2. (Optional.) Configure a global router ID.

   router id *router-id*

   By default, no global router ID is configured.

   If no global router ID is configured, the highest loopback interface IP address, if any, is used as the router ID. If no loopback interface IP address is available, the highest physical interface IP address is used, regardless of the interface status (up or down).
3. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.

description *text*

By default, no description is configured for the OSPF process.

As a best practice, configure a description for each OSPF process.

Creating an OSPF area

1. Enter system view.
   system-view
2. (Optional.) Configure a global router ID.
   router id *router-id*
   By default, no global router ID is configured.
3. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
   By default, OSPF is disabled.
4. (Optional.) Configure a description for the OSPF process.
   description *text*
   By default, no description is configured for the OSPF process.
   As a best practice, configure a description for each OSPF process.
5. Create an OSPF area, and enter OSPF area view.
   area *area-id*
6. (Optional.) Configure a description for the area.
   description *text*
   By default, no description is configured for the area.
   As a best practice, configure a description for each OSPF area.
7. (Optional.) Exclude interfaces in the OSPF area from the base topology:
   capability default-exclusion
   By default, interfaces in an OSPF area belong to the base topology.
   For correct neighbor relationship establishment, perform this task on both the local device and the neighbor device.

Enabling OSPF

About this task

To enable OSPF on a router, you must perform the following tasks:

1. Create an OSPF process.
2. Create an OSPF area for the process.
3. Specify a network in the area.

The interface attached to the network will run the OSPF process in the area. OSPF advertises direct routes of the interface.

OSPF supports multiple processes. To run multiple OSPF processes, you must specify an ID for each process. The process IDs take effect locally and has no influence on packet exchange between routers. Two routers with different process IDs can exchange packets.

OSPF supports multiple VPNs. You can configure an OSPF process to run in a VPN instance. An OSPF process with no VPN instance specified runs on the public network. For more information about VPN, see *MCE Configuration Guide*.

Restrictions and guidelines for enabling OSPF

When you configure OSPF on an interface, follow these restrictions and guidelines:

- You can enable OSPF on the network where the interface resides or directly enable OSPF on that interface. If you configure both, the latter takes precedence.
- If the specified OSPF process and area do not exist, the operation creates an OSPF process and area for the interface. Disabling an OSPF process on an interface does not delete the OSPF process or the area.

Enabling OSPF on a network

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPF area view.

   area *area-id*
4. Specify a network to enable the interface attached to the network to run the OSPF process in the area.

   network *ip-address wildcard-mask*

   By default, no network is specified to enable OSPF on the interface attached to the network.

   A network can be added to only one area.

Enabling OSPF on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable an OSPF process on the interface.

   ospf *process-id* **area** *area-id* [**exclude-subip**]

   By default, OSPF is disabled on an interface.

Configuring OSPF stub and NSSA areas

About OSPF stub and NSSA area configuration

This task allows you to configure an OSPF area as a stub area or NSSA area. It also allows you to create a virtual link if no connectivity can be achieved between a non-backbone area and backbone area, or in the backbone area.

Configuring a stub area

About this task

You can configure a non-backbone area at an AS edge as a stub area. To do so, execute the **stub** command on all routers attached to the area. The routing table size is reduced because Type-5 LSAs will not be flooded within the stub area. The ABR generates a default route into the stub area so all packets destined outside of the AS are sent through the default route.

To further reduce the routing table size and routing information exchanged in the stub area, configure a totally stub area by using the **stub no-summary** command on the ABR. AS external routes and inter-area routes will not be distributed into the area. All the packets destined for outside of the AS or area will be sent to the ABR for forwarding.

A stub or totally stub area cannot have an ASBR because external routes cannot be distributed into the area.

Restrictions and guidelines

Do not configure the backbone area as a stub area or totally stub area.

To configure an area as a stub area, execute the **stub** command on all routers attached to the area.

To configure an area as a totally stub area, execute the **stub** command on all routers attached to the area, and execute the **stub no-summary** command on the ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no stub area is configured.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.
   This command takes effect only on the ABR of a stub area or totally stub area.

Configuring an NSSA area

About this task

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPF routing domain while retaining other stub area characteristics.

To configure an area as a totally NSSA area, use the **nssa no-summary** command. The ABR of the area does not advertise inter-area routes into the area.

Restrictions and guidelines

Do not configure the backbone area as an NSSA area or totally NSSA area.

To configure an NSSA area, configure the **nssa** command on all the routers attached to the area.

To configure a totally NSSA area, configure the **nssa** command on all the routers attached to the area and configure the **nssa no-summary** command on the ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter area view.

   area *area-id*

4. Configure the area as an NSSA area.

   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **type** *type*] * | **no-import-route** | **no-summary** | **suppress-fa** | [[**translate-always**] [**translate-ignore-checking-backbone**]] | **translate-never**] | **translator-stability-interval** *value*] *

   By default, no area is configured as an NSSA area.

5. (Optional.) Set a cost for the default route advertised to the NSSA area.

   default-cost *cost-value*

   By default, the cost for the default route advertised to the NSSA area is 1.

   This command takes effect only on the ABR/ASBR on an NSSA area or totally NSSA area.

Configuring a virtual link

About this task

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

A virtual link cannot traverse a stub area, totally stub area, NSSA area, or totally NSSA area.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure a virtual link.

   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | [**authentication-none** | { **hmac-md5** | **md5** } [*key-id* { **cipher** | **plain** } *string*] | **keychain** *keychain-name* | **simple** [{ **cipher** | **plain** } *string*]] | **retransmit** *seconds* | **trans-delay** *seconds*] *

   Configure this command on both ends of a virtual link. The **hello** and **dead** intervals must be identical on both ends of the virtual link.

Configuring OSPF network types

Based on the link layer protocol, OSPF classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

Restrictions and guidelines for configuring OSPF network types

If any routers in a broadcast network do not support multicasting, change the network type to NBMA.

If only two routers running OSPF exist on a network segment, you can change the network type to P2P to save costs.

Two broadcast-, NBMA-, and P2MP-interfaces can establish a neighbor relationship only when they are on the same network segment.

Configuring the broadcast network type for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the OSPF network type for the interface as broadcast.
   ospf network-type broadcast
   By default, the network type of an interface is broadcast.
4. (Optional.) Set a router priority for the interface.
   ospf dr-priority *priority*
   The default router priority is 1.

Configuring the NBMA network type for an interface

Restrictions and guidelines

After you configure the network type as NBMA, you must specify neighbors and their router priorities because NBMA interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the OSPF network type for the interface as NBMA.
   ospf network-type nbma
   By default, the network type of an interface is broadcast.
4. (Optional.) Set a router priority for the interface.
   ospf dr-priority *priority*
   The default router priority for an interface is 1.
   The router priority configured with this command is for DR election.
5. Return to system view.
   quit
6. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

7. Specify an NBMA neighbor.

   peer *ip-address* [**dr-priority** *priority*]

   By default, no neighbor is specified.

   The priority configured with this command indicates whether a neighbor has the election right or not. If you configure the router priority for a neighbor as 0, the local router determines the neighbor has no election right. It does not send hello packets to this neighbor. However, if the local router is the DR or BDR, it still sends hello packets to the neighbor for neighbor relationship establishment.

Configuring the P2MP network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as P2MP.

   ospf network-type p2mp [**unicast**]

   By default, the network type of an interface is broadcast.

4. Return to system view.

   quit

5. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

6. Specify a P2MP neighbor.

   peer *ip-address* [**cost** *cost-value*]

   By default, no neighbor is specified

   This step is required if the interface network type is P2MP unicast.

Configuring the P2P network type for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the OSPF network type for the interface as P2P.

   ospf network-type p2p [**peer-address-check**]

   By default, the network type of an interface is broadcast.

Configuring OSPF route control

This section describes how to control the advertisement and reception of OSPF routing information, as well as route redistribution from other protocols.

Configuring OSPF inter-area route summarization

About this task

OSPF inter-area route summarization reduces the routing information exchanged between areas and the size of routing tables, and improves routing performance.

OSPF inter-area route summarization enables an ABR to summarize contiguous networks into a single network and advertise the network to other areas. For example, three internal networks 19.1.1.0/24, 19.1.2.0/24, and 19.1.3.0/24 are available within an area. You can configure the ABR to summarize the three networks into network 19.1.0.0/16, and advertise the summary network to other areas in a Type-3 LSA. This configuration reduces the scale of LSDBs on routers in other areas and the influence of topology changes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPF area view.

   area *area-id*

4. Configure ABR route summarization.

   abr-summary *ip-address* { *mask-length* | *mask* } [**advertise** | **not-advertise**] [**cost** *cost-value*]

   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About this task

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route. The ASBR advertises only Type-5 LSAs to reduce the number of LSAs in the LSDB.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.

Restrictions and guidelines

If an ASBR (also an ABR) is a translator in an NSSA area, it summarizes routes in Type-5 LSAs translated from Type-7 LSAs. If it is not a translator, it does not summarize routes in in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure ASBR route summarization.

   asbr-summary *ip-address* { *mask-length* | *mask* } [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

By default, route summarization is not configured on an ASBR.

Configuring received OSPF route filtering

About this task

Perform this task to filter routes calculated using received LSAs.

The following filtering methods are available:

- Use an ACL or IP prefix list to filter routing information by destination address.
- Use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use an ACL or IP prefix list to filter routing information by destination address. At the same time use the **gateway** *prefix-list-name* option to filter routing information by next hop.
- Use the **route-policy** *route-policy-name* option to filter routing information.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPF to filter routes calculated using received LSAs.
   filter-policy { *ipv4-acl-number* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **route-policy** *route-policy-name* } **import**
   By default, OSPF accepts all routes calculated by using received LSAs.

Configuring Type-3 LSA filtering

About this task

Perform this task to filter Type-3 LSAs advertised into the local area or other areas on an ABR.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPF area view.
   area *area-id*
4. Configure Type-3 LSA filtering.
   filter { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }
   By default, the ABR does not filter Type-3 LSAs.

Setting an OSPF cost for an interface

About this task

Set an OSPF cost for an interface by using either of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface. OSPF computes the cost with this formula: Interface OSPF cost = Bandwidth reference value (100 Mbps) / Expected interface bandwidth (Mbps). The expected bandwidth of an interface is configured with the **bandwidth** command (see *Interface Command Reference*).
  - If the calculated cost is greater than 65535, the value of 65535 is used. If the calculated cost is less than 1, the value of 1 is used.
  - If no cost or bandwidth reference value is configured for an interface, OSPF computes the interface cost based on the interface bandwidth and default bandwidth reference value.

Setting an OSPF cost for an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set an OSPF cost for the interface.

   ospf cost *cost-value*

   By default, the OSPF cost is calculated according to the interface bandwidth. For a loopback interface, the OSPF cost is 0 by default.

Setting a bandwidth reference value

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a bandwidth reference value.

   bandwidth-reference *value*

   The default setting is 100 Mbps.

Enabling OSPF to advertise the maximum link cost to neighbors

About this task

On an OSPF network, when a link recovers from failures or the state of an interface changes, OSPF will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable OSPF to advertise the maximum link cost to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, OSPF advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Enable OSPF to advertise the maximum link cost to neighbors within the specified period.
   ospf peer hold-max-cost duration *time*

   By default, OSPF advertises the original link cost to neighbors during a route convergence.

Setting the maximum number of ECMP routes

About this task

OSPF might find multiple optimal equal-cost routes to the same destination, which can be used to share the traffic load. This task allows you to set the maximum number of ECMP routes for OSPF.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of ECMP routes.
   maximum load-balancing *number*

   By default, the maximum number of ECMP routes equals the maximum number of ECMP routes supported by the system.

Setting OSPF preference

About this task

A router can run multiple routing protocols, and each protocol is assigned a preference. If multiple routes are available to the same destination, the one with the highest protocol preference is selected as the best route.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a preference for OSPF.
   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPF internal routes is 10 and the preference of OSPF external routes is 150.

Configuring discard routes for summary networks

About this task

Perform this task on an ABR or ASBR to specify whether to generate discard routes for summary networks. You can also specify a preference for the discard routes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure discard routes for summary networks.

   discard-route { **external** { *preference* | **suppression** } | **internal** { *preference* | **suppression** } } *

   By default, the ABR or ASBR generates discard routes for summary networks and the default preference of discard routes is 255.

Redistributing routes from another routing protocol

About this task

On a router running OSPF and other routing protocols, you can configure OSPF to redistribute routes from other protocols. OSPF advertises the routes in Type-5 LSAs or Type-7 LSAs. In addition, you can configure OSPF to filter redistributed routes so that OSPF advertises only permitted routes.

Restrictions and guidelines

OSPF redistributes only active routes. To view route status information, use the **display ip routing-table protocol** command.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure route redistribution.

   import-route bgp [*as-number*] [**allow-ibgp**] [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **isis** | **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, OSPF does not redistribute routes.

   The **import-route bgp** command redistributes only EBGP routes. The **import-route bgp allow-ibgp** command redistributes both EBGP and IBGP routes, which might cause routing loops. Therefore, use it with caution.

4. (Optional.) Configure OSPF to filter redistributed routes.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

   By default, OSPF accepts all redistributed routes.

5. Configure the default parameters for redistributed routes (cost, tag, and type).

   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *

By default, the cost is 1, the tag is 1, and the route type is 2

Redistributing a default route

About this task

The **import-route** command cannot redistribute a default external route. Perform this task to redistribute a default route.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **type** *type*] *

   default-route-advertise [**summary cost** *cost-value*]

   By default, no default route is redistributed.

   This command is applicable only to VPNs. The PE router advertises a default route in a Type-3 LSA to a CE router.
4. Configure the default parameters for redistributed routes (cost, tag, and type).

   default { **cost** *cost-value* | **tag** *tag* | **type** *type* } *

   By default, the cost is 1, the tag is 1, and the route type is 2

Advertising a host route

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.

   area *area-id*
4. Advertise a host route.

   host-advertise *ip-address cost-value*

   By default, OSPF does not advertise host routes that are not in the area.

Advertising OSPF link state information to BGP

About this task

After the device advertises OSPF link state information to BGP, BGP can advertise the information for intended applications. For more information about BGP LS, see "Configuring BGP."

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Advertise OSPF link state information to BGP.

   distribute bgp-ls [**strict-link-checking**]

   By default, the device does not advertise OSPF link state information to BGP.

Setting OSPF timers

About setting OSPF timers

This task allows you to change OSPF packet timers to adjust the convergence speed and network load and tune the delay time for sending LSAs on low-speed links.

Configuring OSPF packet timers

About this task

An OSPF interface includes the following timers:

- **Hello timer**—Interval for sending hello packets. It must be identical on OSPF neighbors.
- **Poll timer**—Interval for sending hello packets to a neighbor that is down on the NBMA network.
- **Dead timer**—Interval within which if the interface does not receive any hello packet from the neighbor, it declares the neighbor is down.
- **LSA retransmission timer**—Interval within which if the interface does not receive any acknowledgment packets after sending an LSA to the neighbor, it retransmits the LSA.

Restrictions and guidelines

The default value for the hello interval and neighbor dead interval depends on the network type. When the network type for an interface is changed, the default hello interval and neighbor dead interval are restored. Make sure two neighboring interfaces are configured with the same hello interval and neighbor dead interval. Inconsistent settings will affect the OSPF neighbor relationship establishment.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospf timer hello *seconds*

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the poll interval.

   ospf timer poll *seconds*

   The default setting is 120 seconds.

   The poll interval is a minimum of four times the hello interval.

5. Set the dead interval.

   ospf timer dead *seconds*

The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

The dead interval must be a minimum of four times the hello interval on an interface.

6. Set the retransmission interval.

   ospf timer retransmit *interval*

   The default retransmission interval is 5 seconds.

   A retransmission interval setting that is too small can cause unnecessary LSA retransmissions. Typically set a bigger interval than the round-trip time of a packet between two neighbors.

Setting the LSA transmission delay

About this task

To avoid LSAs from aging out during transmission, set an LSA retransmission delay especially for low speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospf trans-delay *seconds*

   The default LSA transmission delay is 1 second.

Setting the OSPF route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.
- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for subsequent route calculations is *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:

- The interval for the first route calculation is *minimum-interval*.
- The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPF.
   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the minimum LSA arrival interval

About this task

OSPF drops any duplicate LSAs (with the same LSA type, LS ID, and router ID) within the minimum LSA arrival interval. This helps avoid overuse of bandwidth and router resources due to frequent network changes.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the minimum LSA arrival interval.
   lsa-arrival-interval *interval*
   By default, the minimum LSA arrival interval is 1000 milliseconds.

Setting the LSA generation interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA generation interval settings for OSPF.

The default LSA generation interval settings are as follows:

- The interval for the first LSA generation is 50 milliseconds.
- The interval for the nth (n ≥ 2) LSA generation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.

- The LSA generation interval is fixed at *maximum-interval*.

- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for subsequent LSA generations is *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA generation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the OSPF exit overflow interval

About this task

When the number of LSAs in the LSDB exceeds the upper limit, the LSDB is in an overflow state. In this state, OSPF does not receive any external LSAs and deletes the external LSAs generated by itself to save system resources.

This task allows you to configure the interval that OSPF exits overflow state.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the interval that OSPF exits overflow state.

   lsdb-overflow-interval *interval*

   By default, the OSPF exit overflow interval is 300 seconds. An interval of 0 means that OSPF does not exit overflow state.

Configuring OSPF packet parameters

Disabling interfaces from receiving and sending OSPF packets

About this task

To enhance OSPF adaptability and reduce resource consumption, you can set an OSPF interface to "silent." A silent OSPF interface blocks OSPF packets and cannot establish any OSPF neighbor relationship. However, other interfaces on the router can still advertise direct routes of the interface in Router LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Disable interfaces from receiving and sending OSPF packets.

   silent-interface { *interface-type interface-number* | **all** }

   By default, an OSPF interface can receive and send OSPF packets.

   This command disables only the interfaces associated with the current process rather than other processes. Multiple OSPF processes can disable the same interface from receiving and sending OSPF packets.

Adding the interface MTU into DD packets

About this task

By default, an OSPF interface adds a value of 0 into the interface MTU field of a DD packet rather than the actual interface MTU. You can enable an interface to add its MTU into DD packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to add its MTU into DD packets.

   ospf mtu-enable

   By default, the interface adds an MTU value of 0 into DD packets.

Setting the DSCP value for outgoing OSPF packets

About this task

The DSCP value specifies the precedence of outgoing packets.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the DSCP value for outgoing OSPF packets.

   dscp *dscp-value*

   By default, the DSCP value for outgoing OSPF packets is 48.

Setting the maximum length of OSPF packets that can be sent by an interface

About this task

This task allows you to limit the length of OSPF packets sent over an interface. In some scenarios, for example, when you establish OSPF neighbors over a tunnel, you can perform this task to prevent OSPF packet fragmentation on the outgoing tunnel interface. Make sure the maximum length of the OSPF packets plus the encapsulated header length is no greater than the outgoing tunnel interface's MTU. For more information about tunnels, see *Layer 3—IP Services Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the maximum length of OSPF packets that can be sent by an interface.

   ospf packet-size *value*

   By default, the maximum length of OSPF packets that an interface can send equals the interface's MTU.

Setting the LSU transmit rate

About this task

During LSDB synchronization, if the local router has multiple neighbors, it must send many LSUs to each neighbor. When a neighbor receives excessive LSUs within a short time period, the following events might occur:

- The neighbor experiences degraded performance because it uses too many system resources to process the received LSU packets.
- The neighbor drops hello packets used for maintaining the neighbor relationship because it is busy dealing with the LSUs. As a result, the neighbor relationship is torn down. To reestablish a relationship to the neighbor, the local router must send more LSUs to the neighbor. This exacerbates the performance degradation.

This task allows you to limit the LSU transmit rate by setting the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.

Procedure

1. Enter system view.

   system-view

2. Enable OSPF to limit the LSU transmit rate.

   ospf lsu-flood-control [*interval count*]

   By default, OSPF does not limit the LSU transmit rate.

Inappropriate use of this command might cause abnormal routing. As a best practice, execute this command with the default values.

3. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

4. (Optional.) Set the LSU transmit interval and the maximum number of LSUs that can be sent at each interval.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPF interface sends a maximum of three LSU packets every 20 milliseconds.

Controlling LSA generation, advertisement, and reception

Setting the maximum number of external LSAs in LSDB

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the maximum number of external LSAs in the LSDB.

   lsdb-overflow-limit *number*

   By default, the maximum number of external LSAs in the LSDB is not limited.

Filtering outbound LSAs on an interface

About this task

To reduce the LSDB size for the neighbor and save bandwidth, you can perform this task on an interface to filter LSAs to be sent to the neighbor.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Filter outbound LSAs on the interface.

   ospf database-filter { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }

   By default, the outbound LSAs are not filtered on the interface.

Filtering LSAs for the specified neighbor

About this task

On a P2MP network, a router might have multiple P2MP type OSPF neighbors. Perform this task to prevent the router from sending LSAs to the specified P2MP neighbor.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Filter LSAs for the specified P2MP neighbor.
   database-filter peer *ip-address* { **all** | { **ase** [**acl** *ipv4-acl-number*] | **nssa** [**acl** *ipv4-acl-number*] | **summary** [**acl** *ipv4-acl-number*] } * }
   By default, the LSAs for the specified P2MP neighbor are not filtered.

Accelerating OSPF convergence speed

Enabling OSPF ISPF

About this task

When the topology changes, Incremental Shortest Path First (ISPF) computes only the affected part of the SPT, instead of the entire SPT.

Procedure

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable OSPF ISPF.
   ispf enable
   By default, OSPF ISPF is enabled.

Configuring prefix suppression

About this task

By default, an OSPF interface advertises all of its prefixes in LSAs. To speed up OSPF convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- On P2P and P2MP networks, OSPF does not advertise Type-3 links in Type-1 LSAs. Other routing information can still be advertised to ensure traffic forwarding.
- On broadcast and NBMA networks, the DR generates Type-2 LSAs with a mask length of 32 to suppress network routes. Other routing information can still be advertised to ensure traffic forwarding. If no neighbors exist, the DR does not advertise Type-3 links in Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPF routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPF process

1. Enter system view.

system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable prefix suppression for the OSPF process.

   prefix-suppression

   By default, prefix suppression is disabled for an OSPF process.

   This feature does not suppress the prefixes of secondary IP addresses, loopback interfaces, and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable prefix suppression for the interface.

   ospf prefix-suppression [**disable**]

   By default, prefix suppression is disabled on an interface.

   This feature does not suppress prefixes of secondary IP addresses.

Configuring prefix prioritization

About this task

OSPF calculates intra-area routes, inter-area routes, and AS external routes in descending convergence priority order: critical, high, medium, and low. When a route has multiple prefix priorities, it uses the highest priority.

By default, the 32-bit OSPF host routes have a medium priority and other routes have a low priority. To prioritize the convergence of specific routes, perform this task to set a higher convergence priority value for those routes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable prefix prioritization.

   prefix-priority route-policy *route-policy-name*

   By default, prefix prioritization is disabled.

Configuring OSPF PIC

About this task

Prefix Independent Convergence (PIC) enables the device to speed up network convergence by ignoring the number of prefixes.

Restrictions and guidelines for OSPF PIC

When both OSPF PIC and OSPF FRR are configured, OSPF FRR takes effect.

OSPF PIC applies only to inter-area routes and external routes.

Enabling OSPF PIC

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable PIC for OSPF.
   pic [**additional-path-always**]
   By default, OSPF PIC is enabled.

Configuring BFD control packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPF PIC.
   ospf primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for OSPF PIC.
   This mode requires BFD configuration on both OSPF routers on the link.

Configuring BFD echo packet mode for OSPF PIC

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPF PIC.
   ospf primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for OSPF PIC.
   This mode requires BFD configuration on one OSPF router on the link.

Configuring advanced OSPF features

Configuring stub routers

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPF routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Router LSAs from the stub router might contain different link type values. A value of 3 means a link to a stub network, and the cost of the link will not be changed by default. To set the cost of the link to 65535, specify the **include-stub** keyword in the **stub-router** command. A value of 1, 2 or 4 means a point-to-point link, a link to a transit network, or a virtual link. On such links, a maximum cost value of 65535 is used. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure the router as a stub router.

   stub-router [**external-lsa** [*max-metric-value*] | **include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] } | **summary-lsa** [*max-metric-value*]] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPF isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPF isolation works as follows:

1. After OSPF isolation is enabled for a device, OSPF increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is increased to 65535.
   - The link cost in the following LSAs is increased to 16711680:
     - Type-3 LSAs (Network summary LSAs).
     - Type-5 LSAs (AS external LSAs).
     - Type-7 LSAs (NSSA external LSAs).
2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPF isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router external-lsa** 16711680 **summary-lsa** 16711680 **include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router** commands, follow these restrictions and guidelines:

- When both the isolation feature and the stub router feature take effect, Type-3 LSAs, Type-5 LSAs, and Type-7 LSAs each use the higher one of the two LSA-specific link costs provided by those features.

- If the **on-startup** keyword is specified in the **stub-router** command, traffic forwarding path selection is affected only by the isolation feature when the stub router does not take effect.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPF isolation.
   - Enable OSPF isolation to gracefully isolate the device from the network.

     isolate enable
   - Disable OSPF isolation to gracefully add the device back to the network.

     undo isolate enable

   By default, OSPF isolation is disabled.

Enabling compatibility with RFC 1583

About this task

RFC 1583 specifies a different method than RFC 2328 for selecting the optimal route to a destination in another AS. When multiple routes are available to the ASBR, OSPF selects the optimal route by using the following procedure:

1. Selects the route with the highest preference.
   - If RFC 2328 is compatible with RFC 1583, all these routes have equal preference.
   - If RFC 2328 is not compatible with RFC 1583, the intra-area route in a non-backbone area is preferred to reduce the burden of the backbone area. The inter-area route and intra-area route in the backbone area have equal preference.
2. Selects the route with the lower cost if two routes have equal preference.
3. Selects the route with the larger originating area ID if two routes have equal cost.

Restrictions and guidelines

To avoid routing loops, set identical RFC 1583-compatibility on all routers in a routing domain.

Procedure

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable compatibility with RFC 1583.

   rfc1583 compatible

   By default, compatibility with RFC 1583 is enabled.

Configuring OSPF GR

About OSPF GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

OSPF GR has the following types:

- **IETF GR**—Uses Opaque LSAs to implement GR.
- **Non-IETF GR**—Uses link local signaling (LLS) to advertise GR capability and uses out of band synchronization to synchronize the LSDB.

A device can act as a GR restarter and GR helper at the same time.

Restrictions and guidelines for OSPF GR

You cannot enable OSPF NSR on a device that acts as GR restarter.

Configuring OSPF GR restarter

Configuring the IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable opaque LSA reception and advertisement capability.
   opaque-capability enable
   By default, opaque LSA reception and advertisement capability is enabled.
4. Enable the IETF GR.
   graceful-restart ietf [**global** | **planned-only**] *
   By default, the IETF GR capability is disabled.
5. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring the non-IETF OSPF GR restarter

1. Enter system view.
   system-view
2. Enable OSPF and enter its view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the link-local signaling capability.

enable link-local-signaling

By default, the link-local signaling capability is disabled.

4. Enable the out-of-band re-synchronization capability.

enable out-of-band-resynchronization

By default, the out-of-band re-synchronization capability is disabled.

5. Enable non-IETF GR.

graceful-restart [**nonstandard**] [**global** | **planned-only**] *

By default, non-IETF GR capability is disabled.

6. (Optional.) Set the GR interval.

graceful-restart interval *interval*

By default, the GR interval is 120 seconds.

Configuring OSPF GR helper

Configuring the IETF OSPF GR helper

1. Enter system view.

system-view

2. Enable OSPF and enter its view.

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable opaque LSA reception and advertisement capability.

opaque-capability enable

By default, opaque LSA reception and advertisement capability is enabled.

4. Enable GR helper capability.

graceful-restart helper enable [**planned-only**]

By default, GR helper capability is enabled.

5. (Optional.) Enable strict LSA checking for the GR helper.

graceful-restart helper strict-lsa-checking

By default, strict LSA checking for the GR helper is disabled.

When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Configuring the non-IETF OSPF GR helper

1. Enter system view.

system-view

2. Enable OSPF and enter its view.

ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable the link-local signaling capability.

enable link-local-signaling

By default, the link-local signaling capability is disabled.

4. Enable the out-of-band re-synchronization capability.

enable out-of-band-resynchronization

By default, the out-of-band re-synchronization capability is disabled.

5. Enable GR helper.

graceful-restart helper enable

By default, GR helper is enabled.

6. (Optional.) Enable strict LSA checking for the GR helper.

   graceful-restart helper strict-lsa-checking

   By default, strict LSA checking for the GR helper is disabled.

   When an LSA change on the GR helper is detected, the GR helper device exits the GR helper mode.

Triggering OSPF GR

About this task

You can trigger OSPF GR by performing an active/standby switchover or using the **reset ospf process** command.

Procedure

To trigger OSPF GR, execute the **reset ospf** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPF NSR

About this task

Nonstop routing (NSR) backs up OSPF link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPF NSR or OSPF GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPF NSR and OSPF GR as follows:

- **Device requirements**—The active and standby processes of OSPF must run on different IRF member devices. To run OSPF NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPF GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPF GR when the IRF fabric contains only one member device. (Centralized IRF devices.)
- **OSPF neighbor requirements**—When you use OSPF NSR, OSPF neighbors cannot detect process restart or active/standby switchover on the local device. OSPF NSR can recover OSPF route information without requiring the cooperation of OSPF neighbors. OSPF GR requires OSPF neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

A device that has OSPF NSR enabled cannot act as GR restarter.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPF NSR.

   non-stop-routing

   By default, OSPF NSR is disabled.

This command takes effect only for the current process. As a best practice, enable OSPF NSR for each process if multiple OSPF processes exist.

Configuring BFD for OSPF

About BFD for OSPF

BFD provides a single mechanism to quickly detect and monitor the connectivity of links between OSPF neighbors, which improves the network convergence speed. For more information about BFD, see *High Availability Configuration Guide*.

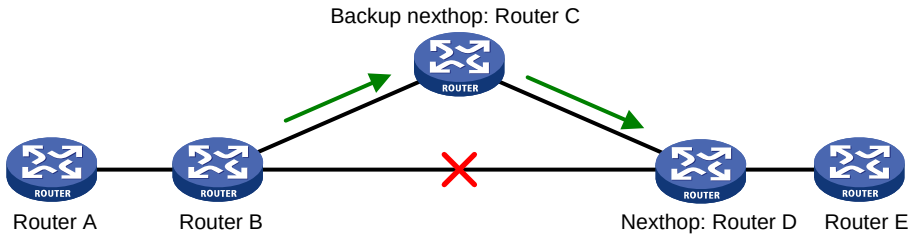
OSPF supports the following BFD detection modes:

- **Bidirectional control detection**—Requires BFD configuration to be made on both OSPF routers on the link.
- **Single-hop echo detection**—Requires BFD configuration to be made on one OSPF router on the link.

Configuring bidirectional control detection

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD bidirectional control detection.
   ospf bfd enable
   By default, BFD bidirectional control detection is disabled.
   Both ends of a BFD session must be on the same network segment and in the same area.

Configuring single-hop echo detection



1. Enter system view.
   system-view
2. Configure the source address of echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source address of echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interfaces.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD single-hop echo detection.
   ospf bfd enable echo
   By default, BFD single-hop echo detection is disabled.

Configuring OSPF FRR

About OSPF FRR

A link or router failure on a path can cause packet loss until OSPF completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 7 Network diagram for OSPF FRR

As shown in Figure 7, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, OSPF directs packets to the backup next hop. At the same time, OSPF calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPF FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Restrictions and guidelines for OSPF FRR

When both OSPF PIC and OSPF FRR are configured, OSPF FRR takes effect.

Configuring OSPF FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Enable LFA on an interface.
   ospf fast-reroute lfa-backup
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

6. Enable OSPF FRR to use the LFA algorithm to calculate a backup next hop.

   fast-reroute lfa [**abr-only**]

   By default, OSPF FRR is disabled.

   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPF FRR to use a backup next hop specified in a routing policy

About this task

Before you perform this task, use the **apply fast-reroute backup-interface** command to specify a backup next hop in a routing policy for OSPF FRR. For more information about the **apply fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPF FRR to use a backup next hop specified in a routing policy.

   fast-reroute route-policy *route-policy-name*

   By default, OSPF FRR is disabled.

Configuring BFD control packet mode for OSPF FRR

About this task

By default, OSPF FRR does not use BFD to detect primary link failures. To speed up OSPF convergence, enable BFD control packet mode for OSPF FRR to detect primary link failures. This mode requires BFD configuration on both OSPF routers on the link.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD control packet mode for OSPF FRR.

   ospf primary-path-detect bfd ctrl

   By default, BFD control packet mode is disabled for OSPF FRR.

Configuring BFD echo packet mode for OSPF FRR

About this task

By default, OSPF FRR does not use BFD to detect primary link failures. To speed up OSPF convergence, enable BFD echo packet mode for OSPF FRR to detect primary link failures. This mode requires BFD configuration on one OSPF router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interface's IP address.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPF FRR.
   ospf primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for OSPF FRR.

Configuring OSPF authentication

About OSPF area and interface authentication

Perform this task to configure OSPF area and interface authentication.

OSPF adds the authentication information into sent packets, and uses the key to authenticate received packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPF neighbor relationship cannot be established.

If you configure OSPF authentication for both an area and an interface in that area, the interface uses the OSPF authentication configured on it.

Restrictions and guidelines for configuring OSPF authentication

OSPF supports the MD5 and HMAC-MD5 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 255.

Configuring OSPF area authentication

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter area view.
   area *area-id*
4. Configure area authentication mode.
   - Configure HMAC-MD5/MD5 authentication.
     authentication-mode { **hmac-md5** | **md5** } [*key-id* { **cipher** | **plain** } *string*]

- Configure simple authentication.

  authentication-mode simple [{ **cipher** | **plain** } *string*]
- Configure keychain authentication.

  authentication-mode keychain *keychain-name*

  For information about keychains, see *Security Configuration Guide*.

By default, no authentication is configured.

All routers in an area must use the same authentication mode. If a key is configured, all routers must be configured with the same key.

Configuring OSPF interface authentication

About this task

To prevent an interface from authenticating OSPF packets, configure the None authentication mode on the interface. Then, the interface will not inherit the authentication configuration of the area.

Restrictions and guidelines

The local interface and its peer interface must use the same authentication mode. If a key is configured, the local and peer interfaces must be configured with the same key.

If you configure the None authentication mode on an interface, make sure its peer interface uses the None authentication mode or is not configured with any authentication modes.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure interface authentication mode.
   - Configure simple authentication.

     ospf authentication-mode simple [{ **cipher** | **plain** } *string*]
   - Configure the None authentication mode.

     ospf authentication-mode none
   - Configure HMAC-MD5/MD5 authentication.

     ospf authentication-mode { **hmac-md5** | **md5** } [*key-id* { **cipher** | **plain** } *string*]
   - Configure keychain authentication.

     ospf authentication-mode keychain *keychain-name*

     For information about keychains, see *Security Configuration Guide*.

   By default, no authentication is configured.

Configuring GTSM for OSPF

About GTSM

The Generalized TTL Security Mechanism (GTSM) protects the device by comparing the TTL value in the IP header of incoming OSPF packets against a valid TTL range. If the TTL value is within the valid TTL range, the packet is accepted. If not, the packet is discarded.

The valid TTL range is from 255 – the configured hop count + 1 to 255.

When GTSM is configured, the OSPF packets sent by the device have a TTL of 255.

Restrictions and guidelines for GTSM

To use GTSM, you must configure GTSM on both the local and peer devices. You can specify different *hop-count* values for them.

The GTSM configuration in OSPF area view applies to all OSPF interfaces in the area. The GTSM configuration in interface view takes precedence over the configuration in OSPF area view.

Configuring GTSM in OSPF area view

1. Enter system view.

   system-view
2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPF area view.

   area *area-id*
4. Enable GTSM for the OSPF area.

   ttl-security [**hops** *hop-count*]

   By default, GTSM is disabled for the OSPF area.

Configuring GTSM in interface view

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure GTSM for the interface.
   - Enable GTSM for the interface.

     ospf ttl-security [**hops** *hop-count*]
   - Disable GTSM for the interface.

     ospf ttl-security disable

     Disable GTSM for an interface when the following conditions exist:
     - The area to which the interface belongs is enabled with GTSM.
     - The neighbor of the interface does not support GTSM.

   By default, an interface uses the GTSM configuration of the area to which the interface belongs.

Configuring OSPF logging, SNMP notifications, and troubleshooting

Logging neighbor state changes

About this task

Perform this task to enable output of neighbor state change logs to the information center. The information center processes the logs according to user-defined output rules (whether and where to output logs). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable the logging of neighbor state changes.

   log-peer-change

   By default, this feature of logging neighbor state changes is enabled.

Configuring the OSPF logging feature

About this task

OSPF logs include LSA aging logs, route calculation logs, neighbor logs, OSPF route logs, and self-originated and received LSA logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the number of OSPF logs.

   event-log { **hello** { **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] } | **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the device can generate a maximum of 100 OSPF logs for each type.

Configuring OSPF network management

About this task

This task involves the following configurations:

- Bind an OSPF process to MIB so that you can use network management software to manage the specified OSPF process.
- Enable SNMP notifications for OSPF to report important events.

- Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPF events to an NMS, enable SNMP notifications for OSPF. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.
   system-view
2. Bind MIB to an OSPF process.
   ospf mib-binding *process-id*
   By default, MIB is bound to the process with the smallest process ID.
3. Enable SNMP notifications for OSPF.
   snmp-agent trap enable ospf [**authentication-failure** | **bad-packet** | **config-error** | **grhelper-status-change** | **grrestarter-status-change** | **if-state-change** | **lsa-maxage** | **lsa-originate** | **lsdb-approaching-overflow** | **lsdb-overflow** | **neighbor-state-change** | **nssatranslator-status-change** | **retransmit** | **virt-authentication-failure** | **virt-bad-packet** | **virt-config-error** | **virt-retransmit** | **virtgrhelper-status-change** | **virtif-state-change** | **virtneighbor-state-change**] *
   By default, SNMP notifications for OSPF are enabled.
4. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
5. Configure the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.
   snmp trap rate-limit interval *trap-interval* **count** *trap-number*
   By default, OSPF outputs a maximum of seven SNMP notifications within 10 seconds.

Setting the maximum number of OSPF neighbor relationship troubleshooting entries

1. Enter system view.
   system-view
2. Set the maximum number of OSPF neighbor relationship troubleshooting entries.
   ospf troubleshooting max-number *number*
   By default, OSPF can record a maximum of 100 neighbor relationship troubleshooting entries.

Display and maintenance commands for OSPF

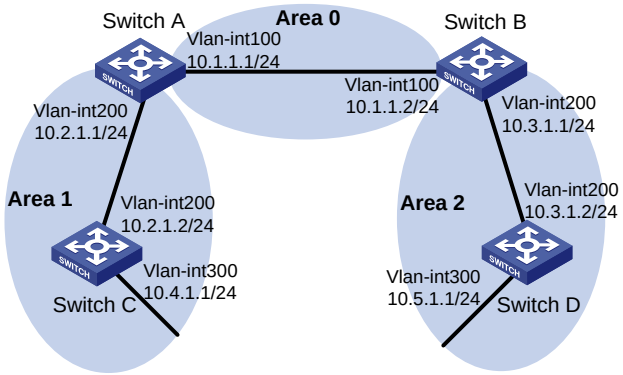
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPF ABR.	**display ospf** [*process-id*] [**area** *area-id*] **abr-summary** [*ip-address* { *mask-length* | *mask* }] [**verbose**]

Task	Command
Display OSPF FRR backup next hop information.	**display ospf** [*process-id*] [**area** *area-id*] **fast-reroute lfa-candidate**
Display OSPF topology information.	**display ospf** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPF process information.	**display ospf** [*process-id*] [**verbose**]
Display OSPF ABR and ASBR information.	**display ospf** [*process-id*] **abr-asbr** [**verbose**]
Display OSPF ASBR route summarization information.	**display ospf** [*process-id*] **asbr-summary** [*ip-address* { *mask-length* | *mask* }]
Display OSPF log information.	**display ospf** [*process-id*] **event-log** { **lsa-flush** | **peer** [*neighbor-id*] [**slot** *slot-number*] | **spf** }
Display OSPF log information about received or sent hello packets.	**display ospf** [*process-id*] **event-log hello** { **received** [**abnormal** | **dropped**] | **sent** } [*neighbor-id*] [**slot** *slot-number*] **display ospf** [*process-id*] **event-log hello sent** { **abnormal** | **failed** } [*neighbor-address*] [**slot** *slot-number*]
Display OSPF GR information.	**display ospf** [*process-id*] **graceful-restart** [**verbose**]
Display OSPF interface information.	**display ospf** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display information about hello packets sent by OSPF interfaces.	**display ospf** [*process-id*] **interface** [*interface-type interface-number*] **hello**
Display OSPF LSDB information.	**display ospf** [*process-id*] [**area** *area-id*] **lsdb** { **asbr** | **network** | **nssa** | **opaque-area** | **opaque-link** | **router** | **summary** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** [**brief** | **originate-router** *advertising-router-id* | **self-originate**] **display ospf** [*process-id*] **lsdb** { **ase** | **opaque-as ase** } [*link-state-id*] [**originate-router** *advertising-router-id* | **self-originate**]
Display OSPF next hop information.	**display ospf** [*process-id*] **nexthop**
Display OSPF NSR information.	**display ospf** [*process-id*] **non-stop-routing status**
Display OSPF neighbor information.	**display ospf** [*process-id*] **peer** [**hello** | **verbose**] [*interface-type interface-number*] [*neighbor-id*]
Display neighbor statistics for OSPF areas.	**display ospf** [*process-id*] **peer statistics**
Display OSPF request queue	**display ospf** [*process-id*] **request-queue**

Task	Command
information.	[*interface-type interface-number*] [*neighbor-id*]
Display OSPF retransmission queue information.	**display ospf** [*process-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPF routing table information.	**display ospf** [*process-id*] **routing** [*ip-address* { *mask-length* | *mask* }] [**interface** *interface-type interface-number*] [**nexthop** *nexthop-address*] [**verbose**]
Display OSPF statistics.	**display ospf** [*process-id*] **statistics** [**error** | **packet** [**hello** | *interface-type interface-number*]]
Display OSPF virtual link information.	**display ospf** [*process-id*] **vlink**
Display OSPF topology information.	**display ospf topology-info**
Display the global router ID.	**display router id**
Display OSPF neighbor relationship troubleshooting information.	**display ospf troubleshooing**
Clear OSPF log information.	**reset ospf** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Clear OSPF log information about received or sent hello packets.	**reset ospf** [*process-id*] **event-log hello** { **received** [**abnormal** | **dropped**] | **sent** [**abnormal** | **failed**] } [**slot** *slot-number*]
Restart an OSPF process.	**reset ospf** [*process-id*] **process** [**graceful-restart**]
Re-enable OSPF route redistribution.	**reset ospf** [*process-id*] **redistribution**
Clear OSPF statistics.	**reset ospf** [*process-id*] **statistics**
Clear OSPF neighbor relationship troubleshooting information.	**reset ospf troubleshooting**

OSPF configuration examples



Example: Configuring basic OSPF

Network configuration

As shown in Figure 8:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs.

Figure 8 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] router id 10.2.1.1
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 10.3.1.1
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 2
[SwitchB-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.2] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 10.4.1.1
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] network 10.4.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

   # Configure Switch D.

```
<SwitchD> system-view
[SwitchD] router id 10.5.1.1
[SwitchD] ospf
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] network 10.5.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Verifying the configuration

Display information about neighbors on Switch A.

```
[SwitchA] display ospf peer verbose

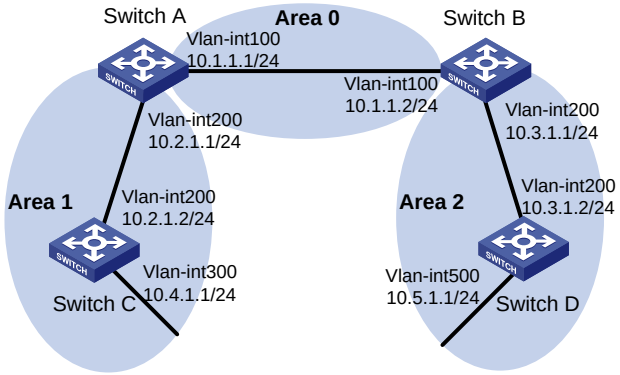
round-trip min/avg/max/std-dev = 0.779/1.408/1.702/0.323 ms
```



Example: Configuring OSPF route redistribution

Network configuration

As shown in Figure 9:

- Enable OSPF on all the switches.
- Split the AS into three areas.
- Configure Switch A and Switch B as ABRs.
- Configure Switch C as an ASBR to redistribute external routes (static routes).

Figure 9 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure OSPF to redistribute routes:

   # On Switch C, configure a static route destined for network 3.1.2.0/24.

   ```
   <SwitchC> system-view
   [SwitchC] ip route-static 3.1.2.1 24 10.4.1.2
   ```

   # On Switch C, configure OSPF to redistribute static routes.

   ```
   [SwitchC] ospf 1
   [SwitchC-ospf-1] import-route static
   ```

Verifying the configuration

Display the ABR/ASBR information on Switch D.

```
<SwitchD> display ospf abr-asbr

```

Example: Configuring OSPF route summarization

Network configuration

As shown in Figure 10:

- Configure OSPF on Switch A and Switch B in AS 200.
- Configure OSPF on Switch C, Switch D, and Switch E in AS 100.
- Configure an EBGP connection between Switch B and Switch C. Configure Switch B and Switch C to redistribute OSPF routes and direct routes into BGP and BGP routes into OSPF.
- Configure Switch B to advertise only summary route 10.0.0.0/8 to Switch A.

Figure 10 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] router id 11.2.1.2
   [SwitchA] ospf
   [SwitchA-ospf-1] area 0
   ```

```
[SwitchA-ospf-1-area-0.0.0.0] network 11.2.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 11.2.1.1
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 11.2.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 11.1.1.2
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] router id 10.3.1.1
[SwitchD] ospf
[SwitchD-ospf-1] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

Configure Switch E.

```
<SwitchE> system-view
[SwitchE] router id 10.4.1.1
[SwitchE] ospf
[SwitchE-ospf-1] area 0
[SwitchE-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
[SwitchE-ospf-1-area-0.0.0.0] network 10.4.1.0 0.0.0.255
[SwitchE-ospf-1-area-0.0.0.0] quit
[SwitchE-ospf-1] quit
```

3. Configure BGP to redistribute OSPF routes and direct routes:

Configure Switch B.

```
[SwitchB] bgp 200
[SwitchB-bgp-default] peer 11.1.1.2 as 100
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 11.1.1.2 enable
[SwitchB-bgp-default-ipv4] import-route ospf
[SwitchB-bgp-default-ipv4] import-route direct
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Configure Switch C.

```
[SwitchC] bgp 100
[SwitchC-bgp-default] peer 11.1.1.1 as 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 11.1.1.1 enable
[SwitchC-bgp-default-ipv4] import-route ospf
[SwitchC-bgp-default-ipv4]import-route direct
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

4. Configure Switch B and Switch C to redistribute BGP routes into OSPF:

Configure OSPF to redistribute routes from BGP on Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] import-route bgp
```

Configure OSPF to redistribute routes from BGP on Switch C.

```
[SwitchC] ospf
[SwitchC-ospf-1] import-route bgp
```

Display the OSPF routing table on Switch A.

```
[SwitchA] display ip routing-table

         Destinations : 16        Routes : 16

Destination/Mask    Proto  Pre  Cost         NextHop         Interface

0.0.0.0/32          Direct 0    0            127.0.0.1       InLoop0
10.1.1.0/24         O_ASE2 150  1            11.2.1.1        Vlan100
10.2.1.0/24         O_ASE2 150  1            11.2.1.1        Vlan100
10.3.1.0/24         O_ASE2 150  1            11.2.1.1        Vlan100
10.4.1.0/24         O_ASE2 150  1            11.2.1.1        Vlan100
11.2.1.0/24         Direct 0    0            11.2.1.2        Vlan100
11.2.1.0/32         Direct 0    0            11.2.1.2        Vlan100
11.2.1.2/32         Direct 0    0            127.0.0.1       InLoop0
11.2.1.255/32       Direct 0    0            11.2.1.2        Vlan100
127.0.0.0/8         Direct 0    0            127.0.0.1       InLoop0
127.0.0.0/32        Direct 0    0            127.0.0.1       InLoop0
127.0.0.1/32        Direct 0    0            127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0
224.0.0.0/4         Direct 0    0            0.0.0.0         NULL0
224.0.0.0/24        Direct 0    0            0.0.0.0         NULL0
255.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0
```

5. Configure route summarization:

Configure route summarization on Switch B to advertise a summary route 10.0.0.0/8.

```
[SwitchB-ospf-1] asbr-summary 10.0.0.0 8
```

Display the IP routing table on Switch A.

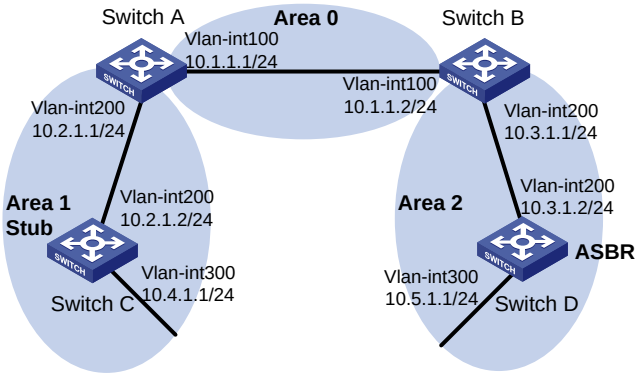
```
[SwitchA] display ip routing-table

         Destinations : 13        Routes : 13

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
```

```
0.0.0.0/32          Direct 0    0           127.0.0.1       InLoop0
10.0.0.0/8          O_ASE2 150  1           11.2.1.1        Vlan100
11.2.1.0/24         Direct 0    0           11.2.1.2        Vlan100
11.2.1.0/32         Direct 0    0           11.2.1.2        Vlan100
11.2.1.2/32         Direct 0    0           127.0.0.1       InLoop0
11.2.1.255/32       Direct 0    0           11.2.1.2        Vlan100
127.0.0.0/8         Direct 0    0           127.0.0.1       InLoop0
127.0.0.0/32        Direct 0    0           127.0.0.1       InLoop0
127.0.0.1/32        Direct 0    0           127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0           127.0.0.1       InLoop0
224.0.0.0/4         Direct 0    0           0.0.0.0         NULL0
224.0.0.0/24        Direct 0    0           0.0.0.0         NULL0
255.255.255.255/32  Direct 0    0           127.0.0.1       InLoop0
```

The output shows that routes 10.1.1.0/24, 10.2.1.0/24, 10.3.1.0/24 and 10.4.1.0/24 are summarized into a single route 10.0.0.0/8.



Example: Configuring OSPF stub area

Network configuration

As shown in Figure 11:

- Enable OSPF on all switches, and split the AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.
- Configure Switch D as the ASBR to redistribute static routes.
- Configure Area 1 as a stub area to reduce advertised LSAs without influencing reachability.

Figure 11 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure route redistribution:

   # Configure Switch D to redistribute static routes.

   ```
   <SwitchD> system-view
   [SwitchD] ip route-static 3.1.2.1 24 10.5.1.2
   [SwitchD] ospf
   [SwitchD-ospf-1] import-route static
   [SwitchD-ospf-1] quit
   ```

Display ABR/ASBR information on Switch C.

```
<SwitchC> display ospf abr-asbr

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table to ABR and ASBR

                Topology base (MTID 0)
 Type        Destination     Area            Cost  Nexthop         RtType
 Intra       10.2.1.1        0.0.0.1         3     10.2.1.1        ABR
 Inter       10.5.1.1        0.0.0.1         7     10.2.1.1        ASBR
```

Display OSPF routing table on Switch C.

```
<SwitchC> display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                   Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
 10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
 10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1

 Routing for ASEs
 Destination        Cost     Type    Tag         NextHop         AdvRouter
 3.1.2.0/24         1        Type2   1           10.2.1.1        10.5.1.1

 Total nets: 6
 Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that Switch C's routing table contains an AS external route.

4. Configure Area 1 as a stub area:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] stub
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display OSPF routing information on Switch C

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.2.1.0/24        3        Transit 0.0.0.0         10.2.1.1        0.0.0.1
 10.3.1.0/24        7        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1
 10.5.1.0/24        17       Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.1.1.0/24        5        Inter   10.2.1.1        10.2.1.1        0.0.0.1

 Total nets: 6
 Intra area: 2  Inter area: 4  ASE: 0  NSSA: 0
```

The output shows that a default route replaces the AS external route.

Configure Area 1 as a totally stub area.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] stub no-summary
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

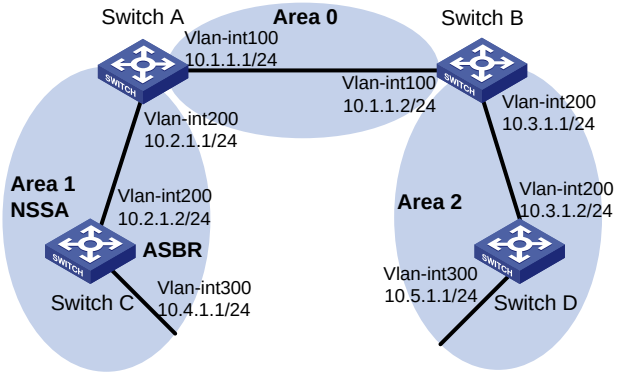
          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 0.0.0.0/0          4        Inter   10.2.1.1        10.2.1.1        0.0.0.1
 10.2.1.0/24        3        Transit 0.0.0.0         10.4.1.1        0.0.0.1
 10.4.1.0/24        3        Stub    10.4.1.1        10.4.1.1        0.0.0.1

 Total nets: 3
 Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that inter-area routes are removed, and only one external route (a default route) exists on Switch C.



Example: Configuring OSPF NSSA area

Network configuration

As shown in Figure 12:

- Configure OSPF on all switches and split AS into three areas.
- Configure Switch A and Switch B as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch C as an ASBR to redistribute static routes into the AS.

Figure 12 Network diagram

Procedure

1. Configure IP addresses for interfaces.
2. Enable OSPF (see "Example: Configuring basic OSPF").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 1
[SwitchA-ospf-1-area-0.0.0.1] nssa
[SwitchA-ospf-1-area-0.0.0.1] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] nssa
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

   # Display OSPF routing information on Switch C.

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 10.4.1.1
                  Routing Table

          Topology base (MTID 0)
```

```
Routing for network

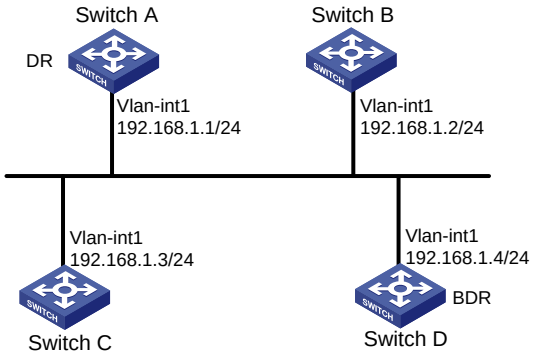
10.5.1.0/24        10       Stub    10.5.1.1        10.5.1.1        0.0.0.2
10.1.1.0/24        12       Inter   10.3.1.1        10.3.1.1        0.0.0.2

Routing for ASEs
Destination        Cost     Type    Tag         NextHop         AdvRouter
3.1.3.0/24         1        Type2   1           10.3.1.1        10.2.1.1

Total nets: 6
Intra area: 2  Inter area: 3  ASE: 1  NSSA: 0
```

The output shows that an external route imported from the NSSA area exists on Switch D.

Example: Configuring OSPF DR election



Network configuration

As shown in Figure 13:

- Enable OSPF on Switches A, B, C, and D on the same network.
- Configure Switch D as the DR, and configure Switch C as the BDR.

- Change the router priorities on the interfaces to configure Switch A as the DR and Switch C as the BDR.

Figure 13 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic OSPF settings on all switches. (Details not shown.)

   For more information, see "Example: Configuring basic OSPF."
3. Display OSPF neighbor information on Switch A.

```
[SwitchA] display ospf peer verbose

          OSPF Process 1 with Router ID 1.1.1.1

   Neighbor is up for 00:01:31
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
   State: Full  Mode: Nbr is master  Priority: 1
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 31  sec
   Neighbor is up for 00:01:28
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 4.4.4.4          Address: 192.168.1.4      GR State: Normal
   State: Full  Mode: Nbr is master  Priority: 1
```

```
  DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 31  sec
  Neighbor is up for 00:01:28
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled
```

The output shows that Switch D is the DR and Switch C is the BDR.

4. Configure router priorities on interfaces:

Configure Switch A.

```
[SwitchA] interface vlan-interface 1
[SwitchA-Vlan-interface1] ospf dr-priority 100
[SwitchA-Vlan-interface1] quit
```

Configure Switch B.

```
[SwitchB] interface vlan-interface 1
[SwitchB-Vlan-interface1] ospf dr-priority 0
[SwitchB-Vlan-interface1] quit
```

Configure Switch C.

```
[SwitchC] interface vlan-interface 1
[SwitchC-Vlan-interface1] ospf dr-priority 2
[SwitchC-Vlan-interface1] quit
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose

          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1      Address: 192.168.1.1      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 100
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 31  sec
   Neighbor is up for 00:11:17
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2      Address: 192.168.1.2      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 0
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:11:19
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

```
 Router ID: 3.3.3.3      Address: 192.168.1.3      GR State: Normal
   State: Full  Mode:Nbr is  slave  Priority: 2
   DR: 192.168.1.4  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 33  sec
   Neighbor is up for 00:11:15
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled
```

The output shows that the DR and BDR are not changed, because the priority settings do not take effect immediately.

5. Restart OSPF processes:

Restart the OSPF process of Switch A.

```
<SwitchA> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch B.

```
<SwitchB> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch C.

```
<SwitchC> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Restart the OSPF process of Switch D.

```
<SwitchD> reset ospf 1 process
Reset OSPF process? [Y/N]:y
```

Display neighbor information on Switch D.

```
<SwitchD> display ospf peer verbose

          OSPF Process 1 with Router ID 4.4.4.4
                  Neighbors

 Area 0.0.0.0 interface 192.168.1.4(Vlan-interface1)'s neighbors
 Router ID: 1.1.1.1          Address: 192.168.1.1      GR State: Normal
   State: Full  Mode: Nbr is slave  Priority: 100
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 39  sec
   Neighbor is up for 00:01:40
   Authentication Sequence: [ 0 ]
   Neighbor state change count: 6
   BFD status: Disabled

 Router ID: 2.2.2.2          Address: 192.168.1.2      GR State: Normal
   State: 2-Way  Mode: None  Priority: 0
   DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
   Options is 0x02 (-|-|-|-|-|-|E|-)
   Dead timer due in 35  sec
   Neighbor is up for 00:01:44
   Authentication Sequence: [ 0 ]
```

```
  Neighbor state change count: 6
  BFD status: Disabled

 Router ID: 3.3.3.3          Address: 192.168.1.3      GR State: Normal
  State: Full  Mode: Nbr is slave  Priority: 2
  DR: 192.168.1.1  BDR: 192.168.1.3  MTU: 0
  Options is 0x02 (-|-|-|-|-|-|E|-)
  Dead timer due in 39  sec
  Neighbor is up for 00:01:41
  Authentication Sequence: [ 0 ]
  Neighbor state change count: 6
  BFD status: Disabled
```

The output shows that Switch A becomes the DR and Switch C becomes the BDR.

If the neighbor state is *full,* Switch D has established an adjacency with the neighbor. If the neighbor state is *2-way*, the two switches are not the DR or the BDR, and they do not exchange LSAs.

Display OSPF interface information.

