated DHCP packets before they are forwarded to the server.

To disable the DHCP relay agent option (option 82), use the following command:

```
unconfigure ip-security dhcp-snooping information option
```

Example

The following command enable the DHCP relay agent option:

```
configure ip-security dhcp-snooping information information option
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-snooping information policy

configure ip-security dhcp-snooping information policy [drop | keep | replace]

Description

Configures the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) policy.

Syntax Description

drop	Specifies to drop the packet.
keep	Specifies to keep the existing option 82 information in place.
replace	Specifies to replace the existing data with the switch's own data.

Default

The default value is replace.

Usage Guidelines

Use this command to set a policy for the relay agent. Packets can be dropped, the option 82 information can be replaced (the default), or the packet can be forwarded with the information unchanged.

Example

The following command configures the DHCP relay agent option 82 policy to keep:

```
configure ip-security dhcp-snooping information information policy keep
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-bindings add

configure ip-security dhcp-binding add ip *ip_address* **mac** *mac_address* {**vlan**} *vlan_name* **server-port** *server_port* **client-port** *client_port* **lease-time** *seconds*

Description

Creates a DHCP binding.

Syntax Description

ip_address	Specifies the IP address for the DHCP binding.
mac_address	Specifies the MAC address for the DHCP binding.

vlan_name	Specifies the name of the VLAN for the DHCP binding.
server_port	Specifies the server port for the DHCP binding.
client_port	Specifies the client port for the DHCP binding.
seconds	Specifies the number of seconds for the lease.

Default

N/A.

Usage Guidelines

This commands allows you to add a DHCP binding in order to re-create the bindings after reboot and to allow IP Security features to work with clients having static IP addresses.

Note

Setting the lease-time to 0 causes the DHCP binding to be static; in other words, it is not aged-out if no DHCP renew occurs. This is for use with clients using static IP addresses.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-bindings delete

configure ip-security dhcp-binding delete ip *ip_address* **{vlan}** *vlan_name*

Description

Deletes a DHCP binding.

Syntax Description

ip_address	Specifies the IP address for the DHCP binding.
vlan_name	Specifies the name of the VLAN for the DHCP binding.

Default

N/A.

Usage Guidelines

This commands allows you to delete a DHCP binding created with the command configure ip-security dhcp-binding add ip <ip_address> mac <mac_address> {vlan} <vlan_name> server-port <server_port> client-port <client_port> lease-time <seconds>.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-bindings storage

configure ip-security dhcp-bindings storage [**write-interval** *minutes* | **write-threshold** *num_changed_entries*]

Description

Configures DHCP bindings file storage upload variables.

Syntax Description

minutes	Specifies the number of minutes for the write interval.
num_changed_entries	Specifies the limit for the write threshold.

Default

The default write threshold is 50 entries; the default write interval is 30 minutes.

Usage Guidelines

This commands allows you to configure the upload variables for the DHCP bindings file that you created with the command configure ip-security dhcp-bindings storage filename <name> and specified the location of with the command configure ip-security dhcp-bindings storage location server [primary | secondary] <ip_address> | <hostname>]{vr <vr-name>} tftp.

For redundancy, the DHCP bindings file is uploaded to both the primary and the secondary server. The failure of one upload (for example, due to a TFTP server timeout) does not affect the upload of any other.

When the maximum file size limit is reached, no additional DHCP bindings can be uploaded until one of the older bindings is removed.

The point at which DHCP bindings can be uploaded can be configured to work in one of the following ways:

- Periodic upload: Upload every N minutes, provided that DHCP bindings have changed since the last upload.
- Upload based on number of yet-to-be uploaded entries: Allows you to configure the maximum number of changed entries that are allowed to accumulate before being uploaded.

The write interval is configurable from 5 minutes to 1 day, with a default value of 30 minutes. The default value of the write threshold is 50 entries, with a minimum of 25 and maximum of 200.

Additions and deletions are considered changes, but updates are not, which means that DHCP renewals of existing leases are not counted.

By default, the write interval is in effect, but not the write-threshold. You may change whichever of these you wish by explicitly configuring the value.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-bindings storage filename

configure ip-security dhcp-bindings storage filename *name*

Description

Creates a storage file for DHCP binding information.

Syntax Description

name	Specifies the name of the DHCP binding storage file.

Default

N/A.

Usage Guidelines

This commands allows you to configure the filename with which the DHCP bindings storage file is created on the external server when it is uploaded to the external server. The text file resides on an external server. You can configure the server with the command configure ip-security dhcp-bindings storage location server [primary | secondary] <ip_address> | <hostname>]{vr <vr-name>} tftp.

The bindings file must have a .xsf extension. If the input filename doesn't already have a .xsf extension, one is added automatically.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure ip-security dhcp-bindings storage location

configure ip-security dhcp-bindings storage location server [primary | secondary] *ip_address* | *hostname*]{**vr** *vr-name*} **tftp**

Description

Specifies the server location for the DHCP bindings storage file. The uploads can be made to any tftp server regardless of the virtual router that it is present in.

Syntax Description

ip_address	Specifies the IP address location for the bindings storage file.
hostname	Specifies the hostname of the server.
vr-name	Specifies the virtual router name.

Default

N/A.

Usage Guidelines

This commands allows you to specify where you want to store the DHCP storage file that you created with the command configure ip-security dhcp-bindings storage filename <name>.

Example

The following command configures storage to the primary server 10.1.1.14:

```
configure ip-security dhcp-bindings storage location server primary 10.1.1.14
vr "VR-Default" tftp
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure mac-lockdown-timeout ports aging-time

configure mac-lockdown-timeout ports [**all** | *port_list*] **aging-time** *seconds*

Description

Configures the MAC address lock down timeout value in seconds for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports
port_list	Specifies one or more ports or slots and ports.
seconds	Configures the length of the time out value in seconds. The default is 15 seconds; the range is 15 to 2,000,000 seconds.

Default

The default is 15 seconds.

Usage Guidelines

This timer overrides the FDB aging time.

This command only sets the duration of the MAC address lock down timer. To enable the lock down timeout feature, use the following command:

```
enable mac-lockdown-timeout ports [all | <port_list>]
```

Example

The following command configures the MAC address lock down timer duration for 300 seconds for ports 2:3, 2:4, and 2:6:

```
configure mac-lockdown-timeout ports 2:3, 2:4, 2:6 aging-time 300
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure ports rate-limit flood

configure ports *port_list* **rate-limit flood** [**broadcast** | **multicast** | **unknown-destmac**] [**no-limit** | *pps*]

Description

Limits the amount of ingress flooded traffic; minimizes network impact of broadcast loops.

Syntax Description

port_list	Specifies the port number. On a stand-alone switch, this value is just the port number, and on a modular switch, this value is the slot and port number.
broadcast	Specifies all broadcast packets.
multicast	Specifies all flooded multicast packets (known IP multicast caches are still forwarded at line rate).
unknown-destmac	Specifies all packets with unknown MAC DAs.
no-limit	Specifies unlimited rate.
pps	Packets per second allowed; range is from 0 to 262,144.

Default

No limit.

Usage Guidelines

Use this command to limit the amount of ingress flooding traffic and to minimize the network impact of broadcast loops.

To display results, use the show ports rate-limit flood command.

Example

The following command rate limits broadcast packets on port 3 on a stand-alone switch to 500 pps:

```
configure ports 3 rate-limit flood broadcast 500
```

History

This command was available in ExtremeXOS 11.1.

Platform Availability

This command is available on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family of switches.

configure ports vlan

configure ports *port_list* **vlan** *vlan_name* [**limit-learning** *number* {**action** [**blackhole** | **stop-learning**]} | **lock-learning** | **unlimited-learning** | **unlock-learning**]

Description

Configures virtual ports for limited or locked MAC address learning.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
vlan_name	Specifies the name of the VLAN.
limit-learning *number*	Specifies a limit on the number of MAC addresses that can be dynamically learned on the specified ports.
blackhole	Specifies that blackhole entries are allowed.
stop-learning	Specifies that the learning be halted to protect the switch from exhausting FDB resources by not creating blackhole entries.
lock-learning	Specifies that the current FDB entries for the specified ports should be made permanent static, and no additional learning should be allowed.
unlimited-learning	Specifies that there should not be a limit on MAC addresses that can be learned.
unlock-learning	Specifies that the port should be unlocked (allow unlimited, dynamic learning).

Default

Unlimited, unlocked learning.

Usage Guidelines

If you have enabled ESRP, see the ExtremeXOS Concepts Guide for information about using this feature with ESRP.

Limited learning

The limited learning feature allows you to limit the number of dynamically-learned MAC addresses per VLAN. When the learned limit is reached, all new source MAC addresses are blackholed at both the ingress and egress points. This prevent these MAC addresses from learning and responding to Internet control message protocol (ICMP) and address resolution protocol (ARP) packets.

If the limit you configure is greater than the current number of learned entries, all the current learned entries are purged.

Dynamically learned entries still get aged, and can be cleared. If entries are cleared or aged out after the learning limit has been reached, new entries will then be able to be learned until the limit is reached again.

Permanent static and permanent dynamic entries can still be added and deleted using the create fdbentry and delete fdbentry commands. These override any dynamically learned entries.

For ports that have a learning limit in place, the following traffic still flows to the port:

- Packets destined for permanent MACs and other non-blackholed MACs
- Broadcast traffic
- EDP traffic

Traffic from the permanent MAC and any other non-blackholed MACs will still flow from the virtual port.

If you configure a MAC address limit on VLANS that participate in an Extreme Standby Router Protocol (ESRP) domain, you should add an additional back-to-back link (that has no MAC address limit on these ports) between the ESRP-enabled switches. Doing so prevents ESRP protocol data units (PDUs) from being dropped due to MAC address limit settings.

Stop learning

When stop-learning is enabled with learning-limit configured, the switch is protected from exhausting FDB resources by not creating blackhole entries. Any additional learning and forwarding is prevented, but packet forwarding from FDB entries is not impacted.

Port lockdown

The port lockdown feature allows you to prevent any additional learning on the virtual port, keeping existing learned entries intact. This is equivalent to making the dynamically-learned entries permanent static, and setting the learning limit to zero. All new source MAC addresses are blackholed.

Locked entries do not get aged, but can be deleted like any other permanent FDB entries. The maximum number of permanent lockdown entries is 1024. Any FDB entries above will be flushed and blackholed during lockdown.

For ports that have lockdown in effect, the following traffic still flows to the port:

- Packets destined for the permanent MAC and other non-blackholed MACs
- Broadcast traffic
- EDP traffic

Traffic from the permanent MAC will still flow from the virtual port.

Once the port is locked down, all the entries become permanent and will be saved across reboot.

When you remove the lockdown using the unlock-learning option, the learning-limit is reset to unlimited, and all associated entries in the FDB are flushed.

To display the locked entries on the switch, use the following command:

```
show fdb
```

Locked MAC address entries have the “l” flag.

To verify the MAC security configuration for the specified VLAN or ports, use the following commands:

```
show vlan <vlan name> security
show ports <port_list> info detail
```

Example

The following command limits the number of MAC addresses that can be learned on ports 1, 2, 3, and 6 in a VLAN named accounting, to 128 addresses:

```
configure ports 1, 2, 3, 6 vlan accounting learning-limit 128
```

The following command locks ports 4 and 5 of VLAN accounting, converting any FDB entries to static entries, and prevents any additional address learning on these ports:

```
configure ports 4,5 vlan accounting lock-learning
```

The following command removes the learning limit from the specified ports:

```
configure ports 1, 2, vlan accounting unlimited-learning
```

The following command unlocks the FDB entries for the specified ports:

```
configure ports 4,5 vlan accounting unlock-learning
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure radius server client-ip

configure radius {**mgmt-access** | **netlogin**} [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {*udp_port*} **client-ip** [*ipaddress*] {**vr** *vr_name*}

Description

Configures the primary and secondary RADIUS authentication server.

Syntax Description

mgmt-access	Specifies the RADIUS authentication server for switch management.
netlogin	Specifies the RADIUS authentication server for network login.
primary	Configures the primary RADIUS authentication server.
secondary	Configures the secondary RADIUS authentication server.
ipaddress	The IP address of the server being configured.
hostname	The host name of the server being configured.
udp_port	The UDP port to use to contact the RADIUS authentication server.
ipaddress	The IP address used by the switch to identify itself when communicating with the RADIUS authentication server.
vr_name	Specifies the virtual router on which the client IP is located. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements.

Default

The following lists the default behavior of this command:

- The UDP port setting is 1812
- The virtual router used is VR-Mgmt, the management virtual router
- Switch management and network login use the same primary and secondary RADIUS servers for authentication.

Usage Guidelines

Use this command to specify RADIUS server information.

Use of the <hostname> parameter requires that DNS be enabled.

The RADIUS server defined by this command is used for user name authentication and CLI command authentication.

Beginning with ExtremeXOS 11.2, you can specify one pair of RADIUS authentication servers for switch management and another pair for network login. To specify RADIUS authentication servers for switch management (Telnet, SSH, and console sessions), use the mgmt-access keyword. To specify RADIUS authentication servers for network login, use the netlogin keyword. If you do not specify a keyword, switch management and network login use the same pair of RADIUS authentication servers.

If you are running ExtremeXOS 11.1 or earlier and upgrade to ExtremeXOS 11.2, you do not loose your existing RADIUS server configuration. Both switch management and network login use the RADIUS authentication server specified in the older configuration.

Example

The following command configures the primary RADIUS server on host radius1 using the default UDP port (1812) for use by the RADIUS client on switch 10.10.20.30 using a virtual router interface of VR-Default:

```
configure radius primary server radius1 client-ip 10.10.20.30 vr vr-Default
```

The following command configures the primary RADIUS server for network login authentication on host netlog1 using the default UDP port for use by the RADIUS client on switch 10.10.20.31 using, by default, the management virtual router interface:

```
configure radius netlogin primary server netlog1 client-ip 10.10.20.31
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure radius shared-secret

configure radius {**mgmt-access** | **netlogin**} [**primary** | **secondary**] **shared-secret** {**encrypted**} *string*

Description

Configures the authentication string used to communicate with the RADIUS authentication server.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
primary	Configures the authentication string for the primary RADIUS server.
secondary	Configures the authentication string for the secondary RADIUS server.

encrypted	Indicates that the string is already encrypted.
string	The string to be used for authentication.

Default

Unconfigured.

Usage Guidelines

The secret must be the same between the client switch and the RADIUS server.

The RADIUS server must first be configured for use with the switch as a RADIUS client.

The mgmt-access keyword specifies the RADIUS server used for switch management authentication.

The netlogin keyword specifies the RADIUS server used for network login authentication.

If you do not specify the mgmt-access or netlogin keywords, the secret applies to both the primary or secondary switch management and netlogin RADIUS servers.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “purplegreen” on the primary RADIUS server for both switch management and network login:

```
configure radius primary shared-secret purplegreen
```

The following command configures the shared secret as “redblue” on the primary switch management RADIUS server:

```
configure radius mgmt-access primary shared-secret redblue
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure radius timeout

configure radius {**mgmt-access** | **netlogin**} **timeout** *seconds*

Description

Configures the timeout interval for RADIUS authentication requests.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
seconds	Specifies the number of seconds for authentication requests. Range is 3 to 120 seconds

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for RADIUS authentication requests. When the timeout has expired, another authentication attempt will be made. After three failed attempts to authenticate, the alternate server will be used. After six failed attempts, local user authentication will be used.

The mgmt-access keyword specifies the RADIUS server used for switch management authentication.

The netlogin keyword specifies the RADIUS server used for network login authentication.

If you do not specify the mgmt-access or netlogin keywords, the timeout interval applies to both switch management and netlogin RADIUS servers.

Example

The following command configures the timeout interval for RADIUS authentication to 10 seconds. After 30 seconds (three attempts), the alternate RADIUS server will be used. After 60 seconds (six attempts) local user authentication is used.

```
configure radius timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure radius-accounting server client-ip

configure radius-accounting {**mgmt-access** | **netlogin**} [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {*tcp_port*} **client-ip** [*ipaddress*] {**vr** *vr_name*}

Description

Configures the RADIUS accounting server.

Syntax Description

mgmt-access	Specifies the RADIUS accounting server for switch management.
netlogin	Specifies the RADIUS accounting server for network login.
primary	Configure the primary RADIUS accounting server.
secondary	Configure the secondary RADIUS accounting server.
ipaddress	The IP address of the accounting server being configured.
hostname	The host name of the accounting server being configured.
tcp_port	The UDP port to use to contact the RADIUS accounting server.
ipaddress	The IP address used by the switch to identify itself when communicating with the RADIUS accounting server.
vr_name	Specifies the virtual router on which the client IP is located. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

The following lists the default behavior of this command:

- The UDP port setting is 1813
- The virtual router used is VR-Mgmt, the management virtual router
- Switch management and network login use the same RADIUS accounting server.

Usage Guidelines

Use this command to specify the radius accounting server.

The accounting server and the RADIUS authentication server can be the same.

Use of the <hostname> parameter requires that DNS be enabled.

Beginning with ExtremeXOS 11.2, you can specify one pair of RADIUS accounting servers for switch management and another pair for network login. To specify RADIUS accounting servers for switch management (Telnet, SSH, and console sessions), use the mgmt-access keyword. To specify RADIUS

accounting servers for network login, use the netlogin keyword. If you do not specify a keyword, switch management and network login use the same pair of RADIUS accounting servers.

If you are running ExtremeXOS 11.1 or earlier and upgrade to ExtremeXOS 11.2, you do not loose your existing RADIUS accounting server configuration. Both switch management and network login use the RADIUS accounting server specified in the older configuration.

Example

The following command configures RADIUS accounting on host radius1 using the default UDP port (1813) for use by the RADIUS client on switch 10.10.20.30 using a virtual router interface of VR-Default for both management and network login:

```
configure radius-accounting primary server radius1 client-ip 10.10.20.30 vr
vr-Default
```

The following command configures RADIUS accounting for network login on host netlog1 using the default UDP port for use by the RADIUS client on switch 10.10.20.31 using the default virtual router interface:

```
configure radius-accounting netlogin primary server netlog1 client-ip
10.10.20.31
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure radius-accounting shared-secret

configure radius-accounting {**mgmt-access** | **netlogin**} [**primary** | **secondary**] **shared-secret** {**encrypted**} *string*

Description

Configures the authentication string used to communicate with the RADIUS accounting server.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.

primary	Configures the authentication string for the primary RADIUS accounting server.
secondary	Configures the authentication string for the secondary RADIUS accounting server.
encrypted	Indicates that the string is already encrypted.
string	The string to be used for authentication.

Default

Unconfigured.

Usage Guidelines

The secret must be the same between the client switch and the RADIUS accounting server.

The mgmt-access keyword specifies the RADIUS accounting server used for switch management.

The netlogin keyword specifies the RADIUS accounting server used for network login.

If you do not specify the mgmt-access or netlogin keywords, the secret applies to both the primary or secondary switch management and netlogin RADIUS accounting servers.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “purpleaccount” on the primary RADIUS accounting server for both management and network login:

```
configure radius primary shared-secret purpleaccount
```

The following command configures the shared secret as “greenaccount” on the primary management RADIUS accounting server:

```
configure radius mgmt-access primary shared-secret greenaccount
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure radius-accounting timeout

configure radius-accounting {**mgmt-access** | **netlogin**} **timeout** *seconds*

Description

Configures the timeout interval for RADIUS-Accounting authentication requests.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.
seconds	Specifies the number of seconds for accounting requests. Range is 3 to 120 seconds.

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for RADIUS-Accounting authentication requests. When the timeout has expired, another authentication attempt will be made. After three failed attempts to authenticate, the alternate server will be used.

The mgmt-access keyword specifies the RADIUS accounting server used for switch management.

The netlogin keyword specifies the RADIUS accounting server used for network login.

If you do not specify the mgmt-access or netlogin keywords, the timeout interval applies to both switch management and netlogin RADIUS accounting servers.

Example

This example configures the timeout interval for RADIUS-Accounting authentication to 10 seconds. After 30 seconds (three attempts), the alternate RADIUS server will be used:

```
configure radius-accounting timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure ssh2 key

configure ssh2 key {pregenerated}

Description

Generates the Secure Shell 2 (SSH2) host key.

Syntax Description

pregenerated	Indicates that the SSH2 authentication key has already been generated. The user will be prompted to enter the existing key.

Default

The switch generates a key for each SSH2 session.

Usage Guidelines

Secure Shell 2 (SSH2) is a feature of ExtremeXOS that allows you to encrypt session data between a network administrator using SSH2 client software and the switch or to send encrypted data from the switch to an SSH2 client on a remote system. Configuration, policy, image, and public key files may also be transferred to the switch using the Secure Copy Program 2 (SCP2)

SSH2 functionality is not present in the base ExtremeXOS software image, but is available as an additional, installable module. Before you can access any SSH2 commands, you must install the module. Without the module, the SSH2 commands do not appear on the command line. To install the module, see the instructions in Software Upgrade and Boot Options

After you have installed the SSH2 module, you must generate a host key and enable SSH2. To generate an SSH2 host key, use the configure ssh2 key command. To enable SSH2, use the enable ssh2 command.

An authentication key must be generated before the switch can accept incoming SSH2 sessions. This can be done automatically by the switch, or you can enter a previously generated key.

If you elect to have the key generated, the key generation process can take up to ten minutes, and cannot be canceled after it has started. Once the key has been generated, you should save your configuration to preserve the key.

To use a key that has been previously created, use the pregenerated keyword. Use the show ssh2 private-key command to list and copy the previously generated key. Then use the configure ssh2 key {pregenerated} command where “pregenerated” represents the key that you paste.

Note

Keys generated by ExtremeXOS cannot be used on switches running ExtremeWare images, and keys generated by ExtremeWare cannot be used on switches running ExtremeXOS images.

The key generation process generates the SSH2 private host key. The SSH2 public host key is derived from the private host key, and is automatically transmitted to the SSH2 client at the beginning of an SSH2 session.

To view the status of SSH2 on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for SSH2 sessions, whether a valid key is present, and the TCP port and virtual router that is being used.

Example

The following command generates an authentication key for the SSH2 session:

```
configure ssh2 key
```

The command responds with the following messages:

```
WARNING: Generating new server host key
This will take approximately 10 minutes and cannot be canceled.
Continue? (y/n)
```

If you respond yes, the command begins the process.

To configure an SSH2 session using a previously generated key, use the following command:

```
configure ssh2 key pregenerated <pre-generated key>
```

Enter the previously-generated key (you can copy and paste it from the saved configuration file; a part of the key pattern is similar to 2d:2d:2d:2d:20:42:45:47:).

History

This command was first available in the ExtremeXOS 11.0 SSH module.

Platform Availability

This command is available on all platforms.

configure sshd2 user-key add user

configure sshd2 user-key *key_name* **add user** *user_name*

Description

Associates a user to a key.

Syntax Description

key_name	Specifies the name of the public key.
user_name	Specifies the name of the user.

Default

N/A.

Usage Guidelines

This command associates (or binds) a user to a key.

Example

The following example binds the key id_dsa_2048 to user admin.

```
configure sshd2 user-key id_dsa_2048 add user admin
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure sshd2 user-key delete user

configure sshd2 user-key *key_name* **delete user** *user_name*

Description

Disassociates a user to a key.

Syntax Description

key_name	Specifies the name of the public key.
user_name	Specifies the name of the user.

Default

N/A.

Usage Guidelines

This command disassociates (or unbinds) a user to a key.

Example

The following example unbinds the key id_dsa_2048 from user admin.

```
configure sshd2 user-key id_dsa_2048 delete user admin
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

configure ssl certificate pregenerated

configure ssl certificate pregenerated

Description

Obtains the pre-generated certificate from the user.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You must upload or generate a certificate for SSL server use. With this command, you copy and paste the certificate into the command line followed by a blank line to end the command. The following security algorithms are supported:

- RSA for public key cryptography (generation of certificate and public-private key pair, certificate signing). RSA key size between 1024 and 4096 bits.
- Symmetric ciphers (for data encryption): RC4, DES, and 3DES.
- Message Authentication Code (MAC) algorithms: RSA Data Security, Inc. MD5 Message-Digest Algorithm and SHA.

This command is also used when downloading or uploading the configuration. Do not modify the certificate stored in the uploaded configuration file because the certificate is signed using the issuer's private key.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

The Converged Network Analyzer (CNA) Agent requires SSL to encrypt communication between the CNA Agent and the CNA Server. For more information about the CNA Agent, see CNA Agent

Example

The following command obtains the pre-generated certificate from the user:

```
configure ssl certificate pregenerated
```

Next, you open the certificate and then copy and paste the certificate into the console/Telnet session, followed by a blank line to end the command.

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

configure ssl certificate privkeylen

configure ssl certificate privkeylen *length* **country** *code* **organization** *org_name* **common-name** *name*

Description

Creates a self signed certificate and private key that can be saved in the EEPROM.

Syntax Description

length	Specifies the private key length in bytes. Valid values are between 1024 and 4096.
code	Specifies the country code in 2-character form.
org_name	Specifies the organization name. The organization name can be up to 64 characters long.
name	Specifies the common name. The common name can be up to 64 characters long.

Default

N/A.

Usage Guidelines

This command creates a self signed certificate and private key that can be saved in the EEPROM. The certificate generated is in the PEM format.

Any existing certificate and private key is overwritten.

The size of the certificate depends on the RSA key length (privkeylen) and the length of the other parameters (country, organization name, and so forth) supplied by the user. If the RSA key length is 1024, then the certificate is approximately 1 kb. For an RSA key length of 4096, the certificate length is approximately 2 kb, and the private key length is approximately 3 kb.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

The CNA Agent requires SSL to encrypt communication between the CNA Agent and the CNA Server. For more information about the CNA Agent, see CNA Agent Commands

Example

The following command creates an SSL certificate in the USA for a website called bigcats:

```
configure ssl certificate privkeylen 2048 country US organization IEEE common-
name bigcats
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

configure ssl privkey pregenerated

configure ssl privkey pregenerated

Description

Obtains the pre-generated private key from the user.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command is also used when downloading or uploading the configuration. The private key is stored in the EEPROM, and the certificate is stored in the configuration file.

With this command, you copy and paste the private key into the command line followed by a blank line to end the command. The following security algorithms are supported:

- RSA for public key cryptography (generation of certificate and public-private key pair, certificate signing). RSA key size between 1024 and 4096 bits.
- Symmetric ciphers (for data encryption): RC4, DES, and 3DES.
- Message Authentication Code (MAC) algorithms: RSA Data Security, Inc. MD5 Message-Digest Algorithm and SHA.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

The CNA Agent requires SSL to encrypt communication between the CNA Agent and the CNA Server. For more information about the CNA Agent, see CNA Agent Commands

Example

The following command obtains the pre-generated private key from the user:

```
configure ssl privkey pregenerated
```

Next, you the open the certificate and then copy and paste the certificate into the console/Telnet session, followed by a RETURN to end the command.

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

configure tacacs server client-ip

configure tacacs [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {*tcp_port*} **client-ip** *ipaddress* {**vr** *vr_name*}

Description

Configures the server information for a TACACS+ authentication server.

Syntax Description

primary	Configures the primary TACACS+ server.
secondary	Configures the secondary TACACS+ server.
ipaddress	The IP address of the TACACS+ server being configured.
hostname	The host name of the TACACS+ server being configured.
tcp_port	The TCP port to use to contact the TACACS+ server.
ipaddress	The IP address used by the switch to identify itself when communicating with the TACACS+ server.
vr_name	Specifies the virtual router on which the client IP is located. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

TACACS+ uses TCP port 49. The default virtual router is VR-Mgmt, the management virtual router.

Usage Guidelines

Use this command to configure the server information for a TACACS+ server.

To remove a server, use the following command:

```
unconfigure tacacs server [primary | secondary]
```

Use of the <hostname> parameter requires that DNS be enabled.

Example

The following command configures server tacacs1 as the primary TACACS+ server for client switch 10.10.20.35 using a virtual router interface of VR-Default:

```
configure tacacs primary server tacacs1 client-ip 10.10.20.35 vr vr-Default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure tacacs shared-secret

configure tacacs [**primary** | **secondary**] **shared-secret** {**encrypted**} *string*

Description

Configures the shared secret string used to communicate with the TACACS+ authentication server.

Syntax Description

primary	Configures the authentication string for the primary TACACS+ server.
secondary	Configures the authentication string for the secondary TACACS+ server.
encrypted	Indicates that the string is already encrypted.
string	The string to be used for authentication.

Default

N/A.

Usage Guidelines

The secret must be the same between the client switch and the TACACS+ server.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “purplegreen” on the primary TACACS+ server:

```
configure tacacs-accounting primary shared-secret purplegreen
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure tacacs timeout

configure tacacs timeout *seconds*

Description

Configures the timeout interval for TACAS+ authentication requests.

Syntax Description

seconds	Specifies the number of seconds for authentication requests. Range is 3 to 120 seconds.

Default

The default is 3 seconds.

Usage Guidelines

Use this command to configure the timeout interval for TACACS+ authentication requests.

To detect and recover from a TACACS+ server failure when the timeout has expired, the switch makes one authentication attempt before trying the next designated TACACS+ server or reverting to the local database for authentication. In the event that the switch still has IP connectivity to the TACACS+ server, but a TCP session cannot be established, (such as a failed TACACS+ daemon on the server), failover happens immediately regardless of the configured timeout value.

For example, if the timeout value is set for 3 seconds (the default value), it will take 3 seconds to fail over from the primary TACACS+ server to the secondary TACACS+ server. If both the primary and the secondary servers fail or are unavailable, it takes approximately 6 seconds to revert to the local database for authentication.

Example

The following command configures the timeout interval for TACACS+ authentication to 10 seconds:

```
configure tacacs timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure tacacs-accounting server

configure tacacs-accounting [**primary** | **secondary**] **server** [*ipaddress* | *hostname*] {*udp_port*} **client-ip** *ipaddress* {**vr** *vr_name*}

Description

Configures the TACACS+ accounting server.

Syntax Description

primary	Configures the primary TACACS+ accounting server.
secondary	Configures the secondary TACACS+ accounting server.
ipaddress	The IP address of the TACACS+ accounting server being configured.
hostname	The host name of the TACACS+ accounting server being configured.
tcp_port	The TCP port to use to contact the TACACS+ server.

ipaddress	The IP address used by the switch to identify itself when communicating with the TACACS+ accounting server.
vr_name	Specifies the virtual router on which the client IP is located. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

Unconfigured. The default virtual router is VR-Mgmt, the management virtual router.

Usage Guidelines

You can use the same TACACS+ server for accounting and authentication.

To remove a server, use the following command:

```
unconfigure tacacs server [primary | secondary]
```

Example

The following command configures server tacacs1 as the primary TACACS+ accounting server for client switch 10.10.20.35 using a virtual router interface of VR-Default:

```
configure tacacs-accounting primary server tacacs1 client-ip 10.10.20.35 vr
vr-Default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure tacacs-accounting shared-secret

configure tacacs-accounting [**primary** | **secondary**] **shared-secret** {**encrypted**} *string*

Description

Configures the shared secret string used to communicate with the TACACS+ accounting server.

Syntax Description

primary	Configures the authentication string for the primary TACACS+ accounting server.
secondary	Configures the authentication string for the secondary TACACS+ accounting server.
string	The string to be used for authentication.

Default

N/A.

Usage Guidelines

Secret needs to be the same as on the TACACS+ server.

The encrypted keyword is primarily for the output of the show configuration command, so the shared secret is not revealed in the command output. Do not use it to set the shared secret.

Example

The following command configures the shared secret as “tacacsaccount” on the primary TACACS+ accounting server:

```
configure tacacs-accounting primary shared-secret tacacsaccount
```

History

This command was first available in ExtremeXOS 10.1.

The encrypted keyword was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure tacacs-accounting timeout

configure tacacs-accounting timeout *seconds*

Description

Configures the timeout interval for TACACS+ accounting authentication requests.

Syntax Description

seconds	Specifies the number of seconds for accounting requests. Range is 3 to 120 seconds

Default

The default is 3 seconds.

Usage Guidelines

This command configures the timeout interval for TACACS+ accounting authentication requests.

To detect and recover from a TACACS+ accounting server failure when the timeout has expired, the switch makes one authentication attempt before trying the next designated TACACS+ accounting server or reverting to the local database for authentication. In the event that the switch still has IP connectivity to the TACACS+ accounting server, but a TCP session cannot be established, (such as a failed TACACS+ daemon on the accounting server), failover happens immediately regardless of the configured timeout value.

For example, if the timeout value is set for 3 seconds (the default value), it takes 3 seconds to fail over from the primary TACACS+ accounting server to the secondary TACACS+ accounting server. If both the primary and the secondary servers fail or are unavailable, it takes approximately 6 seconds to revert to the local database for authentication.

Example

The following command configures the timeout interval for TACACS+ accounting authentication to 10 seconds:

```
configure tacacs-accounting timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure trusted-ports trust-for dhcp-server

configure trusted-ports [*ports*|**all**] **trust-for dhcp-server**

Description

Configures one or more trusted DHCP ports.

Syntax Description

ports	Specifies one or more ports to be configured as trusted ports.
all	Specifies all ports to be configured as trusted ports.

Default

N/A.

Usage Guidelines

To configure trusted DHCP ports, you must first enable DHCP snooping on the switch. To enable DHCP snooping, use the following command:

```
enable ip-security dhcp-snooping {vlan} <vlan_name> ports [all |
<ports>] violation-action [drop-packet {[block-mac | block-port] [duration
<duration_in_seconds> | permanently] | none]}] {snmp-trap}
```

Trusted ports do not block traffic; rather, the switch forwards any DHCP server packets that appear on trusted ports. Depending on your DHCP snooping configuration, the switch drops packets and can disable the port temporarily, disable the port permanently, blackhole the MAC address temporarily, blackhole the MAC address permanently, and so on.

If you configure one or more trusted ports, the switch assumes that all DHCP server packets on the trusted port are valid.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} <vlan_name>
```

To display any violations that occur, including those on DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} <vlan_name>
```

Example

The following command configures ports 2:2 and 2:3 as trusted ports:

```
configure trusted-ports 2:2-2:3 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure trusted-servers add server

configure trusted-servers {**vlan**} *vlan_name* **add server** *ip_address* **trust-for dhcp-server**

Description

Configures and enables a trusted DHCP server on the switch.

Syntax Description

vlan_name	Specifies the VLAN name.
ip_address	Specifies the IP address of the trusted DHCP server.

Default

N/A.

Usage Guidelines

If you configured trusted DHCP server, the switch forwards only DHCP packets from the trusted servers. The switch drops DHCP packets from other DHCP snooping-enabled ports.

You can configure a maximum of eight trusted DHCP servers on the switch.

If you configure a port as a trusted port, the switch assumes that all DHCP server packets on that port are valid.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} <vlan_name>
```

To display any violations that occur, including those on the DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} <vlan_name>
```

Example

The following command configures a trusted DHCP server on the switch:

```
configure trusted-servers vlan purple add server 10.10.10.10 trust-for dhcp-
server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure trusted-servers delete server

configure trusted-servers vlan *vlan_name* **delete server** *ip_address* **trust-for dhcp-server**

Description

Deletes a trusted DHCP server from the switch.

Syntax Description

vlan_name	Specifies the VLAN name.
ip_address	Specifies the IP address of the trusted DHCP server.

Default

N/A.

Usage Guidelines

Use this command to delete a trusted DHCP server from the switch.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} <vlan_name>
```

To display any violations that occur, including those on the DHCP trusted servers if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} <vlan_name>
```

Example

The following command deletes a trusted DHCP server from the switch:

```
configure trusted-servers vlan purple delete server 10.10.10.10 trust-for
dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

configure vlan dhcp-address-range

configure vlan *vlan_name* **dhcp-address-range** *ipaddress1* **-** *ipaddress2*

Description

Configures a set of DHCP addresses for a VLAN.

Syntax Description

vlan_name	Specifies the VLAN on whose ports DHCP will be enabled.
ipaddress1	Specifies the first IP address in the DHCP address range to be assigned to this VLAN.
ipaddress2	Specifies the last IP address in the DHCP address range to be assigned to this VLAN.

Default

N/A.

Usage Guidelines

The following error conditions are checked: ipaddress2 >= ipaddress1, the range must be in the VLAN's network, the range does not contain the VLAN's IP address, and the VLAN has an IP address assigned.

Example

The following command allocates the IP addresses between 192.168.0.20 and 192.168.0.100 for use by the VLAN temporary:

```
configure temporary dhcp-address-range 192.168.0.20 - 192.168.0.100
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure vlan dhcp-lease-timer

configure vlan *vlan_name* **dhcp-lease-timer** *lease-timer*

Description

Configures the timer value in seconds returned as part of the DHCP response.

Syntax Description

name	Specifies the VLAN on whose ports netlogin should be disabled.
lease-timer	Specifies the timer value, in seconds.

Default

N/A.

Usage Guidelines

The timer value is specified in seconds. The timer value range is 0 - 4294967295, where 0 indicates the default (not configured) value of 7200 second.

Example

The following command configures the DHCP lease timer value for VLAN corp:

```
configure vlan corp dhcp-lease-timer <lease-timer>
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure vlan dhcp-options

configure {**vlan**} *vlan_name* **dhcp-options** [**code** *option_number* [**16-bit** *value1* {*value2* {*value3* {*value4*}}} | **32-bit** *value1* {*value2* {*value3* {*value4*}}} | **flag** [**on** | **off**] | **hex** *string_value* | **ipaddress** *ipaddress1* {*ipaddress2* {*ipaddress3* {*ipaddress4*}}} | **string** *string_value*] | **default-gateway** | **dns-server** {**primary** | **secondary**} | **wins-server**] *ipaddress*

Description

Configures the DHCP options returned as part of the DHCP response by a switch configured as a DHCP server.

Syntax Description

vlan_name	Specifies the VLAN on which to configure DHCP
code	Specifies the generic DHCP option code
option_number	Specifies the DHCP Option number
16-bit	Specifies that one to four 16-bit unsigned integer values associated with selected DHCP option
32-bit	Specifies that one to four 32-bit unsigned integer values associated with selected DHCP option
flag	Specifies that 1 byte value associated with selected DHCP option number
hex	Specifies that hexadecimal string associated with selected DHCP option number
string	Specifies that a string is associated with selected DHCP option number
string_value	The string value associated with specified option
default-gateway	Specifies the router option.
dns-server	Specifies the Domain Name Server (DNS) option.

primary	Specifies the primary DNS option.
secondary	Specifies the secondary DNS option.
wins-server	Specifies the NetBIOS name server (NBNS) option.
ipaddress	The IP address associated with the specified option.

Default

N/A.

Usage Guidelines

This command configures the DHCP options that can be returned to the DHCP client. For the default-gateway option you are only allowed to configure an IP address that is in the VLAN's network range. For the other options, any IP address is allowed.

The options below represent the following BOOTP options specified by RFC2132:

- default-gateway—Router option, number 3
- dns-server—Domain Name Server option, number 6
- wins-server—NetBIOS over TCP/IP Name Server option, number 44

Example

The following command configures the DHCP server to return the IP address 10.10.20.8 as the router option:

```
configure vlan <name> dhcp-options default-gateway 10.10.20.8
```

History

This command was first available in ExtremeXOS 11.0.

The primary and secondary DNS options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

create sshd2 key-file

create sshd2 key-file {**host-key** | **user-key**} *key_name*

Description

Creates a file for the user-key or host-key.

Syntax Description

host-key	Specifies the name of the host-key
user-key	Specifies the name of the user-key.
key_name	Specifies the name of the public key.

Default

N/A.

Usage Guidelines

This command is used to write the user or the host public key in a file. The key files will be created with a .ssh file extension; this enables the administrator to copy the public key files to another server.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

create sshd2 user-key

create sshd2 user-key *key_name key* {**subject** *subject*} {**comment** *comment*}

Description

Creates a user key.

Syntax Description

key_name	Specifies the name of the public key.
key	Specifies the key. Note: The key cannot have any spaces in it.
subject	Specifies the subject.
comment	Specifies the comment (an optional field)

Default

N/A.

Usage Guidelines

This command is used to enter, or cut and paste, your public key. You can also enter the public key into the switch by using the SCP or SFTP client that is connected to the switch.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

delete sshd2 user-key

delete sshd2 user-key *key_name*

Description

Deletes a user key.

Syntax Description

key_name	Specifies the name of the public key to be deleted.

Default

N/A.

Usage Guidelines

This command is used to delete a user key. The key is deleted regardless of whether or not it is bound to a user.

Note

If a user is bound to the key, they are first unbound or unassociated, and then the key is deleted

Example

The following example shows the SSH user key id_dsa_2048 being deleted:

```
delete sshd2 user-key id_dsa_2048
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

disable dhcp ports vlan

disable dhcp ports *port_list* **vlan** *vlan_name*

Description

Disables DHCP on a specified port in a VLAN.

Syntax Description

port_list	Specifies the ports for which DHCP should be disabled.
vlan_name	Specifies the VLAN on whose ports DHCP should be disabled.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables DHCP for port 6:9 in VLAN corp:

```
disable dhcp ports 6:9 vlan corp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable dos-protect

disable dos-protect

Description

Disables denial of service protection.

Syntax Description

There are no arguments or variables for this command.

Default

Default is disabled.

Usage Guidelines

None.

Example

The following command disables denial of service protection.

```
disable dos-protect
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable iparp gratuitous protect vlan

disable iparp gratuitous protect vlan *vlan-name*

Description

Disables gratuitous ARP protection on the specified VLAN.

Syntax Description

vlan-name	Specifies the VLAN.

Default

Disabled.

Usage Guidelines

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

This command disables gratuitous ARP protection.

Example

The following command disables gratuitous ARP protection for VLAN corp:

```
disable iparp gratuitous protect vlan corp
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security anomaly-protection

disable ip-security anomaly-protection {**slot** [*slot* | **all**]}

Description

Disables all anomaly checking options.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This commands disables all anomaly checking options, including IP address, UDP/TCP port, TCP flag and fragment, and ICMP anomaly checking.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection ip

disable ip-security anomaly-protection ip { slot [*slot* **| all] }**

Description

Disables source and destination IP address checking.

Syntax Description

slot	Specifies the slot.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables source and destination IP addresses checking. This checking takes effect for both IPv4 and IPv6 packets. When enabled, the switch drops IPv4/IPv6 packets if its source IP address are the same as the destination IP address. In most cases, the condition of source IP address being the same as the destination IP address indicates a Layer3 protocol error. (These kind of errors are found in LAND attacks.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection l4port

disable ip-security anomaly-protection l4port [tcp | udp | both] {slot [*slot* | all]}

Description

Disables TCP and UDP ports checking.

Syntax Description

tcp	Specifies that the TCP port be disabled for checking.
udp	Specifies that the UDP port be disabled for checking.
both	Specifies both the TCP and UDP ports be disabled for checking.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP and UDP ports checking. This checking takes effect for both IPv4 and IPv6 TCP and UDP packets. When enabled, the switch drops TCP and UDP packets if its source port is the same as its destination port. In most cases, when the condition of source port is the same as that of the destination port, it indicates a Layer4 protocol error. (This type of error can be found in a BALT attack.)

Note

Options udp and tcp are supported on Summit X250e platform

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection tcp flags

disable ip-security anomaly-protection tcp flags {slot [*slot* **| all]}**

Description

Disables TCP flag checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP flag checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops TCP packets if one of following condition is true:

- TCP SYN flag==1 and the source port<1024
- TCP control flag==0 and the sequence number==0
- TCP FIN, URG, and PSH bits are set, and the sequence number==0
- TCP SYN and FIN both are set.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection tcp fragment

disable ip-security anomaly-protection tcp fragment {slot [*slot* **| all]}**

Description

Disables TCP fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables TCP fragment checking. This checking takes effect for IPv4/IPv6. When it is enabled, the switch drops TCP packets if one of following condition is true:

- For the first IPv4 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv4 TCP header allowed size
- If its IP offset field==1 (for IPv4 only)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection icmp

disable ip-security anomaly-protection icmp {**slot** [*slot* | **all**]}

Description

Disables ICMP size and fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables ICMP size and fragment checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops ICMP packets if one of following condition is true:

- Fragmented ICMP packets for IPv4 packets.
- IPv4 ICMP pings packets with payload size greater than the maximum IPv4 ICMP-allowed size. (The maximum allowed size is configurable.)
- IPv6 ICMP ping packets with payload size > the maximum IPv6 ICMP-allowed size. (The maximum allowed size is configurable.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security anomaly-protection notify

disable ip-security anomaly-protection notify [log | snmp | cache] {slot [*slot* **| all]}**

Description

Disables protocol anomaly notification.

Syntax Description

log	Specifies the switch to send the notification to a log file.
snmp	Specifies the switch to send an SNMP trap when an event occurs.
cache	Specifies the switch to send the notification to cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command disables anomaly notification. When enabled, any packet failed to pass enabled protocol checking is sent to XOS Host CPU and notifies the user. There are three different types of notifications:

- log: log anomaly events in the switch log system; you can view and manage this log with the show log and configure log commands
- snmp: the anomaly events generate SNMP traps
- cache: logs the most recent and unique anomaly events in memory; rebooting the switch will cause all the logged events to be lost (the number of cached events is configured by command)

When disabled, the switch drops all violating packets silently.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

disable ip-security arp gratuitous-protection

disable ip-security arp gratuitous-protection {**vlan**} [**all** | *vlan_name*]

Description

Disables gratuitous ARP protection on one or all VLANs on the switch.

Syntax Description

all	Specifies all VLANs configured on the switch.
vlan-name	Specifies the VLAN.

Default

By default, gratuitous ARP protection is disabled.

Usage Guidelines

Beginning with ExtremeXOS 11.6, this command replaces the disable iparp gratuitous protect vlan command.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

This command disables gratuitous ARP protection.

Example

The following command disables gratuitous ARP protection for VLAN corp:

```
disable ip-security arp gratuitous-protection vlan corp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security arp learning learn-from-arp

disable ip-security arp learning learn-from-arp {**vlan**} *vlan_name* **ports** [**all** | *ports*]

Description

Disables ARP learning on the specified VLAN and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, ARP learning is enabled.

Usage Guidelines

You can disable ARP learning so that the only entries in the ARP table are either manually added or those created by DHCP secured ARP; the switch does not add entries by tracking ARP requests and replies. By disabling ARP learning and adding a permanent entry or configuring DHCP secured ARP, you can centrally manage and allocate client IP addresses and prevent duplicate IP addresses from interrupting network operation.

To manually add a permanent entry to the ARP table, use the following command:

```
configure iparp add <ip_addr> {vr <vr_name>} <mac>
```

To configure DHCP secure ARP as a method to add entries to the ARP table, use the following command:

```
enable ip-security arp learning learn-from-dhcp vlan <vlan_name_ ports [all |
<ports>] {poll-interval <interval_in_seconds>} {retries <number_of_retries}
```

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} <vlan_name>
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {<ip_addre> | <mac> | vlan <vlan_name> | permanent} {vr <vr_name>}
```

Note

DHCP secured ARP entries are stored as static entries in the ARP table.

Example

The following command disables ARP learning on port 1:1 of the VLAN learn:

```
disable ip-security arp learning learn-from-arp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security arp learning learn-from-dhcp

disable ip-security arp learning learn-from-dhcp {**vlan**} *vlan_name* **ports** [**all** | *ports*]

Description

Disables DHCP secured ARP learning for the specified VLAN and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, DHCP secured ARP learning is disabled.

Usage Guidelines

Use this command to disable DHCP secured ARP learning.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} <vlan_name>
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {<ip_addre> | <mac> | vlan <vlan_name> | permanent} {vr <vr_name>}
```

Example

The following command disables DHCP secured ARP learning on port 1:1 of the VLAN learn:

```
disable ip-security arp learning learn-from-dhcp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security arp validation

disable ip-security arp validation {**vlan**} *vlan_name* [**all** | *ports*]

Description

Disables ARP validation for the specified VLAN and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ports.
ports	Specifies one or more ports.

Default

By default, ARP validation is disabled.

Usage Guidelines

Use this command to disable ARP validation.

Displaying ARP Validation Information

To display information about ARP validation, use the following command:

```
show ip-security arp validation {vlan} <vlan_name>
```

Example

The following command disables ARP validation on port 1:1 of the VLAN valid:

```
disable ip-security arp validation vlan valid ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security dhcp-bindings restoration

disable ip-security dhcp-bindings restoration

Description

Disables the download and upload of DHCP bindings.

Syntax

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The command allows you to disable the download and upload of the DHCP bindings, essentially disabling the DHCP binding functionality. The default is disabled.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security dhcp-snooping

disable ip-security dhcp-snooping {**vlan**} *vlan_name* **ports** [**all** | *ports*]

Description

Disables DHCP snooping on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN.
all	Specifies all ports to stop receiving DHCP packets.
ports	Specifies one or more ports to stop receiving DHCP packets.

Default

By default, DHCP snooping is disabled

Usage Guidelines

Use this command to disable DHCP snooping on the switch.

Example

The following command disables DHCP snooping on the switch:

```
disable ip-security dhcp-snooping vlan snoop ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable ip-security source-ip-lockdown ports

disable ip-security source-ip-lockdown ports [**all** | *ports*]

Description

Disables the source IP lockdown feature on one or more ports.

Syntax Description

all	Specifies all ports for which source IP lockdown should be disabled.
ports	Specifies one or more ports for which source IP lockdown should be disabled.

Default

By default, source IP lockdown is disabled on the switch.

Usage Guidelines

To display the source IP lockdown configuration on the switch, use the following command:

```
show ip-security source-ip-lockdown
```

Example

The following command disables source IP lockdown on ports 1:1 and 1:4:

```
disable ip-security source-ip-lockdown ports 1:1, 1:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

disable mac-lockdown-timeout ports

disable mac-lockdown-timeout ports [**all** | *port_list*]

Description

Disables the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports
port_list	Specifies one or more ports or slots and ports.

Default

By default, the MAC address lock down feature is disabled.

Usage Guidelines

If you disable the MAC lock down timer on a port, existing MAC address entries for the port will time out based on the FDB aging period.

Example

The following command disables the MAC address lock down timer set for ports 2:3 and 2:4:

```
disable mac-lockdown-timeout ports 2:3, 2:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

disable radius

disable radius {mgmt-access | netlogin}

Description

Disables the RADIUS client.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.

Default

RADIUS authentication is disabled for both switch management and network login by default.

Usage Guidelines

Use the mgmt-access keyword to disable RADIUS authentication for switch management functions.

Use the netlogin keyword to disable RADIUS authentication for network login.

If you do not specify a keyword, RADIUS authentication is disabled on the switch for both management and network login.

Example

The following command disables RADIUS authentication on the switch for both management and network login:

```
disable radius
```

The following command disables RADIUS authentication on the switch for network login:

```
disable radius netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable radius-accounting

disable radius-accounting {mgmt-access | netlogin}

Description

Disables RADIUS accounting.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.

Default

RADIUS accounting is disabled for both switch management and network login by default.

Usage Guidelines

Use the mgmt-access keyword to disable RADIUS accounting for switch management functions.

Use the netlogin keyword to disable RADIUS accounting for network login.

If you do not specify a keyword, RADIUS accounting is disabled on the switch for both management and network login.

Example

The following command disables RADIUS accounting on the switch for both management and network login:

```
disable radius-accounting
```

The following command disables RADIUS accounting on the switch for network login:

```
disable radius-accounting netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable ssh2

disable ssh2

Description

Disables the SSH2 server for incoming SSH2 sessions to switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

SSH2 options (non-default port setting) are not saved when SSH2 is disabled.

To view the status of SSH2 on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for SSH2.

Example

The following command disables the SSH2 server:

```
disable ssh2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable tacacs

disable tacacs

Description

Disables TACACS+ authentication.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables TACACS+ authentication for the switch:

```
disable tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable tacacs-accounting

disable tacacs-accounting

Description

Disables TACACS+ accounting.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables TACACS+ accounting:

```
disable tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable tacacs-authorization

disable tacacs-authorization

Description

Disables TACACS+ authorization.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This disables CLI command authorization but leaves user authentication enabled.

Example

The following command disables TACACS+ CLI command authorization:

```
disable tacacs-authorization
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable web http

disable web http

Description

Disables the hypertext transfer protocol (HTTP) access to the switch on the default port (80).

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to disallow users from connecting with HTTP. Disabling HTTP access forces user to use a secured HTTPS connection if web HTTPS is enabled.

Use the following command to enable web HTTPS:

```
enable web https
```

Example

The following command disables HTTP on the default port:

```
disable web http
```

History

This command was first available in the ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

disable web https

disable web https

Description

Disables the secure socket layer (SSL) access to the switch on the default port (443).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable SSL before changing the certificate or private key.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the

module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

Example

The following command disables SSL on the default port:

```
disable web https
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

download ssl certificate

download ssl *ipaddress* **certificate** *cert_file*

Description

Permits downloading of a certificate key from files stored in a TFTP server.

Syntax Description

ipaddress	Specifies the IP address of the TFTP server.
cert_file	Specifies the name of the certificate key.

Default

N/A.

Usage Guidelines

If the download operation is successful, any existing certificate is overwritten. After a successful download, the software attempts to match the public key in the certificate against the private key stored. If the private and public keys do not match, the switch displays a warning message similar to the following: Warning: The Private Key does not match with the Public Key in the certificate. This warning acts as a reminder to also download the private key.

Note

You can only download a certificate key in the VR-Mgmt virtual router.

Downloaded certificates and keys are not saved across switch reboots unless you save your current switch configuration. Once you issue the save command, the downloaded certificate is stored in the configuration file and the private key is stored in the EEPROM.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

You can purchase and obtain SSL certificates from Internet security vendors.

Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for remote IP addresses.

When specifying a remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Colon (:)

When configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following command downloads a certificate from a TFTP server with the IP address of 123.45.6.78:

```
download ssl 123.45.6.78 certificate g0ethner1
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

download ssl privkey

download ssl *ipaddress* **privkey** *key_file*

Description

Permits downloading of a private key from files stored in a TFTP server.

Syntax Description

ipaddress	Specifies the IP address of the TFTP server.
key_file	Specifies the name of the private key file.

Default

N/A.

Usage Guidelines

If the operation is successful, the existing private key is overwritten.

After a successful download, a check is performed to find out whether the private key downloaded matches the public key stored in the certificate. If the private and public keys do not match, the switch displays a warning similar to the following: Warning: The Private Key does not match with the Public Key in the certificate. This warning acts as a reminder to also download the corresponding certificate.

The certificate and private key file should be in PEM format and generated using RSA as the cryptography algorithm.

Downloaded certificates and keys are not saved across switch reboots unless you save your current switch configuration. Once you issue the save command, the downloaded certificate is stored in the configuration file and the private key is stored in the EEPROM.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for remote IP addresses.

When specifying a remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Colon (:)

When configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following command downloads a private key from a TFTP server with the IP address of 123.45.6.78:

```
download ssl 123.45.6.78 privkey t00Ts1e
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

enable dhcp ports vlan

enable dhcp ports *port_list* **vlan** *vlan_name*

Description

Enables DHCP on a specified port in a VLAN.

Syntax Description

port_list	Specifies the ports for which DHCP should be enabled.
vlan_name	Specifies the VLAN on whose ports DHCP should be enabled.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables DHCP for port 5:9 in VLAN corp:

```
enable dhcp ports 5:9 vlan corp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable dos-protect

enable dos-protect

Description

Enables denial of service protection.

Syntax Description

This command has no arguments or variables.

Default

The default is disabled.

Usage Guidelines

None.

Example

The following command enables denial of service protection.

```
enable dos-protect
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

enable dos-protect simulated

enable dos-protect simulated

Description

Enables simulated denial of service protection.

Syntax Description

This command has no arguments or variables.

Default

The default is disabled.

Usage Guidelines

If simulated denial of service is enabled, no ACLs are created. This mode is useful to gather information about normal traffic levels on the switch. This will assist in configuring denial of service protection so that legitimate traffic is not blocked.

Example

The following command enables simulated denial of service protection.

```
enable dos-protect simulated
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on all platforms.

enable iparp gratuitous protect

enable iparp gratuitous protect vlan *vlan-name*

Description

Syntax Description

vlan-name	Specifies the VLAN.

Default

By default, gratuitous ARP is disabled.

Usage Guidelines

Beginning with ExtremeXOS 11.6, the command replaces this command for configuring gratuitous ARP.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

Example

The following command enables gratuitous ARP protection for VLAN corp:

```
enable iparp gratuitous protect vlan corp
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-option loose-source-route

enable ip-option loose-source-route

Description

Enables processing of the loose source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This enables the switch to forward IP packets that have the loose source route IP option (0x83) enabled.

Source routing is used when a sending host specifies the router interfaces that the packet must traverse on it's way to it's destination.

With loose source routing enabled, the packet is forwarded if the routing table has a reverse path to the source IP address of the packet.

Example

The following command enables processing of the loose source route IP option:

```
enable ip-option loose-source-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable ip-security anomaly-protection

enable ip-security anomaly-protection {**slot** [*slot* | **all**]}

Description

Enables all anomaly checking options.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This commands enables all anomaly checking options, including IP address, UDP/TCP port, TCP flag and fragment, and ICMP anomaly checking.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection icmp

enable ip-security anomaly-protection icmp {slot [*slot* **| all]}**

Description

Enables ICMP size and fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables ICMP size and fragment checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops ICMP packets if one of following condition is true:

- Fragmented ICMP packets.
- IPv4 ICMP pings packets with payload size greater than the maximum IPv4 ICMP-allowed size. (The maximum allowed size is configurable.)
- IPv6 ICMP ping packets with payload size > the maximum IPv6 ICMP-allowed size. (The maximum allowed size is configurable.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection ip

enable ip-security anomaly-protection ip { slot [*slot* **| all] }**

Description

Enables source and destination IP address checking.

Syntax Description

slot	Specifies the slot.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables source and destination IP addresses checking. This checking takes effect for both IPv4 and IPv6 packets. When enabled, the switch drops IPv4/IPv6 packets if its source IP address are the same as the destination IP address. In most cases, the condition of source IP address being the same as the destination IP address indicates a Layer3 protocol error. (These kind of errors are found in LAND attacks.)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection l4port

enable ip-security anomaly-protection l4port [**tcp** | **udp** | **both**] {**slot** [*slot* | **all**]}

Description

Enables TCP and UDP ports checking.

Syntax Description

tcp	Specifies that the TCP port be enabled for checking.
udp	Specifies that the UDP port be enabled for checking.
both	Specifies both the TCP and UDP ports be enabled for checking.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enabled TCP and UDP ports checking. This checking takes effect for both IPv4 and IPv6 TCP and UDP packets. When enabled, the switch drops TCP and UDP packets if its source port is the same as its destination port. In most cases, when the condition of source port is the same as that of the destination port, it indicates a Layer4 protocol error. (This type of error can be found in a BALT attack.)

Note

Options udp and tcp are supported on Summit X250e platform

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection notify

enable ip-security anomaly-protection notify [log | snmp | cache] {slot [*slot* | all]}

Description

Enables protocol anomaly notification.

Syntax Description

log	Specifies the switch to send the notification to a log file.
snmp	Specifies the switch to send an SNMP trap when an event occurs.
cache	Specifies the switch to send the notification to cache.
slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables anomaly notification. When enabled, any packet failed to pass enabled protocol checking is sent to XOS Host CPU and notifies the user. There are three different types of notifications:

- log: The anomaly events are logged into EMS log.
- snmp: The anomaly events generate SNMP traps.
- cache: The most recent and unique anomaly events are stored in memory for review and investigation.

When disabled, the switch drops all violating packets silently.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection tcp flags

enable ip-security anomaly-protection tcp flags {**slot** [*slot* | **all**]}

Description

Enables TCP flag checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command Enables TCP flag checking. This checking takes effect for both IPv4 and IPv6 TCP packets. When enabled, the switch drops TCP packets if one of following condition is true:

- TCP SYN flag==1 and the source port<1024
- TCP control flag==0 and the sequence number==0
- TCP FIN, URG, and PSH bits are set, and the sequence number==0
- TCP SYN and FIN both are set.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security anomaly-protection tcp fragment

enable ip-security anomaly-protection tcp fragment {slot [*slot* **| all]}**

Description

Enables TCP fragment checking.

Syntax Description

slot	Specifies the slot to be used.
all	Specifies all IP addresses, or all IP addresses in a particular state.

Default

The default is disabled.

Usage Guidelines

This command enables TCP fragment checking. This checking takes effect for IPv4/IPv6. When it is enabled, the switch drops TCP packets if one of following condition is true:

- For the first IPv4 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv4 TCP header allowed size
- For the first IPv6 TCP fragment (its IP offset field==0), if its TCP header is less than the minimum IPv6 TCP header allowed size
- If its IP offset field==1 (for IPv4 only)

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

enable ip-security arp gratuitous-protection

enable ip-security arp gratuitous-protection {vlan} [all | *vlan_name*]

Description

Enables gratuitous ARP protection on one or all VLANs on the switch.

Syntax Description

all	Specifies all VLANs configured on the switch.
vlan-name	Specifies the VLAN.

Default

By default, gratuitous ARP protection is disabled.

Usage Guidelines

Beginning with ExtremeXOS 11.6, this command replaces the enable iparp gratuitous protect command.

Hosts can launch man-in-the-middle attacks by sending out gratuitous ARP requests for the router's IP address. This results in hosts sending their router traffic to the attacker, and the attacker forwarding that data to the router. This allows passwords, keys, and other information to be intercepted.

To protect against this type of attack, the router will send out its own gratuitous ARP request to override the attacker whenever a gratuitous ARP broadcast with the router's IP address as the source is received on the network.

Beginning with ExtremeXOS 11.6, if you enable both DHCP secured ARP and gratuitous ARP protection, the switch protects its own IP address and those of the hosts that appear as secure entries in the ARP table.

To protect the IP addresses of the hosts that appear as secure entries in the ARP table, use the following commands to enable DHCP snooping, DHCP secured ARP, and gratuitous ARP on the switch:

- enable ip-security dhcp-snooping {vlan} <vlan_name> ports [all | <ports>] violation-action [drop-packet {[block-mac | block-port] [duration <duration_in_seconds> | permanently] | none]}] {snmp-trap}
- enable ipsecurity arp learning learn-from-arp
- enable ip-security arp gratuitous-protection {vlan} [all | <vlan_name>]

Displaying Gratuitous ARP Information

To display information about gratuitous ARP, use the following command:

```
show ip-security arp gratuitous-protection
```

Example

The following command enables gratuitous ARP protection for VLAN corp:

```
enable ip-security arp gratuitous-protectection vlan corp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security arp learning learn-from-arp

enable ip-security arp learning learn-from-arp {**vlan**} *vlan_name* **ports** [**all** | *ports*]

Description

Enables ARP learning for the specified VLAN and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, ARP learning is enabled.

Usage Guidelines

ARP is part of the TCP/IP suite used to associate a device's physical address (MAC address) with its logical address (IP address). The switch broadcasts an ARP request that contains the IP address, and the device with that IP address sends back its MAC address so that traffic can be transmitted across the network. The switch maintains an ARP table (also known as an ARP cache) that displays each MAC address and its corresponding IP address.

By default, the switch builds its ARP table by tracking ARP requests and replies, which is known as ARP learning.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} <vlan_name>
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {<ip_addre> | <mac> | vlan <vlan_name> | permanent} {vr <vr_name>}
```

Example

The following command enables ARP learning on port 1:1 of the VLAN learn:

```
enable ip-security arp learning learn-from-arp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security arp learning learn-from-dhcp

enable ip-security arp learning learn-from-dhcp {**vlan**} *vlan_name* **ports** [**all** | *ports*]

Description

Enables DHCP secured ARP learning for the specified VLAN and member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ingress ports.
ports	Specifies one or more ingress ports.

Default

By default, DHCP secured ARP learning is disabled.

Usage Guidelines

Use this command to configure the switch to add the MAC address and its corresponding IP address to the ARP table as a secure ARP entry. The switch does not update secure ARP entries, regardless of the ARP requests and replies seen by the switch. DHCP secured ARP is linked to the “DHCP snooping” feature. The same DHCP bindings database created when you enabled DHCP snooping is also used by DHCP secured ARP to create secure ARP entries. The switch only removes secure ARP entries when the corresponding DHCP entry is removed from the trusted DHCP bindings database.

Note

If you enable DHCP secured ARP on the switch, ARP learning continues, which allows insecure entries to be added to the ARP table.

The default ARP timeout (configure iparp timeout) and ARP refresh (enable iparp refresh) settings do not apply to DHCP secured ARP entries. The switch removes DHCP secured ARP entries upon any DHCP release packet received from the DHCP client.

Displaying ARP Information

To display how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports, use the following command:

```
show ip-security arp learning {vlan} <vlan_name>
```

To view the ARP table, including permanent and DHCP secured ARP entries, use the following command:

```
show iparp {<ip_addre> | <mac> | vlan <vlan_name> | permanent} {vr <vr_name>}
```

Example

The following command enables DHCP secured ARP learning on port 1:1 of the VLAN learn and uses the default polling and retry intervals:

```
enable ip-security arp learning learn-from-dhcp vlan learn ports 1:1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security arp validation violation-action

enable ip-security arp validation {**destination-mac**} {**source-mac**} {**ip**} {**vlan**} *vlan_name* [**all** | *ports*] **violation-action** [**drop-packet** {[**block-port**] [**duration** *duration_in_seconds* | **permanently**]}] {**snmp-trap**}

Description

Enables ARP validation for the specified VLAN and member ports.

Syntax Description

destination-mac	Specifies that the switch checks the ARP payload for the MAC destination address in the Ethernet header and the receiver's host address in the ARP response.
source-mac	Specifies that the switch checks ARP requests and responses for the MAC source address in the Ethernet header and the sender's host address in the ARP payload.
ip	Specifies the switch checks the IP address in the ARP payload and compares it to the DHCP bindings database. If the IP address does exist in the DHCP bindings table, the switch verifies that the MAC address is the same as the sender hardware address in the ARP request. If not, the packet is dropped.
vlan_name	Specifies the name of the VLAN to which this rule applies.
all	Specifies all ports to participate in ARP validation.
ports	Specifies one or more ports to participate in ARP validation.
drop-packet	Specifies that the switch drops the invalid ARP packet.
block-port	Indicates that the switch blocks invalid ARP requests on the specified port.
permanently	Specifies the switch to permanently disable the port upon receiving an invalid ARP request.
duration_in_seconds	Specifies the switch to temporarily disable the specified port upon receiving an invalid ARP request. The range is seconds.
snmp-trap	Specifies the switch to send an SNMP trap when an event occurs.

Default

By default, ARP validation is disabled.

Usage Guidelines

The violation action setting determines what action(s) the switch takes when an invalid ARP is received.

Depending on your configuration, the switch uses the following methods to check the validity of incoming ARP packets:

- Drop packet—The switch confirms that the MAC address and its corresponding IP address are in the DHCP binding database built by DHCP snooping. This is the default behavior when you enable ARP validation. If the MAC address and its corresponding IP address are in the DHCP bindings database, the entry is valid. If the MAC address and its corresponding IP address are not in the DHCP bindings database, the entry is invalid, and the switch drops the ARP packet.
- IP address—The switch checks the IP address in the ARP payload. If the switch receives an IP address in the ARP payload that is in the DHCP binding database, the entry is valid. If the switch receives an IP address that is not in the DHCP binding database, for example 255.255.255.255 or an IP multicast address, the entry is invalid or unexpected.
- Source MAC address—The switch checks ARP requests and responses for the source MAC address in the Ethernet header and the sender's host address in the ARP payload. If the source MAC address and senders's host address are the same, the entry is valid. If the source MAC source and the sender's host address are different, the entry is invalid.
- Destination MAC address—The switch checks the ARP payload for the destination MAC address in the Ethernet header and the receiver's host address. If the destination MAC address and the target's host address are the same, the entry is valid. If the destination MAC address and the target's host address are different, the entry is invalid.

Any violation that occurs causes the switch to generate an Event Management System (EMS) log message. You can configure to suppress the log messages by configuring EMS log filters. For more information about EMS, see the EMS commands in Commands for Status Monitoring and Statistics

Displaying ARP Validation Information

To display information about ARP validation, use the following command:

```
show ip-security arp validation {vlan} <vlan_name>
```

Example

The following command enables ARP validation on port 1:1 of the VLAN valid:

```
enable ip-security arp validation vlan valid ports 1:1 drop-packet
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security dhcp-bindings restoration

enable ip-security dhcp-bindings restoration

Description

Enables download and upload of DHCP bindings.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The command allows you to enable the download and upload of the DHCP bindings, essentially enabling the DHCP binding functionality. The default is disabled.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security dhcp-snooping

enable ip-security dhcp-snooping {**vlan**} *vlan_name* **ports** [**all** | *ports*] **violation-action** [**drop-packet** {[**block-mac** | **block-port**] [**duration** *duration_in_seconds* | **permanently**] | **none**]}] {**snmp-trap**}

Description

Enables DHCP snooping for the specified VLAN and ports.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN. Create and configure the VLAN before enabling DHCP snooping.
all	Specifies all ports to receive DHCP packets.
ports	Specifies one or more ports to receive DHCP packets.
drop-packet	Indicates that the switch drop the rogue DHCP packet received on the specified port.
block-mac	Indicates that the switch blocks rogue DHCP packets from the specified MAC address on the specified port. The MAC address is added to the DHCP bindings database.
block-port	Indicates that the switch blocks rogue DHCP packets on the specified port. The port is added to the DHCP bindings database.
duration_in_seconds	Specifies that the switch temporarily disable the specified port upon receiving a rogue DHCP packet. The range is seconds.
permanently	Specifies that the switch to permanently disable the specified port upon receiving a rogue DHCP packet.
none	Specifies that the switch takes no action when receiving a rogue DHCP packet; the switch does not drop the packet.
snmp-trap	Specifies the switch to send an SNMP trap when an event occurs.

Default

By default, DHCP snooping is disabled.

Usage Guidelines

Use this command to enable DHCP snooping on the switch.

Note

Snooping IP fragmented DHCP packets is not supported.

The violation action setting determines what action(s) the switch takes when a rouge DHCP server packet is seen on an untrusted port or the IP address of the originating server is not among those of the configured trusted DHCP servers. The DHCP server packets are DHCP OFFER, ACK and NAK. The following list describes the violation actions:

- block-mac—The switch automatically generates an ACL to block the MAC address on that port. The switch does not blackhole that MAC address in the FDB. The switch can either temporarily or permanently block the MAC address.
- block-port—The switch blocks all incoming rogue DHCP packets on that port. The switch disables the port either temporarily or permanently to block the traffic on that port.
- none—The switch takes no action to drop the rogue DHCP packet or block the port, and so on. In this case, DHCP snooping continues to build and manage the DHCP bindings database and DHCP forwarding will continue in hardware as before.

Any violation that occurs causes the switch to generate an Event Management System (EMS) log message. You can configure to suppress the log messages by configuring EMS log filters. For more information about EMS, see the EMS commands in Commands for Status Monitoring and Statistics

Displaying DHCP Snooping Information

To display the DHCP snooping configuration settings, use the following command:

```
show ip-security dhcp-snooping {vlan} <vlan_name>
```

To display the DHCP bindings database, use the following command:

```
show ip-security dhcp-snooping entries {vlan} <vlan_name>
```

To display any violations that occur, use the following command:

```
show ip-security dhcp-snooping violations {vlan} <vlan_name>
```

Example

The following command enables DHCP snooping on the switch and has the switch block DHCP packets from port 1:1:

```
enable ip-security dhcp-snooping vlan snoop ports 1:1 violation-action drop-
packet block-port
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable ip-security source-ip-lockdown ports

enable ip-security source-ip-lockdown ports [**all** | *ports*]

Description

Enables the source IP lockdown feature on one or more ports.

Syntax Description

all	Specifies all ports for which source IP lockdown should be enabled.
ports	Specifies one or more ports for which source IP lockdown should be enabled.

Default

By default, source IP lockdown is disabled on the switch.

Usage Guidelines

Source IP lockdown prevents IP address spoofing by automatically placing source IP address filters on specified ports. If configured, source IP lockdown allows only traffic from a valid DHCP-assigned address obtained by a DHCP snooping-enabled port or an authenticated static IP address to enter the network.

To configure source IP lockdown, you must enable DHCP snooping on the ports connected to the DHCP server and DHCP client before you enable source IP lockdown. You must enable source IP lockdown on the ports connected to the DHCP client, not on the ports connected to the DHCP server. The same DHCP bindings database created when you enable DHCP snooping is also used by the source IP lockdown feature to create ACLs that permit traffic from DHCP clients. All other traffic is dropped. In addition, the DHCP snooping violation action setting determines what action(s) the switch takes when a rouge DHCP server packet is seen on an untrusted port.

To enable DHCP snooping, use the following command:

```
enable ip-security dhcp-snooping {vlan} <vlan_name> ports [all |
<ports>] violation-action [drop-packet {[block-mac | block-port] [duration
<duration_in_seconds> | permanently] | none]}] {snmp-trap}
```

Displaying Source IP Lockdown Information

To display the source IP lockdown configuration on the switch, use the following command:

```
show ip-security source-ip-lockdown
```

Example

The following command enables source IP lockdown on ports 1:1 and 1:4:

```
enable ip-security source-ip-lockdown ports 1:1, 1:4
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

enable mac-lockdown-timeout ports

enable mac-lockdown-timeout ports [**all** | *port_list*]

Description

Enables the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports
port_list	Specifies one or more ports or slots and ports.

Default

By default, the MAC address lock down timeout feature is disabled.

Usage Guidelines

You cannot enable the MAC lock down timer on a port that also has the lock learning feature enabled.

Example

The following command enables the MAC address lock down timeout feature for ports 2:3, 2:4, and 2:6:

```
enable mac-lockdown-timeout ports 2:3, 2:4, 2:6
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

enable radius

enable radius {mgmt-access | netlogin}

Description

Enables the RADIUS client on the switch.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.

Default

RADIUS authentication is disabled for both switch management and network login by default.

Usage Guidelines

Before you enable RADIUS on the switch, you must configure the servers used for authentication and configure the authentication string (shared secret) used to communicate with the RADIUS authentication server.

To configure the RADIUS authentication servers, use the following command:

```
configure radius {mgmt-access | netlogin} [primary | secondary]
server [<ipaddress> | <hostname>] {<udp_port>} client-ip [<ipaddress>] {vr
<vr_name>}
```

To configure the shared secret, use the following command:

```
configure radius {mgmt-access | netlogin} [primary | secondary]
shared-secret {encrypted} <string>
```

If you do not specify a keyword, RADIUS authentication is enabled on the switch for both management and network login. When enabled, all web, Telnet, and SSH logins are sent to the RADIUS servers for authentication. When used with a RADIUS server that supports ExtremeXOS CLI authorization, each CLI command is sent to the RADIUS server for authorization before it is executed.

Use the mgmt-access keyword to enable RADIUS authentication for switch management functions.

Use the netlogin keyword to enable RADIUS authentication for network login.

Example

The following command enables RADIUS authentication on the switch for both management and network login:

```
enable radius
```

The following command enables RADIUS authentication on the switch for network login:

```
enable radius netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable radius-accounting

enable radius-accounting {mgmt-access | netlogin}

Description

Enables RADIUS accounting.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.

Default

RADIUS accounting is disabled for both switch management and network login by default.

Usage Guidelines

The RADIUS client must also be enabled.

Before you enable RADIUS accounting on the switch, you must configure the servers used for accounting and configure the authentication string (shared secret) used to communicate with the RADIUS accounting server.

To configure the RADIUS accounting servers, use the following command:

```
configure radius-accounting {mgmt-access | netlogin} [primary |
secondary] server [<ipaddress> | <hostname>] {<tcp_port>} client-ip
[<ipaddress>] {vr <vr_name>}
```

To configure the shared secret, use the following command:

```
configure radius-accounting {mgmt-access | netlogin} [primary |
secondary] shared-secret {encrypted} <string>
```

If you do not specify a keyword, RADIUS accounting is enabled on the switch for both management and network login.

Use the mgmt-access keyword to enable RADIUS accounting for switch management functions.

Use the netlogin keyword to enable RADIUS accounting for network login.

Example

The following command enables RADIUS accounting on the switch for both management and network login:

```
enable radius-accounting
```

The following command enables RADIUS accounting for network login:

```
enable radius-accounting netlogin
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable ssh2

enable ssh2 {**access-profile** [*access_profile* | **none**]} {**port** *tcp_port_number*} {**vr** [*vr_name* | **all** | **default**]}

Description

Enables SSH2 server to accept incoming sessions from SSH2 clients.

Syntax Description

access_profile	Specifies an ACL policy.
none	Cancels a previously configured ACL policy.
port	Specifies a TCP port number. The default is port 22.
vr_name	Specifies a virtual router name. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
all	Specifies that SSH is enabled on all virtual routers.
default	Specifies that SSH is enabled on the default virtual router.

Default

The SSH2 feature is disabled by default.

Usage Guidelines

SSH2 enables the encryption of session data. You must be logged in as an administrator to enable SSH2.

SSH2 functionality is not present in the base ExtremeXOS software image, but is in an additional, installable module. Before you can access any SSH2 commands, you must install the module. Without the module, the commands do not appear on the command line. To install the module, see the instructions in Software Upgrade and Boot Options

After you have installed the SSH2 module, you must generate a host key and enable SSH2. To generate an SSH2 host key, use the configure ssh2 key command. To enable SSH2, use the enable ssh2 command.

Use the port option to specify a TCP port number other than the default port of 22. You can only specify ports 22 and 1024 through 65535.

Using ACLs to Control SSH Access

You can specify a list of predefined clients that are allowed SSH2 access to the switch. To do this, you configure an ACL policy to permit or deny a specific list of IP addresses and subnet masks for the SSH port. You must create an ACL policy file before you can use the access-profile option. If the ACL policy file does not exist on the switch, the switch returns an error message indicating that the file does not exist.

Use the none option to cancel a previously configured ACL.

In the ACL policy file for SSH2, the source-address field is the only supported match condition. Any other match conditions are ignored.

Policy files can also be configured using the following command:

```
        configure ssh2 access-profile [ <access_profile> | [[add <rule> ]
[first | [[before | after] <previous_rule>]]] | delete <rule> | none ]
```

Creating an ACL Policy File

To create an ACL policy file, use the edit policy command. For more information about creating and implementing ACL policy files, see Policy Manager and ACLs in the ExtremeXOS Concepts Guide.

If you attempt to implement a policy that does not exist on the switch, an error message similar to the following appears:

```
Error: Policy /config/MyAccessProfile_2.pol does not exist on file system
```

If this occurs, make sure the policy you want to implement exists on the switch. To confirm the policies on the switch, use the ls command. If the policy does not exist, create the ACL policy file.

Viewing SSH Information

To view the status of SSH2 sessions on the switch, use the show management command. The show management command displays information about the switch including the enable/disable state for SSH2 sessions and whether a valid key is present.

Example

The following command enables the SSH2 feature:

```
enable ssh2
```

The next example assumes you have already created an ACL to apply to SSH.

The following command applies the ACL MyAccessProfile_2 to SSH:

```
enable ssh2 access-profile MyAccessProfile_2
```

History

This command was first available in the ExtremeXOS 11.0 SSH module.

The access-profile and none options were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable tacacs

enable tacacs

Description

Enables TACACS+ authentication.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

After they have been enabled, all web and Telnet logins are sent to one of the two TACACS+ servers for login name authentication.

Example

The following command enables TACACS+ user authentication:

```
enable tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable tacacs-accounting

enable tacacs-accounting

Description

Enables TACACS+ accounting.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If accounting is used, the TACACS+ client must also be enabled.

Example

The following command enables TACACS+ accounting for the switch:

```
enable tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable tacacs-authorization

enable tacacs-authorization

Description

Enables CLI command authorization.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When enabled, each command is transmitted to the remote TACACS+ server for authorization before the command is executed. TACACS+ authentication must also be enabled to use TACACS+ authorization. Use the following command to enable authentication:

```
enable tacacs
```

Example

The following command enables TACACS+ command authorization for the switch:

```
enable tacacs-authorization
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable web http

enable web http

Description

Enables hypertext transfer protocol (HTTP) access to the switch on the default HTTP port (80).

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

If HTTP access has been disabled, use this command to enable HTTP access to the switch.

Example

The following command enables HTTP on the default port:

```
enable web http
```

History

This command was first available in the ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

enable web https

enable web https

Description

Enables secure socket layer (SSL) access to the switch on the default port (443).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to allow users to connect using a more secure HTTPS connection.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

To use secure HTTP access (HTTPS) for web-based login connections, you must specify HTTPS as the protocol when configuring the redirect URL. For more information about configuring the redirect URL, see the configure netlogin redirect-page command.

Prior to ExtremeXOS 11.2, the SSH module did not include SSL. To use SSL, you must download and install the current SSH module.

If you are currently running SSH with ExtremeXOS 11.0 or 11.1, and you want to use SSL for secure HTTPS web-based login, you must upgrade your core software image to ExtremeXOS 11.2 or later, install the SSH module that works in concert with that core software image, and reboot the switch.

Example

The following command enables SSL on the default port:

```
enable web https
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

scp2

scp2 {**vr** *vr_name*} {**cipher** [**3des** | **blowfish**]} {**port** *portnum*} *user* [*hostname* | *ipaddress*]:*remote_file local_file*

or

scp2 {**vr** *vr_name*} {**cipher** [**3des** | **blowfish**]} {**port** *portnum*} *local_file user* [*hostname* | *ipaddress*]:*remote_file*

Description

The first command initiates an SCP2 client session to a remote SCP2 server and copies a configuration or policy file from the remote system to the switch.

The second command initiates an SCP2 client session to a remote SCP2 server and copies a configuration or policy file from the switch to a remote system.

Syntax Description

vr_name	Specifies the virtual router. The default virtual router is VR-Mgmt. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements
3des	Specifies that the 3des cipher should be used for encryption. This is the default.

blowfish	Specifies that the blowfish cipher should be used for encryption.
portnum	Specifies the TCP port number to be used for communicating with the SSH2 client. The default is port 22.
user	Specifies a login name for the remote host.
hostname	Specifies the name of the remote host.
ipaddress	Specifies the IP address of the remote host.
remote_file	Specifies the name of the remote file (configuration file, policy file, image file, public key file) to be transferred.
local_file	Specifies the name of the local file (configuration file, policy file, image file, public key file) to be transferred.

Default

The default settings for SSH2 parameters are as follows:

- cipher—3des encryption
- port—22
- compression—off
- vr_name—VR-Mgmt

Usage Guidelines

You must be running the SSH2 module (ssh.xmod), which is under Export Control, in order to use the SCP2 command.

SSH2 does not need to be enabled on the switch in order to use this command.

This command logs into the remote host as <user> and accesses the file <remote_file>. You will be prompted for a password from the remote host, if required.

Host Name, User Name, and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name, user name, or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted for host and user names
- Underscore (_) Permitted for host and user names
- Colon (:)
- At symbol (@) Permitted only for user names
- Slash (/) Permitted only for user names

When naming the host, creating a user name, or configuring the IP address, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following command copies the configuration file test.cfg on host system1 to the switch:

```
scp2 admin@system1:test.cfg localtest.cfg
```

The following command copies the configuration file engineering.cfg from the switch to host system1:

```
scp2 engineering.cfg admin@system1:engineering.cfg
```

The following command copies the file Anna5.xsf from the default virtual router to 150.132.82.140:

```
scp2 vr vr-default Anna5.xsf root@150.132.82.140:Anna5.xsf
Upload /config/Anna5.xsf to
Connecting to 150.132.82.140...
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show dhcp-server

show dhcp-server {**vlan** *vlan_name*}

Description

Displays the DHCP server's configuration and address allocation on a specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server of interest.

Default

N/A.

Usage Guidelines

If no VLAN is specified, the configuration and address allocation for the servers on all the VLANs is displayed.

Example

The following command displays the configuration and address allocation for the DHCP server for the VLAN test:

```
show dhcp-server vlan test
```

The following is sample output from this command:

```
X450a-24t.7 # show dhcp-server
VLAN "Default":
DHCP Address Range   : Not configured
Netlogin Lease Timer : Not configured (Default = 10 seconds)
DHCP Lease Timer     : Not configured (Default = 7200 seconds)
DHCP Option Code  12 : hex "11:22:33:44:45"
DHCP Option Code  69 : ipaddress 10.0.0.1 10.0.0.2
Ports DHCP Enabled   : No ports enabled
```

History

This command was first available in ExtremeXOS 11.0.

The output is modified to show primary and secondary DNS servers in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show dos-protect

show dos-protect {detail}

Description

Displays DoS protection configuration and state.

Syntax Description

detail	Specifies to display statistics in addition to configuration and state.

Default

N/A.

Usage Guidelines

Use this command to display the DoS protection settings. Using the detail option will also display the following cumulative statistics:

- trusted
- notify
- alerts

Example

The following command displays the DoS protection settings for the switch:

```
show dos-protect
```

The following is sample output from this command:

```
dos-protect is disabled
dos-protect settings:
interval:         1  (measurement interval secs)
acl expire time:  5  (secs)
trusted ports:
no trusted ports configured
type L3-Protect:
notify threshold:   3500  (level to log a message)
alert threshold:    4000  (level to generate an ACL)
```

The following command displays detailed DoS protection settings for the switch:

```
show dos-protect detail
```

The following is sample output from this command:

```
dos-protect is enabled
dos-protect settings:
interval:         1  (measurement interval secs)
acl expire time:  5  (secs)
trusted ports:
1:2
type L3-Protect:
notify threshold:   3500  (level to log a message)
alert threshold:    4000  (level to generate an ACL)
dos-protect statistics:
trusted:   1301
notify:    0
alerts:    0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show ip-security anomaly-protection notify cache ports

show ip-security anomaly-protection notify cache ports *port_list*

Description

Displays most anomaly notification caches.

Syntax Description

port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

This command displays most anomaly notification caches.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is only available on the Summit X250e, X450a, X450e, X460, X480, X650, and X670 platforms, whether or not included in a SummitStack, and the BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

show ip-security arp gratuitous-protection

show ip-security arp gratuitous-protection

Description

If configured for gratuitous ARP, displays the gratuitous ARP protection configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the name of each VLAN configured for gratuitous ARP.

If you do not have gratuitous ARP configured, the switch does not display any VLAN information.

Example

The following command displays the gratuitous ARP configuration on the switch:

```
show ip-security arp gratuitous-protectection
```

The following is sample output from this command:

```
Gratuitous ARP Protection enabled on following VLANs:
Default, test
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security arp learning

show ip-security arp learning {**vlan**} *vlan_name*

Description

Displays how the switch builds an ARP table and learns MAC addresses for devices on a specific VLAN and associated member ports.

Syntax Description

vlan_name	Specifies the name of the VLAN.

Default

N/A.

Usage Guidelines

The switch displays the following ARP learning information:

- Port—The member port of the VLAN.
- Learn-from—The method the port uses to build the ARP table. The methods are:
  - ARP—ARP learning is enabled. The switch uses a series or requests and replies to build the ARP table.
  - DHCP—DHCP secured ARP is enabled. The switch uses DHCP snooping to build the ARP table.
  - None—Both DHCP secured ARP and ARP learning are disabled.

Example

The following command displays how the switch builds its ARP table for the VLAN learn:

```
show ip-security arp learning vlan learn
```

The following is sample output from this command:

```
Port                Learn-from
---------------------------------
2:1                ARP
2:2                DHCP,  poll 300 sec, retries 3
2:3                ARP
2:4                None
```

```
2:5                 ARP
2:6                 ARP
2:7                 ARP
2:8                 ARP
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security arp validation

show ip-security arp validation {**vlan**} *vlan_name*

Description

Displays ARP validation information for the specified VLAN.

Syntax Description

vlan_name	Specifies the name of the VLAN.

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation-action—Determines what action(s) the switch takes when an invalid ARP is received.

Example

The following command displays ARP validation on for the VLAN valid:

```
show ip-security arp validation vlan valid
```

The following is sample output from this command:

```
-------------------------------------------------------------
Port    Validation              Violation-action
-------------------------------------------------------------
7       DHCP                    drop-packet, block-port for 120 seconds, snmp-
trap
23      DHCP                    drop-packet, block-port for 120 seconds, snmp-
trap
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security arp validation violations

show ip-security arp validation violations {**vlan**} *vlan_name* **ports** [*ports* | **all**]

Description

Displays the violation count on an ARP validation.

Syntax Description

vlan_name	Specifies the name of the VLAN.
ports	Specifies the name of the port.
all	Specifies all ports.

Default

N/A.

Usage Guidelines

The switch displays the following ARP validation information:

- Port—Indicates the port that received the ARP entry.
- Validation—Indicates how the entry is validated.
- Violation count—Indicates the number of violations for each port.

Example

The following command displays ARP validation violation counts on all ports:

```
show ip-security arp validation violations ragu ports all
```

The following is sample output from this command:

```
-------------------------------------------------------------------
Port    Validation Violation Count
-------------------------------------------------------------------
1:1 ip,DHCP 1233
1:3 ip,DHCP 3425
1:4 ip,DHCP 5654
1:5 ip,DHCP 0
1:6 ip,DHCP 3645
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping entries

show ip-security dhcp-snooping entries {**vlan**} *vlan_name*

Description

Displays the DHCP bindings database on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP bindings database information:

- VLAN—The name of the DHCP-snooping VLAN
- IP Addr—The IP address of the untrusted interface or client
- MAC Addr—The MAC address of the untrusted interface or client
- Port—The port number where the untrusted interface or client attempted to access the network

Example

The following command displays the DHCP bindings database on the switch:

```
show ip-security dhcp-snooping entries vlan dhcpVlan
```

The following is sample output from this command:

```
-----------------------------------------
Vlan: dhcpVlan
-----------------------------------------
Server    Client
IP Addr         MAC Addr            Port      Port
-------         --------            ------    ------
172.16.100.9    00:90:27:c6:b7:65   1:1       1:2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping information-option

show ip-security dhcp-snooping information-option

Description

Displays the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays DHCP relay agent option (option 82) settings. For example, the following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
Information option insertion: Enabled
Information option checking : Disabled
Information option policy   : Drop
```

The following command:

```
show ip-security dhcp-snooping information-option
```

Generates the following output:

```
Information option insertion: Enabled
Information option checking : Enabled
Information option policy   : Keep
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping information circuit-id port-information

show ip-security dhcp-snooping information circuit-id port-information ports [*port_list* | **all**]

Description

Displays the port information portion of the circuit ID for the indicated port(s).

Syntax Description

port_list	Specifies one or more ports.
all	Specifies all ports

Default

N/A.

Usage Guidelines

This command displays the port information portion of the circuit ID for the indicated ports.

Example

The following command:

```
X250e-48t.7 # show ip-security dhcp-snooping information circuit-id port-
information ports 1-7
```

Displays the following output:

```
Port            Circuit-ID Port information string
----            ----------------------------------
1               portinfostring1
2               portinfostring2
3               portinfostring3
4               portinfostring4
5               portinfostring5
Port            Circuit-ID Port information string
----            ----------------------------------
6               1006
7               1007
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping information-option circuit-id vlan-information

show ip-security dhcp-snooping information-option circuit-id vlan-information {{vlan} *vlan_name*}

Description

Displays the VLAN information portion of the circuit ID for the indicated VLAN.

Syntax Description

vlan_name	Specifies a vlan_name

Default

N/A.

Usage Guidelines

This command displays the VLAN information portion of the circuit ID for the indicated VLAN. When a VLAN is not specified, the circuit ID information for all the VLANs is displayed

Example

The following command:

```
show ip-security dhcp-snooping information-option circuit-id vlan-information
vlan Mktg
```

Displays the following output:

```
Vlan                            Circuit-ID vlan information string
----                            ----------------------------------
Mktg                             DSLAM1
Note: The full Circuit ID string has the form <Vlan Info>-<Port ifIndex>.
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping

show ip-security dhcp-snooping {vlan} *vlan_name*

Description

Displays the DHCP snooping configurations on the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- DHCP snooping enabled on ports—The ports that have DHCP snooping enabled
- Trusted ports—The ports configured as trusted ports
- Trusted DHCP servers—The servers configured as trusted DHCP servers
- Port—The specific port that has DHCP snooping enabled
- Violation-action—The action the switch takes upon detecting a rogue DHCP packet on the port

Example

The following command displays the DHCP snooping settings for the switch:

```
show ip-security dhcp-snooping vlan "Default"
```

The following is sample output from this command:

```
DHCP Snooping enabled on ports: 7, 9, 11
Trusted Ports: None
Trusted DHCP Servers: None
Bindings Restoration     : Enabled
Bindings Filename        : dhcpsonia.xsf
Bindings File Location   :
Primary Server  : 10.1.1.14, VR-Default, TFTP
Secondary Server: None
Bindings Write Interval  : 5 minutes
Bindings last uploaded at:
-----------------------------------
Port            Violation-action
-----------------------------------
7               none
9               none
11              none
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security dhcp-snooping violations

show ip-security dhcp-snooping violations {vlan} *vlan_name*

Description

Displays the MAC addressed from which the rouge DHCP packet was received by the switch.

Syntax Description

vlan_name	Specifies the name of the DHCP-snooping VLAN.

Default

N/A.

Usage Guidelines

The switch displays the following DHCP snooping information:

- Port—The specific port that received the rouge DHCP packet
- Violating MAC—The MAC address from which the rouge DHCP was received by the switch

Example

The following command displays the DHCP snooping violations for the VLAN green:

```
show ip-security dhcp-snooping violations green
```

The following is sample output from this command:

```
Violations seen on following ports
-----------------------------------------
Port            Violating MAC
-----------------------------------------
2:3             00-0c-11-a0-3e-12
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show ip-security source-ip-lockdown

show ip-security source-ip-lockdown

Description

Displays the source IP lockdown configuration on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The switch displays the following source IP lockdown information:

- Port—Indicates the port that has DHCP snooping enabled and is configured for source IP lockdown
- Locked IP Address—Indicates a valid DHCP-assigned address obtained by a DHCP snooping-enabled port or an authenticated static IP address

Example

The following command displays the source IP configuration on the switch:

```
show ip-security source-ip-lockdown
```

The following is sample output from this command:

```
Ports           Locked IP Address
23 10.0.0.101
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

show mac-lockdown-timeout fdb ports

show mac-lockdown-timeout fdb ports [**all** | *port_list*]

Description

Displays the MAC entries that are learned on the specified port or group of ports or for all ports on the switch along with the aging time of each port.

Syntax Description

all	Specifies all ports
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

If a port is down, the command displays all of the MAC entries that are maintained locally in the software.

The MAC entries learned on the specified port are displayed only if the MAC lock down timeout feature is enabled on the port. If you specify a port on which this feature is disabled, the MAC entries learned on that port are not displayed.

The switch displays the following information:

- Mac—The MAC address that defines the entry
- Vlan—The VLAN name and ID for the entry
- Age—The age of the entry, in seconds
- Flags—Flags that define the type of entry:
  - B—Egress Blackhole
  - b—Ingress Blackhole
  - F—Entry in the hardware FDB
  - L—Entry in the software
- Port—The port on which the MAC address has been learned

Example

The following command displays information about the MAC address lock down timeout settings for ports 2:3 and 2:4:

```
show mac-lockdown-timeout fdb ports 2:3, 2:4
```

The following is sample output from this command:

```
Mac                     Vlan       Age  Flags  Port
-------------------------------------------------------
00:00:01:02:03:04v1(4094)0010F2:3
00:00:01:00:00:02v1(4094)0030FB b2:3
00:00:0A:02:03:04v2(4093)0050L2:4
00:00:0B:02:03:04v2(4093)0090F2:4
Flags : (F) Entry as in h/w FDB, (L) Entry in s/w and not in h/w
(B) Egress Blackhole, (b) Ingress Blackhole
Total: 4 Entries in FDB: 3Entries in s/w: 1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show mac-lockdown-timeout ports

show mac-lockdown-timeout ports [**all** | *port_list*]

Description

Displays information about the MAC address lock down timeout feature for the specified port or group of ports or for all ports on the switch.

Syntax Description

all	Specifies all ports
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

The switch displays the following MAC address timeout information:

- Port—Indicates the port number that you specified in the command
- MAC Lockdown Timeout—Specifies the enabled/disabled state of the MAC address lock down timeout feature.
- Timeout (in seconds)—Specifies the timeout value for the specified ports. By default, the timeout value is 15 seconds. Even if MAC address lock down is disabled, the default timeout value is displayed.

Example

The following command displays information about the MAC address lock down timeout settings for ports 2:3, 2:4, and 2:6:

```
show mac-lockdown-timeout ports 2:3, 2:4, 2:6
```

The following is sample output from this command:

```
Ports   MAC Lockdown Timeout   Timeout (in seconds)
=====================================================
2:3 Enabled300
2:4 Enabled 300
2:6Disabled                     15
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show ports rate-limit flood

show ports {*port_list*} **rate-limit flood** {**no-refresh**}

Description

Displays rate-limit discard statistics.

Syntax Description

port_list	Specifies one or more ports or slots and ports.
no-refresh	Specifies a static snapshot of data.

Default

N/A.

Usage Guidelines

This command displays the per port ingress rate-limit flood traffic counter as well as information about received packets that have not been discarded due to rate-limiting.

It is used to show the results of the configure ports <port_list> rate-limit flood [broadcast | multicast | unknown-destmac] [no-limit | <pps>] command.

Note

As part of the system health check, the system polls the Rate-limit Flood Counters every 5 minutes and looks for non-zero counters on a port. A HAL.RateLimit.Info log message is logged when this is first detected on a port to alert the user that something in the network has triggered the rate limiting to occur. The message is not be logged again unless the counters are cleared.

Example

The following command displays information for port 1:1 without a screen refresh on a BlackDiamond 8800 switch.

```
show port 1:1 rate-limit flood no-refresh
```

Following is sample output from this command.

```
BD-8810.1 # show port 1:1 rate-limit flood no-refresh
Port Rate-Limit Discard Monitor Tue May 27 13:02:37 2008

History

This command was first available in ExtremeXOS 12.2.

Platform Availability

This command is available on the Summit family switches, whether or not included in a SummitStack, BlackDiamond X8 series switches, and BlackDiamond 8000 c-, e-, xl-, and xm-series modules.

show radius

show radius {mgmt-access | netlogin}

Description

Displays the current RADIUS client configuration and statistics.

Syntax Description

mgmt-access	Specifies configuration and statistics for the switch management RADIUS authentication server.
netlogin	Specifies configuration and statistics for the network login RADIUS authentication server.

Default

N/A.

Usage Guidelines

If you do not specify a keyword, configuration details related to both management and network login are displayed. The output from this command displays the status of RADIUS and RADIUS accounting (enabled or disabled) and the primary and secondary servers for RADIUS and RADIUS accounting.

Use the mgmt-access keyword to display only RADIUS configuration details related to management access.

Use the netlogin keyword to only RADIUS configuration details related to network login.

Example

The following command displays the current RADIUS client configuration and statistics for both management and network login:

```
show radius
```

The following is sample output from this command:

```
Switch Management Radius: enabled
Switch Management Radius server connect time out: 3 seconds
Switch Management Radius Accounting: disabled
Switch Management Radius Accounting server connect time out: 3 seconds
Netlogin Radius: enabled
Netlogin Radius server connect time out: 3 seconds
Netlogin Radius Accounting: disabled
Netlogin Radius Accounting server connect time out: 3 seconds
Primary Switch Management Radius server:
Server name   :
IP address    :  10.100.1.100
Server IP Port:  1812
Client address:  10.116.3.101 (VR-Mgmt)
Shared secret :  g~`#uovpkkpvi~`
Access Requests   :  0              Access Accepts    :  0

Round Trip Time   :  0
Secondary Netlogin Radius server:
Server name   :
IP address    :  10.100.1.201
Server IP Port:  1812
Client address:  10.116.3.101 (VR-Mgmt)
Shared secret :  g~`#uovpkkpvi~`
```

```
Access Requests   :  0              Access Accepts    :  0
Access Rejects    :  0              Access Challenges :  0
Access Retransmits:  0              Client timeouts   :  0
Bad authenticators:  0              Unknown types     :  0
Round Trip Time   :  0
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show radius-accounting

show radius-accounting {mgmt-access | netlogin}

Description

Displays the current RADIUS accounting client configuration and statistics.

Syntax Description

mgmt-access	Specifies configuration and statistics for the switch management RADIUS accounting server.
netlogin	Specifies configuration and statistics for the network login RADIUS accounting server.

Default

N/A.

Usage Guidelines

If you do not specify a keyword, configuration details related to both management and network login are displayed. The output from this command displays information about the status and configuration of RADIUS accounting.

Use the mgmt-access keyword to display only RADIUS accounting configuration details related to management access.

Use the netlogin keyword to display only RADIUS accounting configuration details related to network login.

Example

The following command displays RADIUS accounting client configuration and statistics for both management and network login:

```
show radius-accounting
```

The following is sample output from this command:

```
Switch Management Radius Accounting: disabled
Switch Management Radius Accounting server connect time out: 3 seconds
Netlogin Radius Accounting: disabled
Netlogin Radius Accounting server connect time out: 3 seconds
Primary Switch Management Accounting server:
Server name   :
IP address    :  10.100.1.100
Server IP Port:  1813
Client address:  10.116.3.101 (VR-Mgmt)
Shared secret :  g~`#uovpkkpvi~`
Acct Requests     :  0              Acct Responses    :  0
Acct Retransmits  :  0              Timeouts          :  0
Secondary Switch Management Accounting server:
Server name   :
IP address    :  10.100.1.101
Server IP Port:  1813
Client address:  10.116.3.101 (VR-Mgmt)

```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show ssh2 private-key

show ssh2 private-key

Description

Displays the ssh2 server's private key.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the ssh server's private key which can be used to configure the key later or on another switch by using the configure ssh2 key {pregenerated} command. The key is saved in the switch's EEPROM.

To erase the key from the EEPROM, use the unconfigure switch command.

History

This command was first available in ExtremeXOS 12.1.

This command was added to ExtremeXOS 11.6 SR, and ExtremeXOS 12.0 SR.

Platform Availability

This command is available on all platforms.

show sshd2 user-key

show sshd2 user-key {*key_name* **{users}**}

Description

Displays the user names bound to a key.

Syntax Description

key_name	Specifies the name of the public key.
users	Specifies the name of the users.

Default

N/A.

Usage Guidelines

This command displays the names of the users that are bound to a public key.

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

show ssl

show ssl {detail}

Description

Displays the secure socket layer (SSL) configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following information:

- HTTPS port configured. This is the port on which the clients will connect.
- Length of the RSA key (the number of bits used to generate the private key).
- Basic information about the stored certificate.

Similar to SSH2, before you can use any SSL commands, you must first download and install the separate Extreme Networks SSH software module (ssh.xmod). This additional module allows you to

configure both SSH2 and SSL on the switch. SSL is packaged with the SSH module; therefore, if you do not install the module, you are unable to configure SSL. If you try to execute SSL commands without installing the module first, the switch notifies you to download and install the module. To install the module, see the instructions in Software Upgrade and Boot Options of the ExtremeXOS Concepts Guide.

If you attempt to use this command before installing the SSH module, the switch displays a message similar to the following:

```
SSL Module: Not Installed.
```

Note

The switch utilizes the SSH module for SSL functionality. You do not install an SSL module, only the SSH module.

Example

The following command displays the SSL configuration:

```
show ssl
```

The following is sample output from this command:

```
HTTPS Port Number: 443
Private Key matches with the Public Key in certificate. (or Private key does
not match with the Public Key in the certificate)
RSA Key Length: 1024
Certificate:
Data:
Version: 1 (0x0)
Serial Number: 6 (0x6)
Signature Algorithm: md5WithRSAEncryption
Issuer: C=AU, O=CryptSoft Pty Ltd, CN=Test CA (1024 bit)
Validity
Not Before: Oct 16 22:31:03 2000 GMT
Not After : Jan 14 22:31:03 2003 GMT
Subject: C=AU, O=CryptSoft Pty Ltd, CN=Server test cert (512 bit)
```

History

This command was first available in the ExtremeXOS 11.2 and supported with the SSH module.

Platform Availability

This command is available on all platforms.

show tacacs

show tacacs

Description

Displays the current TACACS+ configuration and statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- TACACS+—The current state of TACACS+, enabled or disabled.
- TACACS+ Authorization—The current state of TACACS+ authorization, enabled or disabled.
- TACACS+ Accounting—The current state of TACACS+ accounting, enabled or disabled.
- TACACS+ Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ server failure.
- Primary TACACS+ Server—Describes information about the primary TACACS+ server, including:
  - The name of the primary TACACS+ server
  - The IP address of the primary TACACS+ server
  - The TCP port to use to contact the primary TACACS+ server
  - The IP address and VR used by the switch
  - The shared secret configured for the primary TACACS+ server
- Secondary TACACS+ Server—Contains the same type of output as the primary TACACS+ server for the secondary TACACS+ server, if configured.
- TACACS+ Acct Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ accounting server failure.
- TACACS+ Accounting Server parameters, if configured. Contains the same type of output as the TACACS+ server for the TACACS+ accounting server(s), if configured.

Example

The following command displays TACACS+ client configuration and statistics:

```
show tacacs
```

The following is sample output from this command:

```
TACACS+: enabled
TACACS+ Authorization: enabled
TACACS+ Accounting : enabled
TACACS+ Server Connect Timeout sec: 3
Primary TACACS+ Server:
Server name   :
IP address    :  10.201.31.238
Server IP Port:  49
Client address:  10.201.31.65 (VR-Default)
Shared secret :  qijxou
Secondary TACACS+ Server:
Server name   :
IP address    :  10.201.31.235
Server IP Port:  49
Client address:  10.201.31.65 (VR-Default)
Shared secret :  qijxou
TACACS+ Acct Server Connect Timeout sec: 3
Primary TACACS+ Accounting Server:
Server name   :

Server IP Port:  49
Client address:  10.201.31.65 (VR-Default)
Shared secret :  qijxou
Secondary TACACS+ Accounting Server:
Server name   :
IP address    :  10.201.31.235
Server IP Port:  49
Client address:  10.201.31.65 (VR-Default)
Shared secret :  qijxou
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show tacacs-accounting

show tacacs-accounting

Description

Displays the current TACACS+ accounting client configuration and statistics.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- TACACS+ Accounting—The current state of TACACS+ accounting, enabled or disabled.
- TACACS+ Accounting Server Connect Timeout—The amount of time configured to detect and recover from a TACACS+ server failure.
- Primary TACACS+ Accounting Server—Describes information about the primary TACACS+ accounting server, including:
  - The name of the primary TACACS+ accounting server
  - The IP address of the primary TACACS+ accounting server
  - The TCP port to use to contact the primary TACACS+ accounting server
  - The IP address and VR used by the switch
  - The shared secret configured for the primary TACACS+ accounting server
- Secondary TACACS+ Accounting Server—Contains the same type of output as the primary TACACS + accounting server for the secondary TACACS+ accounting server, if configured.

Example

The following command displays TACACS+ accounting client configuration and statistics:

```
show tacacs-accounting
The following is sample output of this command:
TACACS+ Accounting : enabled
TACACS+ Acct Server Connect Timeout sec: 3
Primary TACACS+ Accounting Server:
Server name   :
IP address    :  10.201.31.238
Server IP Port:  49
Client address:  10.201.31.85 (VR-Default)
Shared secret :  qijxou
Secondary TACACS+ Accounting Server:Not configured
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show vlan dhcp-address-allocation

show {**vlan**} *vlan_name* **dhcp-address-allocation**

Description

Displays the DHCP server's address allocation on a specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server of interest.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the configuration of the DHCP for the VLAN corp:

```
show vlan corp dhcp-address-allocation
```

The following is sample output from this command:

```
================================================================================
IP                MAC                 State      Lease Renewal Time
================================================================================
10.0.0.2   00:02:03:04:05:00   Offered    0000:00:10
10.0.0.3   00:08:03:04:05:00   Assigned   0000:59:09
10.0.0.4   ee:1c:00:04:05:00   Assigned   0000:59:09
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show vlan dhcp-config

show {vlan} *vlan_name* **dhcp-config**

Description

Displays the DHCP server's configuration for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN of the DHCP server of interest.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the configuration of the DHCP server for the VLAN test:

```
show vlan test dhcp-config
```

The following is sample output from this command:

```
    DHCP Address Range                                :    10.10.10.100-
>10.10.10.200
    Netlogin Lease Timer                               :     Not configured
(Default = 10 seconds)
    DHCP Lease Timer         :                          Not configured
(Default = 7200 seconds)
    Primary DNS Server                                 :     1.1.1.1
    Secondary DNS Server         :                      2.2.2.2
    Ports DHCP Enabled                                 :     23
```

History

This command was first available in ExtremeXOS 11.0.

The output is modified to show primary and secondary DNS servers in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show vlan security

show {vlan} *vlan_name* **security**

Description

Displays the MAC limit-learning and lock-learning information for the specified VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

The switch displays the following information:

- Port—Indicates the port on which the MAC address has been learned
- Limit—Indicates that there is either a limited or unlimited amount of learned entries
- State—Indicates that the current FDB entries for the port are permanent, no additional entries are learned, or that the port allows unlimited, dynamic learning
- Learned—Specifies the number of learned entries
- Blackholed—Specifies the number of blackholed entries
- Locked—Specifies the number of locked entries

Example

The following command displays the security setting of the DHCP server for the VLAN corp:

```
show vlan blue security
```

The following is sample output from this command:

```
Port      Limit     State     Learned     Blackholed  Locked
24        Unlimited Unlocked  0           0           0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

ssh2

ssh2 {**cipher** [**3des** | **blowfish**]} {**port** *portnum*} {**compression** [**on** | **off**]} {**user** *username*} {*username*>} [*host* | *ipaddress*] {*remot* **command>**} {**vr** *vr_name*}

Description

Initiates an SSH2 client session to a remote SSH2 server.

Syntax Description

3des	Specifies that the 3des cipher should be used for encryption. This is the default.
blowfish	Specifies that the blowfish cipher should be used for encryption.
portnum	Specifies the TCP port number to be used for communicating with the SSH2 client. The default is port 22.
on	Specifies that the data is to be compressed.
off	Specifies that compression is not to be used. This is the default.
username	Specifies a login name for the remote host, as an alternate to the username@host parameter. Can be omitted if it is the same as the username on the switch.
host	Specifies the name of the remote host.
ipaddress	Specifies the IP address of the remote host.
remote command	Specifies a command to be passed to the remote system for execution. The switch does not support remote commands. The option is only valid if the remote system is a system, such as a UNIX workstation, that accepts remote commands.
vr_name	Specifies the virtual router. The default virtual router is VR-Mgmt. **Note** User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

The default settings for SSH2 parameters are as follows:

- cipher—3des encryption
- port—22
- compression—off
- vr_name—VR-Mgmt

Usage Guidelines

You must be running the SSH2 module (ssh.xmod), which is under Export Control, in order to use the SSH2 client command.

SSH2 does not need to be enabled on the switch in order to use this command.

Typically, this command is used to establish a secure session to a remote switch. You are prompted for your password. Once you have logged in successfully, all ExtremeXOS command you enter are executed on the remote switch. When you terminate the remote session, commands will then resume being executed on the original switch.

Host Name, User Name, and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name, user name, or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted for host and user names
- Underscore (_) Permitted for host and user names
- Colon (:) Permitted for host names and remote IP addresses
- At symbol (@) Permitted only for user names

When naming the host, creating a user name, or configuring the IP address, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/)

When naming a remote file, remember the requirements listed above.

Example

The following command establishes an SSH2 session on switch engineering1:

```
ssh2 admin@engineering1
```

The following command establishes and SSH2 session with the switch named BlackDiamond8810 over TCP port 2050 with compression enabled:

```
ssh2 compression on port 2050 admin@BlackDiamond8810
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms with the SSH2 module installed.

unconfigure ip-security dhcp-snooping information check

unconfigure ip-security dhcp-snooping information check

Description

Disables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) checking in the server-originated packets.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command disables the checking of the server-originated packets for the presence of option 82 so the packets will be forwarded normally.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure ip-security dhcp-snooping information circuit-id port-information ports

unconfigure ip-security dhcp-snooping information circuit-id port-information ports [*port_list* | **all**]

Description

Unconfigures the port information portion of the circuit ID.

Syntax Description

port_list	Specifies the port(s) for which port information of the circuit-ID is unconfigured.
all	Specifies all ports.

Default

The default is all.

Usage Guidelines

This command unconfigures the port information portion of the circuit ID string for the indicated ports thereby restoring it to the default (ifIndex value).

History

This command was first available in ExtremeXOS 12.3.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure ip-security dhcp-snooping information circuit-id vlan-information

unconfigure ip-security dhcp-snooping information circuit-id vlan-information {**vlan**} [*vlan_name*|**all**]

Description

Unconfigures the VLAN info portion of the circuit ID of a VLAN.

Syntax Description

vlan_name	Specifies the VLAN for which VLAN information of the circuit-ID is unconfigured.
all	Specifies all VLANs.

Default

The default is all.

Usage Guidelines

This command unconfigures the VLAN information portion of the circuit ID of a VLAN, restoring it to the default.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure ip-security dhcp-snooping information option

unconfigure ip-security dhcp-snooping informationoption

Description

Disables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command disables the DHCP relay agent option (option 82), which is inserted into client-originated DHCP packets before they are forwarded to the server.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure ip-security dhcp-snooping information policy

unconfigure ip-security dhcp-snooping information policy

Description

Unconfigures the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) policy.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command unconfigures the DHCP relay agent option information policy to the default value of replace.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure radius

unconfigure radius {mgmt-access | netlogin} {server [primary | secondary]}

Description

Unconfigures the RADIUS client configuration.

Syntax Description

mgmt-access	Specifies the switch management RADIUS authentication server.
netlogin	Specifies the network login RADIUS authentication server.
primary	Unconfigures the primary RADIUS server.
secondary	Unconfigures the secondary RADIUS server.

Default

Unconfigures both primary and secondary servers for management and network login.

Usage Guidelines

If you do not specify any keywords, this command unconfigures both the primary and secondary servers for management and network login.

The following list describes the available keywords:

- mgmt-access—Use this keyword to unconfigure only the server(s) for management functions.
- netlogin—Use this keyword to unconfigure only the server(s) for network login.
- primary—Use this keyword to specify only the primary RADIUS sever.
- secondary—Use this keyword to specify only the secondary RADIUS server.

Example

The following command unconfigures the secondary RADIUS server settings for both management and network login:

```
unconfigure radius server secondary
```

The following command unconfigures the secondary RADIUS server settings for only network login:

```
unconfigure radius netlogin server secondary
```

The following command unconfigures all RADIUS server settings for only management functions:

```
unconfigure radius mgmt-access
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

unconfigure radius-accounting

unconfigure radius-accounting {**mgmt-access** | **netlogin**} {**server** [**primary** | **secondary**]}

Description

Unconfigures the RADIUS accounting server configuration.

Syntax Description

mgmt-access	Specifies the switch management RADIUS accounting server.
netlogin	Specifies the network login RADIUS accounting server.
primary	Unconfigures the primary RADIUS accounting server.
secondary	Unconfigures the secondary RADIUS accounting server.

Default

Unconfigures both the primary and secondary accounting servers for management and network login.

Usage Guidelines

If you do not specify any keywords, this command unconfigures both the primary and secondary accounting servers for management and network login.

The following list describes the available keywords:

- mgmt-access—Use this keyword to unconfigure only the accounting server(s) for management functions.
- netlogin—Use this keyword to unconfigure only the accounting server(s) for network login.
- primary—Use this keyword to specify only the primary RADIUS accounting sever.
- secondary—Use this keyword to specify only the secondary RADIUS accounting server.

Example

The following command unconfigures the secondary RADIUS accounting server settings for both management and network login:

```
unconfigure radius-accounting server secondary
```

The following command unconfigures the secondary RADIUS accounting server settings for only network login:

```
unconfigure radius-accounting netlogin server secondary
```

The following command unconfigures all RADIUS accounting server settings for only management functions:

```
unconfigure radius-accounting mgmt-access
```

History

This command was first available in ExtremeXOS 10.1.

The mgmt-access and netlogin keywords were added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

unconfigure tacacs

unconfigure tacacs {server [primary | secondary]}

Description

Unconfigures the TACACS+ server configuration.

Syntax Description

primary	Unconfigures the primary TACACS+ server.
secondary	Unconfigures the secondary TACACS+ server.

Default

Unconfigures both the primary and secondary TACACS+ servers.

Usage Guidelines

None.

Example

The following command unconfigures all TACACS+ servers settings:

```
unconfigure tacacs
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure tacacs-accounting

unconfigure tacacs-accounting {server [primary | secondary]}

Description

Unconfigures the TACACS+ accounting server configuration.

Syntax Description

primary	Unconfigures the primary TACACS+ accounting server.
secondary	Unconfigures the secondary TACACS+ accounting server.

Default

Unconfigures both the primary and secondary TACACS+ accounting servers.

Usage Guidelines

None.

Example

The following command unconfigures all TACACS+ accounting servers settings:

```
unconfigure tacacs-accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure trusted-ports trust-for dhcp-server

unconfigure trusted-ports [*ports* |**all**] **trust-for dhcp-server**

Description

Unconfigures, disables one or more DHCP trusted ports.

Syntax Description

ports	Specifies one or more trusted ports.
all	Specifies all trusted ports.

Default

N/A.

Usage Guidelines

Use this command to disable one or more DHCP trusted ports.

Displaying DHCP Trusted Server Information

To display the DHCP snooping configuration settings, including DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping {vlan} <vlan_name>
```

To display any violations that occur, including those on DHCP trusted ports if configured, use the following command:

```
show ip-security dhcp-snooping violations {vlan} <vlan_name>
```

Example

The following command unconfigures ports 2:2 and 2:3 as trusted ports:

```
unconfigure trusted-ports 2:2-2:3 trust-for dhcp-server
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 series modules, and Summit Family switches.

unconfigure vlan dhcp

unconfigure vlan *vlan_name* **dhcp**

Description

Unconfigure all the DHCP configuration information for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN on which to unconfigure DHCP.

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP server for the VLAN temporary:

```
unconfigure temporary dhcp
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure vlan dhcp-address-range

unconfigure vlan *vlan_name* **dhcp-address-range**

Description

Unconfigure the DHCP address range information for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN on which to unconfigure DHCP.

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP address range for the VLAN temporary:

```
unconfigure temporary dhcp-address-range
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure vlan dhcp-options

unconfigure {**vlan**} *vlan_name* **dhcp-options** {[**default-gateway** | **dns-server** {**primary** | **secondary**} | **wins-server**]}

Description

Unconfigure the DHCP option information for the specified VLAN.

Syntax Description

vlan_name	Specifies the VLAN on which to unconfigure DHCP.
default-gateway	Specifies the router option.
dns-server	Specifies the Domain Name Server (DNS) option.
primary	Specifies the primary DNS option.
secondary	Specifies the secondary DNS option.
wins-server	Specifies the NetBIOS name server (NBNS) option.

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the DHCP options for the VLAN temporary:

```
unconfigure temporary dhcp-options
```

History

This command was first available in ExtremeXOS 11.0.

The primary and secondary DNS options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

upload dhcp-bindings

upload dhcp-bindings

Description

Upload the DHCP bindings immediately on demand.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This commands enables the functionality to allow you to upload DCHP bindings on demand.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

26 CLEAR-Flow Commands

This chapter describes commands for:

- Enabling and disabling CLEAR-Flow
- Displaying CLEAR-Flow rules
- Displaying triggered CLEAR-Flow rules

CLEAR-Flow is a broad framework for implementing security, monitoring, and anomaly detection in ExtremeXOS software. Instead of simply looking at the source and destination of traffic, CLEAR-Flow allows you to specify certain types of traffic that require more attention. Once certain criteria for this traffic are met, the switch can either take an immediate, pre-determined action, or send a copy of the traffic off-switch for analysis.

CLEAR-Flow is an extension to Access Control Lists (ACLs). You create ACL policy rules to count packets of interest. CLEAR-Flow rules are added to the policy to monitor these ACL counter statistics. The CLEAR-Flow agent monitors the counters for the situations of interest to you and your network. You can monitor the cumulative value of a counter, the change to a counter over a sampling interval, the ratio of two counters, or even the ratio of the changes of two counters over an interval. For example, you can monitor the ratio between TCP SYN and TCP packets. An abnormally large ratio may indicate a SYN attack.

If the rule conditions are met, the CLEAR-Flow actions configured in the rule are executed. The switch can respond by installing an ACL that will block or rate limit the traffic, executing a set of CLI commands, or sending a report using a SNMP trap or EMS log message.

Note

CLEAR-Flow is available on platforms with an Edge, Advanced Edge, or Core license. These include BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm- series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches. For more license information, see Feature License Requirements. CLEAR-Flow is supported only on ingress. Any limitations on a given platform for a regular ACL also hold true for CLEAR-Flow.

disable clear-flow

disable clear-flow

Description

Disable the CLEAR-Flow agent.

Syntax Description

This command has no arguments or variables.

Default

CLEAR-Flow is disabled by default.

Usage Guidelines

When the CLEAR-Flow agent is disabled, sampling stops and the and all rules are left in the current state. It will not reset actions that were taken while CLEAR-Flow was enabled.

Example

The following example disables CLEAR-Flow on the switch:

```
disable clear-flow
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches.

enable clear-flow

enable clear-flow

Description

Enable the CLEAR-Flow agent.

Syntax Description

This command has no arguments or variables.

Default

CLEAR-Flow is disabled by default.

Usage Guidelines

When the CLEAR-Flow agent is enabled, sampling begins and actions are taken based on the CLEAR-Flow rules that are configured on the switch.

Example

The following example enables CLEAR-Flow on the switch:

```
enable clear-flow
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches.

show clear-flow

show clear-flow

Description

Displays the status of the CLEAR-Flow agent, any CLEAR-Flow policies on each interface, and the number of CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow:

```
clear-flow: Enabled
VLAN         Port   Policy Name          No. of CF Rules
=============================================================
*            2:1    CFexample            6
*            2:26   CFexample            6
*            2:40   CFexample            6
Default      *      CFexample            6
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches.

show clear-flow acl-modified

show clear-flow acl-modified

Description

Displays the ACLs modified by CLEAR-Flow actions.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the ACLs that have been modified by CLEAR-Flow rules that have been triggered.

Example

The following display shows output for the command show clear-flow acl-modified:

```
Policy Name     Vlan Name       Port Rule Name         Default ACL     CF Added
Actions         Actions
================================================================================
==
clearFlow       *               2:26 acl-rule-4        D               QP1
clearFlow       *               2:26 acl-rule-3        D               D
clearFlow       *               2:26 acl-rule-2        D               M
clearFlow       *               2:26 acl-rule-1                        P
clearFlow       Default         *    acl-rule-4        D               QP1
clearFlow       Default         *    acl-rule-3        D               D
clearFlow       Default         *    acl-rule-2        D               M
clearFlow       Default         *    acl-rule-1                        P
================================================================================
==
Total Entries: 8
Notation:
P - Permit, D- Deny, M - mirror enabled, m - mirror disabled
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches.

show clear-flow rule

show clear-flow [**port** *port* | **vlan** *vlanname* | **any**] {**rule** *rulename*} {**detail**}

Description

Displays the CLEAR-Flow rules, values, and configuration.

Syntax Description

port	Specifies the port.
vlanname	Specifies the VLAN.
any	Specifies the wildcard interface.
rulename	Specifies the entry name of a CLEAR-Flow rule.
detail	Display detailed information.

Default

N/A.

Usage Guidelines

If you issue the command without the rule keyword, all of the CLEAR-Flow rules for the policy on the port, VLAN, and the wildcard are displayed. If you specify a rule name, only that rule will be displayed. The detail keyword displays detailed information about the rule.

Example

The following display shows output for the command show clear-flow port 2:6:

```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8000 c-, e-, xl-, and xm-series modules, E4G-200 and E4G-400 switches, and Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 series switches.

show clear-flow rule-all

show clear-flow rule-all

Description

Displays all the CLEAR-Flow rules on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following display shows output for the command show clear-flow rule-all:

```
Policy Name    Vlan Name      Port Rule Name  Last Value OP Threshold  TCNT
Sec
================================================================================
==
clearFlow      *              2:1  rule-count 1          >  100        0    11
clearFlow      *              2:1  rule-delta 1          >  1000       0    11
clearFlow      *              2:1  rule-delta 0          >  1000       0    4

show clear-flow rule-triggered

show clear-flow rule-triggered

Description

Displays the triggered CLEAR-Flow rules.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the rules that have been triggered; in other words, the rule threshold has been reached.

Example

The following display shows output for the command show clear-flow rule-triggered:

```
Policy Name    Vlan Name      Port Rule Name  Last Value OP Threshold  TCNT

27 EAPS Commands

clear eaps counters
configure eaps add control vlan
configure eaps add protected vlan
configure eaps cfm
configure eaps config-warnings off
configure eaps config-warnings on
configure eaps delete control vlan
configure eaps delete protected vlan
configure eaps failtime
configure eaps failtime expiry-action
configure eaps fast-convergence
configure eaps hello-pdu-egress
configure eaps hellotime
configure eaps mode
configure eaps multicast add-ring-ports
configure eaps multicast send-igmp-query
configure eaps multicast temporary-flooding
configure eaps multicast temporary-flooding duration
configure eaps name
configure eaps port
configure eaps priority
configure eaps shared-port common-path-timers
configure eaps shared-port link-id
configure eaps shared-port mode
configure eaps shared-port segment-timers expiry-action
configure eaps shared-port segment-timers health-interval
configure eaps shared-port segment-timers timeout
configure forwarding L2-protocol fast-convergence
configure ip-arp fast-convergence
create eaps
create eaps shared-port
delete eaps
delete eaps shared-port
disable eaps
enable eaps
show eaps
show eaps cfm groups

This chapter describes commands for completing the following Ethernet Automatic Protection Switching (EAPS) tasks:

- Configuring EAPS
- Displaying EAPS information

For an introduction to EAPS, see the ExtremeXOS Concepts Guide.

clear eaps counters

clear eaps counters

Description

Clears, resets the counters gathered by EAPS for all of the EAPS domains and any EAPS shared ports configured on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to clear, reset the EAPS counters.

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring.

To display information about the EAPS counters, use the following commands:

- show eaps counters—This command displays summary EAPS counter information.
- show eaps counters shared-port—If configured for EAPS shared ports, this command displays summary EAPS shared port counter information.

Example

The following command clears, resets all of the counters for EAPS:

```
clear eaps counters
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure eaps add control vlan

configure eaps *name* **add control** {**vlan**} *vlan_name*

Description

Adds the specified control VLAN to the specified EAPS domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the control VLAN.

Default

N/A.

Usage Guidelines

You must configure one control VLAN for each EAPS domain. The control VLAN is used only to send and receive EAPS messages.

The control VLAN must be configured as follows:

- The VLAN must NOT be assigned an IP address, to avoid loops in the network.
- Only ring ports can be added as members of the control VLAN.
- The ring ports of the control VLAN must be tagged.

A control VLAN cannot belong to more than one EAPS domain. When the EAPS domain is active, you cannot delete or modify the configuration of the control VLAN.

By default, EAPS protocol data units (PDUs) are automatically assigned to QoS profile QP8. This ensures that the control VLAN messages reach their intended destinations. You do not need to configure a QoS profile for the control VLAN.

The VLAN must already exist before you can add it as a control VLAN. If you attempt to add a VLAN that does not exist, the switch displays a message similar to the following:

```
* Switch.8 # configure eaps megtest add control foo
^
%% Invalid input detected at '^' marker.
```

To create the VLAN, use the create vlan command.

Example

The following command adds the control VLAN keys to the EAPS domain eaps_1.

```
configure eapseaps_1add control vlan keys
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps add protected vlan

configure eaps *name* **add protected** {**vlan**} *vlan_name*

Description

Adds the specified protected VLAN to the specified EAPS domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the protected VLAN.

Default

N/A.

Usage Guidelines

You must configure one or more protected VLANs for each EAPS domain. The protected VLANs are the data-carrying VLANs.

A protected VLAN can be added to one or more EAPS domains.

When you configure a protected VLAN, the ring ports of the protected VLAN must be tagged (except in the case of the default VLAN). As long as the ring is complete, the master node blocks the protected VLANs on its secondary port.

The VLAN must already exist before you can add it as a protected VLAN. If you attempt to add a VLAN that does not exist, the switch displays a message similar to the following:

```
* Switch.5 # configure eaps megtest add protected foo
^
%% Invalid input detected at '^' marker.
```

To create the VLAN, use the create vlan command.

Example

The following command adds the protected VLAN orchid to the EAPS domain eaps_1:

```
configure eapseaps_1add protected vlan orchid
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps cfm

configure eaps cfm [add | delete] group *group_name*

Description

Notifies the CFM that EAPs is interested in notifications for the specified MEP and RMEP pair.

Syntax Description

cfm	Connectivity Fault Management.
add	Add a MEP group.

delete	Delete a MEP group.
group*group_name*	MEP group to bind.

Default

N/A.

Usage Guidelines

This command notifies CFM that EAPs is interested in notifications for this MEP and RMEP pair. This MEP should already be bound to a physical port, so when notification is received, EAPS associates that notification with a ring-port failure.

Example

The following command deletes the control VLAN keys from the EAPS domain eaps_1:

```
configure eaps cfm add
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all EXOS platforms; however, not all platforms support hardware-based CFM. Platforms with no hardware-based CFM support are limited to software-based CFM transmit intervals of 100ms., or higher. Hardware-based intervals can go as low as 3.3ms.

Currently, only the x460 and E4G platforms support hardware-based CFM.

configure eaps config-warnings off

configure eaps config-warnings off

Description

Disables the loop protection warning messages displayed when configuring specific EAPS parameters.

Syntax Description

This command has no arguments or variables.

Default

By default, loop protection warnings are enabled and displayed when configuring specific EAPS parameters.

Usage Guidelines

This is a global EAPS command. You configure the warning message display on a per switch basis, not per EAPS domain.

When configuring the following EAPS parameters, the switch displays loop protection warning messages:

- Adding EAPS primary or secondary ring ports to a VLAN
- Deleting a protected VLAN
- Disabling the global EAPS setting on the switch
- Disabling an EAPS domain
- Configuring an EAPS domain as a transit node
- Unconfiguring EAPS primary or secondary ring ports from an EAPS domain

Extreme Networks recommends that you keep the loop protection warning messages enabled. If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For example, if you use a script to configure your EAPS settings, disabling the warning messages allows you to configure EAPS without replying to each interactive yes/no question.

To confirm the setting on the switch, use the show eaps {<eapsDomain>} {detail} command.

Example

The following command disables the loop protection warning messages:

```
configure eaps config-warnings off
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure eaps config-warnings on

configure eaps config-warnings on

Description

Enables the loop protection warning messages displayed when configuring specific EAPS parameters.

Syntax Description

This command has no arguments or variables.

Default

By default, loop protection warnings are enabled and displayed when configuring specific EAPS parameters.

Usage Guidelines

This is a global EAPS command. You configure the warning message display on a per switch basis, not per EAPS domain.

When configuring the following EAPS parameters, the switch displays loop protection warning messages:

- Adding EAPS primary or secondary ring ports to a VLAN
- Deleting a protected VLAN
- Disabling the global EAPS setting on the switch
- Disabling an EAPS domain
- Configuring an EAPS domain as a transit node
- Unconfiguring EAPS primary or secondary ring ports from an EAPS domain

Extreme Networks recommends that you keep the loop protection warning messages enabled.

Example

The following command enables the loop protection warning messages:

```
configure eaps config-warnings on
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure eaps delete control vlan

configure eaps *name* **delete control** {**vlan**} *vlan_name*

Description

Deletes the specified control VLAN from the specified EAPS domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the control VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the control VLAN keys from the EAPS domain eaps_1:

```
configure eapseaps_1 delete control vlan keys
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps delete protected vlan

configure eaps *name* **delete protected** {**vlan**} *vlan_name*

Description

Deletes the specified protected VLAN from the specified EAPS domain.

Syntax Description

name	Specifies the name of an EAPS domain.
vlan_name	Specifies the name of the protected VLAN.

Default

N/A.

Usage Guidelines

To prevent loops in the network, you must delete the ring ports (the primary and the secondary ports) from the protected VLAN **before** deleting the protected VLAN from the EAPS domain. Failure to do so can cause a loop in the network.

The switch displays by default a warning message and prompts you to delete the VLAN from the EAPS domain. When prompted, do one of the following:

- Enter y delete the VLAN from the specified EAPS domain.
- Enter n or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the configure eaps config-warnings off command configure eaps config-warnings off.

Useful show Commands

Use the following show commands to display information about your EAPS domain, including protected VLANs and primary and secondary ports:

- show vlan—This command displays summary information for all of the VLANs on the device. If the VLAN is a protected VLAN, the P flag appears in the flag column. To see more detailed information about the protected VLAN, use the show vlan <vlan_name> detail command.
- show eaps—This command displays summary EAPS domain information, including the name of the domain and the primary and secondary ports. To see more detailed information, including the name of the protected VLAN and the primary and secondary ports, use the show eaps <eapsDomain> command.
- show vlan eaps—This command displays whether the VLAN is a control or partner VLAN for an EAPS domain. This command also displays if the VLAN is not a member of any EAPS domain.

Example

The following command deletes the protected VLAN orchid from the EAPS domain eaps_1:

```
configure eapseaps_1delete protected vlan orchid
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Make sure EAPS ring-ports are deleted from the VLAN first.  Otherwise
deleting the VLAN from the EAPS domain could cause a loop in the network!
Are you sure you want to remove the VLAN before deleting EAPS ring-ports.?
(y/n)
```

Enter y to delete the VLAN from the specified EAPS domain. Enter n to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure eaps failtime

configure eaps *name* **failtime** *seconds milliseconds*

Description

Configures the period after which the master node declares a failure if no hello PDUs are received.

Syntax Description

name	Specifies the name of an EAPS domain.
seconds	Specifies the number of seconds the master node waits before the failtimer expires. Default is 3 seconds, and the range is 0 to 300 seconds.
milliseconds	Specifies the number of milliseconds to wait before the failtimer expires. The range is 300 to 999 milliseconds.

Default

The default is 3 seconds.

Usage Guidelines

Use the failtime keyword and its associated seconds parameter to specify the amount of time the master node waits before the failtimer expires. The failtime period (seconds plus milliseconds) must be set greater than the configured value for hellotime. The default value is three seconds.

Increasing the failtime value reduces the likelihood of false failure detections caused by network congestion.

Note

You configure the action taken when the failtimer expires by using the configure eaps failtime expiry-action command.

In ExtremeXOS 11.0, the failtimer range was 2 to 60 seconds.

Example

The following command configures the failtimer value for the EAPS domain eaps_1 to 15 seconds:

```
configure eapseaps_1failtime15 0
```

The following command configures the failtimer value for the EAPS domain eaps_2 to 300 milliseconds:

```
configure eapseaps_2failtime0 300
```

History

This command was first available in ExtremeXOS 11.0.

The range for the failtimer was changed to 2 to 300 seconds in ExtremeXOS 11.1. The default value for the failtimer remains unchanged.

The milliseconds parameter was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

configure eaps failtime expiry-action

configure eaps *name* **failtime expiry-action** [**open-secondary-port** | **send-alert**]

Description

Configures the action taken when the failtimer expires.

Syntax Description

name	Specifies the name of an EAPS domain.
open-secondary-port	Specifies to open the secondary port when the failtimer expires.
send-alert	Specifies that a critical message is sent to the syslog when the failtimer expires.

Default

Default is send-alert.

Usage Guidelines

By default the action is to send an alert if the failtimer expires. Instead of going into a Failed state, the master node remains in a Complete or Init state, maintains the secondary port blocking, and writes a critical error message to syslog warning the user that there is a fault in the ring. An SNMP trap is also sent.

If the EAPS ring contains non-EAPS devices, you must use the open-secondary-port parameter.

Note

Use caution when setting the failtimer expiry action to open-secondary port. Using this configuration, if the master node loses three consecutive hello PDUs, the failtimer expires—but there might not be a break in the ring. Opening the secondary port in this situation creates a loop.

Example

The following command configures the failtimer expiry action for EAPS domain eaps_1:

```
configure eapseaps_1 failtimeexpiry-action open-secondary-port
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps fast-convergence

configure eaps fast-convergence[**off** | **on**]

Description

Enables EAPS to converge more quickly.

Syntax Description

off	Turns fast-convergence off. Default is off.
on	Turns fast-convergence on.

Default

Default is off.

Usage Guidelines

This command acts on the switch, not per domain.

In certain environments to keep packet loss to a minimum when the ring is broken, configure EAPS with fast-convergence turned on. If fast convergence is turned on, you can view the configuration with the show eaps command.

Note

If fast-convergence is turned on, the link filters on all EAPS ring ports are turned off. This can result problems if the port's hardware encountered a problem and started "flapping" between link-up/link-down states.

Example

The following command configures fast convergence for all of the EAPS domains on the switch:

```
configure eapsfast-convergence on
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps hello-pdu-egress

configure eaps *name* **hello-pdu-egress [primary-port | secondary-port]**

Description

Configures the port through which a master node sends EAPS hello PDUs.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Default is the primary port.

Usage Guidelines

This command is provided for special network topologies that use spatial reuse and require that all EAPS hello PDUs travel in the same direction on the ring.

Note

Extreme Networks recommends the default (primary-port) configuration for this command.

Example

The following command configures the master switch to send EAPS hello packets from the secondary port:

```
configure eaps "domain12" hello-pdu-egress secondary-port
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

configure eaps hellotime

configure eaps *name* **hellotime** *secondsmilliseconds*

Description

Configures the period at which the master node sends EAPS hello PDUs to verify ring connectivity.

Syntax Description

name	Specifies the name of an EAPS domain.
seconds	Specifies the number of seconds to wait between transmission of hello PDUs on the control VLAN. The range is 0 to 15 seconds.
milliseconds	Specifies the number of milliseconds to wait between transmission of hello PDUs on the control VLAN. The range is 0 to 999 milliseconds.

Default

Default is 1 second.

Usage Guidelines

Use the hellotime keyword and its associated parameters to specify the amount of time the master node waits between transmissions of hello PDUs on the control VLAN. Increasing the hellotime value results in a reduced load on the processor and less traffic on the EAPS ring.

Note

The hello PDU timer value must be smaller than the fail timer value to prevent false failure detection. If you change the hello PDU timer, verify that the fail timer value remains larger.

This command applies only to the master node. If you configure the hello PDU timer for a transit node, the timer value is ignored. If you later reconfigure that transit node as the master node, the master node uses the configured hello PDU timer value.

In ExtremeXOS 11.0, the range is 1 to 15 seconds. If you are running ExtremeXOS 11.0 with the hello timer value greater than 15 seconds and you upgrade to ExtremeXOS 11.1 or later, you must modify the hello timer to be within the 1 to 15 seconds range.

Example

The following command configures the hellotime value for the EAPS domain eaps_1 to 300 milliseconds:

```
configure eapseaps_1hellotime0 300
```

History

This command was first available in ExtremeXOS 11.0.

The range for the hello timer was changed to 1 to 15 seconds in ExtremeXOS 11.1. The default value for the hello timer remains unchanged.

Support for a specific number of milliseconds was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

configure eaps mode

configure eaps *name* **mode [master | transit]**

Description

Configures the switch as either the EAPS master node or as an EAPS transit node for the specified domain.

Syntax Description

name	Specifies the name of an EAPS domain.
master	Specifies that this switch should be the master node for the named EAPS domain.
transit	Specifies that this switch should be the transit node for the named EAPS domain.

Default

N/A.

Usage Guidelines

One node (or switch) on the ring must be configured as the master node for the specified domain; all other nodes (or switches) on the ring are configured as transit nodes for the same domain.

If you configure a switch to be a transit node for an EAPS domain, the switch displays by default messages to:

- Remind you to configure a master node in the EAPS domain.
- Notify you that changing a master node to a transit node might cause a loop in the network. If you have not assigned a new master node before changing the current master node to a transit node, you might cause a loop in the network.

When prompted, do one of the following:

- Enter y to identify the switch as a transit node.
- Enter n or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the configure eaps config-warnings off command configure eaps config-warnings off.

Example

The following command identifies this switch as the master node for the domain named eaps_1:

```
configure eapseaps_1mode master
```

The following command identifies this switch as a transit node for the domain named eaps_1:

```
configure eapseaps_1mode transit
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Make sure this specific EAPS domain has a Master node in the ring.
If
you change this node from EAPS master to EAPS transit, you could cause a
```

```
loop in the network.
Are you sure you want to change mode to transit? (y/n)
```

Enter y to identify the switch as a transit node. Enter n to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure eaps multicast add-ring-ports

configure eaps multicast add-ring-ports [on | off]

Description

Configures the switch to add previously blocked ring ports to existing multicast groups when an EAPS topology change occurs.

Syntax Description

on	Enables the multicast add-ring-ports feature.
off	Disables the multicast add-ring-ports feature.

Default

Off.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, multicast traffic is fastpath forwarded using the switch hardware during the topology transition. The on setting improves multicast forwarding performance during the transition.

Note

EAPS multicast flooding must be enabled before this feature will operate. For information on enabling EAPS multicast flooding, see the configure eaps multicast temporary-flooding command description.

When this feature is set to off and an EAPS topology change occurs, multicast traffic is slowpath forwarded using the CPU during the topology transition. The off setting reduces multicast forwarding performance during the transition.

For other methods of supporting multicast traffic during an EAPS topology change, see the descriptions for the following commands:

- configure eaps multicast send-igmp-query
- configure eaps multicast temporary-flooding

Example

The following command enables the add-ring-ports feature:

```
configure eaps multicast add-ring-ports on
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

configure eaps multicast send-igmp-query

configure eaps multicast send-igmp-query [on | off]

Description

Configures the switch to send IGMP query messages to all protected VLANs when an EAPS topology change occurs.

Syntax Description

on	Enables the multicast send-igmp-query feature.
off	Disables the multicast send-igmp-query feature.

Default

On.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, the switch sends IGMP query messages to all protected VLANs. If the protected VLANs in the node detecting (and generating) the topology change do not have IP address, a query is generated with the source IP address set to the querier address in that VLAN.

In a EAPS ring with many protected VLANs, the many responses can impact switch performance. This is the default behavior and was the only method for supporting multicast traffic during EAPS topology changes prior to release 12.1.2.

When this feature is set to off and an EAPS topology change occurs, the switch does not automatically send IGMP queries to all protected VLANS during the topology transition. The off setting improves switch performance during the transition, but you should use one of the following commands to see that multicast traffic is supported during and after the topology change:

- configure eaps multicast add-ring-ports
- configure eaps multicast temporary-flooding

Example

The following command disables the send-igmp-query feature:

```
configure eaps multicast send-igmp-query off
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

configure eaps multicast temporary-flooding

configure eaps multicast temporary-flooding [on | off]

Description

Configures the switch to temporarily enable multicast flooding when an EAPS topology change occurs.

Syntax Description

on	Enables the multicast temporary-flooding feature.
off	Disables the multicast temporary-flooding feature.

Default

Off.

Usage Guidelines

When this feature is set to on and an EAPS topology change occurs, the switch temporarily enables multicast flooding to all protected VLANs for the duration specified by the following command:

```
configure eaps multicast temporary-flooding duration
```

If you change the configuration to off, topology changes that occur after this command do not result in temporary flooding. For example, if you change the configuration to off while flooding is in progress for a protected VLAN or set of protected VLANs (due to an EAPS topology change), the flooding continues for the configured duration period. New topology changes on the protected VLANs do not cause flooding.

When this feature is set to off and an EAPS topology change occurs, the switch does not enable flooding to all protected VLANS during the topology transition. The default switch response for multicast traffic during an EAPS topology change is that defined by the following command:

```
configure eaps multicast send-igmp-query
```

You can also use the following command to configure the switch response for multicast traffic during an EAPS topology change:

```
configure eaps multicast add-ring-ports
```

Example

The following command enables the temporary-flooding feature:

```
configure eaps multicast temporary-flooding on
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

configure eaps multicast temporary-flooding duration

configure eaps multicast temporary-flooding duration *seconds*

Description

Configures the duration for which the switch temporarily enables multicast flooding when an EAPS topology change occurs.

Syntax Description

seconds	Specifies the period (in seconds) for which the switch enables multicast flooding.

Default

15 seconds.

Usage Guidelines

The flooding duration configuration applies only when the temporary-flooding feature is enabled with the following command:

```
configure eaps multicast temporary-flooding
```

Example

The following command configures the temporary-flooding feature duration for 30 seconds:

```
configure eaps multicast temporary-flooding duration 30
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

configure eaps name

configure eaps *old_name* **name** *new_name*

Description

Renames an existing EAPS domain.

Syntax Description

old_name	Specifies the current name of an EAPS domain.
new_name	Specifies a new name for the EAPS domain.

Default

N/A.

Usage Guidelines

If you use the same name across categories (for example, STPD and EAPS names), Extreme Networks recommends that you specify the identifying keyword as well as the actual name. If you do not use the keyword, the system might return an error message.

Example

The following command renames EAPS domain eaps-1 to eaps-5:

```
configure eaps eaps-1 name eaps-5
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps port

configure eaps *name* [**primary** | **secondary**] **port** *ports*

Description

Configures a node port as the primary or secondary port for the specified EAPS domain.

Syntax Description

name	Specifies the name of an EAPS domain.
primary	Specifies that the port is to be configured as the primary port.
secondary	Specifies that the port is to be configured as the secondary port.
ports	Specifies one port or slot and port.

Default

N/A.

Usage Guidelines

Each node on the ring connects through two ring ports. One port must be configured as the primary port; the other must be configured as the secondary port.

The primary and secondary ports have significance only on a master node. The health-check messages are sent out the primary port of the master node, and the master node blocks the protected VLANs on the secondary port.

The master node's secondary EAPS port cannot be configured on ports that are already configured as follows:

- Shared-port
- MLAG ISC port

There is no distinction between the primary and secondary ports on a transit node.

Beginning with ExtremeXOS 11.1, if you have a primary or secondary port that is a member of a load-shared group, you do not need to disable your EAPS domain and remove that ring port when modifying the load-shared group. For more information about configuring load sharing on your switch, see Configuring Slots and Ports on a Switch in the ExtremeXOS Concepts Guide.

For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see Feature License Requirements.

Messages Displayed when Adding EAPS Ring Ports to a VLAN

If you attempt to add EAPS ring ports to a VLAN that is not protected by EAPS, the switch prompts you by default to confirm this action. For example, if you use the configure vlan <vlan_name> add ports <port_list> command, and the ports that you are attempting to add to the VLAN are currently used by EAPS as either primary or secondary ring ports, the switch displays the following message:

```
Make sure <vlan_name> is protected by EAPS. Adding EAPS ring ports to a VLAN
could cause a loop in the network.
Do you really want to add these ports (y/n)
```

Enter y to add the ports to the VLAN. Enter n or press [Return] to cancel this action.

If you see this message, either configure the VLAN as an EAPS protected VLAN by using the configure eaps add protected vlan command or add ports that the EAPS domain does not use as primary or secondary ring ports.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the configure eaps config-warnings off command configure eaps config-warnings off.

Example

The following command adds port 1 of the module installed in slot 8 to the EAPS domain eaps_1 as the primary port:

```
configure eapseaps_1primary port8:1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure eaps priority

configure eaps *name* **priority** {**high** | **normal**}

Description

Configures an EAPS domain priority.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Normal.

Usage Guidelines

Extreme Networks recommends that no more than 200 protected VLANs be configured as high priority domains. Priority protection works best when the majority of protected VLANs are configured for normal priority and a relatively small percentage of the protected VLANs are configured as high priority domains.

When EAPS domains on two separate physical rings share a common link (shared-port configuration) and have one or more protected VLANs in common, the domains must be configured with the same domain priority.

When EAPS domain priority is configured on separate physical rings that are connected to the same switch, the priorities on each ring are serviced independently. For example, if there is a break on both Ring A and Ring B, the high priority domains on each ring are serviced before the lower priority domains. However, the switch does not attempt to process the high priority domains on Ring B before servicing the normal priority domains on Ring A.

For a high priority domain to get priority over normal priority domains, all switches in the EAPS domain must support high priority domains. If high priority domains are configured on a switch that is in a ring with one or more switches that do not support high priority domains (software releases before ExtremeXOS Release 12.5), the high priority domain operates as a normal priority domain.

Example

The following command configures the eaps_1 domain as a high priority domain:

```
configure eapseaps_1 priority high
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure eaps shared-port common-path-timers

configure eaps shared-port *port* **common-path-timers** {[**health-interval** | **timeout**] *seconds*}

Description

Configures the common path health interval or timeout value.

Syntax Description

ports	Specifies the port number of the common link port.
health-interval	Specifies the interval for health check messages on the common link.
timeout	Specifies the timeout value for the common link.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the common path health interval, in seconds, for a given port. The range is from 1 to 10 seconds.

Example

The following command configures a common-link health interval of 5 seconds on port 1:1.

```
configure eaps shared-port 1:1 common-path-timers health-interval 5
```

The following command configures a segment timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 common-path-timers timeout 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

configure eaps shared-port link-id

configure eaps shared-port *ports* **link-id** *id*

Description

Configures the link ID of the shared port.

Syntax Description

ports	Specifies the port number of the common link port.
id	Specifies the link ID of the port. The link ID range is 1 to 65535.

Default

N/A.

Usage Guidelines

Each common link in the EAPS network must have a unique link ID. The controller and partner shared ports belonging to the same common link must have matching link IDs. No other instance in the network should have that link ID.

If you have multiple adjacent common links, Extreme Networks recommends that you configure the link IDs in ascending order of adjacency. For example, if you have an EAPS configuration with three

adjacent common links, moving from left to right of the topology, configure the link IDs from the lowest to the highest value.

Example

The following command configures the EAPS shared port 1:1 to have a link ID of 1.

```
configure eaps shared-port 1:1 link-id 1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure eaps shared-port mode

configure eaps shared-port *ports* **mode** *controller* | *partner*

Description

Configures the mode of the shared port.

Syntax Description

ports	Specifies the port number of the shared port.
controller	Specifies the controller mode. The controller is the end of the common link responsible for blocking ports when the common link fails thereby preventing the superloop.
partner	Specifies partner mode. The partner is responsible only for sending and receiving health-check messages.

Default

N/A.

Usage Guidelines

The shared port on one end of the common link must be configured to be the controller. This is the end responsible for blocking ports when the common link fails thereby preventing the superloop.

The shared port on the other end of the common link must be configured to be the partner. This end does not participate in any form of blocking. It is responsible only for sending and receiving health-check messages.

Example

The following command configures the shared port 1:1 to be the controller.

```
configure eaps shared-port 1:1 mode controller
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure eaps shared-port segment-timers expiry-action

configure eaps shared-port *port* **segment-timers expiry-action** [**segment-down** | **send-alert**]

Description

Configures the action taken when the segment timeout timer expires.

Syntax Description

port	Specifies the port number of the common link port.
segment-down	Marks the segment as DOWN if the segment timer expires. No link-status-query is sent to verify that links are down.
send-alert	If the segment timer expires, the switch keeps segments up, but sends a warning message to the log. The segment fail flag is set, an SNMP trap is sent, and a link-status-query is sent to verify if any links are down.

Default

Default is send-alert.

Usage Guidelines

By default, the action is to send an alert if the segment timeout timer expires. Instead of the segment going into a failed state and being marked as down, the segment remains in a segment up state with the failed flag set. The switch writes a critical error message to the syslog warning the user that there is a fault in the segment. An SNMP trap is also sent.

Note

Use caution when setting the segment-timeout expiry action to segment-down. Using this configuration, if the controller or partner node loses three consecutive hello PDUs, the failtimer expires—but there might not be a break in the segment. Opening a blocked port in this situation creates a loop.

The following describes some general recommendations for using this command:

- When you configure your Extreme Networks switches as the partner and controller, respectively, make sure that their segment timer configurations are identical.

  For example, if you have a partner switch with the segment-timeout expiry action set to send-alert, make sure the controller switch has its segment-timeout expiry action set to send-alert.

  However, if you have a partner switch with the segment-timeout expiry action set to send-alert, and the controller switch does not have a segment timer configuration, you must configure the partner switch's segment-timeout expiry action to segment-down.
- If you have a network containing non-Extreme Networks switches or non-EAPS devices, set the segment-timeout expiry action to segment-down.

The following events can cause a ring segment failure:

- There is a hardware failure.
- The controller or partner received a Link Down message from the partner or controller, respectively.
- The segment timer expires and the expiry action was set to segment-down. This means that either the controller or partner did not receive health check messages during the defined segment timeout period.

To view shared-port information, including shared-port segment status, use the show eaps shared-port {<port>} {detail} command.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure eaps shared-port segment-timers health-interval

configure eaps shared-port *port* **segment-timers health-interval** *seconds*

Description

Configures the shared-port health interval timeout.

Syntax Description

port	Specifies the port number of the common link port.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the shared-port health interval timeout, in seconds, for a given port.

Example

The following command configures a shared-port health interval timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 segment-timers health-interval 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure eaps shared-port segment-timers timeout

configure eaps shared-port *port* **segment-timers timeout** *seconds*

Description

Configures the shared-port timeout.

Syntax Description

port	Specifies the port number of the common link port.
seconds	Specifies the amount of health interval, in seconds.

Default

N/A.

Usage Guidelines

This command allows you to configure the length of the shared-port timeout, in seconds, for a given port.

Example

The following command configures a shared-port timeout of 10 seconds on port 1:1.

```
configure eaps shared-port 1:1 segment-timers timeout 10
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure forwarding L2-protocol fast-convergence

configure forwarding L2-protocol fast-convergence on | off

Description

Configures the switch to flooding the unicast traffic during L2 protocol convergence.

Syntax Description

on	Used to avoid flooding the unicast traffic during L2 protocol convergence.
off	Used to Temporarily flooding unicast traffic during L2 protocol convergence. (default)

Default

On.

Usage Guidelines

Use this command to influence the L2-protocol convergence when topology changes in the network to minimize the congestion.

Example

The following command will influence the L2-Protocol control traffic:

```
configure forwarding L2-protocol fast-convergence off
```

History

This command was first available in ExtremeXOS 15.1.3

Platform Availability

This command available on all Summit, BD8K, BD-X8 platforms.

configure ip-arp fast-convergence

configure ip-arp fast-convergence [on | off]

Description

This command improves IP convergence for IP traffic.

Syntax Description

on	Fast-convergence on.
off	Fast-convergence off (default).

Default

Off.

Usage Guidelines

Use this command for quick recovery when running IP traffic over an EAPS ring.

Example

The following example shows output from the configure ip-arp fast-convergence on command:

```
E4G200-1.2 # show iparp

E4G200-1.5 #
```

History

This command was first available in ExtremeXOS 15.2

Platform Availability

This command is available on all platforms.

create eaps

create eaps *name*

Description

Creates an EAPS domain with the specified name.

Syntax Description

name	Specifies the name of an EAPS domain to be created. Can be up to 32 characters in length.

Default

N/A.

Usage Guidelines

An EAPS domain name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates EAPS domain eaps_1:

```
create eaps eaps_1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

create eaps shared-port

create eaps shared-port *ports*

Description

Creates an EAPS shared port on the switch.

Syntax Description

ports	Specifies the port number of the common link port.

Default

N/A.

Usage Guidelines

To configure a common link, you must create a shared port on each switch on either end of the common link.

Example

The following command creates a shared port on the EAPS domain.

```
create eaps shared-port 1:2
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete eaps

delete eaps *name*

Description

Deletes the EAPS domain with the specified name.

Syntax Description

name	Specifies the name of an EAPS domain to be deleted.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes EAPS domain eaps_1:

```
delete eaps eaps_1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

delete eaps shared-port

delete eaps shared-port *ports*

Description

Deletes an EAPS shared port on a switch.

Syntax Description

ports	Specifies the port number of the Common Link port.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes shared port 1:1.

```
delete eaps shared-port 1:1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable eaps

disable eaps {*name*}

Description

Disables the EAPS function for a named domain or for an entire switch.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Disabled for the entire switch.

Usage Guidelines

To prevent loops in the network, the switch displays by default a warning message and prompts you to disable EAPS for a specific domain or the entire switch. When prompted, do one of the following:

- Enter y to disable EAPS for a specific domain or the entire switch.
- Enter n or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the configure eaps config-warnings off command configure eaps config-warnings off.

Example

The following command disables the EAPS function for entire switch:

```
disable eaps
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Disabling EAPS on the switch could cause a loop in the network!
```

Are you sure you want to disable EAPS? (y/n) Enter y to disable EAPS on the switch. Enter n to cancel this action.

The following command disables the EAPS function for the domain eaps-1:

```
disable eaps eaps-1
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Disabling specific EAPS domain could cause a loop in the network!

Are you sure you want to disable this specific EAPS domain? (y/n)
```

Enter y to disable the EAPS function for the specified domain. Enter n to cancel this action.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

enable eaps

enable eaps {*name*}

Description

Enables the EAPS function for a named domain or for an entire switch.

Syntax Description

name	Specifies the name of an EAPS domain.

Default

Disabled.

Default command enables EAPS for the entire switch.

Usage Guidelines

Note

If you use the same name across categories (for example, STPD and EAPS names), you must specify the identifying keyword as well as the actual name.

To configure and enable an EAPS, complete the following steps:

1 Create EAPS domain and assign the name.
2 Configure the control VLAN.
3 Configure the protected VLAN(s).
4 Add the control VLAN to EAPS domain.
5 Add the protected VLAN(s) to EAPS domain.
6 Configure EAPS mode, master or transit.
7 Configure EAPS port, secondary and primary.
8 If desired, configure timeout and action for failtimer expiration*.
9 If desired, configure the hello time for the health-check packets*.
10 Enable EAPS for the entire switch.
11 If desired, enable Fast Convergence*.
12 Enable EAPS for the specified domain.

Although you can enable EAPS prior to configuring these steps, the EAPS domain(s) does not run until you configure these parameters. (The steps with * can be configured at any time, even after the EAPS domains are running.)

You must enable EAPS globally and specifically for each named EAPS domain.

Example

The following command enables the EAPS function for entire switch:

```
enable eaps
```

The following command enables the EAPS function for the domain eaps-1:

```
enable eaps eaps-1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show eaps

show eaps {*eapsDomain*} {**detail**}

Description

Displays EAPS status information.

Syntax Description

eapsDomain	Specifies the name of an EAPS domain.
detail	Specifies all available detail for each domain.

Default

N/A.

Usage Guidelines

If you enter the show eaps command without a keyword, the command displays less than with the detail keyword.

Use the optional eapsDomain parameter to display status information for a specific EAPS domain.

Some state values are different on a transit node than on a master node.

When you enter the show eaps command without a domain name, the switch displays the following fields:

EAPS Enabled:	Current state of EAPS on this switch: Yes—EAPS is enabled on the switch.No—EAPS is not enabled.
EAPS Fast Convergence:	Displays only when Fast Convergence is on.
EAPS Display Config Warnings:	Displays the setting for loop protection messages: On—Loop protection messages are displayed (this is the default behavior).Off—Loop protection messages are not displayed.
EAPS Multicast Add Ring Ports:	Displays the configuration of the multicast add-ring-ports feature as configured with the configure eaps multicast add-ring-ports command.
EAPS Multicast Send IGMP Query:	Displays the configuration of the multicast send-igmp-query feature as configured with the configure eaps multicast send-igmp-query command.
EAPS Multicast Temporary Flooding:	Displays the configuration of the multicast temporary-flooding feature as configured with the configure eaps multicast temporary-flooding command.
EAPS Multicast Temporary Flooding Duration:	Displays the duration configuration for the multicast temporary-flooding feature as configured with the configure eaps multicast temporary-flooding duration command.
Number of EAPS instances:	Number of EAPS domains created. The maximum number of EAPS domains per switch is 128.
Domain:	Entries in this column identify the name of an EAPS domain.
State:	On a transit node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state.Links-Down—This EAPS domain is running, but one or both of its ports are down.Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state. On a master node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state.Complete—The ring is in the COMPLETE state for this EAPS domain.Failed—There is a break in the ring for this EAPS domain.Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed.Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed.[Failtimer Expired]—When the failtimer expires and it's action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with it's secondary port blocking.
Mo:	The configured EAPS mode for this switch: transit (T) or master (M).
Primary/Secondary port:	The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop.
Prio	The EAPS domain priority, which is H for high priority or N for normal priority.

When you enter the show eaps command with a domain name or the detail keyword, the switch displays the following fields:

Name:	Identifies the EAPS domain displayed.
Priority	The EAPS domain priority, which is either High or Normal.
State:	On a transit node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Links-Up—This EAPS domain is running, and both its ports are up and in the FORWARDING state.Links-Down—This EAPS domain is running, but one or both of its ports are down.Preforwarding—This EAPS domain is running, and both of its ports are up, but one of them is in a temporary BLOCKED state. On a master node, the command displays one of the following states: Idle—The EAPS domain has been enabled, but the configuration is not complete.Init—The EAPS domain has started but has not yet determined the status of the ring. The secondary port is in a BLOCKED state.Complete—The ring is in the COMPLETE state for this EAPS domain.Failed—There is a break in the ring for this EAPS domain.Pre-Init—The EAPS domain has started operation for Init state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from hardware layer indicating the operation is completed.Pre-Complete—The EAPS domain has started operation for Complete state and has sent a request to lower hardware layers to block the secondary port. It is in transient state waiting for acknowledgement from the hardware layer indicating the operation is completed.[Failtimer Expired]—When the failtimer expires and it's action is set to send-alert, this flag is set. This flag indicates there is a misconfiguration or hardware problem in the EAPS ring. The EAPS master node continues to remain in COMPLETE or INIT state with it's secondary port blocking.
[Running: ...]	Yes—This EAPS domain is running.No—This EAPS domain is not running.
Enabled:	Indicates whether EAPS is enabled on this domain. Y—EAPS is enabled on this domain.N—EAPS is not enabled.
Mode:	The configured EAPS mode for this switch: transit (T) or master (M).
Primary/Secondary port:	The port numbers assigned as the EAPS primary and secondary ports. On the master node, the port distinction indicates which port is blocked to avoid a loop.
Port status:	Unknown—This EAPS domain is not running, so the port status has not yet been determined.Up—The port is up and is forwarding data.Down—The port is down.Blocked—The port is up, but data is blocked from being forwarded.
Tagstatus:	Tagged status of the control VLAN: Tagged—The control VLAN has this port assigned to it, and the port is tagged in the VLAN.Untagged—The control VLAN has this port assigned to it, but the port is untagged in the control VLAN.Undetermined—Either a VLAN has not been added as the control VLAN to this EAPS domain or this port has not been added to the control VLAN.
Hello timer interval:	The configured value of the timer in seconds and milliseconds, specifying the time that the master node waits between transmissions of health check packets.
Fail timer interval:	The configured value of the timer in seconds, specifying the time that the master node waits before the failtimer expires.

Failtimer expiry action:	Displays the action taken when the failtimer expires: Send-alert—Sends a critical message to the syslog when the failtimer expires.Open-secondary-port—Opens the secondary port when the failtimer expires. Displays only for master nodes.
Preforwarding Timer interval:[12]	The configured value of the timer. This value is set internally by the EAPS software. The set value is 15 seconds. Note: If two links in an EAPS domain go down at the same time and one link comes back up, it takes 15 seconds for the reconnected link to start receiving traffic again. Displays only for transit nodes.
Last valid EAPS update:	Indicates the last time a hello packet was received.
EAPS Domain Controller Vlan:	Lists the assigned name and ID of the control VLAN.
EAPS Domain Protected Vlan(s):	Lists the assigned names and VLAN IDs of all the protected VLANs configured on this EAPS domain.
Number of Protected Vlans:	The count of protected VLANs configured on this EAPS domain.

Example

The following command displays information for all EAPS domains:

```
Switch.5 # show eaps
EAPS Enabled: Yes
EAPS Fast-Convergence: Off
EAPS Display Config Warnings: On
EAPS Multicast Add Ring Ports: Off
EAPS Multicast Send IGMP Query: On
EAPS Multicast Temporary Flooding: Off
EAPS Multicast Temporary Flooding Duration: 15 sec
Number of EAPS instances: 2
# EAPS domain configuration :
--------------------------------------------------------------------------------
--
Domain         State           Mo  En  Pri   Sec   Control-Vlan VID   Count
Prio
--------------------------------------------------------------------------------
--
d1             Idle            T   N   1     2     cv1          (101 ) 0     H
d2             Links-Up        T   Y   3:8   3:16  c2           (1001) 100   H
--------------------------------------------------------------------------------
--
```

The following command displays information for EAPS domain d1:

```
Switch.7 # show eaps d1
Name: d1           Priority: High
State: Idle        Running: No
Enabled: No        Mode: Transit
Primary port:   1            Port status: Unknown    Tag status: Undetermined
```

[12] These fields apply only to transit nodes; they are not displayed for a master node.

```
Secondary port: 2             Port status: Unknown    Tag status: Undetermined
Hello timer interval: 1  sec  0  millisec
Fail timer interval:  3  sec  0  millisec
Fail Timer expiry action: Send alert
Last valid EAPS update: From Master Id 00:01:30:f9:9c:b0, at Wed Jun  9
09:09:35 2004
EAPS Domain has following Controller Vlan:
Vlan Name                     VID
c1                            1000
EAPS Domain has following Protected Vlan(s):
Vlan Name                     VID
p_1                           1
p_2                           2
p_3                           3
p_4                           4
p_5                           5
p_6                           6
p_7                           7
p_8                           8
p_9                           9

p_15                          15
p_16                          16
p_17                          17
p_18                          18
p_19                          19
p_20                          20
p_21                          21
p_22                          22
p_23                          23
p_24                          24
p_25                          25
p_26                          26
p_27                          27
p_28                          28
p_29                          29
p_30                          30
```

The following command displays information on EAPS domain domain12, which is configured to send hello packets on the secondary port:

```
Switch.9 # show eaps "domain12"
Name: domain12     Priority: High
State: Complete    Running: Yes
Enabled: Yes       Mode: Master
Primary port:   17            Port status: Up Tag status: Tagged
Secondary port: 27            Port status: Blocked    Tag status: Tagged
Hello Egress Port: Secondary
Hello timer interval: 0  sec  100  millisec
Fail timer interval:  0  sec  300  millisec
Fail Timer expiry action: Send alert
Last update: From Master Id 00:04:96:34:e3:43, at Tue May 11 15:39:29 2010
EAPS Domain has following Controller Vlan:
```

```
Vlan Name                    VID
vlanc12                      1002
EAPS Domain has following Protected Vlan(s):
Vlan Name                    VID
pvlan11                      204
pvlan12                      205
pvlan13                      206
Number of Protected Vlans: 3
```

Note

You might see a slightly different display, depending on whether you display the master node or the transit node.

The display from the show eaps detail command shows all the information shown in the show eaps <eapsDomain> command, but displays information for all configured EAPS domains.

For the CFM support in EAPS, t he existing show eaps output places a "!" next to a CFM monitored ring port if the CFM indicates the MEP group for that port is down.

```
X480-48t.1 # sh eaps
EAPS Enabled: Yes
EAPS Fast-Convergence: Off
EAPS Display Config Warnings: Off
EAPS Multicast Add Ring Ports: Off
EAPS Multicast Send IGMP Query: On
EAPS Multicast Temporary Flooding: Off
EAPS Multicast Temporary Flooding Duration: 15 sec
Number of EAPS instances: 1
# EAPS domain configuration :
-------------------------------------------------------------------------------
----
Domain         State           Mo  En  Pri    Sec    Control-Vlan VID   Count
Prio
-------------------------------------------------------------------------------
----
d2             Failed          M   Y   !41     31    v2           (101 )
1     N
-------------------------------------------------------------------------------
----
Flags : (!) CFM Down
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show eaps cfm groups

show eaps cfm groups

Description

Displays summary EAPS CFM groups information.

Syntax Description

There are no keywords or variables for this command.

Default

N/A.