```
<SwitchA> display ospf interface

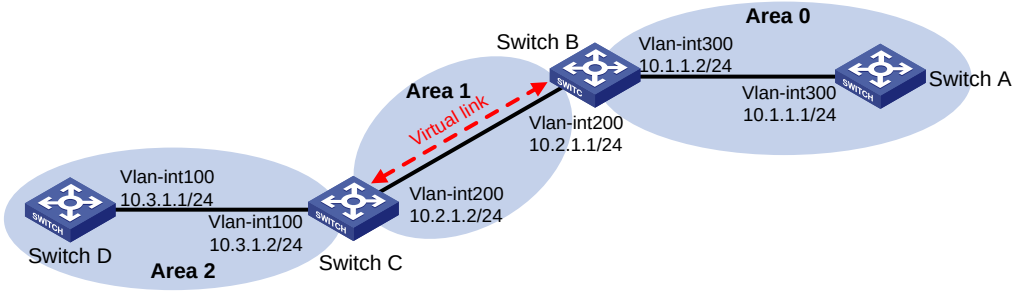
          OSPF Process 1 with Router ID 1.1.1.1
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type      State   Cost  Pri   DR             BDR
 192.168.1.1     Broadcast DR      1     100   192.168.1.1    192.168.1.3

<SwitchB> display ospf interface

          OSPF Process 1 with Router ID 2.2.2.2
                  Interfaces

 Area: 0.0.0.0
 IP Address      Type      State    Cost  Pri   DR             BDR
 192.168.1.2     Broadcast DROther  1     0     192.168.1.1    192.168.1.3
```



The interface state *DROther* means the interface is not the DR or BDR.

Example: Configuring OSPF virtual link

Network configuration

As shown in Figure 14, configure a virtual link between Switch B and Switch C to connect Area 2 to the backbone area. After configuration, Switch B can learn routes to Area 2.

Figure 14 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf 1 router-id 1.1.1.1
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf 1 router-id 2.2.2.2
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] area 1
[SwitchB–ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchB–ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf 1 router-id 3.3.3.3
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] network 10.2.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] area 2
[SwitchC–ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchC–ospf-1-area-0.0.0.2] quit
[SwitchC-ospf-1] quit
```

   # Configure Switch D.

```
<SwitchD> system-view
[SwitchD] ospf 1 router-id 4.4.4.4
[SwitchD-ospf-1] area 2
[SwitchD-ospf-1-area-0.0.0.2] network 10.3.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.2] quit
[SwitchD-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

          OSPF Process 1 with Router ID 2.2.2.2
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
 10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0
 Total nets: 2
 Intra area: 2  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows that Switch B does not have routes to Area 2 because Area 0 is not directly connected to Area 2.

3. Configure a virtual link:

Configure Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 1
[SwitchB-ospf-1-area-0.0.0.1] vlink-peer 3.3.3.3
[SwitchB-ospf-1-area-0.0.0.1] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] area 1
[SwitchC-ospf-1-area-0.0.0.1] vlink-peer 2.2.2.2
[SwitchC-ospf-1-area-0.0.0.1] quit
[SwitchC-ospf-1] quit
```

Display the OSPF routing table on Switch B.

```
[SwitchB] display ospf routing

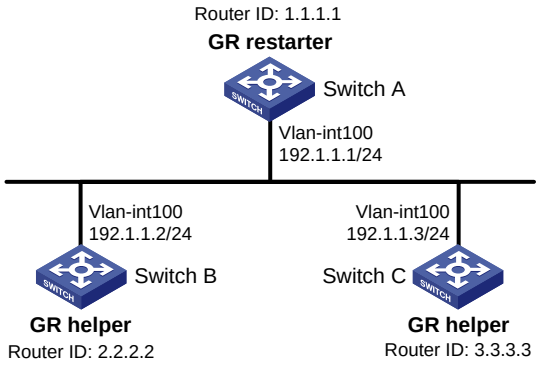
          OSPF Process 1 with Router ID 2.2.2.2
                  Routing Table

                Topology base (MTID 0)

 Routing for network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 10.2.1.0/24        2        Transit 10.2.1.1        3.3.3.3         0.0.0.1
 10.3.1.0/24        5        Inter   10.2.1.2        3.3.3.3         0.0.0.0
 10.1.1.0/24        2        Transit 10.1.1.2        2.2.2.2         0.0.0.0

 Total nets: 3
 Intra area: 2  Inter area: 1  ASE: 0  NSSA: 0
```

The output shows that Switch B has learned the route 10.3.1.0/24 to Area 2.



Example: Configuring OSPF GR

Network configuration

As shown in Figure 15:

- Switch A, Switch B, and Switch C that belong to the same AS and the same OSPF routing domain are GR capable.
- Switch A acts as the non-IETF GR restarter. Switch B and Switch C are the GR helpers, and synchronize their LSDBs with Switch A through OOB communication of GR.

Figure 15 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
SwitchA> system-view
[SwitchA] router id 1.1.1.1
[SwitchA] ospf 100
[SwitchA-ospf-100] area 0
[SwitchA-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchA-ospf-100-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] router id 2.2.2.2
[SwitchB] ospf 100
[SwitchB-ospf-100] area 0
[SwitchB-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchB-ospf-100-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] router id 3.3.3.3
[SwitchC] ospf 100
[SwitchC-ospf-100] area 0
[SwitchC-ospf-100-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchC-ospf-100-area-0.0.0.0] quit
```

```
[SwitchC-ospf-1] quit
```

3. Configure OSPF GR:

Configure Switch A as the non-IETF OSPF GR restarter: enable the link-local signaling capability, the out-of-band re-synchronization capability, and non-IETF GR capability for OSPF process 100.

```
[SwitchA-ospf-100] enable link-local-signaling
[SwitchA-ospf-100] enable out-of-band-resynchronization
[SwitchA-ospf-100] graceful-restart
[SwitchA-ospf-100] quit
```

Configure Switch B as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchB-ospf-100] enable link-local-signaling
[SwitchB-ospf-100] enable out-of-band-resynchronization
```

Configure Switch C as the GR helper: enable the link-local signaling capability and the out-of-band re-synchronization capability for OSPF process 100.

```
[SwitchC-ospf-100] enable link-local-signaling
[SwitchC-ospf-100] enable out-of-band-resynchronization
```

Verifying the configuration

Enable OSPF GR event debugging and restart the OSPF process by using GR on Switch A.

```
<SwitchA> debugging ospf event graceful-restart
<SwitchA> terminal monitor
<SwitchA> terminal logging level 7
<SwitchA> reset ospf 100 process graceful-restart
Reset OSPF process? [Y/N]:y
%Oct 21 15:29:28:727 2019 SwitchA OSPF/5/OSPF_NBR_CHG: OSPF 100 Neighbor

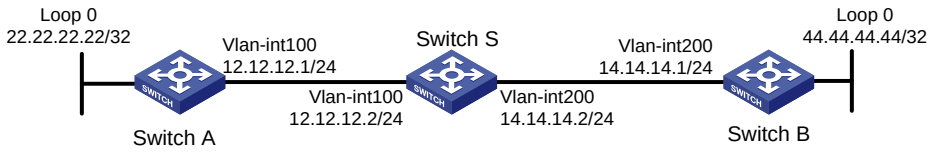
%Oct 21 15:29:35:578 2019 SwitchA OSPF/5/OSPF_NBR_CHG: OSPF 100 Neighbor
192.1.1.2(Vlan-interface100) from Loading to Full.
```



The output shows that Switch A completes GR.

Example: Configuring OSPF NSR

Network configuration

As shown in Figure 16, Switch S, Switch A, and Switch B belong to the same OSPF routing domain. Enable OSPF NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 16 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPF on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with OSPF.
3. Enable OSPF NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ospf 100
[SwitchS-ospf-100] non-stop-routing
[SwitchS-ospf-100] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```
[SwitchS] placement reoptimize
Predicted changes to the placement
Service Group(instance name)                    Cur location  New location
-------------------------------------------------------------------------
rib                                             0/0           0/0
staticroute                                     0/0           0/0
ospf                                            0/0           1/0
Continue? [y/n]:y
Re-optimization of the placement start. You will be notified on completion.
```

```
Re-optimization of the placement complete. Use 'display placement' to view the new
placement.
```

During the switchover period, display OSPF neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
<SwitchA> display ospf peer

Total nets: 4
Intra area: 4  Inter area: 0  ASE: 0  NSSA: 0
```

The output shows the following when an active/standby switchover occurs on Switch S:

- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring BFD for OSPF

Network configuration

As shown in Figure 17, run OSPF on Switch A, Switch B, and Switch C so that they are reachable to each other at the network layer.

- When the link over which Switch A and Switch B communicate through a Layer 2 switch fails, BFD can quickly detect the failure and notify OSPF of the failure.
- Switch A and Switch B then communicate through Switch C.

Figure 17 Network diagram

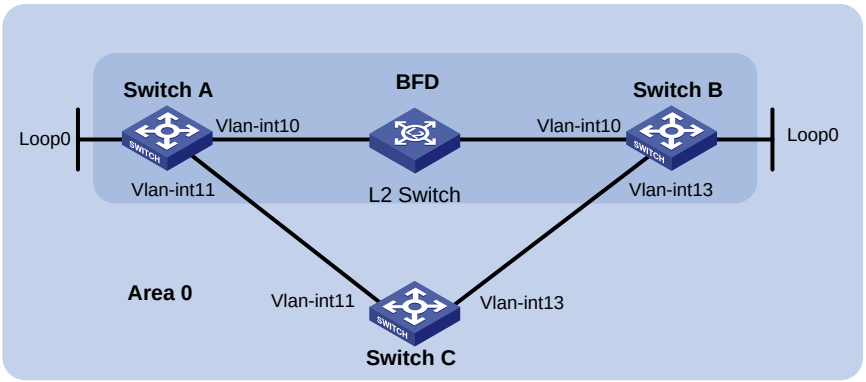

Table 1 Interface and IP address assignment

Device	Interface	IP address
Switch A	Vlan-int10	192.168.0.102/24
Switch A	Vlan-int11	10.1.1.102/24
Switch A	Loop0	121.1.1.1/32
Switch B	Vlan-int10	192.168.0.100/24
Switch B	Vlan-int13	13.1.1.1/24
Switch B	Loop0	120.1.1.1/32
Switch C	Vlan-int11	10.1.1.100/24

Device	Interface	IP address
Switch C	Vlan-int13	13.1.1.2/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable OSPF:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 121.1.1.1 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.0.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 120.1.1.1 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 13.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

3. Configure BFD:

   # Enable BFD on Switch A and configure BFD parameters.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospf bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

   # Enable BFD on Switch B and configure BFD parameters.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospf bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
```

```
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
<SwitchA> display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv4 session working in control packet mode:

 LD/RD          SourceAddr      DestAddr        State    Holdtime    Interface
 3/1            192.168.0.102   192.168.0.100   Up       1700ms      Vlan10
```

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary count : 1

Destination: 120.1.1.1/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s

      IpPre: N/A              QosLocalID: N/A
        Tag: 0                     State: Active Adv
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0x2                 OrigAs: 0
      NibID: 0x26000002          LastAs: 0
     AttrID: 0xffffffff        Neighbor: 0.0.0.0
      Flags: 0x1008c         OrigNextHop: 10.1.1.100
      Label: NULL            RealNextHop: 10.1.1.100
    BkLabel: NULL             B kNextHop: N/A
    SRLabel: NULL               BkSRLabel: NULL
   SIDIndex: NULL                 InLabel: NULL
  Tunnel ID: Invalid            Interface: Vlan-interface11
BkTunnel ID: Invalid         BkInterface: N/A
   FtnIndex: 0x0            TrafficIndex: N/A
  Connector: N/A                  PathID: 0x0
   LinkCost: 0                MicroSegID: 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPF FRR

Network configuration

As shown in Figure 18, Switch A, Switch B, and Switch C reside in the same OSPF domain. Configure OSPF FRR so that when the link between Switch A and Switch B fails, traffic is immediately switched to Link B.

Figure 18 Network diagram

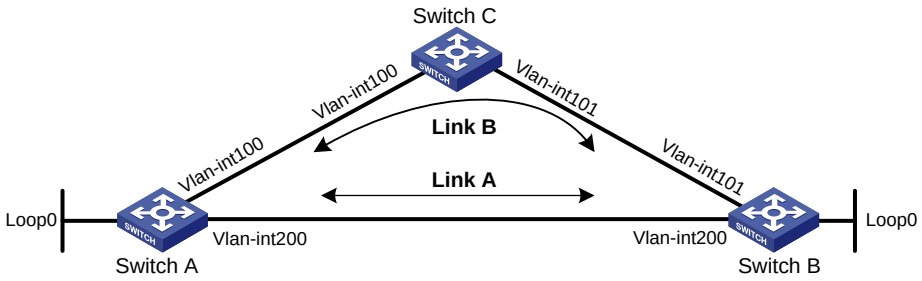

Table 2 Interface and IP address assignment

Device	Interface	IP address
Switch A	Vlan-int100	12.12.12.1/24
Switch A	Vlan-int200	13.13.13.1/24
Switch A	Loop0	1.1.1.1/32
Switch B	Vlan-int101	24.24.24.4/24
Switch B	Vlan-int200	13.13.13.2/24
Switch B	Loop0	4.4.4.4/32

Device	Interface	IP address
Switch C	Vlan-int100	12.12.12.2/24
Switch C	Vlan-int101	24.24.24.2/24

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPF on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPF FRR to automatically calculate the backup next hop:

   You can enable OSPF FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPF FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospf 1
     [SwitchA-ospf-1] fast-reroute lfa
     [SwitchA-ospf-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospf 1
     [SwitchB-ospf-1] fast-reroute lfa
     [SwitchB-ospf-1] quit
     ```

   - (Method 2.) Enable OSPF FRR to designate a backup next hop by using a routing policy.

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ip prefix-list abc index 10 permit 4.4.4.4 32
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ip address prefix-list abc
     [SwitchA-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
     100 backup-nexthop 12.12.12.2
     [SwitchA-route-policy-frr-10] quit
     [SwitchA] ospf 1
     [SwitchA-ospf-1] fast-reroute route-policy frr
     [SwitchA-ospf-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ip prefix-list abc index 10 permit 1.1.1.1 32
     [SwitchB] route-policy frr permit node 10
     [SwitchB-route-policy-frr-10] if-match ip address prefix-list abc
     [SwitchB-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
     101 backup-nexthop 24.24.24.2
     [SwitchB-route-policy-frr-10] quit
     [SwitchB] ospf 1
     [SwitchB-ospf-1] fast-reroute route-policy frr
     [SwitchB-ospf-1] quit
     ```

Verifying the configuration

Display route 4.4.4.4/32 on Switch A to view the backup next hop information.

```
[SwitchA] display ip routing-table 4.4.4.4 verbose

Summary count : 1

Destination: 4.4.4.4/32
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 1              Preference: 10
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                 State: Active Adv
  OrigTblID: 0x0              OrigVrf: default-vrf
    TableID: 0x2               OrigAs: 0
      NibID: 0x26000002        LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c       OrigNextHop: 13.13.13.2
      Label: NULL          RealNextHop: 13.13.13.2
    BkLabel: NULL            BkNextHop: 12.12.12.2

   LinkCost: 0               MicroSegID: 0
```

Troubleshooting OSPF configuration

No OSPF neighbor relationship established

Symptom

No OSPF neighbor relationship can be established.

Analysis

If the physical link and lower layer protocols work correctly, verify OSPF parameters configured on interfaces. Two neighbors must have the same parameters, such as the area ID, network segment, and mask. (A P2P or virtual link can have different network segments and masks.)

Solution

To resolve the problem:

1. Use the **`display ospf peer`** command to verify OSPF neighbor information.
2. Use the **`display ospf interface`** command to verify OSPF interface information.
3. Ping the neighbor router's IP address to verify that the connectivity is normal.
4. Verify OSPF timers. The dead interval on an interface must be a minimum of four times the hello interval.
5. On an NBMA network, use the **`peer ip-address`** command to manually specify the neighbor.
6. A minimum of one interface must have a router priority higher than 0 on an NBMA or a broadcast network.
7. If the problem persists, contact H3C Support.

Incorrect routing information

Symptom

OSPF cannot find routes to other areas.

Analysis

The backbone area must maintain connectivity to all other areas. If a router connects to more than one area, a minimum of one area must be connected to the backbone. The backbone cannot be configured as a stub area.

In a stub area, all routers cannot receive external routes, and all interfaces connected to the stub area must belong to the stub area.

Solution

To resolve the problem:

1. Use the **`display ospf peer`** command to verify neighbor information.
2. Use the **`display ospf interface`** command to verify OSPF interface information.
3. Use the **`display ospf lsdb`** command to verify the LSDB.

4. Use the **display current-configuration configuration ospf** command to verify area configuration. If more than two areas are configured, a minimum of one area is connected to the backbone.
5. In a stub area, all routers attached are configured with the **stub** command. In an NSSA area, all routers attached are configured with the **nssa** command.
6. If a virtual link is configured, use the **display ospf vlink** command to verify the state of the virtual link.
7. If the problem persists, contact H3C Support.

Configuring IS-IS

About IS-IS

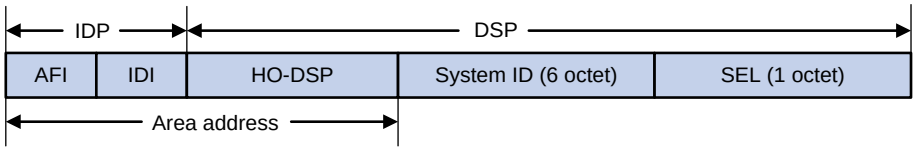
IS-IS is an IGP used within an AS. It uses the SPF algorithm for route calculation.

Terminology

- **Intermediate system**—Similar to a router in TCP/IP, IS is the basic unit used in an IS-IS routing domain to generate and propagate routing information. Throughout this chapter, an IS refers to a router.
- **End system**—Similar to a host in TCP/IP, an ES does not run IS-IS. ISO defines the ES-IS protocol for communication between an ES and an IS.
- **Routing domain**—An RD comprises a group of ISs that exchange routing information with each other by using the same routing protocol.
- **Area**—An IS-IS routing domain can be split into multiple areas.
- **Link State Database**—All link states in the network form the LSDB. Each IS has a minimum of one LSDB. An IS uses the SPF algorithm and LSDB to generate IS-IS routes.
- **Link State Protocol Data Unit or Link State Packet**—An IS advertises link state information in an LSP.
- **Network Protocol Data Unit**—An NPDU is a network layer protocol packet in OSI, similar to an IP packet in TCP/IP.
- **Designated IS**—A DIS is elected on a broadcast network.
- **Network service access point**—An NSAP is an OSI network layer address. The NSAP identifies an abstract network service access point and describes the network address format in the OSI reference model.

IS-IS address

As shown in Figure 1, an NSAP address comprises the Initial Domain Part (IDP) and the Domain Specific Part (DSP). The IDP is analogous to the network ID of an IP address, and the DSP is analogous to the subnet and host ID.



The IDP includes the Authority and Format Identifier (AFI) and the Initial Domain Identifier (IDI).

The DSP includes:

- **High Order Part of DSP (HO-DSP)**—Identifies the area.
- **System ID**—Identifies the host.
- **SEL**—Also known as the N-SEL or the NSAP selector (SEL). It is similar to the protocol identifier in IP and is used to identify the type of service. Different transport layer protocols correspond to different SELs.

The IDP and DSP are variable in length. The length of an NSAP address is in the range of 8 to 20 bytes.

Figure 1 NSAP address format

An IS-IS address contains the following components:

- Area address

  The area address comprises the IDP and the HO-DSP of the DSP, which identify the area and the routing domain. Different routing domains cannot have the same area address.

  Typically, a router only needs one area address, and all nodes in the same area must have the same area address. To support smooth area merging, partitioning, and switching, a router can have a maximum of three area addresses.

- System ID

  A system ID uniquely identifies a host or router. It has a fixed length of 48 bits (6 bytes).

  The system ID of a device can be generated from the router ID. For example, suppose a router uses the IP address 168.10.1.1 of Loopback 0 as the router ID. The system ID can be obtained in the following steps:

  a. Extend each decimal number of the IP address to three digits by adding 0s from the left, such as 168.010.001.001.

  b. Divide the extended IP address into three sections that each has four digits to get the system ID 1680.1000.1001.

  If you use other methods to define a system ID, make sure that it can uniquely identify the host or router.

- SEL

  An SEL is used to identify the type of service. Different transport layer protocols correspond to different SELs. It has a fixed length of 8 bits. All SELs in IP are 00.

NET

A network entity title (NET) identifies the network layer information of an IS. It does not include transport layer information. A NET is a special NSAP address with the SEL being 0. The length of a NET is in the range of 8 to 20 bytes, same as a NSAP address.

A NET includes the following parts:

- **Area ID**—Has a length of 1 to 13 bytes.
- **System ID**—A system ID uniquely identifies a host or router in the area and has a fixed length of 6 bytes.
- **SEL**—Has a value of 0 and a fixed length of 1 byte.

For example, for a NET ab.cdef.1234.5678.9abc.00, the area ID is ab.cdef, the system ID is 1234.5678.9abc, and the SEL is 00.

Typically, a router only needs one NET, but it can have a maximum of three NETs for smooth area merging and partitioning. When you configure multiple NETs, make sure the system IDs are the same.

IS-IS area

IS-IS has a 2-level hierarchy to support large-scale networks. A large-scale routing domain is divided into multiple areas. Typically, a Level-1 router is deployed within an area. A Level-2 router is deployed between areas. A Level-1-2 router is deployed between Level-1 and Level-2 routers.

Level-1 router

A Level-1 router establishes neighbor relationships with Level-1 and Level-1-2 routers in the same area. It maintains an LSDB comprising intra-area routing information. A Level-1 router forwards packets destined for external areas to the nearest Level-1-2 router. Level-1 routers in different areas cannot establish neighbor relationships.

Level-2 router

A Level-2 router establishes neighbor relationships with Level-2 and Level-1-2 routers in the same area or in different areas. It maintains a Level-2 LSDB containing inter-area routing information. All the Level-2 and Level-1-2 routers must be contiguous to form the backbone of the IS-IS routing domain. Level-2 routers can establish neighbor relationships even if they are in different areas.

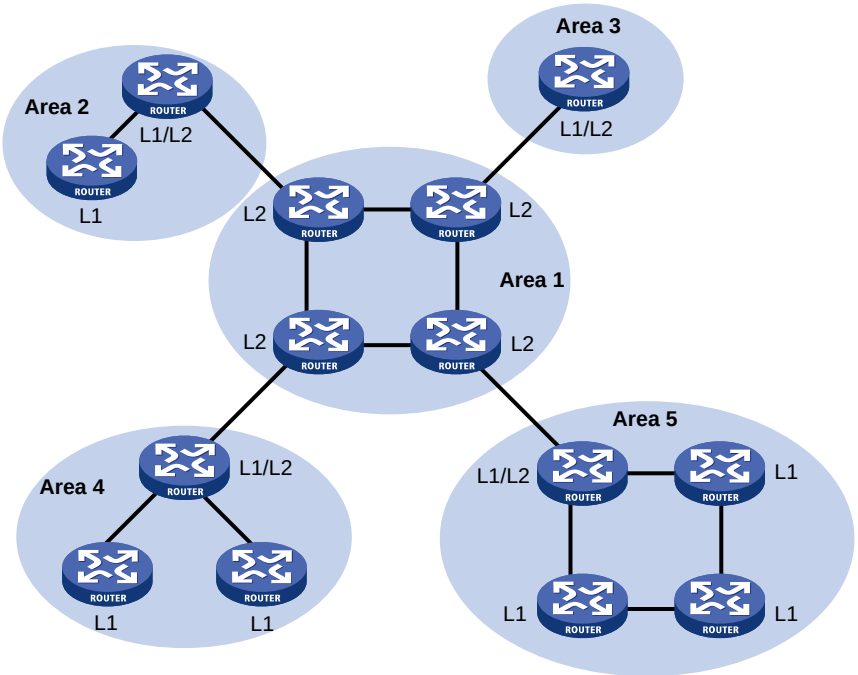
Level-1-2 router

A router with both Level-1 and Level-2 router functions is a Level-1-2 router. It can establish Level-1 neighbor relationships with Level-1 and Level-1-2 routers in the same area. It can establish Level-2 neighbor relationships with Level-2 and Level-1-2 routers in different areas. A Level-1 router can reach other areas only through a Level-1-2 router. The Level-1-2 router maintains two LSDBs, a Level-1 LSDB for intra-area routing and a Level-2 LSDB for inter-area routing.

IS-IS topology

Figure 2 shows one IS-IS network topology. Area 1 is the backbone that comprises a set of Level-2 routers. The other four areas are non-backbone areas connected to the backbone through Level-1-2 routers.

Figure 2 IS-IS topology 1



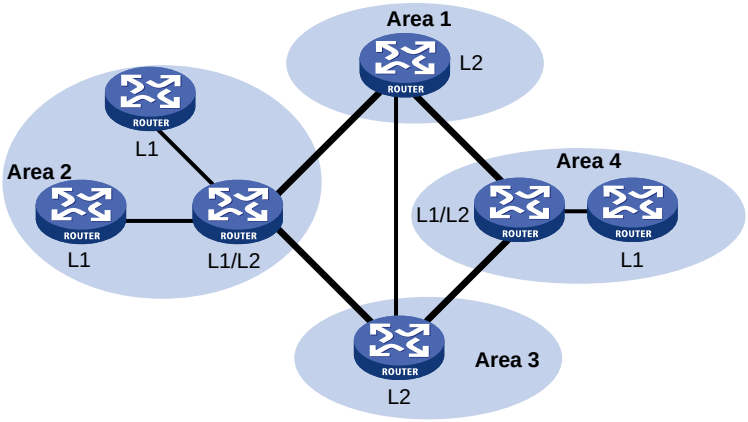


Figure 3 shows another IS-IS topology. No area is defined as the backbone in this topology. The backbone comprises all contiguous Level-2 and Level-1-2 routers in different areas. The IS-IS backbone does not need to be a specific area.

Figure 3 IS-IS topology 2

Both the Level-1 and Level-2 routers use the SPF algorithm to generate the shortest path tree.

Route leaking

Level-2 and Level-1-2 routers form a Level-2 area. An IS-IS routing domain comprises only one Level-2 area and multiple Level-1 areas. A Level-1 area must connect to the Level-1-2 area rather than another Level-1 area.

Level-1-2 routers send the routing information of Level-1 areas to the Level-2 area. Level-2 routers know the routing information of the entire IS-IS routing domain. By default, a Level-2 router does not advertise the routing information of other areas to a Level-1 area. A Level-1 router simply sends packets destined for other areas to the nearest Level-1-2 router. The path passing through the Level-1-2 router might not be the best. To solve this problem, IS-IS provides the route leaking feature.

Route leaking enables a Level-1-2 router to advertise the routes of other areas to the connected Level-1 area so that the Level-1 routers can select the optimal routes.

IS-IS network types

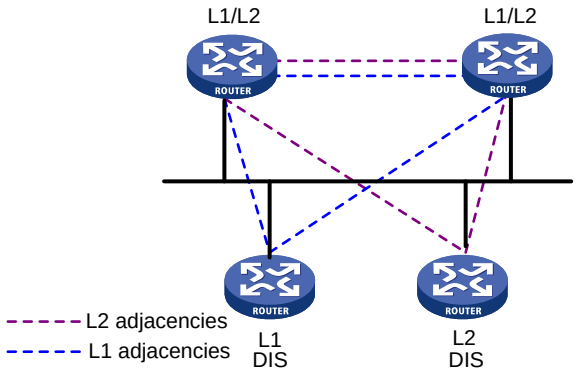
IS-IS supports broadcast networks (for example, Ethernet and Token Ring) and point-to-point networks (for example, PPP and HDLC).

IS-IS cannot run on P2MP links.

DIS and pseudonodes

IS-IS routers on a broadcast network must elect a DIS.

The Level-1 and Level-2 DISs are elected separately. You can assign different priorities to a router for different level DIS elections. The higher the router priority, the more likely the router becomes the DIS. If multiple routers with the same highest DIS priority exist, the one with the highest Subnetwork Point of Attachment (SNPA) address will be elected. On a broadcast network, the SNPA address is the MAC address. A router can be the DIS for different levels.



IS-IS DIS election differs from OSPF DIS election in the following ways:

- A router with priority 0 can also participate in the DIS election.

- When a router with a higher priority is added to the network, an LSP flooding process is performed to elect the router as the new DIS.

As shown in Figure 4, the same level routers on a network, including non-DIS routers, establish adjacency with each other.

Figure 4 DIS in the IS-IS broadcast network

The DIS creates and updates pseudonodes, and generates LSPs for the pseudonodes, to describe all routers on the network.

A pseudonode represents a virtual node on the broadcast network. It is not a real router. In IS-IS, it is identified by the system ID of the DIS and a 1-byte Circuit ID (a non-zero value).

Using pseudonodes simplifies network topology and can reduce the amount of resources consumed by SPF.

NOTE:

On an IS-IS broadcast network, all routers establish adjacency relationships, but they synchronize their LSDBs through the DIS.

On a broadcast network, the device can establish up to 255 neighbor relationships, because the Circuit ID is only one byte long. If the number of broadcast links that require neighbor relationship establishment exceeds 255, the device does not establish IS-IS neighbor relationships on the excess broadcast links.

IS-IS PDUs

PDU

IS-IS PDUs are encapsulated into link layer frames. An IS-IS PDU has two parts, the headers and the variable length fields. The headers comprise the PDU common header and the PDU specific header. All PDUs have the same PDU common header. The specific headers vary by PDU type.

Figure 5 PDU format

Table 1 PDU types

Type	PDU Type	Acronym
15	Level-1 LAN IS-IS hello PDU	L1 LAN IIH
16	Level-2 LAN IS-IS hello PDU	L2 LAN IIH
17	Point-to-Point IS-IS hello PDU	P2P IIH

Type	PDU Type	Acronym
18	Level-1 Link State PDU	L1 LSP
20	Level-2 Link State PDU	L2 LSP
24	Level-1 Complete Sequence Numbers PDU	L1 CSNP
25	Level-2 Complete Sequence Numbers PDU	L2 CSNP
26	Level-1 Partial Sequence Numbers PDU	L1 PSNP
27	Level-2 Partial Sequence Numbers PDU	L2 PSNP

Hello PDU

IS-to-IS hello (IIH) PDUs are used by routers to establish and maintain neighbor relationships. On broadcast networks, Level-1 routers use Level-1 LAN IIHs, and Level-2 routers use Level-2 LAN IIHs. The P2P IIHs are used on point-to-point networks.

LSP

The LSPs carry link state information. LSPs include Level-1 LSPs and Level-2 LSPs. The Level-2 LSPs are sent by the Level-2 routers, and the Level-1 LSPs are sent by the Level-1 routers. The Level-1-2 router can send both types of LSPs.

SNP

A sequence number PDU (SNP) describes the complete or partial LSPs for LSDB synchronization.

SNPs include CSNP and PSNP, which are further divided into Level-1 CSNP, Level-2 CSNP, Level-1 PSNP, and Level-2 PSNP.

A CSNP describes the summary of all LSPs for LSDB synchronization between neighboring routers. On broadcast networks, CSNPs are sent by the DIS periodically (every 10 seconds by default). On point-to-point networks, CSNPs are sent only during the first adjacency establishment.

A PSNP only contains the sequence numbers of one or multiple latest received LSPs. It can acknowledge multiple LSPs at one time. When LSDBs are not synchronized, a PSNP is used to request missing LSPs from a neighbor.

CLV

The variable fields of PDU comprise multiple Code-Length-Value (CLV) triplets.

Figure 6 CLV format

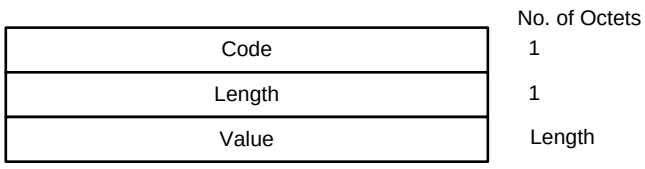


Table 2 shows that different PDUs contain different CLVs. Codes 1 through 10 are defined in ISO 10589 (code 3 and 5 are not shown in the table). Codes 128 through 132 are defined in RFC 1195. Codes 222 through 237 are defined in RFC 5120.

Table 2 CLV codes and PDU types

CLV Code	Name	PDU Type
1	Area Addresses	IIH, LSP
2	IS Neighbors (LSP)	LSP
4	Partition Designated Level 2 IS	L2 LSP

CLV Code	Name	PDU Type
6	IS Neighbors (MAC Address)	LAN IIH
7	IS Neighbors (SNPA Address)	LAN IIH
8	Padding	IIH
9	LSP Entries	SNP
10	Authentication Information	IIH, LSP, SNP
128	IP Internal Reachability Information	LSP
129	Protocols Supported	IIH, LSP
130	IP External Reachability Information	L2 LSP
131	Inter-Domain Routing Protocol Information	L2 LSP
132	IP Interface Address	IIH, LSP
222	MT-ISN	LSP
229	M-Topologies	IIH, LSP
235	MT IP. Reach	LSP
237	MT IPv6 IP. Reach	LSP

IPv6 IS-IS

IS-IS supports multiple network protocols, including IPv6. To support IPv6, the IETF added two type-length-values (TLVs) and a new network layer protocol identifier (NLPID).

The TLVs are as follows:

- **IPv6 Reachability**—Contains routing prefix and metric information to describe network reachability and has a type value of 236 (0xEC).
- **IPv6 Interface Address**—Same as the "IP Interface Address" TLV in IPv4 ISIS, except that the 32-bit IPv4 address is translated to the 128-bit IPv6 address.

The new NLPID is an 8-bit field that identifies which network layer protocol is supported. For IPv6, the NLPID is 142 (0x8E).

IPv4 IS-IS tasks at a glance

To configure IPv4 IS-IS, perform the following tasks:

1. Configuring basic IS-IS
   a. Enabling IPv4 IS-IS
   b. (Optional.) Setting the IS level and circuit level
   c. (Optional.) Configuring P2P network type for an interface
2. (Optional.) Configuring IS-IS multi-instance processes
3. (Optional.) Configuring IS-IS route control

- Configuring IS-IS link cost
- Enabling IS-IS to advertise the maximum link cost to neighbors
- Specifying a preference for IS-IS
- Configuring the maximum number of ECMP routes
- Configuring IS-IS route summarization
- Advertising a default route
- Configuring IS-IS route redistribution
- Filtering routes calculated from received LSPs
- Filtering redistributed routes
- Configuring IS-IS route leaking
- Advertising IS-IS link state information to BGP

4. (Optional.) Configuring IS-IS timers
   - Specifying the interval for sending IS-IS hello packets
   - Specifying the interval for sending IS-IS CSNP packets
   - Setting the maximum age of LSPs
   - Setting the LSP refresh interval and generation interval
   - Setting LSP sending intervals
   - Setting the SPF calculation interval
5. (Optional.) Configuring IS-IS packet-related features
   - Configuring a DIS priority for an interface
   - Configuring the tag value for an interface
   - Specifying the IS-IS hello multiplier
   - Disabling an interface from sending/receiving IS-IS packets
   - Enabling an interface to send small hello packets
   - Setting LSP lengths
   - Enabling LSP flash flooding
   - Enabling LSP fragment extension
6. (Optional.) Configuring advanced IS-IS features
   - Enabling source address check for hello packets on a P2P interface
   - Configuring convergence priorities for specific routes
   - Setting the LSDB overload bit
   - Configuring IS-IS isolation
   - Configuring the ATT bit
   - Configuring system ID to host name mappings
7. (Optional.) Configuring IS-IS logging and SNMP notifications
   - Enabling the logging of neighbor state changes
   - Setting the maximum number of log entries that can be recorded
   - Setting the maximum number of IS-IS neighbor relationship troubleshooting entries
   - Configuring IS-IS network management
8. (Optional.) Configuring IS-IS fast convergence
   - Enabling ISPF
   - Enabling prefix suppression
   - Configuring IS-IS PIC
9. (Optional.) Enhancing IS-IS network security

- Configuring neighbor relationship authentication
- Configuring area authentication
- Configuring routing domain authentication

10. (Optional.) Enhancing IS-IS network reliability:
    - Configuring IS-IS GR
    - Configuring IS-IS NSR
    - Configuring BFD for IS-IS
    - Configuring IS-IS FRR

IPv6 IS-IS tasks at a glance

To configure IPv6 IS-IS, perform the following tasks:

1. Configuring basic IS-IS
    a. Enabling IPv6 IS-IS
    b. (Optional.) Setting the IS level and circuit level
    c. (Optional.) Configuring P2P network type for an interface
2. (Optional.) Configuring IS-IS multi-instance processes
3. (Optional.) Configuring IPv6 IS-IS MTR
4. (Optional.) Configuring IS-IS route control
    - Configuring IS-IS link cost
    - Enabling IS-IS to advertise the maximum link cost to neighbors
    - Specifying a preference for IS-IS
    - Configuring the maximum number of ECMP routes
    - Configuring IS-IS route summarization
    - Advertising a default route
    - Configuring IS-IS route redistribution
    - Filtering routes calculated from received LSPs
    - Filtering redistributed routes
    - Configuring IS-IS route leaking
    - Advertising IS-IS link state information to BGP
5. (Optional.) Configuring IS-IS timers
    - Specifying the interval for sending IS-IS hello packets
    - Specifying the interval for sending IS-IS CSNP packets
    - Setting the maximum age of LSPs
    - Setting the LSP refresh interval and generation interval
    - Setting LSP sending intervals
    - Setting the SPF calculation interval
6. (Optional.) Configuring IS-IS packet-related features
    - Configuring a DIS priority for an interface
    - Configuring the tag value for an interface
    - Specifying the IS-IS hello multiplier
    - Disabling an interface from sending/receiving IS-IS packets
    - Enabling an interface to send small hello packets
    - Setting LSP lengths

- Enabling LSP flash flooding
- Enabling LSP fragment extension

7. (Optional.) Configuring advanced IS-IS features
   - Enabling source address check for hello packets on a P2P interface
   - Configuring convergence priorities for specific routes
   - Setting the LSDB overload bit
   - Configuring IS-IS isolation
   - Configuring the ATT bit
   - Configuring system ID to host name mappings
8. (Optional.) Configuring IS-IS logging and SNMP notifications
   - Enabling the logging of neighbor state changes
   - Setting the maximum number of log entries that can be recorded
   - Setting the maximum number of IS-IS neighbor relationship troubleshooting entries
   - Configuring IS-IS network management
9. (Optional.) Configuring IS-IS fast convergence
   - Enabling ISPF
   - Enabling prefix suppression
   - Configuring IS-IS PIC
10. (Optional.) Enhancing IS-IS network security
    - Configuring neighbor relationship authentication
    - Configuring area authentication
    - Configuring routing domain authentication
11. (Optional.) Enhancing IS-IS network reliability:
    - Configuring IS-IS GR
    - Configuring IS-IS NSR
    - Configuring BFD for IS-IS
    - Configuring IS-IS FRR

Configuring basic IS-IS

Enabling IPv4 IS-IS

1. Enter system view.
   system-view
2. Enable IS-IS and enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   By default, IS-IS is disabled.
3. Assign a NET.
   network-entity *net*
   By default, NET is not assigned.

CAUTION:

When you execute the **network-entity** command together with the **cost-style** and **is-level** commands for the same IS-IS process, execute the **network-entity** command at last. Incorrect configuration order might cause data loss because the IS-IS process will restart.

4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable IS-IS on the interface.
   isis enable [*process-id*]
   By default, IS-IS is disabled.

Enabling IPv6 IS-IS

1. Enter system view.
   system-view
2. Enable an IS-IS process and enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   By default, no IS-IS process is enabled.
3. Configure the NET for the IS-IS process.
   network-entity *net*
   By default, the NET is not configured.

CAUTION:

When you execute the **network-entity** command together with the **cost-style** and **is-level** commands for the same IS-IS process, execute the **network-entity** command at last. Incorrect configuration order might cause data loss because the IS-IS process will restart.

4. Create the IPv6 address family and enter its view.
   address-family ipv6 [**unicast**]
5. Return to IS-IS view.
   quit
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable IPv6 for IS-IS on the interface.
   isis ipv6 enable [*process-id*]
   By default, IPv6 is disabled for IS-IS on an interface.

Setting the IS level and circuit level

About this task

Follow these guidelines when you configure the IS level for routers in only one area:

- Set the IS level of all routers to Level-1 or Level-2 rather than different levels because the routers do not need to maintain two identical LSDBs.
- Set the IS level to Level-2 on all routers in an IP network for good scalability.

For an interface of a Level-1 or Level-2 router, the circuit level can only be Level-1 or Level-2. For an interface of a Level-1-2 router, the default circuit level is Level-1-2. If the router only needs to form Level-1 or Level-2 neighbor relationships, set the circuit level for its interfaces to Level-1 or Level-2. This will limit neighbor relationship establishment.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify the IS level.
   is-level { **level-1** | **level-1-2** | **level-2** }
   By default, the IS level is Level-1-2.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Specify the circuit level.
   isis circuit-level [**level-1** | **level-1-2** | **level-2**]
   By default, an interface can establish either the Level-1 or Level-2 adjacency.

Configuring P2P network type for an interface

About this task

Interfaces with different network types operate differently. For example, broadcast interfaces on a network must elect the DIS and flood CSNP packets to synchronize the LSDBs. However, P2P interfaces on a network do not need to elect the DIS, and have a different LSDB synchronization mechanism.

If only two routers exist on a broadcast network, set the network type of attached interfaces to P2P. This avoids DIS election and CSNP flooding, saving network bandwidth and speeding up network convergence.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure P2P network type for an interface.
   isis [**process-id** *process-id*] **circuit-type p2p**
   By default, the network type of a VLAN interface is broadcast.

Perform this task only for a broadcast network that has up to two attached routers.

Configuring IS-IS multi-instance processes

About this task

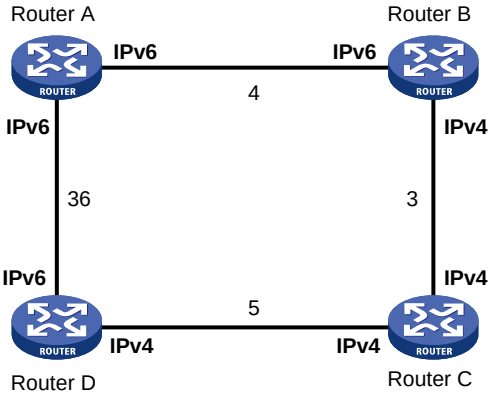
NOTE:

IS-IS processes not enabled with the multi-instance process feature are called traditional IS-IS processes. IS-IS processes enabled with the multi-instance process feature are called IS-IS multi-instance processes.

By default, an interface supports only one IS-IS process. To configure multiple IS-IS processes on a device, you must add more interfaces to the device and configure the interfaces manually. To simplify configuration, use the IS-IS multi-instance process feature to configure multiple IS-IS multi-instance processes as well as a traditional IS-IS process on an interface.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable the IS-IS multi-instance process and specify an instance ID for the process.
   multi-instance enable iid *iid-value*
   By default, IS-IS multi-instance process is disabled.
4. Configure IS-IS multi-instance processes on an interface:
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
   c. Enable an IS-IS multi-instance process on the interface:
      IPv4:
      isis enable [*process-id*]
      By default, IPv4 IS-IS is disabled on an interface, and the interface is not enabled with any IS-IS processes.
      IPv6:
      isis ipv6 enable [*process-id*]
      By default, IPv6 IS-IS is disabled on an interface, and the interface is not enabled with any IS-IS processes.



Configuring IPv6 IS-IS MTR

About this task

On a network, IPv4 and IPv6 topologies must be consistent so that both IPv6 IS-IS and IPv4 IS-IS can use the SPF algorithm to perform route calculation. If they are different, routers supporting both IPv4 and IPv6 might send IPv6 packets to routers that do not support IPv6, resulting in packet loss.

To resolve this issue, configure IPv6 IS-IS MTR to perform route calculation separately in IPv4 and IPv6 topologies.

Figure 7 Network diagram

As shown in Figure 7, the numbers refer to the link costs. Router A, Router B, and Router D support both IPv4 and IPv6. Router C supports only IPv4 and cannot forward IPv6 packets.

Enable IPv6 IS-IS MTR on Router A, Router B, Router C, and Router D to make them perform route calculation separately in IPv4 and IPv6 topologies. With this configuration, Router A does not forward IPv6 packets destined to Router D through Router B, avoiding packet loss.

Restrictions and guidelines

As a best practice to avoid route calculation failures, configure this feature when both IPv4 and IPv6 topologies exist in the network.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify an IS-IS cost style.
   cost-style { **compatible** | **wide** | **wide-compatible** }
   By default, IS-IS only transmits and receives packets using the **narrow** cost style.
4. Enter IPv6 address family view.
   address-family ipv6 [**unicast**]
5. Enable IPv6 IS-IS MTR.
   multi-topology [**compatible**]
   By default, IPv6 IS-IS MTR is disabled.

Configuring IS-IS route control

Configuring IS-IS link cost

About this task

The IS-IS cost of an interface is determined in the following order:

1. IS-IS cost specified in interface view.
2. IS-IS cost specified in system view.
   The cost is applied to the interfaces associated with the IS-IS process.
3. Automatically calculated cost.

If the cost style is **wide** or **wide-compatible**, IS-IS automatically calculates the cost using the formula: Interface cost = (Bandwidth reference value / Expected interface bandwidth) × 10, in the range of 1 to 16777214. For other cost styles, Table 3 applies.

Configure the expected bandwidth of an interface with the **bandwidth** command.

Table 3 Automatic cost calculation scheme for cost styles other than wide and wide-compatible

Interface bandwidth	Interface cost
≤ 10 Mbps	60
≤ 100 Mbps	50
≤ 155 Mbps	40
≤ 622 Mbps	30
≤ 2500 Mbps	20
> 2500 Mbps	10

4. If none of the above costs is used, a default cost of 10 applies.

Configuring an IPv4 IS-IS cost for an interface

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. (Optional.) Specify an IS-IS cost style.
   cost-style { **narrow** | **wide** | **wide-compatible** | { **compatible** | **narrow-compatible** } [**relax-spf-limit**] }
   By default, the IS-IS cost type is **narrow**.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Specify a cost for the IS-IS interface.
   isis [**process-id** *process-id*] **cost** *cost-value* [**level-1** | **level-2**]
   By default, no cost for the interface is specified.

Configuring a global IPv4 IS-IS cost

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify a global IS-IS cost.
   circuit-cost *cost-value* [**level-1** | **level-2**]
   By default, no global cost is specified.

Enabling automatic IPv4 IS-IS cost calculation

1. Enter system view.
   system-view

2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable automatic IS-IS cost calculation.
   auto-cost enable
   By default, automatic IS-IS cost calculation is disabled.
4. (Optional.) Configure a bandwidth reference value for automatic IS-IS cost calculation.
   bandwidth-reference *value*
   The default setting is 100 Mbps.

Configuring an IPv6 IS-IS cost for an interface

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. (Optional.) Specify an IS-IS cost style.
   cost-style { **narrow** | **wide** | **wide-compatible** | { **compatible** | **narrow-compatible** } [**relax-spf-limit**] }
   By default, the IS-IS cost type is **narrow**.
4. Enter IPv6 address family view.
   address-family ipv6 [**unicast**]
5. Return to IS-IS view.
   quit
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable IPv6 for IS-IS on the interface.
   isis ipv6 enable [*process-id*]
   By default, IPv6 is disabled for IS-IS on an interface.
9. Specify an IPv6 cost for the IS-IS interface.
   isis [**process-id** *process-id*] **ipv6 cost** *cost-value* [**level-1** | **level-2**]
   By default, no IPv6 cost is specified for the interface.

Configuring a global IPv6 IS-IS cost

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enter IPv6 address family view.
   address-family ipv6 [**unicast**]
4. Specify a global IPv6 IS-IS cost.
   circuit-cost *cost-value* [**level-1** | **level-2**]
   By default, no global IPv6 cost is specified.

Enabling automatic IPv6 IS-IS cost calculation

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify an IS-IS cost style.
   cost-style { **wide** | **wide-compatible** }
   By default, the IS-IS cost style is **narrow**.
4. Enter IPv6 address family view.
   address-family ipv6 [**unicast**]
5. Enable automatic IPv6 IS-IS cost calculation.
   auto-cost enable
   By default, automatic IPv6 IS-IS cost calculation is disabled.
6. (Optional.) Configure a bandwidth reference value for automatic IPv6 IS-IS cost calculation.
   bandwidth-reference *value*
   By default, the bandwidth reference value is 100 Mbps.

Enabling IS-IS to advertise the maximum link cost to neighbors

About this task

On an IS-IS network, when a link recovers from failures or the state of an interface changes, IS-IS will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable IS-IS to advertise the maximum link cost to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, IS-IS advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IS-IS to advertise the maximum link cost to neighbors within the specified period.
   isis peer hold-max-cost duration *time*
   By default, IS-IS advertises the original link cost to neighbors during a route convergence.

Specifying a preference for IS-IS

About this task

If multiple routing protocols find routes to the same destination, the route found by the routing protocol that has the highest preference is selected as the optimal route.

Perform this task to assign a preference to IS-IS directly or by using a routing policy. For more information about the routing policy, see "Configuring routing policies."

Configuring a preference for IPv4 IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS IPv4 unicast address family view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   address-family ipv4 [**unicast**]
3. Configure a preference for IPv4 IS-IS.
   preference { *preference* | **route-policy** *route-policy-name* } *
   The default setting is 15.

Configuring a preference for IPv6 IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enter IS-IS IPv6 address family view.
   address-family ipv6 [**unicast**]
4. Configure a preference for IPv6 IS-IS.
   preference { **route-policy** *route-policy-name* | *preference* } *
   The default setting is 15.

Configuring the maximum number of ECMP routes

About this task

Perform this task to implement load sharing over ECMP routes.

Configuring the maximum number of ECMP routes for IPv4 IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS IPv4 unicast address family view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   address-family ipv4 [**unicast**]
3. Specify the maximum number of ECMP routes.
   maximum load-balancing *number*
   By default, the maximum number of ECMP routes supported by IPv4 IS-IS equals the maximum number of ECMP routes supported by the system.

Configuring the maximum number of ECMP routes for IPv6 IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enter IS-IS IPv6 address family view.
   address-family ipv6 [**unicast**]
4. Specify the maximum number of ECMP routes.
   maximum load-balancing *number*

By default, the maximum number of ECMP routes supported by IPv6 IS-IS equals the maximum number of ECMP routes supported by the system.

Configuring IS-IS route summarization

About this task

Perform this task to summarize specific routes, including IS-IS routes and redistributed routes, into a single route. Route summarization can reduce the routing table size and the LSDB scale.

Route summarization applies only to locally generated LSPs.

Configuring IPv4 IS-IS route summarization

1. Enter system view.

   system-view
2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]
3. Configure IPv4 IS-IS route summarization.

   summary *ip-address* { *mask-length* | *mask* } [**avoid-feedback** | **generate_null0_route** | [**level-1** | **level-1-2** | **level-2**] | **tag** *tag*] *

   By default, IPv4 IS-IS route summarization is not configured.

   The cost of the summary route is the lowest one among the costs of the more-specific routes.

Configuring IPv6 IS-IS route summarization

1. Enter system view.

   system-view
2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]
4. Configure IPv6 IS-IS route summarization.

   summary *ipv6-prefix prefix-length* [**avoid-feedback** | **generate_null0_route** | [**level-1** | **level-1-2** | **level-2**] | **tag** *tag*] *

   By default, IPv6 IS-IS route summarization is not configured.

Advertising a default route

About this task

IS-IS cannot redistribute a default route to its neighbors. This task enables IS-IS to advertise a default route of 0.0.0.0/0 in an LSP to the same-level neighbors. Upon receiving the default route, the neighbors add it into their routing table.

Advertising an IPv4 IS-IS default route

1. Enter system view.

   system-view
2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]

3. Advertise a Level-1 or Level-2 default route.

   default-route-advertise [[**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name*] *

   By default, IPv4 IS-IS does not advertise a Level-1 or Level-2 default route.

Advertising an IPv6 IS-IS default route

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Advertise a Level-1 or Level-2 default route.

   default-route-advertise [**avoid-learning** | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IPv6 IS-IS does not advertise a Level-1 or Level-2 default route.

Configuring IS-IS route redistribution

About this task

Perform this task to redistribute routes from other routing protocols into IS-IS. You can specify a cost for redistributed routes and specify the maximum number of redistributed routes.

Restrictions and guidelines

This command redistributes only active routes. To display active routes, use the **display ip routing-table protocol** command.

Configuring IPv4 IS-IS route redistribution

1. Enter system view.

   system-view

2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]

3. Redistribute routes from other routing protocols or other IS-IS processes.

   import-route bgp [*as-number*] [**allow-ibgp**] [**cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route bgp [*as-number*] [**allow-ibgp**] **inherit-cost** [[**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route { **direct** | **static** } [**cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route { **direct** | **static** } **inherit-cost** [[**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route { **isis** | **ospf** | **rip** } [*process-id* | **all-processes**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

import-route { **isis** | **ospf** | **rip** } [*process-id* | **all-processes**] **inherit-cost** [**allow-direct** | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

By default, IS-IS does not redistribute routes.

4. (Optional.) Configure the maximum number of redistributed Level 1/Level 2 IPv4 routes.

   import-route limit *number*

   By default, the maximum number of redistributed Level 1/Level 2 IPv4 routes varies by device model as follows:

   - For S5570S-EI switch series, the maximum number is 12288.
   - For S5500V3-SI switch series, the maximum number is 8192.

Configuring IPv6 IS-IS route redistribution

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Redistribute routes from other routing protocols or other IS-IS processes.

   import-route bgp4+ [*as-number*] [**allow-ibgp**] [[**cost** *cost-value* | **inherit-cost**] | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id*] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IPv6 IS-IS does not redistribute routes.

5. (Optional.) Configure the maximum number of redistributed Level 1/Level 2 IPv6 routes.

   import-route limit *number*

   By default, the maximum number of redistributed Level 1/Level 2 IPv6 routes varies by device model as follows:

   - For S5570S-EI switch series, the maximum number is 4096.
   - For S5500V3-SI switch series, the maximum number is 3072.

Filtering routes calculated from received LSPs

About this task

IS-IS saves LSPs received from neighbors in the LSDB, and uses the SPF algorithm to calculate the shortest path tree with itself as the root. IS-IS installs the calculated routes to the IS-IS routing table and the optimal routes to the IP routing table.

Perform this task to filter calculated routes. Only routes that are not filtered can be added to the IP routing table. The filtered routes retain in the IS-IS routing table and can be advertised to neighbors.

Filtering IPv4 IS-IS routes calculated from received LSPs

1. Enter system view.

system-view

2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]

3. Filter routes calculated using received LSPs.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

   By default, IPv4 IS-IS route filtering is not configured.

Filtering IPv6 IS-IS routes calculated from received LSPs

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Filter routes calculated using received LSPs.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

   By default, IPv6 IS-IS route filtering is not configured.

Filtering redistributed routes

About this task

IS-IS can redistribute routes from other routing protocols or other IS-IS processes, add them to the IS-IS routing table, and advertise them in LSPs.

Perform this task to filter redistributed routes. Only routes that are not filtered can be added to the IS-IS routing table and advertised to neighbors.

Restrictions and guidelines

Use this command together with the **import-route** command.

Filtering redistributed IPv4 IS-IS routes

1. Enter system view.

   system-view

2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]

3. Filter routes redistributed from other routing protocols or IS-IS processes.

   filter-policy { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **export** [*protocol process-id*]

   By default, IPv4 IS-IS route filtering is not configured.

Filtering redistributed IPv6 IS-IS routes

1. Enter system view.

   system-view

2. Enter IS-IS view.

isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Filter routes redistributed from other routing protocols or IS-IS processes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **export** [*protocol process-id*]

   By default, IPv6 IS-IS route filtering is not configured.

Configuring IS-IS route leaking

About this task

Perform this task to control route advertisement (route leaking) between Level-1 and Level-2.

You can configure IS-IS to advertise routes from Level-2 to Level-1, and to not advertise routes from Level-1 to Level-2.

Configuring IPv4 IS-IS route leaking

1. Enter system view.

   system-view

2. Enter IS-IS IPv4 unicast address family view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

   address-family ipv4 [**unicast**]

3. Configure route leaking from Level-1 to Level-2.

   import-route isis level-1 into level-2 [**filter-policy** { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } | **tag** *tag*] *

   By default, IS-IS advertises routes from Level-1 to Level-2.

4. Configure route leaking from Level-2 to Level-1.

   import-route isis level-2 into level-1 [**filter-policy** { *ipv4-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } | **tag** *tag*] *

   By default, IS-IS does not advertise routes from Level-2 to Level-1.

Configuring IPv6 IS-IS route leaking

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Configure route leaking from Level-2 to Level-1.

   import-route isisv6 level-2 into level-1 [**filter-policy** { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } | **tag** *tag*] *

   By default, IS-IS does not advertise routes from Level-2 to Level-1.

5. Configure route leaking from Level-1 to Level-2.

import-route isisv6 level-1 into level-2 [**filter-policy** { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } | **tag** *tag*] *

By default, IS-IS advertises routes from Level-1 to Level-2.

Advertising IS-IS link state information to BGP

About this task

After the device advertises IS-IS link state information to BGP, BGP can advertise the information for intended applications. For more information about BGP LS, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Advertise IS-IS link state information to BGP.
   distribute bgp-ls [**instance-id** *id*] [**level-1** | **level-2**]
   By default, the device does not advertise IS-IS link state information to BGP.

Configuring IS-IS timers

Specifying the interval for sending IS-IS hello packets

About this task

If a neighbor does not receive any hello packets from the router within the advertised hold time, it considers the router down and recalculates the routes. The hold time is the hello multiplier multiplied by the hello interval.

Restrictions and guidelines

The interval between hello packets sent by the DIS is 1/3 the hello interval set with the **isis timer hello** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the interval for sending hello packets.
   isis timer hello *seconds* [**level-1** | **level-2**]
   The default setting is 10 seconds.

Specifying the interval for sending IS-IS CSNP packets

About this task

On a broadcast network, perform this task on the DIS that uses CSNP packets to synchronize LSDBs.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the interval for sending CSNP packets on the DIS of a broadcast network.
   isis timer csnp *seconds* [**level-1** | **level-2**]
   The default setting is 10 seconds.

Setting the maximum age of LSPs

About this task

Each LSP has an age that decreases in the LSDB. Any LSP with an age of 0 is deleted from the LSDB. You can adjust the age value based on the scale of a network.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set the maximum LSP age.
   timer lsp-max-age *seconds*
   The default setting is 1200 seconds.

Setting the LSP refresh interval and generation interval

About this task

Each router needs to refresh its LSPs at a configurable interval and send them to other routers to prevent valid routes from aging out. A smaller refresh interval speeds up network convergence but consumes more bandwidth.

When network topology changes such as neighbor state, interface metric, system ID, or area ID changes occur, the router generates an LSP after a configurable interval. If such a change occurs frequently, excessive LSPs are generated, consuming a large amount of router resources and bandwidth. To solve the problem, you can adjust the LSP generation interval.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure the **timer lsp-generation** command:

- If you specify only the *maximum-interval* argument, the LSP generation interval is *maximum-interval*.
- If you do not specify the *incremental-interval* argument, the LSP generation interval is in the range of *minimum-interval* to *maximum-interval*.
- If you specify the *incremental-interval* argument, the LSP generation interval is as follows:
  - When network changes are not frequent, the *minimum-interval* is adopted.

- If network changes are frequent, the LSP generation interval increases by *incremental-interval* × 2^{n-2} (n is the number of calculation times) each time a generation occurs until the *maximum-interval* is reached.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set the LSP refresh interval.
   timer lsp-refresh *seconds*
   By default, the LSP refresh interval is 900 seconds.
4. Set the LSP generation interval.
   timer lsp-generation *maximum-interval* [*minimum-interval* [*incremental-interval*]] [**level-1** | **level-2**]
   By default:
   - The maximum interval is 5 seconds.
   - The minimum interval is 50 milliseconds.
   - The incremental interval is 200 milliseconds.

Setting LSP sending intervals

About this task

If a change occurs in the LSDB, IS-IS advertises the changed LSP to neighbors. You can specify the minimum interval for sending these LSPs to control the amount of LSPs on the network.

On a P2P link, IS-IS requires an advertised LSP be acknowledged. If no acknowledgment is received within a configurable interval, IS-IS will retransmit the LSP.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the minimum interval for sending LSPs and the maximum LSP number that can be sent at a time.
   isis timer lsp *time* [**count** *count*]
   By default, the minimum interval is 33 milliseconds, and the maximum LSP number that can be sent at a time is 5.
4. Specify the LSP retransmission interval on a P2P link.
   isis timer retransmit *seconds*
   By default, the LSP retransmission interval on a P2P link is 5 seconds.

Setting the SPF calculation interval

About this task

Based on the LSDB, an IS-IS router uses the SPF algorithm to calculate the shortest path tree with itself being the root, and uses the shortest path tree to determine the next hop to a destination

network. By adjusting the SPF calculation interval, you can prevent bandwidth and router resources from being over consumed due to frequent topology changes.

When network changes are not frequent, the *minimum-interval* is adopted. If network changes become frequent, the SPF calculation interval increases by *incremental-interval* × 2^{n-2} (n is the number of calculation times) each time a calculation occurs until the *maximum-interval* is reached.

Setting the IPv4 SPF calculation interval

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set the SPF calculation interval.
   timer spf *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default:
   - The maximum interval is 5 seconds.
   - The minimum interval is 50 milliseconds.
   - The incremental interval is 200 milliseconds.

Setting the IPv6 SPF calculation interval

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enter IPv6 address family view.
   address-family ipv6 [**unicast**]
4. Set the SPF calculation interval.
   timer spf *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default:
   - The maximum interval is 5 seconds.
   - The minimum interval is 50 milliseconds.
   - The incremental interval is 200 milliseconds.

Configuring IS-IS packet-related features

Configuring a DIS priority for an interface

About this task

On a broadcast network, IS-IS must elect a router as the DIS at a routing level. You can specify a DIS priority at a level for an interface. The greater the interface's priority, the more likely it becomes the DIS. If multiple routers in the broadcast network have the same highest DIS priority, the router with the highest MAC address becomes the DIS.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a DIS priority for the interface.
   isis dis-priority *priority* [**level-1** | **level-2**]
   The default setting is 64.

Configuring the tag value for an interface

About this task

Perform this task when the link cost style is **wide**, **wide-compatible**, or **compatible**.

When IS-IS advertises a prefix with a tag value, IS-IS adds the tag to the IP reachability information TLV of the prefix.

Configuring the IPv4 IS-IS tag value for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the IPv4 IS-IS tag value for the interface.
   isis tag *tag*
   By default, the IPv4 IS-IS tag value of the interface is not configured.

Configuring the IPv6 IS-IS tag value for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the IPv6 IS-IS tag value for the interface.
   isis ipv6 tag *tag*
   By default, the IPv6 IS-IS tag value of the interface is not configured.
   When IS-IS advertises an IPv6 prefix with a tag value, it adds the tag to the IPv6 reachability information TLV, regardless of the link cost style.

Specifying the IS-IS hello multiplier

About this task

The hello multiplier is the number of hello packets a neighbor must miss before it declares that the router is down.

If a neighbor receives no hello packets from the router within the advertised hold time, it considers the router down and recalculates the routes. The hold time is the hello multiplier multiplied by the hello interval.

On a broadcast link, Level-1 and Level-2 hello packets are advertised separately. You must set a hello multiplier for each level.

On a P2P link, Level-1 and Level-2 hello packets are advertised in P2P hello packets. You do not need to specify Level-1 or Level-2.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify the hello multiplier.
   isis timer holding-multiplier *value* [**level-1** | **level-2**]
   The default setting is 3.

Disabling an interface from sending/receiving IS-IS packets

About this task

After being disabled from sending and receiving hello packets, an interface cannot form any neighbor relationship, but can advertise directly connected networks in LSPs through other interfaces. This can save bandwidth and CPU resources, and ensures that other routers know networks directly connected to the interface.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Disable the interface from sending and receiving IS-IS packets.
   isis silent
   By default, the interface can send and receive IS-IS packets.

Enabling an interface to send small hello packets

About this task

IS-IS messages cannot be fragmented at the IP layer because they are directly encapsulated in frames. Any two IS-IS neighboring routers must negotiate a common MTU. To avoid sending big hellos to save bandwidth, enable the interface to send small hello packets without CLVs.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the interface to send small hello packets without CLVs.
   isis small-hello
   By default, the interface sends standard hello packets.

Setting LSP lengths

About this task

IS-IS messages cannot be fragmented at the IP layer because they are directly encapsulated in frames. IS-IS routers in an area must send LSPs smaller than the smallest interface MTU in the area.

If the IS-IS routers have different interface MTUs, configure the maximum size of generated LSP packets to be smaller than the smallest interface MTU in the area. Without the configuration, the routers must dynamically adjust the LSP packet size to fit the smallest interface MTU, which takes time and affects other services.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify the maximum length of generated Level-1 LSPs or Level-2 LSPs.
   lsp-length originate *size* [**level-1** | **level-2**]
   By default, the maximum length of generated Level-1 LSPs or Level-2 LSPs is 1497 bytes.
4. Specify the maximum length of received LSPs.
   lsp-length receive *size*
   By default, the maximum length of received LSPs is 1497 bytes.

Enabling LSP flash flooding

About this task

Changed LSPs can trigger SPF recalculation. To advertise the changed LSPs before the router recalculates routes for faster network convergence, enable LSP flash flooding.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable LSP flash flooding.
   flash-flood [**flood-count** *flooding-count* | **max-timer-interval** *flooding-interval* | [**level-1** | **level-2**]] *
   By default, LSP flash flooding is disabled.

Enabling LSP fragment extension

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable LSP fragment extension.
   lsp-fragments-extend [**level-1** | **level-1-2** | **level-2**]
   By default, LSP fragment extension is disabled.
   The MTUs of all interfaces running the IS-IS process must not be less than 512. Otherwise, LSP fragment extension does not take effect.
4. Configure a virtual system ID.
   virtual-system *virtual-system-id*
   By default, no virtual system ID is configured.

Configure a minimum of one virtual system to generate extended LSP fragments.

Configuring advanced IS-IS features

Enabling source address check for hello packets on a P2P interface

About this task

An IS-IS P2P interface can have a peer on a different network. Perform this task to configure an IS-IS P2P interface to establish neighbor relationship only with a peer on the same network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable source address check for hello packets on a P2P interface.
   isis peer-ip-check
   By default, an IS-IS P2P interface can have a peer on a different network.

Configuring convergence priorities for specific routes

About this task

A topology change causes IS-IS routing convergence. To improve convergence speed, you can assign convergence priorities to IS-IS routes. Convergence priority levels are critical, high, medium, and low. The higher the convergence priority, the faster the convergence speed.

By default, IS-IS host routes have medium convergence priority, and other IS-IS routes have low convergence priority.

Configuring convergence priorities for specific IPv4 IS-IS routes

1. Enter system view.
   system-view
2. Enter IS-IS IPv4 unicast address family view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   address-family ipv4 [**unicast**]
3. Assign convergence priorities to specific IPv4 IS-IS routes.
   - Assign a convergence priority to IPv4 IS-IS routes matching the specified prefix list.
     prefix-priority { **critical** | **high** | **medium** } { **prefix-list** *prefix-list-name* | **tag** *tag-value* }
   - Assign a convergence priority to IPv4 IS-IS routes by using a route policy.
     prefix-priority route-policy *route-policy-name*

   By default, IPv4 IS-IS routes, except IS-IS host routes, have the low convergence priority.

Configuring convergence priorities for specific IPv6 IS-IS routes

1. Enter system view.
   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Assign convergence priorities to specific IPv6 IS-IS routes.

   prefix-priority { **critical** | **high** | **medium** } { **prefix-list** *prefix-list-name* | **tag** *tag-value* }

   prefix-priority route-policy *route-policy-name*

   By default, IPv6 IS-IS routes, except IS-IS host routes, have the low convergence priority.

Setting the LSDB overload bit

About this task

By setting the overload bit in sent LSPs, a router informs other routers of failures that make it unable to select routes and forward packets.

When an IS-IS router cannot record the complete LSDB, for example, because of memory insufficiency, it will calculate wrong routes. To make troubleshooting easier, temporarily isolate the router from the IS-IS network by setting the overload bit.

Restrictions and guidelines

When both IPv4 and IPv6 topologies exist, the following rules apply to the **set-overload** command and the **multi-topology** command:

- If the **set-overload** command is executed in IS-IS view and the **multi-topology** command is not executed, the **set-overload** command takes effect on both IPv4 IS-IS and IPv6 IS-IS.
- If the following conditions exist, the **set-overload** command does not take effect on IPv6 IS-IS after it is executed in IS-IS IPv6 unicast address family view:
  - The **set-overload** command is not executed in IS-IS view.
  - The **multi-topology** command is not executed.
- If the **set-overload** command is executed in IS-IS view and the **multi-topology** command is executed, the **set-overload** command takes effect only on IPv4 IS-IS. To have the **set-overload** command take effect on IPv6 IS-IS, you must execute it in IS-IS IPv6 unicast address family view.

Setting the LSDB overload bit for IPv4 IS-IS

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set the overload bit.

   set-overload [**on-startup** [[**start-from-nbr** *system-id* [*timeout1* [*nbr-timeout*]]] | *timeout2* | **wait-for-bgp** [*timeout3*]]] [**allow** { **external** | **interlevel** } *]

   By default, the overload bit is not set.

Setting the LSDB overload bit for IPv6 IS-IS

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Specify an IS-IS cost style.

   cost-style { **compatible** | **wide** | **wide-compatible** }

   By default, IS-IS only transmits and receives packets using the **narrow** cost style.

4. Enter IPv6 address family view.

   address-family ipv6 [**unicast**]

5. Enable IPv6 IS-IS MTR.

   multi-topology [**compatible**]

   By default, IPv6 IS-IS MTR is disabled.

6. Set the overload bit.

   set-overload [**on-startup** [[**start-from-nbr** *system-id* [*timeout1* [*nbr-timeout*]]] | *timeout2* | **wait-for-bgp4+** [*timeout3*]]] [**allow** { **external** | **interlevel** } *]

   By default, the overload bit is not set.

Configuring IS-IS isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. IS-IS isolation works as follows:

1. After IS-IS isolation is enabled for a device, IS-IS sets the overload bit in the LSPs advertised by the device and sets the link cost to the maximum value.
2. Each neighbor of the device reselects an optimal route based on the LSPs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable IS-IS isolation on the device to gracefully add it back to the network by resetting its overload bit and restoring its link cost to the original.

Procedure

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configure IS-IS isolation to gracefully remove the device from the network.

   a. Enable IS-IS isolation.

      isolate enable

   b. Disable IS-IS isolation to gracefully add the device to the network.

      undo isolate enable

   By default, IS-IS isolation is disabled.

Configuring the ATT bit

About this task

The ATT bit is used to identify the connection status between a Level-1 area and other areas. By default, a Level-1-2 router sets the ATT bit for Level-1 LSPs as follows:

- The Level-1-2 router sets the ATT bit in Level-1 LSPs to inform the Level-1 devices that it can reach other areas. After a Level-1 device receives a Level-1 LSP with the ATT bit set, it generates a default route destined for the Level-1-2 router.
- The Level-1-2 router does not set the ATT bit in Level-1 LSPs if it can reach only one area.

To edit the default ATT bit setting rule for a Level-1-2 router, perform the following tasks as needed:

- To enable ATT bit setting for all Level-1 LSPs, execute the **`set-att always`** command on the Level-1-2 router.
- To disable a Level-1 router from generating a default route upon receiving an ATT-bit-set Level-1 LSP from the Level-1-2 router, you can perform one of the following tasks:
  - Execute the **`ignore-att`** command on the Level-1 router.
  - Execute the **`set-att never`** command on the Level-1-2 router.

Configuring IS-IS not to calculate the default route through the ATT bit

1. Enter system view.

   `system-view`
2. Enter IS-IS view.

   `isis` [*`process-id`*] [**`vpn-instance`** *`vpn-instance-name`*]
3. Configure IS-IS not to calculate the default route through the ATT bit.

   `ignore-att`

   By default, IS-IS uses the ATT bit to calculate the default route.

Setting the IPv4 ATT bit of Level-1 LSPs

1. Enter system view.

   `system-view`
2. Enter IS-IS view.

   `isis` [*`process-id`*] [**`vpn-instance`** *`vpn-instance-name`*]
3. Set the IPv4 ATT bit of Level-1 LSPs.

   `set-att` { **`always`** | **`never`** }

   By default, the Level-1-2 router sets the ATT bit for IPv4 Level-1 LSPs in accordance with the default ATT bit setting rule.

Setting the IPv6 ATT bit of Level-1 LSPs

1. Enter system view.

   `system-view`
2. Enter IS-IS view.

   `isis` [*`process-id`*] [**`vpn-instance`** *`vpn-instance-name`*]
3. Enter IPv6 address family view.

   `address-family ipv6` [**`unicast`**]
4. Set the IPv6 ATT bit of Level-1 LSPs.

   `set-att` { **`always`** | **`never`** }

   By default, the Level-1-2 router sets the ATT bit for IPv6 Level-1 LSPs in accordance with the default ATT bit setting rule.

Configuring system ID to host name mappings

About this task

A 6-byte system ID in hexadecimal notation uniquely identifies a router or host in an IS-IS network. To make a system ID easy to read, the system allows you to use host names to identify devices. It also provides mappings between system IDs and host names.

The mappings can be configured manually or dynamically.

- **Static system ID to host name mapping**—You must manually configure a mapping for each router in the network. When a new router is added to the network or a mapping must be modified, you must configure all routers manually.
- **Dynamic system ID to host name mapping**—You only need to configure a host name for each router in the network. Each router advertises the host name in a dynamic host name CLV to other routers so all routers in the network can have all mappings. To help check the origin of LSPs in the LSDB, you can configure a name for the DIS in a broadcast network.

Restrictions and guidelines

Follow these guidelines when you configure the mappings:

- To view host names rather than system IDs by using the **display isis lsdb** command, you must enable dynamic system ID to host name mapping.
- If you configure both dynamic mapping and static mapping on a router, the host name specified for dynamic mapping applies.

Configuring a static system ID to host name mapping

1. Enter system view.

   system-view
2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Configure a system ID to host name mapping for a remote IS.

   is-name map *sys-id map-sys-name*

   By default, no system ID to host name mapping is configured for a remote IS.

   A system ID can correspond to only one host name.

Configuring dynamic system ID to host name mapping

1. Enter system view.

   system-view
2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Specify a host name for the IS and enable dynamic system ID to host name mapping.

   is-name *sys-name*

   By default, dynamic system ID to host name mapping is disabled and no host name is specified for the router.
4. Return to system view.

   quit
5. Enter interface view.

   interface *interface-type interface-number*
6. Configure a DIS name.

   isis dis-name *symbolic-name*

   By default, no DIS name is configured.

This command takes effect only on a router enabled with dynamic system ID to host name mapping.

This command is not available on P2P interfaces.

Configuring IS-IS logging and SNMP notifications

Enabling the logging of neighbor state changes

About this task

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes the logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable the logging of neighbor state changes.
   log-peer-change
   By default, the logging of neighbor state changes is enabled.

Setting the maximum number of log entries that can be recorded

About this task

Perform this task to set the maximum number of log entries that IS-IS can record for each log type.

Procedure

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set the maximum number of log entries that IS-IS can record.
   event-log { **hello** { **peer-change** | **received-abnormal** | **received-dropped** | **sent-abnormal** | **sent-failed** } | **peer** } **size** *count*
   By default, IS-IS can record 100 log entries for each log type.

Setting the maximum number of IS-IS neighbor relationship troubleshooting entries

1. Enter system view.
   system-view
2. Set the maximum number of IS-IS neighbor relationship troubleshooting entries.
   isis troubleshooting max-number *number*

By default, IS-IS can record a maximum of 100 neighbor relationship troubleshooting entries.

Configuring IS-IS network management

About this task

This task includes the following configurations:

- Bind an IS-IS process to MIB so that you can use network management software to manage the specified IS-IS process.
- Enable IS-IS notifications to report important events.

To report critical IS-IS events to an NMS, enable SNMP notifications for IS-IS. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an IS-IS process.

   isis mib-binding *process-id*

   By default, MIB is bound to the IS-IS process with the smallest process ID.

3. Enable IS-IS notification sending.

   snmp-agent trap enable isis [**adjacency-state-change** | **area-mismatch** | **authentication** | **authentication-type** | **buffsize-mismatch** | **id-length-mismatch** | **lsdboverload-state-change** | **lsp-corrupt** | **lsp-parse-error** | **lsp-size-exceeded** | **manual-address-drop** | **max-seq-exceeded** | **maxarea-mismatch** | **own-lsp-purge** | **protocol-support** | **rejected-adjacency** | **skip-sequence-number** | **version-skew**] *

   By default, IS-IS notification sending is enabled.

4. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

5. Configure the context name for the SNMP object for managing IS-IS.

   snmp context-name *context-name*

   By default, no context name is set for the SNMP object for managing IS-IS.

Configuring IS-IS fast convergence

Enabling ISPF

About this task

When the network topology changes, Incremental Shortest Path First (ISPF) computes only the affected part of the SPT, instead of the entire SPT.

Enabling IPv4 IS-IS ISPF

1. Enter system view.

   system-view

2. Enter IS-IS view.

isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable IPv4 IS-IS ISPF.

   ispf enable

   By default, IPv4 IS-IS ISPF is enabled.

Enabling IPv6 IS-IS ISPF

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enter IPv6 address family view.

   address-family ipv6 [**unicast**]

4. Enable IPv6 IS-IS ISPF.

   ispf enable

   By default, IPv6 IS-IS ISPF is enabled.

Enabling prefix suppression

About this task

Perform this task to disable an interface from advertising its prefix in LSPs. This enhances network security by preventing IP routing to the interval nodes and speeds up network convergence.

Enabling IPv4 IS-IS prefix suppression

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable IPv4 IS-IS prefix suppression on the interface.

   isis prefix-suppression

   By default, IPv4 IS-IS prefix suppression is disabled on the interface.

   This command is also applicable to the secondary IP address of the interface.

Enabling IPv6 IS-IS prefix suppression

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable IPv6 IS-IS prefix suppression on the interface.

   isis ipv6 prefix-suppression

   By default, IPv6 IS-IS prefix suppression is disabled on the interface.

Configuring IS-IS PIC

About this task

Prefix Independent Convergence (PIC) enables the device to speed up network convergence by ignoring the number of prefixes.

Restrictions and guidelines for IS-IS PIC

Follow these restrictions and guidelines when you configure IS-IS PIC:

- When both IS-IS PIC and IS-IS FRR are configured, IS-IS FRR takes effect.
- IS-IS PIC applies only to LSPs sent by neighbors.

Enabling IS-IS PIC

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable PIC for IS-IS.
   pic [**additional-path-always**]
   By default, IS-IS PIC is enabled.

Enabling BFD control packet mode for IS-IS PIC

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for IS-IS PIC.
   isis primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for IS-IS PIC.
   To use BFD (control packet mode) to detect primary link failures, you must enable BFD control packet mode on both ends of the link.

Enabling BFD echo packet mode for IS-IS PIC

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interface's IP address.
   For more information, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for IS-IS PIC.
   isis primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for IS-IS PIC.
   To use BFD (echo packet mode) to detect primary link failures, you only need to enable BFD echo packet mode on one end of the link.

Enhancing IS-IS network security

To enhance the security of an IS-IS network, you can configure IS-IS authentication. IS-IS authentication involves neighbor relationship authentication, area authentication, and routing domain authentication.

Configuring neighbor relationship authentication

About this task

With neighbor relationship authentication configured, an interface adds the key in the specified mode into hello packets to the peer and checks the key in the received hello packets. If the authentication succeeds, it forms the neighbor relationship with the peer.

The authentication mode and key at both ends must be identical.

To prevent packet exchange failure in case of an authentication key change, configure the interface not to check the authentication information in the received packets.

Restrictions and guidelines

The authentication mode and key at both ends must be identical.

The keychain authentication mode supports only the HMAC-MD5 algorithm.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify the authentication mode and key.

   isis [**process-id** *process-id*] **authentication-mode** { { **gca** *key-id* { **hmac-sha-1** | **hmac-sha-224** | **hmac-sha-256** | **hmac-sha-384** | **hmac-sha-512** } [**nonstandard**] | **md5** | **simple** } { **cipher** | **plain** } *string* | **keychain** *keychain-name* } [**level-1** | **level-2**] [**ip** | **osi**]

   By default, the authentication mode and key are not configured.

4. (Optional.) Configure the interface not to check the authentication information in the received hello packets.

   isis authentication send-only [**level-1** | **level-2**]

   When the authentication mode and key are configured, the interface checks the authentication information in the received packets by default.

Configuring area authentication

About this task

Area authentication prevents the router from installing routing information from untrusted routers into the Level-1 LSDB. The router encapsulates the authentication key in the specified mode in Level-1 packets (LSP, CSNP, and PSNP). It also checks the key in received Level-1 packets.

To prevent packet exchange failure in case of an authentication key change, configure IS-IS not to check the authentication information in the received packets.

Restrictions and guidelines

Routers in an area must have the same authentication mode and key.

The keychain authentication mode supports only the HMAC-MD5 algorithm.

Procedure

1. Enter system view.

   system-view

2. Enter IS-IS view.

isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Specify the area authentication mode and key.

   area-authentication-mode { { **gca** *key-id* { **hmac-sha-1** | **hmac-sha-224** | **hmac-sha-256** | **hmac-sha-384** | **hmac-sha-512** } [**nonstandard**] | **md5** | **simple** } { **cipher** | **plain** } *string* | **keychain** *keychain-name* } [**ip** | **osi**]

   By default, the area authentication mode and key are not configured.

4. (Optional.) Configure the interface not to check the authentication information in the received Level-1 packets, including LSPs, CSNPs, and PSNPs.

   area-authentication send-only

   When the authentication mode and key are configured, the interface checks the authentication information in the received packets by default.

Configuring routing domain authentication

About this task

Routing domain authentication prevents untrusted routing information from entering into a routing domain. A router with the authentication configured encapsulates the key in the specified mode into Level-2 packets (LSP, CSNP, and PSNP) and check the key in received Level-2 packets.

To prevent packet exchange failure in case of an authentication key change, configure IS-IS not to check the authentication information in the received packets.

Restrictions and guidelines

Routers in the backbone must have the same authentication mode and key.

The keychain authentication mode supports only the HMAC-MD5 algorithm.

Procedure

1. Enter system view.

   system-view

2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Specify the routing domain authentication mode and key.

   domain-authentication-mode { { **gca** *key-id* { **hmac-sha-1** | **hmac-sha-224** | **hmac-sha-256** | **hmac-sha-384** | **hmac-sha-512** } [**nonstandard**] | **md5** | **simple** } { **cipher** | **plain** } *string* | **keychain** *keychain-name* } [**ip** | **osi**]

   By default, the routing domain authentication mode and key are not configured.

4. (Optional.) Configure the interface not to check the authentication information in the received Level-2 packets, including LSPs, CSNPs, and PSNPs.

   domain-authentication send-only

   When the authentication mode and key are configured, the interface checks the authentication information in the received packets by default.

Configuring IS-IS GR

About this task

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process.

- **GR restarter**—Graceful restarting router. It must have GR capability.

- **GR helper**—A neighbor of the GR restarter. It assists the GR restarter to complete the GR process. By default, the device acts as the GR helper.

Configure IS-IS GR on the GR restarter.

GR restarter uses the following timers:

- **T1 timer**—Specifies the times that GR restarter can send a Restart TLV with the RR bit set. When rebooted, the GR restarter sends a Restart TLV with the RR bit set to its neighbor. If the GR restarter receives a Restart TLV with the RA set from its neighbor before the T1 timer expires, the GR process starts. Otherwise, the GR process fails.
- **T2 timer**—Specifies the LSDB synchronization interval. Each LSDB has a T2 timer. The Level-1-2 router has a Level-1 timer and a Level-2 timer. If the LSDBs have not synchronized before the two timers expire, the GR process fails.
- **T3 timer**—Specifies the GR interval. The GR interval is set as the holdtime in hello PDUs. Within the interval, the neighbors maintain their adjacency with the GR restarter. If the GR process has not completed within the holdtime, the neighbors tear down the neighbor relationship and the GR process fails.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure IS-IS GR timers:

- The product of the T1 timer and the number of times that the T1 timer can expire must be smaller than the T2 timer.
- The T2 timer must be smaller than the T3 timer.
- IS-IS GR and IS-IS NSR are mutually exclusive. Do not configure them at the same time.

Procedure

1. Enter system view.

   system-view

2. Enable IS-IS and enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable IS-IS GR.

   graceful-restart

   By default, the GR capability for IS-IS is disabled.

4. (Optional.) Suppress the SA bit during restart.

   graceful-restart suppress-sa

   By default, the SA bit is not suppressed.

   By enabling the GR restarter to suppress the Suppress-Advertisement (SA) bit in the hello PDUs, the neighbors will still advertise their adjacency with the GR restarter.

5. (Optional.) Configure the T1 timer.

   graceful-restart t1 *seconds* **count** *count*

   By default, the T1 timer is 3 seconds and can expire 10 times.

6. (Optional.) Configure the T2 timer.

   graceful-restart t2 *seconds*

   By default, the T2 timer is 60 seconds.

7. (Optional.) Configure the T3 timer.

   graceful-restart t3 *seconds*

   By default, the T2 timer is 300 seconds.

Configuring IS-IS NSR

About this task

After an active/standby switchover, the GR restarter obtains routing information from its neighbors, and the IS-IS process must learn all the routes. If the network topology changes during the switchover, removed routes cannot be updated to the device, which can result in blackhole routes.

Nonstop Routing (NSR) solves the problem by backing up IS-IS link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without requiring the cooperation of other devices.

Choose IS-IS NSR or IS-IS GR according to the actual situation and make sure data forwarding is not interrupted. The differences between IS-IS NSR and IS-IS GR as follows:

- **Device requirements**—The active and standby processes of IS-IS must run on different IRF member devices. To run IS-IS NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run IS-IS GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run IS-IS GR when the IRF fabric contains only one member device. (Centralized IRF devices.)
- **IS-IS neighbor requirements**—When you use IS-IS NSR, IS-IS neighbors cannot detect process restart or active/standby switchover on the local device. IS-IS NSR can recover IS-IS route information without requiring the cooperation of IS-IS neighbors. IS-IS GR requires IS-IS neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

IS-IS NSR and IS-IS GR are mutually exclusive. Do not configure them at the same time.

Procedure

1. Enter system view.

   system-view
2. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable IS-IS NSR.

   non-stop-routing

   By default, IS-IS NSR is disabled.

   IS-IS NSR takes effect on a per-process basis. As a best practice, enable NSR for each IS-IS process.

Configuring BFD for IS-IS

About this task

BFD provides a single mechanism to quickly detect and monitor the connectivity of links between IS-IS neighbors, reducing network convergence time. For more information about BFD, see *High Availability Configuration Guide*.

Configuring BFD for IPv4 IS-IS

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable BFD on an IPv4 IS-IS interface.

isis bfd enable

By default, an IPv4 IS-IS interface is not enabled with BFD.

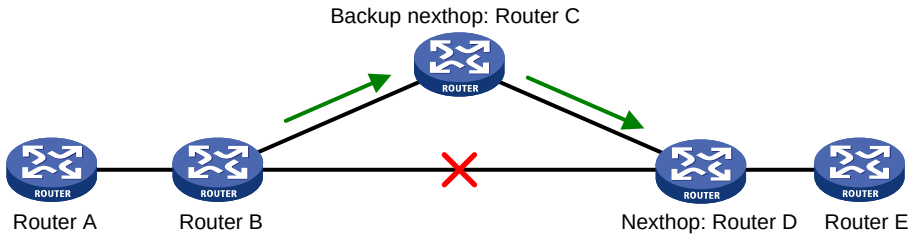
Configuring BFD for IPv6 IS-IS

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD on an IPv6 IS-IS interface.
   isis ipv6 bfd enable
   By default, an IPv6 IS-IS interface is not enabled with BFD.

Configuring IS-IS FRR

About IS-IS FRR

IS-IS Fast Reroute (FRR) calculates a backup path based on the LSDB and saves the backup path information to the FIB. When the primary path fails, the system immediately switches traffic to the backup path to prevent traffic loss and reduce the route convergence time.



IS-IS supports Loop Free Alternate (LFA) FRR.

Configuring IS-IS LFA FRR

About IS-IS LFA FRR

A link or router failure on a path can cause packet loss. IS-IS LFA FRR enables fast rerouting to minimize the failover time.

Figure 8 Network diagram for IS-IS LFA FRR

In Figure 8, after you enable LFA FRR on Router B, IS-IS automatically calculates or designates a backup next hop when a link failure is detected. In this way, packets are directed to the backup next hop to reduce traffic recovery time. Meanwhile, IS-IS calculates the shortest path based on the new network topology, and forwards packets over the path after network convergence.

You can assign a backup next hop for IS-IS FRR through the following ways:

- Enable IS-IS LFA FRR to calculate a backup next hop through LFA calculation.
- Designate a backup next hop with a routing policy for routes matching specific criteria.

Configuring IPv4 IS-IS LFA FRR to calculate a backup next hop through LFA calculation

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. (Optional.) Disable LFA calculation on the interface.
   isis fast-reroute lfa-backup exclude [**level-1** | **level-2**]
   By default, the interface participates in LFA calculation, and can be elected as a backup interface.
4. Return to system view.
   quit
5. Enter IS-IS IPv4 unicast address family view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   address-family ipv4 [**unicast**]
6. Enable IS-IS LFA FRR to calculate a backup next hop through LFA calculation.
   fast-reroute lfa [**ecmp-shared** | **level-1** | **level-2**]
   By default, IS-IS LFA FRR is disabled.

Configuring IPv4 IS-IS LFA FRR using a routing policy

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA calculation on the interface.
   isis fast-reroute lfa-backup exclude [**level-1** | **level-2**]
   By default, the interface participates in LFA calculation, and can be elected as a backup interface.
4. Return to system view.
   quit
5. Enter IS-IS IPv4 unicast address family view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
   address-family ipv4 [**unicast**]
6. Enable IPv4 IS-IS LFA FRR using a routing policy.
   - Create a routing policy and specify a backup next hop.
     apply fast-reroute backup-interface
     For more information about the **apply fast-reroute backup-interface** command and routing policy, see *Layer 3—IP Routing Configuration Guide*.
   - Configure IPv4 IS-IS LFA FRR.
     fast-reroute route-policy *route-policy-name*

   By default, IPv4 IS-IS LFA FRR is disabled.

Enabling BFD control packet mode for IPv4 IS-IS LFA FRR

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for IPv4 IS-IS FRR.
   isis primary-path-detect bfd ctrl
   By default, BFD control packet mode is disabled for IPv4 IS-IS FRR.

To use BFD (control packet mode) to detect primary link failures, you must enable BFD control packet mode on both ends of the link.

Enabling BFD echo packet mode for IPv4 IS-IS LFA FRR

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ip *ip-address*
   By default, the source IP address of BFD echo packets is not configured.
   The source IP address cannot be on the same network segment as any local interface's IP address.
   For more information, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for IPv4 IS-IS LFA FRR.
   isis primary-path-detect bfd echo
   By default, BFD echo packet mode is disabled for IPv4 IS-IS LFA FRR.
   To use BFD (echo packet mode) to detect primary link failures, you only need to enable BFD echo packet mode on one end of the link.

Configuring IPv6 IS-IS LFA FRR to calculate a backup next hop through LFA calculation

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA calculation on the interface.
   isis ipv6 fast-reroute lfa-backup exclude [**level-1** | **level-2**]
   By default, the interface participates in LFA calculation, and can be elected as a backup interface.
4. Return to system view.
   quit
5. Enter IS-IS view.
   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]
6. Enter IS-IS IPv6 address family view.
   address-family ipv6 [**unicast**]
7. Enable IPv6 IS-IS LFA FRR to calculate a backup next hop through LFA calculation.
   fast-reroute lfa [**level-1** | **level-2**]
   By default, IPv6 IS-IS LFA FRR is disabled.

Configuring IPv6 IS-IS LFA FRR using a routing policy

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA calculation on the interface.
   isis ipv6 fast-reroute lfa-backup exclude [**level-1** | **level-2**]

By default, the interface participates in LFA calculation, and can be elected as a backup interface.

4. Return to system view.

   quit

5. Enter IS-IS view.

   isis [*process-id*] [**vpn-instance** *vpn-instance-name*]

6. Enter IS-IS IPv6 address family view.

   address-family ipv6 [**unicast**]

7. Enable IPv6 IS-IS LFA FRR using a routing policy.

   - Create a routing policy and specify a backup next hop.

     apply ipv6 fast-reroute backup-interface

     For more information about the **apply ipv6 fast-reroute backup-interface** command and routing policy, see *Layer 3—IP Routing Configuration Guide*.

   - Configure IPv6 IS-IS LFA FRR.

     fast-reroute route-policy *route-policy-name*

   By default, IPv6 IS-IS LFA FRR is disabled.

Enabling BFD control packet mode for IPv6 IS-IS LFA FRR

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD control packet mode for IPv6 IS-IS LFA FRR.

   isis ipv6 primary-path-detect bfd ctrl

   By default, BFD control packet mode is disabled for IPv6 IS-IS LFA FRR.

   To use BFD (control packet mode) to detect primary link failures, you must enable BFD control packet mode on both ends of the link.

Enabling BFD echo packet mode for IPv6 IS-IS LFA FRR

1. Enter system view.

   system-view

2. Configure the source IPv6 address of BFD echo packets.

   bfd echo-source-ipv6 *ip-address*

   By default, the source IPv6 address of BFD echo packets is not configured.

   The source IPv6 address cannot be on the same network segment as any local interface's IPv6 address.

   For more information, see *High Availability Command Reference*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD echo packet mode for IPv6 IS-IS LFA FRR.

   isis ipv6 primary-path-detect bfd echo

   By default, BFD echo packet mode is disabled for IPv6 IS-IS LFA FRR.

   To use BFD (echo packet mode) to detect primary link failures, you only need to enable BFD echo packet mode on one end of the link.

Display and maintenance commands for IS-IS

Execute **display** commands in any view and the **reset** command in user view.

Displaying and maintaining IPv4 IS-IS

Task	Command
Display IS-IS process information.	**display isis** [*process-id*]
Display IS-IS GR log information.	**display isis event-log graceful-restart slot** *slot-number*
Display IS-IS log information about received or sent hello packets.	**display isis event-log hello** { **peer-change** | **received-abnormal** | **received-dropped** | **sent-abnormal** | **sent-failed** } [*process-id*]
Display IS-IS LSP log information.	**display isis event-log lsp** { **purged** | **refreshed** } [**level-1** | **level-2**] [*process-id*]
Display IS-IS NSR log information.	**display isis event-log non-stop-routing slot** *slot-number*
Display neighbor state change log information.	**display isis event-log peer** [*process-id*]
Display IPv4 IS-IS route calculation log information.	**display isis event-log spf** [**ipv4**] [[**level-1** | **level-2**] | **verbose**] * [*process-id*]
Display the IS-IS GR status.	**display isis graceful-restart status** [**level-1** | **level-2**] [*process-id*]
Display IS-IS interface information.	**display isis interface** [[*interface-type interface-number*] [**verbose**] | **statistics**] [*process-id*]
Display information about hello packets sent by an interface.	**display isis interface** [*interface-type interface-number*] **hello-sent** [*process-id*]
Display IS-IS LSDB information.	**display isis lsdb** [[**level-1** | **level-2**] | **local** | **lsp-id** *lspid* | [**lsp-name** *lspname*] | **verbose**] * [*process-id*]

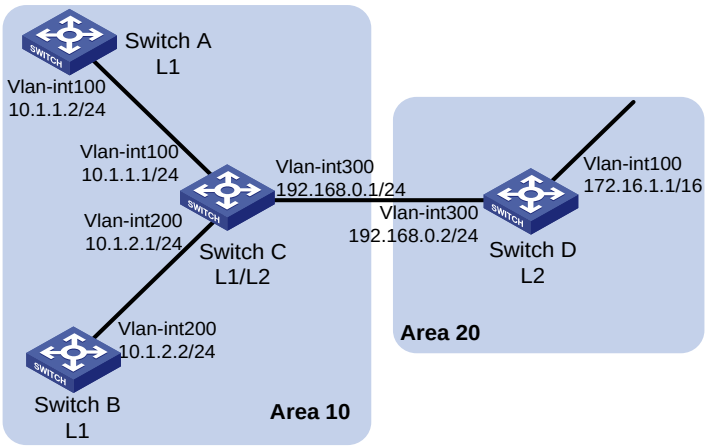
IS-IS configuration examples



Example: Configuring basic IS-IS

Network configuration

As shown in Figure 9, Switch A, Switch B, Switch C, and Switch D reside in an IS-IS AS.

Switch A and B are Level-1 switches, Switch D is a Level-2 switch, and Switch C is a Level-1-2 switch. Switch A, Switch B, and Switch C are in Area 10, and Switch D is in Area 20.

Figure 9 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure IS-IS:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] is-level level-1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] isis enable 1
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] is-level level-1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable 1
[SwitchB-Vlan-interface200] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] isis enable 1
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable 1
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 300
```

```
[SwitchC-Vlan-interface300] isis enable 1
[SwitchC-Vlan-interface300] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] isis 1
[SwitchD-isis-1] is-level level-2
[SwitchD-isis-1] network-entity 20.0000.0000.0004.00
[SwitchD-isis-1] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] isis enable 1
[SwitchD-Vlan-interface100] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] isis enable 1
[SwitchD-Vlan-interface300] quit
```

Verifying the configuration

Display the IS-IS LSDB on each switch to verify the LSPs.

```
[SwitchA] display isis lsdb

                      Database information for IS-IS(1)

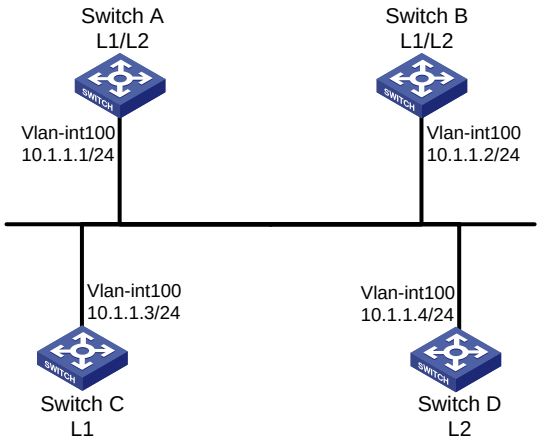
 10.1.1.0/24          20         NULL    Vlan300         192.168.0.1     R/-/-
 10.1.2.0/24          20         NULL    Vlan300         192.168.0.1     R/-/-
 172.16.0.0/16        10         NULL    Vlan100         Direct          D/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that the routing table of Level-1 switches contains a default route with the next hop as the Level-1-2 switch. The routing table of Level-2 switch contains both routing information of Level-1 and Level-2.



Example: Configuring DIS election

Network configuration

As shown in Figure 10, Switches A, B, C, and D reside in IS-IS area 10 on a broadcast network (Ethernet). Switch A and Switch B are Level-1-2 switches, Switch C is a Level-1 switch, and Switch D is a Level-2 switch.

Change the DIS priority of Switch A to make it elected as the Level-1-2 DIS router.

Figure 10 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Enable IS-IS:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] isis 1
   [SwitchA-isis-1] network-entity 10.0000.0000.0001.00
   [SwitchA-isis-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] isis enable 1
   [SwitchA-Vlan-interface100] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   ```

```
[SwitchB] isis 1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] isis enable 1
[SwitchB-Vlan-interface100] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] is-level level-1
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] isis enable 1
[SwitchC-Vlan-interface100] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] isis 1
[SwitchD-isis-1] network-entity 10.0000.0000.0004.00
[SwitchD-isis-1] is-level level-2
[SwitchD-isis-1] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] isis enable 1
[SwitchD-Vlan-interface100] quit
```

Display information about IS-IS neighbors on Switch A.

```
[SwitchA] display isis peer

```

Example: Configuring IS-IS route redistribution

Network configuration

As shown in Figure 11, Switch A, Switch B, Switch C, and Switch D reside in the same AS. They use IS-IS to interconnect. Switch A and Switch B are Level-1 routers, Switch D is a Level-2 router, and Switch C is a Level-1-2 router.

Redistribute RIP routes into IS-IS on Switch D.

Figure 11 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic IS-IS:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] is-level level-1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] isis enable 1
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] is-level level-1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
```

```
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable 1
[SwitchB-Vlan-interface200] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable 1
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] isis enable 1
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] isis enable 1
[SwitchC-Vlan-interface300] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] isis 1
[SwitchD-isis-1] is-level level-2
[SwitchD-isis-1] network-entity 20.0000.0000.0004.00
[SwitchD-isis-1] quit
[SwitchD] interface interface vlan-interface 300
[SwitchD-Vlan-interface300] isis enable 1
[SwitchD-Vlan-interface300] quit
[SwitchD] interface interface vlan-interface 400
[SwitchD-Vlan-interface400] isis enable 1
[SwitchD-Vlan-interface400] quit
```

Display IS-IS routing information on each switch.

```

--------------------------------------------------------------------------------
 192.168.0.0/24       10         NULL    VLAN300         Direct          D/L/-
 10.1.1.0/24          20         NULL    VLAN300         192.168.0.1     R/-/-
 10.1.2.0/24          20         NULL    VLAN300         192.168.0.1     R/-/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

3. Run RIPv2 between Switch D and Switch E, and configure IS-IS to redistribute RIP routes on Switch D:

Configure RIPv2 on Switch D.

```
[SwitchD] rip 1
[SwitchD-rip-1] network 10.0.0.0
[SwitchD-rip-1] version 2
[SwitchD-rip-1] undo summary
```

Configure RIPv2 on Switch E.

```
[SwitchE] rip 1
[SwitchE-rip-1] network 10.0.0.0
[SwitchE-rip-1] version 2
[SwitchE-rip-1] undo summary
```

Configure IS-IS to redistribute RIP routes on Switch D.

```
[SwitchD-rip-1] quit
[SwitchD] isis 1
[SwitchD–isis-1] address-family ipv4
[SwitchD–isis-1-ipv4] import-route rip level-2
```

Display IS-IS routing information on Switch C.

```
[SwitchC] display isis route

                      Route information for IS-IS(1)
                      ------------------------------

                      Level-1 IPv4 Forwarding Table
                      ------------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
--------------------------------------------------------------------------------
 10.1.1.0/24          10         NULL    VLAN100         Direct          D/L/-
 10.1.2.0/24          10         NULL    VLAN200         Direct          D/L/-
 192.168.0.0/24       10         NULL    VLAN300         Direct          D/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set

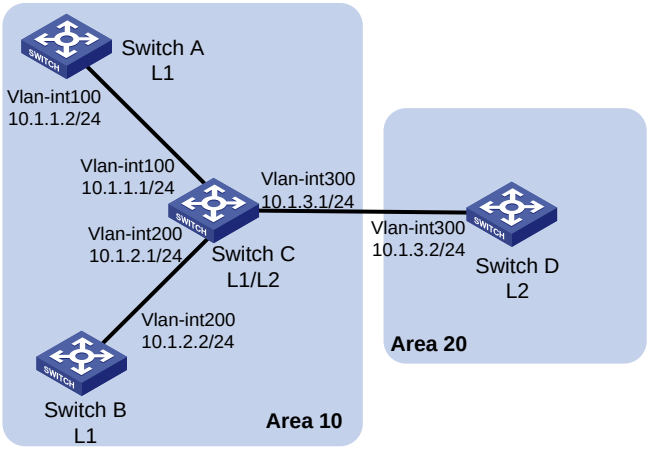
                      Level-2 IPv4 Forwarding Table
                      ------------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
--------------------------------------------------------------------------------
 10.1.1.0/24          10         NULL                                    D/L/-
 10.1.2.0/24          10         NULL                                    D/L/-
 192.168.0.0/24       10         NULL                                    D/L/-
 10.1.4.0/24          20         NULL    VLAN300         192.168.0.2     R/L/-
 10.1.5.0/24          10         0       VLAN300         192.168.0.2     R/L/-
 10.1.6.0/24          10         0       VLAN300         192.168.0.2     R/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

Example: Configuring IS-IS authentication

Network configuration



As shown in Figure 12, Switch A, Switch B, Switch C, and Switch D reside in the same IS-IS routing domain. Run IS-IS among them.

Switch A, Switch B, and Switch C belong to Area 10, and Switch D belongs to Area 20.

- Configure neighbor relationship authentication between neighbors.

- Configure area authentication in Area 10 to prevent untrusted routes from entering into the area.
- Configure routing domain authentication on Switch C and Switch D to prevent untrusted routes from entering the routing domain.

Figure 12 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic IS-IS:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] isis enable 1
[SwitchA-Vlan-interface100] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable 1
[SwitchB-Vlan-interface200] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable 1
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] isis enable 1
```

```
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] isis enable 1
[SwitchC-Vlan-interface300] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] isis 1
[SwitchD-isis-1] network-entity 20.0000.0000.0001.00
[SwitchD-isis-1] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] isis enable 1
[SwitchD-Vlan-interface300] quit
```

3. Configure neighbor relationship authentication between neighbors:

Set the authentication mode to MD5 and set the plaintext key to **eRq** on VLAN-interface 100 of Switch A and on VLAN-interface 100 of Switch C.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] isis authentication-mode md5 plain eRg
[SwitchA-Vlan-interface100] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] isis authentication-mode md5 plain eRg
[SwitchC-Vlan-interface100] quit
```

Set the authentication mode to MD5 and set the plaintext key to **t5Hr** on VLAN-interface 200 of Switch B and on VLAN-interface 200 of Switch C.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis authentication-mode md5 plain t5Hr
[SwitchB-Vlan-interface200] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis authentication-mode md5 plain t5Hr
[SwitchC-Vlan-interface200] quit
```

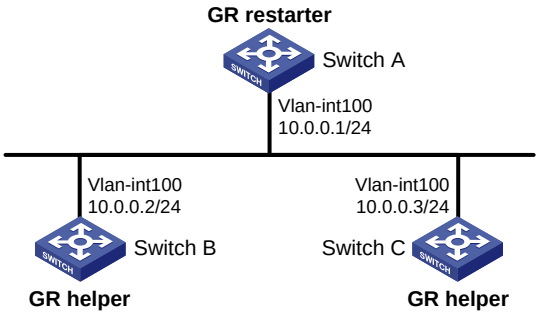
Set the authentication mode to MD5 and set the plaintext key to **hSec** on VLAN-interface 300 of Switch D and on VLAN-interface 300 of Switch C.

```
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] isis authentication-mode md5 plain hSec
[SwitchC-Vlan-interface300] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] isis authentication-mode md5 plain hSec
[SwitchD-Vlan-interface300] quit
```

4. Set the area authentication mode to MD5 and set the plaintext key to **10Sec** on Switch A, Switch B, and Switch C.

```
[SwitchA] isis 1
[SwitchA-isis-1] area-authentication-mode md5 plain 10Sec
[SwitchA-isis-1] quit
[SwitchB] isis 1
[SwitchB-isis-1] area-authentication-mode md5 plain 10Sec
[SwitchB-isis-1] quit
[SwitchC] isis 1
[SwitchC-isis-1] area-authentication-mode md5 plain 10Sec
[SwitchC-isis-1] quit
```

5. Set routing domain authentication mode to MD5 and set the plaintext key to **1020Sec** on Switch C and Switch D.



```
[SwitchC] isis 1
[SwitchC-isis-1] domain-authentication-mode md5 plain 1020Sec
[SwitchC-isis-1] quit
[SwitchD] isis 1
[SwitchD-isis-1] domain-authentication-mode md5 plain 1020Sec
```

Example: Configuring IS-IS GR

Network configuration

As shown in Figure 13, Switch A, Switch B, and Switch C belong to the same IS-IS routing domain.

Figure 13 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces. (Details not shown.)
2. Configure IS-IS on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at layer 3 and dynamic route update can be implemented among them with IS-IS. (Details not shown.)
3. Enable IS-IS GR on Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] graceful-restart
[SwitchA-isis-1] return
```

Verifying the configuration

Restart the IS-IS process on Switch A.

```
<SwitchA> reset isis all 1 graceful-restart
Reset IS-IS process? [Y/N]:y
```

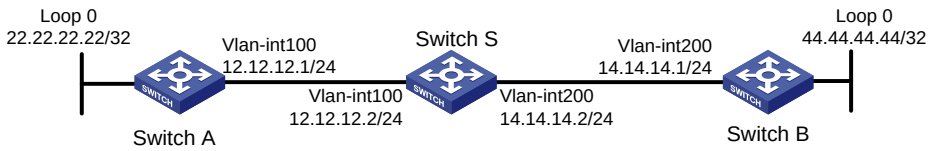
Check the GR state of the IS-IS process on Switch A.

```
<SwitchA> display isis graceful-restart status

                      Restart information for IS-IS(1)
                      --------------------------------
Restart status: COMPLETE
Restart phase: Finish
Restart t1: 3, count 10; Restart t2: 60; Restart t3: 300
SA Bit: supported
```

```
                          Level-1 restart information
                          ---------------------------
Total number of interfaces: 1
Number of waiting LSPs: 0

                          Level-2 restart information
                          ---------------------------
Total number of interfaces: 1
Number of waiting LSPs: 0
```



Example: Configuring IS-IS NSR

Network configuration

As shown in Figure 14, Switch S, Switch A, and Switch B belong to the same IS-IS routing domain.

- Run IS-IS on all the switches to interconnect them with each other.
- Enable IS-IS NSR on Switch S to ensure forwarding continuity between Switch A and Switch B when an active/standby switchover occurs on Switch S.

Figure 14 Network diagram

Procedure

1. Configure the IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure IS-IS on the switches to make sure Switch S, Switch A, and Switch B can communicate with each other at Layer 3 and dynamic route update can be implemented among them with IS-IS. (Details not shown.)
3. Enable IS-IS NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] isis 1
[SwitchS-isis-1] non-stop-routing
[SwitchS-isis-1] return
```

Verifying the configuration

Reoptimize process placement on Switch S to trigger an active/standby switchover.

```
<SwitchS> system-view
[SwitchS] placement reoptimize
Predicted changes to the placement
Service Group(instance name)                    Cur location  New location
--------------------------------------------------------------------------------
rib                                             0/0           0/0
staticroute                                     0/0           0/0
rib6                                            0/0           0/0
staticroute6                                    0/0           0/0
isis                                            0/0           1/0
```

```
Continue? [y/n]:y
Re-optimization of the placement start. You will be notified on completion.
Re-optimization of the placement complete. Use 'display placement' to view the new
placement.
```

During the switchover period, display IS-IS neighbor information on Switch A to verify the neighborship between Switch A and Switch S.

```
<SwitchA> display isis peer

                       Peer information for IS-IS(1)
                       --------------------------

 System ID: 0000.0000.0001
 Interface: Vlan100                Circuit Id: 0000.0000.0001.01
 State: Up     HoldTime:  25s      Type: L1(L1L2)     PRI: 64

 System ID: 0000.0000.0001

 22.22.22.22/32       10         NULL

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that the neighbor information and routing information on Switch A and Switch B have not changed during the active/standby switchover on Switch S. The neighbors are unaware of the switchover.

Example: Configuring BFD for IS-IS

Network configuration

- As shown in Figure 15, run IS-IS on Switch A, Switch B and Switch C so that they can reach each other at the network layer.
- After the link over which Switch A and Switch B communicate through the Layer-2 switch fails, BFD can quickly detect the failure and notify IS-IS of the failure. Switch A and Switch B then communicate through Switch C.

Figure 15 Network diagram

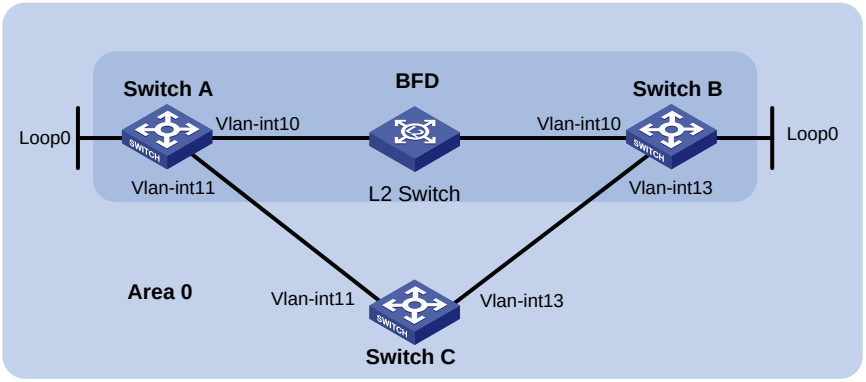

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int10	10.1.0.102/24	Switch B	Vlan-int10	10.1.0.100/24
	Vlan-int11	11.1.1.1/24		Vlan-int13	13.1.1.1/24
	Loop0	121.1.1.1/32		Loop0	120.1.1.1/32
Switch C	Vlan-int11	11.1.1.2/24			
	Vlan-int13	13.1.1.2/24			

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure basic IS-IS:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] isis enable
[SwitchA-LoopBack0] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis enable
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] isis enable
[SwitchA-Vlan-interface11] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] isis enable
[SwitchB-LoopBack0] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis enable
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] isis enable
[SwitchB-Vlan-interface13] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] isis enable
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] isis enable
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD functions:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode passive
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis bfd enable
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis bfd enable
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 8
[SwitchB-Vlan-interface10] return
```

Verifying the configuration

Display the BFD session information on Switch A.

```
<SwitchA> display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active
```

```
 IPv4 session working in control packet mode:

 LD/RD           SourceAddr      DestAddr        State    Holdtime    Interface
 3/1             192.168.0.102   192.168.0.100   Up       1700ms      Vlan10
```

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary count : 1

Destination: 120.1.1.1/32
   Protocol: IS_L1
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 10              Preference: 10
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0x2                 OrigAs: 0
      NibID: 0x26000002          LastAs: 0
     AttrID: 0xffffffff        Neighbor: 0.0.0.0
      Flags: 0x1008c        OrigNextHop: 192.168.0.100
      Label: NULL           RealNextHop: 192.168.0.100
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface10
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
   LinkCost: 0               MicroSegID: 0
```

The output shows that Switch A and Switch B communicate through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display routes destined for 120.1.1.1/32 on Switch A.

```
<SwitchA> display ip routing-table 120.1.1.1 verbose

Summary count : 1

Destination: 120.1.1.1/32
   Protocol: IS_L1
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 20              Preference: 10
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x0                OrigVrf: default-vrf
    TableID: 0x2                 OrigAs: 0
      NibID: 0x26000002          LastAs: 0
     AttrID: 0xffffffff        Neighbor: 0.0.0.0
```

```
      Flags: 0x1008c        OrigNextHop: 10.1.1.100
      Label: NULL           RealNextHop: 10.1.1.100
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface11
BkTunnel ID: Invalid       BkInterface: N/A
   FtnIndex: 0x0          TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
   LinkCost: 0               MicroSegID: 0
```

The output shows that Switch A and Switch B communicate through VLAN-interface 11.

Example: Configuring IS-IS FRR

Network configuration

As shown in Figure 16, Switch A, Switch B, and Switch C belong to the same IS-IS routing domain. Configure IS-IS FRR so that when the Link A fails, traffic can be switched to Link B immediately.

Figure 16 Network diagram

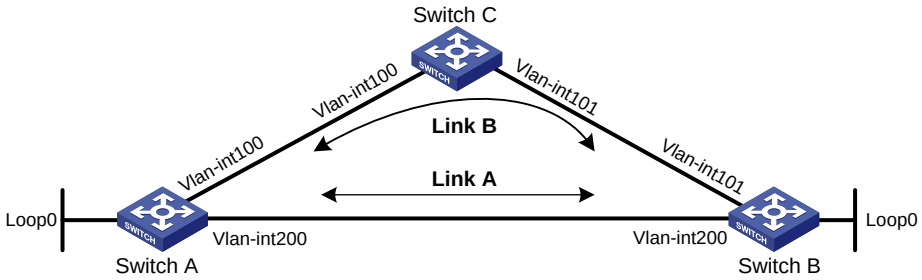

Table 5 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	12.12.12.1/24	Switch B	Vlan-int101	24.24.24.4/24
	Vlan-int200	13.13.13.1/24		Vlan-int200	13.13.13.2/24
	Loop0	1.1.1.1/32		Loop0	4.4.4.4/32
Switch C	Vlan-int100	12.12.12.2/24			
	Vlan-int101	24.24.24.2/24			

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure IS-IS on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure IS-IS FRR:

   Enable IS-IS FRR to calculate a backup next hop through LFA calculation, or designate a backup next hop by using a referenced routing policy.

   - (Method 1.) Enable IS-IS FRR to calculate a backup next hop through LFA calculation:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] isis 1
     ```

```
[SwitchA-isis-1] address-family ipv4
[SwitchA-isis-1-ipv4] fast-reroute lfa
[SwitchA-isis-1-ipv4] quit
[SwitchA-isis-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] address-family ipv4
[SwitchB-isis-1-ipv4] fast-reroute lfa
[SwitchB-isis-1-ipv4] quit
[SwitchB-isis-1] quit
```

- (Method 2.) Enable IS-IS FRR to designate a backup next hop by using a referenced routing policy:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ip prefix-list abc index 10 permit 4.4.4.4 32
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy-frr-10] if-match ip address prefix-list abc
[SwitchA-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
100 backup-nexthop 12.12.12.2
[SwitchA-route-policy-frr-10] quit
[SwitchA] isis 1
[SwitchA-isis-1] address-family ipv4
[SwitchA-isis-1-ipv4] fast-reroute route-policy frr
[SwitchA-isis-1-ipv4] quit
[SwitchA-isis-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ip prefix-list abc index 10 permit 1.1.1.1 32
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ip address prefix-list abc
[SwitchB-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
101 backup-nexthop 24.24.24.2
[SwitchB-route-policy-frr-10] quit
[SwitchB] isis 1
[SwitchB-isis-1] address-family ipv4
[SwitchB-isis-1-ipv4] fast-reroute route-policy frr
[SwitchB-isis-1-ipv4] quit
[SwitchB-isis-1] quit
```

Verifying the configuration

Display route 4.4.4.4/32 on Switch A to view the backup next hop information.

```
[SwitchA] display ip routing-table 4.4.4.4 verbose

Summary count : 1

Destination: 4.4.4.4/32
   Protocol: IS_L1
 Process ID: 1
```

```
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 10             Preference: 10
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c       OrigNextHop: 13.13.13.2
      Label: NULL          RealNextHop: 13.13.13.2
    BkLabel: NULL            BkNextHop: 12.12.12.2
    SRLabel: NULL            BkSRLabel: NULL
   SIDIndex: NULL              InLabel: NULL
  Tunnel ID: Invalid         Interface: Vlan-interface200
BkTunnel ID: Invalid       BkInterface: Vlan-interface100
   FtnIndex: 0x0          TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
   LinkCost: 0              MicroSegID: 0
```

Display route 1.1.1.1/32 on Switch B to view the backup next hop information.

```
[SwitchB] display ip routing-table 1.1.1.1 verbose

Summary count : 1

Destination: 1.1.1.1/32
   Protocol: IS_L1
 Process ID: 1
  SubProtID: 0x1                  Age: 04h20m37s
       Cost: 10             Preference: 10
      IpPre: N/A            QosLocalID: N/A

  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0x2                OrigAs: 0
      NibID: 0x26000002         LastAs: 0
     AttrID: 0xffffffff       Neighbor: 0.0.0.0
      Flags: 0x1008c       OrigNextHop: 13.13.13.1
      Label: NULL          RealNextHop: 13.13.13.1
    BkLabel: NULL            BkNextHop: 24.24.24.2
    SRLabel: NULL            BkSRLabel: NULL
   SIDIndex: NULL              InLabel: NULL
  Tunnel ID: Invalid         Interface: Vlan-interface200
BkTunnel ID: Invalid       BkInterface: Vlan-interface101
   FtnIndex: 0x0          TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
   LinkCost: 0              MicroSegID: 0
```

Example: Configuring IS-IS multi-instance processes

Network configuration

As shown in Figure 17, the IPv4 and IPv6 costs are different on an interface. Configure IS-IS multi-instance processes to isolate the IPv4 and IPv6 network and avoid IPv6 route calculation errors.

Figure 17 Network diagram

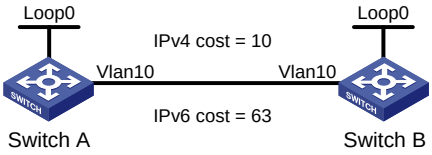

Table 6 Interface and IP address assignment

Device	Interface	IPv4 address	IPv6 address
Switch A	Vlan10	10.1.1.1/24	2001::1/64
	Loop0	1.1.1.1/32	10::1/128
Switch B	Vlan10	10.1.1.2/24	2001::2/64
	Loop0	2.2.2.2/32	20::1/128

Prerequisites

Configure IPv4 and IPv6 addresses for the interfaces. (Details not shown.)

Procedure

1. Configure traditional IPv4 IS-IS processes:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] isis enable 1
[SwitchA-LoopBack0] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis enable 1
[SwitchA-Vlan-interface10] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] isis enable 1
[SwitchB-LoopBack0] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis enable 1
[SwitchB-Vlan-interface10] quit
```

2. Configure IPv6 IS-IS multi-instance processes:

Configure Switch A.

```
[SwitchA] isis 2
[SwitchA-isis-2] network-entity 20.0000.0000.0010.00
[SwitchA-isis-2] multi-instance enable iid 1
[SwitchA-isis-2] address-family ipv6
[SwitchA-isis-2-ipv6] quit
[SwitchA-isis-2] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] isis ipv6 enable 2
[SwitchA-LoopBack0] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis ipv6 enable 2
[SwitchA-Vlan-interface10] isis process-id 2 cost 63
[SwitchA-Vlan-interface10] quit
```

Configure Switch B.

```
[SwitchB] isis 2
[SwitchB-isis-2] network-entity 20.0000.0000.0020.00
[SwitchB-isis-2] multi-instance enable iid 1
[SwitchB-isis-2] address-family ipv6
[SwitchB-isis-2-ipv6] quit
[SwitchB-isis-2] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] isis ipv6 enable 2
[SwitchB-LoopBack0] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis ipv6 enable 2
[SwitchB-Vlan-interface10] isis process-id 2 cost 63
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

View information about the IPv4 IS-IS routing table of Switch A.