Usage Guidelines

The following command displays EAPS CFM group information:

```
X480-48t.2 # sh eaps cfm groups
-------------------------------------------------------------------------------
--
MEP Group Name                    Status Port   MEP ID
-------------------------------------------------------------------------------
--
eapsCfmGrp1                       Up     41     11
eapsCfmGrp2                       Up     31     12
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

show eaps counters

show eaps counters [*eapsDomain* | **global**]

Description

Displays summary EAPS counter information.

Syntax Description

eapsDomain	Specifies the name of an EAPS domain. The switch displays counter information for only that domain.
global	Displays EAPS counter information when the events counted are not applicable to any specific EAPS domain.

Default

N/A.

Usage Guidelines

If you specify the name of an EAPS domain, the switch displays counter information related to only that domain. If you specify the global keyword, the switch displays EAPS counter information when the events counted are not applicable to any specific EAPS domain. The output displayed is for all configured EAPS domains, not just one specific EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, use one of the following commands:

- clear counters
- clear eaps counters

Understanding the Output

The following table describes the significant fields and values in the display output of the show eaps counters <eapsDomain> command:

Field	Description
Rx-Health	Indicates the EAPS domain received EAPS Health PDUs.
Rx-RingUp-FlushFdb	Indicates the EAPS ring is up, and the EAPS domain received EAPS RingUp-FlushFdb PDUs to flush the FDB.
Rx-RingDown-FlushFdb	Indicates the EAPS ring is down, and the EAPS domain received EAPS RingDown-FlushFdb PDUs to flush the FDB.
Rx-Link-Down	Indicates the EAPS domain received EAPS Link-Down PDUs and took down the link.
Rx-Flush-Fdb	Indicates the EAPS domain received EAPS Flush-Fdb PDUs and flushed the FDB.
Rx-Suspend-Prefwd-Timer	Indicates the EAPS domain received EAPS Suspend-Preforward-Timer PDUs. NOTE: Switches running ExtremeWare send this PDU during an MSM/MM failover. Switches running ExtremeXOS 10.1 or later do not send or receive this PDU.

Field	Description
Rx-Query-Link-Status	Indicates the EAPS domain received EAPS Query-Link-Status PDUs.
Rx-Link-Up	Indicates the EAPS domain received EAPS Link-Up PDUs and brought the link back up.
Rx-Unknown	Indicates the EAPS domain dropped unknown EAPS PDUs.
Rx-Another-Master	Indicates the EAPS domain dropped EAPS PDUs because there is another Master switch in the same EAPS domain.
Rx-Unconfigured-Port	Indicates the EAPS domain dropped EAPS PDUs because the ingress port is not configured to be a ring port for the EAPS domain and the corresponding control VLAN.
Rx-Health-Pdu-Pri-Port	Indicates the EAPS domain dropped EAPS Health PDUs because the primary port received them instead of the secondary port. NOTE: The secondary port of the Master switch must receive EAPS Health PDUs, not the primary port.
Tx-Health	Indicates the EAPS domain sent EAPS Health PDUs.
Tx-RingUp-FlushFdb	Indicates the EAPS ring is up, and the EAPS domain sent EAPS RingUp-FlushFdb PDUs to flush the FDB.
Tx-RingDown-FlushFdb	Indicates the EAPS ring is down, and the EAPS domain sent EAPS RingDown-FlushFdb PDUs to flush the FDB.
Tx-Link-Down	Indicates the EAPS domain sent EAPS Link-Down PDUs because the link went down.
Tx-Flush-Fdb	Indicates the EAPS domain sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed.
Tx-Suspend-Prefwd-Timer	Indicates the EAPS domain sent EAPS Suspend-Preforward-Timer PDUs. NOTE: Switches running ExtremeWare send this PDU during an MSM/MM failover. Switches running ExtremeXOS 10.1 or later do not send or receive this PDU. This counter should remain at 0.
Tx-Query-Link-Status	Indicates the EAPS domain sent EAPS Query-Link-Status PDUs.
Tx-Link-Up	Indicates the EAPS domain sent EAPS Link-Up PDUs and the link is up.
Tx-Unknown	Indicates the number of unknown EAPS PDUs sent by the EAPS domain. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine.
Tx-Transmit-Err	Indicates the number of EAPS PDUs the EAPS domain was unable to send because of an error.
Fw-Link-Down	Indicates the number of EAPS Link-Down PDUs received by the EAPS domain and forwarded in slow path.
Fw-Flush-Fdb	Indicates the number of EAPS Flush-Fdb PDUs received by the EAPS domain and forwarded in slow path.
FW-Query-Link-Status	Indicates the number of EAPS Query-Link-Status PDUs received by the EAPS domain and forwarded in slow path.

Field	Description
Fw-Unknown	Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine.
Fw-Transmit-Er	Indicates the number of EAPS PDUs the EAPS domain was unable to forward in slow path because of an error.

Note

Rx and Fw counters—If a PDU is received, processed, and consumed, only the Rx counter increments. If a PDU is forwarded in slow path, both the Rx counter and Fw counter increment.

The following table describes the significant fields and values in the display output of the show eaps counters global command:

Field	Description
Rx-Failed	Indicates an error occurred when receiving packets from the Layer2 forwarding engine.
Rx-Invalid-Vlan-Intf	Indicates that the VLAN interface for the incoming VLAN cannot be found.
Rx-Undersize-Pkt	Indicates the length of the packet is less than the length of the header.
Rx-Invalid-8021Q-Tag	Indicates the VlanTypeLength field in the Ethernet header does not match the default Ethernet value for the 802.1Q tag.
Rx-Invalid-SNAP-Type	Indicates an invalid Subnetwork Access Protocol (SNAP) value in the Ethernet header.
Rx-Invalid-OUI	Indicates the Organizational Unique Identifier (OUI) value in the Ethernet header does not match 00:E0:2B.
Rx-EEP-Unsupported-Version	Indicates an unsupported Extreme Encapsulation Protocol (EEP) version. The EEP version should be 1.
Rx-EEP-Invalid-Length	Indicates the length of the EEP header is greater than the length of the packet.
Rx-EEP-Checksum-Invalid	Indicates the EEP checksum is invalid.
Rx-Domain-Invalid	Indicates the control VLAN's incoming PDU is not associated with an EAPS domain.
Rx-Lif-Invalid	Indicates that EAPS is unable to determine the logical interface (LIF) for the ingress port.
Rx-Lif-Down	Indicates the LIF for the ingress port is in the Down state.
Tx-Failed	Indicates an error occurred when sending packets to the Layer2 forwarding engine.

Example

The following command displays the counters for a specific EAPS domain named eaps1:

```
show eaps counters eaps1
```

The following is sample output from this command:

```
Counters for EAPS domain: eaps1
Rx Stats
Rx-Health                 :  0
Rx-Ringup-Flushfdb        :  0
Rx-Ringdown-Flushfdb      :  0
Rx-Link-Down              :  0
Rx-Flush-Fdb              :  0
Rx-Suspend-Prefwd-Timer   :  0
Rx-Query-Link-Status      :  0
Rx-Link-Up                :  0
Rx Dropped
Rx-Unknown                :  0
Rx-Another-Master         :  0
Rx-Unconfigured-Port      :  0
Rx-Health-Pdu-Pri-Port    :  0
Tx Stats
Tx-Health                 :  5011
Tx-Ringup-Flushfdb        :  0
Tx-Ringdown-Flushfdb      :  0
Tx-Link-Down              :  0
Tx-Flush-Fdb              :  0
Tx-Suspend-Prefwd-Timer   :  0
Tx-Query-Link-Status      :  3342
Tx-Link-Up                :  0
Tx Dropped
Tx-Unknown                :  0
Tx-Transmit-Err           :  0
Fw Stats
Fw-Link-Down              :  0
Fw-Flush-Fdb              :  0
Fw-Query-Link-Status      :  0
Fw Dropped
Fw-Unknown                :  0
Fw-Transmit-Err           :  0
```

The following command displays the global EAPS counters:

```
show eaps counters global
```

The following is sample output from this command:

```
Global counters for EAPS:
Rx-Failed : 0
Rx-Invalid-Vlan-Intf : 0
Rx-Undersize-Pkt : 0
```

```
Rx-Invalid-SNAP-Type : 0
Rx-Invalid-OUI : 0
Rx-EEP-Unsupported-Version : 0

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show eaps counters shared-port

show eaps counters shared-port [**global** | *port* {**segment-port** *segport* {*eapsDomain*}}]

Description

Displays summary EAPS shared port counter information.

Syntax Description

global	Displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance.
port	Identifies the port number of the specified common link port.
segport	Identifies the segment port. The segment port is the other ring port of an EAPS domain that is not the shared-port.
eapsDomain	Specifies the name of the EAPS domain. If no EAPS domain is specified, all counters for all EAPS domains on the specified segment port are displayed.

Default

N/A.

Usage Guidelines

If the switch is configured for EAPS shared ports, use this command to display an array of counters associated with the EAPS shared port functionality.

If you specify the global keyword, the switch displays general counter information for all configured EAPS shared port instances. The output displayed is calculated for all configured EAPS shared ports; not just one specific shared port instance.

If you specify a particular EAPS shared port, the switch displays counter information related to only that shared port.

If you specify a particular EAPS segment port, the switch displays counter information related to only that segment port for the specified EAPS domain.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults.

Clearing the Counters

The counters continue to increment until you clear the information. By clearing the counters, you can see fresh statistics for the time period you are monitoring. To clear, reset the EAPS counters, including the shared port counters, use one of the following commands:

- clear counters
- clear eaps counters

Understanding the Output

The following table describes the significant fields and values in the display output of the show eaps counters shared-port global command:

Field	Description
Rx-Invalid-Instance	Displays the number of dropped EAPS shared-port PDUs because there is not a valid EAPS shared port instance for the incoming port.
Rx-Unknown	Displays the number of unknown EAPS PDUs dropped by the shared port instances.
Fw-Invalid-Instance	Displays the number of EAPS shared-port PDUs that could not be forwarded in slow path because the shared port instances could not find a valid EAPS shared port instance for the outgoing port.

The following table describes the significant fields and values in the display output of the show eaps counters shared-port <port> segment-port <segport> <eapsDomain> command:

Field	Description
Rx-Seg-Health	Indicates the shared port instance received EAPS shared ports Segment-Health-Check PDUs.
Rx-Path-Detect	Indicates the shared port instance received EAPS shared ports Path-Detect PDUs.
Rx-Flush-Notify	Indicates the shared port instance received EAPS shared ports Flush-Notify PDUs and flushed the FDB. If this PDU reaches a port of the shared ports pair that initiated the PDU, the shared port instance might terminate the PDU. Otherwise, the shared port instance forwards the PDU.

Field	Description
Rx-Unknown	Displays the number of unknown EAPS PDUs dropped by the shared port instance.
Rx-Seg-Health-Dropped	Displays the number of EAPS shared ports Segment-Health-Check PDUs dropped by the shared port instance. This counter increments if the Segment-Health-Check PDU returns to the sending switch. If that occurs, the switch drops the Segment-Health-Check PDU.
Rx-Path-Detect-Dropped	Displays the number of EAPS shared ports Path-Detect PDUs dropped by the shared port instance. This counter increments in the following situations: If the packet's Fwd-id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port.If the packet's Link-Id matches the EAPS shared port's Link-Id, the port is not in the blocking state, and the incoming port is a segment port.
Rx-Flush-Notify-Dropped	Displays the number of EAPS shared ports Flush-Notify-Dropped PDUs dropped by the shared port instance. This counter increments in the following situations: If the Flush-Notify-Dropped PDU returns to the sending switch.If the packet's Fwd-Id matches the EAPS shared port's Link-Id and the port is not in the blocking state.
Rx-Dropped-Invalid-Port	Displays the number of EAPS shared ports PDUs dropped by the shared port instance because it does not exist.
Tx-Seg-Health	Indicates the shared port instance sent EAPS shared ports Segment-Health-Check PDUs.
Tx-Path-Detect	Indicates the shared port instance sent EAPS shared ports Path-Detect PDUs. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Flush-Notify	Indicates the shared port instance sent EAPS shared ports Flush-Notify PDUs to flush the FDB. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Flush-Fdb	Indicates the shared port instance sent EAPS Flush-Fdb PDUs because the FDB needs to be flushed. NOTE: This counter appears under Common Link Port Stats and should always be 0.
Tx-Unknown	Indicates the number of unknown EAPS PDUs sent by the shared port instance. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the sending routine.
Tx-Transmit-Err	Indicates the number of EAPS PDUs the shared port instance was unable to send because of an error.
Fw-Seg-Health	Indicates the number of EAPS shared ports Segment-Health-Check PDUs received by the shared port instance and forwarded in slow path.
Fw-Path-Detect	Indicates the number of EAPS shared ports Path-Detect PDUs received by the shared port instance and forwarded in slow path.
Fw-Flush-Notify	Indicates the number of EAPS Flush-Notify PDUs received by the shared port instance and forwarded in slow path to flush the FDB.
Fw-Flush-Fdb	Indicates the number of EAPS Flush-Fdb PDUs received by the shared port instance and forwarded in slow path.

Field	Description
Fw-Unknown	Indicates the number of unknown EAPS PDUs forwarded in slow path. NOTE: Unknown EAPS PDUs can be a new type of PDU that the switch does not track in the forwarding routine.
Fw-Transmit-Err	Indicates the number of EAPS PDUs the shared port instance was unable to forward in slow path because of an error.

Example

The following command displays global, high-level counter information for EAPS shared port:

```
show eaps counters shared-port global
```

The following is sample output from this command:

```
Global counters for EAPS Shared-Ports:
Rx Dropped
Rx-Invalid-Instance : 0
Rx-Unknown          : 0
Fw Dropped
Fw-Invalid-Instance : 0
```

The following example assumes that port 17 is configured as an EAPS shared port. The following command displays counter information the specified EAPS shared port:

```
show eaps counters shared-port 17
```

The following is sample output from this command:

```
Counters for EAPS Shared-Port 17:
Common Link Port Stats
Rx Stats
Rx-Seg-Health            :  0
Rx-Path-Detect           :  0
Rx-Flush-Notify          :  0
Rx Dropped
Rx-Seg-Health-Dropped    :  0
Rx-Path-Detect-Dropped   :  0
Rx-Flush-Notify-Dropped  :  0
Rx-Dropped-Invalid-Port  :  0
Tx Stats
Tx-Seg-Health            :  0
Tx-Path-Detect           :  0
Tx-Flush-Notify          :  0
Tx-Flush-Fdb             :  0
Tx Dropped
Tx-Unknown               :  0
Tx-Transmit-Err          :  0
Fw Stats
```

```
Fw-Seg-Health            :  0
Fw-Path-Detect           :  0
Fw-Flush-Notify          :  0
Fw Dropped
Fw-Unknown               :  0
Fw-Transmit-Err          :  0
```

The following example assumes that port 1:2 is configured as an EAPS shared port and port 1:1 is a segment port. The following command displays counter information the specified EAPS shared port, segment port, and EAPS domain:

```
show eaps counters shared-port 1:2 segment-port 1:1 eaps1
```

The following is sample output from this command:

```
Counters for EAPS Shared-Port 1:2, Segment Port: 1:1, EAPS Domain: eaps1
Rx Stats
Rx-Seg-Health            :  0
Rx-Path-Detect           :  0
Rx-Flush-Notify          :  0
Rx-Seg-Health-Dropped    :  0
Rx-Path-Detect-Dropped   :  0
Rx-Flush-Notify-Dropped  :  0
Rx-Dropped-Invalid-Port  :  0
Tx Stats
Tx-Seg-Health            :  2275
Tx-Path-Detect           :  0
Tx-Flush-Notify          :  0
Tx-Flush-Fdb             :  0
Tx-Transmit-Err          :  0
Tx-Unknown               :  0
Fw Stats
Fw-Seg-Health            :  0
Fw-Path-Detect           :  0
Fw-Flush-Notify          :  0
Fw-Transmit-Err          :  0
Fw-Unknown               :  0
```

History

This command was first available in ExtremeXOS 11.6.

show eaps shared-port

show eaps shared-port {*port*} {**detail**}

Description

Displays shared-port information for one or more EAPS domains.

Syntax Description

port	Specifies a shared-port.
detail	Specifies to display the status of all segments and VLANs.

Default

N/A.

Usage Guidelines

If you enter the show eaps shared-port command without the detail keyword, the command displays a summary of status information for all configured EAPS shared ports.

If you specify an EAPS shared-port, the command displays information about that specific port and the related segment ports. The segment ports are sorted in ascending order based on their port number. You can use this order and your knowledge of the EAPS topology to determine which segment port becomes the active-open port if the common link fails. For more information, see Common Link Fault Detection and Response in the ExtremeXOS Concepts Guide.

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port.

The following table describes the significant fields and values in the display output of the show eaps shared-port {<port>} {detail} commands:

Field	Description
Shared Port	Displays the port number of the shared port.
Mode	Indicates whether the switch on either end of the common link is a controller or partner. The mode is configured by the user.
Link ID	The link ID is the unique common link identifier configured by the user.
Up	Displays one of the following: Yes—Indicates that the link ID and the mode are configured.No—Indicates that the link ID or the mode is not configured.
State	Displays one of the following states: Idle—Shared-port instance is not running.Ready—The EAPS shared-port instance is running, the neighbor can be reached, and the common link is up.Blocking—The EAPS shared-port instance is running, the neighbor cannot be reached, or the common link is down.Preforwarding—The EAPS shared-port instance is in a blocking state, and the common link came up. To prevent a superloop, a temporary blocking state is created before going into Ready state.

Field	Description
Domain Count	Indicates the number of EAPS domains sharing the common link.
VLAN Count	Indicates the total number of VLANs that are protected under the EAPS domains sharing this common link.
Nbr	Yes—Indicates that the EAPS instance on the other end of the common link is configured with matching link ID and opposite modes. For example, if one end of the common link is configured as a controller, the other end must be configured as a partner.Err—Indicates that the EAPS instance on the other end of the common link is configured with a matching link ID, but the modes are configured the same. For example, both modes are configured as controller, or both modes are configured as partner.No—The neighbor on the other end of the common link cannot be reached. Indicates one or more of the following:- The switch on the other end of the common link is not running.- The shared port has not been created.- The link IDs on each side of the common link do not match.- The common link, and any other segment, between the controller and partner are not fully connected.
RB ID	The ID of the root blocker. If the value is none, there are not two or more common-link failures.
RB State	None—This EAPS shared-port is not the root blocker.Active—This EAPS shared-port is the root blocker and is currently active.Inactive—This EAPS shared-port is the root blocker but is currently inactive.
Active Open (available with the detail keyword)	None—Indicates that there is no Active-Open port on the VLAN.Port #—Indicates the port that is Active-Open and is in a forwarding state.
Segment Timer expiry action	Segment down—Specifies that if the controller or partner switch detects a down segment, that segment stays down and a query is not sent through the ring. The switch marks the segment status as Down.Send alert—Specifies that if the controller or partner switch detects a down segment, that switch keeps the segment up and sends a warning message to the log (default). The switch sends a trap alert and sets the failed flag [F].
Segment Port (available with the detail keyword or by specifying a shared port)	Identifies the segment port of an EAPS ring that shares the common link.
Status (available with the detail keyword or by specifying a shared port)	Up—Connectivity is established between the segment and the EAPS shared-port on the common link neighbor.Down—There is a break in the path between the segment and the EAPS shared-port on the common link neighbor.Blocking-Up—The path is Up, but due to the root blocker being in the Active state, this port is blocked to prevent a loop.Blocking-Down—The root blocker is in the Active state; however, the path is Down. Because the path is Down, there is no need to block the root blocker port to prevent a loop.[F]—The segment timer has expired but has not received an explicit link-down notification. The segment port remains in the Up state, with the timer expired flag set to True.
EAPS Domain (available with the detail keyword or by specifying a shared port)	The EAPS domain assigned to the segment port.
Vlan-port count (available with the detail keyword or by specifying a shared port)	The total number of VLANs being protected on this segment port.

Field	Description
Adjacent Blocking Id (available with the detail keyword or by specifying a shared port)	None—The neighbor on this port is not reporting a Controller in the Blocking state.<Link-Id>—The neighbor on this port is a controller in the Blocking state with a link ID of <Link-Id>.
Segment RB Id (available with the detail keyword or by specifying a shared port)	None—The neighbor on this port is not aware of a root blocker in the network.<RB-Id>—The neighbor on this port has determined that there is a root blocker in the network with a link ID of <RB-Id>.
Vlan (available with the detail keyword or by specifying a shared port)	Displays a list of VLANs protected by the segment port.
Virtual-port Status (available with the detail keyword or by specifying a shared port)	This information appears for the Controller, when it is in either the Blocking or Preforwarding state. Active-Open—This VLAN or port is in the Forwarding state and has connectivity to the neighboring EAPS shared port via this port.Open—This VLAN or port is in the Forwarding state but does not have connectivity to the neighboring EAPS shared port via this port.Blocked—This VLAN or port is in the Blocking state to prevent a loop in the network.Down—This port's link is down.Active—At this moment, this VLAN or port is not being handled by EAPS shared port. Rather, this VLAN or port is being handled by the regular EAPS protocol.
Bvlan	When a common link connects an access VLAN (CVLAN or SVLAN) to a core VLAN (BVLAN), this field displays the BVLAN name. For more information, see Common Link Fault Detection and Response in the ExtremeXOS Concepts Guide.

Example

The following command displays shared-port information for all EAPS shared ports on a switch:

```
show eaps shared-port
EAPS shared-port count: 1
--------------------------------------------------------------------------------
--
Link               Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State      count  count Nbr State    Id
--------------------------------------------------------------------------------
--
10:1         Controller  1    Y  Ready      2      1     Yes None     None
Segment Timer expiry action: Send alert
--------------------------------------------------------------------------------
--
```

The following command displays detailed information for all EAPS shared ports:

```
show eaps shared-port detail
EAPS shared-port count: 1
--------------------------------------------------------------------------------
--
Link               Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State      count  count Nbr State    Id
--------------------------------------------------------------------------------
```

```
--
4:1          Controller  10   Y  Blocking   2      1     Yes Active   10
Segment Timer expiry action: Send alert
Segment Port: 5:7,  Status: Blocking-Up
EAPS Domain:             d1
Vlan-port count:         1
Adjacent Blocking Id:    None
Segment RB Id:           None
Vlan                     Virtual-port Status
p_1                  Blocked
Segment Port: 2:11,         Status: Down
EAPS Domain:             d2
Vlan-port count:         1
Adjacent Blocking Id:    20
Segment RB Id:           None
Vlan                     Virtual-port Status
p_1                  Open
Vlan: p_1,   Vlan-port count: 2,    Active Open: None
Segment Port             Virtual-port Status
5:7                  Blocked
2:11                 Open
```

The following command displays detailed information for an EAPS shared port that is in the Blocking state:

```
* Switch.2 #  show eaps shared-port 1:24
-------------------------------------------------------------------------------
--
Link                   Domain Vlan      RB       RB
Shared-port  Mode        Id   Up State          count  count Nbr State    Id
-------------------------------------------------------------------------------
--
1:24         Controller  10   Y  Blocking       3      5     Yes None     None
Segment Health Check interval:        1 sec
Segment Timeout:                      3 sec
Segment Fail Timer expiry action:     Send alert
Common Path Health Check interval:    1 sec
Common Path Timeout:                  3 sec
Segment Port: 3:35  Status: Up
EAPS Domain:             d3
Vlan-port count:         3
Adjacent Blocking Id:    None
Segment RB Id:           None
Segment Port: 3:36  Status: Up
EAPS Domain:             d2
Vlan-port count:         3
Adjacent Blocking Id:    None
Segment RB Id:           None
Segment Port: 3:38  Status: Up
EAPS Domain:             d1
Vlan-port count:         5
Adjacent Blocking Id:    None
Segment RB Id:           None
Vlan: data1,         Vlan-port count: 3,    Active Open: 3:38 Bvlan: metro1
Vlan: data2,         Vlan-port count: 3,    Active Open: 3:38 Bvlan: metro1
Vlan: data3,         Vlan-port count: 3,    Active Open: 3:38 Bvlan: metro2
Vlan: metro1,        Vlan-port count: 1,    Active Open: 3:38
```

```
Vlan: metro2,        Vlan-port count: 1,    Active Open: 3:38
-------------------------------------------------------------------------------
--
```

Note

The BVLAN information in the previous example appears only when a BVLAN configuration is present.

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show eaps shared-port neighbor-info

show eaps shared-port {*port*} **neighbor-info** {**detail**}

Description

Displays shared-port information from neighboring shared links for one or more EAPS domains.

Syntax Description

port	Specifies a shared-port.
detail	Specifies to display the status of all segments and VLANs.

Default

N/A.

Usage Guidelines

If you enter the command without the detail keyword, the command displays a summary of status information for all configured EAPS shared ports from neighboring shared links. If you specify an EAPS shared-port, the command displays information about that specific port. Otherwise, the command displays information about all of the shared-ports configured on the switch.

You can use the detail keyword to display more detailed status information about the segments and VLANs associated with each shared port. For full details of the significant fields and values in the

display output of the command, see the relevant tables in the show eaps shared-port {<port>} {detail} command description.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show vlan eaps

show {vlan} *vlan_name* **eaps**

Description

Displays the EAPS configuration (control, partner, or not added to an EAPS domain) of a specific VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to see if the specified VLAN is associated with an EAPS domain.

The output of this command displays whether the VLAN is a control or partner VLAN for an EAPS domain. This command also displays if the VLAN is not a member of any EAPS domain.

If a VLAN is a partner VLAN for more than one EAPS domain, all of the EAPS domains that the VLAN is a partner of appears in the output.

Example

The following command displays the EAPS configuration for the control VLAN orange in EAPS domain eaps1:

```
show vlan orange eaps
```

The following is sample output from this command:

```
Vlan is Control in following EAPS domain:
```

```
eaps1
```

The following command displays the EAPS configuration for the protected VLAN purple in EAPS domain eaps1:

```
show vlan purple eaps
```

The following is sample output from this command:

```
Vlan is Protected in following EAPS domain(s):
eaps1
```

The following command displays information about the VLAN default not participating in EAPS:

```
show vlan default eaps
```

The following is sample output from this command:

```
Vlan has not been added to any EAPS domain
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure eaps shared-port link-id

unconfigure eaps shared-port *ports* **link-id**

Description

Unconfigures an EAPS link ID on a shared port on the switch.

Syntax Description

ports	Specifies the port number of the Common Link port.

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the link ID on shared port 1:1.

```
unconfigure eaps shared-port 1:1 link-id
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure eaps shared-port mode

unconfigure eaps shared-port *ports* **mode**

Description

Unconfigures the EAPS shared port mode.

Syntax Description

ports	Specifies the port number of the Common Link port.

Default

N/A.

Usage Guidelines

None.

Example

The following command unconfigures the shared port mode on port 1:1:

```
unconfigure eaps shared-port 1:1 mode
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms with the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure eaps port

unconfigure eaps *eapsDomain* **[primary | secondary] port**

Description

Sets the specified port's internal configuration state to INVALID.

Syntax Description

eapsDomain	Specifies the name of an EAPS domain.
primary	Specifies that the primary port should be unconfigured.
secondary	Specifies that the secondary port should be unconfigured.

Default

N/A.

Usage Guidelines

Unconfiguring an EAPS port sets its internal configuration state to INVALID, which causes the port to appear in the Idle state with a port status of Unknown when you use the show eaps detail command to display the status information about the port.

To prevent loops in the network, the switch displays by default a warning message and prompts you to unconfigure the specified EAPS primary or secondary ring port. When prompted, do one of the following:

- Enter y to unconfigure the specified port.
- Enter n or press [Return] to cancel this action.

If you have considerable knowledge and experience with EAPS, you might find the EAPS loop protection warning messages unnecessary. For more information, see the configure eaps config-warnings off command configure eaps config-warnings off.

Example

The following command unconfigures this node's EAPS primary ring port on the domain eaps_1:

```
unconfigureeapseaps_1primary port
```

The switch displays the following warning message and prompts you to confirm this action:

```
WARNING: Unconfiguring the Primary port from the EAPS domain could cause a
loop in the network!
Are you sure you want to unconfigure the Primary EAPS Port? (y/n)
```

Enter y to continue and unconfigure the EAPS primary ring port. Enter n to cancel this action.

The switch displays a similar warning message if you unconfigure the secondary EAPS port.

History

This command was first available in ExtremeXOS 11.0.

The interactive messages were added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

28 ERPS Commands

clear counters erps
configure erps dynamic-state clear
configure erps add control vlan
configure erps add protected vlan
configure erps cfm md-level
configure erps cfm port ccm-interval
configure erps cfm port group
configure erps cfm port mepid

delete erps
disable erps
disable erps block-vc-recovery
disable erps ring-name
disable erps topology-change
enable erps
enable erps block-vc-recovery
enable erps ring-name
enable erps topology-change
run erps force-switch | manual-switch
show erps

This chapter describes commands for completing the following Ethernet Ring Protection Switching (ERPS) tasks:

- Configuring ERPS
- Displaying ERPS information

For an introduction to ERPS (also known as ITU-T standard G.8032), see the ExtremeXOS Concepts Guide.

clear counters erps

clear counters erps *ring-name*

Description

Clear statistics on the specified ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to clear statistics on the specified ERPS ring.

Example

The following command clears statistics on the ERPS ring named “ring1”:

```
clear counters erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps dynamic-state clear

configure erps *ring-name* **dynamic-state** [**force-switch** | **manual-switch** | **clear**] **port** *slot:port*

Description

Clear force and manual switch triggers to the ERPS ring/sub-ring.

Syntax Description

dynamic-state	configure force/manual/clear switch on the active ERPS ring
force-switch	force switch operation
manual-switch	manual switch operation
clear	clear

Default

N/A.

Usage Guidelines

Use this command to clear force and manual switch triggers to the ERPS ring/sub-ring.

Example

The following command clears force and manual switch triggers of an ERPS ring named "ring1":

```
configure erps ring1 dynamic-state clear
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps add control vlan

configure erps *ring-name* **add control** {**vlan**} *vlan_name*

Description

Add a control VLAN on the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
control	VLAN that carries ERPS control traffic
vlan_name	Alphanumeric string identifying the VLAN to be used for control traffic.

Default

N/A.

Usage Guidelines

Use this command to add a control VLAN on the ERPS ring. This is the VLAN that carries ERPS control traffic.

Note

Other VLAN types such as VMAN, SVLAN, CVLAN and BVLAN will not be used for control traffic.

A control VLAN cannot be deleted from a ring that has CFM configured.

Example

The following command adds a control VLAN named “vlan10” to an ERPS ring named “ring1”:

```
configure erps ring1 add control vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps add protected vlan

configure erps *ring-name* **add protected** {**vlan**} *vlan_name*

Description

Add a protected VLAN on the ERPS ring. This is a data VLAN that ERPS will protect.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
vlan_name	Alphanumeric string identifying the data VLAN to be added that ERPS will protect. This can be a VLAN, SVLAN, BVLAN or VMAN.

Default

N/A.

Usage Guidelines

Use this command to add a protected data VLAN on the ERPS ring. This VLAN will be protected by ERPS, and it can be a VLAN, SVLAN, BVLAN or VMAN.

Note

The SVLAN-BVLAN combination cannot both be added to the same ring or sub-ring.

Example

The following command adds a protected VLAN named “vlan10” to an ERPS ring named “ring1”:

```
configure erps ring1 add protected vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps cfm md-level

configure erps *ring-name* **cfm md-level** *level*

Description

Specify the connectivity fault management (CFM) maintenance domain level for an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
level	Maintenance domain level specified for the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to specify the CFM maintenance domain level for an ERPS ring.

Example

The following command sets the CFM maintenance domain level to 6 for an ERPS ring named “ring1”:

```
configure erps ring1 cfm md-level 6
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps cfm port ccm-interval

configure erps *ring-name* **cfm port [east | west] ccm-interval [100 | 1000 | 10000 | 60000 | 600000]**

Description

Specify the time interval for transmitting CFM connectivity check messages (CCM) on a port of an ERPS ring.

ring-name	Alphanumeric string that identifies the ERPS ring.
east	East port.
west	West port.
100	100 milliseconds.
1000	1000 milliseconds.
10000	10000 milliseconds.

60000	60000 milliseconds.
600000	600000 milliseconds.

Default

N/A.

Usage Guidelines

Use this command to specify the time interval at which CCMs are transmitted for a port of an ERPS ring.

Example

The following command sets the CCM time interval to 1000 for the east port of an ERPS ring named "ring1":

```
configure erps ring1 cfm port east ccm-interval 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

New configure erps cfm port group

configure erps *ring_name* **cfm port [east | west] [add | delete] group** *group_name*

Description

Associates or disassociates fault monitoring entities on the ERPS ring ports.

Syntax Description

ring_name	Alphanumeric string that identifies the ERPS ring.
east	East port.
west	West port.
add	Associates a CFM Down-MEP entity.
delete	Disassociates a CFM Down-MEP entity.

group	Specifies a CFM Down-MEP group.
group_name	Specifies the name of the Down MEP group.

Default

N/A.

Usage Guidelines

Use this command to associate or disassociate fault monitoring entities on the ERPS ring ports.

Example

The following command associates fault monitoring on the group "group1":

```
configure erps ring1 cfm port east add group1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms running ExtremeXOS.

configure erps cfm port mepid

configure erps *ring-name* **cfm port** [**east** | **west**] **mepid** *mepid* **remote-mepid** *rmepid*

Description

Specify the maintenance end point identifier for the connectivity fault management (CFM) on a port of an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
east	East port.
west	West port.
mepid	Maintenance End Point identifier for the ring ports.
rmepid	Remote Maintenance End Point identifier for the ring ports.

Default

N/A.

Usage Guidelines

Use this command to specify the maintenance end point identifier for CFM on a port of an ERPS ring.

Example

The following command specifies the maintenance end point identifier for the east port of an ERPS ring named “ring1”:

```
configure erps ring1 cfm port east mepid 1 remote-mepid 3
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps delete control vlan

configure erps *ring-name* **delete control** {**vlan**} *vlan_name*

Description

Delete a control VLAN on the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
vlan_name	Alphanumeric string identifying the VLAN used for control traffic.

Default

N/A.

Usage Guidelines

Use this command to delete a control VLAN from the ERPS ring. This is the VLAN that carries ERPS control traffic.

Note

Other VLAN types such as VMAN, SVLAN, CVLAN and BVLAN will not be used for control traffic.

A control VLAN cannot be deleted from a ring that has CFM configured.

Example

The following command deletes a control VLAN named “vlan10” from an ERPS ring named “ring1”:

```
configure erps ring1 delete control vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps delete protected vlan

configure erps *ring-name* **delete protected** {**vlan**} *vlan_name*

Description

Delete a protected data VLAN from the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
vlan_name	Alphanumeric string identifying the data VLAN to be deleted from the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to delete a protected VLAN from the ERPS ring.

Example

The following command deletes a protected VLAN named “vlan10” from an ERPS ring named “ring1”:

```
configure erps ring1 delete protected vlan vlan10
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps name

configure erps *old-ring-name* **name** *new-ring-name*

Description

Rename the ERPS ring/sub-ring.

Syntax Description

old-ring-name	Alphanumeric string that identifies the ERPS ring.
new-ring-name	New alphanumeric string identifying the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to rename the ERPS ring or sub-ring.

Example

The following command an ERPS ring from “ring1” to “ring2”:

```
configure erps ring1 name ring2
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps neighbor port

configure erps *ring-name* **neighbor-port** *port*

Description

Add RPL (ring protection link) neighbor configuration for the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
port	The slot:port number for RPL neighbor.

Default

N/A.

Usage Guidelines

Use this command to add RPL neighbor configuration for the ERPS ring.

Note

This command implicitly makes the node on which it is configured the RPL neighbor.

Example

The following command adds RPL neighbor on port 5 to an ERPS ring named “ring1”:

```
configure erps ring1 neighbor-port 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps notify-topology-change

configure {**erps**} *ring-name* **notify-topology-change** {**eaps**} *domain_name*

Description

Add an ERPS sub-ring to the EAPS domain.

Syntax Description

ring-name	Alphanumeric string identififying the ERPS sub-ring.
domain_name	Alphanumeric string identifying the EAPS domain.

Default

N/A.

Usage Guidelines

Use this command to add an ERPS sub-ring to the EAPS domain.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps protection-port

configure erps *ring-name* **protection-port** *port*

Description

Add ring protection link (RPL) owner configuration for the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
port	The slot:port number for the ring protection link (RPL) owner.

Default

N/A.

Usage Guidelines

Use this command to add ring protection link (RPL) owner configuration for the ERPS ring.

Note

This command implicitly makes the node on which it is configured the RPL owner.

Example

The following command adds RPL owner configuration on port 5 to an ERPS ring named “ring1”:

```
configure erps ring1 protection-port 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps revert

configure {**erps**} *ring-name* **revert** [**enable** | **disable**]

Description

Add or delete ERPS revert operation along with the “wait-to-restore” time interval.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
enable	Enable revert mode to ERPS ring.
disable	Disable revert mode from ERPS ring.

Default

The default is the revertive mode (enable).

Usage Guidelines

Use this command to enable/disable a G.8032 ring to revert to the original ring protection link (RPL) block state.

Example

The following command disables revert mode from an ERPS ring named “ring1”:

```
configure erps ring1 revert disable
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps ring-ports east | west

configure erps *ring-name* **ring-ports** [**east** | **west**] *port*

Description

Add ring ports on the ERPS ring. Ths ring ports connect the switch to the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
east	Add the ring port to the east port of the switch.
west	Add the ring port to the west port of the switch.
port	The slot:port number for the ring port.

Default

N/A.

Usage Guidelines

Use this command to add ring ports on the ERPS ring. The ring ports can be added to the east or west port of the switch. The ring ports connect the switch to the ERPS ring.

Example

The following command adds port 5 as a ring port on the east port of the switch for an ERPS ring named “ring1”:

```
configure erps ring1 add ring-ports east 5
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps subring-mode

configure erps *ring_name* **subring-mode** [**no-virtualChannel** | **virtualChannel**]

Description

Configures sub-ring mode.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
no-virtualChannel	No Virtual Channel required to complete it's control path.
virtualChannel	Virtual Channel required to complete it's control path.

Default

N/A.

Usage Guidelines

Use this command to add or delete ERPS sub-rings.

Example

The following example configures a virtual channel for the control path:

```
configure erps ring1 subring-mode virtualChannel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

configure erps timer guard

configure {**erps**} *ring-name* **timer guard** [**default** | *milliseconds*]

Description

Configure a guard timer to control when the node should act on received R-APS (ring automatic protection switching) messages.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
default	The default value, 500 milliseconds.
milliseconds	The interval for the guard timer in milliseconds, with a range of 10 to 2000.

Default

The default is 500 milliseconds.

Usage Guidelines

Use this command to configure a guard timer to control when the node should act on received R-APS messages.

Example

The following command sets the guard timer to 1000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer guard 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer hold-off

configure {**erps**} *ring-name* **timer hold-off** [**default** | *milliseconds*]

Description

Configure a hold-off timer to control when a signal fault is relayed.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
default	The default value, 0 milliseconds.
milliseconds	The interval for the hold-off time in milliseconds, with a range of 0 to 10000.

Default

The default is 0 milliseconds.

Usage Guidelines

Use this command to configure a hold-off timer to control when a signal fault is relayed.

Example

The following command sets the hold-off timer to 1000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer hold-off 1000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer periodic

configure {**erps**} *ring-name* **timer periodic** [**default** | *milliseconds*]

Description

Configure a periodic timer to control the interval between signal failures.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
default	The default value, 5000 milliseconds.
milliseconds	The interval for the periodic time in milliseconds, with a range of 2000 to 7000.

Default

The default is 5000 milliseconds.

Usage Guidelines

Use this command to configure a periodic timer to control the interval between signal failure.

Example

The following command sets the periodic timer to 6000 milliseconds for an ERPS ring named “ring1”:

```
configure erps ring1 timer periodic 6000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer wait-to-block

configure {**erps**} *ring-name* **timer wait-to-block** [**default** | *milliseconds*]

Description

Configure a wait-to-block timer for revertive operations on RPL owner initiated reversion.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
default	The default value, 5000 milliseconds.
milliseconds	The time interval to wait before restoring, with a range of 5000 to 7000 milliseconds.

Default

The default is 5000 milliseconds.

Usage Guidelines

Use this command to configure a wait-to-block timer for revertive operations on RPL owner-initiated reversion.

Example

The following command sets the wait-to-block timer to 6000 milliseconds for an ERPS ring named "ring1":

```
configure erps ring1 timer wait-to-block 6000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps timer wait-to-restore

configure {**erps**} *ring-name* **timer wait-to-restore** [**default** | *milliseconds*]

Description

Configure a time interval to wait before restoring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
default	The default value, 1000 milliseconds.
milliseconds	The time interval to wait before restoring, with a range of 0 to 720000 milliseconds.

Default

The default is 1000 milliseconds.

Usage Guidelines

Use this command to configure a time interval to wait before restoring.

Example

The following command sets the wait-to-restore timer to 3000 milliseconds for an ERPS ring named "ring1":

```
configure erps ring1 timer wait-to-restore 3000
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps topology-change

configure erps *ring-name* [**add** | **delete**] **topology-change** *ring-list*

Description

Identify the rings to which topology change events need to be propagated.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
add	Add rings/sub-rings to topology change propagation list.
delete	Delete rings/sub-rings from topology change propagation list.
ring-list	List of ERPS rings/sub-rings to which topology change needs to be propagated.

Default

N/A

Usage Guidelines

Use this command to add or delete ERPS rings/sub-rings from the topology change propagation list.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

create erps ring

create erps *ring-name*

Description

Creates an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to create an ERPS ring.

Example

The following command creates an ERPS ring named “ring1”:

```
create erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

debug erps

debug erps [options]

Description

Debugs an ERPS ring.

Syntax Description

options	Different options to enable looking at debug information

Default

N/A.

Usage Guidelines

Use this command to debug an ERPS ring.

Example

The following command debugs an ERPS ring:

```
debug erps [options]
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

debug erps show

debug erps show *ring-name*

Description

Debugs ERPS ring by checking "show" output.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

To debug this feature, check the output of "show erps" and "show erps ring" to see if the node state is as expected. In steady state, the node should be in "Idle" or "Protected" state.

Check the output of "show erps ring statistics" to see if any error/dropped counters are incrementing. If they are check the state of the ring ports and trace these links to the neighbor node to see the state of the links. The output of "show log" after turning on the filters for ERPS should provide more information on what is happening on the switch.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

delete erps

delete erps *ring-name*

Description

Deletes an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to delete an ERPS ring.

Example

The following command deletes an ERPS ring named “ring1”:

```
delete erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable erps

disable erps

Description

Disable ERPS (Ethernet Ring Protection Switching/ITU-T G.8032 standard).

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to disable ERPS.

Example

The following command disables ERPS.

```
disable erps
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable erps block-vc-recovery

disable erps *ring-name* **block-vc-recovery**

Description

Disables the ability on ERPS rings to block virtual channel recovery to avoid temporary loops .

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
block-vc-recovery	Block on Virtual channel recovery.

Default

N/A.

Usage Guidelines

Use this command to disable the ability on ERPS rings to block on virtual channel recovery to avoid temporary loops. This is done on interconnected nodes for sub-ring configurations.

Example

The following example disables a virtual channel recovery block on “ring1”:

```
diable erps ring1 block-vc-recovery
```

History

This command was first available in ExtremeXOS 15.13.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

disable erps ring-name

disable erps *ring-name*

Description

Disable an existing ERPS ring/sub-ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to disable an existing ERPS ring/sub-ring.

Example

The following example disables an existing ERPS ring identified as “ring1”:

```
disable erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

disable erps topology-change

disable erps *ring-name* **topology-change**

Description

Disable the ability of ERPS to set the topology-change bit to send out Flush events.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS sub-ring.
topology-change	Topology change propagation control.

Default

N/A.

Usage Guidelines

Use this command to disable the ability of ERPS to set the topology-change bit to send out Flush events.

Example

The following example disables the ability to set the topology-change bit for an existing ERPS sub-ring identified as “ring1”:

```
disable erps ring1 topology-change
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable erps

enable erps

Description

Enable ERPS (Ethernet Ring Protection Switching/ITU-T G.8032 standard).

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to enable ERPS.

Example

```
enable erps
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable erps block-vc-recovery

enable erps *ring-name* **block-vc-recovery**

Description

Enable ability on ERPS rings to block virtual channel recovery to avoid temporary loops .

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
block-vc-recovery	Block on Virtual channel recovery.

Default

N/A.

Usage Guidelines

Use this command to enable ability on ERPS rings to block on virtual channel recovery to avoid temporary loops. This is done on interconnected nodes for sub-ring configurations.

Example

The following example enables a virtual channel recovery block on “ring1”:

```
enable erps ring1 block-vc-recovery
```

History

This command was first available in ExtremeXOS 15.13.

Platform Availability

This command is available on all platforms that are running ExtremeXOS.

enable erps ring-name

enable erps *ring-name*

Description

Enable an existing ERPS ring/sub-ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to enable an existing ERPS ring/sub-ring.

Example

The following example enables an existing ERPS ring identified as “ring1”:

```
enable erps ring1
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

enable erps topology-change

enable erps *ring-name* **topology-change**

Description

Enable the ability of ERPS to set the topology-change bit to send out Flush events.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS sub-ring.
topology-change	Topology change propagation control.

Default

N/A.

Usage Guidelines

Use this command to enable the ability of ERPS to set the topology-change bit to send out Flush events.

Example

The following example enables the ability to set the topology-change bit for an existing ERPS sub-ring identified as “ring1”:

```
enable erps ring1 topology-change
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

run erps force-switch | manual-switch

run erps *ring-name* [**force-switch** | **manual-switch**] {**port**} *port*

Description

Set up force and manual switch triggers to the ERPS ring/sub-ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
force-switch	Force switch operation.
manual-switch	Manual switch operation.
port	The slot:port number for the ring port.

Default

N/A.

Usage Guidelines

Use this command to set up force and manual switch triggers to the ERPS ring/sub-ring.

Example

The following command sets up force switch operation on port 6 of an ERPS ring named “ring1”:

```
run erps ring1 force-switch port 6
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps

show erps

Description

Display global information for ERPS.

Syntax Description

N/A.

Default

N/A.

Usage Guidelines

Use this command to display global information for ERPS.

Example

```
# show erps

ERPS Enabled: Yes
ERPS Display Config Warnings: On
ERPS Multicast Add Ring Ports: Off
ERPS Multicast Send IGMP Query: On
```

```
ERPS Multicast Temporary Flooding: Off
ERPS Multicast Temporary Flooding Duration: 15 sec
Number of ERPS instances: 1
# ERPS ring configuration :

--------------------------------------------------------------------------------
--
Ring           State           Type    East    West    Control-Vlan   VID
--------------------------------------------------------------------------------
--

    Flags: (n) Non-revertive, (r) Revertive,
           (+) RPL Protection Port, (^) RPL Neighbor Port
           (f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps ring-name

show erps *ring-name*

Description

Display specific details for an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to display specific details for an ERPS ring.

Example

The following example displays details for an ERPS ring named "R1":

```
# show erps "R1"

Name: R1
Operational State: Protection enabled       Node Type: RPL Owner,  Revertive
Configured State : Enabled

East Ring Port :  21  MepId: 1  Remote MepId: 3      Status: Blocked
West Ring Port : +20  MepId: 2  Remote MepId: 4      Status: Blocked

Periodic timer interval:  5000 millisec (Enabled)
Hold-off timer interval:  0    millisec (Enabled)
Guard timer interval   :  500  millisec (Enabled)
WTB timer interval     :  5500 millisec (Enabled)
WTR timer interval     :  1000 millisec (Enabled)

Ring MD Level          :  1
CCM Interval East      :  1000 millisec
CCM Interval West      :  1000 millisec
Notify Topology Change :  -------
Subring Mode           :  Virtual Channel

ERPS Control Vlan: cvl           VID:1000
Topology Change Propogation List: None
Topology Change Propogation  : Disabled
ERPS Ring's Sub-Ring(s): None
ERPS Ring has following Protected Vlan(s):
    Vlan Name                    VID
    pvl                          1001
Number of Protected Vlans: 1
(+) RPL Protection Port, (^) RPL Neighbor Port
(f) Force Switch Port, (m) Manual Switch Port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

show erps statistics

show erps *ring-name* **statistics**

Description

Display control packet and event statistics for an ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to display control packet and event statistics for an ERPS ring.

Example

The following example displays statistics for an ERPS ring named "R1":

```
# show erps "R1" statistics
port    Sent   Received  Dropped   Blocked  Un-blocked  SF   SF-clear
        R-APS  R-APS     R-APS     events   events
-------------------------------------------------------------------
2:1     2309   3400       4         5         0         0         0
1:20     100     45       0         0        10      2000       100
-------------------------------------------------------------------
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps cfm

unconfigure {**erps**} *ring-name* **cfm**

Description

Unconfigure the CFM maintenance association for the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to unconfigure connectivity fault management (CFM) for the ERPS ring.

Example

The following command unconfigures connectivity fault management on an ERPS ring named “ring1”:

```
unconfigure erps ring1 cfm
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps neighbor-port

unconfigure erps *ring-name* **neighbor-port**

Description

Delete the ring protection link (RPL) neighbor configuration for the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

See Description.

Example

The following command deletes RPL neighbor configuration for the ERPS ring named “ring1”:

```
unconfigure erps ring1 neighbor-port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps notify-topology-change

unconfigure {**erps**} *ring-name* **notify-topology-change** {**eaps**} *domain_name*

Description

Delete an ERPS sub-ring from the EAPS domain.

Syntax Description

ring-name	Alphanumeric string identififying the ERPS sub-ring.
domain_name	Alphanumeric string identifying the EAPS domain.

Default

N/A.

Usage Guidelines

Use this command to delete an ERPS sub-ring from the EAPS domain.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps protection-port

unconfigure erps *ring-name* **protection-port**

Description

Delete ring protection link (RPL) owner configuration for the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.

Default

N/A.

Usage Guidelines

Use this command to delete ring protection link (RPL) owner configuration for the ERPS ring.

Example

The following command deletes RPL owner configuration on an ERPS ring named “ring1”:

```
unconfigure erps ring1 protection-port
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

unconfigure erps ring-ports west

unconfigure erps *ring-name* **ring-ports west**

Description

Delete ring ports on the ERPS ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
west	Delete the ring port on the west port of the switch.

Default

N/A.

Usage Guidelines

Use this command to delete ring ports on the ERPS ring. Ring ports are the ports of the switch that connect it to the ERPS ring. This command deletes the ring port on the west port of the switch.

Note

On unconfiguring the west port, the node is treated as an interconnected node.

Example

The following command deletes the ring ports on the west port of the switch for an ERPS ring named "ring1":

```
unconfigure erps ring1 ring-ports west
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on all platforms supported in 12.6 and forward that are running ExtremeXOS.

configure erps cfm protection group

configure erps *ring_name* **cfm protection** [**add delete**] **group** *cfm_group*

Description

Associates or disassociates a CFM UP MEP group for subring protection across the main ring.

Syntax Description

ring-name	Alphanumeric string that identifies the ERPS ring.
east	East port.

west	West port.
add	Associates a CFM Up-MEP entity.
delete	Disassociates a CFM Up-MEP entity.
group	Specifies a CFM Up-MEP group.
group_name	Specifies the name of the Up MEP group.

Default

N/A

Usage Guidelines

Use this command to associate or disassociate a CFM UP MEP group for subring protection across the main ring.

Example

The following command associates a CFM UP MEP group for subring protection on the group "group1":

```
configure erps ring1 cfm protection add group1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms running ExtremeXOS.

29 STP Commands

This chapter describes commands for:

- Creating, configuring, enabling, and disabling Spanning Tree Protocol (STP) on the switch
- Enabling and disabling Rapid Spanning Tree Protocol (RSTP) on the switch
- Enabling and disabling Multiple Spanning Tree Protocol (MSTP) on the switch
- Displaying and resetting STP settings on the switch

STP

STP is a bridge-based mechanism for providing fault tolerance on networks. STP is a part of the 802.1D bridge specification defined by the IEEE Computer Society. To explain STP in terms used by the 802.1D specification, the switch is referred to as a bridge.

STP allows you to implement parallel paths for network traffic and ensure that redundant paths are:

- Disabled when the main paths are operational.
- Enabled if the main path fails.

Note

STP and Extreme Standby Router Protocol (ESRP) cannot be configured on the same Virtual LAN (VLAN) simultaneously.

RSTP

The Rapid Spanning Tree Protocol (RSTP) IEEE 802.1w provides an enhanced spanning tree algorithm that improves the convergence speed of bridged networks.

RSTP takes advantage of point-to-point links in the network and actively confirms that a port can safely transition to the forwarding state without relying on any timer configurations. If a network topology change or failure occurs, RSTP rapidly recovers network connectivity by confirming the change locally

before propagating that change to other devices across the network. For broadcast links, there is no difference in convergence time between STP and RSTP.

RSTP supersedes legacy STP protocols, supports the existing STP parameters and configurations, and allows for seamless interoperability with legacy STP.

MSTP

MSTP logically divides a Layer2 network into regions.

Each region has a unique identifier and contains multiple spanning tree instances (MSTIs). An MSTI is a spanning tree domain that operates within and is bounded by a region. MSTIs control the topology inside the regions. The Common and Internal Spanning Tree (CIST) is a single spanning tree domain that interconnects MSTP regions. The CIST is responsible for creating a loop-free topology by exchanging and propagating BPDUs across regions to form a Common Spanning Tree (CST).

MSTP uses RSTP as its converging algorithm and is interoperable with the legacy STP protocols: STP (802.1D) and RSTP (802.1w).

Spanning Tree Domains

The switch can be partitioned into multiple virtual bridges. Each virtual bridge can run an independent spanning tree instance. Each spanning tree instance is called a Spanning Tree Domain (STPD). Each STPD has its own root bridge and active path. After an STPD is created, one or more VLANs can be assigned to it.

A port can belong to multiple STPDs. In addition, a VLAN can span multiple STPDs.

The key points to remember when configuring VLANs and STP are:

- Each VLAN forms an independent broadcast domain.
- STP blocks paths to create a loop-free environment.
- Within any given STPD, all VLANs belonging to it use the same spanning tree.

Member VLANs

When you add a VLAN to an STPD, that VLAN becomes a member of the STPD. The two types of member VLANs in an STPD are:

- Carrier
- Protected

Carrier VLAN

A carrier VLAN defines the scope of the STPD, which includes the physical and logical ports that belong to the STPD and if configured, the 802.1Q tag used to transport Extreme Multiple Instance Spanning Tree Protocol (EMISTP) or Per VLAN Spanning Tree (PVST+) encapsulated Bridge Protocol Data Units

(BPDUs). Only one carrier VLAN can exist in a given STPD, although some of its ports can be outside the control of any STPD at the same time.

Note

If you use EMISTP or PVST+, the STPD ID must be identical to the VLAN ID of the carrier VLAN in that STPD.

If you have an 802.1D configuration, Extreme Networks recommends that you configure the StpdID to be identical to the VLAN ID of the carrier VLAN in that STPD.

If you configure MSTP, you do not need carrier VLANs for MSTP operation. With MSTP, you configure a CIST that controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate the status of MSTP regions. All VLANs participating in the MSTP region have the same privileges.

Protected VLAN

Protected VLANs are all other VLANs that are members of the STPD. These VLANs “piggyback” on the carrier VLAN. Protected VLANs do not transmit or receive STP BPDUs, but they are affected by STP state changes and inherit the state of the carrier VLAN. Protected VLANs can participate in multiple STPD, but any particular port in the VLAN can belong to only one STPD. Also known as non-carrier VLANs.

If you configure MSTP, all member VLANs in an MSTP region are protected VLANs. These VLANs do not transmit or receive STP BPDUs, but they are affected by STP state changes communicated by the CIST to the MSTP regions. MSTIs cannot share the same protected VLAN; however, any port in a protected VLAN can belong to multiple MSTIs.

STPD Modes

An STPD has three modes of operation:

- 802.1D mode

  Use this mode for backward compatibility with previous STP versions and for compatibility with third-party switches using IEEE standard 802.1D. When configured in this mode, all rapid configuration mechanisms are disabled.

- 802.1w mode

  Use this mode for compatibility with Rapid Spanning Tree (RSTP). When configured in this mode, all rapid configuration mechanisms are enabled. The benefit of this mode is available on point-to-point and edge ports only.

  You enable or disable RSTP on a per STPD basis only. You do not enable RSTP on a per port basis.

- MSTP mode

  Use this mode for compatibility with Multiple Spanning Tree (MSTP, 802.1s). MSTP is an extension of RSTP and offers the benefit of better scaling with fast convergence. When configured in this mode, all rapid configuration mechanisms are enabled. The benefit of MSTP is available only on point-to-point links and when you configure the peer in MSTP or 802.1w mode. If you do not select point-to-point links and the peer is not configured in 802.1w mode, the STPD fails back to 802.1D mode.

You can create only one MSTP region on the switch, and all switches that participate in the region must have the same regional configurations. You enable or disable an MSTP on a per STPD basis only. You do not enable MSTP on a per port basis.

By default, the:

- STPD operates in 802.1D mode.
- Default device configuration contains a single STPD called s0.
- Default VLAN is a member of STPD s0 with autobind enabled.

All STP parameters default to the IEEE 802.1D values, as appropriate.

Encapsulation Modes

You can configure ports within an STPD to accept and transmit specific BPDU encapsulations. This STP port encapsulation is separate from the STP mode of operation. For example, you can configure a port to accept the PVST+ BPDU encapsulation while running in 802.1D mode.

An STP port has three possible encapsulation modes:

- 802.1D mode

  This mode is used for backward compatibility with previous STP versions and for compatibility with third-party switches using IEEE standard 802.1D. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- Extreme Multiple Instance Spanning Tree Protocol (EMISTP) mode

  EMISTP mode is proprietary to Extreme Networks and is an extension of STP that allows a physical port to belong to multiple STPDs by assigning the port to multiple VLANs. EMISTP adds significant flexibility to STP network design. BPDUs are sent with an 802.1Q tag having an STPD instance Identifier (STPD ID) in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- Per VLAN Spanning Tree (PVST+) mode

  This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

These encapsulation modes are for STP ports, not for physical ports. When a physical port belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains to which it belongs.

MSTP STPDs use only 802.1D BPDU encapsulation mode. The switch prevents you from configuring EMISTP or PVST+ encapsulation mode for MSTP STPDs.

STP Rules and Restrictions

This section summarizes the rules and restrictions for configuring STP as follows:

- The carrier VLAN must span all ports of the STPD. (This is not applicable to MSTP.)
- The STPD ID must be the VLAN ID of the carrier VLAN; the carrier VLAN cannot be partitioned. (This is not applicable to MSTP.)
- A default VLAN cannot be partitioned. If a VLAN traverses multiple STPDs, the VLAN must be tagged.
- An STPD can carry, at most, one VLAN running in PVST+ mode, and its STPD ID must be identical with that VLAN ID. In addition, the PVST+ VLAN cannot be partitioned.
- The default VLAN of a PVST+ port must be identical with the native VLAN on the PVST+ device connected to that port.
- If an STPD contains both PVST+ and non-PVST+ ports, that STPD must be enabled. If that STPD is disabled, the BPDUs are flooded in the format of the incoming STP port, which may be incompatible with those of the connected devices.
- The 802.1D ports must be untagged; and the EMISTP/PVST+ ports must be tagged in the carrier VLAN.
- An STPD with multiple VLANs must contain only VLANs that belong to the same virtual router instance.
- STP and network login operate on the same port as follows:
  - STP (802.1D), RSTP (802.1W), and MSTP (802.1S) support both network login and STP on the same port.
  - At least one VLAN on the intended port should be configured both for STP and network login.
  - When STP blocks a port, network login does not process authentication requests and BPDUs are the only traffic in and out of the port. All user data forwarding stops.
  - When STP places a port in forwarding state, network login operates and BPDUs and user data flow in and out of the port. The forwarding state is the only STP state that allows network login and user data forwarding.
  - When RSTP is used with network login campus mode, autobind must be enabled on all VLANs that support RSTP and network login campus mode.
  - When RSTP is used with network login campus mode on a port, dynamic VLANs cannot be supported.
- STP cannot be configured on the following ports:
  - A mirroring target port.
  - A software-controlled redundant port.
- MSTP and 802.1D STPDs cannot share a physical port.
- Only one MSTP region can be configured on a switch.
- In an MSTP environment, A VLAN can belong to either a CIST or one of the MSTIs.
- A VLAN can belong to only one MSTP domain.
- MSTP is not interoperable with PVST+.
- The CIST can operate without any member VLANs.

clear counters stp

```
clear counters stp {[all | diagnostics | domains | ports]}
```

Description

Clears, resets all STP statistics and counters.

Syntax Description

all	Specifies all STP domain, port, and diagnostics counters.
diagnostics	Specifies STP diagnostics counters.
domains	Specifies STP domain counters.
ports	Specifies STP port counters.

Default

N/A.

Usage Guidelines

If you do not enter a parameter, the result is the same as specifying the all parameter: the counters for all domains, ports, and diagnostics are reset.

Enter one of the following parameters to reset the STP counters on the switch:

- all—Specifies the counters for all STPDs and ports, and clears all STP counters
- diagnostics—Clears the internal diagnostic counters
- domains—Clears the domain level counters
- ports—Clears the counters for all ports and leaves the domain level counters

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period that you are monitoring.

Example

The following command clears all of the STP domain, port, and diagnostic counters:

```
clear counters stp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure mstp format

configure mstp format *format_identifier*

Description

Configures the number used to identify the MSTP BPDUs sent in the MSTP region.

Syntax Description

format_identifier	Specifies a number that MSTP uses to identify all BPDUs sent in the MSTP region. The default is 0. The range is 0 to 255.

Default

The default value used to identify the MSTP BPDU is 0.

Usage Guidelines

For a switch to be part of an MSTP region, you must configure each switch in the region with the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

You can configure only one MSTP region on the switch at any given time.

The switches contained in a region transmit and receive BPDUs that contain information relevant to only that MSTP region. By having devices look at the region identifiers, MSTP discovers the logical boundary of a region.

If you have an active MSTP region, Extreme Networks recommends that you disable all active STPDs in the region before modifying the value used to identify MSTP BPDUs on all participating switches.

Example

The following command configures the number 2 to identify the MSTP BPDUs sent within an MSTP region:

```
configure mstp format 2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure mstp region

configure mstp region *regionName*

Description

Configures the name of an MSTP region on the switch.

Syntax Description

regionName	Specifies a user-defined name for the MSTP region. May be up to 32 characters.

Default

By default, the switch uses the MAC address of the switch to generate an MSTP region.

Before you configure the MSTP region, it also has the following additional defaults:

- MSTP format Identifier—0
- MSTP Revision Level—3

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, mstp. Names must start with an alphabetical character, for example, a, Z.

By default, the switch uses the unique MAC address of the switch to generate an MSTP region. Since each MAC address is unique, every switch is in its own region by default.

For multiple switches to be part of an MSTP region, you must configure each switch in the region with the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

You can configure only one MSTP region on the switch at any given time.

The switches inside a region exchange BPDUs that contain information for MSTIs. The switches connected outside of the region exchange CIST information. By having devices look at the region identifiers, MSTP discovers the logical boundary of a region.

If you have an active MSTP region, Extreme Networks recommends that you disable all active STPDs in the region before renaming the region on all of the participating switches.

Viewing MSTP Information

To view the MSTP configuration on the switch, use the show stpd command. Output from this command contains global MSTP settings, including the name of the MSTP region, the number or tag that identifies all of the BPDUs sent in the MSTP region, and the reserved MSTP revision level. If configured, the output also displays the name of the Common and Internal Spanning Tree (CIST), and the number of Multiple Spanning Tree Instances (MSTIs).

Example

The following command creates an MSTP region named purple:

```
configure mstp region purple
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure mstp revision

configure mstp revision *revision*

Description

Configures the revision number of the MSTP region.

Syntax Description

revision	This parameter is reserved for future use.

Default

The default value of the revision level is 3.

Usage Guidelines

Although this command is displayed in the CLI, it is reserved for future use. Please do not use this command.

If you accidentally configure this command, remember that each switch in the region must have the same MSTP configuration attributes, also known as MSTP region identifiers. These identifiers consist of the following:

- Region Name—The name of the MSTP region.
- Format Selector—The number used to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

Example

The following command returns the MSTP revision number to 3, the default revision number:

```
configure mstp revision 3
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure stpd add vlan

configure stpd *stpd_name* **add vlan** *vlan_name* **ports** [**all** | *port_list*] {[**dot1d** | **emistp** | **pvst-plus**]}

Description

Adds all ports or a list of ports within a VLAN to a specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies a VLAN name.
all	Specifies all of the ports in the VLAN to be included in the STPD.
port_list	Specifies the port or ports to be included in the STPD.
dot1d	Specifies the STP encapsulation mode of operation to be 802.1D.

emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Ports in the default STPD (s0) are in dot1.d mode.

Ports in user-created STPDs are in emistp mode.

Usage Guidelines

To create an STP domain, use the create stpd command. To create a VLAN, use the create vlan command.

In an EMISTP or PVST+ environment, this command adds a list of ports within a VLAN to a specified STPD provided the carrier VLAN already exists on the same set of ports. You can also specify the encapsulation mode for those ports.

In an MSTP environment, you do not need a carrier VLAN. A CIST controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate region status. You must use the dot1d encapsulation mode in an MSTP environment.

You cannot configure STP on the following ports:

- Mirroring target ports
- Software-controlled redundant ports

If you see an error similar to the following:

```
Error: Cannot add VLAN default port 3:5 to STP domain
```

You might be attempting to add:

- A carrier VLAN port to a different STP domain than the carrier VLAN belongs
- A VLAN/port for which the carrier VLAN does not yet belong

Note

This restriction is enforced only in an active STP domain and when you enable STP to make sure you have a legal STP configuration.

Care must be taken to ensure that ports in overlapping domains do not interfere with the orderly working of each domain's protocol.

By default, when the switch boots for the first time, it automatically creates a VLAN named default with a tag value of 1 and STPD s0. The switch associates VLAN default to STPD s0. All ports that belong to this VLAN and STPD are in 802.1D encapsulation mode with autobind enabled. If you disable autobind on the VLAN default, that configuration is saved across a reboot.

Naming Conventions

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keywords stpd and vlan are optional.

STP Encapsulations Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

These encapsulation modes are for STP ports, not for physical ports. When a physical port belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

STPD Identifier

An StpdID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STPD and that VLAN cannot belong to another STPD.

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the Common and Internal Spanning Tree (CIST). The switch assigns this ID automatically when you configure the CIST STPD. A multiple spanning tree instance identifier identifies each STP domain that is part of an MSTP region. You assign the MSTI ID when configuring the STPD that participates in the MSTP region. In an MSTP region, MSTI IDs only have local significance. You can reuse MSTI IDs across MSTP regions.

Automatically Inheriting Ports—MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an MSTI in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Example

Create a VLAN named marketing and an STPD named STPD1 as follows:

```
create vlan marketing
create stpd stpd1
```

The following command adds the VLAN named marketing to the STPD STPD1, and includes all the ports of the VLAN in STPD1:

```
configure stpd stpd1 add vlan marketing ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd default-encapsulation

configure stpd *stpd_name* **default-encapsulation** [**dot1d** | **emistp** | **pvst-plus**]

Description

Configures the default encapsulation mode for all ports added to the specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
dot1d	Specifies the STP encapsulation mode of operation to be 802.1d.
emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Ports in the default STPD (s0) are dot1d mode.

Ports in user-created STPDs are in emistp mode.

Usage Guidelines

Care must be taken to ensure that ports in overlapping domains do not interfere with the orderly working of each domain's protocol.

By default, when the switch boots for the first time, it automatically creates a VLAN named default with a tag value of 1 and STPD s0. The switch associates VLAN default to STPD s0. All ports that belong to this VLAN and STPD are in 802.1d encapsulation mode with autobind enabled. If you disable autobind on the VLAN default, that configuration is saved across a reboot.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

Naming Conventions

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

STP Encapsulation Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

Note

These encapsulation modes are for STP ports, not for physical ports. When a physical port belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

STPD Identifier

An StpdID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STP domain, and that VLAN cannot belong to another STPD.

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the Common and Internal Spanning Tree (CIST). The switch assigns this ID automatically when you configure the CIST STPD. A multiple spanning tree instance identifier identifies each STP domain that is part of an MSTP region. You assign the MSTI ID when configuring the STPD

that participates in the MSTP region. In an MSTP region, MSTI IDs only have local significance. You can reuse MSTI IDs across MSTP regions.

Example

The following command specifies that all ports subsequently added to the STPD STPD1 be in PVST+ encapsulation mode unless otherwise specified or manually changed:

```
configure stpd stpd1 default-encapsulation pvst-plus
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd delete vlan

configure stpd *stpd_name* **delete vlan** *vlan_name* **ports** [**all** | *port_list*]

Description

Deletes one or more ports in the specified VLAN from an STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies a VLAN name.
all	Specifies that all of the ports in the VLAN are to be removed from the STPD.
port_list	Specifies the port or ports to be removed from the STPD.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keywords stpd and vlan are optional.

In EMISTP and PVST+ environments, if the specified VLAN is the carrier VLAN, all protected VLANs on the same set of ports are also removed from the STPD.

You also use this command to remove autobind ports from a VLAN. ExtremeXOS records the deleted ports so that the ports are not automatically added to the STPD after a system restart.

When a port is deleted on the MSTI, it is automatically deleted on the CIST as well.

Example

The following command removes all ports of a VLAN named Marketing from the STPD STPD1:

```
configure stpd stpd1 delete vlan marketing ports all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd description

configure {**stpd**} *stpd_name* **description** [*stpd-description* | **none**}

Description

Adds or overwrites the STP domain description field.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
stpd-description	Specifies an STPD description.
none	Clears the STPD string.

Default

The STP domain description string is empty.

Usage Guidelines

Use this command to add or overwrite the STP domain description field.

The maximum STP domain description length is 180 characters.

The stpd-description must be in quotes if the string contains any spaces.

To display the description, use the show stpd <stpd_name> command. When no STP domain description is configured, Description is not displayed in the output.

To clear the STP domain description string, either specify the keyword none in this command or use the unconfigure stpd {<stpd_name>} command.

Example

The following command adds the description “this is s0 domain” to the STPD named s0:

```
configure stpd s0 description “this is s0 domain”
```

History

This command was first available in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

configure stpd flush-method

configure stpd flush-method [vlan-and-port | port-only]

Description

Configures the method used by STP to flush the FDB during a topology change.

Syntax Description

vlan-and-port	Specifies a VLAN and port combination flush method.
port-only	Specifies a port flush method.

Default

The default flush method is vlan-and-port.

Usage Guidelines

For scaled up configurations where there are more than 1000 VLANs and more than 70 ports participating in STP, the number of messages exchanged between STP/FDB/HAL modules can consume a lot of system memory during an STP topology change using the default configuration for flush method. In such situations, setting the flush method to “port-only” can help reduce the system memory consumption.

Example

The following command sets the flush method to port-only:

```
configure stpd flush-method port-only
```

History

This command was available in ExtremeXOS 12.4.5.

Platform Availability

This command is available on all platforms.

configure stpd forwarddelay

configure stpd *stpd_name* **forwarddelay** *seconds*

Description

Specifies the time (in seconds) that the ports in this STPD spend in the listening and learning states when the switch is the root bridge.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the forward delay time in seconds. The default is 15 seconds, and the range is 4 to 30 seconds.

Default

The default forward delay time is 15 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the <seconds> parameter is 4 through 30 seconds.

Example

The following command sets the forward delay from STPD1 to 20 seconds:

```
configure stpd stpd1 forwarddelay 20
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd hellotime

configure stpd *stpd_name* **hellotime** *seconds*

Description

Specifies the time delay (in seconds) between the transmission of BPDUs from this STPD when it is the root bridge.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the hello time in seconds. The default is 2 seconds, and the range is 1 to 10 seconds.

Default

The default hello time is 2 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

In an MSTP environment, configure the hello timer only on the CIST, not on the MSTIs.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the <seconds> parameter is 1 through 10 seconds.

Example

The following command sets the time delay from STPD1 to 10 seconds:

```
configure stpd stpd1 hellotime 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd maxage

configure stpd *stpd_name* **maxage** *seconds*

Description

Specifies the maximum age of a BPDU in the specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
seconds	Specifies the maxage time in seconds. The default is 20 seconds, and the range is 6 to 40 seconds.

Default

The default maximum age of a BPDU is 20 seconds.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

In an MSTP environment, configure the maximum age of a BPDU only on the CIST, not on the MSTIs.

The range for the <seconds> parameter is 6 through 40 seconds.

Note that the time must be greater than, or equal to 2 * (Hello Time + 1) and less than, or equal to 2 * (Forward Delay –1).

Example

The following command sets the maximum age of STPD1 to 30 seconds:

```
configure stpd stpd1 maxage 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd max-hop-count

configure stpd *stpd_name* **max-hop-count** *hopcount*

Description

Specifies the maximum hop count of a BPDU until the BPDU is discarded in the specified MSTP STP domain.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
hopcount	Specifies the number of hops required to age out information and notify changes in the topology. The default is 20 hops, and the range is 6 to 40 hops.

Default

The default hop count of a BPDU is 20 hops.

Usage Guidelines

This command is applicable only in an MSTP environment.

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The range for the <hopcount> parameter is 6 through 40 hops.

In an MSTP environment, the hop count has the same purpose as the maxage timer for 802.1D and 802.1w environments.

The main responsibility of the CIST is to exchange or propagate BPDUs across regions. The switch assigns the CIST an instance ID of 0, which allows the CIST to send BPDUs for itself in addition to all of the MSTIs within an MSTP region. Inside a region, the BPDUs contain CIST records and piggybacked M-records. The CIST records contain information about the CIST, and the M-records contain information about the MSTIs. Boundary ports only exchange CIST record BPDUs.

On boundary ports, only CIST record BPDUs are exchanged. In addition, if the other end is an 802.1D or 802.1w bridge, the maxage timer is used for interoperability between the protocols.

Example

The following command sets the hop of the MSTP STPD, STPD2, to 30 hops:

```
configure stpd stpd2 max-hop-count 30
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure stpd mode

configure stpd *stpd_name* **mode** [**dot1d** | **dot1w** | **mstp** [**cist** | **msti** *instance*]]

Description

Configures the operational mode for the specified STP domain.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
dot1d	Specifies the STPD mode of operation to be 802.1D.
dot1w	Specifies the STPD mode of operation to be 802.1w, and rapid configuration is enabled.
mstp	Specifies the STPD mode of operation to be 802.1s, and rapid configuration is enabled.
cist	Configures the specified STPD as the common instance spanning tree for the MSTP region.

msti	Configures the specified STPD as a multiple spanning tree instance for the MSTP region.
instance	Specifies the Id of the multiple spanning tree instance. The range is 1 to 4,094.

Default

The STPD operates in 802.1D mode.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

If you configure the STP domain in 802.1D mode, the rapid reconfiguration mechanism is disabled.

If you configure the STP domain in 802.1w mode, the rapid reconfiguration mechanism is enabled. You enable or disable RSTP on a per STPD basis only. You do not enable RSTP on a per port basis.

If you configure the STP domain in MSTP mode, the rapid reconfiguration mechanism is enabled. You enable or disable MSTP on a per STPD basis only. You do not enable MSTP on a per port basis. MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

You must first configure a Common and Internal Spanning Tree (CIST) before configuring any multiple spanning tree instances (MSTIs) in the region. You cannot delete or disable a CIST if any of the MSTIs are active in the system.

Example

The following command configures STPD s1 to enable the rapid reconfiguration mechanism and operate in 802.1w mode:

```
configure stpd s1 mode dot1w
```

The following command configures STPD s2 to operate as an MSTI in an MSTP domain:

```
configure stpd s2 mode mstp msti 3
```

History

This command was first available in ExtremeXOS 10.1.

The mstp parameter was added in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure stpd ports active-role disable

configure stpd *stpd_name* **ports active-role disable** *port*

Description

Allows a port to be selected as an alternate or backup port.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port	Specifies a port.

Default

The default is disabled.

Usage Guidelines

Use this command to revert to the default that allows a specified port to be elected to any STP port role.

Example

The following command disables an active role on STDP s1, port 6:3:

```
configure stpd s1 ports active-role disable 6:3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure stpd ports active-role enable

configure stpd *stpd_name* **ports active-role enable** *port*

Description

Prevents a port from becoming an alternate or backup port.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port	Specifies a port.

Default

The default is disabled.

Usage Guidelines

Use this command to keep a port in an active role. It prevents a specified port from being elected to an alternate or backup role which puts the port in a blocking state.

The following describes the port role and state when RSTP stabilizes.

STP Port Role	Port State
Alternate (inactive)	Blocking
Backup (inactive	Blocking
Root (active)	Forwarding
Designated (active)	Forwarding

This feature can be enabled on only one STP port in the STP domain.

The restricted port role cannot be combined with this feature.

An active port role (root or designated) cannot be enabled with an edge port.

To disable this command, use the configure stpd ports active-role disable command.

To view the status of the active role, use the show stpd ports command.

Example

The following command enables an active role on STDP s1, port 6:3:

```
configure stpd s1 ports active-role enable 6:3
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

configure stpd ports bpdu-restrict

configure {**stpd**} *stpd_name* **ports bpdu-restrict** [**enable** | **disable**] *port_list* {**recovery-timeout** {*seconds*}}

Description

Configures BPDU Restrict.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more ports or slots and ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

The default is disabled.

Usage Guidelines

Before using this command, the port(s) should be configured for edge-safeguard.

Example

The following command enables bpdu-restrict on port 2 of STPD s1:

```
configure stpd s1 ports bpdu-restrict enable 2
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure stpd ports cost

configure stpd *stpd_name* **ports cost** [**auto** | *cost*] *port_list*

Description

Specifies the path cost of the port in the specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
auto	Specifies the switch to remove any user-defined port cost value(s) and use the appropriate default port cost value(s).
cost	Specifies a numerical port cost value. The range is 1 through 200,000,000.
port_list	Specifies one or more ports or slots and ports.

Default

The switch automatically assigns a default path cost based on the speed of the port, as follows:

- 10 Mbps port—the default cost is 2,000,000.
- 100 Mbps port—the default cost is 200,000.
- 1000 Mbps port—the default cost is 20,000.
- 10000 Mbps ports—the default cost is 2,000.

The default port cost for trunked ports is dynamically calculated based on the available bandwidth.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

The 802.1D-2004 standard modified the default port path cost value to allow for higher link speeds. If you have a network with both 802.1D-2004 and 802.1D-1998 compliant bridges, a higher link speed can create a situation whereby an 802.1D-1998 compliant bridge could become the most favorable transit path and possibly cause the traffic to span more bridges. To prevent this situation, configure the port path cost to make links with the same speed use the same path host value. For example, if you have 100 Mbps links on all bridges, configure the port path cost for the 802.1D-2004 compliant bridges to 19 instead of using the default 200,000.

Note

You cannot configure the port path cost on 802.1D-1998 compliant bridges to 200,000 because the path cost range setting is 1 to 65,535.

The range for the cost parameter is 1 through 200,000,000. If you configure the port cost, a setting of 1 indicates the highest priority.

If you configured a port cost value and specify the auto option, the switch removes the user-defined port cost value and returns to the default, automatically assigned, port cost value.

The auto port cost of a trunk port is calculated based on number member ports in the trunk port. Link up and down of the member port does not affect the trunk port cost, thus it does not trigger topology change. Only adding or removing a member port to/from the trunk port causes auto trunk port cost to change. Also, by so configuring a static trunk port cost, the value is frozen regardless of the number of member ports in the trunk port.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the default costs are different than switches running ExtremeXOS 11.6 and later.

The range for the cost parameter is 1 through 65,535.

The switch automatically assigns a default path cost based on the speed of the port, as follows:

- 10 Mbps port—the default cost is 100.
- 100 Mbps port—the default cost is 19.
- 1000 Mbps port—the default cost is 4.
- 10000 Mbps ports—the default cost is 2.

Example

The following command configures a cost of 100 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports cost 100 2:1-2:5
```

History

This command was first available in ExtremeXOS 10.1.

The auto option was added in ExtremeXOS 11.0.

The default costs were updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure stpd ports edge-safeguard disable

configure {**stpd**} *stpd_name* **ports edge-safeguard disable** *port_list* {**bpdu-restrict**} {**recovery-timeout** {*seconds*}}

Description

Disables the edge safeguard loop prevention on the specified RSTP or MSTP edge port.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more edge ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

By default, this feature is disabled.

Usage Guidelines

This command applies only to ports that have already been configured as edge ports.

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs.

If you disable this feature, the edge port enters the forwarding state but no longer transmits BPDUs unless a BPDU is received by that edge port. This is the default behavior.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the configure stpd <stpd_name> ports bpdu-restrict disable <port_list> command.

If edge safeguard is disabled, BPDU restrict is also disabled.

To view the status of the edge safeguard feature use the show {stpd} <stpd_name> ports {[detail | <port_list> {detail}]} command. You can also use the show stpd {<stpd_name> | detail} command to display the STPD configuration on the switch, including the enable/disable state for edge safeguard.

Note

In MSTP, configuring edge safeguard at CIST will be inherited in all MSTI.

To enable or re-enable edge safeguard, use one of the following commands:

- configure {stpd} <stpd_name> ports edge-safeguard enable <port_list> {bpdu-restrict} {recovery-timeout {<seconds>}}
- configure stpd <stpd_name> ports link-type [[auto | broadcast | point-to-point] <port_list> | edge <port_list> {edge-safeguard [enable | disable] {bpdu-restrict} {recovery-timeout <seconds>}}]

Example

The following command disables edge safeguard on RSTP edge port 4 in STPD s1 on a stand-alone switch:

```
configure stpd s1 ports edge-safeguard disable 4
```

The following command disables edge safeguard on the RSTP edge port on slot 2, port 3 in STPD s1 on a modular switch:

```
configure stpd s1 ports edge-safeguard disable 2:3
```

History

This command was first available in ExtremeXOS 11.4.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure stpd ports edge-safeguard enable

configure {**stpd**} *stpd_name* **ports edge-safeguard enable** *port_list* {**bpdu-restrict**} {**recovery-timeout** {*seconds*}}

Description

Enables the edge safeguard loop prevention on the specified RSTP or MSTP edge port.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more edge ports.
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

By default, this feature is disabled.

Usage Guidelines

This command applies only to ports that have already been configured as edge ports.

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. You configure edge safeguard on RSTP or MSTP edge ports to prevent accidental or deliberate misconfigurations (loops) resulting from connecting two edge ports together or by connecting a hub or other non-STP switch to an edge port. Edge safeguard also limits the impact of broadcast storms that might occur on edge ports.

An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs. This advanced loop prevention mechanism improves network resiliency but does not interfere with the rapid convergence of edge ports.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the configure {stpd} <stpd_name> ports bpdu-restrict [enable | disable] <port_list> {recovery-timeout {<seconds>}} command and selecting disable.

If edge safeguard is disabled, BPDU restrict is also disabled.

To view the status of the edge safeguard feature use the show {stpd} <stpd_name> ports {[detail | <port_list> {detail}]} command. You can also use the show stpd {<stpd_name> | detail} command to display the STPD configuration on the switch, including the enable/disable state for edge safeguard.

Note

In MSTP, configuring edge safeguard at CIST will be inherited in all MSTI.

To disable edge safeguard, use one of the following commands:

- configure {stpd} <stpd_name> ports edge-safeguard disable <port_list> {bpdu-restrict} {recovery-timeout {<seconds>}}
- configure stpd <stpd_name> ports link-type [[auto | broadcast | point-to-point] <port_list> | edge <port_list> {edge-safeguard [enable | disable] {bpdu-restrict} {recovery-timeout <seconds>}}]

Example

The following command enables edge safeguard on RSTP edge port 4 in STPD s1 on a stand-alone switch:

```
configure stpd s1 ports edge-safeguard enable 4
```

The following command enables edge safeguard on the RSTP edge port on slot 2, port 3 in STPD s1 on a modular switch:

```
configure stpd s1 ports edge-safeguard enable 2:3
```

History

This command was first available in ExtremeXOS 11.4.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure stpd ports link-type

configure stpd *stpd_name* **ports link-type** [[**auto** | **broadcast** | **point-to-point**] *port_list* | **edge** *port_list* {**edge-safeguard** [**enable** | **disable**] {**bpdu-restrict**} {**recovery-timeout** *seconds*}}]

Description

Configures the ports in the specified STPD as auto, broadcast, edge, or point-to-point link types.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
auto	Specifies the switch to automatically determine the port link type. An auto link behaves like a point-to-point link if the link is in full-duplex mode or if link aggregation is enabled on the port. Used for 802.1w configurations.
broadcast	Specifies a port attached to a LAN segment with more than two bridges. Used for 802.1D configurations. A port with broadcast link type cannot participate in rapid reconfiguration using RSTP or MSTP. By default, all STP.1D ports are broadcast links.
point-to-point	Specifies a port attached to a LAN segment with only two bridges. A port with point-to-point link type can participate in rapid reconfiguration. Used for 802.1w and MSTP configurations. By default, all 802.1w and MSTP ports are point-to-point link types.
port_list	Specifies one or more ports or slots and ports.
edge	Specifies a port that does not have a bridge attached. An edge port is placed and held in the STP forwarding state unless a BPDU is received by the port. Used for 802.1w and MSTP configurations.
edge-safeguard	Specifies that the edge port be configured with edge safeguard, a loop prevention and detection mechanism. Used for 802.1w and MSTP configurations
enable	Specifies that edge safeguard be enabled on the edge port(s).
disable	Specifies that edge safeguard be disabled on the edge port(s).
bpdu-restrict	Disables port as soon as a BPDU is received.
recovery-timeout	Time after which the port will be re-enabled.
seconds	Specifies the time in seconds. The range is 60 to 600. The default is 300.

Default

STP.1D ports are broadcast link types 802.1w and MSTP ports are point-to-point link types

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

The default, broadcast links, supports legacy STP (802.1D) configurations. If the switch operates in 802.1D mode, any configured port link type will behave the same as the broadcast link type.

RSTP rapidly moves the designated ports of a point-to-point link type into the forwarding state. This behavior is supported by RSTP and MSTP only.

In an MSTP environment, configure the same link types for the CIST and all MSTIs.

Auto Link Type

An auto link behaves like a point-to-point link if the link is in full duplex mode or if link aggregation is enabled on the port; otherwise, an auto link behaves like a broadcast link. If a non-STP switch exists between several switches operating in 802.1w mode with auto links, the non-STP switch may negotiate full-duplex even though the broadcast domain extends over several STP devices.

Edge Link Type

RSTP does not send any BPDUs from an edge port nor does it generate topology change events when an edge port changes its state.

If you configure a port to be an edge port, the port immediately enters the forwarding state. Edge ports remain in the forwarding state unless the port receives a BPDU. In that case, edge ports enter the blocking state. The edge port remains in the blocking state until it stops receiving BPDUs and the message age timer expires.

Edge Safeguard

Loop prevention and detection on an edge port configured for RSTP or MSTP is called edge safeguard. You configure edge safeguard on RSTP or MSTP edge ports to prevent accidental or deliberate misconfigurations (loops) resulting from connecting two edge ports together or by connecting a hub or other non-STP switch to an edge port. Edge safeguard also limits the impact of broadcast storms that might occur on edge ports.

An edge port configured with edge safeguard immediately enters the forwarding state and transmits BPDUs. This advanced loop prevention mechanism improves network resiliency but does not interfere with the rapid convergence of edge ports.

Recovery time starts as soon as the port becomes disabled. If no recovery-timeout is specified, the port is permanently disabled.

BPDU restrict can be disabled using the configure stpd <stpd_name> ports bpdu-restrict disable <port_list> command.

If edge safeguard is disabled, BPDU restrict is also disabled.

To configure a port as an edge port and enable edge safeguard on that port, use the configure stpd <stpd_name> ports link-type edge <port_list> edge-safeguard command and specify enable.

To disable edge safeguard on the edge port, use the configure stpd <stpd_name> ports link-type edge <port_list> edge-safeguard command and specify disable.

Two other commands are also available to enable and disable edge safeguard:

```
configure stpd ports edge-safeguard enable
configure stpd ports edge-safeguard disable
```

In MSTP, configuring edge safeguard at CIST will be inherited in all MSTI.

Example

The following command configures slot 2, ports 1 through 4 to be point-to-point links in STPD s1:

```
configure stpd s1 ports link-type point-to-point 2:1-2:4
```

The following command enables edge safeguard on the RSTP edge port on slot 2, port 3 in STPD s1 configured for RSTP:

```
configure stpd s1 ports link-type edge 2:3 edge-safeguard enable
```

History

This command was first available in ExtremeXOS 10.1.

The BPDU Restrict function was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure stpd ports mode

configure stpd *stpd_name* **ports mode** [**dot1d** | **emistp** | **pvst-plus**] *port_list*

Description

Configures the encapsulation mode for the specified port list.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
dot1d	Specifies the STP encapsulation mode of operation to be 802.1d.
emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.
port_list	Specifies one or more ports or slots and ports.

Default

Ports in the default STPD (s0) are dot1d mode.

Ports in user-created STPDs are in emistp mode.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

MSTP STPDs use 802.1D BPDU encapsulation mode by default. To ensure correct operation of your MSTP STPDs, do not configure EMISTP or PVST+ encapsulation mode for MSTP STPDs.

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

  This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.
- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

Example

The following command configures STPD s1 with PVST+ packet formatting for slot 2, port 1:

```
configure stpd s1 ports mode pvst-plus 2:1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure stpd ports port-priority

configure stpd *stpd_name* **ports port-priority** *priority port_list*

Description

Specifies the port priority of the port in the specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies a numerical port priority value. The range is 0 through 240 and is subject to the multiple of 16 restriction.
port_list	Specifies one or more ports or slots and ports.

Default

The default is 128.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

By changing the priority of the port, you can make it more or less likely to become the root port or a designated port.

To preserve backward compatibility and to use ExtremeXOS 11.5 or earlier configurations, the existing configure stpd ports priority command is available in ExtremeXOS 11.6. If you have an ExtremeXOS 11.5 or earlier configuration, the switch interprets the port priority based on the 802.1D-1998 standard. If the switch reads a value that is not supported in ExtremeXOS 11.6, the switch rejects the entry. For example, if the switch reads the configure stpd ports priority 16 command from an ExtremeXOS 11.5 or earlier configuration, (which is equivalent to the command configure stpd ports priority 8 entered through CLI), the switch saves the value in the new ExtremeXOS 11.6 configuration as configure stpd ports port-priority 128.

A setting of 0 indicates the highest priority.

The range for the priority parameter is 0 through 240 and is subject to the multiple of 16 restriction.

Example

The following command assigns a priority of 32 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports port-priority 32 2:1-2:5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure stpd ports priority

configure stpd *stpd_name* **ports priority** *priority port_list*

Description

Specifies the port priority of the port in the specified STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies a numerical port priority value. The range is 0 through 31 for STP and 0 through 15 for MSTP and RSTP.
port_list	Specifies one or more ports or slots and ports.

Default

The default is 128.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

By changing the priority of the port, you can make it more or less likely to become the root port or a designated port.

To preserve backward compatibility and to use ExtremeXOS 11.5 or earlier configurations, the existing configure stpd ports priority command is available in ExtremeXOS 11.6. If you have an ExtremeXOS 11.5 or earlier configuration, the switch interprets the port priority based on the 802.1D-1998 standard. If the switch reads a value that is not supported in ExtremeXOS 11.6, the switch rejects the entry.

A setting of 0 indicates the highest priority.

The range for the priority parameter is 0 through 31 for STP and 0 through 15 for MSTP and RSTP.

ExtremeXOS 11.6 introduces support for a new ports priority command: configure stpd ports port-priority. When you save the port priority value in an ExtremeXOS 11.6 configuration, the switch saves it as the new command configure stpd ports port-priority with the corresponding change in priority values. The priority range of this command is 0 through 240 and is subject to the multiple of 16 restriction. For more information see configure stpd ports port-priority.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the default value for the priority range are different than switches running ExtremeXOS 11.6.

The range for the priority parameter is 0 through 31.

The default is 16.

Example

The following command assigns a priority of 1 to slot 2, ports 1 through 5 in STPD s0:

```
configure stpd s0 ports priority 1 2:1-2:5
```

History

This command was first available in ExtremeXOS 10.1.

The priority range and behavior was updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure stpd ports restricted-role disable

configure stpd *stpd_name* **ports restricted-role disable** *port_list*

Description

Disables restricted role on the specified port inside the core network.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

The restricted role is disabled by default. If set, it can cause a lack of spanning tree connectivity. A network administrator enables the restricted role to prevent bridges external to a core region of the network from influencing the spanning tree active topology, possibly because those bridges are not under the full control of the administrator.

Note

Disabling Restricted Role at CIST is inherited by all MSTI.

Example

The following command disables restricted role for s1 on port 6:3.

```
configure stpd s1 ports restricted-role disable 6:3
```

History

This command was first available in ExtremeXOS 12.1.

This command was added to RSTP in ExtremeXOS 11.6 and 12.0.3.

Platform Availability

This command is available on all platforms.

configure stpd ports restricted-role enable

configure stpd *stpd_name* **ports restricted-role enable** *port_list*

Description

Enables restricted role on the specified port inside the core network.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

Enabling restricted role causes the port not to be selected as a root port even if it has the best spanning tree priority vector. Such a port is selected as an alternate port after the root port has been selected.

The restricted role is disabled by default. If set, it can cause a lack of spanning tree connectivity. A network administrator enables the restricted role to prevent bridges external to a core region of the network from influencing the spanning tree active topology, possibly because those bridges are not under the full control of the administrator.

Note

Restricted role should not be enabled with edge mode.

Enabling Restricted Role at CIST is inherited by all MSTI.

Example

The following command enables restricted role on port 6:3.

```
configure stpd s1 ports restricted-role enable 6:3
```

History

This command was first available in ExtremeXOS 12.1.

This command was added to RSTP in ExtremeXOS 11.6 and 12.0.3.

Platform Availability

This command is available on all platforms.

configure stpd priority

configure stpd *stpd_name* **priority** *priority*

Description

Specifies the bridge priority of the STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
priority	Specifies the bridge priority of the STPD. The range is 0 through 61,440 and is subject to the multiple of 4,096 restriction.

Default

The default priority is 32,768.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

By changing the bridge priority of the STPD, you can make it more or less likely to become the root bridge.

The range for the <priority> parameter is 0 through 61,440 and is subject to the multiple of 4,096 restriction. A setting of 0 indicates the highest priority.

If you have an ExtremeXOS 11.5 or earlier configuration that contains an STP or RSTP bridge priority that is not a multiple of 4,096, the switch rejects the entry and the bridge priority returns to the default value. The MSTP implementation already uses multiples of 4,096 to determine the bridge priority.

For example, to lower the numerical value of the priority (which gives the priority a higher precedence), you subtract 4,096 from the default priority: 32,768 - 4,096 = 28,672. If you modify the priority by a value other than 4,096, the switch rejects the entry.

ExtremeXOS 11.5 and Earlier

If you have switches running ExtremeXOS 11.5 and earlier, the priority range is different than switches running ExtremeXOS 11.6 and later.

The range for the priority parameter is 0 through 65,535. A setting of 0 indicates the highest priority.

Example

The following command sets the bridge priority of STPD1 to 16,384:

```
configure stpd stpd1 priority 16384
```

History

This command was first available in ExtremeXOS 10.1.

The priority range and behavior was updated based on support for the 802.1D-2004 standard in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

configure stpd tag

configure stpd *stpd_name* **tag** *stpd_tag*

Description

Assigns an StpdID to an STPD.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
stpd_tag	Specifies the VLAN ID of the carrier VLAN that is owned by the STPD.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

You should not configure any STP parameters unless you have considerable knowledge and experience with STP. The default STP parameters are adequate for most networks.

An STPD ID is used to identify each STP domain. You assign the StpdID when configuring the domain. An STPD ID must be identical to the VLAN ID of the carrier VLAN in that STP domain, and that VLAN cannot belong to another STPD. Unless all ports are running in 802.1D mode, an STPD with ports running in either EMISTP mode or PVST+ mode must be configured with an STPD ID.

You must create and configure the VLAN, along with the tag, before you can configure the STPD tag. To create a VLAN, use the create vlan command. To configure the VLAN, use the configure vlan commands.

MSTP Only

MSTP uses two different methods to identify the STPDs that are part of the MSTP network. An instance ID of 0 identifies the CIST. The switch assigns this ID automatically when you configure the CIST STPD.

To configure the CIST STPD, use the configure stpd <stpd_name> mode [dot1d | dot1w | mstp [cist | msti <instance>]] command.

An MSTI identifier (MSTI ID) identifies each STP domain that is part of an MSTP region. You assign the MSTI ID when configuring the STPD that participates in the MSTP region. Each STPD that participates in a particular MSTP region must have the same MSTI ID. To configure the MSTI ID, use the configure stpd <stpd_name> mode [dot1d | dot1w | mstp [cist | msti <instance>]] command.

Example

The following command assigns an StpdID to the purple_st STPD:

```
configure stpd purple_st tag 200
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure vlan add ports stpd

configure vlan *vlan_name* **add ports** [**all** | *port_list*] {**tagged** | **untagged**} **stpd** *stpd_name* {[**dot1d** | **emistp** | **pvst-plus**]}

Description

Adds one or more ports in a VLAN to a specified STPD.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all of the ports to be included in the STPD.
port_list	Specifies the port or ports to be included in the STPD.
tagged	Specifies the ports should be configured as tagged.
untagged	Specifies the ports should be configured as untagged.
stpd_name	Specifies an STPD name on the switch.
dot1d	Specifies the STP encapsulation mode of operation to be 802.1d.
emistp	Specifies the STP encapsulation mode of operation to be EMISTP.
pvst-plus	Specifies the STP encapsulation mode of operation to be PVST+.

Default

Ports in the default STPD (s0) are in dot1.d mode.

Ports in user-created STPDs are in emistp mode.

Usage Guidelines

To create a VLAN, use the create vlan command. To create an STP domain, use the create stpd command.

In an EMISTP or PVST+ environment, this command adds a list of ports to a VLAN and a specified STPD at the same time provided the carrier VLAN already exists on the same set of ports. You can also specify the encapsulation mode for those ports.

In an MSTP environment, you do not need a carrier VLAN. A CIST controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate region status. You must use the dot1d encapsulation mode in an MSTP environment.

You cannot configure STP on the following ports:

- Mirroring target ports
- Software-controlled redundant ports

If you see an error similar to the following:

```
Error: Cannot add VLAN default port 3:5 to STP domain
```

You might be attempting to add:

- A carrier VLAN port to a different STP domain than the carrier VLAN belongs
- A VLAN/port for which the carrier VLAN does not yet belong

Note

This restriction is only enforced in an active STP domain and when you enable STP to ensure you have a legal STP configuration.

Naming Conventions

If your VLAN has the same name as another component, for example an STPD, Extreme Networks recommends that you specify the identifying keyword as well as the name. If your VLAN has a name unique only to that VLAN, the keywords vlan and stpd are optional.

STP Encapsulation Modes

You can specify the following STP encapsulation modes:

- dot1d—This mode is reserved for backward compatibility with previous STP versions. BPDUs are sent untagged in 802.1D mode. Because of this, any given physical interface can have only one STPD running in 802.1D mode.

This encapsulation mode supports the following STPD modes of operation: 802.1D, 802.1w, and MSTP.

- emistp—This mode sends BPDUs with an 802.1Q tag having an STPD ID in the VLAN ID field.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.
- pvst-plus—This mode implements PVST+ in compatibility with third-party switches running this version of STP. The STPDs running in this mode have a one-to-one relationship with VLANs, and send and process packets in PVST+ format.

  This encapsulation mode supports the following STPD modes of operation: 802.1D and 802.1w.

These encapsulation modes are for STP ports, not for physical ports. When a physical ports belongs to multiple STPDs, it is associated with multiple STP ports. It is possible for the physical port to run in different modes for different domains for which it belongs.

MSTP STPDs use only 802.1D BPDU encapsulation mode. The switch prevents you from configuring EMISTP or PVST+ encapsulation mode for MSTP STPDs.

Automatically Inheriting Ports—MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an MSTI in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Example

The following command adds slot 1, port 2 and slot 2, port 3, members of a VLAN named Marketing, to the STPD named STPD1, and specifies that they be in EMISTP mode:

```
configure vlan marketing add ports 1:2, 2:3 tagged stpd stpd1 emistp
```

History

This command was first available in ExtremeXOS 10.1.

The nobroadcast keyword was removed in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

create stpd

create stpd *stpd_name* {**description** *stpd-description*}

Description

Creates a user-defined STPD.

Syntax Description

stpd_name	Specifies a user-defined STPD name to be created. May be up to 32 characters in length.
stpd-description	Specifies an STP domain description string.

Default

The default device configuration contains a single STPD called s0.

When an STPD is created, the STPD has the following default parameters:

- State—disabled
- StpdID—none
- Assigned VLANs—none
- Bridge priority—32,768
- Maximum BPDU age—20 seconds
- Hello time—2 seconds
- Forward delay—15 seconds
- Operational mode—802.1D
- Rapid Root Failover—disabled
- Default Binding Mode (encapsulation mode)—Ports in the default STPD (s0) are in 802.1d mode. Ports in user-created STPDs are in emistp mode.
- Maximum hop count (when configured for MSTP)—20 hops
- STP domain description string—empty

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, stp or stpd. Names must start with an alphabetical character, for example, a, Z. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Each STPD name must be unique and cannot duplicate any other named STPDs on the switch. If you are uncertain about the STPD names on the switch, use the show stpd command to view the STPD names.

You can, however, re-use names across multiple categories of switch configuration. For example, you can use the name Test for an STPD and a VLAN. If you use the same name, Extreme Networks recommends that you specify the appropriate keyword when configuring the STPD. If you do not specify the appropriate keyword, the switch displays a message similar to the following:

```
%% Ambiguous command:  "configure Test"
```

To view the names of the STPDs on the switch, enter configure and press [Tab]. Scroll to the end of the output to view the names.

The maximum length for an STPD description is 180 characters. The description must be in quotes if the string contains any spaces. To display the description, use the show stpd <stpd_name> command.

Each STPD has its own Root Bridge and active path. After the STPD is created, one or more VLANs can be assigned to it.

Example

The following example creates an STPD named purple_st:

```
create stpd purple_st
```

History

This command was first available in ExtremeXOS 10.1.

The STPD description option was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

delete stpd

delete stpd *stpd_name*

Description

Removes a user-defined STPD from the switch.

Syntax Description

stpd_name	Specifies a user-defined STPD name on the switch.

Default

N/A.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command:  "delete Test"
```

In this example, to delete the STPD Test, enter delete stpd Test.

If you created an STPD with a name unique only to that STPD, the keyword stpd is optional.

The default STPD, s0, cannot be deleted.

In an MSTP environment, you cannot delete or disable a CIST if any of the MSTIs are active in the system.

Example

The following command deletes an STPD named purple_st:

```
delete stpd purple_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable stpd

disable stpd {*stpd_name*}

Description

Disables the STP protocol on a particular STPD or for all STPDs.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

Disabled.

Usage Guidelines

After you have created the STPD with a unique name, the keyword stpd is optional.

If you want to disable the STP protocol for all STPDs, do not specify an STPD name.

In an MSTP environment, you cannot delete or disable a CIST if any of the MSTIs are active in the system.

Example

The following command disables an STPD named purple_st:

```
disable stpd purple_st
```

The following command disables the STP protocol for all STPDs on the switch:

```
disable stpd
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable stpd auto-bind

Disables the ability to automatically add ports to an STPD when they are added to a member VLAN.

disable stpd *stpd_name* **auto-bind vlan** *vlan_name*

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies the name of a member VLAN with autobind enabled.

Default

The autobind feature is disabled on user-created STPDs. The autobind feature is enabled on the default VLAN that participates in the default STPD S0.

Usage Guidelines

Note

Ports already in the STPD remain in that domain (as if they were added manually).

If you create an STPD and a VLAN with unique names, the keywords stpd and vlan are optional.

Ports added to the STPD automatically when autobind is enabled are not removed when autobind is disabled. The ports are present after a switch reboot.

To view STP configuration status of the ports in a VLAN, use the following command:

```
show {vlan} <vlan_name> stpd
```

Example

The following example disables autobind on an STPD named s8:

```
disable stpd s8 auto-bind v5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable stpd ports

Disables STP on one or more ports for a given STPD.

disable stpd *stpd_name* **ports** [**all** | *port_list*]

Syntax Description

stpd_name	Specifies an STPD name on the switch.
all	Specifies all ports for a given STPD.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

If you create the STPD with a unique name, the keyword stpd is optional.

Disabling STP on one or more ports puts those ports in the forwarding state; all BPDUs received on those ports are disregarded and dropped.

Use the all keyword to specify that all ports of a given STPD are disabled.

Use the port_list parameter to specify a list of ports of a given STPD are disabled.

If you do not use the default STPD, you must create one or more STPDs and configure and enable the STPD before you can use the disable stpd ports command.

Example

The following command disables slot 2, port 4 on an STPD named Backbone_st:

```
disable stpd backbone_st ports 2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable stpd rapid-root-failover

disable stpd *stpd_name* **rapid-root-failover**

Description

Disables rapid root failover for STP recovery times.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

Disabled.

Usage Guidelines

This command is applicable for STPDs operating in 802.1D.

After you have created the STPD with a unique name, the keyword stpd is optional.

To view the status of rapid root failover on the switch, use the show stpd command. The show stpd command displays information about the STPD configuration on the switch including the enable/disable state for rapid root failover.

Example

The following command disables rapid root fail over on STPD Backbone_st:

```
disable stpd backbone_st rapid-root-failover
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable stpd

enable stpd {*stpd_name*}

Description

Enables the STP protocol for one or all STPDs.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

Disabled.

Usage Guidelines

If you want to enable the STP protocol for all STPDs, do not specify an STPD name.

Example

The following command enables an STPD named Backbone_st:

```
enable stpd backbone_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable stpd auto-bind

enable stpd *stpd_name* **auto-bind vlan** *vlan_name*

Description

Automatically adds ports to an STPD when ports are added to a member VLAN.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
vlan_name	Specifies the name of the VLAN to have autobind enabled.

Default

The autobind feature is disabled on user-created STPDs. The autobind feature is enabled on the default VLAN that participates in the default STPD S0.

If you enable autobind and add ports to a member VLAN, those ports are automatically added to the STPD.

Usage Guidelines

If you create an STPD and a VLAN with unique names, the keywords stpd and vlan are optional.

You cannot configure the autobind feature on a network login VLAN.

In an EMISTP or PVST+ environment, when you issue this command, any port or list of ports that you add to the carrier VLAN are automatically added to the STPD with autobind enabled. In addition, any port or list of ports that you remove from a carrier VLAN are automatically removed from the STPD. This allows the STPD to increase or decrease its span as you add ports to or remove ports from a carrier VLAN.

For MSTP, when you issue this command, any port or list of ports that gets automatically added to an MSTI are automatically inherited by the CIST. In addition, any port or list of ports that you remove from an MSTI protected VLAN are automatically removed from the CIST. For more information see the section. For more information, see Automatically Inheriting Ports—MSTP Only.

Carrier VLAN

A carrier VLAN defines the scope of the STPD, which includes the physical and logical ports that belong to the STPD and the 802.1Q tag used to transport STP BPDUs in the encapsulation mode is EMISTP or PVST+. Only one carrier VLAN can exist in a given STPD, although some of its ports can be outside the control of any STPD at the same time.

Note

The STPD ID must be identical to the VLAN ID of the carrier VLAN in that STPD.

If you configure MSTP, you do not need a carrier VLAN. With MSTP, you configure a CIST that controls the connectivity of interconnecting MSTP regions and sends BPDUs across the regions to communicate the status of MSTP regions. All VLANs participating in the MSTP region have the same privileges.

Protected VLAN

Protected VLANs are all other VLANs that are members of the STPD. These VLANs “piggyback” on the carrier VLAN. Protected VLANs do not transmit or receive STP BPDUs, but they are affected by STP state changes and inherit the state of the carrier VLAN. Protected VLANs can participate in multiple STPDs, but any particular port in the VLAN can belong to only one STPD.

Enabling autobind on a protected VLAN does not expand the boundary of the STPD. However, the VLAN and port combinations are added to or removed from the STPD subject to the boundaries of the carrier VLAN.

If you configure MSTP, all member VLANs in an MSTP region are protected VLANs. These VLANs do not transmit or receive STP BPDUs, but they are affected by STP state changes communicated by the CIST to the MSTP regions. MSTIs cannot share the same protected VLAN; however, any port in a protected VLAN can belong to multiple MSTIs.

Automatically Inheriting Ports—MSTP Only

In an MSTP environment, whether you manually or automatically bind a port to an MSTI in an MSTP region, the switch automatically binds that port to the CIST. The CIST handles BPDU processing for itself and all of the MSTIs; therefore, the CIST must inherit ports from the MSTIs in order to transmit and receive BPDUs.

Displaying STP Information

To view STP configuration status of the ports on a VLAN, use the following command:

```
show {vlan} <vlan_name> stpd
```

Example

The examples in this section assume that you have already removed the ports from the Default VLAN.

To automatically add ports to an STPD running 802.1D, EMISTP, or PVST+ and to expand the boundary of the STPD, you must complete the following tasks:

- Create the carrier VLAN.
- Assign a VLAN ID to the carrier VLAN.
- Add ports to the carrier VLAN.
- Create an STPD (or use the default, S0).
- Enable autobind on the STPDs carrier VLAN.
- Configure the STPD tag (the STPD ID must be identical to the VLAN ID of the carrier VLAN in the STP domain).
- Enable STP.

The following example enables autobind on an STPD named s8 after creating a carrier VLAN named v5:

```
create vlan v5
configure vlan v5 tag 100
configure vlan v5 add ports 1:1-1:20 tagged
create stpd s8
enable stpd s8 auto-bind v5
configure stpd s8 tag 100
enable stpd s8
```

To automatically add ports to the CIST STPD and to expand the boundary of the STPD, you must complete the following tasks:

- Create a VLAN or use the Default VLAN. (In this example, the Default VLAN is used.)
- Create the MSTP region.
- Create the STPD to be used as the CIST, and configure the mode of operation for the STPD.
- Specify the priority for the CIST.
- Enable the CIST.

The following example enables autobind on the VLAN Default for the CIST STPD named s1:

```
configure mstp region 1
create stpd s1
configure stpd s1 mode mstp cist
configure stpd s1 priority 32768
enable stpd s1
```

The following example enables autobind on the VLAN math for the MSTI STPD named s2:

```
create vlan math
configure vlan math tag 2
configure vlan math add ports 2-3
configure mstp region 1
create stpd s2
configure stpd s2 mode mstp msti 1
```

```
configure stpd s2 priority 32768
enable stpd s2 auto-bind vlan math
configure stpd s2 ports link-type point-to-point 5-6
enable stpd s2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable stpd ports

enable stpd *stpd_name* **ports** [**all** | *port_list*]

Description

Enables the STP protocol on one or more ports.

Syntax Description

stpd_name	Specifies an STPD on the switch.
all	Specifies all ports for a given STPD.
port_list	Specifies one or more ports or slots and ports.

Default

Enabled.

Usage Guidelines

If you create an STPD with a unique name, the keyword stpd is optional.

If STP is enabled for a port, BPDUs are generated and processed on that port if STP is enabled for the associated STPD.

You must configure one or more STPDs before you can use the enable stpd ports command. To create an STPD, use the create stpd <stpd_name> {description <stpd-description>} command. If you have considerable knowledge and experience with STP, you can configure the STPD using the configure stpd commands. However, the default STP parameters are adequate for most networks.

Example

The following command enables slot 2, port 4 on an STPD named Backbone_st:

```
enable stpd backbone_st ports 2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable stpd rapid-root-failover

enable stpd *stpd_name* **rapid-root-failover**

Description

Enables rapid root failover for faster STP recovery times.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

Disabled.

Usage Guidelines

This command is applicable for STPDs operating in 802.1D.

If you create an STPD with a unique name, the keyword stpd is optional.

To view the status of rapid root failover on the switch, use the show stpd command. The show stpd command displays information about the STPD configuration on the switch including the enable/disable state for rapid root failover.

Example

The following command enables rapid root fail over on STPD Backbone_st:

```
enable stpd backbone_st rapid-root-failover
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show stpd

show stpd {*stpd_name* | **detail**}

Description

Displays STPD settings on the switch.

Syntax Description

stpd_name	Specifies an STPD on the switch.
detail	Specifies that STPD settings should be shown for each STPD.

Default

N/A.

Usage Guidelines

If you specify the command without any options, the following STPD information appears:

- Name—The name of the STPD.
- Tag—The StpdID of the domain, if configured.
- Flags—The following flags communicate information about the current state of the STPD:
  - (C) Topology Change—A network topology change has occurred in the network.
  - (D) Disable—The STPD is disabled.
  - (E) Enable—The STPD is enabled.
  - (R) Rapid Root Failover—The STPD has been configured for rapid root failover
  - (T) Topology Change Detected—The STPD has detected a change in the network topology.
  - (M) MSTP CIST—The STPD has been configured for MSTP, and the STPD is the common and internal spanning tree.
  - (I) MSTP MSTI—The STPD has been configured for MSTP, and the STPD is a multiple instance spanning tree.
- Ports—The number of ports that are part of the STPD.
- Bridge ID—The MAC addresses of the switch.
- Designated Root—The MAC address of the switch that is the designated root bridge.
- Rt Port—The root port.
- Rt Cost—The path cost to the root port.

- Total Number of STPDs—The total number of STPDs configured on the switch.
- STP Flush Method—The method used to flush the FDB during a topology change.

If you have an MSTP region and associated spanning trees configured on the switch, the command also displays the following global MSTP information:

- MSTP Region—The name of the MSTP region configured on the switch.
- Format Identifier—The number used by BPDUs to communicate within an MSTP region.
- Revision Level—This number is reserved for future use.
- Common and Internal Spanning Tree (CIST)—The name of the CIST that controls the connectivity of interconnecting MSTP regions.
- Total number of MST Instances (MSTI)—The number of MSTIs running in the MSTP region.

If you use the show stpd command and specify the name of an STPD, in addition to the data previously described, the command displays more detailed information about the STPD. If you specify the detail option, the switch displays the same type of information for all of the STPDs configured on the switch.

The additional output includes the following:

- STPD mode of operation
- Autobind mode
- Active VLANs
- Timer information
- Topology change information

If you have MSTP configured, the command also displays the following information:

- Bridge role
- CIST root
- CIST regional root
- MSTI instances
- Master port (Displayed only on MSTI STPDs)

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command:  "show Test"
```

In this example, to view the settings of the STPD Test, enter show stpd Test.

If your STPD has a name unique only to that STPD, the keyword stpd is optional.

Example

The following command displays the STPD settings on a switch that has MSTP configured:

```
show stpd
```

The following is sample output from this command:

```
MSTP Global Configuration:
MSTP Region Name                    :  00304841ed97
MSTP format Identifier              :  0

```

History

This command was first available in ExtremeXOS 10.1.

Information about MSTP was added in ExtremeXOS 11.4.

Description was added in ExtremeXOS 12.4.4.

Platform Availability

This command is available on all platforms.

show stpd ports

show {**stpd**} *stpd_name* **ports** {[**detail** | *port_list* {**detail**}]}

Description

Displays the STP state of a port.

Syntax Description

stpd_name	Specifies an STPD name.
port_list	Specifies one or more ports or slots and ports.
detail	Specifies more detailed information about one or more ports of the STPD.

Default

N/A.

Usage Guidelines

This command displays the following:

- STPD port configuration
- STPD port encapsulation mode
- STPD path cost
- STPD priority
- STPD state (root bridge, and so on)
- Port role (root designated, alternate and so on)
- STPD port state (forwarding, blocking, and so on)
- Configured port link type
- Operational port link type
- Edge port settings (inconsistent behavior, edge safeguard setting)
- Restricted role (enabled, disabled)
- MSTP port role (internal or boundary)
- Active port role

To display more detailed information for one or more ports in the specified STPD, including participating VLANs, specify the detail option.

If you have MSTP configured and specify the detail option, this command displays additional information:

- MSTP internal path cost
- MSTP timers

If your STPD has the same name as another component, for example a VLAN, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the stpd keyword, an error message similar to the following is displayed:

```
%% Ambiguous command:  "show Test ports"
```

In this example, to view all of the port settings of STPD Test, enter show stpd Test ports.

If your STPD has a name unique only to that STPD, the keyword stpd is optional.

Example

The following command displays the state of ports 1, 2, and 4 on an STPD named s1:

```
show stpd s1 ports
```

The following is sample output from this command:

```
Port   Mode   State      Cost  Flags     Priority Port ID Designated Bridge
1      EMISTP DISABLED   200000 e?pp-w---t 128      8001
00:00:00:00:00:00:00:00
2      EMISTP DISABLED   200000 e?pp-w---- 128      8002
00:00:00:00:00:00:00:00
4      EMISTP DISABLED   200000 e?pp-w---- 128      8004
00:00:00:00:00:00:00:00
Total Ports: 3
------------------------- Flags: ----------------------------
1:                e=Enable, d=Disable
2: (Port role)    R=Root, D=Designated, A=Alternate, B=Backup, M=Master
3: (Config type)  b=broadcast, p=point-to-point, e=edge, a=auto
4: (Oper. type)   b=broadcast, p=point-to-point, e=edge
5:                p=proposing, a=agree
6: (partner mode) d = 802.1d, w = 802.1w, m = mstp
7:                i = edgeport inconsistency
8:                S = edgeport safe guard active
s = edgeport safe guard configured but inactive
8:                G = edgeport safe guard bpdu restrict active in 802.1w and
mstp

9:                B = Boundary, I = Internal
10:               r = Restricted Role, t = active Role
```

The following command displays the detailed information for the ports in STPD s1:

```
show stpd s1 ports 1 detail
```

The following is sample output from this command:

```
Stpd: s1        Port: 1 PortId: 8001    Stp: ENABLED    Path Cost: 20000
Port Mode: EMISTP
Port State:  DISABLED           Topology Change Ack: FALSE
Port Priority: 128
Designated Root:   00:00:00:00:00:00:00:00      Designated Cost: 0

8:                S = edgeport safe guard active
s = edgeport safe guard configured but inactive
G = edgeport safe guard bpdu restrict active
```

```
g = edgeport safe guard bpdu restrict configured but inactive only dot1w, mstp
9:                B = Boundary, I = Internal
10:               r = Restricted Role, t = active role
```

History

This command was first available in ExtremeXOS 10.1.

Information about MSTP was added in ExtremeXOS 11.4.

Information about BPDU Restrict was added in ExtremeXOS 12.4.

Information about active role was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show vlan stpd

show {vlan} *vlan_name* **stpd**

Description

Displays the STP configuration of the ports assigned to a specific VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If you have a VLAN that spans multiple STPDs, use this command to display the STP configuration of the ports assigned to that specific VLAN.

This command displays the following:

- STPD port configuration
- STPD port mode of operation
- STPD path cost
- STPD priority
- STPD state (root bridge, and so on)
- Port role (root designated, alternate and so on)
- STPD port state (forwarding, blocking, and so on)

- Configured port link type
- Operational port link type

If your VLAN has the same name as another component, for example an STPD, Extreme Networks recommends that you specify the identifying keyword as well as the name. If you do not specify the vlan keyword, the switch displays an error message similar to the following:

```
%% Ambiguous command:  "show Test stpd"
```

In this example, to view the STPD state of VLAN Test, enter show vlan Test stpd.

If you enter a VLAN name that is not associated with an STPD or does not exist, the switch displays an error message similar to the following:

```
Failed to find vlan 'vlan1' or it has no STP domains configured on it
```

If this happens, check to make sure you typed the correct name of the VLAN and that the VLAN is associated with an STPD.

If your VLAN has a name unique only to that VLAN, the keyword vlan is optional.

Example

The following command displays the spanning tree configurations for the VLAN Default:

```
show vlan default stpd
```

The following is sample output from this command:

```
s0(enabled)  Tag: (none)  Ports: 8 Root/P/C: 80:00:00:01:30:94:79:00/-----/0

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure mstp region

unconfigure mstp region

Description

Unconfigures the MSTP region on the switch and returns all MSTP settings to their default values.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Before you unconfigure an MSTP region, Extreme Networks recommends that you disable all active STPDs in the region. This includes the CIST and any active MSTIs.

After you issue this command, all of the MSTP settings return to their default values, as described below:

- Region Name—This indicates the name of the MSTP region. In the Extreme Networks implementation, the maximum length of the name is 32 characters and can be a combination of alphanumeric characters and underscores (_).
- Format Selector—This indicates a number to identify the format of MSTP BPDUs. The default is 0.
- Revision Level—This identifier is reserved for future use; however, the switch uses and displays a default of 3.

Example

The following command unconfigures the MSTP region on the switch:

```
unconfigure mstp region
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

unconfigure stpd

unconfigure stpd {*stpd_name*}

Description

Restores default STP values to a particular STPD or all STPDs.

Syntax Description

stpd_name	Specifies an STPD name on the switch.

Default

N/A.

Usage Guidelines

If you create an STPD with a unique name, the keyword stpd is optional.

Use this command to restore default STP values to a particular STPD. If you want to restore default STP values on all STPDs, do not specify a spanning tree name.

Example

The following command restores default values to an STPD named Backbone_st:

```
unconfigure stpd backbone_st
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure stpd ports link-type

unconfigure stpd *stpd_name* **ports link-type** *port_list*

Description

Returns the specified port to the factory default setting of broadcast link.

Syntax Description

stpd_name	Specifies an STPD name on the switch.
port_list	Specifies one or more ports or slots and ports.

Default

All ports are broadcast link types.

Usage Guidelines

If your STPD has the same name as another component, for example a VLAN, you must enter the stpd keyword to specify the STPD. If your STPD has a name unique only to that STPD, the keyword stpd is optional.

If the switch operates in 802.1D mode, any configured port link type will behave the same as the broadcast link type.

In an MSTP environment, configure the same link types for the CIST and all MSTIs.

Example

The following command configures slot 2, ports 1 through 4 to return to the factory default of broadcast links in STPD s1:

```
unconfigure stpd s1 ports link-type 2:1-2:4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

30 ESRP Commands

clear esrp counters
clear esrp neighbor
clear esrp sticky
configure esrp add elrp-poll ports
configure esrp add master
configure esrp add member
configure esrp add track-environment
configure esrp add track-iproute
configure esrp add track-ping
configure esrp add track-vlan
configure esrp aware add selective-forward-ports
configure esrp aware delete selective-forward-ports
configure esrp delete elrp-poll ports
configure esrp delete master
configure esrp delete member
configure esrp delete track-environment
configure esrp delete track-iproute
configure esrp delete track-ping
configure esrp delete track-vlan
configure esrp domain-id
configure esrp election-policy
configure esrp elrp-master-poll disable
configure esrp elrp-master-poll enable
configure esrp elrp-premaster-poll disable
configure esrp elrp-premaster-poll enable
configure esrp group
configure esrp mode
configure esrp name
configure esrp ports mode
configure esrp ports no-restart
configure esrp ports restart
configure esrp ports weight
configure esrp priority
configure esrp timer hello
configure esrp timer neighbor
configure esrp timer neutral
configure esrp timer premaster

This chapter describes the commands for:

- Enabling and disabling ESRP
- Performing ESRP configuration
- Enabling and disabling port restart and failure tracking for ESRP
- Displaying ESRP configuration information
- Enabling and disabling ELRP in an ESRP environment

For an introduction to ESRP, see the ExtremeXOS Concepts Guide.

clear esrp counters

clear esrp counters

Description

Clears the statistics gathered by ESRP for all ESRP domains on the switch.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

Use this command to clear the state transition and the protocol packet counters gathered by ESRP.

The state transition count displays the number of times the ESRP domain entered the following states:

- Aware—An Extreme switch that does not participate in ESRP elections but is capable of listening to ESRP Bridge Protocol Data Units (BPDUs).
- Master—The master switch is the device with the highest priority based on the election algorithm. The master is responsible for responding to clients for Layer3 routing and Layer2 switching for the ESRP domain.

- Neutral—The neutral state is the initial state entered by the switch. In a neutral state, the switch waits for ESRP to initialize and run. A neutral switch does not participate in ESRP elections.
- PreMaster—The pre-master state is an ESRP switch that is ready to be master but is going through possible loop detection prior to transitioning to master.
- Slave—The slave switch participates in ESRP but is not elected or configured the master and does not respond to ARP requests but does exchange ESRP packets with other switches on the same VLAN. The slave switch is available to assume the responsibilities of the master switch if the master becomes unavailable or criteria for ESRP changes.

  If the slave is in extended mode, it does not send ESRP hello messages; however, it sends PDUs that can trigger a change in the master switch.

  For more information about configuring the ESRP mode of operation on the switch, see the configure esrp mode [extended | standard] command. By default, ESRP operates in extended mode.

To display information about the ESRP domain, including the previously described states, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

The protocol packet count displays the number of times ESRP, ESRP-aware, and ESRP error packets were transmitted and received.

To display information about the ESRP counters, use the show esrp {<name>} counters command.

Example

The following command clears the statistics gathered by ESRP:

```
clear esrp counters
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

clear esrp neighbor

clear esrp *esrpDomain* **neighbor**

Description

Clears the neighbor information for the specified ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

N/A.

Usage Guidelines

If you add a new switch to your ESRP domain, use this command to clear the existing neighbor information for the ESRP domain. After the switch is up, running, and configured as an ESRP-aware or ESRP-enabled device, new neighbor information is learned.

Before using this command, schedule a downtime for your network. Use this command for maintenance purposes only.

Example

The following command clears the existing neighbor information on the ESRP domain esrp1 after adding a new switch to the ESRP domain:

```
clear esrp esrp1 neighbor
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

clear esrp sticky

clear esrp *esrpDomain* **sticky**

Description

Clears the stickiness in the ESRP domain and forces the election of the ESRP master switch.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

N/A.

Usage Guidelines

Use the clear esrp sticky command to force the election of the ESRP master switch. Before using this command, schedule a downtime for your network.

For example, without stickiness configured, if an event causes the ESRP master to failover to the backup, the previous backup becomes the new master. If another event causes the new master to return to backup, you have experienced two network interruptions. To prevent this, use the configure esrp election-policy and select stickiness as an election algorithm.

If you use sticky as an election metric, and an event causes the ESRP master to failover, ESRP assigns the new master with the highest sticky election metric of 1. Therefore, regardless of changes to the neighbor's election algorithm, the new master retains its position. Sticky is set on the master switch only.

ESRP re-election can occur if sticky is set on the master and a local event occurs. During this time, if the current master has lower election parameters, the backup can become the new master.

If you use clear esrp <esrpDomain> sticky command, it only affects the current master and can trigger ESRP re-election.

Example

The following command clears the stickiness on the ESRP domain esrp1:

```
clear esrp esrp1 sticky
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add elrp-poll ports

configure esrp *esrpDomain* **add elrp-poll ports** [*ports* | **all**]

Description

Configures the ports of an ESRP domain where ELRP packet transmission is requested by ESRP.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ports	Specifies list of slots and ports.
all	Specifies all ports in the ESRP domain.

Default

All ports of an ESRP domain have ELRP transmission enabled.

Usage Guidelines

This command allows you to configure the ports in your network that might experience loops, such as ports that connect to master, slave, or ESRP-aware switches, to receive ELRP packets. You do not need to send ELRP packets to host ports.

Note

The ExtremeXOS software does not support ELRP and Network Login on the same port.

Example

The following command enables ELRP packet transmission for slot 2, ports 3-5 on ESRP domain esrp1:

```
configure esrp esrp1 add elrp-poll ports 2:3-2:5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp add master

configure esrp *esrpDomain* **add master** *vlan_name*

Description

Adds a master VLAN to an ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the master VLAN.

Default

N/A.

Usage Guidelines

You must configure one master VLAN for each ESRP domain. A master VLAN can belong to one ESRP domain only. An ESRP domain contains one master and zero or more member VLANs.

The master VLAN:

- Exchanges ESRP PDUs, hello messages, and data between a pair of ESRP-enabled switches.
- Contains the total number of active physical ports that are counted when determining the master ESRP domain. The switch with the highest number of active ports takes priority.

Master VLANs can have their own set of ports, and member VLANs can have a different set of ports. The state of the ESRP device determines whether the ports in the master and member VLANs are in the forwarding or blocking state.

Example

The following command adds VLAN purple to the ESRP domain esrp1 as the master VLAN:

```
configure esrp esrp1 add master purple
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add member

configure esrp *esrpDomain* **add member** *vlan_name*

Description

Adds a member VLAN to an ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the member VLAN.

Default

N/A.

Usage Guidelines

You can configure zero or more member VLANs for each ESRP domain. An ESRP domain contains one master and zero or more member VLANs.

Master VLANs can have their own set of ports, and member VLANs can have a different set of ports. The state of the ESRP device determines whether the ports in the master and member VLANs are in the forwarding or blocking state.

Example

The following command adds VLAN green to the ESRP domain esrp1 as a member VLAN:

```
configure esrp esrp1 add member vlan green
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add track-environment

configure esrp *esrpDomain* **add track-environment failover** *priority*

Description

Configures an ESRP domain to track environmental failures.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
priority	Specifies a number between 0 and 254. The default priority is 255. See the following "Usage Guidelines" section for more information.

Default

No environmental tracking.

Usage Guidelines

Environmental tracking tracks power supply and chassis temperature status.

If a failure is detected, the ESRP domain priority steps to the failover-priority value specified. By setting the failover priority to be lower than the normal priority of the domain, it causes the affected domain to go into slave mode.

The range of the priority value is 0 to 254. Setting the priority to 255 configures the switch to slave mode, and to be ineligible to become the master. The switch remains in slave mode even when the VLAN fails over from the current master.

To make effective use of this feature, the normal priority of the ESRP domain must be higher than the failover priority of this command.

Example

The following command enables environmental failure tracking, and specifies that the ESRP priority for ESRP domain esrp1 be set to 10 upon an environmental failure.

```
configure esrp esrp1 add track-environment failover 10
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add track-iproute

configure esrp *esrpDomain* **add track-iproute** *ipaddress/masklength*

Description

Configures an ESRP domain to track a route entry in the system's routing table.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of the route entry to be tracked.
masklength	Specifies the subnet of the route entry to be tracked.

Default

Disabled.

Usage Guidelines

The track-ip metric consists of the total number of tracked IPv4 routes that are up or functional.

An ESRP domain can track eight IPv4 routes.

Note

ESRP route tracking is not supported on IPv6 networks.

Example

The following command enables IPv4 route failure tracking for routes to the specified subnet:

```
configure esrp esrp1 add track-iproute 192.168.46.0/24
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add track-ping

configure esrp *esrpDomain* **add track-ping** *ipaddress* **frequency** *seconds* **miss** *misses*

Description

Configures an ESRP domain to track an external gateway using ping.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of the external gateway.

seconds	Specifies the interval in seconds between ping requests. The range is 1 to 600 seconds.
misses	Specifies the number of consecutive ping failures that initiates failover to an ESRP slave. The range is 1 to 256 pings.

Default

No ping tracking.

Usage Guidelines

The tracked-ping metric consists of the total number of stations that are successfully tracked using ping. ESRP uses an aggregate of tracked pings and traced routes to track an external gateway.

An ESRP domain can track eight stations.

Note

ESRP ping tracking is not supported on IPv6 networks.

Example

The following command enables ping tracking for the external gateway at 10.207.29.17, pinging every 10 seconds, and considering the gateway to be unreachable if no response is received to 5 consecutive pings:

```
configure esrp esrp1 add track-ping 10.207.29.17 frequency 10 miss 5
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp add track-vlan

configure esrp *esrpDomain* **add track-vlan** *vlan_name*

Description

Configures an ESRP domain to track port connectivity to a specified VLAN.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
vlan_name	Specifies the VLAN to be tracked.

Default

Disabled.

Usage Guidelines

The track-vlan metric is derived from the total number of active physical ports on the VLAN being tracked by the ESRP domain.

If more than one VLAN shares a physical link, each VLAN counts the physical link.

The ESRP switch should have a higher priority number than its neighbors to ensure master election.

An ESRP domain can track one VLAN, and the tracked VLAN should not be a member of any other ESRP domain in the system.

Example

The following command enables ESRP domain esrp1 to track port connectivity to VLAN engineering:

```
configure esrp esrp1 add track-vlan engineering
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp aware add selective-forward-ports

configure esrp *domain* **aware add selective-forward-ports** *port_list* {**group** *group number*}

Description

Enables selective forwarding by creating an aware port list and adds additional ports to the list.

Syntax Description

domain	Specifies an ESRP domain name.
port_list	Specifies the ports to be added to the aware port list.
group number	Specifies the ESRP group within the given domain name

Default

The group number defaults to '0'.

Usage Guidelines

An ESRP-aware switch floods ESRP PDUs from all ports in an ESRP-aware VLAN. This flooding creates unnecessary network traffic because some ports forward ESRP PDUs to switches that are not running the same ESRP groups. You can select the ports that are appropriate for forwarding ESRP PDUs by configuring selective forwarding on an ESRP-aware VLAN and thus reduce this excess traffic. Configuring selective forwarding creates a port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. This ESRP-aware port list is then used for forwarding ESRP PDUs.

Use this command to create or add to an existing port list for the ESRP groups associated with an ESRP-aware VLAN.

Example

The following command configures esrp domain (d1) to forward ESRP PDUs on ports 5:1, 5:2, and 6:2.

```
configure esrp d1 aware add selective-forward-ports 5:1,5:2,6:2 group 0
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on all platforms.

configure esrp aware delete selective-forward-ports

configure esrp *domain* **aware delete selective-forward-ports all**|*port_list* {**group** *group number* }

Description

Disables all or part of selective forwarding by deleting ports from the ESRP-aware port list.

Syntax Description

domain	Specifies an ESRP domain name.
all	Specifies that all of the ports are to be disabled.
port_list	Specifies the ports to be disabled from the ESRP-aware port list.
group number	Specifies the ESRP group within the given domain name

Default

The group number defaults to '0'.

Usage Guidelines

By configuring selective forwarding, you create an ESRP-aware port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. That port list is used for forwarding ESRP PDUs from the selected ports only of an ESRP-aware switch.

Use this command to delete one or more or all of the ports from an ESRP-aware port list. Deleting all of the ports puts the domain back to the default state.

Example

The following command configures esrp domain (d1) to exclude ESRP PDUs on ports 5:1, 5:2, and 6:2.

```
configure esrp d1 aware delete selective-forward-ports 5:1,5:2,6:2 group 0
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on all platforms.

configure esrp delete elrp-poll ports

configure esrp *esrpDomain* **delete elrp-poll ports** [*ports* | **all**]

Descriptioin

Disables ELRP packet transmission on ports of an ESRP domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ports	Specifies list of slots and ports in the ESRP domain.
all	Specifies all ports in the ESRP domain.

Default

All ports of an ESRP domain have ELRP transmission enabled.

Usage Guidelines

If you have host ports on an ESRP domain, you do not need to send ELRP packets to those ports.

If you change your network configuration, and a port no longer connects to a master, slave, or ESRP-aware switch, you can disable ELRP transmission on that port.

Example

The following command disables ELRP packet transmission for slot 2, ports 3-5 on ESRP domain esrp1:

```
configure vlan esrp1 delete elrp-poll ports 2:3-2:5
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp delete master

configure esrp *esrpDomain* **delete master** *vlan_name*

Description

Deletes the specifies master VLAN from the specified ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the master VLAN.

Default

N/A.

Usage Guidelines

You must disable the ESRP domain before removing the master VLAN. To disable the ESRP domain, use the disable esrp {<esrpDomain>} command.

If you attempt to remove the master VLAN before disabling the ESRP domain, the switch displays an error message similar to the following:

```
ERROR: Failed to delete master vlan for domain "esrp1" ; ESRP is enabled!
```

If this happens, disable the ESRP domain and re-issue the configure esrp delete master command.

Example

The following command deletes the master VLAN purple from the ESRP domain esrp1:

```
configure esrp esrp1 delete master purple
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp delete member

configure esrp *esrpDomain* **delete member** *vlan_name*

Description

Deletes a member VLAN from the specified ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
vlan_name	Specifies the name of the member VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the member VLAN green from the ESRP domain esrp1:

```
configure esrp esrp1 delete member vlan green
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp delete track-environment

configure esrp *esrpDomain* **delete track-environment**

Descriptioin

Disables environmental failure tracking for an ESRP domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.

Default

No environmental tracking.

Usage Guidelines

None.

Example

The following command disables environmental failure tracking for ESRP domain esrp1:

```
configure esrp esrp1 delete track-environment
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp delete track-iproute

configure esrp *esrpDomain* **delete track-iproute** *ipaddress/masklength*

Description

Disables route entry tracking for an ESRP domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of a tracked route entry.
masklength	Specifies the subnet of a tracked route entry.

Default

Disabled.

Usage Guidelines

If you disable route tracking for a failed route, the ESRP domain recovers from the forced standby state.

If you disable route tracking for a route that is up and functional, there is no impact on the ESRP state.

Example

The following command disables tracking of routes to the specified subnet for ESRP domain esrp1:

```
configure esrp esrp1 delete track-iproute 192.168.46.0/24
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp delete track-ping

configure esrp *esrpDomain* **delete track-ping** *ipaddress*

Description

Disables the tracking of an external gateway using ping.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ipaddress	Specifies the IPv4 address of the external gateway.

Default

No ping tracking.

Usage Guidelines

If you disable ping tracking for a failed ping, the ESRP domain recovers from the forced standby state.

If you disable route tracking for a successful ping, there is no impact on the ESRP state.

Example

The following command disables ping tracking for the external gateway at 10.207.29.17:

```
configure esrp esrp1 delete track-ping 10.207.29.17
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp delete track-vlan

configure esrp *esrpDomain* **delete track-vlan** *vlan_name*

Description

Disables the tracking of port connectivity to a specified VLAN.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
vlan_name	Specifies the VLAN to be tracked.

Default

Disabled.

Usage Guidelines

If you delete a VLAN that is down, the ESRP domain recovers from the forced standby state.

Example

The following command disables the tracking of port connectivity to VLAN engineering:

```
configure esrp esrp1 delete track-vlan engineering
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp domain-id

configure esrp *esrpDomain* **domain-id** *number*

Description

Assigns an ESRP domain ID to an ESRP domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.
number	Specifies the number to use for the ESRP domain ID. The user-configured ID range is 4096 through 65,535.

Default

If the master VLAN is tagged, ESRP uses that VLANid for the ESRP domain ID. If the master VLAN is untagged, you must specify the ESRP domain ID.

Usage Guidelines

Before you enable a specific ESRP domain, it must have a domain ID. A domain ID is either a user-configured number or the VLANid of the tagged master VLAN. If you do not have a domain ID, you cannot enable ESRP on that domain.

Each switch participating in ESRP for a particular domain must have the same domain ID configured.

The number parameter range for user-configured domain IDs is 4096 through 65,535.

If the master VLAN is tagged, you can use that VLANid for the ESRP domain ID. The range for VLAN tags is 2 through 4095. Tag 1 is assigned to the default VLAN.

Example

The following command assigns the domain ID 5000 to ESRP domain esrp1:

```
configure esrp esrp1 domain-id 5000
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp election-policy

configure esrp *esrpDomain* **election-policy [ports > track > priority | ports > track > priority > mac | priority > mac | priority > ports > track > mac | priority > track > ports > mac | sticky > ports > track > priority | sticky > ports > track > priority > mac | sticky > ports > weight > track > priority > mac | sticky > priority > mac | sticky > priority > ports > track > mac | sticky > priority > track > ports > mac | sticky > track > ports > priority | sticky >**

track > ports > priority > mac | track > ports > priority | track > ports > priority > mac]

Description

Configures the election algorithm on the switch.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
ports > track > priority	Specifies that this ESRP domain should consider election factors in the following order: Active ports, tracking information, ESRP priority.
ports > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Active ports, tracking information, ESRP priority, MAC address. NOTE: This is the default election algorithm for standard mode.
priority > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, MAC address.
priority > ports > track > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, active ports, tracking information, MAC address.
priority > track > ports > mac	Specifies that this ESRP domain should consider election factors in the following order: ESRP priority, tracking information, active ports, MAC address.
sticky > ports > track > priority	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, tracking information, ESRP priority.
sticky > ports > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, tracking information, ESRP priority, MAC address.
sticky > ports > weight > track > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, active ports, port weight, tracking information, ESRP priority, MAC address. NOTE: Beginning with ExtremeXOS 11.1 and later, this is the default election algorithm for extended mode.
sticky > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, MAC address.
sticky > priority > ports > track > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, active ports, tracking information, MAC address.
sticky > priority > track > ports > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, ESRP priority, tracking information, active ports, MAC address.
sticky > track > ports > priority	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, tracking information, active ports, ESRP priority.
sticky > track > ports > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Stickiness, tracking information, active ports, ESRP priority, MAC address.

track > ports > priority	Specifies that this ESRP domain should consider election factors in the following order: Tracking information, active ports, ESRP priority.
track > ports > priority > mac	Specifies that this ESRP domain should consider election factors in the following order: Tracking information, active ports, ESRP priority, MAC address.

Default

In extended mode, the default election algorithm is sticky > ports > weight > track > priority > mac.

In standard mode, the default election algorithm is ports > track > priority > mac.

Usage Guidelines

The election algorithm determines the order of precedence of the election factors used to determine the ESRP Master. The election factors are:

- Stickiness (sticky): the switch with the higher sticky value has higher priority. When an ESRP domain claims master, its sticky value is set to 1 (available in extended mode only).
- Active Ports (ports): the number of active ports (the switch with the highest number takes priority)
- Tracking Information (track): whether the switch is using ESRP tracking. A switch using tracking has priority.
- ESRP Priority (priority): a user-defined priority number between 0 and 254. A higher number has higher priority. The default priority setting is 0. A priority setting of 255 makes an ESRP switch a standby switch that remains in slave mode until you change the priority setting. Extreme Networks recommends this setting for system maintenance. A switch with a priority setting of 255 never becomes the master.
- MAC address (mac): the switch MAC address. A higher-number address has priority.
- Active port weight (weight)—The switch that has the highest port weight takes precedence. The bandwidth of the port automatically determines the port weight (available only in extended mode). ESRP does not count ports with a weight of 0 (known as don't count ports) regardless of ESRP running in extended or standard mode.

The election algorithm must be the same on all switches for a particular ESRP domain. The election algorithms that use sticky are and weight are available in extended mode only.

In ExtremeXOS 11.0, the extended mode default election algorithm is: sticky > ports > track > priority > mac > weight. This election algorithm is not supported in ExtremeXOS 11.1.

Factors to Consider

The ports-track-priority or track-ports-priority options can be used to ensure that there is no failback if the original Master recovers (the Master has the same ports, tracks and priority, but a higher MAC).

Any of the options with sticky can also be used to ensure that there is no failback if the original master recovers. With sticky, if an event causes the ESRP master to failover, ESRP assigns the new master with the sticky count of 1. After sticky is set on the master, regardless of changes to its neighbor's election algorithm, the new master retains its position. For example, adding active ports to the slave does not cause the new master to failback to the original master, even if the slave has more active ports than the

master. Sticky algorithms provide for fewer network interruptions than non-sticky algorithms. Sticky is set on the master switch only.

ESRP re-election can occur if sticky is set on the master and a local event occurs. During this time, if the current master has lower election parameters, the backup can become the new master.

Switch Behavior

If a switch is master, it actively provides Layer3 routing services to other VLANs, and Layer2 switching between all the ports of that VLAN. Additionally, the switch exchanges ESRP packets with other switches that are in slave mode.

If a switch is in slave mode, it exchanges ESRP packets with other switches on that same VLAN. When a switch is in slave mode, it does not perform Layer3 routing or Layer2 switching services for the VLAN.

Updating the Election Algorithm

ESRP uses the default election policy for extended mode. If you have an ESRP domain operating in standard mode, the domain ignores the sticky and weight algorithms. To change the election algorithm, you must first disable the ESRP domain and then configure the new election algorithm. If you attempt to change the election algorithm without disabling the domain first, an error message appears.

To disable the ESRP domain, use the following command:

```
disable esrp {<esrpDomain>}
```

To modify the election algorithm, use the following command:

```
configure esrp <esrpDomain> election-policy [ports > track > priority
| ports > track > priority > mac | priority > mac | priority > ports > track
> mac | priority > track > ports > mac | sticky > ports > track > priority |
sticky > ports > track > priority > mac | sticky > ports > weight > track >
priority > mac | sticky > priority > mac | sticky > priority > ports > track
> mac | sticky > priority > track > ports > mac | sticky > track > ports >
priority | sticky > track > ports > priority > mac | track > ports > priority
| track > ports > priority > mac]
```

If you attempt to use an election algorithm not supported by the switch, an error message similar to the following appears:

```
ERROR: Specified election-policy is not supported!
Supported Policies:
1. sticky > ports > weight > track > priority > mac
2. ports > track > priority
3. sticky > ports > track > priority
4. ports > track > priority > mac
5. sticky > ports > track > priority > mac
6. priority > mac
```

```
7. sticky > priority > mac
8. priority > ports > track > mac
9. sticky > priority > ports > track > mac
10. priority > track > ports > mac
11. sticky > priority > track > ports > mac
12. track > ports > priority
13. sticky > track > ports > priority
14. track > ports > priority > mac
15. sticky > track > ports > priority > mac
```

Example

The following command configures the election algorithm to use tracking information as the first criteria for determining the ESRP master switch for ESRP domain esrp1:

```
configure esrp esrp1 election-policy track > ports > priority > mac
```

History

This command was first available in ExtremeXOS 11.0.

The default election algorithm for extended mode was updated to sticky > ports > weight > track > priority > mac, and the weight election factor was used in ExtremeXOS 11.1. The sticky > ports > track > priority > mac > weight election algorithm is not supported in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp elrp-master-poll disable

configure esrp *esrpDomain* **elrp-master-poll disable**

Description

Disables the use of ELRP by ESRP in the master state.

Syntax Description

esrpDomain	Specifies an ESRP domain name.

Default

Disabled.

Usage Guidelines

Use this command to disable the use of ELRP by ESRP in the master state. When you disable ELRP, the ESRP master switch no longer transmits ELRP PDUs to detect network loops.

Example

The following command disables the use of ELRP in the master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-master poll disable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp elrp-master-poll enable

configure esrp *esrpDomain* **elrp-master-poll enable** {**interval** *interval*}

Description

Enables the use of ELRP by ESRP in the master state, and configures how often the master checks for loops in the network.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
interval	Specifies how often, in seconds, successive ELRP packets are sent. The default is 1 second. The range is 1 to 64 seconds.

Default

- Use of ELRP in the master state—disabled
- Interval—1 second

Usage Guidelines

Use this command to enable the use of ELRP by ESRP in the master state. When an ESRP-enabled switch is in the master state, and you enable elrp-master-poll, the switch periodically sends ELRP PDUs at the configured interval level. If a loop is detected in the network, the transmitted PDUs are received by the switch. The ESRP master switch then transitions to the slave state to break the network loop.

Extreme Networks recommends that you enable both premaster and master polling when using ELRP with ESRP. To enable premaster polling, use the configure esrp <esrpDomain> elrp-premaster-poll enable {count <count> | interval <interval>}.

If you attempt to configure master polling before premaster polling, the switch displays an error message similar to the following:

```
ERROR: Premaster-poll should be enabled before enabling master-poll!
```

If this happens, first configure premaster polling followed by master polling (if required).

Specify the interval parameter to configure how often successive ELRP PDUs are sent while in the master state. If you do not specify an interval value, the default value is used.

Example

The following command enables the use of ELRP in the master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-master poll enable
```

The following command configures the ESRP master to check for loops in the network every 3 seconds:

```
configure esrp elrp1 esrp elrp-master-poll enable interval 3
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp elrp-premaster-poll disable

configure esrp *esrpDomain* **elrp-premaster-poll disable**

Description

Disables the use of ELRP by ESRP in the pre-master state.

Syntax Description

esrpDomain	Specifies an ESRP domain name.

Default

Disabled.

Usage Guidelines

Use this command to disable the use of ELRP by ESRP in the pre-master state. When you disable ELRP in the pre-master state, the ESRP pre-master switch no longer transmits ELRP PDUs to detect network loops prior to changing to the master state.

Example

The following command disables the use of ELRP in the pre-master state on the ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-premaster poll disable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp elrp-premaster-poll enable

configure esrp *esrpDomain* **elrp-premaster-poll enable** {**count** *count* | **interval** *interval*}

Description

Enables the use of ELRP by ESRP in the pre-master state, and configures how many times the switch sends ELRP PDUs and how often the switch sends ELRP PDUS in the pre-master state.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
count	Specifies the number of times the switch sends ELRP PDUs. The default is 3. The range is 1 to 32.
interval	Specifies how often, in seconds, the ELRP PDUs are sent. The default is 1 second. The range is 1 to 32 seconds.

Default

- Use of ELRP in the pre-master state—disabled
- Count—3 times

- Interval—1 second

Usage Guidelines

Use this command to enable the use of ELRP by ESRP in the pre-master state to prevent network loops from occurring. When an ESRP-enabled switch is in the pre-master state (waiting to become the master), and you enable elrp-premaster-poll, the switch periodically sends ELRP PDUs at the configure level for a specified number of times. If there is a loop in the network, the transmitted PDUs are received by the switch. If this happens, the ESRP pre-master switch does not transition to the master state; rather, the switch transitions to the slave state.

Extreme Networks recommends that you enable both premaster and master polling when using ELRP with ESRP. To enable master polling, use the configure esrp <esrpDomain> elrp-master-poll enable {interval <interval>}.

If you attempt to configure master polling before premaster polling, the switch displays an error message similar to the following:

```
ERROR: Premaster-poll should be enabled before enabling master-poll!
```

If this happens, first configure premaster polling followed by master polling (if required).

If you do not specify the optional count or interval parameters, the default values are used.

If the sender does not receive packets, there is no loop in the network.

Example

The following command enables the use of ELRP—with the default settings—in the pre-master state on ESRP domain elrp1:

```
configure esrp elrp1 esrp elrp-premaster poll enable
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp group

configure esrp *esrpDomain group number*

Description

Configures the group number to be used for the ESRP domain.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
group_number	Specifies the ESRP group number to which this ESRP domain should be added. The range is 0 through 31.

Default

The default group number is 0.

Usage Guidelines

Each group runs an instance of ESRP within the same VLAN or broadcast domain. A maximum of seven ESRP groups can be defined within the same networked broadcast domain. In addition, a maximum of seven distinct ESRP groups can be supported on a single ESRP switch. You can configure a maximum of 32 ESRP groups in a network.

The range for the group_number parameter is 0 through 31.

The most typical application for multiple ESRP groups is when two or more sets of ESRP switches are providing fast-failover protection within a common subnet for two or more groups of users. An additional use for ESRP groups is ESRP Host Attach; ESRP VLANs that share the same ESRP HA ports must be members of different ESRP groups.

You must first disable an ESRP domain before you modify an existing or add a new group number. If you try to modify the group number without disabling the ESRP domain, an error message similar to the following is displayed:

```
ERROR: can't change ESRP group for active domain "esrp1"!
```

To disable an ESRP domain, use the disable esrp {<esrpDomain>} command.

Example

The following command configures ESRP domain esrp1 to be a member of ESRP group 2:

```
configure esrp esrp-1 group 2
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp mode

configure esrp mode [extended | standard]

Description

Configures the mode of operation for ESRP on the switch.

Syntax Description

extended	Specifies ESRP extended mode. This mode is compatible with devices running ExtremeXOS and is not backward compatible with devices running ExtremeWare.
standard	Specifies ESRP standard mode. This mode is backward compatible with devices running ExtremeWare.

Default

The default mode is extended.

Usage Guidelines

Use standard ESRP if your network contains a combination of switches running ExtremeXOS and ExtremeWare participating in ESRP. With standard ESRP, the switches running ExtremeXOS are backward compatible with the switches running ExtremeWare.

Use extended ESRP if your network contains switches running only ExtremeXOS; this is the default.

If your network has switches currently running ExtremeWare, and you add a BlackDiamond 8800 series switch, SummitStack, or a Summit family switch running ExtremeXOS, select standard ESRP. By selecting standard, the switch running ExtremeXOS is backward compatible with the ExtremeWare implementation of ESRP.

If you use the default mode—extended—and your ESRP domain contains a switch running ExtremeXOS that detects a neighbor switch running ExtremeWare, the mode automatically changes to standard for that domain. This action causes the switch to enter the neutral state and re-elect the ESRP master. Since you are using the default mode of operation, and the switch running ExtremeXOS detected a neighbor switch running ExtremeWare, the ExtremeXOS switch toggles to standard mode although the configured mode of operation remains as extended.

Note

ExtremeWare switches forward only those ESRP hello messages that apply to the ESRP group to which the switch belongs. ExtremeWare switches do not forward ESRP hello messages for other ESRP groups in the same VLAN. This limitation does not apply to ExtremeXOS switches operating in standard mode.

Example

The following command configures ESRP to run in standard mode:

```
configure esrp mode standard
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp name

configure esrp *esrpDomain* **name** *new-name*

Description

Renames an existing ESRP domain.

Syntax Description

esrpDomain	Specifies the current name of an ESRP domain.
new-name	Specifies a new name for the ESRP domain.

Default

N/A.

Usage Guidelines

The maximum length for a name is 32 characters. Names can contain alphanumeric characters and underscores (_) but cannot be any reserved keywords, for example, esrp. Names must start with an alphabetical character, for example, a, Z.

You can rename an ESRP domain regardless of its current state.

Example

The following command renames ESRP domain esrp1 to esrp3:

```
configure esrp esrp1 name esrp3
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp ports mode

configure esrp ports *ports* **mode** [**host** | **normal**]

Description

Configures the ESRP port mode for ESRP host attach.

Syntax Description

ports	Specifies one or more ports or slots and ports that should be configured.
host	Specifies that the ports should be configured as host ports.
normal	Specifies that the ports should be configured as normal ports.

Default

The default port mode is normal.

Usage Guidelines

Ports configured as normal ports do not accept or transmit Layer2 or Layer3 traffic when the local ESRP device is a slave.

Ports configured as host ports allow the network to continue operation independent of ESRP status. The command sets the port to forward, allowing those ports directly attached to the slave's hosts to communicate with other hosts that are connected to the master. If you use load sharing with the ESRP HA feature, configure the load-sharing group first and then enable Host Attach on the group.

A Layer2 connection for VLANs between ESRP switches is required.

An ESRP Host Attach port cannot be a mirroring port, software-controlled redundant port, or Netlogin port.

Example

The following command configures ports 1 through 5 on slot 3 as host ports:

```
configure esrp port 3:1-3:5 mode host
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp ports no-restart

configure esrp ports *ports* **no-restart**

Description

Disables port restart for a port.

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables port restart for ports 7-9 in slot 3 in the ESRP master domain:

```
configure esrp port 3:7-3:9 no-restart
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp ports restart

configure esrp ports *ports* **restart**

Description

Configures ESRP to restart ports if there is a state change and the downstream switch is from another vendor.

Syntax Description

ports	Specifies one or more ports or slots and ports.

Default

N/A.

Usage Guidelines

If an ESRP domain becomes a slave, ESRP disconnects member ports that have port restart enabled. The disconnection of these ports causes downstream devices to remove the ports from their FDB tables. After 3 seconds the ports re-establish connection with the ESRP-enabled device. This feature allows you to use ESRP in networks that include equipment from other vendors.

If switch becomes a slave, ESRP disconnects the physical links of member ports that have port restart enabled.

An ESRP restart port cannot be a mirroring port, software-controlled redundant port, or Netlogin port.

Example

The following command enables port restart for ports 7-9 in slot 3 on the ESRP master domain:

```
configure esrp port 3:7-3:9 restart
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp ports weight

configure esrp ports *ports* **weight** [**auto** | *port-weight*]

Description

Assigns the port weight for the specified ESRP port(s).

Syntax Description

ports	Specifies one or more ports or slots and ports.
auto	Specifies the switch to calculate the weight of a port based on the port's bandwidth and link speed.
port-weight	Specifies an ESRP port weight of 0. With a port weight of 0, the ports are not counted.

Default

The switch automatically calculates the weight of a port based on the bandwidth of the port.

Usage Guidelines

Use this command to override the automatically calculated port weight.

The port-weight parameter specifies a weight of 0. With this configuration, ESRP does not count host ports and normal ports as active. With a weight of 0, ESRP experiences fewer state changes due to frequent client activities like rebooting and unplugging laptops. A don't-count port cannot be a mirroring, software-controlled redundant port, or a Netlogin port.

For load shared ports, configure one master port in the load-share group with the port weight. A single command specifies the weight for the entire load shared group. You can specify any port from the load share group in the command. A load-shared port has an aggregate weight of all of its member ports. If you add or delete a member port (or trunk), the weight of the master load-shared port is updated. For more information about load sharing, see "Configuring Slots and Ports on a Switch" in the ExtremeXOS Concepts Guide.

Example

The following command configures port 1 on slot 3 with a weight of 0:

```
configure esrp port 3:1 weight 0
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure esrp priority

configure esrp *esrpDomain* **priority** *number*

Description

Configures the ESRP priority.

Syntax Description

esrpDomain	Specifies an ESRP domain number.
number	Specifies a number between 0 and 255.

Default

The default ESRP priority is 0.

Usage Guidelines

The ESRP priority is one of the factors used by the ESRP election algorithm in determining which switch is the Master switch.

The range of the priority value is 0 to 254, with 0 being the lowest priority, 254 being the highest. If the ESRP priority is the determining criteria for the election algorithm, the highest priority value determines which switch acts as master for a particular ESRP domain.

Setting the priority to 255 configures the switch to slave mode, and to be ineligible to become the master. The switch remains in slave mode even when the ESRP domain fails over from the current master. This feature is typically used to ensure a switch cannot become the ESRP master while it is offline for servicing.

Example

The following command configures the ESRP priority to the highest priority on ESRP domain esrp1:

```
configure esrp esrp1 priority 254
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp timer hello

configure esrp *esrpDomain* **timer hello** *seconds*

Description

Configures the ESRP hello timer value.

Syntax Description

esrpDomain	Specifies an ESRP domain name
seconds	Specifies the number of seconds between keep-alive packets. The range is 1 to 255 seconds.

Default

The default hello timer is 2 seconds.

Usage Guidelines

The timer specifies the interval, in seconds, for exchanging keep-alive packets between the ESRP switches for this ESRP domain. A lower value specifies a more frequent exchange of keep-alive messages, resulting in the faster detection of a failover condition. The timer setting must be configured identically for the ESRP domain across all participating switches. To see the hello settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

The seconds range is 1 to 255.

If your configuration contains more than 2,000 ESRP VLANs and 256,000 FDB entries, Extreme Networks recommends a timer setting greater than 3 seconds.

To view the hello timer settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

In a large ESRP configuration, the slave ESRP domain might inadvertently become the master ESRP domain. This can occur when FDB entries are flushed during a master-slave transition. To avoid this Extreme Networks recommends the general neighbor and hello timeout guidelines listed in Table 36: General Neighbor and Hello Timeout on page 2017, which is described in the description for the configure esrp timer neighbor command.

Example

The following command configures the ESRP hello timer to 4 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer hello 4
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp timer neighbor

configure esrp *esrpDomain* **timer neighbor** *seconds*

Description

Configures the ESRP neighbor timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the number of seconds after which an ESRP neighbor times out. The range is 6 to 1024 seconds.

Default

The default neighbor timeout is 8 seconds (four times the hello timer).

Usage Guidelines

The neighbor timeout specifies the amount of time that ESRP waits before considering the neighbor down. The neighbor value must be at least 3 times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >= 3*hello ;
neutral
timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 3*hello to 1024 seconds.

To view the neighbor timer settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

In a large ESRP configuration, the slave ESRP domain might inadvertently become the master ESRP domain. This can occur when FDB entries are flushed during a master-slave transition. To avoid this Extreme Networks recommends the general neighbor and hello timeout guidelines listed in following table.

Table 36: General Neighbor and Hello Timeout

Number of Domains	Number of VLANs	Suggested Neighbor and Hello Timeout
64 or less	1000	Use the default timer values
64	1000 to 3000	hello >=3, neighbor >=9
128	3000	hello >=4, neighbor >=12

Example

The following command configures the ESRP neighbor timeout to 14 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer neighbor 14
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp timer neutral

Configures the ESRP neutral timeout value.

configure esrp *esrpDomain* **timer neutral** *seconds*

Description

Configures the ESRP neutral timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the number of seconds after which an ESRP domain. The range is 4 to 1024 seconds.

Default

The default neutral timeout is 4 seconds (two times the hello timer).

Usage Guidelines

After you create, configure, and enable the ESRP domain, it enters the neutral state. The neutral timeout specifies the amount of time the ESRP domain stays in this temporary state before entering the slave state. The neutral value must be at least 2 times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >= 3*hello ;
neutral
timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 2*hello to 1024.

To view the neutral timer settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

Example

The following command configures the ESRP neutral timeout to 8 seconds for the ESRP domain esrp1:

```
configure esrp esrp1 timer neutral 8
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp timer premaster

configure esrp *esrpDomain* **timer premaster** *seconds*

Description

Configures the ESRP pre-master timeout value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the maximum length of time, in seconds, that the transitioning master VLAN remains in the pre-master state. The range is 6 to 1024.

Default

The default timeout is 6 seconds (three times the hello timer).

Usage Guidelines

The premaster timer specifies how long the ESRP domain stays in the pre-master state. The pre-master timer expires if the neighbor agrees to be the slave. The premaster value must be at least three times the hello timer value. Entering a value outside of that range generates an error message similar to the following:

```
operation Failed. Valid timer relationship "neighbor timeout >= 3*hello ;
neutral
timeout >= 2*hello ; premaster timeout >= 3*hello"!
```

The seconds range is 3*hello-1024.

To view the pre-master timer settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

Caution

Configure the pre-master state timeout only with guidance from Extreme Networks personnel. Misconfiguration can severely degrade the performance of ESRP and your switch.

Example

The following command configures the pre-master timeout to 10 seconds for the ESRP domain esrp1:

```
configure esrp esrp-1 timer premaster 10
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure esrp timer restart

configure esrp *esrpDomain* **timer restart** *seconds*

Description

Configures the ESRP restart timer value.

Syntax Description

esrpDomain	Specifies an ESRP domain name.
seconds	Specifies the maximum length of time, in seconds, that the neighbor ESRP switch remains in its current state during an MSM hitless failover. The range is 15 to 1024.

Default

The default restart timer value is 30 seconds.

Usage Guidelines

The restart timer specifies the amount of time that the neighbor ESRP switch remains in its current state during a hitless failover. This timer prevent the slave ESRP switch from trying to become master during a hitless failover.

The seconds range is 15-1024.

To view the restart settings, use the show esrp { {name} | {type [vpls-redundancy | standard]} } command.

Example

The following command configures the restart timer value to 40 seconds for the ESRP domain esrp1:

```
configure esrp esrp-1 timer restart 40
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

create esrp

create esrp *esrp_domain* **{type [vpls-redundancy | standard]}**

Description

Creates an ESRP domain with the specified name on the switch.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain to be created. Can be up to 32 characters in length.

Default

The ESRP domain is disabled and in the “Aware” state.

When you create an ESRP domain, it has the following default parameters:

- Operational version—Extended
- Priority—0
- VLAN interface—none
- VLAN tag—0
- Hello timer—2 seconds
- Neighbor timer—8 seconds
- Premaster timer—6 seconds
- Neutral timer—4 seconds
- Neighbor restart timer—30 seconds
- VLAN tracking—none
- Ping tracking—none
- IP route tracking—none

Usage Guidelines

The type keyword specifies the type of ESRP domain when a new ESRP domain is created. The only types supported are vpls-redundancy and standard. Not specifying the optional ESRP domain type results in the creation of an ESRP domain of type standard. The standard ESRP domain is equivalent to the legacy ESRP domain type that was implicitly created. The vpls-redundancy domain type is only specified when redundant access to an MPLS VPLS network is desired.

An ESRP domain name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For ESRP domain name guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Each ESRP domain name must be unique and cannot duplicate any other named ESRP domains on the switch. If you are uncertain about the ESRP names on the switch, use the show esrp command to view the ESRP domain names.

You can create a maximum of 128 ESRP domains.

Configuring ESRP-Aware Switches

For an Extreme Networks switch to be ESRP-aware, you must create an ESRP domain on the aware switch, add a master VLAN to that ESRP domain, add a member VLAN to that ESRP domain if configured, and configure a domain ID if necessary.

For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see Feature License Requirements

Example

The following command creates ESRP domain esrp1 on the switch:

```
create esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

delete esrp

delete esrp *esrpDomain*

Description

Deletes the ESRP domain with the specified name.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain to be deleted.

Default

N/A.

Usage Guidelines

You must first disable an ESRP domain before you delete it. To disable an ESRP domain, use the disable esrp command.

You do not have to remove the master or member VLANs from an ESRP domain before you delete it. When you delete an ESRP domain, All VLANs are automatically removed from the domain.

For ESRP domains configured of type VPLS-redundancy, you need to unconfigure all associated VPLS instances from the ESRP domain using the unconfigure vpls redundancy command before deleting the domain.

Example

The following command deletes ESRP domain esrp1 from the switch:

```
delete esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable esrp

disable esrp {*esrpDomain*}

Description

Disables ESRP for a named domain or for the entire switch.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

Disabled for the entire switch.

Usage Guidelines

If you do not specify a domain name, ESRP is disabled for the entire switch.

If you disable an ESRP domain, the domain enters the Aware state, the switch notifies its neighbor that the ESRP domain is going down, and the neighbor clears its neighbor table. If the master switch receives this information, it enters the neutral state to prevent a network loop. If the slave switch receives this information, it enters the neutral state.

Example

The following command disables ESRP for the entire switch:

```
disable esrp
```

The following command disables ESRP for the domain esrp1:

```
disable esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable esrp

enable esrp *esrpDomain*

Description

Enables ESRP for a named domain.

Syntax Description

esrpDomain	Specifies the name of an ESRP domain.

Default

Disabled.

Usage Guidelines

Before you enable an ESRP domain, it must have a domain ID. The ESRP domain ID is determined from one of the following user-configured parameters:

- ESRP domain number created with the configure esrp domain-id command
- 802.1Q tag (VLANid) of the tagged master VLAN

If you do not have a domain ID, you cannot enable ESRP on that domain. A message similar to the following appears:

```
ERROR: Cannot enable ESRP Domain "esrp1" ; No domain id configured!
```

If you add an untagged master VLAN to the ESRP domain, make sure to create an ESRP domain ID with the configure esrp domain-id command before you attempt to enable the domain.

Example

The following command enables ESRP for the domain esrp1:

```
enable esrp esrp1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

show esrp

show esrp { {name} | {type [vpls-redundancy | standard]} }

Description

Displays ESRP configuration information for one or all ESRP domains on the switch.

Syntax Description

name	Specifies an ESRP domain name.
type	Specifies whether ESRP is standard or redundant VPLS
vpls-redundancy	Specifies redundant VPLS
standard	Specifies standard ESRP

Default

Shows summary ESRP information.

Usage Guidelines

This command shows information about the state of an ESRP domain and its neighbors. This includes information about tracked devices.

In addition to ESRP information, ELRP status information is also displayed. This includes information about the master and pre-master states, number of transitions to the pre-master state, and the ports where ELRP is disabled.

The output varies depending upon the configuration and the state of the switch.

Example

The following command displays summary ESRP status information for the ESRP domains on the switch:

```
show esrp
```

The following is sample output from this command:

```
ESRP:                     Enabled
Configured Version:       Extended
# ESRP domain configuration :
--------------------------------------------------------------------------------
-- Domain Grp Ver VLAN    VID  DId   IP/IPX         State  Master MAC Address

```

The following command displays detailed ESRP status information for the specified ESRP domain on the switch (the election policy displayed is the default policy in extended mode):

```
show esrp ed2
```

The following is sample output from this command:

```
show esrp ed2
Domain:                   ed2
Group:                    0
Operational Version:      extended

```

History

This command was first available in ExtremeXOS 11.0.

ELRP status information was added in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

show esrp aware

show esrp *domain* **aware** {**selective-forward-ports** | **statistics**}

Description

Displays all selective forwarding information for a given ESRP-aware domain.

Syntax Description

domain	Specifies the name of an ESRP domain.
selective-forward-ports	Specifies that the selective-forward-port table is the only table displayed.
statistics	Specifies that the selective-forward-port statistics table is the only table displayed.

Default

Disabled.

Usage Guidelines

An ESRP-aware switch floods ESRP PDUs from all ports in an ESRP-aware VLAN. This flooding creates unnecessary network traffic because some ports forward ESRP PDUs to switches that are not running the same ESRP groups. You can select the ports that are appropriate for forwarding ESRP PDUs by configuring selective forwarding on an ESRP-aware VLAN and thus reduce this excess traffic. Configuring selective forwarding creates a port list of only those ports that forward to the ESRP groups that are associated with an ESRP-aware VLAN. This aware port list is then used for forwarding ESRP PDUs.

The first of the two tables that this command displays shows Selective Forward Ports information:

- Group—The number of an ESRP group within the given domain.
- Port Count—The number of ports in the group that are selected to forward PDUs on the master VLAN.
- Selective Forward Ports—The list of ports in the group that are selected to forward PDUs on the master VLAN.

The second of the two tables displays statistical information about the activity of the ports:

- Group—The number of an ESRP group within the given domain
- Master MAC—The MAC address for the master of the group.
- Rx—The number of PDUs received matching the domain/group pair.
- Fwd—The number of PDUs received and forwarded matching the domain/group pair.
- FDB Flush—The number of FDB Flush requests received from the ESRP Master for this domain/group pair.
- Fwd Ports—Selective or Default.

  Selective describes the group as having a configured aware port list for selective forwarding of PDUs on the Master VLAN. The list of ports is displayed in the first table above.

  Default describes the group as one where all the ports on the master VLAN forward the ESRP PDUs that are received for the domain/group pair. Because there is no selective forwarding configuration for this group, there is no entry in the first table.

Example

The following command displays the ESRP aware information for the domain d1.

```
show esrp d1 aware
Domain:             d1
Vlan:            vesrp1
-------------------------------------------------
Group                Port Count                    Selective Forward Ports
-------------------------------------------------
0                5                    5:1, 5:2, 7:31, 7:32: 8:1
3                2                    5:1, 8:1
-------------------------------------------------------------------------
Group            Master MAC                                  Rx
Fwd            FDB Flush                    Fwd Ports
-------------------------------------------------------------------------
0            00:12:00:33:44:55                                 10
10                        1        selective
1            00:22:00:12:21:1F                                 77
77
3                                                             default
3            00:02:00:13:11:11                                 99
99                        3        selective
```

History

This command was first available in Extreme XOS 12.0.

Platform Availability

This command is available on all platforms.

show esrp counters

show esrp {*name*} **counters**

Description

Displays ESRP counter information for ESRP or for a specified ESRP domain.

Syntax Description

name	Specifies an ESRP domain name.

Default

Displays summary ESRP counter information.

Usage Guidelines

The show esrp counters command displays information about the number of:

- Failed received protocol packets
- Failed sent protocol packets
- Dropped protocol packets belonging to unknown ESRP domains
- Dropped protocol packets due to invalid Extreme Encapsulation Protocol (EEP) data
- Dropped packets due to old sequence numbers
- Dropped packets due to an invalid 802.1Q tag
- Dropped packets because the packet length was truncated (packet length is less than expected)
- Dropped packets due to failed checksum verification

The show esrp {<name>} counters command displays information about the number of times ESRP, ESRP-aware, and ESRP error packets were transmitted and received.

Example

The following command displays ESRP counter information:

```
show esrp counters
```

The following is sample output from this command:

```
Current-time:                   Sun Nov 16 00:25:08 2003
esrpStatsRxHelloFailed          = 0
esrpStatsTxHelloFailed          = 0
esrpStatsUnknownDomain          = 0
esrpStatsUnsupportedEEPVersion  = 0
esrpStatsInvalidEEPLength       = 0
esrpStatsNotInTimeWindow        = 0
esrpStatsInvalid8021Qtag        = 0
esrpStatsInvalidSNAPType        = 0
esrpStatsUndersizePkt           = 0
esrpStatsInvalidChecksum        = 0
esrpStatsWrongDigest            = 0
```

The following command displays counter information for ESRP domain ed5:

```
show esrp ed5 counters
```

The following is sample output from this command:

```
Domain:  ed5              Current-time:  Sun Nov 16 00:25:27 2003
Rx-Esrp-Pkts         = 628        Tx-Esrp-Pkts         = 630
Rx-Aware-Esrp-Pkts   = 112        Tx-Aware-Esrp-Pkts   = 34
Rx-Err-Pkts          = 0 Tx-Err-Pkts          = 0
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

31 VRRP Commands

This chapter describes commands for:

- Enabling and disabling Virtual Router Redundancy Protocol (VRRP)
- Performing basic VRRP configuration
- Displaying VRRP information

For an introduction to VRRP, see the ExtremeXOS Concepts Guide.

clear counters vrrp

clear counters vrrp {{**vlan** *vlan_name*} {**vrid** *vridval*}}

Description

Clears, resets all VRRP statistics and counters.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRRP Router ID (VRID) for a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.

Default

N/A.

Usage Guidelines

Use this command to reset the VRRP statistics on the switch. Statistics are not reset when you disable and re-enable VRRP.

If you do not enter a parameter, statistics for all VRRP VLANs are cleared.

If you specify only VLAN name, statistics for all VRRP VRIDs on that VLAN are cleared.

If you specify VLAN name and VRRP VRID, only statistics for that particular VRID are cleared.

Example

The following command clears the VRRP statistics on VRRP VLAN v1:

```
clear counters vrrp vlan v1
```

The following command clears the VRRP statistics for VRID 1 on VRRP VLAN v1:

```
clear counters vrrp vlan v1 vrid 1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid accept-mode

configure vrrp vlan *vlan_name* **vrid** *vridval* **accept-mode** [**on** | **off**]

Description

Configures a backup VRRP router instance to accept or reject packets addressed to the IP address owner when operating as the VRRP master.

Additionally, this command provides capability for switches to configure the VRRP virtual IP as NTP server address.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
on	Specifies that the VRRP instance is to accept packets addressed to the IP address owner.
off	Specifies that the VRRP instance not accept packets addressed to the IP address owner. **Note** Ping packets are accepted, regardless of the configuration for this command.

Default

Off.

Usage Guidelines

When a backup VRRP router operates as master, it accepts VRRP traffic and routes traffic. The backup router in master mode also accepts ping packets and IPv6 neighbor solicitations and advertisements. However, because the backup router is not the IP address owner, the default configuration rejects all other traffic addressed to the IP address owner.

If your network requires that a backup VRRP router in master mode accept all traffic addressed to the IP address owner, use this command to configure accept-mode on.

In the ExtremeXOS 15.3 release, NTP VRRP Virtual IP support is added. This feature allows you to configure the VRRP virtual IP as NTP server address. The NTP server when configured on the VRRP master will listen on the physical and virtual IP address for NTP clients. For this feature to work correctly, you need to enable accept mode in VRRP. Enabling accept mode allows the switch to process non-ping packets that have a destination IP set to the virtual IP address.

Example

The following example configures a backup VRRP router in master mode to accept packets addressed to the IP address owner:

```
configure vrrp vlan vlan-1 vrid 1 accept-mode on
```

History

This command was first available in ExtremeXOS 12.7.

NTP VRRP Virtual IP support was added in ExtremXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

For NTP VRRP Virtual IP support, Summit switches configured as NTP clients need to have the following bootrom version:

- X480, X460, X440, X670 – 2.0.1.7
- 150,250e,350,450a,450e,650,NWI – 1.0.5.7

configure vrrp vlan vrid add ipaddress

configure vrrp vlan *vlan_name* **vrid** *vridval* **add** *ipaddress*

Description

Associates a virtual IP address with a specific VRRP instance.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies a virtual IPv4 or IPv6 address to be assigned to the VRRP instance.

Default

N/A.

Usage Guidelines

Each VRRP instance is identified by an ID number, VLAN name, and virtual IP address. When two or more routers are configured with the same VRRP ID number, VLAN name, and virtual IP address, the routers with matching parameters are all part of the same VRRP instance. One router within the instance will become the VRRP instance master, and the others will become backup routers for the VRRP instance.

Most routers within a VRRP instance will have a virtual IP address that is different from the actual IP addresses configured on the router. If the virtual IP address for a VRRP instance matches an IP address configured on a host router, the VRRP instance is known as the IP address owner. On the IP address owner, the VRRP instance priority defaults to 255, and by default, the IP address owner becomes the VRRP master when VRRP is enabled.

Note

There is no requirement to configure an IP address owner within a VRRP instance.

Before each VRRP router is enabled, it must be configured with at least one virtual IPv4 or IPv6 address. You can repeat this command to add additional virtual IP addresses to the VRRP router. If a virtual IPv4 address is added to a VRRP router, you cannot later add a virtual IPv6 address. Similarly, if a virtual IPv6 address is added to a VRRP router, you cannot later add a virtual IPv4 address.

Each IPv6 VRRP instance is associated with one and only one virtual link local address, which serves as the source IP address for subsequent router announcement packets generated by the master VRRP router. The virtual link local address can be explicitly configured or generated automatically. One way to explicitly configure the virtual link local address is to add it to the virtual IP address list with this command.

Example

The following example associates virtual IPv4 address 10.1.2.3 to VRRP router instance 1:

```
configure vrrp vlan vlan-1 vrid 1 add 10.1.2.3
```

The following example associates virtual IPv6 address 2001:db8::3452/128 to VRRP router instance 2:

```
configure vrrp vlan vlan-1 vrid 2 add 2001:db8::3452/128
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 addresses was added in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid add track-iproute

configure vrrp vlan *vlan_name* **vrid** *vridval* **add track-iproute** *ipaddress/masklength*

Description

Creates a tracking entry for the specified route. When this route becomes unreachable, this entry is considered to be failing.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies the IPv4 or IPv6 prefix of the route to track.
masklength	Specifies the length of the route's prefix.

Default

N/A.

Usage Guidelines

The route specified in this command might not exist in the IP routing table. When you create the entry for a route, an immediate VRRP failover might occur.

Note

VRRP tracking is not supported on MPLS LSPs.

Example

The following command enables IP route failure tracking for routes to the specified subnet:

```
configure vrrp vlan vlan-1 vrid 1 add track-iproute 3.1.0.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid add track-ping

configure vrrp vlan *vlan_name* **vrid** *vridval* **add track-ping** *ipaddress* **frequency** *seconds* **miss** *misses*

Description

Creates a tracking entry for the specified IP address. The entry is tracked using pings to the IP address, sent at the specified frequency.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies the IPv4 or IPv6 address to be tracked.
seconds	Specifies the number of seconds between pings to the target IP address. The range is 1 to 600 seconds.
misses	Specifies the number of misses allowed before this entry is considered to be failing. The range is 1 to 255 pings.

Default

N/A.

Usage Guidelines

Adding an entry with the same IP address as an existing entry causes the new values to overwrite the existing entry's frequency and miss number.

Example

The following command enables ping tracking for the external gateway at 3.1.0.1, pinging every 3 seconds, and considering the gateway to be unreachable if no response is received to 5 consecutive pings:

```
configure vrrp vlan vlan-1 vrid 1 add track-ping 3.1.0.1 frequency 3 miss 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid add virtual-link-local

configure vrrp vlan *vlan_name* **vrid** *vridval* **add virtual-link-local** *vll_addr*

Description

Specifies a virtual IPv6 link local address for the VRRP router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
vll_addr	Specifies a virtual link local address to be assigned to the VRRP instance.

Usage Guidelines

Each IPv6 VRRP instance is associated with one and only one virtual link local address, which serves as the source IP address for subsequent router announcement packets generated by the master VRRP router. The virtual link local address can be explicitly configured or generated automatically.

One way to explicitly configure the virtual link local address is to add it to the virtual IP address list with this command. The new link local address must match the FE80::/64 subnet, and it must match the address in use on all other router in this VRRP instance.

If no virtual link local address is configured, an appropriate address is generated automatically.

Note

If an IPv4 address has been added to a VRRP router, you cannot later add any IPv6 address, so you cannot add a link local address.

Example

The following example associates virtual IPv6 link local address fe80::1111 to VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 add virtual-link-local fe80::1111
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid add track-vlan

configure vrrp vlan *vlan_name* **vrid** *vridval* **add track-vlan** *target_vlan_name*

Description

Configures a VRRP VLAN to track port connectivity to a specified VLAN. When this VLAN is in the down state, this entry is considered to be failing.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
target_vlan_name	Specifies the name of the VLAN to track.

Default

N/A.

Usage Guidelines

Up to eight VLANs can be tracked.

Deleting a tracked VLAN does not constitute a failover event for the VRRP VLAN tracking it, and the tracking entry is deleted.

Example

The following command enables VRRP VLAN vlan-1 to track port connectivity to VLAN vlan-2:

```
configure vrrp vlan vlan-1 vrid 1 add track-vlan vlan-2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid advertisement-interval

configure vrrp vlan *vlan_name* **vrid** *vridval* **advertisement-interval** *interval* **[{seconds} | centiseconds]**

Description

Configures the time between VRRP advertisements in seconds or centiseconds.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
interval	Specifies an interval value for the time between advertisements. The range is 1 through 40 seconds or 10 through 4095 centiseconds.
seconds	Specifies that the interval value is in seconds. If you do not specify seconds or centiseconds, the interval value is applied as seconds.
centiseconds	Specifies that the interval value is in centiseconds.

Default

The advertisement interval is 1 second.

Usage Guidelines

The advertisement interval specifies the interval between advertisements sent by the master router to inform the backup routers that its alive. You must use whole integers when configuring the advertisement interval.

An extremely busy CPU can create a short dual master situation. To avoid this, increase the advertisement interval.

Note

The milliseconds keyword is replaced by the centiseconds keyword, but the milliseconds keyword is still recognized to support existing configurations and scripts. Any values specified in milliseconds are converted to centiseconds. All new configurations and scripts should specify the interval in either seconds or centiseconds. The maximum value for an interval specified in seconds is 40. However, the software supports older configurations and scripts that specify values up to 255, which were supported prior to ExtremeXOS Release 12.7.

To view your VRRP configuration, including the configured advertisement interval, use one of the following commands:

- show vrrp {virtual-router {<vr-name>}} {detail}
- show vrrp vlan <vlan_name> {stats}

If you enter a number that is out of the seconds or centiseconds range, the switch displays an error message. For example, if the interval value is set to 999 and the centiseconds keyword is missing, the switch displays an error message similar to the following:

```
configure vrrp blue vrid 250 advertisement-interval 999
Error: Advertisement interval must be between 1 and 255 seconds. 999 out of
range
```

Example

The following command configures the advertisement interval for 15 seconds:

```
configure vrrp vlan vrrp-1 vrid 1 advertisement-interval 15
```

The following command configures the advertisement interval for 200 centiseconds:

```
configure vrrp vlan vrrp-1 vrid 1 advertisement-interval 200 centiseconds
```

History

This command was first available in ExtremeXOS 10.1.

The milliseconds and seconds keywords were added in ExtremeXOS 11.5.

The centiseconds keyword replaced the milliseconds keyword, and the maximum value for intervals specified in seconds was reduced to 40 in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid authentication

configure vrrp vlan *vlan_name* **vrid** *vridval* **authentication** [**none** | **simplepassword** *password*]

Description

Configures the authentication type for a specific VRRP router.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
password	Specifies the user-defined password for authentication.

Default

Authentication is set to none.

Usage Guidelines

Note

This command applies only to VRRP routers configured only for VRRPv2 (configure vrrp vlan vrid version command, v2 option), and is only supported for backward compatibility. If you try to enter this command in the combined VRRPv2 and VRRPv3 mode or VRRPv3 mode, an error message appears.

This command can add a modest amount of security to VRRP advertisements. All VRRP routers using the same VRID must use the same password when using this feature.

A simple password must be between 1 and 8 characters long.

Example

The following command configures authentication for VRRP VLAN vrrp-1 with the password newvrrp:

```
configure vrrp vlan vrrp-1 vrid 1 authentication simple-password newvrrp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid delete

configure vrrp vlan *vlan_name* **vrid** *vridval* **delete** *ipaddress*

Description

Deletes a virtual IPv4 or IPv6 address from a specific VRRP router.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies the virtual IP address to be deleted from the VRRP instance. This is common for IPv4/IPv6 addresses.

Usage Guidelines

When a VRRP router is enabled, it must have at least one virtual IP address. When the VRRP router is not enabled, there are no restrictions on deleting the IP address.

Example

The following command removes IP address 10.1.2.3 from VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 delete 10.1.2.3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid delete track-iproute

configure vrrp vlan *vlan_name* **vrid** *vridval* **delete track-iproute** *ipaddress/masklength*

Description

Deletes a tracking entry for the specified route.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies the IPv4 or IPv6 prefix of the route.
masklength	Specifies the length of the route's prefix.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

Example

The following command disables tracking of routes to the specified subnet for VLAN vlan-1:

```
configure vrrp vlan vlan-1 vrid 1 delete track-iproute 3.1.0.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid delete track-ping

configure vrrp vlan *vlan_name* **vrid** *vridval* **delete track-ping** *ipaddress*

Descriptioin

Deletes a tracking entry for the specified IP address.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the target VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
ipaddress	Specifies the IP address to be tracked.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

A VRRP node with a priority of 255 might not recover from a ping-tracking failure if there is a Layer2 switch between it and another VRRP node. In cases where a Layer2 switch is used to connect VRRP nodes, Extreme Networks recommends that those nodes have priorities of less than 255.

Example

The following command disables ping tracking for the external gateway at 3.1.0.1:

```
configure vrrp vlan vlan-1 vrid 1 delete track-ping 3.1.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid delete track-vlan

configure vrrp vlan *vlan_name* **vrid** *vridval* **delete track-vlan** *target_vlan_name*

Description

Deletes the tracking of port connectivity to a specified VLAN.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
target_vlan_name	Specifies the name of the tracked VLAN.

Default

N/A.

Usage Guidelines

Deleting a tracking entry while VRRP is enabled causes the VRRP VRs state to be re-evaluated for failover.

Example

The following command disables the tracking of port connectivity to VLAN vlan-2:

```
configure vrrp vlan vlan-1 vrid 1 delete track-vlan vlan-2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid dont-preempt

configure vrrp vlan *vlan_name* **vrid** *vridval* **dont-preempt**

Description

Specifies that a higher priority backup router does not preempt a lower priority master.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID of a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.

Default

The default setting is preempt.

Usage Guidelines

The preempt mode controls whether a higher priority backup router preempts a lower priority master. dont-preempt prohibits preemption. The router that owns the virtual IP address always preempts, independent of the setting of this parameter.

Example

The following command disallows preemption:

```
configure vrrp vlan vlan-1 vrid 1 dont-preempt
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid preempt

configure vrrp vlan *vlan_name* **vrid** *vridval* **preempt** {**delay** *seconds*}

Description

Specifies that a higher priority backup router preempts a lower priority master.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for a VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
seconds	Specifies a preempt delay period in seconds. The value range is 1 to 3600 seconds, or 0, which selects the original preempt delay period.

Default

Preempt enabled.

Delay configuration: 0.

Usage Guidelines

The preempt option enables a higher-priority backup router to preempt a master with a lower priority. When a VRRP enabled router receives a lower priority VRRP advertisement and preemption is enabled, the higher-priority VRRP enabled router takes over as master. The new master starts sending VRRP advertisements and the old, lower-priority master relinquishes mastership.

Note

The router that owns the virtual IP address always preempts, independent of the setting of this parameter.

When a VRRP enabled router preempts the master, it does so in one of the following ways:

- If the preempt delay timer is configured for between 1 and 3600 seconds and the lower-priority master is still operating, the router preempts the master when the timer expires.
- If the preempt delay timer is configured for 0, the router preempts the master after 3 times the hello interval.
- If the higher priority router stops receiving advertisements from the current master for 3 times the hello interval, it takes over mastership immediately.

Note

The preempt feature can be disabled with the configure vrrp vlan vrid dont-preempt command.

Example

The following command allows preemption:

```
configure vrrp vlan vlan-1 vrid 1 preempt
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid priority

configure vrrp vlan *vlan_name* **vrid** *vridval* **priority** *priorityval*

Description

Configures the priority value of a VRRP router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
priorityval	Specifies the priority value of the router. The default is 100. The priority range is 1-255.

Default

The default priority is 100.

Usage Guidelines

This command changes the priority of a VRRP router. If the VRRP router is the IP address owner (which means that the VRRP router IP address matches the VRRP VLAN IP address), the priority is 255 and cannot be changed. If the VRRP router is not the IP address owner, the priority can be changed to values in the range of 1 to 254.

To change the priority of the IP address owner or to make a different VRRP router the IP address owner, disable VRRP and reconfigure the affected switches to use VRRP router addresses that support the priorities you want to assign.

Example

The following command configures a priority of 150 for VLAN vrrp-1:

```
configure vrrp vlan vrrp-1 vrid 1 priority 150
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid track-mode

configure vrrp vlan *vlan_name* **vrid** *vridval* **track-mode** [**all** | **any**]

Description

Defines the conditions under which the router automatically relinquishes master status when the tracked entities fail.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
all	Specifies that the mastership is relinquished when one of the following events occur: All of the tracked VLANs failAll of the tracked routes failAll of the tracked PINGs fail
any	Specifies that the mastership is relinquished when any of the tracked VLANs, routes, or PINGs fail.

Default

The default setting is all.

Usage Guidelines

None.

Example

The following command configures the track mode to any:

```
configure vrrp vlan vrrp-1 vrid 1 track-mode any
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vrrp vlan vrid version

configure vrrp vlan *vlan_name* **vrid** *vridval* **version** [**v3-v2** | **v3** | **v2**]

Description

Selects the VRRP version to apply to the VRRP router instance.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.
v3	Selects VRRP v3.
v2	Specifies VRRP v2.
v3-v2	Specifies VRRP v3 with VRRP v2 compatibility.

Default

VRRP v3 with VRRP v2 compatibility.

Note

Configurations created by earlier ExtremeXOS software releases have an implied version of v2. If the configuration is subsequently saved, the version is explicitly set to v2.

Usage Guidelines

None.

Example

The following command configures the VRRP router instance to use VRRP v3 only:

```
configure vrrp vlan vrrp-1 vrid 1 version v3
```

History

This command was first available in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create vrrp vlan vrid

create vrrp vlan *vlan_name* **vrid** *vridval*

Description

Creates a VRRP instance on the switch.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies a VRID for the VRRP instance. The value can be in the range of 1-255.

Default

N/A.

Usage Guidelines

VRRP Router IDs can be used across multiple VLANs. You can create multiple VRRP routers on different VLANs. VRRP router IDs need not be unique to a specific VLAN.

Note

The total number of supported VRRP router instances is dependent on the switch hardware. For more information, see the ExtremeXOS Release Notes.

Before configuring any VRRP router parameters, you must first create the VRRP instance on the switch. If you define VRRP parameters before creating the VRRP, you might see an error similar to the following:

```
Error: VRRP VR for vlan vrrp1, vrid 1 does not exist.
Please create the VRRP VR before assigning parameters.
Configuration failed on backup MSM, command execution aborted!
```

If this happens, create the VRRP instance and then configure its parameters.

Example

The following command creates a VRRP router on VLAN vrrp-1, with a VRRP router ID of 1:

```
create vrrp vlan vrrp-1 vrid 1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete vrrp vlan vrid

delete vrrp vlan *vlan_name* **vrid** *vridval*

Description

Deletes a specified VRRP instance.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the VRRP instance on the VLAN vrrp-1 identified by VRID 2:

```
delete vrrp vlan vrrp-1 vrid 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable vrrp vrid

disable vrrp {**vlan** *vlan_name* **vrid** *vridval*}

Description

Disables a specific VRRP instance or all VRRP instances.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance. To display the configured VRRP router instances, enter the show vrrp command.

Default

N/A.

Usage Guidelines

This disables a specific VRRP instance on the switch. If no VRRP VLAN is specified, all VRRP instances on the switch are disabled.

Example

The following command disables all VRRP instances on the switch:

```
disable vrrp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable vrrp vrid

enable vrrp {**vlan** *vlan_name* **vrid** *vridval*}

Description

Enables a specific VRRP instance or all VRRP instances on the switch.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
vridval	Specifies the VRID for the VRRP instance to be enabled. To display the configured VRRP router instances, enter the show vrrp command.

Default

N/A.

Usage Guidelines

This enables a specific VRRP instance on the device. If you do not specify a VRRP instance, all VRRP instances on this device are enabled.

Example

The following command enables all VRRP instances on the switch:

```
enable vrrp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show vrrp

show vrrp {**virtual-router** {*vr_name*}} {**detail**}

Description

Displays VRRP configuration information for all VRRP VLANs.

Syntax Description

vr_name	Specifies a virtual router (VR) for which to display VRRP information.
detail	Specifies more detailed VRRP information.

Default

N/A.

Usage Guidelines

The following table describes the significant fields and values that can appear when you enter the different forms of this command:

Field	Description
Advertisement Interval	Indicates the configured advertisement interval.
Authentication	If configured, identifies the VRRP simple password.
IPv6 Router Advertisement Mask	IPv6 router advertisement mask.
Master Mac Address	The MAC address of the master VRRP router.
P	Indicates that the VRRP VLAN is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master.
Preempt	Indicates that the VRRP VLAN is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master.
Pri Priority	The priority value of the VRRP VLAN.
State	The current state of the VRRP router. The state includes the following: Init—The VRRP router is in the initial state.Backup—The VRRP router is a backup router.Master—The VRRP router is the master router.
T	Indicates the configured advertisement interval.
TP	Indicates the number of tracked pings.
TR	Indicates the number of tracked routes.
Tracked IP Routes	If configured, displays the IP address and subnet mask of the tracked route(s).
Tracked Pings	If configured, displays the: Target IP address you are pinging.Number of seconds between pings to the target IP address.Number of misses allowed before this entry is considered to be failing.
Tracked VLANs	If configured, displays the name of the tracked VLAN(s).
Tracking Mode	Indicates the VRRP tracking mode, which is either ALL or ANY.
TV	Indicates the number of tracked VLANs.
Virtual IP Addr Virtual IP Addresses	If configured, the virtual IPv4 or IPv6 address associated with the VRRP VLAN.
Virtual Link-Local Address	Virtual IPv6 link local address configured on the interface.
VLAN	The name of the VRRP VLAN.

Field	Description
VLAN Name	The name of the VRRP VLAN and whether VRRP is enabled or disabled on the VLAN. The enable/disable state appears as follows: En—VRRP is enabled on this VLAN.Ds—VRRP is disabled on this VLAN.
VRID	The VRRP Router Identification number for the VRRP instance.
VRRP	The enabled/disabled state of VRRP on the VLAN.

Example

The following example displays summary VRRP status information for the current VR context:

```
show vrrp
VLAN Name VRID Pri Virtual IP Addr   State  Master Mac Address  TP/TR/TV/P/T
t2t1(En) 0024 255 10.0.0.10          MSTR  00:00:5e:00:01:18    0  0  0 Y 1
t2t1(En) 0039 100 fe80::204:96ff:fe10:e610
BKUP  00:00:5e:00:02:27    0  0  0 Y 1
t2t1(Ds) 0045 100 NONE               INIT  NONE                 0  0  0 Y 0
En-Enabled, Ds-Disabled, Pri-Priority, T-Advert Timer, P-Preempt
TP-Tracked Pings, TR-Tracked Routes, TV-Tracked VLAN
```

The following example displays detailed VRRP status information for the current VR context:

```
show vrrp detail
VLAN:  t2t1     VRID:  24       VRRP:  Enabled  State:  MASTER
Virtual Router:  VR-Default
Priority:  255(master)  Advertisement Interval:  1 sec
Preempt:  Yes     Authentication:  None
Virtual Link-Local Address: fe80::1
IPv6 Router Advertisement Mask: 64
Virtual IP Addresses:
10.0.0.10
Tracking mode:  ALL
Tracked Pings:  -
Tracked IP Routes:  -
Tracked VLANs:  -
VLAN:  t2t1     VRID:  39       VRRP:  Enabled  State:  MASTER
Virtual Router:  VR-Default
Priority:  255(master)  Advertisement Interval:  50 centiseconds
Preempt:  Yes     Authentication:  None
Virtual IP Addresses:
2002::10
fe80::204:96ff:fe10:e610
Tracking mode:  ALL
Tracked Pings:  -
Tracked IP Routes:  -
Tracked VLANs:  -
```

The following example displays VRRP information for all VRs:

```
show vrrp virtual-router
```

```
VLAN Name VRID Pri Virtual IP Addr State  Master Mac Address  Virtual-Router
vlan_3(En) 0003 200 30.1.2.1         MSTR  00:00:5e:00:01:03    vir_3
vlan_4(En) 0003 200 40.1.2.1         MSTR  00:00:5e:00:01:03    vir_4
vlan_5(En) 0005 100 50.1.2.1         BKUP  00:00:5e:00:01:05    vir_3
vlan_6(En) 0005 100 60.1.2.1         BKUP  00:00:5e:00:01:05    vir_4
```

History

This command was first available in ExtremeXOS 10.1.

Support for virtual routers was added in ExtremeXOS 12.0.

Support for IPv6 was added in ExtremeXOS 12.7.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show vrrp vlan

show vrrp vlan *vlan_name* {**stats**}

Description

Displays VRRP information for a particular VLAN.

Syntax Description

vlan_name	Specifies the name of a VRRP VLAN.
stats	Specifies statistics for a particular VLAN.

Default

N/A.

Usage Guidelines

Depending on the software version running on your switch or your switch model, additional or different VRRP information might be displayed.

If you specify the command without the stats keyword, the following VRRP information appears:

- VLAN—The name of the VRRP VLAN.
- VRID—The VRRP Router Identification number for the VRRP instance.
- VRRP—The enabled/disabled state of VRRP on the VLAN.
- State—The current state of the VRRP router. The state includes the following:

    - Init—The VRRP router is in the initial state.
    - Backup—The VRRP router is a backup router.
    - Master—The VRRP router is the master router.
- Priority—The priority value of the VRRP VLAN.
- Advertisement Interval—Indicates the configured advertisement interval.
- Preempt—Indicates that the VRRP VLAN is configured for preempt mode, which controls whether a higher priority backup router preempts a lower priority master.
- Authentication—If configured, identifies the VRRP simple password.
- Virtual IP Addresses—If configured, the virtual IP address associated with the VRRP VLAN.
- Tracked Pings—If configured, displays the:
    - Target IP address you are pinging.
    - Number of seconds between pings to the target IP address.
    - Number of misses allowed before this entry is considered to be failing.
- Tracked IP Routes—If configured, displays the IP address and subnet mask of the tracked route(s).
- Tracked VLANs—If configured, displays the name of the tracked VLAN(s).

If you specify the stats keyword, you see counter and statistics information for the specified VRRP VLAN.

Example

The following example displays configuration information for the specified VRRP VLAN:

```
show vrrp vlan blue
VLAN:  blue     VRID:  2        VRRP:  Disabled State:  INIT
Priority:  1(backup)    Advertisement Interval:  1 sec
Preempt:  Yes   Authentication:  None
Virtual IP Addresses:
Tracked Pings:  -
Tracked IP Routes:  -
Tracked VLANs:  -
* indicates a tracking condition has failed
```

The following example displays statistics for VLAN vrrp-1:

```
show vrrp vlan vrrp-1 stats
VLAN vrrp-1, VR ID 25
Chksum Err:0, Ver Err:0, VRID Err:0, Auth Mismatch:0, Pkt-len Err:0
Become Master:0, Adv recv:0, Adv Err:0, Auth Fail:0, TTL Err:0
Pri-0-recv:0, Pri-0-snt:0, Addr-List Err:0, Invalid Auth Err:0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the VRRP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

32 MPLS Commands

clear counters l2vpn
clear counters mpls
clear counters mpls ldp
clear counters mpls rsvp-te
clear counters mpls static lsp
clear counters vpls
clear fdb vpls
configure forwarding switch-fabric protocol
configure iproute add default
configure iproute add lsp
configure iproute delete
configure iproute delete default
configure l2vpn
configure l2vpn add peer
configure l2vpn add service
configure l2vpn delete peer
configure l2vpn delete service
configure l2vpn health-check vccv
configure l2vpn peer mpls lsp
configure l2vpn peer
configure l2vpn peer mpls lsp
configure l2vpn sharing hash-algorithm
configure l2vpn sharing ipv4
configure l2vpn vpls peer static-pw
configure l2vpn vpls redundancy
configure l2vpn vpws peer static-pw
configure mpls add vlan
configure mpls delete vlan
configure mpls exp examination
configure mpls exp replacement
configure mpls labels max-static
configure mpls ldp advertise
configure mpls ldp loop-detection
configure mpls ldp pseudo-wire
configure mpls ldp timers
configure mpls lsr-id
configure mpls rsvp-te bandwidth committed-rate

configure mpls rsvp-te lsp add path
configure mpls rsvp-te lsp change
configure mpls rsvp-te lsp delete path
configure mpls rsvp-te lsp fast-reroute
configure mpls rsvp-te lsp path use profile
configure mpls rsvp-te lsp transport
configure mpls rsvp-te metric
configure mpls rsvp-te path add ero
configure mpls rsvp-te path delete ero
configure mpls rsvp-te profile
configure mpls rsvp-te profile (fast-reroute)
configure mpls rsvp-te timers lsp rapid-retry
configure mpls rsvp-te timers lsp standard-retry
configure mpls rsvp-te timers session
configure mpls static lsp
configure mpls static lsp transport
configure vpls
configure vpls add peer ipaddress
configure vpls add peer
configure vpls add service
configure vpls delete peer
configure vpls delete service
configure vpls health-check vccv
configure vpls peer mpls lsp
configure vpls peer
configure vpls peer mpls lsp
configure vpls snmp-vpn-identifier
configure vpws add peer ipaddress
create l2vpn fec-id-type pseudo-wire
create mpls rsvp-te lsp
create mpls rsvp-te path
create mpls rsvp-te profile
create mpls rsvp-te profile fast-reroute
create mpls static lsp
create vpls fec-id-type pseudo-wire
delete l2vpn
delete mpls rsvp-te lsp
delete mpls rsvp-te path
delete mpls rsvp-te profile
delete mpls static lsp
delete vpls
disable bgp mpls-next-hop

disable iproute mpls-next-hop

enable l2vpn service
enable mpls
enable mpls bfd
enable mpls exp examination
enable mpls exp replacement
enable mpls ldp
enable mpls ldp bgp-routes

This chapter describes commands for configuring and managing the following Mulitprotocol Label Switching (MPLS) features:

- Basic MPLS
- Virtual Private LAN Service (VPLS) Layer-2 Virtual Private Networks (VPNs)
- Hierarchical VPLS (H-VPLS)
- Protected VPLS
- Resource ReSerVation Protocol-Traffic Engineering (RSVP-TE)
- Time Division Multiplexing (TDM) Pseudo-Wire Ethernet (PWE) over MPLS

For an introduction to MPLS, see the ExtremeXOS Concepts Guide.

Note

The commands in this chapter operate only on the platforms listed for specific features in FOO in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters l2vpn

clear counters l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]]

Description

Clears all the specified VPLS or VPWS counters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS VPNs.

Default

N/A.

Usage Guidelines

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when clearing counters for a VPWS. For backward compatibility, the l2vpn keyword is optional when clearing counters for a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

This example clears all VPLS counters for the specified VPLS:

```
clear counters vpls myvpls
```

This example clears all VPWS counters for the specified VPWS:

```
clear counters l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters mpls

clear counters mpls {[**lsp all** | [{**vlan**} *vlan_name* | **vlan all**]]}

Description

Clears all packet and byte counters for all MPLS LSPs and all MPLS protocol counters for all MPLS interfaces.

Syntax Description

lsp all	Clears all MPLS protocol counters for all MPLS LSPs.
vlan_name	Clears all MPLS protocol counters for the MPLS interface on the specified VLAN.
vlan all	Clears all MPLS protocol counters for all MPLS interfaces.

Default

N/A.

Usage Guidelines

This command clears all packet and byte counters for all MPLS LSPs and all MPLS protocol counters for all MPLS interfaces. If the lsp all keywords are specified, all packet and byte counters for all MPLS LSPs are cleared. If the vlan all keywords are specified, all MPLS protocol counters for all MPLS interfaces are cleared. If a VLAN name is specified, all MPLS protocol counters for the MPLS interface on that VLAN are cleared.

Example

```
This example clears all MPLS counters associated with VLAN 1:
clear counters mpls vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters mpls ldp

clear counters mpls ldp {{{**vlan**} *vlan_name*} | **lsp all**}

Description

Clears LDP control protocol counters and packet and byte counters associated with LDP LSPs.

Syntax Description

vlan_name	Clears LDP control protocol counters on the specified VLAN.
vlan all	Clears LDP control protocol counters on all MPLS interfaces.
lsp all	Clears all LDP LSP packet and byte counters.

Default

N/A.

Usage Guidelines

By default, all LDP control protocol counters are cleared for all LDP interfaces and all byte counters. Specifying the vlan keyword clears only the protocol counters associated with a specified LDP interface. Specifying the lsp keyword clears only the packet and byte counters associated with LDP LSPs.

Example

```
This example clears all LDP control protocol counters and all packet and byte
counters for all LDP LSPs:
clear counters mpls ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters mpls rsvp-te

clear counters mpls rsvp-te {[**lsp all** | [{**vlan**} *vlan_name* | **vlan all**]]}

Description

Clears all packet and byte counters for all RSVP-TE LSPs and all RSVP-TE protocol counters for all MPLS interfaces.

Syntax Description

lsp all	Clears all packet and byte counters for all RSVP-TE LSPs.
vlan_name	Clears all RSVP-TE protocol counters for the MPLS interface on the specified VLAN.
vlan all	Clears all RSVP-TE protocol counters on all MPLS interfaces.

Default

By default, all RSVP-TE control protocol counters are cleared for all RSVP-TE interfaces.

Usage Guidelines

This command clears all packet and byte counters for all RSVP-TE LSPs and all RSVP-TE protocol counters for all MPLS interfaces. If the lsp all keywords are specified, all packet and byte counters for all RSVP-TE LSPs are cleared. If the vlan all keywords are specified, all RSVP-TE protocol counters for all MPLS interfaces are cleared. If a VLAN name is specified, all RSVP-TE protocol counters for the MPLS interface on that VLAN are cleared.

Example

```
This example clears the RSVP-TE protocol counters on VLAN 1 only:
clear counters mpls rsvp-te vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters mpls static lsp

clear counters mpls static lsp {*lsp_name* | **all** }

Description

Clears the packet and byte counters for one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP for which counters are to be cleared.
all	Specifies that counters are to be cleared for all static LSPs on this LSR.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the counters for a static LSP:

```
clear counters mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear counters vpls

clear counters vpls [*vpls_name* | **all**]

Description

Clears all VPLS counters for the specified **vpls_name**.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS VPNs.

Default

N/A.

Usage Guidelines

This command clears all VPLS counters for the specified vpls_name. If the optional all keyword is specified, all packet and byte counters for all VPLS VPNs are cleared.

Example

This example clears all VPLS counters for the specified VPLS:

```
clear counters vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

clear fdb vpls

clear fdb vpls {*vpls_name* {*peer_ip_address*}}

Description

Clears the FDB information learned for VPLS.

Syntax Description

vpls_name	Clears all FDB entries for the specified VPLS and its associated VLAN.
peer_ip_address	Clears all FDB entries for the pseudo wire (PW) associated with the specified VPLS and LDP peer.

Default

N/A.

Usage Guidelines

If the command is used without keywords, every FDB entry learned from any PW is cleared. Using the keywords vpls_name clears every FDB entry, (both PW and front panel Ethernet port for the service VLAN) associated with the specified VPLS and the associated VLAN. If the specified VPLS is not bound to a VLAN, the following error message appears:

```
Error: vpls VPLS_NAME not bound to a vlan
```

Using the keywords vpls_name and peer_ip_address clears all FDB entries from the PW associated with the specified VPLS and LDP peer.

Once the information is cleared from the FDB, any packet destined to a MAC address that has been flushed from the hardware is flooded until the MAC address has been re-learned.

Example

This example clears the FDB information for VPLS 1:

```
clear fdb vpls vpls1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support this feature as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure forwarding switch-fabric protocol

configure forwarding switch-fabric protocol [**standard** | **enhanced**]

Description

Configures the switch-fabric protocol on a BlackDiamond 8800 series switch.

Syntax Description

standard	Specifies the standard protocol, which is supported on all switches.
enhanced	Specifies the enhanced protocol, which is supported only on BlackDiamond 8900 series modules and Summit X460, X480, and X670 series switches. The enhanced protocol is required to support MPLS.

Default

Standard.

Usage Guidelines

To support MPLS, the BlackDiamond 8800 series switch must use one or two 8900-MSM128 cards and only the following BlackDiamond 8900 series modules: 8900-G96T-c and all BlackDiamond 8900 xl- and xm-series modules.

Note

You do not need to reboot the switch to activate the protocol change, but there will be some traffic interruption during protocol activation.

If MPLS is enabled on the switch, you must disable MPLS before you can change the stacking protocol to standard.

To display the switch-fabric protocol configuration, enter the show forwarding configuration command.

Example

To configure a switch to use the enhanced protocol, enter the following command:

```
configure forwarding switch-fabric protocol enhanced
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond 8800 series switches that have the proper hardware installed as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure iproute add default

configure iproute add default [{*gateway* {*metric*} {**vr** *vr_name*} {**unicast-only** | **multicast-only**}} | {**lsp** *lsp_name* {*metric*}}]

Description

Assigns a named LSP to the default route.

Syntax Description

gateway	Specifies a gateway.
metric	Specifies a cost metric.
vr_name	Specifies the virtual router to which the route is added.
unicast-only	Specifies only unicast traffic for the route.

multicast-only	Specifies only multicast traffic for the route.
lsp_name	Specifies a named MPLS LSP to be used to reach the default route.
metric	Specifies a cost metric.

Default

N/A.

Usage Guidelines

This command assigns a named LSP to the default route. Once configured, all IP traffic matching the configured route is forwarded over the specified LSP. For an RSVP-TE LSP, the correct label information is only associated with the default route if the LSP is active. If the RSVP-TE LSP is disabled or is inactive, the label information is removed from the route table and the default route entry is marked down. If multiple LSPs are added to the default route and ECMP is enabled using the route-sharing command, traffic is forwarded over only one LSP.

Note

IP routes can only be assigned to named LSPs in the VR in which MPLS is configured to operate.

Example

The following command specifies a default route for the switch:

```
configure iproute add default lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure iproute add lsp

configure iproute add [*ipaddress netmask* | *ipNetmask*] **lsp** *lsp_name* {**metric**} {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Assigns a specific IP route to use a named LSP.

Note

To create a static IP route that does not use a specific named LSP as an mpls-next-hop, use the following command: configure iproute add [<ipNetmask> | <ip_addr> <mask>] <gateway> {bfd} {metric} {multicast | multicast-only | unicast | unicast-only} {vr <vrname>}.

Syntax Description

ipaddress	Specified an IP address.
netmask	Specifies an IP address/prefix length.
ipNetmask	Specifies an IP address/prefix length.
lsp_name	Specifies a named MPLS LSP to be used to reach the route.
metric	Specifies a cost metric.
multicast	Adds the specified route to the multicast routing table.
multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the virtual router to which the route is added.

Default

N/A.

Usage Guidelines

This command assigns a named LSP to a specific IP route. Once configured, all IP traffic matching the configured route is forwarded over the specified LSP. For an RSVP-TE LSP, the correct label information is only associated with the route if the LSP is active. If the RSVP-TE LSP is disabled or is withdrawn, the label information is removed from the route table and the route entry is marked down. If multiple LSPs are added to a route and ECMP is enabled using route-sharing command, only one LSP is used to forward IP traffic.

Note

IP routes can only be assigned to named LSPs in the VR in which MPLS is configured to operate.

Example

The following command adds a static address to the routing table:

```
configure iproute add 10.1.1.0/24 lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure iproute delete

configure iproute delete [*ipaddress netmask | ipNetmask*] [{*gateway* {**vr** *vr_name*}} | **lsp** *lsp_name*]

Description

Deletes a route entry from the routing table based on the configured LSP.

Syntax Description

ipaddress	Specified an IP address.
netmask	Specifies an IP address/prefix length.
ipNetmask	Specifies an IP address/prefix length.
gateway	Specifies a gateway.
vr_name	Specifies the virtual router from which the route is deleted.
lsp_name	Specifies the named MPLS LSP used to reach the route.

Default

N/A.

Usage Guidelines

This command deletes a route entry from the routing table based on the configured LSP. If the configured IP netmask and LSP name do not match any route entry, the command fails and nothing is deleted.

Note

IP routes can only be assigned to named LSPs in the VR in which MPLS is configured to operate.

Example

The following command deletes an address from the LSP:

```
configure iproute delete 10.1.1.0/24 lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure iproute delete default

configure iproute delete default [{*gateway* {**vr** *vr_name*}} | **lsp** *lsp_name*]

Description

Deletes a default route entry from the routing table based on the configured LSP.

Syntax Description

gateway	Specifies a gateway.
vr_name	Specifies the virtual router from which the route is deleted
lsp_name	Specifies the named MPLS LSP used to reach the default route.

Default

N/A.

Usage Guidelines

This command deletes a default route entry from the routing table based on the configured LSP. If the specified LSP name doesn't match any configured default route entry, the command fails and nothing is deleted.

Note

IP routes can only be assigned to named LSPs in the VR in which MPLS is configured to operate.

Example

The following command deletes a default route from the LSP:

```
configure iproute delete default lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] {**dot1q** [**ethertype** *hex_number* | **tag** [**include** | **exclude**]]} {**mtu** *number*}

Description

Configures VPLS or VPWS parameters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
dot1q	Specifies the action the switch performs with respect to the 802.1Q ethertype or tag.
ethertype	Overwrites the ethertype value for the customer traffic sent across the PW
hex_number	Identifies the ethertype, uses the format of 0xN.
tag	Specifies the action the switch performs with respect to the 802.1Q tag.
include	Includes the 802.1Q tag when sending packets over the VPLS L2 VPN.
exclude	Strips the 802.1Q tag before sending packets over the VPLS L2 VPN.

mtu	Specifies the MTU value of the VPLS transport payload packet.
number	The size (in bytes) of the MTU value. The configurable MTU range is 1492 through 9216. The default VPLS MTU value is 1500.

Default

dot1q tag - excluded

ethertype - the configured switch ethertype is used.

number (MTU) - 1500

Usage Guidelines

This command configures the VPLS and VPWS parameters. PWs are point-to-point links used to carry VPN traffic between two devices within the VPLS. Each device must be configured such that packets transmitted between the endpoints are interpreted and forwarded to the local service correctly. The optional ethertype keyword may be used to overwrite the Ethertype value for the customer traffic sent across the PW. By default, the configured switch ethertype is used. If configured, the ethertype in the outer 802.1q field of the customer packet is overwritten using the configured ethertype value. The ethertype value is ignored on receipt.

Optionally, the switch can be configured to strip the 802.1q tag before sending packets over the VPLS or VPWS Layer2 VPN. This capability may be required to provide interoperability with other vendor products or to emulate port mode services. The default configuration is to include the 802.1q tag.

The mtu keyword optionally specifies the MTU value of the VPLS or VPWS transport payload packet (customer packet). The MTU value is exchanged with VPLS-configured peer nodes. All VPLS peer nodes must be configured with the same MTU value. If the MTU values do not match, PWs cannot be established between peers. The MTU values are signaled during PW establishment so that endpoints can verify that MTU settings are equivalent before establishing the PW. By default the MTU is set to 1500. The configurable MTU range is 1492 through 9216. Changing the MTU setting causes established PWs to terminate. Payload packets might be dropped if the VPLS or VPWS MTU setting is greater than the MPLS MTU setting for the PW interface.

Note

The maximum MTU value supported depends on the current configuration options. For more information, see Configure the Layer 2 VPN MTU in the ExtremeXOS Concepts Guide.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling a VPWS. For backward compatibility, the l2vpn keyword is optional when enabling a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following commands change the various parameters of a particular VPLS:

```
configure vpls vpls1 dot1q ethertype 0x8508
configure vpls vpls1 dot1q ethertype 0x8509 mtu 2500
configure vpls vpls1 dot1q tag exclude mtu 2430
configure vpls vpls1 dot1q mtu 2500
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn add peer

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **add peer** *ipaddress* {**core** {**full-mesh** | **primary** | **secondary**} | **spoke**}

Description

Configures a VPLS, H-VPLS, or VPWS peer for the node you are configuring.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
vpws_name	Specifies the VPWS for which you are configuring a peer.
ipaddress	Specifies the IP address of the peer node.
core	Specifies that the peer is a core node. This option applies only to VPLS peers.
full-mesh	Specifies that the peer is a core full-mesh node. This is the default setting if neither the core or spoke options are specified. This option applies only to VPLS peers.
primary	Specifies that the peer is an H-VPLS core node and configures a primary H-VPLS connection to that core node. This option applies only to H-VPLS peers.
secondary	Specifies that the peer is an H-VPLS core node and configures a secondary H-VPLS connection to that core node. This option applies only to H-VPLS peers.
spoke	Specifies that the peer is a H-VPLS spoke node. This option applies only to H-VPLS peers.

Default

N/A.

Usage Guidelines

Each VPLS or H-VPLS node supports up to 64 peers, and each VPWS supports one peer. H-VPLS core nodes can peer with other core nodes and/or spoke nodes. H-VPLS spoke nodes can peer with core nodes but not with other spoke nodes.

VPLS core nodes must be configured in a full-mesh with other core nodes. Thus, all core nodes in the VPLS must have a configured PW to every other core node serving this VPLS. By default, the best LSP is chosen for the PW. The underlying LSP used by the PW can be configured by specifying the named LSP using the CLI command configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] peer <ipaddress> [add | delete] mpls lsp <lsp_name>.

H-VPLS spoke nodes establish up to two point-to-point connections to peer with core nodes. If both primary and secondary peers are defined for a spoke node, the spoke node uses one of the peers for all communications. If both peers are available, the spoke node uses the connection to the primary peer. If the primary peer connection fails, the spoke node uses the secondary peer. If the primary peer later recovers, the spoke node reverts back to using the primary peer.

VPWS nodes establish a point-to-point connection to one peer.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS peer. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS peer. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command adds a connection from the local core switch to the core switch at 1.1.1.202:

```
configure l2vpn vpls vpls1 add peer 1.1.1.202
```

The following command adds a connection from the local core switch to the spoke switch at 1.1.1.201:

```
configure l2vpn vpls vpls1 add peer 1.1.1.201 spoke
```

The following command adds a primary connection from the local spoke switch to the core switch at 1.1.1.203:

```
configure l2vpn vpls vpls1 add peer 1.1.1.203 core primary
```

The following command adds a VPWS connection from the local node to the peer switch at 1.1.1.204:

```
configure l2vpn vpws vpws1 add peer 1.1.1.204
```

History

This command was first available in ExtremeXOS 11.6.

Support for H-VPLS was first available in ExtremeXOS 12.1.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn add service

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **add service** [{**vlan**} *vlan_name* | {**vman**} *vman_name*]

Description

Adds a VLAN or VMAN service to a VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string).
vpws_name	Identifies the VPWS interface within the switch (character string).
vlan_name	Logically binds the VLAN to the specified VPLS or VPWS.
vman_name	Adds the named VMAN to the VPLS or VPWS.

Default

N/A.

Usage Guidelines

Only one VLAN or VMAN can be configured per VPLS or VPWS.

When a VLAN service is added to a VPLS or VPWS, the VLAN ID is locally significant to the switch. Thus, each VLAN VPLS or VPWS interface within the Layer2 VPN can have a different VLAN ID. This greatly simplifies VLAN ID coordination between metro network access points. Traffic may be switched locally between VLAN ports if more than one port is configured for the VLAN.

When a VMAN service has been configured for a VPLS or VPWS, the VMAN ID is locally significant to the switch. Thus, each VMAN VPLS or VPWS interface within the Layer2 VPN can have a different VMAN ID, just like the VLAN service. The only difference is that the Layer2 VPN overwrites the outer VMAN tag on Layer2 VPN egress and leaves the inner VLAN tag unmodified. Because the inner VLAN tag is considered part of the customer packet data, the VMAN service can be used to emulate port-based services. This is accomplished by configuring the Layer2 VPN to strip the 802.1Q tag from the

tunneled packet. Since the switch inserts the VMAN tag when the packet is received and the 802.1Q tag is stripped before the packet is sent on the VPLS or VPWS PW, all packets received on ports that are members of the VMAN are transmitted unmodified across the Layer2 VPN. The command configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] dot1q tag exclude is used to configure the switch to strip the 802.1Q tag on the VPLS.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when adding a service to VPWS. For backward compatibility, the l2vpn keyword is optional when adding a service to VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The example below adds a VLAN and a VMAN to the named VPLS:

```
configure l2vpn vpls myvpls add service vlan myvlan
configure l2vpn vpls myvpls add service vman myvman
```

The following example adds a VLAN and a VMAN to the named VPWS:

```
configure l2vpn vpws myvpws add service vlan vlan2
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn delete peer

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **delete peer** [*ipaddress* | **all**]

Description

Deletes the specified VPLS or VPWS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).

ipaddress	Specifies the IP address for the peer node that is the endpoint of the VC-LSP. This option applies only to VPLS peers.
all	Deletes all VPLS or VPWS peers. This option applies only to VPLS peers.

Default

N/A.

Usage Guidelines

When the VPLS or VPWS peer is deleted, VPN connectivity to the peer is terminated. The all keyword can be used to delete all peers associated with the specified Layer2 VPN.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when deleting a VPWS peer. For backward compatibility, the l2vpn keyword is optional when deleting a VPLS peer. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following example removes connectivity to 1.1.1.202 from VPLS1:

```
configure vpls vpls1 delete peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn delete service

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **delete service** [{**vlan**} *vlan_name* | {**vman**} *vman_name*]

Description

Deletes the specified VLAN or VMAN service from the specified Layer2 VPN.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string).
vpws_name	Identifies the VPWS interface within the switch (character string).
vlan_name	Logically binds the VLAN to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A

Usage Guidelines

If there are no services configured for the VPLS or VPWS, all PWs within the Layer2 VPN are terminated from the switch.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when deleting a service from a VPWS. For backward compatibility, the l2vpn keyword is optional when deleting a service from a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following example removes a service interface from a VPLS:

```
configure vpls vpls1 delete vman vman1
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn health-check vccv

configure l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]] **health-check vccv** {**interval** *interval_seconds*} {**fault-multiplier** *fault_multiplier_number*}

Description

Configures the Virtual Circuit Connectivity Verification (VCCV) health check test and fault notification intervals for the specified VPLS or VPWS instance.

Syntax Description

vpls_name	Identifies the VPLS instance for which health check is to be configured.
vpws_name	Identifies the VPWS instance for which health check is to be configured.
all	Specifies that the configuration applies to all VPLS instances on the local node.
interval_seconds	Defines the interval between health check tests. The range is 1 to 10 seconds.
fault_multiplier_ number	Specifies how long health check waits before a warning level message is logged. The wait period is the interval_seconds multiplied by the fault_multiplier_number. The fault_multiplier_number range is 2 to 6.

Default

Interval is 5 seconds.

Fault mulitplier is 4.

Usage Guidelines

The VCCV health-check configuration parameters can be configured at anytime after the VPLS has been created.

The show l2vpn {vpls {{<vpls_name>} | vpws {{<vpws_name>}} {peer <ipaddress>} {detail} | summary} command displays the configured interval_seconds and fault-multiplier_number values for the VPLS or VPWS and the VCCV activity state.

The l2vpn keyword is introduced in ExtremeXOS Release 12.4 and is required when configuring health check for a VPWS. For backward compatibility, the l2vpn keyword is optional when configuring health check for a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command configures the health check feature on the VPLS instance myvpls:

```
configure vpls myvpls health-check vccv interval 10 fault-notification 40
```

History

This command was first available in ExtremeXOS 12.1.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn peer mpls lsp

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **peer** *ipaddress* [**add** | **delete**] **mpls lsp** *lsp_name*

Description

Adds or deletes a named LSP as a specified PW for the specified Layer2 VPN peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP. This option applies only to VPLS peers.
add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

If all the named LSPs are deleted from the configured Layer2 VPN peer, VPLS or VPWS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the peer, Layer2 VPN connectivity to the peer is lost. Currently, the VPLS or VPWS PW uses only one LSP.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS instance. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following examples add and remove a named LSP:

```
configure l2vpn vpls vpls1 peer 1.1.1.202 add mpls lsp “to-olympic4”
configure l2vpn vpls vpls1 peer 1.1.1.202 delete mpls lsp “to-olympic4”
```

The following example adds a named LSP for a VPWS peer:

```
configure l2vpn vpws vpws1 peer 1.1.1.203 add mpls lsp “to-olympic5”
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn peer

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **peer** *ipaddress* [**limit-learning** *number* | **unlimited-learning**]

Description

Configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS or VPWS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP. This option applies only to VPLS peers.
limit-learning	Specifies a limit to the number of MAC SAs to be learned for the specified VPLS and peer.
number	The maximum number of MAC SAs that can be learned for the specified VPLS and peer.
unlimited-learning	Specifies no limit to the number of MAC SAs to be learned for the specified VPLS and peer.

Default

Unlimited.

Usage Guidelines

This parameter can only be modified when the specified VPLS or VPWS is disabled. The unlimited-learning keyword can be used to specify that there is no limit. The default value is unlimited-learning.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS instance. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following example causes no more than 20 MAC addresses to be learned on VPLS1's PW to 1.1.1.202:

```
configure vpls vpls1 peer 1.1.1.202 limit-learning 20
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn peer mpls lsp

configure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **peer** *ipaddress* [**add** | **delete**] **mpls lsp** *lsp_name*

Description

Adds or deletes a named LSP as a specified PW for the specified Layer2 VPN peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).

ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP. This option applies only to VPLS peers.
add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

If all the named LSPs are deleted from the configured Layer2 VPN peer, VPLS or VPWS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the peer, Layer2 VPN connectivity to the peer is lost. Currently, the VPLS or VPWS PW uses only one LSP.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4 and is required when configuring a VPWS instance. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following examples add and remove a named LSP:

```
configure l2vpn vpls vpls1 peer 1.1.1.202 add mpls lsp “to-olympic4”
configure l2vpn vpls vpls1 peer 1.1.1.202 delete mpls lsp “to-olympic4”
```

The following example adds a named LSP for a VPWS peer:

```
configure l2vpn vpws vpws1 peer 1.1.1.203 add mpls lsp “to-olympic5”
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn sharing hash-algorithm

configure l2vpn sharing hash-algorithm [**crc-16** | **xor**]

Description

Informs the HW which LSP sharing hash computation to use.

Syntax Description

crc-16	Specifies that you use CRC-16 for load sharing hash computation.
xor	Specifies that you use exclusive-OR for load sharing hash computation (default).

Default

xor

Usage Guidelines

Use this command to inform the HW which LSP sharing hash computation to use.

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn sharing ipv4

configure l2vpn sharing ipv4 [**destination-only** | **L3-and-L4** | **source-and-destination** | **source-only**]

Description

Informs the HW which fields to consider for Pseudo Wire LSP sharing hashing.

Syntax Description

destination-only	Specifies that you only use the destination IP address.
L3-and-L4	Specifies that you use source and destination IP addresses, and layer 4 ports (default).

source-and-destination	Specifies that you use the source and destination IP addresses.
source-only	Specifies that you only use the source IP address only

Default

L3-and-L4.

Usage Guidelines

Use this command to inform the hardware which fields to consider for Pseudo Wire LSP sharing hashing.

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn vpls peer static-pw

configure l2vpn vpls *vpls_name* **peer** *ipaddress* **static-pw** {**transmit-label** *outgoing_pw_label* **receive-label** *incoming_pw_label* }

Description

Changes the labels of a statically configured Ethernet PW for a VPLS.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
peer	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit label	Specifies the static pseudo wire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to change the labels of a statically configured Ethernet PW for a VPLS that already exists. Either or both the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels can be specified. The peer must be similarly configured with a static PW that has the reverse PW label mappings. Locally, the ***incoming_pw_label*** must be unique and is allocated out of the static label space. The ***outgoing_pw_label*** must match the peer's configured incoming PW label. The CES or L2VPN can remain operational during the change; however, the PW will go down and come back up.

Example

The following command changes the VPLS name to ??? :

```
configure l2vpn vpls vpls1 peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn vpls redundancy

configure {**l2vpn**} **vpls** *vpls_name* **redundancy** [**esrp** *esrpDomain* | **eaps** | **stp**]

Description

Configures a VPLS instance to provide protected access using the EAPS redundancy type, the specified ESRP domain, or STP.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring protection.
eaps	Configures a VPLS instance to use the EAPS redundancy type.
esrpDomain	Configures a VPLS instance to provide protected access using the specified ESRP domain.
stp	Configures a VPLS instance to request an FDB relearning process on an adjacent node when STP responds to a topology change for a VLAN.

Default

Redundancy disabled.

Usage Guidelines

Only one redundancy mode can be configured at a time on a VPLS, and the VPLS must be disabled when the redundancy mode is configured. If you attempt to configure a second mode, an error appears. The current redundancy mode must be unconfigured before you configure a different redundancy mode.

The ESRP domain specified must be a valid ESRP domain of type vpls-redundancy. If not, the command is rejected with an appropriate error message. When a VPLS instance is associated with an ESRP domain, the user cannot delete the ESRP domain unless the VPLS redundancy has been unconfigured. For VPLS access protection to become fully functional, VPLS redundancy must also be configured on a second VPLS peer using the same VPLS name and ESRP domain.

Specify the redundancy type as EAPS when using redundant EAPS access rings. This configuration requires EAPS shared links to be configured between redundant VPLS nodes. This configures VPLS to use a PW between VPLS attachment nodes instead of using a customer VLAN. This configuration is only required when there is an EAPS ring on the VPLS service VLAN.

Note

The EAPS master should not be on a VPLS node.

The STP option enables VPLS interfaces to respond appropriately to STP topology changes in a VLAN. For example, if STP detects a link failure, it will flush the appropriate FDB entries to initiate relearning on the STP protected interfaces. When this option is selected and STP initiates relearning, the VPLS interfaces on the same VLAN also initiate relearning so that a new VLAN path to the VPLS core can be learned. For more information, including limitations and restrictions, see C_VPLS STP Redundancy Overview in the ExtremeXOS Concepts Guide.

The l2vpn keyword was introduced in ExtremeXOS Release 12.4. For backward compatibility, the l2vpn keyword is optional when configuring a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command adds redundancy to the vpls1 VPLS using the esrp1 domain:

```
configure l2vpn vpls vpls1 redundancy esrp esrp1
```

The following command specifies the EAPS redundancy type for the vpls2 VPLS:

```
configure l2vpn vpls vpls2 redundancy eaps
```

The following command specifies the STP redundancy type for the vpls3 VPLS:

```
configure l2vpn vpls vpls3 redundancy STP
```

History

This command was first available in ExtremeXOS 12.1.

The l2vpn keyword and the STP option were added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure l2vpn vpws peer static-pw

configure l2vpn vpws *vpws_name* **peer** *ipaddress* **static-pw** {**transmit-label** *outgoing_pw_label* **receive-label** *incoming_pw_label* }

Description

Changes the labels of a statically configured Ethernet PW for a VPWS.

Syntax Description

vpws_name	Specifies the VPWS for which you are configuring a peer.
peer	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit label	Specifies the static pseudo wire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to change the labels of a statically configured Ethernet PW for a VPWS that already exists. Either or both the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels can be specified. The peer must be similarly configured with a static PW that has the reverse PW label

mappings. Locally, the ***incoming_pw_label*** must be unique and is allocated out of the static label space. The ***outgoing_pw_label*** must match the peer's configured incoming PW label. The CES or L2VPN can remain operational during the change; however, the PW will go down and come back up.

Example

The following command changes the VPWS name to "vpws1".

```
configure l2vpn vpws vpws1 peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls add vlan

configure mpls add {vlan} *vlan_name*

Description

Adds an MPLS interface to the specified VLAN.

Syntax Description

vlan_name	Identifies the VLAN where the MPLS interface is added.

Default

VLANs are not configured with an MPLS interface.

Usage Guidelines

An MPLS interface must be configured on a VLAN in order to transmit or receive MPLS packets on that interface. By default, MPLS, LDP, and RSVP-TE are disabled for the MPLS interface. The specified VLAN should have an IP address configured and should have IP forwarding enabled. The MPLS interface on the VLAN does not become active until these two conditions are met. Also, if the IP address is unconfigured from the VLAN or IP forwarding is disabled for the VLAN, the MPLS interface goes down. The MPLS interface state is viewed using the show mpls interface command.

The VLAN must be operational for the MPLS interface to be up. This means that at least one port in the VLAN must be active or the VLAN must be enabled for loopback mode.

It is recommended that when you configure MPLS on an OSPF interface that can be used to reach a given destination, you should configure MPLS on all OSPF interfaces that can be used to reach that destination. (You should enable MPLS on all of the VLANs connected to the backbone network).

Example

The following example adds MPLS to the VLAN vlan_usa.

```
configure mpls add vlan vlan_usa
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls delete vlan

configure mpls delete [{**vlan**} *vlan_name* | **vlan all**]

Description

Removes an MPLS interface from the specified VLAN.

Syntax Description

vlan_name	Identifies the VLAN for which the MPLS interface is deleted.
vlan all	Deletes the MPLS interface from all VLANS that have MPLS configured.

Default

VLANs are not configured with an MPLS interface.

Usage Guidelines

An MPLS interface must be configured on a VLAN in order to transmit or receive MPLS packets on that interface. If the MPLS interface is deleted, all configuration information associated with the MPLS interface is lost. Issuing this command brings down all LDP neighbor sessions and all LSPs that are established through the specified VLAN interface. When the all VLANs option is selected, the MPLS interface for all MPLS configured VLANs is deleted.

Example

The following example deletes MPLS from the VLAN vlan_k.

```
configure mpls delete vlan vlan_k
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls exp examination

configure mpls exp examination {**value**} *value* {**qosprofile**} *qosprofile*

Description

Configures the QoS profile that is used for the EXP value when EXP examination is enabled.

Syntax Description

value	Specifies the value that is used for the EXP value.
qosprofile	Specifies the QoS profile that is used for the EXP value.

Default

The QoS profile matches the EXP value + 1

Usage Guidelines

This command configures the QoS profile that is used for the EXP value when EXP examination is enabled. By default, the QoS profile matches the EXP value + 1. That is, EXP value of 0 is mapped to QoS profile qp1, EXP value of 1 is mapped to QoS profile qp2, etc. This configuration has switch-wide significance. The EXP value must be a valid number from 0 through 7 and the qosprofile must match one of the switch's QoS profiles.

Note

EXP examination must be enabled using the “enable mpls exp examination” command before the configured EXP value to QoS profile mapping is actually used to process packets.

Example

The following command sets QoS profile q5 to be used for EXP value 7:

```
configure mpls exp examination value 7 qosprofile 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls exp replacement

configure mpls exp replacement {**qosprofile**} *qosprofile* {**value**} *value*

Description

Configures the EXP value that is used for the specified QoS profile when EXP replacement is enabled.

Syntax Description

qosprofile	Specifies the QoS profile that is used for the EXP value.
value	Specifies the value that is used for the EXP value.

Default

The EXP value matches the QoS profile -1.

Usage Guidelines

This command configures the EXP value that is used for the QoS profile when EXP replacement is enabled. By default, the EXP value matches the QoS profile - 1. That is, QoS profile qp1 is mapped to EXP value of 0, QoS profile qp2 is mapped to EXP value of 1, etc. This configuration has switch-wide significance. The qosprofile must match one of the switch's QoS profiles and the EXP value must be a valid number from 0 through 7.

Note

EXP replacement must be enabled using the “enable mpls exp replacement” command before the configured EXP value to QoS profile mapping is actually used to process packets.

Example

The following command sets EXP value 2 to be used with QoS profile 4:

```
configure mpls exp replacement qosprofile qp4 value 2
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls labels max-static

configure mpls labels max-static *max_static_labels*

Description

Configures the number of labels that are reserved for specifying the incoming label for static LSPs and static PWs.

Syntax Description

labels max-static	???
max_static-labels	Specifies the number of labels that are reserved for specifying the incoming label for static LSPs and static PWs

Default

The default static label range size is 100.

Usage Guidelines

Use this command to configure the number of labels that are reserved for specifying the incoming label for static LSPs and static PWs. The static label range generally starts at 16 and the default static label range size is 100. This means that the default static label range is 16 through 115 and can be allocated for either incoming (both transit and egress) static LSPs, or incoming static PWs. The maximum static label_range_size is equal to the incoming label table size – 100 labels for signaling. For example, the Summit X480 has a hardware incoming label capacity of 8176 (8k-16) labels for egress LSPs. The maximum number of labels available for static configuration is 8076, since at least 100 of those labels are reserved for dynamic signaling.

Since these values vary per-platform, use the **show mpls label usage** command to see details about label usage and platform capability. The minimum static label range size is 0.

Note

MPLS must be disabled when issuing this command. If MPLS is enabled, an error message is displayed and the command has no affect. All other labels, including outgoing labels for static LSPs and PWs and signaled labels used by RSVP-TE and LDP, are allocated out of the dynamic label space.

Example

The following example ???.

```
configure mpls
```

History

This command was first available in ExtremeXOS 15.4

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls ldp advertise

configure mpls ldp advertise [{direct [all | lsr-id | none]} | {rip [all | none] | {static [all | none]}

Description

Configures a filter to be used by LDP when originating unsolicited label mapping advertisements to LDP neighbors.

Syntax Description

direct	Specifies that the advertisement filter is applied to the associated FECs with directly-attached routing interfaces.
rip	Specifies that the advertisement filter is applied to FECs associated with RIP routes exported by OSPF.
static	Specifies that the advertisement filter is applied to FECs associated with static routes.
all	Specifies that unsolicited label mapping advertisements are originated for all routes of the specified type.

lsr-id	Specifies that an unsolicited label advertisement is originated for a direct route that matches the MPLS LSR ID.
none	Specifies that no unsolicited label mapping advertisements are originated for the specified route type.

Default

None—the default setting for RIP and static routing methods.

lsr-id—the default setting for direct routes.

Usage Guidelines

You can configure how the advertisement filter is applied, as follows:

- direct—The advertisement filter is applied to the FECs associated with directly-attached routing interfaces.
- rip—The advertisement filter is applied to the FECs associated with RIP routes exported by OSPF.
- static—The advertisement filter is applied to the FECs associated with static routes.

You can configure the advertisement filter, as follows:

- all—Label mappings are originated for all routes of the specified type.
- none—No label mappings are originated for all routes of the specified type. This is the default setting for RIP and static routes.
- lsr-id—A label mapping is originated for a direct route that matches the MPLS LSR ID. This is the default setting for direct routes.

Advertising labels for a large number of routes may increase the required number of labels that must be allocated by LSRs. Take care to ensure that the number of labels advertised by LERs does not overwhelm the label capacity of the LSRs.

Example

The following command configures LDP to originate labels for all local IP interfaces:

```
configure mpls ldp advertise direct all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls ldp loop-detection

configure mpls ldp loop-detection [{**hop-count** *hop_count_limit*} {**path-vector** *path_vector_limit*}]

Description

Configures the loop-detection parameters used by LDP.

Syntax Description

hop-count	Configures the number of LSRs that the label message can traverse.
hop_count_limit	Specifies the hop count limit. The valid configuration range is from 1 to 255.
path-vector	Configures the maximum number of LSR IDs that can be propagated in the label message.
path_vector_limit	Specifies the path vector limit. The valid configuration range is from 1 to 255.

Default

The default for the hop-count and path-vector limits is 255.

Usage Guidelines

Configuration changes are only applicable to newly created LDP sessions. Disabling and enabling LDP forces all the LDP sessions to be recreated. LDP loop detection must first be enabled for these configuration values to be used.

Example

This command sets the LDP hop count loop detection value to 10. The configured path vector value remains at 255.

```
configure mpls ldp loop-detection hop-count 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls ldp pseudo-wire

configure mpls ldp pseudo-wire parm-mismatch-recovery ces [auto | none]

Description

Enables or disables automatic recovery from parameter mismatch.

Syntax Description

auto	Allow automatic recovery from parameter mismatch.
none	Disable automatic recovery from parameter mismatch.

Default

The default is auto.

Usage Guidelines

If interface parameters do not match during pseudo wire signaling, the remote side may release our VC label which will prevent the pseudo wire from coming up. If this is detected, the system will attempt automatic recovery to bring the pseudo wire up if this configuration setting is auto. This automatic recovery can be disabled by setting the parameter mismatch recovery to none.

Example

To disable automatic recovery:

```
config mpls ldp pseudo-wire parm-mismatch-recovery ces none
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on the cell site routers (E4G-200 and E4G-400).

configure mpls ldp timers

configure mpls ldp timers [**targeted** | **link**] [{**hello-time** *hello_hold_seconds*} {**keep-alive-time** *keep_alive_hold_seconds*}]

Description

Configures LDP peer session timers for the switch.

Syntax Description

targeted	Specifies targeted LDP sessions.
link	Specifies link LDP sessions.
hello_hold_seconds	The amount of time (in seconds) that a hello message received from a neighboring LSR remains valid. The rate at which Hello messages are sent is 1/3 the configured hello-time. If a Hello message is not received from a particular neighboring LSR within the specified hello_hold_seconds, then the hello-adjacency is not maintained with that neighboring LSR. The range is 6 to 65,534 seconds.
keep_alive_hold_seconds	The time (in seconds) during which an LDP message must be received for the LDP session with a particular peer LSR to be maintained. If an LDP PDU is not received within the specified session keep_alive_hold_seconds, the corresponding LDP session is torn down. The range is 6 to 65,534 seconds.

Default

link <hello_hold_seconds> – 15 seconds

targeted <hello_hold_seconds> – 45 seconds

link <keep_alive_hold_seconds> – 40 seconds

targeted <keep_alive_hold_seconds> – 60 seconds

Usage Guidelines

The LDP peer hello-adjacency timers are separately configurable for link and targeted LDP sessions. The hello timer parameter specifies the amount of time (in seconds) that a Hello message received from a neighboring LSR remains valid. The rate at which Hello messages are sent is 1/3 the configured hello-time. If a Hello message is not received from a particular neighboring LSR within the specified hello_hold_seconds, then the hello-adjacency is not maintained with that neighboring LSR.

The session keep_alive_hold_seconds parameter specifies the time (in seconds) during which an LDP message must be received for the LDP session to be maintained. The rate at which Keep Alive messages are sent, provided there are no LDP messages transmitted, is 1/6 the configured keep-alive-time. If an LDP PDU is not received within the specified session keep_alive_hold_seconds interval, the corresponding LDP session is torn down. The minimum and maximum values for hold timers are 6 and 65,534, respectively.

Changes to targeted timers only affect newly created targeted sessions. Disabling and then enabling VPLS or LDP causes all current targeted sessions to be re-created. The default values for the various times are as follows: link <hello_hold_seconds> (15), link <keep_alive_hold_seconds> (40), targeted <hello_hold_seconds> (45), and targeted <keep_alive_hold_seconds> (60). Changes to the link keep-alive timers do not take effect until the LDP session is cycled.

Example

The following command configures link-level LDP hello adjacency hold time to 30 seconds and the keep alive time to 10 seconds:

```
configure mpls ldp timers link hello-time 30 keep-alive-time 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls lsr-id

configure mpls lsr-id *ipaddress*

Description

Configures the MPLS LSR ID for the switch.

Syntax Description

ipaddress	Specifies an IP address to identify the MPLS LSR for the switch. The MPLS LSR-ID should be configured to the same IP address as the OSPF Router ID.

Default

No LSR ID is configured by default.

Usage Guidelines

LDP, RSVP-TE, and L2 VPNs all use the LSR ID. It is normally set to the OSPF Router ID.

The LSR ID must be configured before MPLS can be enabled. The LSR ID cannot be changed while MPLS is enabled. It is highly recommended that an IP address be configured on a OSPF enabled loopback VLAN that matches the configured LSR ID and OSPF ID. If an LSR ID loopback IP address is configured, OSPF automatically advertises the LSR ID as a routable destination for setting up LSPs. The LSR ID remains active if an interface goes down if the LSR-ID is configured as an IP address on a loopback VLAN, as recommended. This significantly enhances network stability and operation of an MPLS network.

Example

The following command configures the LSR ID to 192.168.50.5

```
configure mpls lsr-id 192.168.50.5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te bandwidth committed-rate

configure mpls rsvp-te bandwidth committed-rate *committed_bps* [**Kbps** | **Mbps** | **Gbps**] [{**vlan**} *vlan_name* | **vlan all**] {**receive** | **transmit** | **both**}

Description

Specifies the maximum amount of Committed Information Rate (CIR) bandwidth which can be used by RSVP-TE LSP reservations.

Syntax Description

committed_bps	Specifies a bitrate for the bandwidth to be reserved.
Kbps	Specifies the designated bitrate in kilobits per second.
Mbps	Specifies the designated bitrate in megabits per second.
Gbps	Specifies the designated bitrate in gigabits per second.
vlan	Specifies that the bandwidth is to be reserved for a specific VLAN.
vlan_name	Identifies the VLAN for which the bandwidth is reserved.
vlan all	Specifies that the bandwidth is reserved for all VLANS that have MPLS configured.
receive	Specifies that the bandwidth is reserved for ingress traffic only.
transmit	Specifies that the bandwidth is reserved for egress traffic only.
both	Specifies that the bandwidth is reserved for both ingress and egress traffic.

Default

The default is zero, which means no RSVP-TE LSP bandwidth reservations are accepted.

If bandwidth is specified without specifying traffic direction, the default is both directions.

Usage Guidelines

This command specifies the maximum amount of Committed Information Rate (CIR) bandwidth which can be used by dynamic RSVP-TE LSP bandwidth reservations. By sub-allocating reserveable bandwidth for RSVP-TE from the VLAN's available bandwidth, the switch can guarantee that as LSPs are established, a minimum amount of CIR bandwidth is available for other traffic.

Note

Beginning with ExtremeXOS Release 12.2.1, CIR bandwidth for the receive direction is not tracked by TE IGPs, such as OSPF-TE, and configuring it is not required. Configuring CIR bandwidth for the receive direction does not prevent an LSP from going operational due to lack of receive bandwidth; however, it can be useful for tracking and informational purposes. An Info level log (MPLS.RSVPTE.IfRxBwdthExcd) is generated if the setup of a TE LSP requires receive bandwidth greater than that which is currently available for the receive direction on a particular interface. This generally happens only when TE LSPs with different previous hops ingress the switch on the same interface (for example, from a multi-access link) and egress the switch on different interfaces.

The keyword both configures the reserved bandwidth for both ingress and egress LSP CIR reservations and overwrites any previous receive or transmit settings.

Example

The following command reserves 25 Mbps of CIR bandwidth for all RSVP-TE CIR reservations on the specified VLAN:

```
configure mpls rsvp-te bandwidth committed-rate 25 Mbps vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp add path

configure mpls rsvp-te lsp *lsp_name* **add path** [*path_name* | **any**] {**profile** *profile_name*} {**primary** {*frr_profile_name*} | **secondary**}

Description

Adds a configured path to the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the name of the LSP you are configuring.
path_name	Specifies the name of the path to be used by the specified LSP.
any	Configures the specified LSP to use any path.
profile_name	Specifies a profile to be applied to the specified LSP. If the profile name is omitted, the profile named default is used.
primary	Designates the specified path as the primary path. Only one primary path can be configured for an RSVP-TE LSP. If this option is omitted and no primary path has been specified, the specified path is added as a primary path. If not specified and a primary path has already been added, the path is added as a secondary path.
secondary	Designates the specified path as a secondary path.
frr_profile_name	Specifies a fast reroute (FRR) profile to be applied to the detour LSP that backs up the specified LSP.

Default

N/A.

Usage Guidelines

The LSP is not signaled until a path is added to the LSP.

If you want fast reroute protection for the LSP, use the primary option and specify the fast reroute profile name you want to use. To specify the default fast reroute profile, enter default-frr.

The switch chooses the local MPLS VLAN interface from which to signal the LSP. To force an LSP to use a specific local MPLS interface, configure the local interface IP address as the first ERO in the associated path.

Example

This command adds the path sydney-bypass to the LSP named aus as a secondary path:

```
configure mpls rsvp-te lsp aus add path sydney-bypass secondary
```

History

This command was first available in ExtremeXOS 11.6.

The fast reroute capability was added in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp change

configure mpls rsvp-te lsp *lsp_name* **change** [*path_name* | **any**] **use profile** [{*standard_profile_name*} {*frr_profile_name*}]

Description

Changes the configuration that has been configured with the `configure mpls rsvp-te lsp <lsp_name> add path [<path_name> | any] {profile <profile_name>} {primary {<frr_profile_name>} | secondary}` command.

Syntax Description

lsp_name	Specifies the name of the LSP you are changing.
path_name	Specifies the name of the path to be used by the specified LSP.
any	Configures the specified LSP to use any path.
standard_profile_ name	Specifies a profile to be applied to the specified LSP. If the profile name is omitted, the profile named default is used.
frr_profile_name	Specifies a fast reroute (FRR) profile to be applied to the detour LSP that backs up the specified LSP.

Default

N/A.

Usage Guidelines

None.

Example

This command changes the LSP named aus to use any available path:

```
configure mpls rsvp-te lsp aus change any
```

History

This command was first available in ExtremeXOS 11.6.

The fast reroute capability was added in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp delete path

configure mpls rsvp-te lsp *lsp_name* **delete path** [*path_name* | **any** | **all**]

Description

Deletes a path from the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies a name for the RSVP-TE LSP.
path_name	Specifies a name for the path to be deleted from the RSVP-TE LSP.
any	Configures the specified LSP to use any path.
all	Deletes all added paths from the specified RSVP-TE LSP.

Default

N/A.

Usage Guidelines

This command deletes a path from the specified RSVP-TE LSP. All the added paths can be deleted by specifying the all keyword. If the active path is deleted, then one of the other configured paths becomes the active path for the LSP. If there are no other defined paths, then the LSP is marked down and cannot be used to forward IP or VPN traffic.

Example

The following command deletes the path called through-knightsbridge for the LSP london:

```
configure mpls rsvp-te lsp london delete path through-knightsbridge
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp fast-reroute

configure mpls rsvp-te lsp *lsp_name* **fast-reroute** [**enable** | **disable**]

Description

Enables or disables fast-reroute protection for the specified LSP.

Syntax Description

lsp_name	Specifies the name of the LSP you are configuring.

Default

Disabled.

Usage Guidelines

To signal the fast-reroute protected LSP, use the enable mpls rsvp-te lsp [<lsp_name> | all] command. Similarly, to disable the fast-reroute protected LSP, use the disable mpls rsvp-te lsp [<lsp_name> | all] command.

Example

This command enables fast-reroute protection on LSP aus:

```
configure mpls rsvp-te lsp aus fast-reroute enable
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp path use profile

configure mpls rsvp-te lsp *lsp_name* **path** [*path_name* | **any**] **use profile** *profile_name*

Description

Changes the profile that the configured LSP path uses.

Syntax Description

lsp_name	Specifies the RSVP-TE LSP.
path_name	Specifies the configured RSVP-TE LSP path.
profile_name	Specifies a profile to be applied to the configured LSP path.

Default

N/A.

Usage Guidelines

This command changes the profile that the configured LSP path uses.

Note

Changing the profile while an LSP is active may cause the LSP to be torn down and re-signaled.

Example

The following command configures the switch to apply the LSP profile gold-class to the LSP path sydney-bypass for the LSP aus:

```
configure mpls rsvp-te lsp aus path sydney-bypass use profile gold-class
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te lsp transport

configure mpls rsvp-te lsp *lsp_name* **transport [ip-traffic [allow | deny] | vpn-traffic [allow {all | assigned-only} | deny]]**

Description

Configures the type of traffic that may be transported across a named LSP.

Syntax Description

lsp_name	Specifies the RSVP-TE LSP.
ip-traffic	Controls the forwarding of routed IP traffic across the specified LSP.
vpn-traffic	Controls the forwarding of VPN traffic over the LSP.
allow	Allows transport of the specified traffic across the LSP.
deny	Denies transport of the specified traffic across the LSP.
allow	Allows all VPLS VPN traffic to be transported across the LSP.
all	Allows the transmission of all VPN traffic over the LSP.
assigned-only	Limits the transport of VPN traffic to VPLS instances that are explicitly configured to use the specified LSP name

Default

The default behavior is to allow RSVP-TE LSPs to transport all types of traffic without restriction.

Usage Guidelines

This command configures the type of traffic that may be transported across a named LSP. By default, both IP traffic and VPN traffic are set to allow transport for a newly created LSP. The ip-traffic keyword is used to allow or deny forwarding of routed IP traffic across the specified LSP. If allowed, the LSP label information is inserted into the routing table and the switch forwards traffic over the LSP that matches the IP route entry to which this LSP is associated. If denied, the LSP label information is removed from the routing table and the switch does not use the LSP to transport IP traffic. The vpn-traffic keyword controls the transmission of VPN traffic over the LSP. When denied, the LSP is not used as a transport for PWs or other VPN related traffic. These transport configuration options are independent. For example, if vpn-traffic is set to allow and ip-traffic is set to deny, then no routed IP traffic is transported across the LSP, but the LSP may still be used to transport VPN traffic.

The optional assigned-only keyword limits the transport of VPN traffic to only those VPLS instances that are explicitly configured to use the specified LSP name.

Example

The following command prevents the switch from using LSP aus to forward IP traffic:

```
configure mpls rsvp-te lsp aus transport ip-traffic deny
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te metric

configure mpls rsvp-te metric [*value* | **use-igp**] {**vlan**} *vlan_name*

Description

Configures the TE metric value for the RSVP-TE interface specified by the vlan_name argument.

Syntax Description

value	Specifies a value for the RSVP-TE metric.
vlan	Specifies that the RSVP-TE metric is configured for a specific VLAN.
vlan_name	Identifies the VLAN for which the RSVP-TE metric is configured.

Default

The associated default IGP metric.

Usage Guidelines

The TE metric can be any unsigned non-zero 32-bit integer. The default value for the RSVP-TE interface is to use the associated default IGP metric. The TE metric is exchanged between OSPF routers and is used in the calculation of the CSPF topology graph.

Example

The following command configures an RSVP-TE metric of 220 on the specified VLAN:

```
configure mpls rsvp-te metric 220 vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te path add ero

configure mpls rsvp-te path *path_name* **add ero** *ipNetmask* **[strict|loose] {order** *number***}**

Description

Adds an IP address to the Explicit Route Object (ERO) for the specified path name.

Syntax Description

path_name	Specifies the path to which the IP address is added.
ipNetmask	Specifies an IP prefix.
strict	Specifies that the subobject must be topologically adjacent to the previous subobject in the ERO list.
loose	Specifies that the subobject need not be topologically adjacent to the previous subobject in the ERO list.
number	Specifies the LSR path order

Default

The order value defaults to 100 if the path has no EROs configured or a value 100 more than the highest order number configured for the path.

Usage Guidelines

This command adds an IP address to the Explicit Route Object (ERO) for the specified path name. The RSVP-TE routed path may be described by a configured sequence of the LSRs and/or subnets that the path traverses. Each defined LSR or subnet represents an ERO subobject. Up to 64 subobjects can be added to each path name. The ERO keyword identifies an LSR using an IP prefix, which may represent an LSR's Router ID, loopback address, or direct router interface. Each IP prefix is included in the ERO as an IPv4 subobject.

If the ERO is specified as strict, the strict subobject must be topologically adjacent[13] to the previous subobject as listed in the ERO. If the ERO is specified as loose, the loose subobject is not required to be topologically adjacent to the previous subobject as listed in the ERO. If the specified IP prefix matches the OSPF router ID or a configured loopback IP address, the ERO must be configured as loose.

The LSR path order is optionally specified using the order keyword. The order number parameter is an integer value from 1 to 65535. IP prefixes with a lower number are sequenced before IP prefixes with a higher number. Thus, the LSP path follows the configured path of IP prefixes with a number value from low to high. If the order keyword is not specified, the number value for the LSR defaults to a value equal to the current highest number value plus 100. If the list of IP prefixes added to the path does not reflect an actual path through the network topology, the path message is returned with an error from a downstream LSR and the LSP is not established.

[13] "Topologically adjacent" indicates that the router next hop matches either the interface IP address or OSPF router ID of an immediate peer LSR.

The order of a configured subobject cannot be changed. The ERO subobject must be deleted and re-added with a different order. If a subobject is added to or deleted from the ERO while the associated LSP is established, the path is torn down and is re-signaled using the new ERO. Duplicate ERO subobjects are not allowed.

Defining an ERO for the path is optional. If no ERO is configured, the path is signaled along the best available path and the ERO is not included in the path message. When the last subobject in the ERO of the path message is reached and the egress IP node of the path has not been reached, the remaining path to the egress node is signaled along the best available path. If the next subobject in the ERO is loose, the best available path to the next subobject is chosen. Configuring EROs could lead an LSP to take an undesirable path through the network, so care should be taken when specifying EROs.

Example

The following example adds the IP interface address 197.57.30.7/24 as a loose ERO to the path sydney-bypass:

```
configure mpls rsvp-te path sydney-bypass add ero 197.57.30.7/24 loose
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te path delete ero

configure mpls rsvp-te path *path_name* **delete ero** [**all** | *ipNetmask* | **order** *number*]

Description

Deletes a subobject from the Explicit Route Object (ERO) for the specified path name.

Syntax Description

path_name	Specifies the path from which the ERO is deleted.
all	Specifies that the entire ERO should be deleted from the named path.
ipNetmask	Specifies the ERO subobject to be deleted.
number	Specifies the order number of the ERO subobject to be deleted.

Default

N/A.

Usage Guidelines

This command deletes a subobject from the Explicit Route Object (ERO) for the specified path name. The ERO subobject is specified using an IP prefix or order number. If a subobject is deleted from an ERO while the associated LSP is established, the path is torn down and is re-signaled using a new ERO. The all keyword may be used to delete the entire ERO from the path name. When there is no configured ERO, the path is no longer required to take an explicit routed path. The path is then signaled along the best available path and no ERO is included in the path message.

Example

The following command deletes all the configured EROs from the path sydney-bypass:

```
configure mpls rsvp-te path sydney-bypass delete ero all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te profile

configure mpls rsvp-te profile *profile_name* {**bandwidth** [**best-effort** | [{**committed-rate** *committed_bps* [**Kbps** | **Mbps** | **Gbps**]} {**max-burst-size** *burst_size* [**Kb** | **Mb**]} {**peak-rate** *peak_bps* [**Kbps** | **Mbps** | **Gbps**]}]} {**hold-priority** *hold_priority*} {**mtu** [**number** | **use-local-interface**]} {**record** [**enabled** {**route-only**} | **disabled**]} {**setup-priority** *setup_priority*}{[**Cosprofile cosprofile** | **default-cosprofile**]}

Description

Configures an RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Specifies the LSP profile.
bandwidth	Specifies bandwidth reservation.
best-effort	Indicates no bandwidth reservation.

committed_bps	Specifies the committed bandwidth to be reserved across the MPLS network, in bits per second. The range is from 64 Kbps to 10 Gbps.
peak_bps	Specifies the maximum bandwidth signaled in bits per second. The range is from 64 Kbps to 10 Gbps.
Kbps	Specifies the designated bitrate in kilobits per second.
Mbps	Specifies the designated bitrate in megabits per second.
Gbps	Specifies the designated bitrate in gigabits per second.
burst_size	Specifies the maximum number of bytes (specified in bits) that the LSP is allowed to burst above the specified peak-rate. The range is from 0 to 1000 Mb.
Kb	Kilobits
Mb	Megabits
hold_priority	Specifies the priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7.
setup_priority	Specifies the priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7.
number	Specifies the MTU value for the LSP. The range is from 296 to 9216/
use-local-interface	Specifies that the MTU value is inherited from the local egress VLAN interface.
record	Configures hop-by-hop path recording.
enabled route-only	Causes the Record Route Object (RRO) to be inserted into the path message. The enabled option enables recording of hops and labels. The enabled route-only option records only hops.
disabled	Specifies that no RRO is inserted into the path message.
cosprofile	This command configures the Class of Service for a RSVP-TE LSP, and specifies the name of the COS profile CP1, CP2, ... CP8. Default is CP1 and represents Best Effort class of Service. CP8 is the highest COS profile.

Default

Bandwidth: Newly-created profiles are configured as best-effort. Setup-priority: 7 (lowest) Hold-priority: 0 (highest) Path recording: disabled MTU: use-local-interface

If the Cosprofile is not specified for an LSP, it is assumed to be in the default CosProfile CP1.

Usage Guidelines

A profile is a set of attributes that are applied to the LSP when the LSP is configured using the configure mpls rsvp-te lsp command. A default profile is provided which cannot be deleted, but may be applied to any TE LSP. The profile_name for the default profile is default. The default profile parameter values are initially set to their respective default values. The maximum number of configurable profiles is 1000.

LSPs may signal reserved bandwidth. By default, newly created profiles are configured to not signal bandwidth requirements and thus are classified as best-effort. If bandwidth needs to be reserved across the MPLS network, the bandwidth parameters specify the desired reserved bandwidth for the

LSP. The committed-rate specifies the mean bandwidth and the peak-rate specifies the maximum bandwidth signaled. The peak-rate must be equal to or greater than the committed-rate. If the peak-rate is not specified, traffic is not clipped above the committed-rate setting. The rates are specified in bps and must be qualified by Kbps, Mbps, or Gbps. The minimum and maximum bandwidth rates are 64 Kbps and 10 Gbps, respectively. The max-burst-size specifies the maximum number of bytes (specified in bits) that the LSP is allowed to burst above the specified peak-rate. The minimum burst size is 0 and the maximum burst size is 1000 Mb.

The setup-priority and hold-priority are optional parameters indicating the LSP priority. During path set up, if the requested bandwidth cannot be reserved through the LSR, the setup-priority parameter is compared to the hold-priority of existing LSPs to determine if any of the existing LSPs need to be preempted to allow a higher priority LSP to be established. Lower numerical values represent higher priorities. The setup-priority range is 0 to 7 and the default value is 7 (lowest). The hold-priority range is also 0 to 7 and the default value is 0 (highest). If bandwidth is requested for the LSP, the CSPF calculation uses the available bandwidth associated with the CoS as specified by the hold-priority.

The bandwidth, hold-priority, and setup-priority values are signaled in the path message. If the bandwidth setting is changed, all LSPs using this profile are re-signaled. If the bps setting is decreased, a new path message is sent along the LSP indicating the new reservation. If the bps setting is increased, the LSP is torn down and resignaled using the new bandwidth reservations.

The record command is used to enable hop-by-hop path recording. The enabled keyword causes the Record Route Object (RRO) to be inserted into the path message. The RRO is returned in the RESV Message and contains a list of IPv4 subobjects that describe the RSVP-TE path. Path recording by default is disabled. When disabled, no RRO is inserted into the path message.

The mtu keyword optionally specifies the MTU value for the LSP. By default, this value is set to use-local-interface. In the default configuration, the MTU value is inherited from the local egress VLAN interface. The minimum MTU value is 296 and the maximum value is 9216. Path MTU information is carried in the Integrated Services or Null Service RSVP objects and is used by RSVP to perform path MTU identification.

Note

Changing any of the profile parameters causes LSPs using the profile to be torn down and re-signaled. There is no guarantee that the re-signaled LSP will be successfully established. Future ExtremeXOS implementations may support the make-before-break LSP concept.

To view a profile configuration, enter the following command:

```
show mpls rsvp-te profile {<profile_name>} {detail}
```

To view LSP recorded route information, enter one of the following commands:

```
show mpls rsvp-te lsp [ingress {fast-reroute} | <ingress_lsp_name> |
ingress <ingress_lsp_name> | ingress [destination | origin] <ipaddress>]
{[all-paths | detail] | summary | down-paths {detail}}
show mpls rsvp-te lsp [egress | transit] {fast-reroute}
```

```
{{<lsp_name>} {[destination | origin] <ipaddress>} {detail} | summary}
```

Example

The following command configures the RSVP-TE profile gold-class with a committed bandwidth of 100 Mbps and the setup and hold priorities are both set to 0 (highest priority):

```
configure mpls rsvp-te profile gold-class bandwidth committed-rate 100 mbps
hold-priority 0 setup-priority 0
```

The following example configures the Cosprofile to CP3:

```
  configure mpls rsvp-te profile gold-class bandwidth committed-rate 100 mbps
holdpriority 0 setup-priority 0 Cosprofile CP3
```

History

This command was first available in ExtremeXOS 11.6.

The cosprofile keyword was added int ExtremeXOS 15.3.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te profile (fast-reroute)

configure mpls rsvp-te profile *frr_profile_name* {**bandwidth** *bandwidth_rate_bps bandwidth_rate_unit*} {**detour** {**hop-limit** *hop_limit_value*} {**bandwidth-protection** [**enabled** | **disabled**]} {**node-protection** [**enabled** | **disabled**]}} {**hold-priority** *hold_priority_value*} {**setup-priority** *setup_priority_value*}

Description

Configures the specified RSVP-TE FRR profile.

Syntax Description

frr_profile_name	Specifies the FRR LSP profile to configure.
bandwidth_rate_bps	Specifies the bandwidth requirement for the FRR LSP. This should be set to match the options chosen for the protected LSP. Otherwise, a mismatch between the bandwidth settings for the detour and protected LSPs can impact service.

bandwidth_rate_unit	Specifies the units for the bandwidth rate. Valid entries are Kbps, Mbps, and Gbps.
detour	Specifies the detour method of fast reroute. This is the only method supported in this release.
hop_limit_value	Specifies the maximum number of hops that the detour path is allowed to take from the current node or point of local repair (PLR) to a merge point (MP) node. If set to 0, only link protection is provided.
bandwidth-protection	When enabled, this option specifies that the signaled bandwidth on the detour path must be guaranteed. If this option is disabled, the detour path might not support the bandwidth needed for the protected LSP.
node-protection	When enabled, the this option indicates to the PLRs along a protected path that a detour path that bypasses at least the next node of the protected LSP is desired. If this option is disabled, the backup path might or might not bypass the next node, in which case the user might or might not have next-node protection.
hold_priority	Specifies the hold priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7. Hold priority is used when deciding whether a session can be preempted by another session. This works exactly the same as the hold-priority set in the standard profile that is valid for the protected LSP and for standard LSPs.
setup_priority	Specifies the setup priority of the LSP. Lower numbers indicate higher priority. The range is from 0 to 7. The setup priority is used when deciding whether the detour LSP can preempt another session. This works exactly the same as the setup-priority set in the standard profile that is valid for the protected LSP and standard LSPs.

Default

Bandwidth: Newly-created profiles are configured as best-effort. Setup-priority: 7 (lowest) Hold-priority: 0 (highest) Hop-limit: 3 Protect-bandwidth: enabled Protect-node: enabled

Usage Guidelines

A FRR profile is a set of attributes that are applied to the detour and protected LSPs when a protected LSP is configured. A default profile (frr-default) is provided which cannot be deleted, but can be applied to any protected LSP. The maximum number of configurable profiles is 1000.

Note

Changing any of the profile parameters causes LSPs using the profile to be torn down and re-signaled. There is no guarantee that the re-signaled LSP will be successfully established. Future ExtremeXOS implementations may support the make-before-break LSP concept.

Example

The following command configures the FRR profile frrprofile for 100 Mbps bandwidth:

```
configure mpls rsvp-te profile frrprofile bandwidth 100 Mbps
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te timers lsp rapid-retry

configure mpls rsvp-te timers lsp rapid-retry {**decay-rate** *percent*} {**delay-interval** *milliseconds*} {**retry-limit** [*number*]}

Description

Configures the timers associated with rapidly retrying failed LSPs.

Syntax Description

percent	Specifies a percent increase in the interval allowed before each subsequent attempt to re-signal an LSP. The valid range is from 0 to 100 percent.
milliseconds	Specifies the time (in milliseconds) to wait before attempting to re-signal the LSP.
retry-limit	Specifies the maximum allowed attempts to establish an LSP.
number	Specifies a maximum number of allowed attempts to establish an LSP. The valid number range is from zero to 255.

Default

Delay interval: 500 milliseconds Decay rate: 50% Retry limit: 10

Usage Guidelines

This command configures the timers associated with rapidly retrying failed LSPs. If an LSP fails to establish, the switch attempts to rapidly retry the setup by sending additional path messages based on the rapid-retry timers. The delay-interval timer specifies the time (in milliseconds) to wait before sending another path message. If the LSP fails to establish itself on subsequent attempts, the delay-interval time is incremented based on the decay-rate setting. The decay operation multiplies the delay-interval time by the decay rate, and adds the result to the current delay-interval time.

For example, if the decay-rate is set to 50 percent and the current delay-interval time is 500 milliseconds, a path message is retransmitted in 750 milliseconds. If the LSP fails to establish on the next attempt, a path message is retransmitted after a further decayed delay interval of 1125 milliseconds (1.125 seconds). A per-LSP delay-interval time is maintained for each LSP until the LSP is established. This process of decaying the retry time continues until the LSP is established or the retry-limit expires. If the retry-limit is reached, attempts to rapidly retry the LSP are suspended.

When the switch starts the process of re-signaling the LSP based on the standard-retry timers, the LSP's rapid-retry timers return to the initial configuration settings. If the standard-retry delay-interval time is reached before all of the rapid-retry attempts have completed, the standard-retry mechanisms take over.

The default rapid-retry LSP timer parameter values are 500 milliseconds for the delay-interval, 50 percent for the decay-rate, and a retry-limit of 10. The valid range for delay-interval is 10 to 1000 milliseconds. The valid decay-rate range is 0 to 100 percent. The valid retry-limit is 0 to 100. A value of 0 indicates that the LSP is not re-signaled using the rapid-retry timers.

When summary-refresh or bundle-message is enabled, the rapid-retry timer values are used for resending any message that is not acknowledged.

Note

RSVP-TE must be disabled before these parameters can be modified.

Example

The following command sets the maximum number of rapid retries to five:

```
configure mpls rsvp-te timers lsp rapid-retry retry-limit 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te timers lsp standard-retry

configure mpls rsvp-te timers lsp standard-retry {**decay-rate** *percent*} {**delay-interval** *seconds*} {**retry-limit** [*number* | **unlimited**]}

Description

Configures the timers associated with the establishment of an LSP.

Syntax Description

percent	Specifies a percent increase in the interval allowed before each subsequent attempt to re-signal an LSP. The valid range is from 0 to 100 percent.
seconds	Specifies the time (in seconds) to wait before attempting to re-signal the LSP.

retry-limit	Specifies the maximum allowed attempts to establish an LSP.
number	Specifies a maximum number of allowed attempts to establish an LSP. The valid number range is from zero to 255.
unlimited	Allows unlimited attempts to establish an LSP.

Default

Delay interval: 30 seconds Decay rate: 0% Retry limit: unlimited

Usage Guidelines

This command configures the timers associated with the establishment of an LSP. If an LSP fails to establish, the LSP is re-signaled based on the configuration of these timers. The delay-interval timer specifies the time (in seconds) to wait before attempting to re-signal the LSP. If the LSP fails to establish itself on subsequent attempts, the delay-interval time is incremented based on the decay-rate setting. The decay operation multiplies the delay-interval time by the decay rate, and adds the result to the current delay-interval time. For example, if the decay-rate is set to 50 percent and the current delay-interval time is 30 seconds, the LSP is re-signaled in 45 seconds. If the LSP failed to establish on the next attempt, the delay interval would be further decayed to 67 seconds.

A per-LSP delay-interval time is maintained for each LSP until the LSP is established. This operation of decaying the retry time continues until the LSP is established or the retry-limit expires. If the retry-limit is reached, attempts to establish the LSP are suspended.

Disabling and enabling the LSP resets the LSP's delay-interval time and retry-limit to the initial configuration settings and LSP establishment attempts resume. The default LSP timer parameter values are 30 seconds for delay-interval, with a 0 percent decay-rate, and retry-limit of unlimited. The valid range for delay-interval is 1 to 60 seconds. The valid decay-rate range is 0 to 100 percent. The valid retry-limit is 0 to 255 or unlimited. A value of 0 indicates that the LSP is not re-signaled.

Note

RSVP-TE must be disabled before these parameters can be modified.

Example

The following command allows unlimited retries for establishing MPLS RSVP-TE LSPs:

```
configure mpls rsvp-te timers lsp standard-retry retry-limit unlimited
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls rsvp-te timers session

configure mpls rsvp-te timers session[{**bundle-message-time** *bundle_message_milliseconds*} {**hello-keep-multiplier** *hello_keep_number*} {**hello-time** *hello_interval_seconds*}{**refresh-keep-multiplier** *refresh_keep_number*} {**refresh-time** *refresh_seconds*}{**summary-refresh-time** *summary_refresh_milliseconds*}] [{**vlan**} *vlan_name* | **vlan all**]

Description

Configures the RSVP-TE protocol parameters for the specified VLAN.

Syntax Description

bundle_message_milliseconds	Specifies the maximum time a transmit buffer is held to allow multiple RSVP messages to be bundled into a single PDU. The valid range is from 50 to 3000 milliseconds.
hello_keep_ number	Specifies the number of hello-time intervals that can elapse before an RSVP-TE peer is declared unreachable. The range is from one to 255.
hello_interval_ seconds	Specifies the RSVP Hello packet transmission interval. The valid range is from 1 to 60 seconds.
refresh_keep_ number	Specifies a factor to be used in calculating the maximum allowed interval without an RSVP refresh message before an RSVP session is torn down. The range is from one to 255.
refresh_seconds	Specifies the interval for sending refresh path messages. The range is from 1 to 600 seconds.
summary_refresh_milliseconds	Specifies the interval for sending summary refresh messages. The valid range is from 50 (1/20 second) to 10000 (10 seconds).
vlan	Specifies that the configured protocol parameters are for a specific VLAN.
vlan_name	Identifies a particular VLAN for which the protocol parameters are configured.
vlan all	indicates that the protocol configuration parameters apply to all RSVP-TE enabled VLANs.

Default

Bundle-message-time: 1000 milliseconds (1 second) Hello-keep-multiplier value: three Hello-time: 3 seconds Refresh-keep-multiplier value: three Refresh-time: 30 seconds Summary-refresh-time: 3000 milliseconds (3 seconds)

Usage Guidelines

This command configures the RSVP-TE protocol parameters for the specified VLAN. The VLAN keyword all indicates that the configuration changes apply to all VLANs that have been added to MPLS.

The hello-time value specifies the RSVP hello packet transmission interval. The RSVP hello packet enables the switch to detect when an RSVP-TE peer is no longer reachable. If an RSVP hello packet is not received from a peer within the configured interval, the peer is declared down and all RSVP sessions to and from that peer are torn down. The formula for calculating the maximum allowed interval is: [hello-time * hello-keep-multiplier]. The default hello-interval time is 3 seconds with a valid range from 1 to 60 seconds. The default hello-keep-multiplier value is three with a range from one to 255.

The refresh-time specifies the interval for sending refresh path messages. RSVP refresh messages provide “soft state” link-level keep-alive information for previously established paths and enable the switch to detect when an LSP is no longer active. Path messages are used to refresh the LSP if summary refresh is disabled. If summary refresh is enabled, summary refresh messages are sent in place of sending individual path messages for every LSP. The default refresh-time is 30 seconds. The minimum and maximum refresh-time values are one and 600 (or 10 minutes) respectively.

If summary refresh is enabled, summary refresh messages are sent at intervals represented by the configured summary-refresh-time. The configurable summary-refresh-time range is 50 milliseconds (one twentieth of a second) to 10000 milliseconds (10 seconds). The default setting for summary-refresh-time is 3000 milliseconds (3 seconds). RSVP sessions are torn down if an RSVP refresh message is not received from a peer within the configured interval. The formula for calculating the maximum allowed interval is: [(refresh-keep-multiplier + 0.5) * 1.5 * (refresh-time or summary-refresh-time)]. The default refresh-keep-multiplier value is three. The minimum and maximum refresh-keep-multiplier values are one and 255 respectively.

The bundle-message-time, specified in milliseconds, indicates the maximum time a transmit buffer is held to allow multiple RSVP messages to be bundled into a single PDU. The default bundle-message-time is 1000 milliseconds (one second). The bundle-message-time value may be set to any value between 50 milliseconds and 3000 milliseconds (or 3 seconds). Message bundling is only attempted when it is enabled.

Note

Summary refresh must be enabled using the “enable mpls rsvp-te summary-refresh” command for a configured summary-refresh-time to actually be used.

Example

The following command sets the RSVP-TE hello time to 5 seconds on all MPLS interfaces:

```
configure mpls rsvp-te timers session hello-time 5 vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls static lsp

configure mpls static lsp *lsp_name* [{**egress** [*egress_label* | **implicit-null**] **egress-vlan** *evlan_name* **next-hop** *ipaddress*} {**ingress** *ingress_label* {**ingress-vlan** *ivlan_name*}}]

Description

Configures the ingress and egress segments of a static LSP.

Syntax Description

lsp_name	Identifies the static LSP to be configured.
egress_label	Specifies the egress label for the LSP. The supported range is x7FC00 to x803FF. The egress label should match the corresponding ingress label of the next hop. There is no egress label at the egress LSR of a static LSP.
egress implicit-null	If PHP is supported, an LSR can be configured to use the implicit-null label for LSPs that terminate at the next-hop LER.
evlan_name	Specifies the egress VLAN for the LSP.
ipaddress	Specifies the IP address for the next-hop router along the static LSP.
ingress_label	Identifies the ingress label for this LSP. The supported range is x7FC00 to x7FFFF at transit LSRs and 0x80000 to 0x803FF at destination LSRs. The ingress label should match the corresponding egress label of the previous hop. There is no ingress label at the ingress LSR of a static LSP.
ivlan_name	When an ingress label is specified, this argument optionally specifies the ingress VLAN for the LSP.

Default

N/A.

Usage Guidelines

The ingress and egress segments can be configured any time before enabling the LSP. At the ingress LER, only the egress segment is configured and at the egress LER, only the ingress segment is configured. For LSPs that transit an LSR, it is mandatory to configure both ingress and egress segments. On any given LSR, the ingress label, if present, must match the egress label on the upstream LSR and the egress label must match the ingress label of the downstream LSR. Once configured, any change to the ingress or egress segments requires administratively disabling the LSP first. If the next-hop IP address is not within the subnet as defined by the interface VLAN name, the configuration is rejected.

Example

The following command configures a static LSP on an ingress LSR:

```
configure mpls static lsp lsp1 egress 0x7fc01 egress-vlan v50 next-hop
50.0.0.2
```

The following command configures a static LSP on a transit LSR:

```
configure mpls static lsp lsp1 egress 0x80001 egress-vlan v100 next-hop
100.0.0.2 ingress 0X7FC01 ingress-vlan v50
```

The following command configures a static LSP on an egress LSR:

```
configure mpls static lsp lsp1 ingress 0x80001  ingress-vlan v100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure mpls static lsp transport

configure mpls static lsp *lsp_name* **transport** [**ip-traffic** [**allow** | **deny**] | **vpn-traffic** [**allow** {**all** | **assigned-only**} | **deny**]]

Description

Configures the type of traffic that can be transported across a static ingress LSP.

Syntax Description

lsp_name	Identifies the static LSP to be configured.
ip-traffic [allow | deny]	Specifies whether IP traffic is to be allowed or denied access to the LSP.
vpn-traffic [allow {all | assigned-only} | deny]	Specifies whether VPN traffic is to be allowed or denied access to the LSP. The optional assigned-only keyword limits the transport of VPN traffic to only those VPLS instances that are explicitly configured to use the specified LSP.

Default

N/A.

Usage Guidelines

This command has no effect if the named LSP is a transit or egress LSP. By default, IP traffic and VPN traffic are set to deny for a newly created static LSP. The transport configuration options are independent. For example, if VPN traffic is set to allow and IP traffic is set to deny, then no routed IP traffic is transported across the LSP, but the LSP can still transport VPN traffic. When configured to deny for IP traffic, the specified LSP cannot be configured as an IP next hop for a default or static route.

Example

The following command configures a static LSP to transport IP traffic and all VPN traffic:

```
configure mpls static lsp lsp598 transport ip-traffic allow vpn-traffic allow
all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls

configure vpls *vpls_name* {**dot1q** [**ethertype** *hex_number* | **tag** [**include** | **exclude**]]} {**mtu** *number*}

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] {dot1q [ethertype <hex_number> | tag [include | exclude]]} {mtu <number>}`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures VPLS parameters.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
dot1q	Specifies the action the switch performs with respect to the 802.1Q ethertype or tag.
ethertype	Overwrites the ethertype value for the customer traffic sent across the PW
hex_number	Identifies the ethertype, uses the format of 0xN.
tag	Specifies the action the switch performs with respect to the 802.1Q tag.
include	Includes the 802.1Q tag when sending packets over the VPLS L2 VPN.
exclude	Strips the 802.1Q tag before sending packets over the VPLS L2 VPN.
mtu	Specifies the MTU value of the VPLS transport payload packet.
number	The size (in bytes) of the MTU value. The configurable MTU range is 1492 through 9216. The default VPLS MTU value is 1500.

Default

dot1q tag - excluded

ethertype - the configured switch ethertype is used.

number (MTU) - 1500

Usage Guidelines

This command configures the VPLS parameters. PWs are point-to-point links used to carry VPN traffic between two devices within the VPLS. Each device must be configured such that packets transmitted between the endpoints are interpreted and forwarded to the local service correctly. The optional ethertype keyword may be used to overwrite the Ethertype value for the customer traffic sent across the PW. By default, the configured switch ethertype is used. If configured, the ethertype in the outer 802.1q field of the customer packet is overwritten using the configured ethertype value. The ethertype value is ignored on receipt.

Optionally, the switch can be configured to strip the 802.1q tag before sending packets over the VPLS L2 VPN. This capability may be required to provide interoperability with other vendor products or to emulate port mode services. The default configuration is to include the 802.1q tag.

The mtu keyword optionally specifies the MTU value of the VPLS transport payload packet (customer packet). The MTU value is exchanged with VPLS-configured peer nodes. All VPLS peer nodes must be configured with the same MTU value. If the MTU values do not match, PWs cannot be established between VPLS peers. The MTU values are signaled during PW establishment so that endpoints can verify that MTU settings are equivalent before establishing the PW. By default the VPLS MTU is set to 1500. The configurable MTU range is 1492 through 9216. Changing the MTU setting causes established PWs to terminate. VPLS payload packets may be dropped if the VPLS MTU setting is greater than the MPLS MTU setting for the PW interface.

Note

The maximum MTU value supported depends on the current configuration options. For more information, see Configure the Layer 2 VPN MTU in the ExtremeXOS Concepts Guide.

Example

The following commands change the various parameters of a particular VPLS:

```
configure vpls vpls1 dot1q ethertype 0x8508
configure vpls vpls1 dot1q ethertype 0x8509 mtu 2500
configure vpls vpls1 dot1q tag exclude mtu 2430
configure vpls vpls1 dot1q mtu 2500
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls add peer ipaddress

configure l2vpn vpls *vpls_name* **add peer ipaddress** *ipaddress* { **static-pw transmit-label** *outgoing_pw_label* **receive-label** *incoming_pw_label* }

Description

Configures L2VPN VPLS service over MPLS Static PW.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
ipaddress	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit label	Specifies the static pseudo wire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to statically configure a new MPLS Ethernet PW for the specified VPLS. You must specify the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels. Similarly, you must configure the peer with a static PW that has the reverse PW label mappings.

Locally, the ***incoming_pw_label*** must be unique and is allocated out of the static label space. The ***outgoing_pw_label*** must match the peer's configured incoming PW label.

Just like a signaled PW, a static PW can optionally be configured to use any type of tunnel LSP: LDP, RSVP-TE, or Static. In the case of RSVP-TE and LDP, those protocols must be configured and enabled and an LSP must be established before traffic can be transmitted over the static PW.

For Static LSPs, only the MPLS ingress LSP (or outgoing LSP) is specified. Unlike signaled PWs, there is no end-to-end PW communication that is used to verify that the PW endpoint is operational, and in the case of static LSPs, that the data path to the PW endpoint is viable. In the event of a network fault, if a secondary RSVP-TE LSP is configured or the routing topology changes such that there is an alternate LDP LSP, the static PW will automatically switch LSPs in order to maintain connectivity with the PW endpoint. Static LSPs can be protected proactively by configuring BFD to verify the static LSPs IP next hop connectivity. Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the VPLS/VPWS remains operationally down until the named LSP is restored.

Since VC Status signaling is not supported, the VC Status "standby" bit cannot be used to allow support for PW redundancy and H-VPLS. Consequently, only "core full-mesh" PWs are allowed to have statically configured labels.

Example

The following command adds ??? :

```
configure vpls vpls1 add peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls add peer

configure vpls *vpls_name* **add peer** *ipaddress* {**core** {**full-mesh** | **primary** | **secondary**} | **spoke**}

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] add peer <ipaddress> {core {full-mesh | primary | secondary} | spoke}` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures a VPLS or H-VPLS peer for the node you are configuring.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring a peer.
ipaddress	Specifies the IP address of the peer node.
core	Specifies that the peer is a core node.
full-mesh	Specifies that the peer is a core full-mesh node. This is the default setting if neither the core or spoke options are specified.
primary	Specifies that the peer is an H-VPLS core node and configures a primary H-VPLS connection to that core node.
secondary	Specifies that the peer is an H-VPLS core node and configures a secondary H-VPLS connection to that core node.
spoke	Specifies that the peer is a H-VPLS spoke node.

Default

N/A.

Usage Guidelines

Up to 32 core nodes can be configured for each VPLS. H-VPLS spoke nodes can peer with core nodes. Nodes can belong to multiple VPLS instances. The ipaddress parameter identifies the VPLS node that is the endpoint of the VPLS PW.

Core nodes must be configured in a full-mesh with other core nodes. Thus, all core nodes in the VPLS must have a configured PW to every other core node serving this VPLS. By default, the best LSP is chosen for the PW. The underlying LSP used by the PW can be configured by specifying the named LSP using the CLI command configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] peer <ipaddress> [add | delete] mpls lsp <lsp_name>.

Spoke nodes establish up to two point-to-point connections to peer with core nodes. If both primary and secondary peers are defined for a spoke node, the spoke node uses one of the peers for all communications. If both peers are available, the spoke node uses the connection to the primary peer. If

the primary peer connection fails, the spoke node uses the secondary peer. If the primary peer later recovers, the spoke node reverts back to using the primary peer.

Example

The following command adds a connection from the local core switch to the core switch at 1.1.1.202:

```
configure vpls vpls1 add peer 1.1.1.202
```

The following command adds a connection from the local core switch to the spoke switch at 1.1.1.201:

```
configure vpls vpls1 add peer 1.1.1.201 spoke
```

The following command adds a primary connection from the local spoke switch to the core switch at 1.1.1.203:

```
configure vpls vpls1 add peer 1.1.1.203 core primary
```

History

This command was first available in ExtremeXOS 11.6.

Support for H-VPLS was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls add service

configure vpls *vpls_name* **add service** [{**vlan**} *vlan_name* | {**vman**} *vman_name*]

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] add service [{vlan} <vlan_name> | {vman} <vman_name>]` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures service for VPLS.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string)
vlan_name	Logically binds the VLAN to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A.

Usage Guidelines

This command configures the VPLS service for the specified vpls_name. The VPLS service may be a customer VLAN or a customer VMAN. Specifying the vlan_name logically binds the VLAN to the specified VPLS. Only one VLAN or VMAN may be configured per VPLS.

When a VLAN service has been configured for a VPLS, the VLAN is added to the VPLS specified by the vpls_name. The VLAN ID is locally significant to the switch. Thus, each VLAN VPLS interface within the VPLS network may have a different VLAN ID service bound to the VPLS. This greatly simplifies VLAN ID coordination between metro network access points. Traffic may be switched locally between VLAN ports if more than one port is configured for the VLAN.

When a VMAN service has been configured for a VPLS, the VMAN is added to the VPLS specified by vpls_name. The VMAN ID is locally significant to the switch. Thus, each VMAN VPLS interface within the VPLS network may have a different VMAN ID, just like the VLAN service. The only difference is that the VPLS network overwrites the outer VMAN tag on VPLS egress and leaves the inner VLAN tag unmodified. Because the inner VLAN tag is considered part of the customer packet data, the VMAN service can be used to emulate port-based services. This is accomplished by configuring the VPLS to strip the 802.1Q tag from the tunneled packet. Since the switch inserts the VMAN tag when the packet is received and the 802.1Q tag is stripped before the packet is sent on the VPLS PW, all packets received on ports that are members of the VMAN are transmitted unmodified across the VPLS. The command configure vpls <vpls_name> dot1q tag exclude is used to configure the switch to strip the 802.1Q tag on the VPLS.

Example

The example below adds a VLAN and a VMAN to the named VPLS:

```
configure vpls myvpls add service vlan myvlan
configure vpls myvpls add service vman myvman
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls delete peer

configure vpls *vpls_name* **delete peer** [*ipaddress* | **all**]

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] delete peer [<ipaddress> | all]` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Deletes a VPLS peer from the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
ipaddress	Specifies the IP address for the peer node that is the endpoint of the VC-LSP
all	Deletes all VPLS peers.

Default

N/A.

Usage Guidelines

This command deletes a VPLS peer from the specified vpls_name. When the VPLS peer is deleted, VPN connectivity to the VPLS peer is terminated. The all keyword may be used to delete all peers associated with the specified VPLS.

Example

The following example removes connectivity to 1.1.1.202 from VPLS1:

```
configure vpls vpls1 delete peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls delete service

configure vpls *vpls_name* **delete service** [{**vlan**} *vlan_name* | {**vman**} *vman_name*]

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] delete service [{vlan} <vlan_name> | {vman} <vman_name>]` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Deletes local VPLS service from the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS interface within the switch (character string)
vlan_name	Logically binds the VLAN to the specified VPLS.
vman_name	Adds the named VMAN to the VPLS.

Default

N/A.

Usage Guidelines

This command deletes the local VPLS service from the specified vpls_name. Specifying the vlan_name or vman_name deletes the service from the VPLS. If there are no services configured for the VPLS, all PWs within the VPLS are terminated from the switch.

Example

The following example removes a service interface from a VPLS:

```
configure vpls vpls1 delete vman vman1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls health-check vccv

configure vpls [*vpls_name* | **all**] **health-check vccv** {**interval** *interval_seconds*} {**fault-multiplier** *fault_multiplier_number*}

Note

This command has been replaced with the following command: `configure l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]] health-check vccv {interval <interval_seconds>} {fault-multiplier <fault_multiplier_number>}` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures the VCCV health check test and fault notification intervals for the specified VPLS instance.

Syntax Description

vpls_name	Identifies the VPLS instance for which health check is to be configured.
all	Specifies that the configuration applies to all VPLS instances on the local node.
interval_seconds	Defines the interval between health check tests. The range is 1 to 10 seconds.
fault_multiplier_ number	Specifies how long health check waits before a warning level message is logged. The wait period is the interval_seconds multiplied by the fault_multiplier_number. The fault_multiplier_number range is 2 to 6.

Default

Interval is 5 seconds.

Fault mulitplier is 4.

Usage Guidelines

The VCCV health-check configuration parameters can be configured at anytime after the VPLS has been created.

The `show l2vpn {vpls {{<vpls_name>} | vpws {{<vpws_name>}} {peer <ipaddress>} {detail} | summary}` command displays the configured `interval_seconds` and `fault-multiplier_number` values for the VPLS and the VCCV activity state.

Example

The following command configures the health check feature on the VPLS instance myvpls:

```
configure vpls myvpls health-check vccv interval 10 fault-notification 40
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls peer mpls lsp

configure vpls *vpls_name* **peer** *ipaddress* **[add | delete] mpls lsp** *lsp_name*

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] peer <ipaddress> [add | delete] mpls lsp <lsp_name>`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures a named LSP to be used for the PW to the specified VPLS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP
add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

This command configures a named LSP to be used for the PW to the specified VPLS peer. The delete keyword removes the LSP specified by the lsp_name. If all the named LSPs are deleted to the configured VPLS peer, VPLS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the VPLS peer, VPN connectivity to the VPLS peer is lost. Currently, the VPLS PW uses only one LSP.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls peer

configure vpls *vpls_name* **peer** *ipaddress* [**limit-learning** *number* | **unlimited-learning**]

Note

This command has been replaced with the following command: `configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] peer <ipaddress> [limit-learning <number> | unlimited-learning]` . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS and peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP.
limit-learning	Specifies a limit to the number of MAC SAs to be learned for the specified VPLS and peer.
number	The maximum number of MAC SAs that can be learned for the specified VPLS and peer.
unlimited-learning	Specifies no limit to the number of MAC SAs to be learned for the specified VPLS and peer.

Default

Unlimited.

Usage Guidelines

This command configures the maximum number of MAC SAs (Source Addresses) that can be learned for a given VPLS and peer. This parameter can only be modified when the specified VPLS is disabled. The **unlimited-learning** keyword can be used to specify that there is no limit. The default value is **unlimited-learning**.

Example

The following example causes no more than 20 MAC addresses to be learned on VPLS1's PW to 1.1.1.202:

```
configure vpls vpls1 peer 1.1.1.202 limit-learning 20
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls peer mpls lsp

configure vpls *vpls_name* **peer** *ipaddress* **[add | delete] mpls lsp** *lsp_name*

Note

This command has been replaced with the following command: **configure l2vpn [vpls <vpls_name> | vpws <vpws_name>] peer <ipaddress> [add | delete] mpls lsp <lsp_name>** . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Configures a named LSP to be used for the PW to the specified VPLS peer.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
ipaddress	Specifies the IP address for the peer node that is the endpoint of the PW-LSP

add	Permits addition of up to four RSVP-TE LSPs to the VPLS peer.
delete	Removes the LSP specified by the lsp_name parameter from the PW-LSP aggregation list.
lsp_name	Removes the specified lsp.

Default

N/A.

Usage Guidelines

This command configures a named LSP to be used for the PW to the specified VPLS peer. The delete keyword removes the LSP specified by the lsp_name. If all the named LSPs are deleted to the configured VPLS peer, VPLS attempts to use the best-routed path LSP, if one exists. The delete portion of this command cannot be used to remove a named LSP that was selected by the switch as the best LSP. If no LSPs exist to the VPLS peer, VPN connectivity to the VPLS peer is lost. Currently, the VPLS PW uses only one LSP.

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpls snmp-vpn-identifier

configure vpls *vpls_name* **snmp-vpn-identifier** *identifier*

Description

Configures a SNMP VPN identifier for traps from the specified VLPLS.

Syntax Description

vpls_name	Specifies the VPLS for which you are configuring the identification string.
identifier	Specifies a text string to identify the VPLS in SNMP traps.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the identifier vpls1trap for SNMP VPN traps on VPLS vpls1:

```
configure vpls vpls1 snmp-vpn-identifier vpls1trap
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

configure vpws add peer ipaddress

configure l2vpn vpws *vpws_name* **add peer ipaddress***ipaddress* { **static-pw transmit-label** *outgoing_pw_label* **receive-label** *incoming_pw_label* }

Description

Configures L2VPN VPWS service over MPLS Static PW.

Syntax Description

vpws_name	Specifies the VPWS for which you are configuring a peer.
ipaddress	Specifies the peer IP address.
ipaddress	Specifies the IP address of the peer node.
static-pw transmit label	Specifies the static pseudo wire transmit label.
outgoing_pw_label	Specifies the name of the egress label.
receive-label	Specifies the static PW receive label.
incoming_pw_label	Specifies the name of the ingress label.

Default

N/A.

Usage Guidelines

Use this command to statically configure a new MPLS Ethernet PW for the specified VPWS. You must specify the outgoing (MPLS ingress) and incoming (MPLS egress) PW labels. Similarly, you must configure the peer with a static PW that has the reverse PW label mappings.

Locally, the ***incoming_pw_label*** must be unique and is allocated out of the static label space. The ***outgoing_pw_label*** must match the peer's configured incoming PW label.

Just like a signaled PW, a static PW can optionally be configured to use any type of tunnel LSP: LDP, RSVP-TE, or Static. In the case of RSVP-TE and LDP, those protocols must be configured and enabled and an LSP must be established before traffic can be transmitted over the static PW.

For Static LSPs, only the MPLS ingress LSP (or outgoing LSP) is specified. Unlike signaled PWs, there is no end-to-end PW communication that is used to verify that the PW endpoint is operational, and in the case of static LSPs, that the data path to the PW endpoint is viable. In the event of a network fault, if a secondary RSVP-TE LSP is configured or the routing topology changes such that there is an alternate LDP LSP, the static PW will automatically switch LSPs in order to maintain connectivity with the PW endpoint. Static LSPs can be protected proactively by configuring BFD to verify the static LSPs IP next hop connectivity. Optionally, the underlying LSP for the PW can be explicitly specified using a named LSP. When a named LSP is explicitly specified, only the specified named LSP is used to carry the PW. In the event that a specified named LSP is withdrawn, the VPLS/VPWS remains operationally down until the named LSP is restored.

Since VC Status signaling is not supported, the VC Status "standby" bit cannot be used to allow support for PW redundancy and H-VPLS. Consequently, only "core full-mesh" PWs are allowed to have statically configured labels.

Example

The following command adds ??? :

```
configure vpls vpls1 add peer 1.1.1.202
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on all platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create l2vpn fec-id-type pseudo-wire

create l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **fec-id-type pseudo-wire** *pwid*

Description

Creates a Layer2 VPN, which can be either a VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string). The vpls_name string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
vpws_name	Identifies the VPWS within the switch (character string). The vpws_name string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
pwid	Specifies a PW ID. Must be a non-zero 32-bit value that has network-wide significance.

Default

For the VPLS dot1q tag, the default value is exclude.

Usage Guidelines

Each VPLS or VPWS is a member of a single VPN, and each VPN can have only one associated VPLS or VPWS per switch. External to the switch, each VPN has an identifier.

A VPLS or VPWS name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Any non-zero 32-bit value that has network-wide significance can be specified for the identifier. This **pwid** is used on all pseudo-wires in the VPLS.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when creating a VPWS. For backward compatibility, the l2vpn keyword is optional when creating a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Note

The switch's LSR ID must be configured before a VPLS or VPWS can be created.

Example

This example creates a VPLS with 99 as the PW ID:

```
create vpls vpls1 fec-id-type pseudo-wire 99
```

The following example creates a VPWS with 101 as the PW ID:

```
create l2vpn vpws vpws1 fec-id-type pseudo-wire 101
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create mpls rsvp-te lsp

create mpls rsvp-te lsp *lsp_name* **destination** *ipaddress*

Description

Creates internal resources for an RSVP-TE LSP.

Syntax Description

lsp_name	Specifies a name for the LSP you are creating. The character string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
ipaddress	Specifies the endpoint of the LSP.

Default

N/A.

Usage Guidelines

This command creates internal resources for an RSVP-TE LSP.

The LSP name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

The ipaddress specifies the endpoint of the LSP. The LSP is not signaled until a path is specified for the LSP using the **configure mpls rsvp-te lsp <lsp_name> add path** command. When multiple LSPs are configured to the same destination, IP traffic is load-shared across active LSPs that have IP transport enabled. The maximum number of RSVP-TE LSPs that can be created is 1024.

Note

The LSP must be created before it can be configured.

Example

The following command creates an RSVP-TE LSP:

```
create mpls rsvp-te lsp lsp598 destination 11.100.100.8
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create mpls rsvp-te path

create mpls rsvp-te path *path_name*

Description

Creates an RSVP-TE routed path resource.

Syntax Description

path_name	Identifies the path within the switch. The character string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.

Default

N/A.

Usage Guidelines

This command creates an RSVP-TE path resource.

The path_name parameter must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

The maximum number of configurable paths is 255.

Note

The RSVP-TE LSP is not signaled along the path until an LSP is created and then configured with the specified path_name.

Example

The following example creates an RSVP-TE path:

```
create mpls rsvp-te path path598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create mpls rsvp-te profile

create mpls rsvp-te profile *profile_name* {**standard**}

Description

Creates configured RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Identifies the RSVP-TE profile. The character string must begin with an alphabetic character and may contain up to 31 additional alphanumeric characters.
standard	The standard option differentiates this command version from the command that creates a fast-reroute profile. If you do not specify an option, a standard RSVP-TE profile is created.

Default

N/A.

Usage Guidelines

This command creates a configured RSVP-TE profile with the specified profile name. The default profile cannot be deleted. If a profile is associated with a configured LSP, the profile cannot be deleted.

A profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates an RSVP-TE profile:

```
create mpls rsvp-te profile prof598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create mpls rsvp-te profile fast-reroute

create mpls rsvp-te profile *profile_name* **fast-reroute**

Description

Creates an LSP container to hold FRR configuration parameters.

Syntax Description

profile_name	Specifies a name for the new RSVP-TE fast-reroute profile. The character string must begin with an alphabetic character and may contain up to 31 additional alphanumeric characters.

Default

N/A.

Usage Guidelines

A profile name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates a new FRR profile named frrprofile:

```
create mpls rsvp-te profile frrprofile fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create mpls static lsp

create mpls static lsp *lsp_name* **destination** *ipaddress*

Description

Creates internal resources for a static LSP and assigns a name to the LSP.

Syntax Description

lsp_name	Identifies the LSP to be created.
ipaddress	Specifies the endpoint of the LSP.

Default

N/A.

Usage Guidelines

An LSP name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates a static LSP:

```
create mpls static lsp lsp598 destination 11.100.100.8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

create vpls fec-id-type pseudo-wire

create vpls *vpls_name* **fec-id-type pseudo-wire** *pwid*

Note

This command has been replaced with the following command: `create l2vpn [vpls <vpls_name> | vpws <vpws_name>] fec-id-type pseudo-wire <pwid>`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Creates a VPLS instance with the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string). The vpls_name string must begin with an alphabetic character, and may contain up to 31 additional alphanumeric characters.
pwid	Specifies a PW ID. Must be a non-zero 32-bit value that has network-wide significance.

Default

For the VPLS dot1q tag, the default value is exclude.

Usage Guidelines

This command creates a VPLS instance with the specified `vpls_name`. Each VPLS represents a separate virtual switch instance (VSI).

The `vpls_name` parameter must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Each VPLS is a member of a single VPN and each VPN may have only one associated VPLS per switch. External to the switch, each VPN has an identifier.

Any non-zero 32-bit value that has network-wide significance can be specified for the identifier. This `pwid` is used on all pseudo-wires in the VPLS.

Note

The switch's LSR ID must be configured before a VPLS can be created.

Example

This example creates a VPLS with 99 as the PW ID:

```
create vpls vpls1 fec-id-type pseudo-wire 99
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete l2vpn

delete l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]]

Description

Deletes the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

N/A.

Usage Guidelines

All PWs established to VPLS or VPWS peers are terminated.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when deleting a VPWS. For backward compatibility, the **l2vpn** keyword is optional when deleting a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

This commands deletes the VPLS myvpls:

```
delete vpls myvpls
```

This commands deletes the VPWS myvpws:

```
delete l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The l2vpn and vpws keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete mpls rsvp-te lsp

delete mpls rsvp-te lsp [*lsp_name* | **all**]

Description

Deletes internal resources for the specified RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the LSP within the switch to be deleted.
all	Deletes all RSVP-TE configured LSPs.

Default

N/A.

Usage Guidelines

This command deletes internal resources for the specified RSVP-TE LSP. The LSP is first withdrawn if it is currently active. Deleting an LSP may cause a PW to fail. Any static routes configured to a deleted LSP are also removed.

Example

The following command deletes the configured RSVP-TE LSP named lsp598:

```
delete mpls rsvp-te lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete mpls rsvp-te path

delete mpls rsvp-te path [*path_name* | **all**]

Description

Deletes a configured RSVP-TE routed path with the specified path name.

Syntax Description

path_name	Specifies a path within the switch to be deleted.
all	Deletes all paths not associated with an LSP.

Default

N/A.

Usage Guidelines

This command deletes a configured RSVP-TE routed path with the specified name. All associated configuration information for the specified path is deleted. If the all keyword is specified, all paths not associated with an LSP are deleted.

Note

A path cannot be deleted as long as the path name is associated with an LSP.

Example

The following command deletes the configured RSVP-TE path named path598:

```
delete mpls rsvp-te path path598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete mpls rsvp-te profile

delete mpls rsvp-te profile [*profile_name* | **all**]

Description

Deletes a configured RSVP-TE profile with the specified profile name.

Syntax Description

profile_name	Specifies a configured RSVP-TE profile to be deleted.
all	Deletes all profiles not associated with an LSP, except the default profile.

Default

N/A.

Usage Guidelines

This command deletes a configured RSVP-TE profile with the specified profile name. If the all keyword is specified, all profiles not associated with an LSP are deleted (except for the default profile).

Note

A profile cannot be deleted as long as the profile name is associated with a configured LSP.

The **default** profile cannot be deleted.

Example

The following command deletes the configured RSVP-TE profile named prof598:

```
delete mpls rsvp-te profile prof598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete mpls static lsp

delete mpls static lsp [*lsp_name* | **all**]

Description

Deletes internal resources for one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP to be deleted.
all	Specifies that all LSPs are to be deleted.

Default

N/A.

Usage Guidelines

All resources associated with the specified LSPs are released. Static LSPs cannot be deleted when the LSP is configured for an IP route or VPLS configuration.

Example

The following command deletes a static LSP:

```
delete mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

delete vpls

delete vpls [*vpls_name* | **all**]

Note

This command has been replaced with the following command: **delete l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]]**. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Deletes the VPLS with the specified **vpls_name**.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
all	Specifies all VPLS.

Default

N/A.

Usage Guidelines

This command deletes the VPLS with the specified **vpls_name**. All PWs established to VPLS peers are terminated. The **all** keyword may be used to indicate that all VPLS instances are to be deleted.

Example

This commands deletes the VPLS myvpls:

```
delete vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable bgp mpls-next-hop

```
disable bgp mpls-next-hop
```

Description

Disables IP forwarding over calculated MPLS LSPs to subnets learned via BGP.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over calculated MPLS LSPs to subnets learned via BGP. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via BGP is disabled.

Example

The following command disables BGP's use of MPLS LSPs to reach BGP routes:

```
disable bgp mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable iproute mpls-next-hop

disable iproute mpls-next-hop

Description

Disables IP forwarding over MPLS LSPs for the default VR.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over MPLS LSPs for the default VR. When disabled, any route with an MPLS LSP as its next hop becomes inactive and is not used to tunnel IP traffic across the MPLS network. By default, IP forwarding over MPLS LSPs is disabled.

Example

This command disables IP forwarding over MPLS LSPs.

```
disable iproute mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable l2vpn

disable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]]

Description

Disables the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

When a VPLS or VPWS instance is disabled, all sessions to its configured peers are terminated. Any locally attached service VLAN/VMAN is immediately isolated from other devices residing in the VPN. If this is an H-VPLS core node, then all spoke nodes connected to this peer are isolated unless redundant core access is configured.

The `l2vpn` keyword is introduced in ExtremeXOS Release 12.4 and is required when disabling a VPWS. For backward compatibility, the `l2vpn` keyword is optional when disabling a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command disables the VPLS named myvpls:

```
disable vpls myvpls
```

The following command disables the VPWS named myvpws:

```
disable l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable l2vpn vpls fdb mac-withdrawal

disable l2vpn vpls fdb mac-withdrawal

Description

Disables the MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When disabled, the switch does not send MAC address withdrawal messages. If a MAC address withdrawal message is received from another VPLS peer, the local peer processes the message and withdraws the specified MAC addresses from its FDB, regardless of the MAC address withdrawal configuration.

Example

The following command disables MAC address withdrawal:

```
disable l2vpn vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

The `l2vpn` keyword was added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable l2vpn health-check vccv

disable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]] **health-check vccv**

Description

Disables the VCCV health check feature on the specified VPLS or VPWS instances.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be disabled.
vpws_name	Identifies the VPWS for which health check is to be disabled.
all	Specifies that health check is to be disabled on all VPLS instances on the local node.

Default

Health check is disabled.

Usage Guidelines

The **l2vpn** keyword was introduced in ExtremeXOS Release 12.4 and is required when disabling health check for a VPWS instance. For backward compatibility, the **l2vpn** keyword is optional when disabling health check for VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command disables the health check feature on the VPLS instance myvpls:

```
disable l2vpn vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** and **vpws** keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable l2vpn service

disable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]] **service**

Description

Disables the configured services for the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS or VPWS is removed from all peer sessions. The keyword all disables services for all VPLS instances.

The `l2vpn` keyword was introduced in ExtremeXOS Release 12.4 and is required when disabling a service for a VPWS peer. For backward compatibility, the `l2vpn` keyword is optional when disabling a service for a VPLS peer. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command disables the configured services for VPLS myvpls:

```
disable l2vpn vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable l2vpn sharing

`disable l2vpn sharing`

Description

Disables LSP sharing for Layer 2 VPN pseudo-wires .

Syntax Description

This command has no keywords or arguments.

Default

Disabled.

Usage Guidelines

This command disables LSP sharing for L2VPN PWs. When LSP sharing is disabled, only 1 named LSP is used for a PW. When LSP sharing is enabled, up to 16 named LSPs are used for a PW.

If LSP Sharing is disabled, and more than 1 Transport LSP is programmed into HW, all but 1 Transport LSP is removed from HW, and the configuration is preserved. If LSP Sharing is enabled, and more than 1 Transport LSP was previously configured, the remaining LSPs is programmed into HW as they become available for use.

Example

The following command disables LSP sharing for L2VPN PWs:

```
disable l2vpn sharing
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls

disable mpls

Description

Disables MPLS on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When MPLS is disabled, no label traffic is received or transmitted, and all MPLS-related protocol peer sessions are terminated.

Example

The following command globally disables MPLS on the switch:

```
disable mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls bfd

disable mpls bfd [**vlan all** | {**vlan**} *vlan_name*] {**delete-sessions**}

Description

Disables the Bidirectional Forwarding Detection (BFD) client for MPLS on the specified VLAN or on all VLANs.

Syntax Description

vlan_name	Specifies the VLAN on which to disable the MPLS BFD client.
delete-sessions	Specifies to delete all MPLS BFD sessions.

Default

Keep existing MPLS BFD sessions.

Usage Guidelines

This command instructs MPLS to cease the establishment of new BFD sessions with neighbors as LSPs are established with those neighbors. The default behavior retains the existing BFD sessions and

ignores status updates from those existing sessions. The **delete-sessions** option instructs MPLS to request the deletion of existing sessions. Whether the sessions are deleted or not, the link state presented to the upper MPLS layers reverts to the normal link operational status.

Note

Deleting existing sessions can result in a neighbor DOWN indication from BFD to MPLS on the other end of the session (the peer switch) and a subsequent interface DOWN indication presented to the upper layers of MPLS on that peer switch. These actions can cause MPLS to reroute or fail the affected LSPs.

To disable the MPLS BFD client and delete all BFD sessions without disrupting the LSPs between two switches, do the following:

- Log into switch A as an admin user and issue the command: **disable mpls bfd vlanx**.
- Log into switch B as an admin user and issue the command: **disable mpls bfd vlanx delete-sessions**

Example

The following command disables the MPLS BFD client on VLAN vlan1:

```
disable mpls bfd vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls exp examination

disable mpls exp examination

Description

Disables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value.

When disabled, all received MPLS packets are assigned to QoS profile `qp1`.

Example

The following command disables the assignment of an MPLS packet to a QoS profile based on the MPLS packet's EXP value:

```
disable mpls exp examination
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls exp replacement

`disable mpls exp replacement`

Description

Disables setting an MPLS packet's EXP value based on the packet's QoS profile.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables setting an MPLS packet's EXP value based on the packet's QoS profile. The QoS profiles to EXP value mappings are configured using the `configure mpls exp replacement` command.

When disabled, all MPLS packets are transmitted with an EXP value of zero.

Example

The following command disables the setting of an MPLS packet's EXP value based on the packet's QoS profile:

```
disable mpls exp replacement
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls ldp

disable mpls ldp [{**vlan**} *vlan_name* | **vlan all**]

Description

Disables LDP for the specified MPLS-configured VLANs.

Syntax Description

vlan	Disables LDP for one or more specific VLANs.
vlan_name	Disables LDP on the specified VLAN.
vlan all	Disables LDP for all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When LDP is disabled, all LDP-advertised labels are withdrawn and all LDP peer sessions are terminated on the specified VLAN(s). By default, LDP is disabled for all VLANs. Specifying the optional all keyword disables LDP for all VLANs that have been added to MPLS.

Example

The following command disables LDP for all VLANs:

```
disable mpls ldp vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls ldp bgp-routes

disable mpls ldp bgp-routes

Description

Disables LDP's use of IP prefixes learned from BGP when establishing LDP LSPs.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command disables LDP's establishment of LSPs to routes learned via BGP, thus reducing the internal resources used by LDP. Note that MPLS LSPs can still be used to transport packets to routes learned via BGP through the use of the `enable bgp mpls-next-hop command`.

When enabled, LDP uses routes learned via BGP when establishing LDP LSPs. As each established LSP consumes internal resources, it is recommended that this setting be used only in BGP environments where the number of BGP routes is controlled.

Example

The following command disables the use of BGP routes by LDP:

```
disable mpls ldp bgp-routes
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls ldp loop-detection

```
disable mpls ldp loop-detection
```

Description

Disables LDP loop detection on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Loop detection provides a mechanism for finding looping LSPs and for preventing Label Request messages from looping in the presence of non-merge-capable LSRs. The mechanism makes use of Path Vector and Hop Count TLVs carried by Label Request and Label Mapping messages.

When LDP loop detection is disabled, LDP does not attempt to detect routing loops.

Example

The following command globally disables LDP loop detection on the switch:

```
disable mpls ldp loop-detection
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls php

disable mpls php [{**vlan**} *vlan_name* | **vlan all**]

Description

Disables penultimate hop popping (PHP) on the specified VLAN. When enabled, PHP is requested on all LSPs advertised over that VLAN for which the switch is the egress LSR.

Syntax Description

vlan	Disables PHP for one or more specific VLANs.
vlan_name	Disables PHP on the specified VLAN.
vlan all	Disables PHP for all VLANs that have been added to MPLS.

Default

Disabled

Usage Guidelines

When PHP is disabled on a VLAN, penultimate hop popping is not requested on any LSPs advertised over that VLAN for which the switch is the egress LSR. Therefore, the Implicit Null Label is not used for any advertised mapping. Extreme's MPLS implementation always performs penultimate hop popping when requested to do so by a peer LSR. When the all VLANs option is selected, PHP is disabled on all existing MPLS interfaces.

Note

PHP is sometimes used to reduce the number of MPLS labels in use. If PHP is enabled on any MPLS interface, a unique MPLS label is consumed for every label advertised over that interface. Therefore, if PHP is being disabled to reduce label consumption, it should be done on all interfaces for minimal label consumption.

In ExtremeXOS, this command can be executed while MPLS is enabled.

Example

The following command disables penultimate hop popping (PHP) on the specified VLAN:

```
disable mpls php vlan vlan1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls protocol ldp

```
disable mpls protocol ldp
```

Description

Disables LDP for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When LDP is disabled, all advertised LDP labels are withdrawn and LDP peer sessions are terminated. Note that this includes any LDP peer sessions established for L2 VPNs. By default, LDP is globally disabled. While LDP is transitioning to the enabled state, only the MPLS show commands are accepted.

Example

The following command globally disables LDP on the switch:

```
disable mpls protocol ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls protocol rsvp-te

disable mpls protocol rsvp-te

Description

Disables RSVP-TE for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When RSVP-TE is disabled, all TE LSPs are released and TE LSPs cannot be established or accepted. While RSVP-TE is transitioning to the disabled state, only the MPLS show commands are accepted.

Example

The following command globally disables RSVP-TE on the switch:

```
disable mpls protocol rsvp-te
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls rsvp-te

disable mpls rsvp-te te [{vlan} *vlan_name* **| vlan all]**

Description

Disables RSVP-TE for the specified MPLS-configured VLAN.

Syntax Description

vlan	Specifies that RSVP-TE is to be disabled on a specific VLAN.
vlan_name	Specifies the VLAN for which RSVP-TE is disabled.
vlan all	Disables RSVP-TE on all VLANS that have been added to MPLS.

Default

Disabled.

Usage Guidelines

This command disables RSVP-TE for the specified MPLS configured VLANs. When RSVP-TE is disabled, all TE LSPs are released and TE LSPs cannot be established or accepted. By default, RSVP-TE is disabled for all MPLS configured VLANs. Specifying the optional **all** keyword disables RSVP-TE for all VLANs that have been added to MPLS.

Example

The following command disables RSVP-TE on the named VLAN:

```
disable mpls rsvp-te vlan vlan_10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls rsvp-te bundle-message

disable mpls rsvp-te bundle-message [{**vlan**} *vlan_name* | **vlan all**]

Description

Disables the bundling of RSVP-TE messages for the specified VLAN interface.

Syntax Description

vlan	Specifies that message-bundling is to be disabled on a specific VLAN.
vlan_name	Identifies the VLAN interface on which message bundling is disabled.
vlan all	Specifies that message bundling is disabled on all VLAN interfaces that have been added to MPLS.

Default

Disabled.

Usage Guidelines

This command disables the bundling of RSVP-TE messages for the VLAN specified interface. By default, message bundling is disabled. Specifying the **all** keyword disables message bundling on all VLANs that have been added to MPLS.

Example

The following command disables message bundling on the specified VLAN:

```
disable mpls rsvp-te bundle-message vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

disable mpls rsvp-te fast-reroute

disable mpls rsvp-te fast-reroute

Description

Disables the MPLS RSVP-TE fast reroute (FRR) protection feature.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When FRR is disabled on the LSR, all established FRR LSPs on the local LSR are torn down, and only standard LSPs can be signaled and processed. The configuration for any existing FRR LSPs is retained, but it is not used until the FRR protection feature is enabled. This command can be used to test the performance of an LSR without the FRR functionality or when the LSR doesn't behave as expected for either standard or FRR LSPs.

Example

The following command disables FRR protection on the local switch:

```
disable mpls rsvp-te fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

disable mpls rsvp-te lsp

disable mpls rsvp-te lsp [*lsp_name* | **all**]

Description

Disables an RSVP-TE LSP.

Syntax Description

lsp_name	Specifies the LSP within the switch to be disabled.
all	Disables all RSVP-TE configured LSPs.

Default

Enabled.

Usage Guidelines

This command disables an RSVP-TE LSP. When an RSVP-TE LSP is disabled, the switch terminates the LSP by signaling the destination by sending a PATH_TEAR message. If there are other LSPs configured to the same destination, traffic may continue to be transmitted to the destination over another LSP. Disabling an LSP does not otherwise change its configuration.

Example

The following command disables the LSP named lsp598:

```
disable mpls rsvp-te lsp lsp598
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls rsvp-te summary-refresh

disable mpls rsvp-te summary-refresh [{**vlan**} *vlan_name* | **vlan all**]

Description

Disables the sending of summary refresh messages, instead of path messages, to refresh RSVP-TE path state for the specified VLAN interface.

Syntax Description

vlan	Specifies that summary refresh messages cannot refresh the RSVP-TE path state on one or more VLAN interfaces.
vlan_name	Specifies the VLAN interface for which RSVP-TE summary refresh messages are to be disabled.
vlan all	Specifies that summary refresh messages are to be disabled on all VLAN interfaces that have been added to MPLS.

Default

Disabled.

Usage Guidelines

This command disables the sending of summary refresh messages to refresh RSVP-TE path state for the specified VLAN interface. By default, summary refresh is disabled. Specifying the **all** keyword disables summary refresh on all VLANs that have been added to MPLS.

Example

The following command disables summary refresh on the specified VLAN:

```
disable mpls rsvp-te summary-refresh vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls static lsp

disable mpls static lsp {*lsp_name* | **all** }

Description

Administratively disables one or all static LSPs.

Syntax Description

lsp_name	Identifies an LSP to be disabled.
all	Specifies that all static LSPs on this LSR are to be disabled.

Default

N/A.

Usage Guidelines

On executing this command, the software de-activates the specified LSPs by setting the administrative state of each LSP to down.

Example

The following command disables a static LSP:

```
disable mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable mpls vlan

disable mpls [{**vlan**} *vlan_name* | **vlan all**]

Description

Disables the MPLS interface for the specified VLAN(s).

Syntax Description

vlan	Disables an MPLS interface for one or more specific VLANs.
vlan_name	Disables an MPLS interface on the specified VLAN.
vlan all	Disables an MPLS interface for all VLANs that have been added to MPLS.

Default

The MPLS interface is disabled for a VLAN.

Usage Guidelines

Disabling MPLS causes all LSPs to be released and all LDP and RSVP-TE peer sessions to be terminated on the specified VLAN(s).

Example

The following command disables an MPLS interface for the specified VLAN:

```
disable mpls vlan vlan-nyc
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable ospf mpls-next-hop

disable ospf mpls-next-hop {**vr** *vrf_name*}

Description

Disables IP forwarding over calculated MPLS LSPs to subnets learned via OSPF.

Syntax Description

vrf_name	Specifies OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

This command disables IP forwarding over calculated MPLS LSPs to subnets learned via OSPF. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via OSPF is disabled.

In order to disable OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables OSPF's use of MPLS LSPs to reach OSPF routes:

```
disable ospf mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable snmp traps l2vpn

disable snmp traps l2vpn

Description

Disables SNMP traps associated with Layer2 VPNs for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All Layer2 VPN traps are disabled.

Example

The following command disables SNMP traps associated with Layer2 VPNs:

```
disable snmp traps l2vpn
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable snmp traps mpls

disable snmp traps mpls

Description

Disables SNMP traps associated with MPLS for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All MPLS traps are disabled.

Example

The following command disables SNMP traps associated with MPLS:

```
disable snmp traps mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable vpls

disable vpls [*vpls_name* | **all**]

Note

This command has been replaced with the following command: `disable l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]]`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Disables the VPLS instance specified by `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

This command disables the VPLS instance specified by **vpls_name**. When a VPLS instance is disabled, all sessions to its configured peers are terminated. Any locally attached service VLAN/VMAN is immediately isolated from other devices residing in the VPN. If this is an H-VPLS core node, then all spoke nodes connected to this peer are isolated unless redundant core access is configured.

Example

The following command disables the VPLS named myvpls:

```
disable vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable vpls fdb mac-withdrawal

disable vpls fdb mac-withdrawal

Note

This command has been replaced with the following command: **disable l2vpn vpls fdb mac-withdrawal** . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Disables the VPLS MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

When disabled, the switch does not send MAC address withdrawal messages. If a MAC address withdrawal message is received from another VPLS peer, the local VPLS peer processes the message and withdraws the specified MAC addresses from its FDB, regardless of the MAC address withdrawal configuration.

Example

The following command disables MAC address withdrawal:

```
disable vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable vpls health-check vccv

disable vpls [*vpls_name* | **all**] **health-check vccv**

Note

This command has been replaced with the following command: `disable l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]] health-check vccv`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Disables the VCCV health check feature on one or all VPLS instances on the local node.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be disabled.
all	Specifies that health check is to be disabled on all VPLS instances on the local node.

Default

Health check is disabled.

Usage Guidelines

None.

Example

The following command disables the health check feature on the VPLS instance myvpls:

```
disable vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

disable vpls service

disable vpls [*vpls_name* | **all**] **service**

Note

This command has been replaced with the following command: `disable l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]] service`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Disables the configured VPLS services for the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS is removed from all peer sessions. The keyword **all** disables services for all VPLS instances.

Example

The following command disables the configured VPLS services for the specified VPLS:

```
disable vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable bgp mpls-next-hop

enable bgp mpls-next-hop

Description

Enables IP forwarding over calculated MPLS LSPs to subnets learned via BGP.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over calculated MPLS LSPs to subnets learned via BGP. (Calculated refers to an LSP that only reaches part of the way to the destination). IP forwarding over MPLS LSPs must be enabled to forward over calculated LSPs. By default, IP forwarding over MPLS LSPs to subnets learned via BGP is disabled.

Example

The following command enables BGP's use of MPLS LSPs to reach BGP routes:

```
enable bgp mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable iproute mpls-next-hop

enable iproute mpls-next-hop

Description

Enables IP forwarding over MPLS LSPs for the default VR.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over MPLS LSPs for the default VR. When enabled, LSP next hops can be used to tunnel IP traffic across the MPLS network. By default, IP forwarding over MPLS LSPs is disabled.

Note

You can enable the use of LSP next hops, or you can enable DHCP/BOOTP relay. The software does not support both features at the same time.

Example

The following command enables IP forwarding over MPLS LSPs:

```
enable iproute mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable l2vpn

enable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]]

Description

Enables the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

All newly created VPLS or VPWS instances are enabled.

Usage Guidelines

When enabled, VPLS or VPWS attempts to establish sessions between all configured peers. Services must be configured and enabled for sessions to be established successfully.

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4 and is required when enabling a VPWS. For backward compatibility, the **l2vpn** keyword is optional when enabling a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command enables the VPLS instance myvpls:

```
enable vpls myvpls
```

The following command enables the VPWS instance myvpws:

```
enable l2vpn vpws myvpws
```

History

This command was first available in ExtremeXOS 11.6.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable l2vpn vpls fdb mac-withdrawal

`enable l2vpn vpls fdb mac-withdrawal`

Description

Enables the Layer2 VPN MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to enable FDB MAC withdrawal after it has been disabled.

Example

The following command enables MAC address withdrawal:

```
enable l2vpn vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

The `l2vpn` keyword was added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable l2vpn health-check vccv

enable l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **health-check vccv**

Description

Enables the VCCV health check feature on the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be enabled.
vpws_name	Identifies the VPWS for which health check is to be enabled.

Default

Health check is disabled.

Usage Guidelines

Health check must be enabled on both ends of a PW to verify connectivity between two VPLS or VPWS peers. Both VCCV peers negotiate capabilities at PW setup. A single VCCV session monitors a single PW. Therefore, a VPLS with multiple PWs will have multiple VCCV sessions to multiple peers.

VCCV in EXOS uses LSP ping to verify connectivity.

The `l2vpn` keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling health check for a VPWS instance. For backward compatibility, the `l2vpn` keyword is optional when enabling health check for a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command enables the health check feature on the VPLS instance myvpls:

```
enable l2vpn vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

The `l2vpn` and vpws `keywords` were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable l2vpn service

enable l2vpn [**vpls** [*vpls_name* | **all**] | **vpws** [*vpws_name* | **all**]] **service**

Description

Enables the configured services for the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).
all	Specifies all VPLS or VPWS instances.

Default

Enabled.

Usage Guidelines

When services are disabled, the VPLS or VPWS is withdrawn from all peer sessions. The keyword all enables services for all VPLS or VPWS instances.

The `l2vpn` keyword was introduced in ExtremeXOS Release 12.4 and is required when enabling services for a VPWS instance. For backward compatibility, the `l2vpn` keyword is optional when enabling services for a VPLS instance. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command enables the configured VPLS services for the specified VPLS instance:

```
enable l2vpn vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable mpls

`enable mpls`

Description

Enables MPLS on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Enabling MPLS allows MPLS processing to begin for any enabled MPLS protocols (RSVP-TE and/or LDP).

While MPLS is transitioning to the enabled state, only the MPLS show commands are accepted.

Before you can enable MPLS on BlackDiamond 8800 series switches, the switch must meet the following requirements:

- Each switch requires the specific software and hardware listed in Feature License Requirements in the ExtremeXOS Concepts Guide.
- You must configure the enhanced stacking protocol on the switch.
- If unsupported modules are installed in the switch, Extreme Networks recommends that you remove them and unconfigure the appropriate slots (`unconfigure slot` command) before

enabling MPLS. You cannot enable MPLS until the appropriate slots are empty or disabled (disable slot command).

Note

When MPLS is enabled on a BlackDiamond 8800 series switch, you cannot enable any modules (**enable slot** command) that are incompatible with MPLS.

Before you can enable MPLS on a SummitStack, the stack must meet the following requirements:

- Each stack switch must meet the software and hardware requirements listed in Feature License Requirements in the ExtremeXOS Concepts Guide.
- You must configure the enhanced stacking protocol on each Summit family switch.
- Although you can mix Summit X460 switches with Summit X480 and X670 series switches in a SummitStack, Extreme Networks recommends that you do not mix these switch types if the desired routing table exceeds the supported limit for the Summit X460 switch, which is 12,256 IPv4 LPM routes.

Note

When MPLS is enabled on a stack, you can only add a MPLS-compatible Summit family switches to the stack.

Example

The following command globally enables MPLS on the switch:

```
enable mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable mpls bfd

enable mpls bfd [{vlan} *vlan_name* **| vlan all]**

Description

Enables the Bidirectional Forwarding Detection (BFD) client for MPLS on the specified VLAN or all VLANs.

Syntax Description

vlan_name	Specifies the VLAN on which to enable the MPLS BFD client.
vlan all	Enables the MPLS BFD client on all VLANs.

Default

Disabled.

Usage Guidelines

This command causes MPLS to request a BFD session to each next-hop peer reachable through the named interface. BFD sessions are triggered by the establishment of an LSP over the interface. If this command is issued after LSPs are established, then the list of active LSPs is searched for next-hop peers associated with the named interface, and a BFD session is requested for each neighbor which does not already have a session. This command also instructs MPLS to begin to consider BFD neighbor session state updates as part of the effective interface link state reported to the MPLS upper layer protocols.

Note

BFD must be enabled on the interface before sessions can be established. To enable BFD, use the command: `[enable | disable] bfd vlan <vlan_name>`.

Example

The following command enables the MPLS BFD client on VLAN vlan1:

```
enable mpls bfd vlan1
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements.

enable mpls exp examination

enable mpls exp examination

Description

Enables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables assigning an MPLS packet to a QoS profile based on the MPLS packet's EXP value. The EXP values to QoS profile mappings are configured using the **`configure mpls exp examination`** command.

When disabled, all received MPLS packets are assigned to QoS profile qp1.

Example

The following command enables assignment of an MPLS packet to a QoS profile based on the MPLS packet's EXP value:

```
enable mpls exp examination
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls exp replacement

`enable mpls exp replacement`

Description

Enables setting an MPLS packet's EXP value based on the packet's QoS profile.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables setting an MPLS packet's EXP value based on the packet's QoS profile. The QoS profiles to EXP value mappings are configured using the **configure mpls exp replacement** command.

When disabled, all MPLS packets are transmitted with an EXP value of zero.

Example

The following command enables the setting of an MPLS packet's EXP value based on the packet's QoS profile:

```
enable mpls exp replacement
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls ldp

enable mpls ldp [{**vlan**} *vlan_name* | **vlan all**]

Description

Enables LDP for the specified MPLS configured VLANs.

Syntax Description

vlan	Enables LDP for one or more specific VLANs.
vlan_name	Enables LDP on the specified VLAN.
vlan all	Enables LDP for all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When LDP is enabled, LDP attempts to establish peer sessions with neighboring routers on the enabled VLAN. Once a peer session is established, LDP advertises labels for local IP interfaces and for routes learned from other neighboring routers. By default, LDP is disabled for all VLANs that have been added to MPLS. Specifying the optional **all** keyword enables LDP for all MPLS configured VLANs.

Example

The following command enables LDP for all VLANs that have been added to MPLS:

```
enable mpls ldp vlan all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls ldp bgp-routes

enable mpls ldp bgp-routes

Description

Enables LDP to use IP prefixes learned from BGP when establishing LDP LSPs.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This command allows LDP to use routes learned via BGP when establishing LDP LSPs. Because each established LSP consumes internal resources, it is recommended that this setting be used only in BGP environments where the number of BGP routes is controlled.

When disabled, LDP does not establish LSPs to routes learned via BGP, thus reducing the internal resources used by LDP. Note that MPLS LSPs can still be used to transport packets to routes learned via BGP through the use of the **enable bgp mpls-next-hop** command.

Example

The following command enables the use of BGP routes by LDP:

```
enable mpls ldp bgp-routes
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls ldp loop-detection

enable mpls ldp loop-detection

Description

Enables LDP loop detection on the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Loop detection provides a mechanism for finding looping LSPs and for preventing Label Request messages from looping in the presence of non-merge capable LSRs. The mechanism makes use of Path Vector and Hop Count TLVs carried by Label Request and Label Mapping messages.

Example

The following command globally enables LDP loop detection on the switch:

```
enable mpls ldp loop-detection
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls php

When enabled, PHP is requested on all LSPs advertised over that VLAN for which the switch is the egress LSR.

enable mpls php [{**vlan**} *vlan_name* | **vlan all**]

Description

Enables penultimate hop popping (PHP) on the specified VLAN.

Syntax Description

vlan	Enables PHP for one or more specific VLANs.
vlan_name	Enables PHP on the specified VLAN.
vlan all	Enables PHP for all VLANs that have been added to MPLS.

Default

Disabled

Usage Guidelines

Penultimate hop popping is requested by assigning the Implicit Null Label in an advertised mapping. Extreme's MPLS implementation always performs penultimate hop popping when requested to do so by a peer LSR. When the all VLANs option is selected, PHP is enabled on all configured VLANs that have been added to MPLS.

Note

ExtremeWare always used the Implicit NULL Label in conjunction with routes exported into OSPF, regardless of the setting of the PHP configuration parameter. This method of operation is not utilized in ExtremeXOS.

Example

The following command enables penultimate hop popping (PHP) on the specified VLAN:

```
enable mpls php vlan vlan1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls protocol ldp

enable mpls protocol ldp

Description

Enables LDP for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When LDP is enabled, LDP attempts to establish peer sessions with neighboring routers on VLAN interfaces where LDP has been enabled (see 6.3.5 page 77). Once a peer session is established, LDP can advertise labels for local IP interfaces and for routes learned from other neighboring routers. While LDP is transitioning to the enabled state, only the MPLS show commands are accepted.

Note that the LDP protocol must be enabled to establish VPLS pseudo-wires even if the transport LSPs are being established using RSVP-TE.

Example

The following command globally enables LDP on the switch:

```
enable mpls protocol ldp
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls protocol rsvp-te

```
enable mpls protocol rsvp-te
```

Description

Enables RSVP-TE for the switch.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

When RSVP-TE is enabled, configured LSPs begin the process of TE LSP establishment and VLAN interfaces that have RSVP-TE enabled begin processing RSVP path/reserve messages. By default, RSVP-TE is disabled. While RSVP-TE is transitioning to the enabled state, only the MPLS show commands are accepted.

Example

The following command globally enables RSVP-TE on the switch:

```
enable mpls protocol rsvp-te
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls rsvp-te

enable mpls rsvp-te [{**vlan**} *vlan_name* | **vlan all**]

Description

Enables RSVP-TE for the specified MPLS-configured VLAN.

Syntax Description

vlan	Specifies that RSVP-TE is to be enabled on one or more VLANs.
vlan_name	Identifies a specific VLAN on which RSVP-TE is to be enabled.
vlan all	Enables RSVP-TE on all VLANS that have been added to MPLS.

Default

Disabled.

Usage Guidelines

When RSVP-TE is enabled, TE LSP establishment for configured LSPs begins and the processing of RSVP path/reserve messages from peer LSRs is permitted. By default, RSVP-TE is disabled for all MPLS-configured VLANs. Specifying the optional all keyword enables RSVP-TE for all VLANs that have been added to MPLS.

Example

The following command enables RSVP-TE on the specified VLAN:

```
enable mpls rsvp-te vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable mpls rsvp-te bundle-message

enable mpls rsvp-te bundle-message [{**vlan**} *vlan_name* | **vlan all**]

Description

Enables the bundling of RSVP-TE messages for the specified VLAN interface.

Syntax Description

vlan	Specifies that message-bundling is to be enabled on one or more VLAN interfaces.
vlan_name	Identifies a VLAN interface for which message bundling is to be enabled.
vlan all	Specifies that message bundling is to be enabled on all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

Enabling message bundling can improve control plane scalability by allowing the switch to bundle multiple RSVP-TE messages into a single PDU. Not all devices support bundled messages. If the switch determines that a peer LSR, connected to a specific interface, does not support message bundling, the switch reverts to sending separate PDUs for each message on that interface. By default, message bundling is disabled. Specifying the **all** keyword enables message bundling on all MPLS-configured VLANs.

Example

The following command enables message bundling on the specified VLAN:

```
enable mpls rsvp-te bundle-message vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls rsvp-te fast-reroute

enable mpls rsvp-te fast-reroute

Description

Enables the MPLS RSVP-TE fast reroute (FRR) protection feature.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

You can configure FRR LSPs only when FRR is enabled on the LSR. Enabling FRR protection on the LSR automatically enables the point-of-local-repair and merge-point capabilities on the LSR. FRR should be enabled on all LSRs along each FRR LSP path.

Example

The following command enables FRR protection on the local switch:

```
enable mpls rsvp-te fast-reroute
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements.

enable mpls rsvp-te lsp

enable mpls rsvp-te lsp [*lsp_name* | **all**]

Description

Enables one or more RSVP-TE LSPs.

Syntax Description

lsp_name	Specifies the ingress LSP within the switch to be enabled.
all	Enables all RSVP-TE configured ingress LSPs.

Default

Enabled.

Usage Guidelines

When an RSVP-TE LSP is enabled, the switch attempts to set up the LSP by signaling the destination by sending a path message using the assigned path and profile. By default, all newly created LSPs are enabled and can become active when the LSP has been configured. Note that an LSP must be configured with at least one path before it can be signaled.

Example

The following command enables all RSVP-TE-configured LSPs:

```
enable mpls rsvp-te lsp all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements .

enable mpls rsvp-te summary-refresh

enable mpls rsvp-te summary-refresh [{**vlan**} *vlan_name* | **vlan all**]

Description

Enables the sending of summary refresh messages, instead of path messages, to refresh RSVP-TE path state for the specified VLAN interface.

Syntax Description

vlan	Specifies that summary refresh messages are to refresh the RSVP-TE path state on one or more VLAN interfaces.
vlan_name	Identifies a VLAN interface on which RSVP-TE summary refresh messages are to refresh the RSVP-TE path state.
vlan all	Specifies that summary refresh messages are to refresh the RSVP-TE path state on all VLANs that have been added to MPLS.

Default

Disabled.

Usage Guidelines

Enabling summary refresh can improve control plane scalability by refreshing multiple LSPs in a single message. Not all devices support summary refresh. If the switch determines that a peer LSR, connected to a specific interface, does not support summary refresh, the switch reverts to using path messages on that interface. By default, summary refresh is disabled. Specifying the **all** keyword enables summary refresh on all MPLS-configured VLANs.

Example

The following command enables summary refresh on the specified VLAN:

```
enable mpls rsvp-te summary-refresh vlan vlan_1
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable mpls static lsp

enable mpls static lsp {*lsp_name* | **all** }

Description

Administratively enables one or all static LSPs.