```
[SwitchA] display isis route ipv4

                        Route information for IS-IS(1)
                        ------------------------------

                        Level-1 IPv4 Forwarding Table
                        -----------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
--------------------------------------------------------------------------------
 1.1.1.1/32           0          NULL    Loop0           Direct          D/L/-
 10.1.1.0/24          10         NULL    Vlan10          Direct          D/L/-
 2.2.2.2/32           10         NULL    Vlan10          10.1.1.2        R/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set

                        Level-2 IPv4 Forwarding Table
```

```
                        ----------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
-------------------------------------------------------------------------------
 1.1.1.1/32           0          NULL    Loop0           Direct          D/L/-
 10.1.1.0/24          10         NULL    Vlan10          Direct          D/L/-
 2.2.2.2/32           10         NULL

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that route calculation results are correct.

View information about the IPv4 IS-IS routing table of Switch B.

```
[SwitchB] display isis route ipv4

                        Route information for IS-IS(1)
                        ----------------------------

                        Level-1 IPv4 Forwarding Table
                        ----------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
-------------------------------------------------------------------------------
 1.1.1.1/32           10         NULL    Vlan10          10.1.1.1        R/L/-
 10.1.1.0/24          10         NULL    Vlan10          Direct          D/L/-
 2.2.2.2/32           0          NULL    Loop0           Direct          D/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set

                        Level-2 IPv4 Forwarding Table
                        ----------------------------

 IPv4 Destination     IntCost    ExtCost ExitInterface   NextHop         Flags
-------------------------------------------------------------------------------
 1.1.1.1/32           10         NULL
 10.1.1.0/24          10         NULL    Vlan10          Direct          D/L/-
 2.2.2.2/32           0          NULL    Loop0           Direct          D/L/-

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that route calculation results are correct.

View information about the IPv6 IS-IS routing table of Switch A.

```
[SwitchA] display isis route ipv6

                        Route information for IS-IS(2)
                        ----------------------------

     Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that route calculation results are correct.

View information about the IPv6 IS-IS routing table of Switch B.

```
[SwitchB] display isis route ipv6

                     Route information for IS-IS(2)
                      ------------------------------

                      Level-1 IPv6 forwarding table
                      -----------------------------

Destination : 10::1                                 PrefixLen: 128
Flag        : R/L/-                                 Cost     : 63
Next hop    : FE80::861F:29FF:FE93:101              Interface: Vlan10

Destination : 2001::                                PrefixLen: 64
Flag        : D/L/-                                 Cost     : 63
Next hop    : Direct                                Interface: Vlan10

Destination : 20::1                                 PrefixLen: 128
```

```
Flag        : D/L/-                                 Cost     : 0
Next hop    : Direct                                Interface: Loop0

     Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set

                        Level-2 IPv6 forwarding table
                        -----------------------------

Destination : 10::1                                 PrefixLen: 128
Flag        : -/-/-                                 Cost     : 63

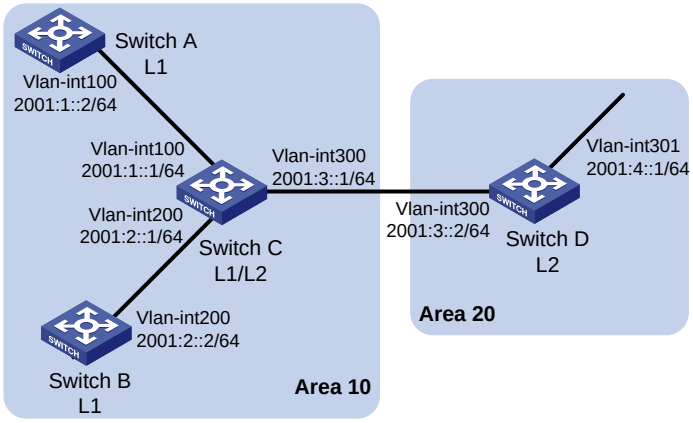
Destination : 2001::                                PrefixLen: 64
Flag        : D/L/-                                 Cost     : 63
Next hop    : Direct                                Interface: Vlan10

Destination : 20::1                                 PrefixLen: 128
Flag        : D/L/-                                 Cost     : 0
Next hop    : Direct                                Interface: Loop0

     Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

The output shows that route calculation results are correct.

IPv6 IS-IS configuration examples



Example: Configuring IPv6 IS-IS basics

Network configuration

As shown in Figure 18, Switch A, Switch B, Switch C, and Switch D, all enabled with IPv6, reside in the same AS. Configure IPv6 IS-IS on the switches so that they can reach each other.

Switch A and Switch B are Level-1 switches, Switch D is a Level-2 switch, and Switch C is a Level-1-2 switch.

Figure 18 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)

2. Configure IPv6 IS-IS:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] is-level level-1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] address-family ipv6
[SwitchA-isis-1-ipv6] quit
[SwitchA-isis-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] isis ipv6 enable 1
[SwitchA-Vlan-interface100] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] is-level level-1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] address-family ipv6
[SwitchB-isis-1-ipv6] quit
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis ipv6 enable 1
[SwitchB-Vlan-interface200] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] address-family ipv6
[SwitchC-isis-1-ipv6] quit
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] isis ipv6 enable 1
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis ipv6 enable 1
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] isis ipv6 enable 1
[SwitchC-Vlan-interface300] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] isis 1
[SwitchD-isis-1] is-level level-2
[SwitchD-isis-1] network-entity 20.0000.0000.0004.00
[SwitchD-isis-1] address-family ipv6
[SwitchD-isis-1-ipv6] quit
[SwitchD-isis-1] quit
[SwitchD] interface vlan-interface 300
```

```
[SwitchD-Vlan-interface300] isis ipv6 enable 1
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 301
[SwitchD-Vlan-interface301] isis ipv6 enable 1
[SwitchD-Vlan-interface301] quit
```

Verifying the configuration

Display the IPv6 IS-IS routing table on Switch A.

```
[SwitchA] display isis route ipv6

                      Route information for IS-IS(1)
                      ------------------------------

                      Level-1 IPv6 Forwarding Table
                      ------------------------------

 Destination : ::                                  PrefixLen: 0
 Flag        : R/-/-                               Cost     : 10

 Flag        : D/L/-                                  Cost     : 0
 Next Hop    : Direct                                 Interface: Loop1

      Flags: D-Direct, R-Added to Rib, L-Advertised in LSPs, U-Up/Down Bit Set
```

Example: Configuring BFD for IPv6 IS-IS

Network configuration

As shown in Figure 19:

- Configure IPv6 IS-IS on Switch A and Switch B so that they can reach other.
- Enable BFD on VLAN-interface 10 of Switch A and Switch B.

After the link between Switch B and the Layer 2 switch fails, BFD can quickly detect the failure and notify IPv6 IS-IS of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 19 Network diagram

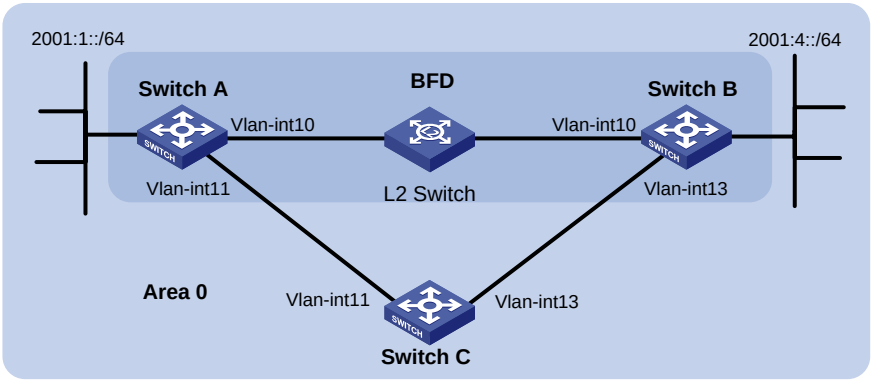

Table 7 Interface and IP address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64	Switch B	Vlan-int10	2001::2/64
	Vlan-int11	2001:2::1/64		Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64			
	Vlan-int13	2001:3::1/64			

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 IS-IS:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] isis 1
[SwitchA-isis-1] is-level level-1
[SwitchA-isis-1] network-entity 10.0000.0000.0001.00
[SwitchA-isis-1] address-family ipv6
[SwitchA-isis-1-ipv6] quit
[SwitchA-isis-1] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis ipv6 enable 1
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] isis ipv6 enable 1
[SwitchA-Vlan-interface11] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis 1
[SwitchB-isis-1] is-level level-1
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] address-family ipv6
[SwitchB-isis-1-ipv6] quit
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis ipv6 enable 1
```

```
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] isis ipv6 enable 1
[SwitchB-Vlan-interface13] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis 1
[SwitchC-isis-1] network-entity 10.0000.0000.0003.00
[SwitchC-isis-1] address-family ipv6
[SwitchC-isis-1-ipv6] quit
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] isis ipv6 enable 1
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] isis ipv6 enable 1
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD functions:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] isis ipv6 bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] return
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] isis ipv6 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
```

Verifying the configuration

Display BFD session information on Switch A.

```
<SwitchA> display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv6 session working in control packet mode:

          Local discr: 1441                      Remote discr: 1450
            Source IP: FE80::20F:FF:FE00:1202 (link-local address of Vlan-interface10 on
Switch A)
       Destination IP: FE80::20F:FF:FE00:1200 (link-local address of Vlan-interface10 on
Switch B)
        Session state: Up                           Interface: Vlan10
            Hold time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : IS_L1
NextHop    : FE80::20F:FF:FE00:1200                     Preference: 15
Interface  : Vlan10                                     Cost      : 10
```

The output shows that Switch A and Switch B communicate through VLAN-interface 10. Then the link over VLAN-interface 10 fails.

Display routes destined for 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : IS_L1
NextHop    : FE80::BAAF:67FF:FE27:DCD0                  Preference: 15
Interface  : Vlan11                                     Cost      : 20
```

The output shows that Switch A and Switch B communicate through VLAN-interface 11.

Example: Configuring IPv6 IS-IS FRR

Network configuration

As shown in Figure 20, Switch A, Switch B, and Switch C belong to the same IS-IS routing domain. Configure IPv6 IS-IS FRR so that when the Link A fails, traffic can be switched to Link B immediately.

Figure 20 Network diagram

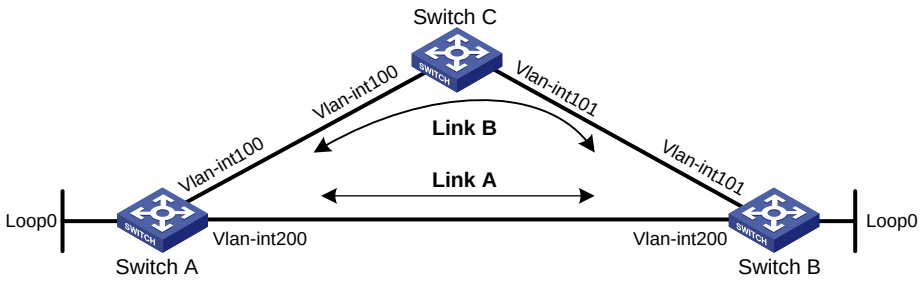

Table 8 Interface and IP address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1::1/64	Switch B	Vlan-int101	3::1/64
	Vlan-int200	2::1/64		Vlan-int200	2::2/64
	Loop0	10::1/128		Loop0	20::1/128
Switch C	Vlan-int100	1::2/64			
	Vlan-int101	3::2/64			

Procedure

1. Configure IPv6 addresses for interfaces on the switches and enable IPv6 IS-IS. (Details not shown.)

2. Configure IPv6 IS-IS on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure IPv6 IS-IS FRR:

   Enable IPv6 IS-IS FRR to calculate a backup next hop through LFA calculation, or designate a backup next hop by using a routing policy.

   - (Method 1.) Enable IPv6 IS-IS FRR to calculate a backup next hop through LFA calculation:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] isis 1
     [SwitchA-isis-1] address-family ipv6
     [SwitchA-isis-1-ipv6] fast-reroute lfa
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] isis 1
     [SwitchB-isis-1] address-family ipv6
     [SwitchB-isis-1-ipv6] fast-reroute lfa
     ```

   - (Method 2.) Enable IPv6 IS-IS FRR to designate a backup next hop by using a routing policy:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 100 backup-nexthop 1::2
     [SwitchA-route-policy-frr-10] quit
     [SwitchA] isis 1
     [SwitchA-isis-1] address-family ipv6
     [SwitchA-isis-1-ipv6] fast-reroute route-policy frr
     [SwitchA-isis-1-ipv6] quit
     [SwitchA-isis-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
     [SwitchB] route-policy frr permit node 10
     [SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 101 backup-nexthop 3::2
     [SwitchB-route-policy-frr-10] quit
     [SwitchB] isis 1
     [SwitchB-isis-1] address-family ipv6
     [SwitchB-isis-1-ipv6] fast-reroute route-policy frr
     [SwitchB-isis-1-ipv6] quit
     [SwitchB-isis-1] quit
     ```

Verifying the configuration

Display route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose
```

```
Summary count : 1

Destination: 20::1/128

BGP overview

Border Gateway Protocol (BGP) is an exterior gateway protocol (EGP). It is called internal BGP (IBGP) when it runs within an AS and called external BGP (EBGP) when it runs between ASs. The current version in use is BGP-4 (RFC 4271).

BGP characteristics

BGP has the following characteristics:

- Focuses on route control and selection rather than route discovery and calculation.
- Uses TCP to enhance reliability.
- Measures the distance of a route by using a list of ASs that the route must travel through to reach the destination. BGP is also called a path-vector protocol.
- Supports CIDR.
- Reduces bandwidth consumption by advertising only incremental updates. BGP is very suitable to advertise large numbers of routes on the Internet.
- Eliminates routing loops by adding AS path information to BGP route updates.
- Uses policies to implement flexible route filtering and selection.
- Has good scalability.

BGP speaker and BGP peer

A router running BGP is a BGP speaker. A BGP speaker establishes peer relationships with other BGP speakers to exchange routing information over TCP connections.

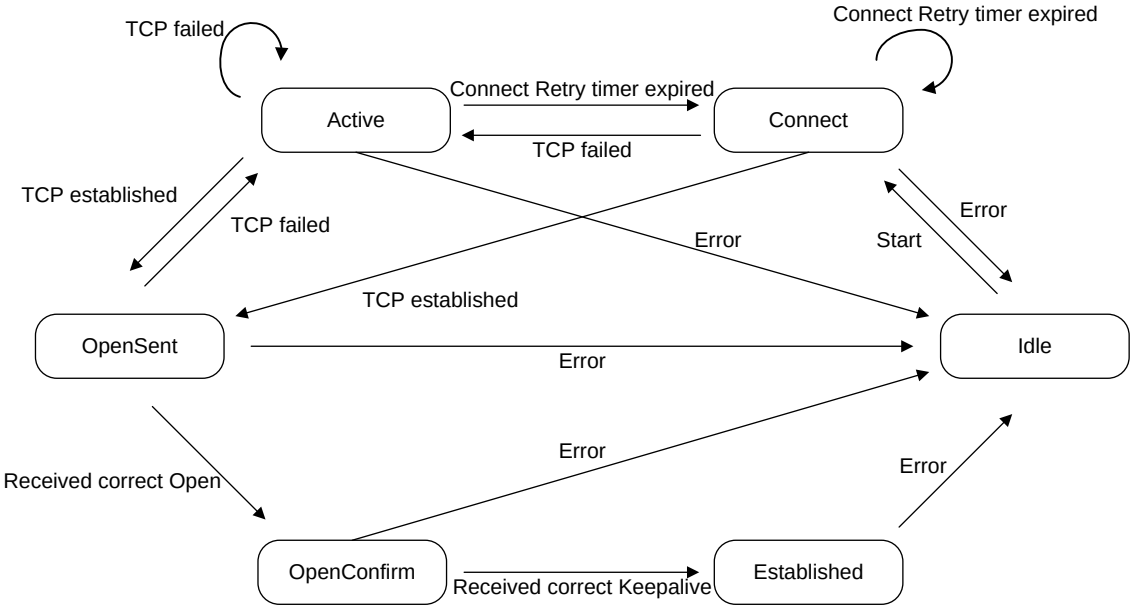
Based on the AS, a BGP peer can be either of the following types:

- **IBGP peer**—Resides in the same AS as the local router.
- **EBGP peer**—Resides in different ASs from the local router.

Based on the IP version, a BGP peer can be either of the following types:

- **IPv4 peer**—Uses an IPv4 address to establish a peer relationship with the local router.
- **IPv6 peer**—Uses an IPv6 address to establish a peer relationship with the local router.

BGP message types



BGP uses the following message types:

- **Open**—After establishing a TCP connection, BGP sends an OPEN message to establish a session to the peer.
- **Update**—BGP sends UPDATE messages to exchange routing information between peers. Each UPDATE message can advertise a group of feasible routes with identical attributes and multiple withdrawn routes.
- **Keepalive**—BGP sends KEEPALIVE messages between peers to maintain connectivity.
- **Route-refresh**—BGP sends a ROUTE-REFRESH message to request the routing information for a specific address family from a peer.
- **Notification**—BGP sends a NOTIFICATION message upon detecting an error and immediately closes the connection.

BGP finite state machine

During session establishment, the devices at the two ends transition between different BGP states, as shown in Figure 1.

Figure 1 BGP finite state machine

Idle

The idle state is the initial BGP state. In this state, BGP rejects any connection requests. Only upon receiving a Start event, the device assigns resources to BGP, and attempts to establish a TCP connection and transition to Connect state.

BGP transitions to Idle state from the remaining states upon a TCP disconnection error, packet error, connection closed due to configuration issues, and reception of a NOTIFICATION message.

Connect

In this state, BGP starts a Connect Retry timer and waits for TCP connection establishment to be completed.

- If TCP connection establishment succeeds before the Connect Retry timer expires, BGP closes the Connect Retry timer, sends an OPEN message to the peer, and transitions to OpenSent state.
- If TCP connection establishment fails before the Connect Retry timer expires, BGP transitions to Active state.
- If the Connect Retry timer expires and no connection response is received, BGP resets the Connect Retry timer, tries to establish a TCP connection with the peer again, and stays in Connect state.

Active

In this state, BGP continuously attempts to establish a TCP connection.

- If TCP connection establishment succeeds, BGP closes the Connect Retry timer, sends an OPEN message to the peer, and transitions to OpenSent state.
- If TCP connection establishment fails, BGP resets the Connect Retry timer and stays in Active state.

- If the Connect Retry timer expires, and no connection response is received, BGP resets the Connect Retry timer and transitions to Connect state.

OpenSent

In this state, BGP waits for an OPEN message from the peer, and checks the BGP version number and AS number in the OPEN message.

- If the OPEN message is correct, BGP sends a KEEPALIVE message to the peer, and transitions to OpenConfirm state.
- If the OPEN message is incorrect, BGP sends a NOTIFICATION message to the peer, and transitions to Idle state.

If the TCP connection is disconnected in this state, BGP resets the Connect Retry timer, transitions to Active state, and tries to establish a TCP connection again.

OpenConfirm

In this state, BGP waits for a KEEPALIVE or NOTIFICATION message.

- Upon receiving a KEEPALIVE message, BGP transitions to Established state.
- Upon receiving a NOTIFICATION message, BGP transitions to Idle state.

Established

In this state, BGP can exchange UPDATE, KEEPALIVE, ROUTE-REFRESH, and NOTIFICATION messages with the peer.

- Upon receiving a correct UPDATE or KEEPALIVE message, BGP stays in Established state.
- Upon receiving an incorrect UPDATE or KEEPALIVE message, BGP sends a NOTIFICATION message to the peer and transitions to Idle state.
- Upon receiving a ROUTE-REFRESH message, BGP does not change its state.
- Upon receiving a NOTIFICATION message, BGP transitions to Idle state.

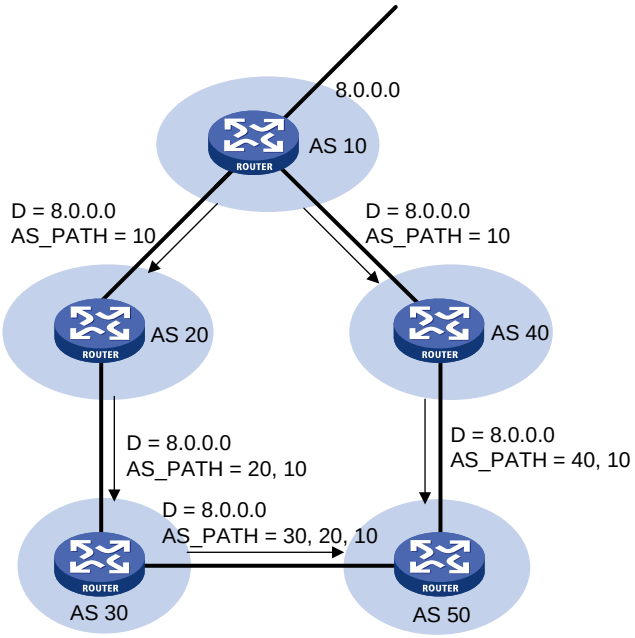
BGP path attributes

BGP uses the following path attributes in UPDATE messages for route filtering and selection:

ORIGIN

The ORIGIN attribute specifies the origin of BGP routes. This attribute has the following types:

- **IGP**—Has the highest priority. Routes generated in the local AS have the IGP attribute.
- **EGP**—Has the second highest priority. Routes obtained through EGP have the EGP attribute.
- **INCOMPLETE**—Has the lowest priority. The source of routes with this attribute is unknown. Routes redistributed from other routing protocols have the INCOMPLETE attribute.



AS_PATH

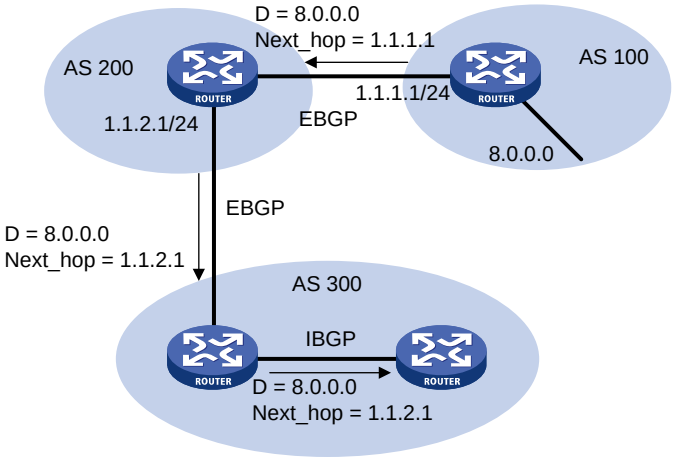
The AS_PATH attribute identifies the ASs through which a route has passed. Before advertising a route to another AS, BGP adds the local AS number into the AS_PATH attribute, so the receiver can determine ASs to route the message back.

The AS_PATH attribute has the following types:

- **AS_SEQUENCE**—Arranges AS numbers in sequence. As shown in Figure 2, the number of the AS closest to the receiver's AS is leftmost.
- **AS_SET**—Arranges AS numbers randomly.

Figure 2 AS_PATH attribute

BGP uses the AS_PATH attribute to implement the following functions:



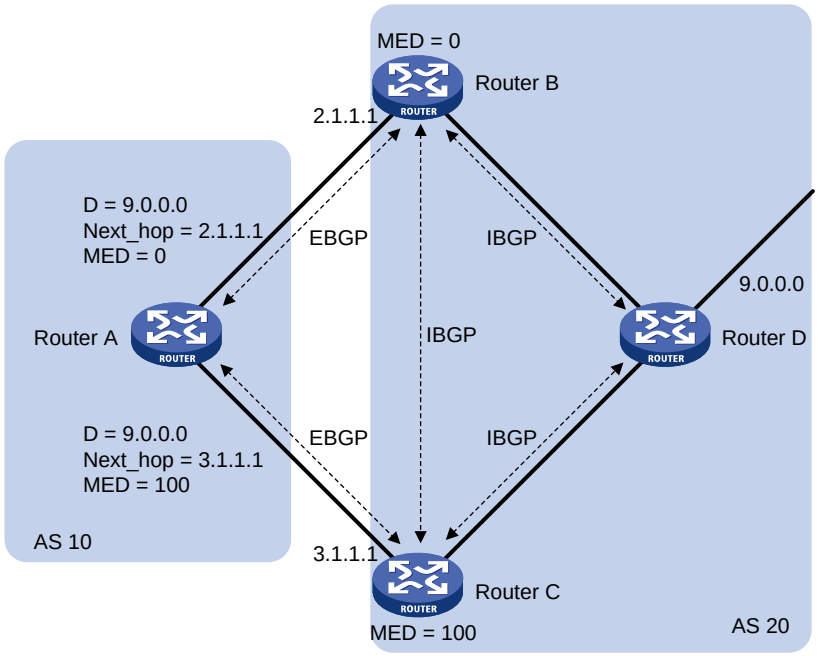
- **Avoid routing loops**—A BGP router does not receive routes containing the local AS number to avoid routing loops.
- **Affect route selection**—BGP gives priority to the route with the shortest AS_PATH length if other factors are the same. As shown in Figure 2, the BGP router in AS 50 gives priority to the route passing AS 40 for sending data to the destination 8.0.0.0. In some applications, you can apply a routing policy to control BGP route selection by modifying the AS_PATH length. For more information about routing policy, see "Configuring routing policies."
- **Filter routes**—By using an AS path list, you can filter routes based on AS numbers contained in the AS_PATH attribute. For more information about AS path list, see "Configuring routing policies."

NEXT_HOP

The NEXT_HOP attribute may not be the IP address of a directly connected router. Its value is determined as follows:

- When a BGP speaker advertises a self-originated route to a BGP peer, it sets the address of the sending interface as the NEXT_HOP.
- When a BGP speaker sends a received route to an EBGP peer, it sets the address of the sending interface as the NEXT_HOP.
- When a BGP speaker sends a route received from an EBGP peer to an IBGP peer, it does not modify the NEXT_HOP attribute. If load balancing is configured, BGP modifies the NEXT_HOP attribute for the equal-cost routes. For load balancing information, see "BGP load balancing."

Figure 3 NEXT_HOP attribute

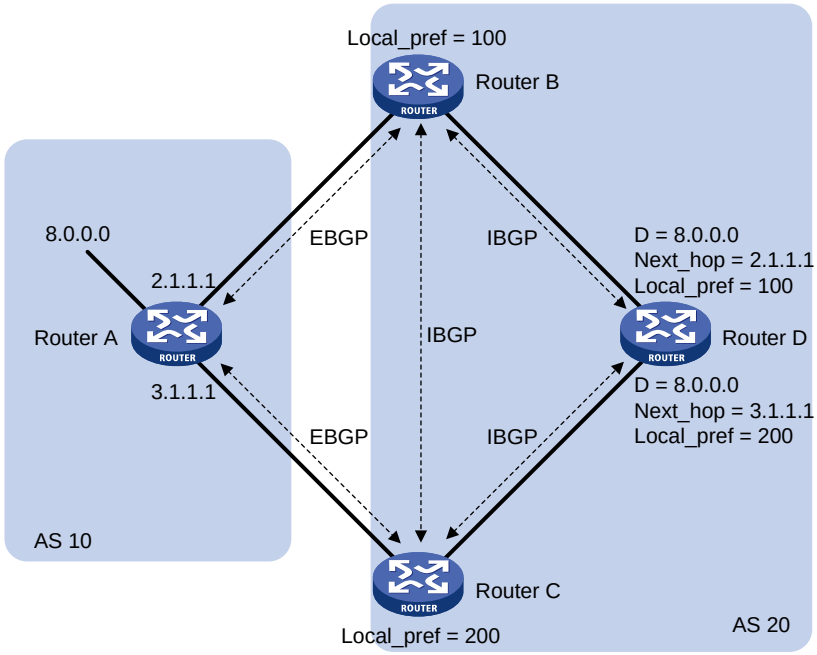


MED (MULTI_EXIT_DISC)

BGP advertises the MED attribute between two neighboring ASs, each of which does not advertise the attribute to any other AS.

Similar to metrics used by IGPs, MED is used to determine the optimal route for traffic going into an AS. When a BGP router obtains multiple routes to the same destination but with different next hops, it selects the route with the smallest MED value as the optimal route. As shown in Figure 4, traffic from AS 10 to AS 20 travels through Router B that is selected according to MED.

Figure 4 MED attribute



Generally BGP only compares MEDs of routes received from the same AS. You can also use the **`compare-different-as-med`** command to force BGP to compare MED values of routes received from different ASs.

LOCAL_PREF

The LOCAL_PREF attribute is exchanged between IBGP peers only, and is not advertised to any other AS. It indicates the priority of a BGP router.

BGP uses LOCAL_PREF to determine the optimal route for traffic leaving the local AS. When a BGP router obtains multiple routes to the same destination but with different next hops, it selects the route with the highest LOCAL_PREF value as the optimal route. As shown in Figure 5, traffic from AS 20 to AS 10 travels through Router C that is selected according to LOCAL_PREF.

Figure 5 LOCAL_PREF attribute

COMMUNITY

The COMMUNITY attribute identifies the community of BGP routes. A BGP community is a group of routes with the same characteristics. It has no geographical boundaries. Routes of different ASs can belong to the same community.

A route can carry one or more COMMUNITY attribute values (each of which is represented by a 4-byte integer). A router uses the COMMUNITY attribute to determine whether to advertise the route and the advertising scope without using complex filters such as ACLs. This mechanism simplifies routing policy configuration, management, and maintenance.

Well-known COMMUNITY attributes involve the following:

- **INTERNET**—By default, all routes belong to the Internet community. Routes with this attribute can be advertised to all BGP peers.
- **NO_EXPORT**—Routes with this attribute cannot be advertised out of the local AS or out of the local confederation, but can be advertised to other sub-ASs in the confederation. For confederation information, see "Settlements for problems in large-scale BGP networks."
- **No_ADVERTISE**—Routes with this attribute cannot be advertised to other BGP peers.
- **No_EXPORT_SUBCONFED**—Routes with this attribute cannot be advertised out of the local AS or other sub-ASs in the local confederation.

You can configure BGP community lists to filter BGP routes based on the BGP COMMUNITY attribute.

Extended community attribute

To meet new demands, BGP defines the extended community attribute. The extended community attribute has the following advantages over the COMMUNITY attribute:

- Provides more attribute values by extending the attribute length to eight bytes.

- Allows for using different types of extended community attributes in different scenarios to enhance route filtering and control and simplify configuration and management.

The device supports the route target attribute and Site of Origin (SoO) extended community attribute. For information about route target, see *MCE Configuration Guide.*

The SoO attribute specifies the site where the route originated. It prevents advertising a route back to the originating site. If the AS-path attribute is lost, the router can use the SoO attribute to avoid routing loops.

The SoO attribute has the following formats:

- *16-bit AS number:32-bit user-defined number*. For example, 100:3.
- *32-bit IP address:16-bit user-defined number*. For example, 192.168.122.15:1.
- *32-bit AS number:16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

BGP route selection

BGP discards routes with unreachable NEXT_HOPs. If multiple routes to the same destination are available, BGP selects the optimal route in the following sequence:

1. The route with the highest Preferred_value.
2. The route with the highest LOCAL_PREF.
3. The route generated by the **network** command, the route redistributed by the **import-route** command, or the summary route in turn.
4. The route with the shortest AS_PATH.
5. The IGP, EGP, or INCOMPLETE route in turn.
6. The route with the lowest MED value.
7. The route learned from EBGP, confederation EBGP, confederation IBGP, or IBGP in turn.
8. The route with the smallest IGP metric.
9. The route with the smallest recursion depth.
10. If a route received from an EBGP peer is the current optimal route, BGP does not change the optimal route when it receives routes from other EBGP peers.
11. The route advertised by the router with the smallest router ID.

    If one of the routes is advertised by a route reflector, BGP compares the ORIGINATOR_ID of the route with the router IDs of other routers. Then, BGP selects the route with the smallest ID as the optimal route.
12. The route with an IPv4 next hop.
13. The route with the shortest CLUSTER_LIST.
14. The route advertised by the peer with the lowest IP address.

The CLUSTER_IDs of route reflectors form a CLUSTER_LIST. If a route reflector receives a route that contains its own CLUSTER ID in the CLUSTER_LIST, the router discards the route to avoid routing loops.

If load balancing is configured, the system selects available routes to implement load balancing.

BGP route advertisement rules

BGP follows these rules for route advertisement:

- When multiple feasible routes to a destination exist, BGP advertises only the optimal route to its peers. If the **advertise-rib-active** command is configured, BGP advertises the optimal route in the IP routing table. If not, BGP advertises the optimal route in the BGP routing table.

- BGP advertises only routes that it uses.
- BGP advertises routes learned from an EBGP peer to all BGP peers, including both EBGP and IBGP peers.
- BGP advertises routes learned from an IBGP peer to EBGP peers, rather than other IBGP peers.
- After establishing a session to a new BGP peer, BGP advertises all the routes matching the above rules to the peer. After that, BGP advertises only incremental updates to the peer.

BGP load balancing

BGP load balancing is applicable between EBGP peers, between IBGP peers, and between confederations.

BGP implements load balancing through route recursion and route selection.

BGP load balancing through route recursion

The next hop of a BGP route might not be directly connected. One of the reasons is that the next hop information exchanged between IBGP peers is not modified. The BGP router must find the directly connected next hop through IGP. The matching route with the direct next hop is called the recursive route. The process of finding a recursive route is route recursion.

If multiple recursive routes to the same destination are load balanced, BGP generates the same number of next hops to forward packets.

BGP load balancing based on route recursion is always enabled in the system.

BGP load balancing through route selection

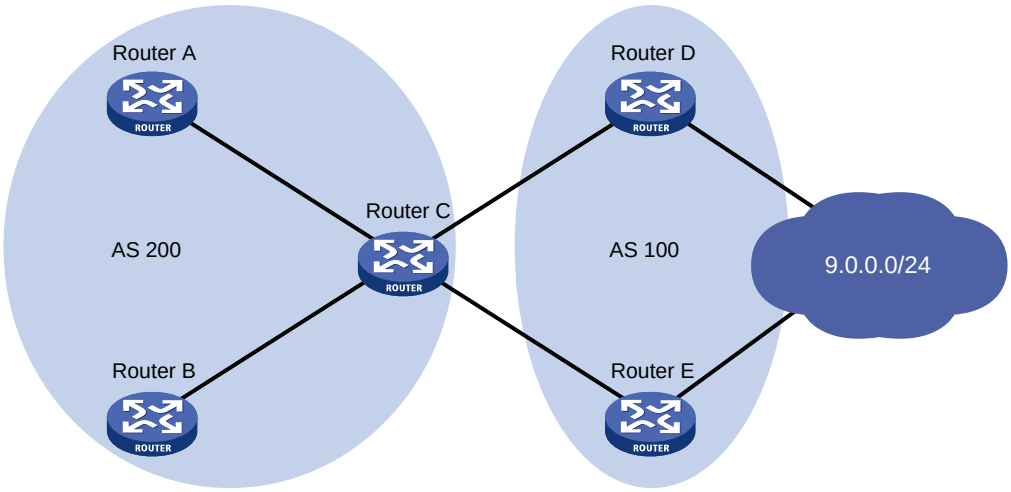
IGP routing protocols, such as RIP and OSPF, can use route metrics as criteria to load balance between routes that have the same metric. BGP cannot load balance between routes by route metrics as an IGP protocol does, because BGP does not have a route computation algorithm.

BGP uses the following load balancing criteria to determine load balanced routes:

- The routes have the same ORIGIN, LOCAL_PREF, and MED attributes.
- The routes meet the following requirements on the AS_PATH attribute:
  - If the **`balance as-path-neglect`** command is configured, the routes can have different AS_PATH attributes.
  - If only the **`balance as-path-relax`** command is configured, the routes can have different AS_PATH attributes, but the length of the AS_PATH attributes must be the same.
  - If neither the **`balance as-path-neglect`** nor the **`balance as-path-relax`** command is configured, the routes must have the same AS_PATH attribute.
- The next hops of the routes meet the following requirements on IGP metrics:
  - If the **`bestroute igp-metric-ignore`** command is not configured, the next hops of the routes must have the same IGP metric value.
  - If the **`bestroute igp-metric-ignore`** command is configured, the next hops of the routes can have different IGP metric values.

BGP does not use the route selection rules described in "BGP route selection" for load balancing.

As shown in Figure 6, Router A and Router B are IBGP peers of Router C. Router C allows a maximum number of two ECMP routes for load balancing.



Router D and Router E both advertise a route 9.0.0.0 to Router C. Router C installs the two routes to its routing table for load balancing if the routes meet the BGP load balancing criteria. After that, Router C forwards to Router A and Router B a single route whose attributes are changed as follows:

- AS_PATH attribute:

- If the **balance as-path-neglect** and **balance as-path-relax** commands are not configured, the AS_PATH attribute does not change.
- If the **balance as-path-neglect** or **balance as-path-relax** command is configured, the AS_PATH attribute is changed to the attribute of the optimal route.

- The NEXT_HOP attribute is changed to the IP address of Router C.
- Other attributes are changed to be the same as the optimal route.

Figure 6 Network diagram

Settlements for problems in large-scale BGP networks

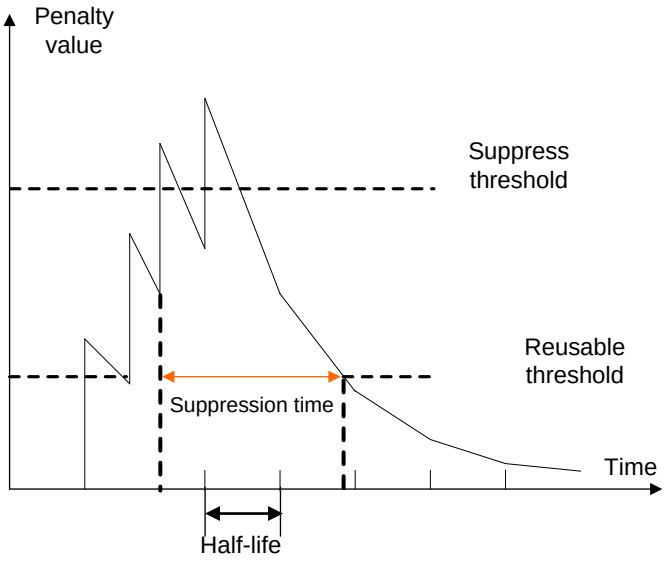
You can use the following methods to facilitate management and improve route distribution efficiency on a large-scale BGP network.

Route summarization

Route summarization can reduce the BGP routing table size by advertising summary routes rather than more specific routes.

The system supports both manual and automatic route summarization. Manual route summarization allows you to determine the attribute of a summary route and whether to advertise more specific routes.

Route dampening



Route flapping (a route comes up and disappears in the routing table frequently) causes BGP to send many routing updates. It can consume too many resources and affect other operations.

In most cases, BGP runs in complex networks where route changes are more frequent. To solve the problem caused by route flapping, you can use BGP route dampening to suppress unstable routes.

BGP route dampening uses a penalty value to judge the stability of a route. The bigger the value, the less stable the route. Each time a route state changes from reachable to unreachable, or a reachable route's attribute changes, BGP adds a penalty value of 1000 to the route. When the penalty value of the route exceeds the suppress value, the route is suppressed and cannot become the optimal route. When the penalty value reaches the upper limit, no penalty value is added.

If the suppressed route does not flap, its penalty value gradually decreases to half of the suppress value after a period of time. This period is called "Half-life." When the value decreases to the reusable threshold value, the route is usable again.

Figure 7 BGP route dampening

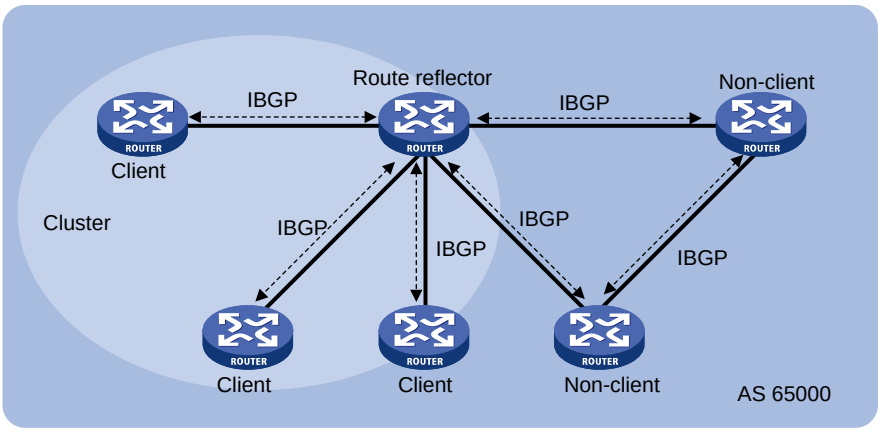
Peer group

You can organize BGP peers with the same attributes into a group to simplify their configurations.

When a peer joins the peer group, the peer obtains the same configuration as the peer group. If the configuration of the peer group is changed, the configuration of group members is changed.

Community

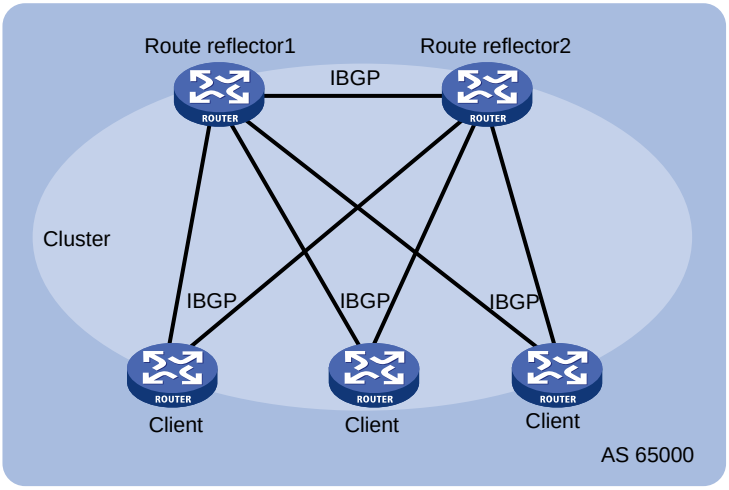
You can apply a community list or an extended community list to a routing policy for route control. For more information, see "BGP finite state machine."



Route reflector

IBGP peers must be fully meshed to maintain connectivity. If n routers exist in an AS, the number of IBGP connections is n(n-1)/2. If a large number of IBGP peers exist, large amounts of network and CPU resources are consumed to maintain sessions.

Using route reflectors can solve this issue. In an AS, a router acts as a route reflector, and other routers act as clients connecting to the route reflector. The route reflector forwards routing information received from a client to other clients. In this way, all clients can receive routing information from one another without establishing BGP sessions.

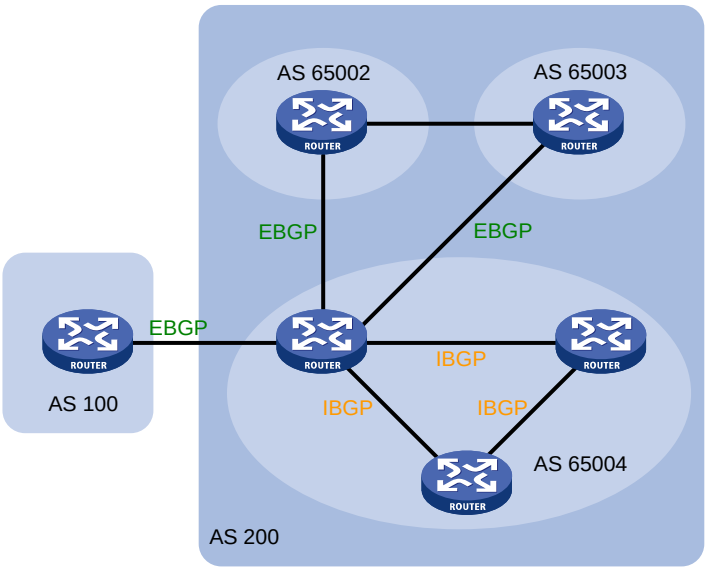


A router that is neither a route reflector nor a client is a non-client, which, as shown in Figure 8, must establish BGP sessions to the route reflector and other non-clients.

Figure 8 Network diagram for a route reflector

The route reflector and clients form a cluster. Typically a cluster has one route reflector. The ID of the route reflector is the Cluster_ID. You can configure more than one route reflector in a cluster to improve availability, as shown in Figure 9. The configured route reflectors must have the same Cluster_ID to avoid routing loops.

Figure 9 Network diagram for route reflectors



When the BGP routers in an AS are fully meshed, route reflection is unnecessary because it consumes more bandwidth resources. You can use commands to disable route reflection instead of modifying network configuration or changing network topology.

After route reflection is disabled between clients, routes can still be reflected between a client and a non-client.

Confederation

Confederation is another method to manage growing IBGP connections in an AS. It splits an AS into multiple sub-ASs. In each sub-AS, IBGP peers are fully meshed. As shown in Figure 10, intra-confederation EBGP connections are established between sub-ASs in AS 200.

Figure 10 Confederation network diagram

A non-confederation BGP speaker does not need to know sub-ASs in the confederation. To the BGP speaker, the confederation is one AS and the confederation ID is the AS number. In the above figure, AS 200 is the confederation ID.

Confederation has a deficiency. When you change an AS into a confederation, you must reconfigure the routers, and the topology will be changed.

In large-scale BGP networks, you can use both route reflector and confederation.

MP-BGP

Supported address families

BGP-4 can only advertise IPv4 unicast routing information. Multiprotocol Extensions for BGP-4 (MP-BGP) can advertise routing information for the following address families:

- IPv6 unicast address family.

MP-BGP extended attributes

Prefixes and next hops are key routing information. BGP-4 uses UPDATE messages to carry the following information:

- Feasible route prefixes in the Network Layer Reachability Information (NLRI) field.
- Unfeasible route prefixes in the withdrawn routes field.
- Next hops in the NEXT_HOP attribute.

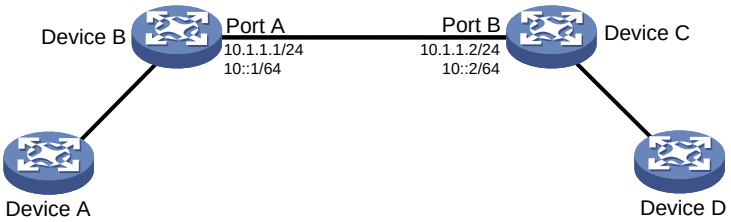
BGP-4 cannot carry routing information for multiple network layer protocols.

To support multiple network layer protocols, MP-BGP defines the following path attributes:

- **MP_REACH_NLRI**—Carries feasible route prefixes and next hops for multiple network layer protocols.
- **MP_UNREACH_NLRI**—Carries unfeasible route prefixes for multiple network layer protocols.

MP-BGP uses these two attributes to advertise feasible and unfeasible routes for different network layer protocols. BGP speakers not supporting MP-BGP ignore updates containing these attributes and do not forward them to its peers.

Address family



MP-BGP uses address families and subsequent address families to identify different network layer protocols for routes contained in the MP_REACH_NLRI and MP_UNREACH_NLRI attributes. For example, an Address Family Identifier (AFI) of 2 and a Subsequent Address Family Identifier (SAFI) of 1 identify IPv6 unicast routing information carried in the MP_REACH_NLRI attribute. For address family values, see RFC 1700.

Exchanging IPv4 and IPv6 routes in both IPv4 and IPv6 address families

MP-BGP supports IPv4 route exchange between IPv6 peers and IPv6 route exchange between IPv4 peers as follows:

- When the next hop of an IPv6 route is an IPv4 address, MP-BGP maps the IPv4 address to an IPv6 address encapsulated in the NEXT_HOP attribute of update messages. In this scenario, you must specify a routing policy to change the next hop of the IPv6 route to the IPv6 address of the peer.
- When the next hop of an IPv4 route is an IPv6 address, BGP negotiates the extended next hop encoding capability with its peer. Then, BGP encapsulates the IPv4 NLRI in the MP_REACH_NLRI attribute of update messages. In this scenario, you must specify a routing policy to change the next hop of the IPv4 route to the IPv4 address of the peer.

Figure 11 Exchanging IPv4 and IPv6 routes in both IPv4 and IPv6 address families

As shown in Figure 11, an IPv6 BGP peer relationship is established between Device A and Device B, between Device B and Device C, and between Device C and Device D. An IPv4 BGP peer relationship is established between Device A and Device B and between Device C and Device D. Device A and Device D can learn both IPv4 and IPv6 routes from each other and traffic is forwarded correctly in both IPv4 and IPv6 address families. For Device C to correctly receive IPv4 routes using the IPv6 address of Device B as the next hop, configure a routing policy on Device C. Use the routing policy to change the next hop of these routes to the IPv4 address of Device B.

BGP multi-instance

A BGP router can run multiple BGP processes. Each BGP process corresponds to a BGP instance. BGP maintains an independent routing table for each BGP instance.

BGP configuration views

BGP uses different views to manage routing information for different BGP instances, VPN instances, and address families. Most BGP commands are available in all BGP views. BGP supports multiple VPN instances by establishing a separate routing table for each VPN instance.

If a command is supported only in BGP instance view, this command takes effect for both the public instance and all VPN instances in the BGP instance.

If a command is supported both in BGP instance view and BGP-VPN instance view, this command takes effect as follows:

- In BGP instance view, this command takes effect only for the public instance in the BGP instance.

- In BGP-VPN instance view, this command takes effect only for VPN instances associated with in the BGP-VPN instance.

Table 1 describes different BGP configuration views.

Table 1 BGP configuration views

View names	Ways to enter the views	Remarks

BGP instance view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc]`
		You can create a BGP instance and enter its view by specifying the **`instance`** keyword in the **`bgp`** command.
		Configurations in this view apply to all public address families for the specified BGP instance. Some configurations (such as confederation, GR, and logging configurations) also apply to the address families of VPN instances.

BGP IPv4 unicast address family view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] address-family ipv4 unicast`
	`[Sysname-bgp-abc-ipv4]`
		Configurations in this view apply to public IPv4 unicast routes and peers of the specified BGP instance.

BGP IPv6 unicast address family view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] address-family ipv6 unicast`
	`[Sysname-bgp-abc-ipv6]`
		Configurations in this view apply to public IPv6 unicast routes and peers of the specified BGP instance.

BGP-VPN instance view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] ip vpn-instance vpn1`
	`[Sysname-bgp-abc-vpn1]`
		Configurations in this view apply to all address families in the specified VPN instance of the specified BGP instance.
		For more information about VPN instances, see *MCE Configuration Guide.*

BGP-VPN IPv4 unicast address family view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] ip vpn-instance vpn1`
	`[Sysname-bgp-abc-vpn1] address-family ipv4 unicast`
	`[Sysname-bgp-abc-ipv4-vpn1]`
		Configurations in this view apply to IPv4 unicast routes and peers in the specified VPN instance of the specified BGP instance.
		For more information about VPN instances, see *MCE Configuration Guide.*

BGP-VPN IPv6 unicast address family view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] ip vpn-instance vpn1`
	`[Sysname-bgp-abc-vpn1] address-family ipv6 unicast`
	`[Sysname-bgp-abc-ipv6-vpn1]`
		Configurations in this view apply to IPv6 unicast routes and peers in the specified VPN instance of the specified BGP instance.
		For more information about VPN instances, see *MCE Configuration Guide.*

BGP LS address family view	`<Sysname> system-view`
	`[Sysname] bgp 100 instance abc`
	`[Sysname-bgp-abc] address-family link-state`
	`[Sysname-bgp-abc-ls]`
		Configurations in this view apply to LS messages and peers of the specified BGP instance.

Building basic BGP networks

Restrictions and guidelines: BGP configuration

You can create multiple public address families for a BGP instance. However, each public address family (except for public IPv4 unicast and public IPv6 unicast address families) can belong to only one BGP instance.

You can create multiple VPN instances for a BGP instance, and each VPN instance can have multiple address families. A VPN instance can belong to only one BGP instance.

On the public network, a peer address can establish a session to only one BGP instance. Multiple BGP instances cannot synchronously establish sessions to the same peer address.

Different BGP instances can have the same AS number but cannot have the same name.

Basic BGP network configuration tasks at a glance (IPv4 unicast)

To build basic BGP networks for the IPv4 unicast address family, perform the following tasks:

1. Configuring basic BGP
   a. Enabling BGP
   b. Configuring a BGP peer
   c. Configuring dynamic BGP peers
   d. Configuring an IBGP peer group

      Configure BGP peer groups on large-scale BGP networks for easy configuration and maintenance.
   e. Configuring an EBGP peer group

      Configure BGP peer groups on large-scale BGP networks for easy configuration and maintenance.
   f. (Optional.) Specifying the source address of TCP connections
2. Controlling BGP route generation

   Choose the following tasks as needed:
   - Injecting a local network
   - Redistributing IGP routes
   - (Optional.) Configuring BGP route summarization
   - (Optional.) Advertising a default route to a peer or peer group
3. (Optional.) Controlling BGP route advertisement
   - Advertising optimal routes in the IP routing table
   - Enabling prioritized withdrawal of the default route
   - Enabling prioritized withdrawal of specific routes
   - Configuring BGP route distribution filtering policies
   - Setting the BGP route sending rate

     This task applies only to IPv4 unicast routes.
   - Configuring BGP to delay sending route updates on reboot
   - Configuring the interval for sending updates for the same route

- Configuring BGP route advertisement delay
- Configuring a startup policy for BGP route updates

4. (Optional.) Controlling BGP route reception
   - Limiting routes received from a peer or peer group
   - Configuring BGP route reception filtering policies
   - Configuring the SoO attribute
5. (Optional.) Configuring BGP timers
   - Configuring the keepalive interval and hold time
   - Setting the session retry timer
6. (Optional.) Configuring BGP logging and notifications
   - Enabling logging for session state changes
   - Enabling logging for BGP route flapping
   - Configuring BGP network management

Basic BGP network configuration tasks at a glance (IPv6 unicast)

To build basic BGP networks for the IPv6 unicast address family, perform the following tasks:

1. Configuring basic BGP
   a. Enabling BGP
   b. Configuring a BGP peer
   c. Configuring dynamic BGP peers
   d. Configuring an IBGP peer group

      Configure BGP peer groups on large-scale BGP networks for easy configuration and maintenance.

   e. Configuring an EBGP peer group

      Configure BGP peer groups on large-scale BGP networks for easy configuration and maintenance.

   f. (Optional.) Specifying the source address of TCP connections
2. Controlling BGP route generation

   Choose the following tasks as needed:
   - Injecting a local network
   - Redistributing IGP routes
   - (Optional.) Configuring BGP route summarization
   - (Optional.) Advertising a default route to a peer or peer group
3. (Optional.) Controlling BGP route advertisement
   - Advertising optimal routes in the IP routing table
   - Enabling prioritized withdrawal of the default route
   - Enabling prioritized withdrawal of specific routes
   - Configuring BGP route distribution filtering policies
   - Setting the BGP route sending rate

     This task applies only to IPv6 unicast routes.
   - Configuring BGP to delay sending route updates on reboot
   - Configuring the interval for sending updates for the same route

- Configuring BGP route advertisement delay
- Configuring a startup policy for BGP route updates

4. (Optional.) Controlling BGP route reception
   - Limiting routes received from a peer or peer group
   - Configuring BGP route reception filtering policies
   - Configuring the SoO attribute
5. (Optional.) Configuring BGP timers
   - Configuring the keepalive interval and hold time
   - Setting the session retry timer
6. (Optional.) Configuring BGP logging and notifications
   - Enabling logging for session state changes
   - Enabling logging for BGP route flapping
   - Configuring BGP network management

Configuring basic BGP

Enabling BGP

Restrictions and guidelines

A router ID is the unique identifier of a BGP router in an AS.

- To ensure the uniqueness of a router ID and enhance availability, specify in BGP instance view the IP address of a local loopback interface as the router ID. Different BGP instances can have the same router ID.
- If no router ID is specified in BGP instance view, the global router ID is used.
- To modify a non-zero router ID of a BGP instance, use the **`router-id`** command in BGP instance view, rather than the **`router id`** command in system view.
- If you specify a router ID in BGP instance view and then remove the interface that owns the router ID, the router does not select a new router ID. To select a new router ID, use the **undo `router-id`** command in BGP instance view.

Procedure

1. Enter system view.

   `system-view`
2. Configure a global router ID.

   `router id` *`router-id`*

   By default, no global router ID is configured.

   If no global router ID is configured, the following rules apply:
   - If loopback interfaces configured with an IP address exist, BGP uses the highest loopback interface IP address as the router ID.
   - If no loopback interface IP address is available, BGP uses the highest physical interface IP address as the route ID regardless of the interface status.
3. Enable BGP and enter BGP instance view.

   `bgp` *`as-number`* [**`instance`** *`instance-name`*]

   By default, BGP is disabled and no BGP instances exist.
4. (Optional.) Configure a router ID for the BGP instance.

   `router-id` *`router-id`*

By default, no router ID is configured for a BGP instance, and the BGP instance uses the global router ID configured by the **router-id** command in system view.

5. (Optional.) Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

   The specified VPN instance must have been created and have an RD.

6. (Optional.) Configure a router ID for the BGP VPN instance.

   router-id { *router-id* | **auto-select** }

   By default, no router ID is configured for a BGP VPN instance.

   The BGP VPN instance uses the router ID configured in BGP instance view. If no router ID is configured in BGP instance view, the BGP VPN instance uses the global router ID configured in system view.

Configuring a BGP peer

Restrictions and guidelines

You can configure BGP peers for the local device by using one of the following methods:

- Specify a BGP peer by its global unicast address.
- Specify a BGP peer by its link-local address. A BGP peer at an IPv6 link-local address must be directly connected to the local router. If you do not specify the interface connected to the peer, you must specify the interface directly connected to the BGP peer as the source interface of TCP connections on the local router.
- Specify a local interface and establish peer relationships with link-local addresses that the interface learned in ND entries.

To exchange IPv4 routes with an IPv6 peer or exchange IPv6 routes with an IPv4 peer, you must configure a routing policy to perform the following tasks:

- Change the next hop of IPv4 routes received from the IPv6 peer to the IPv4 address of the interface that connects the IPv6 peer to the local router.
- Change the next hop of IPv6 routes received from the IPv4 peer to the IPv6 address of the interface that connects the IPv4 peer to the local router.

Procedure (Exchanging IPv4 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IPv4 BGP peer and specify its AS number.

   peer *ipv4-address* **as-number** *as-number*

4. (Optional.) Configure a description for a peer.

   peer *ipv4-address* **description** *text*

   By default, no description is configured for a peer.

5. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

6. Enable the router to exchange IPv4 unicast routing information with the specified peer.

   peer *ipv4-address* **enable**

   By default, the router cannot exchange IPv4 unicast routing information with the peer.

Procedure (Exchanging IPv6 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IPv4 BGP peer and specify its AS number.

   peer *ipv4-address* **as-number** *as-number*

4. (Optional.) Configure a description for the IPv4 peer.

   peer *ipv4-address* **description** *text*

   By default, no description is configured for an IPv4 peer.

5. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

6. Enable BGP to exchange IPv6 unicast routing information with the IPv4 peer.

   peer *ipv4-address* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with an IPv4 peer.

7. Use a routing policy to modify the next hop of routes received from the IPv4 peer.

   peer *ipv4-address* **route-policy** *route-policy-name* **import**

Procedure (Exchanging IPv6 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IPv6 BGP peer and specify its AS number.

   peer { *ipv6-address* | *link-local-address* **interface** *interface-type interface-number* } **as-number** *as-number*

4. (Optional.) Configure a description for a peer.

   peer { *ipv6-address* | *link-local-address* **interface** *interface-type interface-number* } **description** *text*

   By default, no description is configured for a peer.

5. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

6. Enable the router to exchange IPv6 unicast routing information with the specified peer.

   peer { *ipv6-address* | *link-local-address* **interface** *interface-type interface-number* } **enable**

   By default, the router cannot exchange IPv6 unicast routing information with the peer.

Procedure (Exchanging IPv6 unicast routes with IPv6 peers created by specifying an interface)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create peer relationships with link-local addresses that the specified interface learned in ND entries, and specify an AS number for the peers.

   interface-peer *interface-type interface-number* **as-number** *as-number*

4. (Optional.) Configure a description for the peers.

   interface-peer *interface-type interface-number* **description** *text*

   By default, no description is configured for a peer.

5. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

6. Enable the router to exchange IPv6 unicast routing information with the specified peers.

   interface-peer *interface-type interface-number* **enable**

   By default, the router cannot exchange IPv6 unicast routing information with a peer.

Procedure (Exchanging IPv4 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IPv6 BGP peer and specify its AS number.

   peer *ipv6-address* **as-number** *as-number*

4. (Optional.) Configure a description for the IPv6 peer.

   peer *ipv6-address* **description** *text*

   By default, no description is configured for an IPv6 peer.

5. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

6. Enable BGP to exchange IPv4 unicast routing information with the IPv6 peer.

peer *ipv6-address* **enable**

By default, BGP cannot exchange IPv4 unicast routing information with an IPv6 peer.

7. Use a routing policy to modify the next hop of routes received from the IPv6 peer.
   peer *ipv6-address* **route-policy** *route-policy-name* **import**

Procedure (Exchanging IPv4 unicast routes with IPv6 peers created by specifying an interface)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Create peer relationships with link-local addresses that the specified interface learned in ND entries, and specify an AS number for the peers.
   interface-peer *interface-type interface-number* **as-number** *as-number*
4. (Optional.) Configure a description for the IPv6 peers.
   interface-peer *interface-type interface-number* **description** *text*

   By default, no description is configured for an IPv6 peer.
5. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routing information with the specified peers.
   interface-peer *interface-type interface-number* **enable**

   By default, the router cannot exchange IPv4 unicast routing information with a peer.
7. Use a routing policy to modify the next hop of routes received from the IPv6 peer.
   interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **import**

Configuring dynamic BGP peers

About this task

This feature enables BGP to establish dynamic BGP peer relationships with devices in a network. BGP accepts connection requests from the network but it does not initiate connection requests to the network.

After a device in the network initiates a connection request, BGP establishes a dynamic peer relationship with the device.

If multiple BGP peers reside in the same network, you can use this feature to simplify BGP peer configuration.

Restrictions and guidelines

For a remote device to establish a peer relationship with the local device, you must specify the IP address of the local device on the remote device.

A BGP peer at an IPv6 link-local address must be directly connected to the local router. If you do not specify the interface connected to the peer, you must specify the interface directly connected to the BGP peer as the source interface of TCP connections on the local router.

To exchange IPv4 routes with an IPv6 peer or exchange IPv6 routes with an IPv4 peer, you must configure a routing policy to perform the following tasks:

- Change the next hop of IPv4 routes received from the IPv6 peer to the IPv4 address of the interface that connects the IPv6 peer to the local router.
- Change the next hop of IPv6 routes received from the IPv4 peer to the IPv6 address of the interface that connects the IPv4 peer to the local router.

If the local device has established a dynamic peer relationship with an IP address through network segment matching, you cannot configure that IP address as a static peer. Before you configure an IP address as a static peer, make sure that IP address is not in the network segment to which any existing dynamic peer belongs. If the IP address belongs to a predefined dynamic-peer network segment, create that network segment as a dynamic peer only after you finish configuring the IP address as a static peer. For example, if you configure network segment 10.1.1.0/24 as a dynamic peer and the local device establishes a BGP connection with 10.1.1.1, you cannot configure 10.1.1.1 as a static peer. In contrast, if you first configure 10.1.1.1 as a static peer, you can continue to configure network segment 10.1.1.0/24 as a dynamic peer.

Procedure (Exchanging IPv4 unicast routes with dynamic IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Specify devices in a network as dynamic BGP peers and specify an AS number for the peers.

   peer *ipv4-address* *mask-length* **as-number** *as-number*
4. (Optional.) Configure a description for dynamic BGP peers.

   peer *ipv4-address* *mask-length* **description** *text*

   By default, no description is configured for dynamic BGP peers.
5. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routing information with dynamic BGP peers in the specified network.

   peer *ipv4-address mask-length* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with dynamic BGP peers.

Procedure (Exchanging IPv6 unicast routes with dynamic IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

3. Specify devices in an IPv4 network as dynamic IPv4 BGP peers and specify an AS number for the peers.

   peer *ipv4-address* *mask-length* **as-number** *as-number*

4. (Optional.) Configure a description for the dynamic IPv4 peers.

   peer *ipv4-address* *mask-length* **description** *text*

   By default, no description is configured for dynamic IPv4 peers.

5. Create the BGP IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

6. Enable BGP to exchange IPv6 unicast routing information with the dynamic IPv4 peers.

   peer *ipv4-address mask-length* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with dynamic IPv4 peers.

7. Use a routing policy to modify the next hop of routes received from the dynamic IPv4 peers.

   peer *ipv4-address mask-length* **route-policy** *route-policy-name* **import**

Procedure (Exchanging IPv6 unicast routes with dynamic IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Specify devices in a network as dynamic BGP peers and specify an AS number for the peers.

   peer { *ipv6-address* *prefix-length* | *link-local-address* **interface** *interface-type interface-number* } **as-number** *as-number*

4. (Optional.) Configure a description for dynamic BGP peers.

   peer { *ipv6-address* *prefix-length* | *link-local-address* **interface** *interface-type interface-number* } **description** *text*

   By default, no description is configured for dynamic BGP peers.

5. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

6. Enable BGP to exchange IPv6 unicast routing information with dynamic BGP peers in the specified network.

   peer { *ipv6-address* *prefix-length* | *link-local-address* **interface** *interface-type interface-number* } **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with dynamic BGP peers.

Procedure (Exchanging IPv4 unicast routes with dynamic IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

bgp *as-number* [**instance** *instance-name*]

- Execute the following commands in sequence to enter BGP-VPN instance view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

3. Specify devices in an IPv6 network as dynamic IPv6 BGP peers and specify an AS number for the peers.

   peer *ipv6-address prefix-length* **as-number** *as-number*

4. (Optional.) Configure a description for the dynamic IPv6 peers.

   peer *ipv6-address prefix-length* **description** *text*

   By default, no description is configured for dynamic IPv6 peers.

5. Create the BGP IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

6. Enable BGP to exchange IPv4 unicast routing information with the dynamic IPv6 peers.

   peer *ipv6-address prefix-length* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with dynamic IPv6 peers.

7. Use a routing policy to modify the next hop of routes received from the dynamic IPv6 peers.

   peer *ipv6-address mask-length* **route-policy** *route-policy-name* **import**

Configuring an IBGP peer group

About this task

A peer group is an IBGP peer group if peers in it belong to the same AS as the local router.

After you create an IBGP peer group and then add a peer into it, the system creates the peer in BGP instance view and specifies the local AS number for the peer.

Restrictions and guidelines

A BGP peer at an IPv6 link-local address must be directly connected to the local router. If you do not specify the interface connected to the peer, you must specify the interface directly connected to the BGP peer as the source interface of TCP connections on the local router.

To exchange IPv4 routes with an IPv6 peer or exchange IPv6 routes with an IPv4 peer, you must configure a routing policy to perform the following tasks:

- Change the next hop of IPv4 routes received from the IPv6 peer to the IPv4 address of the interface that connects the IPv6 peer to the local router.
- Change the next hop of IPv6 routes received from the IPv4 peer to the IPv6 address of the interface that connects the IPv4 peer to the local router.

If you configure a BGP setting at both the peer group and the peer level, the most recent configuration takes effect on the peer.

Procedure (Exchanging IPv4 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.

   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]

   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IBGP peer group.

   group *group-name* [**internal**]

4. Add a peer into the IBGP peer group.

   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the local AS number.

5. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.

6. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

7. Enable the router to exchange IPv4 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv4 unicast routing information with the peers.

Procedure (Exchanging IPv6 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an IBGP peer group.

   group *group-name* [**internal**]

4. Add an IPv4 peer into the IBGP peer group.

   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the local AS number.

5. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.

6. Create the BGP IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

7. Enable BGP to exchange IPv6 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with peers in a peer group.

8. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Procedure (Exchanging IPv6 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Create an IBGP peer group.
   group *group-name* [**internal**]
4. Add a peer into the IBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.
     peer { *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **group** *group-name* [**as-number** *as-number*]
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.
     interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the local AS number.
5. (Optional.) Configure a description for the peer group.
   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.
6. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.
   address-family ipv6 [**unicast**]
7. Enable the router to exchange IPv6 unicast routing information with peers in the specified peer group.
   peer *group-name* **enable**

   By default, the router cannot exchange IPv6 unicast routing information with the peers.

Procedure (Exchanging IPv4 unicast routes with IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Create an IBGP peer group.
   group *group-name* [**internal**]
4. Add an IPv6 peer into the IBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.
     peer *ipv6-address* [*prefix-length*] **group** *group-name* [**as-number** *as-number*]
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

The **as-number** *as-number* option must specify the local AS number.

5. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.

6. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

7. Enable BGP to exchange IPv4 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with peers in a peer group.

8. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group

About this task

A peer group is an EBGP peer group if peers in it belong to different ASs.

If peers in an EBGP group belong to the same external AS, the EBGP peer group is a pure EBGP peer group. If not, it is a mixed EBGP peer group.

Restrictions and guidelines

Use one of the following methods to configure an EBGP peer group:

- **Method 1**—Create an EBGP peer group, specify its AS number, and add peers into it. All the added peers have the same AS number. All peers in the peer group have the same AS number as the peer group. You can specify an AS number for a peer before adding it into the peer group. The AS number must be the same as that of the peer group.
- **Method 2**—Create an EBGP peer group, specify an AS number for a peer, and add the peer into the peer group. Peers added in the group can have different AS numbers.
- **Method 3**—Create an EBGP peer group and add a peer with an AS number into it. Peers added in the group can have different AS numbers.

To exchange IPv4 routes with an IPv6 peer or exchange IPv6 routes with an IPv4 peer, you must configure a routing policy to perform the following tasks:

- Change the next hop of IPv4 routes received from the IPv6 peer to the IPv4 address of the interface that connects the IPv6 peer to the local router.
- Change the next hop of IPv6 routes received from the IPv4 peer to the IPv6 address of the interface that connects the IPv4 peer to the local router.

If you configure a BGP setting at both the peer group and the peer level, the most recent configuration takes effect on the peer.

Configuring an EBGP peer group by using Method 1 (Exchanging IPv4 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.

   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]

- Enter BGP-VPN instance view.

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Specify the AS number of the group.

   peer *group-name* **as-number** *as-number*

   By default, no AS number is specified.

   If a peer group contains peers, you cannot remove or change its AS number.

5. Add a peer into the EBGP peer group.

   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the same AS number as the **peer** *group-name* **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.

7. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

8. Enable the router to exchange IPv4 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv4 unicast routing information with the peers.

Configuring an EBGP peer group by using Method 2 (Exchanging IPv4 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.

   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]

   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Create an IPv4 BGP peer and specify its AS number.

   peer *ipv4-address* [*mask-length*] **as-number** *as-number*

5. Add the peer into the EBGP peer group.

   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the same AS number as the **peer** *ipv4-address* [*mask-length*] **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

By default, no description is configured for the peer group.

7. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

8. Enable the router to exchange IPv4 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv4 unicast routing information with the peers.

Configuring an EBGP peer group by using Method 1 (Exchanging IPv6 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Specify an AS number for the peer group.

   peer *group-name* **as-number** *as-number*

   By default, no AS number is specified for a peer group.

   If a peer group contains peers, you cannot remove or change its AS number.

5. Add an IPv4 peer into the EBGP peer group.

   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the same AS number as the **peer** *group-name* **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.

7. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

8. Enable BGP to exchange IPv6 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with peers in a peer group.

9. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group by using Method 2 (Exchanging IPv6 unicast routes with IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Create an EBGP peer group.
   group *group-name* **external**
4. Create an IPv4 BGP peer and specify its AS number.
   peer *ipv4-address* [*mask-length*] **as-number** *as-number*
5. Add the IPv4 peer into the EBGP peer group.
   peer *ipv4-address* [*mask-length*] **group** *group-name* [**as-number** *as-number*]

   The **as-number** *as-number* option must specify the same AS number as the **peer** *ipv4-address* [*mask-length*] **as-number** *as-number* command.
6. (Optional.) Configure a description for the peer group.
   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.
7. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.
   address-family ipv6 [**unicast**]
8. Enable BGP to exchange IPv6 unicast routing information with peers in the peer group.
   peer *group-name* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with peers in a peer group.
9. Use a routing policy to modify the next hop of routes received from peers in the peer group.
   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group by using Method 3 (Exchanging IPv6 unicast routes with IPv4 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Create an EBGP peer group.
   group *group-name* **external**
4. Add an IPv4 peer into the EBGP peer group.
   peer *ipv4-address* [*mask-length*] **group** *group-name* **as-number** *as-number*
5. (Optional.) Configure a description for the peer group.
   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.

6. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

7. Enable BGP to exchange IPv6 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv6 unicast routing information with peers in a peer group.

8. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group by using Method 1 (Exchanging IPv6 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Specify the AS number of the group.

   peer *group-name* **as-number** *as-number*

   By default, no AS number is specified.

   If a peer group contains peers, you cannot remove or change its AS number.

5. Add a peer into the EBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer { *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **group** *group-name* [**as-number** *as-number*]
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

     The **as-number** *as-number* option must specify the same AS number as the **peer** *group-name* **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.

7. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

8. Enable the router to exchange IPv6 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv6 unicast routing information with the peers.

Configuring an EBGP peer group by using Method 2 (Exchanging IPv6 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Create an IPv6 BGP peer and specify its AS number. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer { *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **as-number** *as-number*
   - Specify a peer by its directly connected interface. The address of the peer is the link-local address on an ND entry learned by the interface.

     interface-peer *interface-type interface-number* **as-number** *as-number*

5. Add the peer into the EBGP peer group. Choose the options to configure based on the configuration of the above step:
   - Specify a peer by its address.

     peer { *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **group** *group-name* [**as-number** *as-number*]

     The **as-number** *as-number* option must specify the same AS number as the **peer** *ipv6-address* [*prefix-length*] **as-number** *as-number* command.
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

     The **as-number** *as-number* option must specify the same AS number as the **interface-peer** *interface-type interface-number* **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.

7. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

8. Enable the router to exchange IPv6 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv6 unicast routing information with the peers.

Configuring an EBGP peer group by using Method 3 (Exchanging IPv6 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Add the peer into the EBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer { *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **group** *group-name* **as-number** *as-number*
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

5. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for the peer group.

6. Create the BGP IPv6 unicast address family or BGP-VPN IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

7. Enable the router to exchange IPv6 unicast routing information with peers in the specified peer group.

   peer *group-name* **enable**

   By default, the router cannot exchange IPv6 unicast routing information with the peers.

Configuring an EBGP peer group by using Method 1 (Exchanging IPv4 unicast routes with IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Create an EBGP peer group.

   group *group-name* **external**

4. Specify an AS number for the peer group.

   peer *group-name* **as-number** *as-number*

By default, no AS number is specified for a peer group.

If a peer group contains peers, you cannot remove or change its AS number.

5. Add an IPv6 peer into the EBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer *ipv6-address* [*prefix-length*] **group** *group-name* [**as-number** *as-number*]
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

     The **as-number** *as-number* option must specify the same AS number as the **peer** *group-name* **as-number** *as-number* command.
6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.
7. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
8. Enable BGP to exchange IPv4 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with peers in a peer group.
9. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group by using Method 2 (Exchanging IPv4 unicast routes with IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Create an EBGP peer group.

   group *group-name* **external**
4. Create an IPv6 BGP peer and specify its AS number. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer *ipv6-address* [*prefix-length*] **as-number** *as-number*
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **as-number** *as-number*
5. Add the IPv6 peer into the EBGP peer group. Choose the options to configure based on the configuration of the above step:

- Specify a peer by its address.

  peer *ipv6-address* [*prefix-length*] **group** *group-name* [**as-number** *as-number*]

  The **as-number** *as-number* option must specify the same AS number as the **peer** *ipv6-address* [*prefix-length*] **as-number** *as-number* command.
- Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

  interface-peer *interface-type interface-number* **group** *group-name* [**as-number** *as-number*]

  The **as-number** *as-number* option must specify the same AS number as the **interface-peer** *interface-type interface-number* **as-number** *as-number* command.

6. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.
7. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
8. Enable BGP to exchange IPv4 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with peers in a peer group.
9. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Configuring an EBGP peer group by using Method 3 (Exchanging IPv4 unicast routes with IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Create an EBGP peer group.

   group *group-name* **external**
4. Add an IPv6 peer into the EBGP peer group. Choose the options to configure as needed:
   - Specify a peer by its address.

     peer *ipv6-address* [*prefix-length*] **group** *group-name* **as-number** *as-number*
   - Specify peers that are established through link-local addresses that the specified interface learned in ND entries.

     interface-peer *interface-type interface-number* **group** *group-name* **as-number** *as-number*
5. (Optional.) Configure a description for the peer group.

   peer *group-name* **description** *text*

   By default, no description is configured for a peer group.

6. Create the BGP IPv4 unicast address family or BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

7. Enable BGP to exchange IPv4 unicast routing information with peers in the peer group.

   peer *group-name* **enable**

   By default, BGP cannot exchange IPv4 unicast routing information with peers in a peer group.

8. Use a routing policy to modify the next hop of routes received from peers in the peer group.

   peer *group-name* **route-policy** *route-policy-name* **import**

Specifying the source address of TCP connections

About this task

BGP uses TCP as the transport layer protocol. Perform this task in the following scenarios to specify the source address or source interface of TCP connections to a peer or peer group:

- The peer's IPv4/IPv6 address does not belong to the interface directly connected to the local router. To ensure successful TCP connection establishment, use one of the following methods:
  - Specify the interface to which the IPv4/IPv6 address belongs as the source interface on the peer.
  - Specify the IPv4/IPv6 address of the interface directly connected to the local router as the source address on the peer.
- A BGP peer at an IPv6 link-local address must be directly connected to the local router. If you do not specify the interface connected to the peer, you must specify the interface directly connected to the BGP peer as the source interface of TCP connections on the local router.
- On a BGP router that has multiple links to a peer, the source interface for TCP connection changes because the primary source interface fails. To avoid this problem, specify a loopback interface as the source interface or specify the IP address of a loopback interface as the source address.
- You want to establish multiple BGP sessions to a router. In this case, BGP might fail to determine the source address for each TCP connection based on the optimal route to the peer. To prevent this problem, use one of the following methods:
  - If the BGP sessions use IP addresses of different interfaces, specify a source interface or source address for each session.
  - If the BGP sessions use different IP addresses of the same interface, specify a source address for each session.

Restrictions and guidelines

BGP immediately tears down the session to an IBGP peer or peer group when the following conditions exist:

- The source interface of TCP connections to the IBGP peer or peer group is a physical interface.
- The source interface fails and the link to the IBGP peer or peer group goes down.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

3. Specify the source address or source interface of TCP connections to a peer or peer group.
   - Specify the source address of TCP connections to a peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **source-address** *source-ipv4-address*
   - Specify the source interface of TCP connections to a peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **connect-interface** *interface-type interface-number*

   By default, BGP uses the primary IPv4 address of the output interface in the optimal route to a peer or peer group as the source address of TCP connections to the peer or peer group.

Procedure (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Specify the source IPv6 address or source interface of TCP connections to a peer or peer group.
   - Specify the source IPv6 address of TCP connections to a peer or peer group.

     peer { *group-name* | *ipv6-address* [*prefix-length*] } **source-address** *source-ipv6-address*
   - Specify the source interface of TCP connections to a peer or peer group.

     peer { *group-name* | *ipv6-address* [*prefix-length*] } **connect-interface** *interface-type interface-number*

   By default, BGP uses the IPv6 address of the output interface in the optimal route to the BGP peer or peer group as the source address of TCP connections to the peer or peer group.

Controlling BGP route generation

Injecting a local network

About this task

Perform this task to inject a network in the local routing table to the BGP routing table, so BGP can advertise the network to BGP peers. The ORIGIN attribute of BGP routes advertised in this way is IGP. You can also use a routing policy to control route advertisement.

The specified network must be available and active in the local IP routing table.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

bgp *as-number* [**instance** *instance-name*]

address-family ipv4 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv4 [**unicast**]

3. Configure BGP to advertise a local network.

   network *ipv4-address* [*mask-length* | *mask*] [**route-policy** *route-policy-name*]

   By default, BGP does not advertise local networks.

Procedure (IPv6 unicast)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure BGP to advertise a local network.

   network *ipv6-address prefix-length* [**route-policy** *route-policy-name*]

   By default, BGP does not advertise local networks.

Redistributing IGP routes

About this task

Perform this task to configure route redistribution from an IGP to BGP.

By default, BGP does not redistribute default IGP routes. You can use the **default-route imported** command to redistribute default IGP routes into the BGP routing table.

The ORIGIN attribute of BGP routes redistributed from IGPs is INCOMPLETE.

Only active routes can be redistributed. To view route state information, use the **display ip routing-table protocol** or **display ipv6 routing-table protocol** command. For more information about the commands, see *Layer 3—IP Routing Command Reference*.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

bgp *as-number* [**instance** *instance-name*]

address-family ipv4 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv4 [**unicast**]

3. Enable route redistribution from the specified IGP into BGP.
   - Redistribute IS-IS, OSPF, or RIP routes.

     import-route { **isis** | **ospf** | **rip** } [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   - Redistribute direct or static routes.

     import-route { **direct** | **static** } [**med** *med-value* | **route-policy** *route-policy-name*]

   By default, BGP does not redistribute IGP routes.
4. (Optional.) Redistribute all routes with the same destination address.

   import-route multipath

   By default, BGP redistributes only the optimal routes to its routing table when multiple routes with the same destination address exist.

   This command takes effect only on the routes redistributed by the **import-route** command in the same address family.
5. (Optional.) Enable default route redistribution into BGP.

   default-route imported

   By default, BGP does not redistribute default routes.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Enable route redistribution from the specified IGP into BGP.
   - Redistribute IPv6 IS-IS, OSPFv3, or RIPng routes.

     import-route { **isisv6** | **ospfv3** | **ripng** } [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   - Redistribute direct or static routes.

     import-route { **direct** | **static** } [**med** *med-value* | **route-policy** *route-policy-name*] *

By default, BGP does not redistribute IGP routes.

4. (Optional.) Redistribute all routes with the same destination address.

   import-route multipath

   By default, BGP redistributes only the optimal routes to its routing table when multiple routes with the same destination address exist.

   This command takes effect only on the routes redistributed by the **import-route** command in the same address family.

5. (Optional.) Enable default route redistribution into BGP.

   default-route imported

   By default, BGP does not redistribute default routes.

Configuring BGP route summarization

About this task

Route summarization can reduce the number of redistributed routes and the routing table size. IPv4 BGP supports automatic route summarization and manual route summarization. Manual summarization takes precedence over automatic summarization. IPv6 BGP supports only manual route summarization.

Automatic route summarization enables BGP to summarize IGP subnet routes redistributed by the **import-route** command, so BGP advertises only natural network routes.

By configuring manual route summarization, you can do the following:

- Summarize both redistributed routes and routes injected using the **network** command.
- Determine the mask length for a summary route.

Restrictions and guidelines for configuring BGP route summarization

The output interface of a BGP summary route is Null 0 on the originating router. Therefore, a summary route must not be an optimal route on the originating router. Otherwise, BGP will fail to forward packets matching the route. If a summarized specific route has the same mask as the summary route, but has a lower priority, the summary route becomes the optimal route. To ensure correct packet forwarding, change the priority of the summary or specific route to make the specific route the optimal route.

Configuring automatic route summarization (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.

   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure automatic route summarization.

   summary automatic

   By default, automatic route summarization is not configured.

Configuring manual route summarization (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Create a summary route in the BGP routing table.

   aggregate *ipv4-address* { *mask-length* | *mask* } [**as-set** | **attribute-policy** *route-policy-name* | **detail-suppressed** | **origin-policy** *route-policy-name* | **suppress-policy** *route-policy-name*] *

   By default, no summary routes are configured.

Configuring BGP manual route summarization (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Create a summary route in the IPv6 BGP routing table.

   aggregate *ipv6-address prefix-length* [**as-set** | **attribute-policy** *route-policy-name* | **detail-suppressed** | **origin-policy** *route-policy-name* | **suppress-policy** *route-policy-name*] *

   By default, no summary routes are configured.

Advertising a default route to a peer or peer group

About this task

Perform this task to advertise a default BGP route with the next hop being the advertising router to a peer or peer group.

Procedure (IPv4 unicast address family)

1. Enter system view.

system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Advertise a default route to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **default-route-advertise** [**route-policy** *route-policy-name*]

   interface-peer *interface-type interface-number* **default-route-advertise** [**route-policy** *route-policy-name*]

   By default, no default route is advertised.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Advertise a default route to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **default-route-advertise** [**route-policy** *route-policy-name*]

   interface-peer *interface-type interface-number* **default-route-advertise** [**route-policy** *route-policy-name*]

   By default, no default route is advertised.

Controlling BGP route advertisement

Advertising optimal routes in the IP routing table

About this task

By default, BGP advertises optimal routes in the BGP routing table, which may not be optimal in the IP routing table. This task allows you to advertise BGP routes that are optimal in the IP routing table.

Procedure (IPv4 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP to advertise optimal routes in the IP routing table.
   advertise-rib-active
   By default, BGP advertises optimal routes in the BGP routing table.
4. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Enter BGP IPv4 unicast address family view.
     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:
     ip vpn-instance *vpn-instance-name*
     address-family ipv4 [**unicast**]
5. Enable BGP to advertise optimal routes in the IP routing table of the address family in the VPN instance.
   advertise-rib-active
   By default, the setting is the same as that in BGP instance view.

Procedure (IPv6 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP to advertise optimal routes in the IPv6 routing table.
   advertise-rib-active
   By default, BGP advertises optimal routes in the BGP routing table.
4. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Enter BGP IPv6 unicast address family view.
     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:
     ip vpn-instance *vpn-instance-name*
     address-family ipv6 [**unicast**]
5. Enable BGP to advertise optimal routes in the IPv6 routing table of the address family in the VPN instance.

advertise-rib-active

By default, the setting is the same as that in BGP instance view.

Enabling prioritized withdrawal of the default route

About this task

Typically a BGP router does not send withdrawal messages of the default route prior to other routes to its peers. If the peer relationship is down, the default route cannot be withdrawn first. Traffic interruption might occur. Perform this task to configure BGP to send the withdrawal messages of the default route prior to other routes. This can reduce the traffic interruption time when the peer relationship is down.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP to send withdrawal messages of the default route prior to other routes.

   default-route update-first

   By default, BGP does not send withdrawal messages of the default route prior to other routes.

Enabling prioritized withdrawal of specific routes

About this task

Perform this task to configure BGP to send the withdrawal messages of specific routes prior to other routes. This can achieve fast route switchover and reduce the traffic interruption time.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Enable BGP to send withdrawal messages of routes matching the specified routing policy prior to other routes.

   update-first route-policy *route-policy-name*

   By default, BGP does not send withdrawal messages of specific routes prior to other routes.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Enable BGP to send withdrawal messages of routes matching the specified routing policy prior to other routes.

   update-first route-policy *route-policy-name*

   By default, BGP does not send withdrawal messages of specific routes prior to other routes.

Configuring BGP route distribution filtering policies

About this task

To configure BGP route distribution filtering policies, use the following methods:

- Use an ACL or prefix list to filter routing information advertised to all peers.
- Use a routing policy, conditional advertisement policy (existent policy or nonexistent policy), ACL, AS path list, or prefix list to filter routing information advertised to a peer or peer group.

If you configure multiple filtering policies, apply them in the following sequence:

1. **peer prefix-list export**
2. **peer as-path-acl export**
3. **filter-policy export**
4. **peer filter-policy export**
5. **peer advertise-policy exist-policy**
6. **peer advertise-policy non-exist-policy**
7. **peer route-policy export**

Only routes passing all the configured policies can be advertised.

Prerequisites

Before you configure BGP routing filtering policies, configure the following filters used for route filtering as needed:

- ACL (see *ACL and QoS Configuration Guide*).
- Prefix list (see "Configuring routing policies").
- Routing policy (see "Configuring routing policies").
- AS path list (see "Configuring routing policies").

Restrictions and guidelines

As a best practice, make sure all **if-match** and **apply** clauses in the specified routing policy can take effect in the target application scenario. If this requirement is not met, the routing policy might not function as expected.

Procedure (IPv4 unicast address family)

1. Enter system view.

system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Configure BGP route distribution filtering policies. Choose the options to configure as needed:
   - Reference an ACL or IP prefix list to filter advertised BGP routes.

     filter-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* | **prefix-list** *ipv4-prefix-list-name* } **export** [**direct** | { **isis** | **ospf** | **rip** } *process-id* | **static**]
   - Specify a routing policy as the existent policy to control route advertisement. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise-policy** *advertise-policy-name* **exist-policy** *exist-policy-name*

     interface-peer *interface-type interface-number* **advertise-policy** *advertise-policy-name* **exist-policy** *exist-policy-name*

     This command is supported only in BGP IPv4 unicast address family view.
   - Specify a routing policy as the nonexistent policy to control route advertisement. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise-policy** *advertise-policy-name* **non-exist-policy** *non-exist-policy-name*

     interface-peer *interface-type interface-number* **advertise-policy** *advertise-policy-name* **non-exist-policy** *non-exist-policy-name*

     This command is supported only in BGP IPv4 unicast address family view.
   - Reference a routing policy to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* **export**

     interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **export**
   - Reference an ACL to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **filter-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } **export**

     interface-peer *interface-type interface-number* **filter-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } **export**
   - Reference an AS path list to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } { **as-path-acl** *as-path-acl-number* | *as-path-acl-name* } **export**

interface-peer *interface-type interface-number* **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **export**

- Reference an IPv4 prefix list to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv4-prefix-list-name* **export**

  interface-peer *interface-type interface-number* **prefix-list** *ipv4-prefix-list-name* **export**

By default, no BGP distribution filtering policy is configured.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure BGP route distribution filtering policies. Choose the options to configure as needed:
   - Reference an ACL or IPv6 prefix list to filter advertised BGP routes.

     filter-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* | **prefix-list** *ipv6-prefix-list-name* } **export** [**direct** | { **isisv6** | **ospfv3** | **ripng** } *process-id* | **static**]

   - Specify a routing policy as the existent policy to control route advertisement. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise-policy** *advertise-policy-name* **exist-policy** *exist-policy-name*

     interface-peer *interface-type interface-number* **advertise-policy** *advertise-policy-name* **exist-policy** *exist-policy-name*

     This command is supported only in BGP IPv6 unicast address family view.

   - Specify a routing policy as the nonexistent policy to control route advertisement. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise-policy** *advertise-policy-name* **non-exist-policy** *non-exist-policy-name*

     interface-peer *interface-type interface-number* **advertise-policy** *advertise-policy-name* **non-exist-policy** *non-exist-policy-name*

     This command is supported only in BGP IPv6 unicast address family view.

- Reference a routing policy to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **route-policy** *route-policy-name* **export**

  interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **export**

- Reference an ACL to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **filter-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } **export**

  interface-peer *interface-type interface-number* **filter-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } **export**

- Reference an AS path list to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **export**

  interface-peer *interface-type interface-number* **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **export**

- Reference an IPv6 prefix list to filter BGP routes advertised to a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **prefix-list** *ipv6-prefix-list-name* **export**

  interface-peer *interface-type interface-number* **prefix-list** *ipv6-prefix-list-name* **export**

By default, no BGP distribution filtering policy is configured.

Setting the BGP route sending rate

About this task

If a device sends many new routes within a short time period, it might be unable to add the routes to the FIB before the peer device adds them. This might result in traffic forwarding failure. To avoid this problem, you can perform this task to set an appropriate route sending rate for the device.

Restrictions and guidelines

For a device with high performance, you can set a high BGP route sending rate as needed. For a device without high performance, set a relatively low BGP route sending rate as a best practice.

As a best practice to avoid route withdrawal failures, do not set the BGP route sending rate to 0 or a small value when network flapping occurs.

This task applies only to IPv4 unicast routes and IPv6 unicast routes.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

bgp *as-number* [**instance** *instance-name*]

3. Set the BGP route sending rate.

   route-rate-limit *rate*

   By default, the BGP route sending rate is not limited.

Configuring BGP to delay sending route updates on reboot

About this task

This task reduces traffic loss. With this task performed, BGP delays sending route updates when it restores after a device reboot. During the delay time, BGP learns all routes from other neighbors, and then selects the optimal route. After the delay time elapses, BGP will advertise the optimal route.

You can specify a prefix list and enable BGP to immediately send route updates for routes that match the prefix list.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Configure BGP to delay sending route updates when it restores after a device reboot.

   bgp update-delay on-startup *seconds*

   By default, BGP immediately sends route updates to BGP peers in established state when it restores after a device reboot.

4. (Optional.) Configure BGP to immediately send route updates for routes that match an IPv4 prefix list.

   bgp update-delay on-startup prefix-list *ipv4-prefix-list-name*

   By default, no IPv4 prefix list is specified to filter routes.

5. (Optional.) Configure BGP to immediately send route updates for routes that match an IPv6 prefix list.

   bgp update-delay on-startup ipv6-prefix-list *ipv6-prefix-list-name*

   By default, no IPv6 prefix list is specified to filter routes.

Configuring the interval for sending updates for the same route

About this task

A BGP router sends an UPDATE message to its peers when a route is changed. If the route changes frequently, the BGP router keeps sending update or withdrawal messages for the same route, resulting route flapping. To prevent this situation, perform this task to configure the interval for sending updates for the same route to a peer or peer group.

This feature takes effect on withdrawn routes only after you apply the route update interval setting to withdrawn routes.

Restrictions and guidelines

BGP compares the intervals specified for a BGP peer by using the **peer route-update-interval** and **route-update-delay** commands. Only the larger interval takes effect. If you did not execute the **peer route-update-interval** command, BGP uses

the default value of this command to compare with the interval configured by the **route-update-delay** command.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. (Optional.) Apply route update interval setting to withdrawn routes.

   route-update-interval withdrawn enable

   By default, route update interval setting does not apply to withdrawn routes. BGP sends withdrawal messages for withdrawn routes immediately.

4. (Optional.) Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

5. Configure the interval for sending updates for the same route to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **route-update-interval** *interval*

   By default, the interval is 15 seconds for an IBGP peer and 30 seconds for an EBGP peer.

Procedure (IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. (Optional.) Apply route update interval setting to withdrawn routes.

   route-update-interval withdrawn enable

   By default, route update interval setting does not apply to withdrawn routes. BGP sends withdrawal messages for withdrawn routes immediately.

4. (Optional.) Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

5. Configure the interval for sending updates for the same route to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **route-update-interval** *interval*

   interface-peer *interface-type interface-number* **route-update-interval** *interval*

   By default, the interval is 15 seconds for an IBGP peer and 30 seconds for an EBGP peer.

Configuring BGP route advertisement delay

About this task

BGP sends update messages to peers when route changes occur or peer relationship establishment is complete. If a large number of routes need to be updated within a short time period, BGP might send update messages to peers before issuing the updated routes to the FIB. As a result, some packets might be discarded because BGP cannot find the forwarding path for the packets.

To resolve this issue, perform this task to enable BGP route advertisement delay and set a delay timer. When route changes occur or peer relationship establishment is complete, BGP cannot send any update messages unless the delay timer expires.

Restrictions and guidelines

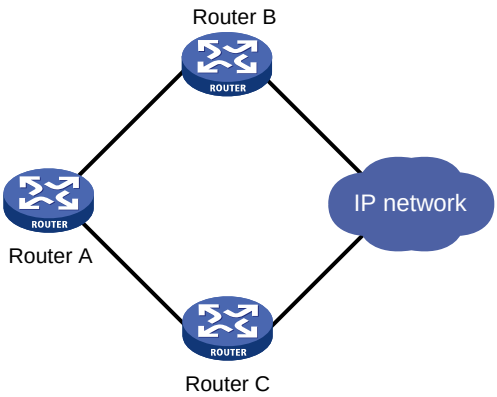
BGP compares the timer values specified for a BGP peer by using the **route-update-delay** command and the **peer route-update-interval** command. Only the larger timer value takes effect. If you did not execute the **peer route-update-interval** command, BGP compares the BGP route advertisement delay timer with the default value of the **peer route-update-interval** command.

This feature applies to the following routes:

- BGP IPv4 unicast routes.
- BGP IPv6 unicast routes.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP route advertisement delay and set a delay timer.
   route-update-delay *delay-value*
   By default, BGP route advertisement delay is disabled.



Configuring a startup policy for BGP route updates

About this task

Perform this task to configure BGP to send route updates with the specified attributes within the specified period after reboot.

As shown in Figure 12, if Router B restarts and sends route updates before route convergence completes, traffic sent from Router A through Router B might be lost. This feature enables Router B to send route updates with the specified attribute values within the specified period after reboot, so that Router A can forward traffic through Router C.

Figure 12 Network diagram

Procedure

1. Enter system view.
   system-view

2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Specify the period after reboot within which the startup policy is effective.
   bgp apply-policy on-startup duration *seconds*
   By default, the startup policy does not take effect.
4. Specify a MED attribute value in the startup policy.
   bgp policy on-startup med *med-value*
   By default, the MED attribute value in the startup policy is 4294967295.

Controlling BGP route reception

Limiting routes received from a peer or peer group

About this task

This feature can prevent attacks that send a large number of BGP routes to the router.

If the number of routes received from a peer or peer group exceeds the upper limit, the router takes one of the following actions based on your configuration:

- Tears down the BGP session to the peer or peer group and does not attempt to re-establish the session.
- Continues to receive routes from the peer or peer group and generates a log message.
- Retains the session to the peer or peer group, but it discards excess routes and generates a log message.
- Tears down the BGP session to the peer or peer group and, after a specific period of time, re-establishes a BGP session to the peer or peer group.

You can specify a percentage threshold for the router to generate a log message. When the ratio of the number of received routes to the maximum number reaches the percentage value, the router generates a log message.

Restrictions and guidelines

If this feature triggers session disconnection or re-establishment for a peer, all address families that contain the peer will be affected.

Procedure (IPv4 unicast address family)

1. Enter system view.
   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:
     bgp *as-number* [**instance** *instance-name*]
     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
     address-family ipv4 [**unicast**]
3. Specify the maximum number of routes that a router can receive from a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

interface-peer *interface-type interface-number* **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

By default, the number of routes that a router can receive from a peer or peer group is not limited.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Specify the maximum number of routes that a router can receive from a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

   interface-peer *interface-type interface-number* **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

   By default, the number of routes that a router can receive from a peer or peer group is not limited.

Configuring BGP route reception filtering policies

About this task

You can use the following methods to configure BGP route reception filtering policies:

- Use an ACL or prefix list to filter routing information received from all peers.
- Use a routing policy, ACL, AS path list, or prefix list to filter routing information received from a peer or peer group.

If you configure multiple filtering policies, apply them in the following sequence:

1. **filter-policy import**
2. **peer filter-policy import**
3. **peer as-path-acl import**
4. **peer prefix-list import**
5. **peer route-policy import**

Only routes passing all the configured policies can be received.

Prerequisites

Before you configure BGP route reception filtering policies, configure the following filters used for route filtering as needed:

- ACL (see *ACL and QoS Configuration Guide*).
- Prefix list (see "Configuring routing policies").
- Routing policy (see "Configuring routing policies").
- AS path list (see "Configuring routing policies").

Restrictions and guidelines

As a best practice, make sure all **if-match** and **apply** clauses in the specified routing policy can take effect in the target application scenario. If this requirement is not met, the routing policy might not function as expected.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure BGP route reception filtering policies. Choose the options to configure as needed:
   - Reference an ACL or IP prefix list to filter BGP routes received from all peers.

     filter-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* | **prefix-list** *ipv4-prefix-list-name* } **import**
   - Reference a routing policy to filter BGP routes received from a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* **import**

     interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **import**
   - Reference an ACL to filter BGP routes received from a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **filter-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } **import**

     interface-peer *interface-type interface-number* **filter-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } **import**
   - Reference an AS path list to filter BGP routes received from a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **import**

interface-peer *interface-type interface-number* **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **import**

- Reference an IPv4 prefix list to filter BGP routes received from a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **prefix-list** *ipv4-prefix-list-name* **import**

  interface-peer *interface-type interface-number* **prefix-list** *ipv4-prefix-list-name* **import**

By default, no route reception filtering is configured.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure BGP route reception filtering policies. Choose the options to configure as needed:
   - Reference ACL or IPv6 prefix list to filter BGP routes received from all peers.

     filter-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* | **prefix-list** *ipv6-prefix-list-name* } **import**

   - Reference a routing policy to filter BGP routes received from a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **route-policy** *route-policy-name* **import**

     interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **import**

   - Reference an ACL to filter BGP routes received from a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **filter-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } **import**

     interface-peer *interface-type interface-number* **filter-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } **import**

   - Reference an AS path list to filter BGP routes received from a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type*

interface-number } **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **import**

interface-peer *interface-type interface-number* **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **import**

- Reference an IPv6 prefix list to filter BGP routes received from a peer or peer group. Choose one command as needed:

  peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **prefix-list** *ipv6-prefix-list-name* **import**

  interface-peer *interface-type interface-number* **prefix-list** *ipv6-prefix-list-name* **import**

By default, no route reception filtering is configured.

Configuring the SoO attribute

About this task

After you configure the SoO attribute for a BGP peer or peer group, BGP adds the SoO attribute into the route updates received from the BGP peer or peer group. In addition, before advertising route updates to the peer or peer group, BGP checks the SoO attribute of the route update against the configured SoO attribute. If they are the same, BGP does not advertise the route updates to the BGP peer or peer group.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure the SoO attribute for a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **soo** *site-of-origin*

   interface-peer *interface-type interface-number* **soo** *site-of-origin*

   By default, no SoO attribute is configured for a peer or peer group.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

address-family ipv6 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Configure the SoO attribute for a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **soo** *site-of-origin*

   interface-peer *interface-type interface-number* **soo** *site-of-origin*

   By default, no SoO attribute is configured for a peer or peer group.

Configuring BGP timers

Configuring the keepalive interval and hold time

About this task

BGP sends KEEPALIVE messages regularly to keep the BGP session between two routers.

If a router receives no KEEPALIVE or UPDATE message from a peer within the hold time, it tears down the session.

You can configure the keepalive interval and hold time globally or for a peer or peer group. The individual settings take precedence over the global settings.

The actual keepalive interval and hold time are determined as follows:

- If the hold time settings on the local and peer routers are different, the smaller setting is used. If the hold time is 0, BGP does not send KEEPALIVE messages to its peers and never tears down the session.
- If the keepalive interval is not 0, the actual keepalive interval is the smaller one between 1/3 of the hold time and the keepalive interval.

Restrictions and guidelines

The hold time must be a minimum of three times the keepalive interval.

You can perform this task for all BGP peers or for a specific BGP peer or peer group. For a BGP peer or peer group, the **peer timer** command takes precedence over the **timer** command. If you do not configure the **peer timer** command for the peer or peer group, the configuration of the **timer** command takes effect on the peer or peer group.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Configure the keepalive interval and hold time.

- Configure the global keepalive interval and hold time.

  timer keepalive *keepalive* **hold** *holdtime*

  This command takes effect for new BGP sessions and does not affect existing sessions.
- Configure the keepalive interval and hold time for a peer or peer group.

  peer { *group-name* | *ipv4-address* [*mask-length*] } **timer keepalive** *keepalive* **hold** *holdtime*

By default, the keepalive interval is 60 seconds, and hold time is 180 seconds.

The timers configured with the **timer** and **peer timer** commands do not take effect until a session is re-established (for example, a session is reset).

Procedure (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Configure the keepalive interval and hold time.
   - Configure the global keepalive interval and hold time.

     timer keepalive *keepalive* **hold** *holdtime*

     This command takes effect for new BGP sessions and does not affect existing sessions.
   - Configure the keepalive interval and hold time for a peer or peer group. Choose one command as needed:

     peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **timer keepalive** *keepalive* **hold** *holdtime*

     interface-peer *interface-type interface-number* **timer keepalive** *keepalive* **hold** *holdtime*

   By default, the keepalive interval is 60 seconds, and hold time is 180 seconds.

   The timers configured with the **timer** and **peer timer** commands do not take effect until a session is re-established (for example, a session is reset).

Setting the session retry timer

About this task

To speed up session establishment to a peer or peer group and route convergence, set a small session retry timer. If the BGP session flaps, you can set a large session retry timer to reduce the impact.

Restrictions and guidelines

The timer set by the **peer timer connect-retry** command takes precedence over the timer set by the **timer connect-retry** command.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Set the session retry timer.
   - Set the session retry timer for all peers or peer groups.
     timer connect-retry *retry-time*
   - Set the session retry timer for a peer or peer group.
     peer { *group-name* | *ipv4-address* [*mask-length*] } **timer connect-retry** *retry-time*

   By default, the session retry timer is 32 seconds for a peer or peer group.

Procedure (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Set the session retry timer.
   - Set the session retry timer for all peers or peer groups.
     timer connect-retry *retry-time*
   - Set the session retry timer for a peer or peer group. Choose one command as needed:
     peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **timer connect-retry** *retry-time*
     interface-peer *interface-type interface-number* **timer connect-retry** *retry-time*

   By default, the session retry timer is 32 seconds for a peer or peer group.

Configuring BGP logging and notifications

Enabling logging for session state changes

About this task

Perform this task to enable BGP to log BGP session establishment and disconnection events. To display the log information, use the **display bgp peer ipv4 unicast log-info** command or the **display bgp peer ipv6 unicast log-info** command. The logs are sent to the information center. The output rules of the logs (whether to output the logs and where to output) are determined by the information center configuration.

For more information about information center configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure (IPv4 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable logging for session state changes globally.
   log-peer-change
   By default, logging for session state changes is enabled globally.
4. (Optional.) Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
5. Enable logging for session state changes for a peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **log-change**
   By default, logging for session state changes is enabled for all peers and peer groups.

Procedure (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable logging for session state changes globally.
   log-peer-change
   By default, logging for session state changes is enabled globally.
4. (Optional.) Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
5. Enable logging for session state changes for a peer or peer group. Choose one command as needed:
   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **log-change**
   interface-peer *interface-type interface-number* **log-change**
   By default, logging for session state changes is enabled for all peers and peer groups.

Enabling logging for BGP route flapping

About this task

This feature enables BGP to generate logs for BGP route flapping events that trigger log generation. The generated logs are sent to the information center. For the logs to be output correctly, you must also configure information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure(IPv4 unicast)

1. Enter system view.
   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:
     bgp *as-number* [**instance** *instance-name*]

address-family ipv4 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv4 [**unicast**]

3. Enable logging for BGP route flapping.

   log-route-flap *monitor-time monitor-count* [*log-count-limit* | **route-policy** *route-policy-name*] *

   By default, logging for BGP route flapping is disabled.

Procedure (IPv6 unicast)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Enable logging for BGP route flapping.

   log-route-flap *monitor-time monitor-count* [*log-count-limit* | **route-policy** *route-policy-name*] *

   By default, logging for BGP route flapping is disabled.

Configuring BGP network management

About this task

After you enable SNMP notifications for BGP, the device generates a notification when a BGP neighbor state change occurs. The notification includes the neighbor address, the error code and subcode of the most recent error, and the current neighbor state. For BGP notifications to be sent correctly, you must also configure SNMP on the device.

BGP does not know the BGP instance to which a managed MIB node belongs. To resolve this issue, configure different SNMP contexts for different BGP instances.

The device selects a MIB for an SNMP packet according to the context (for SNMPv3) or community name (for SNMPv1/v2c) in the following ways:

- For an SNMPv3 packet:
  - The device selects the MIB of the default BGP instance if the packet does not carry a context and no SNMP context is configured for the default BGP instance.
  - The device selects the MIB of a BGP instance if the packet meets the following conditions:
    - Carries a context that is configured with the **snmp-agent context** command in system view.
    - Matches the context of the BGP instance.

- The device does not process any MIBs in other situations.

- For an SNMPv1/v2c packet:
  - The device selects the MIB of the default BGP instance if the following conditions are met:
    - No community name-to-SNMP context mapping is configured with the **snmp-agent community-map** command in system view.
    - No SNMP context is configured for the default BGP instance.
  - The device selects the MIB of a BGP instance if the community name is mapped to an SNMP context and the context matches the context of the BGP instance.
  - The device does not process any MIBs in other situations.

For more information about SNMP contexts and community names, see SNMP configuration in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for BGP.
   snmp-agent trap enable bgp [**instance** *instance-name*]
   By default, SNMP notifications for BGP are enabled.
3. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
4. Configure an SNMP context for the BGP instance.
   snmp context-name *context-name*
   By default, no SNMP context is configured for the BGP instance.

Display and maintenance commands for basic BGP network building

Displaying BGP

Execute **display** commands in any view.

Displaying BGP (IPv4 unicast address family)

Task	Command
Display BGP IPv4 unicast peer group information.	**display bgp** [**instance** *instance-name*] **group ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [**group-name** *group-name*]
Display information about routes advertised by the **network** command and shortcut routes configured by the **network short-cut** command.	**display bgp** [**instance** *instance-name*] **network ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display information about a peer or peer group in BGP IPv4 unicast address family.	**display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*]

Task	Command
	verbose] **display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] [[*ipv6-address prefix-length* | **interface** *interface-type interface-number*] | [*ipv6-address* [**interface** *interface-type interface-number*] **log-info** | [*ipv6-address* [**interface** *interface-type interface-number*] **verbose**]
	display bgp [**instance** *instance-name*] **peer ipv4** [**unicast**] **vpn-instance-all** [**verbose**]
Display BGP IPv4 unicast route flapping statistics.	**display bgp** [**instance** *instance-name*] **routing-table flap-info ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [{ *mask-length* | *mask* } [**longest-match**]] | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* }]
Display BGP IPv4 unicast routing information.	**display bgp** [**instance** *instance-name*] **routing-table ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [{ *mask-length* | *mask* } [**longest-match**]] | *ipv4-address* [*mask-length* | *mask*] **advertise-info** | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } | **community-list** { { *basic-community-list-number* | *comm-list-name* } [**whole-match**] | *adv-community-list-number* } | **peer** { *ipv4-address* | *ipv6-address* [**interface** *interface-type interface-number*] } { **advertised-routes** | **received-routes** } [*ipv4-address* [*mask-length* | *mask*] | **statistics**] | **statistics**]
Display information about BGP peer relationship down events.	**display bgp** [**instance** *instance-name*] **troubleshooting** [*event-count*] [**reverse**]
Display BGP IPv4 unicast address family update group information.	**display bgp** [**instance** *instance-name*] **update-group ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address*] **display bgp** [**instance** *instance-name*] **update-group ipv4** [**unicast**] [*ipv6-address*]
Display information about all BGP instances.	**display bgp instance-info**

Displaying BGP (IPv6 unicast address family)

Task	Command
Display BGP IPv6 unicast peer group information.	**display bgp** [**instance** *instance-name*] **group ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [**group-name** *group-name*]
Display information about routes advertised by the **network** command and shortcut routes configured by the **network short-cut** command.	**display bgp** [**instance** *instance-name*] **network ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display information about a peer or peer group in BGP IPv6 unicast address family.	**display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | { *ipv6-address* | **group-name** *group-name* } **log-info** | [*ipv6-address*] **verbose**] **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [[*link-local-address*] **interface** *interface-type interface-number* | *link-local-address* **interface** *interface-type interface-number* { **log-info** | **verbose** }] **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [*ipv4-address mask-length* | *ipv4-address* **log-info** | [*ipv4-address*] **verbose**] **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] **vpn-instance-all** [**verbose**]
Display BGP IPv6 unicast route flapping statistics.	**display bgp** [**instance** *instance-name*] **routing-table flap-info ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* }]
Display BGP IPv6 unicast routing information.	**display bgp** [**instance** *instance-name*] **routing-table ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* [**advertise-info**] | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } | **community-list** { { *basic-community-list-number* | *comm-list-name* } [**whole-match**] | *adv-community-list-number* } | **peer** *ipv6-address* { **advertised-routes** | **received-routes** } [*ipv6-address prefix-length* | **statistics**] | **statistics**] **display bgp** [**instance** *instance-name*]

Task	Command
	routing-table ipv6 [**unicast**] [**vpn-instance** *vpn-instance-name*] **peer** { *ipv4-address* | [*link-local-address*] **interface** *interface-type interface-number* } { **advertised-routes** | **received-routes** } [*ipv6-address prefix-length* | **statistics**]
Display information about BGP peer relationship down events.	**display bgp** [**instance** *instance-name*] **troubleshooting** [*event-count*] [**reverse**]
Display BGP IPv6 unicast address family update group information.	**display bgp** [**instance** *instance-name*] **update-group ipv6** [**unicast**] [*ipv4-address* | *ipv6-address*] **display bgp** [**instance** *instance-name*] **update-group ipv6** [**unicast**] **vpn-instance** *vpn-instance-name* [*ipv6-address*]
Display information about all BGP instances.	**display bgp instance-info**

Resetting BGP sessions

CAUTION:

A reset operation tears down BGP sessions for a short period of time.

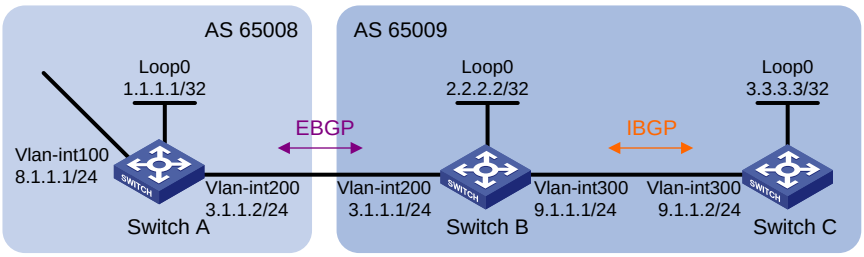
Execute **reset** commands in user view.

Task	Command
Reset BGP sessions for IPv4 unicast address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] **reset bgp** { *ipv6-address* [*prefix-length*] | **interface** *interface-type interface-number* } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Reset BGP sessions for IPv6 unicast address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv6-address* [*prefix-length*] | [*link-local-address*] **interface** *interface-type interface-number* | **all** | **external** | **group** *group-name* | **internal** } **ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] **reset bgp** *ipv4-address* [*mask-length*] **ipv6** [**unicast**]
Reset all BGP sessions.	**reset bgp** [**instance** *instance-name*] **all**

Clearing BGP information

Execute **reset** commands in user view.

Task	Command
Clear flap information for BGP IPv4 unicast routes.	**reset bgp** [**instance** *instance-name*] **flap-info ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [*mask-length* | *mask*] | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } | **peer** *ipv4-address* [*mask-length*]]
Clear flap information for BGP IPv6 unicast routes.	**reset bgp** [**instance** *instance-name*] **flap-info ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } | **peer** *ipv6-address* [*prefix-length*]]



Basic IPv4 BGP network configuration examples

Example: Configuring basic BGP

Network configuration

As shown in Figure 13, all switches run BGP. Run EBGP between Switch A and Switch B, and run IBGP between Switch B and Switch C to allow Switch C to access network 8.1.1.0/24 connected to Switch A.

Figure 13 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure IBGP:
   - To prevent route flapping caused by port state changes, this example uses loopback interfaces to establish IBGP connections.
   - Loopback interfaces are virtual interfaces. Therefore, use the **peer connect-interface** command to specify the loopback interface as the source interface for establishing BGP connections.
   - Enable OSPF in AS 65009 to ensure that Switch B can communicate with Switch C through loopback interfaces.

   # Configure Switch B.

   ```
   <SwitchB> system-view
   ```

```
[SwitchB] bgp 65009
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 3.3.3.3 as-number 65009
[SwitchB-bgp-default] peer 3.3.3.3 connect-interface loopback 0
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 3.3.3.3 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit

[SwitchC-ospf-1] quit
[SwitchC] display bgp peer ipv4

 BGP local router ID : 3.3.3.3
 Local AS number : 65009
 Total number of peers : 1                 Peers in established state : 1

  * - Dynamically created peer
  ^ - Peer created through link-local address
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  2.2.2.2              65009        2        2    0       0 00:00:13 Established
```

The output shows that Switch C has established an IBGP peer relationship with Switch B.

3. Configure EBGP:

- The EBGP peers, Switch A and Switch B (usually belong to different carriers), are located in different ASs. Typically, their loopback interfaces are not reachable to each other, so directly connected interfaces are used for establishing EBGP sessions.
- To enable Switch C to access the network 8.1.1.0/24 connected directly to Switch A, inject network 8.1.1.0/24 to the BGP routing table of Switch A.

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 65008
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 3.1.1.1 as-number 65009
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 3.1.1.1 enable
[SwitchA-bgp-default-ipv4] network 8.1.1.0 24
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch B.

```
[SwitchB] bgp 65009
[SwitchB-bgp-default] peer 3.1.1.2 as-number 65008
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 3.1.1.2 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Display BGP peer information on Switch B.

```
[SwitchB] display bgp peer ipv4

 BGP local router ID : 2.2.2.2
 Local AS number : 65009
 Total number of peers : 2                 Peers in established state : 2

  * - Dynamically created peer
  ^ - Peer created through link-local address
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  3.3.3.3              65009        4        4    0       0 00:02:49 Established
  3.1.1.2              65008        2        2    0       0 00:00:05 Established
```

The output shows that Switch B has established an IBGP peer relationship with Switch C and an EBGP peer relationship with Switch A.

Display the BGP routing table on Switch A.

```
[SwitchA] display bgp routing-table ipv4

 Total number of routes: 1

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >  8.1.1.0/24         8.1.1.1         0                     32768   i
```

Display the BGP routing table on Switch B.

```
[SwitchB] display bgp routing-table ipv4
```

```
 Total number of routes: 1

 BGP local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 8.1.1.0/24         3.1.1.2         0                     0       65008i
```

Display the BGP routing table on Switch C.

```
[SwitchC] display bgp routing-table ipv4

 Total number of routes: 1

 BGP local router ID is 3.3.3.3
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

   i 8.1.1.0/24         3.1.1.2         0          100        0       65008i
```

The outputs show that Switch A has learned no route to AS 65009, and Switch C has learned network 8.1.1.0, but the next hop 3.1.1.2 is unreachable. As a result, the route is invalid.

4. Redistribute direct routes:

Configure BGP to redistribute direct routes on Switch B, so that Switch A can obtain the route to 9.1.1.0/24, and Switch C can obtain the route to 3.1.1.0/24.

Configure Switch B.

```
[SwitchB] bgp 65009
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] import-route direct
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Display the BGP routing table on Switch A.

```
[SwitchA] display bgp routing-table ipv4

 Total number of routes: 4

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete
```

```
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 2.2.2.2/32         3.1.1.1         0                     0       65009?
* >e 3.1.1.0/24         3.1.1.1         0                     0       65009?
* >  8.1.1.0/24         8.1.1.1         0                     32768   i
* >e 9.1.1.0/24         3.1.1.1         0                     0       65009?
```

Two routes, 2.2.2.2/32 and 9.1.1.0/24, have been added in Switch A's routing table.

Display the BGP routing table on Switch C.

```
[SwitchC] display bgp routing-table ipv4

 Total number of routes: 4

 BGP local router ID is 3.3.3.3
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

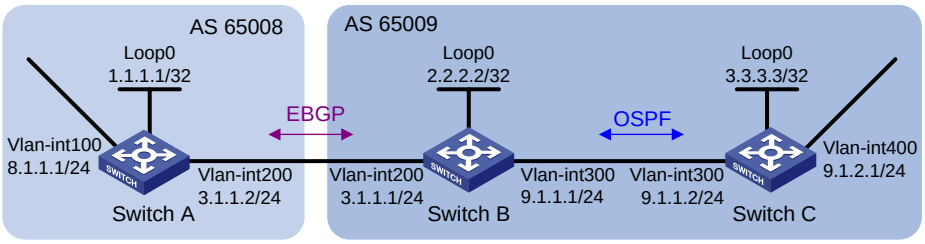
* >i 2.2.2.2/32         2.2.2.2         0          100        0       ?
* >i 3.1.1.0/24         2.2.2.2         0          100        0       ?
* >i 8.1.1.0/24         3.1.1.2         0          100        0       65008i
* >i 9.1.1.0/24         2.2.2.2         0          100        0       ?
```

The output shows that the route 8.1.1.0 becomes valid with the next hop as Switch A.