Syntax Description

lsp_name	Identifies the LSP to be enabled.
all	Specifies that all static LSPs on this LSR are to be enabled.

Default

N/A.

Usage Guidelines

On executing this command, the software tries to activate the static LSP by programming the LSP in hardware. Static LSPs are not enabled by default. You need to explicitly enable LSPs after the ingress and egress segments have been configured.

Example

The following command enables a static LSP:

```
enable mpls static lsp lsp598
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable mpls vlan

enable mpls [{**vlan**}*vlan_name*|**vlan all**]

Description

Enables the MPLS interface for the specified VLAN.

Syntax Description

vlan	Enables an MPLS interface for one or more specific VLANs.
vlan_name	Enables an MPLS interface on the specified VLAN.
vlan all	Enables an MPLS interface for all VLANs that have been added to MPLS.

Default

Disabled.

Example

The following command enables an MPLS interface for the specified VLAN:

```
enable mpls vlan vlan-nyc
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable ospf mpls-next-hop

enable ospf mpls-next-hop {**vr** *vrf_name*}

Description

Enables IP forwarding over calculated MPLS LSPs to subnets learned through OSPF.

Syntax Description

vrf-name	Specifies OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

This command enables IP forwarding over calculated MPLS LSPs to subnets learned through OSPF. (Calculated refers to an LSP that only reaches part of the way to the destination). By default, IP forwarding over MPLS LSPs to subnets learned via OSPF is disabled.

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command enables OSPF's use of MPLS LSPs to reach OSPF routes:

```
enable ospf mpls-next-hop
```

History

This command was first available in ExtremeXOS 11.6.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable snmp traps l2vpn

enable snmp traps l2vpn

Description

Enables SNMP traps associated with Layer 2 VPNs for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All Layer 2 VPN traps are disabled.

Example

The following command enables SNMP traps associated with Layer 2 VPNs:

```
enable snmp traps l2vpn
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable snmp traps mpls

enable snmp traps mpls

Description

Enables SNMP traps associated with MPLS for all MPLS configured VLANs.

Syntax Description

This command has no arguments or variables.

Default

All MPLS traps are disabled.

Example

The following command enables SNMP traps associated with MPLS:

```
enable snmp traps mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable vpls

enable vpls [*vpls_name* | **all**]

Note

This command has been replaced with the following command: `enable l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]]`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Enables the VPLS instance specified by `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS.

Default

All newly created VPLS instances are enabled.

Usage Guidelines

This command enables the VPLS instance specified by **vpls_name**. By default, all newly created VPLS instances are enabled. When enabled, VPLS attempts to establish sessions between all configured peers. Services must be configured and enabled for sessions to be established successfully.

Example

The following command enables the VPLS instance myvpls:

```
enable vpls myvpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable vpls fdb mac-withdrawal

enable vpls fdb mac-withdrawal

Note

This command has been replaced with the following command: **enable l2vpn vpls fdb mac-withdrawal** . This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Enables the VPLS MAC address withdrawal capability.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Use this command to enable FDB MAC withdrawal after it has been disabled.

Example

The following command enables MAC address withdrawal:

```
enable vpls fdb mac-withdrawal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable vpls health-check vccv

enable vpls *vpls_name* **health-check vccv**

Note

This command has been replaced with the following command: `enable l2vpn [vpls <vpls_name> | vpws <vpws_name>] health-check vccv`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Enables the VCCV health check feature on the specified VPLS.

Syntax Description

vpls_name	Identifies the VPLS for which health check is to be enabled.

Default

Health check is disabled.

Usage Guidelines

Health check must be enabled on both ends of a PW to verify connectivity between two VPLS peers. Both VCCV peers negotiate capabilities at PW setup. A single VCCV session monitors a single PW. Therefore, a VPLS with multiple PWs will have multiple VCCV sessions to multiple peers.

VCCV in EXOS uses LSP ping to verify connectivity.

Example

The following command enables the health check feature on the VPLS instance myvpls:

```
enable vpls myvpls health-check vccv
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

enable vpls service

enable vpls [*vpls_name* | **all**] **service**

Note

This command has been replaced with the following command: `enable l2vpn [vpls [<vpls_name> | all] | vpws [<vpws_name> | all]] service`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Enables the configured VPLS services for the specified `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)
all	Specifies all VPLS.

Default

Enabled.

Usage Guidelines

This command enables the configured VPLS services for the specified `vpls_name`. When services are disabled, the VPLS is withdrawn from all peer sessions. The keyword `all` enables services for all VPLS instances.

Example

The following command enables the configured VPLS services for the specified VPLS instance:

```
enable vpls myvpls service
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

ping mpls lsp

ping mpls lsp [*lsp_name* | **any** *host* | **prefix** *ipNetmask*] {**reply-mode** [**ip** | **ip-router-alert**]} {**continuous** | **count** *count*} {**interval** *interval*} {**start-size** *start-size* {**end-size** *end-size*}} {**ttl** *ttl*} {{**from** *from*} {**next-hop** *hopaddress*}}

Description

Sends an MPLS ping packet to a FEC over an LSP.

Syntax Description

lsp_name	Specifies the LSP on which to send the MPLS echo request.
any	Allows the echo request to be sent over any available LSP.
host	Specifies the FEC using an ipaddress or hostname.
prefix	Specifies a prefix.
ipNetmask	Specifies the prefix address.
reply-mode	Specifies the return path for the MPLS echo response.
ip	Requests an IP UDP reply packet. This is the default mode.
ip-router-alert	Requests an IP UDP reply packet with the IP Router Alert option. If the reply is sent in an LSP, the router-alert label is inserted at the top of the label stack.
continuous	Sends pings continuously until the user intervenes.
count	Determines whether the size of the packet increments by one byte for each new MPLS echo request sent.
interval	Specifies the time interval (in seconds) between pings.
start-size	The number of payload data bytes in the MPLS ping packet. The range is from 1 - 1518 (if jumbo frames are disabled) and from 1 - the configured jumbo packet size (if jumbo frames are enabled). The default is 8 bytes.

end-size	Specifies that the size of the packet increments by one byte for each new MPLS echo request sent, up to the specified maximum size for the MPLS ping packet.
ttl	Sets the time-to-live value in the ping packet
from	Specifies the source IP address of the packet.
hopaddress	Specifies the next-hop address.

Default

Destination IP address for MPLS echo request - random, from the 127 and 128 IP address space IP TTL - 1 TTL value in MPLS echo request - 255 Destination UDP port - 3503 Payload data packet size - 8 bytes Number of pings sent - 4

Usage Guidelines

This command sends an MPLS ping packet to a FEC over an LSP. The ping command, with mpls keyword option, can be used to verify data plane connectivity across an LSP. This is useful because not all failures can be detected using the MPLS control plane. The **lsp** keyword and **<lsp_name>** parameter may be used to specify the LSP on which to send the MPLS echo request. The lsp keyword along with the any keyword allows the echo request to be sent over any available LSP that terminates at host, specified as an ipaddress or hostname. If no LSP exists to the specified host, the ping command fails even though an IP routed path may exist. If the optional **next-hop** is specified, the MPLS echo request is sent along the LSP that traverses the specified node. This option is useful for specifying a specific LSP when multiple LSPs exist to the specified FEC. For RSVP-TE LSPs, the FEC is implied from the LSP configuration. The TTL value in the MPLS Echo Request is set to 255.

By default, the destination IP address of the MPLS echo request is randomly chosen from the 127/8 IP address space and the IP TTL is set to 1. The destination UDP port is 3503 and the sender chooses the source UDP port.

The optional **start-size** keyword specifies the number of bytes to include as payload data in the MPLS ping packet. If no **start-size** parameter is specified, the size of the payload data is eight bytes. The minimum valid **start-size** value is one. The maximum **start-size** value is variable, depending on the type of MPLS ping packet sent, but the total size of the MPLS ping packet cannot exceed the configured jumbo packet size, if jumbo frames are enabled, or 1518 if jumbo frames are disabled. If the **end-size** keyword is specified, the size of the packet increments by one byte for each new MPLS echo request sent. The next MPLS echo request is not sent until the MPLS echo response for the previous packet is received. This is useful for detecting interface MTU mismatch configurations between LSRs. The switch ceases sending MPLS echo requests when the specified **end-size** value is reached, the MPLS ping is user interrupted, or an MPLS echo response is not received after four successive retries.

The optional **reply-mode** keyword is used to specify the reply mode for the MPLS echo response. When the **ip** option is specified, the MPLS echo reply is routed back to the sender in a normal IPv4 packet. When the **ip-router-alert** option is specified, the MPLS echo reply is routed back to the sender in an IPv4 packet with the Router Alert IP option set. Additionally, if the **ip-router-alert** option is specified and the reply route is through an LSP, the Router Alert Label is pushed onto the top of the label stack. If the reply-mode is not specified, the **reply-mode ip** option applies.

Example

The following example shows a ping command and the resulting display:

```
ping mpls lsp prefix 11.100.100.212/32
Ping(MPLS) : 4 packets, 8 data bytes, interval 1 second(s).
98 bytes from 11.100.100.212: mpls_seq=0 ttl=64 time=6.688 ms
98 bytes from 11.100.100.212: mpls_seq=1 ttl=64 time=6.036 ms
98 bytes from 11.100.100.212: mpls_seq=2 ttl=64 time=6.218 ms
98 bytes from 11.100.100.212: mpls_seq=3 ttl=64 time=6.467 ms
--- ping statistics ---
4 packets transmitted, 4 received, 0% loss
round-trip min/avg/max = 6/6/6/ms
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

restart process mpls

restart process mpls {**msm** *slot*}

Description

Restarts the MPLS process when it does not respond to the CLI commands.

Syntax Description

slot	Specifies the MSM/MM where process should be terminated and restarted. “A” specifies the MSM/MM installed in slot A, and “B” specifies the MSM/MM installed in slot B.

Default

N/A.

Usage Guidelines

None.

Example

The following command restarts the MPLS process:

```
restart process mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show bandwidth pool

show bandwidth pool [ingress | egress | duplex] vlan *vlan_name*

Description

Displays the configured bandwidth pool settings for the specified VLAN.

Syntax Description

ingress	Displays configured bandwidth pool settings for incoming traffic only.
egress	Displays configured bandwidth pool settings for outgoing traffic only.
duplex	Displays configured bandwidth pool settings for traffic in both directions.
vlan_name	Displays configured bandwidth pool settings only for the specified VLAN.

Default

N/A.

Usage Guidelines

This command displays the configured bandwidth pool settings for a VLAN. Values displayed include the VLAN, maximum reserveable bandwidth (both ingress and egress), and bandwidth reserved by application and by priority level.

Example

The following command displays bandwidth pool settings and accepted bandwidth reservations for all ports:

```
show bandwidth pool duplex vlan vlan_1
* BD-10K.1 # show bandwidth pool duplex vlan vlan_1
(mbps)  Rsvd CIRBW  Cmmt  Cmmt CIRBW
Vlan         Dir   Phy    BE Limit Pools Total Avail
-------------------------------------------------------
vlan_1        Rx  1000     0  1000   300   300   700
Tx  1000     0  1000   500   500   500
-------------------------------------------------------------------
(mbps)   CIRBW Available in Pool (per priority level)
Appl  Dir  Pool     0     1     2     3     4     5     6     7
-------------------------------------------------------------------
mpls   Rx   300   300   300   290   290   290   290   290   290
Tx   500   500   500   491   491   491   491   491   491
(Rx)-Receive, (Tx)-Transmit  (BE)-Best Effort
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show ces

show ces {*ces_name*} {**detail**}

Description

Displays CES services created for use with MPLS.

Syntax Description

ces_name	Specifies the name of the CES.
detail	Specifies to display additional status information about the interface.

Default

N/A.

Usage Guidelines

For CES services created for use with MPLS, the “Type: Static/Signaled” line in the CES section of the output will show “N/A” until a PW has been configured, since this the PW type is not known until the peer is added to the CES.

The PW section of the output includes a “PW Signaling” line that will display “LDP” or “None (Static)”, depending on the PW configuration. This is in keeping with the PW display in the `show l2vpn detail` command. Since the configured labels can be changed while the current labels are in-use, there is a small window where the configured labels and in-use labels are different. If the `show ces detail` command is issued during this window, an extra line is output to indicate this extra information. The configured labels will be noted as “pending” in this case.

Example

The following command displays CES information:

```
# show ces jces detail

CES PW Name  :  jces
  Type                  :  Static
  PW ID                 :  900                Admin State   :   Enabled

  PSN Transport         :  MPLS               Oper State    :   Enabled

  Transport Type        :  E1, Structured-agnostic
  Signaling             :  None
  Service Name          :  mysvc
  Payload Size          :  256  bytes
  Packet Latency        :  1000 us
  Jitter Buffer         :  3000 us (max: 6000 us)
  Clock Recovery        :  None
  LOPS Entry Thresh     :  8
  LOPS Exit Thresh      :  8
  Filler Pattern        :  255 (0xFF)
  QOS Profile           :  QP1
  PW Label TTL          :  4
  Peer Address          :  11.100.100.101
    PW Admin State      :  Enabled
    PW State            :  Up
    PW Signaling        :  None (Static)
    PW Uptime           :  0d:0h:46m:19s
    PW Installed        :  TRUE
    Local PW Status     :  Fault, Att-Rx, PW-Rx
    Remote PW Status    :  Fault, Att-Rx
    Transport LSP       :  lsprsvp02 (Not Configured)
      Next Hop I/F      :  e2-s4vlan1
      Next Hop Addr     :   9.21.1.243            Tx Label          :
0x23F
    PW Rx Label         :  0x9A                   PW Tx Label       :
0x9F
    PW Rx Label (pend)  :  0x9B                   PW Tx Label (pend) :
0x9E
    Signaled Parameters  :
      Payload Size      :  Local=256              Remote=N/A
      Bit-Rate          :  Local=32               Remote=N/A
```

```
      Fragmentation      :  Local=Disabled          Remote=N/A

      Signaling          :  Local=Disabled          Remote=N/A

      RTP Header         :  Local=Disabled          Remote=N/A

      Signaling Error    :  N/A
  PW Rx Pkts             :  0                       PW Tx Pkts    :
13907583
```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available on the following platforms:

- E4G-200
- E4G-400

show l2vpn

show [{**l2vpn**} vpls {*vpls_name*} | **l2vpn vpws** {*vpws_name*} | **l2vpn**] {**peer** *ipaddress*} {**detail**} | **summary** }

Description

Displays Layer 2 VPN configuration and status information.

Syntax Description

l2vpn	Displays specified Layer 2 VPN information.
vpls_name	Displays information for the specified VPLS.
vpws_name	Displays information for the specified VPWS.
ipaddress	Specifies a Layer 2 VPN peer for which to display information.
detail	Displays additional information in comprehensive detail format.
summary	Displays summary information about all VPLS or VPWS instances.

Default

N/A.

Usage Guidelines

The `show l2vpn` command (without any optional parameters) displays all currently configured Layer 2 VPN instances for the switch. The summarized list of Layer 2 VPN instances is displayed in

alphabetical order based on the Layer 2 VPN name. Peers are displayed in the reverse of the order they were added.

When you specify a Layer 2 VPN peer, the display includes a list of all PWs established to the peer, the PW status and PW ID, and information about each Layer 2 VPN to which this peer belongs.

The following table describes the display fields that appear when this command is entered with the `detail` option.

Table 37: Selected show l2vpn Field Definitions

Field	Definition
VPLS Name	VPLS instance or domain name.
VPN ID	Virtual Private Network identifier.
Source Address	Source IP address.
VCCV Status	Virtual Circuit Connectivity Verification (VCCV) feature status, which is either `Enabled` or `Disabled`.
VCCV Interval Time	Displays the configured VCCV interval time.
VCCV Fault Mulitplier	Displays the configured VCCV fault multiplier.
Redundancy Type	Displays the configured VPLS redundancy type, which is `EAPS, ESRP, STP,` or `None`.
Service Interface	Displays a VLAN or VMAN interface name.
Admin State	Displays the administrative state of the VPLS, which is either `Enabled` or `Disabled`.
Oper State	Displays the operational state of the VPLS, which is either `Enabled` or `Disabled`.
MTU	Displays the maximum transmission unit (MTU) size for the VPLS.
Ethertype	Displays the ethertype for the service interface.
.1q tag	Displays the 802.1q priority tag for the VPLS.
Peer IP	Displays the IP address for the VPLS peer.
PW State	PW State represents the state, or status, of a PW. The possible PW state values are: UP - The PW is fully operational and installed in hardware. Traffic is forwarded over PW and VPLS service VLAN/VMAN.Down - The PW is not operational and is not installed in hardware. This only happens when the VPLS instance is disabled, VPLS service is disabled, or there is no service VLAN assigned to the VPLS. No traffic is forwarded.Sgnl - The PW is in a signalling state. The PW is not operational, and no traffic is forwarded. This can occur for a number of reasons, including:No LDP adjacency to peerNo transport LSP to peerNo VC LSP to peerRemote peer not configuredReady - The PW has been signalled, but it has not been installed in hardware. Traffic is not forwarded. The PW can be in a Ready state for a number of reasons, including:The VPLS instance is configured for EAPS redundancy, and the EAPS shared port associated with this VPLS instance is Connected.The VPLS instance is configured for ESRP redundancy, and the ESRP domain associated with this VPLS instance is Slave.The service VLAN associated with this VPLS instance is down.The remote peer has signalled that it has a fault (remote PW status). The remote peer may have a fault due to it's service VLAN being down.
PW Uptime	PW Uptime is the elapsed time that the PW has been in the UP state.

Table 37: Selected show l2vpn Field Definitions (continued)

Field	Definition
PW Installed	PW Installed is a flag to indicate whether the PW is installed in hardware or not. If the PW is in the UP state, this field is True, otherwise, this field is False.
Local PW Status	Local PW Status displays the VC status of the local PW. The values are: No Faults—No faults detected.PW-Tx—Local PSN-facing PW transmit fault. This is set if there is a problem with the VPLS transport LSP.PW-Rx—Local PSN-facing PW receive fault. This is set if there is a problem with the VPLS transport LSP.Att-Tx—Local attachment circuit transmit fault. This is set if there is a problem with the VPLS service VLAN.Att-Rx—Local attachment circuit receive fault. This is set if there is a problem with the VPLS service VLAN.Not Forwarding—The local PW is not forwarding. Look for more information in the PW State field. For example, if VPLS is configured for EAPS redundancy, the Local PW Status is Not Forwarding and the PW State is Ready whenever the EAPS Shared Port state is Connected.
Remote PW Status	Remote PW Status is the VC status of the remote PW. The values for this field are the same values as for Local PW Status.
PW Mode	PW Mode describes how the PW was configured. The values are: Core-to-Core—This VPLS instance is a core node, and the other end of the PW connects to a core node.Core-to-Spoke—This VPLS instance is a core node, and the other end of the PW connects to a spoke node. This is for HVPLS.Spoke-to-Core—This VPLS instance is a spoke node, and the other end of the PW connects to a core node. This is for HVPLS.
Transport LSP	Transport LSP is the LSP that is used to forward frames over the PW. When an LDP LSP is used as a transport, the display shows LDP LSP (Not configured). If an RSVP LSP is used, the name of the RSVP LSP being used as a transport LSP is displayed. An RSVP LSP can be specified as the LSP to use during VPLS configuration.
Next Hop I/F	Displays the interface name for the next hop router.
Next Hop Addr	Displays the interface IP address for the next hop router.
PW Rx Label	Receive label for the VPLS PW.
PW Rx Pkts	Total packets received on the VPLS PW.
PW Rx Bytes	Total bytes received on the VPLS PW.
Tx Label	Transmit label for the LSP.
PW Tx Label	Transmit label for the VPLS PW.
PW Tx Pkts	Total packets transmitted on the VPLS PW.
PW Tx Bytes	Total bytes transmitted on the VPLS PW.

The `l2vpn` keyword is introduced in ExtremeXOS Release 12.4 and is required when displaying VPWS information. For backward compatibility, the `l2vpn` keyword is optional when displaying VPLS information. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

History

This command was first available in ExtremeXOS 11.6.

This command was updated to display flags for H-VPLS spoke nodes and protected VPLS and H-VPLS in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls

show mpls

Description

Displays MPLS configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The `show mpls` command displays the current values for all the MPLS configuration parameters that apply to the entire switch. The parameters displayed include:

- MPLS and MPLS protocol (RSVP-TE and LDP) status.
- SNMP traps configuration.
- EXP examination/replacement configuration.
- the MPLS LSR ID.
- the list of the VLANs which have been added to MPLS.

Example

The following command displays the MPLS configuration parameters for the switch:

```
show mpls
* BD-10K.30 # show mpls
MPLS System
MPLS System            : User VR (Green)
MPLS Admin Status      : Enabled
```

```
MPLS Oper Status       : Enabled
RSVP-TE Admin Status   : Enabled
RSVP-TE Oper Status    : Enabled
LDP Admin Status       : Enabled
LDP Oper Status        : Enabled
SNMP Traps             : Disabled
L2VPN SNMP Traps       : Enabled
EXP Examination        : Disabled
EXP Replacement        : Disabled
LSR ID                 : 11.100.100.20
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls bfd

show mpls bfd [{**vlan**} *vlan_name* | **ip_addr**]

Description

Displays MPLS BFD client information for a VLAN or interface.

Syntax Description

vlan_name	Specifies the VLAN for which to display MPLS BFD client information.
ip_addr	Specifies the IP address of an interface for which to display MPLS client information.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the MPLS BFD client information for all next-hop peers:

```
Switch.1 # show mpls bfd
```

```
Next Hop IP       Count   Flags    Admin   Oper   IfName
-------------------------------------------------------
192.84.86.2          13   ASIU        Up     Up   vlan1
192.84.93.12         13   ASIU        Up     Up   vlan2
Flags: A=Session added to BFD server, S=BFD Server synced,
I=Session Init complete, U=State Updates accepted
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls exp examination

show mpls exp examination

Description

Displays MPLS EXP value to QoS profile mappings and whether MPLS EXP examination is enabled or disabled.

Syntax Description

This command has no arguments or keywords.

Default

N/A.

Usage Guidelines

This command displays MPLS EXP value to QoS profile mappings and the status of MPLS EXP examination (enabled or disabled). These values are set using the **configure mpls exp examination qosprofile** command and can be resent using the **unconfigure mpls exp examination** command.

Example

The following is an example of the output of the **show mpls exp examination** command:

```
* BD-10K.29 # show mpls exp examination
EXP --> QoS Profile mapping:
00 --> QP1
```

```
01 --> QP2
02 --> QP3
03 --> QP4
04 --> QP5
05 --> QP6
06 --> QP7
07 --> QP8
EXP Examination is disabled
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls exp replacement

show mpls exp replacement

Description

Displays the MPLS QoS profile to EXP value mappings and the status of MPLS EXP replacement (enabled or disabled).

Syntax Description

This command has no arguments or keywords.

Default

N/A.

Usage Guidelines

This command displays MPLS QoS profile to EXP value mappings and the status of MPLS EXP replacement (enabled or disabled). These values are set using the **configure mpls exp replacement qosprofile** command and can be resent using the **unconfigure mpls exp replacement** command.

Example

The following is an example of the output of the show mpls exp replacement command:

```
* BD-10K.28 # show mpls exp replacement
```

```
QoS Profile --> EXP mapping:
QP1 --> 00
QP2 --> 01
QP3 --> 02
QP4 --> 03
QP5 --> 04
QP6 --> 05
QP7 --> 06
QP8 --> 07
EXP Replacement is disabled
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls interface

show mpls interface {{**vlan**} *vlan_name*} {**detail**}

Description

Displays the MPLS interface information. Information is displayed in tabular format for all VLANs that have been added to MPLS.

Syntax Description

vlan	Specifies to display information for one VLAN.
vlan_name	Specifies the name of the VLAN.
detail	Specifies to display additional status information about the interface.

Default

N/A.

Usage Guidelines

Information displayed includes:

- a list of all VLANs added to MPLS.
- MTU size.
- Local interface IP address.
- Number of RSVP-TE neighbors.

- Number of LDP adjacencies.
- RSVP-TE and LDP uptimes.
- MPLS protocols and capabilities configured on each VLAN.

Specifying the optional detail keyword displays the information in verbose form and also includes the operational state for RSVP-TE and LDP. Specifying a VLAN limits the output to that of the individual VLAN.

Example

The following command display MPLS interface information:

```
Switch # show mpls interface
Local                  RSVP-TE      LDP
VLAN Name        IP Address      MTU   UpTm #Nbr UpTm  #Adj    Flags
---------------- --------------- ----  ---- ---- ---- ----    -------
loopb            11.100.100.218  1500    3h    0   3h    0     MRL-I-U
toratora         192.84.86.1     1500    3h    0   3h    1     MRL-IBU
tordoze          192.84.93.1     1500    3h    0   3h    1     MRL-IbU
torfour          192.84.83.1     1500    --    0   --    0     MRL-I--
torinasp         192.84.85.1     1500    --    0   --    0     MRL-I--
Flags: (M) MPLS Enabled, (R) RSVP-TE Enabled, (L) LDP Enabled,
(P) PHP Enabled, (I) IP Forwarding Enabled, (B) BFD Enabled,
(b) BFD Disabled(Sessions Exist) (U) MPLS Operational
```

The following command displays detailed MPLS information for VLAN 1:

```
* BD-10K.27 # show mpls interface vlan1 detail
VLAN Name : vlan1
Local IP Address          : 192.84.86.1
IP Forwarding             : Enabled
MPLS I/F MTU              : 1500
PHP Status                : Disabled
BFD Status                : Enabled
MPLS Admin Status         : Enabled
MPLS Oper Status          : Disabled
RSVP-TE Admin Status      : Enabled
Oper Status       : Disabled
UpTime            : 0d:0h:0m:0s
# Neighbors       : 0
LDP Admin Status          : Enabled
Oper Status           : Disabled
UpTime                : 0d:0h:0m:0s
# Link Adjacencies    : 0
```

History

This command was first available in ExtremeXOS 11.6.

The BFD flags and status were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls label

show mpls {**rsvp-te** | **static**} **label** {**summary** | *label_num* | [**advertised** | **received**] {*label_num*} | **received implicit-null**}

Description

Displays label information for all label types and protocols.

Syntax Description

rsvp-te	Specifies that only RSVP-TE LSP labels are displayed.
static	Specifies that only static LSP labels are displayed.
summary	Specifies that summary information for the labels is displayed.
label_num	Specifies that only labels that match the specified hexadecimal label number are displayed.
advertised	Specifies that only labels advertised to other routers are displayed.
received	Specifies that only labels received from other routers are displayed.
implicit-null	Specifies that only implicit-null labels are displayed.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all labels, except advertised implicit-null labels, is displayed. The following table describes the display fields that appear when this command is entered.

Table 38: show mpls label Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.

Table 38: show mpls label Field Definitions (continued)

Field	Definition
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field.locl—Indicates that the tunnel destination is local to this switch.VLAN—The label on the packet is stripped and is IP routed according to the Destination Mapping field.VRF—For advertised labels, the Next Hop column contains the name of the virtual router to which packets with the givenLayer 3 VPNlabel will be forwarded. For received labels, the Next Hop column displays the router ID of the BGP peer, and the Name column displays the name of the VR using this label.VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays a VPLS or LSP name.
Received Label	Received Label displays the label received from other routers.

Note

Unsupported labels will contain no information.

Example

The following command displays all labels except received implicit-null labels:

```
* Switch.1 # show mpls label

Advertised     Destination    LSP     Peer  NHop

Total number of RSVP-TE LSP labels          2           2
```

History

This command was first available in ExtremeXOS 11.6.

This command was modified to display only RSVP-TE and static label information in ExtremeXOS 12.5. Additional commands were added to display LDP Layer 2 VPN and Layer 3 VPN labels.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls label usage

show mpls label usage

Description

Displays the label ranges on the current running system, including configurable and non-configurable ranges.

Syntax Description

usage	Specifies the label ranges on the current running system, including configurable and non-configurable ranges.

Default

N/A.

Usage Guidelines

With the addition of the static PW configuration, there is the need to configure static labels and display more detailed label information. This command displays the label ranges on the current running system, including configurable and non-configurable ranges. The output also includes hardware resource usage to provide better information about MPLS hardware utilization and capacity.

Example

The following command displays ???:

```
* show mpls lab usage
Label Type                Size        Label
Range
--------------------      -------
```

```
---------------------------------------

```

History

This command was first available in ExtremeXOS 15.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the *ExtremeXOS Concepts Guide*.

show mpls ldp

show mpls ldp

Description

Displays summary configuration and status information for LDP. Global status of LDP, LDP session timer configuration, loop detection, and label advertisement status are included in the display output.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the global status of LDP, LDP session timer configuration, loop detection, label advertisement, and LDP-enabled VLANs.

The following table describes the display fields that appear when this command is entered.

Table 39: show mpls ldp Field Definitions

Field	Definition
LDP Admin Status	LDP Admin Status shows whether LDP has been administratively `Enabled` or `Disabled`.
LDP Oper Status	LDP Oper Status shows whether LDP is operating (`Enabled`) or not (`Disabled`).
Protocol Version	Protocol Version specifies the LDP protocol version number.

Table 39: show mpls ldp Field Definitions (continued)

Field	Definition
Label Retention Mode	Label Retention Mode is either **Conservative** or **Liberal**, as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Liberal mode. In Liberal mode, a label switch router maintains all received label-to-FEC mapping advertisements.
Label Distribution Method	Label Distribution Method is either **Downstream Unsolicited** or **Downstream On Demand**, as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Downstream Unsolicited mode. In Downstream Unsolicited mode, a label switch router distributes label bindings to peer label switch routers without waiting for the bindings to be requested.
Label Distribution Control Mode	Label Distribution Control Mode is either **Independent** or **Ordered**, as described in RFC 3036, LDP Specification. The ExtremeXOS software only supports Ordered mode. In Ordered control mode, a label switch router only creates a binding of a label-to-FEC when it is the egress router or it has received a label binding for that FEC from the next hop router for that FEC.
LDP BGP LSPs	LDP BGP LSPs shows whether LDP uses BGP routes. When the displayed value is **Enabled**, LDP accepts BGP routes and stores them in the LDP internal routing table. When the displayed value is **Disabled**, LDP does not accept BGP routes, which reduces memory requirements when LSPs based on BGP routes are not desired. Note that when **Disabled** is displayed, no LDP LSPs are established to prefixes for which BGP is the preferred routing protocol.
LDP Loop Detection	LDP Loop Detection displays the LDP loop detection configuration.
LDP Targeted Timers	LDP Targeted Timers displays the LDP timer configuration used for LDP targeted adjacencies and sessions.
LDP Link Timers	LDP Link Timers displays the LDP timer configuration used for LDP link adjacencies and sessions.

Example

The following command displays summary configuration and status information for LDP:

```
* BD-10K.25 # show mpls ldp
LDP Admin Status                    : Enabled
LDP Oper Status                     : Enabled
Protocol Version                    : v1*
Label Retention Mode                : Liberal*
Label Distribution Method           : Downstream Unsolicited*
Label Distribution Control Mode     : Ordered*
LDP BGP LSPs                        : Enabled
LDP Loop Detection
Status            : Disabled
Hop-Count Limit   : 255
Path-Vector Limit : 255
LDP Targeted Timers
Hello Hold      : 45 seconds
Keep Alive Hold : 60 seconds
LDP Link Timers
Hello Hold      : 15 seconds
Keep Alive Hold : 40 seconds
```

```
Label Advertisement
Direct : Matching LSR-ID Only
Rip    : None
Static : None

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp interface

show mpls ldp interface {{**vlan**} *vlan_name*} {**detail** | **counters**}

Description

Displays LDP information about MPLS interfaces. Summary information is displayed in tabular format for all VLANs that are configured for MPLS.

Syntax Description

vlan	Displays LDP interface information for one VLAN.
vlan_name	Specifies the name of the VLAN.
detail	Displays LDP interface information including LDP control packet counts.
counters	Displays only the LDP control protocol packet counts.

Default

N/A.

Usage Guidelines

If the optional **detail** keyword is specified, the information is shown in verbose form and LDP control packet counts are displayed. If the optional **counters** keyword is specified, only the LDP control protocol packet counts are shown. The counters are described in RFC 3036, LDP Specification.

Example

The following command displays detailed LDP information for the interface associated with VLAN 1:

```
* BD-10K.22 # show mpls ldp interface vlan1 detail
VLAN Name : vlan1
Local IP Address           : 11.121.96.20
MPLS Admin Status          : Enabled
MPLS Oper Status           : Enabled
LDP Admin Status           : Enabled
LDP Oper Status            : Enabled
LDP UpTime                 : 0d:1h:59m:56s
Current Adjacencies        : 1
Negotiated Hello Hold Time : 15000 ms
Time to Send Next Hello    : 4060 ms
Link     Targeted
Counter                         Adjacencies  Adjacencies
------------------------------  -----------  -----------
Shutdown Notifications (Rcvd)             0            0
Shutdown Notifications (Sent)             0            0
Failed Session Attempts (NAKs)            0            0
Hello Errors                              0            0
Parameters Advertised Errors              0            0
Max PDU Length Errors                     0            0
Label Range Errors                        0            0
Bad LDP ID Errors                         0            0
Bad PDU Length Errors                     0            0
Bad Msg Length Errors                     0            0
Bad TLV Length Errors                     0            0
Bad TLV Value Errors                      0            0
Keep-Alive Timeout Errors                 0            0
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label

show mpls {ldp} label {lsp} {summary | *label_num* | **[advertised** | **received]** {*label_num*} | **received implicit-null}**

Description

Displays LDP LSP label information.

Syntax Description

ldp	Specifies that only LDP labels are displayed.
summary	Specifies that summary information for the labels is displayed.
label_num	Specifies that only labels that match the specified hexadecimal label number are displayed.
advertised	Specifies that only labels advertised to other routers are displayed.
received	Specifies that only labels received from other routers are displayed.
implicit-null	Specifies that only implicit-null labels are displayed

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP labels, except advertised implicit-null labels, is displayed. The following table describes the display fields that appear when this command is entered.

Table 40: show mpls ldp label Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.

Table 40: show mpls ldp label Field Definitions (continued)

Field	Definition
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field.vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field.locl—Indicates that the tunnel destination is local to this switch.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays an LSP name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays all LDP labels except received implicit-null labels:

```
* Switch.1 # show mpls ldp label
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label advertised

show mpls ldp label {lsp} advertised implicit-null {*ipNetmask*}

Description

Displays advertised LDP LSP implicit-null label information.

Syntax Description

ipNetmask	Specifies an IP network mask.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP advertised implicit-null labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 41: show mpls ldp label Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field.vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field.locl—Indicates that the tunnel destination is local to this switch.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays a VPLS or LSP name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays all advertised LDP implicit-null labels:

```
* Switch.1 # show mpls ldp label advertised implicit-null
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label l2vpn

show mpls {**ldp**} **label l2vpn** {**summary** | *label_num* | [**advertised** | **received**] {*label_num*}}

Description

Displays LDP Layer 2 VPN label information.

Syntax Description

ldp	Specifies that only LDP labels are displayed.
summary	Specifies that summary information for the labels is displayed.
label_num	Specifies that only labels that match the specified hexadecimal label number are displayed.
advertised	Specifies that only labels advertised to other routers are displayed.
received	Specifies that only labels received from other routers are displayed.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LDP Layer 2 VPN labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 42: show mpls ldp label l2vpn Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays a VPLS or LSP name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays all Layer 2 VPN labels:

```
* Switch.1 # show mpls ldp label l2vpn
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label l2vpn retained

show mpls ldp label l2vpn retained {*ipaddress*}

Description

Displays Layer 2 VPN liberally retained labels received from a peer.

Syntax Description

ipaddress	Specifies an IP address.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all Layer 2 VPN liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 43: show mpls ldp label l2vpn retained Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.

Table 43: show mpls ldp label l2vpn retained Field Definitions (continued)

Field	Definition
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays a VPLS name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays liberally-retained Layer 2 VPN labels received from peers:

```
* Switch.1 # show mpls ldp label l2vpn retained
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label lsp retained

show mpls ldp label lsp retained {*ipNetmask*}

Description

Displays LSP liberally retained labels received from a peer.

Syntax Description

ipNetmask	Specifies an IP network mask.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all LSP liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 44: show mpls ldp label lsp retained Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field.vlan—The label on the packet is stripped and is IP routed according to the Destination Mapping field.locl—Indicates that the tunnel destination is local to this switch.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays an LSP name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays liberally-retained LSP labels received from peers:

```
* Switch.1 # show mpls ldp label lsp retained lsp
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp label retained

show mpls ldp label retained [**l2vpn** {*ipaddress*} | **lsp** {*ipNetmask*}]

Description

Displays liberally-retained labels received from a peer for either the Layer 2 VPN protocol or LSP protocol.

Syntax Description

ipaddress	Specifies an IP address.
ipNetmask	Specifies an IP network mask.

Default

N/A.

Usage Guidelines

If no options are specified, tabular information for all liberally-retained labels is displayed. The following table describes the display fields that appear when this command is entered.

Table 45: show mpls label retained Field Definitions

Field	Definition
Advertised Label	Advertised Label is the label advertised to other routers.
Destination Mapping	Destination Mapping displays the destination IP address and mask.
LSP Flags	LSP Flags lists the flags for each label, which are described in the key at the bottom of the display.
Peer Label	The peer label that replaces the received label of incoming packets during a label swap on a transit LSP. The peer label appears only for transit LSPs.
NHop Type	NHop Type helps define the handling of a packet arriving with the specified advertised label. Possible values are: IP—The label on the packet is swapped and the packet forwarded to the IP address shown in the NextHop field.locl—Indicates that the tunnel destination is local to this switch.VLAN—The label on the packet is stripped and is IP routed according to the Destination Mapping field.VPLS—The label on the packet is stripped and forwarded according to the service configuration of the VPLS specified in the Name field.
Next Hop	Displays an interface ID for the next hop router, which can be a VLAN name, VMAN name, or IP address.
Name	Displays a VPLS or LSP name.
Received Label	Received Label displays the label received from other routers.

Example

The following command displays liberally-retained LSP labels received from peers:

```
* Switch.1 # show mpls ldp label retained lsp
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp lsp

show mpls ldp lsp {**prefix** *ipNetmask*} {**ingress** | **egress** | **transit**} {**detail**}

Description

Displays the LSP information associated with LDP that is used to forward packets within the MPLS network. If no options are specified, summary information for all LSPs is displayed.

Syntax Description

prefix	Displays information for a single FEC that matches the prefix.
ipNetmask	Designates the FEC for which to display information.
ingress	Displays information for LSPs that originate from the switch into the MPLS network.
egress	Displays information for LSPs that terminate at the switch from the MPLS network.
transit	Displays information for LSPs that traverse the switch.
detail	Display detailed LSP information.

Default

N/A.

Usage Guidelines

If no options are specified, this command displays summary information for all LSPs.

Optionally, the LSPs displayed can be further qualified by the keywords **ingress**, **egress**, and **transit**. These keywords qualify the LSPs displayed from the perspective of the switch. Ingress LSPs originate from the switch into the MPLS network. Egress LSPs terminate at the switch from the MPLS network. Transit LSPs traverse the switch. If the optional **prefix** keyword is specified, only the LSP information associated with the FEC that matches the prefix is displayed.

If the **detail** keyword is specified, information is displayed in verbose form and includes received packet and byte counts.

Example

The following command displays LDP information for an ingress LSP:

```
* BD-10K.5 # show mpls ldp lsp 11.100.100.59/32 ingress detail
FEC IP/Prefix: 11.100.100.59/32
Next Hop I/F     : m5vlan1
Next Hop Addr    : 12.224.0.55
Advertised Label : n/a               Received Label : 0x80403 (525315)
Rx Packets       : n/a                   Tx Packets : 61
Rx Bytes         : n/a                     Tx Bytes : 4294967296
```

The following command displays LDP information for a transit LSP:

```
* BD-10K.5 # show mpls ldp lsp 11.100.100.55/32 transit detail
FEC IP/Prefix: 11.100.100.55/32
Next Hop I/F     : m5vlan1
Next Hop Addr    : 12.224.0.55
Advertised Label : 0x11 (17)         Received Label : 0x80403 (525315)
Rx Packets       : 61                    Tx Packets : 61
Rx Bytes         : 4294967296              Tx Bytes : 4294967296
```

The following command displays LDP information for an egress LSP:

```
* BD-10K.5 # show mpls ldp lsp 11.100.100.30/32 egress detail
FEC IP/Prefix: 11.100.100.30/32
Direct VLAN      : loop
Advertised Label : 0x80400 (525312)  Received Label : n/a
Rx Packets       : 61                    Tx Packets : n/a
Rx Bytes         : 4294967296              Tx Bytes : n/a
```

History

This command was first available in ExtremeXOS 11.6.

The output for this command was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls ldp peer

show mpls ldp peer {*ipaddress*} {**detail**}

Description

Displays information about the status of the LDP sessions and hello adjacencies for all LDP peers.

Syntax Description

ipaddress	Display session and hello adjacency information for a single LDP peer.
detail	Display additional detailed information related to the session and adjacencies.

Default

N/A.

Usage Guidelines

Specifying the LDP peer's ipaddress displays session and hello adjacency information for a single LDP peer. When the **detail** keyword is specified, additional detailed information related to the session and adjacencies is displayed.

Table 38: show mpls label Field Definitions on page 2231 describes the display fields that appear when this command is entered.

Table 46: show mpls ldp peer Field Definitions

Field	Definition
IP Address	Local IP address, which is used as the LSR-ID.
LDP Peer	LDP identifier of LDP peer.
State	Displays the state of the Initialization State Machine as described in RFC 3036, LDP Specification. The states are: NonExistent, Initialized, OpenRec, OpenSent, and Operational.
Uptime	Displays the total time the session has been operational.
Adjacencies	Displays the number of active adjacencies with the LDP peer.
Index	The Entity Index used in the LDP Entity Table MIB.
Targeted Peer	The IP address of the peer used in Extended Discovery. If this is not a targeted peer (Basic Discovery was used), this field displays Not Targeted.
Attempted Sessions	This and other counters are described in RFC 3036, LDP Specification.
Shutdown Notifications	This and other counters are described in RFC 3036, LDP Specification.
Peer	IP address of peer.
Peer Label Space	The label space as given by the peer and derived from the LDP Identifier. A **zero value** represents the global or per-platform label space. A non-zero value represents a per interface label space.
Session State	Displays the state of the Initialization State Machine as described in RFC 3036, LDP Specification. The states are: NonExistent, Initialized, OpenRec, OpenSent, and Operational.
Session Uptime	Displays the total time the session has been operational.
Discontinuity Time	The system uptime for the most recent period after which one or more of the session's counters suffered a discontinuity.
Keep Alive Hold Timer	Displays the configured keep alive hold timer value and the remaining hold time.

Table 46: show mpls ldp peer Field Definitions (continued)

Field	Definition
Label Distribution Method	Label Distribution Method is either **DU** (Downstream Unsolicited) or **DOD** (Downstream On Demand), as described in RFC 3036, LDP Specification.
Max PDU Length	The maximum allowable length for LDP PDUs (Protocol Data Units) for this session.
Unknown Msg Type Errors	The number of messages received for this session without a recognized message type and without the ignore bit set.
Unknown TLV Errors	The number of TLVs received for this session without a recognized TLV type and without the ignore bit set.
Next Hop Addr(s)	A list of next hop addresses received from the peer through LDP address messages.

Example

The following command displays MPLS LDP session information for the LDP entity 11.100.100.30:

```
Mariner3.59 # show mpls ldp peer
IP Address      LDP Peer             State        Uptime          Adjacencies
11.100.100.30   11.100.100.55:0      Operational  0d:14h:51m:53s      1
11.100.100.30   14.4.0.99:15         Operational  0d:1h:0m:43s        1
11.100.100.30   14.4.0.99:16         Operational  0d:0h:34m:51s       1
Adjacencies:
Index                    : 1                          Attempted
Sessions        : 1
Targeted Peer            : 11.100.100.210:0           Shutdown
Notifications    : Sent 0 Rcvd 0
Mariner3.32 # show mpls ldp peer detail
Peer: 11.100.100.55      Peer label space: 0 (global)
Session State                 : Operational
Session Uptime               : 0d:0h:13m:41s
...
Peer: 14.4.0.99          Peer label space: 15
Session State                 : Operational
Session Uptime               : 0d:0h:57m:4s
...
Peer: 14.4.0.99          Peer label space: 16
Session State                 : Operational
Session Uptime               : 0d:0h:31m:12s
...
* DUT65.2 # show mpls ldp peer detail
Peer: 11.100.100.210     Peer Label Space: 0 (global)
Session State                : Operational
Session Uptime               : 0d:0h:6m:30s
Discontinuity Time           : 34677
Keep Alive Hold Timer        : 40 (remaining: 37.86)
Label Distribution Method    : DU
Max PDU Length               : 4096
Unknown Msg Type Errors      : 0
Unknown TLV Errors           : 0
Next Hop Addr(s)             : 11.100.100.210 12.20.20.210
Adjacencies:
Index                    : 1                          Attempted

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te

show mpls rsvp-te

Description

Displays displays summary configuration and status information for RSVP-TE.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays summary configuration and status information for RSVP-TE. The parameters displayed include:

- Global status of RSVP-TE.
- Configured standard LSP timer values.
- Configured rapid-retry LSP timer values.
- RSVP-TE VLANs.

Example

The following command shows the summary configuration and status information for RSVP-TE:

```
* BD-10K.16 # show mpls rsvp-te
RSVP-TE Admin Status  : Enabled
RSVP-TE Oper Status   : Enabled
LSP Standard-Retry Timers
Delay-Interval  : 30 seconds
Decay-Rate      : 50 %
Retry-Limit     : unlimited
LSP Rapid-Retry Timers
Delay-Interval  : 500 milliseconds
Decay-Rate      : 50 %
Retry-Limit     : 10
RSVP-TE VLANs  : vlan1
: vlan2
: vlan3
```

History

This command was first available in ExtremeXOS 11.6

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te bandwidth

show mpls rsvp-te bandwidth {{**vlan**} *vlan_name*} {**detail**}

Description

Displays the reserved bandwidth for each TE LSP by interface.

Syntax Description

vlan_name	Displays the reserved bandwidth for each TE LSP associated with the specified VLAN.
detail	Displays the path information in verbose format.

Default

All TE LSPs for all RSVP-TE-enabled interfaces are shown.

Usage Guidelines

This command displays the reserved bandwidth for each TE LSP by interface. By default, all TE LSPs for all RSVP-TE enabled interfaces are shown.

Note

Beginning with ExtremeXOS Release 12.2.1, the receive bandwidth can only be used for tracking. If the configured receive bandwidth is exceeded, the available bandwidth shown might be negative. In this case, “Ovr” is displayed to indicate that the link is oversubscribed in the receive direction. The **detail** option can be used to show the actual LSPs using this bandwidth.

The optional vlan keyword limits the display to only those LSPs that have bandwidth reservations against the specified VLAN. Only committed-rate bandwidth is displayed. Bandwidth is displayed as either received or transmitted bandwidth with respect to the switch.

LSPs are listed using the configured or signaled LSP name. If the LSP name was not included in the setup control messages (which can only occur when using OEM vendor equipment), the LSP is uniquely identified using a concatenated string that includes the tunnel ID and source IP address. Per VLAN, each LSP is listed in descending priority order. That is, the LSPs listed at the top of each VLAN have the highest bandwidth priority and are less likely to be preempted. Bandwidth priority is determined by the signaled hold-priority and the uptime. The TE LSP with a hold-priority of zero and the highest uptime has the highest bandwidth priority and the TE LSP with a hold-priority of seven and the lowest uptime has the lowest bandwidth priority.

Use the **detail** keyword to display detailed information.

Example

The following command displays bandwidth reservation information for the specified VLAN:

```
show mpls rsvp-te bandwidth vlan vlan_1 detail
* BD-10K.2 # show mpls rsvp-te bandwidth vlan_1 detail
Vlan           Dir  Pool     CIR (per priority level)
LSP         0     1     2     3     4     5     6     7
--------------------------------------------------------------------------
vlan_1          Rx   300
vlalsp1         -     -    10     -     -     -     -     -
-----------------------------------------------
Available    300   300   290   290   290   290   290   290
Tx   500
vlalsp2         -     -     9     -     -     -     -     -
-----------------------------------------------
Available    500   500   491   491   491   491   491   491
(Rx)Receive Bandwidth  (Tx)Transmit Bandwidth
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te interface

show mpls rsvp-te interface {{**vlan**} *vlan_name*} {**detail** | **counters**}

Description

Displays RSVP-TE information about MPLS interfaces.

Syntax Description

vlan	Display information for one VLAN.
vlan_name	Specifies the name of the VLAN.
detail	Display RSVP-TE information including the interface up time and LDP control packet counts.
counters	Display only the RSVP-TE control protocol packet counts.

Default

N/A.

Usage Guidelines

This command displays RSVP-TE information about MPLS interfaces. Summary information is displayed in tabular format for all VLANs that are configured for MPLS. The following information is displayed:

- VLAN name.
- Bandwidth reserved.
- TE metric.
- Hello interval time.
- Refresh interval time.
- Summary refresh time.
- Bundle message time.
- Uptime.
- Number of neighbors.
- RSVP-TE state information

When the optional **detail** keyword is specified, additional RSVP-TE information is displayed. This additional information includes:

- RSVP-TE hello keep multiplier.
- RSVP-TE refresh keep multiplier.
- RSVP-TE available bandwidth per priority level.
- RSVP-TE control protocol packet counts.

When the optional **counters** keyword is specified, only the RSVP-TE control protocol packet counts are shown.

Example

The following command displays detailed RSVP-TE information for the interfaces associated with VLAN 1:

```
* BD-10K.15 # show mpls rsvp-te interface vlan1 det
VLAN Name : vlan1
Local IP Address          : 11.121.96.20

```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te lsp

show mpls rsvp-te lsp {{[**destination** | **origin**] *ipaddress*} {**fast-reroute**} {**detail**} | **summary**}

Description

Displays complete or filtered information for all RSVP-TE LSPs.

Syntax Description

destination	Displays only those LSPs that terminate at the specified IP address.
origin	Displays only those LSPs that originate at the specified IP address.
ipaddress	Specifies an IP address for an LSP origin or destination.
fast-reroute	Limits the display to only those LSPs with fast reroute protection.
detail	Displays the LSP information in verbose format.
summary	Displays only the LSP summary statistics section of the normal display.

Default

N/A.

Usage Guidelines

If no options are specified, information for all RSVP-TE LSPs is displayed.

You can limit the display to ingress, transit, or egress LSPs with the following commands:

```
        show mpls rsvp-te lsp [ingress {fast-reroute} | <ingress_lsp_name> |
ingress <ingress_lsp_name> | ingress [destination | origin] <ipaddress>]
{[all-paths | detail] | summary | down-paths {detail}}
                    show mpls rsvp-te lsp [egress | transit] {fast-reroute}
{{<lsp_name>} {[destination | origin] <ipaddress>} {detail} | summary}
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

The following command example displays information about all RSVP-TE LSPs:

```
# show mpls rsvp-te lsp
Ingress LSP Name Path Name        Destination     Next Hop I/F     UpTm Flags

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The fast-reroute feature was first available in ExtremeXOS 12.1.

This command and its output were modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te lsp [egress | transit]

show mpls rsvp-te lsp [egress | transit] {**fast-reroute**} {{*lsp_name*} {[**destination** | **origin**] *ipaddress*} {**detail**} | **summary**}

Description

Displays complete or filtered information for one or all egress or transit RSVP-TE LSPs.

Syntax Description

egress	Limits the display to only the LSPs that terminate at this switch.
transit	Limits the display to only the LSPs that transit this switch.
fast-reroute	Limits the display to only those LSPs with fast reroute protection.
lsp_name	When either the transit or the egress option is specified, this variable specifies a name for a single LSP for which information is displayed.
destination	Displays only those LSPs that terminate at the specified IP address.
origin	Displays only those LSPs that originate at the specified IP address.
ipaddress	Specifies an IP address for an LSP origin or destination.
detail	Displays the LSP information in verbose format.
summary	Displays only the LSP summary statistics section of the normal display.

Default

N/A.

Usage Guidelines

You can limit the display to ingress LSPs with the following command:

```
        show mpls rsvp-te lsp [ingress {fast-reroute} | <ingress_lsp_name> |
ingress <ingress_lsp_name> | ingress [destination | origin] <ipaddress>]
```

```
{[all-paths | detail] | summary | down-paths {detail}}
```

You can display information for all LSPs with the following command:

```
        show mpls rsvp-te lsp {{[destination | origin] <ipaddress>} {fast-
reroute} {detail} | summary}
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

The following command example displays RSVP-TE LSPs that terminate at this switch and at IP address 11.100.100.30:

```
# show mpls rsvp-te lsp egress destination 11.100.100.30
Egress LSP Name  Source IP       Destination     Prev Hop I/F     UpTm
---------------- --------------- --------------- ---------------- ----
tom3             11.100.100.55   11.100.100.30   m5vlan1            5m
frrlsp1tom3      11.100.100.50   11.100.100.30   m2vlan1            5m
tom3             11.100.100.50   11.100.100.30   m2vlan1            5m
Summary of Egress RSVP-TE LSPs to destination 11.100.100.30
Egress LSPs                              : 3
Egress Protected LSPs                    : 0
```

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The fast-reroute feature was first available in ExtremeXOS 12.1.

This command and its output were modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te lsp ingress

show mpls rsvp-te lsp [**ingress** {**fast-reroute**} | *ingress_lsp_name* | **ingress** *ingress_lsp_name* | **ingress** [**destination** | **origin**] *ipaddress*] {[**all-paths** | **detail**] | **summary** | **down-paths** {**detail**}}

Description

Displays information for the specified ingress RSVP-TE LSP.

Syntax Description

fast-reroute	Limits the display to only those LSPs with fast reroute protection.
ingress_lsp_name	Identifies the ingress LSP for which you want to display information.
destination	Displays only those LSPs that terminate at the specified IP address.
origin	Displays only those LSPs that originate at the specified IP address.
ipaddress	Specifies an IP address for an LSP origin or destination.
all-paths	Specifies that the display include all redundant paths.
detail	Displays the LSP information in verbose format.
summary	Displays only the LSP summary statistics section of the normal display.
down-paths	Specifies that the display include only those paths that are operationally down.

Default

N/A.

Usage Guidelines

You can limit the display to egress or transit LSPs with the following command:

```
        show mpls rsvp-te lsp [egress | transit] {fast-reroute} {{<lsp_name>}
{[destination | origin] <ipaddress>} {detail} | summary}
```

You can display information for all LSPs with the following command:

```
        show mpls rsvp-te lsp {{[destination | origin] <ipaddress>} {fast-
reroute} {detail} | summary}
```

When label recording is enabled for an LSP, labels are displayed only for the ingress node (the egress label from the previous node always matches the ingress node label).

Example

Use the following command to display information about a specific LSP:

```
# show mpls rsvp-te lsp jefflsp1
Ingress LSP Name Path Name        Destination     Next Hop I/F     UpTm Flags
---------------- ---------------- --------------- ---------------- ----
--------
```

```
jefflsp1         jeffpath1        11.100.100.204  n/a                0 --PR--
IV
Flags: (U) Up, (E) Enabled, (P) Primary LSP, (S) Secondary LSP,
(F) FRR Primary LSP  (R) Redundant Paths, (B) Bandwidth Requested,
(O) ERO Specified,   (I) IP Traffic Allowed, (V) VPN Traffic Allowed,
(v) VPN Assigned Traffic Allowed
Summary of Ingress RSVP-TE LSPs named jefflsp1
Ingress LSPs (Enabled/Disabled)       : 1 (0/1)
Ingress LSPs with no configured path  : 0
Ingress LSP Paths (Up/Down)           : 2 (0/2)
```

Use the following command to display detailed information about a specific ingress LSP:

```
* BD-10K.7 # show mpls rsvp-te lsp ingress "lsp598" detail
Ingress LSP Name: lsp598
Destination  : 11.100.100.8           Admin Status : Enabled
IP Traffic   : Allow                  #VPLS Cfgd   : 0
VPN Traffic  : Allow                  #VPLS In-Use : 0
Path Name: path598
Profile Name : prof598
Tunnel ID    : 1                  Ext Tunnel ID  : 11.100.100.20

Tx I/F       : 11.121.96.20 - vlan1
Record Route : Indx  IP Address
:    1  11.121.96.5
:    2  11.95.96.9
:    3  11.98.96.8
```

Use the following command to display detailed information about all paths for an LSP:

```
* BD-10K.5 # show mpls rsvp-te lsp jefflsp1 all-paths
Ingress LSP Name Path Name        Destination     Transmit I/F     UpTm Flags
---------------- ---------------- --------------- ---------------- ----
--------
jefflsp1         jeffpath0        11.100.100.204  n/a                0 --SR--
IV
jefflsp1         jeffpath1        11.100.100.204  n/a                0 --PR--

```

History

This command was first available in ExtremeXOS 11.6.

This command and its output were modified, and the summary option was added in ExtremeXOS 12.0.

The command output was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te neighbor

show mpls rsvp-te neighbor {{**vlan**} *vlan_name* | *ipaddress*} {**detail**}

Description

Displays all recognized RSVP-TE neighbors.

Syntax Description

vlan_name	Displays only the neighbors for the specified VLAN.
ipaddress	Displays only the neighbor with the specified ipaddress.

Default

N/A.

Usage Guidelines

This command displays all recognized RSVP-TE neighbors. The IP address of each neighbor is displayed along with the VLAN name for the MPLS interface. For each neighbor, the following information is displayed:

- Number of RSVP-TE LSPs.
- Number of hello periods that have elapsed without receiving a valid hello.
- Remaining time before next hello is sent.
- Remaining time before next bundle message is sent.
- Neighbor up time.
- Neighbor supports RSVP hello.
- RSVP hello state.
- Neighbor supports refresh reduction.

If `vlan_name` is specified, only neighbors for the matching VLAN are shown. If `ipaddress` is specified, only the neighbor with that IP address is shown. If the `detail` keyword is specified, the information is shown in a verbose manner.

Example

The following command displays all recognized RSVP-TE neighbors:

```
* BD-10K.5 # show mpls rsvp-te neighbor
NeighborIP      VLAN Name            #LSPs #Miss NxtHello NxtBundl Flag UpTm
--------------- -------------------- ----- ----- -------- -------- ---- ----
11.121.96.5     vlan1                    2     0     2870        0 UTH-  15m
11.122.96.8     vlan2                    2     0     1770        0 UTH-  15m
Flags: (U) Hello Session Up, (T) Two Way Hello, (H) Neighbor Supports Hello,
(R) Neighbor Supports Refresh Reduction
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te path

show mpls rsvp-te path {*path_name*} {**detail**}

Description

Displays the configuration and usage information for MPLS RSVP-TE routed paths.

Syntax Description

path_name	Displays configuration and usage information for the specified MPLS RSVP-TE path.
detail	Displays the path information in verbose format.

Default

N/A.

Usage Guidelines

This command displays the configuration and usage information for MPLS RSVP-TE paths. Information is listed in tabular format and includes:

- Path name.
- Number of configured ERO objects.
- Number of LSPs configured to use this path.
- List of EROs and their type.

Specifying the optional **detail** keyword displays the path information in verbose format. If **detail** is specified, all LSPs that are configured to use the path are also displayed.

Example

The following command displays configuration and status information for the specified MPLS RSVP-TE paths:

```
* BD-10K.2 # show mpls rsvp-te path path598
Path Name         #LSP #ERO Ord#  ERO IP Netmask       Type
----------------- ---- ---- ----- -------------------- ------
path598              1    3   100 11.100.100.5/32      loose
200 11.100.100.9/32      loose
300 11.100.100.8/32      loose
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te profile

show mpls rsvp-te profile {*profile_name*} {**detail**}

Description

Displays the configuration for the specified profile.

Syntax Description

profile_name	Displays configuration and usage information for the specified profile, which can be either a standard or a fast-reroute profile.
detail	Displays the profile information in verbose format, and displays all LSPs that are configured to use the specified profile.

Default

N/A.

Usage Guidelines

If the `profile_name` argument is omitted, the profile parameter values for all profiles are displayed.

Example

The following command displays configuration information for all defined profiles:

```
* BD-10K.13 # show mpls rsvp-te profile
Profile Name      Peak       Committed  Max Burst SPri HPri RRO MTU  #LSP
----------------- ---------- ---------- --------- ---- ---- --- ---- ----
default                    0          0         0    7    0 Off i/f     0
prof598                    0          0         0    7    0 On  1500    1
FRR Profile Name Mode   Bandwidth SPri HPri HopLmt P-BW P-Node #LSP
---------------- ------ --------- ---- ---- ------ ---- ------ ----
Prf1_frr         Detour         0    7    0      3 Ena  Ena       2
```

The following command displays configuration information for a specific fast-reroute profile:

```
* BD-10K.14 # show mpls rsvp-te profile prf1_frr detail
Profile Name : prf1_frr
Profile type         : Fast Reroute / Standard
Peak Rate            : 0 Kbps
Committed Rate       : 0 Kbps
Max Burst Size       : 0 Kb
Setup Priority       : 7
Hold Priority        : 4
Hop Limit            : 1
Protected BW         : Disabled
Protect Node         : Enabled
#LSP References      : 2
LSP / Path           : pc10_lsp / p1
```

History

This command was first available in ExtremeXOS 11.6.

The fast-reroute feature was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements of Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls rsvp-te profile fast-reroute

show mpls rsvp-te profile fast-reroute {detail}

Description

Displays the configuration for all fast-reroute profiles.

Syntax Description

detail	Displays the profile information in verbose format.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays summary configuration information for all fast-reroute profiles:

```
* BD-10K.13 # show mpls rsvp-te profile fast-reroute
FRR Profile Name Mode   Bandwidth SPri HPri HopLmt P-BW P-Node #LSP
---------------- ------ --------- ---- ---- ------ ---- ------ ----

```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls static lsp

show mpls static lsp {**summary** | {*lsp_name*} {**detail**}}

Description

Displays the configuration of one or all static LSPs.

Syntax Description

summary	Displays only static LSP summary information.
lsp_name	Identifies the LSP to be displayed.
detail	Displays additional information about the static LSPs, including packet and byte counts.

Default

N/A.

Usage Guidelines

If no command options are specified, all defined static LSPs are displayed in tabular format. The information displayed includes the configured ingress label, egress label, next-hop router IP address, and the MPLS interface status for the egress path. The summarized list of static LSPs is displayed in alphabetical order based on the LSP name.

Example

The following command displays detailed information about an ingress static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name  : statlsp1            LSP Type      : Ingress-Lsp
Destination  : 11.100.100.55       Next Hop Addr : 12.220.0.30
Ingress I/F  : **None**            Egress I/F    : m3vlan1
Admin Status : Disabled            Oper Status   : Disabled
Ing-Label    : **None**            Eg-Label      : 0x7FF00
IP Traffic   : Allow               VPN Traffic   : Allow
Rx Packets   : n/a                 Tx Packets    : 0
Rx Bytes     : n/a                 Tx Bytes      : 0
```

The following command displays detailed information about a transit static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name  : statlsp1            LSP Type      : Transit-Lsp
Destination  : 11.100.100.55       Next Hop Addr : 12.224.0.55
Ingress I/F  : m2vlan1             Egress I/F    : m5vlan1
Admin Status : Disabled            Oper Status   : Disabled
Ing-Label    : 0x7FF00             Eg-Label      : 0x80300
IP Traffic   : Not Applicable      VPN Traffic   : Not Applicable
Rx Packets   : 0                   Tx Packets    : 0
Rx Bytes     : 0                   Tx Bytes      : 0
```

The following command displays detailed information about an egress static LSP:

```
show mpls static lsp statlsp1 detail
Static LSP Name  : statlsp1            LSP Type      : Egress-Lsp
Destination  : 11.100.100.55       Next Hop Addr : **None**
Ingress I/F  : m3vlan1             Egress I/F    : **None**
Admin Status : Disabled            Oper Status   : Disabled
Ing-Label    : 0x80300             Eg-Label      : **None**
IP Traffic   : Not Applicable      VPN Traffic   : Not Applicable
Rx Packets   : 0                   Tx Packets    : n/a
Rx Bytes     : 0                   Tx Bytes      : n/a
```

History

This command was first available in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show mpls statistics l2vpn

show mpls statistics l2vpn {*vpls_name* | *vpws_name* } {**detail**}

Description

Displays MPLS statistics for one or all Layer 2 VPNs.

Syntax Description

vpls_name	Specifies VPLS for which to display statistics.
vpws_name	Specifies VPWS for which to display statistics.
detail	Displays additional information about the Layer2 VPNs.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays statistics for all Layer 2 VPNs:

```
Switch.1 # show mpls statistics l2vpn
VPN ID     Peer IP             RxPackets      RxBytes    TxPackets
TxBytes

```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show vpls

show vpls {{*vpls_name*} {**peer** *ipaddress*} {**detail**} | **summary**}

Note

This command has been replaced with the following command: show l2vpn {vpls {{<vpls_name>} | vpws {{<vpws_name>}} {peer <ipaddress>} {detail} | summary}. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Displays VPLS and H-VPLS configuration and status information.

Syntax Description

vpls_name	Displays information for the specified vpls.
ipaddress	Specifies a VPLS peer for which to display information.
detail	Displays additional information in comprehensive detail format.

Default

N/A.

Usage Guidelines

The **show vpls** command (without any optional parameters) displays all currently configured VPLS instances for the switch. The summarized list of VPLS instances is displayed in alphabetical order based on the **vpls_name**. Peers are displayed in the reverse of the order they were added.

When you specify a VPLS peer, the display includes a list of all PWs established to the peer, the PW status and PW ID, and information about each VPLS to which this peer belongs.

The show l2vpn command describes the display fields that appear when this command is entered with the **detail** option.

Table 47: Selected show vpls Field Definitions

Field	Definition
VPLS Name	VPLS instance or domain name.
VPN ID	Virtual Private Network identifier.
Source Address	Source IP address.
VCCV Status	Virtual Circuit Connectivity Verification (VCCV) feature status, which is either **Enabled** or **Disabled**.
VCCV Interval Time	Displays the configured VCCV interval time.
VCCV Fault Mulitplier	Displays the configured VCCV fault multiplier.
Redundancy Type	Displays the configured VPLS redundancy type, which is **EAPS**, **ESRP**, or **None**.
Service Interface	Displays a VLAN or VMAN interface name.
Admin State	Displays the administrative state of the VPLS, which is either **Enabled** or **Disabled**.
Oper State	Displays the operational state of the VPLS, which is either **Enabled** or **Disabled**.
MTU	Displays the maximum transmission unit (MTU) size for the VPLS.
Ethertype	Displays the ethertype for the service interface.
.1q tag	Displays the 802.1q priority tag for the VPLS.
Peer IP	Displays the IP address for the VPLS peer.

Table 47: Selected show vpls Field Definitions (continued)

Field	Definition
PW State	PW State represents the state, or status, of a PW. The possible PW state values are: UP - The PW is fully operational and installed in hardware. Traffic is forwarded over PW and VPLS service VLAN/VMAN.Down - The PW is not operational and is not installed in hardware. This only happens when the VPLS instance is disabled, VPLS service is disabled, or there is no service VLAN assigned to the VPLS. No traffic is forwarded.Sgnl - The PW is in a signalling state. The PW is not operational, and no traffic is forwarded. This can occur for a number of reasons, including:No LDP adjacency to peerNo transport LSP to peerNo VC LSP to peerRemote peer not configuredReady - The PW has been signalled, but it has not been installed in hardware. Traffic is not forwarded. The PW can be in a Ready state for a number of reasons, including:The VPLS instance is configured for EAPS redundancy, and the EAPS shared port associated with this VPLS instance is Connected.The VPLS instance is configured for ESRP redundancy, and the ESRP domain associated with this VPLS instance is Slave.The service VLAN associated with this VPLS instance is down.The remote peer has signalled that it has a fault (remote PW status). The remote peer may have a fault due to it's service VLAN being down.
PW Uptime	PW Uptime is the elapsed time that the PW has been in the UP state.
PW Installed	PW Installed is a flag to indicate whether the PW is installed in hardware or not. If the PW is in the UP state, this field is True, otherwise, this field is False.
Local PW Status	Local PW Status displays the VC status of the local PW. The values are: No Faults—No faults detected.PW-Tx—Local PSN-facing PW transmit fault. This is set if there is a problem with the VPLS transport LSP.PW-Rx—Local PSN-facing PW receive fault. This is set if there is a problem with the VPLS transport LSP.Att-Tx—Local attachment circuit transmit fault. This is set if there is a problem with the VPLS service VLAN.Att-Rx—Local attachment circuit receive fault. This is set if there is a problem with the VPLS service VLAN.Not Forwarding—The local PW is not forwarding. Look for more information in the PW State field. For example, if VPLS is configured for EAPS redundancy, the Local PW Status is Not Forwarding and the PW State is Ready whenever the EAPS Shared Port state is Connected.
Remote PW Status	Remote PW Status is the VC status of the remote PW. The values for this field are the same values as for Local PW Status.
PW Mode	PW Mode describes how the PW was configured. The values are: Core-to-Core—This VPLS instance is a core node, and the other end of the PW connects to a core node.Core-to-Spoke—This VPLS instance is a core node, and the other end of the PW connects to a spoke node. This is for HVPLS.Spoke-to-Core—This VPLS instance is a spoke node, and the other end of the PW connects to a core node. This is for HVPLS.
Transport LSP	Transport LSP is the LSP that is used to forward frames over the PW. When an LDP LSP is used as a transport, the display shows LDP LSP (Not configured). If an RSVP LSP is used, the name of the RSVP LSP being used as a transport LSP is displayed. An RSVP LSP can be specified as the LSP to use during VPLS configuration.
Next Hop I/F	Displays the interface name for the next hop router.
Next Hop Addr	Displays the interface IP address for the next hop router.
PW Rx Label	Receive label for the VPLS PW.
PW Rx Pkts	Total packets received on the VPLS PW.
PW Rx Bytes	Total bytes received on the VPLS PW.
Tx Label	

Table 47: Selected show vpls Field Definitions (continued)

Field	Definition
PW Tx Label	Transmit label for the VPLS PW.
PW Tx Pkts	Total packets transmitted on the VPLS PW.
PW Tx Bytes	Total bytes transmitted on the VPLS PW.

Example

The following example shows the display that appears when you enter the show vpls command without the `detail` option:

```
Switch.38 # show vpls

```

History

This command was first available in ExtremeXOS 11.6.

This command was updated to display flags for H-VPLS spoke nodes and protected VPLS and H-VPLS in ExtremeXOS 12.1.

The output for this command was modified in ExtremeXOS 12.2.2.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

traceroute mpls lsp

traceroute mpls lsp [*lsp_name* | **any** *host* | **prefix** *ipNetmask*] {**reply-mode** [**ip** | **ip-router-alert**]} {{**from** *from*} {**ttl** *ttl*} {**next-hop** *hopaddress*}}

Description

Traces the path an LSP takes for the specified FEC.

Syntax Description

lsp_name	Specifies the LSP on which to send the MPLS echo request.
any	Allows the echo request to be sent over any available LSP.
host	Specifies the FEC using an ipaddress or hostname.
prefix	Specifies a prefix.
ipNetmask	Specifies the prefix address.
reply-mode	Specifies the reply mode for the MPLS echo response.
ip	Requests an IP UDP reply packet. This is the default mode.
ip-router-alert	Requests an IP UDP reply packet with the IP Router Alert option.
from	Specifies the IP address to be used as the source address in the MPLS echo request.
ttl	Specifies the starting TTL hop value. The range is from 1 - 30. The default is 1.
hopaddress	Specifies the next-hop address.

Default

The maximum time-to-live value is 30 seconds.

Usage Guidelines

This command traces the path an LSP takes for the specified FEC. The `traceroute` command, with the `mpls` keyword option, works by repeatedly sending an MPLS echo request (or “MPLS Ping”). The TTL value is incremented for each successive MPLS echo request sent. The sending LSR waits 5 seconds before sending the next MPLS echo request. This operation continues until either the egress LSR for the FEC is reached, the maximum TTL value is reached, or the operation is interrupted. For each response received, the following information is displayed on the console:

- IP address of the replying LSR
- Return code
- Indication of an MPLS echo reply timeout if no response was received

The FEC can be specified using the ipaddress or hostname via the `host` parameter. If the optional `next-hop` is specified, the MPLS echo request is sent along the LSP that traverses the specified node. This option is useful for tracing a specific LSP when multiple LSPs exist to the specified FEC. The `lsp` keyword may be used to specify a named LSP to trace. The selected LSP is specified by the `lsp_name` parameter. The `any` keyword indicates that the switch can trace any available LSP to the specified host.

The optional **reply-mode** keyword is used to specify the reply mode for the MPLS echo response. When the **ip** option is specified, the MPLS echo reply is routed back to the sender in a normal IPv4 packet. When the **ip-router-alert** option is specified, the MPLS echo reply is routed back to the sender in an IPv4 packet with the Router Alert IP option set. Additionally, if the **ip-router-alert** option is specified and the reply route is via an LSP, the Router Alert Label is pushed onto the top of the label stack. If the reply-mode is not specified, the **reply-mode ip** option applies.

The optional **ttl** keyword specifies the starting TTL value in the MPLS echo request packet. Within each router along the path, the TTL value is decremented. When the TTL value reaches zero, the LSR drops the packet and replies with a TTL-expired Internet Control Message Protocol (ICMP) message. The originating LSR responds by displaying the hop for which the TTL expired. To discover all hops to a destination, the originating router repeats the MPLS echo request and increments the TTL start value by one each time until the destination is reached. The maximum TTL is 30, so the **traceroute** command terminates if the destination is not reached in 30 hops.

If the **ttl** keyword is omitted, the starting TTL value is 1. If you specify a larger starting TTL value, initial hops are excluded from the **traceroute** display. For example, if you specify a start TTL value of 5, the TTL value does not decrement to 0 at the first four routers, so the fifth hop router is the first to appear in the **traceroute** command display.

The **from** keyword is used to specify the source IP address used in the MPLS echo request. This is the IP address used by the target LSR to send the MPLS echo reply. If not specified, the OSPF router ID is used.

Example

The following example shows a sample display for the **traceroute** command:

```
BD-10K.5 # traceroute mpls lsp prefix 11.100.100.10/32
traceroute to 11.100.100.10, 30 hops max
1  11.100.100.8                                5 ms        5 ms        2 ms
2  11.100.100.10                               2 ms        1 ms        2 ms
BD-10K.6 #
BD-10K.6 # traceroute mpls lsp lsp598
traceroute to lsp598, 30 hops max
1  11.100.100.5                                6 ms        1 ms        5 ms
2  11.100.100.9                                3 ms        2 ms        2 ms
3  11.100.100.8                                3 ms        4 ms        3 ms
BD-10K.7 #
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure l2vpn dot1q ethertype

unconfigure l2vpn [**vpls** *vpls_name* | **vpws** *vpws_name*] **dot1q ethertype**

Description

Resets the ethertype setting for the specified VPLS or VPWS.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string).
vpws_name	Identifies the VPWS within the switch (character string).

Default

N/A.

Usage Guidelines

The setting is changed back to the value displayed in the show `dot1q` command.

The `l2vpn` keyword is introduced in ExtremeXOS Release 12.4 and is required when resetting the ethertype for a VPWS. For backward compatibility, the `l2vpn` keyword is optional when resetting the ethertype for a VPLS. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command changes the ethertype setting for the specified VPLS to the value displayed in the `show dot1q` command:

```
unconfigure l2vpn vpls my_vpls dot1q ethertype
```

History

This command was first available in ExtremeXOS 11.6.

The `l2vpn` and `vpws` keywords were first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure l2vpn vpls redundancy

unconfigure {**l2vpn**} **vpls** *vpls_name* **redundancy** [**eaps** | **esrp** | **stp**]

Description

Disassociates the VPLS instance from EAPS, an ESRP domain, or STP.

Syntax Description

vpls_name	Specifies the VPLS for which you are removing protection.
eaps	Disassociates the VPLS instance from EAPS.
esrp	Disassociates the VPLS instance from the ESRP domain.
stp	Disassociates the VPLS instance from STP.

Default

Redundancy disabled.

Usage Guidelines

The **l2vpn** keyword is introduced in ExtremeXOS Release 12.4. For backward compatibility, the **l2vpn** keyword is optional. However, this keyword will be required in a future release, so Extreme Networks recommends that you use this keyword for new configurations and scripts.

Example

The following command disassociates the VPLS instance from ESRP:

```
unconfigure l2vpn vpls vpls1 redundancy esrp
```

History

This command was first available in ExtremeXOS 12.1.

The **l2vpn** keyword and the **STP** option were added in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure mpls

unconfigure mpls

Description

Resets MPLS configuration parameters to the default settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command deletes all VLANs from MPLS and resets all MPLS configuration parameters to their default values. The parameters that are reset include the LSR ID, all LDP-specific settings, all RSVP-TE-specific settings, all RSVP-TE reserved bandwidth, and all EXP Qos Profile mappings. MPLS must be disabled to unconfigure MPLS.

Note

MPLS must be disabled to globally unconfigure MPLS.

Example

The following command resets MPLS configuration parameters to the default settings:

```
unconfigure mpls
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure mpls exp examination

unconfigure mpls exp examination [**all** | {{**value**} *value*}]

Description

Resets the QoS profile assigned to the EXP value back to the default QoS profile.

Syntax Description

value	Specifies the EXP value whose QoS profile is reset.

Default

The QoS profile matches the EXP value + 1

Usage Guidelines

This command resets the QoS profile assigned to the EXP value (defined by the value keyword and argument) back to the default QoS profile. If the **all** option is specified, all EXP values are reset back to their default QoS profiles. By default, the QoS profile matches the EXP value + 1. That is, EXP value of 0 is mapped to QoS profile qp1, EXP value of 1 is mapped to QoS profile qp2, etc. This configuration has switch-wide significance.

Example

Use the following command to restore the QoS profile of EXP value 5 to its default setting:

```
unconfigure mpls exp examination value 5
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure mpls exp replacement

unconfigure mpls exp replacement [**all** | {{**qosprofile**} *qosprofile*}]

Description

Resets the EXP value assigned to the QoS profile back to the default EXP value.

Syntax Description

qosprofile	Specifies the QoS profile whose EXP replacement value is unconfigured.

Default

The EXP value matches the QoS profile -1.

Usage Guidelines

This command resets the EXP value assigned to the QoS defined by **qosprofile** back to the default EXP value. If the **all** option is specified, all QoS profiles are reset back to their default EXP values. By default, the EXP value matches the QoS profile - 1. That is, QoS profile qp1 is mapped to EXP value of 0, QoS profile qp2 is mapped to EXP value of 1, etc. This configuration has switch-wide significance.

Example

Use the following command to restore all EXP values to their default setting:

```
unconfigure mpls exp replacement all
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure mpls vlan

unconfigure mpls {**vlan**} *vlan_name*

Description

Resets MPLS configuration parameters to the default settings. This command does not delete the VLAN from MPLS.

Syntax Description

vlan_name	Specifies the VLANs for which MPLS is unconfigured.

Default

N/A.

Usage Guidelines

This command resets all MPLS configuration parameters for the specified VLAN to their default values. It does not delete the VLAN from MPLS. These parameters include the enable state for LDP and RSVP-TE, the bandwidth reserved for RSVP-TE LSPs, RSVP-TE timers, and the RSVP-TE metric. MPLS does not have to be disabled to unconfigure a specific VLAN.

Example

The following command resets MPLS configuration parameters to the default settings for a single VLAN:

```
unconfigure mpls vlan boone
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure vpls dot1q ethertype

unconfigure vpls *vpls_name* **dot1q ethertype**

Note

This command has been replaced with the following command: `unconfigure l2vpn [vpls <vpls_name> | vpws <vpws_name>] dot1q ethertype`. This command is still supported for backward compatibility, but it will be removed from a future release, so Extreme Networks recommends that you start using the new command.

Description

Unconfigures the ethertype setting for the VPLS specified by `vpls_name`.

Syntax Description

vpls_name	Identifies the VPLS within the switch (character string)

Default

N/A

Usage Guidelines

This command unconfigures the ethertype setting for the VPLS specified by `vpls_name`. The setting is changed back to the value displayed in the `show dot1q` command.

Example

The following command changes the ethertype setting for the specified VPLS to the value displayed in the `show dot1q` command:

```
unconfigure vpls my_vpls dot1q ethertype
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

unconfigure vpls snmp-vpn-identifier

unconfigure vpls *vpls_name* **snmp-vpn-identifier**

Description

Removes an SNMP VPN identifier for traps from the specified VLPLS.

Syntax Description

vpls_name	Specifies the VPLS for which you are removing the identification string.

Default

N/A.

Usage Guidelines

None.

Example

The following command removes the identifier for SNMP VPN traps on VPLS vpls1:

```
unconfigure vpls vpls1 snmp-vpn-identifier
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available only on the platforms that support MPLS as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

This chapter describes commands for configuring and managing the following IP protocols and functions:

- DHCP and BOOTP relay
- IP ARP
- IP routing
- IP multinetting
- IP broadcast handling
- IP Duplicate Address Detection (DAD)
- Broadcast UDP packet forwarding
- Static routes
- ICMP
- IRDP
- VLAN aggregation

For an introduction to these IP protocols and functions, see the ExtremeXOS Concepts Guide.

clear ip dad

clear ip dad {{**vr**} *vr_name* {*ip_address*} | **vr all** | {**vlan**} *vlan_name*} {**counters**}

Description

Clears the counters for the DAD feature on the specified IP interfaces.

Syntax Description

vr_name	Specifies a VR for which to clear the counters.
ip_address	Specifies an IP address for which to clear the counters.
vlan_name	Specifies a VLAN for which to clear the counters.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The vr all option clears the DAD counters for all IP interfaces on the switch.

Example

The following command clears the DAD counters for all IP interfaces in all VRs:

```
clear ip dad vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

clear iparp

clear iparp {*ip_addr* {**vr** *vr_name*} | **vlan** *vlan_name* | **vr** *vr_name*}

Description

Removes dynamic entries in the IP ARP table.

Syntax Description

ip_addr	Specifies an IP address.
vlan_name	Specifies a VLAN name.
vr_name	Specifies a Virtual Router (VR) or Virtual Router Forwarding instance (VRF) name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Permanent IP ARP entries are not affected.

This command is specific to a single VR or VRF, and it applies to the current VR context if you do not specify a VR or VRF.

Example

The following command removes a dynamically created entry from the IP ARP table:

```
clear iparp 10.1.1.5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure bootprelay add

configure bootprelay add *ip_address* {**vr** *vrid*}

Description

Configures the addresses to which BOOTP requests should be directed.

Syntax Description

ip_address	Specifies an IP address.
vrid	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

After IP unicast routing has been configured, you can configure the switch to forward Dynamic Host Configuration Protocol (DHCP) or BOOTP requests coming from clients on subnets being serviced by the switch and going to hosts on different subnets.

To configure the relay function, follow these steps:

- Configure VLANs and IP unicast routing.
- Configure the addresses to which DHCP or BOOTP requests should be directed, using the following command:

```
configure bootprelay add <ip_address>
```

- Enable the DHCP or BOOTP relay function, using the following command:

```
enable bootprelay
```

Example

The following command configures BOOTP requests to be directed to 123.45.67.8:

```
configure bootprelay add 123.45.67.8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure bootprelay delete

configure bootprelay delete [*ip_address* | **all**] {**vr** *vrid*}

Description

Removes one or all IP destination addresses for forwarding BOOTP packets.

Syntax Description

ip_address	Specifies an IP address.
vrid	Specifies a VR name.
all	Specifies all IP address entries.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following command removes the destination address:

```
configure bootprelay delete 123.45.67.8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information check

configure bootprelay dhcp-agent information check

Description

Enables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) checking.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to prevent DHCP reply packets with invalid or missing relay agent options from being forwarded to the client.

To disable this check, use the following command:

```
unconfigure bootprelay dhcp-agent information check
```

Example

The following command configures the DHCP relay agent option check:

```
configure bootprelay dhcp-agent information check
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information circuit-id port-information

configure bootprelay dhcp-agent information circuit-id port-information *port_info* **port** *port*

Description

Configures the circuit ID sub-option that identifies the port for an incoming DHCP request.

Syntax Description

port_info	Specifies a text string that becomes the circuit ID sub-option for the specified port. Specify a text string composed of 1 to 32 characters.
port	Specifies the port to which the circuit ID sub-option is assigned.

Default

The default port_info is encoded as ((slot_number * 1000) + port_number/portIfindex). For example, if the DHCP request is received on port 3:12, the default circuit ID port_info value is 3012. On standalone switches, the slot number is one, so the default circuit ID port_info value is (1000 + port_number/portIfindex). For example, the default port_info for port 3 on a standalone switch is 1003.

Usage Guidelines

The full circuit ID string uses the format <vlan_info>-<port_info>. To configure the vlan_info portion of the circuit ID string, use the following command:

```
configure bootprelay dhcp-agent information circuit-id vlan-
information <vlan_info> {vlan} [<vlan_name>|all]
```

To display the port_info information, use the following command:

```
show bootprelay dhcp-agent information circuit-id port-information
ports all
```

Example

The following command configures the circuit ID port_info value slot1port3 for port 1:3:

```
configure bootprelay dhcp-agent information circuit-id port-information
slot1port3 port 1:3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information circuit-id vlan-information

configure bootprelay dhcp-agent information circuit-id vlan-information *vlan_info* **{vlan}** [*vlan_name*|**all**]

Description

Configures the circuit ID sub-option that identifies the VLAN for an incoming DHCP request.

Syntax Description

vlan_info	Specifies a text string that becomes the circuit ID sub-option for the specified VLAN. Specify a text string composed of 1 to 32 characters.
vlan_name	Specifies the VLAN to which the circuit ID sub-option is assigned.
all	Specifies that the vlan_info entered is to be used in the circuit ID sub-option for all VLANs.

Default

The default vlan_info for each VLAN is the VLAN ID or tag.

Usage Guidelines

The full circuit ID string uses the format <vlan_info>-<port_info>. To configure the port_info portion of the circuit ID string, use the following command:

```
configure bootprelay dhcp-agent information circuit-id port-
information <port_info> port <port>
```

To display the vlan_info information, use the following command:

```
show bootprelay dhcp-agent information circuit-id vlan-information
```

Example

The following command configures the circuit ID vlan_info value VLANblue for VLAN blue:

```
configure bootprelay dhcp-agent information circuit-id vlan-information
VLANblue blue
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information option

configure bootprelay dhcp-agent information option

Description

Enables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

After IP unicast routing has been configured, you can configure the switch to forward DHCP or BOOTP requests coming from clients on subnets being serviced by the switch and going to hosts on different subnets.

To configure the relay function, follow these steps:

- Configure VLANs and IP unicast routing.
- Enable the DHCP or BOOTP relay function, using the following command:

  enable bootprelay {{vlan} [<vlan_name>] | {{vr} <vr_name>} | all [{vr} <vr_name>]}
- Configure the addresses to which DHCP or BOOTP requests should be directed, using the following command:

  configure bootprelay add <ip_address> {vr <vrid>}

configure bootprelay dhcp-agent information option

Configure the DHCP relay agent option (option 82), using the following command:

To disable the DHCP relay agent option (option 82), use the following command:

```
unconfigure bootprelay dhcp-agent information option
```

Example

The following command configures the DHCP relay agent option:

```
configure bootprelay dhcp-agent information option
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information policy

configure bootprelay dhcp-agent information policy [drop | keep | replace]

Description

Configures the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) policy.

Syntax Description

drop	Specifies to drop the packet.
keep	Specifies to keep the existing option 82 information in place.
replace	Specifies to replace the existing data with the switch's own data.

Default

Replace.

Usage Guidelines

Use this command to set a policy for the relay agent. Packets can be dropped, the option 82 information can be replaced (the default), or the packet can be forwarded with the information unchanged.

Example

The following command configures the DHCP relay agent option 82 policy to keep:

```
configure bootprelay dhcp-agent information policy keep
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure bootprelay dhcp-agent information remote-id

configure bootprelay dhcp-agent information remote-id [*remote_id* | **system-name**] {**vr** *vrid*}

Description

Configures the remote ID sub-option that identifies the relaying switch for DHCP requests and replies.

Syntax Description

remote_id	Specifies a text string that becomes the remote ID sub-option for the switch. Specify a text string composed of 1 to 32 characters.
system-name	Specifies that the switch name is used as the remote ID sub-option for the switch.
vrid	Specifies the VR on which to configure the remote ID sub-option.

Default

The switch MAC address.

Usage Guidelines

To display the remote-ID, use the following command:

```
show bootprelay
```

Example

The following command configures the remote ID sub-option to specify the switch name in DHCP requests and replies:

```
configure bootprelay dhcp-agent information remote-id system-name
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure forwarding sharing

configure forwarding sharing [**L3** | **L3_L4**]

Description

Identifies the fields that are used to select ECMP routes and load-sharing group ports.

Syntax Description

L3	Uses only Layer3 IP addresses to select ECMP routes and load-sharing ports.
L3_L4	Uses Layer3 IP addresses and Layer4 TCP/UDP port numbers, if present, to select ECMP routes and load-sharing ports.

Default

L3_L4.

Usage Guidelines

This command configures the criteria used to select ECMP routes and load-sharing group ports.

For ECMP routes, the configured criteria selects the next hop gateway. The L3 option uses only the source and destination IP addresses to select the next hop gateway. The L3_L4 option uses the Layer4 TCP or UDP port and the source and destination IP addresses to select the next hop gateway.

For load-sharing groups (link aggregation groups), the configured criteria selects the load-sharing group port. The load-sharing groups can be configured to use the following address-based algorithms:

- L2—Specifies port selection based on Layer2 information.
- L3—Specifies port selection based on Layer3 information.
- L3_L4—Specifies port selection based on Layer3 and Layer4 information.

This command affects all the load-sharing groups that use either the L3 or L3_L4 link aggregation algorithm. If the L3 option is specified, all the load-sharing groups that are configured with either the L3 or the L3_L4 address-based link aggregation algorithm use just the Layer3 IP addresses for the egress port selection. Similarly if the L3_L4 option is specified, all the load-sharing groups that are configured with either L3 or L3_L4 address-based link aggregation algorithm use the Layer3 IP addresses and Layer4 port number for the egress port selection.

Selecting the L3 option over L3_L4 can be useful in a network where IP fragments are present, since only the first fragment contains the Layer4 TCP or UDP port number. If the L3 option is selected, all IP fragments in a given TCP or UDP session use the same ECMP gateway or load-sharing group port, potentially avoiding inefficient packet reordering by the destination. If IP fragments are not prevalent, better traffic distribution can be achieved by selecting L3_L4.

To display the forwarding sharing feature configuration, enter the command:

```
show forwarding configuration
```

Example

The following command modifies the sharing selection criteria to use just the Layer3 IP addresses:

```
configure forwarding sharing L3
```

The following command modified the sharing selection criteria to use the Layer3 and Layer4 information:

```
configure forwarding sharing L3_L4
```

History

This command was first available in ExtremeXOS 11.6.4.

Platform Availability

This command is available only on the BlackDiamond X8 series switches, BlackDiamond 8800 series switch, SummitStack, and the Summit family of switches.

configure ip dad

configure ip dad [**off** | **on** | {**on**} **attempts** *max_solicitations*] {{**vr**} *vr_name* | **vr all**}

Description

Configures the operation of the duplicate address detection (DAD) feature on the specified VR.

Syntax Description

max_solicitations	Specifies the number of times the DAD feature tests for a duplicate address. The range is 1 to 10, and the default value is 1.
vr_name	Specifies a VR on which to enable this feature.

Default

DAD status: Off on VR-Default.

Maximum solicitations: 1 on VR-Default.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

This command can be entered in a configuration file for execution at switch startup, or it can be entered at the CLI prompt.

Changes to the number of solicitations configuration take affect the next time the DAD check is run.

By default, this command applies to the current VR context, if no VR name is specified. If vr all is specified, the command applies to all user VRs and VR-Default.

Example

The following command enables the DAD feature on all user VRs and VR-Default:

```
configure ip dad on vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

configure iparp add

configure iparp add *ip_addr* {vr*vr_name*} *mac*

Description

Adds a permanent entry to the ARP table.

Specify the IP address and MAC address of the entry.

Syntax Description

ip_addr	Specifies an IP address.
mac	Specifies a MAC address.
vr_name	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following command adds a permanent IP ARP entry to the switch for IP address 10.1.2.5:

```
configure iparp add 10.1.2.5 00:11:22:33:44:55
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iparp add proxy

configure iparp add proxy [*ipNetmask* | *ip_addr* {*mask*}] {**vr** *vr_name*} {*mac* | **vrrp**} {**always**}

Description

Configures the switch to respond to ARP Requests on behalf of devices that are incapable of doing so.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
mac	Specifies a MAC address to use in the ARP reply.
vrrp	Specifies a MAC address to use in the ARP reply. For VLANs running VRRP, the switch replies with the VRRP virtual MAC. For non-VRRP VLANs, the switch replies with the switch MAC.
always	Specifies that the switch responds regardless of the VLAN that the request arrives from.
vr_name	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When mask is not specified, an address with the mask 255.255.255.255 is assumed. When neither mac nor vrrp is specified, the MAC address of the switch is used in the ARP Response. When always is specified, the switch answers ARP Requests without filtering requests that belong to the same subnet of the receiving router interface.

After IP ARP is configured, the system responds to ARP requests on behalf of the device as long as the following conditions are satisfied:

- The valid IP ARP request is received on a router interface.
- The target IP address matches the IP address configured in the proxy ARP table.
- The source IP address is not on the same subnet as the target address (unless the always flag is set).

After all the proxy ARP conditions have been met, the switch formulates an ARP response using the configured MAC address in the packet.

The default maximum number of proxy entries is 256, but can be increased to 4096 by using the following command:

```
configure iparp max_proxy_entries {vr <vr_name>} <max_proxy_entries>
```

Example

The following command configures the switch to answer ARP requests for all devices with the address range of 100.101.45.1 to 100.101.45.255:

```
configure iparp add proxy 100.101.45.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iparp delete

configure iparp delete *ip_addr* {**vr** *vr_name*}

Description

Deletes an entry from the ARP table. Specify the IP address of the entry to delete.

Syntax Description

ip_addr	Specifies an IP address.
vr_name	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Removes any IP ARP entry (dynamic or permanent) from the table.

Example

The following command deletes an IP address entry from the ARP table:

```
configure iparp delete 10.1.2.5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iparp delete proxy

configure iparp delete proxy [[*ipNetmask* | *ip_addr* {*mask*}] {**vr** *vr_name*} | **all**]

Description

Deletes one or all proxy ARP entries.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
all	Specifies all ARP entries.
vr_name	Specifies a VR name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When the mask is not specified, the software assumes a host address (that is, a 32-bit mask).

Example

The following command deletes the IP ARP proxy entry 100.101.45.0/24:

```
configure iparp delete proxy 100.101.45.0/24
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iparp distributed-mode

configure iparp distributed-mode [on | off]

Description

Configures the distributed IP ARP feature as either on or off.

Syntax Description

on	Configures the distributed IP ARP feature to become active after the next switch restart.
off	Configures the distributed IP ARP feature to become inactive after the next switch restart.

Default

Off.

Usage Guidelines

The distributed IP ARP feature provides higher IP ARP scaling by distributing IP ARP forwarding information to only the I/O module to which each IP host is connected. This feature is off by default to match the operation in ExtremeXOS releases prior to 12.5. When this feature is off, complete IP ARP information for all destinations is stored on all modules, reducing the available space for unique destinations.

If the sum of the values required for the configure iparp max_entries command for all VRs is greater than 8000, ExtremeNetworks recommends that you configure the distributed IP ARP feature as on, save the configuration, and activate the new configuration by restarting the switch.

Note

To activate or deactivate the distributed IP ARP feature, you must change the configuration, save the configuration, and restart the switch.

The distributed IP ARP feature imposes the following limitations:

- The number of unique load share groups in a BlackDiamond 8800 series switch is reduced from 128 to 64 groups. On BlackDiamond X8, the number of load share groups is not reduced.
- A load share group must include ports from only BlackDiamond 8000 c-, xl-, and xm-series modules or from modules that are not BlackDiamond 8000 c-, xl-, or xm-series modules. The switch does not support load share groups that mix ports from the two module groups when the distributed IP ARP is feature is active. On BlackDiamond X8, the limitation is not applicable; load share group ports may be from any module type.

- Load distribution of IPv4 unicast packets across ports of a load share group is affected if the ingress port and any load share member ports reside on the same I/O module and port cluster within that module. Packets are distributed as expected if the ingress port is on a different module or different port cluster than all ports in the destination's load share group.

To view the configured and current operational state of the distributed IP ARP feature, use the show iparp command. To display distributed IP ARP statistics by slot when this feature is enabled, use the show iparp distributed-mode statistics command.

Example

The following command configures the distributed IP ARP feature to become active after the next switch restart:

```
configure iparp distributed-mode on
```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8 series switches, BlackDiamond 8000 c-, xl-, and xm-series modules.

configure iparp max_entries

configure iparp max_entries {**vr** *vr_name*} *max_entries*

Description

Configures the maximum allowed IP ARP entries.

Syntax Description

vr_name	Specifies a VR name.
max_entries	Specifies the maximum number of IP ARP entries. The range is 1 to x, where x is the number listed for the appropriate platform in table below.

Default

8192 for the Default VR and all user-created VRs.

4096 for the VR-Mgmt VR.

If you do not specify a VR or VRF, the current VR context is used.

Note

The default value for the Default and user-created VRs changed from 4,096 to 8,192 in ExtremeXOS Release12.2.

Usage Guidelines

The maximum IP ARP entries include dynamic, static, and incomplete IP ARP entries. The range for the max_entries parameter is 1 to x, where x is the number listed for the appropriate platform in the following table.

Table 48: Maximum IP ARP Entries for each Platform

		Distributed IP ARP Feature Configuration	
Platform	Maximum Entries	Off (Default)	On
BlackDiamond 8806	Depends on distributed IP ARP configuration.	20480	130,000[14]
BlackDiamond 8810	Depends on distributed IP ARP configuration.	20480	260,000a
All others	20480	N/A	N/A

The switch hardware supports only the maximum number of entries listed in the table above. If the hardware limit is reached, the switch displays a message and can no longer store additional ARP entries.

Example

The following command sets the maximum IP ARP entries to 2000 entries:

```
configure iparp max_entries 2000
```

History

This command was first available in ExtremeXOS 10.1.

Support for up to 32,768 ARP entries was first available in ExtremeXOS 12.4.

The support for more than 20,480 ARP entries on BlackDiamond 8800 series switches was added with the distributed IP ARP feature in ExtremeXOS12.5.

[14] The distributed IP ARP feature must be configured as on before the switch will accept any value above 20480. The switch cannot support values above 20480 until after the distributed IP ARP mode has been configured as on and the switch has been restarted.

Platform Availability

This command is available on all platforms.

configure iparp max_pending_entries

configure iparp max_pending_entries {vr*vr_name*} *max_pending_entries*

Description

Configures the maximum allowed incomplete IP ARP entries.

Syntax Description

vr_name	Specifies a VR name.
max_pending_entries	Specifies a number of maximum IP ARP entries.

Default

256.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Range: 1 - 4096.

Example

The following command sets the maximum pending IP ARP entries to 500 entries:

```
configure iparp max_pending_entries 500
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iparp max_proxy_entries

configure iparp max_proxy_entries {**vr** *vr_name*} *max_proxy_entries*

Description

Configures the maximum allowed IP ARP proxy entries.

Syntax Description

vr_name	Specifies a VR name.
max_proxy_entries	Specifies maximum number of IP ARP proxy entries.

Default

256.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Range: 0 - 4096.

Example

The following command sets the maximum IP ARP proxy entries to 500 entries:

```
configure iparp max_proxy_entries 500
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure iparp timeout

configure iparp timeout {**vr** *vr_name*} *minutes*

Description

Configures the IP ARP timeout period.

Syntax Description

vr_name	Specifies which VR or VRF IP ARP setting to change.
minutes	Specifies a time in minutes.

Default

20 minutes.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

The range is 0-32,767. A setting of 0 disables timeout.

When the switch learns an ARP entry, it begins the timeout for that entry. When the timer reaches 0, the entry is aged out, unless IP ARP refresh is enabled. If ARP refresh is enabled, the switch sends an ARP request for the address before the timer expires. If the switch receives a response, it resets the timer for that address.

Example

The following command sets the IP ARP timeout period to 10 minutes:

```
configure iparp timeout 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure ipforwarding originated-packets

configure ipforwarding originated-packets [require-ipforwarding | dont-require-ipforwarding]

Description

Configures whether IP forwarding must be enabled on a VLAN before transmitting IP packets originated by the switch on that VLAN to a gateway.

Syntax Description

require-ipforwarding	Specifies that IP forwarding must be enabled on a VLAN before IP packets that originate on the switch can be transmitted to a gateway.
dont-require-ipforwarding	Specifies that all IP packets that originate on the switch can be transmitted, regardless of the IP forwarding configuration to the gateway.

Default

dont-require-ipforwarding.

Usage Guidelines

To display the current setting for this command, use the show ipconfig command.

Example

The following command configures the switch to transmit switch-originated packets to gateways only on those VLANs for which IP forwarding is enabled:

```
configure ipforwarding originated-packets require-ipforwarding
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure iproute add (IPv4)

configure iproute add [*ipNetmask* | *ip_addr mask*] *gateway* {**bfd**} {**metric**} {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Adds a static route to the specified routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a gateway IP address.
bfd	Enables Bidirectional Forwarding Detection (BFD) protection for the route.
metric	Specifies a cost metric.
multicast	Adds the specified route to the multicast routing table.

multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the VR or VRF to which the route is added.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Use a mask value of 255.255.255.255 to indicate a host entry.

The gateway address must be present on a directly attached subnet, or the following message appears:

```
ERROR: Gateway is not on directly attached subnet
```

The gateway address must be different from the VLAN address, or the following message appears:

```
ERROR: Gateway cannot be own address (x.x.x.x) #where x.x.x.x is the IP
address specified
```

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

This command can add BFD protection to a link only when the BFD client at each end of the link is enabled (configure iproute add (IPv4) command). Once the BFD session is established, the operational status of the route reflects the operational status of the BFD session. To remove BFD protection for a static route, enter this command without the BFD keyword.

Example

The following command adds a static address to the routing table:

```
configure iproute add 10.1.1.0/24 123.45.67.1 5
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute add blackhole

configure iproute add blackhole [*ipNetmask* | *ip_address mask*] {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Adds a blackhole address to the routing table. All traffic destined for a configured blackhole IP address is silently dropped, and no Internet Control Message Protocol (ICMP) message is generated.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_address	Specifies an IP address.
mask	Specifies a subnet mask.
vrname	Specifies the VR or VRF to which the route is added.
multicast	Adds the blackhole route to the multicast routing table.
multicast-only	Adds the blackhole route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the blackhole route to the unicast routing table.
unicast-only	Adds the blackhole route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

A blackhole entry configures packets with the specified destination IP subnet to be discarded. Blackhole entries are useful as a security measure or in special circumstances where a specific destination IP subnet must be discarded. Blackhole entries are treated like permanent entries in the event of a switch reset or power off/on cycle.

Example

The following command adds a blackhole address to the routing table for packets with a destination address of 100.101.145.4:

```
configure iproute add blackhole 100.101.145.4/32
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute add blackhole ipv4 default

configure iproute add blackhole ipv4 default {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Adds a default blackhole route to the routing table. All traffic destined for an unknown IP destination is silently dropped, and no Internet Control Message Protocol (ICMP) message is generated.

Syntax Description

vrname	Specifies the VR or VRF to which the route is added.
multicast	Adds the default blackhole route to the multicast routing table.
multicast-only	Adds the default blackhole route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the default blackhole route to the unicast routing table.
unicast-only	Adds the default blackhole route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IP destination, and a blackhole route is for discarding traffic destined to a specified IP destination, a default blackhole route is for discarding traffic to the unknown IP destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route's origin is "b" or "blackhole" and the gateway IP address for this route is 0.0.0.0.

Example

The following command adds a blackhole default route into the routing table:

```
configure iproute add blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure iproute add default

configure iproute add default *gateway* {*metric*} {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Adds a default gateway to the routing table.

Syntax Description

gateway	Specifies a VLAN gateway.
metric	Specifies a cost metric. If no metric is specified, the default of 1 is used.
multicast	Adds the default route to the multicast routing table.
multicast-only	Adds the default route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the default route to the unicast routing table.
unicast-only	Adds the default route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the VR or VRF to which the route is added.

Default

If no metric is specified, the default metric of 1 is used. If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IP interface. Use the unicast-only or multicast-only options to specify a particular traffic type. If not specified, both unicast and multicast traffic uses the default route.

Example

The following command configures a default route for the switch:

```
configure iproute add default 123.45.67.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute delete

configure iproute delete [*ipNetmask* | *ip_address mask*] *gateway* {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Deletes a static address from the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_address	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a VLAN gateway.
multicast	Specifies a multicast route to delete.
multicast-only	Specifies a multicast route to delete.
unicast	Specifies a unicast route to delete.
unicast-only	Specifies a unicast route to delete.
vrname	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Use a value of 255.255.255.255 or /32 for mask to indicate a host entry.

Example

The following command deletes an address from the gateway:

```
configure iproute delete 10.101.0.0/24 10.101.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute delete blackhole

configure iproute delete blackhole [*ipNetmask* | *ip_address mask*] {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Deletes a blackhole address from the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_address	Specifies an IP address.
mask	Specifies a netmask.
multicast	Specifies a blackhole multicast route to delete.
multicast-only	Specifies a blackhole multicast-only route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Specifies a blackhole unicast route to delete.
unicast-only	Specifies a blackhole unicast-only route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following command removes a blackhole address from the routing table:

```
configure iproute delete blackhole 100.101.145.4
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute delete blackhole ipv4 default

configure iproute delete blackhole ipv4 default {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Deletes a default blackhole route from the routing table.

Syntax Description

multicast	Specifies a default blackhole multicast route to delete.
multicast-only	Specifies a default blackhole multicast route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Specifies a default blackhole unicast route to delete.
unicast-only	Specifies a default blackhole unicast-only route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies a VR or VRF name.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

None.

Example

The following command deletes a blackhole default route from the routing table:

```
configure iproute delete blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute delete default

configure iproute delete default *gateway* {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Deletes a default gateway from the routing table.

Syntax Description

gateway	Specifies a VLAN gateway.
multicast	Specifies a default multicast route to delete.
multicast-only	Specifies a default multicast route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Specifies a default unicast route to delete.
unicast-only	Specifies a default unicast route to delete. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
vrname	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IP interface.

Example

The following command deletes a default gateway:

```
configure iproute delete default 123.45.67.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

configure iproute priority

configure iproute {**ipv4**} **priority** [**blackhole** | **bootp** | **ebgp** | **ibgp** | **icmp** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external** | **mpls** | **ospf-as-external** | **ospf-extern1** | **ospf-extern2** | **ospf-inter** | **ospf-intra** | **rip** | **static**] *priority* {**vr** *vrname*}

Description

Changes the priority for all routes from a particular route origin.

Syntax Description

blackhole	Specifies the blackhole route.
bootp	Specifies BOOTP.
ebgp	Specifies E-BGP routes
ibgp	Specifies I-BGP routes
icmp	Specifies ICMP.
isis	Specifies IS-IS and applies only to blackhole routes installed for summary addresses.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.

mpls	Specifies MPLS routing.
ospf-as-external	Specifies OSPF as External routing.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies RIP.
static	Specifies static routes.
priority	Specifies a priority number in the range of 11 to 65534.
vrname	Specifies a VR or VRF name.

Default

The following table lists the relative priorities assigned to routes depending upon the learned source of the route.

Table 49: Relative Route Priorities

Route Origin	Priority
Direct	10
MPLS	20
Blackhole	50
Static	1100
ICMP	1200
EBGP	1700
IBGP	1900
OSPFIntra	2200
OSPFInter	2300
IS-IS	2350
IS-IS L1	2360
IS-IS L2	2370
RIP	2400
OSPFAsExt	3100
OSPF External 1	3200
OSPF External 2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500
BOOTP	5000

Usage Guidelines

Although these priorities can be changed, do not attempt any manipulation unless you are expertly familiar with the possible consequences. If you change the route priority, you must save the configuration and reboot the system.

Note

The priority for a blackhole route cannot overlap with the priority of any other route origin.

Example

The following command sets IP route priority for static routing to 1200:

```
configure iproute priority static 1200
```

History

This command was first available in ExtremeXOS 10.1.

The route priority restrictions were added in ExtremeXOS 11.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

The vr option was added in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

configure iproute reserved-entries

configure iproute reserved-entries [*num_routes_needed* | **maximum** | **default**] **slot** [**all** | *slot_num*]

Description

Reserves storage space for IPv4 and IPv6 routes in the Longest Prefix Match (LPM) hardware tables, allowing individual local and remote IPv4 unicast hosts to occupy the unused portions of the tables.

Syntax Description

num_routes_needed	Specifies a specific number of routes to reserve.
maximum	Reserves the maximum amount of space for IP route entries. No IPv4 hosts are stored in the LPM and External tables.
default	Reserves the default amount of space for IP route entries.

all	For BlackDiamond X8, BlackDiamond 8800 series and SummitStack switches only, this option applies the reservation to all applicable slots.
slot_num	For BlackDiamond X8, BlackDiamond 8800 series and SummitStack switches only, this option applies the reservation to the specified slot.

Default

The default values are as follows:

- For a BlackDiamond 8000 e-series module or a Summit X250e or X450e switch: 464
- For a BlackDiamond X8, BlackDiamond 8000 c-, or xm-series module or a Summit X450a, X460, X650, or X670 switch:12240
- For a BlackDiamond 8900 xl-series module or a Summit X480 switch: 245728. Note that the default value for a BlackDiamond 8900 xl-series module or a Summit X480 switch depends on the value configured with the command: configure forwarding external-tables.
- For a Summit X440 switch: 16

Usage Guidelines

Demand on the Layer3 Hash table can be reduced by allowing IPv4 hosts to be stored in the LPM tables instead. This command allows you to reserve a portion of the LPM tables for routes, and this creates an unreserved portion that can be used to store IPv4 hosts. For more information, see the Extended IPv4 Host Cache section in the Extreme XOS Concepts Guide.

The default setting can support most networks, but if more than a few hundred local IP hosts and IP multicast entries are present, you can improve switch performance by calculating and configuring the reserved space for route entries to allow unreserved space for IPv4 hosts. Changing the number of reserved route entries does not require a reboot of the affected slots or switches.

You can view the current LPM hardware table usage by entering the show iproute reserved-entries statistics command. The LPM table statistics are in the columns under the In HW Route Table heading.

If the switch contains fewer routes than the capacity of the LPM tables, the number of route entries to reserve for a slot or switch should be the number of routes currently used in the hardware tables, plus an additional cushion for anticipated growth. Because each IPv6 route takes up the space of two IPv4 routes, the number of route entries to reserve is two times the value in the IPv6 routes column, plus the

value in the IPv4 routes column, plus room for anticipated growth. For example, if you want to reserve space for 100 IPv4 routes and 20 IPv6 routes, the required number of route entries is 140 (100 + 2*20).

Note

For a BlackDiamond 8900 xl-series module or a Summit X480 switch, IPv6 routes are not included in the calculation for the number of reserved route entries if the configure forwarding external-tables command is set to include IPv4 routes (for example, l3-only, l3-only ipv4, l3-only ipv4-and-ipv6, l2-and-l3, and l2-and-l3-and-acl). When the external tables are configured for IPv4 routes, IPv6 routes occupy the entire Internal LPM table, or in the case of l3-only ipv4-and-ipv6, IPv6 routes occupy a separate partition within the External LPM table

On a BlackDiamond X8, BlackDiamond 8000 c-, or xm-series module, Summit X450a, X460, X650, or X670 switch, the capacity of the LPM table is 4,096 higher than the capacity for local IPv4 or IPv6 hosts. Therefore, on such hardware, there is no need to configure fewer than 4096 reserved route entries.

The maximum value for num_routes_needed is as follows:

- For a Summit X440 switch: 32
- For a BlackDiamond 8000 e-series module or a Summit X250e or X450e switch: 480
- For a BlackDiamond 8000 c-series module or a Summit X450a, X460, or X650 switch: 12256
- For a BlackDiamond X8, BlackDiamond 8900 xm-series module or a Summit X670 switch: 16352
- For a BlackDiamond 8900 xl-series module or a Summit X480 switch, the maximum value depends on the value configured with the configure forwarding external-tables command as follows:
  - l2-only, acl-only, l3-only ipv6 and none options: 16352 (default 12240)
  - l2-and-l3-and-acl option: 131040 (default 114656)
  - l2-and-l3 option: 262112 (default 245728)
  - l3-only {ipv4} option: 524256 (default 507872)
  - l3-only ipv4-and-ipv6 option: 475104 (default 458720)
  - l2-and-l3-and-ipmc option: 131040 (default 114656)

The maximum values shown above apply to Summit family switches operating independently or as part of a SummitStack. The maximum option can be used to specify the maximum values.

When maximum is specified, IPv4 hosts do not occupy LPM table space. Note that when maximum is specified, software forwarding can result, depending on the utilization and addresses in the Layer3 Hash table, and is therefore not recommended.

If the switch contains more routes than the capacity of the LPM tables, say 700 routes on a BlackDiamond 8000 e-series module, a trade-off can be made. You can choose to reserve 400 iproute entries, for example. The 400 IPv4 routes with the longest length network masks will be installed in the LPM table, and the remainder of the LPM table can be used for cache space for local and remote hosts. The remote host entries are only required for IPv4 addresses matching one of the 300 routes not installed in the LPM table. Since not all 700 routes can be stored on a BlackDiamond 8000 e-series module anyway, leaving appropriate room for individual remote hosts can result in more fast-path forwarding.

Depending on the actual routes present, IP route compression can be enabled to reduce the number of routes required in the LPM tables. For more information, see the description for the following command:

```
enable iproute compression {vr <vrname>}
```

Example

The following command reserves up to 140 IPv4 routes or 70 IPv6 routes, or any combination in between, on all BlackDiamond X8, BlackDiamond 8000 series modules, or on all Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 switches in a SummitStack:

```
configure iproute reserved-entries 140 slot all
```

For details on the configuration changes, see the command descriptions for the following commands:

```
show iproute reserved-entries
            show iproute reserved-entries statistics
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules and on Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 switches when operating independently or in a SummitStack.

configure iproute sharing max-gateways

configure iproute sharing max-gateways *max_gateways*

Description

Specifies the maximum number of gateways in each gateway set in the equal-cost multipath (ECMP) hardware table.

Syntax Description

max-gateways	Specifies the maximum number of ECMP gateways in a gateway. The only values allowed are 2, 4, 8, 16 and 32.

Default

4 gateways.

Usage Guidelines

When IP route sharing is enabled, the maximum number of gateways value represents the maximum number of next-hop gateways that can be used for communications with a destination subnet. Each gateway represents an alternative path to a subnet. The gateways can be defined with static routes, or they can be learned through the OSPF, BGP, or IS-IS protocols.

The ExtremeXOS Release Notes lists the total number of route destinations and the total combinations of gateway sets that each platform can support with the different max-gateways option selections. For more information on selecting the maximum number of gateways and how this affects different platforms, see ECMP Hardware Table in the ExtremeXOS Concepts Guide.

You must save the configuration and reboot the switch for the new value to take effect. To see the current and configured value, use the following command:

```
show ipconfig
```

To see the current and configured value, use the following command:

```
show ipconfig ipv6
```

Example

The following command changes the maximum number of ECMP gateways per subnet or gateway set to eight:

```
configure iproute sharing max-gateways 8
```

History

This command was first available in ExtremeXOS 11.4.

The value 2 was first available in ExtremeXOS 12.0.2.

Support for shared gateway sets in the ECMP table was added in ExtremeXOS 12.4.

The values 16 and 32 were first available in ExtremeXOS 15.3.

This command first applied to IPv6 routes in ExtremeXOS 15.3.

Platform Availability

This command is available only on BlackDiamond X8, BlackDiamond 8000 series modules, SummitStack, and SummitX250e, X450, X460, X480, X650, and X670 series switches.

configure irdp

configure irdp [**multicast** | **broadcast** | *mininterval maxinterval lifetime preference*]

Description

Configures the destination address of the router advertisement messages.

Syntax Description

multicast	Specifies multicast setting.
broadcast	Specifies broadcast setting.
mininterval	Specifies the minimum time between advertisements.
maxinterval	Specifies the maximum time between advertisements. Default is 600.
lifetime	Specifies the lifetime of the advertisement. Default is 1800.
preference	Specifies the router preference level. Default is 0.

Default

Broadcast (255.255.255.255). The default mininterval is 450.

Usage Guidelines

ICMP Router Discovery Protocol allows client machines to determine what default gateway address to use. The switch sends out IP packets at the specified intervals identifying itself as a default router. IRDP enabled client machines use this information to determine which gateway address to use for routing data packets to other networks.

Example

The following command sets the address of the router advertiser messages to multicast:

```
configure irdp multicast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure vlan add secondary-ipaddress

configure vlan *vlan_name* **add secondary-ipaddress** [*ip_address* {*netmask*} | *ipNetmask*]

Description

Configures secondary IP addresses on a VLAN to support multinetting.

Syntax Description

vlan_name	Specifies a VLAN name.
ip_address	Specifies an IP address.
netmask	Specifies a network mask.
ipNetmask	Specifies an IP address with network mask.

Default

N/A.

Usage Guidelines

Adding a secondary IP address to a VLAN enables multinetting. Secondary addresses are added to support legacy stub IP networks.

Once you have added a secondary IP address to a VLAN, you cannot unconfigure the primary IP address of that VLAN until you delete all the secondary addresses. Delete secondary address with the following command:

```
configure vlan <vlan_name> delete secondary-ipaddress [<ip_address> | all]
```

Example

The following command configures the VLAN multi to support the 10.1.1.0/24 subnet in addition to its primary subnet:

```
configure vlan multi add secondary-ipaddress 10.1.1.1/24
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure vlan delete secondary-ipaddress

configure vlan *vlan_name* **delete secondary-ipaddress** [*ip_address* | **all**]

Description

Removes secondary IP addresses on a VLAN that were added to support multinetting.

Syntax Description

vlan_name	Specifies a VLAN name.
ip_address	Specifies an IP address.
all	Specifies all secondary IP addresses.

Default

N/A.

Usage Guidelines

Once you have added a secondary IP address to a VLAN, you cannot unconfigure the primary IP address of that VLAN until you delete all the secondary addresses. Use the all keyword to delete all the secondary IP addresses from a VLAN.

Example

The following command removes the 10.1.1.0 secondary IP address from the VLAN multi:

```
configure vlan multi delete secondary-ipaddress 10.1.1.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

configure vlan subvlan

configure vlan *vlan_name* [**add** | **delete**] **subvlan** *sub_vlan_name*

Description

Adds or deletes a subVLAN to a superVLAN.

Syntax Description

vlan_name	Specifies a superVLAN name.
add	Specifies to add the subVLAN to the superVLAN.
delete	Specifies to delete the subVLAN from the superVLAN.
sub_vlan_name	Specifies a subVLAN name.

Default

N/A.

Usage Guidelines

The following properties apply to VLAN aggregation operation:

- All broadcast and unknown traffic remains local to the subVLAN and does not cross the subVLAN boundary. All traffic within the subVLAN is switched by the subVLAN, allowing traffic separation between subVLANs (while using the same default router address among the subVLANs).
- Hosts can be located on the superVLAN or on subVLANs. Each host can assume any IP address within the address range of the superVLAN router interface. Hosts on the subVLAN are expected to have the same network mask as the superVLAN and have their default router set to the IP address of the superVLAN.
- All IP unicast traffic between subVLANs is routed through the superVLAN. For example, no ICMP redirects are generated for traffic between subVLANs, because the superVLAN is responsible for subVLAN routing. Unicast IP traffic across the subVLANs is facilitated by the automatic addition of an ARP entry (similar to a proxy ARP entry) when a subVLAN is added to a superVLAN. This feature can be disabled for security purposes.

Example

The following command adds the subVLAN vsub1to the superVLAN vsuper:

```
configure vlan vsuper add subvlan vsub1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure vlan subvlan-address-range

configure vlan *vlan_name* **subvlan-address-range** *ipaddress1 ipaddress2*

Description

Configures subVLAN address ranges on each subVLAN to prohibit the entry of IP addresses from hosts outside of the configured range.

Syntax Description

vlan_name	Specifies a subVLAN name.
ipaddress1	Specifies an IP address.
ipaddress2	Specifies another IP address.

Default

N/A.

Usage Guidelines

There is no error checking to prevent the configuration of overlapping subVLAN address ranges between multiple subVLANs. Doing so can result in unexpected behavior of ARP within the superVLAN and associated subVLANs.

Example

The following command configures the subVLAN vsuper to prohibit the entry of IP addresses from hosts outside of the configured range of IP addresses:

```
configure vlan vsuper subvlan-address-range 10.1.1.1 - 10.1.1.255
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

configure vlan delete secondary-ipaddress

configure vlan *vlan_name* **delete secondary-ipaddress** [*ip_address* | **all**]

Description

Removes secondary IP addresses on a VLAN that were added to support multinetting.

Syntax Description

vlan_name	Specifies a VLAN name.
ip_address	Specifies an IP address.
all	Specifies all secondary IP addresses.

Default

N/A.

Usage Guidelines

Once you have added a secondary IP address to a VLAN, you cannot unconfigure the primary IP address of that VLAN until you delete all the secondary addresses. Use the all keyword to delete all the secondary IP addresses from a VLAN.

Example

The following command removes the 10.1.1.0 secondary IP address from the VLAN multi:

```
configure vlan multi delete secondary-ipaddress 10.1.1.1
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable bootp vlan

disable bootp vlan [*vlan* | **all**]

Description

Disables the generation and processing of BOOTP packets on a VLAN to obtain an IP address for the VLAN from a BOOTP server.

Syntax Description

vlan	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the generation and processing of BOOTP packets on a VLAN named accounting:

```
disable bootp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable bootprelay

disable bootprelay {{**vlan**} [*vlan_name*] | {{**vr**} *vr_name*} | **all** [{**vr**} *vr_name*]}

Description

Disables the BOOTP relay function on one or all VLANs for the specified VR or VRF.

Syntax Description

vlan_name	Specifies a single VLAN on which to disable the BOOTP relay feature.
vr_name	Specifies a single VR on which to disable the BOOTP relay feature.
all	Specifies that BOOTP relay is to be disabled for all VLANs on the specified VR or VRF.

Default

The BOOTP relay function is disabled on all VLANs and VRs.

Usage Guidelines

Because VLAN names are unique on the switch, you can specify only a VLAN name (and omit the VR name) to disable BOOTP relay. When you disable BOOTP relay on a VR or VRF, BOOTP relay is disabled on all VLANs for that VR. If you enter the command without specifying a VLAN or a VR, the functionality is disabled for all VLANs in the current VR context.

Example

The following command disables the forwarding of BOOTP requests on all VLANs in the current VR context:

```
disable bootprelay
```

You can use either of the following commands to disable the forwarding of BOOTP requests on VLAN unit2:

```
disable bootprelay unit2
disable bootprelay vlan unit2
```

You can use any one of the following commands to disable the forwarding of BOOTP requests on all VLANs in VR zone3:

```
disable bootprelay zone3
disable bootprelay vr zone3
disable bootprelay all zone3
disable bootprelay all vr zone3
```

History

This command was first available in ExtremeXOS 10.1.

The capability to disable BOOTP relay on a VLAN was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

disable icmp address-mask

disable icmp address-mask {**vlan** *name*}

Description

Disables the generation of an ICMP address-mask reply on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

Disables the generation of an ICMP address-mask reply (type 18, code 0) when an ICMP address mask request is received. The default setting is disabled. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables the generation of an ICMP address-mask reply on VLAN accounting:

```
disable icmp address-mask vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The default was changed to disabled in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable icmp parameter-problem

disable icmp parameter-problem {**vlan** *name*}

Description

Disables the generation of an ICMP parameter-problem message on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of an ICMP parameter-problem message (type 12) when the switch cannot properly process the IP header or IP option information. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables the generation of an ICMP parameter-problem message on VLAN accounting:

```
disable icmp parameter-problem vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp port-unreachables

disable icmp port-unreachables {**vlan** *name*}

Description

Disables the generation of ICMP port unreachable messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of ICMP port unreachable messages (type 3, code 3) when a TCP or UDP request is made to the switch and no application is waiting for the request, or an access policy denies the request. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables ICMP port unreachable messages on VLAN accounting:

```
disable icmp port-unreachables vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp redirects

disable icmp redirects {**ipv4**} {**vlan all** |{**vlan**} {*name*}}

Description

Disables the generation of ICMP redirect messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of ICMP redirects (Type 5) to hosts who direct routed traffic to the switch where the switch detects that there is another router in the same subnet with a better route to the destination.

Example

The following command disables ICMP redirects from VLAN accounting:

```
disable icmp redirects vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp time-exceeded

disable icmp time-exceeded {**vlan** *name*}

Description

Disables the generation of ICMP time exceeded messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of an ICMP time exceeded message (type 11) when the TTL field expires during forwarding. IP multicast packets do not trigger ICMP time exceeded messages. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables the generation of ICMP time exceeded messages on VLAN accounting:

```
disable icmp time-exceeded vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp timestamp

disable icmp timestamp {vlan *name***}**

Description

Disables the generation of an ICMP timestamp response on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of an ICMP timestamp response (type 14, code 0) when an ICMP timestamp request is received. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables the generation of an ICMP timestamp response on VLAN accounting:

```
disable icmp timestamp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp unreachables

disable icmp unreachables {**vlan** *name*}

Description

Disables the generation of ICMP unreachable messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Disables the generation of an ICMP timestamp response (type 3, code 0) when an ICMP timestamp request is received. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command disables the generation of ICMP unreachable messages on all VLANs:

```
disable icmp unreachables
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable icmp useredirects

disable icmp useredirects

Description

Disables the modification of route table information when an ICMP redirect message is received.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This option only applies to the switch when the switch is not in routing mode.

If the switch has a route to a destination network, the switch uses that router as the gateway to forward the packets to. If that router knows about a better route to the destination, and the next hop is in the same subnet as the originating router, the second router sends an ICMP redirect message to the first router. If ICMP useredirects is disabled, the switch disregards these messages and continues to send the packets to the second router.

Example

The following command disables the changing of routing table information:

```
disable icmp useredirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable iparp checking

disable iparp {**vr** *vr_name*} **checking**

Description

Disable checking if the ARP request source IP address is within the range of the local interface or VLAN domain.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command disables IP ARP checking:

```
disable iparp checking
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable iparp refresh

disable iparp {**vr** *vr_name*} **refresh**

Description

Disables IP ARP to refresh its IP ARP entries before timing out.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

The purpose of disabling ARP refresh is to reduce ARP traffic in a high node count Layer2 switching only environment.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command disables IP ARP refresh:

```
disable iparp refresh
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

disable ipforwarding

disable ipforwarding {**broadcast**} {**vlan** *vlan_name*}

Description

Disables routing (or routing of broadcasts) for one or all VLANs. If no argument is provided, disables routing for all VLANs.

Syntax Description

broadcast	Specifies broadcast IP forwarding.
vlan_name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

Disabling IP forwarding also disables broadcast forwarding. Broadcast forwarding can be disabled without disabling IP forwarding. When new IP interfaces are added, IP forwarding (and IP broadcast forwarding) is disabled by default.

Other IP related configuration is not affected.

Example

The following command disables forwarding of IP broadcast traffic for a VLAN named accounting:

```
disable ipforwarding broadcast vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The ignore-broadcast and fast-direct-broadcast keywords were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable ip-option loose-source-route

disable ip-option loose-source-route

Description

Disables processing of the loose source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from forwarding IP packets with the IP option for loose source routing turned on. Packets with the loose-source-route option enabled are dropped by the switch.

Example

The following command disables processing of the loose source route IP option:

```
disable ip-option loose-source-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable ip-option record-route

disable ip-option record-route

Description

Disables processing of the record route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from adding itself into the IP options header when the record route IP option is enabled in a packet that is transiting the switch.

Example

The following command disables processing of the record route IP option:

```
disable ip-option record-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable ip-option record-timestamp

disable ip-option record-timestamp

Description

Disables processing of the record timestamp IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from adding a timestamp into the IP options header when it receives a packet with the record timestamp IP option.

Example

The following command disables processing of the record timestamp IP option:

```
disable ip-option record-timestamp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable ip-option router-alert

disable ip-option router-alert

Description

Disables processing of the router alert IP option in IPv4 packet headers.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

None.

Example

The following command disables processing of the router alert IP option:

```
disable ip-option router-alert
```

History

This command was first available in EXOS 10.1.

Platform Availability

This command is available on all platforms.

disable ip-option strict-source-route

disable ip-option strict-source-route

Description

Disables processing the strict source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Disables the switch from forwarding IP packets that have the strict source routing IP option turned on. The switch drops packets that have the strict source routing IP option enabled.

Example

The following command disables processing of the strict source route IP option:

```
disable ip-option strict-source-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

disable iproute bfd

disable iproute bfd {**gateway**} *ip_addr* {**vr** *vrname*}

Description

Disables BFD client services for IPv4 static routes.

Syntax Description

ip_addr	Specifies the IPv4 address of a neighbor for which BFD services are to be stopped.
vrname	Specifies the VR or VRF name for which BFD services are being disabled.

Default

Disabled.

Usage Guidelines

When the BFD client is disabled, BFD services for all static IP routes terminates. This command does not disable services for other BFD clients (such as the MPLS BFD client).

Example

The following example disables BFD client protection for communications with neighbor 10.10.10.1:

```
disable iproute bfd 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

disable iproute compression

disable iproute compression {**vr** *vrname*}

Description

Disables IPv4 route compression.

Syntax Description

vrname	VR or VRF name for which the IP route compression is being disabled. If the VR or VRF name is not specified, route compression is disabled for the VR context from which CLI command is issued.

Default

Disabled.

Usage Guidelines

Disables IPv4 route compression for a specified VR or VRF.

Example

The following example disables IP route compression:

```
disable iproute compression
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

disable iproute sharing

disable iproute {ipv4} sharing {{{vr} vrname} | { {vr} all}}

Description

Disables IPv4 route sharing.

Syntax Description

vrname	VR or VRF name for which IP route sharing is being disabled.

Default

Disabled.

Usage Guidelines

If a VR is not specified, this command disables IP route sharing in the current VR context.

Example

The following command disables load sharing for multiple routes:

```
disable iproute sharing
```

History

This command was first available in ExtremeXOS 12.1.

The vr option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

disable irdp

disable irdp {vlan *name***}**

Description

Disables the generation of ICMP router advertisement messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

If no optional argument is specified, all the IP interfaces are affected.

Example

The following command disables IRDP on VLAN accounting:

```
disable irdp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable subvlan-proxy-arp vlan

disable subvlan-proxy-arp vlan [*vlan-name* | **all**]

Description

Disables the automatic entry of subVLAN information in the proxy ARP table.

Syntax Description

vlan-name	Specifies a superVLAN name.
all	Specifies all VLANs.

Default

Enabled.

Usage Guidelines

To facilitate communication between subVLANs, by default, an entry is made in the IP ARP table of the superVLAN that performs a proxy ARP function. This allows clients on one subVLAN to communicate with clients on another subVLAN. In certain circumstances, intra-subVLAN communication may not be desired for isolation reasons.

Note

The isolation option works for normal, dynamic, ARP-based client communication.

Example

The following command disables the automatic entry of subVLAN information in the proxy ARP table of the superVLAN vsuper:

```
disable subvlan-proxy-arp vlan vsuper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

disable udp-echo-server

disable udp-echo-server {**vr** *vrid*}

Description

Disables UDP echo server support.

Syntax Description

vrid	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

UDP Echo packets are used to measure the transit time for data between the transmitting and receiving end.

Example

The following command disables UDP echo server support:

```
disable udp-echo-server
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable bootp vlan

enable bootp vlan [*vlan* | **all**]

Description

Enables the generation and processing of BOOTP packets on a VLAN to obtain an IP address for the VLAN from a BOOTP server.

Syntax Description

vlan	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables the generation and processing of BOOTP packets on a VLAN named accounting:

```
enable bootp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable bootprelay

enable bootprelay {{**vlan**} [*vlan_name*] | {{**vr**} *vr_name*} | **all** [{**vr**} *vr_name*]}

Description

Enables the BOOTP relay function on one or all VLANs for the specified VR or VRF.

Syntax Description

vlan_name	Specifies a single VLAN on which to enable the BOOTP relay feature.
vr_name	Specifies a single VR on which to enable the BOOTP relay feature.
all	Specifies that BOOTP relay is to be enabled for all VLANs on the specified VR or VRF.

Default

The BOOTP relay function is disabled on all VLANs and VRs.

Usage Guidelines

Because VLAN names are unique on the switch, you can specify only a VLAN name (and omit the VR name) to enable BOOTP relay on a particular VLAN. When you enable BOOTP relay on a VR or VRF,

BOOTP relay is enabled on all VLANs for that VR. If you enter the command without specifying a VLAN or a VR, the functionality is enabled for all VLANs in the current VR context.

Note

If DHCP/BOOTP Relay is enabled on a per VLAN basis, make sure it is enabled on both the client-side and server-side VLANs.

You can enable the use of LSP next hops, or you can enable DHCP/BOOTP relay. The software does not support both features at the same time.

Example

The following command enables the forwarding of BOOTP requests for all VLANs in the current VR context:

```
enable bootprelay
```

You can use either of the following commands to enable the forwarding of BOOTP requests for VLAN client1:

```
enable bootprelay "client1"
enable bootprelay vlan "client1"
```

You can use any one of the following commands to enable the forwarding of BOOTP requests for all VLANs on VR zone3:

```
enable bootprelay zone3
enable bootprelay vr zone3
enable bootprelay all zone3
enable bootprelay all vr zone3
```

History

This command was first available in ExtremeXOS 10.1.

The capability to enable BOOTP relay on a VLAN was added in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

enable icmp address-mask

enable icmp address-mask {**vlan** *name*}

Description

Enables the generation of an ICMP address-mask reply on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

Enables the generation of an ICMP address-mask reply (type 18, code 0) when an ICMP address mask request is received. The default setting is disabled. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables the generation of an ICMP address-mask reply on VLAN accounting:

```
enable icmp address-mask vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The default was changed to disabled in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable icmp parameter-problem

enable icmp parameter-problem {**vlan** *name*}

Description

Enables the generation of an ICMP parameter-problem message on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Enables the generation of an ICMP parameter-problem message (type 12) when the switch cannot properly process the IP header or IP option information. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables the generation of an ICMP parameter-problem message on VLAN accounting:

```
enable icmp parameter-problem vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp port-unreachables

enable icmp port-unreachables {**vlan** *name*}

Description

Enables the generation of ICMP port unreachable messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Enables the generation of ICMP port unreachable messages (type 3, code 3) when a TCP or UDP request is made to the switch and no application is waiting for the request, or when an access policy denies the request. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables ICMP port unreachable messages on VLAN accounting:

```
enable icmp port-unreachables vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp redirects

enable icmp redirects {**ipv4**} {**vlan all** | {**vlan**} {*name*}}

Description

Enables the generation of ICMP redirect messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

This option only applies to the switch when the switch is in routing mode.

ICMP redirects are used in the situation where there are multiple routers in the same subnet. If a host sends a packet to one gateway, the gateway router looks at it's route table to find the best route to the destination. If it sees that the best route is through a router in the same subnet as the originating host, the switch sends an ICMP redirect (type 5) message to the host that originated the packet, telling it to use the other router with the better route. The switch also forwards the packet to the destination.

ICMP redirects are only generated for IPv4 unicast packets that are "slowpath" forwarded by the CPU. That is, IPv4 packets that contain IP Options, or packets whose Destination IP is not in the Layer 3 forwarding hardware table.

Example

The following command enables the generation of ICMP redirect messages on all VLANs:

```
enable icmp redirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp time-exceeded

enable icmp time-exceeded {**vlan** *name*}

Description

Enables the generation of ICMP time exceeded messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Enables the generation of an ICMP time exceeded message (type 11) when the TTL field expires during forwarding. IP multicast packets do not trigger ICMP time exceeded messages. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables the generation of ICMP time exceeded messages on VLAN accounting:

```
enable icmp time-exceeded vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp timestamp

enable icmp timestamp {**vlan** *name*}

Description

Enables the generation of an ICMP timestamp response on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Enables the generation of an ICMP timestamp response (type 14, code 0) when an ICMP timestamp request is received. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables the generation of an ICMP timestamp response on VLAN accounting:

```
enable icmp timestamp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp unreachables

enable icmp unreachables {**vlan** *name*}

Description

Enables the generation of ICMP unreachable messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

Enables the generation of an ICMP timestamp response (type 3, code 0) when an ICMP timestamp request is received. If a VLAN is not specified, the command applies to all IP interfaces.

This command only affects the generation of certain ICMP packets. Filtering of ICMP packets usually forwarded by the switch is controlled by the access-list commands.

Example

The following command enables the generation of ICMP unreachable messages on all VLANs:

```
enable icmp unreachables
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable icmp useredirects

```
enable icmp useredirects
```

Description

Enables the modification of route table information when an ICMP redirect message is received.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If the switch has a route to a destination network, the switch uses that router as the gateway to forward the packets to. If that router knows about a better route to the destination, and the next hop is in the same subnet as the originating router, the second router sends an ICMP redirect message to the originating router. If ICMP useredirects is enabled, the switch adds a route to the destination network using the third router as the next hop and starts sending the packets to the third router.

Example

The following command enables the modification of route table information:

```
enable icmp useredirects
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable iparp checking

enable iparp {**vr** *vr_name*} **checking**

Description

Enables checking if the ARP request source IP address is within the range of the local interface or VLAN domain.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command enables IP ARP checking:

```
enable iparp checking
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable iparp refresh

enable iparp {**vr** *vr_name*} **refresh**

Description

Enables IP ARP to refresh its IP ARP entries before timing out.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

If ARP refresh is enabled, the switch resends ARP requests for the host at 3/4 of the configured ARP timer value.

For example: If the ARP timeout is set to 20 minutes, the switch attempts to resend an ARP request for the host when the host entry is at 15 minutes. If the host replies, the ARP entry is reset back to 0, and the timer starts again.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command enables IP ARP refresh:

```
enable iparp refresh
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

enable ipforwarding

enable ipforwarding {ipv4 | broadcast} {vlan *vlan_name***}**

Description

Enables IPv4 routing or IPv4 broadcast forwarding for one or all VLANs. If no argument is provided, enables IPv4 routing for all VLANs that have been configured with an IP address on the current VR or VRF.

Syntax Description

ipv4	Specifies IPv4 forwarding
broadcast	Specifies broadcast IP forwarding.
vlan_name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

IP forwarding must first be enabled before IP broadcast forwarding can be enabled. When new IP interfaces are added, IP forwarding (and IP broadcast forwarding) is disabled by default. Currently, Extreme Networks switches only have a single hardware control per VLAN for IP forwarding of IPv4 and IPv6 unicast packets. Therefore, enabling IPv4 forwarding on a VLAN also enables IPv6 hardware forwarding on that VLAN. Future switches may have independent controls per-VLAN for forwarding of IPv4 and IPv6 unicast packets.

The broadcast, ignore-broadcast, and fast-directbroadcast options each prompt with a warning message when executed while the IP forwarding on the corresponding VLAN is disabled. The hardware and software are NOT programmed until IP forwarding is enabled on the VLAN.

The fast-direct-broadcast and ignore-broadcast options cannot be enabled simultaneously. These are mutually exclusive.

The broadcast option can be enabled in conjunction with fast-direct-broadcast and ignore-broadcast.

Example

The following command enables forwarding of IP traffic for all VLANs in the current VR context with IP addresses:

```
enable ipforwarding
```

The following command enables forwarding of IP broadcast traffic for a VLAN named accounting:

```
enable ipforwarding broadcast vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

The ignore-broadcast and the fast-direct-broadcast keywords were added in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable ip-option record-route

```
enable ip-option record-route
```

Description

Enables processing of the record route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

IP option record-route (IP option 7) means that each router along the path should add it's IP address into the options data.

Enabling means that the switch adds itself into the IP options header when the record route IP option is enabled in a packet that is transiting the switch.

Example

The following command enables processing of the record route IP option:

```
enable ip-option record-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable ip-option record-timestamp

enable ip-option record-timestamp

Description

Enables processing of the record timestamp IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Enables the switch to use the timestamp IP option (0x44). When the switch receives an IP packet with the timestamp option turned on, it inserts the timestamp into the IP options header before forwarding the packet to the destination.

Example

The following command enables processing of the record timestamp IP option:

```
enable ip-option record-timestamp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable ip-option strict-source-route

enable ip-option strict-source-route

Description

Enables processing of the strict source route IP option in the IPv4 packet header.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

This enables the switch to forward IP packets that have the strict source route IP option (0x89) enabled.

Source routing is used when a sending host specifies the router interfaces that the packet must traverse on it's way to it's destination.

When strict source routing is used, it means that the packet must use the exact path of routers that lie in the designated router path.

With strict source routing enabled, the switch forwards IP packets with the strict source route option enabled, only if the switch's IP is in the designated list and as long as the next hop in the list is directly attached to one of the router's interfaces.

Example

The following command enables processing of the strict source route IP option:

```
enable ip-option strict-source-route
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

enable ip-option router-alert

enable ip-option router-alert

Description

Enables processing of the router alert IP option in IPv4 packet headers.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

None.

Example

The following command enables processing of the router alert IP option:

```
enable ip-option router-alert
```

History

This command was first available in EXOS 10.1.

Platform Availability

This command is available on all platforms.

enable iproute bfd

enable iproute bfd {**gateway**} *ip_addr* {**vr** *vrname*}

Description

Enables the BFD client to provide services for IPv4 static routes.

Syntax Description

ip_addr	Specifies the IPv4 address of a neighbor to which BFD services are to be provided.
vrname	Specifies the VR or VRF name for which BFD services are being enabled.

Default

Disabled.

Usage Guidelines

To enable BFD services to an IPv4 neighbor, you must do the following:

- Execute this command on the switches at both ends of the link.
- Enable BFD for specific IPv4 static routes with the configure iproute add (IPv4) command.

Once a BFD session is established between two neighbors, BFD notifies the Route Manager process of the BFD session status and any changes. If other BFD clients (such as the MPLS BFD client) are configured between the same neighbors, the clients share a single session between the neighbors.

Example

The following example enables BFD client protection for communications with neighbor 10.10.10.1:

```
enable iproute bfd 10.10.10.1
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

enable iproute compression

enable iproute compression {**vr** *vrname*}

Description

Enables IPv4 route compression.

Syntax Description

vrname	VR or VRF name for which the IP route compression is being enabled.

Default

Disabled.

Usage Guidelines

Enables IPv4 route compression for the specified VR or VRF. If the VR name is not specified, route compression is enabled for the VR context from which the CLI command is issued.

The command applies a compression algorithm on each of the IP prefixes in the routing table. Essentially, routes with longer network masks might not be necessary if they are a subset of other routes with shorter network masks using the same gateway(s). When IP route compression is enabled, these unnecessary routes are not provided to the Forwarding Information Base (FIB).

Example

The following example enables IP route compression:

```
enable iproute compression
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

enable iproute sharing

enable iproute {ipv4} sharing {{{vr} vrname} | { {vr} all}}

Description

Enables load sharing if multiple routes to the same destination are available. When multiple routes to the same destination are available, load sharing can be enabled to distribute the traffic to multiple destination gateways. Only paths with the same lowest cost are shared.

Syntax Description

vrname	VR or VRF name for which IP route sharing is being enabled.

Default

Disabled.

Usage Guidelines

IP route sharing allows multiple equal-cost routes to be used concurrently. IP route sharing can be used with static routes or with OSPF, BGP, or IS-IS routes. In OSPF, BGP, and IS-IS, this capability is referred to as equal cost multipath (ECMP) routing.

Configure static routes and OSPF, BGP, or IS-IS as you would normally. The ExtremeXOS software supports route sharing across up to 32 ECMP static routes or up to 8 ECMP routes for OSPF, BGP, or IS-IS. However, on the BlackDiamond 8800 family, SummitStack, and Summit family switches, by default, up to 4 routes are supported. To support 2, 4, 8, 16 or 32 routes on these switches, use the following command:

```
configure iproute sharing max-gateways <max_gateways>
```

If a VR is not specified, this command enables IP route sharing in the current VR context.

Example

The following command enables load sharing for multiple routes:

```
enable iproute sharing
```

History

This command was first available in ExtremeXOS 11.1.

The vr option was added in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms, except Summit X440. If present in a SummitStack, any Summit X440 nodes ingressing IPv4 unicast packets will still perform unipath IPv4 forwarding in hardware.

enable irdp

enable irdp {vlan *name***}**

Description

Enables the generation of ICMP router advertisement messages on one or all VLANs.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

ICMP Router Discovery Protocol allows client machines to determine what default gateway address to use. The switch sends out IP packets at the specified intervals identifying itself as a default router. IRDP enabled client machines use this information to determine which gateway address to use for routing data packets to other networks.

If no optional argument is specified, all the IP interfaces are affected.

Example

The following command enables IRDP on VLAN accounting:

```
enable irdp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable subvlan-proxy-arp vlan

enable subvlan-proxy-arp vlan [*vlan-name* | **all**]

Description

Enables the automatic entry of subVLAN information in the proxy ARP table.

Syntax Description

vlan-name	Specifies a superVLAN name.
all	Specifies all VLANs.

Default

Enabled.

Usage Guidelines

To facilitate communication between subVLANs, by default, an entry is made in the IP ARP table of the superVLAN that performs a proxy ARP function. This allows clients on one subVLAN to communicate with clients on another subVLAN. In certain circumstances, intra-subVLAN communication may not be desired for isolation reasons.

Note

The isolation option works for normal, dynamic, ARP-based client communication.

Example

The following command enables the automatic entry of subVLAN information in the proxy ARP table of the superVLAN vsuper:

```
enable subvlan-proxy-arp vlan vsuper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

enable udp-echo-server

enable udp-echo-server {**vr** *vrid*}{**udp-port** *port*}

Description

Enables UDP echo server support.

Syntax Description

port	Specifies the UDP port.
vrid	Specifies the VR or VRF.

Default

Disabled.

Usage Guidelines

UDP Echo packets are used to measure the transit time for data between the transmitting and receiving ends.

Example

The following command enables UDP echo server support:

```
enable udp-echo-server
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

rtlookup

rtlookup [*ipaddress* | *ipv6address*] { **unicast** | **multicast** | **vr** *vr_name*}

Description

Looks up and displays routes to the specified IP address.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
unicast	Displays the routes from the unicast routing table in the current router context.
multicast	Selects the multicast routing table for the search.
vr_name	Displays the available routes in the specified router context.

Default

N/A.

Usage Guidelines

When IP Route sharing is enabled, the rtlookup command displays all ECMP routes for the specified IP address.

When IP route sharing is disabled and there are multiple ECMP routes for the specified IP address, the rtlookup command displays only one route, which is the route with lowest value gateway IP address.

Example

The following command looks up IP address 10.0.0.0 in the VR-Mgmt router and displays the available routes:

```
BD-12804.4 # rtlookup 66.6.6.6
Ori  Destination        Gateway         Mtr  Flags        VLAN       Duration
#s   66.6.6.6/32        80.1.10.58      1    UG---S-um--f v8         0d:0h:
18m:58s
```

```
Origin(Ori): (b) BlackHole, (be) EBGP, (bg) BGP, (bi) IBGP, (bo) BOOTP
(ct) CBT, (d) Direct, (df) DownIF, (dv) DVMRP, (e1) ISISL1Ext
(e2) ISISL2Ext, (h) Hardcoded, (i) ICMP, (i1) ISISL1 (i2) ISISL2
(is) ISIS, (mb) MBGP, (mbe) MBGPExt, (mbi) MBGPInter, (mp) MPLS Lsp
(mo) MOSPF (o) OSPF, (o1) OSPFExt1, (o2) OSPFExt2
(oa) OSPFIntra, (oe) OSPFAsExt, (or) OSPFInter, (pd) PIM-DM, (ps) PIM-SM
(r) RIP, (ra) RtAdvrt, (s) Static, (sv) SLB_VIP, (un) UnKnown
(*) Preferred unicast route (@) Preferred multicast route
(#) Preferred unicast and multicast route
Flags: (B) BlackHole, (D) Dynamic, (G) Gateway, (H) Host Route
(L) Matching LDP LSP, (l) Calculated LDP LSP, (m) Multicast
(P) LPM-routing, (R) Modified, (S) Static, (s) Static LSP
(T) Matching RSVP-TE LSP, (t) Calculated RSVP-TE LSP, (u) Unicast, (U) Up
(f) Provided to FIB (c) Compressed Route
```

History

This command was first available in ExtremeXOS 10.1.

The xhostname option was removed in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

The c flag was added in ExtremeXOS 12.0.

The unicast and multicast options were added in ExtremeXOS 12.1.

The f flag was added in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

run ip dad

run ip dad [{**vlan**} *vlan_name* | {{**vr**} *vr_name*} *ip_address*]

Description

Runs the DAD check on the specified IP interface for which the DAD feature is enabled.

Syntax Description

vlan_name	Specifies a VLAN on which to run the test.
vr_name	Specifies a VR on which to run the test.
ip_address	Specifies an IP address for which to run the test.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

To run the check, you must specify a VLAN name or a specific IP address. To support the check, the DAD feature must be enabled on the parent VR for the specified VLAN or IP interface.

This command is ignored for the following conditions:

- The specified IP address is in tentative state
- DAD is configured to be off
- The host VLAN is disabled
- Loopback mode is enabled on the host VLAN
- DAD is already running due to interface initialization or a previous issue of this command
- The host VLAN belongs to virtual router VR-Mgmt

If a duplicate address is detected during the check, the event is logged and the address remains valid if it was already valid. A valid address is an address that previously passed a DAD check (no duplicate address detected) and displays the U flag (Interface up) when the show ip dad command is entered. In this situation, the show ip dad command displays the D (duplicate address detected), E (Interface enabled), and U flags.

If the address was not already valid, the event is logged, the duplicate address transitions to duplicate address detected state, and the duplicate address displays the D flag when the show ip dad command is entered. If no duplicate IP address is detected, the specified IP interface transitions to or remains in the Interface up (U flag) state.

Example

The following command runs the DAD check on the IP interfaces in VLAN vlan1:

```
run ip dad vlan1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

show bootprelay

show bootprelay

Description

Displays the DHCP/BOOTP relay statistics and the configuration for the VRs.

Syntax Description

This command has no arguments or variables.

Default

None.

Usage Guidelines

The fields displayed in the DHCP Information Option 82 section depend on the configuration defined by the configure bootprelay dhcp-agent information policy [drop | keep | replace] command. If the policy configured is keep, the Requests unmodified counter appears. If the policy configured is replace, the Requests replaced counter appears. And if the drop policy is configured, the Requests dropped counter appears.

The Opt82 added to Requests counter indicates the number of DHCP requests to which the bootprelay agent (the switch) has added its own option 82 information.

Example

The following example displays the DHCP/BOOTP relay statistics for existing VRs:

```
Switch.1 # show bootprelay
Bootprelay : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Option : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Check  : Enabled  on virtual router "VR-Default"
DHCP Relay Agent Information Policy : Replace
DHCP Relay Agent Information Remote-ID : "default"
Bootprelay servers for virtual router "VR-Default":
Destination: 10.127.8.1
DHCP/BOOTP relay statistics for virtual router "VR-Default"
Received from client =          2  Received from server =          2
Requests relayed     =          2  Responses relayed    =          2
DHCP Discover        =          1  DHCP Offer           =          1
DHCP Request         =          1  DHCP Ack             =          1
DHCP Decline         =          0  DHCP NAck            =          0
DHCP Release         =          0
DHCP Inform          =          0
DHCP Information Option 82 packets statistics for virtual router "VR-Default"
Received from client    =          0  Received from server =          2
Requests replaced       =          0  Responses dropped    =          0
Opt82 added to Requests =          2
Note: Default Remote-ID : System MAC Address
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show bootprelay configuration

show bootprelay configuration {{**vlan**} *vlan_name* | {**vr**} *vr_name*}

Description

Displays the enabled/disabled configuration of BOOTP relay on one or all VLANs for the specified VR.

Syntax Description

vlan_name	Specifies a single VLAN for which to display BOOTP relay configuration information.
vr_name	Specifies a single VR for which to display BOOTP relay configuration information.

Default

None.

Usage Guidelines

If a VR is not specified, this command displays the specified VLANs for the current VR context.

Example

The following example displays the BOOTP relay configuration for all VLANs on the VR-Default virtual router:

```
Switch.88 # show bootprelay configuration vr "VR-Default"
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
--------------------------------        -----------
Default                                 Disabled
client1                                 Enabled
serv                                    Enabled
```

The following example displays the BOOTP relay configuration for all VLANs in the current VR context:

```
Switch.95 # show bootprelay configuration
```

```
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
--------------------------------        -----------
Default                                 Disabled
client1                                 Disabled
serv                                    Disabled
```

The following example displays the BOOTP relay configuration for VLAN client1:

```
Switch.87 # show bootprelay configuration vlan "client1"
BOOTP Relay : Enabled on virtual router "VR-Default"
VLAN                                    BOOTP Relay
--------------------------------        -----------
client1                                 Disabled
```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

show bootprelay dhcp-agent information circuit-id port-information

show bootprelay dhcp-agent information circuit-id port-information ports all

Description

Displays the circuit ID sub-option that identifies the port for an incoming DHCP request.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID port_info value for all ports:

```
Switch.12 # show bootprelay dhcp-agent information circuit-id port-
information ports all
Port            Circuit-ID Port information string
----            ----------------------------------
1               1001
2               1002
3               extreme1
4               1004
5               1005
6               1006
7               1007
8               1008
9               1009
10              1010
:
:
11              1011
12              1012
:
:
48              1048
49              1049
50              1050
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show bootprelay dhcp-agent information circuit-id vlan-information

show bootprelay dhcp-agent information circuit-id vlan-information

Description

Displays the circuit ID sub-options that identify the VLANs on the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the circuit ID vlan_info for all VLANs:

```
X250e-48t.8 # show bootprelay dhcp-agent information circuit-id vlan-
information
Vlan            Circuit-ID vlan information string
----            ----------------------------------
Default         1
Mgmt            4095
v1              4094
v2              extreme123
Note: The full Circuit ID string has the form '<Vlan Info>-<Port Info>'
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show ip dad

show ip dad {[{{**vr**} *vr_name* {*ip_address*} | **vr all** | {**vlan**} *vlan_name*} {**tentative** | **valid** | **duplicate**} | {{**vr**} *vr_name*} *ip_address*]}

Description

Displays the configuration and run time status for the DAD feature on the specified IP interface.

Syntax Description

vr_name	Specifies a VR for which to display the DAD information.
ip_address	Specifies an IP address for which to display the DAD information.
vlan_name	Specifies a VLAN for which to display the DAD information.
tentative	Displays information for IP interfaces for which the status is up and the DAD check is incomplete.

valid	Displays information for IP interfaces that the DAD check has declared valid.
duplicate	Displays information for IP interfaces for which a duplicate IP address was detected.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The vr all option displays DAD information for all IP interfaces on the switch.

The DAD check takes very little time, so you might not see the T flag (tentative address) during normal operation.

A valid IP address displays the E (interface enabled) and U (interface up) flags, and switch processes can use the IP address. If a duplicate IP address is detected after an IP address is declared valid, the D flag (duplicate address detected) also appears.

An invalid IP address does not show the U flag and might not show the E flag. If a duplicate address was detected for the invalid address, the D flag appears.

The L flag indicates an IP address for a loopback VLAN. The DAD check does not run on loopback VLANs and always marks a loopback VLAN as valid.

Example

The following command displays the DAD feature status for all IP interfaces in the current VR context:

```
IPv4 Duplicate Address Detection
DAD Status                 : On
Max Solicitation Attempts  : 1
Virtual Router         Interface             Flags    IP Address
Conflict MAC         Failures
--------------------------------------------------------------------------------
--
VR-Default             loop158               -ELU    81.70.100.35
00:00:00:00:00:00       0
VR-Default             exL-v188              -E-U    13.224.90.90
00:04:96:12:ae:60       1
Flags : (D) Duplicate address detected, (T) Tentative address,
(E) Interface enabled, (L) Loopback enabled, (U) Interface up
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

show iparp

show iparp {*ip_addr* | *mac* | **vlan** *vlan_name* | **permanent**} {**vr** *vr_name*}

Description

Displays the IP Address Resolution Protocol (ARP) table. You can filter the display by IP address, MAC address, VLAN, or permanent entries.

Syntax Description

ip_addr	Specifies an IP address.
mac	Specifies a MAC address.
vlan_name	Specifies a VLAN name.
permanent	Specifies permanent entries.
vr_name	Specifies a VR or VRF.

Default

Show all entries, except for proxy entries.

Usage Guidelines

Displays the IP ARP table, including:

- IP address
- MAC address
- Aging timer value
- VLAN name, VLAN ID and port number
- Flags

If you do not specify a VR or VRF, the command applies to the current VR context.

The show output displays the following information:

ARP address check	Whether IP ARP checking is enabled or disabled. IP ARP checking verifies if the ARP request's source address is in the receiving interface's subnet.
ARP refresh	Whether ARP refresh is enabled or disabled. ARP refresh is performed when an ARP entry's age is three-fourths of the timeout value.

Distributed mode	Displays the configured and current states for the distributed IP ARP feature, which applies only to BlackDiamond 8800 series switches. The Configured field shows the feature state that will apply the next time the switch is restarted. The Current state shows the current state that was applied the last time the switch was restarted.
Dup IP Addr	IP addresses that have been used by other hosts on the network.
Dynamic entries	The number of dynamic (learned ARP) entries in the table.
Failed requests	The number of failed ARP requests sent (by this VR or VRF).
In Request	The number of ARP request packets received (by this VR or VRF).
In Response	The number of ARP reply packets received (by this VR or VRF).
Max ARP entries	Maximum ARP table size for the VR or VRF (each VR has its own ARP table).
Max ARP pending entries	Maximum number of incomplete (pending) ARP entries allowed in the table.
Out Request	The number of ARP request packets sent (by this VR or VRF).
Out Response	The number of ARP reply packets sent (by this VR or VRF).
Pending entries	The number of sent ARP requests that have not yet received a response.
Proxy Answered	The number of ARP requests answered by the ARP proxy.
RX Error	The number of incorrect ARP request and reply packets received. The malformed packets include the following errors: incorrect ARP op code, hardware address type is not Ethernet, the protocol address is not IP, and similar errors.
Static entries	The number of configured (static ARP) entries in the table.
Rejected Count	The number of rejected ARP request packets.
Rejected I/F	The VLAN on which the last rejected ARP request packet arrived.
Rejected IP	The source address for the last rejected ARP request. An example reason for an ARP request packet to be rejected is if the source address of the packet is not in the subnet.
Rejected Port	The port on which the last rejected ARP request packet arrived.
Timeout	Timeout value for a dynamic (learned) ARP entry.

Example

The following command displays the IP ARP table for the current VR or VRF context:

```
show iparp
```

The following is sample output for the command:

```
VR            Destination      Mac                Age  Static  VLAN
VID  Port
VR-Default    10.10.10.6       00:04:96:1f:a5:71    8      NO  bluered
4092  1
VR-Default    10.128.32.1      00:01:30:ba:6a:a0    0      NO  Default
4095
```

```
VR-Default    10.128.32.2      00:01:03:1c:ae:b0    5      NO  Default

```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

For BlackDiamond 8800 series switches only, additional display information was added to show the configured and current state of the distributed IP ARP feature in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show iparp distributed-mode statistics

show iparp distributed-mode statistics { **slot** [*slot* | **all**] }

Description

Displays distributed IP ARP statistics when this feature is activated on BlackDiamond X8, BlackDiamond 8000 c-, xl-, and xm-series modules.

Syntax Description

slot	Displays distributed IP ARP statistics for the specified slot.
all	Displays distributed IP ARP statistics for all slots.

Default

Displays distributed IP ARP statistics for all slots.

Usage Guidelines

When distributed IP ARP mode is active on a switch, this command allows you to view how many IP ARP entries are assigned to the ports on supported I/O modules. To turn on distributed IP ARP mode, use the configure iparp distributed-mode command.

You can use the information from this show command to determine if the total entries in use is close to or equal to the total entries supported by the I/O module hardware. When the total entries in use reaches the hardware limit, new entries must replace existing entries, and IP forwarding temporarily takes place using the slow path through software, rather than the fast path through hardware.

If the total entries in use gets close to the maximum entries supported by the hardware, consider moving IP hosts to a port or port group that is not so close to the hardware limit.

Example

The following command displays distributed IP ARP statistics for all slots:

```
Switch #  show iparp distributed-mode statistics
System- ||  # ARPs     GW's,
wide    ||  Native     IPv6,
Slot  Type                        ARPs    ||  To This    PBR,     Total

```

History

This command was first available in ExtremeXOS 12.5.

Platform Availability

This command is available only on BlackDiamond X8, BlackDiamond 8000 c-, xl-, and xm-series modules.

show iparp proxy

show iparp proxy {[*ipNetmask* | *ip_addr mask*]} {**vr** *vr_name*}

Description

Displays the proxy ARP table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_address	Specifies an IP address.
mask	Specifies a subnet mask.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

If no argument is specified, then all proxy ARP entries are displayed.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command displays the proxy ARP table:

```
show iparp proxy 10.1.1.5/24
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show iparp security

show iparp security {{**vlan**} *vlan_name*}

Description

Displays the IP ARP security violation information for one or all VLANs.

Syntax Description

vlan_name	Specifies a single VLAN for which to display security violation information.

Default

Shows security violation information for all VLANs except Mgmt.

Usage Guidelines

None.

Example

The following command displays IP ARP security violation information for all VLANs:

```
Switch.4 # show iparp security
Most Recent Violation
=========================================
Vlan               Security   Violations  Type   IP address
MAC          Port
================================================================================
========
Default            ----
test               ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

The following command displays IP ARP security violation information for VLAN Default:

```
Switch.5 # show iparp security "Default"
Most Recent Violation
=========================================
Vlan               Security   Violations  Type   IP address
MAC          Port
================================================================================
========
Default            ----
Security Setting: (G) Gratuitous ARP Protection
Violation Type  : (g) Gratuitous ARP Violation
```

History

This command was first available in ExtremeXOS 10.1.

The vr option was added in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show iparp stats

show iparp stats [[*vr_name* | **vr** {**all** | *vr_name*}] {**no-refresh**} | {**vr**} **summary**]
show iparp stats [**vlan** {**all** {**vr** *vr_name*}} | {**vlan**} *vlan_name*] {**no-refresh**}**show iparp stats ports** {**all** | *port_list*} {**no-refresh**}

Description

Displays the IP ARP statistics for one or more VRs, VLANs, or ports.

Syntax Description

vr_name	Specifies a VR or VRF for which to display statistics.
vlan_name	Specifies a VLAN for which to display statistics.
port_list	Specifies a list of ports for which to display statistics.
no-refresh	Requests a static display for statistics.

Default

Shows all VLAN ARP statistics in a dynamic display.

Usage Guidelines

VLAN statistics and totals are displayed for a single VR. When you display IPARP statistics for one or all VLANS, the display includes the specified VLANS for the specified VR. If you do not specify a VR for a VLAN report, the display includes the specified VLANS for the current VR context.

Counters displayed under Pending, Failed, ARP Unneeded are per VR and 'show iparp stats' includes VR-Management as well which typically skews the ARP statistics considerably. The Total entries counter reflects the total number of entries that are currently allocated and not freed. Hence they also include Failed entries as well as ARP unneeded entries. Dynamic Entries counter indicates the reachable entries. Periodically as part of cleanup, failed entries will go down and hence the total entries goes down. In certain scenarios they may help detect a problem (e.g. memory leak or an attack). Since the counters together accurately convey the state of the system, we choose to display these entries. "show iparp stats" shows totals across all VRs* including VR-Mgmt.

Example

The following command displays ARP table statistics for all VRs and VRFs:

```
Switch.1 # show iparp stats vr all
IP ARP VR Statistics                                  Wed Apr 07 15:30:49 2010
ARP Total    Dynamic     Static    Pending   Unneeded     Failed  (Rejected)
================================================================================

```

History

This command was first available in ExtremeXOS 12.4.2.

Platform Availability

This command is available on all platforms.

show ipconfig

show ipconfig {**ipv4**} {**vlan** *vlan_name*}

Description

Displays configuration information for one or more VLANs in the current VR context.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If no VLAN information is specified, then global IP configuration is displayed. Otherwise, specific VLAN information is displayed.

Example

```
* X250e-24p.20 # sho ipconfig
      Use Redirects : Disabled
      IpOption LSRR : Enabled
      IpOption SSRR : Enabled
        IpOption RR : Enabled
        IpOption TS : Enabled
        IpOption RA : Enabled
      Route Sharing : Disabled
  Originated Packets : Don't require ipforwarding
  IP Fwding into LSP : Disabled
 Max Shared Gateways : Current: 4  Configured: 4

      IRDP:
          Advertisement Address: 255.255.255.255
          Maximum Interval: 600
          Minimum Interval: 450     Lifetime: 1800    Preference: 0
  Interface    IP Address          Flags                  nSIA
  data2        200.0.0.1       /24 EUf---MPuRX--------    0
  inet         1.1.1.2         /24 EUf---MPuRX--------    0
  mytun        2.0.0.2         /24 EU----MPuRX--------    0
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

Platform Availability

This command is available on all platforms.

show iproute

show iproute {**ipv4**} {**priority** | **vlan** *vlan_name* | **permanent** | *ip_address netmask* | **summary**} {**multicast** | **unicast**} {**vr** *vrname*}}

Description

Displays the contents of the IP routing table or the route origin priority.

Syntax Description

priority	Displays the priority values for each route origin type.
vlan_name	Specifies a VLAN name.
permanent	Specifies permanent routing.
ip_address	Specifies an IP address.
netmask	Specifies a subnet mask.
summary	Displays summary information.
multicast	Displays information for IPv4 multicast routes only.
unicast	Displays information for IPv4 unicast routes only.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

A c flag in the Flags column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the f flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command example displays detailed information about all IP routing:

```
Switch.3 # show iproute
Ori  Destination        Gateway         Mtr  Flags        VLAN       Duration

```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

The c flag was added in ExtremeXOS 12.0.

The f flag was added in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show iproute mpls

show iproute mpls {**lsp** *lsp_name* | **vlan** *vlan_name* | **permanent** | *ip_address netmask* | **summary**} {**unicast**} {**vr** *vrname*}

Description

Displays the MPLS contents of the IP routing table.

Syntax Description

lsp_name	Specifies an LSP name.
vlan_name	Specifies a VLAN name.
permanent	Specifies permanent routing.
ip_address	Specifies an IP address.
netmask	Specifies a subnet mask.

unicast	Displays unicast routes.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

A c flag in the Flags column indicates a compressed route resulting from enabling compression using the enable iproute compression command. The total number of compressed routes is also shown.

All routes that are provided to the FIB display the f flag.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command example displays detailed information about all IP routing:

```
Switch.3 # show iproute mpls
```

History

This command was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show iproute mpls origin

show iproute mpls origin [**bgp** | **blackhole** | **bootp** | **direct** | **ebgp** | **ibgp** | **icmp** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external** | **mpls** {**signaling-protocol** [**ldp** | **rsvp-te** | **static**]} | **ospf** | **ospf-extern1** | **ospf-extern2** | **ospf-inter** | **ospf-intra** | **rip** | **static**] {**unicast**} {**vr** *vrname*}

Description

Displays the MPLS contents of the IP routing table for routes with the specified origin.

Syntax Description

bgp	Specifies BGP routes.
blackhole	Specifies blackhole routes.
bootp	Specifies BOOTP routes.
direct	Specifies direct routes.
ebgp	Specifies E-BGP routes.
ibgp	Specifies I-BGP routes.
icmp	Specifies ICMP routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.
mpls	Specifies MPLS routes. This option is available only on platforms that support the MPLS feature pack, which is described in the Feature Pack Features section of Feature License Requirements
signaling-protocol [ldp | rsvp-te | static]	Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the Feature Pack Features section of Feature License Requirements
ospf	Specifies OSPF routes.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies RIP routes.
static	Specifies static routes.
unicast	Displays unicast routes with the specified origin.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays all the MPLS routes that originate from BGP:

```
show iproute mpls origin bgp
```

History

This command was first available in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms that support MPLS.

show iproute origin

show iproute origin [**bgp** | **blackhole** | **bootp** | **direct** | **ebgp** | **embgp** | **ibgp** | **icmp** | **imbgp** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external** | **mbgp** | **mpls** {**signaling-protocol** [**ldp** | **rsvp-te** | **static**]} | **ospf** | **ospf-extern1** | **ospf-extern2** | **ospf-inter** | **ospf-intra** | **rip** | **static**] {**unicast**} {**vr** *vrname*}

Description

Displays the contents of the IP routing table for routes with the specified origin.

Syntax Description

bgp	Specifies BGP routes.
blackhole	Specifies blackhole routes.
bootp	Specifies BOOTP routes.
direct	Specifies direct routes.
ebgp	Specifies E-BGP routes.
embgp	Specifies EMBGP routes.
ibgp	Specifies I-BGP routes.
icmp	Specifies ICMP routes.
imbgp	Specifies IMBGP routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.

mbgp	Specifies MBGP routes.
mpls	Specifies MPLS routes. This option is available only on platforms that support the MPLS feature pack, which is described in the Feature Pack Features section of Feature License Requirements
signaling-protocol [ldp | rsvp-te | static]	Specifies an MPLS signaling protocol. This option is available only on platforms that support the MPLS feature pack, which is described in the Feature Pack Features section of Feature License Requirements
ospf	Specifies OSPF routes.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies RIP routes.
static	Specifies static routes.
unicast	Displays unicast routes with the specified origin.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays all the BGP routes:

```
show iproute origin bgp
```

History

This command was first available in ExtremeXOS 10.1.

The ipv4 keyword was added in ExtremeXOS 11.2.

The embgp, mbgp, and mpls options are added and the ipv4 and multicast options removed in ExtremeXOS 12.2.2.

Platform Availability

This command is available on all platforms.

show iproute reserved-entries

show iproute reserved-entries {**slot** *slot_num*}

Description

Displays the configured number of IPv4 and IPv6 routes reserved in the Longest Prefix Match (LPM) hardware table.

Syntax Description

slot_num	For BlackDiamond X8 and 8800 series switches and SummitStack only, this option displays the reservations for the specified slot.

Default

N/A.

Usage Guidelines

The IPv4 Routes column in the command output shows whether IPv4 routes are stored in internal or external LPM tables.

The "(or IPv6)" column in the command output shows whether IPv6 routes are stored in internal ("int.") or external ("ext.") LPM tables.

Use the following command to modify the configuration that the show iproute reserved-entries command displays:

```
        configure iproute reserved-entries [ <num_routes_needed> | maximum |
default ] slot [all | <slot_num>]
```

Example

The following command displays the reserved space for IP routes:

```
# show iproute reserved-entries
IPv4       # Reserved Routes            Minimum #
Slot  Type               Routes      IPv4   (or IPv6)            IPv4 Hosts
----  ----------------   --------   ------  ------------------   ----------
1     G48Pe              Internal      464  (   232) [default]           16
2     G48Pe              Internal      480  (   240) [maximum]            0
3     G48Ta              Internal    12240  (  6120) [default]           16
4     G48Ta              Internal    12256  (  6128) [maximum]            0
5     G8X                Internal      n/a
6
7     10G4Xa             Internal    10000  (  5000)                  2256
8     10G4Xa             Internal     9000  (  4500)                  3256
```

```
9     G48Xa             Internal     9000  (  4500)                   3256
10    8900-10G8X-xl     External   507872  (  int.) [default]        16384
Maximum supported # IPv4 (or IPv6) Reserved Routes:
"e"-series        Internal      480  (   240)
"a" and "c"       Internal    12256  (  6128)
"xl"-series       External   524256  (  int.)
IPv6: "xl"-series "int." indicates external table, up to 8192 IPv6 routes.
IPv6: "xl"-series "ext." indicates external table.
Note:  IPv4 Hosts can occupy unused HW Route table space,
unless # Reserved Routes is "maximum".
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on Black Diamond X8, BlackDiamond 8000 series modules, SummitStack, and on Summit X250e, X450a, X450e, X460, X480, X650, and X670 switch families.

show iproute reserved-entries statistics

show iproute reserved-entries statistics { **slot** *slot_num* }

Description

Displays the current usage statistics of the Longest Prefix Match (LPM) hardware table and the Layer3 hardware hash table by resource type.

Syntax Description

slot_num	For BlackDiamond 8800 series switches and SummitStack only, this option displays the statistics for the specified slot.

Default

N/A.

Usage Guidelines

This command shows the current number of IP routes and local and remote IPv4 hosts in the LPM hardware table. It also shows the number of IPv4 unicast, multicast, and IPv6 unicast entries in the Layer3 hardware hash table. The theoretical maximums for each individual resource type are shown at the bottom of the output. These maximum values cannot all be achieved simultaneously, and individual values might not be reached depending on the addresses or routes in use.

The ExtremeXOS software supports the coexistence of higher- and lower-capacity hardware in the same BlackDiamond 8800 chassis or Summit family switch stack. To allow for coexistence and

increased hardware forwarding, when the number of IPv4 routes exceeds 25,000, the lower-capacity hardware automatically transitions from using LPM routing to forwarding of individual remote hosts, also known as IP Forwarding Database (IP FDB) mode. Higher-capacity hardware continues using LPM routing. Lower capacity hardware operating in IP FDB mode will be indicated with a d flag in the output of show iproute reserved-entries statistics command, indicating that only direct routes are installed. For more information, see Coexistence of Higher- and Lower-Capacity Hardware in the *ExtremeXOS Concepts Guide*.

Example

The following command displays usage statistics for the LPM and Layer3 hardware tables:

```
# show iproute reserved-entries statistics
|-----In HW Route Table----|   |--In HW L3 Hash Table--|
# Used Routes   # IPv4 Hosts   IPv4   IPv4   IPv6  IPv4
Slot  Type              IPv4   IPv6    Local Remote   Local  Rem.   Loc.

```

History

This command was first available in ExtremeXOS 12.1.

Support for additional IPv4 local host entries was added with the distributed IP ARP feature for Black Diamond X8, BlackDiamond 8000 c- and xl-series modules in ExtremeXOS 12.5.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8000 series modules, SummitStack, and on Summit X250e, X440, X450a, X450e, X460, X480, X650, and X670 switch families.

show ipstats

show ipstats {ipv4} {vlan *name* **| vr** *vrname***}**

Description

Displays IP statistics for the switch CPU or for a particular VLAN.

Syntax Description

name	Specifies a VLAN name.
vrname	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU.

If you do not specify a VR or VRF, the command applies to the current VR context.

The fields displayed in the show ipstats command are defined in the following tables.

Table 50: Global IP Statistics Field Definitions

Field	Definition
InReceives	Total number of incoming IP packets processed by the CPU.
InUnicast	Total number of unicast IP packets processed by the CPU.
InBcast	Total number of broadcast IP packets processed by the CPU.
InMcast	Total number of multicast IP packets processed by the CPU.
InHdrEr	Total number of packets with an IP Header Error forwarded to the CPU.

Table 50: Global IP Statistics Field Definitions (continued)

Field	Definition
Bad vers	Total number of packets with a version other than IPv4 in the IP version field.
Bad chksum	Total number of packets with a bad IP checksum forwarded to the CPU.
Short pkt	IP packets that are too short.
Short hdr	IP packets with a header that is too short.
Bad hdrlen	IP packets with a header length that is less than the length specified.
Bad length	IP packets with a length less than that of the header.
InDelivers	IP packets passed to upper layer protocols.
Bad Proto	IP packets with unknown (not standard) upper layer protocol.
OutRequest	IP packets sent from upper layers to the IP stack.
OutDiscard	IP packets that are discarded due to lack of buffer space or the router interface being down, or broadcast packets with broadcast forwarding disabled.
OutNoRoute	IP packets with no route to the destination.
Forwards	ForwardOK and Fwd Err aggregate count.
ForwardOK	Total number of IP packets forwarded correctly.
Fwd Err	Total number of IP packets that cannot be forwarded.
NoFwding	Aggregate number of IP packets not forwarded due to errors.
Redirects	IP packets forwarded on the same network.
No route	Not used.
Bad TTL	IP packets with a bad time-to-live.
Bad MC TTL	IP packets with a bad multicast time-to-live.
Bad IPdest	IP packets with an address that does not comply with the IPv4 standard.
Blackhole	IP packets with a destination that is a blackhole entry.
Output err	Not used. This is the same as Fwd Err.
MartianSrc	IP packets with an invalid source address.

Table 51: Global ICMP Statistics Field Definitions

Field	Definition
OutResp	Echo replies sent from the CPU.
OutError	Redirect from broadcast or multicast source addresses.
InBadcode	Incoming ICMP packets with an invalid CODE value.
InTooshort	Incoming ICMP packets that are too short.
Bad chksum	Incoming ICMP packets with checksum errors.
In Badlen	Incoming ICMP packets with length errors.
echo reply (In/Out):	ICMP “echo reply” packets that are received and transmitted.

Table 51: Global ICMP Statistics Field Definitions (continued)

Field	Definition
destination unreachable (In/Out):	ICMP packets with destination unreachable that are received and transmitted.
port unreachable (In/Out):	ICMP packets with port unreachable that are received and transmitted.
echo (In/Out):	ICMP echo packets that are received and transmitted.

Table 52: Global IGMP Statistics Field Definitions

Field	Definition
Out Query	Number of IGMP query messages sent by the router.
Out Report	Number of reports sent on an active multicast route interface for reserved multicast addresses and for regular IGMP reports forwarded by the query router.
Out Leave	Number of IGMP out leave messages forwarded for IP multicast router interfaces.
In Query	Number of IGMP query messages received.
In Report	Number of IGMP report messages received (mostly from hosts).
In Leave	Number of IGMP leave messages received (mostly from hosts).
In Error	Number of IGMP packets with bad header fields or checksum failures.

Table 53: Router Interface Statistics Field Definitions

Field	Definition
Packets IN/OUT	Total number of IP packets received or transmitted on a VLAN router interface.
Octets IN/OUT	Total number of octets received or transmitted on a VLAN router interface.
Mcast packets IN/OUT	Total number of multicast packets received or transmitted on a VLAN router interface.
Bcast packets IN/OUT	Total number of broadcast packets received or transmitted on a VLAN router interface.
Errors IN/OUT	Total number of IP packets with errors received or transmitted on a VLAN router interface.
Discards IN/OUT	Total number of IP packets that cannot travel up to the CPU due to lack of buffer space.
Unknown Protocols IN/OUT	Total number of IP packets with unknown upper layer protocols received by the router interface.

Example

The following command displays IP statistics for the VLAN accounting:

```
show ipstats vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The keyword ipv4 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show udp-profile

show udp-profile {**vlan** *vlan-name* | {**policy**} *policy-name*}

Description

Displays UDP forwarding profiles.

Syntax Description

vlan-name	Specifies a VLAN.
policy-name	Specifies a UDP forwarding profile.

Default

If no VLAN or policy is specified, all configured profiles are displayed.

Usage Guidelines

UDP profiles can also be displayed by using the policy manager command show policy {<policy-name> | detail}. However, the format of the policy display is different than that for this command.

Example

The following command displays all the configured UDP forwarding profiles on the switch:

```
show udp-profile
```

The following is sample output:

```
UDP Profile Name: move_to7
Number of datagram forwarded: 181
Dest UDP Port: 67 Fwd to IP Addr: 20.0.0.5
Dest UDP Port: 67 Fwd to VLAN: to7
Applied to incoming traffic on VLANS:
to-mariner
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure bootprelay dhcp-agent information check

unconfigure bootprelay dhcp-agent information check

Description

Disables Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) checking.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

In some instances, a DHCP server may not properly handle a DHCP request packet containing a relay agent option. Use this command to disable the switch from preventing DHCP reply packets with invalid or missing relay agent options from being forwarded to the client.

To enable this check, use the following command:

```
configure bootprelay dhcp-agent information check
```

Example

The following command disables the DHCP relay agent option check:

```
unconfigure bootprelay dhcp-agent information check
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

unconfigure bootprelay dhcp-agent information circuit-id port-information

unconfigure bootprelay dhcp-agent information circuit-id port-information ports [*port_list* | **all**]

Description

Configures the circuit ID sub-option that identifies the specified ports to use the default value.

Syntax Description

port_list	Specifies a list of one or more ports that are to be configured to use the default value.
all	Specifies that all ports are to be configured to use the default value.

Default

The port_info is encoded as ((slot_number * 1000) + port_number). For example, if the DHCP request is received on port 3:12, the default circuit ID port_info value is 3012. On non-slot-based switches, the default circuit ID port_info value is simply the port number.

Usage Guidelines

None.

Example

The following command configures port 1:3 to use the default circuit ID port information value:

```
unconfigure bootprelay dhcp-agent information circuit-id port-information
ports 1:3
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

unconfigure bootprelay dhcp-agent information circuit-id vlan-information

unconfigure bootprelay dhcp-agent information circuit-id vlan-information {**vlan**} [*vlan_name*|**all**]

Description

Configures the circuit ID sub-option that identifies the specified VLANs to use the default value.

Syntax Description

vlan_name	Names a VLAN to be configured to use the default value.
all	Specifies that all VLANs are to be configured to use the default value.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures VLAN blue to use the default VLAN information for the circuit ID sub-option:

```
unconfigure bootprelay dhcp-agent information circuit-id vlan-information blue
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

unconfigure bootprelay dhcp-agent information option

unconfigure bootprelay dhcp-agent information option

Description

Disables the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82).

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

To enable the DHCP relay agent option (option 82), use the following command:

```
configure bootprelay dhcp-agent information option
```

Example

The following command disables the DHCP relay agent option:

```
unconfigure bootprelay dhcp-agent information option
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

unconfigure bootprelay dhcp-agent information policy

unconfigure bootprelay dhcp-agent information policy

Description

Unconfigures the Dynamic Host Configuration Protocol (DHCP) relay agent option (option 82) policy.

Syntax Description

This command has no arguments or variables.

Default

Replace.

Usage Guidelines

Use this command to unconfigure the policy for the relay agent.

Example

The following command unconfigures the DHCP relay agent option 82 policy:

```
unconfigure bootprelay dhcp-agent information policy
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

unconfigure bootprelay dhcp-agent information remote-id

unconfigure bootprelay dhcp-agent information remote-id {**vr** *vrid*}

Description

Configures the remote ID sub-option to the default value.

Syntax Description

vrid	Specifies the VR on which to configure the remote ID sub-option to the default value.

Default

The switch MAC address.

Usage Guidelines

None.

Example

The following command configures the remote ID sub-option to use the default value on the current VR:

```
configure bootprelay dhcp-agent information remote-id
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

unconfigure icmp

unconfigure icmp

Description

Resets all ICMP settings to the default values.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all ICMP settings to the default values.

```
unconfigure icmp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure iparp

unconfigure iparp

Resets the following to their default values:

- IP ARP timeout
- Maximum ARP entries
- Maximum ARP pending entries
- ARP checking
- ARP refresh

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets IP ARP timeout to its default value:

```
unconfigure iparp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

unconfigure iproute priority

unconfigure iproute {ipv4} priority [all | blackhole | bootp | ebgp | ibgp | icmp | isis | isis-level-1 | isis-level-1-external | isis-level-2 | isis-level-2-

external | mpls | ospf-as-external | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-intra | rip | static] {vr *vrname***}**

Description

Unconfigures the priority for all IP routes from one or all route origin types.

Syntax Description

all	Specifies all route origins.
blackhole	Specifies the blackhole route.
bootp	Specifies BOOTP.
ebgp	Specifies E-BGP routes
ibgp	Specifies I-BGP routes
icmp	Specifies ICMP.
isis	Specifies IS-IS and applies only to blackhole routes installed for summary addresses.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.
mpls	Specifies MPLS routing.
ospf-as-external	Specifies OSPF as External routing.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
rip	Specifies RIP.
static	Specifies static routes.
vrname	Specifies a VR or VRF name.

Default

N/A

Usage Guidelines

Default Route Priorities

The following table lists the default priorities that apply after you enter this command.

Route Origin	Priority
Direct	10
MPLS	20
Blackhole	50
Static	1100
ICMP	1200
EBGP	1700
IBGP	1900
OSPFIntra	2200
OSPFInter	2300
IS-IS	2350
IS-IS L1	2360
IS-IS L2	2370
RIP	2400
OSPFAsExt	3100
OSPF External 1	3200
OSPF External 2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500
BOOTP	5000

Example

The following command returns the IP route priority for all route origins to the default values:

```
unconfigure iproute priority all
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on all platforms.

unconfigure irdp

unconfigure irdp

Syntax Description

This command has no arguments or variables.

Description

Resets all router advertisement settings to the default values.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all router advertisement settings to the default values.

```
unconfigure irdp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure vlan subvlan-address-range

unconfigure vlan *vlan_name* **subvlan-address-range**

Description

Unconfigures subVLAN address ranges on each subVLAN to prohibit the entry of IP addresses from hosts outside of the configured range.

Syntax Description

vlan_name	Specifies a subVLAN name.

Default

N/A.

Usage Guidelines

This command removes a subVLAN address range. There is no error checking to prevent the configuration of overlapping subVLAN address ranges between multiple subVLANs. Doing so can result in unexpected behavior of ARP within the superVLAN and associated subVLANs.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

unconfigure vlan udp-profile

unconfigure vlan *vlan_name* **udp-profile**

Description

Removes any UDP forwarding profile from a VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

No UDP profiles are associated with the VLAN.

Usage Guidelines

None.

Example

The following command removes any UDP forwarding profile from the VLAN to-sales:

```
unconfigure vlan to-sales udp-profile
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms that use the Edge, Advanced Edge, or Core license. For information on the licenses available for each platform, see the ExtremeXOS Concepts Guide, Feature License Requirements

34 IPv6 Unicast Commands

This chapter describes commands for configuring and managing the following IPv6 features:

- IPv6 unicast routing
- Duplicate Address Detection (DAD)
- Route sharing

- Route compression
- IPv6 multinetting

For an introduction to these IPv6 features, see the ExtremeXOS Concepts Guide.

clear ipv6 dad

clear ipv6 dad {{**vr**} *vr_name* {*ipaddress*} | **vr all** | {**vlan**} *vlan_name*} {**counters**}

Description

Clears the counters for the DAD feature.

Syntax Description

vr_name	Specifies a VR for which to clear the counters.
ipaddress	Specifies an IPv6 address for which to clear the counters.
vlan_name	Specifies a VLAN for which to clear the counters.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The vr all option clears the DAD counters for all IPv6 interfaces on the switch.

This command clears the DAD failure counters and removes the MAC for the conflicting IPv6 address after the duplicate address condition has been resolved. The DAD counters and saved MAC addresses are not automatically cleared; they must be cleared with this command.

Example

The following command clears the DAD counters for all IPv6 interfaces in all VRs:

```
clear ipv6 dad vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

clear neighbor-discovery cache

clear neighbor-discovery cache ipv6 {*ipv6address* {**vr** *vr_name*} | **vlan** *vlan_name* | **vr** *vr_name*}

Description

Deletes a dynamic entry from the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command clears dynamic entries from the neighbor cache. The vr option is used to specify the VR or VRF on which the operation is performed. When this option is omitted it applies to current VR context.

When the ipv6address or vlan options are specified, only the entries with matching IPv6 addresses or that correspond to that VLAN are cleared.

Example

The following command clears all entries from the neighbor cache:

```
clear neighbor-discovery cache
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute add (IPV6)

configure iproute add *ipv6Netmask* [*ipv6Gateway* | *ipv6ScopedGateway*] {*metric*} {**vr** *vr_name*} {**multicast** | **multicast-only** | **unicast** | **unicast-only**}

Description

Adds an IPv6 static route to the routing table.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
ipv6Gateway	Specifies a gateway.
ipv6ScopedGateway	Specifies a scoped gateway.
metric	Specifies a cost metric.
vr_name	Specifies the VR or VRF to which the route is added.
multicast	Adds the specified route to the multicast routing table.
multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.

Default

If you do not specify a VR or VRF, the current VR context is used. If you do not specify a metric, then the default metric of 1 is used.

Usage Guidelines

Use a prefix length of 128 to indicate a host entry.

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

Example

The following command adds a static route to the routing table:

```
configure iproute add 2001:db8:0:1111::/64 fe80::1111%default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute add blackhole

configure iproute add blackhole {ipv6} [*ipv6Netmask*] **{vr** *vr_name*} **{multicast-only | unicast-only}**

Description

Adds a blackhole address to the routing table. All traffic destined for an unknown IPv6 destination is silently dropped.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
vr_name	Specifies the VR or VRF to which the route is added.
multicast-only	Specifies only multicast traffic for the route.
unicast-only	Specifies only unicast traffic for the route.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

A blackhole entry directs packets with a matching specified address prefix to be discarded. Blackhole entries are useful as a security measure or in special circumstances where a specific destination address must be discarded. Blackhole entries are treated like permanent entries in the event of a switch reset or power off/on cycle.

The packets are silently discarded. In other words, no ICMP message is sent to indicate that the packets are discarded.

Example

The following command causes packets with a destination address of 2001:db8::3452 to be silently discarded:

```
configure iproute add blackhole 2001:db8::3452/128
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute add blackhole ipv6 default

configure iproute add blackhole ipv6 default {**vr** *vr_name*} {**multicast-only** | **unicast-only**}

Description

Adds a default blackhole route to the routing table. All traffic destined for an unknown IPv6 destination is silently dropped.

Syntax Description

vr_name	Specifies the VR or VRF to which the route is added.
multicast-only	Specifies only multicast traffic for the route.
unicast-only	Specifies only unicast traffic for the route.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IPv6 destination, and a blackhole route is for discarding traffic destined to a specified IPv6 destination, a default blackhole route is for discarding traffic to the unknown IPv6 destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route's origin is "b" or "blackhole" and the gateway IPv6 address for this route is ::.

The packets are silently discarded. In other words, no ICMP message is sent to indicate that the packets are discarded.

Example

The following command adds a blackhole default route into the routing table:

```
configure iproute add blackhole ipv6 default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

configure iproute add default

configure iproute add default [*ipv6Gateway* | *ipv6ScopedGateway*] {**metric**} {**vr** *vr_name*} {**multicast-only** | **unicast-only**}

Description

Adds a default gateway to the routing table.

Syntax Description

ipv6Gateway	Specifies a VLAN gateway IPv6 address.
metric	Specifies a cost metric. If no metric is specified, the default of 1 is used.
ipv6ScopedGateway	Specifies a scoped gateway.
vr_name	Specifies the VR or VRF to which the route is added.

Default

If no metric is specified, the default metric of 1 is used. If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IPv6 interface. Use the unicast-only or multicast-only options to specify a particular traffic type. If not specified, both unicast and multicast traffic uses the default route.

Example

The following command configures a default route for the switch:

```
configure iproute add default 2001:db8::1234:5678
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute delete

configure iproute delete *ipv6Netmask* [*ipv6Gateway* | *ipv6ScopedGateway*] {**vr** *vr_name*}

Description

Deletes an IPv6 static route from the routing table.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
ipv6Gateway	Specifies a gateway.
ipv6ScopedGateway	Specifies a scoped gateway.
vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Use a prefix length of 128 to indicate a host entry.

Example

The following command deletes a static address from the routing table:

```
configure iproute delete 2001:db8:0:1111::/64 fe80::1111
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute delete blackhole

configure iproute delete blackhole [*ipv6Netmask*] {**vr** *vr_name*}

Description

Deletes a blackhole route from the routing table.

Syntax Description

ipv6Netmask	Specifies an IPv6 address/prefix length.
vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

A blackhole entry directs packets with a specified destination address to be discarded. Blackhole entries are useful as a security measure or in special circumstances where a specific destination address must be discarded. Blackhole entries are treated like permanent entries in the event of a switch reset or power off/on cycle.

Example

The following command deletes a blackhole route from the routing table for packets with a destination address of 2001:db8::3452, so the packets are no longer discarded:

```
configure iproute delete blackhole 2001:db8::3452/128
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute delete blackhole ipv6 default

configure iproute delete blackhole ipv6 default {**vr** *vr_name*}

Description

Deletes a default blackhole route from the routing table.

Syntax Description

vr_name	Specifies the VR or VRF from which the route is deleted.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

While a default route is for forwarding traffic destined to an unknown IPv6 destination, and a blackhole route is for discarding traffic destined to a specified IPv6 destination, a default blackhole route is for discarding traffic to the unknown IPv6 destination.

Using this command, all traffic with an unknown destination is discarded.

The default blackhole route is treated like a permanent entry in the event of a switch reset or power off/on cycle. The default blackhole route’s origin is “b” or “blackhole” and the gateway IPv6 address for this route is ::.

Example

The following command deletes a blackhole default route from the routing table:

```
configure iproute delete blackhole default
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute delete default

configure iproute delete default [*ipv6Gateway* | *ipv6ScopedGateway*] {**vr** *vr_name*}

Description

Deletes a default gateway from the routing table.

Syntax Description

ipv6Gateway	Specifies a VLAN gateway IPv6 address.
ipv6ScopedGateway	Specifies a scoped gateway.
vrname	Specifies the VR or VRF from which the route is deleted.

Default

If no metric is specified, the default metric of 1 is used. If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

Default routes are used when the router has no other dynamic or static route to the requested destination. A default gateway must be located on a configured IPv6 interface.

Example

The following command deletes a default route from the switch:

```
configure iproute delete default 2001:db8::1234:5678
```

History

This command was first available in ExtremeXOS 10.1.

Support for IPv6 was added in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute ipv6 priority

configure iproute ipv6 priority [**ripng** | **blackhole** | **icmp** | **static** | **ospfv3-intra** | **ospfv3-inter** | **ospfv3-as-external** | **ospfv3-extern1** | **ospfv3-extern2** | **isis-leve1-1** | **isis-level-2** | **isis-level-1-external** | **isis-level-2-external**] *priority* {**vr** *vr_name*}

Description

Changes the priority for all routes from a particular route origin.

Syntax Description

ripng	Specifies RIPng.
icmp	Specifies ICMP.
blackhole	Specifies the blackhole route.
static	Specifies static routes.
ospfv3-intra	Specifies OSPFv3 Intra routing.
ospfv3-inter	Specifies OSPFv3 Inter routing.
ospfv3-as-external	Specifies OSPFv3 AS External routing.
ospfv3-extern1	Specifies OSPFv3 External 1 routing.
ospfv3-extern2	Specifies OSPFv3 External 2 routing.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.

priority	Specifies a priority number in the range of 11 to 65534.
vr_name	Specifies a VR or VRF name.

Default

The following table lists the relative priorities assigned to routes depending upon the learned source of the route.

Table 54: Route Priorities

Route Origin	Priority
Direct	10
BlackHole	50
Static	1100
ICMP	1200
OSPF3Intra	2200
OSPF3Inter	2300
IS-IS L1	2360
IS-IS L2	2370
RIPg	2400
OSPFv3 ASExt	3100
OSPFv3 Extern1	3200
OSPFv3 Extern2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500

Usage Guidelines

Although these priorities can be changed, do not attempt any manipulation unless you are expertly familiar with the possible consequences. If you change the route priority, you must save the configuration and reboot the system.

Note

The priority for a blackhole route can not overlap with the priority of any other route origin.

Example

The following command sets the IPv6 route priority for static routing to 1200:

```
configure iproute ipv6 priority static 1200
```

History

This command was first available in ExtremeXOS 11.2.

The vr option was added in ExtremeXOS 12.1.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure iproute sharing max-gateways

configure iproute sharing max-gateways *max_gateways*

Description

Specifies the maximum number of gateways in each gateway set in the equal-cost multipath (ECMP) hardware table.

Syntax Description

max_gateways	Specifies the maximum ECMP gateways per IP destination supported in the switch hardware. The only values allowed are 2, 4, 8, 16 and 32.

Default

Four gateways.

Usage Guidelines

When IPv6 route sharing is enabled, the maximum number of gateways value represents the maximum number of next-hop gateways that can be used for communications with a destination subnet. Each gateway represents an alternative path to a subnet. The gateways can be defined with static routes, or they can be learned through the OSPFv3, or BGP protocols. The ExtremeXOS Release Notes lists the total number of route destinations and the total combinations of gateway sets that each platform can support with the different max-gateways option selections. For more information on selecting the maximum number of gateways and how this affects different platforms, see ECMP Hardware Table in the ExtremeXOS Concepts Guide. The value for max-gateways applies to both IPv4 and IPv6 on all VRs. The maximum number of gateways in each IPv4 or IPv6 gateway set can be 2, 4, 16, or 32.

Note
You must save the configuration and reboot the switch for the new value to take effect.

Example

The following command changes the maximum number of ECMP gateways per subnet or gateway set to eight: configure

```
iproute sharing max-gateways 8
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the platforms listed for the IPv4 or IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements”, except Summit X250e, X450e and X450a. If present in a SummitStack, any Summit X250e, X450e or X450a nodes ingressing IPv6 unicast packets will still perform unipath IPv6 forwarding in hardware.

configure ipv6 dad

configure ipv6 dad [**off** | **on** | {**on**} **attempts** *max_solicitations*] {{**vr**} *vr_name* | **vr all**}

Description

Configures the operation of the duplicate address detection (DAD) feature on the specified VR.

Syntax Description

max_solicitations	Specifies the number of times the DAD feature tests for a duplicate address. The range is 1 to 10, and the default value is 1.
vr_name	Specifies a VR on which to enable this feature.

Default

DAD status: On on VR-Default.

Maximum solicitations: 1 for VR-Default.

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

When the DAD feature is enabled, the switch checks for duplicate IPv6 addresses on the specified VR when an IPv6 interface is initialized, or when a DAD check is initiated with a CLI command. After initialization, and when this feature is off, the switch does not start DAD checks.

Changes to the number of solicitations configuration take affect the next time the DAD check is run.

By default, this command applies to the current VR context, if no VR name is specified. If vr all is specified, the command applies to all user VRs and VR-Default.

The DAD feature does not run on loopback VLANs.

Example

The following command enables the DAD feature on all user VRs and VR-Default:

```
configure ipv6 dad on vr all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

configure ipv6 hop-limit

configure ipv6 hop-limit *hop_limit* {**dont-specify-in-ra**} {{**vr**} *vr_name* | {**vlan**} *vlan_name* | **vlan all**}

Description

This command allows you to configure the ipv6 hop-limit. This hop-limit is used in all originated IPv6 packets, and (if router discovery is enabled) in outgoing Router Advertisement packets as well.

Syntax Description

hop-limit	Hop limit for all originated IPv6 packets, and the advertised hop-limit for Router Advertisements. Hop limit value between 1 and 255. Default is 64.
dont-specify-in-ra	Sets the advertised hop-limit in Router Advertisements to zero.
vr	Virtual router
vlan	VLAN
all	All VLANs.

Default

64.

Usage Guidelines

Use this command to configure the ipv6 hop-limit. The hop-limit is used in all originated IPv6 packets, and (if router discovery is enabled) in outgoing Router Advertisement packets as well.

0 is a special value used only in outgoing Router Advertisements to convey to the receiving hosts that the router has not specified a hop-limit value to be used when originating ipv6 packets. This can be configured by specifying the optional 'dont-specify-in-ra' keyword. The hop-limit can be configured for a vlan, all vlans in a Virtual Router, or all vlans in the system. By default, the hop-limit is configured for all vlans in the current Virtual Router context of the CLI.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

```
This command is available on all platforms.
```

configure neighbor-discovery cache add

configure neighbor-discovery cache {**vr** *vr_name*} **add** [*ipv6address* | *scoped_link_local*] *mac*

Description

Adds a static entry to the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
scoped_link_local	Specifies a scoped, link-local address.
mac	Specifies a MAC address.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

This command adds static entries to the neighbor cache.

Example

The following command adds a static entry to the neighbor cache:

```
configure neighbor-discovery cache add fe80::2315%default 00:11:22:33:44:55
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure neighbor-discovery cache delete

configure neighbor-discovery cache {**vr** *vr_name*} **delete** [*ipv6address* | *scoped_link_local*]

Description

Deletes a static entry from the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
ipv6address	Specifies an IPv6 address.
scoped_link_local	Specifies a scoped, link-local address.

Default

If you do not specify a VR or VRF, the current VR context is used.

Usage Guidelines

This command deletes static entries from the neighbor cache.

Example

The following command deletes a static entry from the neighbor cache:

```
configure neighbor-discovery cache delete fe80::2315%default
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure neighbor-discovery cache max_entries

configure neighbor-discovery cache {**vr** *vr_name*} **max_entries** *max_entries*

Description

Configures the maximum allowed IPv6 neighbor entries.

Syntax Description

vr_name	Specifies a VR or VRF.
max_entries	Specifies the maximum allowed IPv6 neighbor entries. The range is 1 to 20480.

Default

4096.

Usage Guidelines

None.

Example

The following command sets the maximum allowed IPv6 neighbor entries to 512:

```
configure neighbor-discovery cache max_entries 512
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure neighbor-discovery cache max_pending_entries

configure neighbor-discovery cache {**vr** *vr_name*} **max_pending_entries** *max_pending_entries*

Description

Configures the maximum number of pending IPv6 neighbor entries.

Syntax Description

vr_name	Specifies a VR or VRF.
max_entries	Specifies the maximum number of pending IPv6 neighbor entries. The range is 1 to 4096.

Default

1024.

Usage Guidelines

None.

Example

The following command sets the maximum number of pending IPv6 neighbor entries to 2056:

```
configure neighbor-discovery cache max_pending_entries 2056
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure neighbor-discovery cache timeout

configure neighbor-discovery cache {**vr** *vr_name*} **timeout** *timeout*

Description

Configures a timeout value for entries in the neighbor cache.

Syntax Description

vr_name	Specifies a VR or VRF.
timeout	Specifies a timeout value for neighbor cache entries. The range is 1 to 32767 minutes.

Default

20 minutes.

Usage Guidelines

None.

Example

The following command configures the neighbor cache timeout for 30 minutes:

```
configure neighbor-discovery cache timeout 30
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery add prefix

configure vlan *vlan_name* **router-discovery** {**ipv6**} **add prefix** *prefix*

Description

Adds a prefix to the router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies the prefix to add.

Default

N/A.

Usage Guidelines

This command adds a prefix to the router advertisement messages for the VLAN. Prefixes defined with this command are only included in the router advertisement messages and have no operational impact on VLANs.

To configure the parameters for this prefix, use the following command:

```
configure vlan <vlan_name> router-discovery {ipv6} set prefix
<prefix> [autonomous-flag <auto_on_off> | onlink-flag <onlink_on_off> |
preferred-lifetime <preflife> |valid-lifetime <validlife>]
```

Example

The following command adds the prefix 2001:db8:3456::/64 for the VLAN top_floor:

```
configure vlan top_floor router-discovery add prefix 2001:db8:3456::/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure vlan router-discovery delete prefix

configure vlan *vlan_name* **router-discovery** {**ipv6**} **delete prefix** [*prefix* | **all**]

Description

Deletes prefixes from the router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies the prefix to delete.
all	Specifies to delete all prefixes.

Default

N/A.

Usage Guidelines

This command deletes previously defined router advertisement prefixes.

Example

The following command deletes the prefix 2001:db8:3161::/64 for the VLAN top_floor:

```
configure vlan top_floor router-discovery delete 2001:db8:3161::/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery default-lifetime

configure vlan *vlan_name* **router-discovery** {**ipv6**} **default-lifetime** *defaultlifetime*

Description

Configures the router lifetime value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
defaultlifetime	Specifies the router lifetime. Range is 0, max-interval to 9000 seconds.

Default

1800 seconds

Usage Guidelines

This command configures the router lifetime value to be included in the router advertisement messages.

The value is specified in seconds and is either 0, or between max-interval and 9000 seconds. A value of 0 indicates that the router is not to be used as a default router.

After a host sends a router solicitation, and receives a valid router advertisement with a non-zero router lifetime, the host must desist from sending additional solicitations on that interface, until an event such as re-initialization takes place.

Example

The following command configures the default-lifetime to be 3600 seconds for the VLAN top_floor:

```
configure vlan top_floor router-discovery default-lifetime 3600
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery link-mtu

configure vlan *vlan_name* **router-discovery** {**ipv6**} **link-mtu** *linkmtu*

Description

Configures the link MTU value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
linkmtu	Specifies the link MTU. Range is 0 to 9216.

Default

0, meaning that no link MTU information is sent.

Usage Guidelines

This command configures the link MTU placed into the router advertisement messages. Advertisement of the MTU helps ensure use of a consistent MTU by hosts on the VLAN.

The minimum value is 0. The maximum value is 9216. The default value is 0, which means that no link MTU information is included in the router discovery messages.

Example

The following command configures the link MTU to be 5126 for the VLAN top_floor:

```
configure vlan top_floor router-discovery link-mtu 5126
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery managed-config-flag

```
configure vlan <vlan_name> router-discovery {ipv6} managed-config-flag
<on_off>
```

Description

Configures the managed address configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
on_off	Specifies setting the flag to on or off.

Default

Off.

Usage Guidelines

This command configures the contents of the managed address configuration flag in the router advertisement messages.

A value of on tells hosts to use the administered (stateful) protocol (DHCP) for address autoconfiguration in addition to any addresses autoconfigured using stateless address autoconfiguration. A value of off tells hosts to use stateless address autoconfiguration. If this command is not entered, the default value is off.

Example

The following command configures the managed address configuration flag to be on for the VLAN top_floor:

```
configure vlan top_floor router-discovery managed-config-flag on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery max-interval

configure vlan *vlan_name* **router-discovery** {**ipv6**} **max-interval** *maxinterval*

Description

Configures the maximum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
maxinterval	Specifies the maximum time between advertisements, in seconds. Range is 4 to 1800

Default

600 seconds.

Usage Guidelines

This command configures the maximum amount of time before an unsolicited router advertisement message is advertised over the links corresponding to the VLAN.

Example

The following command configures the max-interval to be 300 seconds for the VLAN top_floor:

```
configure vlan top_floor router-discovery max-interval 300
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery min-interval

configure vlan *vlan_name* **router-discovery** {**ipv6**} **min-interval** *mininterval*

Description

Configures the minimum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
mininterval	Specifies the minimum time between advertisements, in seconds. Range is 3 to 1350 (see guidelines).

Default

200 seconds, or max-interval * .33 (see guidelines)

Usage Guidelines

This command configures the minimum amount of time before an unsolicited router advertisement message is advertised over the links corresponding to the VLAN.

The minimum value is 3 seconds. The maximum time is (.75 * max-interval) seconds. If you do not explicitly set this value, the min-interval value is reset whenever the max-interval is configured. Min-interval will then be dynamically adjusted to .33 times the max-interval.

Example

The following command configures the min-interval to be 300 seconds for the VLAN top_floor:

```
configure vlan top_floor router-discovery min-interval 300
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery other-config-flag

```
configure vlan <vlan_name> router-discovery {ipv6} other-config-flag <on_off>
```

Description

Configures the other stateful configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
on_off	Specifies setting the flag to on or off.

Default

Off.

Usage Guidelines

This command configures the contents of the other stateful configuration flag in the router advertisement messages.

When set to on, hosts use the administered (stateful) protocol (DHCP) for autoconfiguration of other (non-address) information. If this command is not entered, the default value is off.

Example

The following command configures the other stateful configuration flag to be on for the VLAN top_floor:

```
configure vlan top_floor router-discovery other-config-flag on
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery reachable-time

```
configure vlan <vlan_name> router-discovery {ipv6} reachable-time
<reachabletime>
```

Description

Configures the reachable time value in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
reachabletime	Specifies the reachable time value in advertisements, in milliseconds. Range is 0 to 3,600,000 (one hour).

Default

30,000 milliseconds.

Usage Guidelines

The reachable time is the time, in milliseconds, that a node assumes a neighbor is reachable after having received a reachability confirmation. A value of 0 means the time is unspecified by this router. The maximum value is 3,600,000 (1 hour).

Example

The following command configures the reachable time to be 3,600,000 milliseconds for the VLAN top_floor:

```
configure vlan top_floor router-discovery reachable-time 3600000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure vlan router-discovery retransmit-time

```
configure vlan <vlan_name> router-discovery {ipv6} retransmit-time
<retransmittime>
```

Description

Configures the retransmit time value in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
retransmittime	Specifies the reachable time value in advertisements, in milliseconds. Range is 0 to 4,294,967,295 (approximately 50 days).

Default

1,000 milliseconds.

Usage Guidelines

This command configures the retransmit time value in the router advertisement messages.

The retransmit time, in milliseconds, is the time between retransmitted neighbor solicitation messages. A value of 0 means the value is unspecified by this router. The maximum value is 4,294,967,295.

Example

The following command configures the retransmit time to be 604,800,000 milliseconds (one week) for the VLAN top_floor:

```
configure vlan top_floor router-discovery retransmit-time 604800000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

configure vlan router-discovery set prefix

configure vlan *vlan_name* **router-discovery** {**ipv6**} **set prefix** *prefix* [**autonomous-flag** *auto_on_off* | **onlink-flag** *onlink_on_off* | **preferred-lifetime** *preflife* | **valid-lifetime** *validlife*]

Description

Sets the parameters for a prefix in the router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
prefix	Specifies which prefix's parameters to set.
auto_on_off	Specifies the autonomous flag.
onlink_on_off	Specifies the on link flag.
preflife	Specifies the preferred lifetime in seconds. Maximum value is 4,294,967,295.
validlife	Specifies the valid lifetime in seconds. Maximum value is 4,294,967,295.

Default

The prefix parameter defaults are:

- Valid lifetime—2,592,000 seconds (30 days)
- On-link flag—on
- Preferred lifetime—604,800 seconds (7 days)
- Autonomous flag—on

Usage Guidelines

This command configures the attributes associated with the specified prefix.

The autonomous flag option modifies the autonomous flag of the prefix. The autonomous flag value specifies whether the prefix can be used for autonomous address configuration (on) or not (off).

The onlink flag option modifies the on link flag of the prefix. The on link flag specifies whether the prefix can be used for on link determination (on) or not (off). The default value of the on link flag is on.

The preferred lifetime option modifies the preferred lifetime of a prefix. The preferred lifetime value is the time (from when the packet is sent) that addresses generated from the prefix via stateless address autoconfiguration remain preferred. The maximum value is 4,294,967,295. The default value is 604,800 seconds (7 days).

The valid lifetime option modifies the valid lifetime of a prefix. The valid lifetime value is the time (from when the packet was sent) that the prefix is valid for the purpose of on-link determination. The maximum value is a 4,294,967,295. The default value is 2,592,000 seconds (30 days).

Example

The following command sets the on link parameter of the prefix 2001:db8:3161::/64 to off, for the VLAN top_floor:

```
configure vlan top_floor router-discovery set prefix 2001:db8:3161::/64
onlink-flag off
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure tunnel ipaddress

configure tunnel *tunnel_name* **ipaddress [ipv6-link-local | {eui64}** *ipv6_address_mask* **]**

Description

Configures an IPv6 address/prefix on a tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
eui64	Specifies an EUI64 interface identifier for the lower 64 bits of the address.
ipv6_address_mask	Specifies an IPv6 address / IPv6 prefix length.
ipv6-link-local	Specifies the link-local address for a tunnel.

Default

N/A.

Usage Guidelines

This command will configure an IPv6 address/prefix route on the specified tunnel.

6to4 tunnels must follow the standard address requirement. The address must be of the form 2002:<IPv4_source_endpoint>::/16, where <IPv4_source_endpoint> is replaced by the IPv4 source address of the endpoint, in hexadecimal, colon separated form. For example, for a tunnel endpoint located at IPv4 address 10.20.30.40, the tunnel address would be 2002:a14:1e28::/16. In hex, 10 is a, 20 is 14, 30 is 1e and 40 is 28.

6in4 tunnels have no restrictions on their address format or prefix allocations.

Note

This command does not work for GRE tunnels. The following error message is displayed:

```
Error: IPv6 addresses can not be configured on GRE type tunnels!
```

Example

The following command configures the 6in4 tunnel link39 with the IPv6 link-local address:

```
configure tunnel link39 ipaddress ipv6-link-local
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

create tunnel 6to4

create tunnel *tunnel_name* **6to4 source** *source-address*

Description

Creates an IPv6-to-IPv4 (6to4) tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
source-address	Specifies an IPv4 address for the tunnel.

Default

N/A.

Usage Guidelines

This command will create a new IPv6-to-IPv4 (also known as a 6to4 tunnel), and add it to the system. A maximum of 1 6to4 tunnel can be configured on any particular VR.

The tunnel name must be unique and cannot overlap the same name space as VLANs, other tunnels, or VRs. The name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

The source address of the tunnel must be one of the IPv4 addresses already configured on the switch. You cannot remove an IPv4 address from the switch if a tunnel that uses it still exists.

Example

The following command creates the 6to4 tunnel link35 with source address 192.168.10.1:

```
create tunnel link35 6to4 source 192.168.10.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

New create tunnel gre destination source

create tunnel *tunnel_name* **gre destination** *destination-address* **source** *source-address*

Description

Allows switch administrators to add a GRE tunnel. This command is in-line with adding an ipv6-in-ipv4 tunnel.

Syntax Description

gre	Generic Routing Encapsulation tunnel
destination-address	IPv4 destination address of the tunnel
source-address	IPv4 source address of the tunnel

Default

No GRE tunnels exist in the system.

Usage Guidelines

Use this command to add a GRE tunnel.

Example

```
create tunnel myGREtunnel gre destination 10.0.0.2 source 10.0.0.1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on Summit X460, X480, X650, X670, and E4G, SummitStack, BD8800 (G96T-c, 10G24X-c, G48T-XL, G48X-XL, 10G8X-XL, and 40G6x-xm), and BlackDiamond X8 (all I/O cards).

create tunnel ipv6-in-ipv4

```
create tunnel <tunnel_name> ipv6-in-ipv4 destination <destination-address>
source <source-address>
```

Description

Creates an IPv6-in-IPv4 (6in4) tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
source-address	Specifies an IPv4 address for the tunnel.

Default

N/A.

Usage Guidelines

This command will create a new IPv6-in-IPv4 (otherwise known as a configured tunnel or a 6in4 tunnel) and add it to the system. A maximum of 255 tunnels (including one 6to4 tunnel) can be configured on the system.

The tunnel name must be unique and cannot overlap the same name space as VLANs, other tunnels, or VRs. The name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

The source address of the tunnel must be one of the IPv4 addresses already configured on the switch. You cannot remove an IPv4 address from the switch if a tunnel is still exists that uses it.

Example

The following command creates the 6in4 tunnel link39 with destination address 10.10.10.10 and source address 192.168.10.15:

```
create tunnel link39 ipv6-in-ipv4 destination 10.10.10.10 source 192.168.10.15
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

delete tunnel

delete tunnel *tunnel_name*

Description

Deletes an IPv6 tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

This command will destroy a previously created tunnel. The command acts on either a 6to4 or a 6in4 tunnel. When the tunnel interface is removed, all dynamic routes through that interface are purged from the system. The configured static routes are removed from the hardware tables and become inactive.

Example

The following command deletes the tunnel link39:

```
delete tunnel link39
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

disable icmp redirects ipv6 fast-path

disable icmp redirects ipv6 fast-path

Description

When disabled (default), only slow path packets (packets that cannot be forwarded by hardware) may trigger ICMP redirects.

Syntax Description

fast-path	Only slow path packets (packets that cannot be forwarded by hardware) may trigger ICMP redirects.

Default

Disabled.

Usage Guidelines

Use this command so that only slow path packets (packets that cannot be forwarded by hardware) may trigger ICMP redirects.

Example

The enabled or disabled setting is displayed in the CLI command show ipconfig ipv6.

```
BD-8810.1 # show ipconfig ipv6
Route Sharing               : Disabled
ICMP Redirect for Fast Path : Enabled
Max Shared Gateways         : Current: 4   Configured: 4

Interface              IPv6 Prefix
Flags
v1                     2001::1/24                                      -EUf---R-
v1                     fe80::204:96ff:fe1e:ec00%v1/64                  -EUfP--R-

BD-8810.2 #
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

disable ipforwarding ipv6

disable ipforwarding ipv6 {**vlan** *vlan_name* | **tunnel** *tunnel_name* | **vr** *vr_name*}

Description

Disables routing for one or all interfaces. If no argument is provided, disables routing for all interfaces on the current VR or VRF.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
vr_name	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

When new IPv6 interfaces are added, IPv6 forwarding is disabled by default.

Extreme Networks switches have a single hardware control per VLAN for IPv6 forwarding of IPv4 and IPv6 unicast packets. Therefore, enabling IPv6 forwarding on a VLAN also enables IPv4 hardware forwarding on that VLAN.

Example

The following command disables forwarding of IPv6 traffic for a VLAN named accounting:

```
disable ipforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable iproute ipv6 compression

disable iproute ipv6 compression {**vr** *vr_name*}

Description

This command disables IPv6 route compression.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Vrname—current CLI context VR

By default, IPv6 route compression is disabled for all address families and VRs.

Usage Guidelines

This command disables IPv6 route compression for the IPv6 address family and VR. This command decompresses previously compressed prefixes in the IPv6 prefix database.

Example

The following example disables IPv6 route compression for the IPv6 address family and the VR of the current CLI context.

```
disable iproute ipv6 compression
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

New disable iproute ipv6 sharing

disable iproute ipv6 sharing {{**vr**} *vr_name*} | {{**vr**} **all**}}

Description

This command disables IPv6 route sharing.

Syntax Description

vr_name	Specifies a VR or VRF.
all	Specifies all VR or VRF.

Default

vrname—current CLI context VR

By default, IPv6 route sharing is disabled.

Usage Guidelines

This command disables IPv6 route sharing for the IPv6 address family and VR.

Example

The following example disables IPv6 route sharing for the IPv6 address family and the VR of the current CLI context.

```
disable iproute ipv6 sharing
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

The ability to enable and disable ECMP for IPv6 is now supported for all Summit and BlackDiamond, except for the Summit X440, X250e, X450e and X450a.

disable neighbor-discovery refresh

disable neighbor-discovery {**vr** *vr_name*} **refresh**

Description

Prevents the IPv6 neighbor cache from refreshing an entry before the timeout period expires.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

None.

Example

The following command disables the refresh of neighbor discovery cache entries:

```
disable neighbor-discovery refresh
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable router-discovery

disable router-discovery {**ipv6**} **vlan** *vlan_name*

Description

Disables router discovery advertisements on the VLAN and the processing of router discovery messages.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables router discovery for the VLAN top_floor:

```
disable router-discovery vlan top_floor
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

 disable tunnel

disable {tunnel} *tunnel_name*

Description

Allows GRE tunnels to be disabled.

Syntax Description

tunnel_name	GRE tunnel name

Default

Enabled.

Usage Guidelines

Use this command to disable GRE tunnels.

Example

```
disable myGREtunnel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on Summit X460, X480, X650, X670, and E4G, SummitStack, BD8800 (G96T-c, 10G24X-c, G48T-XL, G48X-XL, 10G8X-XL, and 40G6x-xm), and BlackDiamond X8 (all I/O cards).

enable icmp redirects ipv6 fast-path

enable icmp redirects ipv6 fast-path

Description

When enabled, IPv6 packets forwarded by hardware (fast path) may trigger ICMP redirects.

Syntax Description

fast-path	IPv6 packets forwarded by hardware may trigger ICMP redirects

Default

Disabled.

Usage Guidelines

Use this command to trigger ICMP redirects when IPv6 packets are forwarded by hardware (fast-path).

Example

The enabled or disabled setting is displayed in the CLI command show ipconfig ipv6.

```
BD-8810.1 # show ipconfig ipv6
Route Sharing               : Disabled
ICMP Redirect for Fast Path : Enabled
Max Shared Gateways         : Current: 4   Configured: 4

Interface              IPv6 Prefix
Flags
v1                     2001::1/24                                    -EUf---R-
v1                     fe80::204:96ff:fe1e:ec00%v1/64                -EUfP--R-
Flags : D - Duplicate address detected on VLAN, T - Tentative address
E - Interface enabled, U - Interface up, f - IPv6 forwarding enabled,
i - Accept received router advertisements enabled,
R - Send redirects enabled, r - Accept redirects enabled
P - Prefix address
BD-8810.2 #
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on all platforms.

enable ipforwarding ipv6

enable ipforwarding ipv6 {**vlan** *vlan_name* | **tunnel** *tunnel_name* | **vr** *vr_name*}

Description

Enables IPv6 routing VLANs. If no argument is provided, enables IPv6 routing for all VLANs and tunnels that have been configured with an IPv6 address on the current VR or VRF.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
vr_name	Specifies a VR or VRF.

Default

Disabled.

Usage Guidelines

When new IPv6 interfaces are added, IPv6 forwarding is disabled by default.

Extreme Networks switches have a single hardware control per VLAN for forwarding of IPv4 and IPv6 unicast packets. Therefore, enabling IPv6 forwarding on a VLAN also enables IPv4 hardware forwarding on that VLAN.

Example

The following command enables forwarding of IPv6 traffic for all VLANs in the current VR context with IPv6 addresses:

```
enable ipforwarding ipv6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

New enable ipforwarding

enable ipforwarding

Description

Allows switch administrators to enable IPv4 forwarding on a GRE tunnel. This command is in-line with the existing command to configure IPv4 forwarding on a VLAN.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to enable IPv4 forwarding on a GRE tunnel.

Example

```
enable ipforwarding ipv4 myGREtunnel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on Summit X460, X480, X650, X670, and E4G, SummitStack, BD8800 (G96T-c, 10G24X-c, G48T-XL, G48X-XL, 10G8X-XL, and 40G6x-xm), and BlackDiamond X8 (all I/O cards).

enable iproute ipv6 compression

This command enables IPv6 route compression.

```
enable iproute  ipv6  compression {vr <vrname>}
```

Syntax Description

vrname	Specifies a VR or VRF.

Default

Vrname—current CLI context VR

Usage Guidelines

This command enables IPv6 route compression for the VR. This command applies a compression algorithm to each IPv6 prefix in the IPv6 prefix database.

Example

The following example enables IPv6 route compression in the current VR context.

```
enable iproute ipv6 compression
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

New enable iproute ipv6 sharing

enable iproute ipv6 sharing {{**vr**} *vr_name*} | { {**vr**} **all**}}

Description

This command enables IPv6 route sharing.

Syntax Description

vrname	Specifies a VR or VRF.
all	Specifies all VR or VRF.

Default

vrname—current CLI context VR

By default, IPv6 route sharing is disabled.

Usage Guidelines

This command enables IPv6 route sharing for the IPv6 address family and VR.

Example

The following example enables IPv6 route sharing for the IPv6 address family and the VR of the current CLI context.

```
enable iproute ipv6 sharing
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements,” except Summit X250e, X450e and X450a.

The ability to enable and disable ECMP for IPv6 is now supported for all Summit and BlackDiamond, except for the Summit X440, X250e, X440, X450e and X450a. If present in a SummitStack, any Summit X250e, X440, X450e or X450a nodes ingressing IPv6 unicast packets will still perform unipath IPv6 forwarding in hardware.

enable neighbor-discovery refresh

enable neighbor-discovery {**vr** *vr_name*} **refresh**

Description

Enables the IPv6 neighbor cache to refresh each entry before the timeout period expires.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

Enabled.

Usage Guidelines

None.

Example

The following command enables the refresh of neighbor discovery cache entries:

```
enable neighbor-discovery refresh
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable router-discovery

enable router-discovery {**ipv6**} **vlan** *vlan_name*

Description

Enables router discovery advertisements on the VLAN and the processing of router discovery messages.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command is only valid when the specified VLAN has an IPv6 address associated with it. After IPv6 Router Discovery is enabled on a VLAN, router advertisement messages are regularly sent on all ports associated with the VLAN.

Example

The following command enables router discovery for the VLAN top_floor:

```
enable router-discovery vlan top_floor
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable tunnel

enable {tunnel} *tunnel_name*

Description

Allows GRE tunnels to be enabled.

Syntax Description

tunnel_name	GRE tunnel name

Default

Enabled.

Usage Guidelines

Use this command to enable GRE tunnels.

Example

```
enable myGREtunnel
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on Summit X460, X480, X650, X670, and E4G, SummitStack, BD8800 (G96T-c, 10G24X-c, G48T-XL, G48X-XL, 10G8X-XL, and 40G6x-xm), and BlackDiamond X8 (all I/O cards).

rtlookup

rtlookup [*ipaddress* | *ipv6address*] { **unicast** | **multicast** | **vr** *vr_name*}

Description

Displays the available routes to the specified IPv6 address.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
unicast	Displays the routes from the unicast routing table in the current router context.
multicast	Displays the routes from the multicast routing table in the current router context.
vr_name	Specifies the VR or VRF for which to display the route.

Default

N/A.

Usage Guidelines

None.

Example

The following command performs a look up in the route table to determine the best way to reach the specified IPv6 address:

```
rtlookup 2001:db8::ef80:2525:1023:5213 unicast
```

History

This command was first available in ExtremeXOS 10.1.

The xhostname option was removed in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

The unicast and multicast options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

rtlookup rpf

rtlookup [*ipaddress* | *ipv6address*] **rpf** {**vr** *vr_name*}

Description

Displays the RPF for a specified multicast source.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
rpf	Selects the RPF for the specified multicast source.
vr_name	Specifies the VR or VRF for which to display the route.

Default

vr_name is the VR of the current CLI context.

Usage Guidelines

None.

Example

The following example displays the RPF lookup for a multicast source through VR-Default:

```
rtlookup 2001db8::ef80:2525:1023:5213 rpf vr vr-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

run ipv6 dad

run ipv6 dad [{**vlan**} *vlan_name* | {{**vr**} *vr_name*} *ipaddress*]

Description

Runs the DAD check on the specified IPv6 interface for which the DAD feature is enabled.

Syntax Description

vlan_name	Specifies a VLAN on which to run the test.
vr_name	Specifies a VR on which to run the test.
ipaddress	Specifies an IPv6 address for which to run the test.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

To run the test, you must specify a VLAN name or a specific IPv6 address. To support the test, the DAD feature must be enabled on the parent VR for the specified VLAN or IPv6 interface.

This command is ignored for the following conditions:

- The specified IP address is in tentative state
- DAD is configured to be off
- The host VLAN is disabled
- Loopback mode is enabled on the host VLAN
- DAD is already running due to interface initialization or a previous issue of this command
- The host VLAN belongs to virtual router VR-Mgmt

If a duplicate address is detected during the test, the event is logged and the address remains valid if it was already valid. If the address was not already valid, the event is logged and the duplicate address transitions to duplicate state. If no duplicate IPv6 address is detected, the specified IPv6 interface transitions to or remains in the up state.

Example

The following command runs the DAD check on the IPv6 interfaces in VLAN vlan1:

```
run ipv6 dad vlan1
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

show ipconfig ipv6

show ipconfig ipv6 {**vlan** *vlan_name* | **tunnel** *tunnel_name*}

Description

Displays configuration information for one or more interfaces in the current VR context.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

If no interface is specified, then global IPv6 configuration is displayed. Otherwise, specific interface(s) will be displayed. Global IPv6 configuration information includes:

- IPv6 address/netmask/etc.
- IPv6 forwarding information / IPv6 multicast forwarding information

Example

The following command displays configuration information on a VLAN named accounting:

```
show ipconfig ipv6 vlan accounting
```

The current and configured values for **max-gateways** now apply to IPv6 gateway sets as well as IPv4, so these values are added to the output of `show ipconfig ipv6`.

```
show ipconfig ipv6
Route Sharing               : Disabled
ICMP Redirect for Fast Path : Disabled
Max Shared Gateways         : Current: 32  Configured: 32
```

History

This command was first available in ExtremeXOS 11.2.

This command changed to display information for the current VR context in ExtremeXOS 12.5.

The show output for **max-gateways** was added in ExtremeXOS 15.3.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show iproute ipv6

show iproute ipv6 {**priority** | **vlan** *vlan_name* | **tunnel** *tunnel_name* | *ipv6Netmask* | **summary** {**multicast** | **unicast**}} {**vr** *vr_name*}}

Description

Displays the contents of the IPv6 routing table.

Syntax Description

priority	Displays the priority values for each route origin type.
vlan_name	Specifies a VLAN name.
tunnel_name	Specifies a tunnel name.
ipv6Netmask	Specifies an IPv6 address/prefix length.
summary	Specifies summary information
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command displays detailed information about all IPv6 routing:

```
Switch.18 # show iproute ipv6
Ori Destination                                 Mtr  Flags        Duration

RIPng                   2400
OSPFv3AsExt             3100
OSPFv3Ext1              3200
OSPFv3Ext2              3300
IsisL1Ext               3400
IsisL2Ext               3500
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

show iproute ipv6 origin

show iproute ipv6 origin [**direct** | **static** | **blackhole** | **ripng** | **ospfv3** | **ospfv3-intra** | **ospv3-inter** | **ospfv3-extern1** | **ospfv3-extern2** | **isis** | **isis-leve1-1** | **isis-level-2** | **isis-level-1-external** | **isis-level-2-external**] {**vr** *vr_name*}

Description

Displays the contents of the IPv6 routing table for routes with the specified origin.

Syntax Description

direct	Specifies direct routes.
static	Specifies static routes.
blackhole	Specifies blackhole routes.
ripng	Specifies RIPng routes.
ospfv3	Specifies OSPFv3 routes.
ospfv3-intra	Specifies OSPFv3 Intra routing.
ospfv3-inter	Specifies OSPFv3 Inter routing.
ospfv3-extern1	Specifies OSPFv3 External 1 routing.
ospfv3-extern2	Specifies OSPFv3 External 2 routing.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.

isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the RIPng routes:

```
show iproute ipv6 origin ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show ipstats ipv6

show ipstats ipv6 {**vlan** *name* | **tunnel** *tunnel_name* | **vr** *vr_name*}

Description

Displays IPv6 statistics for the CPU for the switch or for a particular VLAN.

Syntax Description

name	Specifies a VLAN name.
tunnel_name	Specifies a tunnel name.
vr_name	Specifies a VR or VRF.

Default

N/A.

Usage Guidelines

This command only shows statistics of the CPU-handled packets. Not all packets are handled by the CPU. For example, packets forwarded in hardware do not increment the statistics counters.

If you do not specify a VR or VRF, the command applies to the current VR context.

Example

The following command displays IPv6 statistics for the VLAN accounting:

```
show ipstats ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show ipv6 dad

show ipv6 dad {[{**vr**} *vr_name* {*ip_address*} | **vr all** | {**vlan**} *vlan_name*} {**tentative** | **valid** | **duplicate**} | {{**vr**} *vr_name*} *ipaddress*] | {**tunnel**} *tunnel_name*}

Description

Displays the configuration and run time status for the DAD feature on the specified IPv6 interface.

Syntax Description

vr_name	Specifies a VR for which to display the DAD information.
ip_address	Specifies an IPv6 address for which to display the DAD information.
vlan_name	Specifies a VLAN for which to display the DAD information.
tentative	Displays information for IPv6 interfaces for which the status is up and the DAD check is incomplete.
valid	Displays information for IPv6 interfaces for which the status is up, the DAD check is complete, and no duplicate IPv6 addresses were detected.
duplicate	Displays information for IPv6 interfaces for which the status is down because a duplicate IPv6 address was detected.

Default

If you do not specify a VR or VRF, the command applies to the current VR context.

Usage Guidelines

The vr all option displays DAD information for all IPv6 interfaces on the switch.

Example

The following command displays the DAD feature status for all interfaces in the current VR context:

```
show ipv6 dad
IPv6 Duplicate Address Detection
DAD Status                  : On
Max Solicitation Attempts  : 1
Virtual Router         Interface              Flags    IP Address
Conflict MAC         Failures
-------------------------------------------------------------------------------
--
VR-Default             exG-v154               -E-U    2001:db8:a::123/64
00:00:00:00:00:00       0
VR-Default             exL-v188               DE-U    2001:db8:b::123/64
00:04:96:12:ae:60       1
Flags : (D) Duplicate address detected, (T) Tentative address,
(E) Interface enabled, (L) Loopback enabled, (U) Interface up
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on BlackDiamond X8, BlackDiamond 8800 series switches and Summit family switches.

show neighbor-discovery cache ipv6

show neighbor-discovery {**cache** {**ipv6**}} {[*ipv6_addr* | *mac* | **permanent**] {**vr** *vr_name*}} | **vlan** *vlan_name* | **vr** *vr_name*}

Description

This command displays all the entries from the neighbor cache.

Syntax Description

ipv6_addr	Specifies an IPv6 address.
permanent	Specifies static entries.
vr_name	Specifies a VR or VRF.
vlan_name	Specifies an IPv6 configured VLAN.
mac	Specifies a MAC address.

Default

N/A.

Usage Guidelines

This command displays the entries present in the neighbor cache.

The entries displayed can be filtered by IPv6 address, MAC address, or by VLAN. The permanent keyword filters the output to display static entries.

The vr_name indicates the VR or VRF on which the operation is performed. In its absence, the operation applies to VR-Default.

Example

The following command shows all entries from the neighbor cache:

```
show neighbor-discovery cache ipv6
```

The following is sample output:

```
VR            Destination
Mac                Age  Static  VLAN          VID   Port
VR-Default    2001:db8:100::7
00:01:30:00:6b:00    0      NO  gtag100       100   1:2
VR-Default    2001:db8:100::99
00:01:02:33:33:33    0     YES  gtag100       100
VR-Default    2001:db8:99::99
00:01:02:01:01:01    0     YES  gtag99        99
Total Entries    :      0
Dynamic Entries  :      0             Static Entries       :          0
Pending Entries  :      0
Max Entries      :   1024             Max Pending entries  :       1024
Timeout          :     20 minutes     Refresh              :    Enable
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show router-discovery

show router-discovery {**ipv6**} {**vlan** *vlan_name*}

Description

Displays the router discovery settings.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

If no VLAN is specified, the settings are displayed for all IPv6 configured VLANs.

Example

The following command displays router discovery settings for the VLAN top_floor:

```
show router-discovery vlan top_floor
```

The following is sample output:

```
Router Advertisements disabled on v1
Minimum/Maximum Interval:  200 / 600
Managed / Other Info Flags:  Off / Off
Link MTU:  0
Reachable Time:  0
Retrans Timer:  0
Current Hop Limit:  64
Default Lifetime:  1800
Number of Prefixes:  1,  Prefix List:
Valid           Preferred
Prefix  Lifetime     Auto  Lifetime OnLink
2001:db8::1/64
2592000       On    604800     On
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show tunnel

show [{**tunnel**} {*tunnel_name*}]

Description

Displays system tunnel information for a specified tunnel or for all tunnels.

Syntax Description

tunnel_name	Specifies an IPv6-in-IPv4 or IPv6-to-IPv4 tunnel name.

Default

N/A.

Usage Guidelines

The tunnel keyword is optional only when you specify a valid IPv6-in-IPv4 or IPv6-to-IPv4 tunnel name. The Total tunnels count in the display represents all tunnels on the switch.

Example

The following command displays system tunnel information for all tunnels:

```
Switch.1 # show tunnel
Name                            Type                                    Flags
tunfour                         6in4 10.20.30.40 => 10.10.10.10         U
mytun                           GRE 1.1.1.2 => 1.1.1.1
Utunfive2                        6to4 10.20.30.40 => *.*.*.*             D
Total tunnels: 3
Flags: (U) Up / (D) Down / (a) Administratively Disabled
       (S) System Disabled (incompatible hardware)
```

The following command displays system tunnel information for tunnel tunfour:

```
Switch.3 # show "tunfour"
Name                            Type                                    Flags
```

```
tunfour                          6in4 10.20.30.40 => 10.10.10.10         U
Total tunnels: 2
Flags: (U) Up / (D) Down
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

unconfigure iproute ipv6 priority

unconfigure iproute ipv6 priority [**all** | **blackhole** | **icmp** | **isis** | **isis-leve1-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external** | **ospfv3-as-external** | **ospfv3-extern1** | **ospfv3-extern2** | **ospfv3-inter** | **ospfv3-intra** | **ripng** | **static**] {**vr** *vr_name*}

Description

Resets the priority for all IPv6 routes from one or all route origin types to the default values.

Syntax Description

all	Specifies all route origins.
blackhole	Specifies the blackhole route.
icmp	Specifies ICMP.
isis	Specifies IS-IS and applies only to blackhole routes installed for summary addresses.
isis-level-1	Specifies ISIS Level 1 routing.
isis-level-1-external	Specifies ISIS Level 1 External routing.
isis-level-2	Specifies ISIS Level 2 routing.
isis-level-2-external	Specifies ISIS Level 2 External routing.
ospf-as-external	Specifies OSPF as External routing.
ospf-extern1	Specifies OSPF External 1 routing.
ospf-extern2	Specifies OSPF External 2 routing.
ospf-inter	Specifies OSPFInter routing.
ospf-intra	Specifies OSPFIntra routing.
ripng	Specifies RIP.

static	Specifies static routes.
vr_name	Specifies a VR or VRF name.

Default

N/A.

Usage Guidelines

The following table lists the default values that apply after you enter this command.

Default Route Priorities

Route Origin	Priority
Direct	10
BlackHole	50
Static	1100
ICMP	1200
OSPF3Intra	2200
OSPF3Inter	2300
IS-IS L1	2360
IS-IS L2	2370
RIPg	2400
OSPFv3 ASExt	3100
OSPFv3 Extern1	3200
OSPFv3 Extern2	3300
IS-IS L1 Ext	3400
IS-IS L2 Ext	3500

Example

The following command returns the IPv6 route priority for all route origins to the default values:

```
unconfigure iproute ipv6 priority all
```

History

This command was first available in ExtremeXOS 12.1.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure neighbor-discovery cache

unconfigure neighbor-discovery cache {**vr** *vr_name*}

Description

Resets the neighbor-discovery cache configuration parameters to their default values.

Syntax Description

vr_name	Specifies a VR or VRF.

Default

IPv6 neighbor timeout: 20 minutes

Maximum IPv6 neighbor entries: 1024

Maximum IPv6 neighbor pending entries: 1024

IPv6 neighbor refresh: Enabled

Usage Guidelines

None.

Example

The following command resets the neighbor-discovery cache configuration:

```
unconfigure neighbor-discovery cache
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery

unconfigure vlan *vlan_name* **router-discovery {ipv6}**

Description

Unconfigures all the router-discovery parameters and resets them to their respective default values.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

Each of the router-discovery parameters is set to the default value. For example, the default-lifetime parameter is set to 1800 seconds. The default value for each of the router-discovery parameters is listed in the corresponding configure vlan router-discovery command description.

Example

The following command unconfigures all the router-discovery parameters for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery default-lifetime

unconfigure vlan *vlan_name* **router-discovery {ipv6} default-lifetime**

Description

Unconfigures the router lifetime value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the default-lifetime parameter to the default value of 1800 seconds.

Example

The following command unconfigures the default-lifetime for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery default-lifetime
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery hop-limit

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **hop-limit**

Description

Unconfigures the current hop limit value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the hop-limit parameter to the default value of 64.

Example

The following command unconfigures the current hop limit for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery hop-limit
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery link-mtu

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **link-mtu**

Description

Unconfigures the link MTU value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the link-mtu parameter to the default value of 0.

Example

The following command unconfigures the link MTU for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery link-mtu
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery managed-config-flag

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **managed-config-flag**

Description

Unconfigures the managed address configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the managed-config-flag parameter to the default value off.

Example

The following command unconfigures the managed address configuration flag for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery managed-config-flag
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery max-interval

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **max-interval**

Description

Unconfigures the maximum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the max-interval parameter to the default value of 600 seconds.

Example

The following command unconfigures the max-interval for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery max-interval
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery min-interval

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **min-interval**

Description

Unconfigures the minimum time between unsolicited router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the min-interval parameter to the default value of (max-interval * .33 seconds).

Example

The following command unconfigures the min-interval for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery min-interval
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery other-config-flag

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **other-config-flag**

Description

Unconfigures the other stateful configuration flag value sent in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the other-config-flag parameter to the default value off.

Example

The following command unconfigures the other stateful configuration flag for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery other-config-flag
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery reachable-time

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **reachable-time**

Description

Unconfigures the reachable time value in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the reachable-time parameter to the default value of 30,000 milliseconds.

Example

The following command unconfigures the reachable time for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery reachable-time
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure vlan router-discovery retransmit-time

unconfigure vlan *vlan_name* **router-discovery** {**ipv6**} **retransmit-time**

Description

Unconfigures the retransmit time value in router discovery advertisements on the VLAN.

Syntax Description

vlan_name	Specifies an IPv6 configured VLAN.

Default

N/A.

Usage Guidelines

This command sets the retransmit-time parameter to the default value of 1000 milliseconds.

Example

The following command unconfigures the retransmit time for the VLAN top_floor:

```
unconfigure vlan top_floor router-discovery retransmit-time
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 unicast routing feature in the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure tunnel

unconfigure tunnel *tunnel_name* **ipaddress** *ipv6_address_mask*

Description

Unconfigures an IPv6 address/prefix route from a tunnel.

Syntax Description

tunnel_name	Specifies an IPv6 tunnel.
ipv6_address_mask	Specifies an IPv6 address / IPv6 prefix length.

Default

N/A.

Usage Guidelines

Use this command to unconfigure an IPv6 address/prefix route from the specified tunnel.

Example

The following command unconfigures the 6in4 tunnel link39 with the address 2001:db8::1111/64

```
unconfigure tunnel link39 2001:db8::1111/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 interworking feature in Appendix A, “Feature License Requirements.” in Appendix A, “Feature License Requirements.”

35 RIP Commands

This chapter describes commands used for the interior gateway protocol RIP. Routing Information Protocol (RIP) is an Interior Gateway Protocol (IGP) first used in computer routing in the Advanced

Research Projects Agency Network (ARPAnet) as early as 1969. It is primarily intended for use in homogeneous networks of moderate size.

To determine the best path to a distant network, a router using RIP always selects the path that has the least number of hops. Each router that data must traverse is considered to be one hop.

The routing table in a router using RIP contains an entry for every known destination network. Each routing table entry contains the following information:

- IP address of the destination network
- Metric (hop count) to the destination network
- IP address of the next router
- Timer that tracks the amount of time since the entry was last updated

The router exchanges an update message with each neighbor every 30 seconds (default value), or if there is a change to the overall routed topology (also called triggered updates). If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

A new version of RIP, called RIP version 2 (RIPv2), expands the functionality of RIP version 1 to include:

- Variable-Length Subnet Masks (VLSMs)
- Next-hop addresses
- Support for next-hop addresses allows for optimization of routes in certain environments
- Multicasting

If you are using RIP with supernetting/Classless Inter-Domain Routing (CIDR), you must use RIPv2 only, and RIP route aggregation must be turned off.

Note

RIP is available on all platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Feature License Requirements

clear rip counters

clear rip counters

Description

Clears the RIP counters (statistics).

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the RIP statistics counters:

```
clear rip counters
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip add vlan

configure rip add vlan [*vlan_name* | **all**]

Description

Configures RIP on an IP interface.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

When an IP interface is created, RIP configuration is disabled on the interface by default. When the RIP interface is disabled, the parameters are not reset to default automatically.

Example

The following command configures RIP on the VLAN finance:

```
configure rip add finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip delete vlan

configure rip delete vlan [*vlan_name* | **all**]

Description

Disables RIP on an IP interface.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

When an IP interface is created, RIP configuration is disabled on the interface by default. When the RIP interface is disabled by this command, the parameters are not reset to default automatically.

Example

The following command deletes RIP on a VLAN named finance:

```
configure rip delete finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip garbagetime

configure rip garbagetime {*seconds*}

Description

Configures the RIP garbage time.

Syntax Description

seconds	Specifies a time in seconds.

Default

120 seconds.

Usage Guidelines

None.

Example

The following command configures the RIP garbage time to have a 60-second delay:

```
configure rip garbagetime 60
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip import-policy

configure rip import-policy [*policy-name* | **none**]

Description

Configures the import policy for RIP.

Syntax Description

policy-name	Specifies the policy.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding RIP routes to the IP route table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove an import policy.

Example

The following example applies the policy campuseast to RIP routes:

```
configure rip import-policy campuseast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip routetimeout

configure rip routetimeout *seconds*

Description

Configures the route timeout period.

Syntax Description

seconds	Specifies a time in seconds.

Default

180 seconds.

Usage Guidelines

If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

Example

The following example sets the route timeout period to 120 seconds:

```
configure rip routetimeout 120
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip updatetime

configure rip updatetime *seconds*

Description

Specifies the time interval in seconds within which RIP sends update packets.

Syntax Description

seconds	Specifies a time in seconds. The range is 10 to 180.

Default

30 seconds.

Usage Guidelines

The router exchanges an update message with each neighbor every 30 seconds (default value), or if there is a change to the overall routed topology (also called triggered updates). The timer granularity is 10 seconds. Timer minimum is 10 seconds and maximum is 180 seconds.

Example

The following command sets the update timer to 60 seconds:

```
configure rip updatetime 60
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan cost

configure rip vlan [*vlan_name* | **all**] **cost** *cost*

Description

Configures the cost (metric) of the interface.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
cost	Specifies a cost metric.

Default

The default setting is 1.

Usage Guidelines

The specified interface cost is added to the cost of the route received through this interface.

Example

The following command configures the cost for the VLAN finance to a metric of 3:

```
configure rip vlan finance cost 3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan route-policy

configure rip vlan [*vlan_name* | **all**] **route-policy** [**in** | **out**] [*policy-name* | **none**]

Description

Configures RIP to ignore certain routes received from its neighbor, or to suppress certain routes when performing route advertisements.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
policy-name	Specifies a policy.
none	Removes any policy from the VLAN.

Default

N/A.

Usage Guidelines

Use the in option to configure an input route policy, which determines which RIP routes are accepted as valid routes. This policy can be combined with the trusted neighbor policy to accept selected routes only from a set of trusted neighbors.

Use the out option to configure an output route policy, which determines which RIP routes are advertised on the VLAN.

Example

The following command configures the VLAN backbone to accept selected routes from the policy nosales:

```
configure rip vlan backbone route-policy in nosales
```

The following command uses the policy nosales to determine which RIP routes are advertised into the VLAN backbone:

```
configure rip vlan backbone route-policy out nosales
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan rxmode

configure rip [**vlan** *vlan_name* | **all**] **rxmode** [**none** | **v1only** | **v2only** | **any**]

Description

Syntax Description

none	Specifies to drop all received RIP packets.
v1only	Specifies to accept only RIP version 1 format packets.
v2only	Specifies to accept only RIP version 2 format packets.
any	Specifies to accept RIP version 1 and RIP version 2 packets.
vlan_name	Specifies to apply settings to specific VLAN name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the receive mode for the VLAN finance to accept only RIP version 1 format packets:

```
configure rip finance rxmode v1only
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan trusted-gateway

configure rip vlan [*vlan_name* | **all**] **trusted-gateway** [*policy-name* | **none**]

Description

Configures a trusted neighbor policy to determine trusted RIP router neighbors for the VLAN on the switch running RIP.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
policy-name	Specifies a policy.
none	Removes any trusted-gateway policy from the VLAN.

Default

N/A.

Usage Guidelines

Use this command to set a policy to determine trusted neighbors. A neighbor is defined by its IPaddress. Only the RIP control packets from trusted neighbors will be processed.

Example

The following command configures RIP to use the policy nointernet to determine from which RIP neighbor to receive (or reject) the routes to the VLAN backbone:

```
configure rip vlan backbone trusted-gateway nointernet
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

configure rip vlan txmode

configure rip [**vlan** *vlan_name* | **all**] **txmode** [**none** | **v1only** | **v1comp** | **v2only**]

Description

Changes the RIP transmission mode for one or all VLANs.

Syntax Description

none	Specifies to not transmit any packets on this interface.
v1only	Specifies to transmit RIP version 1 format packets to the broadcast address.
v1comp	Specifies to transmit RIP version 2 format packets to the broadcast address.
v2only	Specifies to transmit RIP version 2 format packets to the RIP multicast address.
vlan_name	Specifies to apply settings to a specific VLAN name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the transmit mode for the VLAN finance to transmit version 2 format packets to the broadcast address:

```
configure rip finance txmode v1comp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip

disable rip

Description

Disables RIP for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

RIP has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table
- Slow convergence
- Routing decisions based on hop count; no concept of link costs or delay
- Flat networks; no concept of areas or boundaries

Example

The following command disables RIP for the whole router:

```
disable rip
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip aggregation

disable rip aggregation

Description

Disables the RIP aggregation of subnet information on a RIP version 2 (RIPv2) router.

Syntax Description

This command has no arguments or variables.

Default

RIP aggregation is disabled by default.

Usage Guidelines

The disable RIP aggregation command disables the RIP aggregation of subnet information on a switch configured to send RIPv2-compatible traffic. The switch summarizes subnet routes to the nearest class network route. The following rules apply when using RIP aggregation:

- Within a class boundary, no routes are aggregated.
- If aggregation is disabled, subnet routes are never aggregated, even when crossing a class boundary.

Example

The following command disables RIP aggregation on the interface:

```
disable rip aggregation
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip export

disable rip export [bgp | direct | e-bgp | i-bgp | ospf | ospf-extern1 | ospf-extern2 | ospf-inter | ospf-intra | static | isis | isis-level-1| isis-level-1-external | isis-level-2| isis-level-2-external]

Description

Disables RIP from redistributing routes from other routing protocols.

Syntax Description

static	Specifies static routes.
bgp	Specifies BGP routes.
direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
e-bgp	Specifies external BGP routes.
i-bgp	Specifies internal BGP routes.
ospf	Specifies all OSPF routes.
ospf-intra	Specifies OSPF-intra area routes.
ospf-inter	Specifies OSPF-inter area routes.
ospf-extern1	Specifies OSPF external route type 1.
ospf-extern2	Specifies OSPF external route type 2.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.

Default

Disabled.

Usage Guidelines

This command disables the exporting of BGP, static, direct, and OSPF-learned routes into the RIP domain.

Example

The following command disables RIP from redistributing any routes learned from OSPF:

```
disable rip export ospf
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip poisonreverse

disable rip poisonreverse

Description

Disables poison reverse algorithm for RIP.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command disables the split horizon with poison reverse algorithm for RIP:

```
disable rip poisonreverse
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip splithorizon

disable rip splithorizon

Description

Disables the split horizon algorithm for RIP.

Syntax Description

This command has no arguments or variable.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command disables the split horizon algorithm for RIP:

```
disable rip splithorizon
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip triggerupdates

Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric.

disable rip triggerupdates

Description

Disables the trigger update mechanism.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more RIP-related traffic.

Example

The following command disables the trigger update mechanism:

```
disable rip triggerupdate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

disable rip use-ip-router-alert

disable rip use-ip-router-alert

Description

Disables router alert IP option in outgoing RIP control packets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the RIP router alert IP option:

```
disable rip use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip

```
enable rip
```

Description

Enables RIP for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

RIP has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table
- Slow convergence
- Routing decisions based on hop count; no concept of link costs or delay
- Flat networks; no concept of areas or boundaries

Example

The following command enables RIP for the whole router:

```
enable rip
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip aggregation

```
enable rip aggregation
```

Description

Enables the RIP aggregation of subnet information on a RIP version 2 (RIPv2) interface.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The enable (disable) rip aggregation command enables (disables) the RIP aggregation of subnet information on an interface configured to send RIPv1 or RIPv2-compatible traffic. The switch summarizes subnet routes to the nearest class network route. The following rules apply when using RIP aggregation:

- Subnet routes are aggregated to the nearest class network route when crossing a class boundary.
- Within a class boundary, no routes are aggregated.
- If aggregation is enabled, the behavior is the same as in RIPv1.
- If aggregation is disabled, subnet routes are never aggregated, even when crossing a class boundary.

Example

The following command enables RIP aggregation on the interface:

```
enable rip aggregation
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip export

enable rip export [**bgp** | **direct** | **e-bgp** | **i-bgp** | **ospf** | **ospf-extern1** | **ospf-extern2** | **ospf-inter** | **ospf-intra** | **static** | **isis** | **isis-level-1**| **isis-level-1-external** | **isis-level-2** | **isis-level-2-external**] [**cost** *number* {**tag** *number*} | **policy** *policy-name*]

Description

Enables RIP to redistribute routes from other routing functions.

Syntax Description

bgp	Specifies BGP routes.
direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
e-bgp	Specifies E-BGP routes.
I-bgp	Specifies I-BGP routes.
ospf	Specifies all OSPF routes.
ospf-intra	Specifies OSPF-intra area routes.
ospf-inter	Specifies OSPF-inter area routes.
ospf-extern1	Specifies OSPF external route type 1.
ospf-extern2	Specifies OSPF external route type 2.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.
cost *number*	Specifies the cost metric, from 0-15. If set to 0, RIP uses the route metric obtained from the route origin.
tag *number*	Specifies a tag number.
policy-name	Specifies a policy.

Default

Disabled.

Usage Guidelines

This command enables the exporting of BGP, static, direct, and OSPF-learned routes into the RIP domain. You can choose which types of OSPF routes are injected, or you can simply choose ospf, which will inject all learned OSPF routes regardless of type.

The cost metric is inserted for all RIP-learned, static, and direct routes injected into RIP. If the cost metric is set to 0, the cost is inserted from the route. For example, with BGP, the cost could be the MED or the length of the BGP path. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag.

Each protocol can have a policy associated with it to control or modify the exported routes.

Example

The following command enables RIP to redistribute routes from all OSPF routes:

```
enable rip export ospf cost 0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip originate-default cost

enable rip originate-default {**always**} **cost** *number* {**tag** *number*}

Description

Configures a default route to be advertised by RIP.

Syntax Description

always	Specifies to always advertise the default route.
cost number	Specifies a cost metric. The range is 1 - 15.
tag *number*	Specifies a tag number.

Default

Disabled.

Usage Guidelines

If always is specified, RIP always advertises the default route to its neighbors. If always is not specified, RIP advertises a default route only if a reachable default route is in the system route table.

The default route advertisement is filtered using the out policy.

The cost metric is inserted for all RIP-learned, static, and direct routes injected into RIP. The tag value is used only by special routing applications.

Example

The following command configures a default route to be advertised by RIP if there is a default route in the system routing table:

```
enable rip originate-default cost 7
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip poisonreverse

enable rip poisonreverse

Description

Enables poison reverse algorithm for RIP.

Syntax Description

Enables poison reverse algorithm for RIP.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command enables the split horizon with poison reverse algorithm for RIP:

```
enable rip poisonreverse
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip splithorizon

enable rip splithorizon

Description

Enables the split horizon algorithm for RIP.

Syntax Description

Enables the split horizon algorithm for RIP.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command enables the split horizon algorithm for RIP:

```
enable rip splithorizon
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip triggerupdates

Triggered updates are a mechanism for immediately notifying a router's neighbors when the router adds or deletes routes or changes their metric.

enable rip triggerupdates

Description

Enables the trigger update mechanism.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more RIP-related traffic.

Example

The following command enables the trigger update mechanism:

```
enable rip triggerupdate
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

enable rip use-ip-router-alert

enable rip use-ip-router-alert

Description

Enables the router alert IP option in the outgoing RIP control packets.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables the RIP router alert IP option:

```
enable rip use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

show rip

show rip

Description

Displays RIP specific configuration.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific configuration:

```
show rip
```

The following is sample output from this command:

```
X650-24t(SS).1 # show rip
RIP Routing      : Disabled          Operational status: Down

```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

show rip interface

show rip interface {detail}

Description

Displays RIP-specific configuration and statistics for all VLANs.

Syntax Description

detail	Specifies detailed display.

Default

Show summary output for all interfaces.

Usage Guidelines

Summary includes the following information per interface:

- VLAN name
- IP address and mask
- interface status
- packets transmitted
- packets received
- number of triggered updates
- cost

Detail includes the following per interface:

- VLAN name
- IP address and mask
- tx mode
- rx mode
- cost
- peer information (for each peer)
  - age
  - version
  - received packets
  - received updates
  - received bad packets
  - received bad routes
- in policy
- out policy
- trusted gateway policy
- packets transmitted
- sent triggered updates
- packets received
- bad packets received
- bad routes received

Example

The following command displays the RIP configuration for all VLANS:

```
show rip interface
```

The following is sample output from this command:

```
X650-24t(SS).2 # show rip interface
VLAN       IP Address         Flags  Sent     Rcvd     Triggered Cost
Packets  Packets  Updates
Flags: (f) Interface Forwarding Enabled, (i) Interface RIP Enabled
(n) Multinetted VLAN, (r) Router RIP Enabled
```

The following command displays RIP-specific statistics for all VLANs:

```
show rip interface detail
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

show rip interface vlan

show rip interface vlan *vlan_name*

Description

Displays RIP specific statistics and configuration for a VLAN in detail.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific statistics for the VLAN accounting:

```
show rip interface vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

show rip memory

show rip memory {**detail** | *memoryTyp*}

Description

Displays RIP specific memory usage.

Syntax Description

detail	Displays detail information.
memoryType	Specifies the memory type usage to display.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIP specific memory for TEST:

```
show rip memory test
```

The following is sample output from this command:

```
X650-24t(SS).11 # show rip memory test
RIP Memory Information
```

```
----------------------
Bytes Allocated: 0        AllocFailed: 0

0      0
AllocFail      0      0      0      0      0      0      0      0      0
0      0
FreeFail      0      0      0      0      0      0      0      0      0
0      0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

show rip routes

show rip routes {**detail**} {**network** *ripNetworkPrefix*}

Description

Displays routes advertised by RIP.

Syntax Description

detail	Displays all available information from the RIP routing table.
ripNetworkPrefix	Specifies the route prefix for the routes to show.

Default

N/A.

Usage Guidelines

The routes displayed include all routes advertised by RIP, including routes exported from the system routing table and originated by other protocols, for example BGP.

Example

The following command displays a summary of RIP specific routes for the networks 10.0.0.0/8:

```
show rip routes network 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

unconfigure rip

unconfigure rip {vlan *vlan-name* **| all}**

Description

Resets all RIP parameters to the default for all VLANs or for the specified VLAN.

Syntax Description

vlan-name	Specifies a VLAN name.

Default

All.

Usage Guidelines

Does not change the enable/disable state of the RIP settings.

Example

The following command resets the RIP configuration to the default for the VLAN finance:

```
unconfigure rip finance
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms with an Edge, Advanced Edge, or Core license.

36 RIPng Commands

This chapter describes commands used for the IPv6 interior gateway protocol RIPng.

To determine the best path to a distant network, a router using RIPng always selects the path that has the least number of hops. Each router that data must traverse is considered to be one hop.

The routing table in a router using RIPng contains an entry for every known destination network. Each routing table entry contains the following information:

- IP address and prefix length of the destination network
- Metric (hop count) to the destination network
- IP address of the next hop router, if the destination is not directly connected
- Interface for the next hop
- Timer that tracks the amount of time since the entry was last updated

- A flag that indicates if the entry is a new one since the last update
- The source of the route, for example, static, RIPng, OSPFv3, etc.

The router exchanges an update message with each neighbor every 30 seconds (default value), or if there is a change to the overall routed topology (also called triggered updates). If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

Note

RIPng is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Feature License Requirements

clear ripng counters

clear ripng counters {**vlan** *vlan-name* | **tunnel** *tunnel-name*}

Description

Clears the RIPng global or interface-specific counters (statistics).

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the RIPng statistics counters:

```
clear ripng counters
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng add

configure ripng add [**vlan** *vlan-name* | **tunnel** *tunnel-name* | [**vlan** | **tunnel**] **all**]

Description

Configures RIPng on an IP interface.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or tunnels.

Default

N/A.

Usage Guidelines

For RIPng to be active on the interface, it must also be globally enabled using the command disable ripng export [direct | ospfv3 | ospfv3-extern1 | ospfv3-extern2 | ospfv3-inter | ospfv3-intra | static | isis | isis-level-1| isis-level-1-external | isis-level-2| isis-level-2-external | bgp]. If the keyword all is specified, all IPv6 configured VLANs or tunnels will be configured for RIPng.

Example

The following command configures RIPng on the VLAN finance:

```
configure ripng add finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng cost

configure ripng [**vlan** *vlan-name* | **tunnel** *tunnel-name*] **cost** *metric*

Description

Configures the cost (metric) of the interface..

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
metric	Specifies a cost metric. Range is 1 to 15.

Default

The default setting is 1.

Usage Guidelines

The specified interface cost is added to the cost of the route received through this interface.

Example

The following command configures the cost for the VLAN finance to a metric of 3:

```
configure ripng vlan finance cost 3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng delete

configure ripng delete [**vlan** *vlan-name* | **tunnel** *tunnel-name* | [**vlan** | **tunnel**] **all**]

Default

Removes an interface from RIPng routing.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or tunnels.

Default

N/A.

Usage Guidelines

This command removes an interface from RIPng routing. However, the RIPng-specific interface configuration will be preserved, even if RIPng is unconfigured on the interface. The interface configuration information is removed only when the IPv6 interface itself gets deleted by, for example, by unconfiguring all the IPv6 addresses on the interface.

Example

The following command removes the VLAN finance from RIPng routing:

```
configure ripng delete finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng garbagetime

configure ripng garbagetime {*seconds*}

Description

Configures the RIPng garbage time.

Syntax Description

seconds	Specifies a time in seconds. Range is 10 to 2400 seconds.

Default

120 seconds.

Usage Guidelines

This command configures the time interval after which a route in the RIPng routing database that has expired will be removed. The value is rounded off to nearest multiple of 10.

Example

The following command configures the RIPng garbage time to have a 60-second delay:

```
configure ripng garbagetime 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng import-policy

configure ripng import-policy [*policy-name* | **none**]

Description

Configures the import policy for RIPng.

Syntax Description

policy-name	Specifies the policy.

Default

No policy.

Usage Guidelines

Use this command to configure the policy to be applied to RIPng routes installed into the system routing table from the RIPng routing process. This policy can be used to modify parameters associated with routes installed into the routing table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove the import policy.

The following is a sample policy file that can be used with RIPng. It changes the metric to 12 for any routes from the subnets 2001:db8:2ccc::/64 and 2001:db8:2ccd::/64:

```
entry filter_routes {
        If match any{
            nlri 2001:db8:2ccc:: /64;
            nlri 2001:db8:2ccd:: /64;
        }
        then {
        cost 12;
        }
    }
```

Example

The following example applies the policy campuseast to RIPng routes:

```
configure ripng import-policy campuseast
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng route-policy

configure ripng [**vlan** *vlan-name* | **tunnel** *tunnel-name*] **route-policy** [**in** | **out**] [*policy-name* | **none**]

Description

Configures RIPng to ignore or modify certain routes received from its neighbors, or to suppress certain routes when performing route advertisements.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
policy-name	Specifies a policy.
none	Removes any policy from the VLAN.

Default

N/A.

Usage Guidelines

Use the in option to configure an input route policy, which determines which RIPng routes are accepted as valid routes from RIPng neighbors. This policy can be combined with the trusted neighbor policy to accept selected routes only from a set of trusted neighbors.

Use the out option to configure an output route policy, which determines which RIPng routes are advertised to other RIPng neighbors.

The following is a sample policy file that could be used with RIPng. It will drop any routes from the subnets 2001:db8:2ccc::/64 and 2001:db8:2ccd::/64:

```
entry filter_routes {
    If match any{
        nlri 2001:db8:2ccc:: /64;
        nlri 2001:db8:2ccd:: /64;
    }
    then {
        deny;
    }
}
```

Example

The following command configures the VLAN backbone to accept routes from its neighbor as specified by the policy nosales:

```
configure ripng vlan backbone route-policy in nosales
```

The following command uses the policy nosales to determine which RIP routes are advertised into the VLAN backbone:

```
configure rip vlan backbone route-policy out nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng routetimeout

configure ripng routetimeout *seconds*

Description

Configures the route timeout period for RIPng.

Syntax Description

seconds	Specifies a time in seconds. Range is 10 to 3600.

Default

180 seconds.

Usage Guidelines

If a router does not receive an update message from its neighbor within the route timeout period (180 seconds by default), the router assumes the connection between it and its neighbor is no longer available.

The configured value is rounded off to the nearest multiple of 10.

Example

The following example sets the route timeout period to 120 seconds:

```
configure ripng routetimeout 120
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng trusted-gateway

configure ripng [**vlan** *vlan-name* | **tunnel** *tunnel-name*] **trusted-gateway** [*policy-name* | **none**]

Description

Configures a trusted neighbor policy to determine trusted RIPng router neighbors for the interfaces on the switch running RIPng.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
policy-name	Specifies a policy.
none	Removes any trusted-gateway policy from the VLAN.

Default

None. Control packets from all of the neighbors are processed.

Usage Guidelines

Use this command to set a policy to determine trusted neighbors. A neighbor is defined by its IPaddress. Only the RIPng control packets from trusted neighbors will be processed.

The following policy designates neighbors from the fe80:202:b3ff:fe4a:6ada:: /64 subnet and the neighbor at fe80:203::b3ff:fe4a:6ada as trusted gateways:

```
entry filter_gateways {
    If match any{
        nlri fe80:202:b3ff:fe4a:6ada:: /64;
        nlri fe80:203::b3ff:fe4a:6ada:: /64;
    }
    then {
        permit;
    }
}
```

Example

The following command configures RIPng to use the policy nointernet to determine from which RIPng neighbor to receive (or reject) the routes to the VLAN backbone:

```
configure ripng vlan backbone trusted-gateway nointernet
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

configure ripng updatetime

configure ripng updatetime *seconds*

Description

Specifies the time interval in seconds within which RIPng sends update packets.

Syntax Description

seconds	Specifies a time in seconds. The range is 10 to 3600.

Default

30 seconds.

Usage Guidelines

The router exchanges an update message with each neighbor every 30 seconds (default value), or if there is a change to the overall routed topology (also called triggered updates). The timer granularity is 10 seconds. Timer minimum is 10 second and maximum is 3600 seconds.

Example

The following command sets the update timer to 60 seconds:

```
configure ripng updatetime 60
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng

disable ripng

Description

Disables RIPng for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables RIPng for the whole router:

```
disable ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng export

disable ripng export [direct | ospfv3 | ospfv3-extern1 | ospfv3-extern2 | ospfv3-inter | ospfv3-intra | static | isis | isis-level-1| isis-level-1-external | isis-level-2| isis-level-2-external | bgp]

Description

Disables RIPng from redistributing routes from other routing protocols.

Syntax Description

static	Specifies user configured static routes.
direct	Specifies directly reachable subnets from the router (only interfaces that have IP forwarding enabled are exported).

ospfv3	Specifies all OSPFv3 routes.
ospfv3-intra	Specifies OSPFv3-intra area routes.
ospfv3-inter	Specifies OSPFv3-inter area routes.
ospfv3-extern1	Specifies OSPFv3 external route type 1.
ospfv3-extern2	Specifies OSPFv3 external route type 2.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies BGP IPv6 routes

Default

Disabled.

Usage Guidelines

This command disables the exporting of static, direct, IS-IS, and OSPF-learned routes from the switch routing table into the RIPng domain.

Example

The following command disables RIPng from redistributing any routes learned from OSPFv3:

```
disable ripng export ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng originate-default

disable ripng originate-default

Description

Disables the advertisement of a default route to the neighbors.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command unconfigures a default route to be advertised by RIPng if no other default route is advertised:

```
disable ripng originate-default
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng poisonreverse

disable ripng poisonreverse {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Disables poison reverse algorithm for RIPng.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Like split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

Example

The following command disables the split horizon with poison reverse algorithm for RIPng:

```
disable ripng poisonreverse
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng splithorizon

disable ripng splithorizon {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Disables the split horizon algorithm for RIPng.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command disables the split horizon algorithm for RIPng:

```
disable rip splithorizon
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

disable ripng triggerupdate

disable ripng triggerupdate {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Triggered updates are a mechanism for immediately notifying a router’s neighbors when the router adds or deletes routes or changes their metric. This command disables the trigger update mechanism.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more RIPng-related traffic.

When this feature is disabled, any metric change on the interface, or an interface going down will not be communicated until the next periodic update. To configure how often periodic updates are sent, use the following command:

```
configure ripng updatetime
```

Example

The following command disables the trigger update mechanism:

```
disable ripng triggerupdate
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng

enable ripng

Description

Enables RIPng for the whole router.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Although RIPng is useful in small networks, it has a number of limitations that can cause problems in large networks, including:

- A limit of 15 hops between the source and destination networks
- A large amount of bandwidth taken up by periodic broadcasts of the entire routing table
- Slow convergence
- Routing decisions based on hop count; no concept of link costs or delay
- Flat networks; no concept of areas or boundaries

For larger networks, consider OSPFv3 as an alternative IGP.

Example

The following command enables RIPng for the whole router:

```
enable ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng export

enable ripng export [**direct** | **ospfv3** | **ospfv3-extern1** | **ospfv3-extern2** | **ospfv3-inter** | **ospfv3-intra** | **static** | **isis** | **isis-level-1**| **isis-level-1-external** | **isis-level-2**| **isis-level-2-external** | **bgp**] [**cost** *number* {**tag** *number*} | **policy** *policy-name*]

Description

Enables RIPng to redistribute routes from other routing functions.

Syntax Description

direct	Specifies interface routes (only interfaces that have IP forwarding enabled are exported).
ospfv3	Specifies all OSPFv3 routes.
ospfv3-intra	Specifies OSPFv3-intra area routes.
ospfv3-inter	Specifies OSPFv3-inter area routes.
ospfv3-extern1	Specifies OSPFv3 external route type 1.
ospfv3-extern2	Specifies OSPFv3 external route type 2.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies BGP IPv6 routes
cost number	Specifies the cost metric, from 0-15. If set to 0, RIPng uses the route metric obtained from the route origin.
tag number	Specifies a tag number.
policy-name	Specifies a policy.

Default

Disabled. However, direct routes will always be advertised for all the interfaces where RIPng is enabled. For those interfaces where RIPng is not enabled, the corresponding direct route could be redistributed if direct route export is enabled through this command.

Default tag is 0.

Usage Guidelines

This command enables the exporting of static, direct, IS-IS, and OSPFv3-learned routes from the routing table into the RIPng domain. You can choose which types of IS-IS or OSPFv3 routes are injected, or you can simply choose isis or ospfv3, which will inject all learned routes (of all types) for the selected protocol.

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into RIPng. If the cost metric is set to 0, the cost is inserted from the route table. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag.

Each protocol can have a policy associated with it to control or modify the exported routes. The following is sample policy file which modifies the cost of redistributed routes from OSPFv3 and statically configured routes:

```
entry filter_rt {
```

```
    If match any {
        Route-origin ospfv3;
        Route-origin static;
    }
    then {
        cost 10;
    }
}
```

Example

The following command enables RIPng to redistribute routes from all OSPFv3 routes:

```
enable ripng export ospfv3 cost 0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng originate-default

enable ripng originate-default {**always**} **cost** *metric* {**tag** *number*}

Description

Configures a default route to be advertised by RIPng.

Syntax Description

always	Specifies to advertise the default route in addition to learned default route.
cost metric	Specifies a cost metric. The range is 1 - 15.
tag number	Specifies a tag number.

Default

Disabled.

Usage Guidelines

If always is specified, RIPng always advertises the default route to its neighbors. If always is not specified, RIPng advertises a default route only if a reachable default route is in the system route table (the route is learned from other neighbors).

The default route advertisement is filtered using the out policy. Use the command, configure ripng route-policy, to specify the out policy.

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into RIPng. The tag value is used only by special routing applications.

Example

The following command configures a default route to be advertised by RIPng if there is a default route in the system routing table:

```
enable ripng originate-default cost 7
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng poisonreverse

enable ripng poisonreverse {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Enables the split horizon with poison reverse algorithm for RIPng on specified interfaces.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Used with split horizon, poison reverse is a scheme for eliminating the possibility of loops in the routed topology. In this case, a router advertises a route over the same interface that supplied the route, but the route uses a hop count of 16, defining it as unreachable.

If both split horizon and poison reverse are enabled, poison reverse takes precedence.

Example

The following command enables split horizon with poison reverse for RIPng on all IPv6 interfaces in the virtual router:

```
enable ripng poisonreverse
```

The following command enables split horizon with poison reverse for all the IPv6 configured VLANs in the virtual router:

```
enable ripng poisonreverse vlan all
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng splithorizon

enable ripng splithorizon {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Enables the split horizon algorithm for RIPng.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Split horizon is a scheme for avoiding problems caused by including routes in updates sent to the router from which the route was learned. Split horizon omits routes learned from a neighbor in updates sent to that neighbor.

Example

The following command enables the split horizon algorithm for RIPng on all IPv6 configured interfaces:

```
enable ripng splithorizon
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

enable ripng triggerupdates

enable ripng triggerupdates {**vlan** *vlan-name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**}

Description

Enables the trigger update mechanism. Triggered updates are a mechanism for immediately notifying a router’s neighbors when the router adds or deletes routes or changes their metric.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies all interfaces.

Default

Enabled.

Usage Guidelines

Triggered updates occur whenever a router changes the metric for a route and it is required to send an update message immediately, even if it is not yet time for a regular update message to be sent. This will generally result in faster convergence, but may also result in more RIPng-related traffic.

Example

The following command enables the trigger update mechanism on all IPv6 configured interfaces:

```
enable ripng triggerupdate
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show ripng

show ripng

Description

Displays RIPng global configuration and runtime information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays RIPng global configuration and runtime information:

```
show ripng
```

The following is sample output from this command:

```
RIPng Routing    : Disabled
Aggregation      : Disabled
Update Interval  : 30               Route Timeout     : 180
Garbage Timeout  : 120
Originate Default: Disabled
Sys Import-Policy: None
Redistribute:
Protocol        Status    Cost Tag    Policy
-------------------------------------------------------------
Direct          Disabled  0    0      none
Static          Disabled  0    0      none
Ospfv3-intra    Disabled  0    0      none
Ospfv3-inter    Disabled  0    0      none
Ospfv3-extern1  Disabled  0    0      none
Ospfv3-extern2  Disabled  0    0      none
IsisL1          Disabled  0    0      none
IsisL2          Disabled  0    0      none
IsisL1Ext       Disabled  0    0      none
IsisL2Ext       Disabled  0    0      none
bgp            Disabled  0 0      none
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show ripng interface

show ripng interface {**detail** | **vlan** *vlan-name* | **tunnel** *tunnel-name*}

Description

Displays RIPng-specific configuration and statistics for the specified interface.

Syntax Description

detail	Specifies detailed display.
vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.

Default

Show summary output for all interfaces.

Usage Guidelines

Displays the RIPng interface configuration and runtime information. If no interface is specified, only the summary data for all the configured interfaces is displayed. If an interface is specified, only the data for that interface is displayed in detail. If the keyword detail is specified, detailed data for all interfaces is displayed.

Example

The following command displays the RIPng configuration summary for all interfaces:

```
show ripng interface
```

The following is sample output from this command:

```
VLAN       IP Address         Flags    Sent     Rcvd     Triggered Cost
                                       Packets  Packets  Updates
v1         22cc::3        /64  rif-pst  106349   106349   3         15
v2         22bb::1        /64  rif-pst  106349   106095   3         1
v3         2abc::1        /120 rif-pst  106351   0        4         1
v4         3ffe::1        /64  rif-pst  106349   139124   3         1

Flags: (f) Interface Forwarding Enabled, (i) Interface RIPng Enabled
       (n) Multinetted Interface, (r) Router RIPng Enabled
       (p) Poison Reverse Enabled, (s) Split Horizon Enabled
       (t) Trigerred Update Enabled.
```

The following command displays RIPng-specific statistics for the VLAN v1:

```
show ripng interface v1
```

The following is sample output from this command:

```
VLAN               : v1                Interface          : 22cc::3/64
Router RIPng       : Enabled           Cost               : 15
Input Policy       : None              Output Policy      : None
Trusted GW Policy  : gw6               Poison Reverse     : Enabled
Split Horizon      : Enabled           Triggered Updates  : Enabled
```

```

Interface Addresses : 22cc::3/64, fe80::280:c8ff:feb9:2855/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

show ripng routes

show ripng routes {**detail**} {**network** *ripngNetworkPrefix*}

Description

Displays all matching routes in the RIPng routing database.

Syntax Description

detail	Displays all available information from the RIPng routing table.
ipv6-prefix	Specifies the route prefix for the routes to show.
prefix-length	Specifies the address mask of the IPv6 prefix.

Default

N/A.

Usage Guidelines

The routes displayed include all routes advertised by RIPng, including routes exported from the system routing table and originated by other protocols, for example OSPFv3 (also called redistributed routes).

Example

The following command displays a summary of RIPng specific routes:

```
show ripng routes
```

The following is sample output from this command:

```
Network                          Next Hop                        Mtr VLAN
*> 2aaa::/64                 fe80::201:30ff:fef4:5ca0%v1    2   v1
*                                 fe80::201:30ff:fe94:f400%v2    2   v2
*> 2bbb::/64                 fe80::201:30ff:fef4:5ca0%v1    2   v1
*                                 fe80::201:30ff:fe94:f400%v2    3   v2
*> 2ccc::/64                 (local)                        1   (direct)
*                                 fe80::201:30ff:fef4:5ca0%v1    2   v1
*                                 fe80::201:30ff:fe94:f400%v2    3   v2
*> 2ddd::/64                 (local)                        1   (direct)
*                                 fe80::201:30ff:fe94:f400%v2    2   v2
```

The following command displays the detailed RIPng route information:

```
show ripng routes detail
```

The following is sample output from this command:

```
IPv6 RIPng routing table entry for 2aaa::/64
Paths: (2 available, best #1)
    fe80::201:30ff:fef4:5ca0%v1 from fe80::201:30ff:fef4:5ca0%v1 (v1)
        Metric 2, tag 0, timeout in 02:38, valid, best
    fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
        Metric 2, tag 0, timeout in 02:44, valid
IPv6 RIPng routing table entry for 2bbb::/64
Paths: (2 available, best #1)
    fe80::201:30ff:fef4:5ca0%v1 from fe80::201:30ff:fef4:5ca0%v1 (v1)
        Metric 2, tag 0, timeout in 02:38, valid, best
    fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
        Metric 3, tag 0, timeout in 02:44, valid
IPv6 RIPng routing table entry for 2ccc::/64
Paths: (3 available, best #1)
    Local from direct
        Metric 1, tag 0, no timeout, valid, best
    fe80::201:30ff:fef4:5ca0%v1 from fe80::201:30ff:fef4:5ca0%v1 (v1)
        Metric 2, tag 0, timeout in 02:38, valid
    fe80::201:30ff:fe94:f400%v2 from fe80::201:30ff:fe94:f400%v2 (v2)
        Metric 3, tag 0, timeout in 02:44, valid
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

unconfigure ripng

unconfigure ripng {**vlan** *vlan-name* | **tunnel** *tunnel-name* | **vlan all** | **tunnel all**}

Description

Resets RIPng parameters to the default value.

Syntax Description

vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
all	Specifies either all IPv6 configured VLANs or all IPv6 tunnels.

Default

N/A.

Usage Guidelines

Issuing the command unconfigure ripng resets all the interfaces and the global configuration to the defaults, and disables RIPng, as that is the default.

Example

The following command resets the RIPng configuration to the default for the VLAN finance:

```
unconfigure rip finance
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Edge, Advanced Edge, or Core license. For licensing information, refer to the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements.”

37 OSPF Commands

This chapter describes commands used for the interior gateway protocol OSPF.

Open Shortest Path First (OSPF) is a link-state protocol that distributes routing information between routers belonging to a single IP domain, also known as an autonomous system (AS). In a link-state routing protocol, each router maintains a database describing the topology of the autonomous system. Each participating router has an identical database maintained from the perspective of that router.

From the link-state database (LSDB), each router constructs a tree of shortest paths, using itself as the root. The shortest path tree provides the route to each destination in the autonomous system. When several equal-cost routes to a destination exist, traffic can distributed among them. The cost of a route is described by a single metric.

OSPF allows parts of a networks to be grouped together into areas. The topology within an area is hidden from the rest of the autonomous system. Hiding this information enables a significant reduction in link-state advertisement (LSA) traffic, and reduces the computations needed to maintain the LSDB. Routing within the area is determined only by the topology of the area.

The three types of routers defined by OSPF are as follows:

- Internal Router (IR)—An internal router has all of its interfaces within the same area.
- Area Border Router (ABR)—An ABR has interfaces belonging to two or more areas. It is responsible for exchanging summary advertisements with other ABRs.

- Autonomous System Border Router (ASBR)—An ASBR acts as a gateway between OSPF and other routing protocols, or other autonomous systems.

Each switch that is configured to run OSPF must have a unique router ID. It is recommended that you manually set the router ID of the switches participating in OSPF, instead of having the switch automatically choose its router ID based on the highest interface IP address. Not performing this configuration in larger, dynamic environments could result in an older LSDB remaining in use.

Note

Do not set the router ID to 0.0.0.0.

Licensing

See the Extreme XOS Concepts Guide, Feature License Requirements for information about licensing requirements.

OSPF Edge Mode

OSPF Edge Mode is a subset of OSPF available on platforms with an Advanced Edge license. There are two restrictions on OSPF Edge Mode:

- At most, four Active OSPF VLAN interfaces are permitted. There is no restriction on the number of Passive interfaces.
- The OSPF Priority on VLANs is zero, and is not configurable. This prevents the system from acting as a DR or BDR.

clear ospf counters

clear ospf counters { **interfaces** [**all** | **vlan** *vlan_name* | **area** *area-identifier*] | **area** [**all** | *area-identifier*] | **virtual-link** [**all** | *router-identifier area-identifier*] | **neighbor** [**all** | **routerid** [*ip-address* {*ip-mask*} | *ipNetmask*] | **vlan** *vlan_name*]| **system**} {**vr** *vrf_name*}

Description

Clears the OSPF counters (statistics).

Syntax Description

vlan_name	Specifies a VLAN name.
router-identifier	Specifies a router interface number.
area-identifier	Specifies an OSPF area.
ip-address	Specifies an IP address
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask

system	Specifies the OSPF system counters.
vrf_name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

The global command clear counters also clears all OSPF counters. This global command is the equivalent of clear ospf counters for OSPF.

To clear OSPF counters on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command clears the OSPF counters for area 1.1.1.1:

```
clear ospf counters area 1.1.1.1
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf add virtual-link

configure ospf add virtual-link *router-identifier area-identifier*

Description

Adds a virtual link connected to another ABR.

Syntax Description

router-identifier	Specifies the router ID of the other end of the link.
area-identifier	Specifies an OSPF area.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- router-identifier—Far-end router interface number.
- area-identifier—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command configures a virtual link between the two interfaces:

```
configure ospf add virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf add vlan area

configure ospf add vlan [*vlan-name* | **all**] **area** *area-identifier* {**passive**} {**vr** *vrf_name*}

Description

Enables OSPF on one or all VLANs (router interfaces).

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
area-identifier	Specifies the area to which the VLAN is assigned.
passive	Specifies to stop sending and receiving hello packets on this interface.
vrf-name	Configures OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command enables OSPF on a VLAN named accounting:

```
configure ospf add vlan accounting area 0.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf add vlan area link-type

configure ospf add vlan *vlan-name* **area** *area-identifier* **link-type** [**auto** | **broadcast** | **point-to-point**] {**passive**}

Description

Configures the OSPF link type.

Syntax Description

vlan-name	Specifies a VLAN name.
area-identifier	Specifies the area to which the VLAN is assigned.
auto	Specifies to automatically determine the OSPF link type based on the interface type.
broadcast	Specifies a broadcast link, such as Ethernet. Routers must elect a DR and a BDR during synchronization.
point-to-point	Specifies a point-to-point link type, such as PPP.
passive	Specifies to stop sending and receiving packets on this interface.

Default

Auto.

Usage Guidelines

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Example

The following command configures the OSPF link type as automatic on a VLAN named accounting:

```
configure ospf add vlan accounting area 0.0.0.1 link-type auto
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area external-filter

configure ospf area *area-identifier* **external-filter** [*policy-map* |**none**]

Description

Configures an external filter policy.

Syntax Description

area-identifier	Specifies the OSPF target area.
policy-map	Specifies a policy.
none	Specifies not to apply an external filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPF areas (an ABR function), a policy can be applied to an OSPF area that filters a set of OSPF external routes from being advertised into that area.

Using the none mode specifies that no external filter is applied.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures an external filter policy, nosales:

```
configure ospf area 1.2.3.4 external-filter nosales
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area interarea-filter

configure ospf area *area-identifier* **interarea-filter** [*policy-map* | **none**]

Description

Configures a global inter-area filter policy.

Syntax Description

area-identifier	Specifies the OSPF target area.
policy-map	Specifies a policy.
none	Specifies not to apply an interarea filter.

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPF areas (an ABR function), a policy can be applied to an OSPF area that filters a set of OSPF inter-area routes from being sourced from any other areas.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures an inter-area filter policy, nosales:

```
configure ospf area 0.0.0.6 interarea-filter nosales
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area add range

configure ospf area *area-identifier* **add range** [*ip-address ip-mask* | *ipNetmask*] [**advertise** | **noadvert**] [**type-3** | **type-7**]

Description

Configures a range of IP addresses in an OSPF area to be aggregated.

Syntax Description

area-identifier	Specifies an OSPF area.
ip-address	Specifies an IP address
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
advertise	Specifies to advertise the aggregated range of IP addresses.
noadvertise	Specifies not to advertise the aggregated range of IP addresses.
type-3	Specifies type 3 LSA, summary LSA.
type-7	Specifies type 7 LSA, NSSA external LSA.

Default

N/A.

Usage Guidelines

If advertised, the aggregated IP range is exported as a single LSA by the ABR.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command is used to summarize a certain range of IP addresses within an area and export them out as a single address:

```
configure ospf area 1.2.3.4 add range 10.1.2.0/24 advertise type-3
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area normal

configure ospf area *area-identifier* **normal**

Description

Configures an OSFP area as a normal area.

Syntax Description

area-identifier	Specifies an OSPF area.

Default

Normal.

Usage Guidelines

A normal area is an area that is not any of the following:

- Stub area
- NSSA

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Virtual links can be configured through normal areas. External routes can be distributed into normal areas.

Example

The following command configures an OSPF area as a normal area:

```
configure ospf area 10.1.0.0 normal
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area stub stub-default-cost

configure ospf area *area-identifier* **stub** [**summary** | **nosummary**] **stub-default-cost** *cost*

Description

Configures an OSPF area as a stub area.

Syntax Description

area-identifier	Specifies an OSPF area.
summary	Specifies that type-3 can be propagated into the area.
nosummary	Specifies that type-3 cannot be propagated into the area.
cost	Specifies a cost metric.

Default

N/A.

Usage Guidelines

A stub area is connected to only one other area. The area that connects to a stub area can be the backbone area. External route information is not distributed into stub areas. Stub areas are used to reduce memory and computation requirements on OSPF routers.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures an OSPF area as a stub area:

```
configure ospf area 0.0.0.6 stub nosummary stub-default-cost 10
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf area timer

configure ospf area *area-identifier* **timer** *retransmit-interval transit-delay hello-interval dead-interval* {*wait-timer-interval*}

Description

Configures the timers for all interfaces in the same OSPF area.

Syntax Description

area-identifier	Specifies an OSPF area.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1- 3,600 seconds.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 0 - 3,600 seconds.

hello-interval	Specifies the interval at which routers send hello packets. The range is 1 - 65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 - 2,147,483,647 seconds.
wait-timer-interval	Specifies the interval between the interface coming up and the election of the DR and BDR. Usually equal to the dead timer interval.

Default

- retransmit interval—Default: 5
- transit delay—Default: 1
- hello interval—Default: 10
- dead interval—Default: 40
- wait timer interval—Default: dead interval

Usage Guidelines

Configuring OSPF timers on a per-area basis is a shorthand for applying the timers and authentication to each VLAN in the area at the time of configuration. If you add more VLANs to the area, you must configure the timers and authentication for the new VLANs explicitly.

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- dead interval—This interval should be a multiple of the hello interval.
- wait timer interval—This interval is required by the OSPF standard to be equal to the router dead interval. Under some circumstances, setting the wait interval to smaller values can help OSPF routers on a broadcast network to synchronize more quickly at the expense of possibly electing an incorrect DR or BDR. This value should not be set to less than the hello interval. The default value is equal to the router dead interval.

Example

The following command sets the timers in area 0.0.0.2:

```
configure ospf area 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf ase-limit

configure ospf ase-limit *number* {**timeout** *seconds*} {**vr** *vrf_name*}

Description

Configures the AS-external LSA limit and overflow duration associated with OSPF database overflow handling.

Syntax Description

number	Specifies the number of external routes that can be held in a link-state database.
seconds	Specifies a duration for which the system has to remain in the overflow state.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

The default for timeout is 0, which indicates that once the router goes into overflow state, it stays there until OSPF is disabled and then re-enabled.

Usage Guidelines

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures the AS-external LSA limit and overflow duration:

```
configure ospf ase-limit 50000 timeout 1800
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf ase-summary add

configure ospf ase-summary add [*ipaddress ip-mask* | *ipNetmask*] **cost** *cost* {**tag** *number*} {**vr** *vrf_name*}

Description

Aggregates AS-external routes in a specified address range.

Syntax Description

ipaddress	Specifies an IP address.
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
cost	Specifies a metric that will be given to the summarized route.
tag	Specifies an OSPF external route tag.
vrf_name	Specifies OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

This command is only valid on an ASBR.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command summarizes AS-external routes:

```
configure ospf ase-summary add 175.1.0.0/16 cost 10
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is availablSe on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf ase-summary delete

configure ospf ase-summary delete [*ip-address ip-mask* | *ipNetmask*] {**vr** *vrf_name*}

Description

Deletes an aggregated OSPF external route.

Syntax Description

ip-address	Specifies an IP address.
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask.
vrf-name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

This command is only valid on an ASBR.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command deletes the aggregated AS-external route:

```
configure ospf ase-summary delete 175.1.0.0/16
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf authentication

configure ospf [**vlan** [*vlan-name* | **all** {**vr** *vrf_name*}] | **area** *area-identifier* {**vr** *vrf_name*}| **virtual-link** *router-identifier area-identifier*] **authentication** [{**encrypted**} **simple-password** *simple-password* | {**encrypted**} **md5** *md5_key_id* *md5_key*| **none**] {**vr** *vrf_name*}

Description

Specifies the authentication password (up to eight characters) or RSA Data Security, Inc. MD5 Message-Digest Algorithm key for one or all interfaces in a specific area or a virtual link.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs
vrf-name	Configures OSPF on a particular VRF.
area-identifier	Specifies an OSPF area.
router-identifier	Specifies the router ID of the remote router.
encrypted	Indicates that the password (or key) is already encrypted (do not use this option).
simple-password	Specifies an authentication password (up to 8 ASCII characters).
md5-key_id	Specifies a RSA Data Security, Inc. MD5 Message-Digest Algorithm key, from 0-255.
md5_key	Specifies a numeric value from 0-65,536. Can also be alphanumeric, up to 26 characters.
none	Disables authentication.

Default

N/A.

Usage Guidelines

The md5_key is a numeric value with the range 0 to 65,536 or alphanumeric. When the OSPF area is specified, authentication information is applied to all OSPF interfaces within the area.

The encrypted option is used by the switch when generating a configuration file and when parsing a switch-generated configuration file. Do not select the encrypted option in the CLI.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication on the VLAN subnet_26:

```
configure ospf vlan subnet_26 authentication md5 32 test
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

New configure ospf bfd

configure ospf vlan *vlan-name* **bfd on | off**

Description

Configures BFD for OSPFv2.

Syntax Description

bfd	Bidirectional forwarding detection
on	Turn on BFD for OSPF interface.
off	Turn off BFD for OSPF interface.

Default

Off.

Usage Guidelines

Use this command to turn BFD protection on or off on a specific OSPF interface.

The following example configures BFD protection on for VLAN 1:

Example

```
configure ospf vlan1 bfd on
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

configure ospf cost

configure ospf [**area** *area-identifier* | **vlan** [*vlan-name* | **all**] {**vr** *vrf_name*}] **cost** [**automatic** | *cost*]

Description

Configures the cost metric of one or all interface(s) or an area.

Syntax Description

area-identifier	Specifies an OSPF area.
vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
vrf-name	Configures OSPF on a particular VRF.
automatic	Determine the advertised cost from the OSPF metric table.
cost	Specifies the cost metric.

Default

The default cost is automatic.

Usage Guidelines

The range is 1 through 65535.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures the cost metric of the VLAN accounting:

```
configure ospf vlan accounting cost 10
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf delete virtual-link

configure ospf delete virtual-link *router-identifier area-identifier*

Description

Removes a virtual link.

Syntax Description

router-identifier	Specifies the router ID of the other end of the link.
area-identifier	Specifies an OSPF area.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes a virtual link:

```
configure ospf delete virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf delete vlan

configure ospf delete vlan [*vlan-name* | **all**] {**vr** *vrf_name*}

Description

Disables OSPF on one or all VLANs (router interfaces).

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
vrf-name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables OSPF on VLAN accounting:

```
configure ospf delete vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf import-policy

configure ospf import-policy [*policy-map* | **none**] {**vr** *vrf_name*}

Description

Configures the import policy for OSPF.

Syntax Description

policy-map	Specifies the policy.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding OSPF routes to the IP route table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove an import policy.

In order to configure OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following example applies the policy campuseast to OSPF routes:

```
configure ospf import-policy campuseast
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf lsa-batch-interval

configure ospf lsa-batch-interval *seconds* {**vr** *vrf_name*}

Description

Configures the OSPF LSA batching interval.

Syntax Description

seconds	Specifies a time in seconds.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

The default setting is 30 seconds.

Usage Guidelines

The range is between 0 (disabled) and 600 seconds, using multiples of 5 seconds. The LSAs added to the LSDB during the interval are batched together for refresh or timeout.

In order to configure OSPF on a particular VRF, you must supply the optional **vr** *vr-name* CLI parameter.

Example

The following command configures the OSPF LSA batch interval to a value of 100 seconds:

```
configure ospf lsa-batch-interval 100
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf metric-table

configure ospf metric-table 10M *cost_10m* **100M** *cost_100m* **1G** *cost_1g* {**10G** *cost_10g*} {**40G** *cost_40g*} {**vr** *vrf_name*}

Description

Configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces, and optionally, the 10 Gbps and 40 Gbps interfaces.

Syntax Description

cost	Specifies the interface cost for the indicated interfaces.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

- 10 Mbps—The default cost is 10.
- 100 Mbps—The default cost is 5.
- 1 Gbps—The default cost is 4.
- 10 Gbps—The default cost is 2.
- 40 Gbps—The default cost is 2.

Usage Guidelines

In order to configure OSPF on a particular VRF, you must supply the optional vr vr-name CLI parameter.

Example

The following command configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces:

```
configure ospf metric-table 10m 20 100m 10 1g 2
```

History

This command was first available in ExtremeXOS 10.1.

The 40 Gbps parameter was added in ExtremeXOS 12.6.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf priority

configure ospf [**area** *area-identifier* {**vr** *vrf_name*} | **vlan** [*vlan-name* | **all** {**vr** *vrf_name*}]] **priority** *priority*

Description

Configures the priority used in the designated router and backup designated router election algorithm for one or all OSPF interface(s) or for all the interfaces within the area.

Syntax Description

area-identifier	Specifies an OSPF area.
vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
vrf-name	Configures OSPF on a particular VRF.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

The range is 0 through 255, and the default setting is 1. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command sets all the interfaces in area 1.2.3.4 to not be selected as the designated router:

```
configure ospf area 1.2.3.4 priority 0
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf restart

configure ospf restart [none | planned | unplanned | both]

Description

Configures the router as a graceful OSPF restart router.

Syntax Description

none	Do not act as a graceful OSPF restart router.
planned	Only act as a graceful OSPF restart router for planned restarts.
unplanned	Only act as a graceful OSPF restart router for unplanned restarts.
both	Act as a graceful OSPF restart router for both planned and unplanned restarts.

Default

The default is none.

Usage Guidelines

This command configures the router as a graceful OSPF router. When configured for planned restarts, it will advertise Grace-LSAs before restarting (for example, during an upgrade of the OSPF module). When configured for unplanned restarts, it will advertise Grace-LSAs after restarting but before sending any Hellos. When configured for both, the router will advertise restarting regardless of whether the restart was planned or unplanned.

Example

The following command configures a router to perform graceful OSPF restarts only for planned restarts:

```
configure ospf restart planned
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf restart grace-period

configure ospf restart grace-period *seconds*

Description

Configures the grace period sent out in Grace-LSAs and used by a restarting router.

Syntax Description

seconds	Grace period, in seconds. The default value is 120 seconds. Range is 1 to 1800 seconds.

Default

The default is 120 seconds.

Usage Guidelines

This command configures the grace period sent out to helper neighbor routers and used by the restarting router. The value of the grace period must be greater that the dead interval, and less than the LSA refresh time.

Example

The following command configures a router to send LSAs with a 240 second grace period during graceful OSPF restarts:

```
configure ospf restart grace-period 240
```

History

This command was first available in ExtremeXOS 11.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf restart-helper

configure ospf [**vlan** [**all** {**vr** *vrf_name*}| *vlan-name*] | **area** *area-identifier* | **virtual-link** *router-identifier area-identifier*] **restart-helper** [**none** | **planned** | **unplanned** | **both**] {**vr** *vrf_name*}

Description

Configures the router as a graceful OSPF restart helper router.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs
vrf-name	Configures OSPF on a particular VRF.
area-identifier	Specifies an OSPF area.
router-identifier	Specifies the router ID of the remote router of the virtual link.
none	Do not act as a graceful OSPF restart helper router.
planned	Only act as a graceful OSPF restart helper router for planned restarts.
unplanned	Only act as a graceful OSPF restart helper router for unplanned restarts.
both	Act as a graceful OSPF restart helper router for both planned and unplanned restarts.

Default

The router default is none.

Usage Guidelines

This command configures the router as a graceful OSPF restart helper router for a single or multiple routers. When the router is acting as a helper, it will continue to advertise the restarting router as if it was fully adjacent.

One OSPF interface may not help more than one restarting router. An OSPF interface may not enter helper mode when the router is performing a graceful restart. All the interfaces to a neighbor router must be configured as graceful restart helpers, or the router will not support graceful restart for its neighbor.

To specify OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures a router to be a graceful OSPF helper router for planned restarts for all routers in area 10.20.30.40:

```
configure ospf area 10.20.30.40 restart-helper planned
```

History

This command was first available in ExtremeXOS 11.3.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf routerid

configure ospf routerid [**automatic** | *router-identifier*] {**vr** *vrf_name*}

Description

Configures the OSPF router ID. If automatic is specified, the switch uses the highest IP interface address as the OSPF router ID.

Syntax Description

automatic	Specifies to use automatic addressing.
router-identifier	Specifies a router address.
vrf-name	Configures OSPF on a particular VRF.

Default

Automatic.

Usage Guidelines

Each switch that is configured to run OSPF must have a unique router ID. It is recommended that you manually set the router ID of the switches participating in OSPF, instead of having the switch automatically choose its router ID based on the highest interface IP address. Not performing this configuration in larger, dynamic environments could result in an older link-state database remaining in use.

Note

Do not set the router ID to 0.0.0.0.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command sets the router ID:

```
configure ospf routerid 10.1.6.1
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf spf-hold-time

configure ospf spf-hold-time *seconds* {**vr** *vrf_name*}

Description

Configures the minimum number of seconds between Shortest Path First (SPF) recalculations.

Syntax Description

seconds	Specifies a time in seconds. The range is 0 to 300 seconds.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

3 seconds.

Usage Guidelines

In order to configure OSPF on a particular VRF, you must supply the optional vr vr-name CLI parameter.

Example

The following command configures the minimum number of seconds between Shortest Path First (SPF) recalculations:

```
configure ospf spf-hold-time 6
```

History

This command was first available in ExtremeXOS 10.1.

The vr vrf_name keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf virtual-link timer

configure ospf virtual-link *router-identifier area-identifier* **timer** *retransmit-interval transit-delay hello-interval dead-interval* {**vr** *vrf_name*}

Description

Configures the timers for a virtual link.

Syntax Description

router-identifier	Specifies the router ID of the other end of the link.
area-identifier	Specifies an OSPF area.
vrf-name	Configures OSPF on a particular VRF.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 - 3,600 seconds.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 0 - 3,600 seconds.
hello-interval	Specifies the interval at which routers send hello packets. The range is 1 - 65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 - 2,147,483,647 seconds.

Default

- retransmit interval—Default: 5
- transit delay—Default: 1
- hello interval—Default: 10
- dead interval—Default: 40
- wait timer interval—Default: dead interval

Usage Guidelines

Configuring OSPF timers on a per-area basis is a shorthand for applying the timers and authentication to each VLAN in the area at the time of configuration. If you add more VLANs to the area, you must configure the timers and authentication for the new VLANs explicitly.

To configure OSPF timers on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command sets the timers on the virtual link in area 0.0.0.2 and remote router ID 6.6.6.6:

```
configure ospf virtual-link 6.6.6.6 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf vlan area

configure ospf vlan *vlan-name* **area** *area-identifier*

Description

Associates a VLAN (router interface) with an OSPF area. By default, all router interfaces are associated with area 0.0.0.0.

Syntax Description

vlan-name	Specifies a VLAN name.
area-identifier	Specifies an OSPF area.

Default

Area 0.0.0.0

Usage Guidelines

Any OSPF network that contains more than one area is required to have an area configured as area 0, also called the backbone. All areas in an autonomous system must be connected to the backbone. When designing networks, you should start with area 0, and then expand into other areas.

The backbone allows summary information to be exchanged between ABRs. Every ABR hears the area summaries from all other ABRs. The ABR then forms a picture of the distance to all networks outside of its area by examining the collected advertisements, and adding in the backbone distance to each advertising router.

When a VLAN is configured to run OSPF, by default you must assign it to an area.

Example

The following command associates the VLAN accounting with an OSPF area:

```
configure ospf vlan accounting area 0.0.0.6
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf vlan neighbor add

configure ospf vlan *vlan-name* **neighbor add** *ip-address*

Description

Configures the IP address of a point-to-point neighbor.

Syntax Description

vlan-name	Specifies a VLAN name.
ip-address	Specifies an IP address.

Default

N/A.

Usage Guidelines

None.

Example

The following command configures the IP address of a point-to-point neighbor:

```
configure ospf vlan accounting neighbor add 10.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf vlan neighbor delete

configure ospf vlan *vlan-name* **neighbor delete** *ip-address*

Description

Deletes the IP address of a point-to-point neighbor.

Syntax Description

vlan-name	Specifies a VLAN name.
ip-address	Specifies an IP address.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes the IP address of a point-to-point neighbor:

```
configure ospf vlan accounting neighbor delete 10.0.0.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospf vlan timer

configure ospf vlan [*vlan-name* | **all** {**vr** *vrf_name*}] **timer** *retransmit-interval transit-delay hello-interval dead-interval* {*wait-timer-interval*}

Description

Configures the OSPF wait interval for a VLAN or all VLANs.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
vrf-name	Configures OSPF on a particular VRF.
retransmit-interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 - 3,600.
transit-delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 0 - 3,600 seconds.
hello-interval	Specifies the interval at which routers send hello packets. The range is 1 - 65,535 seconds.
dead-interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 - 2,147,483,647.
wait-timer-interval	Specifies the interval between the interface coming up and the election of the DR and BDR. Usually equal to the dead timer interval.

Default

- retransmit interval—5 seconds.
- transit delay—1 second.
- hello interval—10 seconds.
- dead interval—40 seconds.
- wait timer interval—dead interval.

Usage Guidelines

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- dead interval—This interval should be a multiple of the hello interval.
- wait timer interval—This interval is required by the OSPF standard to be equal to the router dead interval. Under some circumstances, setting the wait interval to smaller values can help OSPF routers on a broadcast network to synchronize more quickly at the expense of possibly electing an

incorrect DR or BDR. This value should not be set to less than the hello interval. The default value is equal to the router dead interval.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command configures the OSPF wait interval on the VLAN accounting:

```
configure ospf vlan accounting timer 10 15 20 60 60
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

create ospf area

create ospf area *area-identifier* {**vr** *vrf_name*}

Description

Creates an OSPF area.

Syntax Description

area-identifier	Specifies an OSPF area.
vrf-name	Configures OSPF on a particular VRF.

Default

Area 0.0.0.0.

Usage Guidelines

Area 0.0.0.0 does not need to be created. It exists by default.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command creates an OSPF area:

```
create ospf area 1.2.3.4
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

delete ospf area

delete ospf area [*area-identifier* | **all**] {**vr** *vrf_name*}

Description

Deletes an OSPF area or all OSPF areas.

Syntax Description

area-identifier	Specifies an OSPF area.
all	Specifies all areas.
vrf-name	Deletes OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

An OSPF area cannot be deleted if it has an associated interface. Also, area 0.0.0.0 cannot be deleted.

To delete OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command deletes an OSPF area:

```
delete ospf area 1.2.3.4
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf

disable ospf {**vr** *vrf_name*}

Description

Disables the OSPF process for the router.

Syntax Description

vrf-name	Disables OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

In order to disable OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command disables the OSPF process for the router:

```
disable ospf
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf capability opaque-lsa

disable ospf capability opaque-lsa {**vr** *vrf_name*}

Description

Disables opaque LSAs across the entire system.

Syntax Description

vrf-name	Specifies to configure OSPF on a particular VRF.

Default

Enabled.

Usage Guidelines

Opaque LSAs are a generic OSPF mechanism used to carry auxiliary information in the OSPF database. Opaque LSAs are most commonly used to support OSPF traffic engineering.

Normally, support for opaque LSAs is auto-negotiated between OSPF neighbors. In the event that you experience interoperability problems, you can disable opaque LSAs.

If your network uses opaque LSAs, all routers on your OSPF network should support opaque LSAs. Routers that do not support opaque LSAs do not store or flood them. At minimum a well-interconnected subsection of your OSPF network needs to support opaque LSAs to maintain reliability of their transmission.

On an OSPF broadcast network, the designated router (DR) must support opaque LSAs or none of the other routers on that broadcast network will reliably receive them. You can use the OSPF priority feature to give preference to an opaque-capable router, so that it becomes the elected DR.

For transmission to continue reliably across the network, the backup designated router (BDR) must also support opaque LSAs.

In order to disable OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command disables opaque LSAs across the entire system:

```
disable ospf capability opaque-lsa
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf export

disable ospf export [**bgp** | **direct** | **e-bgp** | **i-bgp** | **rip** | **static** | **isis** | **isis-level-1**| **isis-level-1-external** | **isis-level-2** | **isis-level-2-external**] {**vr** *vrf_name*}

Description

Disables redistribution of routes to OSPF.

Syntax Description

bgp	Specifies BGP routes.
direct	Specifies direct routes.
i-bgp	Specifies I-BGP routes.
e-bgp	Specifies E-BGP routes.
rip	Specifies RIP routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

The default setting is disabled.

Usage Guidelines

Use this command to stop OSPF from exporting routes derived from other protocols.

In order to disable OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables OSPF to export BGP-related routes to other OSPF routers:

```
disable ospf export bgp
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf originate-default

disable ospf originate-default {**vr** *vrf_name*}

Syntax Description

vrf-name	Specifies to configure OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

In order to disable OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables generating a default external LSA:

```
disable ospf originate-default
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf restart-helper-lsa-check

disable ospf [**vlan** [**all** {**vr** *vrf_name*}| *vlan-name*] | **area** *area-identifier* | **virtual-link** *router-identifier area-identifier*{**vr** *vrf_name*}] **restart-helper-lsa-check**

Description

Disables the restart helper router from terminating graceful OSPF restart when received LSAs would affect the restarting router.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs
vrf-name	Specifies OSPF on a particular VRF.
area-identifier	Specifies an OSPF area.
router-identifier	Specifies the router ID of the remote router of the virtual link.

Default

The default is enabled.

Usage Guidelines

This command disables the restart helper router from terminating graceful OSPF restart when received LSAs would affect the restarting router.

To disable OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables a router from terminating graceful OSPF restart for all routers in area 10.20.30.40 if it receives an LSA that would affect routing:

```
disable ospf area 10.20.30.40 restart-helper-lsa-check
```

History

This command was first available in ExtremeXOS 11.3.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospf use-ip-router-alert

disable ospf use-ip-router-alert {**vr** *vrf_name*}

Description

Disables the router alert IP option in outgoing OSPF control packets.

Syntax Description

vrf-name	Specifies to configure OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command disables the OSPF router alert IP option:

```
disable ospf use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable snmp traps ospf

disable snmp traps ospf

Description

Disables the OSPF module from sending traps on various OSPF events.

Syntax Description

This command has no arguments or variables.

Default

Disabled

Usage Guidelines

None.

Example

The following command disables the OSPF process:

```
disable snmp traps ospf
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospf

enable ospf {**vr** *vrf_name*}

Description

Enables the OSPF process for the router.

Syntax Description

vrf-name	Enables OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

In order to enable OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter..

Example

The following command enables the OSPF process for the router:

```
enable ospf
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospf capability opaque-lsa

enable ospf capability opaque-lsa {**vr** *vrf_name*}

Description

Enables opaque LSAs across the entire system.

Syntax Description

vrf-name	Specifies to configure OSPF on a particular VRF.

Default

Enabled.

Usage Guidelines

Opaque LSAs are a generic OSPF mechanism used to carry auxiliary information in the OSPF database. Opaque LSAs are most commonly used to support OSPF traffic engineering.

Normally, support for opaque LSAs is auto-negotiated between OSPF neighbors. In the event that you experience interoperability problems, you can disable opaque LSAs.

If your network uses opaque LSAs, all routers on your OSPF network should support opaque LSAs. Routers that do not support opaque LSAs do not store or flood them. At minimum a well-interconnected subsection of your OSPF network needs to support opaque LSAs to maintain reliability of their transmission.

On an OSPF broadcast network, the designated router (DR) must support opaque LSAs or none of the other routers on that broadcast network will reliably receive them. You can use the OSPF priority feature to give preference to an opaque-capable router, so that it becomes the elected DR.

For transmission to continue reliably across the network, the backup designated router (BDR) must also support opaque LSAs.

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command enables opaque LSAs across the entire system:

```
enable ospf capability opaque-lsa
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements.

enable ospf export

enable ospf export [**bgp** | **direct** | **e-bgp** | **i-bgp** | **rip** | **static** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external**] [**cost** *cost* **type** [**ase-type-1** | **ase-type-2**] {**tag** *number*} | *policy-map*] {**vr** *vrf_name*}

Description

Enables redistribution of routes to OSPF.

Syntax Description

bgp	Specifies BGP routes.
i-bgp	Specifies I-BGP routes.
direct	Specifies direct routes.
e-bgp	Specifies E-BGP routes.
rip	Specifies RIP routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies ISIS Level 1 routes.
isis-level-1-external	Specifies ISIS Level 1 External routes.
isis-level-2	Specifies ISIS Level 2 routes.
isis-level-2-external	Specifies ISIS Level 2 External routes.
cost	Specifies a cost metric.
ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.
policy-map	Specifies a policy.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

The default tag number is 0. The default setting is disabled.

Usage Guidelines

After OSPF export is enabled, the OSPF router is considered to be an ASBR. Interface routes that correspond to the interface that has OSPF enabled are ignored.

The cost metric is inserted for all BGP, IS-IS, RIP-learned, static, and direct routes injected into OSPF. If the cost metric is set to 0, the cost is inserted from the route. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag. The tag value in this instance has no relationship with 802.1Q VLAN tagging.

The same cost, type, and tag values can be inserted for all the export routes, or a policy can be used for selective insertion. When a policy is associated with the export command, the policy is applied on every exported route. The exported routes can also be filtered using a policy.

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command enables OSPF to export BGP-related routes using LSAs to other OSPF routers:

```
enable ospf export bgp cost 1 ase-type-1 tag 0
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospf originate-default

enable ospf originate-default {**always**} **cost** *cost* **type** [**ase-type-1** | **ase-type-2**] {**tag** *number*} {**vr** *vrf_name*}

Description

Enables a default external LSA to be generated by OSPF, if no other default route is originated by OSPF by way of RIP and static route re-distribution.

Syntax Description

always	Specifies for OSPF to always advertise the default route.
cost	Specifies a cost metric.
ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.
vrf-name	Specifies to configure OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

If always is specified, OSPF always advertises the default route. If always is not specified, OSPF adds the default LSA if a reachable default route is in the route table.

In order to configure OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command generates a default external type-1 LSA:

```
enable ospf originate-default cost 1 ase-type-1 tag 0
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospf restart-helper-lsa-check

enable ospf [**vlan** [**all** {**vr** *vrf_name*}| *vlan-name*] | **area** *area-identifier* {**vr** *vrf_name*} | **virtual-link** *router-identifier area-identifier*] **restart-helper-lsa-check**

Description

Enables the restart helper router to terminate graceful OSPF restart when received LSAs would affect the restarting router.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs
vrf-name	Enables OSPF on a particular VRF.
area-identifier	Specifies an OSPF area.
router-identifier	Specifies the router ID of the remote router of the virtual link.

Default

The default is enabled.

Usage Guidelines

This command configures the restart helper router to terminate graceful OSPF restart when received LSAs would affect the restarting router. This will occur when the restart-helper receives an LSA that will be flooded to the restarting router or when there is a changed LSA on the restarting router's retransmission list when graceful restart is initiated.

To enable OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter.

Example

The following command configures a router to terminate graceful OSPF restart for all routers in area 10.20.30.40 if it receives an LSA that would affect routing:

```
enable ospf area 10.20.30.40 restart-helper-lsa-check
```

History

This command was first available in ExtremeXOS 11.3.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospf use-ip-router-alert

enable ospf use-ip-router-alert {**vr** *vrf_name*}

Description

Enables the generation of the OSPF router alert IP option.

Syntax Description

vrf-name	Specifies that you configure OSPF on a particular VRF.

Default

Disabled.

Usage Guidelines

In order to configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command enables the OSPF router alert IP option:

```
enable ospf use-ip-router-alert
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable snmp traps ospf

enable snmp traps ospf [**all** | **trap-map** *bit-map*]

Description

Enables the OSPF module to send traps on various OSPF events.

Syntax Description

all	Sets RFC1850 ospfSetTrap to 0x1ffff.
trap-map	Specifies the ospfSetTrap as defined in RFC1850
bit-map	Specifies the ospfSetTrap value in HEX (for example, 0x1ffff for all traps).

Default

The default is disabled.

Usage Guidelines

This command enables the OSPF module to send traps on various OSPF events.

Example

The following command sets ospfSetTrap for all traps:

```
enable snmp traps ospf all
```

History

This command was first available in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf

show ospf {**vr** *vrf_name*}

Description

Displays global OSPF information.

Syntax Description

vrf-name	Specifies OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

In order to display OSPF output on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command displays global OSPF information:

```
show ospf
```

The following is sample output from this command:

```
OSPF                : Disabled         MPLS LSP as Next-Hop: No

isis-level-2-external Disabled 0     0    0          None
```

History

This command was first available in ExtremeXOS 10.1.

The SNMP Traps and 40G parameters were added in ExtremeXOS 12.6.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf area

show ospf area {**detail** | *area-identifier*} {**vr** *vrf_name*}

Description

Displays information about the OSPF area.

Syntax Description

detail	Specifies to display the information in detailed format.
area-identifier	Specifies an OSPF area.
vrf-name	Specifies OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information about OSPF areas:

```
show ospf area
```

The following is sample output from this command:

```
BD-8810Rack3.2 # show ospf area
AREA ID        Type Summ  Def   Num  Num  SPF  Num    LSA
Metric ABR  ASBR Runs LSAs   Checksum
0.0.0.0         NORM ---- ------ 0    0    0    0      0x0
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf ase-summary

show ospf ase-summary {**vr** *vrf_name*}

Description

Displays the OSPF external route aggregation configuration.

Syntax Description

vrf-name	Displays OSPF statistics for a particular VRF.

Default

N/A.

Usage Guidelines

To display OSPF output on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter. .

Example

The following command displays the OSPF external route aggregation configuration:

```
show ospf ase-summary
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf interfaces

show ospf interfaces {**vlan** *vlan-name* | **area** *area-identifier* {**vr** *vrf_name*} | **enabled**}

Description

Displays information about one or all OSPF interfaces.

Syntax Description

vlan-name	Specifies a VLAN name.
area-identifier	Specifies an OSPF area.
vrf-name	Configures OSPF on a particular VRF.
enabled	Displays only OSPF enabled interfaces.

Default

If no argument is specified, all OSPF interfaces are displayed.

Usage Guidelines

To configure OSPF on a particular VRF, you must supply the optional **vr** *vr-name* CLI parameter.

Example

The following command displays information about one or all OSPF interfaces on the VLAN accounting:

```
show ospf interfaces vlan accounting
```

The following output displays BFD protection configuration information:

```
# show ospf interfaces

VLAN      IP Address         AREA ID        Flags      Cost State
Neighbors
HQ_10_0_2  10.0.2.2       /24 0.0.0.0         -rifb--      4/A DR        1
HQ_10_0_5  10.0.5.2       /24 0.0.0.0         -rif---      4/A BDR       1

Flags:  b – BFD protection configured, D - Duplicate address detected on

    Options (0x42): Opaque LSA: Yes
    BFD Session State: Active
```

History

This command was first available in ExtremeXOS 10.1.

The enabled option was added in ExtremeXOS 12.2.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

BFD display output was added in 15.3.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show ospf interfaces detail

show ospf interfaces detail {**vr** *vrf_name*}

Description

Displays detailed information about all OSPF interfaces.

Syntax Description

detail	Specifies to display the information in detailed format.
vrf-name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

To show OSPF on a particular VRF, you must supply the optional vr *vr-name* CLI parameter. .

Example

The following command displays information about all OSPF interfaces:

```
show ospf interfaces detail
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf lsdb

show ospf lsdb {**detail** | **stats**} {**area** [*area-identifier* | **all**]} {{**lstype**} [*lstype* | **all**]} {**lsid** *lsid-address*{*lsid-mask*}} {**routerid** *routerid-address* {*routerid-mask*}} {**interface**[[*ip-address*{*ip-mask*} | *ipNetmask*] | **vlan** *vlan-name*]} {**vr** *vrf_name*}

Description

Displays a table of the current Link-State Database (LSDB).

Syntax Description

detail	Specifies to display all fields of matching LSAs in a multi-line format.
stats	Specifies to display the number of matching LSAs, but not any of their contents.
area-identifier	Specifies an OSPF area.
all	Specifies all OSPF areas.
lstype	Specifies an LS type
lsid	Specifies an LS ID.
lsid-mask	Specifies an LS ID mask
interface	Specifies to display interface types.
routerid-address	Specifies a LSA router ID address.
vlan-name	Specifies a VLAN name.
vrf-name	Configures OSPF on a particular VRF.

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the show ospf lsdb command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospf lsdb
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all with no detail. If detail is specified, each entry includes complete LSA information.

To show OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command displays all areas and all types in a summary format:

```
show ospf lsdb
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospf memory

show ospf memory {**detail** | *memoryTyp*}

Description

Displays OSPF specific memory usage.

Syntax Description

detail	Displays detail information.
memoryType	Specifies the memory type usage to display.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays OSPF specific memory for all types:

```
show ospf memory detail
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show ospf neighbor

show ospf neighbor {**routerid** [*ip-address* {*ip-mask*} | *ipNetmask*]} {**vlan** *vlan-name*} {**detail**} {**vr** *vrf_name*}

Description

Displays information about an OSPF neighbor.

Syntax Description

ip-address	Specifies an IP address
ip-mask	Specifies a subnet mask.
ipNetmask	Specifies IP address / Netmask
vlan-name	Specifies a VLAN name.

detail	Specifies detail information.
vrf-name	Configures OSPF on a particular VRF.

Default

If no argument is specified, all OSPF neighbors are displayed.

Usage Guidelines

To configure OSPF on a particular VRF, you must supply the optional **vr** *vr-name* CLI parameter.

Example

The following command displays information about the OSPF neighbors on the VLAN accounting:

```
show ospf neighbor vlan accounting
```

The following command output displays BFD protection status of all OSPF neighbors.

```
# show ospf neighbor

Neighbor ID     Pri State              Up/Dead Time

```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

BFD output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show ospf virtual-link

show ospf virtual-link {*router-identifier area-identifier*} {**vr** *vrf_name*}

Description

Displays virtual link information about a particular router or all routers.

Syntax Description

router-identifier	Specifies a router interface number.
area-identifier	Specifies an OSPF area.
vrf-name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

The area-identifier refer to the transit area used for connecting the two end-points. The transit area cannot have an area identifier of 0.0.0.0 and cannot be a stub or NSSA area.

To configure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command displays virtual link information about a particular router:

```
show ospf virtual-link 1.2.3.4 10.1.6.1
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** *vrf_name* keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure ospf

unconfigure ospf {**vlan** *vlan-name* | **area** *area-identifier* {**vr** *vrf_name*}}

Description

Resets one or all OSPF interfaces to the default settings.

Syntax Description

vlan-name	Specifies a VLAN name.
area-identifier	Specifies an OSPF area.
vrf-name	Configures OSPF on a particular VRF.

Default

N/A.

Usage Guidelines

ExtremeXOS OSPF allows you to change certain configurable OSPF parameters on the fly. This command selectively resets the configurable parameters to their default values. Following is the list of parameters whose values will be reset to their defaults:

Interface

- Hello interval
- Dead interval
- Transmit delay
- Retransmit interval
- Priority
- Cost
- OSPF graceful restart helper mode

Area

- All the parameters of interfaces associated with this area
- Inter-Area-Prefix_LSA Filter
- AS-External-LSA Filter

OSPF Global

- All parameters of all areas in this OSPF domain
- SPF delay interval

- Interface cost metric table
- Route redistribution
- OSPF graceful restart

To unconfigure OSPF on a particular VRF, you must supply the optional vr ***vr-name*** CLI parameter.

Example

The following command resets the OSPF interface to the default settings on the VLAN accounting:

```
unconfigure ospf accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **vr** ***vrf_name*** keyword and variable were added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements.

38 OSPFv3 Commands

This chapter describes commands used for the IPv6 interior gateway protocol OSPFv3. Open Shortest Path First (OSPFv3) is a link-state protocol that distributes routing information between routers belonging to a single IP domain, also known as an autonomous system (AS). In a link-state routing protocol, each router maintains a database describing the topology of the autonomous system. Each participating router in an area has an identical database maintained from the perspective of that router.

OSPFv3 supports IPv6, and uses commands only slightly modified from that used to support IPv4. OSPFv3 has retained the use of the four-byte, dotted decimal numbers for router IDs, LSA IDs, and area IDs.

From the link-state database (LSDB), each router constructs a tree of shortest paths, using itself as the root. The shortest path tree provides the route to each destination in the autonomous system. When several equal-cost routes to a destination exist, traffic can distributed among them. The cost of a route is described by a single metric.

OSPFv3 allows parts of a networks to be grouped together into areas. The topology within an area is hidden from the rest of the autonomous system. Hiding this information enables a significant reduction in link-state advertisement (LSA) traffic, and reduces the computations needed to maintain the LSDB. Routing within the area is determined only by the topology of the area.

The three types of routers defined by OSPFv3 are as follows:

- Internal Router (IR)—An internal router has all of its interfaces within the same area.
- Area Border Router (ABR)—An ABR has interfaces belonging to two or more areas. It is responsible for exchanging summary advertisements with other OSPFv3 routers.
- Autonomous System Border Router (ASBR)—An ASBR acts as a gateway between OSPFv3 and other routing protocols, or other autonomous systems.

Each switch that is configured to run OSPFv3 must have a unique router ID. It is recommended that you manually set the router ID of the switches participating in OSPFv3, instead of having the switch automatically choose its router ID based on the highest interface IPv4 address, since your router may not have an IPv4 address. Not performing this configuration in larger, dynamic environments could result in an older LSDB remaining in use.

Note

Do not set the router ID to 0.0.0.0.

Licensing

See ExtremeXOS Concepts Guide, Feature License Requirements for information about licensing requirements.

OSPF Edge Mode

OSPF Edge Mode is a subset of OSPF available on platforms with an Advanced Edge license. There are two restrictions on OSPF Edge Mode:

- At most, four Active OSPF VLAN interfaces are permitted. There is no restriction on the number of Passive interfaces.
- The OSPF Priority on VLANs is zero, and is not configurable. This prevents the system from acting as a DR or BDR.

clear ospfv3 counters

clear ospfv3 {**domain** *domainName*} **counters** { **interfaces** [[**vlan** | **tunnel**] **all** | **vlan** *vlan_name* | **tunnel** *tunnel_name* | **area** *area_identifier*] | **area** [**all** | *area_identifier*] | **virtual-link** [**all** | {**routerid**} *router-identifier* {**area**} *area_identifier*] | **neighbor** [**all** | **routerid** *router_identifier* | **vlan** *vlan_name* | **tunnel** *tunnel_name*]| **system**}

Description

Clears the OSPFv3 counters (statistics).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
all	Specifies all VLANs, tunnels, areas, neighbors, or virtual-links.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
router-identifier	Specifies a router identifier, a four-byte, dotted decimal number.
area-identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
system	Specifies the OSPFv3 system/global counters.

Default

N/A.

Usage Guidelines

The global command clear counters also clears all OSPFv3 counters. This global command is the equivalent of clear ospfv3 counters for OSPFv3.

This command can be used to clear various OSPFv3 counters (Interface, Area, Virtual-Link, System etc.). The following is the list of various counters that would be reset to zero by this command:

- Neighbor specific counters

    - Number of state changes
    - Number of events
- Interface/VLAN/Virtual-link/Tunnel specific counters
    - Number of Hellos rxed
    - Number of Hellos txed
    - Number of DB Description rxed
    - Number of DB description txed
    - Number of LS request rxed
    - Number of LS request txed
    - Number of LS update rxed
    - Number of LS update txed
    - Number of LS ack rxed
    - Number of LS ack txed
    - Number of rxed OSPFv3 packet discarded
    - Number of state changes
    - Number of events
- Area Specific counters
    - All counters of interfaces associated with an area
    - Number of SPF runs
- Domain (global)/system specific counters
    - Number of self originated LSAs
    - Number of received LSAs

Example

The following command clears the OSPFv3 counters for area 1.1.1.1:

```
clear ospfv3 counters area 1.1.1.1
```

The following command clears all the OSPFv3 counters for the neighbor 192.168.0.1 in the domain ospf-core:

```
clear ospfv3 domain ospf-core counters neighbor routerid 192.168.0.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 add interface

configure ospfv3 {**domain** *domainName*} **add** [**vlan** *vlan_name* | **tunnel** *tunnel_name*] {**instance-id** *instanceId*} **area** *area_identifier* **link-type** [**auto** | **broadcast** | **point-to-point**] {**passive**}

Syntax Description

Enables OSPFv3 on an interface.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
instanceId	Specifies the instance ID for this interfaces. Range is 0 to 255.
area_identifier	Specifies the area to which the VLAN is assigned.
auto	Specifies to automatically determine the OSPFv3 link type based on the interface type.
broadcast	Specifies a broadcast link, such as Ethernet. Routers must elect a DR and a BDR during synchronization. (This option is not currently supported.)
point-to-point	Specifies a point-to-point link type, such as PPP. (This option is not currently supported.)
passive	Specifies to stop sending and receiving hello packets on this interface.

Default

The default link-type is Auto.

The default instance ID is 0.

Usage Guidelines

This command is used to enable the OSPFv3 protocol on an IPv6 configured VLAN or an IPv6 tunnel. The instance ID is used to control the selection of other routers as neighbors. The router will become a neighbor only with routers that have the same instance ID.

An interface can have only one instance ID associated with it in one OSPFv3 domain. However, the same interface can be associated with another OSPFv3 domain with a different instance ID. An interface associated with two OSPFv3 domains cannot have same instance ID.

To change the instance ID associated with an interface, you must first remove the interface from the OSPFv3 area and then add it back with a different instance ID.

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Enable IPv6 forwarding before enabling OSPFv3, otherwise, you will receive a warning message.

Note

Configuration of the link-type parameter is not supported. OSPFv3 will always consider the link-type to be broadcast.

Example

The following command adds the VLAN accounting (enabling OSPFv3 on the interface), to the area 0.0.0.1 with an instance ID of 2:

```
configure ospfv3 add vlan accounting instance-id 2 area 0.0.0.1 link-type auto
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 add interface all

configure ospfv3 {**domain** *domainName*} **add** [**vlan** | **tunnel**] **all** {**instance-id** *instanceId*} **area** *area_identifier* {**passive**}

Description

Enables OSPFv3 on all VLANs or all tunnels (router interfaces).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
instanceId	Specifies the instance ID for these interfaces. Range is 0 to 255.
area_identifier	Specifies the area to which the interfaces are assigned.
passive	Specifies to stop sending and receiving hello packets on this interface.

Default

OSPFv3 is disabled on the interfaces.

The default instance ID is 0.

Usage Guidelines

This command is used to enable the OSPFv3 protocol on all IPv6 configured VLANs or all IPv6 tunnels. The instance ID is used to control the selection of other routers as neighbors. The router will become a neighbor only with routers that have the same instance ID.

An interface can have only one instance ID associated with it in one OSPFv3 domain. However, the same interface can be associated with another OSPFv3 domain with a different instance ID. An interface associated with two OSPFv3 domains cannot have same instance ID.

To change the instance ID associated with an interface, you must first remove the interface from the OSPFv3 area and then add it back with a different instance ID.

The passive parameter indicates that the router only synchronizes and listens, and does not originate or send any new information on the interface.

Example

The following command enables OSPFv3 on all IPv6 tunnels:

```
configure ospfv3 add tunnel all area 0.0.0.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 add virtual-link

configure ospfv3 {**domain** *domainName*} **add virtual-link** {**routerid**} *router_identifier* {**area**} *area_identifier*

Description

Adds a virtual link connected to another ABR.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies the transit area identifier, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- router-identifier—Far-end router identifier, a four-byte, dotted decimal number.
- area-identifier—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command configures a virtual link with router ID 10.1.2.1 through the transit area 10.1.0.0:

```
configure ospfv3 add virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area add range

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **add range** *ipv6netmask* [**advertise** | **noadvert**] **inter-prefix**

Description

Configures a range of IP addresses in an OSPFv3 area to be aggregated.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
ipv6netmask	Specifies an IPv6 address / prefix length.
advertise	Specifies to advertise the aggregated range of IP addresses.
noadvert	Specifies not to advertise the aggregated range of IP addresses.
inter-prefix	Specifies aggregate, inter-area-prefix LSAs.

Default

No OSPFv3 inter-area-prefix LSAs are configured.

Usage Guidelines

If advertised, the aggregated IP range is exported as a single LSA by the ABR.

Example

The following command is used to summarize a certain range of IP addresses within an area and export them out as a single address to area 0.0.0.1:

```
configure ospfv3 area 0.0.0.1 add range 2aaa:456:3ffe::/64 advertise inter-
prefix
```

History

This command was first available in ExtremeXOS 11.2

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area cost

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **cost** [**automatic** | *cost*]

Description

Configures the cost of sending a packet to all interfaces belonging to an area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
automatic	Determine the advertised cost from the OSPFv3 metric table.
cost	Specifies the cost metric. Range is 1 to 65535.

Default

The default cost is automatic. The default domain is OSPF-Default.

Usage Guidelines

Use this command to set the cost of the links belonging to area manually, if the default cost needs to be overwritten. The interface cost is advertised as the link cost in router-LSA.

Example

The following command configures the cost of area 0.0.0.1 to 10. All the links of this area will inherit the area's cost value of 10.

```
configure ospfv3 domain ospf-enterprise area 0.0.0.1 cost  10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area delete range

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **delete range** *ipv6netmask*

Description

Removes a range of IP addresses in an OSPFv3 area to be aggregated.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
ipv6netmask	Specifies an IPv6 address / prefix length.

Default

No OSPFv3 inter-area-prefix LSAs are configured.

Usage Guidelines

If you attempt to delete a range that was not configured, you will receive an error message.

Example

The following command is used to delete a summary network from area 0.0.0.1:

```
configure ospfv3 area 0.0.0.1 delete range 2aaa:456:3ffe::/64
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area external-filter

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **external-filter** [*policy_map* |**none**]

Description

Configures an external filter policy.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies the OSPFv3 target area.

policy_map	Specifies a policy.
none	Specifies not to apply an external filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

For switches configured to support multiple OSPFv3 areas (an ABR function), a policy can be applied to an OSPFv3 area that filters a set of OSPFv3 external routes from being advertised into that area, in other words, filtering some of the inbound AS-external-LSAs.

OPSFv3 routers that do not have enough memory to hold the entire AS-external-LSAa should configure an external area filter to drop part of the external-LSAs. Configuring this policy will enable routers with limited resources to be put into an OSPFv3 network.

Using the none mode specifies that no external filter is applied.

Policy files for this command will only recognize the following policy attributes:

- Match attributes
  - nlri <IPv6-address>/<mask-len>
- Action (set) attributes
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example of an external area policy file:

```
entry one {
    if match any{
        nlri 2001:db8:3e5c::/48;
        nlri 2001:db8:2146:2341::/64;
    } then {
        deny;
    }
}
```

Example

The following command configures an external filter policy, nosales for area 1.2.3.4:

```
configure ospfv3 area 1.2.3.4 external-filter nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area interarea-filter

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **interarea-filter** [*policy_map* |**none**]

Description

Configures an inter-area filter policy.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies the OSPFv3 target area.
policy_map	Specifies a policy.
none	Specifies not to apply an inter-area filter (removes the existing policy, if any).

Default

N/A.

Usage Guidelines

ExtremeXOS OSPFv3 can apply an inter-area policy to filter some inter-area-prefix-LSAs and inter-area-router-LSAs from other areas. This can reduce the size of link state database of routers belonging to the area.

Using the none mode specifies that no external filter is applied.

Policy files for this command will only recognize the following policy attributes:

- Match attributes
  - nlri <IPv6-address>/<mask-len>
- Action (set) attributes
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example of an external area policy file:

```
entry one {
    if match any{
        nlri 2001:db8:3e5c::/48;
        nlri 2001:db8:2146:2341::/64;
    } then {
        deny;
    }
}
entry two {
    if match any{
        nlri 2001:db8:444::/48;
        nlri 2001:db8:541f:65bd::/64;
    } then {
        permit;
    }
}
```

Example

The following command configures an inter-area filter policy, nosales for area 1.2.3.4:

```
configure ospfv3 area 1.2.3.4 interarea-filter nosales
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area normal

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **normal**

Description

Configures an OSFPv3 area as a normal area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

Normal.

Usage Guidelines

A normal area is an area that is not any of the following:

- Stub area
- NSSA

Virtual links can be configured through normal areas. External routes can be distributed into normal areas.

Example

The following command configures an OSPFv3 area as a normal area:

```
configure ospfv3 area 10.1.0.0 normal
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area priority

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **priority** *priority*

Description

Configures the priority used in the designated router and backup designated router election algorithm for all the interfaces within the area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

When two routers are attached to a network, both attempt to become the designated router. The one with the higher priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

Example

The following command sets all the interfaces in area 1.2.3.4 to not be selected as the designated router:

```
configure ospfv3 area 1.2.3.4 priority 0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area stub

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **stub** [**summary** | **nosummary**] **stub-default-cost** *cost*

Description

Configures an OSPFv3 area as a stub area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
summary	Specifies that inter-area LSAs can be propagated into the area.
nosummary	Specifies that inter-area LSAs cannot be propagated into the area.
cost	Specifies a cost metric.

Default

N/A.

Usage Guidelines

A stub area is connected to only one other area. The area that connects to a stub area can be the backbone area. External route information is not distributed into stub areas. Stub areas are used to reduce memory consumption requirements on OSPFv3 routers.

Example

The following command configures an OSPFv3 area as a stub area:

```
configure ospfv3 area 0.0.0.6 stub nosummary stub-default-cost 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 area timer

configure ospfv3 {**domain** *domainName*} **area** *area_identifier* **timer** {**retransmit-interval**} *retransmit_interval* {**transit-delay**} *transit-delay* {**hello-interval**} *hello_interval* {**dead-interval**} *dead_interval*

Description

Configures the timers for all interfaces in the same OSPFv3 area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 3600 seconds.
transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 3600 seconds.

hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65535 seconds.

Default

- retransmit interval—Default: 5 seconds
- transit delay—Default: 1 second
- hello interval—Default: 10 seconds
- dead interval—Default: 40 seconds

Usage Guidelines

Configuring OSPFv3 timers on a per-area basis is a shorthand for applying the timers to each VLAN and tunnel in the area at the time of configuration. If you add more VLANs or tunnels to the area, you must configure the timers for them explicitly.

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- dead interval—This interval should be a multiple of the hello interval.

The value of the dead interval and the hello interval must be same for all OSPFv3 routers connected to a common link. The value of the dead interval and the hello interval are advertised by OSPFv3 in Hello packets. The shorter the hello interval, the earlier topological changes will be detected, but more routing traffic will ensue.

The retransmit interval must be greater than the expected round trip delay between any two routers on the attached network. The setting of this parameter must be conservative, or needless retransmission will result.