Verifying the configuration

Verify that Switch C can ping 8.1.1.1.

```
[SwitchC] ping 8.1.1.1
Ping 8.1.1.1 (8.1.1.1): 56 data bytes, press CTRL+C to break
56 bytes from 8.1.1.1: icmp_seq=0 ttl=254 time=10.000 ms
56 bytes from 8.1.1.1: icmp_seq=1 ttl=254 time=4.000 ms
56 bytes from 8.1.1.1: icmp_seq=2 ttl=254 time=4.000 ms
56 bytes from 8.1.1.1: icmp_seq=3 ttl=254 time=3.000 ms
56 bytes from 8.1.1.1: icmp_seq=4 ttl=254 time=3.000 ms
--- Ping statistics for 8.1.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 3.000/4.800/10.000/2.638 ms
```



Example: Configuring BGP and IGP route redistribution

Network configuration

As shown in Figure 14, all devices of company A belong to AS 65008, and all devices of company B belong to AS 65009.

Configure BGP and IGP route redistribution to allow Switch A to access network 9.1.2.0/24 in AS 65009, and Switch C to access network 8.1.1.0/24 in AS 65008.

Figure 14 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure OSPF:

   Enable OSPF in AS 65009, so Switch B can obtain the route to 9.1.2.0/24.

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ospf 1
   [SwitchB-ospf-1] area 0
   [SwitchB-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
   [SwitchB-ospf-1-area-0.0.0.0] network 9.1.1.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] quit
   [SwitchB-ospf-1] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ospf 1
   [SwitchC-ospf-1] import-route direct
   [SwitchC-ospf-1] area 0
   [SwitchC-ospf-1-area-0.0.0.0] network 9.1.1.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] quit
   [SwitchC-ospf-1] quit
   ```

3. Configure the EBGP connection:

   Configure the EBGP connection and inject network 8.1.1.0/24 to the BGP routing table of Switch A, so that Switch B can obtain the route to 8.1.1.0/24.

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] bgp 65008
   [SwitchA-bgp-default] router-id 1.1.1.1
   [SwitchA-bgp-default] peer 3.1.1.1 as-number 65009
   [SwitchA-bgp-default] address-family ipv4 unicast
   [SwitchA-bgp-default-ipv4] peer 3.1.1.1 enable
   [SwitchA-bgp-default-ipv4] network 8.1.1.0 24
   [SwitchA-bgp-default-ipv4] quit
   [SwitchA-bgp-default] quit
   ```

   # Configure Switch B.

   ```
   [SwitchB] bgp 65009
   [SwitchB-bgp-default] router-id 2.2.2.2
   [SwitchB-bgp-default] peer 3.1.1.2 as-number 65008
   [SwitchB-bgp-default] address-family ipv4 unicast
   ```

```
[SwitchB-bgp-default-ipv4] peer 3.1.1.2 enable
```

4. Configure BGP and IGP route redistribution:

- Configure BGP to redistribute routes from OSPF on Switch B, so Switch A can obtain the route to 9.1.2.0/24.
- Configure OSPF to redistribute routes from BGP on Switch B, so Switch C can obtain the route to 8.1.1.0/24.

Configure route redistribution between BGP and OSPF on Switch B.

```
[SwitchB-bgp-default-ipv4] import-route ospf 1
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

Display the BGP routing table on Switch A.

```
[SwitchA] display bgp routing-table ipv4

 Total number of routes: 3

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 3.3.3.3/32         3.1.1.1         1                     0       65009?
* >  8.1.1.0/24         8.1.1.1         0                     32768   i
* >e 9.1.2.0/24         3.1.1.1         1                     0       65009?
```

Display the OSPF routing table on Switch C.

```
[SwitchC] display ospf routing

          OSPF Process 1 with Router ID 3.3.3.3
                  Routing Table

 Routing for Network
 Destination        Cost     Type    NextHop         AdvRouter       Area
 9.1.1.0/24         1        Transit 9.1.1.2         3.3.3.3         0.0.0.0

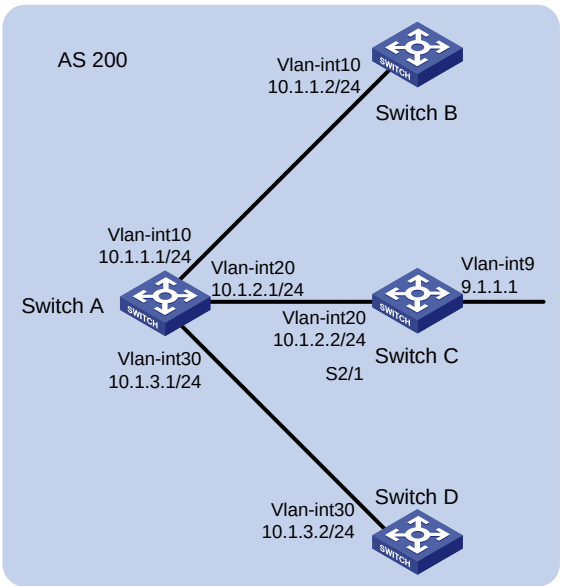
--- Ping statistics for 8.1.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 3.000/4.400/9.000/2.332 ms
```



Example: Configuring dynamic BGP peers

Network configuration

As shown in Figure 15, Switch A needs to establish IBGP peer relationships with Switch B, Switch C, and Switch D in network 10.1.0.0/16. Configure dynamic BGP peers to simplify the configuration.

Configure Switch A as the route reflector, and configure Switch B, Switch C, and Switch D as its clients.

Figure 15 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure IBGP peer relationship:

   # Configure Switch A to establish dynamic BGP peer relationships with switches in network 10.1.0.0/16.

```
<SwitchA> system-view
[SwitchA] bgp 200
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 10.1.0.0 16 as-number 200
[SwitchA-bgp-default] address-family ipv4
[SwitchA-bgp-default-ipv4] peer 10.1.0.0 16 enable
```

   # Configure Switch B to establish an IBGP peer relationship with Switch A.

```
<SwitchB> system-view
[SwitchB] bgp 200
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 10.1.1.1 as-number 200
[SwitchB-bgp-default] address-family ipv4
[SwitchB-bgp-default-ipv4] peer 10.1.1.1 enable
```

   # Configure Switch C to establish an IBGP peer relationship with Switch A.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 10.1.2.1 as-number 200
[SwitchC-bgp-default] address-family ipv4
[SwitchC-bgp-default-ipv4] peer 10.1.2.1 enable
```

   # Configure Switch D to establish an IBGP peer relationship with Switch A.

```
<SwitchD> system-view
[SwitchD] bgp 200
[SwitchD-bgp-default] router-id 4.4.4.4
[SwitchD-bgp-default] peer 10.1.3.1 as-number 200
[SwitchD-bgp-default] address-family ipv4
[SwitchD-bgp-default-ipv4] peer 10.1.3.1 enable
```

   # Display BGP peer information on Switch A. The output shows that Switch A has established IBGP peer relationships with Switch B, Switch C, and Switch D.

```
[SwitchA] display bgp peer ipv4

 BGP local router ID : 1.1.1.1
 Local AS number : 200

 Total number of peers : 3                 Peers in established state : 3

 * - Dynamically created peer
 ^ - Peer created through link-local address
 Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

*10.1.1.2               200        7       10    0       0 00:06:09 Established
*10.1.2.2               200        7       10    0       0 00:06:09 Established
*10.1.3.2               200        7       10    0       0 00:06:09 Established
```

3. Configure Switch A as the route reflector, and configure peers in network 10.1.0.0/16 as its clients.

   ```
   [SwitchA-bgp-default-ipv4] peer 10.1.0.0 16 reflect-client
   ```

4. Configure Switch C to advertise network 9.1.1.0/24.

   ```
   [SwitchC-bgp-default-ipv4] network 9.1.1.0 24
   ```

Verifying the configuration

Verify that route 9.1.1.0/24 exists in the BGP routing table on Switch A, Switch B, and Switch D. This example uses Switch A.

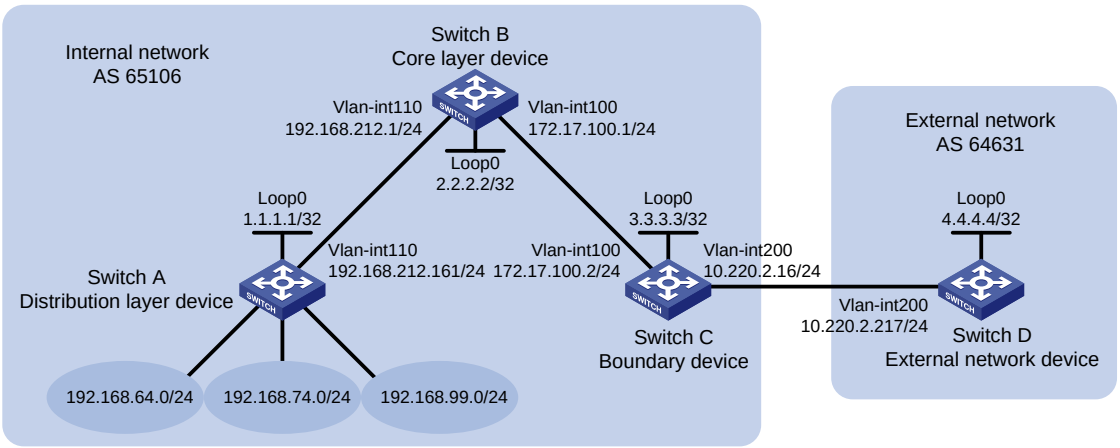
```
[SwitchA-bgp-default] display bgp routing-table ipv4

 Total Number of Routes: 1

 BGP Local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

  * i 9.1.1.0/24        10.1.2.2        0          100        0       ?
```



Example: Configuring BGP route summarization

Network configuration

As shown in Figure 16, run EBGP between Switch C and Switch D, so the internal network and external network can communicate with each other.

- In AS 65106, perform the following configurations so the devices in the internal network can communicate:
  - Configure static routing between Switch A and Switch B.
  - Configure OSPF between Switch B and Switch C.
  - Configure OSPF to redistribute static routes.
- Configure route summarization on Switch C so BGP advertises a summary route instead of advertising routes to the 192.168.64.0/24, 192.168.74.0/24, and 192.168.99.0/24 networks to Switch D.

Figure 16 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure static routing between Switch A and Switch B:

   # Configure a default route with the next hop 192.168.212.1 on Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ip route-static 0.0.0.0 0 192.168.212.1
   ```

   # Configure static routes to 192.168.64.0/24, 192.168.74.0/24, and 192.168.99.0/24 with the same next hop 192.168.212.161 on Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ip route-static 192.168.64.0 24 192.168.212.161
   [SwitchB] ip route-static 192.168.74.0 24 192.168.212.161
   [SwitchB] ip route-static 192.168.99.0 24 192.168.212.161
   ```

3. Configure OSPF between Switch B and Switch C and configure OSPF on Switch B to redistribute static routes:

   # Configure OSPF to advertise the local network and enable OSPF to redistribute static routes on Switch B.

   ```
   [SwitchB] ospf
   [SwitchB-ospf-1] area 0
   [SwitchB-ospf-1-area-0.0.0.0] network 172.17.100.0 0.0.0.255
   [SwitchB-ospf-1-area-0.0.0.0] quit
   [SwitchB-ospf-1] import-route static
   [SwitchB-ospf-1] quit
   ```

   # Configure OSPF to advertise the local networks on Switch C.

   ```
   [SwitchC] ospf
   [SwitchC-ospf-1] area 0
   [SwitchC-ospf-1-area-0.0.0.0] network 172.17.100.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] network 10.220.2.0 0.0.0.255
   [SwitchC-ospf-1-area-0.0.0.0] quit
   [SwitchC-ospf-1] quit
   ```

   # Display the IP routing table on Switch C.

   ```
   [SwitchC] display ip routing-table protocol ospf

   Summary count : 5
   ```

```
OSPF Routing table Status : <Active>
Summary count : 3

Destination/Mask    Proto    Pre  Cost         NextHop         Interface
192.168.64.0/24     O_ASE2   150  1            172.17.100.1    Vlan100
192.168.74.0/24     O_ASE2   150  1            172.17.100.1    Vlan100
192.168.99.0/24     O_ASE2   150  1            172.17.100.1    Vlan100

OSPF Routing table Status : <Inactive>
Summary count : 2

Destination/Mask    Proto     Pre  Cost         NextHop         Interface
10.220.2.0/24       O_INTRA   10   1            10.220.2.16     Vlan200
172.17.100.0/24     O_INTRA   10   1            172.17.100.2    Vlan100
```

The output shows that Switch C has learned routes to 192.168.64.0/24, 192.168.99.0/24, and 192.168.64.0/18 through OSPF.

4. Configure BGP between Switch C and Switch D and configure BGP on Switch C to redistribute OSPF routes:

On Switch C, enable BGP, specify Switch D as an EBGP peer, and configure BGP to redistribute OSPF routes.

```
[SwitchC] bgp 65106
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 10.220.2.217 as-number 64631
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 10.220.2.217 enable
[SwitchC-bgp-default-ipv4] import-route ospf
```

Enable BGP, and configure Switch C as an EBGP peer on Switch D.

```
[SwitchD] bgp 64631
[SwitchD-bgp-default] router-id 4.4.4.4
[SwitchD-bgp-default] peer 10.220.2.16 as-number 65106
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 10.220.2.16 enable
[SwitchD-bgp-default-ipv4] quit
[SwitchD-bgp-default] quit
```

Display the IP routing table on Switch D.

```
[SwitchD] display ip routing-table protocol bgp

Summary count : 3

BGP Routing table Status : <Active>
Summary count : 3

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
192.168.64.0/24     BGP    255  1            10.220.2.16     Vlan200
192.168.74.0/24     BGP    255  1            10.220.2.16     Vlan200
192.168.99.0/24     BGP    255  1            10.220.2.16     Vlan200
```

```
BGP Routing table Status : <Inactive>
Summary count : 0
```

The output shows that Switch D has learned routes to 192.168.64.0/24, 192.168.74.0/24, and 192.168.99.0/24 through BGP.

Verify that Switch D can ping hosts on networks 192.168.74.0/24, 192.168.99.0/24, and 192.168.64.0/18. (Details not shown.)

5. Configure route summarization on Switch C to summarize 192.168.64.0/24, 192.168.74.0/24, and 192.168.99.0/24 into a single route 192.168.64.0/18, and disable advertisement of specific routes.

```
[SwitchC-bgp-default-ipv4] aggregate 192.168.64.0 18 detail-suppressed
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Verifying the configuration

Display IP routing table on Switch C.

```
[SwitchC] display ip routing-table | include 192.168
192.168.64.0/18     BGP      130  0            127.0.0.1       NULL0
192.168.64.0/24     O_ASE2   150  1            172.17.100.1    Vlan100
192.168.74.0/24     O_ASE2   150  1            172.17.100.1    Vlan100
192.168.99.0/24     O_ASE2   150  1            172.17.100.1    Vlan100
```

The output shows that Switch C has a summary route 192.168.64.0/18 with the output interface Null0.

Display IP routing table on Switch D.

```
[SwitchD] display ip routing-table protocol bgp

Summary count : 1

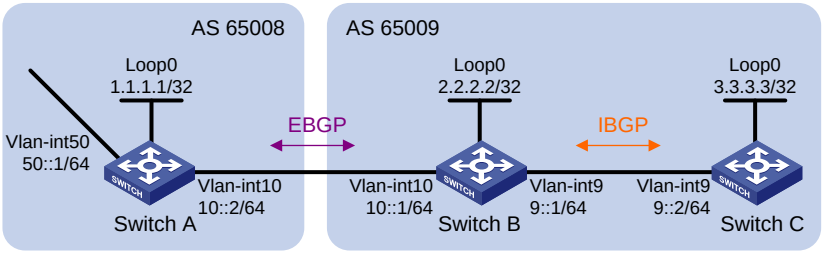
BGP Routing table Status : <Active>
Summary count : 1

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
192.168.64.0/18     BGP    255  0            10.220.2.16     Vlan200

BGP Routing table Status : <Inactive>
Summary count : 0
```

The output shows that Switch D has only one route 192.168.64.0/18 to AS 65106.

Verify that Switch D can ping the hosts on networks 192.168.64.0/24, 192.168.74.0/24, and 192.168.99.0/24. (Details not shown.)



Basic IPv6 BGP network configuration examples

Example: Configuring IPv6 BGP basics

Network configuration

As shown in Figure 17, all switches run BGP. Run EBGP between Switch A and Switch B, and run IBGP between Switch B and Switch C to allow Switch C to access network 50::/64 connected to Switch A.

Figure 17 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure IBGP:

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] bgp 65009
   [SwitchB-bgp-default] router-id 2.2.2.2
   [SwitchB-bgp-default] peer 9::2 as-number 65009
   [SwitchB-bgp-default] address-family ipv6
   [SwitchB-bgp-default-ipv6] peer 9::2 enable
   [SwitchB-bgp-default-ipv6] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] bgp 65009
   [SwitchC-bgp-default] router-id 3.3.3.3
   [SwitchC-bgp-default] peer 9::1 as-number 65009
   [SwitchC-bgp-default] address-family ipv6
   [SwitchC-bgp-default-ipv6] peer 9::1 enable
   ```

3. Configure EBGP:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] bgp 65008
   [SwitchA-bgp-default] router-id 1.1.1.1
   [SwitchA-bgp-default] peer 10::1 as-number 65009
   [SwitchA-bgp-default] address-family ipv6
   [SwitchA-bgp-default-ipv6] peer 10::1 enable
   ```

   # Configure Switch B.

   ```
   [SwitchB-bgp-default] peer 10::2 as-number 65008
   [SwitchB-bgp-default] address-family ipv6
   [SwitchB-bgp-default-ipv6] peer 10::2 enable
   ```

4. Inject network routes to the BGP routing table:

   # Configure Switch A.

   ```
   [SwitchA-bgp-default-ipv6] network 10:: 64
   [SwitchA-bgp-default-ipv6] network 50:: 64
   [SwitchA-bgp-default-ipv6] quit
   [SwitchA-bgp-default] quit
   ```

   # Configure Switch B.

   ```
   [SwitchB-bgp-default-ipv6] network 10:: 64
   ```

```
[SwitchB-bgp-default-ipv6] network 9:: 64
[SwitchB-bgp-default-ipv6] quit
[SwitchB-bgp-default] quit
```

Configure Switch C.

```
[SwitchC-bgp-default-ipv6] network 9:: 64
[SwitchC-bgp-default-ipv6] quit
[SwitchC-bgp-default] quit
```

Verifying the configuration

Display IPv6 BGP peer information on Switch B.

```
[SwitchB] display bgp peer ipv6

 BGP local router ID: 2.2.2.2
 Local AS number: 65009
 Total number of peers: 2                 Peers in established state: 2

  * - Dynamically created peer
  ^ - Peer created through link-local address
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  9::2                 65009       41       43    0       1 00:29:00 Established
  10::2                65008       38       38    0       2 00:27:20 Established
```

The output shows that Switch A and Switch B have established an EBGP connection, and Switch B and Switch C have established an IBGP connection.

Display IPv6 BGP routing table information on Switch A.

```
[SwitchA] display bgp routing-table ipv6

 Total number of routes: 4

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

* >e Network : 9::                                      PrefixLen : 64
     NextHop : 10::1                                    LocPrf    :
     PrefVal : 0                                        OutLabel  : NULL
     MED     : 0
     Path/Ogn: 65009i

* >  Network : 10::                                     PrefixLen : 64

     PrefVal : 32768                                    OutLabel  : NULL
     MED     : 0
     Path/Ogn: i

*  e Network : 10::                                     PrefixLen : 64
```

```
     NextHop : 10::1                                        LocPrf    :
     PrefVal : 0                                            OutLabel  : NULL
     MED     : 0
     Path/Ogn: 65009i

* >  Network : 50::                                         PrefixLen : 64
     NextHop : ::                                           LocPrf    :
     PrefVal : 32768                                        OutLabel  : NULL
     MED     : 0
     Path/Ogn: i
```

The output shows that Switch A has learned routing information of AS 65009.

Display IPv6 BGP routing table information on Switch C.

```
[SwitchC] display bgp routing-table ipv6

 Total number of routes: 4

 BGP local router ID is 3.3.3.3
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

* >  Network : 9::                                          PrefixLen : 64
     NextHop : ::                                           LocPrf    :
     PrefVal : 32768                                        OutLabel  : NULL
     MED     : 0
     Path/Ogn: i

*  i Network : 9::                                          PrefixLen : 64
     NextHop : 9::1                                         LocPrf    : 100
     PrefVal : 0                                            OutLabel  : NULL
     MED     : 0
     Path/Ogn: i

* >i Network : 10::                                         PrefixLen : 64
     NextHop : 9::1                                         LocPrf    : 100
     PrefVal : 0                                            OutLabel  : NULL
     MED     : 0
     Path/Ogn: i

* >i Network : 50::                                         PrefixLen : 64
     NextHop : 10::2                                        LocPrf    : 100
     PrefVal : 0                                            OutLabel  : NULL
     MED     : 0
     Path/Ogn: 65008i
```

The output shows that Switch C has learned the route 50::/64.

Verify that Switch C can ping hosts on network 50::/64. (Details not shown.)

Troubleshooting BGP

State of the connection to a peer cannot become established

Symptom

The **display bgp peer ipv4 unicast** or **display bgp peer ipv6 unicast** command output shows that the state of the connection to a peer cannot become established.

Analysis

To become BGP peers, any two routers must establish a TCP connection using port 179 and exchange OPEN messages successfully.

Solution

1. To resolve the problem:
   a. Use the **display current-configuration** command to verify the current configuration, and verify that the peer's AS number is correct.
   b. Use the **display bgp peer ipv4 unicast** or **display bgp peer ipv6 unicast** command to verify that the peer's IP/IPv6 address is correct.
   c. If a loopback interface is used, verify that the loopback interface is specified with the **peer connect-interface** command.
   d. If the peer is a non-direct EBGP peer, verify that the **peer ebgp-max-hop** command is configured.
   e. If the **peer ttl-security hops** command is configured, verify that the command is configured on the peer. Verify that the *hop-count* values configured on them are greater than the number of hops between them.
   f. Verify that a valid route to the peer is available.
   g. Use the **ping** command to verify the connectivity to the peer.
   h. Use the **display tcp verbose** or **display ipv6 tcp verbose** command to verify the TCP connection.
   i. Verify that no ACL rule is applied to disable TCP port 179.
2. If the problem persists, contact H3C Support.

Configuring large-scale BGP networks

Large-scale BGP network configuration tasks at a glance

To configure large-scale BGP networks, perform the following tasks:

- Configuring BGP route dampening
- Configuring BGP communities
- Configuring BGP route reflection
- Configuring BGP confederation settings
  - Configuring a BGP confederation
  - (Optional.) Configuring confederation compatibility

Configuring BGP route dampening

About this task

Route dampening enables BGP to not select unstable routes as optimal routes.

Restrictions and guidelines

This feature applies to EBGP routes but not to IBGP routes.

If an EBGP peer goes down after you configure this feature, routes coming from the peer are dampened but not deleted.

After an active/standby switchover, BGP route dampening processes and information will be reset. The device needs to recalculate the dampening mechanism of BGP routes.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure BGP route dampening.

   dampening [*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

   By default, BGP route dampening is not configured.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure IPv6 BGP route dampening.

   dampening [*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

   By default, IPv6 BGP route dampening is not configured.

Configuring BGP communities

About this task

By default, a router does not advertise the COMMUNITY or extended community attribute to its peers or peer groups. When the router receives a route carrying the COMMUNITY or extended community attribute, it removes the attribute before advertising the route to other peers or peer groups.

Perform this task to enable a router to advertise the COMMUNITY or extended community attribute to its peers for route filtering and control. You can also use a routing policy to add or modify the COMMUNITY or extended community attribute for specific routes. For more information about routing policy, see "Configuring routing policies."

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Advertise the COMMUNITY attribute to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise-community**

interface-peer *interface-type interface-number* **advertise-community**

By default, the COMMUNITY attribute is not advertised.

4. Advertise the extended community attribute to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

interface-peer *interface-type interface-number* **advertise-ext-community**

By default, the extended community attribute is not advertised.

5. (Optional.) Apply a routing policy to routes advertised to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **route-policy** *route-policy-name* **export**

interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **export**

By default, no routing policy is applied.

Procedure (IPv6 unicast address family)

1. Enter system view.

system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Advertise the COMMUNITY attribute to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise-community**

interface-peer *interface-type interface-number* **advertise-community**

By default, the COMMUNITY attribute is not advertised.

4. Advertise the extended community attribute to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise-ext-community**

interface-peer *interface-type interface-number* **advertise-ext-community**

By default, the extended community attribute is not advertised.

5. (Optional.) Apply a routing policy to routes advertised to a peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **route-policy** *route-policy-name* **export**

interface-peer *interface-type interface-number* **route-policy** *route-policy-name* **export**

By default, no routing policy is applied.

Configuring BGP route reflection

Configuring a BGP route reflector

About this task

Perform this task to configure a BGP route reflector and its clients. The route reflector and its clients automatically form a cluster identified by the router ID of the route reflector. The route reflector forwards route updates among its clients.

To improve availability, you can specify multiple route reflectors for a cluster. The route reflectors in the cluster must have the same cluster ID to avoid routing loops.

When a route reflector is connected to multiple clusters in the network, you can specify different cluster IDs for different peers and peer groups to control route reflection.

You only need to configure BGP route reflection on the device that acts as a route reflector. Other devices do not need to know the role of the local device in route reflection.

After you configure a device as a route reflector, it advertises routes as follows:

- Advertises routes received from a non-client IBGP peer to all clients.
- Advertises routes received from an IBGP peer that acts as a client to all peers.
- Advertises routes received from an EBGP peer to all peers.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Configure the router as a route reflector and specify a peer or peer group as its client. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

   interface-peer *interface-type interface-number* **reflect-client**

   By default, no route reflector or client is configured.
4. (Optional.) Enable route reflection between clients.

reflect between-clients

By default, route reflection between clients is enabled.

5. (Optional.) Configure the cluster ID of the route reflector.

   reflector cluster-id { *cluster-id* | *ipv4-address* }

   By default, a route reflector uses its own router ID as the cluster ID.

6. (Optional.) Enable the route reflector to change the attributes of routes to be reflected.

   reflect change-path-attribute

   By default, the route reflector cannot change the attributes of routes to be reflected.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

   bgp *as-number* [**instance** *instance-name*]

   address-family ipv6 [**unicast**]

3. Configure the router as a route reflector and specify a peer or peer group as its client. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **reflect-client**

   interface-peer *interface-type interface-number* **reflect-client**

   By default, no route reflector or client is configured.

   The *ipv4-address* [*mask-length*] and *link-local-address* **interface** *interface-type interface-number* options and the **interface-peer** command are not supported in BGP IPv6 multicast address family view.

4. (Optional.) Enable route reflection between clients.

   reflect between-clients

   By default, route reflection between clients is enabled.

5. (Optional.) Configure the cluster ID of the route reflector.

   reflector cluster-id { *cluster-id* | *ipv4-address* }

   By default, a route reflector uses its own router ID as the cluster ID.

6. (Optional.) Enable the route reflector to change the attributes of routes to be reflected.

   reflect change-path-attribute

   By default, the route reflector cannot change the attributes of routes to be reflected.

Ignoring the ORIGINATOR_ID attribute

About this task

By default, BGP drops incoming route updates whose ORIGINATOR_ID attribute is the same as the local router ID. Some special networks such as firewall networks require BGP to accept such route updates. To meet the requirement, you must configure BGP to ignore the ORIGINATOR_ID attribute.

Restrictions and guidelines

Make sure this command does not result in a routing loop.

After you execute this command, BGP also ignores the CLUSTER_LIST attribute.

Procedure (IPv4 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Ignore the ORIGINATOR_ID attribute.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **ignore-originatorid**
   By default, BGP does not ignore the ORIGINATOR_ID attribute.

Procedure (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Ignore the ORIGINATOR_ID attribute. Choose one command as needed:
   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **ignore-originatorid**
   interface-peer *interface-type interface-number* **ignore-originatorid**
   By default, BGP does not ignore the ORIGINATOR_ID attribute.

Configuring BGP confederation settings

About BGP confederation

BGP confederation provides another way to reduce IBGP connections in an AS.

A confederation contains sub-ASs. In each sub-AS, IBGP peers are fully meshed. Sub-ASs establish EBGP connections in between.

Configuring a BGP confederation

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Configure a confederation ID.
   confederation id *as-number*
   By default, no confederation ID is configured.

From an outsider's perspective, the sub-ASs of the confederation is a single AS, which is identified by the confederation ID.

4. Specify confederation peer sub-ASs in the confederation.

   confederation peer-as *as-number-list*

   By default, no confederation peer sub-ASs are specified.

   A confederation can contain a maximum of 32 sub-ASs. The AS number of a sub-AS is effective only in the confederation.

   If the router needs to establish EBGP connections to other sub-ASs, you must specify the peering sub-ASs in the confederation.

Configuring confederation compatibility

About this task

If any routers in the confederation do not comply with RFC 3065, enable confederation compatibility to allow the router to work with those routers.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enable confederation compatibility.

   confederation nonstandard

   By default, confederation compatibility is disabled.

Display and maintenance commands for large-scale BGP network configuration

Execute **display** commands in any view.

Displaying BGP (IPv4 unicast address family)

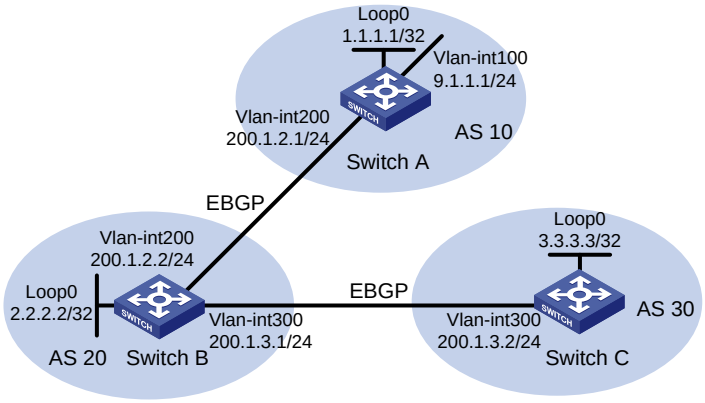
Task	Command
Display BGP IPv4 unicast route dampening parameter information.	**display bgp** [**instance** *instance-name*] **dampening parameter ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display BGP IPv4 unicast peer group information.	**display bgp** [**instance** *instance-name*] **group ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [**group-name** *group-name*]
Display information about a peer or peer group in BGP IPv4 unicast address family.	**display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*] **verbose**] **display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] [[*ipv6-address*

Task	Command
	prefix-length | **interface** *interface-type interface-number*] | [*ipv6-address* [**interface** *interface-type interface-number*] **log-info** | [*ipv6-address* [**interface** *interface-type interface-number*] **verbose**]
Display dampened BGP IPv4 unicast route information.	**display bgp** [**instance** *instance-name*] **routing-table dampened ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display BGP IPv4 unicast route flapping statistics.	**display bgp** [**instance** *instance-name*] **routing-table flap-info ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address* [{ *mask-length* | *mask* } [**longest-match**]] | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* }]

Displaying BGP (IPv6 unicast address family)

Task	Command
Display BGP IPv6 unicast route dampening parameter information.	**display bgp** [**instance** *instance-name*] **dampening parameter ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display BGP IPv6 unicast peer group information.	**display bgp** [**instance** *instance-name*] **group ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [**group-name** *group-name*]
Display information about a peer or peer group in BGP IPv6 unicast address family.	**display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | { *ipv6-address* | **group-name** *group-name* } **log-info** | [*ipv6-address*] **verbose**] **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] [[*link-local-address*] **interface** *interface-type interface-number* | *link-local-address* **interface** *interface-type interface-number* { **log-info** | **verbose** }] **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [*ipv4-address mask-length* | *ipv4-address* **log-info** | [*ipv4-address*] **verbose**]
Display dampened BGP IPv6 unicast route information.	**display bgp** [**instance** *instance-name*] **routing-table dampened ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]
Display BGP IPv6 unicast route flapping statistics.	**display bgp** [**instance** *instance-name*] **routing-table flap-info ipv6** [**unicast**]

Task	Command
	[**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length* | **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* }]



Large-scale BGP network configuration examples

Example: Configuring BGP communities

Network configuration

As shown in Figure 18, Switch B establishes EBGP connections with Switch A and Switch C. Configure NO_EXPORT community attribute on Switch A to make routes from AS 10 not advertised by AS 20 to any other AS.

Figure 18 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure EBGP connections:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 10
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 200.1.2.2 as-number 20
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 200.1.2.2 enable
[SwitchA-bgp-default-ipv4] network 9.1.1.0 255.255.255.0
[SwitchA-bgp-default] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 20
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 200.1.2.1 as-number 10
[SwitchB-bgp-default] peer 200.1.3.2 as-number 30
[SwitchB-bgp-default] address-family ipv4 unicast
```

```
[SwitchB-bgp-default-ipv4] peer 200.1.2.1 enable
[SwitchB-bgp-default-ipv4] peer 200.1.3.2 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 30
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 200.1.3.1 as-number 20
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 200.1.3.1 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Display the BGP routing table on Switch B.

```
[SwitchB] display bgp routing-table ipv4 9.1.1.0

 BGP local router ID: 2.2.2.2
 Local AS number: 20

 Paths:   1 available, 1 best

 BGP routing table information of 9.1.1.0/24:
 From            : 200.1.2.1 (1.1.1.1)
 Rely nexthop    : 200.1.2.1
 Original nexthop: 200.1.2.1
 OutLabel        : NULL
 RxPathID        : 0x0
 TxPathID        : 0x0
 AS-path         : 10
 Origin          : igp
 Attribute value : pref-val 0
 State           : valid, external, best
 IP precedence   : N/A
 QoS local ID    : N/A
 Traffic index   : N/A
```

Display advertisement information of network 9.1.1.0 on Switch B.

```
[SwitchB] display bgp routing-table ipv4 9.1.1.0 advertise-info

 BGP local router ID: 2.2.2.2
 Local AS number: 20

 Paths:   1 best

 BGP routing table information of 9.1.1.0/24:
 Advertised to peers (1 in total):
    200.1.3.2
```

The output shows that Switch B can advertise the route with the destination 9.1.1.0/24 to other ASs through BGP.

Display the BGP routing table on Switch C.

```
[SwitchC] display bgp routing-table ipv4

 Total number of routes: 1

 BGP local router ID is 3.3.3.3
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 9.1.1.0/24         200.1.3.1                             0       20 10i
```

The output shows that Switch C has learned route 9.1.1.0/24 from Switch B.

3. Configure a BGP community:

Configure a routing policy.

```
[SwitchA] route-policy comm_policy permit node 0
[SwitchA-route-policy-comm_policy-0] apply community no-export
[SwitchA-route-policy-comm_policy-0] quit
```

Apply the routing policy.

```
[SwitchA] bgp 10
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 200.1.2.2 route-policy comm_policy export
[SwitchA-bgp-default-ipv4] peer 200.1.2.2 advertise-community
```

Verifying the configuration

Display the routing table on Switch B.

```
[SwitchB] display bgp routing-table ipv4 9.1.1.0

 BGP local router ID: 2.2.2.2
 Local AS number: 20

 Paths:   1 available, 1 best

 BGP routing table information of 9.1.1.0/24:
 From            : 200.1.2.1 (1.1.1.1)
 Rely nexthop    : 200.1.2.1
 Original nexthop: 200.1.2.1
 OutLabel        : NULL
 RxPathID        : 0x0
 TxPathID        : 0x0
 Community       : No-Export
 AS-path         : 10
 Origin          : igp
 Attribute value : pref-val 0
 State           : valid, external, best
 IP precedence   : N/A
```

```
 QoS local ID    : N/A
 Traffic index   : N/A
```

Display advertisement information for the route 9.1.1.0 on Switch B.

```
[SwitchB] display bgp routing-table ipv4 9.1.1.0 advertise-info

 BGP local router ID: 2.2.2.2
 Local AS number: 20

 Paths:   1 best

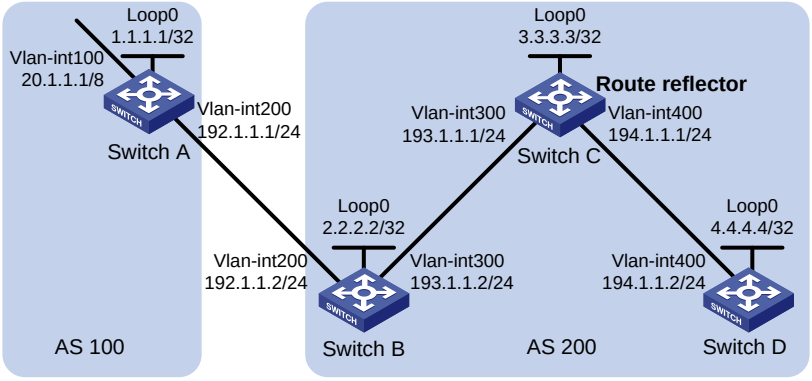
 BGP routing table information of 9.1.1.0/24:
 Not advertised to any peers yet
```

Display the BGP routing table on Switch C.

```
[SwitchC] display bgp routing-table ipv4

 Total number of routes: 0
```

The output shows that BGP has not learned any route.



Example: Configuring BGP route reflector

Network configuration

As shown in Figure 19, all switches run BGP. Run EBGP between Switch A and Switch B, and run IBGP between Switch C and Switch B, and between Switch C and Switch D.

Configure Switch C as a route reflector with clients Switch B and Switch D to allow Switch D to learn route 20.0.0.0/8 from Switch C.

Figure 19 Network diagram

Procedure

1. Configure IP addresses for interfaces and configure OSPF in AS 200. (Details not shown.)
2. Configure BGP connections:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] bgp 100
   [SwitchA-bgp-default] router-id 1.1.1.1
   [SwitchA-bgp-default] peer 192.1.1.2 as-number 200
   [SwitchA-bgp-default] address-family ipv4 unicast
   ```

```
[SwitchA-bgp-default-ipv4] peer 192.1.1.2 enable
```

Inject network 20.0.0.0/8 to the BGP routing table.

```
[SwitchA-bgp-default-ipv4] network 20.0.0.0
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 200
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 192.1.1.1 as-number 100
[SwitchB-bgp-default] peer 193.1.1.1 as-number 200
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 192.1.1.1 enable
[SwitchB-bgp-default-ipv4] peer 193.1.1.1 enable
[SwitchB-bgp-default-ipv4] peer 193.1.1.1 next-hop-local
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 193.1.1.2 as-number 200
[SwitchC-bgp-default] peer 194.1.1.2 as-number 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 193.1.1.2 enable
[SwitchC-bgp-default-ipv4] peer 194.1.1.2 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] bgp 200
[SwitchD-bgp-default] router-id 4.4.4.4
[SwitchD-bgp-default] peer 194.1.1.1 as-number 200
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 194.1.1.1 enable
[SwitchD-bgp-default-ipv4] quit
[SwitchD-bgp-default] quit
```

3. Configure Switch C as the route reflector.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 193.1.1.2 reflect-client
[SwitchC-bgp-default-ipv4] peer 194.1.1.2 reflect-client
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Verifying the configuration

Display the BGP routing table on Switch B.

```
[SwitchB] display bgp routing-table ipv4
```

```
 Total number of routes: 1

 BGP local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 20.0.0.0           192.1.1.1       0                     0       100i
```

Display the BGP routing table on Switch D.

```
[SwitchD] display bgp routing-table ipv4

 Total number of routes: 1

 BGP local router ID is 4.4.4.4
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >i 20.0.0.0           193.1.1.2       0          100        0       100i
```

The output shows that Switch D has learned route 20.0.0.0/8 from Switch C.

Example: Configuring BGP confederation

Network configuration

As shown in Figure 20, split AS 200 into three sub-ASs (AS 65001, AS 65002, and AS 65003) to reduce IBGP connections. Switches in AS 65001 are fully meshed.

Figure 20 Network diagram

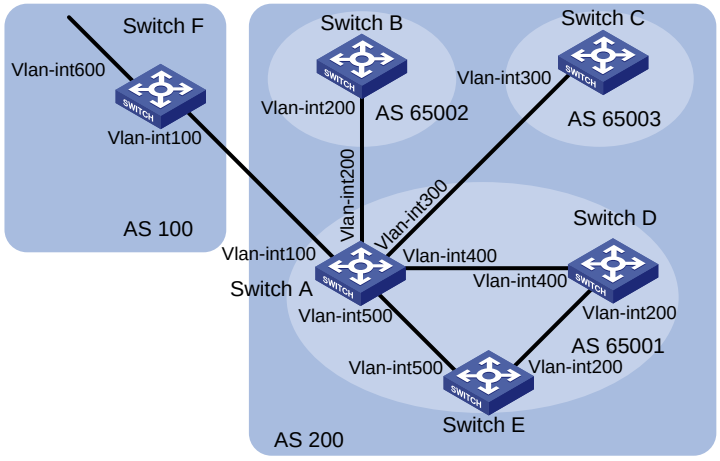


Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	200.1.1.1/24	Switch D	Vlan-int200	10.1.5.1/24
	Vlan-int200	10.1.1.1/24		Vlan-int400	10.1.3.2/24
	Vlan-int300	10.1.2.1/24	Switch E	Vlan-int200	10.1.5.2/24
	Vlan-int400	10.1.3.1/24		Vlan-int500	10.1.4.2/24
	Vlan-int500	10.1.4.1/24	Switch F	Vlan-int100	200.1.1.2/24
Switch B	Vlan-int200	10.1.1.2/24		Vlan-int600	9.1.1.1/24
Switch C	Vlan-int300	10.1.2.2/24			

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure BGP confederation:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 65001
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] confederation id 200
[SwitchA-bgp-default] confederation peer-as 65002 65003
[SwitchA-bgp-default] peer 10.1.1.2 as-number 65002
[SwitchA-bgp-default] peer 10.1.2.2 as-number 65003
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 10.1.1.2 enable
[SwitchA-bgp-default-ipv4] peer 10.1.2.2 enable
[SwitchA-bgp-default-ipv4] peer 10.1.1.2 next-hop-local
[SwitchA-bgp-default-ipv4] peer 10.1.2.2 next-hop-local
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 65002
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] confederation id 200
[SwitchB-bgp-default] confederation peer-as 65001 65003
[SwitchB-bgp-default] peer 10.1.1.1 as-number 65001
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 10.1.1.1 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 65003
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] confederation id 200
[SwitchC-bgp-default] confederation peer-as 65001 65002
```

```
[SwitchC-bgp-default] peer 10.1.2.1 as-number 65001
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 10.1.2.1 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

3. Configure IBGP connections in AS 65001:

Configure Switch A.

```
[SwitchA] bgp 65001
[SwitchA-bgp-default] peer 10.1.3.2 as-number 65001
[SwitchA-bgp-default] peer 10.1.4.2 as-number 65001
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 10.1.3.2 enable
[SwitchA-bgp-default-ipv4] peer 10.1.4.2 enable
[SwitchA-bgp-default-ipv4] peer 10.1.3.2 next-hop-local
[SwitchA-bgp-default-ipv4] peer 10.1.4.2 next-hop-local
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] bgp 65001
[SwitchD-bgp-default] router-id 4.4.4.4
[SwitchD-bgp-default] confederation id 200
[SwitchD-bgp-default] peer 10.1.3.1 as-number 65001
[SwitchD-bgp-default] peer 10.1.5.2 as-number 65001
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 10.1.3.1 enable
[SwitchD-bgp-default-ipv4] peer 10.1.5.2 enable

```

The output shows the following:

- Switch F can send route information to Switch B and Switch C through the confederation by establishing only an EBGP connection with Switch A.
- Switch B and Switch D are in the same confederation, but belong to different sub-ASs. They obtain external route information from Switch A, and generate identical BGP route entries although they have no direct connection in between.

Controlling BGP path selection

BGP path selection control tasks at a glance

By configuring BGP path attributes, you can control BGP path selection.

To control BGP path selection, perform the following tasks:

1. Configuring preferences for BGP routes
2. Configuring the NEXT_HOP attribute
   - Setting the local device IP as the next hop
   - Advertising only the global unicast address in the NEXT_HOP attribute
3. Setting a preferred value for received routes
4. Configuring the default local preference
5. Configuring the AS_PATH attribute
   - Permitting local AS number to appear in routes from a peer or peer group
   - Ignoring the AS_PATH attribute during optimal route selection
   - Advertising a fake AS number to a peer or peer group
   - Configuring AS number substitution
   - Removing private AS numbers from sent updates
   - Ignoring the first AS number of EBGP route updates
6. Configuring the MED attribute
   - Configuring the default MED value
   - Enabling MED comparison for routes from different ASs
   - Enabling MED comparison for routes on a per-AS basis
   - Enabling MED comparison for routes from confederation peers
7. Controlling BGP optimal route selection
   - Ignoring IGP metrics during optimal route selection
   - Ignoring router IDs during optimal route selection

Configuring preferences for BGP routes

About this task

Routing protocols each have a default preference. If they find multiple routes destined for the same network, the route found by the routing protocol with the highest preference is selected as the optimal route. A smaller preference value indicates a higher preference.

You can use the **`preference`** command to modify preferences for EBGP, IBGP, and local BGP routes, or use a routing policy to set a preference for matching routes. For routes not matching the routing policy, the default preference applies.

If a device has an EBGP route and a local BGP route to reach the same destination, it does not select the EBGP route because the EBGP route has a lower preference than the local BGP route by default. You can use the **`network short-cut`** command to configure the EBGP route as a shortcut route that has the same preference as the local BGP route. The EBGP route will more likely become the optimal route.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure preferences for EBGP, IBGP, and local BGP routes.

   preference { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

   By default, the preferences for EBGP, IBGP, and local BGP routes are 255, 255, and 130, respectively.

   You can use this command to configure preferences for BGP routes generated by the local device. In the current software version, this command takes effect only on BGP summary routes generated by using the **aggregate** command.

4. (Optional.) Configure an EBGP route as a shortcut route.

   network *ipv4-address* [*mask-length* | *mask*] **short-cut**

   By default, an EBGP route has a preference of 255.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure preferences for EBGP, IBGP, and local BGP routes.

   preference { *external-preference internal-preference local-preference* | **route-policy** *route-policy-name* }

   By default, the preferences for EBGP, IBGP, and local BGP routes are 255, 255, and 130, respectively.

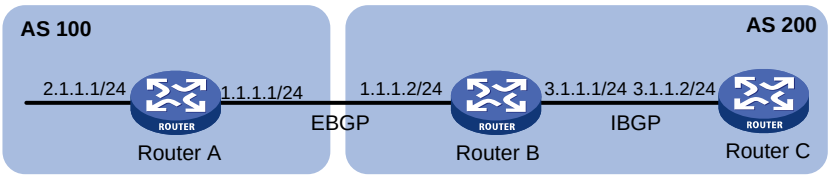
   You can use this command to configure preferences for BGP routes generated by the local device. In the current software version, this command takes effect only on BGP summary routes generated by using the **aggregate** command.

4. (Optional.) Configure an EBGP route as a shortcut route.

network *ipv6-address prefix-length* **short-cut**

By default, an EBGP route has a preference of 255.

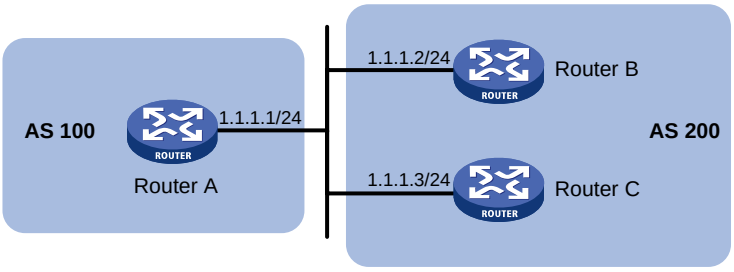
Configuring the NEXT_HOP attribute



Setting the local device IP as the next hop

About this task

By default, a BGP router does not set itself as the next hop for routes advertised to an IBGP peer or peer group. In some cases, however, you must configure the advertising router as the next hop to ensure that the BGP peer can find the correct next hop.



For example, as shown in Figure 21, Router A and Router B establish an EBGP neighbor relationship, and Router B and Router C establish an IBGP neighbor relationship. If Router C has no route destined for IP address 1.1.1.1/24, you must configure Router B to set itself 3.1.1.1/24 as the next hop for the network 2.1.1.1/24 advertised to Router C.

Figure 21 NEXT_HOP attribute configuration

If a BGP router has two peers on a broadcast network, it does not set itself as the next hop for routes sent to an EBGP peer by default. As shown in Figure 22, Router A and Router B establish an EBGP neighbor relationship, and Router B and Router C establish an IBGP neighbor relationship. They are on the same broadcast network 1.1.1.0/24. When Router B sends EBGP routes to Router A, it does not set itself as the next hop by default. However, you can configure Router B to set it (1.1.1.2/24) as the next hop for routes sent to Router A by using the **peer next-hop-local** command as needed.

Figure 22 NEXT_HOP attribute configuration

Restrictions and guidelines

If you have configured BGP load balancing, the router sets itself as the next hop for routes sent to an IBGP peer or peer group regardless of whether the **peer next-hop-local** command is configured.

A route reflector can change the NEXT_HOP attribute of reflected routes only if it is configured with both of the **peer next-hop-local** and **reflect change-path-attribute** commands.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Specify the local device IP as the next hop for routes sent to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **next-hop-local**

   interface-peer *interface-type interface-number* **next-hop-local**

   The default settings are as follows:
   - When the device advertises a route to an EBGP peer, it processes the next hop of that route as follows:
     - If the EBGP peer is a directly connected peer and the next hop of the route is in the same network as the peer-facing interface of the local device, the device does not change the next hop of the route.
     - In other scenarios, the device sets the local device IP as the next hop of the route.
   - The device does not change the next hops of routes sent to an IBGP peer or peer group. When the device sends ECMP BGP routes to IBGP peers, it sets the local device IP as the next hop of the optimal route among these routes.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Specify the local device IP as the next hop for routes sent to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **next-hop-local**

   interface-peer *interface-type interface-number* **next-hop-local**

   The default settings are as follows:
   - When the device advertises a route to an EBGP peer, it processes the next hop of that route as follows:

- If the EBGP peer is a directly connected peer and the next hop of the route is in the same network as the peer-facing interface of the local device, the device does not change the next hop of the route.
- In other scenarios, the device sets the local device IP as the next hop of the route.

- The device does not change the next hops of routes sent to an IBGP peer or peer group. When the device sends ECMP BGP routes to IBGP peers, it sets the local device IP as the next hop of the optimal route among these routes.

Advertising only the global unicast address in the NEXT_HOP attribute

About this task

A directly-connected IPv6 EBGP peer might fail to learn routes if it cannot parse a route update that contains both the link-local address and the global unicast address. To resolve this issue, perform this task to enable the local device to advertise only the global unicast address in the NEXT_HOP attribute to its IPv6 peers.

Restrictions and guidelines

This feature might not apply to EBGP peers established through directly connected broadcast interfaces. If the next hop of the advertised route and the directly connected broadcast interfaces belong to the same subnet, this feature does not take effect.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Enable the device to advertise only the global unicast address in the NEXT_HOP attribute to its IPv6 peers.

   nexthop global-address-only

   By default, if the local device has a link-local address, it advertises both the link-local address and the global unicast address in the NEXT_HOP attribute to the directly-connected IPv6 EBGP peers established with its global unicast address.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

address-family ipv6 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Enable the device to advertise only the global unicast address in the NEXT_HOP attribute to its IPv6 peers.

   nexthop global-address-only

   By default, if the local device has a link-local address, it advertises both the link-local address and the global unicast address in the NEXT_HOP attribute to the directly-connected IPv6 EBGP peers established with its global unicast address.

Setting a preferred value for received routes

About this task

Perform this task to set a preferred value for specific routes to control BGP path selection.

Among multiple routes that have the same destination/mask and are learned from different peers, the one with the greatest preferred value is selected as the optimal route.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Set a preferred value for routes received from a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **preferred-value** *value*

   interface-peer *interface-type interface-number* **preferred-value** *value*

   By default, the preferred value is 0 for routes received from a peer or peer group.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

address-family ipv6 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Set a preferred value for routes received from a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **preferred-value** *value*

   interface-peer *interface-type interface-number* **preferred-value** *value*

   By default, the preferred value is 0 for routes received from a peer or peer group.

Configuring the default local preference

About this task

The local preference is used to determine the optimal route for traffic leaving the local AS. When a BGP router obtains from several IBGP peers multiple routes to the same destination, but with different next hops, it selects the route with the highest local preference as the optimal route.

This task allows you to specify the default local preference for routes sent to IBGP peers.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.

   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure the default local preference.

   default local-preference *value*

   The default local preference is 100.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.

   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Configure the default local preference.

   default local-preference *value*

   The default local preference is 100.

Configuring the AS_PATH attribute

Permitting local AS number to appear in routes from a peer or peer group

About this task

In general, BGP checks whether the AS_PATH attribute of a route from a peer contains the local AS number. If yes, it discards the route to avoid routing loops.

In certain network environments, however, the AS_PATH attribute of a route from a peer must be allowed to contain the local AS number. Otherwise, the route cannot be advertised correctly.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Permit the local AS number to appear in routes from a peer or peer group and set the appearance times. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **allow-as-loop** [*number*]

   interface-peer *interface-type interface-number* **allow-as-loop** [*number*]

   By default, the local AS number is not allowed in routes from a peer or peer group.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.

- Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  address-family ipv6 [**unicast**]
- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Permit the local AS number to appear in routes from a peer or peer group and set the appearance times. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **allow-as-loop** [*number*]

   interface-peer *interface-type interface-number* **allow-as-loop** [*number*]

   By default, the local AS number is not allowed in routes from a peer or peer group.

Ignoring the AS_PATH attribute during optimal route selection

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Configure BGP to ignore the AS_PATH attribute during optimal route selection.

   bestroute as-path-neglect

   By default, BGP includes the AS_PATH attribute in optimal route selection.

Advertising a fake AS number to a peer or peer group

About this task

After you move a BGP router from an AS to another AS (from AS 2 to AS 3 for example), you have to modify the AS number of the router on all its EBGP peers. To avoid such modifications, you can configure the router to advertise a fake AS number 2 to its EBGP peers so that the EBGP peers still think that Router A is in AS 2.

Restrictions and guidelines

This command applies only to EBGP peers or EBGP peer groups.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Advertise a fake AS number to a peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **fake-as** *as-number*
   By default, no fake AS number is advertised to a peer or peer group.

Procedure (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Advertise a fake AS number to a peer or peer group. Choose one command as needed:
   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **fake-as** *as-number*
   interface-peer *interface-type interface-number* **fake-as** *as-number*
   By default, no fake AS number is advertised to a peer or peer group.

Configuring AS number substitution

About this task

To use EBGP between PE and CE in some networks, VPN sites in different geographical areas should have different AS numbers. Otherwise, BGP discards route updates containing the local AS number. If two CEs connected to different PEs use the same AS number, you must configure AS number substitution on each PE. This substitution can replace the AS number in route updates originated by the remote CE as its own AS number before advertising them to the connected CE.

Restrictions and guidelines

Do not configure AS number substitution in normal circumstances. Otherwise, routing loops might occur.

Procedure (IPv4 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*

3. Configure AS number substitution for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **substitute-as**

   By default, AS number substitution is not configured.

Procedure (IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Configure AS number substitution for a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **substitute-as**

   interface-peer *interface-type interface-number* **substitute-as**

   By default, AS number substitution is not configured.

Removing private AS numbers from sent updates

About this task

Private AS numbers are typically used in test networks, and should not be transmitted in public networks. The range of private AS numbers is from 64512 to 65535.

Perform this task to enable BGP to remove or replace private AS numbers from the AS_PATH attribute of updates sent to a peer or peer group.

Restrictions and guidelines

This feature is applicable only to EBGP peers or peer groups.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Configure BGP to remove private AS numbers from the AS_PATH attribute of updates sent to an EBGP peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **public-as-only** [{ **force** | **limited** } [**replace**] [**include-peer-as**]]

interface-peer *interface-type interface-number* **public-as-only** [{ **force** | **limited** } [**replace**] [**include-peer-as**]]

By default, BGP updates sent to an EBGP peer or peer group can carry both public and private AS numbers.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure BGP to remove private AS numbers from the AS_PATH attribute of updates sent to an EBGP peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **public-as-only** [{ **force** | **limited** } [**replace**] [**include-peer-as**]]

   interface-peer *interface-type interface-number* **public-as-only** [{ **force** | **limited** } [**replace**] [**include-peer-as**]]

   By default, BGP updates sent to an EBGP peer or peer group can carry both public and private AS numbers.

   This command applies only to EBGP peers and peer groups.

Ignoring the first AS number of EBGP route updates

About this task

By default, BGP checks the first AS number of an EBGP-learned route update. If the first AS number is neither the AS number of the BGP peer nor a private AS number, the BGP router disconnects the BGP session to the peer.

Ignoring the first AS number of EBGP route updates

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Configure BGP to ignore the first AS number of EBGP route updates.

   ignore-first-as

   By default, BGP checks the first AS number of EBGP-learned route updates.

Ignoring the first AS number of EBGP route updates received from a peer or peer group (IPv4 peers)

1. Enter system view.

system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enable BGP to ignore the first AS number of EBGP route updates received from the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **ignore-first-as**
   By default, BGP checks the first AS number of route updates learned from EBGP peers or peer groups.

Ignoring the first AS number of EBGP route updates received from a peer or peer group (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enable BGP to ignore the first AS number of EBGP route updates received from a peer or peer group. Choose one command as needed:
   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **ignore-first-as**
   interface-peer *interface-type interface-number* **ignore-first-as**
   By default, BGP checks the first AS number of route updates learned from EBGP peers or peer groups.

Configuring the MED attribute

About the MED attribute

BGP uses MED to determine the optimal route for traffic going into an AS. When a BGP router obtains multiple routes with the same destination but with different next hops, it selects the route with the smallest MED value as the optimal route if other conditions are the same.

Configuring the default MED value

Configuring the default MED value (IPv4 unicast address family)

1. Enter system view.
   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

bgp *as-number* [**instance** *instance-name*]

address-family ipv4 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv4 [**unicast**]

3. Configure the default MED value.

   default med *med-value*

   The default MED value is 0.

Configuring the default MED value (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure the default MED value.

   default med *med-value*

   The default MED value is 0.

Enabling MED comparison for routes from different ASs

About this task

By default, BGP only compares the MEDs of routes from the same AS. This task enables BGP to compare the MEDs of routes from different ASs.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]

   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Enable MED comparison for routes from different ASs.

   compare-different-as-med

   By default, MED comparison for routes from different ASs is disabled.

Enabling MED comparison for routes on a per-AS basis

About this task

This task enables BGP to compare the MEDs of routes from an AS.

Figure 23 Route selection based on MED (in an IPv4 network)

As shown in Figure 23, Device D establishes indirect EBGP peer relationships with Device A, Device B, and Device C, and learns addresses 1.1.1.1/32, 2.2.2.2/32, and 3.3.3.3/32 through OSPF. The following output shows the routing information on Device D.

```
Destination/Mask    Proto   Pre Cost        NextHop         Interface
1.1.1.1/32          O_INTRA 10  10          11.1.1.2        Interface D1
2.2.2.2/32          O_INTRA 10  20          12.1.1.2        Interface D2
3.3.3.3/32          O_INTRA 10  30          13.1.1.2        Interface D3
```

Device D learns network 10.0.0.0 from both Device A and Device B. Because the route learned from Device B has a smaller IGP metric, the route is optimal. The following output shows the BGP routing table on Device D.

```
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn
 *>e  10.0.0.0          2.2.2.2         50                    0       300 400e
 * e                    3.3.3.3         50                    0       200 400e
```

When Device D learns network 10.0.0.0 from Device C, it compares the route with the optimal route in its routing table. Because Device C and Device B reside in different ASs, BGP does not compare the MEDs of the two routes. The route from Device C has a smaller IGP metric than the route from Device B, so the route from Device C becomes optimal. The following output shows the BGP routing table on Device D.

```
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn
 *>e  10.0.0.0          1.1.1.1         60                    0       200 400e
 * e  10.0.0.0          2.2.2.2         50                    0       300 400e
 * e                    3.3.3.3         50                    0       200 400e
```

However, Device C and Device A reside in the same AS, and Device C has a greater MED, so network 10.0.0.0 learned from Device C should not be optimal.