Note

The wait interval for the interface is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers in area 0.0.0.2:

```
configure ospfv3 area 0.0.0.2 timer 10 1 20 200
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 bfd

configure ospfv3 vlan *vlan-name* **bfdon | off**

Description

Configures BFD for OSPFv3.

Syntax Description

bfd	Bidirectional forwarding detection
on	Turn on BFD for OSPFv3 interface.
off	Turn off BFD for OSPFv3 interface.

Default

Off.

Usage Guidelines

Use this command to turn on or off BFD protection on a specific OSPFv3 interface.

The following example configures BFD protection on for VLAN 1:

Example

```
configure ospfv3 vlan1 bfd on
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on all platforms.

configure ospfv3 delete interface

configure ospfv3 {**domain** *domainName*} **delete** [**vlan** *vlan_name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**]

Description

Disables OSPFv3 on one or all VLANs or tunnels (router interfaces).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all VLANs, or tunnels.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables OSPFv3 on VLAN accounting:

```
configure ospfv3 delete vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 delete virtual-link

configure ospfv3 {**domain** *domainName*} **delete virtual-link** {**routerid**} *router_identifier* {**area**} *area_identifier*

Description

Deletes a virtual link connected to another ABR.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies the transit area identifier, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

A virtual link provides a logical path between the ABR of the disconnected area and the ABR of the normal area that connects to the backbone. A virtual link must be established between two ABRs that have a common area, with one ABR connected to the backbone. Specify the following:

- router-identifier—Far-end router identifier, a four-byte, dotted decimal number.
- area-identifier—Transit area used for connecting the two end-points. The transit area cannot have the area identifier 0.0.0.0. and cannot be a stub area or an NSSA.

Example

The following command deletes a virtual link with router ID 10.1.2.1 through the transit area 10.1.0.0:

```
configure ospfv3 delete virtual-link 10.1.2.1 10.1.0.0
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 import-policy

configure ospfv3 {**domain** *domainName*} **import-policy** [*policy_map* | **none**]

Description

Configures the import policy for OSPFv3.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
policy_map	Specifies the policy.

Default

No policy.

Usage Guidelines

An import policy is used to modify route attributes while adding OSPFv3 routes to the IP route table. The import policy cannot be used to determine the routes to be added to the routing table.

Use the none option to remove the policy association.

Policy files for this command will recognize only the following policy attributes:

- Match attributes
  - nlri <IPv6-address>/<mask-len>
  - route-origin [ospfv3 | ospfv3-extern1 | ospfv3-extern2 | ospfv3-inter | ospfv3-intra]
- Action (set) attributes
  - cost <cost>
  - tag <number>

Any other policy attribute will not be recognized and will be ignored.

Example

The following example applies the policy campuseast to OSPFv3 routes:

```
configure ospfv3 import-policy campuseast
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 interface area

configure ospfv3 {**domain** *domainName*} [**vlan** *vlan_name* | **tunnel** *tunnel_name*] **area** *area_identifier*

Description

Moves an interface from one OSPFv3 area to another.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan-name	Specifies an IPv6 configured VLAN.
tunnel-name	Specifies an IPv6 tunnel.
area-identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

Area 0.0.0.0

Usage Guidelines

Use this command to move an already configured interface from one area to another. The instance ID associated with the interface will be unchanged.

Example

The following command moves the VLAN accounting to the OSPFv3 area 0.0.0.6:

```
configure ospfv3 vlan accounting area 0.0.0.6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 interface cost

configure ospfv3 {**domain** *domainName*} [**vlan** *vlan_name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**]] **cost** [**automatic** | *cost*]

Description

Configures the cost of one or all interface(s).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
automatic	Determine the advertised cost from the OSPFv3 metric table.
cost	Specifies the cost metric. Range is 1 to 65535.

Default

The default cost is automatic.

Usage Guidelines

Use this command to set the cost of an interface (a VLAN or tunnel) manually, if the default cost needs to be overwritten. The interface cost is advertised as the link cost in router-LSA.

Example

The following command configures the cost metric of the VLAN accounting:

```
configure ospfv3 vlan accounting cost 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 interface priority

configure ospfv3 {**domain** *domainName*} [**vlan** *vlan_name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**] **priority** *priority*

Description

Configures the priority used in the designated router and backup designated router election algorithm for one or all OSPFv3 interface(s).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
priority	Specifies a priority range. The range is 0 through 255.

Default

The default setting is 1.

Usage Guidelines

When two routers are attached to a network, both attempt to become the designated router. The one with the higher priority takes precedence. If there is a tie, the router with the higher router ID takes precedence. Setting the value to 0 ensures that the router is never selected as the designated router or backup designated router.

Example

The following command sets the priority of the interface VLAN corporate to 10:

```
configure ospfv3 domain ospf-internal vlan corporate priority 10
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 interface timer

configure ospfv3 {**domain** *domainName*} [**vlan** *vlan_name* | **tunnel** *tunnel_name* | [**vlan** | **tunnel**] **all**] **timer** {**retransmit-interval**} *retransmit_interval* {**transit-delay**} *transit_delay* {**hello-interval**} *hello_interval* {**dead-interval**} *dead_interval*

Description

Configures the timers for all interfaces in the same OSPFv3 area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
all	Specifies all IPv6 configured VLANs or all IPv6 tunnels.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 3600 seconds.
transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 3600 seconds.
hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65535 seconds.

Default

- retransmit interval—Default: 5 seconds
- transit delay—Default: 1 second
- hello interval—Default: 10 seconds
- dead interval—Default: 40 seconds

Usage Guidelines

Use this command to configure the OSPFv3 timers on a per-interface basis.

Specify the following:

- retransmit interval—If you set an interval that is too short, unnecessary retransmissions will result.
- transit delay—The transit delay must be greater than 0.
- hello interval—Smaller times allow routers to discover each other more quickly, but also increase network traffic.
- dead interval—This interval should be a multiple of the hello interval.

The value of the dead interval and the hello interval must be same for all OSPFv3 routers connected to a common link. The value of the dead interval and the hello interval are advertised by OSPFv3 in Hello packets. The shorter the hello interval, the earlier topological changes will be detected, but more routing traffic will ensue.

The retransmit interval must be greater than the expected round trip delay between any two routers on the attached network. The setting of this parameter must be conservative, or needless retransmission will result.

Note

The wait interval for the interface is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers for the VLAN corporate:

```
configure ospfv3 domain ospf-default vlan corporate timer retransmit-interval
10 transit-delay 2 hello-interval 20 dead-interval 80
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 metric-table

configure ospfv3 {**domain** *domainName*} **metric-table 10M** *cost_10m* **100M** *cost_100m* **1G** *cost_1g* {**10G** *cost_10g*} {**40G** *cost_40g*}

Description

Configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces, and optionally, the 10 Gbps and 40 Gbps interfaces.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
cost_x	Specifies the interface cost for the indicated interfaces. Range is 1 to 65535.

Default

- 10 Mbps—The default cost is 100.
- 100 Mbps—The default cost is 50.
- 1 Gbps—The default cost is 40.
- 10 Gbps—The default cost is 20.
- 40 Gbps—The default cost is 20.

Usage Guidelines

The value of the costs cannot be greater for higher speed interfaces. In other words, the following condition must be true:

cost_10m >= cost_100m >= cost_1g >= cost_10g >=cost_40g

Example

The following command configures the automatic interface costs for 10 Mbps, 100 Mbps, and 1 Gbps interfaces:

```
configure ospfv3 metric-table 10m 200 100m 100 1g 20
```

The following example displays the output of the show ospfv3 command:

```
show ospfv3
OSPF Domain Name    : OSPF-Default

isis-level-2-external  Disabled  20        2     ---    none
```

History

This command was first available in ExtremeXOS 11.2.

The 40 Gbps parameter was added in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 routerid

configure ospfv3 {**domain** *domainName*} **routerid** [**automatic** | *router_identifier*]

Description

Configures the OSPFv3 router ID. If automatic is specified, the switch uses the highest IPv4 interface address as the OSPFv3 router ID.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
automatic	Specifies to use automatic addressing.
router_identifier	Specifies a router identifier, a four-byte, dotted decimal number.

Default

Automatic.

Usage Guidelines

Each switch that is configured to run OSPFv3 must have a unique router ID. The router ID is a four-byte, dotted decimal number, like an IPv4 address. Even though the IP address format has changed from IPv4 to IPv6, the router ID format has not. It is recommended that you manually set the router ID of the switches participating in OSPFv3, instead of having the switch automatically choose its router ID based on the highest interface IPv4 address (if it exists). Not performing this configuration in larger, dynamic environments could result in an older link-state database remaining in use.

This command is accepted only when OSPFv3 is globally disabled.

Note

Do not set the router ID to 0.0.0.0.

Example

The following command sets the router ID to 10.1.6.1:

```
configure ospfv3 routerid 10.1.6.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 spf-hold-time

configure ospfv3 {**domain** *domainName*} **spf-hold-time** *seconds*

Description

Configures the minimum number of seconds between Shortest Path First (SPF) recalculations.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
seconds	Specifies a time in seconds. The range is 0 to 300 seconds.

Default

3 seconds.

Usage Guidelines

Setting the interval too high will force OSPFv3 to run SPF calculations less frequently. This will reduce the CPU load, but will cause delay in routes getting updated in the IP routing table. Setting the interval too low will decreases the interval between SPF calculations, but will increase the processing load on CPU.

Example

The following command configures the minimum number of seconds between Shortest Path First (SPF) recalculations:

```
configure ospfv3 spf-hold-time 6
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

configure ospfv3 virtual-link timer

configure ospfv3 {**domain** *domainName*} **virtual-link** {**routerid**} *router_identifier* {**area**} *area_identifier* **timer** {**retransmit-interval**} *retransmit_interval* {**transit-delay**} *transit_delay* {**hello-interval**} *hello_interval* {**dead-interval**} *dead_interval*

Description

Configures the timers for a virtual link.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
router_identifier	Specifies the router ID of the other end of the link.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
retransmit_interval	Specifies the length of time that the router waits before retransmitting an LSA that is not acknowledged. The range is 1 to 3600 seconds.
transit_delay	Specifies the length of time it takes to transmit an LSA packet over the interface. The range is 1 to 3600 seconds.
hello_interval	Specifies the interval at which routers send hello packets. The range is 1 to 65535 seconds.
dead_interval	Specifies the interval after which a neighboring router is declared down due to the fact that hello packets are no longer received from the neighbor. The range is 1 to 65535 seconds.

Default

- retransmit interval—Default: 5 seconds
- transit delay—Default: 1 second
- hello interval—Default: 10 seconds
- dead interval—Default: 40 seconds

Usage Guidelines

In OSPFv3, all areas must be connected to a backbone area. If the connection to the backbone is lost, it can be repaired by establishing a virtual link.

The smaller the hello interval, the faster topological changes will be detected, but more routing traffic will ensue.

The setting of the retransmit interval should be conservative, or needless retransmissions will result. The value should be larger for serial lines and virtual links.

The transmit delay value should take into account the transmission and propagation delays for the interface.

Note

The wait interval is not separately configurable. It is always equal to the dead interval.

Example

The following command sets the timers on the virtual link to router 6.6.6.6 transiting area 0.0.0.2:

```
configure ospfv3 virtual-link 6.6.6.6 area 0.0.0.2 timer 10 transit-delay 1
hello-interval 20 dead-interval 200
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

create ospfv3 area

create ospfv3 {**domain** *domainName*} **area** *area_identifier*

Description

Creates an OSPFv3 area.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

Area 0.0.0.0

Usage Guidelines

Area 0.0.0.0 does not need to be created. It exists by default.

Example

The following command creates a non-backbone OSPFv3 area:

```
create ospfv3 area 1.2.3.4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

delete ospfv3 area

delete ospfv3 {**domain** *domainName*} **area** [*area_identifier* | **all**]

Description

Deletes an OSPFv3 area or all OSPFv3 areas.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
all	Specifies all areas.

Default

N/A.

Usage Guidelines

An OSPFv3 area cannot be deleted if it has an associated interface. Also, area 0.0.0.0 cannot be deleted.

Example

The following command deletes an OSPFv3 area:

```
delete ospfv3 area 1.2.3.4
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospfv3

disable ospfv3 {**domain** *domainName*}

Description

Disables OSPFv3 for the router.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables OSPFv3 for the router:

```
disable ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

disable ospfv3 export

disable ospfv3 {**domain** *domainName*} **export** [**direct** | **ripng** | **static** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external** | **bgp**]

Description

Disables redistribution of routes to OSPFv3.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
direct	Specifies direct routes.
ripng	Specifies RIP routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies BGP IPv6 routes.

Default

The default setting is disabled.

Usage Guidelines

Use this command to stop OSPFv3 from exporting routes derived from other protocols.

Example

The following command disables OSPFv3 to export RIPng routes to other OSPFv3 routers:

```
disable ospfv3 export ripng
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospfv3

enable ospfv3 {**domain** *domainName*}

Description

Enables OSPFv3 for the router.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.

Default

N/A.

Usage Guidelines

When OSPFv3 is enabled, it will start exchanging Hellos on all of it's active interfaces. It will also start exporting routes into OSPFv3 routing domain from other protocols, if enabled.

When OSPFv3 is disabled, it will release all the run-time allocated resources like adjacencies, link state advertisements, run-time memory, etc.

OSPFv3 can be enabled successfully if and only if:

- At least one of the VLANs in the current virtual router has one IPv4 address configured

—OR—

- You explicitly configure the OSPFv3 router ID, a four-byte, dotted decimal number

Example

The following command enables OSPFv3 for the router:

```
enable ospfv3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ospfv3 export

enable ospfv3 {**domain** *domainName*} **export** [**direct** | **ripng** | **static** | **isis** | **isis-level-1** | **isis-level-1-external** | **isis-level-2** | **isis-level-2-external**| **bgp**] [**cost<cost> type** [**ase-type-1** | **ase-type-2**] | *policy_map*]

Description

Enables redistribution of routes to OSPFv3.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
direct	Specifies direct routes.
ripng	Specifies RIPng routes.
static	Specifies static routes.
isis	Specifies IS-IS routes.
isis-level-1	Specifies IS-IS Level 1 routes.
isis-level-1-external	Specifies IS-IS Level 1 External routes.
isis-level-2	Specifies IS-IS Level 2 routes.
isis-level-2-external	Specifies IS-IS Level 2 External routes.
bgp	Specifies BGP IPv6 routes.
cost	Specifies a cost metric.

ase-type-1	Specifies AS-external type 1 routes.
ase-type-2	Specifies AS-external type 2 routes.
number	Specifies a tag value.
policy_map	Specifies a policy.

Default

The default tag number is 0. The default setting is disabled.

Usage Guidelines

The cost metric is inserted for all RIPng-learned, static, and direct routes injected into OSPFv3. If the cost metric is set to 0, the cost is inserted from the route. The tag value is used only by special routing applications. Use 0 if you do not have specific requirements for using a tag. The tag value in this instance has no relationship with 802.1Q VLAN tagging.

Note

Setting the tag value is not supported in this release.

The same cost, type, and tag values can be inserted for all the export routes, or a policy can be used for selective insertion. When a policy is associated with the export command, the policy is applied on every exported route. The exported routes can also be filtered using a policy.

Policy files for this command will only recognize the following policy attributes:

- Match attributes
  - nlri <IPv6-address>/<mask-len>
- Action (set) attributes
  - cost <cost>
  - tag <number>
  - cost-type [ase-type-1 | ase-type-2]
  - permit
  - deny

Any other policy attribute will not be recognized and will be ignored.

The following is an example OSPFv3 export policy file:

```
entry first {
    if match any{
        nlri 2001:db8:200:300:/64;
        nlri 2001:db8:2146:23d1::/64;
        nlri 2001:db8:af31:3d0::/64;
        nlri 2001:db8:f6:2341::/64;
    } then {
        deny;
    }
}
entry second {
```

```
    if match any{
        nlri 2001:db8:304::/48;
        nlri 2001:db8:ca11::/48;

        nlri 2001:db8:f6a6::/48;
    } then {
        cost 220;
        cost-type ase-type-2;
        permit;
    }
}
```

Example

The following command enables OSPFv3 to export RIPng-related routes and associates a policy redist:

```
enable ospfv3 export ripng redist
```

History

This command was first available in ExtremeXOS 11.2.

The tag keyword was removed in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3

show ospfv3 {**domain** *domainName*}

Description

Displays global OSPFv3 information.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays global OSPFv3 information:

```
show ospfv3
```

The following is sample output:

```
OSPF Domain Name    : OSPF-Default
OSPFv3              : Disabled          RouterId            : 0.0.0.0

```

History

This command was first available in ExtremeXOS 11.2.

The 40G parameter was added in ExtremeXOS 12.6.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3 area

show ospfv3 {**domain** *domainName*} **area** {*area_identifier* | **detail**}

Description

Displays information about OSPFv3 areas.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
detail	Specifies to display the information in detailed format.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays summary information about the OSPFv3 areas:

```
show ospfv3 area
```

The following is sample output:

```
AREA ID         Type Summ  Def   Num  Num  Num  SPF  Num    LSA
Metric ABR  ASBR Intf Runs LSAs   Checksum
0.0.0.0          NORM ---- ------ 0    0    1    7    7      0x3155b
1.0.0.0          NORM ---- ------ 1    1    1    6    9      0x4793d

show ospfv3 interfaces

show ospfv3 {**domain** *domainName*} **interfaces** {**vlan** *vlan_name* | **tunnel** *tunnel_name* | **area** *area_identifier* | **detail**}

Description

Displays information about one or all OSPFv3 interfaces.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
detail	Specifies to display the information in detailed format.

Default

If no argument is specified, all OSPFv3 interfaces are displayed.

Usage Guidelines

None.

Example

The following command shows a summary of the OSPFv3 interfaces:

```
show ospfv3 interfaces
```

The following is sample output from the command:

```
VLAN/Tunnel IPv6 Address                  AREA ID         Flags Cost
State   Neighbors
ixia        4:5:6:7::1/64                 2.0.0.0         -rif  5/A
DR      1

```

History

This command was first available in ExtremeXOS 11.2.

BFD example output was added in 15.3.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in Feature License Requirements in the ExtremeXOS Concepts Guide.

show ospfv3 lsdb

show ospfv3 {**domain** *domainName*} **lsdb** {**detail**} {**area** [*area_identifier* | **all**] {**lstype** [**router** | **network** | **inter-prefix** | **inter-router** | **intra-prefix**]} | [**vlan** [*vlan_name* | **all**] | **tunnel** [*tunnel_name* | **all**]] {**lstype link**} | **lstype** [**as-external** | **router** | **network** | **inter-prefix** | **inter-router** | **intra-prefix** | **link**]} {**lsid** *lsid_address*} {**adv-router** *router_identifier*}

Description

Displays a table of the current Link-State Database (LSDB).

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
detail	Specifies to display all fields of matching LSAs in a multi-line format.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
all	Specifies all OSPFv3 areas, IPv6 configured VLANs, or IPv6 tunnels.
link	Link LSA
router	Router LSA
network	Network LSA
inter-prefix	Inter Area Prefix LSA
inter-router	Inter Area Router LSA
intra-prefix	Intra Area Prefix LSA
as-external	AS External LSA
lsid_address	Specifies the link state ID of the LSA.
routerid_identifier	Specifies the router identifier of the advertising router.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the show ospfv3 lsdb command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospfv3 lsdb
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all with no detail. If detail is specified, each entry includes complete LSA information.

Example

The following command displays all areas and all types in a summary format:

```
show ospfv3 lsdb
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3 lsdb stats

show ospfv3 {**domain** *domainName*} **lsdb stats** {**area** [*area_identifier* | **all**] {**lstype** [**router** | **network** | **inter-prefix** | **inter-router** | **intra-prefix**]} | [**vlan** [*vlan_name* | **all**] | **tunnel** [*tunnel_name* | **all**]] {**lstype link**} | **lstype** [**as-external** | **router** | **network** | **inter-prefix** | **inter-router** | **intra-prefix** | **link**]} {**lsid** *lsid_address*} {**adv-router** *router_identifier*}

Description

Displays a table of the current Link-State Database (LSDB) statistics.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
all	Specifies all OSPFv3 areas, IPv6 configured VLANs, or IPv6 tunnels.
link	Link LSA
router	Router LSA
network	Network LSA
inter-prefix	Inter Area Prefix LSA
inter-router	Inter Area Router LSA
intra-prefix	Intra Area Prefix LSA
as-external	AS External LSA
lsid_address	Specifies the link state ID of the LSA.
routerid_identifier	Specifies the router identifier of the advertising router.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.

Default

Display in summary format.

Usage Guidelines

ExtremeXOS provides several filtering criteria for the show ospfv3 lsdb stats command. You can specify multiple search criteria and only the results matching all of the criteria are displayed. This allows you to control the displayed entries in large routing tables.

A common use of this command is to omit all optional parameters, resulting in the following shortened form:

```
show ospfv3 lsdb stats
```

The shortened form displays all areas and all types in a summary format.

You can filter the display using either the area ID, the remote router ID, or the link-state ID. The default setting is all.

Example

The following command displays all areas and all types in a summary format:

```
show ospfv3 lsdb stats
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3 memory

show ospfv3 memory {**detail** | *memoryTyp*}

Description

Displays OSPFv3 specific memory usage.

Syntax Description

detail	Displays detail information.
memoryType	Specifies the memory type usage to display.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays OSPFv3 specific memory for all types:

```
show ospfv3 memory detail
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3 neighbor

show ospfv3 {**domain** *domainName*} **neighbor** {**routerid** *ip_address*} {**vlan** *vlan_name* | **tunnel** *tunnel_name*} {**detail**}

Description

Displays information about an OSPFv3 neighbor.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
ip_address	Specifies a neighbor router ID.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.
detail	Specifies detail information.

Default

If no argument is specified, all OSPFv3 neighbors are displayed.

Usage Guidelines

None.

Example

The following command displays information about the OSPFv3 neighbors on the VLAN accounting:

```
show ospfv3 neighbor vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

show ospfv3 virtual-link

show ospfv3 {**domain** *domainName*} **virtual-link** {{**routerid**} *router_identifier* {**area**} *area_identifier*}

Description

Displays virtual link(s) information.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
router_identifier	Specifies a router identifier, a four-byte, dotted decimal number.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.

Default

N/A.

Usage Guidelines

router-identifier—Router ID for the other end of the link.

area-identifier—Transit area used for connecting the two end-points. The transit area cannot have an area identifier of 0.0.0.0 and cannot be a stub or NSSA area.

Example

The following command displays information about the virtual link to a particular router:

```
show ospfv3 virtual-link 1.2.3.4 10.1.6.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure ospfv3

unconfigure ospfv3 {**domain** *domainName*} {**area** *area_identifier* | **vlan** *vlan_name* | **tunnel** *tunnel_name*}

Description

Resets one or all OSPFv3 interfaces to the default settings.

Syntax Description

domainName	Specifies an OSPFv3 domain. OSPF-Default is the only one currently supported.
area_identifier	Specifies an OSPFv3 area, a four-byte, dotted decimal number.
vlan_name	Specifies an IPv6 configured VLAN.
tunnel_name	Specifies an IPv6 tunnel.

Default

N/A.

Usage Guidelines

ExtremeXOS OSPFv3 allows you to change certain configurable OSPFv3 parameters on the fly. This command selectively resets the configurable parameters to their default values. The following is the list of parameters whose values will be reset to their defaults:

- Interface
  - Hello Interval
  - Dead Interval
  - Transmit Delay
  - Retransmit Interval
  - Priority
  - Cost
- Area
  - All the parameters of Interfaces associated with this area
  - Inter-Area-Prefix-LSA Filter
  - AS-External-LSA Filter
- OSPF Global
  - All parameters of all areas in this OSPF domain
  - SPF Delay interval
  - Interface Cost metric Table
  - Route Redistribution

Example

The following command resets the OSPFv3 interface to the default settings on the VLAN accounting:

```
unconfigure ospfv3 accounting
```

The following command unconfigures the parameters of the area 0.0.0.1 (and all its associated interfaces):

```
unconfigure ospfv3 domain ospf-default area 0.0.0.1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms with an Advanced Edge or Core license as described in the ExtremeXOS Concepts Guide, Feature License Requirements

39 IS-IS Commands

clear isis counters
clear isis counters area
clear isis counters vlan
configure isis add vlan
configure isis area add area-address
configure isis area add summary-address
configure isis area area-password
configure isis area delete area-address
configure isis area delete summary-address
configure isis area domain-password
configure isis area interlevel-filter level 1-to-2
configure isis area interlevel-filter level 2-to-1
configure isis area is-type level
configure isis area metric-style
configure isis area overload-bit on-startup
configure isis area system-id
configure isis area timer lsp-gen-interval
configure isis area timer lsp-refresh-interval
configure isis area timer max-lsp-lifetime
configure isis area timer restart
configure isis area timer spf-interval
configure isis area topology-mode
configure isis circuit-type
configure isis delete vlan
configure isis hello-multiplier
configure isis import-policy
configure isis link-type
configure isis mesh
configure isis metric
configure isis password vlan
configure isis priority
configure isis restart
configure isis restart grace-period
configure isis timer csnp-interval
configure isis timer hello-interval
configure isis timer lsp-interval
configure isis timer restart-hello-interval

This chapter describes commands for doing the following:

- Configuring IS-IS
- Displaying IS-IS information
- Managing IS-IS

For an introduction to the IS-IS feature, see the ExtremeXOS Concepts Guide.

clear isis counters

clear isis counters

Description

This command clears all IS-IS-related counters in the current virtual router.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command clears all area and VLAN counters.

The following area counters are cleared: corrupted LSPs, LSPDB overloads, manual address from area count, LSP sequence number wraps, LSP sequence number skips, LSP purges, partition changes, and SPF calculations.

The following VLAN counters are cleared: adjacency changes, adjacency initialization failures, rejected adjacencies, ID field length mismatches, maximum area address mismatches, authentication type failures, authentication failures, DIS changes, hello PDU TX and RX count, LSP TX and RX count, CSNP TX and RX count, PSNP TX and RX count, unknown PDU type TX and RX count.

Example

The following command clears all IS-IS counters:

```
clear isis counters
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

clear isis counters area

clear isis counters area [*area_name* | **all**]

Description

This command clears all IS-IS counters for the specified router process or all router processes.

Syntax Description

area_name	Specifies the router process for which counters are cleared.
all	Clears IS-IS counters for all router processes.

Default

N/A.

Usage Guidelines

The following counters are cleared: corrupted LSPs, LSPDB overloads, manual address from area count, LSP sequence number wraps, LSP sequence number skips, LSP purges, partition changes, SPF calculations, authentication type failures, authentication failures, and ID field length mismatches.

Example

The following command clears the IS-IS counters for areax:

```
clear isis counters area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

clear isis counters vlan

clear isis counters [**vlan all** | {**vlan**} *vlan_name*]

Description

This command clears all IS-IS counters for one or all VLANs.

Syntax Description

vlan all	Clears the counters for all VLANs.
vlan_name	Specifies a single VLAN for which counters are cleared.

Default

N/A.

Usage Guidelines

This command only affects VLANs that have been added to IS-IS router processes. The following counters are cleared: adjacency changes, adjacency initialization failures, rejected adjacencies, ID field length mismatches, maximum area address mismatches, authentication type failures, authentication failures, DIS changes, hello PDU TX and RX count, LSP TX and RX count, CSNP TX and RX count, PSNP TX and RX count, unknown PDU type TX and RX count.

Example

The following command clears the IS-IS counters for all VLANs:

```
clear isis counters vlan all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis add vlan

configure isis add [**vlan all** | {**vlan**} *vlan_name*] **area** *area_name* {**ipv4** | **ipv6**}

Description

This command associates the specified VLAN interface with the specified IS-IS router process.

Syntax Description

vlan all	Adds all IS-IS eligible VLANs to the router process.
vlan_name	Specifies a single IS-IS eligible VLAN to be added to the router process.
area_name	Identifies the router process to which the VLANs are added.
ipv4 | ipv6	Specifies the VLAN IP address type, IPv4 or IPv6, to be added. If you do not specify an IP address type, the VLAN is added for the IPv4 address type. To support both IP address types on the same VLAN, enter the command twice, using a different IP address type each time.

Default

IPv4.

Usage Guidelines

An IS-IS-eligible interface is one that already has the appropriate IP address type (IPv4 or IPv6) address assigned to it. The VLAN must have an IPv4 address assigned to it if ipv4 is specified or an IPv6 address assigned to it if ipv6 is specified. In the event that a VLAN address is unconfigured, the interface is automatically removed from the IS-IS router.

VLANs are added to an IS-IS router process to form adjacencies with neighboring IS-IS routers. Hello PDUs are transmitted over these interfaces once the router process is enabled and has a system ID and area address. IP forwarding, IPv6 forwarding, or both must be enabled on the interface. If the router process operates at both L1 and L2, interfaces can be configured to form adjacencies in only a specific level.

Example

The following command adds VLAN SJvlan with an IPv4 address type to areax:

```
configure isis add SJvlan area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area add area-address

configure isis area *area_name* **add area-address** *area_address*

Description

This command adds an IS-IS area address to the specified routing process.

Syntax Description

area_name	Specifies the area name of the IS-IS process to which to add the area address.
area_address	Specifies an IS-IS area address to add to the IS-IS process. The area address can be from 1 to 13 bytes long and must be entered in the following format: 0101.0102.0103.0104.0105.0106.07.

Default

None

Usage Guidelines

The IS-IS area address defines an L1 or L2 area within an AS. An IS-IS routing process must be assigned at least one area address before it can send or process PDUs. The area address must be configured appropriately. Level 1 routers only form adjacencies with other level 1 routers with at least one area address in common. Multiple area addresses may be configured, which may be desirable during a topological transition. The maximum number of area addresses that can be configured is 3.

Example

The following command assigns area address 0011.03 to areax:

```
configure isis area areax add area-address 0011.03
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area add summary-address

configure isis area *area_name* **add summary-address** [*ipv4_address_mask* | *ipv6_address_mask*] {**level** [**1** | **2**]}

Description

This command adds an IPv4 or IPv6 summary address for the specified level on the specified router process.

Syntax Description

area_name	Specifies the router process to which the summary address is to be added.
ipv4_address_mask	Specifies an IPv4 summary address.
ipv6_address_mask	Specifies an IPv6 summary address.
level	Specifies the IS-IS level for the summary address. The level 1 option summarizes level 2 routes leaked to level 1. The level 2 option summarizes level 1 routes that are advertised into level 2.

Default

No summarization.

Usage Guidelines

Route summaries are useful for minimizing the number of LSPs required to describe reachability for an area. The summary address is advertised instead of the actual reachable addresses. This is particularly useful for L1/L2 routers in which the summary address is used in a single LSP instead of including a part or all of the addresses reachable in its level 1 area.

Note that a summary address is only advertised if at least one route matches the summary address. If there is no route present that matches the summary address exactly, a blackhole route is installed for the summary address. If an interlevel filter permits any route matched by the summary address, and that route is present, the summary address is advertised.

If multiple summary addresses are installed in which one or more supersede each other (10.0.0.0/8 and 10.0.0.0/16, for example), only the more specific summary addresses are advertised.

Example

The following command adds an IPv4 summary address to areax:

```
configure isis area areax add summary-address 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area area-password

configure isis area *area_name* **area-password [none | {encrypted} simple** *password* **{authenticate-snp {tx-only}}]**

Description

This command sets or clears the password for level 1 LSPs.

Syntax Description

area_name	Specifies the router process to which the password configuration applies.
none	Disables level 1 password authentication.

encrypted simple password	Enables password authentication and specifies that the supplied password is encrypted and must be decrypted prior to placement in a TLV.
authenticate-snp tx-only	Enables password authentication and level 1 SNP authentication. If the tx-only keyword is specified, the password is included in SNPs on transmission, but received SNPs are not authenticated.

Default

None.

Usage Guidelines

Only plain text passwords are supported. Passwords may be up to 254 alphanumeric characters in length. Although passwords are plaintext in the protocol, they are displayed and saved in an encrypted form.

When password authentication is enabled, received packets are authenticated against the configured password and are discarded if the password does not match. Authentication TLVs are included in transmitted level 1 LSPs with a configured password.

Example

The following command configures the password extreme for areax:

```
configure isis area areax area-password simple extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area delete area-address

configure isis area *area_name* **delete area-address** *area_address*

Description

This command deletes an area address from the specified routing process.

Syntax Description

area_name	Specifies the area name of the IS-IS process from which to delete the area address.
area_address	Specifies the area address name to delete from the IS-IS process.

Default

None.

Usage Guidelines

If this router process has only one area address configured, this command also causes the routing process to stop sending or processing IS-IS PDUs.

Example

The following command deletes the 0011.03 area address from areax:

```
configure isis area areax delete area-address 0011.03
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area delete summary-address

configure isis area *area_name* **delete summary-address** [*ipv4_address_mask* | *ipv6_address_mask*] {**level** [**1** | **2**]}

Description

This command removes the specified IPv4 or IPv6 summary address from the specified router process at the specified level.

Syntax Description

area_name	Specifies the router process from which the summary address is to be deleted.
ipv4_address_mask	Specifies an IPv4 summary address.

ipv6_address_mask	Specifies an IPv6 summary address.
level	Specifies the IS-IS level for the summary address.

Default

No summarization.

Usage Guidelines

Individual reachable addresses that were superseded by the summary address are now advertised in separate LSPs.

Example

The following command deletes an IPv4 summary address from areax:

```
configure isis area areax delete summary-address 10.0.0.0/8
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area domain-password

configure isis area *area_name* **domain-password [none | {encrypted} simple** *password* **{authenticate-snp {tx-only}}]**

Description

This command sets or clears the password for Level 2 LSPs.

Syntax Description

area_name	Specifies the router process for which the password is set or cleared.
none	Disables level 2 password authentication.
encrypted	Specifies that the supplied password is encrypted and must be decrypted prior to using it in a TLV.

password	Specifies a password. Passwords may be up to 254 alphanumeric characters in length.
authenticate-snp tx-only	If the optional authenticate-snp keyword is included, level 2 SNPs are also authenticated on receive and the password is included on transmission. If tx-only is specified, the password is included in SNPs on transmission, but received SNPs are not authenticated.

Default

None.

Usage Guidelines

Packets received are authenticated against the configured password and are discarded if the password does not match. Authentication TLVs are included in transmitted level 2 LSPs with the configured password. Only plain text passwords are supported. Although LSPs contain plain text passwords, passwords are displayed and saved in an encrypted form.

Example

The following command sets the domain password to Extreme:

```
configure isis area areax domain-password simple Extreme
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area interlevel-filter level 1-to-2

configure isis area *area_name* **interlevel-filter level 1-to-2** [*policy* | **none**] **{ipv4 | ipv6}**

Description

This command provides a method of restricting L1 routes from being redistributed into the L2 domain on an L1/L2 router.

Syntax Description

area_name	Specifies the router process for which this configuration change applies.
policy	Specifies a policy to control how L1 routes are redistributed.
none	Removes any previously configured interlevel filters.
ipv4 | ipv6	Applies the interlevel filter to IPv4 or IPv6. If neither IPv4 nor IPv6 is specified, this command applies to IPv4.

Default

None.

Usage Guidelines

This command has no effect on level 1-only and level 2-only routers. Normally all L1 routes are redistributed into L2 on an L1/L2 router. Routes are permitted unless explicitly denied in the policy. This command does not necessarily disable level 1 to level 2 redistribution unless the configured policy effectively filters out all routes. For policies, the nlri match attribute is supported, and the permit and deny set attributes are supported.

Example

The following command removes any previously configured interlevel filters in areax for IPv4:

```
configure isis area areax interlevel-filter level 1-to-2 none
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area interlevel-filter level 2-to-1

configure isis area *area_name* **interlevel-filter level 2-to-1** [*policy* | **block-all** | **allow-all**] {**ipv4** | **ipv6**}

Description

This command enables route leaking from level 2 to level 1 on an L1/L2 router.

Syntax Description

area_name	Specifies the router process for which this configuration change applies.
policy	Specifies a policy to control how L2 routes are leaked to L1.
block-all	Blocks all route leaking.
allow-all	Leaks all routes into level 1.
ipv4 | ipv6	Applies the interlevel filter to IPv4 or IPv6. If neither IPv4 nor IPv6 is specified, this command applies to IPv4.

Default

block-all.

Usage Guidelines

When a policy is supplied with this command, all routes are leaked unless explicitly denied in the policy. This command has no effect on level 1-only and level 2-only routers. For policies, the nlri match attribute is supported, and the permit and deny set attributes are supported.

Example

The following command configures areax to leak all level 2 routes to level 1 for IPv4:

```
configure isis area areax interlevel-filter level 2-to-1 allow-all
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area is-type level

configure isis area *area_name* **is-type level [1 | 2 | both-1-and-2]**

Description

This command configures the specified router process to operate as a level 1, level 2, or level 1/level 2 router.

Syntax Description

area_name	Specifies the router process you are configuring.
level	Specifies the IS-IS operation level for the router.

Default

both-1-and-2.

Usage Guidelines

Adjacencies are only formed with other routers of the same level. In addition, level 1 adjacencies are only formed with other level 1 routers with the same area address.

If there are no other L2 areas, the default is both-1-and-2. If an L2 or L1/L2 area is already present, the default is L1. This is because there can be only one L2 area in each system.

Example

The following command configures the areax router to operate at level 1:

```
configure isis area areax is-type level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area metric-style

configure isis area *area_name* **metric-style [[narrow | wide] {transition}] | transition] {level [1 | 2]}**

Description

This command specifies the metric style for the specified router process and IS-IS level.

Syntax Description

area_name	Specifies the router process for which the metric style is to be configured.
narrow	Specifies the narrow metric style, which uses the 6-bit default metric. Only narrow metrics are encoded in originated TLVs; only narrow SPF calculations are performed.

narrow transition	Specifies the narrow metric style, which uses the 6-bit default metric. Only narrow metrics are encoded in originated TLVs; both narrow and wide SPF calculations are performed.
wide	Specifies the wide metric style, which uses the 24-bit metric specified in RFC 3784. Only wide metrics area encoded in originated TLVs; only wide SPF calculations are performed.
wide transition	Specifies the wide metric style, which uses the 24-bit metric specified in RFC 3784. Only wide metrics are encoded in originated TLVs; both narrow and wide SPF calculations are performed.
transition	Specifies both the narrow and wide metrics. Both narrow and wide metric types are encoded in TLVs; both narrow and wide SPF calculations are performed.
level	Specifies the IS-IS level to which the metric style applies.

Default

Narrow.

Usage Guidelines

Refer to RFC 3787, Section 5.1, for information on how to migrate a network from narrow metric-style to wide metric-style. Note that Section 5.2 is not supported. As a result, each interface's narrow and wide metric values must match while transitioning the metric style. Only when the entire network has transitioned to wide metric style should the interface metrics be configured differently than the configured narrow metric.

Example

The following command configures areax for the narrow metric style:

```
configure isis area areax metric-style narrow
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area overload-bit on-startup

configure isis area *area_name* **overload-bit on-startup** [**off** | {**suppress** [**external** | **interlevel** | **all**]} *seconds*]

Description

This command enables or disables the overload bit feature while the specified IS-IS process is initializing.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be enabled or disabled.
off	Disables the overload bit feature during initialization.
suppress	Specifies that one or all types of reachability information is to be suppressed or excluded from LSPs during initialization.
external	When included with the suppress option, this specifies that external reachability information is to be excluded from LSPs during initialization.
interlevel	When included with the suppress option, this specifies that interlevel reachability information is to be excluded from LSPs during initialization.
all	When included with the suppress option, this specifies that external and interlevel reachability information is to be excluded from LSPs during initialization.
seconds	Specifies the period (in seconds) during which this feature is enabled at initialization.

Default

Off.

Usage Guidelines

This command configures the overload bit to be set only while the configured router is initializing, and only for the period of time specified. This can be useful to minimize network churn while a new router joins and learns the topology. The suppress options are used during startup if the router process is level 1/level 2 or is running another protocol, such as BGP (in order to wait for the other protocol to converge). Note that in the latter case, there is no signaling between protocols to indicate convergence. Again, this can reduce churn while the topologies are learned during router initialization.

Note

Although enable isis area <area_name> overload-bit {suppress [external | interlevel | all]} and disable isis area <area_name> overload-bit override the overload bit behavior configured by the configure isis area <area_name> overload-bit on-startup [off | {suppress [external | interlevel | all]} <seconds>] command, the enable and disable commands do not modify the configured parameters.

Example

The following command enables the areax overload bit feature for 15 seconds during initialization:

```
configure isis area areax overload-bit on-startup 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area system-id

configure isis area *area_name* **system-id** [**automatic** | *system_id*]

Description

This command configures the system ID for an IS-IS router process.

Syntax Description

area_name	Specifies the area name of the IS-IS process to which to add the system ID.
automatic	Sets the system ID to the system MAC address.
system_id	Specifies the 6-byte system ID using three sets of four hexadecimal digits, where each set is separated by a period. For example: 001B.1F62.1201.

Default

automatic (system MAC address is used).

Usage Guidelines

The system ID must be a unique ID within the AS. Typically a system MAC address is used as the system ID. Sometimes a combination of one of the router's IP addresses and 2 prefix bytes are used. The assignment of the system ID may vary depending on how the AS is chosen to be administered.

Example

The following example configures an IS-IS system ID for areax:

```
configure isis area areax system-id 001B.1F62.1201
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area timer lsp-gen-interval

configure isis area *area_name* **timer lsp-gen-interval** *seconds* {**level**[**1**| **2**]}

Description

This command configures the minimum time required to wait before regenerating the same LSP.

Syntax Description

area_name	Specifies the router process for which you want to configure the LSP generation interval.
seconds	Specifies the generation level in seconds. The range is 1 to 120 seconds.
level	Specifies the level to which you want to apply the configuration. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

30 seconds.

Usage Guidelines

In link flapping situations in a mesh network, this can greatly reduce the amount of network traffic generated from LSP flooding.

Example

The following command sets the LSP generation interval to a value of 40 seconds:

```
configure isis area areax timer lsp-gen-interval 40
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area timer lsp-refresh-interval

configure isis area *area_name* **timer lsp-refresh-interval** *seconds*

Description

This command configures the refresh rate for locally originated LSPs.

Syntax Description

area_name	Specifies the router process for which you are setting the LSP refresh timer.
seconds	Specifies the LSP refresh interval. The range is 1 to 65535 seconds.

Default

900 seconds.

Usage Guidelines

This value should be configured to be less than the maximum LSP lifetime value, which is set with the configure isis area <area_name> timer max-lsp-lifetime <seconds> command. Locally originated LSPs are purged and retransmitted at the specified interval regardless of link state.

Example

The following command sets the LSP refresh timer for areax to 1200 seconds:

```
configure isis area areax timer lsp-refresh-interval 1200
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area timer max-lsp-lifetime

configure isis area *area_name* **timer max-lsp-lifetime** *seconds*

Description

This command configures the LSP lifetime timer for locally originated LSPs.

Syntax Description

area_name	Specifies the router process for which you want to configure the LSP lifetime timer.
seconds	Specifies the LSP lifetime in seconds. The range is 1 to 65535 seconds.

Default

1200 seconds.

Usage Guidelines

This value should be configured to be greater than the LSP refresh interval, which is set with the configure isis area <area_name> timer lsp-refresh-interval <seconds> command. The remaining lifetime value is included in LSPs when they are flooded. Routers age out LSPs from other routers using the remaining lifetime provided in the LSP. If a refreshed version of the LSP is not received before it is aged out, an SPF recalculation occurs, possibly resulting in routing around the router from which the LSP originated.

Example

The following command configures the LSP lifetime timer for 1800 seconds:

```
configure isis area areax timer max-lsp-lifetime 1800
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area timer restart

configure isis area *area_name* **timer restart** *seconds* {**level** [**1** | **2**]}

Description

This command configures the IS-IS T2 timer for the specified router process and level.

Syntax Description

area_name	Specifies the router process for which the T2 timer configuration applies.
seconds	Specifies the T2 timer value. The range is 5 to 65535 seconds.
level	Specifies the IS-IS level to which this timer configuration applies. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

60 seconds.

Usage Guidelines

The T2 timer is the restart timer for the LSP database for an IS-IS level. If the T2 timer for the respective level expires before the database has been resynchronized, SPF is run for that level.

Example

The following command configures the areax level 1 T2 timer for 90 seconds:

```
configure isis area areax timer restart 90 level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area timer spf-interval

configure isis area *area_name* **timer spf-interval** *seconds* **{level[1|2]}**

Description

This command specifies the minimum time to wait between SPF calculations.

Syntax Description

area_name	Specifies the router process for which you are configuring the SPF interval.
seconds	Specifies the minimum time between SPF calculations. The range is 1 to 120 seconds.
level	Specifies the IS-IS level to which the timer configuration applies. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

This helps prevent switch CPU overloading when a link flap causes several back-to-back SPF calculations.

Example

The following command configures the SPF interval timer for 30 seconds on areax:

```
configure isis area areax timer spf-interval 30
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis area topology-mode

configure isis area *area_name* **topology-mode [single | multi | transition] {level [1 | 2]}**

Description

This command enables or disables use of multi-topology TLVs as specified in draft-ietf-isis-wg-multi-topology-11.

Syntax Description

area_name	Specifies the router process to be configured.
single	Specifies a single topology, where extended TLVs are used in SPF calculation and TLVs.
multi	Specifies a multi topology, where only the multi-topology TLVs are used in SPF calculation and TLVs.
transition	Specifies a transition topology, where both extended and multi-topology TLVs are used in SPF calculation and TLVs. The transition option is useful when migrating a routing domain.
level	For L1/L2 routers, this applies the configuration to IS-IS level 1 or level 2. If the level option is not specified, the configuration applies to both L1 and L2 areas. This option has no affect on L1-only and L2-only routers.

Default

Single.

Usage Guidelines

Multi-topology capability is desirable if both an IPv4 topology and an IPv6 topology exist with different routing paths.

Extreme supports MT IDs 0 and 2 (IPv4 unicast and IPv6 unicast) only.

Example

The following command configures the transition topology mode for areax:

```
configure isis area areax topology-mode transition
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis circuit-type

configure isis [**vlan all** | {**vlan**} *vlan_name*] **circuit-type level** [**1** | **2** | **both-1-and-2**]

Description

This command configures the circuit type level for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the selected circuit type to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the circuit type configuration applies.
level [1 | 2 | both-1-and-2]	Sets the circuit type level to level 1, level 2, or to both level 1 and level 2.

Default

both-1-and-2.

Usage Guidelines

Hello PDUs are only sent on the specified level for the selected VLANs. This can be useful for level 1/level 2 routers that are neighbors.

Note that for per-level VLAN configurable parameters L1 and L1/L2, point-to-point interfaces use the level 1 parameters, and L2-only point-to-point interfaces use the L2 parameters.

Example

The following command configures all IS-IS VLANs to use circuit type level 1:

```
configure isis vlan all circuit-type level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis delete vlan

configure isis delete [**vlan all** | {**vlan**} *vlan_name*] {**area** *area_name*} {**ipv4** | **ipv6**}

Description

This command removes a VLAN interface from the specified router process.

Syntax Description

vlan all	Deletes all IS-IS VLANs.
vlan_name	Specifies a single VLAN to delete.
area_name	Specifies the router process from which the VLAN is deleted. If you do not specify an IS-IS area, the software deletes the VLAN from the configured IS-IS area.
ipv4 | ipv6	Specifies the IP address type for which the VLAN is deleted. If you do not specify an IP address type, the VLAN for the IPv4 address type is deleted. If the VLAN was added as IPv6, the ipv6 option must be used to remove the VLAN. If the VLAN was added as both IPv4 and IPv6, each VLAN IP address type must be deleted with a separate command.

Default

N/A.

Usage Guidelines

The associated adjacency is removed, causing the removal of the corresponding LSP if there is one, and causing an SPF recalculation if the router process is enabled. Hello PDUs are no longer sent on the specified interface. This command applies to IS-IS-enabled VLANs only.

Example

The following command deletes the IPv4 address type for all VLANs in areax:

```
configure isis delete vlan all area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis hello-multiplier

configure isis [**vlan all** | {**vlan**} *vlan_name*] **hello-multiplier** *multiplier* {**level** [**1** | **2**]}

Description

This command sets the hello multiplier for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
multiplier	Sets the hello multiplier. The range is 2 to 100.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

3.

Usage Guidelines

The hello multiplier is used in conjunction with the hello interval to compute the holding time. The holding time is included in hello PDUs and is calculated by multiplying the hello multiplier by the hello interval. If the hello interval is set to minimal, the holding time is set to 1 second and the hello interval is calculated by dividing 1 second by the hello multiplier. For example, a hello interval of minimal and a hello multiplier of 4 means that the hold interval is set to 250 ms (and the holding time to 1 second). The holding time tells the neighboring router how long to wait before declaring the sending router dead.

Example

The following command sets the SJvlan hello multiplier to 4:

```
configure isis SJvlan hello-multiplier 4
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis import-policy

configure isis import-policy [*policy-map* | **none**]

Description

This command applies a policy map for routes imported to the FIB from all IS-IS router processes on this virtual router.

Syntax Description

policy-map	Specifies the policy to apply.
none	Removes any policies assigned to this virtual router.

Default

None.

Usage Guidelines

IS-IS policy files support the following policy match conditions:

- nlri <IPv4-address>/<mask-len> <IPv6-address>/<mask-len>

- route-origin [isis-level-1 | isis-level-2 | isis-level-1-external | isis-level-2-external]

IS-IS policy files support the following policy action statements:

- cost

Example

The following command applies the IS-IS policy policy2 to the virtual router:

```
configure isis import-policy policy2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis link-type

configure isis [**vlan all** | {**vlan**} *vlan_name*] **link-type** [**broadcast** | **point-to-point**]

Description

This command specifies the link type for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the link type configuration to all IS-IS VLANs.
vlan_name	Specifies a single IS-IS VLAN to which the link type configuration is applied.
broadcast	Selects the broadcast link type for the specified VLANs.
point-to-point	Selects the point-to-point link type for the specified VLANs.

Default

Broadcast.

Usage Guidelines

On broadcast interfaces, a DIS is elected. There is no DIS election on point-to-point interfaces. If it is known that only two routers will be present on a physical network, it may be desirable to set their connecting interfaces to point-to-point mode. This reduces the overhead associated with DIS election and periodic CSNP transmissions and processing. In addition, if the adjacency is both level 1 and level 2,

only one set of hello PDUs are sent on a point-to-point interface whereas hello PDUs are sent for both levels on broadcast interfaces. Interfaces in point-to-point mode must have an IP address assigned to them. Unnumbered interfaces are not supported.

For point-to-point interfaces, level 1 parameters apply to L1-only and L1/L2 interfaces. Level 2 parameters apply to L2-only point-to-point interfaces.

Example

The following command configures all IS-IS VLANs to use the broadcast link type:

```
configure isis vlan all link-type broadcast
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis mesh

configure isis [**vlan all** | {**vlan**} *vlan_name*] **mesh** [**block-none** | **block-all** | **block-group** *group_id*]

Description

This command configures LSP flooding behavior for the specified interface.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
block-none	Disables LSP blocking.
block-all	Blocks all LSPs. No LSPs are flooded out of the selected interface.
block-group	Blocks LSPs that contain the specified group ID.
group_id	Specifies a group ID number. The range is 1 to 4294967295.

Default

block-none.

Usage Guidelines

In a mesh environment, which is a set of fully interconnected point-to-point interfaces, LSP flooding can generate N2 PDUs because no router can tell which routers have and have not received the flooded LSP. By carefully selecting the links over which LSPs are flooded, traffic can be greatly reduced at the cost of some resiliency. Using mesh group IDs instead of a full block (the block-all option) allows a finer granularity of control.

Example

The following command configures blocking on SJvlan for group 5:

```
configure isis SJvlan mesh block-group 5
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis metric

configure isis [**vlan all** | {**vlan**} *vlan_name*] **metric** *metric* {**level**[**1**|**2**]}

Description

This command sets the narrow metric for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
metric metric	Sets the metric value. The range is 1 to 63.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10.

Usage Guidelines

If narrow metrics are enabled, this value is used in the associated LSPs for the selected VLANs.

Example

The following command sets the narrow metric for all IS-IS VLANs to 15:

```
configure isis vlan all metric 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis password vlan

configure isis [**vlan all** | {**vlan**} *vlan_name*] **password** [**none** | {**encrypted**} **simple** *password*] **level** [**1** | **2**]

Description

This command sets or clears the authentication password for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the password configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the password configuration is applied.
none	Clears the password configuration and disables hello PDU authentication.
encrypted	Specifies that the supplied password is encrypted and must be decrypted prior to using it in a TLV.
password	Specifies the password. Passwords may be up to 254 alphanumeric characters in length.
level [1 | 2]	Limits the password configuration to level 1 or level 2. If neither level 1 or level 2 is specified, the configuration applies to both levels.

Default

None.

Usage Guidelines

If configured, the specified password is included in Hello PDUs for the specified level. In addition, received Hello PDUs on the specified interface are authenticated with the same password. Hello PDUs that are not authenticated are discarded.

Only plain text passwords are supported. Note that if the password is changed on an interface with an existing adjacency, the neighboring router needs to be configured as well. Depending on how timers are configured, the adjacency may time out while transitioning between passwords. Although passwords appear in plain text during configuration, they are displayed and saved in encrypted form.

Example

The following command assigns password Extreme to all level 1 VLANs configured for IS-IS:

```
configure isis vlan all password simple Extreme level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis priority

configure isis [**vlan all** | {**vlan**} *vlan_name*] **priority** *priority* {**level**[**1** | **2**]}

Description

This command sets the priority used for DIS election on broadcast interfaces.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
priority priority	Sets the priority value. The range is 0 to 127.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

64.

Usage Guidelines

A higher priority value is preferred over a lower priority value. The priority is encoded in level 1 or level 2 hello PDUs. This command is not valid for point-to-point interfaces. Note that a priority of 0 has no special meaning other than the fact that it is the lowest priority. A router with a priority of 0 can still become the DIS.

Example

The following command configures priority level 32 for SJvlan:

```
configure isis SJvlan priority 32
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis restart

configure isis restart [none | planned | unplanned | both]

Description

This command configures IS-IS graceful restart behavior.

Syntax Description

none	Disables IS-IS graceful restart. When graceful restart is disabled, this router still operates as a helper to other restarting routers.
planned	Initiates IS-IS graceful restart only in response to the restart process isis or run msm-failover commands.
unplanned	Initiates graceful restart only when the IS-IS process is restarted due to a process crash or an unplanned failover.
both	Initiates graceful restart for all events supported by the planned and unplanned options.

Default

None.

Usage Guidelines

The command options specify under which circumstances graceful restart is to be performed. This command has no affect during normal switch boot up. All IS-IS routing processes in the current virtual router are affected by this command.

All neighboring routers must support IS-IS restart in order for graceful restart to work. If graceful restart is not performed after a process restart or failover, the router's adjacencies are re-initialized

causing SPF recalculation throughout the network and, if the overload bit is not configured to be set during startup, churn as adjacencies change state and LSPs are learned.

Note

The planned and unplanned command options do not affect the actual restart protocol operation of IS-IS; they only determine when the restart process occurs.

Example

The following command configures the switch to initiate a graceful restart for all events supported by the planned and unplanned options:

```
configure isis restart both
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis restart grace-period

configure isis restart grace-period *seconds*

Description

This command configures the T3 global restart timer for all IS-IS router processes on the current virtual router.

Syntax Description

seconds	Specifies the restart grace period in seconds. The range is 1 to 65535 seconds.

Default

65535.

Usage Guidelines

If the grace period expires before LSP resynchronization is complete, the virtual router sets the overload bit in LSPs that it originates.

Example

The following command sets the restart grace period to 5000 seconds:

```
configure isis restart grace-period 5000
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis timer csnp-interval

configure isis [**vlan all** | {**vlan**} *vlan_name*] **timer csnp-interval** *seconds* {**level** [**1** | **2**]}

Description

This command sets the minimum time between consecutive CSNP transmissions on the specified interface.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Sets the timer interval. The range is 1 to 65535 seconds.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

Periodic CSNPs are only sent on broadcast interfaces and only by the DIS.

Example

The following command sets the CSNP interval time for all IS-IS VLANs to 15 seconds:

```
configure isis vlan all timer csnp-interval 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis timer hello-interval

configure isis [**vlan all** | {**vlan**} *vlan_name*] **timer hello-interval** [*seconds* | **minimal**] {**level** [**1** | **2**]}

Description

This command sets the interval between two consecutive hello transmissions.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Sets the timer interval. The range is 1 to 65535 seconds.
minimal	Specifies that the hello interval is calculated by dividing 1 second by the hello multiplier.
level [1 | 2]	Limits the configuration to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10 seconds.

Usage Guidelines

If this router is the elected DIS, hellos are sent three times more frequently than the configured interval.

When the timer configuration is set to minimal, the holding time included in the PDU is set to 1 second. Otherwise, the holding time is computed by multiplying the hello interval by the hello multiplier. The holding time tells the neighboring router how long to wait before declaring the sending router dead.

Example

The following command sets the hello interval timer for all VLANs to 15 seconds:

```
configure isis vlan all timer hello-interval 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis timer lsp-interval

configure isis [**vlan all** | {**vlan**} *vlan_name*] **timer lsp-interval** *milliseconds*

Description

This command sets the minimum time between LSP transmissions.

Syntax Description

vlan all	Applies the timer configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
milliseconds	Specifies the timer value. The range is 1 to 4294967295 milliseconds.

Default

33 milliseconds.

Usage Guidelines

This is used to throttle LSP flooding. Higher values reduce network traffic and can help keep underpowered routers from becoming overloaded during network events. Lower values speed up convergence.

Example

The following command sets the minimal LSP interval for IS-IS VLANs to 66 milliseconds:

```
configure isis vlan all timer lsp-interval 66
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis timer restart-hello-interval

configure isis [**vlan all** | {**vlan**} *vlan_name*] **timer restart-hello-interval** *seconds* {**level** [**1** | **2**]}

Description

This command configures the T1 restart retransmit timer for one or all VLANs.

Syntax Description

vlan all	Specifies that the T1 restart timer configuration applies to all VLANs.
vlan_name	Specifies a VLAN to which the T1 restart timer configuration applies.
seconds	Specifies the T1 restart timer value. The range is 1 to 65535 seconds.
level [1 | 2]	Limits the configuration change to level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

3 seconds.

Usage Guidelines

If, after sending a restart request, the router process associated with this interface does not receive a restart acknowledgement and a CSNP within the period specified by this command, another restart request is sent.

Example

The following command sets the T1 restart timer to 6 seconds on all level 1 VLANs:

```
configure isis vlan all timer restart-hello-interval 6 level 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis timer retransmit-interval

configure isis [**vlan all** | {**vlan**} *vlan_name*] **timer retransmit-interval** *seconds*

Description

This command sets the time to wait for an acknowledgement of a transmitted LSP on a point-to-point interface.

Syntax Description

vlan all	Applies the timer value to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the timer configuration applies.
seconds	Defines the timer value. The range is 0 to 65535 seconds.

Default

5 seconds.

Usage Guidelines

If an acknowledgement is not received when the timer expires, the LSP is resent and the timer is reset.

Example

The following command sets the retransmit interval for the SJvlan to 10 seconds:

```
configure isis SJvlan timer retransmit-interval 10
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

configure isis wide-metric

configure isis [**vlan all** | {**vlan**} *vlan_name*] **wide-metric** *metric* {**level**[**1** | **2**]}

Description

This command sets the wide metric value for one or all IS-IS VLANs.

Syntax Description

vlan all	Applies the configuration to all IS-IS VLANs.
vlan_name	Specifies a single VLAN to which the configuration applies.
metric	Sets the metric. The range is 1 to 16777214.
level [1 | 2]	Limits the configuration change to either level 1 or level 2. If neither level 1 nor level 2 is specified, the configuration applies to both levels.

Default

10.

Usage Guidelines

If the wide metric style is enabled on the associated IS-IS router process, the wide metric value is used in Extended IP reachability TLVs, Extended IS Reachability TLVs, and IPv6 Reachability TLVs in LSPs.

Example

The following command sets the wide metric to 15 for all IS-IS VLANs:

```
configure isis vlan all wide-metric 15
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

create isis area

create isis area *area_name*

Description

This command creates an IS-IS router process in the current virtual router.

Syntax Description

area_name	Defines a name for the new IS-IS router process.

Default

N/A.

Usage Guidelines

No PDUs are sent until after the following events:

- The router process has been enabled
- The router process has been assigned a system ID and area address
- The router process has at least one interface (VLAN) that has IPv4 or IPv6 forwarding enabled.

By default, newly created IS-IS router processes are Level 1/Level 2 routers if a level 2 router process does not already exist in the current virtual router. No more than one IS-IS router process may be configured as a level 2 router. IS-IS router processes on different virtual routers may have the same name, but this is not recommended as it may cause confusion when administering the switch. The router process name supplied with this command may be optionally used as the hostname for this router process when dynamic hostname exchange support is enabled.

The area name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

A maximum of one area can be created per VR in this release.

Example

The following command creates a new IS-IS router process named areax:

```
create isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

delete isis area

delete isis area [**all** | *area_name*]

Description

This command disables and deletes the specified IS-IS router process in the current virtual router.

Syntax Description

all	Deletes all IS-IS router processes.
area_name	Specifies the name of the IS-IS router process to be deleted.

Default

None.

Usage Guidelines

All configuration for the specified router is lost. All routes learned from this router process are purged from the routing tables.

Example

The following command deletes the IS-IS process named areax:

```
delete isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis

disable isis {**area** *area_name*}

Description

This command disables the specified IS-IS router process on the current virtual router.

Syntax Description

area_name	Specifies the name of the IS-IS router process to be disabled.

Default

Disabled.

Usage Guidelines

IS-IS PDUs are no longer sent or processed on this IS-IS router process. The LSP and neighbor databases are purged. IS-IS routes are purged from the routing table. This command should only be used during planned network outages. This command has no effect on router processes that are already disabled.

Example

The following command disables the IS-IS process named areax:

```
disable isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis area adjacency-check

disable isis area *area_name* **adjacency-check {ipv4| ipv6}**

Description

This command disables the checking of the following TLVs when forming adjacencies: Protocols Supported and IP Interface Address.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should no longer perform the adjacency check.
ipv4	Specifies that the adjacency check should no longer be performed on IPv4 interfaces.
ipv6	Specifies that the adjacency check should no longer be performed on IPv6 interfaces.

Default

IPv4: Enabled.

IPv6: Enabled.

Usage Guidelines

When adjacency checking is disabled, adjacencies may be formed on interfaces that do not reside on the same subnet or do not support IPv4 (if disabled for IPv4) or IPv6 (if disabled for IPv6). If neither ipv4 nor ipv6 is specified, this command applies to IPv4.

Example

The following command directs the IS-IS process named areax to disable adjacency checks on IPv6 interfaces:

```
disable isis area areax adjacency-check ipv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis area dynamic-hostname

disable isis area *area_name* **dynamic-hostname**

Description

This command disables the dynamic hostname feature.

Syntax Description

area_name	Specifies the name of the IS-IS process for which the dynamic-hostname feature is to be disabled.

Default

Disabled.

Usage Guidelines

The specified router process no longer includes code 137 TLVs in its LSPs and names are no longer displayed in show commands.

Example

The following command disables the display of area names or SNMP names instead of system IDs:

```
disable isis area areax dynamic-hostname
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis area export

disable isis area *area_name* **export** {**ipv4**} *route-type*

Description

This command disables IPv4 route redistribution of the specified type into IS-IS.

Syntax Description

area_name	Specifies the IS-IS router process for which route redistribution is disabled.
ipv4	Specifies that the configuration change is for IPv4 IS-IS routing.
route-type	Selects the type of export route to disable. The valid route types are: bgp, direct, e-bgp, i-bgp, ospf, ospf-extern1, ospf-extern2, ospf-inter, ospf-intra, rip, and static.

Default

All types are disabled.

Usage Guidelines

None.

Example

The following command disables RIP route distribution into areax:

```
disable isis area areax export rip
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis area export ipv6

disable isis area *area_name* **export ipv6** *route-type*

Description

This command disables IPv6 route redistribution of the specified type into IS-IS.

Syntax Description

area_name	Specifies the IS-IS router process for which route redistribution is disabled.
route-type	Selects the type of export route to disable. The valid route types are: direct, ospfv3, ospfv3-extern1, ospfv3-extern2, ospfv3-inter, ospfv3-intra, ripng, bgp, and static.

Default

All types are disabled.

Usage Guidelines

None.

Example

The following command disables RIPng route distribution into areax:

```
disable isis area areax export ipv6 ripng
```

History

This command was first available in ExtremeXOS 12.1.

Support for BGP was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on platforms with a Core license.

disable isis area originate-default

disable isis area *area_name* **originate-default** {**ipv4** | **ipv6**}

Description

This command disables the generation of one or all default routes in the LSPs for the specified router process.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should no longer generate the default route.
ipv4	Specifies that the router process should no longer generate the default IPv4 route.
ipv6	Specifies that the router process should no longer generate the default IPv6 route.

Default

IPv4: Disabled.

IPv6: Disabled.

Usage Guidelines

This applies to level 2 routing only. By default this command disables IPv4 default route origination. The optional ipv6 keyword disables IPv6 default route origination. This command has no effect on router processes that are already disabled for default route origination on level 1-only router processes.

Example

The following command directs the IS-IS process named areax to stop generating the default IPv4 route in it's LSPs:

```
disable isis area areax originate-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis area overload-bit

disable isis area *area_name* **overload-bit**

Description

This command disables the overload-bit feature.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be disabled.

Default

Disabled.

Usage Guidelines

Disabling the overload bit feature causes an SPF recalculation throughout the network. In addition, external and interlevel router redistribution is no longer suppressed if those options were included when the overload bit was enabled. If the overload bit is currently set as a result of the overload-bit on-startup command, this command overrides the configuration and disables this feature.

Example

The following command disables the overload bit feature for areax:

```
disable isis area areax overload-bit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis hello-padding

disable isis [**vlan all** | {**vlan**} *vlan_name*] **hello-padding**

Description

This command disables the padding of Hello PDUs for one or all IS-IS VLANs.

Syntax Description

vlan all	Disables hello padding on all IS-IS VLANs.
vlan_name	Specifies a single VLAN on which to disable hello padding.

Default

Enabled.

Usage Guidelines

Implicit adjacency MTU verification is not performed when hello padding is disabled.

Example

The following command disables hello padding on all IS-IS VLANs:

```
disable isis vlan all hello-padding
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

disable isis restart-helper

disable isis restart-helper

Description

This command disables the IS-IS restart helper.

Syntax Description

This command has no arguments or variables.

Default

Enabled

Usage Guidelines

When this feature is disabled, the router does not act as a restart helper and may time out a restarting router's adjacency per normal operation.

Example

The following command disables the IS-IS restart helper:

```
disable isis restart-helper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis

enable isis {**area** *area_name*}

Description

This command enables the specified IS-IS router process on the current virtual router.

Syntax Description

area_name	Specifies the name of the IS-IS router process to be enabled.

Default

Disabled

Usage Guidelines

If no area name is specified, all IS-IS router processes on the current virtual router are enabled. Once a router process is enabled, IS-IS PDUs are sent and processed provided that the following conditions are met:

- The router process has a system ID and area address configured.
- At least one associated VLAN interface has IPv4 or IPv6 forwarding enabled.

This command has no effect on router processes that are already enabled.

Example

The following command enables the IS-IS process named areax:

```
enable isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis area adjacency-check

enable isis area *area_name* **adjacency-check** {**ipv4** | **ipv6**}

Description

This command enables the checking of the following TLVs when forming adjacencies: Protocols Supported and IP Interface Address.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should perform the adjacency check.
ipv4	Specifies that the adjacency check is to be performed in IPv4 interfaces.
ipv6	Specifies that the adjacency check is to be performed in IPv6 interfaces.

Default

ipv4/ipv6: Enabled.

Usage Guidelines

When enabled for IPv4, IPv4 adjacencies may only be formed with neighbors whose connected interface supports IPv4 and is on the same subnet as the receiving interface. Similarly, when enabled for IPv6, IPv6 adjacencies may only be formed with neighbors whose connected interface supports IPv6 and is on the same link local subnet as the receiving interface. For each enabled protocol, if both criteria are not met, received Hello PDUs are discarded. By default, IPv4 routing is affected by this command. The optional ipv6 keyword enables adjacency checking for IPv6 interfaces on the specified router process. It may be necessary to disable adjacency checking in multi-topology environments where a neighbor may only form an IPv4 or an IPv6 adjacency, but not both.

Example

The following command directs the IS-IS process named areax to perform adjacency checks on IPv6 interfaces:

```
enable isis area areax adjacency-check ipv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis area dynamic-hostname

enable isis area *area_name* **dynamic-hostname [area-name | snmp-name]**

Description

This command enables the dynamic hostname feature, which displays either the area name or the SNMP name instead of a IS-IS router system ID in select show commands.

Syntax Description

area_name	Specifies the name of the IS-IS process for which the dynamic-hostname feature is to be enabled.
area-name	Specifies that affected show commands display the area name instead of the IS-IS system ID.
snmp-name	Specifies that affected show commands display the SNMP name instead of the IS-IS system ID.

Default

Disabled.

Usage Guidelines

This command enables support for the dynamic hostname exchange feature defined by RFC 2763.

Example

The following command enables the display of IS-IS area names:

```
enable isis area areax dynamic-hostname area-name
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis area export

enable isis area *area_name* **export** {**ipv4**} *route-type* [*policy* | **metric** *mvalue* {**metric-type** [**internal** | **external**]}] {**level**[**1**| **2** | **both-1-and-2**]}

Description

This command enables IPv4 route redistribution into IS-IS for direct, static, BGP, RIP, or OSPF routes.

Syntax Description

area_name	Specifies the IS-IS router process that receives the exported routes.
ipv4	Specifies that the redistributed routes are for use in IPv4 IS-IS routing.
route-type	Selects the type of route for export. The valid route types are: bgp, direct, e-bgp, i-bgp, ospf, ospf-extern1, ospf-extern2, ospf-inter, ospf-intra, rip, and static.
policy	Specifies a policy that controls how routes are redistributed into IS-IS.
mvalue	Specifies a metric to assign to the routes exported to IS-IS. The range is 0 to 4261412864.
metric-type [internal | external]	Specifies a metric type, which is internal or external, to assign to the routes exported to IS-IS.
level [1 | 2 | both-1-and-2]	Limits the use of redistributed routes to level 1, level 2, or both.

Default

All types are disabled.

Usage Guidelines

If wide metrics are enabled, redistributed routes are included in the Extended IP Reachability TLV in LSPs. If wide metrics are not enabled, redistributed routes are added to IP External Reachability TLV in LSPs. For policies, the nlri match attribute is supported, and the cost, cost-type internal, permit, and deny set attributes are supported.

Example

The following command exports RIP routes to IS-IS and assigns the internal metric type and metric value 5 to the redistributed routes:

```
enable isis area areax export rip metric 5 metric-type internal
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis area export ipv6

enable isis area *area_name* **export ipv6** *route-type* [*policy* | **metric** *mvalue*] {**level**[**1**| **2** | **both-1-and-2**]}

Description

This command enables IPv6 route redistribution into IS-IS for direct, static, RIPng, or OSPFv3 routes.

Syntax Description

area_name	Specifies the IS-IS router process that receives the exported routes.
route-type	Selects the type of route for export. The valid route types are: direct, ospfv3, ospfv3-extern1, ospfv3-extern2, ospfv3-inter, ospfv3-intra, ripng, bgp, and static.
policy	Specifies a policy that controls how routes are redistributed into IS-IS.
mvalue	Specifies a metric to assign to the routes exported to IS-IS. The range is 0 to 4261412864.
level [1 | 2 | both-1-and-2]	Limits the use of redistributed routes to level 1, level 2, or both.

Default

All types are disabled.

Usage Guidelines

If a policy is specified, the policy is used to determine what specific routes are redistributed into IS-IS. Otherwise, the specified metric and type are assigned to the redistributed routes. Redistributed routes are added to the IPv6 External Reachability TLV in LSPs. For policies, the nlri match attribute is supported, and the cost, cost-type internal, permit, and deny set attributes are supported.

Example

The following command exports RIPng routes to IS-IS and assigns the internal metric type and metric value 5 to the redistributed routes:

```
enable isis area areax export ipv6 ripng metric 5 metric-type internal
```

History

This command was first available in ExtremeXOS 12.1.

Support for BGP was added in ExtremeXOS 12.6.0-BGP.

Platform Availability

This command is available on platforms with a Core license.

enable isis area originate-default

enable isis area *area_name* **originate-default** {**ipv4** | **ipv6**}

Description

This command causes the specified IS-IS router process to generate the default route in its LSPs.

Syntax Description

area_name	Specifies the name of the IS-IS router process that should generate the default route.
ipv4	Specifies that the router process should generate the default IPv4 route.
ipv6	Specifies that the router process should generate the default IPv6 route.

Default

IPv4: Disabled

IPv6: Disabled

Usage Guidelines

This applies to level 2 routing only. In contrast, level 1 routers compute the default route as the nearest attached L1/L2 router. When enabled, the router process generates an IPv4 default route unless the ipv6 option is specified. Only one level 2 router in the IS-IS domain should be configured to originate a default route. This command has no effect on router processes that are already enabled for default route origination or on router processes that are level 1-only.

Example

The following command directs the IS-IS process named areax to generate the default IPv4 route in it's LSPs:

```
enable isis area areax originate-default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis area overload-bit

enable isis area *area_name* **overload-bit** {**suppress** [**external** | **interlevel** | **all**]}

Description

This command enables the overload-bit feature, which signals other routers that they are no longer permitted to use this router as a transit or forwarding node.

Syntax Description

area_name	Specifies the area name of the IS-IS process for which this feature is to be enabled.
suppress	Specifies that one or all types of reachability information is to be suppressed or excluded from LSPs.
external	When included with the suppress option, this specifies that external reachability information is to be excluded from LSPs.
interlevel	When included with the suppress option, this specifies that interlevel reachability information is to be excluded from LSPs.
all	When included with the suppress option, this specifies that external and interlevel reachability information is to be excluded from LSPs.

Default

Disabled

Usage Guidelines

When the overload bit feature is enabled, the router process still receives and processes LSPs.

Example

The following command enables the overload bit feature for areax:

```
enable isis area areax overload-bit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis hello-padding

enable isis [**vlan all** | {**vlan**} *vlan_name*] **hello-padding**

Description

This command enables the padding of hello PDUs on one or all VLANs.

Syntax Description

vlan all	Enables hello padding on all IS-IS VLANs.
vlan_name	Specifies a single VLAN on which hello padding is enabled.

Default

Enabled

Usage Guidelines

When hello padding is enabled, IS-IS pads hello packets to the interface MTU. This is used among neighbors to verify that adjacencies have the same MTU configured on either end. The disadvantage of hello padding is the price of bandwidth consumed by larger packets.

Example

The following command enables hello padding on the SJvlan VLAN:

```
enable isis SJvlan hello-padding
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

enable isis restart-helper

enable isis restart-helper

Description

This command enables the IS-IS router to act as a restart helper according to draft-ietf-isis-restart-02—Restart signaling for IS-IS.

Syntax Description

This command has no arguments or variables.

Default

Enabled

Usage Guidelines

None.

Example

The following command enables the IS-IS restart helper:

```
enable isis restart-helper
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis

show isis

Description

This command displays the global IS-IS configuration information as well as a summarized router process listing.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The displayed global configuration information includes the restart enablement, restart grace period, and import-policy setting. The router process listing includes the area name, system ID, whether it's enabled, the IS type, and a count of associated interfaces and area addresses. This command applies only to the IS-IS router processes running in the current virtual router.

Example

The following command displays IS-IS information:

```
show isis
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis area

show isis area [*area_name* | **all**]

Description

This command displays configuration information for a specific router process or for all IS-IS router processes.

Syntax Description

area_name	Specifies the router process for which to display IS-IS area information.
all	Displays information for all IS-IS router processes.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS configuration for areax:

```
show isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis area summary-addresses

show isis area *area_name* **summary-addresses**

Description

This command displays the configured IPv4 and IPv6 summary addresses for the specified area.

Syntax Description

area_name	Specifies the router process for which you want to display summary addresses.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the summary addresses for areax:

```
show isis area areax summary-addresses
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis counters

show isis counters {**area** [*area-name* | **all**] | **vlan** [*vlan-name* | **all**]}

Description

This command displays counters for an area or a VLAN.

Syntax Description

area_name	Specifies a router process for which to display the IS-IS counters. If you do not specify an IS-IS area, the software displays counters for all areas.
vlan_name	Specifies a VLAN for which to display IS-IS counters.
all	Displays IS-IS counters for all areas or VLANs.

Default

None.

Usage Guidelines

If you enter the show isis counters command without any additional keywords or parameters, the software displays the counters for all areas.

Example

The following command displays the IS-IS counters for the configured area:

```
show isis counters
```

The following command displays the IS-IS counters for the SJvlan VLAN:

```
show isis counters vlan SJvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis lsdb

show isis lsdb {**area** *area_name* {**lsp-id** *lsp_id*}} {**level** [**1**|**2**]} {**detail** | **stats**}

Description

Displays a summary of the IS-IS link state database for one or all IS-IS router processes running in the current virtual router.

Syntax Description

area_name	Specifies the name of a router process for which to display the IS-IS link state database. If the area name is omitted, this command displays information for all areas.
lsp_id	Limits the display to the specified LSP ID, which is specified in the form *system id*.*pseudonode ID*-*LSP number*. For example: 0102.0ff2.0023.00-01.The pseudonode ID and LSP numbers are optional. If they are not included, multiple listings might appear.
level [1|2]	Limits the display to LSPs for either level 1 or level 2.
detail	Expands the display to include the LSP TLVs and IPv4 and IPv6 reachability information. The displayed information varies depending on what is included in the LSPs.
stats	Displays counts of the number of LSPs and prefixes in the LSP database.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays information for a specific LSP:

```
show isis lsdb area areax lsp-id 0102.0ff2.0023.00-01
```

The following example shows the display for the stats option:

```
(debug) Switch.6 # show isis lsdb stats
Area "a1" :
IS-IS Level-1 Link State Database:
LSPs (including fragments)   : 4
Internal Prefixes (Type 128) : 7
External Prefixes (Type 130) : 0
IPv4 Prefixes     (Type 135) : 0
IPv6 Prefixes     (Type 236) : 0
MT IPv4 Prefixes  (Type 235) : 0
MT IPv6 Prefixes  (Type 237) : 0
IS-IS Level-2 Link State Database:
LSPs (including fragments)   : 1
Internal Prefixes (Type 128) : 5
External Prefixes (Type 130) : 0
IPv4 Prefixes     (Type 135) : 0
IPv6 Prefixes     (Type 236) : 0
MT IPv4 Prefixes  (Type 235) : 0
MT IPv6 Prefixes  (Type 237) : 0
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis neighbors

show isis neighbors {**area** *area_name*} {**vlan** *vlan_name*} {**ipv4** | **ipv6**} {**detail**}

Description

This command displays information about neighbors and their adjacencies.

Syntax Description

area_name	Specifies a router process for which to specify neighbor information. If you do not specify an IS-IS area, the software displays the neighbors in all areas.
vlan_name	Specifies a VLAN for which to specify neighbor information.
ipv4	Displays only the neighbors that advertise the IPv4 protocol as supported.
ipv6	Displays only the neighbors that advertise the IPv6 protocol as supported.
detail	Displays detailed information for IS-IS neighbors.

Default

N/A.

Usage Guidelines

If you do not specify either the ipv4 or the ipv6 keyword, this command displays all neighbors regardless of the supported protocol.

Example

The following command displays IS-IS neighbor information for areax:

```
show isis neighbors area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis topology

show isis topology {**area** *area_name* {**level** [**1** | **2**]}} {**ipv4** | **ipv6**}

Description

This command displays the topology for IPv4, IPv6, or both IPv4 and IPv6 for the specified area and level.

Syntax Description

area_name	Specifies the router process for which the topology applies.
level [1 | 2]	Specifies the IS-IS level of the topology you want to view.
ipv4	Selects the IPv4 topology for display. If you omit the ipv4 and ipv6 options, the IPv4 topology appears.
ipv6	Selects the IPv6 topology for display. If you omit this option, the IPv4 topology appears.

Default

None.

Usage Guidelines

Each known IS in the area or domain is displayed along with the next-hop and metric information.

Example

The following command display IPv4 topology information for areax:

```
show isis topology area areax ipv4
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

show isis vlan

show isis vlan {enabled | { *vlan_name* | **all**} }

Description

This command displays configuration and status information about the specified IS-IS interface.

Syntax Description

enabled	Displays information only for IS-IS-enabled VLANs.
vlan_name	Specifies a VLAN for which to display IS-IS interface information.
all	Displays information on all IS-IS interfaces.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays IS-IS interface information for the SJvlan VLAN:

```
show isis vlan SJvlan
ISIS Interfaces Summary :
--------------------------------------------------------------------------------
VLAN       Area          State    Cfg       Address
--------------------------------------------------------------------------------
bd10k      a1            u46n-    b1246     11.1.1.1/24
v2         a1            u46--    p1246     2.1.1.2/24
2001:db8:2010::1/64
v3         a1            u46-g    p1246     2001:db8:2011::2/64
State Flags :
u - Links up, d - Links down,
4 - IPv4 forwarding enabled, 6 - IPv6 forwarding enabled,
n - Multinetted (v4), g - Multiple global addresses (v6)
Cfg Flags   :
b - Broadcast interface, p - Point-To-Point interface,
1 - L1 circuit type, 2 - L2 circuit type,
4 - ISIS-enabled for IPv4, 6 - ISIS-enabled for IPv6
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

unconfigure isis area

unconfigure isis area *area_name* {**level** [**1**|**2**]}

Description

This command resets most configurable parameters for the specified router process to the default values.

Syntax Description

area_name	Specifies the router process to be unconfigured.
level [1|2]	Specifies either level 1 or level 2.

Default

N/A.

Usage Guidelines

This command does not delete interfaces from the router process, but it does disable them. The system ID and IS type are not changed. Where appropriate, the default values apply to level 1, level 2, and both IPv4 and IPv6.

Example

The following command resets the area configuration parameters for areax:

```
unconfigure isis area areax
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

unconfigure isis vlan

unconfigure isis [**vlan all** | {**vlan**} *vlan_name*] {**level** [**1**|**2**]}

Description

This command resets all configurable interface parameters to the defaults on one or all VLANs.

Syntax Description

vlan all	Unconfigures IS-IS for all VLANs.
vlan_name	Specifies a single VLAN for which IS-IS is unconfigured.
level [1|2]	Specifies either level 1 or level 2.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets IS-IS configuration parameters for SJvlan:

```
unconfigure isis SJvlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms with a Core license.

40 BGP Commands

clear bgp flap-statistics
clear bgp neighbor counters
configure bgp add aggregate-address
configure bgp add confederation-peer sub-AS-number
configure bgp add network
configure bgp as-display-format
configure bgp as-number
configure bgp cluster-id
configure bgp confederation-id
configure bgp delete aggregate-address
configure bgp delete confederation-peer sub-AS-number
configure bgp delete network
configure bgp export shutdown-priority
configure bgp import-policy
configure bgp local-preference
configure bgp maximum-paths
configure bgp med
configure bgp neighbor allowas-in
configure bgp neighbor dampening
configure bgp neighbor description
configure bgp neighbor dont-allowas-in
configure bgp neighbor maximum-prefix
configure bgp neighbor next-hop-self
configure bgp neighbor no-dampening
configure bgp neighbor password
configure bgp neighbor peer-group
configure bgp neighbor route-policy
configure bgp neighbor route-reflector-client
configure bgp neighbor send-community
configure bgp neighbor shutdown-priority
configure bgp neighbor soft-reset
configure bgp neighbor source-interface
configure bgp neighbor timer
configure bgp neighbor weight
configure bgp peer-group allowas-in
configure bgp peer-group dampening
configure bgp peer-group dont-allowas-in

configure bgp peer-group maximum-prefix
configure bgp peer-group next-hop-self
configure bgp peer-group no-dampening
configure bgp peer-group password
configure bgp peer-group remote-AS-number
configure bgp peer-group route-policy
configure bgp peer-group route-reflector-client
configure bgp peer-group send-community
configure bgp peer-group soft-reset
configure bgp peer-group source-interface
configure bgp peer-group timer
configure bgp peer-group weight
configure bgp restart
configure bgp restart address-family
configure bgp restart restart-time
configure bgp restart stale-route-time
configure bgp restart update-delay
configure bgp routerid
configure bgp soft-reconfiguration
create bgp neighbor peer-group
create bgp neighbor remote-AS-number
create bgp peer-group
delete bgp neighbor
delete bgp peer-group
disable bgp
disable bgp adj-rib-out
disable bgp advertise-inactive-route
disable bgp aggregation
disable bgp always-compare-med
disable bgp community format
disable bgp export
disable bgp export vr
disable bgp fast-external-fallover
disable bgp neighbor
disable bgp neighbor capability
disable bgp neighbor capability address-family vpnv4
disable bgp neighbor capability
disable bgp neighbor originate-default
disable bgp neighbor remove-private-AS-numbers
disable bgp neighbor soft-in-reset
disable bgp peer-group
disable bgp peer-group capability

This chapter describes commands for doing the following:

- Configuring BGP
- Displaying BGP information
- Managing BGP

Note

Many of the BGP commands in this chapter are enhanced to support BGP configurations in a VRF (PE – CE). All of these commands can be executed in a context of a VRF, and the configuration is applied to the BGP instance running inside a VRF.

For an introduction to the BGP feature, see the *ExtremeXOS Concepts Guide*.

clear bgp flap-statistics

clear bgp {**neighbor**} *remoteaddr* {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **flap-statistics** [**all** | **rd** *rd_value* |**as-path** *pat* **expression>** | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community_num* | *AS_Num*:*Num*] | **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

Description

Clears flap statistics for routes to specified neighbors.

Syntax Description

all	Specifies flap statistics for all routes.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
rd_value	Specifies the Route Distinguisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_num	Specifies a community number.
AS_Num	Specifies an autonomous system ID (0-65535).
Num	Specifies a community number.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a subnet mask length (number of bits).
networkPrefixFilter	Specifies an IP address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

Use this command to clear flap statistics for a specified BGP neighbor.

The option network any / <netMaskLen> clears the statistics for all BGP routes whose mask length is equal to or greater than <maskLength>, irrespective of their network address.

The option network any / <netMaskLen> exact clears the statistics for all BGP routes whose mask length is exactly equal to <maskLength>, irrespective of their network address.

To clear flap statistics on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP routes on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Example

The following command clears the flap statistics for a specified neighbor:

```
clear bgp neighbor 10.10.10.10 flap-statistics all
```

History

This command was first available in ExtremeXOS 10.1.

The any / <netMaskLen> options were added in ExtremeXOS 11.0

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 in BGP was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

clear bgp neighbor counters

clear bgp neighbor [*remoteaddr* | **all**] **counters**

Description

Resets the BGP counters for one or all BGP neighbor sessions to zero.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a specific BGP neighbor.
all	Specifies that counters for all BGP neighbors should be reset.

Default

N/A.

Usage Guidelines

This command resets the following counters:

- In-total-msgs
- Out-total-msgs
- In-updates
- Out-updates
- FsmTransitions

The command clear counters also resets all counter for all BGP neighbors. For BGP, the clearcounters command is equivalent to the following BGP command:

```
clear bgp neighbor all counters
```

This command applies to the current VR or VRF context.

Example

The following command resets the counters for the BGP neighbor at 10.20.30.55:

```
clear bgp neighbor 10.20.30.55 counters
```

History

This command was first available in ExtremeXOS 10.1.

For complete information about software licensing, including how to obtain and upgrade your license and what licenses are appropriate for this feature, see Feature License Requirements

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp add aggregate-address

configure bgp add aggregate-address {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} *ipaddress/masklength* {**as-match** | **as-set**} {**summary-only**} {**advertise-policy** *policy*} {**attribute-policy** *policy*}

Description

Configures a BGP aggregate route.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and mask length.
as-match	Generates autonomous system sequence path information (order of AS numbers in AS_PATH is preserved).
as-set	Generates autonomous system set path information (order of AS numbers in AS_PATH is not preserved).
summary-only	Specifies to send only aggregated routes to the neighbors.
advertise-policy	Specifies the policy used to select routes for this aggregated route.
attribute-policy	Specifies the policy used to set the attributes of the aggregated route.

Default

If no address family is specified, IPv4 unicast is the default.

N/A.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

Before you can create an aggregate route, you must enable BGP aggregation using the following command:

```
enable bgp aggregation
```

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

BGP supports overlapping routes. For example, you can configure both of the following aggregate addresses:

- 192.0.0.0/8
- 192.168.0.0/16

After you create an aggregate route, the aggregate route remains inactive until BGP receives a route with an IP address and mask that conforms to an aggregate route. When a conforming route is received, the aggregate route becomes active and is advertised to BGP neighbors. If the summary-only option is specified, only the aggregate route becomes active and is advertised. If the summary-only option is omitted, any conforming aggregate routes and the received route are advertised to BGP neighbors.

Example

The following command configures a BGP aggregate route:

```
configure bgp add aggregate-address 192.1.1.4/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for overlapping aggregate addresses was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp add confederation-peer sub-AS-number

configure bgp add confederation-peer sub-AS-number *number*

Description

Adds a sub-AS to a confederation.

Syntax Description

number	Specifies a sub-AS number of the confederation. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

Before you can add a sub-AS to a confederation on the switch, you must disable any BGP neighbor sessions that are configured with the same AS number as a remote AS number. To disable BGP neighbor sessions, use the following command:

```
disable bgp neighbor [<remoteaddr> | all]
```

Invoke the configure bgp add confederation-peer sub-AS-number command multiple times to add multiple sub-ASs.

IBGP requires networks to use a fully-meshed router configuration. This requirement does not scale well, especially when BGP is used as an interior gateway protocol. One way to reduce the size of a fully-meshed AS is to divide the AS into multiple sub-autonomous systems and group them into a routing confederation. Within the confederation, all BGP speakers in each sub-AS must be fully-meshed. The confederation is advertised to other networks as a single AS.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command adds one sub-AS to a confederation using the ASPLAIN 4-byte AS number format:

```
configure bgp add confederation-peer sub-AS-number 65536
```

The following command adds one sub-AS to a confederation using the ASDOT 4-byte AS number format:

```
configure bgp add confederation-peer sub-AS-number 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp add network

configure bgp add network {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} *ipaddress/masklength* {**network-policy** *policy*}

Description

Adds a network to be originated from this router.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and mask length.
policy	Name of policy to be associated with network export. Policy can filter and/or change the route parameters.

Default

If no address family is specified, IPv4 unicast is the default.

N/A.

Usage Guidelines

The network must be present in the routing table.

Using the export command to redistribute routes complements the redistribution of routes using the configure bgp add network command. The configure bgp add network command adds the route to BGP only if the route is present in the routing table. The enable bgp export command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command adds a network to be originated from this router:

```
configure bgp add network 192.1.1.16/32
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp as-display-format

configure bgp as-display-format [asdot | asplain]

Description

Configures the AS number format displayed in show commands.

Syntax Description

asdot	Specifies the ASDOT format.
asplain	Specifies the ASPLAIN format.

Default

N/A.

Usage Guidelines

The ASPLAIN and ASDOT formats are described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command selects the ASDOT 4-byte AS number format:

```
configure bgp as-display-format asdot
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp as-number

configure bgp AS-number *number*

Description

Changes the local AS number used by BGP.

Syntax Description

number	Specifies a local AS number. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

BGP must be disabled before the AS number can be changed.

This command applies to the current VR or VRF context.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command specifies a local AS number using the ASPLAIN 4-byte AS number format:

```
configure bgp AS-number 65551
```

The following command specifies a local AS number using the ASDOT 4-byte AS number format:

```
configure bgp AS-number 1.15
```

Note

To remove the configured bgp as-number, assign as-number value as 0, i.e. configure bgp AS-number 0.

The following command configures the BGP router ID:

```
configure bgp routerid
```

Note

To remove the configured bgp routerid, give routerid value as 0.0.0.0 i.e. configure bgp routerid 0.0.0.0

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp cluster-id

configure bgp cluster-id *cluster-id*

Description

Configures the local cluster ID.

Syntax Description

cluster-id	Specifies a 4 byte field used by a route reflector to recognize updates from other route reflectors in the same cluster. The range is 0 - 4294967295.

Default

N/A.

Usage Guidelines

BGP must be disabled before the cluster ID can be changed.

Used when multiple route reflectors are used within the same cluster of clients.

Example

The following command appends a BGP route reflector cluster ID to the cluster list of a route:

```
configure bgp cluster-id 40000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp confederation-id

configure bgp confederation-id *number*

Description

Specifies a BGP routing confederation ID.

Syntax Description

confederation-id	Specifies a routing confederation identifier, which is a 4-byte AS number in the range of 1 to 4294967295.

Default

N/A.

Usage Guidelines

IBGP requires that networks use a fully-meshed router configuration. This requirement does not scale well, especially when BGP is used as an interior gateway protocol. One way to reduce the size of a fully-meshed AS is to divide the AS into multiple sub-autonomous systems and group them into a routing confederation. Within the confederation, each sub-AS must be fully-meshed. The confederation is advertised to other networks as a single AS.

The confederation ID is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

BGP must be disabled before the confederation ID can be changed.

Use a confederation ID of 0 to indicate no confederation. You cannot unconfigure the confederation ID while confederation peers are configured. You must delete the confederation peers before you unconfigure the confederation ID.

Example

The following command specifies a BGP routing confederation ID using the ASPLAIN 4-byte AS number format:

```
configure bgp confederation-id 65551
```

The following command specifies a BGP routing confederation ID using the ASDOT 4-byte AS number format:

```
configure bgp confederation-id 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp delete aggregate-address

configure bgp delete aggregate-address {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} [*ipaddress/masklength* | **all**]

Description

Deletes one or all BGP aggregated routes.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
ipaddress/masklength	Specifies an IP network address and netmask length.
all	Specifies all aggregated routes in the specified address family. If you do not specify an address family, all aggregated routes in all address families are deleted.

Default

N/A.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command deletes a BGP aggregate route:

```
configure bgp delete aggregate-address 192.1.1.4/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp delete confederation-peer sub-AS-number

configure bgp delete confederation-peer sub-AS-number *number*

Description

Specifies a sub-AS that should be deleted from a confederation.

Syntax Description

sub-AS-number	Specifies a sub-AS.

Default

N/A.

Usage Guidelines

Before you can change the configuration with this command, you must disable the BGP neighbors in the confederation using the following command:

```
disable bgp neighbor [<remoteaddr> | all]
```

Example

The following command deletes a sub-AS from a confederation using the ASPLAIN 4-byte AS number format:

```
configure bgp delete confederation-peer sub-AS-number 65551
```

The following command deletes a sub-AS from a confederation using the ASDOT 4-byte AS number format:

```
configure bgp delete confederation-peer sub-AS-number 1.15
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp delete network

configure bgp delete network {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast**]} [**all** | *ipaddress/masklength*]

Description

Deletes a network to be originated from this router.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
all	Specifies all networks for the specified address family. If no address family is specified, all networks for all address families are deleted.
ipaddress/masklength	Specifies an IP network address and netmask length.

Default

N/A.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified address is an IPv4 address, an IPv4 address family must be specified with the command. If the specified address is an IPv6 address, an IPv6 address family must be specified with the command.

Example

The following command deletes a network to be originated from this router:

```
configure bgp delete network 192.1.1.12/30
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp export shutdown-priority

configure bgp export *route_type* {**address-family**} *address_family*} **shutdown-priority** *number*

Description

Configures the shutdown priority for IGP export.

Syntax Description

route_type	Specifies the BGP export route type.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
number	Specifies the shutdown priority. The range is 0 - 65,535.

Default

The default value is 2048.

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

To export IPv6 protocols to BGP, you must specify an IPv6 address family.

Note

This command is not currently supported, and is not recommended for use.

Higher priority values lower the chance of an IGP export to be automatically disabled in case BGP or the system goes to a low memory condition.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify OSPF and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

Example

The following command configures the shutdown priority of BGP exported OSPF routes to 1000:

```
configure bgp export ospf shutdown-priority 1000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp import-policy

configure bgp import-policy [*policy-name* | **none**]

Description

Configures the import policy for BGP.

Syntax Description

policy-name	Specifies the policy.
none	Specifies no policy.

Default

N/A.

Usage Guidelines

Use the none keyword to remove a BGP import policy.

An import policy is used to modify route attributes while adding BGP routes to the IP route table.

Example

The following command configures a policy imprt_plcy for BGP:

```
configure bgp import-policy imprt_plcy
```

The following command unconfigures the import policy for BGP:

```
configure bgp import-policy none
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp local-preference

configure bgp local-preference *number*

Description

Changes the default local preference attribute.

Syntax Description

number	Specifies a value used to advertise this router's degree of preference to other routers within the AS. Range is 0 to 2147483647.

Default

100.

Usage Guidelines

BGP must be disabled before the local preference attribute can be changed.

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

Local preference is used to determine a preferred exit point from an AS. Local preferences are exchanged throughout the AS. A change in the local-preference can result in a change in routing and forwarding of traffic leaving the AS.

Example

The following command changes the default local preference attribute to 500:

```
configure bgp local-preference 500
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp maximum-paths

configure bgp maximum-paths *max-paths*

Description

Enables or disables the BGP ECMP feature and specifies the maximum number of paths supported on the current VR.

Syntax Description

max-paths	Specifies the maximum number of paths. The range is 1 to 8. The value 1 disables BGP ECMP. A value greater than 1 enables BGP ECMP and specifies the maximum number of paths.

Default

One. BGP ECMP is disabled.

Usage Guidelines

This command triggers the BGP decision process, causing BGP to re-install the entire BGP routing table into the IP forwarding table. This activity requires a significant amount of switch processor resources, so Extreme Networks recommends that you enable or disable the BGP ECMP feature before enabling the BGP protocol globally on a VR. To ensure that BGP ECMP routes are programmed in the hardware, enter the enable iproute sharing command.

Note

BGP must be disabled before you can change the configuration with this command.

Example

The following command enables BGP ECMP and sets the maximum number of paths to 4:

```
configure bgp maximum-paths 4
```

History

This command was first available in ExtremeXOS 12.1.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp med

configure bgp med [**none** | *bgp_med*]

Description

Configures the metric to be included in the Multi-Exit-Discriminator (MED) path attribute.The MED path attribute is included in route updates sent to external peers if a value is configured.

Syntax Description

none	Specifies not to use a multi-exist-discriminator number.
bgp_med	Specifies a multi-exit-discriminator number. The range is 0-2147483647.

Default

N/A.

Usage Guidelines

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

Note

BGP must be disabled before you can change the configuration with this command.

Example

The following command configures the metric to be included in the MED path attribute:

```
configure bgp med 3
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor allowas-in

configure bgp neighbor [**all** | *remoteaddr*] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **allowas-in** {**max-as-occurrence** *as-count*}

Description

Configures EBGP to receive and accept a looped EBGP route from the specified neighbor, provided the number of occurrences of local AS number in AS-Path is less than or equal to the value of `as-count`

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
as-count	The maximum number of occurrences of local AS number in the received route AS-Path. If the number of occurrences of local AS number in AS-Path is more than as-count, the route is not accepted. The valid range is from 1-16.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session or for a PE to CE neighbor session

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound EBGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

Note

A looped AS path is always allowed for IBGP, irrespective of the BGP configuration.

All EBGP routes with looped AS-Path are silently discarded by default.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following example enables BGP to accept looped BGP routes that contains a maximum of 6 occurrences of receiver's AS-number in AS-Path attribute:

```
configure bgp neighbor 192.162.17.54 allowas-in max-as-occurrence 6
```

History

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor dampening

configure bgp neighbor [**all** | *remoteaddr*] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **dampening** {{**half-life** *half-life-minutes* {**reuse-limit** *reuse-limit-number* **suppress-limit** *suppress-limit-number* **max-suppress** *max-suppress-minutes*} | **policy-filter** [*policy-name* | **none**]}

Description

Configures the route flap dampening feature for a BGP neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. Using this keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
half-life	Specifies the dampening half life. Range is 1 to 45 minutes.
reuse	Specifies the reuse limit. Range is 1 to 20000.
suppress	Specifies the suppress limit. Range is 1 to 20000.
max-suppress	Specifies the maximum hold down time. Range is 1 to 255 minutes.
policy-filter	Specifies a policy.

Default

This feature is disabled by default.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

The half life is the period of time, in minutes, during which the accumulated penalty of a route is reduced by half. The range is 1 to 45 minutes, and the default is 15 minutes.

The reuse limit is the penalty value below which a route is used again. The range is 1-20,000, and the default is 750.

The suppress limit is the penalty value above which a route is suppressed. The range is 1-20,000, and the default is 2,000.

The maximum hold down time is the maximum time a route can be suppressed, no matter how unstable it has been, as long as it no longer flaps. The range is 1-255 minutes, and the default is 4 * the half life.

If you change dampening parameters when routes are in suppressed or history state, the new dampening parameters apply only to routes in the active state. Routes in the suppressed or history state continue to use the old dampening parameters until they become active, at which time they use the updated dampening parameters.

Instead of explicitly configuring the dampening parameters using the command line, you can associate a policy using the policy-filter option. Multiple sets of parameters can be supplied using a policy.

Use the following command to disable route flap dampening for BGP neighbors:

```
        configure bgp neighbor [<remoteaddr> | all] {address-family [ipv4-
unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} no-
dampening
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures route flap dampening to the BGP neighbor at 192.168.1.22 to the default values:

```
configure bgp neighbor 192.168.1.22 dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor description

configure bgp neighbor [**all** | *remoteaddr*] **description** {*description*}

Description

Configures a description for a BGP neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
description	Specifies a string used to describe the neighbor.

Default

The description is a NULL string by default.

Usage Guidelines

Use this command to attach a description to a BGP neighbor. This description is displayed in the output of the show bgp neighbor command when you specify the detail option, or when you specify a

particular neighbor. Enclose the string in double quotes if there are any blank spaces in the string. The maximum length of the string is 56 characters.

If you do not specify the <description> parameter, the description is reset to the default.

This command applies to the current VR or VRF context.

Example

The following command configures the description for the BGP neighbor 192.168.1.22 to Toledo_5:

```
configure bgp neighbor 192.168.1.22 description Toledo_5
```

History

This command was first available in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor dont-allowas-in

configure bgp neighbor [**all** | *remoteaddr*] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **dont-allowas-in**

Description

Disables EBGP from receiving and accepting a looped EBGP route from the specified neighbor, provided the number of occurrences of local AS number in AS-Path is less than or equal to the value of **as-count**.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration change applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration change applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration change applies to all IPv6 neighbors.

ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound EBGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

Note

A looped AS path is always allowed for IBGP, irrespective of the BGP configuration.

All EBGP routes with looped AS-Path are silently discarded by default.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor maximum-prefix

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast** | **vpnv4**]} **maximum-prefix** *number* {{**threshold** *percent*} {**teardown** {**holddown-interval** *seconds*}} {**send-traps**}

Description

Configures the maximum number of IP prefixes accepted from a BGP neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
number	Specifies the maximum number of prefixes that can be accepted. The range is 0 to 4294967294. A value of 0 disables prefix limit feature.
percent	Specifies the percentage of the maximum prefix (threshold) at which a warning message is printed in the log (and console), and/or a trap is sent to the SNMP manager.
teardown	Specifies that the peer session is torn down when the maximum is exceeded.
seconds	Specifies the length of time before the session is re-established, if the session is torn down due to maximum prefix exceeded. If the hold-down interval is zero or not specified, it is kept down until the peer is enabled. The range is 30 to 86400 seconds.
send-traps	Specifies sending “number of prefix reached threshold” and “number of prefix exceed the max-prefix limit” SNMP traps.

Default

This feature is disabled by default.

The default threshold is 75%.

By default, teardown is not specified.

By default, send-traps is not specified.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Configure the peer group before configuring the neighbors. To configure the peer group, use the following command:

```
configure bgp peer-group <peer-group-name> {address-family [ipv4-
unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} maximum-
prefix <number> {{threshold <percent>} {teardown {holddown-interval
<seconds>}} {send-traps}
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the maximum number of IP prefixes accepted from all neighbors to 5000, sets the threshold for warning messages to 60%, and specifies SNMP traps:

```
configure bgp neighbor all maximum-prefix 5000 threshold 60 send-traps
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor next-hop-self

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} [**next-hop-self** | **no-next-hop-self**]

Description

Configures the next hop address used in the outgoing updates to be the address of the BGP connection originating the update.

Syntax Description

remoteaddr	Specifies an IP address.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
next-hop-self	Specifies that the next hop address used in the updates be the address of the BGP connection originating it.
no-next-hop-self	Specifies that the next hop address used in the updates not be the address of the BGP connection originating it (lets BGP decide what would be the next hop).

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context. These settings apply to the peer group and all neighbors of the peer group.

Note

The BGP neighbor must be disabled before you can change the configuration with this command.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the next hop address used in the updates to be the address of the BGP connection originating it:

```
configure bgp neighbor 172.16.5.25 next-hop-self
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor no-dampening

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast** | **vpnv4**]} **no-dampening**

Description

Configures no route flap dampening over BGP peer sessions (disables route flap dampening).

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Use the following command to enable route flap dampening for BGP neighbors:

```
configure bgp neighbor [all | <remoteaddr>] {address-family [ipv4-
unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} dampening
{{half-life <half-life-minutes> {reuse-limit <reuse-limit-number> suppress-
limit <suppress-limit-number> max-suppress <max-suppress-minutes>} | policy-
filter [<policy-name> | none]}
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command disables route flap dampening to the BGP neighbor at 192.168.1.22:

```
configure bgp neighbor 192.168.1.22 no-dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor password

configure bgp neighbor [**all** | *remoteaddr*] **password** [**none** | {**encrypted**} *tcpPassword*]

Description

Configures an RSA Data Security, Inc. MD5 Message-Digest Algorithm secret password for a neighbor.

Syntax Description

all	Specifies all IPv4 and IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
none	Specifies not to use a password
encrypted	Specifies an encrypted string; do not use.
tcpPassword	Specifies a password string.

Default

N/A.

Usage Guidelines

This command applies to the current VR or VRF context.

You must disable the BGP neighbor before changing the password.

When a password is configured, TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication is enabled on the TCP connection that is established with the neighbor.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

To change any one of the following parameters you must disable and re-enable the peer session:

- timer
- source-interface
- soft-in-reset
- password

Changing a route reflector client automatically disables and enables the peer session.

The encrypted option is used by the switch when generating a configuration file, and when parsing a switch-generated configuration file. Do not select the encrypted option in the CLI.

Example

The following command configures the password for a neighbor as Extreme:

```
configure bgp neighbor 192.168.1.5 password extreme
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor peer-group

configure bgp neighbor [**all** | *remoteaddr*] **peer-group** [*peer-group-name* | **none**] {**acquire-all**}

Description

Configures an existing neighbor as the member of a peer group.

Syntax Description

all	Specifies all neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
peer-group-name	Specifies a peer group name.
none	Removes the neighbor from the peer group.
acquire-all	Specifies that all parameters should be inherited by the neighbor from the peer group.

Default

By default, remote AS (if configured for the peer group), source-interface, outbound route policy, send-community and next-hop-self settings are inherited.

Usage Guidelines

This command applies to the current VR or VRF context.

If acquire-all is not specified, only the default parameters are inherited by the neighbor.

When you remove a neighbor from a peer group, it retains the parameter settings of the group. The parameter values are not reset to those the neighbor had before it inherited the peer group values.

To create a new neighbor and add it to a BGP peer group, use the following command:

```
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-
hop}
```

The new neighbor is created as part of the peer group and inherits all of the existing parameters of the peer group. The peer group must have a remote AS configured.

If you are adding an IPv4 peer to a peer group and no IPv4 address family capabilities are assigned to the specified peer group, the IPv4 unicast and multicast address families are automatically enabled for that peer group. If you adding an IPv6 peer to a peer group and no IPv6 address family capabilities are assigned to the peer group, you must explicitly enable the IPv6 address family capabilities you want to support.

Note

If the peer group or any member of the peer group has been configured with an IPv4 or IPv6 address family, the peer group only accepts peers that are configured to use that family. For example, if a peer group is configured for the IPv4 unicast address family, the switch will not allow you to add an IPv6 peer. LIkewise, an IPv6 peer group cannot accept an IPv4 peer.

Example

The following command configures an existing neighbor as the member of the peer group outer:

```
configure bgp neighbor 192.1.1.22 peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor route-policy

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **route-policy** [**in** | **out**] [**none** | *policy*]

Description

Configures a route map filter for a neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.

in	Specifies to install the filter on the input side.
out	Specifies to install the filter on the output side.
none	Specifies to remove the filter.
policy	Specifies a policy.

Default

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

This command applies to the current VR or VRF context.

The policy can be installed on the input or output side of the router. The policy is used to modify or filter the NLRI information and the path attributes associated with it when exchanging updates with the neighbor.

Note

A policy file applied to BGP neighbors cannot have NLRI for both IPv4 and IPv6 address families defined in the same policy file.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the route-policy filter for a neighbor based on the policy nosales:

```
configure bgp neighbor 192.168.1.22 route-policy in nosales
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor route-reflector-client

configure bgp neighbor [*remoteaddr* | **all**] [**route-reflector-client** | **no-route-reflector-client**]

Description

Configures a BGP neighbor to be a route reflector client.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
route-reflector-client	Specifies for the BGP neighbor to be a route reflector client.
no-route-reflector-client	Specifies for the BGP neighbor not to be a route reflector client.

Default

N/A.

Usage Guidelines

Another way to overcome the difficulties of creating a fully-meshed AS is to use route reflectors. Route reflectors allow a single router to serve as a central routing point for the AS or sub-AS.

Use this command to implicitly define the router to be a route reflector. The neighbor must be in the same AS as the router.

This command applies to the current VR or VRF context.

When changing the route reflector status of a peer, the peer is automatically disabled and re-enabled and a warning message appears on the console and in the log.

A cluster is formed by the route reflector and its client routers. Peer routers that are not part of the cluster must be fully meshed according to the rules of BGP.

Example

The following command configures a BGP neighbor to be a route reflector client:

```
configure bgp neighbor 192.168.1.5 route-reflector-client
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor send-community

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} [**send-community** | **dont-send-community**] {**both** | **extended** | **standard**}

Description

Configures whether the community path attribute associated with a BGP NLRI should be included in the route updates sent to the BGP neighbor.

Syntax Description

remoteaddr	Specifies an IP address of a BGP neighbor.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
send-community	Specifies to include the community path attribute.
dont-send-community	Specifies not to include the community path attribute.

both	Send both standard and extended community attributes to this BGP neighbor, or neighbors in peer group
extended	Send only extended communities to this BGP neighbor or neighbors in peer group
standard	Send only standard communities to this BGP neighbor or neighbors in peer group

Default

If no address family is specified, IPv4 unicast is the default. If no optional keyword (both, standard or extended) is specified, standard is assumed.

Usage Guidelines

A BGP community is a group of BGP destinations that require common handling. ExtremeXOS supports the following well-known BGP community attributes:

- no-export
- no-advertise
- no-export-subconfed

The command is additive; that is, if the command is executed twice with the standard or extended option, both the extended and standard communities are sent to the BGP neighbor.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command includes the community path attribute associated with a BGP NLRI in the route updates sent to all BGP neighbors:

```
configure bgp neighbor all send-community
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Options to control the advertisement of extended community attributes were added in ExtremeXOS12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor shutdown-priority

configure bgp neighbor [**all** | *remoteaddr*] **shutdown-priority** *number*

Description

Configures the shutdown priority for a BGP neighbor.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
number	Specifies the shutdown priority. The range is 0 - 65,535.

Default

The default value is 1024.

Usage Guidelines

Note

This command is not currently supported, and is not recommended for use.

Higher priority values lower the chance of a BGP neighbor to be automatically disabled in case BGP or the system goes to a low memory condition.

Example

The following command configures the shutdown priority of the BGP neighbor 10.0.20.1 to 500:

```
configure bgp neighbor 10.0.20.1 shutdown-priority 1000
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor soft-reset

configure bgp neighbor [*remoteaddr* | **all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **soft-reset** {**in** | **out**}

Description

Applies the current input or output routing policy to the routing information already exchanged with the neighbor.

Syntax Description

remoteaddr	Specifies an IP address of a BGP neighbor.
all	Specifies all neighbors.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support. This address family is applicable for PE to PE BGP neighbor sessions only. This keyword may prompt warning or error messages if executed for a regular BGP neighbor session, or for a PE to CE neighbor session.
soft-reset	Do a soft reconfiguration for the BGP neighbor.
in	Specifies to apply the input routing policy.
out	Specifies to apply the output routing policy.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The input/output policy is determined by the route policy configured for the neighbor on the input and/or output side of the router. This command does not affect the switch configuration.

If both the local BGP neighbor and the neighbor router support the route refresh capability (ExtremeWare does not support this feature), a dynamic soft input reset can be performed. The configure bgp neighbor soft-reset command triggers the generation of a Route-Refresh message to the neighbor. As a response to the Route-Refresh message, the neighbor sends the entire BGP routing table in updates and the switch applies the appropriate routing policy to the updates.

This command applies to the current VR or VRF context.

If the route-refresh capability is not supported by the neighbor (like ExtremeWare), the configure bgp neighbor soft-reset command reprocesses the BGP route database using the policy configured for that neighbor.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

ORF policies interact with existing route-refresh commands as follows:

- The **configure bgp neighbor** *x.x.x.x* **soft-reset in** command will trigger a full refresh and the remote BGP speaker will apply both the ORF and outbound policy before sending updates.
- The **configure bgp neighbor x.x.x.x soft-reset out** command will trigger a full refresh, and BGP will apply both the ORF filters and outbound policy.

Example

The following command applies the current input routing policy to the routing information already exchanged with the neighbor:

```
configure bgp neighbor 192.168.1.5 soft-reset in
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor source-interface

configure bgp neighbor [*remoteaddr* | **all**] **source-interface** [**any** | **ipaddress** *ipAddr*]

Description

Changes the BGP source interface for TCP connections.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
any	Specifies any source interface.
ipAddr	Specifies the IP address of a source interface.

Default

Any.

Usage Guidelines

The source interface IP address must be a valid IP address of any VLAN configured on the switch.

This command applies to the current VR or VRF context.

Example

The following command changes the BGP source interface to 10.43.55.10:

```
configure bgp neighbor 192.168.1.5 source-interface ipaddress 10.43.55.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor timer

configure bgp neighbor [*remoteaddr* | **all**] **timer keep-alive** *keepalive* **hold-time** *holdtime*

Description

Configures the BGP neighbor timers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
keepalive	Specifies a BGP neighbor timer keepalive time in seconds. The range is 0 to 21,845 seconds.
holdtime	Specifies a BGP neighbor timer hold time in seconds. The range is 0 and 3to65,535 seconds.

Default

The default keepalive setting is 60 seconds. The default hold time is 180 seconds.

Usage Guidelines

You must disable the BGP neighbor before changing the timer values.

This command applies to the current VR or VRF context.

Example

The following command configures the BGP neighbor timers:

```
configure bgp neighbor 192.168.1.5 timer keep-alive 120 hold-time 360
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp neighbor weight

configure bgp neighbor [*remoteaddr* | **all**] **weight** *weight*

Description

Assigns a locally-used weight to a neighbor connection for the route selection algorithm.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.
weight	Specifies a BGP neighbor weight.

Default

By default, the weight is 1.

Usage Guidelines

All routes learned from this peer are assigned the same weight. The route with the highest weight is more preferable when multiple routes are available to the same network. The range is 0 to 65,535.

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

This command applies to the current VR or VRF context.

Example

The following command assigns a locally used weight of 10 to a neighbor connection:

```
configure bgp neighbor 192.168.1.5 weight 10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group allowas-in

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **allowas-in** {**max-as-occurrence** *as-count*}

Description

Configures BGP to receive and accept a looped BGP route from the neighbors of the specified peer group, provided the number of occurrences of local AS number in AS-Path is less than or equal to that specified in `as-count`.

Syntax Description

peer-group-name	Specifies a peer group
as-count	The maximum number of occurrences of local AS number in the received route AS-Path. If the number of occurrences of local AS number in AS-Path is more than as-count, the route is not accepted. The valid range is from 1-16.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

In a hub and spoke configuration, it becomes necessary to accept an inbound BGP route even though the route's AS-Path contains the receiver's own AS-number. In such network topologies, this feature can be enabled.

This feature can also be enabled for both IBGP and EBGP neighbors, wherever necessary.

This command applies to the current VR or VRF context.

Note

BGP neighbors do not inherit the allowas-in configuration from their peer group unless you explicitly specify the acquire-all option when adding a neighbor to a peer-group.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following example enables BGP to accept looped BGP routes that contains a maximum of 8 occurrences of receiver's AS-number in AS-Path attribute:

```
configure bgp peer-group internal allowas-in max-as-occurrence 8
```

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group dampening

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **dampening** {{**half-life** *half-life-minutes* {**reuse-limit** *reuse-limit-number* **supress-limit** *suppress-limit-number* **max-suppress** *max-suppress-minutes*}} | **policy-filter** [*policy-name* | **none**]}

Description

Configures route flap dampening for a BGP peer group.

Syntax Description

peer-group-name	Specifies a peer group
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
half-life-minutes	Specifies the dampening half life.
reuse-limit-number	Specifies the reuse limit.
suppress-limit-number	Specifies the suppress limit.
max-suppress-minutes	Specifies the maximum hold down time.
policy-name	Specifies a policy
none	Removes any policy association.

Default

This feature is disabled by default.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

The half life is the period of time, in minutes, during which the accumulated penalty of a route is reduced by half. The range is 1 to 45 minutes, and the default is 15 minutes.

The reuse limit is the penalty value below which a route is used again. The range is 1-20,000, and the default is 750.

The suppress limit is the penalty value above which a route is suppressed. The range is 1-20,000, and the default is 2,000.

The maximum hold down time is the maximum time a route can be suppressed, no matter how unstable it has been, as long as it no longer flaps. The range is 1-255 minutes, and the default is 4 * the half life.

If you change dampening parameters when routes are in suppressed or history state, the new dampening parameters apply only to routes in the active state. Routes in the suppressed or history state continue to use the old dampening parameters until they become active, at which time they use the updated dampening parameters.

Instead of explicitly configuring the dampening parameters using the command line, you can associate a policy using the policy-filter option. Multiple sets of parameters can be supplied using a policy.

Use the following command to disable route flap dampening for a BGP peer-group:

```
configure bgp peer-group <peer-group-name> {address-family [ipv4-
unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} no-
dampening
```

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures route flap dampening for the BGP peer group outer:

```
configure bgp peer-group outer dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group dont-allowas-in

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **dont-allowas-in**

Description

Disables BGP from receiving and accepting a looped BGP route from the neighbors of the specified peer group, provided the number of occurrences of local AS number in AS-Path is less than or equal to that specified in `as-count`.

Syntax Description

peer-group-name	Specifies a peer group
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no as-count is specified, the as-count defaults to 3.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Note

BGP neighbors do not inherit the allowas-in configuration from their peer group unless you explicitly specify the acquire-all option when adding a neighbor to a peer-group.

History

This command was first available in ExtremeXOS 12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group maximum-prefix

configure bgp peer-group *peer-group-name* **{address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} maximum-prefix** *number* **{{threshold** *percent*} **{teardown {holddown-interval** *seconds*}} **{send-traps}**

Description

Configures the maximum number of IP prefixes accepted for all neighbors in the peer group.

Syntax Description

name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.

ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
number	Specifies the maximum number of prefixes that can be accepted. The range is 0 to 4294967294. A value of 0 disables prefix limit feature.
percent	Specifies the percentage of the maximum prefix (threshold) at which a warning message is printed in the log (and on the console). An SNMP trap can also be sent.
teardown	Specifies that the peer session is torn down when the maximum is exceeded.
seconds	Specifies the length of time before the session is re-established, if the session has been torn down due to exceeding the max limit. If the hold down interval is 0 or not specified, it is kept down until the peer is enabled. The range is 30 to 86400 seconds.
send-traps	Specifies sending “number of prefix reached threshold” and “number of prefix exceed the max-prefix limit” SNMP traps.

Default

This feature is disabled by default.

The default threshold is 75%.

By default, teardown is not specified.

By default, send-traps is not specified.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Configure the peer group before configuring the neighbors. To configure the neighbors, use the following command:

```
configure bgp neighbor 192.168.1.1 maximum-prefix
```

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the maximum number of IP prefixes accepted from the peer group outer to 5000, sets the threshold for warning messages to 60%, and specifies SNMP traps:

```
configure bgp peer-group outer maximum-prefix 5000 threshold 60 send-traps
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group next-hop-self

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} [**next-hop-self** | **no-next-hop-self**]

Description

Configures the next hop address used in the updates to be the address of the BGP connection originating the update.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.

ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
next-hop-self	Specifies that the next hop address used in the updates be the address of the BGP connection originating it.
no-next-hop-self	Specifies that the next hop address used in the updates not be the address of the BGP connection originating it (Let the BGP protocol decide the next hop).

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

These settings apply to the peer group and all neighbors of the peer group.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the next hop address used in the updates to be the address of the BGP connection originating it:

```
configure bgp peer-group outer next-hop-self
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group no-dampening

configure bgp peer-group *peer-group-name* **{address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} no-dampening**

Description

Configures no route flap dampening for a BGP peer group (disables route flap dampening).

Syntax Description

peer-group-name	Specifies a BGP peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

This feature is disabled by default.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Use the following command to enable route flap dampening for a BGP peer-group:

```
configure bgp peer-group <peer-group-name> {address-family [ipv4-
unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast | vpnv4]} dampening
```

```
{{half-life <half-life-minutes> {reuse-limit <reuse-limit-number> supress-
limit <suppress-limit-number> max-suppress <max-suppress-minutes>}} | policy-
filter [<policy-name> | none]}
```

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command disables route flap dampening to the BGP peer group outer:

```
configure bgp peer-group outer no-dampening
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group password

configure bgp peer-group *peer-group-name* **password** [**none** | *tcpPassword*]

Desccription

Configures the TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm secret password for a peer group and all neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
none	Specifies no password.
tcpPassword	Specifies a password.

Default

N/A.

Usage Guidelines

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

This command applies to the current VR or VRF context.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following command configures the password as Extreme for the peer group outer and its neighbors:

```
configure bgp peer-group outer password extreme
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group remote-AS-number

configure bgp peer-group *peer-group-name* **remote-AS-number** *number*

Description

Configures the remote AS number for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
number	Specifies a remote AS number. The range is 1 to 4294967295.

Default

N/A.

Usage Guidelines

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following command configures the remote AS number for the peer group outer and its neighbors using the ASPLAIN 4-byte AS number format:

```
configure bgp peer-group outer remote-AS-number 65536
```

The following command configures the remote AS number for the peer group abc and its neighbors using the ASDOT 4-byte AS number format:

```
configure bgp peer-group abc remote-AS-number 1.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group route-policy

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **route-policy** [**in** |**out**] [**none** | *policy*]

Description

Configures the policy for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
in	Specifies to install the policy on the input side.
out	Specifies to install the policy on the output side.
none	Specifies to remove the filter.
policy	Specifies a policy.

Default

There is no default policy configuration.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures the route policy for the peer group outer and its neighbors using the policy nosales:

```
configure bgp peer-group outer route-policy in nosales
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group route-reflector-client

configure bgp peer-group *peer-group-name* **[route-reflector-client | no-route-reflector-client]**

Description

Configures all the peers in a peer group to be a route reflector client.

Syntax Description

peer-group-name	Specifies a peer group.
route-reflector-client	Specifies that all the neighbors in the peer group be a route reflector client.
no-route-reflector-client	Specifies that all the neighbors in the peer group not be a route reflector client.

Default

N/A.

Usage Guidelines

This command implicitly defines this router to be a route reflector.

This command applies to the current VR or VRF context.

The peer group must be in the same AS of this router.

Example

The following command configures the peer group outer as a route reflector client:

```
configure bgp peer-group outer route-reflector-client
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group send-community

configure bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} [**send-community** | **dont-send-community**] {**both** | **extended** | **standard**}

Description

Configures whether communities should be sent to neighbors as part of route updates.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
send-community	Specifies that communities are sent to neighbors as part of route updates.
dont-send-community	Specifies that communities are not sent to neighbors as part of route updates.
both	Send both standard and extended community attributes to this BGP neighbor, or neighbors in peer group

extended	Send only extended communities to this BGP neighbor or neighbors in peer group
standard	Send only standard communities to this BGP neighbor or neighbors in peer group

Default

If no address family is specified, IPv4 unicast is the default. If no optional keyword (both, standard or extended) is specified, standard is assumed.

Usage Guidelines

These settings apply to the peer group and all neighbors of the peer group.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

The command is additive; that is, if the command is executed twice with the standard or extended option, both the extended and standard communities are sent to the BGP neighbor.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command configures communities to be sent to neighbors as part of route updates:

```
configure bgp peer-group outer send-community
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Options to control the advertisement of extended community attributes were added in ExtremeXOS12.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group soft-reset

configure bgp peer-group *peer-group-name* **{address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4]} soft-reset {in | out}**

Description

Applies the current input/output routing policy to the neighbors in the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
in	Specifies to apply the input routing policy.
out	Specifies to apply the output routing policy.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The input/output routing policy is determined by the route policy configured for the neighbors in the peer group on the input/output side of the router. This command does not affect configuration of the switch.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

Any configuration change with this command automatically disables and enables the neighbors before the changes.

To configure this feature on Layer 3 VPNs, you must configure this feature in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command applies the current input routing policy to the neighbors in the peer group outer:

```
configure bgp peer-group outer soft-reset in
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group source-interface

configure bgp peer-group *peer-group-name* **source-interface [any | ipaddress** *ipAddr*]

Description

Configures the source interface for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
any	Specifies any source interface.
ipAddr	Specifies an interface.

Default

N/A.

Usage Guidelines

The source interface IP address must be a valid IP address of a VLAN configured on the switch.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

This command applies to the current VR or VRF context.

After you enter this command, the switch automatically disables and enables the neighbors so that the changes can take effect.

Example

The following command configures the source interface for the peer group outer and its neighbors on 10.34.25.10:

```
configure bgp peer-group outer source-interface ipaddress 10.34.25.10
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group timer

configure bgp peer-group *peer-group-name* **timer keep-alive** *seconds* **hold-time** *seconds*

Description

Configures the keepalive timer and hold timer values for a peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
keep-alive *seconds*	Specifies a keepalive time in seconds. Range is 0 to 21845.
hold-time *seconds*	Specifies a hold-time in seconds. Range is 0 and 3 to 65535.

Default

N/A.

Usage Guidelines

This command applies to the current VR or VRF context.

Changes made to the parameters of a peer group are applied to all neighbors in the peer group.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

Example

The following command configures the keepalive timer and hold timer values for the peer group outer and its neighbors:

```
configure bgp peer-group outer timer keep-alive 30 hold-time 90
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp peer-group weight

configure bgp peer-group *peer-group-name* **weight** *number*

Description

Configures the weight for the peer group and all the neighbors of the peer group.

Syntax Description

peer-group-name	Specifies a peer group.
number	Specifies a BGP peer group weight. Range is 0 to 65535.

Default

N/A.

Usage Guidelines

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest routerID

This command applies to the current VR or VRF context.

Example

The following command configures the weight for the peer group outer and its neighbors:

```
configure bgp peer-group outer weight 5
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp restart

configure bgp restart [none | planned | unplanned | both | aware-only]

Description

Configures the router as a graceful BGP restart router.

Syntax Description

none	Do not act as a graceful BGP restart router.
planned	Only act as a graceful BGP restart router for planned restarts.
unplanned	Only act as a graceful BGP restart router for unplanned restarts.
both	Act as a graceful BGP restart router for both planned and unplanned restarts.
aware-only	Only act as a graceful BGP receiver (helper) router.

Default

The default is none; graceful restart is disabled.

Usage Guidelines

This command configures the router as a graceful BGP router. You can decide to configure a router to enter graceful restart for only planned restarts, for only unplanned restarts, or for both. Also, you can decide to configure a router to be a receiver only (which helps a restarting BGP router to perform the graceful restart process), and not to do graceful restarts itself.

After a graceful restart, the switch preserves the time stamps for all BGP routes in the RIB that were received before the stale timer expired. After restart, the capabilities for all BGP peers are renegotiated.

Note

End of Restart (EOR) messages are not sent to BGP peers if the graceful restart feature is disabled.

This command cannot be used while BGP is enabled globally on the switch.

Example

The following command configures a router to perform graceful BGP restarts only for planned restarts:

```
configure bgp restart planned
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp restart address-family

configure bgp restart [add | delete] address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast]

Description

Configures the address family used with graceful BGP restart.

Syntax Description

add	Add the address family.
delete	Remove the address family.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

The default is IPv4 unicast.

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the disable bgp command.

This command configures the address family participating in graceful BGP restart. An address family can be added or deleted. By adding an address family, BGP instructs the switch to preserve BGP routes

of that address family during a graceful restart. The local OPEN message contains all the added address families.

Note

When graceful restart is enabled on the switch, the IPv4 unicast address family support is added by default. Graceful restart for other address families must be explicitly added using this command.

For BGP graceful restart to inter-operate with Cisco routers, any restarting routers connected to Cisco routers must be configured with the command, enable bgp neighbor capability, in the following form, enable bgp neighbor <remoteaddr> capability ipv4-unicast. The command must be executed before BGP is enabled globally on the switch.

Example

The following command configures a router to add IPv4 unicast addresses to graceful BGP restarts:

```
configure bgp restart add address-family ipv4-unicast
```

History

This command was first available in ExtremeXOS 11.4.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp restart restart-time

configure bgp restart restart-time *seconds*

Description

Configures the restart time used with graceful BGP restart. This is the maximum time a receiver router waits for a restarting router to come back up.

Syntax Description

seconds	Specifies the restart time. The range is 1 to 3600 seconds.

Default

The default is 120 seconds

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the disable bgp command.

This command configures the restart timer. This timer is started on the receiver router when it detects the neighbor router is restarting (usually when the peer TCP session is reset). At that time, routes from the restarting router are marked as stale, but are preserved in the routing table. The timer is stopped when the restarting BGP neighbor goes to the ESTABLISHED state (it has finished restarting). If the timer expires, the stale routes are deleted.

Example

The following command configures the graceful BGP restart timer:

```
configure bgp restart restart-time 200
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp restart stale-route-time

configure bgp restart stale-route-time *seconds*

Description

Configures the stale route timer used with graceful BGP restart. This is the maximum time to hold stale paths on receiver routers while its neighbor gracefully restarts.

Syntax Description

seconds	Specifies the stale route time. The range is 1 to 3600 seconds.

Default

The default is 360 seconds

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the disable bgp command.

This command configures the stale route timer. This timer is started when the restarting BGP peer goes to the ESTABLISHED state after it restarts. The timer is stopped when the restarting BGP peer sends EOR messages for all address families. When the timer is stopped, or it expires, the stale routes are deleted.

Example

The following command configures the graceful BGP stale route timer:

```
configure bgp restart stale-route-time 400
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp restart update-delay

configure bgp restart update-delay *seconds*

Description

Configures the update delay timer used with graceful BGP restart. This is the maximum time to delay updating BGP routes to the local IP route table.

Syntax Description

seconds	Specifies the stale route time. The range is 1 to 3600 seconds.

Default

The default is 600 seconds

Usage Guidelines

Before you can enter this command, you must disable BGP services on the switch with the disable bgp command.

This command configures the update delay timer. Usually, a restarting router waits to receive EOR messages from all the receiving BGP neighbors before it starts the route update. Otherwise, it does the route selection when the timer expires.

Example

The following command configures the graceful BGP update delay timer:

```
configure bgp restart update-delay 800
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp routerid

configure bgp routerid *route identifier*

Description

Changes the router identifier.

Syntax Description

router identifier	Specifies a router identifier in the IPv4 address format.

Default

N/A.

Usage Guidelines

BGP must be disabled before changing the router ID.

BGP selects routes based on the following precedence (from highest to lowest):

- higher weight
- higher local preference
- shortest length (shortest AS path)
- lowest origin code
- lowest MED
- route from external peer
- lowest cost to Next Hop
- lowest router ID

This command applies to the current VR or VRF context.

Example

The following command changes the router ID:

```
configure bgp routerid 192.1.1.13
```

Note

To remove the configured bgp routerid, give routerid value as 0.0.0.0 i.e. configure bgp routerid 0.0.0.0.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure bgp soft-reconfiguration

configure bgp soft-reconfiguration

Description

Immediately applies the route policy associated with the network command, aggregation, import, and redistribution.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command does not affect the switch configuration.

This command applies to the current VR or VRF context.

Example

The following command applies the route policy associated with the network command, aggregation, import, and redistribution:

```
configure bgp soft-reconfiguration
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create bgp neighbor peer-group

create bgp neighbor *remoteaddr* **peer-group** *peer-group-name* **{multi-hop}**

Description

Creates a new neighbor and makes it part of the peer group.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
peer-group-name	Specifies a peer group.
multi-hop	Specifies to allow connections to EBGP peers that are not directly connected.

Default

N/A.

Usage Guidelines

You can specify an IPv4 or IPv6 address for the BGP peer. The address can be a global unicast or a link-local address. IPv6 link-local remote addresses are supported only for EBGP single-hop peerings.

If you are adding an IPv4 peer to a peer group and no IPv4 address family capabilities are assigned to the specified peer group, the IPv4 unicast and multicast address families are automatically enabled for that peer group. If you adding an IPv6 peer to a peer group and no IPv6 address family capabilities are assigned to the peer group, you must explicitly enable the IPv6 address family capabilities you want to support.

Note

If the peer group or any member of the peer group has been configured with an IPv4 or IPv6 address family, the peer group only accepts peers that are configured to use that family. For example, if a peer group is configured for the IPv4 unicast address family, the switch will not allow you to add an IPv6 peer. LIkewise, an IPv6 peer group cannot accept an IPv4 peer.

If the multihop keyword is not specified, the IP addresses of the EBGP speaker and peer must belong to the same subnet.

All the parameters of the neighbor are inherited from the peer group. The peer group should have the remote AS configured.

To add an existing neighbor to a peer group, use the following command:

```
        configure bgp neighbor [all | <remoteaddr>] peer-group [<peer-group-
name> | none] {acquire-all}
```

If you do not specify acquire-all, only the mandatory parameters are inherited from the peer group. If you specify acquire-all, all of the parameters of the peer group are inherited. This command disables the neighbor before adding it to the peer group.

Example

The following command creates a new neighbor and makes it part of the peer group outer:

```
create bgp neighbor 192.1.1.22 peer-group outer
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
  virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally,

BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create bgp neighbor remote-AS-number

create bgp neighbor *remoteaddr* **remote-AS-number** *as-number* {**multi-hop**}

Description

Creates a new BGP peer.

Syntax Description

remoteaddr	Specifies an IP address of the BGP neighbor.
as-number	Specifies a remote AS number. The range is 1 to 4294967295.
multi-hop	Specifies to allow connections to EBGP peers that are not directly connected.

Default

N/A.

Usage Guidelines

You can specify an IPv4 or IPv6 address for the BGP peer. The address can be a global unicast or a link-local address. IPv6 link-local remote addresses are supported only for EBGP single-hop peerings.

If the multihop keyword is not specified, the IP addresses of the EBGP speaker and peer must belong to the same subnet.

The AS number is a 4-byte AS number in either the ASPLAIN or the ASDOT format as described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

If the AS number is the same as the AS number provided in the configure bgp as command, then the peer is consider an IBGP peer, otherwise the neighbor is an EBGP peer. The BGP session to a newly created peer is not started until the enable bgp neighbor command is issued.

Example

The following command specifies a BGP peer AS number using the ASPLAIN 4-byte AS number format:

```
create bgp neighbor 10.0.0.1 remote-AS-number 65540
```

The following command specifies a BGP peer AS number using the ASDOT 4-byte AS number format:

```
create bgp neighbor 10.0.0.1 remote-AS-number 1.5
```

The following command specifies a BGP peer using an IPv6 address:

```
create bgp neighbor fe80::204:96ff:fe1e:a8f1%vlan1 remote-AS-number 200
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
  virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally, BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for 4-byte AS numbers was first available in ExtremeXOS 12.4.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create bgp peer-group

create bgp peer-group *peer-group-name*

Description

Creates a new peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

You can use BGP peer groups to group together up to 512 BGP neighbors. All neighbors within the peer group inherit the parameters of the BGP peer group. The following mandatory parameters are shared by all neighbors in a peer group:

- source-interface
- out-nlri-filter
- out-aspath-filter
- out-route-policy
- send-community
- next-hop-self

The BGP peer group name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Feature License Requirements in the ExtremeXOS Concepts Guide.

No IPv4 or IPv6 address family capabilities are added a to a new peer group. When the first IPv4 peer is added to a peer group, the IPv4 unicast and multicast families are enabled by default. No IPv6 address family capabilities are automatically added when an IPv6 peer is added to a peer group; you must explicitly add any IPv6 address family capabilities that you want for a peer group.

Example

The following command creates a new peer group named outer:

```
create bgp peer-group outer
```

The following example specifies how to create a neighbor peer group in a VRF (PE – CE neighbor session):

```
  virtual-router <vr_vrf_name>
create bgp neighbor <remoteaddr> remote-AS-number <asNumber> {multi-hop}
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-hop}
delete bgp [{neighbor} <remoteaddr> | neighbor all ]
[create | delete] bgp peer-group <peer-group-name>
```

BGP maintains a separate RIB (RIB-In, RIB-Loc and RIB-Out) for each of the VRF it is configured to run. So routes received from a peer in VRF1 are not mixed up with routes from a peer in VRF2. Additionally, BGP routes in a VRF are regular IPv4 routes of address family ipv4. The BGP decision algorithm occurs inside a VRF and is not impacted by any BGP activity in other VRF.There can be two BGP neighbors with the same peer IP address in two different VRFs.

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for L3 VPN was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete bgp neighbor

delete bgp neighbor [*remoteaddr* | **all**]

Description

Deletes one or all BGP neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of the BGP neighbor to be deleted.
all	Specifies all IPv4 and IPv6 neighbors.

Default

N/A.

Usage Guidelines

You can use global unicast remote addresses to delete all BGP peer types. You can use link-local remote address to delete only EBGP single-hop peers.

Example

The following command deletes the specified IPv4 BGP neighbor:

```
delete bgp neighbor 192.168.1.17
```

The following command deletes the specified IPv6 BGP neighbor:

```
delete bgp neighbor fe80::204:96ff:fe1e:a8f1%vlan1
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete bgp peer-group

delete bgp peer-group *peer-group-name*

Description

Deletes a peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

Use this command to delete a specific BGP peer group.

Example

The following command deletes the peer group named outer:

```
delete bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp

disable bgp

Description

Disables BGP.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Use this command to disable BGP on the router.

Example

The following command disables BGP:

```
disable bgp
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp adj-rib-out

disable bgp adj-rib-out

Description

Disables local storage of Adj-Rib-Out (ARO) data to reduce memory usage.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The default configuration for this feature conserves memory usage by not storing the Adj-RIB-Out for each peer. This results in reduced performance during outbound route advertisements, withdraws, outbound policy evaluations, and the display of transmitted routes in response to CLI commands.

If your configuration has a relatively low number of peers, you can enable this feature and benefit from the increased performance. If your configuration has a relatively large number of peers, you might want to disable this feature to reduce memory usage.

This command applies to the BGP instance for the current VR or VRF context.

Example

The following command disables ARO data storage:

```
disable bgp adj-rib-out
```

History

This command was first available in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on the platforms that support this Core license feature as listed in the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp advertise-inactive-route

disable bgp {address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast]} advertise-inactive-route

Description

Disables advertisement of BGP inactive routes, which are defined as those routes that rated best by BGP and not best in the IP routing table.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default address family.

Usage Guidelines

This command can be successfully executed only when BGP is globally disabled. If you want to disable inactive route advertisement and BGP is enabled, you must disable BGP (disable bgp), disable this feature, and then enable BGP (enable bgp).

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command disables inactive route advertisement for IPv4 unicast traffic:

```
disable bgp address-family ipv4-unicast advertise-inactive-route
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp aggregation

disable bgp aggregation

Description

Disables BGP route aggregation.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

Use this command to disable BGP route aggregation.

Example

The following command disables BGP route aggregation:

```
disable bgp aggregation
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp always-compare-med

disable bgp always-compare-med

Description

Disables BGP from comparing Multi Exit Discriminators (MEDs) for paths from neighbors in different Autonomous Systems (AS).

Syntax Description

This command has no arguments or variables.

Default

ExtremeXOS does not compare MEDs for paths from neighbors in different AS.

Usage Guidelines

The MED is one of the parameters that is considered when selecting the best path among many alternative paths. The path with a lower MED is preferred over a path with a higher MED. By default, during the best path selection process, MED comparison is done only among paths from the same AS.

BGP must be disabled before you can change the configuration with this command.

Example

The following command disables MED from being used in comparison among paths from different AS:

```
disable bgp always-compare-med
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp community format

disable bgp community format AS-number : number

Description

Disables the AS-number:number format of display for communities in the output of show commands.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Using this command, communities are displayed as a single decimal value.

Example

The following command disables the AS-number:number format of display for communities:

```
disable bgp community format AS-number : number
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp export

disable bgp export *route_type* {**address-family**} *address_family*}

For Layer 3 VPNs:

disable bgp export *route_type* {**address-family**} *address_family*}

Description

Disables BGP from exporting routes from other protocols to BGP peers.

Syntax Description

bgp	For Layer 3 VPNs, this specifies that BGP routes learned from CE routers are to be exported to remote PE routers.
route_type	Specifies the BGP export route type.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

The exporting of routes between any two routing protocols is a discrete configuration function. For example, you must configure the switch to export routes from OSPF to BGP and, if desired, you must configure the switch to export routes from BGP to OSPF. You must first configure both protocols and

then verify the independent operation of each. Then you can configure the routes to export from OSPF to BGP, and the routes to export from BGP to OSPF.

You can use policies to associate BGP attributes including Community, NextHop, MED, Origin, and Local Preference with the routes. Policies can also be used to filter out exported routes.

Using the export command to redistribute routes complements the redistribution of routes using the configure bgp add network command. The configure bgp add network command adds the route to BGP only if the route is present in the routing table. The enable bgp export command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify OSPF and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

For Layer 3 VPNs, the disable bgp export command must be entered in the context of the VRF that supports the Layer 3 VPN.

When the export source is the Layer 3 VPN, you can specify direct, or remote-vpn to disable route export to the VRF. The destination address family must be ipv4-unicast.

When the export source is the VRF, you can specify direct, or bgp to disable route export to the VPN. The destination address family must be vpnv4.

Example

The following command disables BGP from exporting routes from the OSPF protocol to BGP peers:

```
disable bgp export ospf
```

The following command disables the export of BGP routes from a VRF to a VPN:

```
disable bgp export bgp address-family vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp export vr

disable bgp export {**vr**} *vr_name route_type* {*address-family*} vpnv4

Description

For IPv4 and IPv6 routes, this command disables the PE router to export and redistribute local VRF routes to remote PE routers through BGP .

Syntax Description

vr	Specifies the source VPN VRF of the exported routes .
vr_name	Specifies the name of the source VPN VRF.
route_type	Specifies the source or origin of the route types to be exported to remote PE routers. Valid Types: blackhole, direct, and bgp .
address-family	Specifies the address family for the exported routes. Valid types are ipv4-unicast, vpnv4.
vpn4	Specifies that routes from the VRF are exported as vpnv4 routes over MPBGP.

Default

Disabled.

Usage Guidelines

This command disables a PE router to advertise learned routes from CE routers to remote PE routers in a Service Provider's backbone. Executing this command allows the PE router to convert VRF native IPv4 routes into VPN-IPv4 route,s and advertise to all remote PE BGP neighbors as VPN-IPv4 routes.

- For Layer 3 VPNs, you must enter the **disable bgp export** vrcommand in the context of the VRF that supports the Layer 3 VPN.
- When the export source is the Layer 3 VPN, you can specify direct, or remote-vpn to disable route export to the VRF. The destination address family must be ipv4-unicast.
- This export command is applicable in Parent VR context only. If you execute it in a VRF context, an error message is returned.
- The source VPN VRF must be a child of the Parent VR.
- BGP need not be added to a VPN VRF to export routes from a VPN VRF.
- The direction of where the redistribution is targeted is implicit on the keywords used, For eg:- remote-vpn only applies to remote routes from PE redistributed to CE, hence we cannot use it with address family vpnv4. Similarly bgp only applies to EBGP routes from CE exported as VPN routes,

hence we use it only with address family vpnv4. Other sources such as “static” and “direct” are redistributed both ways.

Example

The following command disables BGP to advertise a vpnv4 route named "corp1_vpn_vrf":

```
switch 19 # disable bgp export "corp1_vpn_vrf" bgp address-family vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp fast-external-fallover

disable bgp fast-external-fallover

Description

Disables BGP fast external fallover functionality.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the BGP fast external fallover on the router. This command applies to all directly-connected external BGP neighbors.

When BGP fast external fallover is enabled, the directly-connected EBGP neighbor session is immediately reset when the connecting link goes down.

If BGP fast external fallover is disabled, BGP waits until the default hold timer expires (3 keepalives) to reset the neighboring session. In addition, BGP might teardown the session somewhat earlier than hold timer expiry if BGP detects that the TCP session and it's directly connected link is broken (BGP detects this while sending or receiving data from TCP socket).

Example

The following command disables BGP fast external fallover:

```
disable bgp fast-external-fallover
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp neighbor

disable bgp neighbor [*remoteaddr* | **all**]

Description

Disables the BGP session.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

After the session has been disabled, all the information in the route information base (RIB) for the neighbor is flushed.

This command applies to the current VR or VRF context.

Example

The following command disables the BGP session:

```
disable bgp neighbor 192.168.1.17
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp neighbor capability

disable bgp neighbor [**all** | *remoteaddr*] **capability** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4** |**route-refresh**]

Description

This command disables an address family or the route-refresh capability for one or all neighbors.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
route-refresh	Specifies ROUTE-REFRESH message capabilities.

Default

The following capabilities are enabled by default for IPv4 peers: IPv4 unicast, IPv4 multicast, and route refresh.

The following capabilities are enabled by default for IPv6 peers: route refresh.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

To inter-operate with Cisco routers for BGP graceful restart, you must enable IPv4 unicast address capability.

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Example

The following command disables the route-refresh feature for all neighbors:

```
disable bgp neighbor all capability route-refresh
```

The following command disables the VPNv4 address family for a neighbor:

```
disable bgp neighbor 192.168.96.235 capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp neighbor capability address-family vpnv4

disable bgp {**neighbor**} [**all** | *remoteaddr*] **capability address-family vpnv4 type** [**community** | **ext-community** | **prefix**] {[**send** | **receive** | **both**]}

Description

This command disables neighbor capability for one or all BGP neighbors on a Layer 3 VPN.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors.
remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables neighbor capability for communities.
ext-community	Disables neighbor capability for extended communities.
prefix	Disables neighbor capability for prefixes.
send	Disables neighbor capability filter list send capability.
receive	Disables neighbor capability filter list receive capability.
both	Disables neighbor capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

Example

The following command disables the neighbor capability feature for a Layer 3 VPN neighbor:

```
disable bgp neighbor 1.1.1.1 capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see Feature License Requirements

disable bgp neighbor capability

disable bgp {**neighbor**} [*remoteaddr* | **all**] **capability** {[**address-family** [**ipv4-unicast** | **ipv4-multicast**]} **type** [**community**|**ext-community**|**prefix**] {[**send**|**receive**|**both**]}

Description

This command disables an address family or the route-refresh capability for one or all neighbors.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor. The switch uses the IP address format to determine if the address is an IPv4 or IPv6 address.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
community	Disables ORF for communities.
ext-community	Disables ORF for extended communities.
prefix	Disables ORF for prefixes.
send	Disables ORF filter list send capability.
receive	Disables ORF filter list receive capability.
both	Disables ORF filter list send and receive capability.

Default

The following capabilities are enabled by default for IPv4 peers: IPv4 unicast, IPv4 multicast, and route refresh.

The following capabilities are enabled by default for IPv6 peers: route refresh.

Usage Guidelines

ORF is disabled globally by default

ORF capabilities are assumed to be disabled by default for all neighbors

If address family is not specified, *ipv4-unicast* is assumed.

If *direction* is not specified, *both* is assumed

Note
prefix is not supported for vpnv4 address family.

Example

The following command disables the ORF capabilities for the ipv4-multicast address families:

```
BD-12802.20 # disable bgp neighbor 113.0.0.1 capability orf address-family
ipv4-multicast type prefix?
  both           Enable ORF filter list receive and send capability
  receive        Enable ORF filter list receive capability
  send           Enable ORF filter list send capability       (pacman debug)

BD-12802.20 # Disable bgp neighbor 113.0.0.1 capability orf address-family
ipv4-multicast type ?
  both           Disable ORF filter list receive and send capability
  receive        Disable ORF filter list receive capability
  send           Disable ORF filter list send capability
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the L3 VPN feature, see the ExtremeXOS Concepts Guide.

disable bgp neighbor originate-default

disable bgp [{**neighbor**} *remoteaddr* | **neighbor all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} **originate-default**

Description

Removes a default route to a single BGP neighbor or to all BGP neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peer is enabled or disabled.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command removes default routes for IPv4 unicast traffic for all BGP peer nodes:

```
disable bgp neighbor all originate-default
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp neighbor remove-private-AS-numbers

disable bgp neighbor [*remoteaddr* | **all**] **remove-private-AS-numbers**

Description

Disables the removal of private AS numbers from the AS path in route updates sent to EBGP peers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

Private AS numbers are AS numbers in the range 64512 through 65534. You can remove private AS numbers from the AS path attribute in updates that are sent to external BGP (EBGP) neighbors. Possible reasons for using private AS numbers include:

- The remote AS does not have officially allocated AS numbers.
- You want to conserve AS numbers if you are multi-homed to the local AS.

Private AS numbers should not be advertised on the Internet. Private AS numbers can only be used locally within an administrative domain. Therefore, when routes are advertised out to the Internet, the private AS number can be stripped out from the AS paths of the advertised routes using this feature.

This command applies to the current VR or VRF context.

Example

The following command disables the removal of private AS numbers from the AS path in route updates sent to the EBGP peers:

```
disable bgp neighbor 192.168.1.17 remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp neighbor soft-in-reset

disable bgp neighbor [**all** | *remoteaddr*] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **soft-in-reset**

Description

Disables the soft input reset feature.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Before you can change the configuration with this command, you must disable BGP, and you must disable the corresponding BGP neighbor session using the following command:

```
disable bgp neighbor [<remoteaddr> | all]
```

To disable this feature on Layer 3 VPNs, you must do so in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Example

The following command disables the soft input reset for the neighbor at 192.168.1.17:

```
disable bgp neighbor 192.168.1.17 soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp peer-group

disable bgp peer-group *peer-group-name*

Description

Disables a BGP peer group and all its BGP neighbors.

Syntax Description

peer-group-name	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command disables the BGP peer group outer:

```
disable bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp peer-group capability

disable bgp peer-group *peer-group-name* **capability [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast |vpnv4 |route-refresh]**

Description

This command disables an address family or the route-refresh capability for a peer group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
route-refresh	Specifies ROUTE-REFRESH message capabilities.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

All capabilities are enabled for IPv4 peer groups by default.

Only the route refresh capability is enabled for peer groups by default.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

To inter-operate with Cisco routers for BGP graceful restart, you must enable IPv4 unicast address capability.

Example

The following command disables the route-refresh feature for the peer group outer:

```
disable bgp peer-group outer route-refresh
```

The following command disables the VPNv4 address family for a peer group:

```
disable bgp peer-group backbone capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp peer-group capability address-family vpnv4

disable bgp peer-group *peer-group-name* **capability address-family vpnv4 type [community | ext-community] {[send | receive | both]}**

Description

This command disables peer-group capability for a peer group on a Layer 3 VPN.

Syntax Description

remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables peer-group capability for communities.
ext-community	Disables peer-group capability for extended communities.
send	Disables peer-group capability filter list send capability.
receive	Disables peer-group capability filter list receive capability.
both	Disables peer-group capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message: `Outbound-route-filtering not supported for IPv6 neighbors`, or `Outbound-route-filtering not supported for address family` *`addr_family`* .

Example

The following command disables the peer-group capability feature for a Layer 3 VPN peer group:

```
disable bgp peer-group vpn capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the Feature License Requirements

disable bgp peer-group originate-default

disable bgp {**peer-group**} *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} **originate-default**

Description

Removes default routes to all BGP neighbors in the specified peer group.

Syntax Description

peer-group-name	Specifies the BGP peer group for which the default routes are removed.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peers are enabled or disabled.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command removes default routes for IPv4 unicast traffic for all nodes in the test BGP peer group:

```
disable bgp peer-group test originate-default
```

History

This command was first available in ExtremeXOS 12.2.2.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp peer-group remove-private-AS-numbers

disable bgp peer-group *peer-group-name* **remove-private-AS-numbers**

Description

Disables the removal of private autonomous system (AS) numbers from the AS_Path attribute of outbound updates.

Syntax Description

peer-group-name	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command disables the BGP peer group outer from removing private AS numbers:

```
disable bgp peer-group outer remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable bgp peer-group soft-in-reset

disable bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} **soft-in-reset**

Description

Disables the soft input reset feature.

Syntax Description

peer-group-name	Specifies a peer group.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command disables the soft input reset feature:

```
disable bgp peer-group outer soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp

enable bgp

Description

Enables BGP.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the Border Gateway Protocol (BGP) on the router. Before invoking this command, the local AS number and BGP router ID must be configured.

Example

The following command enables BGP:

```
enable bgp
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp adj-rib-out

enable bgp adj-rib-out

Description

Enables local storage of Adj-Rib-Out (ARO) data to support the display of transmitted routes by other CLI commands.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The default configuration for this feature conserves memory usage by not storing the Adj-RIB-Out for each peer. This results in reduced performance during outbound route advertisements, withdraws, outbound policy evaluations, and the display of transmitted routes in response to CLI commands.

If your configuration has a relatively low number of peers, you can enable this feature and benefit from the increased performance. If your configuration has a relatively large number of peers, you might want to disable this feature to reduce memory usage.

This command applies to the BGP instance for the current VR or VRF context.

Example

The following command enables ARO data storage:

```
enable bgp adj-rib-out
```

History

This command was first available in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on the platforms that support this Core license feature as listed in the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp advertise-inactive-route

enable bgp {address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast]} advertise-inactive-route

Description

Enables advertisement of BGP inactive routes, which are defined as those routes that are rated best by BGP and not best in the IP routing table.

Syntax Description

address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default address family.

Usage Guidelines

This command can be successfully executed only when BGP is globally disabled. It is best to enable this feature before you enable BGP (enable bgp). If BGP is enabled, you must disable BGP (disable bgp), enable this feature, and then enable BGP.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command enables inactive route advertisement for IPv4 unicast traffic:

```
enable bgp address-family ipv4-unicast advertise-inactive-route
```

History

This command was first available in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp aggregation

enable bgp aggregation

Description

Enables BGP route aggregation.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

Route aggregation is the process of combining the characteristics of several routes so that they are advertised as a single route. Aggregation reduces the amount of information that a BGP speaker must store and exchange with other BGP speakers. Reducing the information that is stored and exchanged also reduces the size of the routing table.

To use BGP route aggregation, follow these steps:

- Enable aggregation using the following command:

  enable bgp aggregation
- Create an aggregate route using the following command:

  configure bgp add aggregate-address {address-family [ipv4-unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast]} <ipaddress/masklength> {as-match | as-set} {summary-only} {advertise-policy <policy>} {attribute-policy <policy>}

Example

The following command enables BGP route aggregation:

```
enable bgp aggregation
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp always-compare-med

enable bgp always-compare-med

Description

Enables BGP to use the Multi Exit Discriminator (MED) from neighbors in different autonomous systems (ASs) in the route selection algorithm.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

MED is only used when comparing paths from the same AS, unless always-compare-med is enabled. When this command is issued, MEDs from different AS are used in comparing paths. A MED value of zero is treated as the lowest MED and therefore the most preferred route.

BGP must be disabled before you can change the configuration with this command.

Example

The following command enables BGP to use the Multi Exit Discriminator (MED) from neighbors in different autonomous systems in the route selection algorithm:

```
enable bgp always-compare-med
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp community format

enable bgp community format AS-number : number

Description

Enables the as-number:number format of display for the communities in the output of `show` commands.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If not enabled, the communities are displayed as a single decimal value.

Example

The following command enables the AS-number:number format of display for communities:

```
enable bgp community format AS-number : number
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp export

For IPv4 and IPv6 routes:

enable bgp export *route_type* {{address-family} *address_family*} {export-policy *policy-name*}

For VPNv4 routes:

enable bgp export remote-vpn {{address-family} ipv4-unicast} {export-policy *policy-name*}

Description

For IPv4 and IPv6 routes, this command enables the export of routes learned from BGP peers to the specified protocol.

For VPNv4 routes, this command enables the exchange of routes between a BGP PE router and a CE router.

Syntax Description

bgp	For Layer 3 VPNs, this specifies that BGP routes learned from CE routers are to be exported to remote PE routers.
route_type	Specifies the BGP export route type. Valid ***route_type*** values are: blackhole; direct; isis; isis-level-1; isis-level-2; isis-level-1-external; isis-level-2-external; ospf; ospf-extern1; ospf-extern2; ospf-inter; ospf-intra; rip; static; ospfv3; ospfv3-extern1; ospfv3-extern2; ospfv3-inter; ospfv3-intra; ripng;
address-family	Valid ***address_family*** values are: ipv4-unicast; ipv4-multicast; ipv6-unicast; ipv6-multicast
remote-vpn	For Layer 3 VPNs, this specifies that BGP routes learned from remote PE routers are to be exported to the local VRF.
policy-name	Name of policy to be associated with network export. Policy can filter and/or change the route parameters.

Default

Disabled.

If no address family is specified for an IPv6 protocol, the default IPv6 unicast family applies; otherwise if no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The exporting of routes between any two routing protocols is a discrete configuration function. For example, you must configure the switch to export routes from OSPF to BGP and, if desired, you must configure the switch to export routes from BGP to OSPF. You must first configure both protocols and then verify the independent operation of each. Then, you can configure the routes to export from OSPF to BGP, and the routes to export from BGP to OSPF.

You can use a policy to associate BGP attributes including Community, NextHop, MED, Origin, and Local Preference with the routes. A policy can also be used to filter out exported routes.

Using the export command to redistribute routes complements the redistribution of routes using the configure bgp add network command. The configure bgp add network command adds the route to BGP only if the route is present in the routing table. The enable bgp export command redistributes an individual route from the routing table to BGP. If you use both commands to redistribute routes, the routes redistributed using the network command take precedence over routes redistributed using the export command.

Note

For this command to execute, the specified protocol must support the specified address family. For example, the command fails if you specify OSPF and the IPv6 unicast address family. You can specify blackhole, direct, static, and IS-IS routes with IPv4 or IPv6 address families.

To export Layer 3 VPN routes to the CE peer in a VPN VRF, the source must be remote-vpn and destination address family must be ipv4-unicast.

Example

The following command enables BGP to export BGP routes to OSPF:

```
enable bgp export ospf
```

The following command enables export of Layer3 VPN Routes recevied from the PE Core in a VPN-VRF to its CE peers:

```
enable bgp export remote-vpn address-family ipv4-unicast
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

The blackhole option was added in ExtremeXOS 12.1.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp export vr

enable bgp export {**vr**} *vr_name route_type* {*address-family*} vpnv4 {**export-policy** *policy_name*}

Description

For IPv4 and IPv6 routes, this command enables the PE router to export and redistribute local VRF routes to remote PE routers through BGP .

Syntax Description

vr	Specifies the source VPN VRF of the exported routes .
vr_name	Specifies the name of the source VPN VRF.
route_type	Specifies the source or origin of the route types to be exported to remote PE routers. Valid Types: blackhole, direct, and bgp, and static .
address-family	Specifies the address family for the exported routes. Valid types are vpnv4.

export-policy vpnv4	(Optional) The export policy can be specified when you enable bgp export. Specifies that routes from the VRF are exported as vpnv4 routes over MPBGP.
policy_name	Name of export policy to be associated with export of VRF routes into BGP's VPN-IPv4 domain for advertisement to other PE routers.

Default

Disabled.

Usage Guidelines

This command enables a PE router to advertise learned routes from CE routers to remote PE routers in a Service Provider's backbone. Executing this command allows the PE router to convert VRF native IPv4 routes into VPN-IPv4 route,s and advertise to all remote PE BGP neighbors as VPN-IPv4 routes.

- This export command is applicable in Parent VR context only. If you execute it in a VRF context, an error message is returned.
- The source VPN VRF must be a child of the Parent VR.
- BGP need not be added to a VPN VRF to export routes from a VPN VRF.
- The direction of where the redistribution is targeted is implicit on the keywords used. Similarly bgp only applies to EBGP routes from CE exported as VPN routes, hence we use it only with address family vpnv4. Other sources such as "static" and "direct" are redistributed both ways.
- Use **show vr** *parent_vr_name* to check routes exported from various VPN VRFs into the MBGP's VPN-IPv4 domain.
- Use **show vr** *vpn_vrf_name* to check routes exported from a VPN VRF into the MBGP's VPN-IPv4 domain.

Example

The following command enables BGP to advertise a vpnv4 route named "corp1_vpn_vrf":

```
switch 19 # enable bgp export "corp1_vpn_vrf" bgp address-family vpnv4
```

History

This command was first added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp fast-external-fallover

enable bgp fast-external-fallover

Description

Enables BGP fast external fallover functionality.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables the BGP fast external fallover on the router. This command applies to all directly-connected external BGP neighbors.

When BGP fast external fallover is enabled, the directly-connected EBGP neighbor session is immediately reset when the connecting link goes down.

If BGP fast external fallover is disabled, BGP waits until the default hold timer expires (3 keepalives) to reset the neighboring session. In addition, BGP might teardown the session somewhat earlier than hold timer expiry if BGP detects that the TCP session and it's directly connected link is broken (BGP detects this while sending or receiving data from TCP socket).

Example

The following command enables BGP fast external fallover:

```
enable bgp fast-external-fallover
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp neighbor

enable bgp neighbor [*remoteaddr* | *all*]

Desription

Enables the BGP session. The neighbor must be created before the BGP neighbor session can be enabled.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

To create a new neighbor and add it to a BGP peer group, use the following command:

```
create bgp neighbor <remoteaddr> peer-group <peer-group-name> {multi-
hop}
```

This command applies to the current VR or VRF context.

Example

The following command enables the BGP neighbor session:

```
enable bgp neighbor 192.168.1.17
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp neighbor originate-default

enable bgp [{**neighbor**} *remoteaddr* | **neighbor all**] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} **originate-default** {**policy** *policy-name*}

Description

Enables the origination and advertisement of a default route to a single BGP neighbor or to all BGP neighbors.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
policy-name	Specifies a policy to be applied to the default route origination.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Note

You must specify an IPv6 address family for an IPv6 peer, because an IPv6 peer does not support the default IPv4 unicast address family. Similarly, if you specify an IPv4 peer and an address family in the command, an IPv4 address family must be specified.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peer is enabled or disabled. The default route or routes are created regardless of whether or not there are matching entries in the IP route table.

When a BGP neighbor is added to a peer group, it does not inherit the default route origination configuration from the peer group. Also, default route origination for a neighbor and the associated peer group can be different.

If a policy is configured and specified in the command, a default route can be originated only if there is a route in the local BGP RIB that matches the policy's match rules. The default route's attribute can be modified using the same policy file by including statements in the set block of the policy.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command enables the origination and advertisement of default routes for IPv4 unicast traffic for all BGP peer nodes:

```
enable bgp neighbor all originate-default
```

History

This command was first available in ExtremeXOS 12.3.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp neighbor remove-private-AS-numbers

enable bgp neighbor [*remoteaddr* | **all**] **remove-private-AS-numbers**

Description

Enables the removal of private AS numbers from the AS path in route updates sent to EBGP peers.

Syntax Description

remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
all	Specifies all IPv4 and IPv6 neighbors.

Default

Disabled.

Usage Guidelines

Private AS numbers are AS numbers in the range 64512 through 65534. You can remove private AS numbers from the AS path attribute in updates that are sent to external BGP (EBGP) neighbors. Possible reasons for using private AS numbers include:

- The remote AS does not have officially allocated AS numbers.
- You want to conserve AS numbers if you are multi-homed to the local AS.

Private AS numbers should not be advertised on the Internet. Private AS numbers can only be used locally within an administrative domain. Therefore, when routes are advertised out to the Internet, the routes can be stripped out from the AS paths of the advertised routes using this feature.

This command applies to the current VR or VRF context.

Example

The following command enables the removal of private AS numbers from the AS path in route updates sent to the EBGP peers:

```
enable bgp neighbor 192.168.1.17 remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp neighbor soft-in-reset

enable bgp neighbor [**all** | *remoteaddr*] {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **soft-in-reset**

Description

Enables the soft input reset feature.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified, the configuration applies to the IP Unicast family on all IPv4 peers. If an IPv4 address family is specified, the configuration applies to all IPv4 neighbors. If an IPv6 address family is specified, the configuration applies to all IPv6 neighbors.
remoteaddr	Specifies the IPv4 or IPv6 address of a BGP neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified and an IPv4 address is detected, IPv4 unicast is the default address family.

Usage Guidelines

Before you can change the configuration with this command, you must disable BGP, and you must disable the corresponding BGP neighbor session using the following command:

```
disable bgp neighbor [<remoteaddr> | all]
```

To enable this feature on Layer 3 VPNs, you must do so in the context of the MPLS-enabled VR; this feature is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and the command fails. Similarly an IPv4 peer only supports IPv4 address families and the command fails if an IPv6 address family is specified.

Example

The following command enables the soft recognition feature:

```
enable bgp neighbor 192.168.1.17 soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group

enable bgp peer-group *peer-group-name*

Description

Enables a peer group and all the neighbors of a peer group.

Syntax Description

peer-group-name	Specifies a peer group.

Default

Disabled.

Usage Guidelines

You can use BGP peer groups to group together up to 200512 BGP neighbors. All neighbors within the peer group inherit the parameters of the BGP peer group. The following mandatory parameters are shared by all neighbors in a peer group:

- source-interface
- out-nlri-filter
- out-aspath-filter

- out-route-map
- send-community
- next-hop-self

This command applies to the current VR or VRF context.

Example

The following command enables the BGP peer group outer and all its neighbors:

```
enable bgp peer-group outer
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group capability

enable bgp peer-group *peer-group-name* **capability [ipv4-unicast | ipv4-multicast | ipv6-unicast | ipv6-multicast |vpnv4 |route-refresh]**

Description

This command enables BGP Multiprotocol (MP) and route-refresh capabilities for a peer-group.

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
route-refresh	Specifies ROUTE-REFRESH message capabilities.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

All capabilities are enabled for IPv4 peer groups by default.

The route refresh capability is enabled for IPv6 peer groups by default.

Usage Guidelines

This command enables BGP Multiprotocol or route-refresh capabilities for a peer group. When you change the capability configuration, you must enable the BGP peer group before the configuration becomes active. If the BGP peer group was enabled before the change, you must disable and enable the BGP peer group. After the capabilities have been enabled, the BGP peer announces its capabilities to neighbors in an OPEN message.

When one or more address families are enabled, routes from the specified address families are updated, accepted, and installed. If more than one address family capability is enabled,or if the VPNv4 address family is enabled,the MBGP extension is automatically enabled. To disable MBGP, you must disable all enabled address families.

A peer group can be configured for either IPv4 or IPv6 address families, but not both. Because a peer-group cannot support both IPv4 and IPv6 peers, the switch prevents the enabling of address families that are not compatible with peers that are already in the peer-group. Similarly if a particular address family is enabled for the peer-group, a peer that is incompatible with the existing peer-group configuration cannot be added to the group.

To support Layer 3 VPNs, you must enable the VPNv4 address family for all MBGP peers that will distribute VPNv4 routes across the service provider backbone. The VPNv4 address family must be enabled on the MPLS-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

This command applies to the current VR or VRF context.

Note

To inter-operate with Cisco routers for BGP graceful restart, you must enable IPv4 unicast address capability.

Example

The following command enables the route-refresh feature for the peer group outer:

```
enable bgp peer-group outer capability route-refresh
```

The following command enables the VPNv4 address family for a peer group:

```
enable bgp peer-group backbone capability vpnv4
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group originate-default

Enables the origination and advertisement of default routes to all BGP neighbors in the specified peer group.

enable bgp {**peer-group**} *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} **originate-default** {**policy** *policy_name*}

Syntax Description

peer-group *peer-group-name*	Specifies the BGP peer group for which the default routes are originated and advertised.
address-family	Specifies an IPv4 or IPv6 unicast or multicast address family.
policy_name	Specifies a policy to be applied to the default routes during origination.

Default

Disabled. BGP does not automatically originate and advertise default routes to BGP neighbors.

Usage Guidelines

This command can be successfully executed at any time, irrespective of whether local BGP or the remote BGP peers are enabled or disabled. The default routes are created regardless of whether or not there are matching entries in the IGP route table.

When a BGP neighbor is added to a peer group, it does not inherit the default route origination configuration from the peer group. Also, default route origination for a neighbor and the associated peer group can be different.

If a policy is configured and specified in the command, a default route can be originated only if there is a route in the local BGP RIB that matches the policy's match rules. The default route's attribute can be modified using the same policy file by including statements in the set block of the policy.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command enables the origination and advertisement of default routes for IPv4 unicast traffic for all nodes in the test BGP peer group:

```
enable bgp peer-group test originate-default
```

History

This command was first available in ExtremeXOS 12.2.2.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group remove-private-AS-numbers

Enables the removal of private autonomous system (AS) numbers from the AS_Path attribute of outbound updates.

enable bgp peer-group *peer-group-name* **remove-private-AS-numbers**

Syntax Description

peer-group-name	Specifies a peer group.

Default

Disabled.

Usage Guidelines

This command applies to the current VR or VRF context.

Example

The following command enables the BGP peer group outer from removing private AS numbers:

```
enable bgp peer-group outer remove-private-AS-numbers
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group soft-in-reset

Enables the soft input reset feature.

enable bgp peer-group *peer-group-name* {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast** |**vpnv4**]} **soft-in-reset**

Syntax Description

peer-group-name	Specifies a peer group.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

Disabled.

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

Disabling the soft input reset feature can potentially limit the amount of system memory consumed by the RIB-in.

After you enter this command, the switch automatically disables and enables all neighbors in the peer group before the change takes effect.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

If the specified peer group contains IPv6 peers, it is an IPv6 peer group and you must specify an IPv6 address-family. When the specified peer group is an IPv6 peer group, this command fails if no address family is specified or if an IPv4 address-family is specified. This command also fails if an IPv6 address family is specified for an IPv4 peer-group.

Example

The following command enables the soft input reset feature:

```
enable bgp peer-group outer soft-in-reset
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp

show bgp

Description

Displays BGP configuration information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command examples display various BGP configurations:

Output for show bgp for a VRF (PE-CE Protocol, RD and RT configured).

```
(virtual-router vrf-foo) BD-12802.15 # show bgp

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

This command was modified in Extreme EXOS 15.3 to reflect its operation in VRs and VRFs.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp memory

show bgp memory {**detail** | *memoryType*}

Description

Displays BGP specific memory usage.

Syntax Description

detail	Displays detail information.
memoryType	Specifies the memory type usage to display.

Default

N/A.

Usage Guidelines

To see the memory types that you can display, enter the show bgp memory command without any attributes.

Example

The following command displays detailed BGP output for a specific memory types:

```
Switch.16.3 # sh bgp memory
BGP Memory Information
--------------------------------------------------------------------------------
------------------------------
Current Memory Utilization Level:      GREEN
--------------------------------------------------------------------------------
------------------------------
Type                        AN              AB
--------------------------------------------------------------------------------
------------------------------
Callbacks                 1141        17039828
Buffers                     19            8456
```

```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

This command is updated to reflect L3 VPN changes in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp neighbor

For IPv4 and IPv6 address families:

show bgp {**neighbor**} *remoteaddr* {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast**]} [**accepted-routes** | **received-routes** | **rejected-routes** | **transmitted-routes**] {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community_number* | *autonomous-system-id* : *bgp-community*] | **network** [**any** / *netMaskLen* | **networkPrefixFilter**] {**exact**}]

For the VPNv4 address family:

show bgp {**neighbor**} *remoteaddr* **address-family vpnv4** [**accepted-routes** | **received-routes** | **rejected-routes** | **transmitted-routes**] {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community_number* | *autonomous-system-id* :*bgp-community*] | **rd** *rd_value* **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

Description

Displays information about routes to a specified neighbor.

Syntax Description

remoteaddr	Specifies an IPv4 or IPv6 address that identifies a BGP neighbor.
ipv4-unicast	Specifies IPv4 unicast routes.
ipv4-multicast	Specifies IPv4 multicast routes.

ipv6-unicast	Specifies IPv6 unicast routes.
ipv6-multicast	Specifies IPv6 multicast routes.
vpnv4	Specifies VPNv4 routes.
accepted-routes	Specifies that only accepted routes are displayed.
received-routes	Specifies that only received routes are displayed.
rejected-routes	Specifies that only rejected routes are displayed.
transmitted-routes	Specifies that only transmitted routes are displayed.
detail	Specifies to display the information in detailed format.
all	Specifies all routes.
path-expression	Display routes that match the specified AA path expression.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinguisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

show bgp neighbor now supports v6 unicast and multicast and vpnv4 address families. This command is also modified to show the new address families as well as the ORF feature. This command applies to the current VR or VRF context.

Note

If this command displays Bad Source Address, the BGP neighbor IP address is unavailable. Possible causes for this condition include a deleted or unconfigured VLAN or IP address.

The option network any / ***netMaskLen*** displays all BGP routes whose mask length is equal to or greater than ***maskLength***, irrespective of their network address.

The option network any / ***netMaskLen*** exact displays all BGP routes whose mask length is exactly equal to ***maskLength***, irrespective of their network address.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default address-family, i.e. IPv4 unicast is assumed and hence no address-family information appears. Similarly an IPv4 peer only supports IPv4 address families and no address-family information appears if an IPv6 address family is specified.

To display Layer 3 VPN information, you must enter this command in the context of on the MPLS-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command displays sample output for show bgp neighbor summary:

```
Switch.18 # show bgp nei ?

<cr>         Execute the command
detail       display all information available about BGP neighbor
<remoteaddr> BGP neighbor IP address  "11.0.0.2" “3001::1”

BD-12802.1 # show bgp neighbor

History

This command was first available in ExtremeXOS 10.1.

The any / <netMaskLen> options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp neighbor [flap-statistics | suppressed-routes]

For IPv4 and IPv6 address families:

show bgp {**neighbor**} *remoteaddr* {**address-family** [**ipv4-unicast** | **ipv4-multicast** | **ipv6-unicast** | **ipv6-multicast**]} [**flap-statistics** | **suppressed-routes**] {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community-number* | *autonomous-system-id* : *bgp-community*] | **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

For the VPNv4 address family:

show bgp {**neighbor**} *remoteaddr* **address-family vpnv4** [**flap-statistics** | **suppressed-routes**] {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community-number* | *autonomous-system-id* : *bgp-community*] | **rd** *rd_value* **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

Description

Displays flap statistics or suppressed-route information about a specified neighbor.

Syntax Description

remoteaddr	Specifies an IPv4 or IPv6 address that identifies a BGP neighbor.
ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
flap-statistics	Specifies that only flap-statistics should be displayed (for route flap dampening enabled routes).
suppressed-routes	Specifies that only suppressed routes should be displayed (for route flap dampening enabled routes).
detail	Specifies to display the information in detailed format.
all	Specifies all routes.
path-expression	Display routes that match the specified AA path expression.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinguisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

Note

If this command displays Bad Source Address, the BGP neighbor IP address is unavailable. Possible causes for this condition include a deleted or unconfigured VLAN or IP address.

The option network any / ***netMaskLen*** displays all BGP routes whose mask length is equal to or greater than ***maskLength***, irrespective of their network address.

The option network any / ***netMaskLen*** exact displays all BGP routes whose mask length is exactly equal to ***maskLength***, irrespective of their network address.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Note

For an IPv6 peer, an IPv6 address family must be specified, because an IPv6 peer does not support IPv4 address families. If no address family is specified for an IPv6 peer, the default, the IPv4 unicast address family, applies and no address-family information appears. Similarly an IPv4 peer only supports IPv4 address families and no address-family information appears if an IPv6 address family is specified.

To display Layer 3 VPN information, you must enter this command in the context of on the MPLS-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

Example

The following command displays flap statistics for the specified IPv4 neighbor:

```
* Switch.18 # show bgp neighbor 10.0.0.0 flap-statistics
  BGP Routes Flap Statistics
  Destination            NextHop          Penalty Flaps Duration Reuse
       AS-Path

-------------------------------------------------------------------------------
-----------
  * ?100:1:100.0.0.0/8    11.0.0.2                100
        100
Flags: (*) Preferred BGP route, (>) Active, (d) Suppressed, (h) History

       (s) Stale, (m) Multipath, (u) Unfeasible
Origin: (?) Incomplete, (e) EGP, (i) IGP
Total Number of Flapped Routes: 1
```

The following command displays flap statistics for the specified IPv6 neighbor:

```
* Switch.21 # show bgp neighbor 2001::64:: address-family ipv6-unicast flap-
statistics
  BGP Routes Flap Statistics
Destination            NextHop          Penalty Flaps Duration Reuse
       AS-Path
-------------------------------------------------------------------------------
----------
* ?2001::/64           3001::1                100
        100
```

```
Flags: (*)  Preferred BGP route, (>) Active, (d) Suppressed, (h) History

       (s) Stale, (m) Multipath, (u) Unfeasible
Origin: (?) Incomplete, (e) EGP, (i) IGP
Total Number of Flapped Routes: 1
```

History

This command was first available in ExtremeXOS 10.1.

The any / <netMaskLen> options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp peer-group

show bgp peer-group {**detail** | *peer-group-name* {**detail**}}

Description

Displays the peer groups configured in the system.

Syntax Description

detail	Specifies to display the information in detailed format.
peer-group-name	Specifies a peer group.

Default

N/A.

Usage Guidelines

If the detail keyword is specified then the parameters of the neighbors in the peer group, which are different from the ones that are configured in the peer group, are displayed.

If no peer group name is specified, all the peer group information is displayed.

This command applies to the current VR or VRF context.

Example

The following command displays information for the outer peer group:

```
* (debug) Summit-PC.19 # show bgp peer-group "outer"
Peer Group          : outer
Enabled             : No                AS                  : 65551

Source Interface    : Not configured    RRClient            : No
Remove Private AS   : No                Router-Alert        : Disabled
Capabilities Config : ipv4-unicast ipv4-multicast route-refresh 4-Byte-AS
Policy for NLRI Type ipv4-unicast
In Policy         : None
Out Policy        : None
NextHopSelf       : Disabled          Send Communities    : No
Soft Input Recfg  : Disabled          Allow Looped AS-Path: No
Policy for NLRI Type ipv4-multicast
In Policy         : None
Out Policy        : None
NextHopSelf       : Disabled          Send Communities    : No
Soft Input Recfg  : Disabled          Allow Looped AS-Path: No
Peers               : 11.11.11.11
BGP Peer Group Statistics
Total Peer Groups : 1
Enabled           : 0
Disabled          : 1
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp routes

For IPv4 and IPv6 address families:

show bgp routes {**address-family** [**ipv4-unicast** | **ipv4-multicast** |**ipv6-unicast** | **ipv6-multicast**]} {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community_number* |

autonomous-system-id : *bgp-community*] | **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

For the VPNv4 address family:

show bgp routes address-family vpnv4 {**detail**} [**all** | **as-path** *path-expression* | **community** [**no-advertise** | **no-export** | **no-export-subconfed** | **number** *community-number* | *autonomous-system-id* : *bgp-community*] | **rd** *rd* **network** [**any** / *netMaskLen* | *networkPrefixFilter*] {**exact**}]

Description

Displays the BGP route information base (RIB).

Syntax Description

ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.
ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
all	Specifies all routes.
path-expression	Display routes that match the specified AA path expression.
no-advertise	Specifies the no-advertise community attribute.
no-export	Specifies the no-export community attribute.
no-export-subconfed	Specifies the no-export-subconfed community attribute.
community_number	Specifies a community number.
autonomous-system-id	Specifies an autonomous system ID (0-65535).
bgp-community	Specifies the BGP community number.
rd	Specifies the Route Distinguisher (RD) value for the Layer 3 VPN routes for which you want to clear flap statistics.
any	Specifies all routes with a given or larger mask length.
netMaskLen	Specifies a IPv4 or IPv6 subnet mask length (number of bits).
networkPrefixFilter	Specifies an IPv4 or IPv6 address and netmask.
exact	Specifies an exact match with the IP address and subnet mask.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

The option network any / ***netMaskLen*** displays all BGP routes whose mask length is equal to or greater than ***maskLength***, irrespective of their network address.

The option network any / ***netMaskLen*** exact displays all BGP routes whose mask length is exactly equal to ***maskLength***, irrespective of their network address.

To display Layer 3 VPN information, you must enter this command in the context of on the MPLS-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

You can only execute the show for **vpnv4** address family in a VR context. If you execute this command in a VRF context, the "Cannot execute command in VRF context" error is displayed.

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

Example

The following command displays detailed information about all BGP routes:

```
* Switch.5 #  show bgp routes all
Received Routes:
Destination         LPref Weight MED     Peer            Next-Hop        AS-
Path
-------------------------------------------------------------------------------
------
*>? 1.1.1.1/32      100   0              11.0.0.1        11.0.0.1
100
* ? 11.0.0.0/24     100   0              11.0.0.1        11.0.0.1
100

History

This command was first available in ExtremeXOS 10.1.

The any / <netMaskLen> options were added in ExtremeXOS 11.0.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show bgp routes summary

show bgp routes {address-family [ipv4-unicast | ipv4-multicast |ipv6-unicast | ipv6-multicast | vpnv4]} summary

Description

Displays a summary of the BGP route information base (RIB).

Syntax Description

ipv4-unicast	Specifies the IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
ipv6-unicast	Specifies the IPv6 unicast address family.

ipv6-multicast	Specifies an IPv6 multicast address family.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.

Default

If no address family is specified, IPv4 unicast is the default.

Usage Guidelines

This command applies to the current VR or VRF context.

If you do not specify an address family, this command applies to the IPv4 unicast address family. To apply this command to an address family other than the IPv4 unicast address family, you must specify the address family.

To display Layer 3 VPN information, you must enter this command in the context of on the MPLS-enabled VR; it is not supported for BGP neighbors on the CE (VRF) side of the PE router.

When the **show bgp routes summary** command is issued with **address-family vpnv4**, the command will impact the behavior of PE to PE neighbor sessions and display/clear the VPN-IPv4 RIB of BGP.

Example

The following command displays a summary of the BGP route information base (RIB) for IPv4 multicast:

```
show bgp routes address-family ipv4-multicast summary
```

The following example displays VPN routes with RD 100:1.

```
virtual-router corp1_vrf
  show bgp routes address-family vpnv4 rd 100:1
```

History

This command was first available in ExtremeXOS 10.1.

This command required a specific license in ExtremeXOS 11.1.

Support for IPv6 was added in ExtremeXOS 12.6 BGP.

Support for Layer 3 VPNs was added in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

41 L3 VPN Commands

Layer 3 Virtual Private Networks (L3 VPN) is a specific implementation of a Provider Provisioned VPN (PPVPN). L3VPN is a way to create a tunnel between customer sites through a Provider Backbone, and that tunnel is established and maintained by the Service Provider.

This chapter describes commands for configuring L3 VPN.

disable snmp traps l3vpn

```
disable synmp traps l3vpn {vr vr_name
```

Description

Use this command to turn off SNMP trap support for L3 VPN.

Syntax Description

vr-_name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If VR ***name*** is not provided, then this command is applied to the VR in the current context.

Default

Enabled.

Usage Guidelines

Use this command to disable L3VPN SNMP traps.

Example

The following command disables L3 VPN SNMP traps support on the switch:

```
disable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

enable bgp neighbor capability address-family vpnv4

enable bgp {**neighbor**} [**all** | *remoteaddr*] **capability address-family vpnv4 type** [**community** | **ext-community**] {[**send** | **receive** | **both**]}

Description

This command enables Outbound Route Filtering (ORF) for one or all BGP neighbors on a Layer 3 VPN.

Syntax Description

all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors.
remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpnv4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Enables neighbor capability for communities.
ext-community	Enables neighbor capability for extended communities.
send	Enables neighbor capability filter list send capability.
receive	Enables neighbor capability filter list receive capability.
both	Enables neighbor capability filter list send and receive capability.

Default

Disabled.

If the direction is not specified, the both option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error

message: **Outbound-route-filtering not supported for IPv6 neighbors**, or **Outbound-route-filtering not supported for address family *addr_family*** .

Example

The following command enables the neighbor capability feature for a Layer 3 VPN neighbor:

```
enable bgp neighbor 1.1.1.1 capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see Feature License Requirements.

enable bgp neighbor capability

enable bgp {**neighbor**} [**all** | *remoteaddr*] **capability** {**address-family** [**ipv4-unicast** | **ipv4-multicast**]} **type** [**community** | **ext-community**] {[**send** | **receive** | **both**]}

Description

This command enables capabilities for a particular peer, peer-group, or all peers for one or all address-families and ORF types .

Syntax Description

neighbor	Specifies a BGP neighbor.
all	Specifies that the configuration applies to all neighbors in the specified address family. If no address family is specified or if an IPv4 address is specified, the configuration applies to all IPv4 neighbors.
remoteaddr	Specifies the IPv4 address of a BGP neighbor.
address-family	Specifies the capabilities for one or all address-families.
ipv4-unicast	Specifies the capabilities for IPv4 unicast address family.
ipv4-multicast	Specifiesthe capabilities for IPv4 multicast address family.
community	Enables BGP for communities.
ext-community	Enables BGP for extended communities.
send	Enables BGP filter list send capability.
receive	Enables BGP filter list receive capability.
both	Enables BGP filter list send and receive capability.

Default

Disabled globally by default.

If address family is not specified, ipv4-unicast is assumed.

If direction is not specified, both is assumed.

Usage Guidelines

By specifying the address-family, type, and direction in multiple commands, you can achieve greater control over the actual ORF capabilities sent to a peer.

In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

Example

The following command enables BGP capabilities for all neighbors, and for all address families except ipv4-multicast:

```
virtual-router corp1_vrf
enable bgp neighbor 1.1.1.1 capability address-family all
disable bgp neighbor 1.1.1.1 capability address-family ipv4-multicast
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see Feature License Requirements.

enable bgp peer-group capability

enable bgp peer-group *peer-group-name* **capability {[address-family [ipv4-unicast | ipv4-multicast]} type [community | ext-community | prefix] {[send | receive | both]}**

Description

This command enables ORF capabilities for a particular peer, peer-group, or all peers for one or all address-families and ORF types (for example, communities, extended communities and prefixes). The command specifies whether ORF capabilities are sent to the peer, and if they are honoured if received from the peer, or both.

Syntax Description

peer-group-name	Specifies a peer group.
orf	Specifies outbound route filtering.
address-family	Specifies outbound route filtering.
ipv4-unicast	Specifies an IPv4 unicast address family.
ipv4-multicast	Specifies an IPv4 multicast address family.
community	Enables ORF for communities.
ext-community	Enables ORF for extended communities.
prefix	Enables ORF for prefixes.
send	Enables ORF filter list send capability.
receive	Enables ORF filter list receive capability.
both	Enables ORF filter list send and receive capability.

Default

- ORF is disabled globally.
- ORF capabilities are assumed to be disabled by default for all neighbors.
- If address family is not specified, **ipv4-unicast** is assumed.
- If direction is not specified, **both** is assumed.
- 

  Note

  prefix is not supported for vpnv4 address family..

The route refresh capability is enabled for IPv6 peer groups by default.

Usage Guidelines

By specifying the***address-family***, ***type*** and ***direction*** in multiple commands you can better control the ORF capabilities sent to a peer. In cases where a particular ***address-family*** is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with an error message **Outbound-route-filtering not supported for IPv6 neighbors**, or **Outbound-route-filtering not supported for address family** ***addr_family*** .

Example

The following command enables send only ORF capabilities for an ipv4 multicast peer group:

```
enable bgp peer-group capability orf address-family ipv4-multicast type
community send
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable bgp peer-group capability address-family vpnv4

```
disable bgp peer-group peer-group-name capability address-family vpnv4 type
[community | ext-community] {[send | receive | both]}
```

Description

This command disables peer-group capability for a peer group on a Layer 3 VPN.

Syntax Description

remoteaddr	Specifies the IPv4 address of a BGP neighbor.
vpn4	Specifies the VPNv4 address family for Layer 3 VPN support.
community	Disables peer-group capability for communities.
ext-community	Disables peer-group capability for extended communities.
send	Disables peer-group capability filter list send capability.
receive	Disables peer-group capability filter list receive capability.
both	Disables peer-group capability filter list send and receive capability.

Default

Disabled. If the direction is not specified, the **both** option applies.

Usage Guidelines

Enter this command multiple times to configure the address family, type, and direction attributes.

By specifying the address-family, type and direction in multiple commands, you can better control the actual ORF capabilities sent to a peer. In the case where a particular address-family is explicitly disabled for a peering, the ORF capability configuration for that address-family is ignored and not sent.

ORF capabilities can only be enabled for IPv4 neighbors, and only for IPv4 address families. If configured for IPv6 neighbors or address-families the command is rejected with the following error message: `Outbound-route-filtering not supported for IPv6 neighbors, orOutbound-route-filtering not supported for address family addr_family` .

The following command disables the peer-group capability feature for a Layer 3 VPN peer group:

```
disable bgp peer-group vpn capability address-family vpnv4
```

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see Feature License Requirements.

New enable snmp traps l3vpn

enable snmp traps l3vpn {**vr** *vr_name*}

Description

Use this command to turn on SNMP trap support for L3 VPN.

Syntax Description

vr_name	Specifies the name of the parent VR where this RFC 4382 scalar is applied. If VR name is not provided, then this command is applied to the VR in the current context.

Default

Enabled.

Usage Guidelines

Use this command to enable generation of L3VPN SNMP traps—mplsL3VpnVrfUp and mplsL3VpnVrfDown. These trap notifications are sent under the following conditions:

- mplsL3VpnVrfUp – first IP VLAN becomes active and administrative state is enabled.
- mplsL3VpnVrfDown – last active IP VLAN becomes inactive OR administrative state is disabled.

Example

The following command enables L3 VPN SNMP traps support on the switch:

```
enable snmp traps l3vpn vr vr-default
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

42 OpenFlow Commands

OpenFlow provides a standardized, flexible operational tool for building virtualized networks. OpenFlow enables switching control plane features to be implemented and evolved in a hardware independent manner.

This chapter describes commands for configuring OpenFlow on the switch. There are additional EXOS commands that you can use to configure OpenFlow. Please refer to the ExtremeXOS Concepts Guide, 15.3 for more configuration details.

clear openflow counters

clear openflow counters {**flow** | **controller** {**primary** | **secondary**}}

Description

Globally clears the flow error count, packets sent and received. **controller {primary | secondary}** clears the connection counters of the primary, secondary, or both controllers.

Syntax Description

This command has no keywords or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command clears Openflow counters on the switch:

```
clear openflow counters
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide

 configure openflow controller

configure openflow controller [**primary** | **secondary**] [**in-band** [**port** *port-number* | **discovery**] | **out-of-band** [**active** [**ipaddress** *ipaddress* | **hostname** *host_name*] {*port*} | **passive** *port*]] {**tls**} {**vr** *vr_name*} {**rate-limit** *rate_limit* {**burst-size** *burst-size*}}

Description

Configures the OpenFlow controller(s) that the switch will communicate with.

Syntax Description

primary	Specifies the primary openflow controller.
secondary	Specifies the secondary openflow controller.
port	Specifies the port number for in-band mode .
portNumber	Specifies the physical port number.
out-of-band	Specifies the out-of-band connection to the controller.
active	Specifies that you actively connect to the controller .
ipaddress	Specifies that you use an IP address for active out-of-band mode; it might be followed by tcp port.
ipaddress	Configures an IP address, for example: 192.168.32.25.
hostname	Specifies the hostname.
port	Specifies the TCP port. for example: 6643.

passive	Configures the passive mode for out-of-band; you must specify a tcp port.
tls	Specifies that you use the Transport Layer Security (TLS) option.
vr	Specifies that you use the virtual router option.
vr_name	Specifies the name of the virtual router.
rate-limit	Specifies the rate-limit Packet-In packets sent to the controller.
rate_limit	Specifies packets per second. Default is 1000, the range is 100-2147483647.
burst-size	Specifies that you use the burst-size with rate-limit.
burst_size	Specifies the burst size in bytes; the range is 1500-65536.

Default

If ***burst-size*** is not specified, the default is 1500 bytes. If ***rate_limit*** is not specified, the default value is 1000.

Usage Guidelines

Use this command to configure the OpenFlow controller(s) that the switch will communicate with.

If only a secondary controller is configured, it will be treated as a primary controller until a primary controller is configured.

OpenFlow attempts to communicate with the primary controller until connectivity fails, in which case it automatically fails over to the secondary controller, if configured. 'out-of-band' control enables controller(s) to connect to the switch using a non-OpenFlow vlan. 'vr' specifies the virtual router used by the switch to communicate with the controller(s).

The **rate-limit** *rate* and **burst-size** *burstSize* options limit the rate and burst-size of messages sent from the switch to the controller.

Example

The following example illustrates how to use the **configure openflow controller** command . :

```
configure openflow controller primary out-of-band active ipaddress
10.1.1.1 6633 vr vr-mgmt
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Openflow feature, see the ExtremeXOS Concepts Guide.

debug openflow

Short reference description.

debug openflow {**on** | **off** | {**on**} {{{**verbosity** *verbosity*} {**output** *output_file*}} | {{**output** *output_file*} {**verbosity** *verbosity*}}}}

Description

Captures OpenFlow protocol packets for analysis.

Syntax Description

on	Turn debug on.
off	Turn debug off.
verbosity	Verbosity of output.
output	Output packet capture information to a file.
output_file	Output filename.
verbosity	0 (default) is the least detailed, 5 is the most detailed.

Default

0 is the default value for ***verbosity***.

Usage Guidelines

Use this command to decode OpenFlow protocol packets sent to and from the connected OpenFlow controllers for analysis.

Example

The following example turns debugging off:

```
debug openflow off
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

debug openflow show flows

debug openflow show [**tables** | **controller stats** | **flows** [**vendor-table** | **exos-tree**] | **flow** *flow_no*]

Description

Displays the flows currently configured by the active controller. The command is used to show the contents of the reference code flow table datastructure, or an EXOS-specific flow table datastructure.

Syntax Description

tables	Displays internal VLAN tables.
controller stats	Displays controller connection counters.
vendor-table	Displays the flows in vendor datastructure .
exos-tree	Displays flows in binary tree maintained by EXOS .
flow *flow_no*	Displays the match conditions and actions of flow_no

Default

None.

Usage Guidelines

Used to view internal tables, counters, and datastructures for debugging purposes.

Example

The following example displays openflow flow statistics:

```
debug openflow show flows exos-tree
=====================================
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable openflow

disable openflow

Description

Globally disables the Openflow application on the switch.

Syntax Description

disable	Disables openflow.

Default

The default is disabled.

Usage Guidelines

None.

Example

The following command disables Openflow on the switch:

```
disable openflow
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Openflow feature, see the ExtremeXOS Concepts Guide.

disable openflow vlan

disable openflow {vlan} *vlan_name*

Description

Disables OpenFlow on a specific VLAN.

Syntax Description

vlan	Specifies that OpenFlow is disabled on a VLAN.
vlan_name	Specifies the name of the VLAN to disable

Default

None.

Usage Guidelines

You must specify a VLAN name to disable.

Example

The following command disables OpenFlow on VLAN 1:

```
disable openflow vlan 1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide.

 enable openflow

enable openflow

Description

Globally enables the Openflow application on the switch.

Syntax Description

enable	Enables openflow.

Default

The default is disabled.

Usage Guidelines

You do not have to issue this command before you issue other OpenFlow commands.

Example

The following command enables Openflow on the switch:

```
enable openflow
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

New enable openflow vlan

enable openflow {**vlan**} *vlan_name*

Description

Enables OpenFlow on specific VLANs .

Syntax Description

vlan	Specifies the VLAN on which to enable Openflow.
vlan_name	Specifies the VLAN name.

Default

No VLANs are enabled for OpenFlow by default.

Usage Guidelines

Only one VLAN can be enabled for OpenFlow on the switch.

Example

The following command specifies the ports to enable Openflow on the switch:

```
enable openflow
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the OpenFlow feature, see the ExtremeXOS Concepts Guide.

 show openflow

show openflow

Description

Shows whether OpenFlow is enabled or disabled globally on the switch.

Syntax Description

This command has no keywords or variables.

Default

None.

Usage Guidelines

None.

Example

The following example displays the current configuration for the primary controller:

```
show openflow
openflow is enabled!
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide.

show openflow controller

```
show openflow controller {primary | secondary}
```

Description

Shows the OpenFlow controller configuration and status on the switch.

Syntax Description

primary	Specifies the primary openflow controller.
secondary	Specifies the secondary openflow controller.

Default

None.

Usage Guidelines

None.

Example

The following example displays the current configuration for the primary controller:

```
show openflow controller
Controller       : Primary
  Configured     : Yes
  Datapath ID    : abcdef0123456789
  Target         : tcp:10.1.1.1:6633
  VR             : VR-Default
  Mode           : out-of-band Active
  Status         : ACTIVE           SSL              : Disabled
  Probe(secs)    : 30               Uptime(secs)     : 130
  Rate Limit     : 1000             Burst Size       :  250
  Packets Sent : 9                  Packets Received : 8
Controller       : Secondary
  Configured     : No
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide.

show openflow flows

show openflow flows {*flow_name*}

Description

Display the match conditions and actions of installed OpenFlow flows.

Syntax Description

flow_name	Specifies the flow name.

Default

None.

Usage Guidelines

Use this command to determine the number and details of OpenFlow flows installed on the switch by an OpenFlow controller.

Example

The following example displays the current OpenFlow flows:

```
show openflow flows
Total number of flows: 1
Flow name Type Duration (secs)     Prio  Packets
--------- ---- ------------------ ----- --------------------
of_12345  FDB  9223372036854775807 65535 18446744073709551615
Match:    Input port:         2
          Src MAC:            00:11:22:33:44:55
          Dst MAC:            00:11:22:33:44:55
          VLAN ID:            1234
          VLAN priority:      255
          Ethernet type:      0x8888
          IP TOS:             0x1234
          IP protocol:        0x1234
          IP src address:     255.255.255.255
          IP dst address:     255.255.255.255
          Transport src port: 65535
          Transport dst port: 65535
    Actions: Output port: 3, Output port: 4, Drop
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide.

show openflow vlan

show openflow {vlan} *vlan_name*

Description

Shows the OpenFlow configuration state for the specified ports.

Syntax Description

vlan	Specifies that show output is restricted to a specified VLAN.
vlan_name	Specifies a named VLAN.

Default

None.

Usage Guidelines

If the VLAN name is specified, the output is restricted to that VLAN.

Example

The following command displays show output for all configured OpenFlow ports:

```
show openflow
OpenFlow is enabled.
  Controller       : Primary
    Status         : ACTIVE
      Datapath ID  : 000011112222
      VR           : VR_Default
      Mode         : out-of-band Active
      Target       : tcp:10.1.1.2:6633
      Uptime(secs) : 200s
  Secondary controller:  Not configured.

                                                Flows
  VLAN                              VID    Ports   Active   Error
  --------------------------------  ----   -----   ------ ------
```

```
  of1                                20     5      999999   999999
  Total number of VLAN(s): 1

show openflow vlan of1
Primary controller: tcp:10.1.1.2:6633, out-of-band, Active, Uptime: 200s
Secondary controller: Disabled.
                                          Flows
VLAN                           VID  Ports Active Error
------------------------------ ---- ----- ------ ------
of1                             20     5 999999 999999
Total number of VLAN(s): 1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the BGP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure openflow controller

unconfigure openflow controller [**primary** | **secondary**]

Description

Unconfigures the OpenFlow controller(s)..

Syntax Description

primary	Specifies the primary openflow controller.
secondary	Specifies the secondary openflow controller.

Default

N/A.

Usage Guidelines

None.

Example

The following exampleunconfigures the primary controller:

```
unconfigure openflow controller primary
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the Openflow feature, see the ExtremeXOS Concepts Guide.

43 IP Multicast Commands

This chapter describes commands for configuring and managing the following IPv4 multicast features:

- Multicast routing
- Protocol Independent Multicast (PIM)
- Internet Group Management Protocol (IGMP)
- Multicast VLAN Registration (MVR)

For an introduction to these features, see the ExtremeXOS Concepts Guide.

New Commands in ExtremeXOS 15.2

- configure mcast ipv4 cache timeout

clear igmp group

clear igmp group {*grpipaddress*} {{**vlan**} *name*}

Description

Removes one or all IGMP groups.

Syntax Description

name	Specifies a VLAN name.
grpipaddress	Specifies the group IP address.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove learned IGMP group entries instantly. Traffic is impacted until the IGMP groups are relearned. Use this command for diagnostic purposes only.

Example

The following command clears all IGMP groups from VLAN accounting:

```
clear igmp group accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

clear igmp snooping

clear igmp snooping {{**vlan**} *name*}

Description

Removes one or all IGMP snooping entries.

Syntax Description

name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove IGMP snooping entries instantly. However, removing an IGMP snooping entry can disrupt the normal forwarding of multicast traffic, until the snooping entries are learned again.

The dynamic IGMP snooping entries are removed, then recreated upon the next general query. The static router entry and static group entries are removed and recreated immediately.

This command clears both the IGMPv2 and IGMPv3 snooping entries.

Example

The following command clears IGMP snooping from VLAN accounting:

```
clear igmp snooping accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

clear pim cache

clear pim cache {*group_addr* {*source_addr*}}

Description

Resets the IP multicast cache table.

Syntax Description

group_addr	Specifies a group address.
source_addr	Specifies a source IP address.

Default

If no options are specified, all IP multicast cache entries are flushed.

Usage Guidelines

This command can be used by network operators to manually remove IPMC software and hardware forwarding cache entries instantly. If the stream is available, caches are re-created, otherwise caches are removed permanently. This command can disrupt the normal forwarding of multicast traffic.

Example

The following command resets the IP multicast table for group 224.1.2.3:

```
clear pim cache 224.1.2.3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

clear pim snooping

clear pim snooping {**vlan**} *name*}

Description

Clears all PIM snooping neighbors, joins received on the VLAN, and the VLAN forwarding entries.

Syntax Description

name	Specifies the VLAN to which this command applies.

Default

N/A.

Usage Guidelines

None.

Example

The following command clears the PIM snooping database for the Default VLAN:

```
clear pim snooping “Default”
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure forwarding ipmc compression

configure forwarding ipmc compression {group-table | off}

Description

Enables or disables compression of entries in the IP multicast group table to facilitate improved IP multicast scaling.

Syntax Description

group-table	Enables compression.
off	Disables compression.

Default

group-table

Usage Guidelines

Compression of IP multicast group table entries allows the switch to process more multicast traffic using the faster switch hardware instead of the relatively slower switch software. Compression requires

additional processing. Disable this feature if you suspect a problem exposed by IP multicast compression.

When you enable or disable this feature, all IP multicast entries are flushed, and this can result in a temporary loss of multicast traffic while the IP multicast entries are relearned.

Note

On BlackDiamond X8 series switches and BlackDiamond 8800 series switches, all IP multicast forwarding entries utilizing the same IP multicast group table entry share a single backplane link, limiting the total throughput to 12Gbps.

To display the compression feature configuration, enter the command:

```
show forwarding configuration
```

Example

The following command disables compression:

```
configure forwarding ipmc compression off
```

History

This command was first available in ExtremeXOS 12.2.

Platform Availability

This command is available on all Summit family switches, BlackDiamond X8 series switches and BlackDiamond 8000 series modules.

configure forwarding ipmc lookup-key

configure forwarding ipmc lookup-key [group-vlan | source-group-vlan | mac-vlan | mixed-mode]

Description

Enables you to choose the lookup-key for multicast forwarding.

Syntax Description

group-vlan	Specifies that IP multicast forwarding database entries are programmed as (*,GroupIP,VlanId).
source-group-vlan	Specifies that IP multicast forwarding database entries are programmed as (SourceIP, GroupIP, VlanId). (Default).
mac-vlan	Specifies that IP multicast forwarding database entries are programmed as (Mac, VlanId).
mixed-mode	Specifies that IP multicast forwarding database entries are programmed as follows: L3 cache entries (PIM/MVR/PVLAN) use source-group-vlan; L2 cache entries (IGMP/MLD/PIM snooping) use mac-vlan.

Default

source-group-vlan.

Usage Guidelines

Use this command to choose the lookup-key for multicast forwarding.

The following restrictions apply to this command:

The **`configure forwarding ipmc lookup-key mac-vlan`** command is disallowed under the following conditions.

- If IPMC forwarding is enabled on at least on one VLAN
- If MVR is enabled either globally or on a VLAN

  Similarly, enabling the above two features are disallowed, when the ipmc lookup-key is **`mac-vlan.`** The following warning message is displayed when the “mac-vlan” option is specified: **`Warning: Usage of multicast IP addresses that could result in overlapping MAC addresses should be avoided. Example: Using 225.1.1.1, 226.1.1.1 and 225.129.1.1 should be avoided. Either one of the addresses could be used. Using multicast with PVLAN should be avoided with this forwarding option.`**
- Mixed-mode **`configure forwarding ipmc lookup-key mixed-mode`**

  If the chassis or stack has a member node with Felix/Helix/Firebolt*, then the command is disallowed. After enabling this mode, if a new member with unsupported chipset joins, then that card will be failed. The following warning message is displayed when the “mixed-mode” option is specified: **`Warning: Usage of multicast IP addresses that could result in overlapping MAC addresses should be avoided for snooping (IGMP/MLD/PIM snooping) controlled traffic.`**

  Example: Using 225.1.1.1, 226.1.1.1 and 225.129.1.1 should be avoided. Either one of the addresses could be used.
- The **`configure igmp snooping forwarding-mode [group-vlan | source-group-vlan]`** command was introduced to support (*, G, V) forwarding before the IPMC compression feature was introduced. Because we are introduced IPv6 multicast support in EXOS 15.2, this command is deprecated, and the new **`configure forwarding ipmc lookup-key`** command now covers both IPv4 and IPv6.

Example

The following command specifies that IP multicast forwarding database entries are programmed as (*,GroupIP,VlanId):

```
configure forwarding ipmc lookup-key group-vlan
```

To display the ipmc lookup-key configuration, enter the command:

```
show forwarding configuration
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all Summit family switches, BlackDiamond X8 series switches and BlackDiamond 8000 series modules.

configure igmp

configure igmp *query_interval query_response_interval last_member_query_interval* {*robustness*}

Description

Configures the Internet Group Management Protocol (IGMP) timers.

Syntax Description

query_interval	Specifies the interval (in seconds) between general queries.
query_response_interval	Specifies the maximum query response time (in seconds).
last_member_query_interval	Specifies the maximum group-specific query response time (in seconds).
robustness	Specifies the degree of robustness for the network.

Default

- query interval—125 seconds
- query response interval—10 seconds
- last member query interval—1 second
- robustness—2

Usage Guidelines

Timers are based on RFC2236. Specify the following:

- query interval—The amount of time, in seconds, the system waits between sending out general queries. The range is 1 to 429,496,729 seconds.
- query response interval—The maximum response time inserted into the periodic general queries. The range is 1 to 25 seconds.
- last member query interval—The maximum response time inserted into a group-specific query sent in response to a leave group message. The range is 1 to 25 seconds.
- robustness—The degree of robustness of the network. The range is 2 to 7. This parameter allows tuning for the expected packet loss on a link. If a link is expected to have packet loss, this parameter can be increased.
- The group timeout is defined by the formula: group_timeout = (query_interval x robustness) + query_response_interval, according to RFC 2236. You can explicitly define the host timeout using the configure igmp snooping timer <router_timeout> <host_timeout> {vr <vrname>} command. The effective host_timeout is the lesser value of the group_timeout and the configured host_timeout.

Example

The following command configures the IGMP timers:

```
configure igmp 100 5 1 3
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp router-alert receive-required

configure igmp router-alert receive-required [**on** | **off**] {{**vlan**} *vlan_name*}

Description

Controls when the router-alert option is required for IGMPv2 and IGMPv3 packet reception and processing.

Syntax Description

vlan	Applies the configuration only to the specified VLAN. If no VLAN is specified, the configuration applies to all VLANs.

Default

Off—All IGMP packets are received and processed.

Usage Guidelines

By default, the ExtremeXOS software receives and processes all IGMP packets, regardless of the setting of the router-alert option within a packet. The default configuration works with all switches that support the ExtremeXOS software.

IETF standards require that a router accept and process IGMPv2 and IGMPv3 packets only when the router-alert option is set. The on setting for this command sets the ExtremeXOS software to comply with the IETF standards and should be used when the switch will be used with third-party switches that expect IETF compliant behavior.

Example

The following command configures the switch for IETF compliant IGMP packet processing:

```
configure igmp router-alert receive-required on
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp router-alert transmit

configure igmp router-alert transmit [on | off] {{vlan} *vlan_name*}

Description

Controls whether the router-alert option is set when forwarding IGMPv2 and IGMPv3 packets.

Syntax Description

vlan	Applies the configuration only to the specified VLAN. If no VLAN is specified, the configuration applies to all VLANs.

Default

On—The router-alert option is set when forwarding IGMPv2 and IGMPv3 packets.

Usage Guidelines

IETF standards require that a router set the router-alert option in forwarded IGMPv2 and IGMPv3 packets. The ExtremeXOS software has been updated to comply with this requirement using the default settings.

Earlier versions of the ExtremeXOS software forwarded all IGMP packets without setting the router-alert option. If compatibility issues arise, you can configure the software to use the legacy behavior by using this command with the off option.

Example

The following command configures the switch for IETF compliant IGMP packet processing:

```
configure igmp router-alert transmit on
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping filters

configure igmp snooping filters [per-port | per-vlan]

Description

Selects the type of IGMP snooping filters that are installed.

Syntax Description

per-port	Installs the per-port IGMP snooping filters.
per-vlan	Installs the per-VLAN IGMP snooping filters.

Default

per-port

Usage Guidelines

This command applies only to Summit family switches and BlackDiamond 8800 series switches.

Use the per-vlan option when the number of VLANs configured on the switch is lower than the maximum numbers listed in the following table. This option conserves usage of the hardware Layer3 multicast forwarding table.

When the number of configured VLANs is larger than the maximum values listed here, select the per-port option. Each VLAN requires additional interface hardware ACL resources. The per-port option conserves usage of the interface hardware ACL resources.

Table 55: Maximum Number of VLANs Supported by per-VLAN IGMP Snooping Filters

Summit Switch and BlackDiamond 8000 Series Module Type	Maximum Number of VLANs When per-VLAN Snooping Filters are Installed[15]
a Series	1000
c Series	2000
e Series	448
xl Series	2000

To display the IGMP snooping filters configuration, use the show igmp snooping command.

Note

For MLD Snooping, the maximum number of VLANs is half of the numbers provided in this table.

The maximum number specified here is individual limit for IGMP snooping filters. If both IGMP and MLD snooping filters are used, the maximum numbers are lower than the ones specified.

Example

The following command configures the switch to install the per-VLAN IGMP snooping filters:

```
configure igmp snooping filters per-vlan
```

[15] The actual maximum value is smaller if other processes require entries in the interface ACL table.
[15] The actual maximum value is smaller if other processes require entries in the interface ACL table.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping flood-list

configure igmp snooping flood-list [*policy* | **none**] {**vr** *vrname*}

Description

Configures certain multicast addresses to be slow path flooded within the VLAN.

Syntax Description

policy	Specifies a policy file with a list of multicast addresses to be handled.
none	Specifies no policy file is to be used.
vrname	Specifies a virtual router.

Default

None.

Usage Guidelines

With this command, a user can configure certain multicast addresses to be slow path flooded within the VLAN, which otherwise are fast path forwarded according to IGMP and/or Layer3 multicast protocol.

A policy file is a text file with the extension, .pol. It can be created or edited with any text editor. The specified policy file <policy file> should contain a list of addresses which determine if certain multicast streams are to be treated specially. Typically, if the switch receives a stream with a destination address which is in the <policy file> in 'permit' mode, that stream is software flooded and no hardware entry is installed.

When adding an IP address into the policy file, a 32-bit host address is recommended.

This feature is meant to solve the multicast connectivity problem for unknown destination addresses within system reserved ranges. Specifically this feature was introduced to solve the problem of recognizing certain streams as control packets.

To create a policy file for the snooping flood-list, use the following template:

```
# This is a template for IGMP Snooping Flood-list Policy File
# Add your group addresses between "Start" and "End"
# Do not touch the rest of the file!!!!
entry igmpFlood {
if match any {
#------------------ Start of group addresses ------------------
nlri  234.1.1.1/32;
nlri  239.1.1.1/32;
#------------------- end of group addresses -------------------
} then {
permit;
}
}
entry catch_all {
if {
} then {
deny;
}
}
```

Note

The switch does not validate any IP address in the policy file used in this command. Therefore, slow-path flooding should be used only for streams which are very infrequent, such as control packets. It should not be used for multicast data packets. This option overrides any default mechanism of hardware forwarding (with respect to IGMP, PIM, or DVMRP) so it should be used with caution.

Slow path flooding is done within the L2 VLAN only.

Use the none option to effectively disable slow path flooding.

You can use the show igmp command to see the configuration of slow path flooding.

Example

The following command configures the multicast data stream specified in access1 for slow path flooding:

```
configure igmp snooping flood-list access1
```

The following command specifies that no policy file is to be used, this effectively disabling slow path flooding:

```
configure igmp snooping flood-list none
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping forwarding-mode

configure igmp snooping forwarding-mode [group-vlan | source-group-vlan]

Description

Configures the format for stored multicast entries in hardware as either the default mode (S, G) or the optional mode (*, G).

Syntax Description

group-vlan	Stores multicast entries in the format (* <AnySourceIP>, GroupIP, VlanId), which is also referred to as (*, G).
source-group-vlan	Stores multicast entries in the format (SourceIP, GroupIP, VlanId), which is also referred to as (S, G).

Default

source-group-vlan (S, G).

Usage Guidelines

In networks where there are many sources for each multicast address, the default (S, G) format can consume storage space. To use less storage space for multicast entries, specify the (*, G) format with the group-vlan format.

Note

Once the entries are programmed as (*, G), any multicast traffic for the group is forwarded based on the (*, G) entries and does not come to the CPU. Use the group-vlan option only with IGMPv2 networks.

Example

The following command configures the group-vlan format:

```
configure igmp snooping forwarding-mode group-vlan
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping leave-timeout

configure igmp snooping leave-timeout *leave_timeout_ms* {**vr** *vrname*}

Description

Configures the IGMP snooping leave timeout.

Syntax Description

leave_timeout_ms	Specifies an IGMP leave timeout value in milliseconds.
vrname	Specifies a virtual router.

Default

1000 ms.

Usage Guidelines

The leave-timeout is the IGMP leave override interval. If no other hosts override the IGMP leave by the end of this interval, the receiver port is removed.

The range is 0 - 175000 ms (175 seconds). For timeout values of one second or less, you must set the leave-timeout to a multiple of 100ms. For values of more than one second, you must set the leave-timeout to a multiple of 1000ms (one second).

Example

The following command configures the IGMP snooping leave timeout:

```
configure igmp snooping leave-timeout 10000
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping timer

configure igmp snooping timer *router_timeout host_timeout* {**vr** *vrname*}

Description

Configures the IGMP snooping timers.

Syntax Description

router_timeout	Specifies the time in seconds before removing a router snooping entry.
host_timeout	Specifies the time in seconds before removing a host's group snooping entry.
vrname	Specifies a virtual router.

Default

The router timeout default setting is 260 seconds. The host timeout setting is 260 seconds.

Usage Guidelines

Timers should be set to approximately 2.5 times the router query interval in use on the network. Specify the following:

- router timeout—The maximum time, in seconds, that a router snooping entry can remain in the IGMP snooping table without receiving a router report. If a report is not received, the entry is deleted. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.
- host timeout—The maximum time, in seconds, that a group snooping entry can remain in the IGMP snooping table without receiving a group report. If a report is not received, the entry is deleted. The range is 10 to 214,748,364 seconds. The default setting is 260 seconds.

Note

The host_timeout value should be less than or equal to the query timeout value, which is defined by the following configure igmp command timers as follows: query_interval x robustness) + query_response_interval.

IGMP snooping expects at least one device on every VLAN to periodically generate IGMP query messages. Without an IGMP querier, the switch eventually stops forwarding IP multicast packets to any port, because the IGMP snooping entries time out, based on the value specified in host_timeout or router_timeout.

Example

The following command configures the IGMP snooping timers:

```
configure igmp snooping timer 600 600
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

New configure igmp snooping vlan ports add dynamic group

configure igmp snooping {**vlan**} *vlan_name* {**ports** *portlist*} **add dynamic group** [**v4group** | **v6group**]

Description

Configures an IGMP dynamic group.

Syntax Description

vlan_name	Specifies a vlan name.
portlist	Specifies a port list.
v4group	Specifies a version 4 group.
v6group	Specifies a version 6 group.

Default

N/A.

Usage Guidelines

This command is not saved in the configuration. The following message is displayed on execution of this command:**INFO: This command is not saved in the configuration.**

Example

```
show igmp group
Group Address     Ver Vlan            Port        Age
```

```
224.0.0.2          2     v1              1        40
224.0.0.6          2     v1              1        44
225.1.1.1(s)       2     v3              Lpbk     0

show igmp snooping
Igmp Snooping Flag            : forward-all-router
Igmp Snooping Flood-list      : none
Igmp Snooping Proxy           : Enable
Igmp Snooping Filters         : per-port

Vlan             Vid  Port   #Senders #Receivers Router Enable
-------------------------------------------------------------
Default          1           0                           Yes
v1               10          3                           Yes

                      1               0         Yes
v3               4088        0                           Yes

                      Lpbk            1         No
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

configure igmp snooping vlan ports add static group

configure igmp snooping {**vlan**} *vlanname* {**ports** *portlist* }**add static group<ip address>**

Description

Configures VLAN ports to receive the traffic from a multicast group, even if no IGMP joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.
ip address	Specifies the multicast group IP address.

Default

None.

Usage Guidelines

Use this command to forward a particular multicast group to VLAN ports. In effect, this command emulates a host on the port that has joined the multicast group. As long as the port is configured with the static entry, multicast traffic for that multicast group is forwarded to that port.

This command is for IGMPv2 only.

The switch sends proxy IGMP messages in place of those generated by a real host. The proxy messages use the VLAN IP address for source address of the messages. If the VLAN has no IP address assigned, the proxy IGMP message uses 0.0.0.0 as the source IP address.

The multicast group should be in the class-D multicast address space, but should not be in the multicast control subnet range (224.0.0.x/24).

If the ports also have an IGMP filter configured, the filter entries take precedence. IGMP filters are configured using the command:

```
configure igmp snooping vlan <vlan name> ports <portlist> filter <policy file>
```

Example

The following command configures a static IGMP entry so the multicast group 224.34.15.37 is forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 add static group 224.34.15.37
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping vlan ports add static router

configure igmp snooping {vlan} *vlanname* **ports** *portlist* **add static router**

Description

Configures VLAN ports to forward the traffic from all multicast groups, even if no IGMP joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.

Default

None.

Usage Guidelines

Use this command to forward all multicast groups to the specified VLAN ports. In effect, this command emulates a multicast router attached to those ports. As long as the ports are configured with the static entry, all available multicast traffic is forwarded to those ports.

Example

The following command configures a static IGMP entry so all multicast groups are forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 add static router
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping vlan ports delete static group

configure igmp snooping {**vlan**} *vlanname* **ports** *portlist* **delete static group**[*ip_address* | **all**]

Description

Removes the port configuration that causes multicast group traffic to be forwarded, even if no IGMP leaves have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.
ip address	Specifies the multicast group IP address.
all	Delete all the static groups.

Default

None.

Usage Guidelines

Use this command to remove a static group entry created by the following command:

```
configure igmp snooping vlan <vlan name> ports <portlist> add static
group<ipaddress>
```

Example

The following command removes a static IGMP entry that forwards the multicast group 224.34.15.37 to the VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 delete static group
224.34.15.37
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping vlan ports delete static router

configure igmp snooping vlan *vlanname* **ports** *portlist* **delete static router**

Description

Removes the configuration that causes VLAN ports to forward the traffic from all multicast groups, even if no IGMP joins have been received on the port.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports. On a modular switch, can be a list of slots and ports. On a stand-alone switch, can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

None.

Usage Guidelines

Use this command to remove an entry created by the following command:

```
configure igmp snooping vlan <vlanname> ports <portlist> add static router
```

Example

The following command removes the static IGMP entry that caused all multicast groups to be forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 delete static router
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping vlan ports filter

configure igmp snooping vlan *vlanname* **ports** *portlist* **filter** [*policy* | **none**]

Description

Configures an IGMP snooping policy file filter on VLAN ports.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports. On a modular switch, can be a list of slots and ports. On a stand-alone switch, can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.
policy	Specifies the policy file for the filter.

Default

None.

Usage Guidelines

Use this command to filter multicast groups to the specified VLAN ports.

The policy file used by this command is a text file that contains the class-D addresses of the multicast groups that you wish to block.

To remove IGMP snooping filtering from a port, use the none keyword version of the command.

Use the following template to create a snooping filter policy file:

```
#
# Add your group addresses between "Start" and "end"
# Do not touch the rest of the file!!!!
entry igmpFilter {
if match any {
#------------------ Start of group addresses ------------------
nlri  239.11.0.0/16;
nlri  239.10.10.4/32;
#------------------- end of group addresses -------------------
} then {
deny;
}
}
entry catch_all {
if {
} then {
permit;
}
}
```

Example

The following command configures the policy file ap_multicast to filter multicast packets forwarded to VLAN marketing on ports 2:1-2:4:

```
configure igmp snooping marketing ports 2:1-2:4 filter ap_multicast
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp snooping vlan ports set join-limit

configure igmp snooping {**vlan**} *vlanname* **ports** *portlist* **set join-limit** {*num*}

Description

Configures VLAN ports to support a maximum number of IGMP joins.

Syntax Description

vlanname	Specifies a VLAN name.
portlist	Specifies one or more ports or slots and ports.
num	Specifies the maximum number of joins permitted on the ports. The range is 1 to 500.

Default

No limit.

Usage Guidelines

None.

Example

The following command configures port 2:1 in the Default VLAN to support a maximum of 100 IGMP joins:

```
configure igmp snooping “Default” ports 2:1 set join-limit 100
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp ssm-map add

configure igmp ssm-map add *group_ip* [*prefix* | *mask*] [*source_ip* | *src_domain_nam*] {**vr<vr-name>**}

Description

Configures an IGMP SSM mapping.

Syntax Description

group_ip	Specifies the multicast IP address for the group mapping.
prefix	Specifies a prefix length for the multicast group IP address. The range is 4 to 32.
mask	Specifies the network mask for the group multicast IP address.
source_ip	The IP address for a multicast group source.
src_domain_name	The source domain name for the multicast group source.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

IGMP SSM mapping operates only with IPv4.

Example

The following command configures an IGMP-SSM mapping for the range of multicast IP addresses at 232.1.1.0/24 to IP host 172.16.8.1:

```
configure igmp ssm-map add 232.1.1.0/24 172.16.8.1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure igmp ssm-map delete

configure igmp ssm-map delete *group_ip* [**/<prefix>**} | *mask*] [*source_ip* | **all**] *v vr-name*}

Description

Unconfigures an SSM mapping.

Syntax Description

group_ip	Specifies the multicast IP address for the group mapping.
prefix	Specifies a prefix length for the multicast group IP address. The range is 4 to 32.
mask	Specifies the network mask for the group multicast IP address.
source_ip	The IP address for a multicast group source.
all	Specifies that all sources for the specified group or mask are deleted.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes an IGMP-SSM mapping for the range of multicast IP addresses at 232.1.1.0/24 to IP host 172.16.8.1:

```
configure igmp ssm-map delete 232.1.1.0/24 172.16.8.1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure ipmcforwarding

configure ipmcforwarding to-cpu [auto | off] ports *port_list*

Description

Configure whether IP multicast CPU filters are installed automatically.

Syntax Description

auto	The software will automatically program IP multicast processing based on configuration.
off	IP multicast packets received on this port are always flooded with no CPU processing.
port_list	Specifies on or more ports.

Default

N/A.

Usage Guidelines

IP forwarding and IPMC forwarding must be enabled for the configuration to operate.

Example

The following example configures automatic operation for port 2.1:

```
configure ipmcforwarding to-cpu auto ports 2.1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure ipmroute add

configure ipmroute add [*source-net>/<mask-len* | *source-net mask*] {{**protocol**} *protocol*} *rpf-address* {*metric*} {**vr** *vr-name*}

Description

Adds a static multicast route to the multicast routing table.

Syntax Description

source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is [1-32].
mask	Specifies a subnet mask.
protocol	Unicast routing protocol that is to be used for route learning.
rpf-address	Next hop through which the multicast source can be reached.
metric	Specifies a cost metric.
vr-name	Specifies the virtual router to which the route is added.

Default

The following defaults apply:

- metric—1
- vr-name—VR of the current CLI context
- protocol—none

Usage Guidelines

This command allows you to statically configure where multicast sources are located (even though the unicast routing table has different entries). It allows you to configure a multicast static route in such a way as to have non-congruent topology for Unicast and Multicast topology and traffic.

Example

The following command configures a multicast static route for all multicast sources within network subnet 192.168.0.0/16. Those sources are reachable through the gateway 192.75.0.91.

```
configure ipmroute add 192.168.0.0/16 192.75.0.91
```

The following example configures multicast static route for all sources via a single gateway with a metric of 100:

```
configure ipmroute add 0.0.0.0/0 192.75.0.91 100
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure ipmroute delete

configure ipmroute delete [*source-net>/<mask-len* | *source-net mask*] {{**protocol**} *protocol*} *rpf-address* {**vr** *vr-name*}

Description

Deletes a static multicast address from the multicast routing table.

Syntax Description

source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is [1-32].
mask	Specifies a subnet mask.
protocol	Unicast routing protocol that is to be used for route learning.
rpf-address	Next hop through which the multicast source can be reached.
vr-name	Specifies the virtual router to which the route is added.

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

This command allows you to delete an existing multicast static route. It allows you to configure congruent topology for unicast and multicast packets and traffic.

Example

The following command deletes a multicast static route:

```
configure ipmroute delete 192.168.0.0/16 192.75.0.91
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure iproute add (Multicast)

configure iproute add [*ipNetmask* | *ip_addr mask*] *gateway* {**metric**} {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Adds a static route to the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ip_addr	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a VLAN gateway.
metric	Specifies a cost metric.
vrname	Specifies the virtual router to which the route is added.
multicast	Adds the specified route to the multicast routing table.
multicast-only	Adds the specified route to the multicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.
unicast	Adds the specified route to the unicast routing table.
unicast-only	Adds the specified route to the unicast routing table. This option is provided for backward compatibility with releases prior to ExtremeXOS Release 12.1.

Default

If you do not specify a virtual router, the current virtual router context is used.

Usage Guidelines

Use a mask value of 255.255.255.255 to indicate a host entry.

Note

Although dynamic unicast routes can be captured in the multicast routing table, unicast static routes cannot be captured in the multicast routing table. To create a static route for the multicast routing table, you must specify the multicast option.

Example

The following command adds a static address to the multicast routing table:

```
configure iproute add 10.1.1.0/24 123.45.67.1 5 multicast
```

History

This command was first available in ExtremeXOS 10.1.

The multicast and unicast keywords were first available in ExtremeXOS 12.1. These keywords replace the multicast-only and unicast-only keywords, which remain in the software for backward compatibility.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure iproute delete

configure iproute delete [*ipNetmask* | *ipaddress mask*] *gateway* {**multicast** | **multicast-only** | **unicast** | **unicast-only**} {**vr** *vrname*}

Description

Deletes a static address from the routing table.

Syntax Description

ipNetmask	Specifies an IP address/mask length.
ipaddress	Specifies an IP address.
mask	Specifies a subnet mask.
gateway	Specifies a VLAN gateway.
multicast	Specifies a multicast route to delete.

multicast-only	Specifies a multicast route to delete.
unicast	Specifies a unicast route to delete.
unicast-only	Specifies a unicast route to delete.
vrname	Specifies the virtual router to which the route is deleted.

Default

If you do not specify a virtual router, the current virtual router context is used.

Usage Guidelines

Use a value of 255.255.255.255 or /32 for mask to indicate a host entry.

Example

The following command deletes an address from the multicast routing table:

```
configure iproute delete 10.101.0.0/24 10.101.0.1 multicast
```

History

This command was first available in ExtremeXOS 10.1.

The multicast and unicast keywords were first available in ExtremeXOS 12.1. These keywords replace the multicast-only and unicast-only keywords, which remain in the software for backward compatibility.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mcast ipv4 cache timeout

configure mcast ipv4 cache timeout {*seconds* | **none**}

Description

Configures the IPv4 multicast cache timeout.

Syntax Description

seconds	Idle time after which cache entries are deleted.
none	Cache entries are not timed out.

Default

300 seconds

Usage Guidelines

Cache timeout is the time after which the cache entries are deleted, if traffic is not received for that duration. The applies only for snooping and MVR caches and does not apply for PIM caches.

The range is 90 to 100000 seconds. You can use the option none if you do not want the cache entry to be deleted. If none is configured, the cache entries could be deleted only using the following command:

```
clear igmp snooping
```

Example

```
configure mcast ipv4 cache timeout 400
configure mcast ipv4 cache timeout none
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements”.

configure mvr add receiver

configure mvr vlan *vlan-name* **add receiver port** *port-list*

Description

Configures a port to receive MVR multicast streams.

Syntax Description

vlan-name	Specifies a VLAN name.
port-list	A list of ports or slots and ports.

Default

N/A.

Usage Guidelines

This command is used to add a group of virtual ports for multicast forwarding through MVR. By default, some ports on non-MVR VLANs (router ports, primary and secondary EAPS ports), are excluded from the MVR cache egress list. This command is used to override these rules, so that if valid IGMP memberships are received, or a router is detected, streams are forwarded out on the ports.

Example

The following command adds the ports 1:1 and 1:2 of VLAN v1 to MVR for forwarding:

```
configure mvr vlan v1 add receiver port 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mvr add vlan

configure mvr add vlan *vlan-name*

Description

Configures a VLAN as an MVR VLAN.

Syntax Description

vlan-name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Configures MVR on the specified VLAN. When a multicast stream in the specified MVR address range is received on the VLAN, it is leaked to all other VLAN ports where the corresponding IGMP join message is received. By default, the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24 is used for MVR. To change the MVR address range, use the following command:

```
configure mvr vlan <vlan-name> mvr-address {<policy-name> | none}
```

Example

The following command configures VLAN v1 as an MVR VLAN:

```
configure mvr add vlan v1
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mvr delete receiver

configure mvr vlan *vlan-name* **delete receiver port** *port-list*

Description

Configures a port not to receive MVR multicast streams.

Syntax Description

vlan-name	Specifies a VLAN name.
port-list	A list of ports or slots and ports.

Default

N/A.

Usage Guidelines

This command is used to delete a group of virtual ports for multicast forwarding through MVR. After using this command, the ports revert to the default forwarding rules.

Example

The following command deletes the ports 1:1 and 1:2 of VLAN v1 to MVR for forwarding:

```
configure mvr vlan v1 delete receiver port 1:1-1:2
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mvr delete vlan

configure mvr delete vlan *vlan-name*

Description

Deletes a VLAN from MVR.

Syntax Description

vlan-name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Removes MVR from the specified VLAN.

Example

The following command configures VLAN v1 as a non-MVR VLAN:

```
configure mvr delete vlan v1
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mvr mvr-address

configure mvr vlan *vlan-name* **mvr-address** {*policy-name* | **none**}

Description

Configures the MVR address range on a VLAN.

Syntax Description

vlan-name	Specifies a VLAN name.
policy-name	Specifies a policy file.

Default

The default address range is 224.0.0.0/4 (all multicast addresses), but excluding 224.0.0.0/24 (the multicast control range).

Usage Guidelines

If no policy file is specified (the none option), the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24 is used for MVR.

MVR must first be configured on the VLAN before using this command.

If the policy is later refreshed, groups denied and newly allowed groups in the policy are flushed from fast path forwarding. This allows synching existing channels with the new policy, without disturbing existing channels.

The following is a sample policy file mvrpol.pol. This policy configures 236.1.1.0/24 as the MVR address range. Any address outside this range has the standard switching behavior on an MVR VLAN.

```
Entry extreme1 {
    if match any {
        nlri  236.1.1.0/24 ;
    }
    then {
        permit ;
    }
}
```

Example

The following command configures the MVR address range specified in the policy file mvrpol.pol for the VLAN v1:

```
configure mvr vlan v1 mvr-address mvrpol
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure mvr static group

configure mvr vlan *vlan-name* **static group** {*policy-name* | **none**}

Description

Configures the MVR static group address range on a VLAN.

Syntax Description

vlan-name	Specifies a VLAN name.
policy-name	Specifies a policy file.

Default

By default, all the MVR group addresses work in static mode.

Usage Guidelines

If no policy file is specified (the none option), the entire multicast address range 224.0.0.0/4, except for the multicast control range 224.0.0.0/24, is used for static groups in MVR.

MVR must first be configured on the VLAN before using this command.

The following is a sample policy file mvrpol.pol. This policy configures 236.1.1.0/24 as the MVR static group address range. Any MVR addresses outside this range are dynamically registered through IGMP. An MVR VLAN will proxy join only for addresses that are not in the static group. If you want all the multicast groups to by dynamic, use a policy file with this command that denies all multicast addresses.

```
Entry extreme1 {
    if match any {
        nlri  236.1.1.0/24 ;
    }
    then {
        permit ;
    }
}
```

Example

The following command configures the MVR static group address range specified in the policy file mvrpol.pol for the VLAN v1:

```
configure mvr vlan v1 static group mvrpol
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim add vlan

configure pim add vlan [*vlan-name* | **all**] {**dense** | **sparse**} {**passive**}

Description

Configures an IP interface for PIM.

Syntax Description

vlan-name	Specifies a VLAN name.
all	Specifies all VLANs.
dense	Specifies PIM dense mode (PIM-DM).
sparse	Specifies PIM sparse mode (PIM-SM).
passive	Specifies a passive interface.

Default

Dense.

Usage Guidelines

When an IP interface is created, per-interface PIM configuration is disabled by default.

The switch supports both dense mode and sparse mode operation. You can configure dense mode or sparse mode on a per-interface basis. After they are enabled, some interfaces can run dense mode, while others run sparse mode.

Passive interfaces are host only interfaces that allow a multicast stream from other VLANs to be forwarded to edge hosts. Since they do not peer with other PIM routers, do not connect a multicast router to a passive interface.

In order for the interface to participate in PIM, PIM must be enabled on the switch using the following command:

```
enable pim
```

Example

The following command enables PIM-DM multicast routing on VLAN accounting:

```
configure pim add vlan accounting dense
```

History

This command was first available in ExtremeXOS 10.1.

The passive parameter was added in ExtremeXOS 11.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim border

configure pim {ipv4 | ipv6} [{vlan} *vlan_name* | vlan all] border

Description

Configures a PIM VLAN as a border VLAN, which is used to demarcate a PIM domain when using MSDP.

Syntax Description

ipv4	Configures a PIM timer on IPv4 router interfaces.
ipv6	Configures a PIM timer on IPv6 router interfaces.
vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
border	Interface is domain border.

Default

None.

Usage Guidelines

MSDP is used to connect multiple multicast routing domains. A PIM-SM domain is created by limitingthe reach of PIM BSR advertisements. When a border VLAN is configured, PIM BSR advertisements are not forwarded out of the PIM VLAN.

Example

The following command configures a PIM border on a VLAN called “vlan_border”:

```
configure pim vlan_border border
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide.

configure pim cbsr

configure pim cbsr [{**vlan**} *vlan_name* {*priorit* [**0-254**]} | **none**]

Description

Configures a candidate bootstrap router for PIM sparse-mode operation.

Syntax Description

vlan_name	Specifies a VLAN name.
priority	Specifies a priority setting. The range is 0 - 254.
none	Specifies to delete a CBSR.

Default

The default setting for priority is 0, and indicates the lowest priority.

Usage Guidelines

The VLAN specified for CBSR must have PIM enabled for it to take effect. After PIM is enabled, CBSRs advertise themselves in the PIM domain. A bootstrap router (BSR) is elected among all the candidates based on CBSR priority. To break the tie among routers with the same priority setting, the router with the numerically higher IP address is chosen.

An Extreme XOS switch can support up to 145 RPs per group when it is configured as a PIM BSR (bootstrap router). If more than 145 RPs are configured for a single group, the BSR ignores the group and does not advertise the RPs. Non-BSR switches can process more than 145 RPs in the BSR message.

Example

The following command configures a candidate bootstrap router on the VLAN accounting:

```
configure pim cbsr vlan accounting 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim crp static

configure pim crp static *ip_address* [**none** | *policy*] {*priority* [**0-254**]}

Description

Configures a rendezvous point and its associated groups statically, for PIM sparse mode operation.

Syntax Description

ip_address	Specifies a static CRP address.
none	Deletes the static rendezvous point.
policy	Specifies a policy file name.
priority	Specifies a priority setting. The range is 0 - 254.

Default

The default setting for priority is 0, which indicates highest priority.

Usage Guidelines

In PIM-SM, the router sends a join message to the rendezvous point (RP). The RP is a central multicast router that is responsible for receiving and distributing multicast packets. If you use a static RP, all switches in your network must be configured with the same RP address for the same group (range).

ExtremeXOS switches support up to 50 RPs in a switch, and up to 180 groups (group/mask entries) in a single RP policy file. If you configure more than 180 group entries in a single RP policy file, the switch will not process entries added after the first 180.

The policy file contains a list of multicast group addresses served by this RP.

This policy file is not used for filtering purposes. As used with this command, the policy file is just a container for a list of addresses. So a typical policy file used for RP configuration looks a little different from a policy used for other purposes.

If routers have different group-to-RP mappings, due to misconfiguration of the static RP (or any other reason), traffic is disrupted.

Example

The following command statically configures an RP and its associated groups defined in policy file rp-list:

```
configure pim crp static 10.0.3.1 rp-list
```

The following is a sample policy file:

```
entry extreme1 {
if match any {  }
then { nlri  224.0.0.0/4 ;
nlri  239.255.0.0/24 ;
nlri  232.0.0.0/8 ;
nlri  238.1.0.0/16 ;
nlri  232.232.0.0/20 ;
}
}
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim crp timer

configure pim crp timer *crp_adv_interval*

Description

Configures the candidate rendezvous point advertising interval in PIM sparse mode operation.

Syntax Description

crp_adv_interval	Specifies a candidate rendezvous point advertising interval in seconds. The range is 1 to 1,717,986,918.

Default

The default is 60 seconds.

Usage Guidelines

Increasing this time results in increased convergence time for CRP information to the PIM routers.

Example

The following command configures the candidate rendezvous point advertising interval to 120 seconds:

```
configure pim crp timer 120
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim crp vlan

configure pim crp vlan *vlan_name* [**none** | *policy*] {*priority*}

Description

Configures the dynamic candidate rendezvous point (CRP) for PIM sparse-mode operation.

Syntax Description

vlan_name	Specifies a VLAN name.
none	Specifies no policy file.
policy	Specifies a policy file name.
priority	Specifies a priority setting. The range is 0 - 254.

Default

The default setting for priority is 0 and indicates the highest priority.

Usage Guidelines

ExtremeXOS switches support up to 50 RPs in a switch, and up to 180 groups (group/mask entries) in a single RP policy file. If you configure more than 180 group entries in single RP policy file, then switch will not process entries added after first 180.

The policy file contains the list of multicast group addresses serviced by this RP. This set of group addresses are advertised as candidate RPs. Each router then elects the common RP for a group address based on a common algorithm. This group to RP mapping should be consistent on all routers.

This policy file is not used for filtering purposes. As used with this command, the policy file is just a container for a list of addresses. So a typical policy file used for RP configuration looks a little different from a policy used for other purposes. The following is a sample policy file which configures the CRP for the address ranges 239.0.0.0/24 and 232.144.27.0/24:

```
entry extreme1 {
    if match any {
    }
        then {
            nlri  239.0.0.0/24 ;
            nlri  232.144.27.0/24 ;
    }
}
```

The VLAN specified for a CRP must have PIM configured.

To delete a CRP, use the keyword none as the access policy.

Example

The following command configures the candidate rendezvous point for PIM sparse-mode operation on the VLAN HQ_10_0_3 with the policy rp-list and priority set to 30:

```
configure pim crp HQ_10_0_3 rp-list 30
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim delete vlan

configure pim delete vlan [*vlanname* | **all**]

Description

Disables PIM on a router interface.

Syntax Description

vlan name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

N/A.

Usage Guidelines

None.

Example

The following command disables PIM on VLAN accounting:

```
configure pim delete vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim dr-priority

configure pim {ipv4 | ipv6} [{vlan} *vlan_name* **| vlan all] dr-priority** *priority*

Description

Configures the designated router (DR) priority that is advertised in PIM hello messages.

Syntax Description

ipv4	IPv4 address family (default)
ipv6	IPv6 address family
vlan all	Apply to all VLANs
dr-priority	Designated Router Priority for VLAN
priority	Priority value for VLAN (default 1). The range is 1 to 4294967295.

Default

The default setting for dr-priority is 1.

Usage Guidelines

The DR_Priority option allows a network administrator to give preference to a particular router in the DR election process by giving it a numerically larger DR priority. The DR_Priority option is included in every hello message, even if no DR priority is explicitly configured on that interface. This is necessary because priority-based DR election is only enabled when all neighbors on an interface advertise that they are capable of using the DR_Priority Option. The default priority is 1.

The DR priority is a 32-bit unsigned number, and the numerically larger priority is always preferred. A router's idea of the current DR on an interface can change when a PIM hello message is received, when a neighbor times out, or when a router's own DR priority changes. If the router becomes the DR or ceases to be the DR, this will normally cause the DR register state machine to change state. Subsequent actions are determined by that state machine. DR election process on interface is:

- If any one of the neighbor on the interface is not advertised the DR priority (not DR capable) then DR priority will not considered for the all the neighbors in the circuit, and the primary IP address will be considered for all the neighbors.
- Higher DR priority or higher primary address will be elected as DR.

Example

```
configure pim ipv4 vlan accounting priority 10
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

New configure pim iproute sharing hash

configure pim {ipv4 | ipv6} iproute sharing hash [source | group | source-group | source-group-nexthop]

Description

This command is used to configure the PIM ECMP hash algorithm.

Syntax Description

hash	Configure Hash Algorithm for Equal Cost Multipath Routing
source	Hash for route sharing is based on source address only.
group	Hash for route sharing is based on group address only.
source-group	Hash for route sharing is based on source and group addresses.
source-group-nexthop	Hash for route sharing is based on source, group, and next hop addresses (default).

Default

Source-group-nexthop.

Usage Guidelines

Use this command to configure the PIM ECMP hash algorithm.

Example

The following command configures the PIM ECMP hash algorithm based on source-group-nexthop.

```
configure pim ipv6 iproute sharing hash source-group-nexthop
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. All platforms except Summit X440 support IP route sharing in the ExtremeXOS 15.3.2 release. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

New configure pim register-policy

configure pim {ipv4 | ipv6} register-policy [*rp_policy_name* | **none**]

Description

Configures the register filter at the First Hop Router (FHR).

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.
rp_policy_name	Specifies the Policy File for Register filter.
none	Unconfigures the configured RP Register filter.

Default

IPv4 is the default value.

Usage Guidelines

None.

Example

The following command configures an IPv4 register policy named "entry_policy" at the FHR:

```
configure pim ipv4 register-policy entry_policy
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

New configure pim register-policy rp

configure pim {ipv4 | ipv6} register-policy rp [*rp_policy_name* | **none**]

Description

Configures the register filter at the Rendezvous Point .

Syntax Description

ipv4	Specifies the IPv4 address family.
ipv6	Specifies the IPv6 address family.

rp_policy_name	Specifies the Policy File for RP Register filter.
none	Unconfigures the configured RP Register filter.

Default

N/A.

Usage Guidelines

None.

Example

The following command configuresna IPv4 register policy named "entry_policy":

```
configure pim ipv4 register-policy rp entry_policy
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim register-rate-limit-interval

configure pim register-rate-limit-interval *interval*

Description

Configures the initial PIM-SM periodic register rate.

Syntax Description

interval	Specifies an interval time in seconds. Range is 0 - 60. Default is 0.

Default

Default is 0.

Usage Guidelines

Configuring a non-zero interval time can reduce the CPU load on the first hop switch, in case register stop messages are not received normally.

When a non-zero value is configured, the first hop switch sends a few register messages and then waits for a corresponding register stop from the RP for <time> seconds. The process is repeated until the register stop is received. This command should be used when the (S,G) tree between the first hop router and the RP is not converging quickly.

The default value is zero in default mode, the switch sends continuous register messages until the register stop is received.

Example

The following command configures the initial PIM register rate limit interval:

```
configure pim register-rate-limit-interval 2
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim register-suppress-interval register-probe-interval

configure pim register-suppress-interval *reg-interval* **register-probe-interval** *probe_interval*

Description

Configures an interval for periodically sending null-registers.

Syntax Description

reg-interval	Specifies an interval time in seconds. Range is 30 - 200 seconds. Default is 60.
probe-interval	Specifies an interval time in seconds. Default is 5.

Default

The following defaults apply:

- register-suppress-interval—60
- register-probe-interval—5

Usage Guidelines

The register-probe-interval time should be set less than the register-suppress-interval time. By default, a null register is sent every 55 seconds (register-suppress-interval - register-probe-interval). A response to the null register is expected within register probe interval. By specifying a larger interval, a CPU peak load can be avoided because the null-registers are generated less frequently. The register probe time should be less than half of the register suppress time, for best results.

Example

The following command configures the register suppress interval and register probe time:

```
configure pim register-suppress-interval 90 register-probe time 10
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim register-checksum-to

configure pim register-checksum-to [include-data | exclude-data]

Description

Configures the checksum computation to either include data (for compatibility with Cisco Systems products) or to exclude data (for RFC-compliant operation), in the register message.

Syntax Description

include-data	Specifies to include data.
exclude-data	Specifies to exclude data.

Default

Include data.

Usage Guidelines

None.

Example

The following command configures the checksum mode to include data for compatibility with Cisco Systems products:

```
configure pim register-checksum-to include-data
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim shutdown-priority

configure pim {**ipv4** | **ipv6**} [{**vlan**} *vlan_name* | **vlan all**] **shutdown-priority** *number*

Description

Configures a time-to-live (TTL) value for PIM-DM state refresh messages.

Syntax Description

ipv4	Configures a PIM timer on IPv4 router interfaces.
ipv6	Configures a PIM timer on IPv6 router interfaces.
vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
number	Priority for VLAN range is [0 - 65535].

Default

IPv4.

Usage Guidelines

None.

Example

The following command configures the shutdown priority for VLAN 36:

```
config pim vlan v36 shutdown-priority 22
```

History

This command was first available in ExtremeXOS 12.4.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim spt-threshold

configure pim spt-threshold *leaf-threshold* {*rp_threshold*}

Description

Configures the threshold, in kbps, for switching to SPT. On leaf routers, this setting is based on data packets. On the RP, this setting is based on register packets.

Syntax Description

leaf-threshold	Specifies the rate of traffic per (s,g,v) group in kbps for the last hop. Range is 0 - 419403.
rp_threshold	Specifies an RP threshold. Range is 0 - 419403.

Default

The default setting is 0 for both parameters.

Usage Guidelines

For the best performance, use default value of 0.

Example

The following command sets the threshold for switching to SPT:

```
configure pim spt-threshold 4 16
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim ssm range

configure pim ssm range [**default** | **policy** *policy-name*]

Description

Configures the range of multicast addresses for PIM SSM.

Syntax Description

default	Specifies the default address range, 232.0.0.0/8.
policy-name	Specifies a policy that defines the SSM address range.

Default

By default, no SSM range is configured. Using this command with the default keyword sets the range to 232.0.0.0/8. To reset the switch to the initial state, use the unconfigure pim ssm range command.

Usage Guidelines

You must disable PIM before configuring or unconfiguring a PIM-SSM range. Use the disable pim command.

Initially, no range is configured for SSM. After a range is configured, you can remove the range with the unconfigure pim ssm range command. If you wish to change the PIM SSM range, you must first unconfigure the existing range, and then configure the new range.

SSM requires that hosts use IGMPv3 messages to register to receive multicast group packets. When a range is configured for SSM, any IGMPv2 messages for an address in the range are ignored. Also, any IGMPv3 Exclude messages are ignored.

Note

If a PIM-SSM range is configured, IGMPv2 messages and IGMPv3 exclude messages within the PIM-SSM range are ignored on all IP interfaces, whether or not PIM-SSM is configured on the interfaces.

To specify a range different from the default PIM SSM range, create a policy file. The match statement of the policy file contains the group addresses to be treated as PIM SSM addresses. For example, to specify the PIM SSM address range as 232.0.0.0/8 and 233.0.0.0/8, use the following policy file:

```
Entry extreme1 {
    if match any {
        nlri  232.0.0.0/8 ;
        nlri  233.0.0.0/8 ;
    }
    then {
        permit ;
    }
}
```

Example

The following command sets the PIM SSM range to 232.0.0.0/8 and 233.0.0.0/8, if the policy file ssmrange.pol contains the policy example used above:

```
configure pim ssm range policy ssmrange.pol
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim state-refresh

configure pim state-refresh {**vlan**} [*vlanname* | **all**] [**on** | **off**]

Description

Enables or disables the PIM-DM state refresh feature on one or all VLANs.

Syntax Description

vlanname	Specifies a VLAN on which to enable or disable the PIM-DM state refresh feature.
on	Enables the PIM-DM state refresh feature on the specified VLANs.
off	Disables the PIM-DM state refresh feature on the specified VLANs.

Default

Disabled.

Usage Guidelines

When this feature is disabled on an interface, the interface behaves as follows:

- State refresh messages are not originated.
- State refresh messages received on the interface are dropped without processing.
- State refresh messages received on other interfaces are not forwarded to the disabled interface.

Example

The following command enables the PIM-DM state refresh feature on VLAN blue:

```
configure pim state-refresh blue on
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim state-refresh timer origination-interval

configure pim state-refresh timer origination-interval *interval*

Description

Configures the interval at which state refresh messages are originated.

Syntax Description

interval	Specifies a refresh interval in seconds. The range is 30 to 90 seconds.

Default

60 seconds.

Usage Guidelines

None.

Example

The following command configures the interval to 45 seconds:

```
configure pim state-refresh timer origination-interval 45
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim state-refresh timer source-active-timer

configure pim state-refresh timer source-active-timer *interval*

Description

Defines how long a multicast source (S,G) is considered active after a packet is received from the source.

Syntax Description

interval	Specifies a source-active timer interval in seconds. The range is 90 to 300 seconds.

Default

210 seconds.

Usage Guidelines

None.

Example

The following command configures the interval to 45 seconds:

```
configure pim state-refresh timer source-active-timer 180
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim state-refresh ttl

configure pim state-refresh ttl *ttlvalue*

Description

Configures a time-to-live (TTL) value for PIM-DM state refresh messages.

Syntax Description

ttl	Specifies a TTL value. The range is 1 to 64.

Default

16.

Usage Guidelines

None.

Example

The following command the TTL value for 24:

```
configure pim state-refresh ttl 24
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim timer vlan

configure pim timer *hello_interval jp_interval* [{**vlan**} *vlan_name* | **vlan all**]

Description

Configures the global PIM timers on the specified router interfaces.

Syntax Description

hello_interval	Specifies the amount of time before a hello message is sent out by the PIM router. The range is 1 to 65,535 seconds.
jp_interval	Specifies the join/prune interval. The range is 1 to 65,535 seconds.
vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

- hello_interval—30 seconds.
- jp_interval—60 seconds.

Usage Guidelines

These default timers should only be adjusted when excess PIM control packets are observed on the interface.

Example

The following command configures the PIM timers on the VLAN accounting:

```
configure pim timer 150 300 vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim vlan trusted-gateway

configure pim [{**vlan**} *vlan_name* | **vlan all**] **trusted-gateway** [*policy* | **none**]

Description

Configures a trusted neighbor policy.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.
policy	Specifies an policy file name.
none	Specifies no policy file, so all gateways are trusted.

Default

No policy file, so all gateways are trusted.

Usage Guidelines

Because PIM leverages the unicast routing capability that is already present in the switch, the access policy capabilities are, by nature, different. When the PIM protocol is used for routing IP multicast traffic, the switch can be configured to use a policy file to determine trusted PIM router neighbors for the VLAN on the switch running PIM. This is a security feature for the PIM interface.

Example

The following command configures a trusted neighbor policy on the VLAN backbone:

```
configure pim vlan backbone trusted-gateway nointernet
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable igmp

disable igmp {**vlan** *name*}

Description

Disables IGMP on a router interface. If no VLAN is specified, IGMP is disabled on all router interfaces.

Syntax Description

name	Specifies a VLAN name.

Default

Enabled.

Usage Guidelines

IGMP is a protocol used by an IP host to register its IP multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, hosts respond to the query, and group registration is maintained.

IGMP is enabled by default on the switch. However, the switch can be configured to disable the generation and processing of IGMP packets. IGMP should be enabled when the switch is configured to perform IP multicast routing.

This command disables IGMPv2 and IGMPv3.

Example

The following command disables IGMP on VLAN accounting:

```
disable igmp vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable igmp snooping

disable igmp snooping {**forward-mcrouter-only** | **with-proxy** | **vlan** *name*}

Description

Disables IGMP snooping.

Syntax Description

forward-mcrouter-only	Specifies that the switch forwards all multicast traffic to the multicast router only.
with-proxy	Disables the IGMP snooping proxy.
name	Specifies a VLAN.

Default

IGMP snooping and the with-proxy option are enabled by default, but forward-mcrouter-only option is disabled by default.

Usage Guidelines

If a VLAN is specified, IGMP snooping is disabled only on that VLAN, otherwise IGMP snooping is disabled on all VLANs.

This command applies to both IGMPv2 and IGMPv3.

If the switch is in the forward-mcrouter-only mode, then the command disable igmp snooping forward-mcrouter-only changes the mode so that all multicast traffic is forwarded to any IP router. If not in the forward-mcrouter-mode, the command disable igmp snooping forward-mcrouter-only has no effect.

To change the snooping mode you must disable IP multicast forwarding. Use the command:

```
disable ipmcforwarding
```

The with-proxy option can be used for troubleshooting purpose. It should be enabled for normal network operation.

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer3 switch. The proxy also suppresses unnecessary IGMP leave messages so that they are forwarded only when the last member leaves the group.

Example

The following command disables IGMP snooping on the VLAN accounting:

```
disable igmp snooping accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable igmp snooping vlan fast-leave

disable igmp snooping {**vlan**} *name* **fast-leave**

Description

Disables the IGMP snooping fast leave feature on the specified VLAN.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the IGMP snooping fast leave feature on the default VLAN:

```
disable igmp snooping “Default” fast-leave
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable igmp ssm-map

disable igmp ssm-map {**vr** *vr-name*}

Description

Disables IGMP SSM mapping.

Syntax Description

vr-name	Specifies a virtual router name. If the VR name is omitted, the switch disables mapping on the VR specified by the current CLI VR context.

Default

Disabled on all interfaces.

Usage Guidelines

None.

Example

The following command disables IGMP-SSM mapping on the VR in the current CLI VR context:

```
disable igmp ssm-map
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable ipmcforwarding

disable ipmcforwarding {**vlan** *name*}

Description

Disables IP multicast forwarding on a router interface.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IP interfaces are affected. When new IP interfaces are added, IP multicast forwarding is disabled by default.

IP forwarding must be enabled before enabling IP multicast forwarding.

Disabling IP multicast forwarding disables any Layer3 multicast routing for the streams coming to the interface.

Example

The following command disables IP multicast forwarding on the VLAN accounting:

```
disable ipmcforwarding vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable mvr

disable mvr

Description

Disables MVR on the system.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables MVR on the system:

```
disable mvr
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable pim

disable pim

Description

Disables PIM on the system.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables PIM on the system:

```
disable pim
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable pim iproute sharing

disable pim {ipv4 | ipv6} iproute sharing

Description

Disables the PIM Equal Cost Multi Path (ECMP) feature.

Syntax Description

iproute	IP Route
sharing	Equal Cost Multipath Routing

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables the PIM ECMP feature:

```
disable pim ipv4 iproute sharing
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. All platforms except Summit X440 support IP route sharing in the ExtremeXOS 15.3.2 release. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

disable pim snooping

disable pim snooping {{**vlan**} *name*}

Description

Disables PIM snooping and clears all the snooping PIM neighbors, joins received on the VLAN, and the forwarding entries belonging to one or all VLANs.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

None.

Example

The following command disables PIM snooping for all VLANs on the switch:

```
disable pim snooping
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable pim ssm vlan

disable pim ssm vlan [*vlan_name* | **all**]

Description

Disables PIM SSM on a router interface.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled on all interfaces.

Usage Guidelines

This command disables PIM-SSM on the specified Layer3 VLAN.

IGMPv3 include messages for multicast addresses in the SSM range is only processed by PIM if PIM-SSM is enabled on the interface. Any non-IGMPv3 messages in the SSM range are not processed by PIM on any switch interface, whether SSM is enabled or not.

Example

The following command disables PIM-SSM multicast routing on VLAN accounting:

```
disable pim ssm vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable igmp

enable igmp {vlan *vla* **name>} {IGMPv1 | IGMPv2 | IGMPv3}**

Description

Enables IGMP on a router interface. If no VLAN is specified, IGMP is enabled on all router interfaces.

Syntax Description

vlan name	Specifies a VLAN name.
IGMPv1	Specifies the compatibility mode as IGMPv1.
IGMPv2	Specifies the compatibility mode as IGMPv2.
IGMPv3	Specifies the compatibility mode as IGMPv3.

Default

Enabled, set to IGMPv2 compatibility mode.

Usage Guidelines

IGMP is a protocol used by an IP host to register its IP multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, IP hosts respond to the query, and group registration is maintained.

IGMPv2 is enabled by default on the switch. However, the switch can be configured to disable the generation and processing of IGMP packets. IGMP should be enabled when the switch is configured to perform IP multicast routing.

Example

The following command enables IGMPv2 on the VLAN accounting:

```
enable igmp vlan accounting
```

The following command enables IGMPv3 on the VLAN finance:

```
enable igmp vlan finance igmpv3
```

History

This command was first available in ExtremeXOS 10.1.

The IGMPv1, IGMPv2, and IGMPv3 options were added in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable igmp snooping

enable igmp snooping {**forward-mcrouter-only** | {**vlan**} *name* | **with-proxy vr** *vrname*}

Description

Enables IGMP snooping on one or all VLANs.

Syntax Description

forward-mcrouter-only	Specifies that the switch forward all multicast traffic to the multicast router only.
name	Specifies a VLAN or VMAN on which to enable IGMP snooping.
with-proxy vr vrname	Controls how join and leave messages are forwarded from the specified virtual router. If this option is specified, one join message per query is forwarded, and a leave message is forwarded only if it is from the last receiver on the VLAN.

Default

Enabled.

Usage Guidelines

This command applies to both IGMPv2 and IGMPv3.

IGMP snooping is enabled by default on the switch. If you are using multicast routing, IGMP snooping can be enabled or disabled. If IGMP snooping is disabled, all IGMP and IP multicast traffic floods within a given VLAN or VMAN.

The forward-mcrouter-only, vlan, and with-proxy options control three separate and independent features. You can manage one feature at a time with the enable igmp snooping command, and you can enter the command multiple times as needed to control each feature. For example, you can enter the command twice to enable both the forward-mcrouter-only and with-proxy options.

If a VLAN or VMAN is specified with the enable igmp snooping command, IGMP snooping is enabled only on that VLAN or VMAN. If no options are specified, IGMP snooping is enabled on all VLANs.

Note

IGMP snooping is not supported on SVLANs on any platform.

The with-proxy option enables the IGMP snooping proxy feature, which reduces the number of join and leave messages forwarded on the virtual router as described in the table above. This feature is enabled by default.

An optional optimization for IGMP snooping is the strict recognition of routers only if the remote devices are running a multicast protocol. Two IGMP snooping modes are supported:

- The forward-mcrouter-only mode forwards all multicast traffic to the multicast router (that is, the router running PIM, DVMRP or CBT).
- When not in the forward-mcrouter-only mode, the switch forwards all multicast traffic to any IP router (multicast or not), and any active member port to the local network that has one or more subscribers.

Note

The forward-mcrouter-only mode for IGMP snooping is enabled/disabled on a switch-wide basis, not on a per-VLAN basis. In other words, all the interfaces enabled for IGMP snooping are either in the forward-mcrouter-only mode or in the non-forward-mcrouter-only mode, and not a mixture of the two modes.

To change the snooping mode you must disable IP multicast forwarding. To disable IP multicast forwarding, use the command:

```
disable ipmcforwarding {vlan <name>}
```

To change the IGMP snooping mode from the non-forward-mcrouter-only mode to the forward-mcrouter-only mode, use the commands:

```
disable ipmcforwarding
enable igmp snooping forward-mcrouter-only
enable ipmcforwarding (vlan <name>}
```

To change the IGMP snooping mode from the forward-mcrouter-only mode to the non-forward-mcrouter-only mode, use the commands:

```
disable ipmcforwarding
disable igmp snooping forward-mcrouter-only
enable ipmcforwarding (vlan <name>}
```

Example

The following command enables IGMP snooping on the switch:

```
enable igmp snooping
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable igmp snooping vlan fast-leave

enable igmp snooping {**vlan**} *name* **fast-leave**

Description

Enables the IGMP snooping fast leave feature on the specified VLAN.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

The fast leave feature operates only with IGMPv2.

To view the fast leave feature configuration, use the show configuration msmgr command. This show command displays the fast leave configuration only when the feature is enabled.

Example

The following command enables the IGMP snooping fast leave feature on the default VLAN:

```
enable igmp snooping “Default” fast-leave
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable igmp snooping with-proxy

enable igmp snooping with-proxy

Description

Enables the IGMP snooping proxy. The default setting is enabled.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer3 switch. The proxy also suppresses unnecessary IGMP leave messages so that they are forwarded only when the last member leaves the group.

This command can be used for troubleshooting purpose. It should be enabled for normal network operation. The command does not alter the snooping setting.

This feature can be enabled when IGMPv3 is enabled; however, it is not effective for IGMPv3.

Example

The following command enables the IGMP snooping proxy:

```
enable igmp snooping with-proxy
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable igmp ssm-map

enable igmp ssm-map {**vr** *vr-name*}

Description

Enables IGMP SSM mapping on a VR.

Syntax Description

vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

Disabled on all interfaces.

Usage Guidelines

Configure the range of multicast addresses for PIM SSM before you enable IGMP SSM mapping. IGMP SSM mapping operates only with IPv4.

Example

The following command enables IGMP-SSM mapping on the VR in the current CLI VR context:

```
enable igmp ssm-map
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

enable ipmcforwarding

enable ipmcforwarding {**vlan** *name*}

Description

Enables IP multicast forwarding on an IP interface.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled.

Usage Guidelines

If no options are specified, all configured IP interfaces are affected. When new IP interfaces are added, IPMC forwarding is disabled by default.

IP forwarding must be enabled before enabling IPMC forwarding.

Example

The following command enables IPMC forwarding on the VLAN accounting:

```
enable ipmcforwarding vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable mvr

enable mvr

Description

Enables MVR on the system.

Syntax Descripton

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables MVR on the system:

```
enable mvr
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable pim

enable pim

Description

Enables PIM on the system.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

None.

Example

The following command enables PIM on the system:

```
enable pim
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

 enable pim iproute sharing

enable pim {ipv4 | ipv6} iproute sharing

Description

Enables the PIM Equal Cost Multi Path (ECMP) feature.

Syntax Description

iproute	IP Route
sharing	Equal Cost Multipath Routing

Default

Disabled.

Usage Guidelines

Use this feature to allow downstream PIM router to choose multiple ECMP path to source via hash from one of the following selections without affecting the existing unicast routing algorithm:

- Source
- Group
- Source-Group
- Source-Group-Next-Hop

This feature does load splitting, not load balancing and operates on a per (S, G) basis splitting the load onto the available equal cost paths by hashing according to the selection criteria defined by the user.

Make sure that IP route sharing is also enabled using **enable iproute {ipv4| ipv6} sharing**.

Example

The following command enables the PIM ECMP feature:

```
enable pim ipv4 iproute sharing
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. All platforms except Summit X440 support IP route sharing in the ExtremeXOS 15.3.2 release. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

enable pim snooping

enable pim snooping {{**vlan**} *name*}

Description

Enables PIM snooping on one or all VLANs.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

PIM snooping does not require PIM to be enabled. However, IGMP snooping must be disabled on VLANs that use PIM snooping. PIM snooping and MVR cannot be enabled simultaneously on a switch. PIM snooping should not be enabled on a VLAN that supports PIM-DM neighbors.

Example

The following command enables PIM snooping on the default VLAN:

```
enable pim snooping default
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable pim ssm vlan

enable pim ssm vlan [*vlan_name* | **all**]

Description

Enables PIM SSM on an IP interface.

Syntax Description

vlan_name	Specifies a VLAN name.
all	Specifies all VLANs.

Default

Disabled on all interfaces.

Usage Guidelines

This command enables PIM-SSM on the specified Layer3 VLAN.

PIM-SM must also be configured on the interface for PIM to begin operating (which includes enabling IP multicast forwarding).

IGMPv3 include messages for multicast addresses in the SSM range are only processed by PIM if PIM-SSM is enabled on the interface. Any non-IGMPv3 include messages in the SSM range are not processed by PIM on any switch interface, whether SSM is enabled or not.

Example

The following command enables PIM-SSM multicast routing on VLAN accounting:

```
enable pim ssm vlan accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

mrinfo

mrinfo {*router_address*} {**from** *from_address*} {**timeout** *seconds*} {**multiple-response-timeout** *multi_resp_timeout*} {**vr** *vrname*}

Description

Requests information from a multicast router.

Syntax Description

router_address	Specifies the unicast IP address of the router for which you want information.
from_address	Specifies the unicast IP address of the interface where the mrinfo request is generated.
seconds	Specifies a maximum time to wait for a response. The range is 1 to 30 seconds.
multi_resp_timeout	Specifies a maximum time to wait for additional responses after the first response is received. The range is 0 to 3 seconds.
vrname	Specifies a VR name.

Default

router_address: One of the local interface addresses.

from: IP address of interface from which the mrinfo query is generated.

timeout: 3 seconds

multiple-response-timeout: 1 second

vr: DefaultVR

Usage Guidelines

The last column of the mrinfo command output displays information in the following format:

```
[Metric/threshold/type/flags]
```

This information is described in detail here .

Table 56: mrinfo Command Display Data

Data	Description
Metric	This should always be 1 because mrinfo queries the directly connected interfaces of a device.
Threshold	This should always be 0 because the threshold feature is not supported in ExtremeXOS software.
Type	The type specifies the multicast protocol type. Because the ExtremeXOS software only supports PIM, this value is always pim.
querier	The querier flag indicates that the queried router is the IGMP querier.
leaf	The leaf flag indicates that the IP interface has no neighbor router.
down	The down flag indicates that the interface link status is down.

Example

The following command requests information from multicast router 1.1.1.1:

```
Switch.1 # mrinfo 1.1.1.1
1.1.1.1 [Flags:PGM]
2.2.2.1 -> 2.2.2.2 [1/0/pim/querier]
1.1.1.1 -> 0.0.0.0 [1/0/pim/querier/leaf]
8.8.8.1 -> 8.8.8.4 [1/0/pim/querier]
3.3.3.1 -> 0.0.0.0 [1/0/pim/down]
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

mtrace

mtrace source *src_address* {**destination** *dest_address*} {**group** *grp_address*} {**from** *from_address*} {**gateway** *gw_address*} {**timeout** *seconds*} {**maximum-hops** *number*} {**router-alert** [**include** | **exclude**]} {**vr** *vrname*}

Description

Traces multicast traffic from the receiver back to the source.

Syntax Description

src_address	Specifies the unicast IP address of the multicast source.
dest_address	Specifies the unicast IP address of the multicast group receiver.
grp_address	Specifies the multicast IP address of the group.
from_address	Specifies the unicast IP address of the interface where the mtrace request originates. This is used as the IP destination address of the mtrace response packet.
gw_address	Specifies the gateway router IP address of the multicast router to which the unicast mtrace query is sent.
seconds	Specifies a maximum time to wait for the mtrace response before making the next attempt. The range is 1 to 30 seconds.
number	Specifies the maximum number of hops for the trace. The range is 1 to 255.
router-alert	Specifies whether the router-alert option is included or excluded in mtrace packets.
vrname	Specifies a VR name.

Default

destination: IP address of interface from which mtrace query is generated.

group: 0.0.0.0

from: IP address of interface from which mtrace query is generated.

gateway: 224.0.0.2 when the destination is in the same subnet as one of the IP interfaces. For a non-local destination address, it is mandatory to provide a valid multicast router address.

timeout: 3 seconds

maximum-hops: 32

router-alert: include

vr: DefaultVR

Usage Guidelines

The multicast traceroute initiator node generates a multicast query and waits for timeout period to expire. If there is no response for the timeout period, the initiator node makes 2 more attempts. If no

response is received after 3 attempts, the initiator node moves to a hop-by-hop trace by manipulating the maximum hop fields to perform a linear search.

The multicast trace response data contains the following fields:

- Incoming interface address—Interface on which traffic is expected from the specific source and group
- Outgoing interface address—Interface on which traffic is forwarded from the specified source and group towards the destination
- Previous hop router address
- Input packet count on incoming interface
- Output packet count on outgoing interface
- Total number of packets for this source-group pair
- Multicast routing protocol
- Forwarding code

Extreme Networks switches set the packet count statistics field to 0xffffffff to indicate that this field is not supported.

The last column of the mtrace command output displays forwarding codes, which are described in the following table.

Table 57: mtrace Command Forwarding Codes

Forwarding Code	Description
Wrong interface	mtrace request arrived on an interface to which this router would not forward for this source and group.
Prune sent upstream	This router has sent a prune request upstream for the source and group in the mtrace request.
Output pruned	This router has stopped forwarding for this source and group in response to a prune request from the next hop router.
Hit scope boundary[16]	The group is subject to administrative scoping at this hop.
No route	This router has no route for the source or group and no way to determine a potential route.
Wrong Last Hop	This router is not the proper last-hop router.
Not forwardinga	This router is not forwarding for this source and group on the outgoing interface for an unspecified reason.
Reached RP/Core	Reached rendezvous point or core.
RPF Interface	mtrace request arrived on the expected RPF interface (upstream interface) for this source and group.
Multicast disabled	mtrace request arrived on an interface which is not enabled for multicast.
Info. Hiddena	One or more hops have been hidden from this trace.
No space in packet	There was not enough room to insert another response data block in the packet.

[16] ExtremeXOS switches along the mtrace path do not provide this forwarding code.

Table 57: mtrace Command Forwarding Codes (continued)

Forwarding Code	Description
Next router no mtracea	The previous hop router does not understand mtrace requests.
Admin. Prohibiteda	mtrace is administratively prohibited.

Example

The following command initiates an mtrace for group 225.1.1.1 at IP address 1.1.1.100:

```
Switch.6 # mtrace source 1.1.1.100 group 225.1.1.1
Mtrace from 1.1.1.100 to Self via 225.1.1.1
0          34.2.2.4
-1          34.2.2.4  PIM thresh^ 0         1.1.1.100/32   RPF Interface
-2          34.2.2.3  PIM thresh^ 0         1.1.1.100/32
-3          23.1.1.2  PIM thresh^ 0         1.1.1.100/32
-4          2.2.2.1   PIM thresh^ 0         1.1.1.100/32
Round trip time 9 ms; total ttl of 4 required.
```

History

This command was first available in ExtremeXOS 12.4.

The router-alert option was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

rtlookup

rtlookup [*ipaddress* | *ipv6address*] { **unicast** | **multicast** | **rpf** } {**vr<vr_name>**}

Description

Displays the available routes to the specified IP address.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
unicast	Displays the routes from the unicast routing table in the current router context.

multicast	Displays the routes from the multicast routing table in the current router context.
rpf	Displays the RPF route to the specified destination.
vr-name	Specifies the virtual router for which to display the route.

Default

vr-name is the VR of the current CLI context.

When no option (unicast or multicast) is provided, this command displays the route in the unicast routing table.

Usage Guidelines

None.

Example

The following example displays the route lookup for 12.1.20.12 in the multicast routing table for the default VR:

```
BD10K # rtlookup 12.1.20.12 multicast vr vr-default
@mbe  12.1.0.0/16       50.1.10.21      1    UG---S--m--- toronto    0d:0h:

```

History

This command was first available in ExtremeXOS 10.1.

The xhostname option was removed in ExtremeXOS 11.0.

Support for IPv6 was added in ExtremeXOS 11.2.

The unicast and multicast options were added in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

rtlookup rpf

rtlookup [*ipaddress* | *ipv6address*] **rpf** {**vr** *vr_name*}

Description

Displays the RPF for a specified multicast source.

Syntax Description

ipaddress	Specifies an IPv4 address.
ipv6address	Specifies an IPv6 address.
rpf	Selects the RPF for the specified multicast source.
vr-name	Specifies the virtual router for which to display the route.

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

None.

Example

The following example displays the RPF lookup for multicast source 12.1.20.12 in the default VR:

```
BD10K # rtlookup 12.1.20.12 rpf vr vr-default
Ori Prefix          Route              Gateway         VLAN
@d  12.1.10.22      12.1.10.0/24       12.1.10.10      v1
Origin(Ori): (b) BlackHole, (be) EBGP, (bg) BGP, (bi) IBGP, (bo) BOOTP
(ct) CBT, (d) Direct, (df) DownIF, (dv) DVMRP, (e1) ISISL1Ext
(e2) ISISL2Ext, (h) Hardcoded, (i) ICMP, (i1) ISISL1 (i2) ISISL2
(mb) MBGP, (mbe) MBGPExt, (mbi) MBGPInter, (mp) MPLS Lsp
(mo) MOSPF (o) OSPF, (o1) OSPFExt1, (o2) OSPFExt2
(oa) OSPFIntra, (oe) OSPFAsExt, (or)OSPFInter, (pd) PIM-DM,(ps) PIM-SM
(r) RIP, (ra) RtAdvrt, (s) Static, (sv) SLB_VIP, (un) UnKnown
(*) unicast route (@) multicast route
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp

show igmp {vlan} {*vlan* name>}

Description

This command can be used to display an IGMP-related configuration and group information, per VLAN.

Syntax Description

vlan name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

The output of this command shows:

- The VLAN name.
- The router interface IP address and subnet mask.
- If the interface is active (up), by the letter U.
- If IP forwarding is enabled for the interface, by the letter f.
- If multicast forwarding is enabled, by the letter M.
- If IGMP is enabled, by the letter i.
- If IGMP snooping is enabled, by the letter z.

Example

The following command displays the IGMP configuration:

```
show igmp
VLAN                IP Address           Flags     nLRMA  nLeMA IGMPver
Default             0.0.0.0        / 0   ---izpt-      0      0       3
isc                 50.50.50.1     /24   ---izpt-      0      0       3
v1                  0.0.0.0        / 0   U--izpt-      0      2       3
```

```
v3000               1.1.1.1        /24   ---izpt-      0      0       3
v666                6.0.0.1        /16   ---izpt-      0      0       3
Flags: (f) Forwarding Enabled, i) IGMP Enabled
(m) Multicast Forwarding Enabled, (p) IGMP Proxy Query Enabled
(r) Receive Router Alert Required (t) Transmit Router Alert
(U) Interface Up, (z) IGMP Snooping Enabled
(nLeMA) Number of Learned Multicast Addresses
(nLRMA) Number of Locally Registered Multicast Addresses
```

The following command displays the IGMP configuration for VLAN vlan1:

```
show igmp vlan1
Query Interval    :    125 sec
Max Response Time :     10 sec
Last Member Query :      1 sec
Robustness        :      2
Interface on VLAN vlan1 is enabled and up.
inet 0.0.0.0/0
Locally registered multicast addresses:
Learned multicast addresses(Last Querier=118.1.1.100):
224.0.0.2          224.0.0.22
s = static igmp member
Flags:
IP Fwding  NO       IPmc Fwding  NO            IGMP YES
IGMP Ver  V3          Snooping YES     Proxy Query YES
XmitRtrAlrt YES     RcvRtrAlrtReq  NO
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp group

show igmp group {{**vlan**} {*name*} | {*grpipaddress*}} {**IGMPv3**}

Description

Lists the IGMP group membership for the specified VLAN.

Syntax Description

grpipaddress	Specifies a group IP address.
name	Specifies a VLAN name.
IGMPv3	Display the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise display in earlier format).

Default

IGMPv2.

Usage Guidelines

If no VLAN is specified all VLANs are displayed. You can also filter the display by group address and by multicast stream sender address.

The output of this command shows:

- The multicast group address received.
- The version of the IGMP group.
- The name of the VLAN where the group address is being received.
- The physical port where the group address is being received. If multiple ports within the VLAN have subscribers for the group, all the ports are listed.
- The age since the last IGMP report for this group was received.

Note

The show igmp group command output is populated on the router that is the PIM Rendezvous Point.

Example

The following command lists the IGMP group membership:

```
show igmp group
```

The following is sample output from this command:

```
Group Address      Ver Vlan                 Port      Age
239.2.4.70         2   banana               7         101
224.0.1.24         2   banana               7         107
239.255.255.254    2   banana               7         103
Total: 3
```

History

This command was first available in ExtremeXOS 10.1.

The IGMPv3 option was added in ExtremeXOS 11.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp snooping

show igmp snooping {detail {IGMPv3}}

Description

Displays IGMP snooping registration information for all VLANs.

Syntax Description

detail	Displays the information in detailed format.
IGMPv3	Display the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise display in earlier format).

Default

IGMPv2.

Usage Guidelines

None.

Example

The following command displays IGMP snooping registration information for all VLANs:

```
show igmp snooping
Igmp Snooping Flag            : forward-all-router
Igmp Snooping Flood-list      : none
Igmp Snooping Proxy           : Disable
Igmp Snooping Filters         : per-port
Vlan             Vid  Port   #Senders #Receivers Router Enable
-------------------------------------------------------------
Default          1           0                         Yes
v1               4090        0                         Yes
```

History

This command was first available in ExtremeXOS 10.1.

The IGMP Forwding Lookup mode output was removed from this command in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp snooping cache

This command is provided for backward compatibility. The recommended command is:

show mcast cache {{**vlan**} *name*} {{[**group** *grpaddressMask* | *grpaddressMask*] {**source** *sourceIP* | *sourceIP*}} {**type** [**snooping** | **pim** | **mvr**]}| {**summary**}}

The syntax for the original form of this command is:

show igmp snooping cache {{**vlan**} *name*} {{**group**} *grpaddressMask*}

Description

Displays multicast cache entries added by IGMP snooping for all VLANs and groups. The display can be limited to specific VLANs or groups.

Syntax Description

name	Specifies a VLAN name.
grpaddressMask	Specifies a multicast group address and mask.

Default

Displays information for all VLANs and groups.

Usage Guidelines

None.

Example

The following command displays IGMP snooping cache information for all VLANs and groups:

```
BD-8808.2 # show igmp snooping cache
```

This command display is the same as for the following preferred command:

```
        show mcast cache {{vlan} <name>} {{[group <grpaddressMask> |
<grpaddressMask>] {source <sourceIP> | <sourceIP>}} {type [snooping | pim |
mvr]}| {summary}}
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

show igmp snooping vlan

show igmp snooping {**vlan**} *name* {**port** *port*} {**IGMPv3**}

Description

Displays IGMP snooping registration information for a specific VLAN. The display can be further limited to a specific port or to only IGMPv3 entries.

Syntax Description

name	Specifies a VLAN name.
port	Specifies a single port for which information is displayed.
IGMPv3	Display the IGMP group in IGMPv3 format (if group record is IGMPv3 compatible, otherwise display in earlier format).

Default

IGMPv2.

Usage Guidelines

The two types of IGMP snooping entry are sender entry and subscribed entry.

The following information is displayed in a per-interface format:

- Group membership information
- Router entry

- Timeout information
- Sender entry

Example

The following command displays IGMP snooping registration information on VLAN v1:

```
show igmp snooping vlan v1
Router Timeout                :    260 sec
Host Timeout                  :    260 sec
Igmp Snooping Fast Leave Time :   1000 ms
VLAN v1 d              (4084) Snooping=Enabled
Port   Host            Subscribed        Age    Group-Limit
25     118.1.1.100     All Groups        3      0
```

The following command displays IGMP snooping registration information for port 2:1 on VLAN test:

```
show igmp snooping test port 2:1
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp snooping vlan filter

show igmp snooping {**vlan**} *name* **filter**

Description

Displays IGMP snooping filters.

Syntax Description

name	Specifies a VLAN name.

Default

None.

Usage Guidelines

Use this command to display IGMP snooping filters configured on the specified VLAN. When no VLAN is specified, all the filters are displayed.

Example

The following command displays the IGMP snooping filter configured on VLAN vlan101:

```
show igmp snooping vlan101 filter
Filter           Port Flags
igmppermit0      5:10 a
Flags: (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp snooping vlan static

show igmp snooping {**vlan**} *name* **static** [**group** | **router**]

Description

Displays static IGMP snooping entries.

Syntax Description

name	Specifies a VLAN name.
group	Displays static multicast groups.
router	Displays static router entries.

Default

None.

Usage Guidelines

Use this command to display the IGMP snooping static groups or router ports configured on the specified VLAN. When no VLAN is specified, all the static groups or router ports are displayed.

Example

The following command displays the IGMP snooping static groups configured on VLAN vlan101:

```
show igmp snooping vlan101 static group
VLAN vlan101 (4094)
Group            Port   Flags
239.1.1.2        29      s-
239.1.1.2        30      s-
239.1.1.2        31      sa
239.1.1.2        32      s-
239.1.1.2        34      s-
Total number of configured static IGMP groups = 5
Flags: (s) Static, (a) Active
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show igmp ssm-map

show igmp ssm-map {*group_ip*} {**vr** *vr-name*}

Description

Displays the IGMP SSM feature status (enabled or disabled), the mappings for the specified multicast group IP address, and the total count of maps.

Syntax Description

group_ip	Specifies an IP multicast group, for which all mappings in the PIM SSM range are to be displayed. If no group address is specified, the switch displays all IGMP-SSM mappings.
vr-name	Specifies a virtual router name. If the VR name is omitted, the switch displays the mappings on the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

When a target group is specified, this command displays all mapping entries for the configured range in which the group IP address resides.

Example

The following command displays the mappings for the multicast group IP address 232.1.1.2:

```
show igmp ssm-map 232.1.1.2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements..

show ipmroute

show ipmroute {*source-net*>/<*mask-len* | *source-net mask* | **summary**} {**vr** *vr-name*}

Description

Displays the contents of the IP multicast routing table or the route origin priority.

Syntax Description

source-net	Specifies an IP address/mask length.
mask-len	Mask length for the IP multicast source's subnet. Range is [1-32].
mask	Specifies a subnet mask.
summary	Displays the statistics of multicast static routes.
vr-name	Specifies the virtual router to which the route is added.

Default

vr-name is the VR of the current CLI context.

Usage Guidelines

This command allows you to view the configured multicast static routes. You can specify the filtering criteria on this CLI to view only the desired route. The multicast static routes are displayed in ascending order of their prefix (same order as show iproute displays).

Example

The following example displays a multicast static route from a default virtual router:

```
* (debug) Summit-PC.19 # show ipmroute
Destination        Gateway         Mtr  Flags Protocol         VLAN
Default Route      20.20.20.1      255  UG    None             pc4-1
*1.1.0.0/16         20.20.20.1      10   UG    bgp               pc4-1
*11.0.0.0/8         30.30.30.1      12   U-    None              pc5-3
11.22.0.0/16       20.20.20.1      10   UG    None             pc4-1
*11.22.33.0/24      30.30.30.1      8    U-    None              pc5-3
11.22.33.44/32     20.20.20.1      4    UG    None             pc4-1
*12.0.0.0/8         20.20.20.1      0    UG    None              pc4-1
12.24.0.0/16       30.30.30.1      0    U-    None             pc5-3
*12.24.48.96/32     30.30.30.1      2    U-    ospf-extern1      pc5-3
44.66.0.0/16       30.30.30.1      0    U-    None             pc5-3
Flags: (*) Active, (G) Gateway,  (U) Up
Mask distribution:
1 default routes               2 routes at length  8
4 routes at length 16          1 routes at length 24
2 routes at length 32
Total number of multicast static routes = 10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show iproute multicast

show iproute {**ipv4**} {{**vlan**} *name* | [*ipaddress netmask* | *ipNetmask*] | **origin** [**direct** | **static** | **mbgp** | **imbgp** | **embgp**]} **multicast** {**vr** *vr_name*}

Description

Displays all or a filtered set of multicast routes in the IP multicast routing table.

Syntax Description

ipv4	Selects only IPv4 multicast routes.
name	Specifies a VLAN for which to display multicast routes.
ipaddress netmask	Specifies an IP address and network mask (in dotted decimal notation) for which to display multicast routes.
ipNetmask	Specifies the IP address and network mask in classless inter domain routing (CIDR) notation.
origin	Limits the displayed multicast routes to those generated by the specified origin. Origin options select direct routes, static routes, and routes created by the MBGP, IMBGP, and EMBGP protocols.
v_name	Specifies the virtual router for which to display multicast routes.

Default

vr_name is the VR of the current CLI context.

Usage Guidelines

This command does not display unicast routes, which can be used for multicast traffic.

Example

The following example displays all the routes in multicast routing table:

```
BD10K # show iproute multicast
Ori   Destination        Gateway         Mtr  Flags        VLAN       Duration

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show L2stats

show L2stats {**vlan** *vlan_name*}

Description

Displays the counters for the number of packets bridged, switched, and snooped (Layer2 statistics).

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

None.

Example

The following command displays the counters for the number of packets bridged, switched, and snooped (Layer2 statistics) for the VLAN accounting:

```
show L2stats accounting
```

Note

You can also enter the command as show l2stats. We use the uppercase letter here to avoid confusion with the numeral 1.

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

show mcast cache

The display can be limited to entries for specific VLANs or groups, and it can be limited to specific types of entries, such as those created by snooping protocols, PIM, or MVR.

show mcast cache {{**vlan**} *name*} {{[**group** *grpaddressMask* | *grpaddressMask*] {**source** *sourceIP* | *sourceIP*}} {**type** [**snooping** | **pim** | **mvr**]}| {**summary**}}

Description

Displays multicast cache information.

Syntax Description

name	Specifies a VLAN name.
grpaddressMask	Specifies a multicast group address and mask.
sourceIP	Specifies the source IP address for a multicast group.
snooping	Limits the display to cache entries created by PIM or IGMP snooping.

pim	Limits the display to cache entries created by PIM.
mvr	Limits the display to cache entries created by MVR.
summary	Specifies the summary display format.

Default

Displays information for all entries in the multicast cache.

Usage Guidelines

If the `configure forwarding ipmc lookup-key mac-vlan` command is configured, the following message is displayed:

```
NOTE: Traffic is forwarded based on MAC address. Actual traffic forwarded
based on the installed MAC address need not be the same displayed in this
command, if overlapping IP multicast addresses are used in the network.
```

If the mode is **mixed-mode**, the following message is displayed:

```
NOTE: Traffic could be forwarded based on MAC address. Actual traffic
forwarded based on the installed MAC address need not be the same
displayed in this command, if overlapping IP multicast addresses are used
in the network.
```

Example

The following command displays all multicast cache information:

```
show mcast cache
Snooping/MVR Cache Timeout: 300 sec
Type Group              Sender                Age  InVlan
snoop 225.1.1.1          222.222.222.222       17   snvlan
Vlan              Port         Vid
snvlan            2            400
23          400
snoop 224.0.0.5          100.1.2.2             2    pmvlan2
Vlan              Port         Vid
pmvlan2           4            402
snoop 224.0.0.5          100.1.3.3             17   pmvlan3
Vlan              Port         Vid
pmvlan3           23           403
snoop 224.0.0.13         100.1.2.2             11   pmvlan2
Vlan              Port         Vid
pmvlan2           4            402
snoop 224.0.0.13         100.1.3.3             14   pmvlan3
Vlan              Port         Vid
pmvlan3           23           403
pim 226.1.1.1            100.1.1.12            0    pmvlan1
Vlan              Port         Vid
pmvlan2           4            402
pmvlan3           23           403
```

```
Multicast cache distribution:
5 entries from Snooping          0 entries from MVR          1 entries from
PIM
Total Cache Entries: 6
```

The following command displays summary cache information for VLAN pmvlan1:

```
show mcast cache vlan pmvlan1 summary
Snooping/MVR Cache Timeout: 300 sec
==============MULTICAST CACHE SUMMARY==============
Multicast cache distribution:
5 entries from Snooping          0 entries from MVR          1 entries from
PIM
pmvlan1: Multicast cache distribution:
0 entries from Snooping          0 entries from MVR          1 entries from
PIM
Total Cache Entries: 6
Total Cache Entries for VLAN pmvlan1: 1
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show mvr

show mvr {**vlan** *vlan_name*}

Description

Displays the MVR configuration on the switch.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If a VLAN is specified, information for the VLAN is displayed.

Example

The following command displays the MVR configuration for the VLAN accounting:

```
show mvr accounting
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show mvr cache

This command is provided for backward compatibility. The recommended command is:

show mcast cache {{**vlan**} *vlan_name*} {{[**group** *grpaddressMask* | *grpaddressMask*] {**source** *sourceIP* | *sourceIP*}} {**type** [**snooping** | **pim** | **mvr**]}| {**summary**}}

The syntax for the original form of this command is:

show mvr cache {**vlan***vlan_name*}

Description

Displays the multicast cache entries added by MVR.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If no VLAN is specified, information for all the VLANs is displayed.

Example

The following command displays the multicast cache in the MVR range for the VLAN vlan110:

```
Switch.78 # show mvr cache vlan110
```

This command display is the same as for the following preferred command:

```
                show mcast cache {{vlan} <name>} {{[group <grpaddressMask> |
<grpaddressMask>] {source <sourceIP> | <sourceIP>}} {type [snooping | pim |
mvr]}| {summary}}
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MVR feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

show pim

show pim {**ipv4** | **ipv6** | **detail** | **rp-set** {*group_addr*} | **vlan** *vlan_name*}

Description

Displays the PIM configuration and statistics.

Syntax Description

ipv4	Displays PIM IPv4 configuration information.
ipv6	Displays PIM IPv6 configuration information.
detail	Displays show output in the detailed format.
group_addr	Specifies an IP multicast group, for which the RP is to be displayed.
vlan_name	Specifies a VLAN name.

Default

IPv4 is the default for the **show pim {ipv4 | ipv6}** command.

If no VLAN is specified, the configuration is displayed for all PIM interfaces.

If no multicast group is specified for the rp-set option (Rendezvous Point set), all RPs are displayed.

Usage Guidelines

The detail version of this command displays the global statistics for PIM, as well as the details of each PIM enabled VLAN.

Example

The following command displays the global PIM configuration and statistics:

```
Switch. 14 # show pim
PIM Enabled, Version 2

History

This command was first available in ExtremeXOS 10.1.

The PIM-SSM information was added in ExtremeXOS 11.4.

Border VLAN information was added in ExtremeXOS 12.0.

The **ipv6** keyword was added to PIM Register Policy Filter feature in ExtremeXOS 15.3.

DR Priority output was added in ExtremeXOS 15.3.2.

IP Route Sharing output was added in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see Feature License Requirements in the ExtremeXOS Concepts Guide.

show pim cache

show pim cache {{**detail**} | {**state-refresh**} {**mlag-peer-info**} {*group_addr* {*source_addr*}}}

Description

Displays the multicast cache entries created by PIM.

Syntax Description

detail	Specifies to display the information in detailed format.
group_addr	Specifies an IP group address.
source_addr	Specifies an IP source address.
state-refresh	Specifies to display the PIM cache entries with state refresh parameters.
mlag-peer-info	Shows MLAG peer related information

Default

N/A.

Usage Guidelines

Displays the following information:

- IP group address
- IP source address / source mask
- Upstream neighbor (RPF neighbor)
- Interface (VLAN) to upstream neighbor
- Cache expire time
- Egress and prune interface list

When the detail option is specified, the switch displays the egress VLAN list and the pruned VLAN list.

Example

The following command displays the PIM cache entry for group 239.255.255.1:

```
Switch.33 # show pim cache 239.255.255.1
Index  Dest Group      Source             InVlan   Origin
[0000] 239.255.255.1   124.124.124.124 (WR) v4    Sparse
Entry timer is not run; UpstNbr: 200.124.124.24
EgressIfList =  vbs15(0)(FW)(SM)(I)
[0001] 239.255.255.1   118.5.1.1 (S)      vbs5  Sparse
Expires after 186 secs UpstNbr: 0.0.0.0
RP: 124.124.124.124 via 200.124.124.24 in v4
EgressIfList =  vbs15(0)(FW)(SM)(I) , vpim5(170)(FW)(SM)(S)
PrunedIfList =  v4(0)(SM)
Number of multicast cache = 20
Entry flags :-
R: RP tree. S: Source tree. W: Any source.
Egress/Pruned interface flags :-
SM: Sparse Mode           DM: Dense Mode
Fw: Forwarding            PP: Prune pending
AL: Assert Loser           N: Neighbor present
I: IGMP member present    S: (s,g) join received
Z: (*,g) join received    Y: (*,*,rp) join received
```

The following command displays the PIM-DM cache entry with state-refresh information for group 225.0.0.1:

```
Switch.5 # show pim cache state-refresh 225.0.0.1
Index  Dest Group      Source             InVlan   Origin
[0001] 225.0.0.1       64.1.1.100 (S)     vixia    Dense   Not Pruned
Expires after 204 secs UpstNbr: 0.0.0.0
Refresh State: Originator(20), TTL: 16
EgressIfList =  v36(0)(FW)(DM)(N)
[0001] 225.0.0.1       65.1.1.100 (S)     vixia    Dense   Not Pruned
Expires after 195 secs UpstNbr: 65.1.1.200
Refresh State: Not-Originator(25), TTL: 8
EgressIfList =  v36(0)(FW)(DM)(N)
```

The following command displays the ingress VLAN information of all MLAG peers.

```
Switch.5 # show pim cache mlag-peer-info
Index  Dest Group      Source             InVlan   Origin
[0001] 225.0.0.1       64.1.1.100 (S)     vixia    Sparse
Expires after 210 secs UpstNbr: 0.0.0.0
[S1] Peer Ingress VLAN: 1.1.1.1/24 (Same)
EgressIfList =  v36(0)(FW)(DM)(I)
```

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 15.2 to display MLAG peer information.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show pim snooping

show pim snooping {**vlan**} *name*

Description

Displays the PIM snooping configuration for a VLAN.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

None.

Example

The following command displays the PIM snooping configuration for the default VLAN:

```
BD-8810Rack3.8 # show pim snooping default
Global PIM Snooping DISABLED
Default         Snooping DISABLED
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure igmp

unconfigure igmp

Description

Resets all IGMP settings to their default values and clears the IGMP group table.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all IGMP settings to their default values and clears the IGMP group table:

```
unconfigure igmp
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure igmp snooping vlan ports set join-limit

unconfigure igmp snooping {**vlan**} *vlan_name* **ports** *port_list* **set join-limit**

Description

Removes the join limit set on VLAN ports.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports.

Default

No limit.

Usage Guidelines

None.

Example

The following command removes the join limit for port 2:1 in the Default VLAN:

```
unconfigure igmp snooping “Default” ports 2:1 set join-limit
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IGMP snooping feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure igmp ssm-map

unconfigure igmp ssm-map {*v vr-name*}

Description

Unconfigures all SSM mappings on the virtual router.

Syntax Description

vr-name	Specifies a virtual router name. If the VR name is omitted, the switch uses the VR specified by the current CLI VR context.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes all IGMP-SSM mappings on the virtual router xyz:

```
unconfigure igmp ssm-map vr xyz
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure pim

unconfigure pim {**ipv4** | **ipv6**} {**vlan** *vlan_name*} | {**tunnel**} *tunnel_name*] **border**

Description

Resets all PIM settings on an IPv4 or IPv6 module, or on one or all VLANs, to their default values.

Syntax Description

vlan_name	Specifies the VLAN from which PIM is to be unconfigured.
ipv4	Specifies the ipv4 module from which PIM is to be unconfigured.
ipv6	Specifies the ipv6 module from which PIM is to be unconfigured.
tunnel	Specifies the tunnel which PIM is to be unconfigured.
tunnel_name	Specifies the tunnel name.
border	Specifies the border.

Default

If no VLAN is specified, the configuration is reset for all PIM interfaces.

Usage Guidelines

If you unconfigure PIM, you also unconfigure PIM-SSM, removing the PIM-SSM range.

Example

The following command resets all PIM settings on the VLAN accounting:

```
unconfigure pim vlan accounting
```

History

This command was first available in ExtremeXOS 10.1.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure pim ssm range

unconfigure pim {ipv4 | ipv6} ssm range

Description

Unconfigures the range of multicast addresses for PIM SSM.

Syntax Description

ipv4	Configures PIM functionality on IPv4 router interfaces.
ipv6	Configures PIM functionality on IPv6 router interfaces.

Default

By default, no SSM range is configured.

Usage Guidelines

You must disable PIM before configuring or unconfiguring a PIM-SSM range. Use the disable pim command.

Initially, no range is configured for SSM. After a range is configured, you can remove the range with the unconfigure pim ssm range command.

When no range is configured for PIM SSM, the switch does not use PIM SSM for any multicast groups.

Example

The following command removes the PIM SSM range:

```
unconfigure pim ssm range
```

History

This command was first available in ExtremeXOS 11.4.

The **ipv4** and **ipv6** keywords were added giving an option to support this functionality in IPv6 as well, in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

44 IPv6 Multicast Commands

This chapter describes commands for doing the following:

- Configuring IPv6 multicast routing
- Displaying IPv6 multicast information

For an introduction to the IPv6 multicast feature, see the *ExtremeXOS Concepts Guide*.

This chapter contains information about the following commands:

- clear mld counters
- clear mld group
- clear mld snooping
- configure mld
- configure mcast ipv6 cache timeout
- configure mld snooping fast-learning
- configure mld snooping filters
- configure mld snooping vlan ports add static group
- configure mld snooping vlan ports delete static group
- configure mld snooping vlan ports add static router
- configure mld snooping vlan ports delete static router
- configure mld snooping vlan ports delete static group
- configure mld snooping vlan ports join-limit
- configure mld snooping flood-list
- configure mld snooping leave-timeout
- configure mld snooping timer
- disable mld
- disable mld snooping
- enable mld
- enable mld snooping
- enable mld snooping with-proxy
- show mcast ipv6 cache
- show mld
- show mld counters
- show mld group
- show mld snooping
- show mld snooping vlan filter
- show mld snooping vlan static
- unconfigure mld

For an introduction to the IPv6 multicast feature, see the Multicast Routing Overview in the *ExtremeXOS Concepts Guide*.

clear mld counters

clear mld counters {**vlan**} *vlan_name*}

Description

Clears MLD statistics counters.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to manually clear MLD statistics counters.

Example

The following example clears all MLD counters for all VLANs:

```
clear mld counters
```

If a VLAN is specified, only the counters on the specific VLAN is cleared.

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

clear mld group

clear mld group {*v6grpipaddress*} {{**vlan**} *name*}

Description

Removes one or all MLD groups.

Syntax Description

name	Specifies a VLAN name.
v6grpipaddress	Specifies the group IP address.

Default

N/A.

Usage Guidelines

This command is used to manually remove learned MLD group entries instantly.

Example

The following command clears all MLD groups from VLAN accounting:

```
clear mld group accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

clear mld snooping

clear mld snooping {{**vlan**} *name*}

Description

Removes one or all MLD snooping entries.

Syntax Description

name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

This command can be used by network operations to manually remove MLD snooping entries instantly. However, removing an MLD snooping entry can disrupt the normal forwarding of multicast traffic, until the snooping entries are learned again.

The static and dynamic MLD snooping entries are removed, then recreated upon the next general query. The static router entry is removed and recreated immediately.

Example

The following command clears MLD snooping from VLAN accounting:

```
clear mld snooping accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld

configure mld *query_interval query_response_interval last_member_query_interval* {*robustness*}

Description

Configures the Multicast Listener Discovery (MLD) timers.

Syntax Description

query_interval	Specifies the interval (in seconds) between general queries.
query_response_interval	Specifies the maximum query response time (in seconds).
last_member_query_interval	Specifies the maximum group-specific query response time (in seconds).
robustness	Specifies the degree of robustness for the network.

Default

- query interval—125 seconds
- query response interval—10 seconds
- last member query interval—1 second
- robustness—2

Usage Guidelines

Timers are based on RFC2710. Specify the following:

- query interval—The amount of time, in seconds, the system waits between sending out general queries. The range is 1 to 429,496,729 seconds.
- query response interval—The maximum response time inserted into the periodic general queries. The range is 1 to 25 seconds.
- last member query interval—The maximum response time inserted into a group-specific query sent in response to a leave group message. The range is 1 to 25 seconds.
- robustness—The degree of robustness of the network. The range is 2 to 7.

Example

The following command configures the MLD timers:

```
configure mld 100 5 1 3
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mcast ipv6 cache timeout

configure mcast ipv6 cache timeout {*seconds* | **none**}

Description

Configures the IPv6 multicast cache timeout.

Syntax Description

seconds	Idle time after which cache entries are deleted.
none	Cache entries are not timed out.

Default

300 seconds

Usage Guidelines

Cache timeout is the time after which the cache entries are deleted, if traffic is not received for that duration. The applies only for snooping and MVR caches and does not apply for PIM caches.

The range is 90 to 100000 seconds. You can use the option none if you do not want the cache entry to be deleted. If none is configured, the cache entries could be deleted only using the following command:

```
clear igmp snooping
```

Example

```
configure mcast ipv6 cache timeout 400
configure mcast ipv6 cache timeout none
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, “Feature License Requirements”.

configure mld snooping fast-learning

configure mld snooping fast-learning [on | off] [vlan *vlan_name*]

Description

Configures fast-learning mode.

Syntax Description

vlan_name	Specifies a vlan name

Default

off

Usage Guidelines

When MLD snooping is enabled on a VLAN, learning of group entries will happen only when the next periodic query is sent by the querier in the network. When fast-learning is turned on using this command, a general is sent under the following conditions:

- When MLD snooping is enabled.
- When MLD snooping VLAN is operationally up.

- Group join limit changed through configuration.

Query generated for faster learning uses unspecified address as the source address (both L2 and L3), unless the switch generating the triggered query is the querier for the network.

Example

```
configure mld snooping fast-learning on
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

configure mld snooping filters

configure mld snooping filters [per-port | per-vlan]

Description

Selects the type of MLD snooping filters that are installed.

Syntax Description

per-port	Installs the per-port MLD snooping filters
per-vlan	Installs the per-VLAN MLD snooping filters

Default

per-port

Usage Guidelines

This command applies only to Summit family switches and BlackDiamond 8800 series switches.

Use the per-vlan option when the number of VLANs configured on the switch is lower than half of the maximum numbers listed in Table 60Table60. This option conserves usage of the hardware Layer 3 multicast forwarding table.

When the number of configured VLANs is larger than half of the maximum values listed in Table 60Table60, select the per-port option. Each VLAN requires additional interface hardware ACL resources. The per-port option conserves usage of the interface hardware ACL resources.

To display the MLD snooping filters configuration, use the show mld snooping command.

Example

The following command configures the switch to install the per-VLAN MLD snooping filters:

```
configure mld snooping filters per-vlan
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

configure mld snooping vlan ports add dynamic group

configure mld snooping {**vlan**} *vlan_name* {**ports** *portlist*} **add dynamic group** [**v4group** | **v6group**]

Description

Configures an MLD dynamic group.

Syntax Description

vlan_name	Specifies a vlan name.
portlist	Specifies a port list.
v4group	Specifies a version 4 group.
v6group	Specifies a version 6 group.

Default

N/A.

Usage Guidelines

This command is not saved in the configuration. The following message is displayed on execution of this command:**INFO: This command is not saved in the configuration.**

Example

```
show mcast cache
Snooping/MVR Cache Timeout: 300 sec

Type Group             Sender               Age  InVlan

pim   225.1.1.1         20.20.20.50          0    v1
      Vlan             Port        Vid
      v1               1           10
      v3               Lpbk        4088

snoop 224.0.0.5         10.10.10.1           21   v1
      Vlan            Port        Vid
      v1              1           10       snoop 224.0.0.13
10.10.10.1           21   v1         Vlan
          Port        Vid         v1
          1           10       Multicast cache
        distribution:        2 entries from Snooping           0 entries from
MVR           1 entries from PIM           Total Cache Entries: 3
```

History

This command was first available in ExtremeXOS 15.3.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv4 multicast feature, see Feature License Requirements in the the ExtremeXOS Concepts Guide.

configure mld snooping vlan ports add static group

configure mld snooping {**vlan**} *vlan_name* {**ports** *port_list* }**add static group** *v6grpipaddress*

Description

Configures VLAN ports to receive the traffic from a multicast group, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a modular switch, it can be a list of slots and ports. On a stand-alone switch, it can be one or more port numbers. In the form 1, 2, 3-5, 2:5, 2:6-2:8.
v6grpipaddress	Specifies the multicast group IPv6 address.

Default

None.

Usage Guidelines

Use this command to forward a particular multicast group to VLAN ports. In effect, this command emulates a host on the port that has joined the multicast group. As long as the port is configured with the static entry, multicast traffic for that multicast group is forwarded to that port.

The switch sends proxy MLD messages in place of those generated by a real host. The proxy messages use the VLAN IPv6 address for source address of the messages. If the VLAN has no IPv6 address assigned, the proxy MLD message uses 0::0 as the source IP address.

Example

The following command configures a static MLD entry so the multicast group ff02::1:1 is forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 add static group ff02::1:1
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld snooping vlan ports delete static group

configure mld snooping {**vlan**} *vlan_name* **ports** *port_list* **delete static group**[**all** | *v6grpipaddress*]

Description

Removes the configuration that causes VLAN ports to receive the traffic from a multicast group, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a modular switch, it can be a list of slots and ports. On a stand-alone switch, it can be one or more port numbers. In the form 1, 2, 3-5, 2:5, 2:6-2:8.
all	Specifies all multicast groups.
v6grpipaddress	Specifies the multicast group IPv6 address.

Default

None.

Usage Guidelines

Use this command to delete a static group from a particular VLAN port.

To add a static group, use the following command:

```
configure mld snooping {vlan} <vlan_name> ports <port_list> add static
group <v6grpipaddress> configure mld snooping {vlan} <vlanname> ports
<port_list> add static group <v6grpipaddress>
```

Example

The following command removes a static MLD entry so the multicast group ff02::a:b is not forwarded to VLAN marketing on ports 2:1-2:4, unless an MLD join message is received on the port:

```
configure mld snooping marketing ports 2:1-2:4 delete static group ff02::a:b
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements.

configure mld snooping vlan ports add static router

configure mld snooping {**vlan**} *vlan_name* **ports** *port_list* **add static router**

Description

Configures VLAN ports to forward the traffic from all multicast groups, even if no MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a modular switch, it can be a list of slots and ports. On a stand-alone switch, it can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

None.

Usage Guidelines

Use this command to forward all multicast groups to the specified VLAN ports. In effect, this command emulates a multicast router attached to those ports. As long as the ports are configured with the static entry, all available multicast traffic is forwarded to those ports.

Example

The following command configures a static MLD entry so all multicast groups are forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 add static router
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld snooping vlan ports delete static router

configure mld snooping {vlan} *vlan_name* **ports** *port_list* **delete static router**

Description

Configures VLAN ports to stop forwarding the traffic from all multicast groups, unless MLD joins have been received on the port.

Syntax Description

vlan_name	Specifies a VLAN name.
port_list	Specifies one or more ports or slots and ports. On a modular switch, it can be a list of slots and ports. On a stand-alone switch, it can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.

Default

None.

Usage Guidelines

Use this command to remove the configuration that forwards all multicast groups to the specified VLAN ports.

Example

The following command removes a static MLD entry so all multicast groups are not forwarded to VLAN marketing on ports 2:1-2:4, unless an MLD join is received on the port:

```
configure mld snooping marketing ports 2:1-2:4 delete static router
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld snooping vlan ports filter

configure mld snooping vlan *vlan_name* **ports** *port_list* **filter** [*policy*]

Description

Configures a MLD snooping policy file filter on VLAN ports.

Syntax Description

vlan_name	Specifies a VLAN name
port_list	Specifies one or more ports or slots and ports. On a modular switch, can be a list of slots and ports. On a standalone switch, can be one or more port numbers. May be in the form 1, 2, 3-5, 2:5, 2:6-2:8.
policy	Specifies the policy file for the filter.

Default

None.

Usage Guidelines

Use this command to filter multicast groups to the specified VLAN ports.

The policy file used by this command is a text file that contains the IPv6 multicast addresses of the multicast groups that you wish to block.

To remove MLD snooping filtering from a port, use the none keyword version of the command.

Use the following template to create a snooping filter policy file:

```
#
# Add your group addresses between "Start" and "end"
# Do not touch the rest of the file!!!!
entry mldFilter {
if match any {
#------------------ Start of group addresses ------------------
nlri FF03::1/128;
nlri FF05::1/112;
#------------------- end of group addresses -------------------
} then {
deny;
}
}
entry catch_all {
if {
} then {
permit;
}
```

Example

The following command configures the policy file ap_multicast to filter multicast packets forwarded to VLAN marketing on ports 2:1-2:4:

```
configure mld snooping marketing ports 2:1-2:4 filter ap_multicast
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see Feature License Requirements.

configure mld snooping vlan ports join-limit

configure mld snooping {vlan} *vlan_name* **ports** *port_list* **join-limit** [*num_joins* | **no-limit**]

Description

Configures VLAN ports to support a maximum number of MLD joins.

Syntax Description

vlan_name	Specifies a VLAN name
port_list	Specifies one or more ports or slots and ports.
num	Specifies the maximum number of joins permitted on the ports. The range is 1 to 5000.

Default

No limit.

Usage Guidelines

None.

Example

The following command configures port 2:1 in the Default VLAN to support a maximum of 100 MLD joins:

```
configure mld snooping "Default" ports 2:1 join-limit 100
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see Feature License Requirements.

configure mld snooping flood-list

configure mld snooping flood-list [*policy* | **none**]

Description

Configures certain multicast addresses to be slow path flooded within the VLAN.

Syntax Description

policy	Specifies a policy file with a list of multicast addresses to be handled.
none	Specifies no policy file is to be used.

Default

None.

Usage Guidelines

With this command, a user can configure certain multicast addresses to be slow path flooded within the VLAN, instead of fast path forwarded according to MLD and/or Layer3 multicast protocol.

A policy file is a text file with the extension .pol. It can be created or edited with any text editor. The specified policy file <policy file> should contain a list of addresses that determine if certain multicast streams are to be treated specially. Typically, if the switch receives a stream with a destination address which is in the <policy file> in 'permit' mode, that stream is software flooded and no hardware entry is installed.

When adding an IPv6 address into the policy file, a 128-bit host address is recommended.

This feature is meant to solve the multicast connectivity problem for unknown destination addresses within system reserved ranges. Specifically this feature was introduced to solve the problem of recognizing a certain stream as control packets.

To create a policy file for the snooping flood-list, use the following template:

```
# This is a template for MLD Snooping Flood-list Policy File
# Add your group addresses between "Start" and "End"
# Do not touch rest of file!!!!
entry mldFlood {
if match any {
#------------------ Start of group addresses ------------------
nlri  ff05::100:1/128;
```

```
nlri  ff05::100:15/128;
#------------------- end of group addresses -------------------
} then {
permit;
}
}
entry catch_all {
if {
} then {
deny;
}
}
```

Note

The switch does not validate any IP address in the policy file used in this command. Therefore, slow-path flooding should be used only for streams which are very infrequent, such as control packets. It should not be used for multicast data packets. This option overrides any default mechanism of hardware forwarding (with respect to MLD or PIM) so it should be used with caution.

Slow path flooding occurs within the L2 VLAN only.

Use the none option to effectively disable slow path flooding.

You can use the show mld command to see the configuration of slow path flooding.

Note

This command has no effect in the current release, since IPv6 multicast traffic floods on all platforms.

Example

The following command configures the multicast data stream specified in access1 for slow path flooding:

```
configure mld snooping flood-list access1
```

The following command specifies that no policy file is to be used, this effectively disabling slow path flooding:

```
configure mld snooping flood-list none
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld snooping leave-timeout

configure mld snooping leave-timeout *leave_timeout_ms*

Description

Configures the MLD snooping leave timeout.

Syntax Description

leave_timeout_ms	Specifies an MLD leave timeout value in milliseconds, upon receiving an MLD done message.

Default

1000 ms.

Usage Guidelines

The range is 0 - 175000 ms (175 seconds). For timeout values of one second or less, you must set the leave-timeout to a multiple of 100ms. For values of more than one second, you must set the leave-timeout to a multiple of 1000ms (one second).

The specified time is the maximum leave timeout value. The switch could leave sooner if an MLD done message is received before the timeout occurs.

Example

The following command configures the MLD snooping leave timeout:

```
configure mld snooping leave-timeout 10000
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

configure mld snooping timer

configure mld snooping timer *router_timeout host_timeout*

Description

Configures the MLD snooping timers.

Syntax Description

router_timeout	Specifies the time in seconds before removing a router snooping entry.
host_timeout	Specifies the time in seconds before removing a host's group snooping entry.

Default

The router timeout default setting is 260 seconds. The host timeout setting is 260 seconds.

Usage Guidelines

Timers should be set to approximately 2.5 times the router query interval in use on the network. Specify the following:

- router timeout—The maximum time, in seconds, that a router snooping entry can stay without receiving a router report. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.
- host timeout—The maximum time, in seconds, that a group snooping entry can stay without receiving a group report. The range is 10 to 214,748,364 seconds (6.8 years). The default setting is 260 seconds.

MLD snooping is a Layer2 function of the switch. It does not require multicast routing to be enabled. The feature reduces the flooding of IPv6 multicast traffic. On the VLAN, MLD snooping optimizes the usage of network bandwidth and prevents multicast traffic from being flooded to parts of the network that do not need it. The switch does not reduce any IP multicast traffic in the local multicast domain (FF02::x).

MLD snooping is enabled by default on the switch. MLD snooping expects at least one device on every VLAN to periodically generate MLD query messages. Without an MLD querier, the switch eventually stops forwarding IPv6 multicast packets to any port, because the MLD snooping entries times out, based on the value specified in host timeout.

Example

The following command configures the MLD snooping timers:

```
configure mld snooping timer 600 600
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

 disable ipmcforwarding ipv6

disable ipmcforwarding ipv6 {**vlan**} *name* }

Description

Disables IPv6 multicast forwarding on a router interface.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled

Usage Guidelines

If no options are specified, all configured IPv6 interfaces are affected. When new IPv6 interfaces are created, IPv6 multicast forwarding is disabled by default.

Disabling IPv6 multicast forwarding disables any Layer 3 IPv6 multicast routing for the streams coming to the interface.

Example

The following command disables IPv6 multicast forwarding on VLAN accounting:

```
disable ipmcforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv6 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

disable mld

disable mld {vlan *name***}**

Description

Disables MLD on a router interface. If no VLAN is specified, MLD is disabled on all router interfaces.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled

Usage Guidelines

MLD is a protocol used by an IPv6 host to register its IPv6 multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, hosts respond to the query, and group registration is maintained.

MLD is disabled by default on the switch. However, the switch can be configured to enable the generation and processing of MLD packets. MLD should be enabled when the switch is configured to perform IPv6 unicast or IPv6 multicast routing.

This command disables all MLD versions. When MLD is disabled, the MLDv2 compatibility mode setting is lost. If compatibility mode is not specified in the command when MLD is enabled again, MLDv1 compatibility mode is set.

Example

The following command disables MLD on VLAN accounting:

```
disable mld vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

disable mld snooping

disable mld snooping {**with-proxy** | **vlan** *name*}

Description

Disables MLD snooping.

Syntax Description

with-proxy	Disables the MLD snooping proxy.
name	Specifies a VLAN.

Default

The with-proxy option is enabled by default, but MLD snooping and forward-mcrouter-only option is disabled by default.

Usage Guidelines

If a VLAN is specified, MLD snooping is disabled only on that VLAN, otherwise MLD snooping is disabled on all VLANs.

The with-proxy option can be used for troubleshooting purpose. It should be enabled for normal network operation.

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer3 switch. The proxy also suppresses unnecessary MLD done messages so that they are forwarded only when the last member leaves the group.

Example

The following command disables MLD snooping on the VLAN accounting:

```
disable mld snooping accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

enable ipmcforwarding ipv6

enable ipmcforwarding ipv6 {{**vlan**} *name* }

Description

Enables IPv6 multicast forwarding on a router interface.

Syntax Description

name	Specifies a VLAN name.

Default

Disabled

Usage Guidelines

If no options are specified, all configured IPv6 interfaces are affected. When new IPv6 interfaces are created, IPv6 multicast forwarding is disabled by default.

IPv6 forwarding must be enabled before enabling IPv6 multicast forwarding.

Example

The following command enables IPv6 multicast forwarding on VLAN accounting:

```
enable ipmcforwarding ipv6 vlan accounting
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the IPv6 multicast feature, see the ExtremeXOS Concepts Guide, Feature License Requirements.

enable mld

If no VLAN is specified, MLD is enabled on all router interfaces.

enable mld {vlan *vla* name>} {MLDv1 | MLDv2}

Description

Enables MLD on a router interface.

Syntax Description

vlan name	Specifies a VLAN name.
MLDv1	Sets the compatibility mode to MLDv1.
MLDv2	Sets the compatibility mode to MLDv2.

Default

Disabled.

Usage Guidelines

MLD is a protocol used by an IPv6 host to register its IPv6 multicast group membership with a router. Periodically, the router queries the multicast group to see if the group is still in use. If the group is still active, IPv6 hosts respond to the query, and group registration is maintained.

MLD is disabled by default on the switch. However, the switch can be configured to enable the generation and processing of MLD packets. If compatibility mode is not specified in the command, MLDv1 compatibility mode is set.

A VLAN must have an IPv6 address to support MLD.

Example

The following command enables MLDv1 on the VLAN accounting:

```
enable mld vlan accounting
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

enable mld snooping

enable mld snooping vlan *name*

Description

Enables MLD snooping on the switch.

Syntax Description

name	Specifies a VLAN.

Default

Disabled.

Usage Guidelines

If a VLAN is specified, MLD snooping is enabled only on that VLAN, otherwise MLD snooping is enabled on all VLANs.

A VLAN must have an IPv6 address to support MLD.

Example

The following command enables MLD snooping on the switch:

```
enable mld snooping
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

enable mld snooping with-proxy

enable mld snooping with-proxy

Description

Enables the MLD snooping proxy. The default setting is enabled.

Syntax Description

This command has no arguments or variables.

Default

Enabled.

Usage Guidelines

Enabling the proxy allows the switch to suppress the duplicate join requests on a group to forward to the connected Layer3 switch. The proxy also suppresses unnecessary MLD leave messages so that they are forwarded only when the last member leaves the group.

This command can be used for troubleshooting purpose. It should be enabled for normal network operation. The command does not alter the snooping setting.

Example

The following command enables the MLD snooping proxy:

```
enable mld snooping with-proxy
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

show mcast ipv6 cache

show mcast ipv6 cache {{**vlan**} *name*} {{[**group** *v6GrpAddressMask* | *v6GrpAddressMask*] {**source** *v6SourceIP* | *v6SourceIP*}} {**type** [**snooping** | **pim**]} {**with-in-port**} | {**summary**}}

Description

Displays multicast cache information. The display can be limited to entries for specific VLANs or groups, and it can be limited to specific types of entries, such as those created by snooping protocols, or PIM.

Syntax Description

name	Specifies a VLAN name.
v6GrpAddressMask	Specifies a multicast group address and mask.
v6SourceIP	Specifies the source IP address for a multicast group.
snooping	Limits the display to cache entries created by MLD snooping.
pim	Limits the display to cache entries created by PIM.
summary	Specifies the summary display format.

Default

Displays information for all entries in the multicast cache.

Usage Guidelines

None.

Example

The following command displays all multicast cache information:

```
show mcast ipv6 cache
Snooping Cache Timeout: 300 sec
(ff03::1  3001::1)
Type: snoop Age: 9 Ingress Vlan: v1
Vlan             Port        Vid
v1               25          4084
(ff03::1  3001::2)
Type: snoop Age: 9 Ingress Vlan: v1
Vlan             Port        Vid
v1               25          4084
Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
Total Cache Entries: 2
```

The following command displays summary cache information for VLAN v1:

```
show mcast ipv6 cache vlan v1 summary
Snooping Cache Timeout: 300 sec
==============MULTICAST CACHE SUMMARY==============
Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
v1: Multicast cache distribution:
2 entries from Snooping          0 entries from PIM
Total Cache Entries: 2
Total Cache Entries for VLAN v1: 2
*X480-48t.22 #
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

show mld

show mld {vlan} {*name*}

Description

This command can be used to display an MLD-related configuration and group information, per VLAN or for the switch as a whole.

Syntax Description

name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

If you do not specify a VLAN, the command displays the switch configuration.

Example

The following command displays the MLD configuration:

```
show mld
```

The following is sample output from this command:

```
show mld
VLAN            IP Address                              Flags  nLRMA  nLeMA
MLDver
Default         ::/0                                  ---iz-      0      0
0
v1              ::/0                                  U--iz-      0      5
0
```

```
Flags:   (f) Forwarding Enabled, (g) Fast-learning on, (i) MLD Enabled,
(m) Multicast Forwarding Enabled, (U) Interface Up,
(z) MLD Snooping Enabled.
(nLeMA) Number of Learned Multicast Addresses
(nLRMA) Number of Locally Registered Multicast Addresses
```

The following command displays the MLD configuration for VLAN v1:

```
show mld v1
Query Interval    : 125 sec
Max Response Time : 10 sec
Last Member Query : 1 sec
Robustness        : 2
Interface on VLAN v1 is enabled and up.

ff02::1:ff00:2                   ff02::1:ff3a:ce50
ff02::1:ff55:5c27
s = static MLD member
Flags:
IP Fwding  NO     IPmc Fwding  NO             MLD YES
MLD Ver  v0        Snooping YES
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

show mld counters

show mld counters {{**vlan**} *name*}

Description

Use this command to display an MLD packet statistics.

Syntax Description

<name>	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

The following command displays the MLD configuration:

* topleft.74 # show mld counters

```
MLD Message type               Received  Originated  Forwarded
MLD Query (v1/v2)                     0          20          0
MLDv1 Report                        499           0        157
MLDv1 Done                          101           0         91
MLDv2 Report                          0           0          0
Global Statistics:
MLD Packet unknown                    0
MLD Packet Error                    617
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

show mld group

show mld group {{**vlan**} {*name*} | {*v6grpipaddress*}} {**MLDv2**}

Description

Lists the MLD group membership for the specified VLAN or group.

Syntax Description

grpipaddress	Specifies a group IPv6 address.
name	Specifies a VLAN name.
MLDv2	Display the MLD group in MLDv2 format (if group record is MLDv2 compatible, otherwise display in earlier format). This option is not supported in this release.

Default

MLDv1.

Usage Guidelines

If no VLAN is specified all VLANs are displayed. You can also filter the display by group address and by multicast stream sender address.

Example

The following command lists the MLD group membership for the VLAN accounting:

```
show mld group vtest3
```

Output from this command looks similar to the following:

```
Group Address               Ver Vlan            Port   Age
ff03::1:1                   1   vtest3          4:5    25
ff03::1:2                   1   vtest3          4:5    25
ff02::1:ff22:124            1   vtest3          4:45   26
ff05::a:abcd                1   vtest3          4:15   23
ff05::a:abce                1   vtest3          4:15   23
ff02::1:ff22:112            1   vtest3          4:45   26
ff02::1:ff1f:a418           1   vtest3          4:45   26
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

show mld snooping

show mld snooping {**vlan** *name* | **detail**} {**MLDv2**}

Note

MLD snooping is not supported in this software release.

Description

Displays MLD snooping registration information and a summary of all MLD timers and states.

Syntax Description

name	Specifies a VLAN name.
detail	Displays the information in detailed format.
MLDv2	Display the MLD group in MLDv2 format (if group record is MLDv2 compatible, otherwise display in earlier format). This option is not supported in this release.

Default

MLDv1.

Usage Guidelines

The two types of MLD snooping entries are sender entry and subscribed entry.

The following information is displayed in a per-interface format:

- Group membership information
- Router entry
- Timeout information
- Sender entry

Example

Here is an example of the show output:

```
show mld snooping
MLD Snooping Flood-list : none
MLD Snooping Proxy      : Enable
MLD Snooping Filters    : per-port
Vlan             Vid  Port   #Senders #Receivers Router Enable
-------------------------------------------------------------
Default          1           0                            Yes
v1               4084        0                            Yes
25               1          Yes
41               2          No
42               2          No
```

The following command displays MLD snooping registration information for the VLAN V1:

```
show mld snooping v1
Router Timeout                :    260 sec
Host Timeout                  :    260 sec
MLD Snooping Fast Leave Time  :   1000 ms
VLAN v1              (4084) Snooping=Enabled
Port    Host                                          Age
Subscribed                                    Join Limit
25    fe80::204:96ff:fe3a:ce50                       13
ff02::1:ff3a:ce50                             No Limit
25    fe80::204:96ff:fe3a:ce50                       14
```

```
All Groups                                          No Limit
41    fe80::200:8ff:fe55:5c27                             13
ff02::1:ff00:2                                      No Limit
41    fe80::200:8ff:fe55:5c27                             13
ff02::1:ff55:5c27                                   No Limit
42    fe80::200:8ff:fe56:5c2b                             14
ff02::1:ff00:2                                      No Limit
42    fe80::200:8ff:fe56:5c2b                             13
ff02::1:ff56:5c2b                                   No Limit
s = static MLD member
* X480-48t.27 #
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

show mld snooping vlan filter

show mld snooping {vlan} *name* **filter**

Description

Displays MLD snooping filters..

Syntax Description

name	Specifies a VLAN name.

Default

None.

Usage Guidelines

Use this command to display MLD snooping filters configured on the specified VLAN. When no VLAN is specified, all the filters are displayed.

Example

The following command displays the MLD snooping filter configured on VLAN vlan101:

```
show mld snooping vlan101 filter
```

```
Filter Port Flags
mldpermit0 5:10 a
Flags: (a) Active
```

History

This command was first available in ExtremeXOS 15.2.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MLD snooping feature, see the ExtremeXOS Concepts Guide, Appendix A, "Feature License Requirements."

show mld snooping vlan static

show mld snooping vlan *name* **static** [**group** | **router**]

Description

Displays static MLD snooping entries.

Syntax Description

name	Specifies a VLAN name.

Default

None.

Usage Guidelines

Use this command to display the MLD snooping static groups or router ports configured on the specified VLAN. When no VLAN is specified, all the static groups or router ports are displayed.

Example

The following command displays the MLD snooping static groups configured on VLAN vlan101:

```
show mld snooping vlan101 static group
```

The following is sample output for this command:

```
Group                          Port       Flags
```

```
  ff03::1:1:1                   7          sa
  ff03::1:1:1                   15         sa
Flags: (s) Static, (a) Active
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure mld

unconfigure mld

Description

Resets all MLD settings to their default values and clears the MLD group table.

Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

The following command resets all MLD settings to their default values and clears the MLD group table:

```
unconfigure mld
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on the platforms listed for the IPv6 multicast routing feature in the ExtremeXOS Concepts Guide, Feature License Requirements

45 MSDP Commands

clear msdp counters
clear msdp sa-cache
configure msdp as-display-format
configure msdp max-rejected-cache
configure msdp originator-id
configure msdp peer default-peer
configure msdp peer description
configure msdp peer mesh-group
configure msdp peer no-default-peer
configure msdp peer password
configure msdp peer sa-filter
configure msdp peer sa-limit
configure msdp peer source-interface
configure msdp peer timer
configure msdp peer ttl-threshold
configure msdp sa-cache-server
configure pim border
create msdp mesh-group
create msdp peer
delete msdp mesh-group
delete msdp peer
disable msdp
disable msdp data-encapsulation
disable msdp export local-sa
disable msdp peer
disable msdp process-sa-request
enable msdp
enable msdp data-encapsulation
enable msdp export local-sa
enable msdp peer
enable msdp process-sa-request
show msdp
show msdp memory
show msdp mesh-group
show msdp peer
show msdp sa-cache
unconfigure msdp sa-cache-server

unconfigure pim border

This chapter describes commands for doing the following:

- Configuring MSDP
- Displaying MSDP information

For an introduction to the MSDP feature, see the ExtremeXOS Concepts Guide.

clear msdp counters

clear msdp counters {**peer** *remoteaddr* | **peer all** | **system**} {**vr** *vrname*}

Description

This command resets the MSDP counters to zero.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
system	Clears the global MSDP counters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

The clear msdp counters command clears the following MSDP counters:

- Per peer counters
  - Number of SA messages received
  - Number of SA messages transmitted
  - Number of SA request messages received
  - Number of SA request messages transmitted
  - Number of SA response messages received
  - Number of SA response messages transmitted
  - Number of SA messages received without encapsulated data
  - Number of SA messages transmitted without encapsulated data
  - Number of SA messages received with encapsulated data
  - Number of SA messages transmitted with encapsulated data
  - Number of times the MSDP peer attained an “ESTABLISHED” state

  - Number of times the peer-RPF check failed
  - Number of times the TCP connection attempt failed
  - Total number of received messages
  - Total number of transmitted messages
- Global counters
  - None defined

The clear counters command will also clear all MSDP counters, but it clears the counters for all other applications too.

Example

The following command clears the counters for an MSDP peer with the IP address 192.168.45.43:

```
clear msdp counters peer 192.168.45.43
```

The following command clears the all peer and global counters:

```
clear msdp counters
```

The following command clears all counters for a particular peer:

```
clear msdp counters peer 192.168.32.45
```

The following command clears the counters of all MSDP peers:

```
clear msdp counters peer all
```

The following command clears the global counters:

```
clear msdp counters system
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

clear msdp sa-cache

clear msdp sa-cache {{**peer**} *remoteaddr* | **peer all**} {**group-address** *grp-addr*} {**vr** *vrname*}

Description

This command purges all SA cache entries and notifies the PIM that the SA cache is empty.

Syntax Description

grp-addr	Specifies the IP address and subnet mask of the multicast group you want to clear. All SA cache entries that match the specified group address are removed from the database.
peer all	Specifies all MSDP peers. All matching SA cache entries from all peers are removed from the database.
remoteaddr	Specifies the IP address of the MSDP peer. All matching SA cache entries learned from the specified peer are removed from the database.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

MSDP receives SA messages periodically. So, after clearing SA cache entries from the local database, MSDP relearns those entries during the next advertisement from its peer.

Example

The following command clears SA cache records for an MSDP peer with the IP address 192.168.45.43:

```
clear msdp sa-cache peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp as-display-format

configure msdp as-display-format [asdot | asplain]

Description

Configures the AS number format displayed in show commands.

Syntax Description

asdot	Specifies the ASDOT format.
asplain	Specifies the ASPLAIN format.

Default

N/A.

Usage Guidelines

The ASPLAIN and ASDOT formats are described in RFC 5396, Textual Representation of Autonomous System (AS) Numbers.

Example

The following command selects the ASDOT 4-byte AS number format:

```
configure msdp as-display-format asdot
```

History

This command was first available in ExtremeXOS 12.4.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp max-rejected-cache

configure msdp max-rejected-cache *max-cache* {**vr** *vrname*}

Description

Configures the maximum limit on rejected SA cache entries that an MSDP router will store in its database.

Syntax Description

max-cache	Specifies the maximum number of rejected SA cache entries that the MSDP router will store in its database. To remove the limit, enter 0 (zero) for the *max-cache* value.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the maximum cache entries stored is zero. That is, rejected SA cache entries are not stored. Any SA cache entries that are stored and not refreshed for six minutes are removed.

Usage Guidelines

SA cache are rejected because of:

- Peer-RPF failure
- Policy denied

When a previously rejected SA cache entry is accepted because of an RP reachability change or policy rule change, the rejected SA cache entry is moved to the accepted SA cache list.

By default, rejected SA cache entries are discarded. You can configure a limit for rejected cache entries to store them, which will help debug/diagnose some issues; however, it consumes extra memory.

Example

The following command sets the maximum rejected cache limit to 100 for an MSDP router:

```
configure msdp max-rejected-cache 100
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp originator-id

configure msdp originator-id *ip-address* {**vr** *vrname*}

Description

Configures the originator ID for an MSDP router. The originator ID is the RP address you want to use (instead of the default) in locally originated SA messages.

Syntax Description

ip-address	Specifies the RP address to use in locally originated SA messages. To unconfigure an originator ID (that is, to use the default RP address), enter the IP address 0.0.0.0.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the RP address is used as the originator ID in locally originated SA messages.

Usage Guidelines

Use this command to override the default RP address used in SA messages. Because only RPs and MSDP border routers originate SAs, there are times when it is necessary to change the ID used for this purpose. The originator ID address must be one of the interface addresses on the MSDP router.

You can configure the MSDP originator ID only when MSDP is disabled globally.

To remove an originator ID, enter the IP address 0.0.0.0.

Example

The following command configures the originator ID for an MSDP router:

```
configure msdp originator-id 10.203.134.1
```

The following command unconfigures the originator ID for an MSDP router:

```
configure msdp originator-id 0.0.0.0
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer default-peer

configure msdp peer [*remoteaddr* | **all**] **default-peer** {**default-peer-policy** *filter-name*} {**vr** *vrname*}

Description

This command configures a default or static RPF peer from which all MSDP SA messages are accepted. To remove the default peer, enter the configure msdp peer no-default-peer command.

Syntax Description

filter-name	Specifies the name of the policy filter associated with the default peer. The peer will be the default peer for all SA entries that are permitted by the policy filter. If an SA message is allowed by the policy filter, it will be accepted. Otherwise, the SA message has to go through the regular RPF-check. The static peer RPF check is the last step in peer RPF algorithm. So, if an SA message is denied by the default peer policy, ultimately the SA message will be rejected by MSDP.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no static RPF peer is configured.

The “default-peer-policy” keyword specifies the name of the policy filter associated with the default peer. You can configure multiple default peers with different policies. If no policy is specified, then the current peer is the default RPF peer for all SA messages.

Usage Guidelines

Configuring a default peer simplifies peer-RPF checking of SA messages. If the peer-RPF check fails, the default peer rule is applied to see if the SA messages should be accepted or rejected.

If a default peer policy is specified, the peer is the default peer only for the (Source, Group), or (S, G), that satisfies the policy. If the policy is not specified, then the default peer is used for all (S, G, RP).

You can configure multiple default peers on an MSDP router; however all default peers must either have a default policy or not. A mix of default peers, with a policy and without a policy, is not allowed.

When configuring multiple default peer rules, follow these guidelines:

- When you enter multiple default-peer commands with the default-peer-policy keyword, you can use all the default peers at the same time for different RP prefixes.
- When you enter multiple default-peer commands without the default-peer-policy keyword, you can use a single active peer to accept all SA messages. If that peer goes down, then the next configured default peer accepts all SA messages. This configuration is typically used at a stub site.

You can use the following policy attributes in a default peer policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following command configures an MSDP peer with the IP address 192.168.45.43 as the default peer policy for “sales”:

```
configure msdp peer 192.168.45.43 default-peer default-peer-policy sales
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer description

configure msdp peer *remoteaddr* **description** {*peer-description*} {**vr** *vrname*}

Description

Configures a name or description for an MSDP peer. This text is for display purposes only.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer.
peer-description	Specifies the name or description of the MSDP peer. The maximum is 63characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no name or description is specified.

Usage Guidelines

Use this command to configure a name or description to make an MSDP peer easier to identify. The description is visible in the output of the show msdp peer command.

To remove the description, use this command without a description string.

Example

The following command configures the name “internal_peer” to an MSDP peer:

```
configure msdp peer 192.168.45.43 description internal_peer
```

The following command removes the description from an MSDP peer:

```
configure msdp peer 192.168.45.43 description
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer mesh-group

configure msdp peer [*remoteaddr* | **all**] **mesh-group** [*mesh-group-name* | **none**] {**vr** *vrname*}

Description

This command configures an MSDP peer to become a member of a mesh-group. To remove a peer from a mesh-group, enter the none CLI keyword for the mesh-group.

Syntax Description

mesh-group-name	Specifies the name of the MSDP mesh-group.
none	Removes a peer from a mesh-group.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Any SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group.