To avoid this problem, you can configure the **bestroute compare-med** command to enable MED comparison for routes from the same AS on Device D. After that, Device D puts the routes received

from each AS into a group, selects the route with the lowest MED from each group, and compares routes from different groups. Network 10.0.0.0 learned from Device B is the optimal route. The following output shows the BGP routing table on Device D.

```
     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn
 *>e  10.0.0.0          2.2.2.2         50                    0       300 400e
 * e                    3.3.3.3         50                    0       200 400e
 * e                    1.1.1.1         60                    0       200 400e
```

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable MED comparison for routes on a per-AS basis.

   bestroute compare-med

   By default, MED comparison for routes on a per-AS basis is disabled.

Enabling MED comparison for routes from confederation peers

About this task

This task enables BGP to compare the MEDs of routes received from confederation peers. However, if a route received from a confederation peer has an AS number that does not belong to the confederation, BGP does not compare the route with other routes. For example, a confederation has three AS numbers 65006, 65007, and 65009. BGP receives three routes from different confederation peers. The AS_PATH attributes of these routes are 65006 65009, 65007 65009, and 65008 65009, and the MED values of them are 2, 3, and 1. Because the third route's AS_PATH attribute contains AS number 65008 that does not belong to the confederation, BGP does not compare it with other routes. As a result, the first route becomes the optimal route.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable MED comparison for routes from confederation peers.

   bestroute med-confederation

   By default, MED comparison for routes from confederation peers is disabled.

Ignoring IGP metrics during optimal route selection

About this task

By default, BGP includes IGP metrics in optimal route selection. If multiple routes to the same destination are available, BGP selects the route with the smallest IGP metric as the optimal route.

Perform this task to enable BGP to ignore IGP metrics during optimal route selection.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Configure BGP to ignore IGP metrics during optimal route selection.
   bestroute igp-metric-ignore
   By default, BGP includes IGP metrics in optimal route selection.

Ignoring router IDs during optimal route selection

About this task

By default, BGP compares router IDs during optimal route selection. If multiple routes to the same destination are available, BGP selects the route with the smallest router ID as the optimal route.

Perform this task to enable BGP to ignore router IDs during optimal route selection.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Configure BGP to ignore router IDs during optimal route selection.
   bestroute router-id-ignore
   By default, BGP compares router IDs during optimal route selection.

Display and maintenance commands for BGP path selection control

Execute **display** commands in any view.

Displaying BGP (IPv4 unicast address family)

Task	Command
Display BGP path attribute information.	**display bgp** [**instance** *instance-name*] **paths** [*as-regular-expression*]

Displaying BGP (IPv6 unicast address family)

Task	Command
Display BGP path attribute information.	**display bgp** [**instance** *instance-name*] **paths** [*as-regular-expression*]

BGP path selection control configuration examples

Example: Configuring BGP path selection

Network configuration

As shown in Figure 24, all switches run BGP.

- EBGP runs between Switch A and Switch B, and between Switch A and Switch C.
- IBGP runs between Switch B and Switch D, and between Switch D and Switch C. OSPF is the IGP protocol in AS 200.

Configure routing policies, making Switch D use the route 1.0.0.0/8 from Switch C as the optimal.

Figure 24 Network diagram

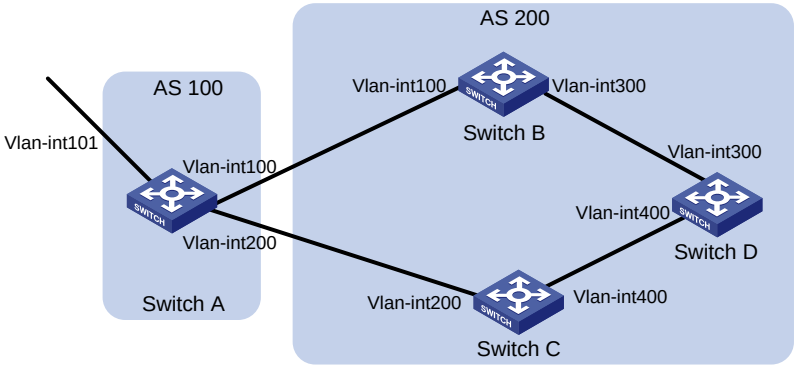


Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int101	1.0.0.1/8	Switch D	Vlan-int400	195.1.1.1/24

Device	Interface	IP address	Device	Interface	IP address
	Vlan-int100	192.1.1.1/24		Vlan-int300	194.1.1.1/24
	Vlan-int200	193.1.1.1/24	Switch C	Vlan-int400	195.1.1.2/24
Switch B	Vlan-int100	192.1.1.2/24		Vlan-int200	193.1.1.2/24
	Vlan-int300	194.1.1.2/24			

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure OSPF on Switch B, Switch C, and Switch D:

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ospf
[SwitchB-ospf] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 194.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ospf
[SwitchC-ospf] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 193.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 195.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

   # Configure Switch D.

```
<SwitchD> system-view
[SwitchD] ospf
[SwitchD-ospf] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 194.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] network 195.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

3. Configure BGP connections:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] peer 192.1.1.2 as-number 200
[SwitchA-bgp-default] peer 193.1.1.2 as-number 200
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 192.1.1.2 enable
[SwitchA-bgp-default-ipv4] peer 193.1.1.2 enable
```

   # Inject network 1.0.0.0/8 to the BGP routing table on Switch A.

```
[SwitchA-bgp-default-ipv4] network 1.0.0.0 8
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch B.

```
[SwitchB] bgp 200
[SwitchB-bgp-default] peer 192.1.1.1 as-number 100
[SwitchB-bgp-default] peer 194.1.1.1 as-number 200
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 192.1.1.1 enable
[SwitchB-bgp-default-ipv4] peer 194.1.1.1 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

Configure Switch C.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] peer 193.1.1.1 as-number 100
[SwitchC-bgp-default] peer 195.1.1.1 as-number 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 193.1.1.1 enable
[SwitchC-bgp-default-ipv4] peer 195.1.1.1 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Configure Switch D.

```
[SwitchD] bgp 200
[SwitchD-bgp-default] peer 194.1.1.2 as-number 200
[SwitchD-bgp-default] peer 195.1.1.2 as-number 200
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 194.1.1.2 enable
[SwitchD-bgp-default-ipv4] peer 195.1.1.2 enable
[SwitchD-bgp-default-ipv4] quit
[SwitchD-bgp-default] quit
```

4. Configure local preference for route 1.0.0.0/8, making Switch D give priority to the route learned from Switch C:

Define IPv4 basic ACL 2000 on Switch C to permit route 1.0.0.0/8.

```
[SwitchC] acl basic 2000
[SwitchC-acl-ipv4-basic-2000] rule permit source 1.0.0.0 0.255.255.255
[SwitchC-acl-ipv4-basic-2000] quit
```

Configure a routing policy named **localpref** on Switch C, setting the local preference of route 1.0.0.0/8 to 200 (the default is 100).

```
[SwitchC] route-policy localpref permit node 10
[SwitchC-route-policy-localpref-10] if-match ip address acl 2000
[SwitchC-route-policy-localpref-10] apply local-preference 200
[SwitchC-route-policy-localpref-10] quit
```

Apply routing policy **localpref** to routes from peer 193.1.1.1.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 193.1.1.1 route-policy localpref import
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

Display the BGP routing table on Switch D.

```
[SwitchD] display bgp routing-table ipv4
```

```
 Total number of routes: 2

BGP local router ID is 195.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >i 1.0.0.0            193.1.1.1                  200        0       100i
*  i                    192.1.1.1                  100        0       100i
```

Route 1.0.0.0/8 learned from Switch C is the optimal.

Tuning and optimizing BGP networks

BGP network tuning and optimization tasks at a glance

To tune and optimize BGP networks, perform the following tasks:

- Establishing and resetting EBGP sessions
  - Enabling BGP to establish an EBGP session over multiple hops
  - Enabling immediate re-establishment of direct EBGP connections upon link failure
- Enabling BGP ORF capabilities negotiation
- Establishing, terminating, and resetting BGP sessions
  - Enabling 4-byte AS number suppression
  - Disabling BGP session establishment
  - Configuring BGP soft-reset
- Configuring BGP load balancing
- Configuring the BGP Additional Paths feature
- Protecting an EBGP peer when memory usage reaches level 2 threshold
- Setting a DSCP value for outgoing BGP packets
- Disabling route recursion policy control for routes received from a peer or peer group
- Flushing the suboptimal BGP route to the RIB
- Enabling BGP to not flush specific routes to the routing table
- Configuring BGP optimal route selection delay
- Enabling fast host route update upon user migration
- Enabling conversational remote host route learning

Enabling BGP to establish an EBGP session over multiple hops

About this task

To establish an EBGP session, two routers must have a direct physical link and use directly connected interfaces. If no direct link is available, you must use the **peer ebgp-max-hop** command to enable BGP to establish an EBGP session over multiple hops and specify the maximum hops.

Restrictions and guidelines

When the BGP GTSM feature is enabled, two peers can establish an EBGP session after passing GTSM check, regardless of whether the maximum number of hops is reached.

To ensure correct BGP route recursion, do not specify any direct EBGP peer or peer group when you configure the **peer ebgp-max-hop** command.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BGP to establish an EBGP session to an indirectly connected peer or peer group and specify the maximum hop count.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **ebgp-max-hop** [*hop-count*]

   By default, BGP cannot establish an EBGP session to an indirectly connected peer or peer group.

Procedure (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BGP to establish an EBGP session to an indirectly connected peer or peer group and specify the maximum hop count.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **ebgp-max-hop** [*hop-count*]

   By default, BGP cannot establish an EBGP session to an indirectly connected peer or peer group.

Enabling immediate re-establishment of direct EBGP connections upon link failure

About this task

With this feature disabled, when the link to a directly connected EBGP peer goes down, the router does not re-establish a session to the peer until the hold time timer expires. This feature enables BGP to immediately recreate the session in that situation. When this feature is disabled, route flapping does not affect EBGP session state.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enable immediate re-establishment of direct EBGP connections upon link failure.

   ebgp-interface-sensitive

   By default, immediate re-establishment of direct EBGP connections is enabled.

Enabling BGP ORF capabilities negotiation

About BGP ORF

BGP Outbound Route Filtering (ORF) saves the system resources by reducing the route updates that are sent between BGP peers.

The BGP peers negotiate the ORF capabilities through Open messages. After completing the negotiation process, the BGP peers can exchange ORF information (local route reception filtering policy) through route refresh messages. Then, only routes that pass both the local route distribution filtering policy and the received route reception filtering policy can be advertised.

Restrictions and guidelines

You can enable the ORF information sending, receiving, or both sending and receiving capabilities on a BGP router. For two BGP peers to successfully negotiate the ORF capabilities, make sure one end has the sending capability and the other end has the receiving capability.

After you enable BGP ORF capabilities negotiation for a peer, the local device negotiates standard ORF capabilities as defined in RFC with the peer. If the peer uses nonstandard ORF, you must also enable nonstandard ORF capabilities negotiation for the peer.

Enabling BGP ORF capabilities negotiation for a peer or peer group

Procedure (IPv4 unicast)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Enable BGP ORF capabilities negotiation for a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise orf prefix-list** { **both** | **receive** | **send** }

   interface-peer *interface-type interface-number* **capability-advertise orf prefix-list** { **both** | **receive** | **send** }

   By default, BGP ORF capabilities negotiation is disabled for a peer or peer group.

Procedure (IPv6 unicast)

1. Enter system view.

system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Enable BGP ORF capabilities negotiation for a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **capability-advertise orf prefix-list** { **both** | **receive** | **send** }

   interface-peer *interface-type interface-number* **capability-advertise orf prefix-list** { **both** | **receive** | **send** }

   By default, BGP ORF capabilities negotiation is disabled for a peer or peer group.

Enabling nonstandard BGP ORF capabilities negotiation for a peer or peer group

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable nonstandard BGP ORF capabilities negotiation for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise orf non-standard**

   By default, nonstandard BGP ORF capabilities negotiation is disabled for a peer or peer group.

Enabling 4-byte AS number suppression

About this task

BGP supports 4-byte AS numbers. The 4-byte AS number occupies four bytes, in the range of 1 to 4294967295. By default, a device sends an OPEN message to the peer device for session establishment. The OPEN message indicates that the device supports 4-byte AS numbers. If the peer device supports 2-byte AS numbers instead of 4-byte AS numbers, the session cannot be established. To resolve this issue, enable the 4-byte AS number suppression feature. The device then sends an OPEN message to inform the peer that it does not support 4-byte AS numbers, so the BGP session can be established.

Restrictions and guidelines

If the peer device supports 4-byte AS numbers and the peer AS number is greater than 65535, do not enable the 4-byte AS number suppression feature. Otherwise, the BGP session cannot be established.

Procedure (IPv4 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enable 4-byte AS number suppression.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **capability-advertise suppress-4-byte-as**
   By default, 4-byte AS number suppression is disabled.

Procedure (IPv6 peers)

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enable 4-byte AS number suppression.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **capability-advertise suppress-4-byte-as**
   By default, 4-byte AS number suppression is disabled.

Disabling BGP session establishment

About disabling BGP session establishment

This task enables you to temporarily tear down BGP sessions to a peer/peer group or all peers/peer groups. You can perform network upgrade and maintenance without needing to delete and reconfigure the peers and peer groups. To recover the sessions, execute the **undo peer ignore** or **undo ignore all-peers** command.

If you specify the **graceful** keyword in the **peer ignore** command, BGP performs the following tasks:

- Gracefully shuts down the session to the specified peer or peer group in the specified graceful shutdown period of time.
- Advertises all routes to the specified peer or peer group and changes the attribute of the advertised routes to the specified value.

- Advertises routes from the specified peer or peer group to other IBGP peers and peer groups and changes the attribute of the advertised routes to the specified value.

If you specify the **graceful** keyword in the **ignore all-peers** command, BGP performs the following tasks:

- Gracefully shuts down the sessions to all peers and peer groups in the specified graceful shutdown period of time.
- Advertises all routes to all peers and peer groups and changes the attribute of the advertised routes to the specified value.

Restrictions and guidelines

For a BGP peer or peer group, the configuration made by the **peer ignore** command takes precedence over the configuration made by the **ignore all-peers** command.

Disabling BGP session establishment with a peer or peer group (IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Disable BGP session establishment with a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **ignore** [**graceful** *graceful-time* { **community** { *community-number* | *aa:nn* } | **local-preference** *preference* | **med** *med* } *]

   By default, BGP can establish a session to a peer or peer group.

CAUTION:

- If a session has been established to a peer, executing this command for the peer tears down the session and clears all related routing information.
- If sessions have been established to a peer group, executing this command for the peer group tears down the sessions to all peers in the group and clears all related routing information.

Disabling BGP session establishment with a peer or peer group (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]

- Enter BGP-VPN instance view.

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

3. Disable BGP session establishment with a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **ignore** [**graceful** *graceful-time* { **community** { *community-number* | *aa:nn* } | **local-preference** *preference* | **med** *med* } *]

   interface-peer *interface-type interface-number* **ignore** [**graceful** *graceful-time* { **community** { *community-number* | *aa:nn* } | **local-preference** *preference* | **med** *med* } *]

   By default, BGP can establish a session to a peer or peer group.

CAUTION:

- If a session has been established to a peer, executing this command for the peer tears down the session and clears all related routing information.
- If sessions have been established to a peer group, executing this command for the peer group tears down the sessions to all peers in the group and clears all related routing information.

Disabling BGP session establishment with all peers or peer groups

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Disable BGP session establishment with all peers or peer groups.

   ignore all-peers [**graceful** *graceful-time* { **community** { *community-number* | *aa:nn* } | **local-preference** *preference* | **med** *med* } *]

   By default, BGP can establish sessions to all peers and peer groups.

CAUTION:

Executing this command tears down all existing sessions to peers and peer groups and clears all related routing information.

Configuring BGP soft-reset

About BGP soft-reset

After you modify the route selection policy, for example, modify the preferred value, you must reset BGP sessions to apply the new policy. The reset operation tears down and re-establishes BGP sessions.

To avoid tearing down BGP sessions, you can use one of the following soft-reset methods to apply the new policy:

- **Enabling route refresh**—The BGP router advertises a ROUTE-REFRESH message to the specified peer, and the peer resends its routing information to the router. After receiving the routing information, the router filters the routing information by using the new policy.

  This method requires that both the local router and the peer support route refresh.
- **Saving updates**—Use the **peer keep-all-routes** command to save all route updates from the specified peer. After modifying the route selection policy, filter routing information by using the new policy.

  This method does not require that the local router and the peer support route refresh but it uses more memory resources to save routes.
- **Manual soft-reset**—Use the **refresh bgp** command to enable BGP to send local routing information or advertise a ROUTE-REFRESH message to the specified peer. The peer then resends its routing information. After receiving the routing information, the router filters the routing information by using the new policy.

  This method requires that both the local router and the peer support route refresh.

Enabling route refresh (IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BGP route refresh for a peer or peer group.
   - Enable BGP route refresh for the specified peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] }
     capability-advertise route-refresh
   - Enable the BGP route refresh, multi-protocol extension, and 4-byte AS number features for the specified peer or peer group.

     undo peer { *group-name* | *ipv4-address* [*mask-length*] }
     capability-advertise conventional

   By default, the BGP route refresh, multi-protocol extension, and 4-byte AS number features are enabled.

Enabling route refresh (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BGP route refresh for a peer or peer group.

- Enable BGP route refresh for the specified peer or peer group.

  peer { *group-name* | *ipv6-address* [*prefix-length*] } **capability-advertise route-refresh**

- Enable the BGP route refresh, multi-protocol extension, and 4-byte AS number features for the specified peer or peer group.

  undo peer { *group-name* | *ipv6-address* [*prefix-length*] } **capability-advertise conventional**

By default, the BGP route refresh, multi-protocol extension, and 4-byte AS number features are enabled.

Saving updates (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Save all route updates from the peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **keep-all-routes**

   interface-peer *interface-type interface-number* **keep-all-routes**

   By default, route updates from peers and peer groups are not saved.

   This command takes effect only for the routes received after this command is executed.

Saving updates (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Save all route updates from the peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **keep-all-routes**

interface-peer *interface-type interface-number* **keep-all-routes**

By default, route updates from peers and peer groups are not saved.

This command takes effect only for the routes received after this command is executed.

Configuring manual soft-reset (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BGP route refresh for a peer or peer group.
   - Enable BGP route refresh for the specified peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **capability-advertise route-refresh**
   - Enable the BGP route refresh, multi-protocol extension, and 4-byte AS number features for the specified peer or peer group.

     undo peer { *group-name* | *ipv4-address* [*mask-length*] } **capability-advertise conventional**

   By default, the BGP route refresh, multi-protocol extension, and 4-byte AS number features are enabled.
4. Return to user view.

   return
5. Perform manual soft-reset. Choose one option as needed:
   - Perform manual soft-reset on IPv4 sessions in BGP IPv4 address family.

     refresh bgp [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*]
   - Perform manual soft-reset on IPv6 sessions in BGP IPv4 address family.

     refresh bgp [**instance** *instance-name*] { *ipv6-address* [*prefix-length*] | [*link-local-address*] **interface** *interface-type interface-number* } { **export** | **import** } **ipv4** [**unicast**]

Configuring manual soft-reset (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

3. Enable BGP route refresh for a peer or peer group.
   - Enable BGP route refresh for the specified peer or peer group.

     peer { *group-name* | *ipv6-address* [*prefix-length*] }
     capability-advertise route-refresh
   - Enable the BGP route refresh, multi-protocol extension, and 4-byte AS number features for the specified peer or peer group.

     undo peer { *group-name* | *ipv6-address* [*prefix-length*] }
     capability-advertise conventional

   By default, the BGP route refresh, multi-protocol extension, and 4-byte AS number features are enabled.
4. Return to user view.

   return
5. Perform manual soft-reset. Choose one option as needed:
   - Perform manual soft-reset on IPv6 sessions in BGP IPv6 address family.

     refresh bgp [**instance** *instance-name*] { *ipv6-address* [*prefix-length*] | [*link-local-address*] **interface** *interface-type interface-number* | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*]
   - Perform manual soft-reset on IPv4 sessions in BGP IPv6 address family.

     refresh bgp [**instance** *instance-name*] *ipv4-address* [*mask-length*] { **export** | **import** } **ipv6** [**unicast**]

Configuring BGP load balancing

About this task

Perform this task to specify the maximum number of BGP ECMP routes for load balancing.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. (Optional.) Enable BGP to ignore IGP metrics during optimal route selection.

   bestroute igp-metric-ignore

   By default, BGP compares IGP metrics during optimal route selection, and selects the route with the smallest IGP metric as the optimal route.

   BGP cannot use routes with different IGP metrics to implement load balancing. To resolve this issue, you can use this command.
4. Return to system view.
   - In BGP instance view:

quit

- In BGP-VPN instance view:

  quit

  quit

5. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
6. Specify the maximum number of BGP ECMP routes for load balancing.

   balance [**ebgp** | **eibgp** | **ibgp**] *number*

   By default, load balancing is disabled.
7. (Optional.) Enable BGP to ignore the AS_PATH attribute when it implements load balancing.

   balance as-path-neglect

   By default, BGP does not ignore the AS_PATH attribute when it implements load balancing.
8. (Optional.) Enable BGP to perform load balancing for routes that have different AS_PATH attributes of the same length.

   balance as-path-relax [**ebgp** | **ibgp**]

   By default, BGP cannot perform load balancing for routes that have different AS_PATH attributes of the same length.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Execute the following commands in sequence to enter BGP-VPN instance view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. (Optional.) Enable BGP to ignore IGP metrics during optimal route selection.

   bestroute igp-metric-ignore

   By default, BGP compares IGP metrics during optimal route selection, and selects the route with the smallest IGP metric as the optimal route.

   BGP cannot use routes with different IGP metrics to implement load balancing. To resolve this issue, you can use this command.
4. Return to system view.
   - In BGP instance view:

     quit
   - In BGP-VPN instance view:

     quit

quit

5. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
6. Specify the maximum number of BGP ECMP routes for load balancing.

   balance [**ebgp** | **eibgp** | **ibgp**] *number*

   By default, load balancing is disabled.
7. (Optional.) Enable BGP to ignore the AS_PATH attribute when it implements load balancing.

   balance as-path-neglect

   By default, BGP does not ignore the AS_PATH attribute when it implements load balancing.
8. (Optional.) Enable BGP to perform load balancing for routes that have different AS_PATH attributes of the same length.

   balance as-path-relax [**ebgp** | **ibgp**]

   By default, BGP cannot perform load balancing for routes that have different AS_PATH attributes of the same length.

Configuring the BGP Additional Paths feature

About this task

By default, BGP advertises only one optimal route. When the optimal route fails, traffic forwarding will be interrupted until route convergence completes.

The BGP Additional Paths (Add-Path) feature enables BGP to advertise multiple routes with the same prefix and different next hops to a peer or peer group. When the optimal route fails, the suboptimal route becomes the optimal route, which shortens the traffic interruption time.

You can enable the BGP additional path sending, receiving, or both sending and receiving capabilities on a BGP peer. For two BGP peers to successfully negotiate the Additional Paths capabilities, make sure one end has the sending capability and the other end has the receiving capability.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

address-family ipv4 [**unicast**]

3. Configure the BGP Additional Paths capabilities. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **additional-paths** { **receive** | **send** } *

   interface-peer *interface-type interface-number* **additional-paths** { **receive** | **send** } *

   By default, no BGP Additional Paths capabilities are configured.

4. Set the maximum number of Add-Path optimal routes that can be advertised to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise additional-paths best** *number*

   interface-peer *interface-type interface-number* **advertise additional-paths best** *number*

   By default, a maximum of one Add-Path optimal route can be advertised to a peer or peer group.

5. Set the maximum number of Add-Path optimal routes that can be advertised to all peers.

   additional-paths select-best *best-number*

   By default, a maximum of one Add-Path optimal route can be advertised to all peers.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Configure the BGP Additional Paths capabilities. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **additional-paths** { **receive** | **send** } *

   interface-peer *interface-type interface-number* **additional-paths** { **receive** | **send** } *

   By default, no BGP Additional Paths capabilities are configured.

4. Set the maximum number of Add-Path optimal routes that can be advertised to a peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise additional-paths best** *number*

   interface-peer *interface-type interface-number* **advertise additional-paths best** *number*

By default, a maximum of one Add-Path optimal route can be advertised to a peer or peer group.

5. Set the maximum number of Add-Path optimal routes that can be advertised to all peers.

   additional-paths select-best *best-number*

   By default, a maximum of one Add-Path optimal route can be advertised to all peers.

Protecting an EBGP peer when memory usage reaches level 2 threshold

About this task

Memory usage includes the following threshold levels: normal, level 1, level 2, and level 3. When the level 2 threshold is reached, BGP periodically tears down an EBGP session to release memory resources until the memory usage falls below the level 2 threshold. You can configure this feature to avoid tearing down the EBGP session to an EBGP peer when the memory usage reaches the level 2 threshold.

For more information about memory usage thresholds, see device management configuration in *Fundamentals Configuration Guide*.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Configure BGP to protect an EBGP peer or peer group when the memory usage reaches level 2 threshold.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **low-memory-exempt**

   By default, BGP periodically tears down an EBGP session to release memory resources when level 2 threshold is reached.

Procedure (IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Configure BGP to protect an EBGP peer or peer group when the memory usage reaches level 2 threshold. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **low-memory-exempt**

   interface-peer *interface-type interface-number* **low-memory-exempt**

By default, BGP tears down an EBGP session to release memory resources periodically when level 2 threshold is reached.

Setting a DSCP value for outgoing BGP packets

About this task

The DSCP value of an IP packet specifies the priority level of the packet and affects the transmission priority of the packet.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Set a DSCP value for outgoing BGP packets. Choose one command as needed:
   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **dscp** *dscp-value*
   interface-peer *interface-type interface-number* **dscp** *dscp-value*
   By default, the DSCP value for outgoing BGP packets is 48.

Disabling route recursion policy control for routes received from a peer or peer group

About this task

If you configure routing policy-based recursive lookup for BGP routes, this route recursion policy applies to BGP routes learned from all peers. This task allows you to disable route recursion policy control for routes learned from certain peers, for example, direct EBGP peers.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Disable route recursion policy control for routes received from the specified peer or peer group. Choose one command as needed:

peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number*} **nexthop-recursive-policy disable**

interface-peer *interface-type interface-number* **nexthop-recursive-policy disable**

By default, the route recursion policy applies to routes received from the peer or peer group.

Flushing the suboptimal BGP route to the RIB

About this task

This feature flushes the suboptimal BGP route to the RIB when the following conditions are met:

- The optimal route is generated by the **network** command or is redistributed by the **import-route** command.
- The suboptimal route is received from a BGP peer.

After the suboptimal route is flushed to the RIB on a network, BGP immediately switches traffic to the suboptimal route when the optimal route fails.

For example, the device has a static route to the subnet 1.1.1.0/24 that has a higher priority than a BGP route. BGP redistributes the static route and receives a route to 1.1.1.0/24 from a peer. After the **flush suboptimal-route** command is executed, BGP flushes the received BGP route to the RIB as the suboptimal route. When the static route fails, BGP immediately switches traffic to the suboptimal route if inter-protocol FRR is enabled. For more information about inter-protocol FRR, see "Configuring basic IP routing."

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Flush the suboptimal BGP route to the RIB.

   flush suboptimal-route

   By default, BGP is disabled from flushing the suboptimal BGP route to the RIB, and only the optimal route is flushed to the RIB.

Enabling BGP to not flush specific routes to the routing table

About this task

Perform this task to enable BGP to not flush routes matching the specified routing policy to the routing table.

In a route reflection network, perform this task to not flush specific BGP routes to the routing table of the RR. Then, the RR only advertises and receives routes but does not forward service traffic, which saves the system resources of the RR.

Procedure (IPv4 unicast)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.

- Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  address-family ipv4 [**unicast**]
- Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv4 [**unicast**]

3. Enable BGP to not flush routes matching the specified routing policy to the routing table.

   routing-table bgp-rib-only [**route-policy** *route-policy-name*]

   By default, BGP flushes the optimal routes to the routing table.

Procedure (IPv6 unicast)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

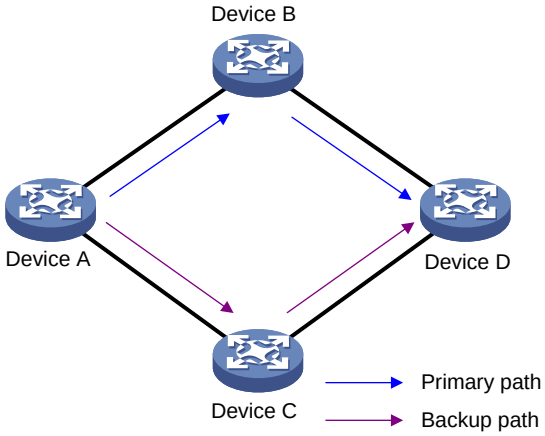
     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]
3. Enable BGP to not flush routes matching the specified routing policy to the routing table.

   routing-table bgp-rib-only [**route-policy** *route-policy-name*]

   By default, BGP flushes the optimal routes to the routing table.



Configuring BGP optimal route selection delay

About this task

Typically BGP optimal route selection is triggered in real time by the events such as attribute change, configuration change, and route recursion. To avoid packet loss upon switchover between redundant links, you can perform this task to delay optimal route selection.

As shown in Figure 25, BGP runs on all devices in the network. Device A and Device D uses the primary path for communication. When the primary path fails, Device A and Device D switch to the backup path for communication and then back to the primary path after the primary path recovers. In such case, traffic loss might occur if Device A forwards packets through Device B before Device B completes route convergence. You can configure optimal route selection delay on Device A to resolve the problem.

Figure 25 Network diagram

Restrictions and guidelines

Follow these restrictions and guidelines when you configure this feature:

- The optimal route selection delay setting applies only when multiple effective routes with the same prefix exist after a route change occurs.
- For routes being delayed for optimal route selection, modifying the optimal route selection delay timer has the following effects:
  - If you modify the delay timer to a non-zero value, the routes are not affected, and they still use the original delay timer.
  - If you execute the **undo** form of the **route-select delay** command or modify the delay timer to 0, the device performs optimal route selection immediately.
- If you configure this feature multiple times for an address family, the most recent configuration takes effect.
- The optimal route selection delay configuration does not apply to the following conditions:
  - A route change is caused by execution of a command or by route withdrawal.
  - After a route change occurs, only one route exists for a specific destination network.
  - An active/standby process switchover occurs.
  - A route change occurs among equal-cost routes.
  - Only the optimal and suboptimal routes exist when FRR is configured.
  - Optimal route selection is triggered by a redistributed route.

Procedure (IPv4 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Set the optimal route selection delay timer.

   route-select delay *delay-value*

   By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed.

Procedure (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv6 [**unicast**]

3. Set the optimal route selection delay timer.

   route-select delay *delay-value*

   By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed.

Enabling fast host route update upon user migration

About this task

As shown in Figure 26, the host roams between AP 1 and AP 2 frequently, and both Device A and Device C save the host route. The host route entries on Device A and Device C are not updated in real time, so traffic forwarding might be affected. To resolve this issue, perform this task to enable fast host route update upon user migration.

Figure 26 Network diagram

As shown in Figure 26, after you enable fast host route update upon user migration on Device A and Device C, Device A and Device C process the host route as follows:

1. When the host comes online on AP 1 for the first time, Device A generates a route for the host and advertises the route to Device C through Device B.
2. When the host roams to AP 2, Device C generates a route for the host, and it has two routes for the host. In this case, BGP selects the locally generated route as the optimal route, increases the host migration serial number by one, and then advertises the optimal route to Device A through Device B.
3. After receiving the host route advertised by Device C, Device B compares the host migration serial number carried in the routes advertised by Device C and Device A. Device B selects the route with the larger host migration serial number as the optimal route and advertises the optimal route to Device A.
4. After receiving the host route from Device B, Device A checks whether the ARP or ND entry corresponding to the received route exists. If the ARP or ND entry does not exist, Device A deletes the local ARP or ND entry and the direct route, and then advertises the received route to all peers. If the ARP or ND entry exists, Device A determines that the host has migrated to it. Then, Device A takes the following actions:
   a. Compares the host migration serial number in the received route with that in the local host route.
   b. Increases the larger host migration serial number by one.
   c. Advertises the local route with the new host migration serial number to its peers.

When the host roams frequently, devices in the network might receive host routes with the same host migration serial number. In this case, a device selects the optimal route as follows:

- When the device receives multiple host routes with the same serial number, it selects the route received from the peer with the smallest route ID as the optimal route.
- When the device receives a host route with the same serial number as that in the local host route, it selects the optimal route based on the ARP or ND entry, as described in step 4.

Host migration serial numbers are advertised through the extended community attribute. Enabling this feature also enables BGP to advertise the extended community attribute to all peers and peer groups.

Procedure (IPv4 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
4. Enable fast host route update upon user migration.
   user-move fast-update
   By default, fast host route update upon user migration is disabled.

Procedure (IPv6 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
4. Enable fast host route update upon user migration.
   user-move fast-update
   By default, fast host route update upon user migration is disabled.

Enabling conversational remote host route learning

About this task

By default, BGP generates FIB entries for all host routes received from peers (remote host routes) and issues the routes to the FIB. To conserve device resources, you can enable conversational remote host route learning. This feature enables BGP to issue a remote host route to the FIB only if it is required for forwarding a packet.

Restrictions and guidelines

This feature takes effect only on remote host routes generated based on ARP or ND entries and does not take effect on local host routes and other BGP routes. Host routes generated based on ARP or ND entries carry a special mark advertised through the extended community attribute. Enabling this feature also enables BGP to advertise the extended community attribute to all peers and peer groups.

This feature takes effect only when you execute the **ip forwarding-conversational-learning** command.

The device can perform conversational learning for a remote host route only if a local interface belongs to a network segment that contains the destination address of the host route.

Procedure (IPv4 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
4. Enable conversational remote host route learning.
   forwarding-conversational-learning [**route-policy** *route-policy-name*]
   By default, conversational remote host route learning is disabled.

Procedure (IPv6 unicast)

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
4. Enable conversational remote host route learning.
   forwarding-conversational-learning [**route-policy** *route-policy-name*]
   By default, conversational remote host route learning is disabled.

Display and maintenance commands for BGP network tuning and optimization

Displaying BGP

Execute **display** commands in any view.

Displaying BGP (IPv4 unicast address family)

Task	Command
Display ORF prefix information received by a peer.	**display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] *ipv4-address* **received prefix-list** **display bgp** [**instance** *instance-name*] **peer ipv4** [**unicast**] *ipv6-address* [**interface** *interface-type interface-number*] **received prefix-list**

Displaying BGP (IPv6 unicast address family)

Task	Command
Display ORF prefix information received by a peer.	**display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] *ipv6-address* **received prefix-list** **display bgp** [**instance** *instance-name*] **peer ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] { *ipv4-address* |

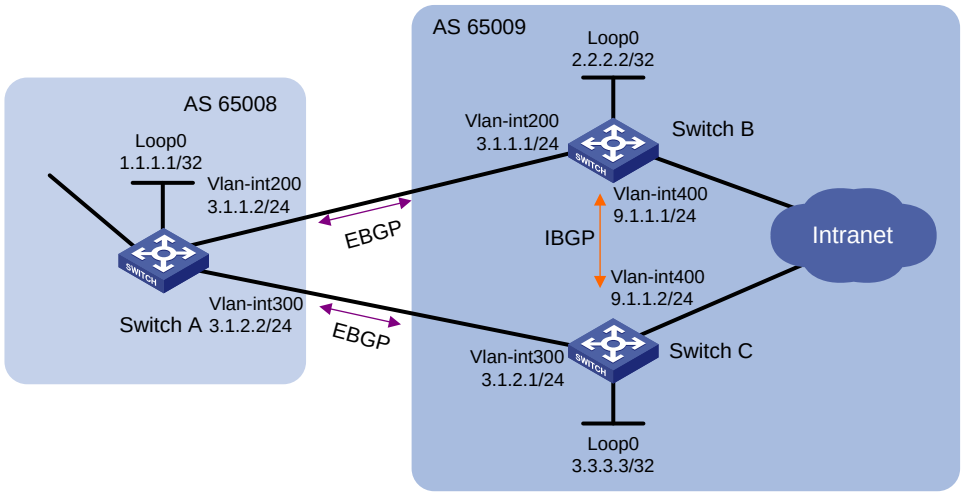
Task	Command
	[*link-local-address*] **interface** *interface-type interface-number* } **received prefix-list**

Resetting BGP sessions

CAUTION:
A reset operation tears down BGP sessions for a short period of time.

Execute **reset** commands in user view.

Task	Command
Reset BGP sessions for IPv4 unicast address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] **reset bgp** [**instance** *instance-name*] { *ipv6-address* [*prefix-length*] | **interface** *interface-type interface-number* } **ipv4** [*unicast*]
Reset BGP sessions for IPv6 unicast address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv6-address* [*prefix-length*] | [*link-local-address*] **interface** *interface-type interface-number* | **all** | **external** | **group** *group-name* | **internal** } **ipv6** [**unicast**] [**vpn-instance** *vpn-instance-name*] **reset bgp** *ipv4-address* [*mask-length*] **ipv6** [**unicast**]
Reset all BGP sessions.	**reset bgp** [**instance** *instance-name*] **all**



BGP network tuning and optimization configuration examples

Example: Configuring BGP load balancing

Network configuration

As shown in Figure 27, run EBGP between Switch A and Switch B, and between Switch A and Switch C. Run IBGP between Switch B and Switch C.

Figure 27 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure BGP connections:
   - On Switch A, establish EBGP connections with Switch B and Switch C. Configure BGP to advertise network 8.1.1.0/24 to Switch B and Switch C, so that Switch B and Switch C can access the internal network connected to Switch A. Configure load balancing over the two EBGP links on Switch A.
   - On Switch B, establish an EBGP connection with Switch A and an IBGP connection with Switch C. Configure BGP to advertise network 9.1.1.0/24 to Switch A, so that Switch A can access the intranet through Switch B. Configure a static route to interface loopback 0 on Switch C (or use a routing protocol like OSPF) to establish the IBGP connection.
   - On Switch C, establish an EBGP connection with Switch A and an IBGP connection with Switch B. Configure BGP to advertise network 9.1.1.0/24 to Switch A, so that Switch A can access the intranet through Switch C. Configure a static route to interface loopback 0 on Switch B (or use another protocol like OSPF) to establish the IBGP connection.

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 65008
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 3.1.1.1 as-number 65009
[SwitchA-bgp-default] peer 3.1.2.1 as-number 65009
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 3.1.1.1 enable
[SwitchA-bgp-default-ipv4] peer 3.1.2.1 enable
[SwitchA-bgp-default-ipv4] network 8.1.1.0 24
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 65009
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 3.1.1.2 as-number 65008
[SwitchB-bgp-default] peer 3.3.3.3 as-number 65009
```

```
[SwitchB-bgp-default] peer 3.3.3.3 connect-interface loopback 0
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 3.1.1.2 enable
[SwitchB-bgp-default-ipv4] peer 3.3.3.3 enable
[SwitchB-bgp-default-ipv4] network 9.1.1.0 24
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
[SwitchB] ip route-static 3.3.3.3 32 9.1.1.2
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 65009
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 3.1.2.2 as-number 65008
[SwitchC-bgp-default] peer 2.2.2.2 as-number 65009
[SwitchC-bgp-default] peer 2.2.2.2 connect-interface loopback 0
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 3.1.2.2 enable
[SwitchC-bgp-default-ipv4] peer 2.2.2.2 enable
[SwitchC-bgp-default-ipv4] network 9.1.1.0 24
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
[SwitchC] ip route-static 2.2.2.2 32 9.1.1.1
```

Display the BGP routing table on Switch A.

```
[SwitchA] display bgp routing-table ipv4

 Total number of routes: 3

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >  8.1.1.0/24         8.1.1.1         0                     32768   i
* >e 9.1.1.0/24         3.1.1.1         0                     0       65009i
*  e                    3.1.2.1         0                     0       65009i
```

- The output shows two valid routes to destination 9.1.1.0/24. The route with next hop 3.1.1.1 is marked with a greater-than sign (>), indicating that it is the optimal route (because the ID of Switch B is smaller). The route with next hop 3.1.2.1 is marked with an asterisk (*), indicating that it is a valid route, but not the optimal route.
- By using the **`display ip routing-table`** command, you can find only one route to 9.1.1.0/24 with next hop 3.1.1.1 and output interface VLAN-interface 200.

3. Configure loading balancing:

Because Switch A has two routes to reach AS 65009, configuring load balancing over the two BGP routes on Switch A can improve link usage.

Configure Switch A.

```
[SwitchA] bgp 65008
```

```
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] balance 2
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Verifying the configuration

Display the BGP routing table on Switch A.

```
[SwitchA] display bgp routing-table ipv4

 Total number of routes: 3

 BGP local router ID is 1.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a – additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >  8.1.1.0/24         8.1.1.1         0                     32768   i
* >e 9.1.1.0/24         3.1.1.1         0                     0       65009i
* >e                    3.1.2.1         0                     0       65009i
```

- The route 9.1.1.0/24 has two next hops, 3.1.1.1 and 3.1.2.1, both of which are marked with a greater-than sign (>), indicating that they are the optimal routes.
- By using the **`display ip routing-table`** command, you can find two routes to 9.1.1.0/24. One has next hop 3.1.1.1 and output interface VLAN-interface 200, and the other has next hop 3.1.2.1 and output interface VLAN-interface 300.

Example: Configuring the BGP Additional Paths feature

Network configuration

As shown in Figure 28, all switches run BGP. EBGP runs between Switch A and Switch B, and between Switch A and Switch C. IBGP runs between Switch B and Switch D, between Switch C and Switch D, and between Switch D and Switch E. Switch D is a route reflector and Switch E is its client.

Configure the BGP Additional Paths feature to enable Switch E to learn routes with the same prefix and different next hops from Switch B and Switch C.

Figure 28 Network diagram

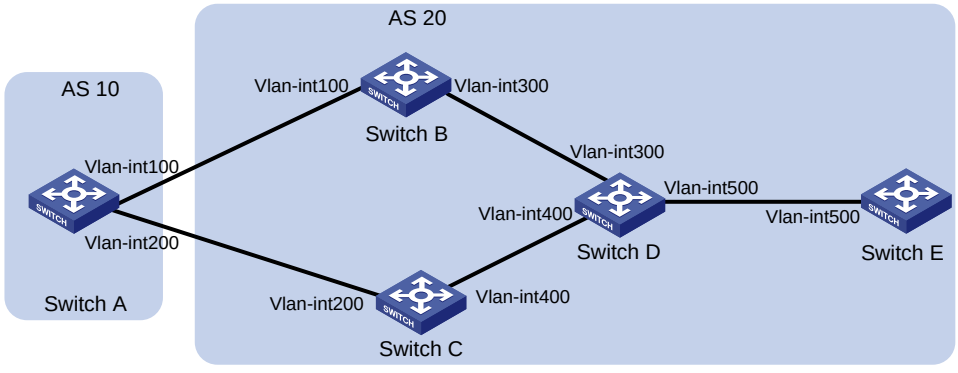


Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.1.1.1/24	Switch D	Vlan-int300	30.1.1.1/24
	Vlan-int200	20.1.1.1/24		Vlan-int400	40.1.1.1/24
Switch B	Vlan-int100	10.1.1.2/24		Vlan-int500	50.1.1.1/24
	Vlan-int300	30.1.1.2/24	Switch E	Vlan-int500	50.1.1.2/24
Switch C	Vlan-int200	20.1.1.2/24			
	Vlan-int400	40.1.1.2/24			

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure BGP connections:

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 10
[SwitchA-bgp-default] peer 10.1.1.2 as-number 20
[SwitchA-bgp-default] peer 20.1.1.2 as-number 20
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 10.1.1.2 enable
[SwitchA-bgp-default-ipv4] peer 20.1.1.2 enable
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 20
[SwitchB-bgp-default] peer 10.1.1.1 as-number 10
[SwitchB-bgp-default] peer 30.1.1.1 as-number 20
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 10.1.1.1 enable
[SwitchB-bgp-default-ipv4] peer 30.1.1.1 enable
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 20
[SwitchC-bgp-default] peer 20.1.1.1 as-number 10
[SwitchC-bgp-default] peer 40.1.1.1 as-number 20
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 20.1.1.1 enable
[SwitchC-bgp-default-ipv4] peer 40.1.1.1 enable
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] bgp 20
[SwitchD-bgp-default] peer 30.1.1.2 as-number 20
[SwitchD-bgp-default] peer 40.1.1.2 as-number 20
[SwitchD-bgp-default] peer 50.1.1.2 as-number 20
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 30.1.1.2 enable
[SwitchD-bgp-default-ipv4] peer 40.1.1.2 enable
[SwitchD-bgp-default-ipv4] peer 50.1.1.2 enable
```

Configure Switch E.

```
<SwitchE> system-view
[SwitchE] bgp 20
[SwitchE-bgp-default] peer 50.1.1.1 as-number 20
[SwitchE-bgp-default] address-family ipv4 unicast
[SwitchE-bgp-default-ipv4] peer 50.1.1.1 enable
```

3. Configure Switch A to advertise network 10.1.1.0/24.

```
[SwitchA-bgp-default-ipv4] network 10.1.1.0 24
```

4. Set the local switch as the next hop for routes sent to a peer:

Configure Switch B.

```
[SwitchB-bgp-default-ipv4] peer 30.1.1.1 next-hop-local
```

Configure Switch C.

```
[SwitchC-bgp-default-ipv4] peer 40.1.1.1 next-hop-local
```

5. Configure Switch D as a route reflector.

```
[SwitchD-bgp-default-ipv4] peer 50.1.1.2 reflect-client
```

6. Configure the Additional Paths feature:

Enable the additional path sending capability on Switch D.

```
[SwitchD-bgp-default-ipv4] peer 50.1.1.2 additional-paths send
```

Set the maximum number to 2 for Add-Path optimal routes that can be advertised.

```
[SwitchD-bgp-default-ipv4] additional-paths select-best 2
```

Set the maximum number to 2 for Add-Path optimal routes that can be advertised to peer 50.1.1.2.

```
[SwitchD-bgp-default-ipv4] peer 50.1.1.2 advertise additional-paths best 2
```

Enable the additional path receiving capability on Switch E.

```
[SwitchE-bgp-default-ipv4] peer 50.1.1.1 additional-paths receive
```

Verifying the configuration

Display BGP routing information on Switch E.

```
[Switch E] display bgp routing-table ipv4

 Total number of routes: 2

 BGP local Switch ID is 50.1.1.2
 Status codes: * - valid, > - best, d - dampened, h - history
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
       Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

   i 10.1.1.0/24        30.1.1.2        0          100        0       10i
   i                    40.1.1.2        0          100        0       10i
```

The output shows that Switch D has learned two routes with the same prefix and different next hops.

Configuring BGP security features

BGP security feature configuration tasks at a glance

To configure BGP security features, perform the following tasks:

- Enabling MD5 authentication for BGP peers
- Configuring GTSM for BGP
- Enabling keychain authentication for BGP peers
- Configuring IPsec for IPv6 BGP
- Configuring BGP RPKI

Enabling MD5 authentication for BGP peers

About this task

MD5 authentication provides the following benefits:

- Peer authentication ensures that only BGP peers that have the same password can establish TCP connections.
- Integrity check ensures that BGP packets exchanged between peers are intact.

Procedure (IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable MD5 authentication for a BGP peer group or peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **password** { **cipher** | **simple** } *password*

   By default, MD5 authentication is disabled.

Procedure (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Enable MD5 authentication for a BGP peer group or peer. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **password** { **cipher** | **simple** } *password*

   interface-peer *interface-type interface-number* **password** { **cipher** | **simple** } *password*

   By default, MD5 authentication is disabled.

Configuring GTSM for BGP

About this task

The Generalized TTL Security Mechanism (GTSM) protects a BGP session by comparing the TTL value in the IP header of incoming BGP packets against a valid TTL range. If the TTL value is within the valid TTL range, the packet is accepted. If not, the packet is discarded.

The valid TTL range is from 255 – the configured hop count + 1 to 255.

When GTSM is configured, the BGP packets sent by the device have a TTL of 255.

GTSM provides best protection for directly connected EBGP sessions, but not for multihop EBGP or IBGP sessions because the TTL of packets might be modified by intermediate devices.

Restrictions and guidelines

When GTSM is configured, the local device can establish an EBGP session to the peer after both devices pass GTSM check, regardless of whether the maximum number of hops is reached.

To use GTSM, you must configure GTSM on both the local and peer devices. You can specify different *hop-count* values for them.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Configure GTSM for the specified BGP peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **ttl-security hops** *hop-count*

   By default, GTSM is disabled.

Procedure (IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

3. Configure GTSM for the specified BGP peer or peer group.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **ttl-security hops** *hop-count*

   By default, GTSM is disabled.

Enabling keychain authentication for BGP peers

About this task

Keychain authentication enhances the security of TCP connection establishment between BGP peers. It allows BGP peers to establish TCP connections only when the following conditions are met:

- Keychain authentication is enabled on both BGP peers.
- The keys used by the BGP peers at the same time must have the same ID.
- The keys with the same ID must use the same authentication algorithm and key string.

Before configuring keychain authentication, make sure the specified keychain has been created.

For more information about keychains, see *Security Configuration Guide*.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure the algorithm and key ID in keychain authentication:

- BGP supports the HMAC-MD5, MD5, and HMAC-SHA-256 algorithms. To configure an algorithm, execute the **authentication-algorithm** command.
- BGP supports key IDs in the range of 0 to 63. To configure a key ID, execute the **key** command.

Procedure (IPv4 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

3. Enable keychain authentication for a BGP peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **keychain** *keychain-name*

   By default, keychain authentication is disabled.

Procedure (IPv6 peers)

1. Enter system view.

   system-view

2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

3. Enable keychain authentication for a BGP peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **keychain** *keychain-name*

   interface-peer *interface-type interface-number* **keychain** *keychain-name*

   By default, keychain authentication is disabled.

Configuring IPsec for IPv6 BGP

About this task

Perform this task to configure IPsec for IPv6 BGP. IPsec can provide privacy, integrity, and authentication for IPv6 BGP packets exchanged between BGP peers.

When two IPv6 BGP peers are configured with IPsec (for example, Device A and Device B), Device A encapsulates an IPv6 BGP packet with IPsec before sending it to Device B. If Device B successfully receives and de-encapsulates the packet, it establishes an IPv6 BGP peer relationship with Device A and learns IPv6 BGP routes from Device A. If Device B receives but fails to de-encapsulate the packet, or receives a packet not protected by IPsec, it discards the packet.

Procedure

1. Enter system view.

   system-view

2. Configure an IPsec transform set and a manual IPsec profile.

   See *Security Configuration Guide*.

3. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

4. Apply the IPsec profile to an IPv6 BGP peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **ipsec-profile** *profile-name*

   interface-peer *interface-type interface-number* **ipsec-profile** *profile-name*

   By default, no IPsec profile is configured for any IPv6 BGP peer or peer group.

   This command supports only IPsec profiles in manual mode.

Configuring BGP RPKI

About BGP RPKI

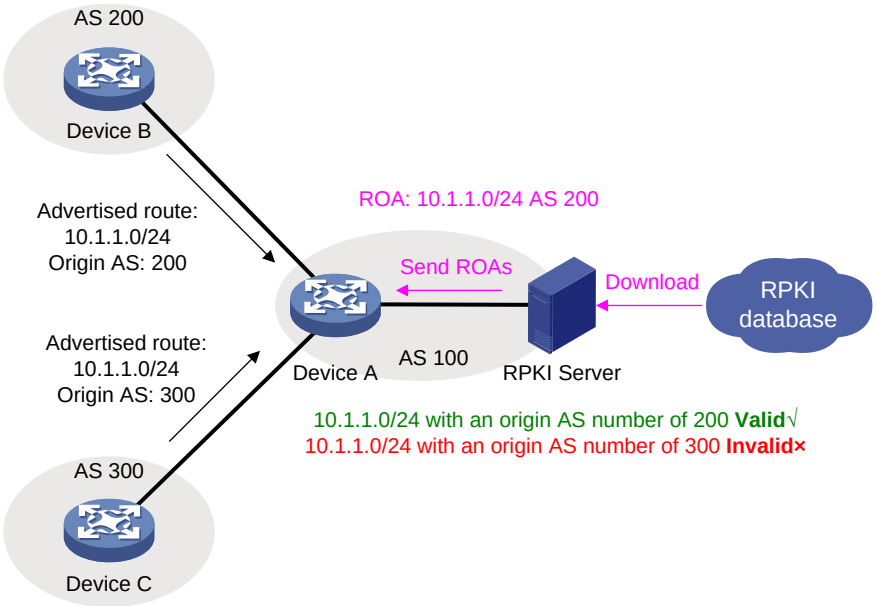
About RPKI

The AS_PATH attribute identifies the ASs through which a route has passed, and the AS that originated the route is the origin AS of the route. If the origin AS number of a route is incorrect, traffic transmission failure or even network collapse might occur.

To avoid this problem, you can configure the BGP Resource Public Key Infrastructure (RPKI) feature. It enables BGP to validate the origin AS of a route and determine whether to use and advertise the route based on the validation state.

BGP RPKI can address the issue of traffic hijacking. For example, an ISP advertises a legitimate route with a prefix of 192.168.0.0/16 to its users, and an attacker advertises a route with a prefix of 192.168.10.0/24. After receiving the two routes, a user prefers route 192.168.10.0/24 during route selection, because this route is more specific. As a result, the user might send traffic to the attacker mistakenly. To avoid this issue, configure BGP RPKI.

About ROAs



Route Origin Authorization (ROA) is a digital certificate that binds a route prefix to an origin AS number. With ROAs, the device can verify the validity of a route based on its origin AS number.

As shown in Figure 29, Device A and the RPKI server are connected. The RPKI server downloads ROA information from the RPKI database and sends the downloaded ROAs to Device A. Device A then stores the received ROAs in its local ROA database. Upon receiving a route, Device A searches the local ROA database for an ROA that matches the route prefix. If such an ROA exists, Device A compares the origin AS number of the route with that of the matching ROA.

- If the two AS numbers are the same, the route is valid.
- If the two AS numbers are different, the route is invalid.

In this example, Device A determines that route 10.1.1.0/24 from Device B is valid and route 10.1.1.0/24 from Device C is invalid.

Figure 29 Route validation with ROAs

Restrictions and guidelines

If the device has connections with multiple RPKI servers, all ROAs received from those RPKI servers can take effect. The device determines a received route as valid if that route matches any of the ROAs.

Configuring RPKI connection parameters

About this task

A router establishes a TCP connection with an RPKI server to obtain the Route Origin Authorization (ROA) information used for RPKI validation. The router checks the connection to the RPKI server at the specified interval. If the router does not receive a response from the RPKI server within the specified time period, it tears down the connection to the RPKI server.

When the connection between a router and an RPKI server goes down (except when the **shutdown** command is executed), the router takes the following actions:

- Attempts to reconnect to the server.
- Places the ROA information obtained from the server in aging state, and starts the aging timer for the ROA information.

If the router reconnects to the server before the aging timer expires, it releases the ROA information from the aging state. If the router fails to reconnect to the server when the aging timer expires, it deletes the ROA information obtained from the server.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure RPKI connection parameters:

- As a best practice, set an ROA information aging time longer than the time to wait for the response from the RPKI server.
- To tear down the connection to an RPKI server, execute the **undo port** command in RPKI server view.
- If you execute the **undo rpki** command, all configurations in RPKI view are removed.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP RPKI view.

   rpki
4. Specify an RPKI server by its IP address and enter RPKI server view.

   server [**vpn-instance** *vpn-instance-name*] **tcp** { *ipv4-address* | *ipv6-address* }

   By default, no RPKI server is specified.
5. Specify the port number of the RPKI server.

   port *port-number*

   By default, the port number of the RPKI server is not specified.

   To enable a router to establish a TCP connection with the RPKI server, you must configure the port number of the RPKI server on the router.
6. (Optional.) Specify the MD5 authentication password.

   passwords { **cipher** | **simple** } *string*

By default, the RPKI server does not perform MD5 authentication.

The MD5 authentication password must be the same as the authentication password configured on the RPKI server.

MD5 authentication ensures the validity of the RPKI server and the security of BGP RPKI packets.

7. (Optional.) Set the RPKI connection check interval.

   refresh-time *refresh-time*

   By default, the RPKI connection check interval is 600 seconds.

8. (Optional.) Set the time to wait for the response from the RPKI server.

   response-time *response-time*

   By default, the time to wait for the response from the RPKI server is 30 seconds.

9. (Optional.) Set the aging time for the ROA information.

   purge-time *purge-time*

   By default, the aging time for the ROA information is 60 seconds.

Enabling BGP RPKI validation

About this task

After you configure this feature, BGP validates the prefix and origin AS number of a received route. BGP determines the validation state of the route based on the following requirements:

1. A minimum of one ROA contains the prefix.
2. The mask length of the route does not exceed the longest mask length among all ROAs.
3. The AS number of an ROA is the same as the origin AS number of the route.

If the route meets all requirements, the route is in **Valid** state. If the route cannot meet requirement 1, the route is in **Not-found** state. If the route meets requirement 1, but cannot meet requirement 2 or 3, the route is in **Invalid** state.

Restrictions and guidelines

If you configure this feature, BGP uses the local RPKI validation states. If you do not configure this feature, BGP uses the validation states in the received BGP routes.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP RPKI view.

   rpki

4. Enable BGP RPKI validation.

   check-origin-validation

   By default, BGP RPKI validation is disabled.

Applying the BGP RPKI validation state to optimal route selection

About this task

If multiple routes to the same destination are available, BGP first discards routes with unreachable next hops, and then selects the optimal route according to the following rules:

- Routes with a BGP RPKI validation state of **Valid** takes precedence over routes with a validation state of **Not-found** or **Invalid**.
- Routes with a BGP RPKI validation state of **Not-found** takes precedence over routes with a validation state of **Invalid**.
- Routes without a BGP RPKI validation state have the same priority as routes with a BGP RPKI validation state of **Not-found**.
- For routes that have the same BGP RPKI validation state, BGP selects the optimal route according to the rules in "BGP route selection."

You can configure a routing policy to filter routes based on the BGP RPKI validation state. For more information about routing policies, see "Configuring routing policies."

Procedure (IPv4 unicast)

1. Enter system view.

   system-view
2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]
3. Apply the BGP RPKI validation state to optimal route selection.

   bestroute origin-as-validation [**allow-invalid**]

   By default, BGP ignores the BGP RPKI validation state during optimal route selection.

   To allow routes with a validation state of **Invalid** to participate in optimal route selection, you must specify the **allow-invalid** keyword.

Procedure (IPv6 unicast)

1. Enter system view.

   system-view
2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   - Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv6 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

ip vpn-instance *vpn-instance-name*

address-family ipv6 [**unicast**]

3. Apply the BGP RPKI validation state to optimal route selection.

   bestroute origin-as-validation [**allow-invalid**]

   By default, BGP ignores the BGP RPKI validation state during optimal route selection.

   To allow routes with a validation state of **Invalid** to participate in optimal route selection, you must specify the **allow-invalid** keyword.

Advertising BGP RPKI validation state to a peer or peer group

Restrictions and guidelines

BGP advertises the BGP RPKI validation state to a peer or peer group through the extended community attribute. To enable this feature, you must first enable BGP to advertise the extended community attribute to the peer or peer group and make sure RPKI settings are correct.

In the current software version, BGP can advertise the BGP RPKI validation state only to IBGP peers and peer groups.

Procedure (IPv4 unicast)

1. Enter system view.

   system-view

2. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.

   - Execute the following commands in sequence to enter BGP IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family ipv4 [**unicast**]

   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

3. Advertise the extended community attribute to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise-ext-community**

   By default, BGP does not advertise the extended community attribute.

4. Advertise the BGP RPKI validation state to the specified peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise origin-as-validation**

   interface-peer *interface-type interface-number* **advertise origin-as-validation**

   By default, BGP does not advertise the BGP RPKI validation state.

Procedure (IPv6 unicast)

1. Enter system view.

   system-view

2. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.

- Execute the following commands in sequence to enter BGP IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  address-family ipv6 [**unicast**]

- Execute the following commands in sequence to enter BGP-VPN IPv6 unicast address family view:

  bgp *as-number* [**instance** *instance-name*]

  ip vpn-instance *vpn-instance-name*

  address-family ipv6 [**unicast**]

3. Advertise the extended community attribute to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise-ext-community**

   By default, BGP does not advertise the extended community attribute.

4. Advertise the BGP RPKI validation state to the specified peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **advertise origin-as-validation**

   interface-peer *interface-type interface-number* **advertise origin-as-validation**

   By default, BGP does not advertise the BGP RPKI validation state.

Resetting BGP RPKI sessions

Execute the following command in user view.

reset bgp [**instance** *instance-name*] **rpki server** [**vpn-instance** *vpn-instance-name*] **tcp** { *ipv4 address* | *ipv6 address* }

CAUTION:

After you execute this command, the device will delete and re-establish the specified BGP RPKI session and cause temporary session interruption.

Display and maintenance commands for BGP security features

Execute **display** commands in any view.

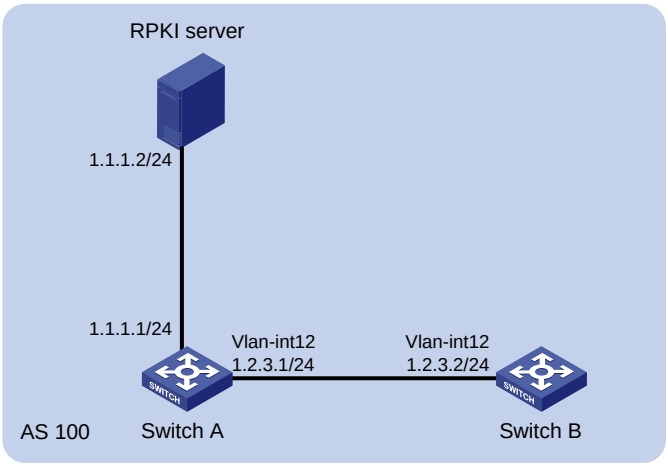
Displaying BGP (IPv4 unicast address family)

Step	Command
Display information about connections to RPKI servers.	**display bgp** [**instance** *instance-name*] **rpki server** [[**vpn-instance** *vpn-instance-name*] *ipv4-address*]
Display the ROA information obtained from RPKI servers.	**display bgp** [**instance** *instance-name*] **rpki table ipv4** [*ipv4-address* **min** *min-length* **max** *max-length*]

Displaying BGP (IPv6 unicast address family)

Step	Command
Display information about connections to RPKI servers.	**display bgp** [**instance** *instance-name*] **rpki server** [[**vpn-instance** *vpn-instance-name*] *ipv6-address*]
Display the ROA information obtained from RPKI servers.	**display bgp** [**instance** *instance-name*] **rpki table ipv6** [*ipv6-address* **min** *min-length* **max** *max-length*

IPv4 BGP security feature configuration examples



Example: Configuring BGP RPKI

Network configuration

As shown in Figure 30, all switches run BGP. Establish a TCP connection between Switch A and the RPKI server, and establish an IBGP connection between Switch A and Switch B.

Configure Switch A to advertise the BGP RPKI validation state to Switch B, and configure a routing policy to filter routes based on the validation state for Switch B.

Figure 30 Network diagram

Procedure

1. Configure IP addresses for interfaces and establish an IBGP connection between Switch A and Switch B. (Details not shown.)
2. Configure Switch A to establish a TCP connection to the RPKI server.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] rpki
[SwitchA-bgp-default-rpki] server tcp 1.1.1.2
[SwitchA-bgp-default-rpki-server] port 1234
[SwitchA-bgp-default-rpki-server] quit
```

3. Enable BGP RPKI validation on Switch A.

```
[SwitchA-bgp-default-rpki] check-origin-validation
```

```
[SwitchA-bgp-default-rpki] quit
```

4. Apply the BGP RPKI validation state to optimal route selection.

```
[SwitchA-bgp-default] address-family ipv4
[SwitchA-bgp-default-ipv4] bestroute origin-as-validation
```

5. Configure Switch A to advertise the BGP RPKI validation state to peer 1.2.3.2.

```
[SwitchA-bgp-default-ipv4] peer 1.2.3.2 advertise-ext-community
[SwitchA-bgp-default-ipv4] peer 1.2.3.2 advertise origin-as-validation
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

6. Configure Switch B to permit routes with a BGP RPKI validation state of **Valid**:

Configure a routing policy.