Mesh-groups achieve two goals:

- Reduce SA message flooding
- Simplify peer-RPF flooding

Example

The following command configures an MSDP peer with the IP address 192.168.45.43 to become a member of a mesh-group called “intra”:

```
configure msdp peer 192.168.45.43 mesh-group intra
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer no-default-peer

configure msdp peer [*remoteaddr* | **all**] **no-default-peer** {**vr** *vrname*}

Description

This command removes a default peer.

Syntax Description

no-default-peer	Removes a default peer.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

N/A.

Example

The following command removes all MSDP peers:

```
configure msdp peer all no-default-peer
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer password

configure msdp peer [*remoteaddr* | **all**] **password** [**none** | {**encrypted**} *tcpPassword*] {**vr** *vrname*}

Description

This command configures a TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm password for an MSDP peer. This command enables TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication for a MSDP peer. When a password is configured, MSDP receives only authenticated MSDP messages from its peers. All MSDP messages that fail TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication are dropped.

Syntax Description

encrypted	Encrypts the password for RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication. To improve security, the password displays in encrypted format and cannot be seen as simple text. Additionally, the password is saved in encrypted format.
none	Removes the previously configured password.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
tcpPassword	Specifies the password to use for RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication at the TCP level. The password must be an ASCII string with a maximum of 31 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Defaults

By default, TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication is disabled for the MSDP peer.

Usage Guidelines

Extreme Networks recommends that you enable TCP RSA Data Security, Inc. MD5 Message-Digest Algorithm authentication for all MSDP peers to protect MSDP sessions from attacks. You can execute this command only when the MSDP peer is disabled or when MSDP is globally disabled on that VR.

Example

The following command configures a password for the MSDP peer with the IP address 192.168.45.43, which automatically enables TCP MD5 authentication:

```
configure msdp peer 192.168.45.43 password test123
```

The following command removes the password:

```
configure msdp peer 192.168.45.43 password none
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer sa-filter

configure msdp peer [*remoteaddr* | **all**] **sa-filter** [**in** | **out**] [*filter-name* | **none**] {**vr** *vr_name*}

Description

This command configures an incoming or outgoing policy filter for SA messages.

Syntax Description

filter-name	Specifies the name of the policy associated with an SA filter. To remove an SA filter, enter the “none” CLI keyword for ***filter-name***.
in	Associates the SA filter with inbound SA messages.
out	Associates the SA filter with outbound SA messages.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no SA filter is configured for an MSDP peer. That is, incoming and outgoing SA messages are not filtered.

Usage Guidelines

This command configures an SA filter such that only a specified set of SA messages are accepted or sent to a peer. Note that an SA filter does not adversely impact the flow of SA request and response messages.

To remove an SA filter, enter the “none” CLI keyword for <filter-name>.

You can use the following policy attributes in an SA filter policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following command configures an incoming SA messages filter on an MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 sa-filter in allow_229
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer sa-limit

configure msdp peer [*remoteaddr* | **all**] **sa-limit** *max-sa* {**vr** *vr_name*}

Description

This command allows you to limit the number of SA entries from an MSDP peer that the router will allow in the SA cache. To allow an unlimited number of SA entries, use 0 (zero) as the value for ***max-sa***.

Syntax Description

max-sa	Specifies the maximum number of SA entries from an MSDP peer allowed in the SA cache. To specify an unlimited number of SA entries, use 0 (zero) as the value for ***max-sa***.
peer all	Specifies all MSDP peers.

remoteaddr	Specifies the IP address of the MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, no SA entry limit is set. The router can receive an unlimited number of SA entries from an MSDP peer.

Usage Guidelines

You can use this command to prevent a distributed denial of service (DOS) attack. Extreme Networks recommends that you configure an MSDP SA limit on all MSDP peer sessions. Note that a rejected SA cache entry is not included in the number of SA cache entries received from a peer.

Example

The following command configures the SA entry limit of 500 for the MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 sa-limit 500
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer source-interface

configure msdp peer [*remoteaddr* | **all**] **source-interface** [*ipaddress* | **any**] {**vr** *vrname*}

Description

This command configures the source interface for the MSDP peer TCP connection.

Syntax Description

any	Specifies to use any interface as one end of the TCP connection. The source interface is selected based on the IP route entry used to reach the MSDP peer. The egress interface that reaches the MSDP peer is used as the source interface for the TCP connection. Basically, this command removes the previously configured source interface of the MSDP peer.
ipaddress	Specifies the IP address of the MSDP router interface to use on one end of a TCP connection. The *ipaddress* must be one of the MSDP router interface addresses; otherwise, the command fails and an error message displays.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Defaults

By default, the source interface is selected based on the IP route entry used to reach the MSDP peer. The egress interface that reaches the MSDP peer is used as the source interface for the TCP connection.

Usage Guidelines

You must first disable MSDP or the MSDP peer before using this command. Extreme Networks recommends that you configure a source interface for MSDP peers that are not directly connected. We also recommend using the loopback address as the MSDP peer connection endpoint.

Example

The following command configures a source interface for an MSDP peer with the IP address 192.168.45.43:

```
configure msdp peer 192.168.45.43 source-interface 60.0.0.5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer timer

configure msdp peer [*remoteaddr* | **all**] **timer keep-alive** *keep-alive-sec* **hold-time** *hold-time-sec* {**vr** *vrname*}

Description

The command configures the keep-alive and hold timer intervals of the MSDP peers.

Syntax Description

hold-time-sec	Specifies the hold timer interval in seconds, in the range of 3 through 75 seconds.
keep-alive-sec	Specifies the keep-alive timer interval in seconds, in the range of 1 through 60 seconds.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the:

- Keep-alive timer interval is 60 seconds.
- Hold timer interval is 75 seconds.
- SA timer interval is 60 seconds.

Usage Guidelines

You can use this command only when either MSDP or the MSDP peer is disabled. The hold timer interval must be greater than the keep-alive timer interval.

Example

The following command configures the keep-alive and hold timer intervals for the MSDP peer 55.0.0.83:

```
configure msdp peer 55.0.0.83 timer keep-alive 30 hold-time 60
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp peer ttl-threshold

configure msdp peer [*remoteaddr* | **all**] **ttl-threshold** *ttl* {**vr** *vrname*}

Description

Configures the limit to which multicast data packets are sent in SA messages to an MSDP peer. If the time-to-live (TTL) in the IP header of an encapsulated data packet exceeds the TTL threshold configured, encapsulated data is not forwarded to MSDP peers.

Syntax Description

all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer on which to configure a TTL threshold.
ttl	Specifies the TTL value. The range is 0 through 255. To restore the default value, enter a TTL value of 0 (zero).
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

The default value is zero, meaning all multicast data packets are forwarded to the peer regardless of the TTL value in the IP header of the encapsulated data packet.

Usage Guidelines

This command allows you to configure a TTL value to limit multicast data traffic.

Example

The following command configures a TTL threshold of 5:

```
configure msdp peer 192.168.45.43 ttl-threshold 5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure msdp sa-cache-server

configure msdp sa-cache-server *remoteaddr* {**vr** *vr_name*}

Description

Configures the MSDP router to send SA request messages to the MSDP peer when a new member becomes active in a group.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP peer from which the local router requests SA messages when a new member becomes active in a group, and MSDP has no cache entry for the group in the local database.
vr_name	Specifies the name of the virtual router on which the MSDP cache server is configured. If a virtual router name is not specified, it is extracted from the current CLI context.

Default

By default, the router does not send SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member simply waits to receive SA messages, which eventually arrive.

Usage Guidelines

You can use this command to force a new member of a group to learn the current active multicast sources in a connected PIM-SM domain that are sending to a group. The router will send SA request messages to the specified MSDP peer when a new member joins a group and MSDP doesn't have a cache entry for that group in the local database. The peer replies with the information in an SA cache response message.

Note

An MSDP peer must exist before it can be configured as an SA cache server. The configure msdp sa-cache-server command accepts the value for <remoteaddr> only if it is an existing peer's IP address.

Example

The following command configures an MSDP cache server:

```
configure msdp sa-cache-server 172.19.34.5
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

configure pim border

configure pim *vlan_name* **border**

Description

Configures a PIM VLAN as a border VLAN, which is used to demarcate a PIM domain when using MSDP.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

MSDP is used to connect multiple multicast routing domains. A PIM-SM domain is created by limiting the reach of PIM BSR advertisements. When a border VLAN is configured, PIM BSR advertisements are not forwarded out of the PIM VLAN.

Example

The following command configures a PIM border on a VLAN called “vlan_border”:

```
configure pim vlan_border border
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create msdp mesh-group

create msdp mesh-group *mesh-group-name* {**vr** *vrname*}

Description

Creates an MSDP mesh-group.

Syntax Description

mesh-group-name	Specifies the name for the MSDP mesh-group.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Create a mesh-group to:

- Reduce SA message flooding
- Simplify peer-RPF flooding

SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group, which reduces SA message flooding.

A mesh group name must begin with an alphabetical character and may contain alphanumeric characters and underscores (_), but it cannot contain spaces. The maximum allowed length for a name is 32 characters. For name creation guidelines and a list of reserved names, see Object Names in the ExtremeXOS Concepts Guide.

Example

The following command creates a mesh-group called “verizon”:

```
create msdp mesh-group verizon
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

create msdp peer

create msdp peer *remoteaddr* {**remote-as** *remote-AS*} {**vr** *vrname*}

Description

Creates an MSDP peer.

Syntax Description

remoteaddr	Specifies the IP address of the MSDP router to configure as an MSDP peer.
remote-AS	Specifies the autonomous system (AS) number of the MSDP peer. This optional parameter is deprecated in ExtremeXOS 12.1, though the option is still available in the CLI for backward compatibility. The software ignores this parameter.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

The BGP route database is used by MSDP to determine the AS number for the peer. You can display the AS number (which can be a 2-byte for 4-byte AS number) using the command: show msdp [peer {detail} | {peer} <remoteaddr>] {vr <vrname>}.

Example

The following command creates an MSDP peer:

```
create msdp peer 192.168.45.43 remote-as 65001
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete msdp mesh-group

delete msdp mesh-group *mesh-group-name* {**vr** *vrname*}

Description

Removes an MSDP mesh-group.

Syntax Description

mesh-group-name	Specifies the name of the MSDP mesh-group. The character string can be a maximum of 31 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

A mesh-group is a group of MSDP peers with fully meshed MSDP connectivity. Mesh-groups are used to achieve two goals:

- Reduce SA message flooding
- Simplify peer-RPF flooding

SA messages received from a peer in a mesh-group are not forwarded to other peers in the same mesh-group.

Use the delete msdp mesh-group command only if you created a mesh-group that you want to remove. By default, there is no MSDP mesh-group.

Example

The following command removes a mesh-group called “verizon”:

```
delete msdp mesh-group verizon
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

delete msdp peer

delete msdp peer [**all** | *remoteaddr*] {**vr** *vr_name*}

Description

Deletes an MSDP peer.

Syntax Description

all	Deletes all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP router to configure as an MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

None.

Example

The following command deletes an MSDP peer:

```
delete msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable msdp

disable msdp {**vr** *vrname*}

Description

Disables MSDP on a virtual router.

Syntax Description

vrname	Specifies the name of the virtual router on which MSDP is being enabled or disabled. If a name is not specified, it is extracted from the current CLI context.

Default

MSDP is disabled by default.

Usage Guidelines

Use this command to disable MSDP on a virtual router.

Example

The following command disables MSDP on a virtual router:

```
disable msdp
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable msdp data-encapsulation

disable msdp data-encapsulation {**vr** *vrname*}

Description

Disables the encapsulation of locally originated SA messages with multicast data (if available).

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, multicast data packet encapsulation is enabled for locally originated SA messages.

Usage Guidelines

N/A.

Example

The following command disables multicast data packet encapsulation:

```
disable msdp data-encapsulation
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable msdp export local-sa

disable msdp export local-sa {**vr** *vrname*}

Description

Disables the advertisement of local sources to groups for which the router is an RP.

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the export of local sources is enabled. All sources are advertised if the router is an RP for the groups. Use this command to disable it.

Usage Guidelines

You can create a policy to filter out some of the local sources so that they are not advertised to MSDP peers and exposed to the external multicast domain. To configure an export filter, you must first disable the export of local sources (with the disable msdp export local-sa command), and then re-enable it with an export filter (with the enable msdp export local-sa export-filter command).

Example

The following command disables the advertisement of local sources:

```
disable msdp export local-sa
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable msdp peer

disable msdp [{**peer**} *remoteaddr* | **peer all**] {**vr** *vr_name*}

Description

Configures the administrative state of an MSDP peer.

Syntax Description

all	Disables all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer to disable.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, MSDP peers are disabled.

Usage Guidelines

Use this command to administratively disable MSDP peers to stop exchanging SA messages.

Example

The following command disables an MSDP peer:

```
disable msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

disable msdp process-sa-request

disable msdp [{**peer**} *remoteaddr* | **peer all**] **process-sa-request** {**vr** *vrname*}

Description

This command configures a router to reject SA request messages from a specified peer or all peers.

Syntax Description

peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, all SA request messages are accepted from all peers.

Usage Guidelines

Use this command to configure the router to reject SA request messages from a specified peer or all peers.

You cannot change an SA request filter while SA request processing is enabled for an MSDP peer. You must first disable SA request processing for a peer and then re-enable it with an SA request filter.

You can use the following policy attributes in an SA request policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following command disables processing of SA request messages received from a peer with the IP address 192.168.45.43:

```
disable msdp peer 192.168.45.43 process-sa-request
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable msdp

enable msdp {**vr** *vrname*}

Description

Enables MSDP on a virtual router.

Syntax Description

vrname	Specifies the name of the virtual router on which MSDP is being enabled or disabled. If a name is not specified, it is extracted from the current CLI context.

Default

MSDP is disabled by default.

Usage Guidelines

Use this command to enable MSDP on a virtual router.

Example

The following command enables MSDP on a virtual router:

```
enable msdp
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable msdp data-encapsulation

enable msdp data-encapsulation {**vr** *vrname*}

Description

Enables the encapsulation of locally originated SA messages with multicast data (if available).

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, multicast data packet encapsulation is enabled for locally originated SA messages. Multicast data packets with a packet size of up to 8 KB are encapsulated in SA messages.

Usage Guidelines

Enable data encapsulation to handle bursty sources.

Example

The following command enables multicast data packet encapsulation:

```
enable msdp data-encapsulation
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable msdp export local-sa

enable msdp export local-sa {**export-filter** *filter-name*} {**vr** *vrname*}

Description

Enables the advertisement of local sources to groups for which the router is an RP.

Syntax Description

filter-name	Specifies the policy to associate with the export of local sources. No policy is specified by default.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, the export of local sources is enabled. All sources are advertised if the router is an RP for the groups.

Usage Guidelines

You can create a policy to filter out some of the local sources so that they are not advertised to MSDP peers and exposed to the external multicast domain. To configure an export filter, you must first disable the export of local sources (with the disable msdp export local-sa command), and then re-enable it with an export filter (with the enable msdp export local-sa export-filter command).

You can use the following policy attributes in an export policy. All other attributes are ignored.

- Match:
  - multicast-group

    - multicast-source
    - pim-rp
- Set:
    - permit
    - deny

Please note that the syntax for “multicast-group”, “multicast-source,” and “pim-rp” are the same as for the “nlri” policy attribute.

```
[multicast-group | multicast-source | pim-rp]  [<ipaddress> | any]/<mask-
length>  {exact}
[multicast-group | multicast-source | pim-rp]  [<ipaddress> | any]  mask
<mask>  {exact}
```

An example of an MSDP policy file follows:

```
entry allow_internal_rp {
if match any {
multicast-group  234.67.89.0/24;
multicast-source  23.123.45.0/24;
pim-rp  10.203.134.5/32;
} then {
permit;
}
}
entry deny_local_group239 {
if match any {
multicast-group 239.0.0.0/8;
multicast-source  23.123.45.0/24;
} then {
deny;
}
}
entry allow_external_rp_172 {
if {
multicast-group 234.172.0.0/16;
} then {
permit
}
}
# deny remaining entries
```

Example

The following command enables the advertisement of local sources:

```
enable msdp export local-sa
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable msdp peer

enable msdp [{**peer**} *remoteaddr* | **peer all**] {**vr** *vr_name*}

Description

Configures the administrative state of an MSDP peer.

Syntax Description

all	Enables all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer to configure.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, MSDP peers are disabled.

Usage Guidelines

You must use this command to administratively enable the MSDP peers before they can establish peering sessions and start exchanging SA messages.

Example

The following command enables an MSDP peer:

```
enable msdp peer 192.168.45.43
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

enable msdp process-sa-request

enable msdp [{**peer**} *remoteaddr* | **peer all**] **process-sa-request** {**sa-request-filter** *filter-name* } {**vr** *vr_name*}

Description

This command configures MSDP to receive and process SA request messages from a specified peer or all peers. If an SA request filter is specified, only SA request messages from those groups permitted are accepted. All others are ignored.

Syntax Description

filter-name	Specifies the name of the policy filter associated with SA request processing.
peer all	Specifies all MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

By default, all SA request messages are accepted from peers.

Usage Guidelines

Use this command to configure the router to accept all or just some SA request messages from peers. If no policy is specified, all SA request messages are accepted. If a policy is specified, only SA request messages from those groups permitted are accepted, and all others are ignored.

You cannot change an SA request filter while SA request processing is enabled for an MSDP peer. You must first disable SA request processing for a peer and then re-enable it with an SA request filter.

You can use the following policy attributes in an SA request policy. All other attributes are ignored.

- Match:
  - multicast-group
  - multicast-source
  - pim-rp
- Set:
  - permit
  - deny

Example

The following command enables processing of SA request messages received from a peer with the IP address 192.168.45.43:

```
enable msdp peer 192.168.45.43 process-sa-request sa-request-filter
intra_domain
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show msdp

show msdp {**vr** *vrname*}

Description

This command displays global configuration and run-time parameters for MSDP.

Syntax Description

vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

Use this command to verify the global configuration parameters of MSDP.

Example

The following command displays global configuration and run-time parameters for MSDP:

```
Switch.2 # show msdp
MSDP Enabled         : No                 VR-Name              : VR-Default
Originator RP Addr   : not configured     SA Cache ageout time : 360
```

```
Store SA Cache       : Yes                SA Cache Server      : not
configured
Export Local SAs     : Yes                Export SA filter     : not
configured
Max Rejected Cache   : not configured     Encapsulate data     : Yes
Num of Rejected SAs  : 0                  Total Num of SAs     : 0
Num of Local SAs     : 0                  AS Disp Format       : Asdot
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show msdp memory

show msdp memory {**detail** | *memoryType*}

Description

This command displays current memory utilization of the MSDP process, including all virtual router instances of the MSDP process.

Syntax Description

detail	Displays detailed statistics for all memory types.
memoryType	Displays statistics for a particular memory type.

Default

N/A.

Usage Guidelines

Use this command to view and diagnose the memory utilization of the MSDP process.

Example

The following displays current memory utilization of the MSDP process, including all virtual router instances of the MSDP process:

```
show msdp memory
```

The following is sample output from this command:

```
MSDP Memory Information
-----------------------
Bytes Allocated: 79792  AllocFailed: 0  OversizeAlloc: 0
Current Memory Utilization Level: GREEN
Memory Utilization Statistics
-----------------------------
Size    16     32     48     64     80     96    128    256   1024   4096

0      0      0
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show msdp mesh-group

show msdp [**mesh-group** {**detail**} | {**mesh-group**} *mesh-group-name*] {**vr** *vrname*}

Description

This command displays configuration information about MSDP mesh-groups.

Syntax Description

detail	Displays detailed information about MSDP mesh-groups.
mesh-group-name	Specifies the name of the MSDP mesh-group. The character string can be a maximum of 31 characters.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

Use this command to display configuration information about MSDP mesh-groups, as follows:

- For summary information, enter the show msdp mesh-group command.
- For detailed information, enter the show msdp mesh-group detail command.
- For detailed information about a specific mesh-group, enter the show msdp mesh-group <name> command.

Example

The following command displays the peer count for a mesh-group:

```
show msdp mesh-group
```

The following is sample output from this command:

```
MeshGroupName                       PeerCount
-----------------------------------------
external                            0
internal                            0
msdp_mesh                           4
```

The following command displays detailed information about a mesh-group called “msdp_mesh”:

```
show msdp mesh-group "msdp_mesh"
```

The following is sample output from this command:

```
Mesh Group Name      : msdp_mesh Num of Peers : 4
Peers                : 54.172.168.97   55.0.0.83       124.56.78.90
221.160.90.228
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show msdp peer

show msdp [peer {detail} | {peer} *remoteaddr*] **{vr** *vr_name*}

Description

This command displays configuration and run-time parameters about MSDP peers.

Syntax Description

detail	Displays detailed information about MSDP peers.
remoteaddr	Specifies the IP address of the MSDP peer.
vr_name	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

Use this command to verify the configuration and run-time parameters for MSDP peers, as follows:

- For summary information, enter the show msdp peer command.
- For detailed information for all peers, enter the show msdp peer detail command.
- For detailed information for a specific peer, enter the show msdp peer <remoteaddr> command.

Example

The following command displays configuration and run-time parameters for MSDP peers:

```
show msdp peer
```

The following is sample output from this command:

```
Peer Address    AS    State       Up/Down   Resets  SA_Cnt  Name
```

```
-------------------------------------------------------------------------
-d 54.172.168.97   14490 DISABLED    00:31:36  0       0       test
*e 55.0.0.83       100   ESTABLISHED 00:21:04  1       0       to-Hawaii
-d 124.56.78.90    2345  DISABLED    00:31:36  0       0
-d 221.160.90.228  23456 DISABLED    00:31:36  0       0
Flags: (*) default peer, (d) disabled, (e) enabled
```

The following command displays output from an MSDP peer with the IP address 16.0.0.2:

```
* Switch.8 # show msdp peer 16.0.0.2
MSDP Peer             : 16.0.0.2
Enabled               : No                  AS Number            : 100.100

```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

show msdp sa-cache

show msdp [**sa-cache** | **rejected-sa-cache**] {**group-address** *grp-addr*} {**source-address** *src-addr*} {**as-number** *as-num*} {**originator-rp** *originator-rp-addr*} {**local**} {**peer** *remoteaddr*} {**vr** *vrname*}

Description

This command displays the SA cache database. The following quadruplet per SA cache entry displays: {Group, Source, originating RP, and peer}. In addition, information about the following displays: the cache uptime, aging, whether sources are local or remote, etc.

Syntax Description

as-num	Displays all SA cache that originated from the specified Autonomous System (AS) number.
grp-addr	Displays the SA cache within the specified group address range.
originator-rp-addr	Displays all SA cache entries that were originated by the specified rendezvous point.
local	Displays locally originated SA cache entries only.
remoteaddr	Displays the SA cache entries received from the MSDP peer with the specified IP address.
src-addr	Displays the SA cache within the specified source address range.
vrname	Specifies the name of the virtual router to which this command applies. If a name is not specified, it is extracted from the current CLI context.

Default

N/A.

Usage Guidelines

Use this command to view and troubleshoot the SA cache database. There are various filtering criteria you can use to display just a subset of the SA cache database. The following are some of the criteria, which you can use together or separately, to display information about the SA cache:

- Filtering on the group address range
- Filtering on the source address range
- Filtering on the originator rendezvous point address
- Filtering of the advertising MSDP peer
- Locally originated SA cache
- Rejected SA cache

Example

The following command displays the SA cache database:

```
show msdp sa-cache
Group Address   Source Address  Originator      Peer Address    Age/Ageout In
------------------------------------------------------------------------------
--
235.100.200.1   10.20.30.1      60.0.0.5        10.0.0.1        00:44:24/05:10
235.100.200.2   10.20.30.2      60.0.0.5        192.0.0.16      00:44:24/05:16
235.100.200.3   10.20.30.3      60.0.0.5        10.0.0.1        00:44:24/05:10
235.100.200.4   10.20.30.4      60.0.0.5        10.0.0.1        00:44:24/05:10
235.100.200.5   10.20.30.5      60.0.0.5        55.0.0.5        00:44:24/05:01
```

```
235.100.200.6   10.20.30.6      60.0.0.5        178.54.67.23    00:44:24/05:17

235.100.200.17  10.20.30.17     60.0.0.5        0.0.0.0         00:44:24/00:00
235.100.200.18  10.20.30.18     60.0.0.5        0.0.0.0         00:44:24/00:00
235.100.200.19  10.20.30.19     60.0.0.5        0.0.0.0         00:44:25/00:00
Number of accepted SAs      : 255
Number of rejected SAs      : 0
Flags: (a) Accepted, (f) Filtered by policy, (r) RPF check failed
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure msdp sa-cache-server

unconfigure msdp sa-cache-server {**vr** *vrname*}

Description

Removes the MSDP SA cache server.

Syntax Description

vrname	Specifies the name of the virtual router on which the MSDP cache server is configured. If a virtual router name is not specified, it is extracted from the current CLI context.

Default

By default, the router does not send SA request messages to its MSDP peers when a new member joins a group and wants to receive multicast traffic. The new member simply waits to receive SA messages, which eventually arrive.

Usage Guidelines

Use this command to remove the MSDP SA cache server you specified with the configure msdp sa-cache-server command.

Example

The following command removes the MSDP SA cache server:

```
unconfigure msdp sa-cache-server
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the MSDP feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

unconfigure pim border

unconfigure pim *vlan_name* **border**

Description

Unconfigures a PIM VLAN that has been configured as a border VLAN, which is used to demarcate a PIM domain when using MSDP.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

By default, no PIM VLANs are configured as border VLANs.

Usage Guidelines

A PIM-SM domain is created by limiting the reach of PIM BSR advertisements. When a border VLAN is configured, PIM BSR advertisements are not forwarded out of the PIM VLAN. Use the unconfigure pim border command to remove the border functionality of the specified PIM VLAN.

Example

The following command unconfigures a PIM border on a VLAN called “vlan_border”:

```
unconfigure pim vlan_border border
```

History

This command was first available in ExtremeXOS 12.0.

Platform Availability

This command is available on platforms that support the appropriate license. For complete information about software licensing, including how to obtain and upgrade your license and which licenses support the PIM feature, see the ExtremeXOS Concepts Guide, Feature License Requirements

46 Configuration and Image Commands

This appendix describes commands for:

- Downloading and using a new switch software image
- Saving, uploading, and downloading switch configuration information
- Downloading and installing a new BootROM image and switch rebooting

The switch software image contains the executable code that runs on the switch. An image comes preinstalled from the factory. The image can be upgraded by downloading a new version from a Trivial File Transfer Protocol (TFTP) server on the network. If you have a switch with a compact flash card or a USB 2.0 storage device, you can also download a new version from the storage device.

A switch can store up to two images; a primary and a secondary image. You can download a new image into either one of these, and you can select which image will load on the next switch reboot.

The configuration is the customized set of parameters that you have selected to run on the switch. As you make configuration changes, the new settings are stored in run-time memory. To retain the settings, and have them load when you reboot the switch, you must save the configuration to nonvolatile storage.

The switch can store multiple user-defined configuration files, each with its own file name. By default, the switch has two pre-named configurations: a primary and a secondary configuration. You can select to which configuration you want the changes saved, or you can save the changes to a new configuration file. You can also select which configuration will be used on the next switch reboot.

The BootROM initializes certain important switch variables during the switch boot process. In specific situations, you can upgrade the BootROM on the Summit family switches and SummitStack by download from a TFTP server on the network. On the BlackDiamond X8 and BlackDiamond 8800 series switches, you can upgrade the firmware, including the BootROM, when you upgrade the software image.

clear license-info

clear license-info {software}

Description

This command, which should be used only in conjunction with a representative from Extreme Networks, clears the licensing information from the switch.

Syntax Description

software	Specifies ExtremeXOS base software license

Default

N/A.

Usage Guidelines

Note

Use this command only under the guidance of an Extreme Networks representative.

When you issue the command, the following message is displayed:

```
This will clear the license information stored in EEPROM and also delete
the license file (license.xlic).
Are you sure you want to continue? (y/N)
```

When you reply “yes”, the license information is removed from the EEPROM and the switch deletes the license.xlic file permanently.

Example

The following command removes licensing information from the switch:

```
clear license-info
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

configure firmware

configure firmware [auto-install | install-on-demand]

Description

Configures the way a BlackDiamond 8800 series switch performs a system firmware upgrade.

Syntax Description

auto-install	Specifies ExtremeXOS to automatically upgrade the firmware if the software detects a newer firmware image is available. The switch does not prompt you to confirm the firmware upgrade.
install-on-demand	Specifies the switch to prompt you to upgrade the firmware when ExtremeXOS determines that a newer firmware image is available. This is the default behavior.

Default

The default is install-on-demand.

Usage Guidelines

Use the configure firmware [auto-install | install-on-demand] and install firmware {force} commands to upgrade the BootROM images on the MSM and I/O modules and the firmware on the PSU controllers installed in BlackDiamond X8 and BlackDiamond 8800 series switches.

Firmware images are bundled with ExtremeXOS software images. ExtremeXOS automatically compares the existing firmware image flashed into the hardware with the firmware image bundled with the ExtremeXOS image when you:

- Download a new version of ExtremeXOS to the alternate (inactive) partition.
- Install a new module into an active chassis.

After a firmware image upgrade, messages are sent to the log.

In addition, if you insert an I/O module that has older firmware present into a chassis that is configured for auto-install then the following behaviors occur:

On the Black Diamond 8800, newer firmware is installed automatically upon insertion and the following log message is generated.

```
<Info:HAL.Card.Info> MSM-A: Slot  2 bootrom updated to 1.0.1.3
```

There is also a log message that states that the newer firmware will not be used until after the next reboot of the I/O module.

On the BlackDiamond X8, newer firmware will not be installed automatically. A log message is generated informing the user that newer firmware is available and the command to use to install it. This behavior applies to MM, IO, FM, and FanTray only.

If you select the auto-install parameter, you are not prompted to confirm the firmware upgrade. Whenever ExtremeXOS determines a newer firmware image is available, the firmware is automatically upgraded.

If you use the default configuration install-on-demand, you have the opportunity to cancel the firmware upgrade. If you install a new software image, and a new firmware image is available, the switch prompts you to upgrade the firmware. Enter y to upgrade the firmware image. Enter n to cancel the firmware upgrade for the specified hardware and continue scanning for other hardware that needs to be upgraded.

The following command downloads the switch software image. The secondary partition must be the alternate partition.

```
download image bd8800-11.3.0.10.xos secondary
```

If you download a new image and new firmware images are available, you see messages similar to the following:

```
Do you want to install image after downloading? (y - yes, n - no, <cr> -
cancel) Yes
Downloading to MSM-
A.....................................................................
.....................
Saving configuration on secondary MSM ............. done!
Installing to secondary partition!
Installing to MSM-
A.....................................................................
.....................................................................
.....................................................................
.....................................................................
.....................................................................
.....................................................................
.....................................
Image installed successfully
```

Installing version 1.0.0.16 of the MSM bootrom(s). Do you want to continue? (y/n) Yes

Installing version 1.0.0.24 of the IO module bootrom(s). Do you want to continue? (y/n) Yes

Installing version 2.4 of the PSU control module firmware. Do you want to continue? (y/n) Yes

Installing bootrom...

MSM bootrom(s) installed successfully

Installing bootrom...

IO module bootrom(s) installed successfully

Installing firmware...

PSU controller firmware installed successfully

```
...
```

Displaying BootROM and Firmware Versions

To display the BootROM (firmware) version for all modules and PSU controllers installed in the switch, use the show version command.

Recovering From a Corrupted BootROM

If your default BootROM image becomes corrupted, you can force the MSM to boot from an alternate BootROM image by inserting a pen into the Alternate (A) and Reset (R) holes on the BlackDiamond 8800 MSM and applying pressure. For more information, please refer to the hardware documentation.

Example

The following command automatically upgrades the firmware when a newer firmware image is present without prompting you to confirm the upgrade:

```
configure firmware auto-install
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on the BlackDiamond X8 and BlackDiamond 8800 series switches.

download image

Using TFTP

download image [[*hostname* | *ipaddress*] *filename* {{**vr**} *vrname*} | **memorycard** *filename*] {*partition*} {**msm** *slotid*}

To download an image to a stack:

download image [[*hostname* | *ipaddress*] *filename* {{**vr**} *vrname*} | **memorycard** *filename*] {*partition*} {**slot** *slot number*

Description

Downloads a new version of the ExtremeXOS software image.

The image file can be downloaded using TFTP which is not a secure method or SFTP and SCP2 which are secure methods. The procedure using TFTP begins above and using SFTP/SCP2 Using SFTP and SCP2.

Note

Beginning with ExtremeXOS 12.1, an ExtremeXOS core image must be downloaded and installed on the alternate (non-active) partition. If a user tries to download to an active partition, the error message `Error: Image can only be installed to the non-active partition.` is displayed.

Syntax Description

hostname	Specifies the hostname of the TFTP server from which the image should be obtained.
ipaddress	Specifies the IP address of TFTP server from which the image should be obtained.
memorycard	Specifies that the image should be obtained from a removable storage device, which can be a compact flash card or a USB 2.0 storage device. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 series switches and for USB 2.0 storage devices on BlackDiamond X8, Summit X460, X480, X650, X670, and X670V switches.
filename	Specifies the filename of the new image.
vrname	Specifies the name of the virtual router. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements.
partition	Specifies which partition the image should be saved to: primary or secondary. Select primary to save the image to the primary partition and secondary to save the image to the secondary partition.

slotid	Specifies the MSM/MM where the software image should be downloaded. A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches.
slot number	Specifies the slot where the software image should be downloaded. The value may be from 1 to 8. NOTE: This parameter is available only on stackable switches in a stack.

Default

Stores the downloaded image in the alternate (inactive) partition.

Using SFTP andSCP2

SFTP and SCP2 provide secure methods of downloading the ExtremeXOS software image files, *.xos or *.xmod. You can use one of three procedures:

- From the switch, running the command SCP2. connect to and “get” from a remote server. This is similar to the download image command.
- From outside the switch, connect to the switch which is acting as the server and “put” from the remote server. There is no TFTP equivalent for this method.
  - Using SFTP, or
  - Using SCP2.

Example of these procedures are included in the Examples section that starts Example.

Usage Guidelines

Prior to downloading an image on the switch, you must download the image you received from Extreme Networks to a TFTP server on your network. If your switch has a removable storage device, you can also download the image to that device.

Note

Unlike ExtremeWare, the download image command in ExtremeXOS causes the switch to use the newly downloaded software image during the next switch reboot. To modify or reset the software image used during a switch reboot, use the use image command. Use the use image command after downloading and installing the image for it to be effective.

Specify the ipaddress or hostname parameters to download an image from a TFTP server on the network. Use of the hostname parameter requires that DNS be enabled.

Specify memorycard to download a an image from a removable storage device. Use a PC with appropriate hardware such as a compact flash reader/writer and follow the manufacturer’s instructions to access the compact flash card and place the image onto the card. For more information about installing a removable storage device, see the hardware documentation.

Core Software Images

The switch can store up to two core images: a primary and a secondary. When downloading a new image, you select which partition (primary or secondary) to install the new image. The ExtremeXOS core image must be downloaded and installed to the alternate partition.

Image Filenames

The software image file can be an .xos file, which contains an ExtremeXOS core image, or an .xmod file, which contains an ExtremeXOS modular software package. Modular software packages have additional functionality that supplement a core image.

You can identify the appropriate image or module for your platform based on the filename of the image. The following table lists the filename prefixes for each platform:

Table 58: Filename Prefixes

Platform	Filename Prefixes
BlackDiamond X8	bdX-
BlackDiamond 8810	bd8800-
BlackDiamond 8806	bd8800-
Summit family	summitX-

For example, if you have a BlackDiamond 8806 switch, download image filenames with the prefix bd8800-.

Displaying the Software Image Versions

To display the software image version running on the switch, use the show version or show switch commands.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Local and Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local or remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

When naming a local or remote file, remember the requirements listed above.

Messages Displayed by the Switch

When you download a new image, you see the following message:

```
Do you want to install image after downloading? (y - yes, n - no, <cr> -
cancel)
```

Do one of the following:

- Enter y if you want to install the image after download.
- Enter n if you want to install the image at a later time.
- Press [Enter] if you want to cancel the download.

Core Dump Messages

If you configure the switch to write core dump (debug) files to the internal memory card and attempt to download a new software image, you might have insufficient space to complete the image download. If this occurs, you must decide whether to continue the software download or move or delete the core dump files from the internal memory. For example, if you have a switch with removable storage device and available space, transfer the files to the device. On switches without removable storage devices, transfer the files from the internal memory card to a TFTP server. This frees up space on the internal memory card while keeping the core dump files.

The switch displays a message similar to the following and prompts you to take action:

```
Core dumps are present in internal-memory and must be removed before this
download can continue. (Please refer to documentation for the “configure
debug core-dumps” command for additional information)
Do you wnat to continue with download and remove existing core dumps? (y/n)
```

Enter y to remove the core dump files and download the new software image. Enter n to cancel this action and transfer the files before downloading the image.

For information about configuring and sending core dump information, see the configure debug core-dumps and save debug tracefiles memorycard commands.

SummitStack Only

You can issue this command only from the Master node.

If a slot is not specified, the image is downloaded to every node in the Active Topology. If a slot is specified, the image is downloaded to that slot only.

If all nodes to be downloaded are not running the same partition, the command is not executed and following message is displayed:

```
Error: all nodes do not have the same image partition selected.
```

If all nodes to be downloaded have the same partition selected but the EXOS is currently running from the selected partition, the command is not executed and the following message is displayed:

```
Error: the image partition selected must not be the active partition.
```

Downloading a New Image

The following assumes you have already downloaded the image to a network TFTP server or removable storage device. The information in this section provides more detailed information for downloading a new image to your switch.

Note

Always refer to the most recent version of the release notes for the most current download instructions.

Step 1—Verifying the Virtual Router

If you loaded the image onto a removable storage device, proceed to step 2.

If you loaded the image onto a TFTP server, use one of the following ping commands to confirm which virtual router reaches your TFTP server:

```
ping vr vr-Mgmt <host>          ping vr vr-Default <host>
```

At least one of these commands must successfully reach your TFTP server for you to download the image. After verifying the virtual router that reaches your TFTP server, specify that virtual router when you download the image.

Step 2—Viewing the Partition

To view your selected and booted partition, use the following command:

```
show switch
```

Output from this command includes the selected and booted images and if they are in the primary or the secondary partition.

Step 3—Selecting the Partition

The image must be downloaded and installed to the alternate (inactive) partition. To specify the partition when downloading and installing the image, use one of the following commands:

```
download image [[<hostname> | <ipaddress>] <filename> {{vr} <vrname>}
| memorycard <filename>] {<partition>} {msm <slotid>} (modular
switches)        download image [[<hostname> | <ipaddress>] <filename> {{vr}
<vrname>} | memorycard <filename>] {<partition>} {slot <slot number>}
(SummitStack)
```

Step 4—Downloading and Installing the Image

To download the image, use the appropriate, previously described, download image command.

Downloading an ExtremeXOS core image

An ExtremeXOS core image uses the file extension .xos.

- Before the download begins, the switch asks if you want to install the image immediately after the download is finished.

  Enter y to install the image after download. Enter n to install the image at a later time.

  When you install the image to the alternate (inactive) partition; you do not need to reboot the switch until you are ready to use the image.

  If you install the image at a later time, the image is still downloaded and saved to the switch, but you must use the following command to install the software and reboot the switch:

  install image <fname> {<partition>} {msm <slotid>} {reboot}

  Where fname specifies the filename of the new, downloaded image.

Downloading an ExtremeXOS module image.

An ExtremeXOS module image has functionality that supplements a core image. You download and install a module onto an already installed core image. The version number of the core image and the module must match. For example, the module bd10K-11.0.0.25-ssh.xmod can only be installed onto the core image bd10K-11.0.0.25.xos.

To install a module to the inactive partition, use the download image command to download the module to the inactive partition, and use the install firmware command to install it, if you did not choose to install when the image was downloaded. Remember, the core image on the inactive partition must be of the same version as the module. When you make the inactive partition active, by issuing the use image command and rebooting the switch, the module is also activated at boot time.

To install a module to the active partition (except on SummitStack), use the download image command to download the module to the active partition, and use the install firmware command to install it, if you did not choose to install when the image was downloaded. Remember, the core image on the active partition must be of the same version as the module. If you reboot the switch, the module will also be activated, but you can activate the module without rebooting the switch by issuing the run update command. After issuing that command, all the functionality, and command line interface (CLI) commands, of the module will be available.

Performing a Hitless Upgrade—Modular Switches Only

Hitless upgrade is a mechanism that allows you to upgrade the ExtremeXOS software running on the switch without taking the switch out of service. Some additional benefits of using hitless upgrade include:

- Minimizing network downtime
- Reducing the amount of traffic lost

Although any method of upgrading software can have an impact on network operation, including interrupting Layer2 network operation, performing a hitless upgrade can decrease that impact.

You must have two MSMs installed in your switch to perform a hitless upgrade. With two MSMs installed in the switch, one assumes the role of primary and the other assumes the role of backup. The primary MSM provides all of the switch management functions including bringing up and programming the I/O modules, running the bridging and routing protocols, and configuring the switch. The primary MSM also synchronizes its configurations with the backup MSM which allows the backup to take over the management functions of the primary.

Note

If you download an image to the backup MSM, the image passes through the primary MSM before the image is downloaded to the backup MSM.

Before performing a hitless upgrade, review the following list to confirm that your system supports hitless upgrade:

- BlackDiamond 8800 series switch with a mix of BlackDiamond 8000 c-, e-, and xl-series modules installed—Both MSMs are running ExtremeXOS 11.5 or later. r.

To perform a hitless upgrade, do the following:

View current switch information using the following command:

show switch

Determine your selected and booted partition, verify which MSM is the primary and which is the backup, and confirm that the MSMs are synchronized.

Output from this command indicates, for each MSM, the selected and booted images and if they are in the primary or the secondary partition. The selected image partition indicates which image will be used at the next reboot. The booted image partition indicates the image used at the last reboot. It is the active partition.

The current state indicates which MSM is the primary (displayed as MASTER), which MSM is the backup (displayed as BACKUP), and if the backup MSM is synchronized with the primary MSM (displayed as In Sync).

Select the partition to download the image to and download and install the new ExtremeXOS software on the backup MSM using the following command:

download image [[<hostname> | <ipaddress>] <filename> {{vr} <vrname>} | memorycard <filename>] {<partition>} {msm <slotid>}

Note

If the backup MSM is installed in slot B, specify msm B. If the backup MSM is installed in slot A, specify msm A.

- Before the download begins, the switch asks if you want to install the image immediately after the download is finished.

  Enter y to install the image after download. Enter n to install the image at a later time.

  When you install the image after download to the alternate partition, you need to reboot only the Backup MSM that the newer code was downloaded and installed on. Use the reboot msm b command (if "b" is the Backup MSM).

  If you install the image at a later time, use the following command to install the software:

  install image <fname> {<partition>} {msm <slotid>} {reboot}

Verify that the backup MSM comes up correctly and that the MSMs are synchronized using the following command:

show switch

The current state indicates which MSM is the primary (displayed as MASTER), which MSM is the backup (displayed as BACKUP), and if the backup MSM is synchronized with the primary MSM (displayed as In Sync).

Initiate failover from the primary MSM to the backup MSM using the following command:

run msm-failover

When you failover from the primary MSM to the backup MSM, the backup becomes the new primary, runs the newly downloaded software, and provides all of the switch management functions.

If you have a BlackDiamond 8800 series switch and the new ExtremeXOS image supports hitless upgrade but is not compatible with the current running I/O module image (the I/O version numbers do not match), you cannot perform a hitless upgrade.

The switch displays a warning message similar to the following:

WARNING: Failover will not be hitless due to incompatible images. Traffic will be interrupted.

Are you sure you want to failover? (y/n)

You can either continue the upgrade or cancel the action. If you continue the upgrade, the primary MSM downloads the new image to the I/O module and reboots.

Verify that the backup MSM comes up correctly and that the MSMs are synchronized using the following command:

show switch

The current state indicates which MSM is the primary (displayed as MASTER), which MSM is the backup (displayed as BACKUP), and if the backup MSM is synchronized with the primary MSM (displayed as In Sync).

Select the partition to download the image to and download and install the new ExtremeXOS software on the new backup MSM (this was the original primary MSM) using the following command:

download image [<hostname> | <ipaddress>] <filename> {vr <vrname>} msm <slotid>

Note

If the new backup MSM is installed in slot A, specify msm A. If the new backup MSM/MM is installed in slot B, specify msm B.

Before the download begins, the switch asks if you want to install the image immediately after the download is finished.

- When you download and install the software image on the alternate partition, you need to reboot only the Backup MSM that the newer code was downloaded and installed on. This can be done using the reboot msm a command (if "a" is the New Backup)
- If you install the image at a later time, use the following command to install the software:

  install image <fname> {<partition>} {msm <slotid>} {reboot}

Verify that the new backup MSM comes up correctly and that the MSMs are synchronized using the following command:

show switch

The current state indicates which MSM is the primary (displayed as MASTER), which MSM is the backup (displayed as BACKUP), and if the backup MSM is synchronized with the primary MSM (displayed as In Sync).

Optionally, initiate failover from the new primary MSM to the new backup MSM using the following command:

run msm-failover

When you failover from the new primary MSM to the new backup MSM, this optional step restores the switch to the original primary and backup MSM.

Optionally, confirm that the failover is successful by checking the current state of the MSMs using the following command:

show switch

You can also perform a hitless upgrade on ExtremeXOS modular software packages (.xmod files). To perform a hitless upgrade of a software package, you must install the core software image first, and the version number of the modular software package must match the version number of the core image that it will be running with. For more information about hitless upgrade, see the ExtremeXOS Concepts Guide.

Hitless Upgrade Caveats for the BlackDiamond 8800 Series Switches Only

The following is a summary of hitless upgrade caveats for only the BlackDiamond 8800 series switches:

- If you are running ExtremeXOS 11.4 or earlier, do not attempt to perform a hitless upgrade to ExtremeXOS 11.5 or later. If attempted, the backup MSM enters the non-operational state.

  To recover from the non-operational state, do the following:

From the primary MSM, use the synchronize command to return the MSMs to the same version of software.To confirm the MSMs are synchronized, use the show switch command.

The current state indicates which MSM is the primary (displayed as MASTER), which MSM is the backup (displayed as BACKUP), and if the backup MSM is synchronized with the primary MSM (displayed as In Sync).

After you recover from the non-operational state and confirm the MSMs are synchronized, perform a normal code upgrade to install and upgrade the image on the switch. For more information, see the sections starting with Step 1—Verifying the Virtual Router through Downloading an ExtremeXOS core image.

Note

ExtremeXOS 11.5 introduced support for the BlackDiamond 8800 e-series modules. If your switch is running ExtremeXOS 11.4 or earlier, you must upgrade to ExtremeXOS 11.5 to operate the modules. Hitless upgrade is not supported between major releases. Do not attempt to perform a hitless upgrade. To upgrade the switch from ExtremeXOS 11.4 or earlier to ExtremeXOS 11.5 or later, reboot the switch after downloading and installing the new image to both installed MSMs.

Example

Using TFTP

Modular Switches—

The following command downloads the switch software image from the TFTP server at 10.10.15.4, from the file named bd12K-12.4.1.1.xos without specifying the desired partition:

```
download image 10.10.15.4 bd12K-12.4.1.1.xos
```

```
Note: The inactive partition (secondary) will be used for installation.
Do you want to install image after downloading? (y - yes, n - no, <cr> -
cancel) Yes
Downloading to MSM-
A.....................................................
Installing to secondary partition!
Installing to MSM-
A.....................................................................
.....................................................................................
.
.....................................................................................
.
.........................
```

The following command downloads the switch software image from the TFTP server at 10.10.15.4, from the file named bd10K-11.0.0.25.xos specifying the desired partition. The secondary partition is the alternate partition in this example.

```
download image 10.10.15.4 bd10K-11.0.0.25.xos secondary
```

On a modular switch, when you download an image into the alternate partition, you see output similar to the following:

```
Do you want to install image after downloading? (y - yes, n - no, <cr> -
cancel) Yes

Downloading to MSM-
A.....................................................
Downloading to MSM-B.............................
Installing to secondary partition!

Installing to MSM-
B .....................................................
.....................................................................................
.
.....................................................................................
.
.....................................................................................
.
Installing to MSM-
A.....................................................
.....................................................................................
.
.....................................................................................
.
.....................................................................................
.
```

If you answer yes to installing the image, the switch reboots upon completion of the installation.

Summit Switch—

The following command downloads the switch software image from the TFTP server at 10.10.15.4, from the file named summitX450-11.2.0.15.xos:

```
download image 10.10.15.4 summitX450-12.4.1.1.xos
Note: The inactive partition (secondary) will be used for installation.
```

When you download an image into the alternate partition, you see output similar to the following:

```
Do you want to install image after downloading? (y - yes, n - no, <cr> -
cancel) Yes

Downloading to
Switch.....................................................
Installing to secondary partition!
................................................................................
.
................................................................................
.
................................................................................
.
................................................................................
.
................................................................................
.
```

If you answer yes to installing the image, you must reboot the switch upon completion of the installation.

When you download an image to a SummitStack, the image is simultaneously downloaded to multiple switches as shown in the following example:

```
Downloading to
Slot-1(Master): ................................................
Downloading to Slot-2(Backup):
Downloading to
Slot-3(Standby): .*..*****....**..**..**..**..***..**...**..***..****....***..
.
```

The ".*..*****....**..**..**..**..***..**...**..***..****....***..." pattern above indicates that the image is being downloaded to Slot2(Backup) and Slot-3(Standby) in parallel.

In the next example, the ".*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*." pattern indicates that the image is being installed to Slot-2 (backup) and Slot-3 (standby) in parallel. The "....." pattern for the master shows that the image is being installed to only the master.

```
Installing to Slot-2(Backup):
Installing to Slot-3(Standby): .*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.
*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.
*.*.*.*.
.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*
.*.*.*.*
```

```
*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.
*.*.*.*.
.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*
.*.*.*.*
*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.
*.*.*.*.
.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*
.*.*.*.*

.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*
.*.*.*.*
*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.*.**.*.*.*.*.*.*.*.*.*
.*.*.*.*
.*.*.*.*.*.*.*.*.*.*.*.*.***************
Installing to
Slot-1(Master): ..............................................................
...............
..............................................................................
........
..............................................................................
........
```

Using SFTP and SCP2

The following commands show the three procedures

- From the Switch using SCP2

  (debug) SummitX450-24x.5 # scp2 root@10.203.133.13:/tmp/summitX-12.0.0.4-ssh.xmod summitX-12.0.0.4-ssh.xmod Download to /scratch/summitX-12.0.0.4-ssh.xmod on switch Connecting to 10.203.133.13... root@10.203.133.13's password: Fetching /tmp/summitX-12.0.0.4-ssh.xmod to /scratch/summitX-12.0.0.4-ssh.xmod /tmp/summitX-12.0.0.4-ssh.xmod 100% 997KB 996.9KB/s 00:00 Please wait validating image summitX-12.0.0.4-ssh.xmod ,this will take approximately 30 seconds ... * (debug) SummitX450-24x.6 #
- From Outside the Switch using SFTP

  sftp admin@10.203.3.231 Connecting to 10.203.3.231... admin@10.203.3.231's password: sftp> put summitX-12.0.0.4-ssh.xmod Examplesftp.xmod Uploading summitX-12.0.0.4-ssh.xmod to /config/Examplesftp.xmod sftp>
- From Outside the Switch using SCP2

- scp2 summitX-12.0.0.4-ssh.xmod admin@10.203.3.231:Examplescp.xmod
- Keyboard-interactive:
- Keyboard-interactive authentication
- Enter password for admin:
- summitX-12.0.0.4-ssh.xmod | 997kB | 997kB/s | TOC: 00:00:01 | 100%
- [~/cvs/branch-fixes_v1200b4.c4/exos/cougar/release]$

Following download, the output from a show log command is similar to the following for the last two procedures—the two from outside the switch.

```
show log
```

04/03/2007 14:32:29.31 <Info:AAA.LogSsh> Got Image file Example.xmod 04/03/2007 14:32:29.31 <Info:AAA.LogSsh> Validating Image file, this could take approximately 30 seconds.. Example.xmod 04/03/2007 14:32:30.89 <Info:AAA.LogSsh> Image file Example.xmod successfully validated can now install image

History

This command was first available in ExtremeXOS 10.1.

The memorycard option was added in ExtremeXOS 11.0.

The msm parameter was added in ExtremeXOS 11.1.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

enable license

enable license {**software**} *key*

Description

Enables software license or feature pack that allows you to use advanced features.

Syntax Description

key	Specifies your hexadecimal license key in format xxxx-xxxx-xxxx-xxxx-xxxx.

Default

N/A

Usage Guidelines

The software license levels that apply to ExtremeXOS software are described in the ExtremeXOS Concepts Guide, Feature License Requirements

To obtain a software license, specify the key in the format xxxx-xxxx-xxxx-xxxx-xxxx.

You obtain the software license key (or feature pack key) either by ordering it from the factory or by obtaining a license voucher from your Extreme Networks supplier. You can obtain a regular software license or a trial software license, which allows you use of the license for either 30, 60 or 90 days; you cannot downgrade software licenses.

The voucher contains all the necessary information on the software license, whether regular or trial, and number of days for trial software license.

After you enable the software license or feature pack by entering the software key, the system returns a message that you either successfully or unsuccessfully set the license.

Once you enable the software license (or if you do not use the correct key, attempt to downgrade the license, or already installed the software license) you see one of the following messages:

```
Enabled license successfully.
Error: Unable to set license using supplied key.
Error: Unable to set license - downgrade of licenses is not supported.
Error: Unable to set license - license is already enabled.
Error: Unable to set license - trial license already enabled.
```

If you enable a trial license, the system generates a daily message showing the number of days until expiry.

Once installed (or enabled), the software license goes with the switch chassis itself (not with the MSM/MM module on modular switches). A software license must be installed separately on each Summit X250e or X450 series switch, whether or not it is operating in a SummitStack. The software license information is stored in EEPROM in the modular switches and NVRAM on the stand-alone switches and SummitStack; the information persists through reboots, software upgrades, power outages, and reconfigurations.

If you attempt to execute a command and you do not either have the required software license or have reached the limits defined by the current software license level, the system returns one of the following messages:

```
Error: This command cannot be executed at the current license level.
Error: You have reached the maximum limit for this feature at this license
level.
```

If you attempt to execute a command and you do not have the required feature pack, the system also returns a message.

To protect against attacks to install maliciously created license keys, the system has an exponential delay of each failed attempt to install a license.

To view the type of software license you are currently running on the switch, use the show licenses command. The license key number is not displayed, but the type of software license is displayed in the show licenses output. This command can be run on any node in a SummitStack, regardless of its node role (Master, Standby, or Backup).

Example

The following command enables a software license on the switch:

```
enable license 2d5e-0e84-e87d-c3fe-bfff
```

History

This command was first available in ExtremeXOS 11.1.

The software parameter was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

enable license file

enable license file *filename*

Description

Enables the text file that applies software licenses and feature packs licenses to more than one switch at a time.

Syntax Description

fileneame	Specifies the filename that you download onto the switch using TFTP; the file extension is .xlic.

Default

N/A

Usage Guidelines

You download the license file to the switch using TFTP or SCP. The file name extension for this file is <xlic>; for example, you may see a file named systemlic.xlic.

Using this file, you enable the software and feature pack licenses for more than one switch simultaneously. The file can contain licenses for some or all of the Extreme Networks switches that the customer owns. During upload, only those license keys destined for the specific switch are used to attempt enabling the licenses. The license file is a text file that has the switch serial number, software license type, and license key; it is removed from the switch after the licenses are enabled.

After you enable the license file, the system returns one or more of the following messages:

```
Enabled license successfully.
Error: Unable to set license <license_name> using supplied key.
Error: Unable to set license <license_name> - downgrade of licenses is not
supported.
Error: Unable to set license <license_name> - license is already enabled.
Error: Unable to set license <license_name> - trial license already enabled.
```

To protect against attacks to install maliciously created license keys, the system has an exponential delay of each failed attempt to install a license.

For Summit X250e and X450 switches, the command must be executed on each node, whether or not it is operating in a SummitStack.

Example

The following command enables a license file on the specified Extreme Networks switches:

```
enable license file santaclara.xlic
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

install bootrom

install bootrom *fname* {**reboot**} {**msm** *slotid*}

On a SummitStack use:

install bootrom *fname* {**reboot**} {**slot** *slotid*}

Description

Installs a new version of the ExtremeXOS BootROM image.

Syntax Description

fname	Specifies the BootROM image file.
reboot	Reboots the switch after the image is installed.
slotid	Specifies the MSM/MM where the BootROM image should be installed. A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on the SummitStack. On a SummitStack, the slotid specifies the node on which the BootROM image should be installed.

Default

N/A.

Usage Guidelines

When you download a BootROM image, the system asks if you want to install the image immediately after the download is finished. If you choose to install the image at a later time, use this command to install the software on the switch.

The BootROM image file is an .xbr file, and this file contains the executable code.

Displaying the BootROM Versions

To display the BootROM version for the switch and all of the modules and PSU controllers installed in a modular switch, use the show version command.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local or remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

SummitStack Only

You can issue this command only from the Master node.

Example

The following command installs the bootrom image file bd10K-1.0.1.5-bootrom.xbr:

```
install bootrom bd10K-1.0.1.5-bootrom.xbr
```

On the Summit series switch, you see output similar to the following:

```
Installing bootrom...
Writing bootrom
................................................................
................................................................
........................
Verifying Flash contents...
................................................................
................................................................
................................................................
................................................................
```

```
.................................................
bootrom written.
Bootrom installed successfully
```

History

This command was first available in ExtremeXOS 11.0.

The msm parameter was added in ExtremeXOS 11.1.

From ExtremeXOS 12.0, this command is supported on a stack. The slot parameter is added. The slot parameter is applicable only when the switch is in a stack.

Platform Availability

This command is available only on Summit family switches and SummitStack.

install firmware

install firmware {force}

Description

Installs the firmware bundled with the ExtremeXOS image on the BlackDiamond X8 and BlackDiamond 8800 series switches.

Syntax Description

force	Specifies that a new image is installed without a version check.

Default

N/A.

Usage Guidelines

On BlackDiamond X8 switches, use the install firmware command to upgrade the BootROM images on the MM, I/O, and Fabric modules and the firmware on the fan bars installed on the switch. On BlackDiamond 8800 series switches, use the install firmware command to upgrade the BootROM images on the MSM and I/O modules and the firmware on the PSU controllers installed in the switch.

Firmware images are bundled with ExtremeXOS software images.

On BlackDiamond X8 and BlackDiamond 8800 series switches, the ExtremeXOS software automatically compares the existing firmware image flashed into the hardware with the firmware image bundled with the ExtremeXOS image. You can also use the install firmware command to compare the firmware images.

Before using the install firmware command, wait until the show slot command indicates the MSMs and I/O modules are operational. When the modules are operational, use the install firmware command.

BlackDiamond X8 Switches.

The switch scans MM, I/O, Fabric modules and the Fanbar controllers for a possible firmware upgrade. If the bundled firmware image is newer than the existing firmware image, the switch prompts you to confirm the upgrade.

- Enter y to upgrade the firmware.
- Enter n to cancel the firmware upgrade for the specified hardware and continue scanning for other hardware that needs to be upgraded.
- Enter <cr> to cancel the upgrade. After a firmware image upgrade, messages are sent to the log.

The Fanbar controller firmware is used immediately after it is installed without rebooting the switch. The new BootROM and firmware overwrite the older versions flashed into the hardware. Use the reboot command to reboot the switch and activate the new BootROM and firmware.

During the firmware upgrade, do not cycle down or disrupt the power to the switch. If a power interruption occurs, the firmware may be corrupted and need to be recovered. ExtremeXOS automatically recovers corrupted firmware; however, the time it takes for the switch to boot-up may increase.

The switch displays status messages after you use the install firmware command. The output varies depending upon your platform and the software version running on your system.

BlackDiamond 8800 Series Switches

The switch scans the I/O and MSM modules and the PSU controllers for a possible firmware upgrade. If the bundled firmware image is newer than the existing firmware image, the switch prompts you to confirm the upgrade.

- Enter y to upgrade the firmware.
- Enter n to cancel the firmware upgrade for the specified hardware and continue scanning for other hardware that needs to be upgraded.
- Enter <cr> to cancel the upgrade. After a firmware image upgrade, messages are sent to the log.

The PSU controller firmware is used immediately after it is installed without rebooting the switch. The new BootROM and firmware overwrite the older versions flashed into the hardware. Use the reboot command to reboot the switch and activate the new BootROM and firmware.

During the firmware upgrade, do not cycle down or disrupt the power to the switch. If a power interruption occurs, the firmware may be corrupted and need to be recovered. ExtremeXOS automatically recovers corrupted firmware; however, the time it takes for the switch to boot-up may increase.

The switch displays status messages after you use the install firmware command. The output varies depending upon your platform and the software version running on your system.

Note

If the information in the most current version of the ExtremeXOS Installation and Release Notes differs from the information in this section, follow the release notes.

Sample Output—BlackDiamond X8 Series Switch

The following is sample output from a BlackDiamond X8 switch:

```
Installing version 1.0.0.4 of the BIOS for MMs. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing version 1.0.0.8 of the bootrom for BD-X series
I/O and Fabric modules. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing version 1.0.2.9 of fanbar firmware on all fanbars. Do you want to
continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing MM FPGA image version 0.1.22. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing IO/FM FPGA image version 0.0.36. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes

Installing Bootrom for MM(s) may take several minutes, please do not reboot
system during this time
Installing bootrom...
Bootrom for MMs installed successfully and will be activated upon next MM
reboot
Installing bootrom...
Bootrom for BD-X I/O and Fabric modules installed successfully and will be
activated upon next module reboot
This image will be used only after rebooting the switch!
```

Sample Output—BlackDiamond 8800 Series Switch

The following is sample output from a BlackDiamond 8800 series switch:

```
Installing version 1.0.4.2 of the bootrom for MSMs. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Do you want to save configuration changes to primary.cfg? (y or n) Yes
Saving configuration on primary MSM ....... done!
Installing version 1.0.4.0 of the bootrom for I/O modules.
Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing version 1.0.1.0 of the bootrom for newer (e.g. 8900-series)
I/O modules. Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing version 2.13 of the firmware for PSU control modules.
Do you want to continue?
(y - yes, n - no, <cr> - cancel) Yes
Installing bootrom...
MSM bootrom(s) installed successfully
MSM bootrom(s) will be activated upon next MSM reboot
Installing bootrom...
IO module bootrom(s) installed successfully
IO module bootrom(s) will be activated upon next IO module reboot
Installing firmware...
PSU controller firmware installed successfully
```

Additional Behavior—BlackDiamond X8 and BlackDiamond 8800 Series Switches Only

During a firmware upgrade, the switch prompts you to save your configuration changes to the current, active configuration. Enter y to save your configuration changes to the current, active configuration. Enter n if you do not want to save your changes.

In earlier versions of ExtremeXOS, you are required to immediately reboot the system after a firmware upgrade. In ExtremeXOS 11.3.3 and later, the system displays a message informing you that the new firmware image will be activated the next time you reboot the system.

Use the configure firmware [auto-install | install-on-demand] command to configure how the switch performs a system firmware upgrade. If you select the auto-install parameter, you are not prompted to confirm the firmware upgrade. If you use the default configuration install-on-demand, you can cancel the firmware upgrade.

Power over Ethernet (PoE) firmware is always automatically upgraded or downgraded to match the operational code image. This configuration is not applicable to PoE firmware.

Recovering From a Corrupted BootROM—BlackDiamond 8800 Series Switches Only

If your default BootROM image becomes corrupted, you can force the MSM to boot from an alternate BootROM image by inserting a pen into the Alternate (A) and Reset (R) holes on the BlackDiamond 8800 MSM and applying pressure. For more information, please refer to the hardware documentation.

Displaying BootROM and Firmware Versions

To display the BootROM (firmware) version for all modules and PSU controllers installed in the switch, use the show version command.

Example

The following command installs the newer firmware image(s):

```
install firmware
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available only on BlackDiamond X8 and BlackDiamond 8800 series switches.

install image

install image *fname* {*partition*} {**msm** *slotid*} {**reboot**}

On a SummitStack use:

install image *fname* {*partition*} {**slot** *slot number*} {**reboot**}

Description

Installs a new version of the ExtremeXOS software image.

Note

Beginning with ExtremeXOS 12.1, an ExtremeXOS core image must be installed on the alternate (non-active) partition. If a user tries to install on an active partition, the error message **Error: Image can only be installed to the non-active partition.** is displayed.

Syntax Description

fname	Specifies the software image file.
partition	Specifies which partition the image should be saved to: primary or secondary. Select primary to save the image to the primary partition and secondary to save the image to the secondary partition.
slotid	Specifies the MSM/MM where the software image file should be installed. A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches and SummitStack. On a SummitStack, the slotid specifies the node to which the BootROM image should be installed.
reboot	Reboots the switch after the image is installed.

Default

N/A.

Usage Guidelines

When you download a software image, you are asked if you want to install the image immediately after the download is finished. If you choose to install the image at a later time, use this command to install the software on the switch.

The software image file can be an .xos file, which contains an ExtremeXOS core image, or an .xmod file, which contains additional functionality to supplement a core image.

SummitStack Only

You can issue this command only from a Master node. The slot parameter is available only on a stack.

Displaying the Software Image Version

To display the software image version running on the switch, use the show version or show switch commands.

Displaying the Downloaded Software Image Version.

To display a software image version that has been downloaded but not installed, use the install image ? command.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local, remember the requirements listed above.

Installing an ExtremeXOS core image.

Install the software image on the alternate partition. You can continue to run the currently booted image, but to run the newly installed image, you will need to set the boot partition with the use image {partition} <partition> {msm <slotid>} command and reboot the switch.

Installing an ExtremeXOS module image

An ExtremeXOS module image has functionality that supplements a core image. You will install a module onto an already installed core image. The version number of the core image and the module must match. For example, the module bd10K-11.0.0.25-ssh.xmod can only be installed onto the core image bd10K-11.0.0.25.xos.

To install a module to the alternate partition, use the install firmware command to install the module. Remember, the core image on the alternate partition must be of the same version as the module. When you make the alternate partition active, by issuing the use image command and rebooting the switch, the module is also activated at boot time.

To install a module to the active partition, use the install firmware command to install the module. Remember, the core image on the active partition must be of the same version as the module. If you reboot the switch, the module will also be activated, but you can activate the module without rebooting the switch by issuing the run update command. After issuing that command, all the functionality, and CLI commands, of the module will be available.

Performing a Hitless Upgrade—Modular Switches Only

If you specify the msm parameter on a BlackDiamond 8800 series switch, you can initiate hitless upgrade between the primary and backup MSMs installed in the switch.

Hitless upgrade is a mechanism that allows you to upgrade the ExtremeXOS software running on the switch without taking the switch out of service. Some additional benefits of using hitless upgrade include:

- Minimizing network downtime
- Reducing the amount of traffic lost

Although any method of upgrading software can have an impact on network operation, including interrupting Layer2 network operation, performing a hitless upgrade can decrease that impact.

Regardless of how you upgrade the software, you must:

- Review the following list to confirm that your system supports hitless upgrade:
  - BlackDiamond 8800 series switch with a mix of BlackDiamond 8000 c-, e-, and xl-series modules installed—Both MSMs are running ExtremeXOS 11.5 or later.
- View the current switch information to determine your selected and booted image partitions, verify which MSM is the primary and which is the backup, and confirm that the MSMs are synchronized using the show switch command
- Select the partition to use when downloading the image using the download image [[<hostname> | <ipaddress>] <filename> {{vr} <vrname>} | memorycard <filename>] {<partition>} {msm <slotid>} command.

When performing a hitless upgrade, you must:

- Download the software to the backup MSM. Download the image to the alternate partition.
- Use the install image <fname> {<partition>} {msm <slotid>} {reboot} command to install the software image at a later time.
- Reboot the Backup MSM using the reboot msm b command.
- Use the run msm-failover command to initiate failover from the primary MSM to the backup MSM. The original primary MSM becomes the new backup MSM.
- Download the software to the new backup MSM. Again, download the image to the alternate partition, and use the install image <fname> {<partition>} {msm <slotid>} {reboot} command to install the software image at a later time.

For more detailed information about hitless upgrade, see the download image command.

Example

The following command installs the software image file bd8800-11.3.0.10.xos on a BlackDiamond 8810 switch:

```
install image bd8800-11.3.0.10.xos
```

The following command installs the software image file summitX450-11.5.1.2.xos on a Summit family switch:

```
install image summitX450-11.5.1.2.xos
```

The following command displays a software image version that has been downloaded but not displayed:

```
install image ?
```

A message similar to the following is displayed:

```
SummitX450-24t.10 # install image ?
<fname>         Image file name
"summitX-12.1.0.52.xos"
```

History

This command was first available in ExtremeXOS 10.1.

The msm parameter was added in ExtremeXOS 11.1.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0

Platform Availability

This command is available on all platforms.

load script

load script *filename* **{arg1} {arg2} ... {arg9}**

Description

Loads (plays back) an ASCII-formatted configuration file or a user-written script file on the switch.

Syntax Description

filename	Specifies the user-defined name of the ASCII-formatted configuration file or a user-written script file. The script file is known as the XOS script file and uses the .xsf file extension.
arg	Specifies up to nine variable values that can be specified by the user. The variables are created with the names CLI.ARGV1, CLI.ARGV2, ... CLIARGV9.

Default

N/A.

Usage Guidelines

Use this command to load an ASCII-formatted configuration file or a user-written script file.

Configuration File: After downloading the configuration file from the TFTP server, this command loads and restores the ASCII-formatted configuration file to the switch.

An ASCII-formatted configuration file uses the .xsf file extension, not the .cfg file extension. The .xsf file extension (known as the XOS script file) saves the XML-based configuration in an ASCII format readable by a text editor.

For more detailed information about the ASCII configuration file, including the steps involved to upload, download, and save the configuration, see the upload configuration [<hostname> | <ipaddress>] <filename> {vr <vr-name>} command.

User-Written Script File: After writing a script, this command executes the script and passes arguments to it. As with the configuration files, these files use the .xsf file extension that is automatically added.

The command allows up to nine optional variable values to be passed to the script. These are created with the names CLI.ARGV1, CLI.ARGV2, CLI.ARGV3, ... CLI.ARGV9.

In addition, two other variables are always created. CLI.ARGC gives the count of the number of parameters passed, and CLI.ARGV0 contains the name of the script that is being executed.

To check the variable values use the command, show var.

Note

Only the .xsf extension is used. The load script command assumes an .xsf extension and retries opening the file if the file cannot be found with the original specified name or no extension is provided.

Example

The following command loads the ASCII-formatted configuration named configbackup.xsf:

```
load script configbackup.xsf
```

After issuing this command, the ASCII configuration quickly scrolls across the screen. The following is an example of the type of information displayed when loading the ASCII configuration file:

```
script.meg_upload_config1.xsf.389 # enable snmp access
script.meg_upload_config1.xsf.390 # enable snmp traps
script.meg_upload_config1.xsf.391 # configure mstp region purple
script.meg_upload_config1.xsf.392 # configure mstp revision 3
script.meg_upload_config1.xsf.393 # configure mstp format 0
script.meg_upload_config1.xsf.394 # create stpd s0
```

History

This command was first available in ExtremeXOS 11.4.

Multiple arguments for user-written scripts were added in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

run update

run update

Description

Activates a newly installed modular software package.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

After you install a modular software package to the active partition, use this command to make the update active. This command causes the ExtremeXOS system to start the newly installed processes contained in the package, without rebooting the switch.

If you installed the package to the inactive partition, you need to reboot the switch to activate the package.

Example

The following command activates any newly installed modular software packages installed on the active partition:

```
run update
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

save configuration

save configuration {**primary** | **secondary** | *existing-config* | *new-config*}

Description

Saves the current configuration from the switch's runtime memory to non-volatile memory.

Syntax Description

primary	Specifies the primary saved configuration.
secondary	Specifies the secondary saved configuration.
existing-config	Specifies an existing user-defined configuration.
new-config	Specifies a new user-defined configuration.

Default

Saves the current configuration to the location used on the last reboot.

Usage Guidelines

The configuration takes effect on the next reboot.

Each file name must be unique and can be up to 32 characters long but cannot include any spaces, commas, or special characters.

Configuration files have a .cfg file extension. When you enter the name of the file in the CLI, the system automatically adds the .cfg file extension. Do not use this command with ASCII-formatted configuration files. Those configuration files have an .xsf file extension. For more information about using ASCII-formatted configuration files see the upload configuration [<hostname> | <ipaddress>] <filename> {vr <vr-name>} and the load script <filename> {arg1} {arg2} ... {arg9} commands.

This command also displays in alphabetical order a list of available configurations. The following is sample output that displays the primary, secondary, and user-created and defined configurations ("test" and "XOS1" are the names of the user-created and defined configurations):

```
exsh.9 # save configuration
<cr>               Execute the command
primary            Primary configuration file
secondary          Secondary configuration file
<existing-config>  Existing configuration file name
"test"  "XOS1"
<new-config>       New configuration file name
```

The switch prompts you to save your configuration changes. Enter y to save the changes or n to cancel the process.

If you enter n, the switch displays a message similar to the following:

```
Save configuration cancelled.
```

If you enter y, the switch saves the configuration and displays a series of messages. The following sections provide information about the messages displayed when you save a configuration on your switch.

Note

Configuration files are forward compatible only and not backward compatible. That is, configuration files created in a newer release, such as ExtremeXOS 12.4, might contain commands that do not work properly in an older release, such as ExtremeXOS 12.1.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

Saving a New Configuration

If you create and save a configuration with a new file name, the switch saves the new configuration and then prompts you to select the newly created configuration as the switch's default configuration.

The following sample output is similar to the message displayed:

```
Do you want to save configuration to test1.cfg? (y/n) Yes
Saving configuration on primary MSM ............................... done!
Configuration saved to test1.cfg successfully.
```

The switch then prompts you to select which configuration to use to bootup the system. The following sample output is similar to the message displayed:

```
The current selected default configuration database to boot up the system
(primary.cfg) is different than the one just saved (test.cfg).
Do you want to make test.cfg the default database? (y/n)
```

Enter y to use the new configuration as the default configuration. Enter n to cancel the operation and keep using the current default, active configuration.

Saving an Existing Configuration

If you make and save changes to an existing configuration, the switch prompts you to save and override the existing configuration.

The following sample output is similar to the message displayed:

```
The configuration file test.cfg already exists.
Do you want to save configuration to test.cfg and overwrite it? (y/n) Yes
Saving configuration on primary MSM ............................. done!
Configuration saved to test.cfg successfully.
```

The following sample output on a SummitStack is similar to the output displayed:

```
The configuration file primary.cfg already exists.
Do you want to save configuration to primary.cfg and overwrite it? (y/N) Yes
Saving configuration on primary ........... done!
Synchronizing configuration to backup .... done!
Saving config on Standbys (Slots: 1).
...
Configuration saved on Standby (Slot 1): done!
```

If you override an existing configuration that is not the current default, active configuration, the switch prompts you to select which configuration to use to bootup the system. The following sample output is similar to the message displayed:

```
The current selected default configuration database to boot up the system
(primary.cfg) is different than the one just saved (test.cfg).
Do you want to make test.cfg the default database? (y/n) No
Default configuration database selection cancelled.
```

Enter y to use the updated configuration as the default configuration. Enter n to cancel the operation and keep using the current default, active configuration.

Example

The following command saves the current switch configuration to the configuration file named XOS1:

```
save configuration XOS1
```

The following command save the current switch configuration to the secondary configuration file:

```
save configuration secondary
```

History

This command was first available in ExtremeXOS 10.1.

The status messages displayed by the switch were updated in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

save configuration as-script

save configuration as-script *script-name*

Description

Saves the running configuration as a script.

Syntax Description

script-name	Specifies the name of the file to save the configuration to. The script file is known as the XOS script file and uses the .xsf file extension.

Default

N/A

Usage Guidelines

The save configuration as-script command allows the user to save the current configuration as a script and export it out of the box for later use.

For SummitStack only.

The script is saved on all the nodes in a SummitStack when the save configuration as-script command is executed.

Example

The following command saves a running ASCII-formatted configuration named primary.xsf.

```
save configuration as-script primary.xsf
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show configuration

show configuration {*module-name*} {**detail**}

Description

Displays the current configuration for the system or the specified module.

Syntax Description

module-name	Specifies the name of configuration module. The term configuration module refers to feature in ExtremeXOS. By displaying a module, you can view the commands used to configure that feature. For example, to display all of the configurations that you made for only STP, specify the stp as the module-name.
detail	Displays configuration data including default. If the detail option is not specified, only the configuration changes you made to the factory defaults are shown.

Default

N/A.

Usage Guidelines

If the output scrolls off the top of the screen, you can use the enable clipaging command to pause the display when the output fills the screen. The default for clipaging is enabled.

Extreme Networks recommends using the show configuration command to view on the CLI your currently running switch configuration. These files have the .cfg file extension. Do not use a text editor to view or modify your XML-based switch configuration files.

To save the configuration file as an ASCII-formatted file, and to view it with a text editor, see the upload configuration [<hostname> | <ipaddress>] <filename> {vr <vr-name>} and the load script <filename> {arg1} {arg2} ... {arg9} commands.

Beginning with ExtremeXOS 12.1, when you specify show configuration only, the switch displays configuration information for each of the switch modules excluding the default data.

You can display only the configuration of a module of interest by using the module-name keyword. For example, some of the modules are AAA, ACL, BGP, EDP, FDB, SNMP, and VLAN. Use [TAB]-completion to see a list.

You must have administrator access to view the output of the show configuration command.

Depending on the software version running on your switch, the configurations on your switch, and the type of switch you have, additional or different configuration information may be displayed.

Example

This command shows the current configuration of the OSPF module in the switch:

```
show configuration ospf
```

The following is sample output from this command:

```
# Module ospf configuration.
#
configure ospf routerid automatic
configure ospf spf-hold-time 3
configure ospf metric-table 10M 10 100M 5 1G 4 10G 2
configure ospf lsa-batch-interval 30
configure ospf import-policy none
configure ospf ase-limit 0
disable ospf originate-default
disable ospf use-ip-router-alert
disable ospf
configure ospf restart none
configure ospf restart grace-period 120
disable ospf export direct
disable ospf export static
disable ospf export rip
disable ospf export e-bgp
disable ospf export i-bgp
configure ospf area 0.0.0.0 external-filter none
configure ospf area 0.0.0.0 interarea-filter none
SummitX450a-24x #
```

History

This command was first available in ExtremeXOS 11.0.

The detail variable was added in ExtremeXOS 12.1.

The display of blackhole output was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show licenses

show licenses

Description

Displays current software license level and feature packs enabled on your switches.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The command displays information on the software license level and feature packs enabled on the switch, including the trial license and days left to expiry.

To see the license information on a SummitStack node, run the command while logged into that node.

Note

Refer to the specific chapter that discusses each feature of the ExtremeXOS Concepts Guide to determine if a license is required for some functionality. If not noted, all functionality is available, and license is not required.

Example

The following command displays the license level configuration:

```
show licenses
```

On a SummitStack, the output from this command looks similar to the following:

```
Slot-3 Stack.12 > show licenses
Enabled License Level:
Advanced Edge
Enabled Feature Packs:
None
Effective License Level:
Edge
```

History

This command was first available in ExtremeXOS 11.1.

The information on enabled feature packs was added in ExtremeXOS 11.4.

The information on the trial licenses was added in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.

show memorycard

```
show memorycard
```

Description

Displays whether a compact flash card or USB 2.0 storage device is present in the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

None.

Example

This command shows whether a removable storage device is present on the switch:

```
show memorycard
```

If you do not have a removable storage device installed, the output is similar to the following:

```
Memorycard is not present.
```

On the BlackDiamond X8 switch, there are two USB ports, and so the command indicates which port is being used:

```
BD-X8.1 # show memorycard
Memorycard is present in USB-1.
```

History

This command was first available in ExtremeXOS 11.0.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on BlackDiamond X8 and 8800 series switches and Summit X460, X480, X650, X670, and X670V switches.

show script output autoexec

```
show script output autoexec
```

Description

Shows the results of executing the autoexec script.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to show results when a autoexec.xsf file is executed. The file is not executed when a default.xsf file has been executed.

The CLI script file autoexec.xsf is executed after the configuration has been loaded. Its purpose is to run some commands after every reboot. It can also be used to revert to the original configuration following changes made by UPM executed persistent commands.

Example

This command shows the results of executing the autoexec script

```
show script output autoexec
```

When there is no autoexec.xsf file, there is no response.

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

show script output default

show script output default

Description

Shows the results of executing default.xsf on bootup.

Syntax Description

This command has no arguments or variables.

Default

N/A

Usage Guidelines

Use this command to show results when a default.xsf file is loaded.

An existing default.xsf file is executed if the switch comes up in an unconfigured state because the configuration file is missing, or the configuration file cannot be determined due to a corrupt NVRAM or other problems. This returns the switch to some basic configuration. When default.xsf is executed, the show switch command shows default.xsf as the booted configuration file.

Example

This command shows the results of executing the autoexec script

```
show script output default
```

When there is no default.xsf file, there is no response

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available on all platforms.

synchronize

synchronize {slot *slotid***}**

Description

The synchronize command replicates all saved images and configurations from the primary MSM/MM or node to the backup MSM/MM or target node on a switch or SummitStack.

Syntax Description

slotid	On a SummitStack, the slotid specifies the target node that has to be synchronized with the Master node. If the slotid is omitted, the target is the backup node. NOTE: This parameter is available only with SummitStack.

Default

N/A.

Usage Guidelines

This command:

- Reboots the backup MSM/MM or target node to prepare it for synchronizing with the primary MSM/MM or node
- Performs a binary copy of the primary MSM/MM or node to the backup MSM/MM or target node, including the primary and secondary software images, all configurations and policies, and temporary files
- Reboots the backup MSM/MM or target node after replication is complete

During a synchronization, half of the switch fabric is lost. When the primary MSM/MM or node finishes replicating its configurations and images to the backup MSM/MM or target node, the full switch fabric is restored.

To use the synchronize command make sure your switch or SummitStack is running the following software:

- BlackDiamond 8800 series switch with a mix of BlackDiamond 8000 c-, e-, and xl-series modules installed—Both MSMs are running ExtremeXOS 11.5 or later.
- SummitStack—All nodes are running ExtremeXOS 12.0 or later.

When you install a backup MSM/MM, you are not prompted to synchronize the images and the configurations from the primary. If not synchronized, the backup uses its image and the primary's configuration. This image/configuration mismatch will likely cause the switch to operate differently after failover. Use the synchronize command to replicate all saved images and configurations from the primary to the backup.

If you have not saved your runtime configuration, you are prompted to save it when you use the synchronize command. A message similar to the following appears:

```
Do you want to save configuration changes to primary.cfg? (y or n)
```

Enter y to save the configuration and continue with synchronizing the MSMs/MMs. Enter n to cancel the operation. If you enter y, messages similar to the following appear:

```
Saving configuration on primary MSM ...... done!
Synchronizing configuration to backup MSM .. done!
```

After the configuration has been saved and replicated to the backup MSM/MM, synchronization begins.

After the initial reboot, if the backup MSM/MM is not available or does not respond within 120 seconds, the synchronize operation fails.

Use the show switch {detail} command to verify that the backup MSM/MM is in sync with the primary MSM/MM.

BlackDiamond 8800 Series Switch Only

On a BlackDiamond 8800 series switch, the I/O ports on the backup MSM go down when you synchronize the MSMs. When the primary MSM finishes replicating its configurations and images to the backup MSM, the I/O ports on the backup MSM come back up.

SummitStack Only.

While using the command synchronize {slot <slot-number>} if the slot number is provided, that slot is the target of the synchronize operation. If the slot number is not provided, the Backup node is synchronized. This command can be executed only on the Master node.

The synchronize command preserves the following stacking configurations on the target node:

- slot number
- master-capable configuration
- alternate IP address, subnetwork mask, and default gateway
- priority
- license restriction

Thus a synchronized node comes up in the same place in the active topology that it occupied before the synchronize command was issued.

When the target slot of this command is occupied by any Summit X450a or X450e switch, the ability to synchronize the switch in that slot is dependent on whether or not the switch in that slot is using or is configured to use alternate stacking ports. If the active topology is a ring, then at least one stacking port must be configured and in use as a native stacking port. If the active topology is a daisy chain, then both stacking ports must be configured and in use as native stacking ports. If one of these two conditions is not met, then the following message is displayed:

```
Slot-1 Stack.6 # synchronize slot 3
Error: Summit X450a and X450e only support synchronization when:
(a) the active topology is a ring and only one stacking port is in
use or configured as an alternate port, or
(b) both stacking ports are in use or configured as native ports.
```

```
Please refer to the Concepts Guide section on Synchronizing in a SummitStack.
Slot-1 Stack.6 #
```

If the synchronizing switch cannot determine the stacking support configuration on the target switch, the following message is displayed:

```
Error: Information for the target switch is temporarily unavailable.
Please retry the command.
```

Note

The synchronize {slot <slot-number>} command is not allowed in certain SummitStack-V configurations when the target slot is occupied by a Summit X450a or X450e switch. In these cases, you can use the use image and download image commands to change the images on the node. Use the save configuration command to transfer the configuration file. Use the tftp put and tftp get commands to transfer other files via a remote host (tftp requires alternate IP address configuration on non-master nodes).

ExtremeXOS software does not allow a synchronize operation on a SummitStack between a Summit X460 or X670 switch and a Summit X250e X450a, X450e, X480, or X650 switch. If one is attempted, the following message is displayed:

```
Error: the target slot's partitions are not compatible with the Master's for
synchronize.
```

Example

The following example assumes you have already saved your runtime configuration.

The following command replicates all saved images and configurations from the master MSM to the backup MSM:

```
synchronize
```

After you enter synchronize, status messages similar to the following appear:

```
Synchronize will reboot the backup MSM, then overwrite all code images
and configs with a copy from the master MSM.
Synchronize currently requires ExtremeXOS version 11 or greater on
the backup MSM
DO NOT interrupt synchronize, the backup MSM may become unbootable!
OK to continue? (y/n) Yes
Rebooting Backup MSM...
NOTE: The command line is locked during synchronize
synchronizing...
synchronizing nvram...
synchronizing nvram...
synchronizing nvram...
synchronizing nvram...
```

```
synchronizing nvram...
synchronizing nvram...
synchronizing XOS...
[======================================] 100% XOS
Synchronize complete - rebooting backup MSM...
BD-8808.4 #
```

History

This command was first available in ExtremeXOS 11.0.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0

Platform Availability

This command is available only on modular switches and SummitStack.

unconfigure switch

unconfigure switch {all}

Description

Returns the switch configuration to its factory default settings and reboots the switch.

Syntax Description

all	Specifies that the entire configuration should be changed to the default values, including the management IP address, failsafe account, and SummitStack-specific parameters, and the switch rebooted.

Default

N/A.

Usage Guidelines

Use unconfigure switch to reset the configuration to factory defaults, but without erasing the configuration. This preserves users account information, date and time settings, SummitStack configuration, and so on.

Include the parameter all to clear the entire current configuration, including all switch and SummitStack parameters, and reboot using the last used image and factory default configuration.

The command unconfigure switch all does not clear licensing information. The license cannot be disabled once it is enabled on the switch.

For SummitStack only.

The all option also resets all stacking-specific parameters to defaults. To reset only the stacking-specific parameters to defaults, enter the unconfigure stacking command.

Beginning with ExtremeXOS 12.5, stacking support and stacking port selection are reset only on the local node. When stacking support of any kind is supported on the platform, the following message is added to the output that is shown on the console after this command has been confirmed:

```
Stacking-support will be unconfigured on this node only.
```

Example

The following command preserves the entire current configuration (but does not reload the current configuration after the switch reboots) and reboots the switch or SummitStack using the last specified saved image and factory default configuration:

```
unconfigure switch all
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

uninstall image

uninstall image *fname partition* {**msm** *slotid*} {**reboot**}

On a SummitStack, use:

uninstall image *fname partition* {**slot** *slo* **number>**} {**reboot**}

Description

Uninstalls an ExtremeXOS software package.

Syntax Description

fname	Specifies the software package to uninstall.
partition	Specifies which partition the package was installed to: primary or secondary. Select primary to remove it from the primary partition and secondary to remove it from the secondary partition.

slotid	Specifies the MSM where the package should be uninstalled. A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches and SummitStack. On a SummitStack, the slot number specifies the node on which the BootROM image should be uninstalled.
reboot	Reboots the switch after the package is uninstalled.

Default

N/A.

Usage Guidelines

Use this command to uninstall a software package previously installed on the switch.

When you uninstall a software package, the switch prompts you to save your changes to your currently active configuration file:

```
Uninstallation of the  EXOS module
Do you want to save configuration changes to primary.cfg? (y or n)
```

Enter y to save the changes to your configuration file. Enter n to not save the changes to your configuration file.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local and remote filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements previously described.

SummitStack Only

You can issue this command only from a Master node.

Example

The following command uninstalls the modular software package for Secure Shell, bd10K-11.2.0.18-ssh.xmod, from the secondary partition:

```
uninstall image bd10K-11.2.0.18-ssh.xmod secondary
```

History

This command was first available in ExtremeXOS 11.0.

The msm parameter was added in ExtremeXOS 11.1.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0

Platform Availability

This command is available on all platforms.

upload configuration

upload configuration [*hostname* | *ipaddress*] *filename* {**vr** *vr-name*}

Description

Uploads the current configuration in ASCII format to a TFTP server on your network.

Syntax Description

hostname	Specifies the hostname of the TFTP server where you want to download the configuration file. You must have DNS enabled
ipaddress	Specifies the IP address of the TFTP server where you want to download the configuration file.
filename	Specifies a user-defined name for the configuration file. You must use the .xsf file extension when naming an ASCII-formatted configuration file.
vr-name	Specifies the name of the virtual router. By default the switch uses VR-Mgmt for this command. NOTE: User-created VRs are supported only on the platforms listed for this feature in the ExtremeXOS Concepts Guide, Feature License Requirements

Default

Uploads the current configuration in ASCII format immediately to a TFTP server.

Usage Guidelines

Specify the ipaddress or hostname parameters to upload the current, active configuration file from the switch to a TFTP server on the network. Use of the hostname parameter requires that DNS be enabled.

The uploaded ASCII file retains the CLI format. This allows you to do the following:

- Modify the configuration using a text editor, and later download a copy of the file to the same switch or to one or more different switches.
- Send a copy of the configuration file to Extreme Networks Technical Support for problem-solving purposes.

This command is not applicable to XML-based configurations. Those files use the .cfg file extension.

If you want to view your configuration in ASCII format, use the .xsf file extension (known as the XOS script file) when you save the configuration file on the switch. This saves the XML-based configuration in an ASCII format readable by a text editor.

If you successfully upload the active configuration to the network TFTP server, the switch displays a message similar to the following:

```
Uploading meg_upload_config1.xsf to 10.10.10.10 ... done!
```

If the switch displays a timeout error message similar to the following:

```
failed!
Error: timeout
```

Make sure you entered the correct host name or IP address of the TFTP server

If the switch displays an unreachable network error similar to the following:

```
failed!
Error: Network is unreachable
```

Make sure you entered the correct virtual router. By default the switch uses VR-Mgmt for this command.

Summary of Steps

The following summary only describes the CLI involved to transfer the configuration and load it on the switch; it is assumed that you know how to modify the configuration file with a text editor. As previously described, to use these commands, use the .xsf file extension. These steps are not applicable to configurations that use the .cfg file extension.

To work with an ASCII-formatted configuration file, complete the following tasks:

- Upload the configuration to a network TFTP server using the following command:

  upload configuration [<hostname> | <ipaddress>] <filename> {vr <vr-name>}

After the configuration file is on the TFTP server, use a text editor to the desired changes.

- Download the configuration from the TFTP server to the switch using one of the following commands:

  tftp [<host-name> | <ip-address>] -g -r <remote-file>

  tftp get [<host-name> | <ip-address>] <remote-file>
- Verify the configuration file is on the switch using the following command:

  ls
- Load and restore the new configuration file on the switch using the following command:

  load script <filename> {arg1} {arg2} ... {arg9}
- Save the configuration to the configuration database so the switch can reapply the configuration after switch reboot using the following command:

  save configuration {primary | secondary | <existing-config> | <new-config>}

  When you save the configuration file, the switch automatically adds the .cfg file extension to the filename. This saves the ASCII configuration as an XML-based configuration file.

The following describes the steps in more detail.

Uploading the ASCII Configuration File To a TFTP Server

To upload the current switch configuration as an ASCII-based file to the TFTP server, use the upload configuration command and save the configuration with the .xsf file extension.

For example, to transfer the current switch configuration as an ASCII-based file named meg_upload_config1.xsf to the TFTP server with an IP address of 10.10.10.10, do the following:

```
upload configuration 10.10.10.10 meg_upload_config1.xsf
```

If you successfully upload the configuration to the TFTP server, the switch displays a message similar to the following:

```
Uploading meg_upload_config1.xsf to 10.10.10.10 ... done!
```

Downloading the ASCII Configuration File to the Switch

To download the configuration from the TFTP server to the switch, use the tftp command. For example, to retrieve the configuration file named meg-upload_config1.xsf from a TFTP server with an IP address of 10.10.10.10, you can use one of the following commands:

```
tftp 10.10.10.10 -g -r meg_upload_config1.xsf
tftp get 10.10.10.10 meg_upload_config1.xsf
```

If you successfully download the configuration to the switch, the switch displays a message similar to the following:

```
Downloading meg_upload_config1.xsf to switch... done!
```

Verifying that the ASCII Configuration File is on the Switch

To confirm that the ASCII configuration file is on the switch, use the ls command. The file with an .xsf extension is the ASCII configuration.

The following sample output contains an ASCII configuration file:

```
-rw-r--r--    1 root     0           98362 Nov  2 13:53 Nov022005.cfg
-rw-r--r--    1 root     0          117136 Dec 12 12:56 epicenter.cfg
-rw-r--r--    1 root     0              68 Oct 26 11:17 mcastgroup.pol
-rw-r--r--    1 root     0           21203 Dec 13 15:40 meg_upload_config1.xsf
-rw-r--r--    1 root     0          119521 Dec  6 14:35 primary.cfg
-rw-r--r--    1 root     0           96931 Nov 11 11:01 primary_11_11_05.cfg
-rw-r--r--    1 root     0           92692 Jul 19 16:42 secondary.cfg
```

Loading the ASCII Configuration File

After downloading the configuration file, you must load the new configuration on the switch. To load and restore the ASCII configuration file, use the load script <filename> {arg1} {arg2} ... {arg9} command. After issuing this command, the ASCII configuration quickly scrolls across the screen.

The following is an example of the type of information displayed when loading the ASCII configuration file:

```
script.meg_upload_config1.xsf.389 # enable snmp access
script.meg_upload_config1.xsf.390 # enable snmp traps
script.meg_upload_config1.xsf.391 # configure mstp region purple
script.meg_upload_config1.xsf.392 # configure mstp revision 3
script.meg_upload_config1.xsf.393 # configure mstp format 0
script.meg_upload_config1.xsf.394 # create stpd s0
```

Instead of entering each command individually, the script runs and loads the CLI on the switch.

Saving the Configuration

After you load the configuration, save it to the configuration database for use by the switch. This allows the switch to reapply the configuration after a switch reboot. To save the configuration, use the save configuration {primary | secondary | <existing-config> | <new-config>} command.

When you save the configuration file, the switch automatically adds the .cfg file extension to the filename. This saves the ASCII configuration as an XML-based configuration file.

You can use any name for the configuration. For example, after loading the file meg_upload_config1.xsf, you need to save it to the switch. To save the configuration as configuration1.cfg, do the following:

```
save configuration configuration1
```

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Remote Filename Character Restrictions

This section provides information about the characters supported by the switch for remote filenames.

When specifying a remote filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)
- Slash (/) Permitted only for remote files

When naming a remote file, remember the requirements previously described.

Example

The following command uploads the current switch configuration as an ASCII-based file named configbackup.xsf to the TFTP server with an IP address of 10.10.10.10:

```
upload configuration 10.10.10.10 configbackup.xsf
```

If you successfully upload the configuration to the TFTP server, the switch displays a message similar to the following:

```
Uploading configbackup.xsf to 10.10.10.10 ... done!
```

History

This command was first available in ExtremeXOS 11.4.

Platform Availability

This command is available on all platforms.

use configuration

use configuration [primary | secondary | *file_name*]

Description

Configures the switch to use a previously saved configuration on the next reboot.

Syntax Description

primary	Specifies the configuration file named primary.cfg.
secondary	Specifies the configuration file named secondary.cfg.
file_name	Specifies an existing user-defined configuration file name (displays a list of available user-defined configuration files).

Default

N/A.

Usage Guidelines

XML-based configuration files have a .cfg file extension. When you enter the name of the file in the CLI, the system automatically adds the .cfg file extension.

Do not use this command with ASCII-formatted configuration files. Those configuration files have an .xsf file extension. For more information about using and saving ASCII-formatted configuration files see the upload configuration [<hostname> | <ipaddress>] <filename> {vr <vr-name>} and the load script <filename> {arg1} {arg2} ... {arg9} commands.

There is no special significance to the primary and secondary configurations. They are just conveniences to specify the files primary.cfg and secondary.cfg.

When you configure the switch to use a previously saved configuration, the switch displays the following message:

```
The selected configuration will take effect after the next switch reboot.
```

You can create a new configuration file by saving your current switch configurations and using that file on the next reboot. For example, to create a new configuration named test1 based on your current CLI session and switch configurations, use the following command:

```
save configuration test1
```

Tracking and Displaying Switch Configuration Files

To keep track of your configuration file names, use the ls command to display the files saved on your switch. Files with the .cfg extension are configuration files. In addition, you can see a list of available configuration files when you use the use configuration command.

The following is sample output from this command ("test" and "XOS1" are the names of the user-created and defined configurations):

```
exsh.1 # use configuration
primary         Primary configuration file
secondary       Secondary configuration file
<file-name>     Configuration file name
"test" "XOS1"
```

You can also use the ls command to display a list of the current configuration and policy files in the system.

Displaying the Active Configuration

To view the currently active, running configuration, use the show switch command.

Local Filename Character Restrictions

This section provides information about the characters supported by the switch for local filenames.

When specifying a local filename, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-)
- Underscore (_)

When naming a local file, remember the requirements listed above.

Example

The following command specifies that the next reboot should use the saved configuration file named XOS1.cfg:

```
use configuration XOS1
```

The following command specifies that the next reboot should use the configuration saved in the primary partition:

```
use configuration primary
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

use image

use image {**partition**} *partition* {**msm** *slotid*}

On a SummitStack, use:

use image {**partition**} *partition* {**slot** *slotid*}

Description

Configures the switch to use a saved image on the next reboot.

Syntax Description

partition	Specifies which image to use on the next reboot, the one stored on the primary partition, or the one stored on the secondary partition.
slotid	A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches and SummitStack. On a SummitStack, the slotid specifies the node on which the BootROM image is selected.

Default

The currently booted image.

Usage Guidelines

This command specifies which image to use on the next reboot. Two images can be stored, one on the primary partition, one on the secondary partition. To view your current (active) partition and the selected partition for the next reboot or installation, use the following command:

```
show switch
```

Output from this command includes the selected and booted images and if they are in the primary or the secondary partition. Primary indicates the saved image in the primary partition; secondary indicates the saved image in the secondary partition.

SummitStack Only

You can issue this command only from a Master node. The image to use is stored in NVRAM on all target nodes.

If a slot number is not provided, the partition is selected on all nodes in the Active Topology.

Example

Using TFTP

The following command configures the switch to use the image stored in the primary partition on the next reboot:

```
use image partion primary
```

A message similar to the following is displayed:

```
To take effect of partition change please reboot the switch!
```

History

This command was first available in ExtremeXOS 10.1.

The msm parameter was added in ExtremeXOS 11.1.

The slot parameter was added to support SummitStack in ExtremeXOS 12.0.

Platform Availability

This command is available on all platforms.

47 CNA Agent Commands

The Converged Network Analyzer (CNA) Agent is part of the CNA software from Avaya Inc.â that is used to test network conditions. Use the CNA Agent only if your network includes an Avaya solution that uses CNA.

The entire CNA software package consists of multiple parts. The user interface is a combination of a Java applet hosted from the CNA Server and a Command Line Interface (CLI). You obtain all parts (except the CNA Agent) from your Avaya representative, along with the accompanying documentation. You configure and manage the CNA Agent using the CLI.

The CNA Agent is a downloadable software module that is used when running the Avaya CNA software.

Note

You must download and install the Secure Shell (SSH2) software module prior to downloading and installing the CNA Agent software module.

Using the CNA software, the CNA Agent runs the requested tests and returns the test results. The CNA Agent runs the following tests as directed by the CNA Server:

- Traceroute
- RTP
- Ping
- TCPconnect
- Merge

You enable the software and configure the CNA Agent to communicate with the CNA Server, to clear the test counters, and to display connection status and test results.

clear cna-testplug counters

```
clear cna-testplug counters
```

Description

Clears all counters maintained by the CNA Agent and resets the counters to zero.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You can also use the clear counters command to reset the internal counters for the CNA Agent and return them to 0.

Example

The following command clears all the counters on the CNA Agent and returns the values to zero:

```
clear cna-testplug counters
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure cna-testplug scheduler ipaddress

configure cna-testplug scheduler ipaddress *ip_address*

Description

Configures the IP address of the CNA Server using open Secure Socket Layer (SSL); you enter the IP address of the CNA server.

Syntax

ip_address	Specifies the IP address of the CNA Server that communicates with the CNA Agent to schedule tests and receive the results.

Default

N/A.

Usage Guidelines

Use this command to configure the CNA Agent with the IP address of the CNA Server. The CNA Server requests the timing and type of networking testing, and the CNA Agent runs the tests.

Note

You use the CNA Agent only if you are running the Avaya CNA solution; you must have other pieces of the CNA (available from Avaya) to run these tests.

You enter the IP address of the CNA server.

This command sets up the encryption key that is subsequently used for all communication between the CNA Agent and the CNA Server.

Note

You must have previously installed the Secure Shell (SSH2) downloadable software module, which contains SSL, to use the CNA Agent software.

Example

The following command enters the CNA Server's IP address to 10.6.13.116; the CNA Agent uses this IP address to communicate with the CNA Server:

```
configure cna-testplug scheduler ipaddress 10.6.13.116
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

configure cna-testplug vlan

configure cna-testplug vlan *vlan_name*

Description

Configures the CNA Agent (test plug) to an interface. By default, the CNA Agent is bound to the Default VLAN.

Syntax

vlan_name	Specifies which interface IP address the CNA Server uses to communicate with the CNA Agent.

Default

Default VLAN.

Usage Guidelines

The interface IP address is specified when setting up the SSL connection with the CNA Server (when you issue the configure cna-testplug scheduler ipaddress command. The CNA Server attempts to establish the socket connection on the interface specified in the configure cna-testplug vlan interface to conduct the actual tests.

The system uses the primary IP address if the VLAN has more than one IP address. By default, the CNA Server uses the Default VLAN.

Note

Extreme Networks recommends that you put IP telephones on the same virtual router.

Example

The following command instructs the CNA Server to use the interface associated with VLAN gateway to conduct tests:

```
configure cna-testplug vlan gateway
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

disable cna-testplug

disable cna-testplug

Description

Disables the CNA Agent.

Syntax

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

You must enable the CNA Agent before it can run the network tests requested by the CNA Server.

Example

The following command disables the CNA Agent:

```
disable cna-testplug
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

enable cna-testplug

enable cna-testplug

Description

Once enabled, the CNA Agent coordinates with the CNA Server to test the network for throughput.

Syntax

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

If you previously configured the IP address for the CNA Server and the VLAN interface, the CNA Agent immediately registers with the CNA Server upon being enabled and begins running the requested tests.

Example

The following command enables the CNA Agent:

```
enable cna-testplug
```

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

show cna-testplug

show cna-testplug

Description

Displays the statistics and connection status with the CNA software from Avaya. The display includes configured CNA Agent (test plug) and CNA Server (scheduler) connections and the number of tests conducted on each connection.

Syntax

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following information:

- Hardware Name—The name of the Extreme Networks device running the CNA Agent (test plug)
- Firmware version—The version of ExtremeXOS firmware running on the device
- Interface VLAN—VLAN (and virtual router) interface the CNA Server uses to schedule and run the tests
- IP address on the interface—IP address of the interface the CNA Server uses; the connection on which the CNA Agent tests and sends results
- CNA Test plug version—Version of CNA Agent (test plug) software, in the following format: MajorRev.MinorRev.Build
- Interface version with Scheduler—Shows compatibility between the CNA Agent (test plug) and the CNA Server (scheduler) software
- Enabled or Disabled

- Status—Connection status to the CNA Server:
  - Registered
  - Unregistered
- Errors—Number of errors in tests of connectivity
- Total tests received—Total test requests received by the CNA Agent
- Scheduler (SBC)—IP address and port number on which the CNA Server communicates with the CNA Agent; the connection on which the CNA Agent listens
- Listening ports
  - Test requests(from ANS)—Number of tests that the CNA Agent was requested to run by the Adaptive Networking Software (ANS) on the CNA Server
  - RTP test requests(from test plugs)—Number of RTP streams that the CNA Agent initiates
  - RTP and Traceroute responses(from test plugs)—Number of responses by the CNA Agent to requests for RTP and Traceroute tests
- Last Test—Last test that CNA Agent performed
- Result Last Test—Results of the last test, which the CNA Agent sends to the CNA Server
- Test—Tests run by the CNA Agent
- Count—Number of tests successfully run

Example

The following command displays CNA Agent statistics and connection status on the Summit X450 series switch:

```
show cna
HW Name:                          SummitX450-24t
Firmware version:                 11.3.0.11
Interface VLAN:                   "Default" on Virtual router "VR-Default"
IP address of the Interface:      10.203.128.126
CNA Test plug version:            3.0.2
CNA Interface version:            17
Admin:                            Enabled
Status:                           Registered
Errors:                           22
Total tests received:             23529

Note

Adaptive Networking Software (ANS) runs on the CNA Server.

History

This command was first available in ExtremeXOS 11.2.

Platform Availability

This command is available on all platforms.

A Troubleshooting Commands

Extreme Loop Recovery Protocol
disable log debug-mode
clear elrp counters
clear esvt traffic-test
configure debug core-dumps
configure elrp-client disable ports
configure elrp-client one-shot
configure elrp-client periodic
configure forwarding fabric hash
configure forwarding hash-algorithm
configure forwarding hash-recursion-level
disable elrp-client
disable led locator
disable log debug-mode
eject memorycard
enable elrp-client
enable led locator
enable log debug-mode
nslookup
run diagnostics
run elrp
run esvt traffic-test
save debug tracefiles memorycard
show debug
show diagnostics
show elrp
show elrp disabled-ports
show esvt traffic-test
show forwarding configuration
show tech
stop esvt traffic-test
top
unconfigure elrp-client
unconfigure elrp-client disable ports
upload debug

If you encounter problems when using your switch, ExtremeXOS provides troubleshooting commands. Use these commands only under the guidance of Extreme Networks technical personnel.

This appendix describes commands for troubleshooting your switch, including:

- Running diagnostics and displaying diagnostic test results
- Enabling and disabling the standalone Extreme Loop Recovery Protocol (ELRP) client
- Enabling and disabling debug mode for Event Management System (EMS) components

You can contact Extreme Networks Technical Support at (800) 998-2408 or (408) 579-2826.

Extreme Loop Recovery Protocol

Extreme Loop Recovery Protocol (ELRP) is a feature of ExtremeXOS that allows you to detect Layer2 loops in the network.

You can use ELRP with other protocols such as the Extreme Standby Router Protocol (ESRP) and the Ethernet Automatic Protection Switching Protocol (EAPS).

A switch running ELRP transmits multicast packets with special MAC destination address out of some or all of the ports belonging to a Virtual LAN (VLAN). All the other switches in the network treat this packet as a regular, multicast packet and flood it to all the ports belonging to the VLAN. If the packets transmitted by a switch are received back by that switch, this indicates a loop in the Layer2 network.

Standalone ELRP provides the ability to send ELRP packets, either periodically or on an ad hoc "one-shot" basis on a specified subset of VLAN ports. If any of these transmitted packets is received back then standalone ELRP can perform configured actions such as sending a log message to the system log file and, in the case of periodic transmission, sending a trap to the SNMP manager and disabling the port where the packet ingressed.

ELRP is discussed in more detail in the ExtremeXOS Concepts Guide chapter, "Troubleshooting."

Details of using ELRP with ESRP are discussed in the ExtremeXOS Concepts Guide chapter, "ESRP," and the commands used to configure ELRP with ESRP are described in ESRP Commands.

disable log debug-mode

disable log debug-mode

Description

Disables debug mode. The switch stops generating debug events.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables debug mode. Debug mode must be enabled prior to configuring advanced debugging capabilities. These include allowing debug messages, which can severely degrade performance. For typical network device monitoring, debug mode should remain disabled, the default setting. Debug mode should only be enabled when advised by technical support, or when advanced diagnosis is required. The debug mode setting is saved to FLASH.

The following configuration options require that debug mode be enabled:

- Including a severity of debug-summary, debug-verbose, or debug-data when configuring filters
- Target format options process-name, process-id, source-function, and source-line

Example

The following command disables debug mode:

```
disable log debug-mode
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

clear elrp counters

clear elrp counters

Description

Clears and resets the ELRP counters.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

You should view the switch statistics before you delete the ELRP counters. Use the show log counters command to display event statistics.

Viewing and maintaining statistics on a regular basis allows you to see how well your network is performing. If you keep simple daily records, you will see trends emerging and notice problems arising before they cause major network faults. By clearing the counters, you can see fresh statistics for the time period that you are monitoring.

Example

The following command clears all switch statistics related to ELRP:

```
clear elrp counters
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

clear esvt traffic-test

clear esvt traffic-test {{**vlan**} *vlan_name*}

Description

Clears all measurements of the Service verification test.

Syntax Description

vlan	Specifies the VLAN for the traffic test.
vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to clear all measurements of the Service verification test .

Example

The following example clears all measurments of the Extreme Service Verification tool on vlan1:

```
clear esvt traffic-test v1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available in X460, X480, E4G-200, E4G-400, X670, X650, Stacking, BDX8 and BD8800.

configure debug core-dumps

configure debug core-dumps [**internal-memory** | **memorycard** | **off**]

Description

Enables or disables the sending of core dump files to the internal memory card, a compact flash card, or a USB 2.0 storage device.

Syntax Description

internal-memory	Specifies that saving debug information to the internal memory card is enabled. This is the default behavior. Use this parameter only under the guidance of Extreme Networks Technical Support personnel.
memorycard	Enables saving debug information to a removable storage device, which can be a compact flash card or a USB 2.0 storage device. Use this parameter only under the guidance of Extreme Networks Technical Support personnel. NOTE: This parameter is available for compact flash cards on BlackDiamond 8800 and for USB 2.0 storage devices on Summit X460, X480, X650, X670, and X670V switches.
off	Specifies that the switch does not save core dump files to memory or to removable storage devices.

Default

Beginning with ExtremeXOS 11.6, configure debug core-dumps internal-memory is enabled by default.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support personnel to troubleshoot the switch.

The switch only generates core dump files and writes them to the specified device in the following situations:

- If an ExtremeXOS process fails.
- When forced under the guidance of Extreme Networks Technical Support.

If you configure the switch to write core dump files to the internal memory and attempt to download a new software image, you might have insufficient space to complete the image download. If this occurs, move or delete the core dump files from the internal memory. For example, if the switch supports a removable storage device that has space available, transfer the files to the device. On switches without removable storage devices, transfer the files from the internal memory card to a TFTP server. This frees up space on the internal memory card while keeping the core dump files.

Before you can enable and save debug information to a removable storage device, you must install the device. For more information about installing a removable storage device, refer to the hardware documentation.

After you use the eject memorycard command and manually remove a removable storage device, this setting is automatically changed to off.

Stackables in Stack Mode

This command works only from the master node. If you enable it on stack master, it is applicable for all nodes.

Example

The following example enables a switch to save debug information to a removable storage device:

```
configure debug core-dumps memorycard
```

The following example enables the switch to save debug information to the internal memory card:

```
configure debug core-dumps internal-memory
```

History

This command was first available in ExtremeXOS 11.1.

The internal-memory parameter was added in ExtremeXOS 11.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

configure elrp-client disable ports

configure elrp-client disable-ports [exclude | include] [*ports* | eaps-ring-ports]

Description

Creates an ELRP exclude port list.

Syntax Description

exclude	Specifies that selected ports are to be excluded from ELRP disabling.
include	Specifies that selected ports are to be included in ELRP disabling.
ports	Specifies one or more ports to be excluded or included.
eaps-ring-ports	Specifies whether EAPS ring ports are to be excluded or included.

Default

All ports, together with EAPS ring ports, are included by default; that is, they will be disabled if a loop is detected on that port.

Usage Guidelines

Use this command to specify ports or EAPS ring ports that are to be part of an ELRP exclude port list. Use the exclude option to add ports to the exclude port list. Use the include option to remove them from the list.

When ELRP detects a loop and has been configured to automatically disable the port where a looped ELRP PDU is received and an exclude port list has been configured, it will check to determine if that port is on the exclude port list. If that port is on the list, ELRP will not disable it; if it is not on the list, it will be disabled.

Any port on the switch can be added to or removed from the list. EAPS ring ports can be part of the list.

To display the ports that are include in the exclude port list, use the show elrp disabled-ports command.

To remove the exclude port list, use the unconfigure elrp-client disable ports command.

Example

The following example adds port 2:1 to an ELRP exclude port list:

```
configure elrp-client disable-ports exclude 2:1,2:3
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

configure elrp-client one-shot

configure elrp-client one-shot *vlan_name* **ports** [*ports* | **all**] **interval** *sec* **retry** *count* [**log** | **print** | **print-and-log**]

Description

Starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval.

Syntax Description

vlan_name	Specifies a VLAN name.
ports	Specifies the set of VLAN ports for packet transmission.
all	Specifies all ports of this VLAN for packet transmission.
sec	Specifies the interval (in seconds) between consecutive packet transmissions. The range is 1 to 600 seconds. The default is 1 second.
count	Specifies the number of times ELRP packets must be transmitted. The range is 1 to 255 times. The default is 3 times.
log	Specifies that a message should be logged in the system log file when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
print	Specifies that a message should be printed to the console when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
print-and-log	Specifies that a message should be logged in the system log file and printed to the console when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.

Default

sec—The interval between consecutive packet transmissions is 1 second.

count—The number of times ELRP packets must be transmitted is 3.

Usage Guidelines

This command starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval. If any of these transmitted packets is returned, indicating loopback detection, the ELRP client can perform a configured action such as logging a message in the system log file or printing a log message to the console. There is no need to send a trap to the SNMP manager for non-periodic requests.

Note

This command is backward compatible with Extreme Networks switches running ExtremeWare. If your network contains switches running only ExtremeXOS, you can also use the run elrp <vlan_name> {ports <ports>} {interval <sec>} {retry <count>} to perform one-time ELRP packet transmission.

Use the configure elrp-client periodic command to configure periodic transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the enable elrp-client command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the disable elrp-client command to globally disable the ELRP client.

Example

The following example starts one-time, non-periodic ELRP packet transmission on all ports of the VLAN sales, uses the default interval and transmission times, and sends messages to the console:

```
configure elrp-client one-shot sales ports all interval 1 retry 3 print
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

configure elrp-client periodic

configure elrp-client periodic *vlan_name* **ports** [*ports* | **all**] **interval** *sec* [**log** | **log-and-trap** | **trap**] {**disable-port** {{**duration** *seconds*} | **permanent**}

Description

Starts periodic ELRP packet transmission on the specified ports of the VLAN using the specified interval.

Syntax Description

vlan_name	Specifies a VLAN name.
ports	Specifies the set of VLAN ports for packet transmission.
all	Specifies all ports of this VLAN for packet transmission.
sec	Specifies the interval (in seconds) between consecutive packet transmissions. The range is 1 to 600 seconds. The default is 1 second.
log	Specifies that a message should be logged in the system log file when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
log-and-trap	Specifies that a message should be logged in the system log file and a trap message should be sent to the SNMP manager when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
trap	Specifies that a trap message should be sent to the SNMP manager when ELRP packets are received back indicating detection of network loop, or no packets are received within the specified duration.
disable-port	Specifies that the port should be disabled where the looped PDU is received.
duration	Specifies a hold time that the port is kept disabled before re-enabling.
seconds	The number of seconds the port is kept disabled.
permanent	Specifies that the port is disabled permanently. User intervention is required to enable.

Default

The default interval between consecutive packet transmissions is 1 second.

If a duration in seconds is not specified, the default is permanent.

Usage Guidelines

This command starts periodic ELRP packet transmission on the specified ports of the VLAN using the specified interval. If any of these transmitted packets is returned, indicating loopback detection, the ELRP client performs a configured action of logging a message in the system log file and/or sending a trap to the SNMP manager.

Beginning with ExtremeXOS 12.4, you have the option to automatically disable the port where the looped packet arrives and to specify the time interval for which the port remains disabled. When that specified time expires, the port is automatically enabled.

Should a loop occur on multiple ports, only the first port in the VLAN on which the PDU is received is disabled. The second port is ignored for 1 or 2 seconds and then if another PDU is received, that port is disabled until the loop is gone. This prevents shutting down all ports in the VLAN.

Use either the configure elrp-client one-shot or the run elrp command to configure non-periodic, one-time transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the enable elrp-client command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the disable elrp-client command to globally disable the ELRP client.

The ExtremeXOS software does not support ELRP and Network Login on the same port.

Use the show elrp command to check the ELRP status and the show elrp disabled-ports command to view details of ELRP disabled ports.

Example

The following example starts periodic ELRP packet transmission on slot 3, port 2 of VLAN marketing, sends packet transmissions every 2 seconds, sends messages to the log, and should a loop be detected, disables the port for 5 seconds:

```
configure elrp-client periodic marketing ports 3:2 interval 2 log disable-
port duration 5
```

History

This command was first available in ExtremeXOS 11.1.

The disable port feature was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

configure forwarding fabric hash

configure forwarding fabric hash [**default** | **source-port** | **packet** {**algorithm** [**crc** |**xor**] | **dynamic-mode** [**spray** | **eligibility** | **none**]}] {**slot** *slot-number*}

Description

A 40Gb port must use multiple 20Gb HGd links to carry its traffic. In the degenerate case, a particular HGd link is always the target of the hash result. With a 40Gb link hashing into a 20Gb link, half the traffic is lost. Extreme will attempt to configure the packet hash algorithm to accommodate most common situations; however, some customers may have uncommon situations and may wish to adjust the hash. For this reason, the user will be able to specify values for some of the hash parameters in normal packet hash mode:

- Source port hash (cannot be used when 40Gb ports are in use)
- Packet field hash calculation algorithm (CRC or XOR)

The packet hash is configurable. A Dynamic Load Balance (DLB) algorithm allows distribution of flows to the links in the switch fabric trunk that are currently carrying the least load. DLB uses the packet field hash, but does not use the hash code that is reduced to a number modulo the number of links in the group. Instead the number used is 15 bits for a total of 32K possible hash codes. This 15-bit hash code indexes into a 32K-entry “flow table”. Each time an unused entry is allocated to one or more “micro-flows” (i.e., to flows that generate the same 15-bit hash value), a load calculation is performed and the link with the most available bandwidth is assigned to the flow table entry. DLB offers two modes:

- Spray mode causes the link assignment to occur on every packet transmission. This is similar to a “round-robin” hash. Every packet goes to the link with the least load but ordering within flows is not guaranteed. This mode is useful for Bandwidth Management Testing (BMT).
- Eligibility mode keeps the link fixed to the flow entry until a 32ms inactivity timeout occurs. Ordering within flows is guaranteed.

For blades that provide 10Gb ports only (and for 40Gb blades that are entirely configured for 10Gb operation), source port hashing will be used by default. While source port hashing can be used for non-blocking operation, such operation depends on the switch fabric distribution. . For example, suppose three 10Gb ports on one BDXA-10G48X card hash to the same switch fabric "channel". Also suppose that the three 10Gb ports' traffic is aggregated into the same 40Gb port on a different I/O blade. Since each switch fabric channel can only provide 20Gb of bandwidth to a single 40Gb port, then the switch fabric channel will try to send 30Gb/s of Ethernet packets to the same 20Gb switch fabric link, causing congestion in the channel on the FM blade.

To avoid this situation, the user can configure DLB Eligibility mode which will cause per 10Gb Ethernet port traffic to be distributed to all switch fabric channels instead of being sent to the same channel. Use the following command:

```
                    configure forwarding fabric hash [default |source-port |
packet {algorithm [crc |xor] |
dynamic-mode [spray | eligibility | none]}] {slot slot-number}
```

Syntax Description

default	Resets the hashing algorithm to the default value on the specified slot or slots.
source-port	Indicates that the system should distribute traffic based on the ingress port (the system controls the mapping between the ingress port and the switch fabric ingress port).
packet	Indicates that packet fields are to be used to calculate a hash value that will be used to select the switch fabric port that will carry the packet. Use algorithm to select from crc or xor. Each of these is a 16-bit result. If algorithm is not specified, packet hashing occurs and is set to a default value.
dynamic-mode	Dynamic Load Balancing (DLB) allows flow distribution to links within the switch fabric trunk based on the current load on the individual trunk links. DLB is configurable in one of three modes: spray, eligib ility, and none (direct packet hash without considering the load).
slot-number	Selects the I/O slot to which the command is applied.

Default

The default option resets the hashing algorithm to the default value on the specified slot or slots.

Usage Guidelines

Note

Modify the hash algorithm only with the guidance of Extreme Networks technical personnel.

For the packet hash, the following fields are used depending on packet type:

- IPv4 packets – IP source, IP destination, VLAN ID, source and destination L4 ports, and L3 protocol ID.
- IPv6 packets – Collapsed IP source and destination addresses, VLAN ID, source and destination L4 ports, and L3 protocol ID. (Collapsed source and destination addresses are the 32-bit result of the exclusive OR of the bits IP[127-96], IP[95-64], IP[63-32], and IP[31-0].)
- L2 packets – MAC source, MAC destination, Ethertype, and VLAN ID.
- L2 MPLS – Payload MAC source, payload MAC destination, payload Ethertype, and payload outer VLAN ID.
- L3 MPLS – Payload source and destination IPv4 or collapsed IPv6 addresses, tunnel VLAN ID, source and destination L4 ports, and L3 protocol field.
- Non-terminated MPLS (label swapped or L2 switched on outer-most header) – RPID, labels 1, 2, and 3, and payload source and destination IPv4 or collapsed IPv6 addresses.
- MAC-in-MAC with tunnel termination – L2 payload MAC DA, L2 payload MAC SA, L2 payload Ethertype, and L2 payload outer VLAN ID.
- MAC-in-MAC without termination – RPID, tunnel MAC DA, tunnel MAC SA, and ISID.
- FiberChannel over Ethernet – RPID, source ID, destination ID, originator exchange ID, responder exchange ID, fabric ID, and VLAN ID.
- TRILL – Egress RBridge nickname, Ingress RBridge nickname, payload MAC destination (low 32-bits), payload MAC source (low 32-bits), payload Ethertype, and payload VLAN ID.

Example

Example output not yet available and will be provided in a future release.

History

This command was first available in ExtremeXOS 15.1.

Platform Availability

This command variant is available only on the BlackDiamond X8 switch.

configure forwarding hash-algorithm

```
configure forwarding hash-algorithm [crc16 | crc32] {dual-hash [on | off]}
```

Description

Modifies hardware table utilization by configuring the hash algorithm or dual-hash settings.

Syntax Description

crc16	Specifies the CRC16 hash algorithm.
crc32	Specifies the CRC32 hash algorithm. This is the default setting.
on	Specifies that the dual-hash feature be turned on for the L3 Hash Table for hardware with dual-hash capability. With dual-hash on, each hash bucket is divided into two half-buckets with independent hash algorithms. One half-bucket uses the configured hash algorithm (CRC16 or CRC32), and the other half-bucket uses an alternate hash algorithm. This is the default setting. The “dual-hash” function applies only to the BlackDiamond 8800 series switches.
off	Specifies that the dual-hash feature be turned off, even for hardware with dual-hash capability. The “dual-hash” function applies only to the BlackDiamond 8800 series switches.

Default

In ExtremeXOS 11.5, the default hash algorithm is crc32

In ExtremeXOS 11.4 and earlier, the default hash algorithm is crc16.

The dual-hash default is “on.”

Usage Guidelines

Note

Modify the hardware table hash algorithm only with the guidance of Extreme Networks technical personnel.

The switch uses a hash algorithm to decide where to store the addresses in the hardware table. The standard, default hash algorithm works well for most systems; however, for some addresses with certain patterns, the hardware may attempt to store address information in the same section of the hardware.

If you are running ExtremeXOS 11.4 or earlier and experience a full hardware table that affects Layer2, IP local host, and IP multicast forwarding, you see messages similar to the following in the log:

```
<Info:HAL.IPv4Adj.Info> : adj 136.159.188.109: IP add error is Table full for
new or newly resolved ARP, egress valid
<Info:HAL.IPv4Adj.Info> : adj 136.159.188.109: returned -17 for L3 table
bucket 181
<Warn:HAL.IPv4Mc.Warning> : Could not allocate a hardware S,G,V entry
(889f4648,effffffa,70) - hardware table resource exceeded (rv=-17).
```

If you are running ExtremeXOS 11.5 or later and experience a full hardware table that affects Layer2, IP local host, and IP multicast forwarding, you see messages similar to the following in the log:

```
<HAL.IPv4Adj.L3TblFull> MSM-A: IPv4 unicast entry not added.  Hardware L3
Table full.
```

(ExtremeXOS 12.1 and later have the Extended IPv4 Host Cache feature and do not display this HAL.IPv4Adj.L3TblFull message on the MSM for a full hash table condition.)

```
<Card.IPv4Adj.Warning> Slot 4: IPv4 unicast entry not added.  Hardware L3
Table full.
<HAL.IPv4Mc.GrpTblFullEnt> MSM-A: IPv4 multicast entry
(10.0.0.1,224.1.1.1,vlan 1) not added.  Hardware Group Table full.
<Card.IPv4Mc.Warning> Slot-4: IPv4 multicast entry not added.  Hardware L3
Table full.
```

In the previously described situations, you can configure a different hash algorithm to select a different section of the hardware to store addresses. You must save your configuration and reboot the switch to modify the hash algorithm used by the hardware table. Typically, the dual-hash feature improves hash utilization. You must save your configuration and reboot the switch to turn dual-hash on or off.

Upgrading to ExtremeXOS 11.5

When you upgrade to ExtremeXOS 11.5, the hash algorithm automatically becomes crc32. For example, if you saved a configuration using an image from ExtremeXOS 11.4 or earlier with the hash algorithm set to crc16, when ExtremeXOS 11.5 loads, the hash algorithm becomes crc32. To change the hash algorithm to crc16, use the configure forwarding hash-algorithm crc16 and save your switch configuration.

Example

The following command modifies the hardware table hash algorithm to crc16:

```
configure forwarding hash-algorithm crc16
```

The switch displays the following message to describe the change and to prompt you to save your configuration and reboot the switch:

```
Configured hash alorithm has been changed to ‘crc16’ with L3 dual-hash
support ‘on’ for applicable HW.
Warning:  This command will only take effect after a save and reboot
```

The following command disables dual-hashing on BlackDiamond 8000 c- and xl-series I/O modules.

```
configure forwarding hash-algorithm crc32 dual-hash off
```

The switch displays the following message:

```
Configured hash algorithm has been changed to ‘crc32’ with L3 dual-hash
support ‘off’ for applicable HW.
Warning: This command will only take effect after a save and reboot.
```

To display the results, use the show forwarding configuration command.

History

This command was first available in ExtremeXOS 11.3.2.

The default hash algorithm was changed to crc32 in ExtremeXOS 11.5.

Platform Availability

This command is available only on the BlackDiamond X8, BlackDiamond 8800 series switches, SummitStack, and the Summit family switches.

configure forwarding hash-recursion-level

configure forwarding hash-recursion-level *0-3*

Description

Modifies hardware table utilization by configuring the dual hashing recursion level.

Syntax Description

0-3	Sets the maximum number of L3 hash buckets to modify to make room for a new entry.

Default

The default is “1.”

Usage Guidelines

This command allows you to select the dual hashing “recursion level” for hardware with the dual-hash feature. The setting applies only if dual-hash is configured or defaulted to “on” using the configure forwarding hash-algorithm command.

The configured recursion level is the maximum number of existing hash entries to move in an attempt to add a new hash entry. A higher recursion level may provide better hash utilization at the expense of additional CPU processing. This command does not require a system reboot. However, the new recursion level takes effect only for addresses added after the command is issued.

Example

The following command modifies the dual-hash recursion level to modify up to two L3 hash buckets in an attempt to add a new entry:

```
configure forwarding hash-recursion-level 2
```

History

This command was first available in ExtremeXOS 12.1.

Platform Availability

This command is available only on the BlackDiamond X8 and BlackDiamond 8800 series switches.

disable elrp-client

disable elrp-client

Description

Disables the ELRP client (standalone ELRP) globally.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables the ELRP globally so that none of the ELRP VLAN configurations take effect.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the enable elrp-client command to globally enable the ELRP client.

Example

The following command globally disables the ELRP client:

```
disable elrp-client
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

disable led locator

disable led locator { **slot** [*slot* | **all**]}

Description

Disables the front panel LEDs from flashing on a switch or chassis.

Syntax Description

slot *slot*	Slot number.
all	All slots.

Default

N/A.

Usage Guidelines

None.

Example

The following example disables the front panel LEDs on all slots:

```
disable led locator all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

disable log debug-mode

disable log debug-mode

Description

Disables debug mode. The switch stops generating debug events.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command disables debug mode. Debug mode must be enabled prior to configuring advanced debugging capabilities. These include allowing debug messages, which can severely degrade performance. For typical network device monitoring, debug mode should remain disabled, the default setting. Debug mode should only be enabled when advised by technical support, or when advanced diagnosis is required. The debug mode setting is saved to FLASH.

The following configuration options require that debug mode be enabled:

- Including a severity of debug-summary, debug-verbose, or debug-data when configuring filters
- Target format options process-name, process-id, source-function, and source-line

Example

The following command disables debug mode:

```
disable log debug-mode
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

eject memorycard

eject memorycard

Description

Ensures that the compact flash card or USB 2.0 storage device can be safely removed from the switch.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

After the switch writes to a compact flash card or USB 2.0 storage device, and before you can view the contents on the device, you must ensure it is safe to remove the device from the switch. Use the eject memorycard command to prepare the device for removal. After you issue the eject memorycard command, you can manually remove the device.

If the configure debug coredumps memorycard command is in effect when you issue the eject memorycard command, the behavior is similar to issuing the configure debug coredumps off command.

For more information about removing a compact flash card or USB 2.0 storage device, refer to the hardware documentation.

To access and read the data on the card, use a PC with appropriate hardware such as a compact flash reader/writer and follow the manufacturer's instructions to access the compact flash card and read the data.

Example

The following command prepares a compact flash card or USB 2.0 storage device to be removed from the switch:

```
eject memorycard
```

On the BlackDiamond X8 switch, there are two USB ports, and so the command indicates which port is being ejected.

If only USB slot 1 has a USB storage device:

```
BD-X8.3 # eject memorycard
sync filesystem...
unmount filesystem...
memorycard unmounted from USB-1
```

If both USB slots have a USB storage device:

```
BD-X8.3 # eject memorycard
sync filesystem...
unmount filesystem...
```

```
memorycard unmounted from USB-1
memorycard auto-mounted on USB-2
```

Note

When both USB slots have a USB storage device, the first one inserted is the one currently visible to the user. If both devices were left in the slots since the last reboot, the system may make either one visible to the user, that is, it is not deterministic.

History

This command was first available in ExtremeXOS 11.1.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on BlackDiamond X8 and 8800 series switches and Summit X460, X480, X670, and X670V switches.

enable elrp-client

enable elrp-client

Description

Enables the Extreme Loop Recovery Protocol (ELRP) client (standalone ELRP) globally.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

The ELRP client must be enabled globally in order for it to work on any VLANs.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the disable elrp-client command to globally disable the ELRP client.

The ExtremeXOS software does not support ELRP and Network Login on the same port."

Example

The following command globally enables the ELRP client:

```
enable elrp-client
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

 enable led locator

enable led locator {**timeout** [*seconds* | **none**]} {**pattern** [**alternating** | **flash-all** | **high-to-low** | **scanner**]} {**slot** [*slot* | **all**]}

Description

Configures the front panel LEDs to flash so a switch/chassis can be easily located in a crowded lab/ data center.

Syntax Description

timeout	Limit the LED display time to ***seconds*** before returning to normal operation.
seconds	The length of time to display the flashing LEDs. The default is 300 seconds. The maximum value is 1 week (604800 seconds).
none	Display LED pattern until disabled.
pattern	Configures the LED display pattern.
alternating	Groups of LEDs are lit in alternating patterns (Default).
flash-all	All LEDs flash on and off.
high-to-low	LED's are lit in descending port order.
scanner	A group of 4 LED's is lit back and forth
slot *slot*	Slot number.
all	All slots.

Default

The default **timeout** length is 300 seconds.

The default pattern is alternating.

Usage Guidelines

Use this command to enable the front panel LEDs to flash so that a switch/chassis can be easily located in a crowded lab, or data center.

Example

The following example enables the front panel LEDs to flash in an alternating pattern for one hour on all slots:

```
enable led locator timeout 3600 pattern alternating all
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available on all platforms.

enable log debug-mode

The switch generates debug events.

```
enable log debug-mode
```

Description

Enables debug mode.

Syntax Description

This command has no arguments or variables.

Default

Disabled.

Usage Guidelines

This command enables debug mode. Debug mode must be enabled prior to configuring advanced debugging capabilities. These include allowing debug messages, which can severely degrade performance. For typical network device monitoring, debug mode should remain disabled, the default setting. Debug mode should only be enabled when advised by technical support, or when advanced diagnosis is required. The debug mode setting is saved to FLASH.

The following configuration options require that debug mode be enabled:

- Including a severity of debug-summary, debug-verbose, or debug-data when configuring filters

- Target format options process-name, process-id, source-function, and source-line

Example

The following command enables debug mode:

```
enable log debug-mode
```

When you enable debug mode, the following message appears:

```
WARNING: Debug mode should only be enabled when advised by technical support,
or when advanced diagnosis is required.  Performance degradation is possible.
Debug mode now enabled.
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

nslookup

nslookup {**IPv4** | **IPv6**} *hostname*

Description

Displays the IP address of the requested host.

Syntax Description

IPv4	Lookup only IPv4 address(es)
IPV6	Lookup only IPv6 address(es)
hostname	Specifies the hostname.

Default

Lookup both IPv4 and IPv6 addresses.

Usage Guidelines

For nslookup to work, you must configure the DNS client, and the switch must be able to reach the DNS server.

By default, the command looks for both IPv4 and IPv6 addresses and reports an error only when neither an IPv4 address nor an IPv6 address is found for the host.

If the IPv4 or IPv6 option is specified, DNS lookup happens only for that address type, and an error is reported when no address of that type is found.

Host Name and Remote IP Address Character Restrictions

This section provides information about the characters supported by the switch for host names and remote IP addresses.

When specifying a host name or remote IP address, the switch permits only the following characters:

- Alphabetical letters, upper case and lower case (A-Z, a-z)
- Numerals (0-9)
- Period (.)
- Dash (-) Permitted only for host names
- Underscore (_) Permitted only for host names
- Colon (:)

When naming or configuring an IP address for your network server, remember the requirements listed above.

Example

The following command looks up the IP addresses of a computer with the name myhost.mydomain that has 2 IPv4 addresses and 1 IPv6 address:

```
nslookup myhost.mydomain
```

The following is sample output from the command on a Summit X450a 24t switch:

```
Host "myhost.mydomain" has the IPv4 address 192.168.1.1
Host "myhost.mydomain" has the IPv4 address 192.168.1.2
Host "myhost.mydomain" has the IPv6 address 2000::1
```

History

This command was first available in ExtremeXOS 10.1.

Support for using an IP address to obtain the name of the host was added in ExtremeXOS 11.0. Support for looking up IPv6 addresses was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

run diagnostics

run diagnostics [extended | normal | stack-port] {slot [*slot* | A | B]}

Description

Runs normal or extended diagnostics on the switch, slot, node, or management module. On the Summit family switches, this command also runs diagnostics on the stacking ports.

This command is not supported in stacking mode. But if you issue the show diagnostics command from the master node, it will show the diagnostic results for all the nodes.

Syntax Description

extended	Runs an extended diagnostic routine. Takes the ports offline, and performs extensive ASIC and packet loopback tests on all of the ports. BlackDiamond 8800 series switches only—If you have a Power over Ethernet (PoE) module installed, the switch also performs an extended PoE test, which tests the functionality of the inline power adapter.
normal	Runs a normal diagnostic routine. Takes the ports offline, and performs a simple ASIC and packet loopback test on all of the ports.
stack-port	Runs the diagnostic routine on the stack ports. NOTE: This parameter is available only on Summit family switches that are not operating in stacking mode.
slot	Specifies the slot number of an I/O module. BlackDiamond X8 switches only - The slot argument is used to refer to both I/O and fabric modules. NOTE: This parameter is available only on modular switches.
A | B	Specifies which MSM/MM to run diagnostics on. A specifies the MSM/MM installed in slot A.B specifies the MSM/MM installed in slot B. NOTE: This parameter is available only on modular switches.

Default

N/A.

Usage Guidelines

Depending on your platform, use this command to run diagnostics on the switch, slot, management module, or stack port.

Running Diagnostics-BlackDiamond X8 Switches Only.

If you run the diagnostic routine on an I/O or Fabric module, that module is taken offline while the diagnostic test is performed. The module does not forward traffic. Once the diagnostic test is completed, the I/O or Fabric module is automatically reset and becomes operational again. On a

management module, the module is taken offline while the diagnostics test is performed. Once the diagnostic test is completed, the management module (MM) reboots, and becomes operational again.

After the switch runs the diagnostic routine, test results are saved in the module's EEPROM and messages are logged to the syslog. On an I/O or Fabric or MM module, the extended diagnostic routine can require significantly more time to complete.

Running Diagnostics—BlackDiamond X8 Series Switches and BlackDiamond 8800 Series Switches Only

If you run the diagnostic routine on an I/O module, that module is taken offline while the diagnostic test is performed. The ports on the module do not forward traffic. Once the diagnostic test is completed, the I/O module is automatically reset and becomes operational again.

After the switch runs the diagnostic routine, test results are saved in the module's EEPROM and messages are logged to the syslog.

On an I/O module, the extended diagnostic routine can require significantly more time to complete, depending on the number of ports on the module.

On a management module, the module is taken offline while the diagnostics test is performed. Once the diagnostic test is completed, the MSM reboots, and becomes operational again.

Note

BlackDiamond 8810 switch—If you run diagnostics on slots 5 and 6 with an MSM installed in those slots, the diagnostic routine tests the I/O subsystem of the MSM. BlackDiamond 8806 switch—if you run diagnostics on slots 3 and 4 with an MSM installed in those slots, the diagnostic routine tests the I/O subsystem of the MSM. BlackDiamond 8800 series switches—To run diagnostics on the management portion of the master MSM, specify slot A or B.

Running Diagnostics—Summit Family Switches Only

If you run the diagnostic routine on the switch, it reboots and then performs the diagnostic test. During the test, traffic to and from the ports on the switch is temporarily unavailable. When the diagnostic test is complete, the switch reboots and becomes operational again.

To run the diagnostic routine on the stack ports, you need a dedicated stacking cable that connects stack port 1 to stack port 2, which are located at the rear of the switch. The stacking cable is available from Extreme Networks. The switch performs a hardware test to confirm that the stack ports are operational; traffic to and from the ports on the switch is temporarily unavailable. This Bit Error Rate Test (BERT) provides an analysis of the number of bits transmitted in error.

After the switch runs the diagnostic routine, test results are saved to the switch's EEPROM and messages are logged to the syslog.

To run diagnostics on a Summit switch that is in a SummitStack, first disable stacking on that switch, then restart the switch. Once restarted, log into the switch via its console port, and run diagnostics. The switch will perform the diagnostic tests and then restart. Once restarted, log into the switch via its console port and enable stacking, then reboot the switch. Once restarted, the switch will rejoin the stack.

Viewing Diagnostics

To view results of the last diagnostics test run, use the following command:

```
show diagnostics {[<cr>] | slot [<slot> | A | B]}
```

Note

The slot, A, and B parameters are available only on modular switches.

If the results indicate that the diagnostic failed on a module, replace the module with another module of the same type.

If the results indicate that the diagnostic failed on the switch, contact Extreme Networks Technical Support.

BlackDiamond X8 switch example.

The following commands runs normal diagnostics on the I/O module installed in slot 2 :

```
run diagnostics normal slot 2
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

The following commands runs normal diagnostics on the first Fabric module :

```
run diagnostics extended slot fm-1
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

The following commands runs normal diagnostics on the MM-A :

```
run diagnostics extended slot a
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

Sample Console Output while running Diagnostics on BlackDiamond X8 MM.

BlackDiamond 8800 series switch example

The following command runs normal diagnostics on the I/O module installed in slot 2 of a BlackDiamond 8800 series switch:

```
run diagnostics normal slot 2
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

Summit family switch example

The following command runs normal diagnostics on the Summit family switch:

```
run diagnostics normal
```

The switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

The following command runs diagnostics on the stack ports on a Summit family switch:

```
run diagnostics stack-port
```

If you issue this command with a console connection, the switch displays the following information. You also have the opportunity to continue or cancel the test:

```
Summit Diagnostics Mode Enabled, Starting Diagnostics....
Found X450a-24T in Motherboard
Motherboard CPLD Revision: 2
Starting stacking port diagnostics
*****************************************************************
*                                                               *
* Please connect a cable between Stack Port 1 and Stack Port 2. *
*                                                               *
*        Press S to skip test, ENTER key to continue.           *
*                                                               *
*****************************************************************
```

Press [Enter] to continue and run the diagnostics. Enter S to cancel the operation.

If you continue with diagnostics, the switch displays messages similar to the following:

```
Stack Port 1 and Stack Port 2
BERT ..........................................................................
.............
```

```
.....................................................................
.....
Stacking ports
Port 1 (Device 0 - Device port 26)
Lane 0 PASSED.
Lane 1 PASSED.
Lane 2 PASSED.
Lane 3 PASSED.
Port 2 (Device 0 - Device port 27)
Lane 0 PASSED.
Lane 1 PASSED.
Lane 2 PASSED.
Lane 3 PASSED.
DIAGNOSTIC PASS: run test bert stacking
Summit Diagnostics completed, rebooting system...
```

If you issue this command with a Telnet connection, the switch displays a warning similar to the following about the impact of this test. You also have the opportunity to continue or cancel the test:

```
Running Diagnostics will disrupt network traffic.
Are you sure you want to continue? (y/n)
```

Enter y to continue and run the diagnostics. Enter n to cancel the operation.

History

This command was first available in ExtremeXOS 10.1.

This command was modified in ExtremeXOS 11.0 to run diagnostics on management modules from the command line interface (CLI).

The stack-port parameter for the Summit family switches was added in ExtremeXOS 11.5.

Platform Availability

This command is available on all platforms.

run elrp

run elrp *vlan_name* {**ports** *ports*} {**interval** *sec*} {**retry** *count*}

Description

Starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval.

Syntax Description

vlan_name	Specifies a VLAN name.
ports	Specifies the set of VLAN ports for packet transmission.
sec	Specifies the interval (in seconds) between consecutive packet transmissions. The range is 1 to 64 seconds. The default is 1 second.
count	Specifies the number of times ELRP packets must be transmitted. The range is 3 to 255 times. The default is 10 times.

Default

sec—The interval between consecutive packet transmissions is 1 second.

count—The number of time ELRP packets must be transmitted is 10.

Usage Guidelines

This command starts one-time, non-periodic ELRP packet transmission on the specified ports of the VLAN using the specified count and interval. If any of these transmitted packets is returned, indicating loopback detection, the ELRP client prints a log message to the console. There is no need to send a trap to the SNMP manager for non-periodic requests.

Note

This command is compatible with Extreme Networks switches running only the ExtremeXOS software. If your network contains switches running ExtremeXOS and switches running ExtremeWare, use the configure elrp-client one-shot <vlan_name> ports [<ports> | all] interval <sec> retry <count> [log | print | print-and-log] command to perform one-time ELRP packet transmission.

If you do not specify the optional interval or retry parameters, the default values are used.

Use the configure elrp-client periodic command to configure periodic transmission of ELRP packets.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the enable elrp-client command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the disable elrp-client command to globally disable the ELRP client.

Example

The following command starts one-time, non-periodic ELRP packet transmission on the VLAN green using the default interval and packet transmission:

```
run elrp green
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

run esvt traffic-test

run esvt traffic-test {**vlan**} *vlan_name* **loopback-port** *loopback-port* **peer-switch-ip** *ipaddress* **packet-size** *packet_size* **rate** *rate* [**Kbps**|**Mbps** |**Gbps**] **duration** *time* [**seconds** | **minutes** | **hours**]

Description

Runs the Extreme Service Verification tool on the specified ports of the VLAN using the specified count and interval.

Syntax Description

vlan	Specifies the VLAN for the traffic test.
vlan_name	Specifies a VLAN name.
loopback-port	Specifies the loopback port for the traffic test.
loopback-port	Specifies the *loopback-port*.
peer-switch-ip	Specifies the peer switch for the traffic test.
ipaddress	Specifies the IP address of the peer switch.
packet-size	Specifies the size of packet to use for service verification.
packet_size	Specifies the size; the range is 64 - 9216.
rate	Specifies the maximum service utilization rate and rate value.
Kbps	Specifies K bits per second.
Mbps	Specifies M bits per second.
Gbps	Specifies G bits per second.
duration	Specifies the duration of time to run service verification.
time	Specifies the duration value; the range is 1-65534.
seconds	Specifies the time in seconds.
minutes	Specifies the time in minutes..
hours	Specifies the time in hours.

Default

N/A.

Usage Guidelines

Use this command to run the Extreme Service Verification tool on the specified ports of the VLAN using the specified count and interval.

Example

The following example starts the Extreme Service Verification tool on vlan1, loopback port 2:

```
run esvt traffic-test v1 loopback-port 2 peer-switch-ip 2.2.2.2 packet-size
64 rate 200 Mbps duration 5 minutes
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available in X460, X480, E4G-200, E4G-400, X670, X650, Stacking, BDX8 and BD8800.

save debug tracefiles memorycard

save debug tracefiles memorycard

Description

Copies debug information to a compact flash card or USB 2.0 storage device.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support to troubleshoot the switch.

Use this command to copy debug information to an installed removable storage device. The debug information includes log files and trace files.

Progress messages are displayed that indicate the file being copied and when the copying is finished.

Beginning with ExtremeXOS 11.6, you can use the upload debug [<hostname> | <ipaddress>] {{vr} <vrname>} command to copy debug information to a network TFTP server.

Example

The following command copies debug information to a removable storage device:

```
save debug tracefiles memorycard
```

History

This command was first available in ExtremeXOS 11.0.

The syntax for this command was modified in ExtremeXOS 11.1 from upload debug-info memorycard to save debug tracefiles memorycard.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on BlackDiamond 8800 series switches and Summit X460, X480, X670, and X670V switches.

show debug

show debug

Description

This command displays whether the writing of core dump files is enabled or disabled and whether the files are written to internal memory, a compact flash card, or a USB 2.0 storage device.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

By default, the switch writes core dump files to the internal memory card. To change the default configuration, use the configure debug core-dumps command.

Example

The following example shows that the switch is configured to send core dump files to the internal memory card:

```
Switch.2 # show debug
Debug Settings:
    Core dumps: Enabled (internal-memory)
```

The following example shows that the sending core dump files is disabled:

```
Switch.99 # show debug
Debug Settings:
    Core dumps: Disabled
```

The following example shows that the switch is configured to send core dump files to a compact flash card or USB 2.0 storage device:

```
Switch.76 # show debug
Debug Settings:
    Core dumps: Enabled (memorycard)
```

History

This command was first available in ExtremeXOS 11.1.

Support for the internal memory card was added in ExtremeXOS 11.2.

Support for USB 2.0 storage devices was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

show diagnostics

show diagnostics {[*cr*] | **slot** [*slot* | **A** | **B**]}

On a stack:

show diagnostics {**slot** [*slot_number*]}

Description

Displays the status of the last diagnostic test run on the switch.

Syntax Description

slot	Specifies which I/O or Fabric module to display diagnostic status information on. NOTE: This parameter is available only on modular switches.
A | B	Specifies which MSM/MM to display diagnostic status information on:A specifies the MSM installed in slot A.B specifies the MSM installed in slot B. NOTE: This parameter is available only on modular switches.
slot_number	Specifies the slot number of the node on which you need to run the diagnostics. Values can be from 1 to 8 or FM-1 to FM-4 (BDX8 only). Note: This parameter is available only on a stackable switch in stack mode.

Default

N/A.

Usage Guidelines

Use this command to display information from the last diagnostic test run on the switch.

To run diagnostics on a switch in a stack, you need to remove the node from the stacking mode, restart the node, and then run the diagnostics locally on the node. You can see the latest diagnostics results from the Master node of a stack after the node has rejoined the stack.

Output on BlackDiamond X8 Switches

If you have run diagnostics, a brief summary of the overall diagnostic test is displayed.

The switch displays the following diagnostic information:

- Date the test was run-The month, date, and year.
- Last Test Version-The ExtremeXOS version associated with the results.
- Summary-A brief summary of the overall diagnostic test. Options are:
  - Diagnostics Pass-The diagnostic test has passed.
  - Diagnostics Fail-One or more diagnostic test has failed.
  - Diagnostics Interrupted-The diagnostic test was interrupted on the I/O or Fabric module or MM module.

If you have never run diagnostics on a specific slot, the switch displays a message similar to the following:

```
Slot-6: G8X
No Diagnostics Data
```

If you attempt to view diagnostics information for a slot that does not have a module installed, the

switch displays a message similar to the following:

```
Slot-7: No Module Present
```

Output on the BlackDiamond 8800 Series Switches

The switch displays the following diagnostic information:

If you have run diagnostics, a brief summary of the overall diagnostic test is displayed. Options are:

- Date the test was run—The month, date, and year.
- Last Test Version—The ExtremeXOS version associated with the results.
- Summary—A brief summary of the overall diagnostic test. Options are:
  - Diagnostics Pass—The diagnostic test has passed.
  - Diagnostics Fail—One or more diagnostic test has failed.
  - Diagnostics Interrupted—The diagnostic test was interrupted on the I/O module due to initiating an MSM failover.

If you have never run diagnostics on a specific slot, the switch displays a message similar to the following:

```
Slot-6: G8X
No Diagnostics Data
```

If you attempt to view diagnostics information for a slot that does not have a module installed, the switch displays a message similar to the following:

```
Slot-7: No Module Present
```

Output on the Summit Family Switches

The switch displays the following diagnostic information:

If you have run diagnostics, information includes the:

- Date the test was run—The month, date, and year.
- Last Test Version—The ExtremeXOS version associated with the results.
- Test data—If the diagnostic test failed, the switch displays the name of the failed test. The switch displays a message similar to the following:

  MAC memory test failed
- Summary—A brief summary of the overall diagnostic test. Options are:
  - Diagnostics Pass—The diagnostic test has passed.
  - Diagnostics Fail—One or more diagnostic tests have failed.

If you have never run diagnostics on the switch or stack ports, the switch displays a message similar to the following:

```
Result: FAIL
Test date run is invalid. Please run Diagnostics.
Error reading diagnostics information.
```

This message is normal and expected if you have never run diagnostics on the switch. After you run diagnostics, you should see information about the executed test.

Additional Guidelines Applicable to Modular Switches Only

If you use the show diagnostics {[<cr>] | slot [<slot> | A | B]} command on a slot where diagnostics have not been run, the switch displays messages similar to the following:

```
No Diagnostics Data
```

or

```
Diagnostics never run
```

If you try to display diagnostic test information on a slot where no module is installed, the switch displays messages similar to the following:

```
No Module Present
```

or

```
No card in slot
```

Running Diagnostics

To run diagnostics on an I/O module or an MSM installed in the BlackDiamond 8800 series switch, use the following command:

```
run diagnostics [extended | normal] {slot [<slot> | A | B]}
```

To run diagnostics on Summit family switches, use the following command:

```
run diagnostics [extended | normal | stack-port]
```

Depending on the software version running on your switch or your switch model, additional or different diagnostic information might be displayed. For more information, see the command run diagnostics run diagnostics.

Example

The following command displays the results of module diagnostics for the I/O module in slot 2:

The following is sample output from a BlackDiamond X8 switch:

```
BD-X8.5 # show diagnostics slot 2
Slot-2: BDXA-40G24X
Last Test Date: Tue Jan 24 15:09:54 2012
Last Test Version:        1.7
Summary: Diagnostics Pass
```

The following is sample output from a BlackDiamond 8800 series switch:

```
Slot-2: G24X
Last Test Date: Wed May  6 23:57:17 2009
Last Test Version:   12.3.0.1
Summary: Diagnostics Pass
```

When the version is unknown, Last Test Version reads “Unknown.”

The following is sample output from the BlackDiamond 12804 switch:

```
Slotnum 2
DiagResult timestamp Fri Dec  2 11:15:29 2005
Test Temperature = 41 degrees C
Diag Test Version=1.0.1.2.      S/N=05364-00058
--------------------------------------------------------------------------
CPU System |  Passed
--------------------------------------------------------------------------
Register Test |  Passed
--------------------------------------------------------------------------
Memory Test |  Passed
--------------------------------------------------------------------------
System Test |  Passed
--------------------------------------------------------------------------
Summary: Diagnostics Pass
```

The following command displays the results of the switch diagnostics for the Summit family switch:

```
show diagnostics
```

The following is sample output from this command:

```
Last Test Date: May-04-2006
Last Test Version: 12.3.0.1
Summary: Diagnostics Pass
```

When the version is unknown, Last Test Version reads “Unknown.”

History

This command was available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

show elrp

show elrp

Description

Displays ELRP information.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the following:

- State of ELRP (enabled/disabled).
- Total number of ELRP sessions.
- ELRP packets transmitted.
- ELRP packets received.

In addition to the summary information at the top of the display, the show elrp command also displays the following information:

Client	Displays the name of the ELRP client.
VLAN	Displays the name of the VLAN with ELRP enabled.
Ports	Displays the set of VLAN ports used for packet transmission.
Interval	Displays the configured interval. An interval of 3 indicates that ELRP PDUs are transmitted every 3 seconds.
Count	Lists the configured number of ELRP PDUs that are transmitted. The PDUs are transmitted at the configured interval. This method of ELRP PDU transmission is used by ESRP in the pre-master state. A count of 0 indicates continuous PDU transmission. If the Cyclic value is Yes, the count is always 0.

Cyclic	Indicates whether ELRP PDUs are being continuously sent. The column shows Yes for the master VLAN because that VLAN is continuously sending ELRP PDUs for loop detection. When a VLAN is in the pre-master state, it only sends three ELRP PDUs before changing to master or slave. During this time the column shows No for that VLAN.
Pkts-Xmit	Displays the number of ELRP PDUs transmitted.
Pkts-Rcvd	Displays the number of ELRP PDUs received.
Action	Displays the configured action the switch takes when ELRP messages are received back indicating a detection of a network loop or no packets are received within the specified duration. The following list describes the actions: Print (P)—Specifies that the switch prints a message to the console.Log (L)—Specifies that the switch sends a message to the system log file.Trap (T)—Specifies that the switch sends a message to the SNMP manager.Callback (C)—Specifies a callback action. If you use ELRP with another protocol (for example ESRP), ELRP uses a callback action to notify the protocol of a loop detection.
Disable Port	Displays the configured hold time (number of seconds or permanent) for a port that was disabled with the configure elrp-client periodic command. When the time in seconds expires, the port is automatically enabled.

Example

The following command displays summary ELRP status information on the switch:

```
show elrp
```

The following sample output is displayed:

```
ELRP Standalone Client:       Enabled
Number of ELRP sessions:          1
Number of ELRP pkts transmitted:  14
Number of ELRP pkts received:     0
Pkt       Pkts             Disable
Client  Vlan        Ports  Int.    Count Cyclic Xmit      Rcvd      Action
Port
-------------------------------------------------------------------------------
----
CLI     vlanp1       All   1        0     Yes    14        0         L      -
CLI     vlanp2       All   1        0     Yes    14        0         T
Perm
CLI     vlanp3       All   1        0     Yes    14        0         LT     15
-------------------------------------------------------------------------------
----
Action : (P) Print , (L) Log , (T) Trap , (C) Callback
```

History

This command was first available in ExtremeXOS 11.1.

The disable port feature was added in ExtremeXOS 12.4.

Platform Availability

This command is available on all platforms.

show elrp disabled-ports

```
show elrp disabled-ports
```

Description

Displays information about ELRP disabled ports.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

This command displays the results of disabling ports using the configure elrp-client periodic command.

This command displays the following:

- Excluded Ports—User defined ports that will not be disabled.
- Exclude EAPS ring ports--Whether EAPS ring ports can be excluded.
- Disabled Port—The port that ELRP disabled.
- Detected VLAN—The VLAN with looping ELRP PDU(s).
- Duration—The configured time to keep the port disabled.
- Time Disabled—The time when ELRP disabled the port.

Example

The following command displays summary ELRP status information on the switch:

```
show elrp disabled-ports
```

The following sample output is displayed:

```
Exclude EAPS ring ports: Yes
Excluded Ports
-------------------------------------------------------------------
1:1 1:9 1:14 1:18
-------------------------------------------------------------------
Disabled Detected             Duration Time
Port     Vlan                 (sec)    Disabled
```

```
-------------------------------------------------------------------
1:20     vlan1                15        Fri Jul 16 17:53:16 2010
-------------------------------------------------------------------
```

History

This command was first available in ExtremeXOS 12.4.

The excluded port list was added in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

show esvt traffic-test

show esvt traffic-test {{**vlan**} *vlan_name*}

Description

Displays statistics output for the Extreme Service Verification tool on the specified VLAN.

Syntax Description

vlan	\Specifies the VLAN for the traffic test.
vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to display test output for the Extreme Service Verification tool on the specified VLAN.

Example

The following example displays show output for the Extreme Service Verification tool on vlan1 and vlan3:

```
VLAN  Status    Loopback  Duration  Tx rate Tx Frame Tx Total Rx Total
                      Port    (hh:mm:ss) (Mbps)  Size Frames  Frames

Error                               : Failed to communicate with peer
switch
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available in X460, X480, E4G-200, E4G-400, X670, X650, Stacking, BDX8 and BD8800.

show forwarding configuration

show forwarding configuration

Description

Displays the configured selection criteria for ECMP routes and load-sharing group ports and the hardware table settings, including the configured and current hash algorithm and dual-hash settings.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

The output of this command displays the following information:

- Configured hash algorithm—The hash algorithm configured on the switch. After the configuration is saved and the switch is rebooted, the switch uses this hash algorithm.
- Current hash algorithm—The hash algorithm currently used by the switch.
- Configured dual-hash setting—Whether the dual-hash feature is configured ‘on’ or ‘off’ on the switch. After the configuration is saved and the switch is rebooted, the switch uses this setting.
- Current dual-hash setting—Whether the dual-hash feature is currently ‘on’ or ‘off’ on the switch.
- Dual-Hash recursion level—The current dual-hash recursion level; default is ‘1.’
- Sharing criteria—Current selection criterion used for ECMP route sharing as well as for load-sharing groups. Specifies which Layer3 and Layer4 information is used in the sharing hash algorithm. For more information, see the description for the configure forwarding sharing [L3 | L3_L4] command.
- Group Table Compression—Whether the group table compression is currently ‘on’ or ‘off’ on the switch.
- Switching mode—Whether the switching mode is currently set to ‘cut-through’ or ‘store-and-forward.’
- Fabric flow control—Whether flow control fabric configuration is set to ‘auto’ or ‘off.’

It is possible for the values of the configured and the current hash, or the configured and current dual-hash settings to be different. For example, if you modified the hash algorithm and have not saved the

configuration and rebooted the switch, the values might be different. In this situation, the switch also displays the following message:

```
NOTE: A save and reboot are required before the configured hash will take
effect
```

Example

The following command displays the hardware forwarding algorithm configured on the switch:

```
show forwarding configuration
```

The following is sample output from this command on a BlackDiamond 8800 series switch:

```
BD-8810.1 # show forwarding configuration
L2 and L3 Forwarding table hash algorithm:
Configured hash algorithm:              crc32
Current hash algorithm:                 crc32
L3 Dual-Hash configuration:  (Applies only to "c" and "xl"-series HW)
Configured setting:                     on
Current setting:                        on
Dual-Hash Recursion Level:              1
Hash criteria for IP unicast traffic for L2 load sharing and ECMP route
sharing
Sharing criteria:                      L3_L4
IP multicast:
Group Table Compression:                on
IP multicast:
    Group Table Compression:            on
    Lookup-Key                          SourceIP, GroupIP, VlanId
Switch Settings:
    Switching mode:                     store-and-forward
Fabric Flow Control:
    Fabric Flow Control:                auto
```

In addition to the data shown above, on BlackDiamond X8 series switches the following lines appear at the end of the output:

```
Fabric Hash Slot-1:
Packet Algorithm:
Dynamic mode
Eligibility
or
Fabric Hash Slot-2:
Packet Algorithm:
crc16-ccitt
seed: 0x12345678
or
Fabric Hash Slot-5:
Source-port
```

For BlackDiamond X8 series switches, when the switch fabric hash is set to Default, there is no printed output for the related slot.

Dual-hash information appears only on BlackDiamond X8 series switches and BlackDiamond 8800 series switches.

Fabric flow control information appears only on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, SummitStack, and Summit X460, X650, and X670 switches.

History

This command was first available in ExtremeXOS 11.3.2.

The flow control feature was added in ExtremeXOS 12.5.

The Forwarding Lookup-Key feaure show output is added in ExtremeXOS 15.3.

Platform Availability

This command is available only on BlackDiamond X8 series switches, BlackDiamond 8800 series switches, SummitStack, and Summit family switches.

show tech

show tech {**all** | *area*} {**detail**} {**logto** [**file**]}

Description

Displays the output of various show commands to assist in monitoring and troubleshooting the switch; use only in conjunction with Extreme Networks Technical support

.

Syntax Description

all	Indicates all available show command output to be displayed.
area	Specifies one tech support area. For example, if you want to view STP information, enter stp.
detail	Specifies more detailed information.
logto [file]	Instructs the switch to log the show tech output into a file located in the switch's internal memory. The default file name is show_tech.log.tgz.

Default

N/A.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support personnel to view your switch configurations and to troubleshoot the switch.

The show tech command displays the output of the following commands, among others:

- ls internal-memory
- show bootprelay
- show configuration
- show dhcp-client state
- show diagnostics
- show management
- show memory
- show odometers
- show policy
- show port rxerror
- show port txerror
- show power
- show power budget
- show power controller
- show process
- show radius
- show session
- show switch
- show tacacs
- show version
- show vlan

Information about the following areas is also displayed, among others:

- aaa
- bootp
- cli
- stp

If you enter the detail keyword, the following show output is displayed, among others:

- show log
- show log configuration
- show log counters all
- show process detail

This information can be useful for your technical support representative if you experience a problem.

Depending on the software version running on your switch, the configurations running on your switch, and the type of switch you have, additional or different show command and configuration output may be displayed.

Note

When the **show tech** command is executed from the Backup MSM, the following commands will not generate proper output:

- **show debug system-dump msm/slot**
- **debug hal show version msm <Master MSM a or b>**
- **show iparp distributed-mode statistics**

Example

The following command displays the show command output on the switch:

```
show tech
```

History

This command was first available in ExtremeXOS 10.1.

Platform Availability

This command is available on all platforms.

stop esvt traffic-test

stop esvt traffic-test {**vlan**} *vlan_name*}

Description

Stops the Extreme Service Verification tool on the specified VLAN.

Syntax Description

vlan	Specifies the VLAN for the traffic test.
vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

Use this command to stop the Extreme Service Verification tool on the specified VLAN.

Example

The following example stops the Extreme Service Verification tool on vlan1:

```
stop esvt traffic-test v1
```

History

This command was first available in ExtremeXOS 15.3.

Platform Availability

This command is available in X460, X480, E4G-200, E4G-400, X670, X650, Stacking, BDX8 and BD8800.

top

top

Description

Displays real-time CPU utilization information by process.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to show the percentage of CPU processing devoted to each process, sampled every 5 seconds.

You can change the display by typing a character while the display is active. The following table displays the supported commands.

Table 59: TOP Interactive Command Display Options

Key	Action
P	Sort process list by CPU utilization
T	Sort process list by time usage
N	Sort process list by number (process ID)
M	Sort process list by memory usage
q [Ctrl] + c	Exit the top program

For more detailed information about the top command including display options, command fields, and command usage, please refer to your UNIX documentation.

Example

The following command displays the real-time CPU utilization information by process:

```
top
```

History

This command was first available in ExtremeXOS 11.0.

Platform Availability

This command is available on all platforms.

unconfigure elrp-client

unconfigure elrp-client *vlan_name*

Description

Disables a pending one-shot or periodic ELRP request for the specified VLAN.

Syntax Description

vlan_name	Specifies a VLAN name.

Default

N/A.

Usage Guidelines

This command disables a pending one-shot or periodic ELRP request for the specified VLAN.

To start one-time, non-periodic ELRP packet transmission on specified ports of a VLAN using a particular count and interval, use one of the following commands:

- configure elrp-client one-shot <vlan_name> ports [<ports> | all] interval <sec> retry <count> [log | print | print-and-log]—(This command is backward compatible with Extreme Networks switches running the ExtremeWare software.)
- run elrp <vlan_name> {ports <ports>} {interval <sec>} {retry <count>}

To configure periodic transmission of ELRP packets, use the configure elrp-client periodic command.

The ELRP client must be enabled globally in order for it to work on any VLANs. Use the enable elrp-client command to globally enable the ELRP client.

The ELRP client can be disabled globally so that none of the ELRP VLAN configurations take effect. Use the disable elrp-client command to globally disable the ELRP client.

Example

The following command disables a pending ELRP request on VLAN elrp1:

```
unconfigure elrp-client elrp1
```

History

This command was first available in ExtremeXOS 11.1.

Platform Availability

This command is available on all platforms.

unconfigure elrp-client disable ports

unconfigure elrp-client disable-ports

Description

Deletes an ELRP exclude port list.

Syntax Description

This command has no arguments or variables.

Default

N/A.

Usage Guidelines

Use this command to remove an ELRP exclude port list.

Example

The following example removes the existing ELRP exclude port list:

```
unconfigure elrp-client disable-port
```

History

This command was first available in ExtremeXOS 12.5.3.

Platform Availability

This command is available on all platforms.

upload debug

upload debug [*hostname* | *ipaddress*] {{**vr**} *vr_name*}

Description

Uploads debug information files to a tftp server. On a platform that has both primary and backup MSMs/MMs, debug information files are uploaded from both the backup and primary MSMs/MMs.

Syntax Description

hostname	Specifies the host name of the TFTP server to which the debug files will be uploaded to.
ipaddress	Specifies the IP address of the TFTP server to which the debug files will be uploaded to.
vr_name	Specifies the name of the virtual router.

Default

By default, the virtual router VR-Mgmt will be used.

Usage Guidelines

Note

Use this command only under the guidance of Extreme Networks Technical Support personnel to troubleshoot the switch.

Use this command to copy, upload debug information (for example, core, trace, show tech, configuration, and policy files) to the specified TFTP server.

Progress messages are displayed that indicate the file being copied and when the copying is finished. Depending on your platform, the switch displays a message similar to the following:

```
The following files on have been uploaded:
Tarball Name: TechPubsLab_C_09271428.tgz
./primary.cfg
```

You can also use this command in conjunction with the show tech command. Prior to uploading debug information files, the switch prompts you with the following message to run the show tech command with the logto file option:

```
Do you want to run show tech logto file first? (y/n)
```

Enter y to run the show tech command before uploading debug information. If you enter y, the show_tech.log.tgz file is included during the upload. Enter n to upload debug information without running the show tech command.

After you upload the debug information, you should see a compressed TAR file, which contains the debug information.

The TAR file naming convention is

```
<SysName>_<{<slot#>|A|B}I|C>_<Current Time>.tgz
- Current Time = mmddhhmm ( month(01-12), date(01-31), hour(0-24),
minute(00-59) ).
```

Example

The following command uploads debug files to a network TFTP server:

```
upload debug 10.10.10.10
```

History

This command was first available in ExtremeXOS 11.6.

Platform Availability

This command is available on all platforms.