```
<SwitchB> system-view
[SwitchB] route-policy rpki_policy permit node 0
[SwitchB-route-policy-rpki_policy-0] if-match rpki valid
[SwitchB-route-policy-rpki_policy-0] quit
```

Apply the routing policy.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] address-family ipv4
[SwitchB-bgp-default-ipv4] peer 1.2.3.1 route-policy rpki_policy import
```

Verifying the configuration

Display information about the connection between Switch A and the RPKI server.

```
[SwitchA] display bgp rpki server

  Server          VPN-index  Port        State      Time       ROAs(IPv4/IPv6)
  1.1.1.2         0          1234        Establish  00:04:43   5/4
```

The output shows that Switch A has established a TCP connection to the RPKI server.

Display the ROA information on Switch A.

```
[SwitchA] display bgp rpki table ipv4

 Total number of entries: 5

 Status codes: S - stale, U - used

  Network         Mask-range    Origin-AS    Server       Status
  1.2.3.4         8-24          100          1.1.1.2      U
  2.2.3.6         8-32          100          1.1.1.2      U
  2.2.3.6         10-24         4294967295   1.1.1.2      U
  2.2.3.9         20-24         4294967295   1.1.1.2      U
  3.2.3.5         8-26          200          1.1.1.2      U
```

The output shows that Switch A has obtained the ROA information from the RPKI server.

Display the BGP RPKI validation state on Switch A.

```
[SwitchA] display bgp routing-table ipv4 1.2.3.0

 BGP local router ID: 2.2.2.2
 Local AS number: 100
```

```
 Paths:   1 available, 1 best

 BGP routing table information of 1.2.3.0/24:
 Imported route.
 Original nexthop: 0.0.0.0
 OutLabel        : NULL
 RxPathID        : 0x0
 TxPathID        : 0x0
 Org-validation  : Valid
 AS-path         : (null)
 Origin          : incomplete
 Attribute value : MED 0, pref-val 32768
 State           : valid, local, best
 IP precedence   : N/A
 QoS local ID    : N/A
 Traffic index   : N/A
```

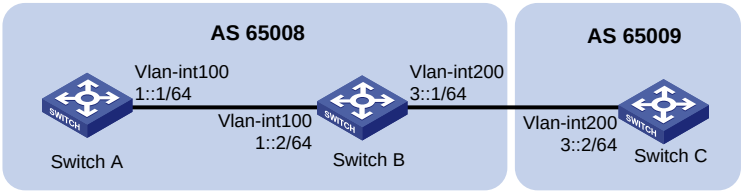
The route to 1.2.3.0 matches the ROA with a prefix of 1.2.3.4, a mask length range of 8 to 24, and an origin AS number of 100. Therefore, the BGP RPKI validation state of the route to 1.2.3.0 is **Valid**.

On Switch B, display detailed information about the BGP IPv4 unicast route to 1.2.3.0.

```
[SwitchB] display bgp routing-table ipv4 1.2.3.0
RR-client route.
 From            : 1.2.3.1 (192.168.56.22)
 Rely nexthop    : 1.2.3.1
 Original nexthop: 1.2.3.1
 OutLabel        : NULL
 Ext-Community   : <Origin Valid State: Valid >
 RxPathID        : 0x0
 TxPathID        : 0x0
 Org-validation  : Valid
 AS-path         : (null)
 Origin          : incomplete
 Attribute value : MED 0, localpref 100, pref-val 0
 State           : valid, internal, best
 IP precedence   : N/A
 QoS local ID    : N/A
 Traffic index   : N/A
```

The output displays information about the BGP IPv4 unicast route to 1.2.3.0 because Switch B permits routes with a BGP RPKI validation state of **Valid**.

IPv6 BGP security feature configuration examples



Example: Configuring IPsec for IPv6 BGP packets

Network configuration

As shown in Figure 31, all switches run IPv6 BGP. Establish an IBGP connection between Switch A and Switch B, and establish an EBGP connection between Switch B and Switch C.

To enhance security, configure IPsec to protect IPv6 BGP packets.

Figure 31 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Establish an IBGP connection between Switch A and Switch B:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 65008
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] group ibgp internal
[SwitchA-bgp-default] peer 1::2 group ibgp
[SwitchA-bgp-default] address-family ipv6 unicast
[SwitchA-bgp-default-ipv6] peer ibgp enable
[SwitchA-bgp-default-ipv6] quit
[SwitchA-bgp-default] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 65008
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] group ibgp internal
[SwitchB-bgp-default] peer 1::1 group ibgp
[SwitchB-bgp-default] address-family ipv6 unicast
[SwitchB-bgp-default-ipv6] peer ibgp enable
[SwitchB-bgp-default-ipv6] quit
```

3. Establish an EBGP connection between Switch B and Switch C:

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 65009
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] group ebgp external
[SwitchC-bgp-default] peer 3::1 as-number 65008
[SwitchC-bgp-default] peer 3::1 group ebgp
[SwitchC-bgp-default] address-family ipv6 unicast
[SwitchC-bgp-default-ipv6] peer ebgp enable
[SwitchC-bgp-default-ipv6] quit
[SwitchC-bgp-default] quit
```

   # Configure Switch B.

```
[SwitchB-bgp-default] group ebgp external
[SwitchB-bgp-default] peer 3::2 as-number 65009
[SwitchB-bgp-default] peer 3::2 group ebgp
[SwitchB-bgp-default] address-family ipv6 unicast
[SwitchB-bgp-default-ipv6] peer ebgp enable
```

```
[SwitchB-bgp-default-ipv6] quit
[SwitchB-bgp-default] quit
```

4. Configure IPsec transform sets and IPsec profiles:

On Switch A, create an IPsec transform set named **tran1**.

```
[SwitchA] ipsec transform-set tran1
```

Set the encapsulation mode to transport mode.

```
[SwitchA-ipsec-transform-set-tran1] encapsulation-mode transport
```

Set the security protocol to ESP, the encryption algorithm to DES, and authentication algorithm to SHA1.

```
[SwitchA-ipsec-transform-set-tran1] esp encryption-algorithm des
[SwitchA-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchA-ipsec-transform-set-tran1] quit
```

Create an IPsec profile named **policy001**, and specify the manual mode for it.

```
[SwitchA] ipsec profile policy001 manual
```

Use IPsec transform set **tran1**.

```
[SwitchA-ipsec-profile-policy001-manual] transform-set tran1
```

Set the SPIs of the inbound and outbound SAs to **12345**.

```
[SwitchA-ipsec-profile-policy001-manual] sa spi outbound esp 12345
[SwitchA-ipsec-profile-policy001-manual] sa spi inbound esp 12345
```

Set the keys for the inbound and outbound SAs using ESP to **abcdefg**.

```
[SwitchA-ipsec-profile-policy001-manual] sa string-key outbound esp simple abcdefg
[SwitchA-ipsec-profile-policy001-manual] sa string-key inbound esp simple abcdefg
[SwitchA-ipsec-profile-policy001-manual] quit
```

On Switch B, create an IPsec transform set named **tran1**.

```
[SwitchB] ipsec transform-set tran1
```

Set the encapsulation mode to transport mode.

```
[SwitchB-ipsec-transform-set-tran1] encapsulation-mode transport
```

Set the security protocol to ESP, the encryption algorithm to DES, and authentication algorithm to SHA1.

```
[SwitchB-ipsec-transform-set-tran1] esp encryption-algorithm des
[SwitchB-ipsec-transform-set-tran1] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran1] quit
```

Create IPsec profile named **policy001**, and specify the manual mode for it.

```
[SwitchB] ipsec profile policy001 manual
```

Use IPsec transform set **tran1**.

```
[SwitchB-ipsec-profile-policy001-manual] transform-set tran1
```

Set the SPIs of the inbound and outbound SAs to **12345**.

```
[SwitchB-ipsec-profile-policy001-manual] sa spi outbound esp 12345
[SwitchB-ipsec-profile-policy001-manual] sa spi inbound esp 12345
```

Set the keys for the inbound and outbound SAs using ESP to **abcdefg**.

```
[SwitchB-ipsec-profile-policy001-manual] sa string-key outbound esp simple abcdefg
[SwitchB-ipsec-profile-policy001-manual] sa string-key inbound esp simple abcdefg
[SwitchB-ipsec-profile-policy001-manual] quit
```

Create an IPsec transform set named **tran2**.

```
[SwitchB] ipsec transform-set tran2
```

Set the encapsulation mode to transport mode.

```
[SwitchB-ipsec-transform-set-tran2] encapsulation-mode transport
```

Set the security protocol to ESP, the encryption algorithm to DES, and authentication algorithm to SHA1.

```
[SwitchB-ipsec-transform-set-tran2] esp encryption-algorithm des
[SwitchB-ipsec-transform-set-tran2] esp authentication-algorithm sha1
[SwitchB-ipsec-transform-set-tran2] quit
```

Create IPsec profile named **policy002**, and specify the manual mode for it.

```
[SwitchB] ipsec profile policy002 manual
```

Use IPsec transform set **tran2**.

```
[SwitchB-ipsec-profile-policy002-manual] transform-set tran2
```

Set the SPIs of the inbound and outbound SAs to **54321**.

```
[SwitchB-ipsec-profile-policy002-manual] sa spi outbound esp 54321
[SwitchB-ipsec-profile-policy002-manual] sa spi inbound esp 54321
```

Set the keys for the inbound and outbound SAs using ESP to **gfedcba**.

```
[SwitchB-ipsec-profile-policy002-manual] sa string-key outbound esp simple gfedcba
[SwitchB-ipsec-profile-policy002-manual] sa string-key inbound esp simple gfedcba
[SwitchB-ipsec-profile-policy002-manual] quit
```

On Switch C, create an IPsec transform set named **tran2**.

```
[SwitchC] ipsec transform-set tran2
```

Set the encapsulation mode to transport mode.

```
[SwitchC-ipsec-transform-set-tran2] encapsulation-mode transport
```

Set the security protocol to ESP, the encryption algorithm to DES, and authentication algorithm to SHA1.

```
[SwitchC-ipsec-transform-set-tran2] esp encryption-algorithm des
[SwitchC-ipsec-transform-set-tran2] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-tran2] quit
```

Create IPsec profile named **policy002**, and specify the manual mode for it.

```
[SwitchC] ipsec profile policy002 manual
```

Use IPsec transform set **tran2**.

```
[SwitchC-ipsec-profile-policy002-manual] transform-set tran2
```

Set the SPIs of the inbound and outbound SAs to **54321**.

```
[SwitchC-ipsec-profile-policy002-manual] sa spi outbound esp 54321
[SwitchC-ipsec-profile-policy002-manual] sa spi inbound esp 54321
```

Set the keys for the inbound and outbound SAs using ESP to **gfedcba**.

```
[SwitchC-ipsec-profile-policy002-manual] sa string-key outbound esp simple gfedcba
[SwitchC-ipsec-profile-policy002-manual] sa string-key inbound esp simple gfedcba
[SwitchC-ipsec-profile-policy002-manual] quit
```

5. Configure IPsec to protect IPv6 BGP packets between Switch A and Switch B:

Configure Switch A.

```
[SwitchA] bgp 65008
[SwitchA-bgp-default] peer 1::2 ipsec-profile policy001
[SwitchA-bgp-default] quit
```

Configure Switch B.

```
[SwitchB] bgp 65008
[SwitchB-bgp-default] peer 1::1 ipsec-profile policy001
[SwitchB-bgp-default] quit
```

6. Configure IPsec to protect IPv6 BGP packets between Router B and Switch C:

Configure Switch C.

```
[SwitchC] bgp 65009
[SwitchC-bgp-default] peer ebgp ipsec-profile policy002
[SwitchC-bgp-default] quit
```

Configure Switch B.

```
[SwitchB] bgp 65008
[SwitchB-bgp-default] peer ebgp ipsec-profile policy002
[SwitchB-bgp-default] quit
```

Verifying the configuration

Display detailed information about IPv6 BGP peers on Switch B.

```
[SwitchB] display bgp peer ipv6 verbose

         Peer: 1::1      Local: 2.2.2.2

No routing policy is configured
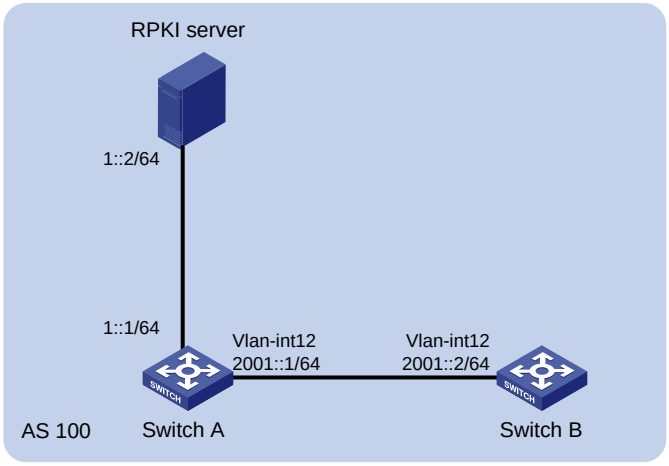
```



Example: Configuring BGP RPKI

Network configuration

As shown in Figure 32, all switches run IPv6 BGP. Establish a TCP connection between Switch A and the RPKI server, and establish an IBGP connection between Switch A and Switch B.

Configure Switch A to advertise the BGP RPKI validation state to Switch B, and configure a routing policy to filter routes based on the validation state for Switch B.

Figure 32 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces and establish an IBGP connection between Switch A and Switch B. (Details not shown.)
2. Configure Switch A to establish a TCP connection to the RPKI server.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] rpki
[SwitchA-bgp-default-rpki] server tcp 1::2
[RouterA-bgp-default-rpki-server] port 1234
[RouterA-bgp-default-rpki-server] quit
```

3. Enable BGP RPKI validation on Switch A.

```
[SwitchA-bgp-default-rpki] check-origin-validation
[SwitchA-bgp-default-rpki] quit
```

4. Apply the BGP RPKI validation state to optimal route selection.

```
[SwitchA-bgp-default] address-family ipv6
[SwitchA-bgp-default-ipv6] bestroute origin-as-validation
```

5. Configure Switch A to advertise the BGP RPKI validation state to peer 2001::2.

```
[SwitchA-bgp-default-ipv6] peer 2001::2 advertise-ext-community
[SwitchA-bgp-default-ipv6] peer 2001::2 advertise origin-as-validation
[SwitchA-bgp-default-ipv6] quit
[SwitchA-bgp-default] quit
```

6. Configure Switch B to permit routes with a BGP RPKI validation state of **Valid**:

   # Configure a routing policy.

```
<SwitchB> system-view
[SwitchB] route-policy rpki_policy permit node 0
[SwitchB-route-policy-rpki_policy-0] if-match rpki valid
```

   # Apply the routing policy.

```
<SwitchB> system-view
[SwitchB] bgp 100
[SwitchB-bgp-default] address-family ipv6
[SwitchB-bgp-default-ipv6] peer 2001::1 route-policy rpki_policy import
```

Verifying the configuration

Display information about the connection between Switch A and the RPKI server.

```
[SwitchA] display bgp rpki server

  Server          VPN-index  Port        State      Time       ROAs(IPv4/IPv6)
  1::2            0          1234        Establish  00:04:43   5/5
```

The output shows that Switch A has established a TCP connection to the RPKI server.

Display the ROA information on Switch A.

```
[SwitchA] display bgp rpki table ipv6

 Total number of entries: 5

 Status codes: S - stale, U - used

  Network         Mask-range    Origin-AS    Server       Status
  2001:4860::     32-32         100          1::2         U
  2404:6800::     32-32         100          1::2         U
  2607:F8B0::     28-28         4294967295   1::2         U
  2A03:ACE0::     40-40         4294967295   1::2         U
  2001::1         64-64         200          1::2         U
```

The output shows that Switch A has obtained ROAs from the RPKI server.

Display the BGP RPKI validation state on Switch A.

```
[SwitchA] display bgp routing-table ipv6 2001::1 64

 BGP local router ID: 2.2.2.2
 Local AS number: 100

 Paths:   1 available, 1 best

 BGP routing table information of 2001::1/64:
 Imported route.
 Original nexthop: 0.0.0.0
 OutLabel        : NULL
 RxPathID        : 0x0
 TxPathID        : 0x0
 Org-validation  : Valid
 AS-path         : (null)
 Origin          : incomplete
 Attribute value : MED 0, pref-val 32768
 State           : valid, local, best
 IP precedence   : N/A
 QoS local ID    : N/A
```

The route to 2001::1 matches the ROA with a prefix of 2001::1, a prefix length range of 64 to 64, and an origin AS number of 200. Therefore, the BGP RPKI validation state of the route to 2001::1 is **Valid**.

On Switch B, display detailed information about the BGP IPv6 unicast route to network 2001::1.

```
[SwitchB] display bgp routing-table ipv6 2001::1 64
```

```
RR-client route.
 From            : 2001::1 64 (192.168.56.22)
 Rely nexthop    : 2001::1
 Original nexthop: 2001::1
 OutLabel        : NULL
 Ext-Community   : <Origin Valid State: Valid >
 RxPathID        : 0x0
 TxPathID        : 0x0
 Org-validation  : Invalid
 AS-path         : (null)
 Origin          : incomplete
 Attribute value : MED 0, localpref 100, pref-val 0
 State           : valid, internal, best
 IP precedence   : N/A
 QoS local ID    : N/A
 Traffic index   : N/A
```

The output displays information about the BGP IPv6 unicast route to 2001::1 because Switch B permits routes with a BGP RPKI validation state of **Valid**.

Improving BGP network reliability

BGP network reliability improvement tasks at a glance

To improve the BGP network reliability, perform the following tasks:

- Configuring BGP GR
- Configuring BGP NSR
- Configuring BFD for BGP
- Configuring BGP FRR
- Configuring BGP isolation

Configuring BGP GR

About this task

Graceful Restart (GR) ensures forwarding continuous when a routing protocol restarts or an active/standby switchover occurs. Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Performs GR upon a BGP restart or active/standby switchover.
- **GR helper**—Helps the GR restarter to complete the GR process.

A device can act as a GR restarter and GR helper at the same time.

BGP GR works as follows:

1. The BGP GR restarter and helper exchange OPEN messages for GR capability negotiation. If both parties have the GR capability, they establish a GR-capable session. The GR restarter sends the GR timer set by the **`graceful-restart timer restart`** command to the GR helper in an OPEN message.
2. When an active/standby switchover occurs or BGP restarts, the GR restarter does not remove existing BGP routes from Routing Information Base (RIB) and Forwarding Information Base (FIB). It still uses these routes for packet forwarding, and it starts the RIB purge timer (set by the **`graceful-restart timer purge-time`** command). The GR helper marks all routes learned from the GR restarter as stale instead of deleting them. It continues to use these routes for packet forwarding. During the GR process, packet forwarding is not interrupted.
3. After the active/standby switchover or BGP restart completes, the GR restarter re-establishes a BGP session to the GR helper. If the BGP session fails to be established after both the GR timer and the extra timer to wait expire, the GR helper removes the stale routes. To set the extra timer to wait after the restart timer expires, execute the **`peer graceful-restart timer restart extra`** command.
4. If the BGP session is established, routing information is exchanged for the GR restarter to retrieve route entries and for the GR helper to recover stale routes.
5. Both the GR restarter and the GR helper start the End-Of-RIB marker waiting timer.

   The End-Of-RIB marker waiting time is set by the **`graceful-restart timer wait-for-rib`** command. If routing information exchange is not completed within the time, the GR restarter does not receive new routes. The GR restarter updates the RIB with the BGP routes already learned, and removes the aged routes from the RIB. The GR helper removes the stale routes.

6. The GR restarter quits the GR process if routing information exchange is not completed within the RIB purge timer. It updates the RIB with the BGP routes already learned, and removes the aged routes.

When the TCP connection goes down, the hold timer expires, or the support for a new address family is added, BGP tears down and then re-establishes the peer sessions, which will cause traffic interruption. To avoid traffic interruption in these cases, enable BGP to reset peer sessions gracefully.

Restrictions and guidelines

Follow these guidelines when you configure BGP GR:

- The End-Of-RIB indicates the end of route updates.
- The maximum time to wait for the End-of-RIB marker configured on the local end is not advertised to the peer. It controls the time for the local end to receive updates from the peer. Set a large value for the maximum time to wait for the End-of-RIB marker when a large number of routes need to be exchanged.
- As a best practice, perform the BGP GR configuration on both the GR restarter and GR helper.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enable GR capability for BGP.

   graceful-restart

   By default, GR capability is disabled for BGP.

4. Configure the GR timer.

   graceful-restart timer restart *timer*

   The default setting is 150 seconds.

   The time that a peer waits to re-establish a session must be less than the hold time.

5. (Optional.) Set the extra time to wait after the restart timer expires. Choose one command as needed:

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **graceful-restart timer restart extra** { *time* | **no-limit** }

   interface-peer *interface-type interface-number* **graceful-restart timer restart extra** { *time* | **no-limit** }

   By default, the extra time to wait after the restart timer expires is 0 seconds.

6. Configure the maximum time to wait for the End-of-RIB marker.

   graceful-restart timer wait-for-rib *timer*

   The default setting is 600 seconds.

7. Configure the RIB purge timer.

   graceful-restart timer purge-time *timer*

   The default setting is 480 seconds.

8. (Optional.) Enable BGP to reset peer sessions gracefully.

   graceful-restart peer-reset [**all**]

   By default, BGP does not reset peer sessions gracefully.

Configuring BGP NSR

About this task

To use BGP nonstop routing (NSR), the system must have a minimum of two IRF member devices.

NSR ensures nonstop services when BGP has redundant processes on multiple IRF member devices. In contrast to GR, NSR does not require a neighbor device to recover routing information.

BGP NSR backs up BGP state and data information from the active BGP process to the standby BGP process. The standby BGP process takes over when any of the following events occurs:

- The active BGP process restarts.
- The member device that runs the active BGP process fails.

Restrictions and guidelines

When both GR and NSR are configured for BGP, NSR has a higher priority than GR. The device will not act as the GR restarter. If the device acts as a GR helper, it cannot help the restarter to complete GR.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP NSR.

   non-stop-routing

   By default, BGP NSR is disabled.

Configuring BFD for BGP

About this task

BGP maintains neighbor relationships based on the keepalive timer and hold timer in seconds. It requires that the hold time must be at least three times the keepalive interval. This mechanism slows down link failure detection. Once a failure occurs on a high-speed link, a large quantity of packets will be dropped before routing convergence completes. BFD for BGP can solve this problem by fast detecting link failures to reduce convergence time.

Before you enable BFD for a BGP peer or peer group, you must establish a BGP session between the local router and the peer or peer group.

For more information about BFD, see *High Availability Configuration Guide*.

Restrictions and guidelines

Follow these restrictions and guidelines when you configure echo packet mode BFD:

- Echo packet mode BFD is applicable only to directly connected BGP peers.
- Echo packet mode BFD is not applicable to BGP peers established through loopback interfaces.
- For successful BFD session establishment, make sure a source address has been specified for echo packets by using the **bfd echo-source-ip** or **bfd echo-source-ipv6** command.

To detect the link between BGP peers established through link-local addresses, use single-hop BFD in control packet mode.

To establish a control packet mode BFD session to a BGP peer, you must configure the same BFD detection mode (multi-hop or single-hop) on the local router and the BGP peer.

If you have enabled GR, use BFD with caution because BFD might detect a failure before the system performs GR, which will result in GR failure. If you have enabled both BFD and GR for BGP, do not disable BFD during a GR process to avoid GR failure.

Procedure (IPv4 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*
3. Enable BFD to detect the link to the specified BGP peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **bfd** [**echo** | **multi-hop** | **single-hop**]

   By default, BFD is disabled.

Procedure (IPv6 peers)

1. Enter system view.

   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

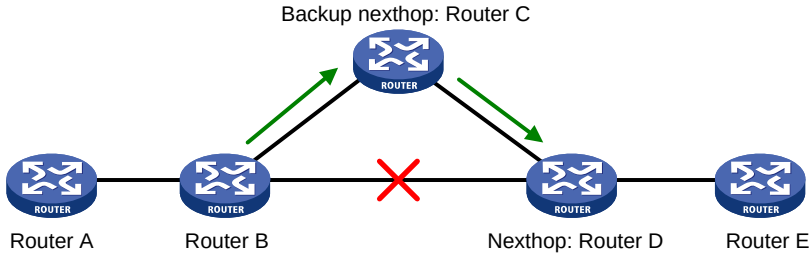
     ip vpn-instance *vpn-instance-name*
3. Enable BFD to detect the link to the specified IPv6 BGP peer or peer group. Choose one command as needed:

   peer { *group-name* | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **bfd** [**echo** | **multi-hop** | **single-hop**]

   interface-peer *interface-type interface-number* **bfd** [**multi-hop** | **single-hop**]

   By default, BFD is disabled.

   The *link-local-address* **interface** *interface-type interface-number* option and the **echo** keyword are mutually exclusive.



Configuring BGP FRR

About BGP FRR

When a link fails, the packets on the link are discarded, and a routing loop might occur until BGP completes routing convergence based on the new network topology.

You can enable BGP fast reroute (FRR) to resolve this issue.

Figure 33 Network diagram for BGP FRR

After you configure FRR on Router B as shown in Figure 33, BGP generates a backup next hop Router C for the primary route. BGP uses ARP or BFD echo packet mode in an IPv4 network or ND in an IPv6 network to detect the connectivity to Router D. When the link to Router D fails, BGP directs packets to the backup next hop. At the same time, BGP calculates a new optimal route, and forwards packets over the optimal route.

You can use the following methods to configure BGP FRR:

- **Method 1**—Execute the **pic** command in BGP address family view. BGP calculates a backup next hop for each BGP route in the address family if there are two or more unequal-cost routes that reach the destination.
- **Method 2**—Execute the **fast-reroute route-policy** command to use a routing policy in which a backup next hop is specified by using the command **apply** [**ipv6**] **fast-reroute backup-nexthop**. The backup next hop calculated by BGP must be the same as the specified backup next hop. Otherwise, BGP does not generate a backup next hop for the primary route. You can also configure **if-match** clauses in the routing policy to identify the routes protected by FRR.

If both methods are configured, Method 2 takes precedence over Method 1.

BGP supports FRR for IPv4 and IPv6 unicast routes.

Configuring BGP FRR by using a routing policy (IPv4 unicast address family)

1. Enter system view.

   system-view
2. Configure the source address of echo packets.

   bfd echo-source-ip *ipv4-address*

   By default, no source address is specified for echo packets.

   This step is required when BFD echo packet mode is used to detect the connectivity to the next hop of the primary route.

   Specify a source IP address that does not belong to any local network.

   For more information about this command, see BFD commands in *High Availability Command Reference*.
3. Create a routing policy and enter routing policy view.

   route-policy *route-policy-name* **permit node** *node-number*

   For more information about this command, see routing policy commands in *Layer 3—IP Routing Command Reference*.
4. Set the backup next hop for FRR.

   apply fast-reroute backup-nexthop *ipv4-address*

   By default, no backup next hop is set.

For more information about this command, see routing policy commands in *Layer 3—IP Routing Command Reference*.

5. Return to system view.

   quit

6. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

7. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   - Enter BGP IPv4 unicast address family view.

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

8. Apply a routing policy to FRR for the address family.

   fast-reroute route-policy *route-policy-name*

   By default, no routing policy is applied.

   The **apply fast-reroute backup-nexthop** command and **apply ipv6 fast-reroute backup-nexthop** command can take effect in the applied routing policy. Other **apply** commands do not take effect.

Configuring BGP FRR by using a routing policy (IPv6 unicast address family)

1. Enter system view.

   system-view

2. Create a routing policy and enter routing policy view.

   route-policy *route-policy-name* **permit node** *node-number*

   For more information about this command, see routing policy commands in *Layer 3—IP Routing Command Reference*.

3. Set the backup next hop for FRR.

   apply ipv6 fast-reroute backup-nexthop *ipv6-address*

   By default, no backup next hop is set.

   For more information about this command, see routing policy commands in *Layer 3—IP Routing Command Reference*.

4. Return to system view.

   quit

5. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.

     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

6. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.

   address-family ipv6 [**unicast**]

7. Apply a routing policy to FRR for the address family.

fast-reroute route-policy *route-policy-name*

By default, no routing policy is applied.

The **apply fast-reroute backup-nexthop** and **apply ipv6 fast-reroute backup-nexthop** commands can take effect in the applied routing policy. Other **apply** commands do not take effect.

Configuring BGP FRR through PIC (IPv4 unicast address family)

Restrictions and guidelines

This feature might result in routing loops. Use it with caution.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enter BGP IPv4 unicast address family view or BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
4. Enable BGP FRR through PIC.
   pic

   By default, BGP FRR is disabled.

Configuring BGP FRR through PIC (IPv6 unicast address family)

Restrictions and guidelines

This feature might result in routing loops. Use it with caution.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view or BGP-VPN instance view.
   - Enter BGP instance view.
     bgp *as-number* [**instance** *instance-name*]
   - Enter BGP-VPN instance view.
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
3. Enter BGP IPv6 unicast address family view or BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
4. Enable BGP FRR through PIC.

pic

By default, BGP FRR is disabled.

Configuring BFD-powered nexthop connectivity detection for BGP FRR

About this task

By default, BGP FRR uses ARP to detect next hop connectivity for the primary route. This method is not efficient at detecting the failure of the primary route. As a result, data loss might occur when the primary route fails, because the backup path might not take over to forward traffic in time. To resolve this issue, enable BFD-powered nexthop connectivity detection for BGP FRR. This feature enables BGP to create an IP FRR BFD session that detects next hop connectivity for the primary route. This can speed up primary and backup route switchover when the next hop of the primary route fails.

Restrictions and guidelines

This feature takes effect and creates an IP FRR BFD session only when the primary route has a backup next hop.

BGP does not support backup next hop calculation for the routes used for load balancing. This command cannot take effect when the primary route is an ECMP route.

When you configure echo-mode BFD for nexthop connectivity detection, you only need to configure this feature on the local router.

When another routing protocol (such as OSPF or IS-IS) uses BFD to detect next hop connectivity for the primary route, it also creates a BFD session. If the detected link is the same as the link attached to the next hop of the BGP primary route, BGP reuses the BFD session created by the protocol. In this situation, BGP will not create an additional BFD session.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. (Optional.) Enable BFD-powered nexthop connectivity detection for BGP FRR.

   primary-path-detect bfd echo

   By default, BGP FRR uses ARP to detect nexthop connectivity for the primary route.

Configuring BGP isolation

About this task

To maintain a BGP network device, you can use BGP isolation to remove the device from the network. This feature reduces configuration workload and impact on the network by retaining the device configuration during the maintenance. After maintenance, you can disable BGP isolation to add the device back to the network.

BGP isolation works as follows:

1. BGP withdraws all routes advertised by the device except for the directly-connected routes.
2. BGP keeps all routes learned from its peers.
3. Each peer of the device reselects an optimal route and updates the FIB table. During optimal route selection, the peers can still use the routes advertised by the device to forward traffic.

4. After an optimal route is selected and the FIB table is updated, the peers stop forwarding packets except for those destined for the device to the device. The device is fully isolated from the network and you can upgrade it.
5. After the maintenance, disable BGP isolation on the device to gracefully add it back to the network. After returning to the network, the device advertises and learns routes as follows:
   - Advertises routes to its peers.
   - Learns routes if BGP was reset during the isolation.

Restrictions and guidelines

To avoid isolation failure, do not use this feature when GR or NSR is enabled for the device.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP isolation to gracefully remove the device from the network.
   isolate enable
   By default, BGP isolation is disabled.
4. Disable BGP isolation to gracefully add the device to the network.
   undo isolate enable

Display and maintenance commands for BGP network reliability improvement

Execute **display** commands in any view.

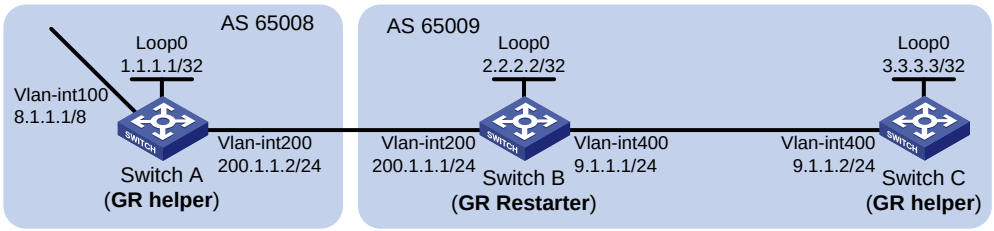
Displaying BGP (IPv4 unicast address family)

Task	Command
Display BGP NSR status information.	**display bgp** [**instance** *instance-name*] **non-stop-routing status**

Displaying BGP (IPv6 unicast address family)

Task	Command
Display BGP NSR status information.	**display bgp** [**instance** *instance-name*] **non-stop-routing status**

IPv4 BGP network reliability improvement configuration examples



Example: Configuring BGP GR

Network configuration

As shown in Figure 34, all switches run BGP. EBGP runs between Switch A and Switch B. IBGP runs between Switch B and Switch C.

Enable GR capability for BGP so that the communication between Switch A and Switch C is not affected when an active/standby switchover occurs on Switch B.

Figure 34 Network diagram

Procedure

1. Configure Switch A:

   # Configure IP addresses for interfaces. (Details not shown.)

   # Configure the EBGP connection.

   ```
   <SwitchA> system-view
   [SwitchA] bgp 65008
   [SwitchA-bgp-default] router-id 1.1.1.1
   [SwitchA-bgp-default] peer 200.1.1.1 as-number 65009
   ```

   # Enable GR capability for BGP.

   ```
   [SwitchA-bgp-default] graceful-restart
   ```

   # Inject network 8.0.0.0/8 to the BGP routing table.

   ```
   [SwitchA-bgp-default] address-family ipv4
   [SwitchA-bgp-default-ipv4] network 8.0.0.0
   ```

   # Enable Switch A to exchange IPv4 unicast routing information with Switch B.

   ```
   [SwitchA-bgp-default-ipv4] peer 200.1.1.1 enable
   ```

2. Configure Switch B:

   # Configure IP addresses for interfaces. (Details not shown.)

   # Configure the EBGP connection.

   ```
   <SwitchB> system-view
   [SwitchB] bgp 65009
   [SwitchB-bgp-default] router-id 2.2.2.2
   [SwitchB-bgp-default] peer 200.1.1.2 as-number 65008
   ```

   # Configure the IBGP connection.

   ```
   [SwitchB-bgp-default] peer 9.1.1.2 as-number 65009
   ```

   # Enable GR capability for BGP.

   ```
   [SwitchB-bgp-default] graceful-restart
   ```

Inject networks 200.1.1.0/24 and 9.1.1.0/24 to the BGP routing table.

```
[SwitchB-bgp-default] address-family ipv4
[SwitchB-bgp-default-ipv4] network 200.1.1.0 24
[SwitchB-bgp-default-ipv4] network 9.1.1.0 24
```

Enable Switch B to exchange IPv4 unicast routing information with Switch A and Switch C.

```
[SwitchB-bgp-default-ipv4] peer 200.1.1.2 enable
[SwitchB-bgp-default-ipv4] peer 9.1.1.2 enable
```

3. Configure Switch C:

Configure IP addresses for interfaces. (Details not shown.)

Configure the IBGP connection.

```
<SwitchC> system-view
[SwitchC] bgp 65009
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 9.1.1.1 as-number 65009
```

Enable GR capability for BGP.

```
[SwitchC-bgp-default] graceful-restart
```

Enable Switch C to exchange IPv4 unicast routing information with Switch B.

```
[SwitchC-bgp-default-ipv4] peer 9.1.1.1 enable
```

Verifying the configuration

Ping Switch C on Switch A. Meanwhile, perform an active/standby switchover on Switch B. The ping operation is successful during the whole switchover process. (Details not shown.)

Example: Configuring BFD for BGP

Network configuration

As shown in Figure 35, configure OSPF as the IGP in AS 200.

- Establish two IBGP connections between Switch A and Switch C. When both paths operate correctly, Switch C uses the path Switch A<—>Switch B<—>Switch C to exchange packets with network 1.1.1.0/24.
- Configure BFD over the path. When the path fails, BFD can quickly detect the failure and notify it to BGP. Then, the path Switch A<—>Switch D<—>Switch C takes effect immediately.

Figure 35 Network diagram

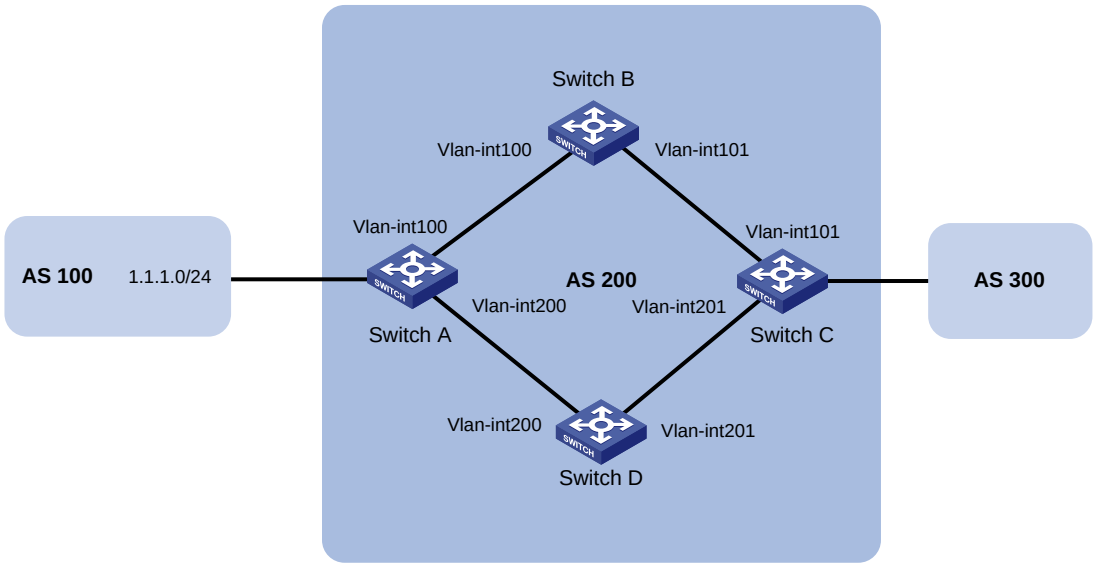


Table 5 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	3.0.1.1/24	Switch C	Vlan-int101	3.0.2.2/24
	Vlan-int200	2.0.1.1/24		Vlan-int201	2.0.2.2/24
Switch B	Vlan-int100	3.0.1.2/24	Switch D	Vlan-int200	2.0.1.2/24
	Vlan-int101	3.0.2.1/24		Vlan-int201	2.0.2.1/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure OSPF to ensure that Switch A and Switch C are reachable to each other. (Details not shown.)
3. Configure BGP on Switch A:

   # Establish two IBGP connections to Switch C.

```
<SwitchA> system-view
[SwitchA] bgp 200
[SwitchA-bgp-default] peer 3.0.2.2 as-number 200
[SwitchA-bgp-default] peer 2.0.2.2 as-number 200
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 3.0.2.2 enable
[SwitchA-bgp-default-ipv4] peer 2.0.2.2 enable
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

   # Create IPv4 basic ACL 2000 to permit 1.1.1.0/24 to pass.

```
[SwitchA] acl basic 2000
[SwitchA-acl-ipv4-basic-2000] rule permit source 1.1.1.0 0.0.0.255
[SwitchA-acl-ipv4-basic-2000] quit
```

   # Create two routing policies to set the MED for route 1.1.1.0/24. The policy **apply_med_50** sets the MED to 50, and the policy **apply_med_100** sets the MED to 100.

```
[SwitchA] route-policy apply_med_50 permit node 10
```

```
[SwitchA-route-policy-apply_med_50-10] if-match ip address acl 2000
[SwitchA-route-policy-apply_med_50-10] apply cost 50
[SwitchA-route-policy-apply_med_50-10] quit
[SwitchA] route-policy apply_med_100 permit node 10
[SwitchA-route-policy-apply_med_100-10] if-match ip address acl 2000
[SwitchA-route-policy-apply_med_100-10] apply cost 100
[SwitchA-route-policy-apply_med_100-10] quit
```

Apply routing policy **apply_med_50** to routes outgoing to peer 3.0.2.2, and apply routing policy **apply_med_100** to routes outgoing to peer 2.0.2.2.

```
[SwitchA] bgp 200
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 3.0.2.2 route-policy apply_med_50 export
[SwitchA-bgp-default-ipv4] peer 2.0.2.2 route-policy apply_med_100 export
[SwitchA-bgp-default-ipv4] quit
```

Enable BFD for peer 3.0.2.2.

```
[SwitchA-bgp-default] peer 3.0.2.2 bfd
[SwitchA-bgp-default] quit
```

4. Configure BGP on Switch C:

Establish two IBGP connections to Switch A.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] peer 3.0.1.1 as-number 200
[SwitchC-bgp-default] peer 2.0.1.1 as-number 200
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 3.0.1.1 enable
[SwitchC-bgp-default-ipv4] peer 2.0.1.1 enable
[SwitchC-bgp-default-ipv4] quit
```

Enable BFD for peer 3.0.1.1.

```
[SwitchC-bgp-default] peer 3.0.1.1 bfd
[SwitchC-bgp-default] quit
[SwitchC] quit
```

Verifying the configuration

Display detailed BFD session information on Switch C.

```
<SwitchC> display bfd session verbose
 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv4 Session Working in control packet mode:
      Local Discr: 513                  Remote Discr: 513
        Source IP: 3.0.2.2           Destination IP: 3.0.1.1
    Session State: Up                      Interface: N/A
     Min Tx Inter: 500ms                 Act Tx Inter: 500ms
     Min Rx Inter: 500ms                 Detect Inter: 2500ms
         Rx Count: 135                       Tx Count: 135
     Connect Type: Indirect           Running Up for: 00:00:58
        Hold Time: 2457ms                 Auth mode: None
      Detect Mode: Async                       Slot: 0
         Protocol: BGP
          Version: 1
```

```
        Diag Info: No Diagnostic
```

The output shows that a BFD session has been established between Switch A and Switch C.

Display BGP peer information on Switch C.

```
<SwitchC> display bgp peer ipv4

 BGP local router ID: 3.3.3.3
 Local AS number: 200
 Total number of peers: 2                 Peers in established state: 2

  * - Dynamically created peer
  ^ - Peer created through link-local address
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  2.0.1.1                200        4        5    0       0 00:01:55 Established

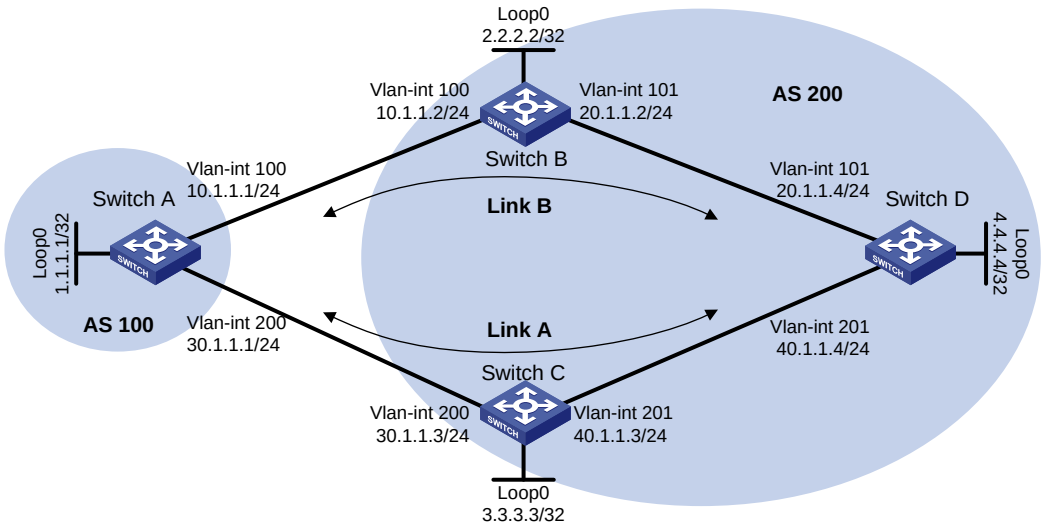
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```



The output shows that Switch C communicates with network 1.1.1.0/24 through the path Switch C<—>Switch D<—>Switch A.

Example: Configuring BGP FRR

Network configuration

As shown in Figure 36, configure BGP FRR so that when Link B fails, BGP uses Link A to forward traffic.

Figure 36 Network diagram

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)

2. Configure OSPF in AS 200 to ensure connectivity among Switch B, Switch C, and Switch D. (Details not shown.)

3. Configure BGP connections:

   # Configure Switch A to establish EBGP sessions to Switch B and Switch C, and advertise network 1.1.1.1/32.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 10.1.1.2 as-number 200
[SwitchA-bgp-default] peer 30.1.1.3 as-number 200
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] peer 10.1.1.2 enable
[SwitchA-bgp-default-ipv4] peer 30.1.1.3 enable
[SwitchA-bgp-default-ipv4] network 1.1.1.1 32
```

   # Configure Switch B to establish an EBGP session to Switch A, and an IBGP session to Switch D.

```
<SwitchB> system-view
[SwitchB] bgp 200
[SwitchB-bgp-default] router-id 2.2.2.2
[SwitchB-bgp-default] peer 10.1.1.1 as-number 100
[SwitchB-bgp-default] peer 4.4.4.4 as-number 200
[SwitchB-bgp-default] peer 4.4.4.4 connect-interface loopback 0
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 10.1.1.1 enable
[SwitchB-bgp-default-ipv4] peer 4.4.4.4 enable
[SwitchB-bgp-default-ipv4] peer 4.4.4.4 next-hop-local
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

   # Configure Switch C to establish an EBGP session to Switch A, and an IBGP session to Switch D.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 30.1.1.1 as-number 100
[SwitchC-bgp-default] peer 4.4.4.4 as-number 200
[SwitchC-bgp-default] peer 4.4.4.4 connect-interface loopback 0
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 30.1.1.1 enable
[SwitchC-bgp-default-ipv4] peer 4.4.4.4 enable
[SwitchC-bgp-default-ipv4] peer 4.4.4.4 next-hop-local
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

   # Configure Switch D to establish IBGP sessions to Switch B and Switch C, and advertise network 4.4.4.4/32.

```
<SwitchD> system-view
[SwitchD] bgp 200
[SwitchD-bgp-default] router-id 4.4.4.4
[SwitchD-bgp-default] peer 2.2.2.2 as-number 200
[SwitchD-bgp-default] peer 2.2.2.2 connect-interface loopback 0
```

```
[SwitchD-bgp-default] peer 3.3.3.3 as-number 200
[SwitchD-bgp-default] peer 3.3.3.3 connect-interface loopback 0
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] peer 2.2.2.2 enable
[SwitchD-bgp-default-ipv4] peer 3.3.3.3 enable
[SwitchD-bgp-default-ipv4] network 4.4.4.4 32
```

4. Configure preferred values so Link B is used to forward traffic between Switch A and Switch D:

Configure Switch A to set the preferred value to 100 for routes received from Switch B.

```
[SwitchA-bgp-default-ipv4] peer 10.1.1.2 preferred-value 100
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

Configure Switch D to set the preferred value to 100 for routes received from Switch B.

```
[SwitchD-bgp-default-ipv4] peer 2.2.2.2 preferred-value 100
[SwitchD-bgp-default-ipv4] quit
[SwitchD-bgp-default] quit
```

5. Configure BGP FRR:

On Switch A, set the source address of BFD echo packets to 11.1.1.1.

```
[SwitchA] bfd echo-source-ip 11.1.1.1
```

Create routing policy **frr** to set a backup next hop 30.1.1.3 (Switch C) for the route destined for 4.4.4.4/32.

```
[SwitchA] ip prefix-list abc index 10 permit 4.4.4.4 32
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy] if-match ip address prefix-list abc
[SwitchA-route-policy] apply fast-reroute backup-nexthop 30.1.1.3
[SwitchA-route-policy] quit
```

Use BFD echo packet mode to detect the connectivity to Switch D.

```
[SwitchA] bgp 100
[SwitchA-bgp-default] primary-path-detect bfd echo
```

Apply the routing policy to BGP FRR for BGP IPv4 unicast address family.

```
[SwitchA-bgp-default] address-family ipv4 unicast
[SwitchA-bgp-default-ipv4] fast-reroute route-policy frr
[SwitchA-bgp-default-ipv4] quit
[SwitchA-bgp-default] quit
```

On Switch D, set the source address of BFD echo packets to 44.1.1.1.

```
[SwitchD] bfd echo-source-ip 44.1.1.1
```

Create routing policy **frr** to set a backup next hop 3.3.3.3 (Switch C) for the route destined for 1.1.1.1/32.

```
[SwitchD] ip prefix-list abc index 10 permit 1.1.1.1 32
[SwitchD] route-policy frr permit node 10
[SwitchD-route-policy] if-match ip address prefix-list abc
[SwitchD-route-policy] apply fast-reroute backup-nexthop 3.3.3.3
[SwitchD-route-policy] quit
```

Use BFD echo packet mode to detect the connectivity to Switch A.

```
[SwitchD] bgp 200
[SwitchD-bgp-default] primary-path-detect bfd echo
```

Apply the routing policy to BGP FRR for BGP IPv4 unicast address family.

```
[SwitchD-bgp-default] address-family ipv4 unicast
[SwitchD-bgp-default-ipv4] fast-reroute route-policy frr
```

```
[SwitchD-bgp-default-ipv4] quit
[SwitchD-bgp-default] quit
```

Verifying the configuration

Display detailed information about the route to 4.4.4.4/32 on Switch A. The output shows the backup next hop for the route.

```
[SwitchA] display ip routing-table 4.4.4.4 32 verbose

Summary count : 1

Destination: 4.4.4.4/32
   Protocol: BGP             Process ID: 0
  SubProtID: 0x2                    Age: 00h01m52s

```

IPv6 BGP network reliability improvement configuration examples

Example: Configuring BFD for IPv6 BGP

Network configuration

As shown in Figure 37, configure OSPFv3 as the IGP in AS 200.

- Establish two IBGP connections between Switch A and Switch C. When both paths operate correctly, Switch C uses the path Switch A<—>Switch B<—>Switch C to exchange packets with network 1200::0/64.
- Configure BFD over the path. When the path fails, BFD can quickly detect the failure and notify it to IPv6 BGP. Then, the path Switch A<—>Switch D<—>Switch C takes effect immediately.

Figure 37 Network diagram

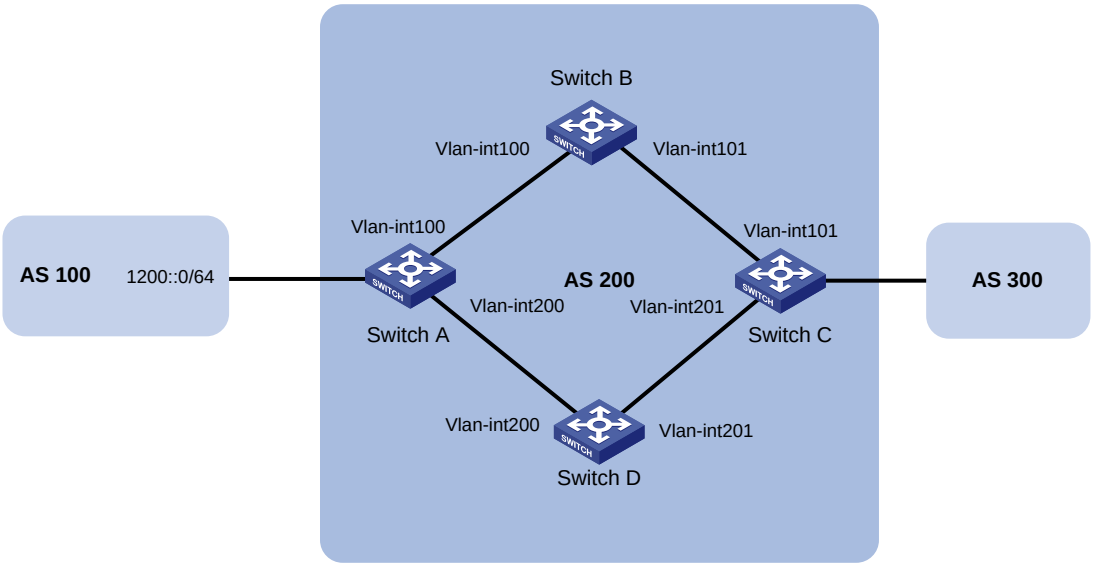

Table 6 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	3000::1/64	Switch C	Vlan-int101	3001::3/64
	Vlan-int200	2000::1/64		Vlan-int201	2001::3/64
Switch B	Vlan-int100	3000::2/64	Switch D	Vlan-int200	2000::2/64
	Vlan-int101	3001::2/64		Vlan-int201	2001::2/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)

2. Configure OSPFv3 so that Switch A and Switch C can reach each other. (Details not shown.)
3. Configure IPv6 BGP on Switch A:

   # Establish two IBGP connections to Switch C.

```
<SwitchA> system-view
[SwitchA] bgp 200
[SwitchA-bgp-default] router-id 1.1.1.1
[SwitchA-bgp-default] peer 3001::3 as-number 200
[SwitchA-bgp-default] peer 2001::3 as-number 200
[SwitchA-bgp-default] address-family ipv6
[SwitchA-bgp-default-ipv6] peer 3001::3 enable
[SwitchA-bgp-default-ipv6] peer 2001::3 enable
[SwitchA-bgp-default-ipv6] quit
```

   # Create IPv6 basic ACL 2000 to permit 1200::0/64 to pass.

```
[SwitchA] acl ipv6 basic 2000
[SwitchA-acl-ipv6-basic-2000] rule permit source 1200:: 64
[SwitchA-acl-ipv6-basic-2000] quit
```

   # Create two routing policies to set the MED for route 1200::0/64. The policy **apply_med_50** sets the MED to 50, and the policy **apply_med_100** sets the MED to 100.

```
[SwitchA] route-policy apply_med_50 permit node 10
[SwitchA-route-policy-apply_med_50-10] if-match ipv6 address acl 2000
[SwitchA-route-policy-apply_med_50-10] apply cost 50
[SwitchA-route-policy-apply_med_50-10] quit
[SwitchA] route-policy apply_med_100 permit node 10
[SwitchA-route-policy-apply_med_100-10] if-match ipv6 address acl 2000
[SwitchA-route-policy-apply_med_100-10] apply cost 100
[SwitchA-route-policy-apply_med_100-10] quit
```

   # Apply routing policy **apply_med_50** to routes outgoing to peer 3001::3, and apply routing policy **apply_med_100** to routes outgoing to peer 2001::3.

```
[SwitchA] bgp 200
[SwitchA-bgp-default] address-family ipv6 unicast
[SwitchA-bgp-default-ipv6] peer 3001::3 route-policy apply_med_50 export
[SwitchA-bgp-default-ipv6] peer 2001::3  route-policy apply_med_100 export
[SwitchA-bgp-default-ipv6] quit
```

   # Enable BFD for peer 3001::3.

```
[SwitchA-bgp-default] peer 3001::3 bfd
[SwitchA-bgp-default] quit
```

4. Configure IPv6 BGP on Switch C:

   # Establish two IBGP connections to Switch A.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 3.3.3.3
[SwitchC-bgp-default] peer 3000::1 as-number 200
[SwitchC-bgp-default] peer 2000::1 as-number 200
[SwitchC-bgp-default] address-family ipv6
[SwitchC-bgp-default-ipv6] peer 3000::1 enable
[SwitchC-bgp-default-ipv6] peer 2000::1 enable
[SwitchC-bgp-default-ipv6] quit
```

   # Enable BFD for peer 3001::1.

```
[SwitchC-bgp-default] peer 3000::1 bfd
[SwitchC-bgp-default] quit
[SwitchC] quit
```

Verifying the configuration

Display detailed BFD session information on Switch C.

```
<SwitchC> display bfd session verbose
Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 Session Working in control packet mode:
       Local Discr: 513                 Remote Discr: 513
         Source IP: 3001::3
    Destination IP: 3000::1
     Session State: Up                     Interface: N/A
      Min Tx Inter: 500ms                Act Tx Inter: 500ms
      Min Rx Inter: 500ms                Detect Inter: 2500ms
          Rx Count: 13                       Tx Count: 14
      Connect Type: Indirect           Running Up for: 00:00:05
         Hold Time: 2243ms                  Auth mode: None
       Detect Mode: Async                        Slot: 0
          Protocol: BGP4+
           Version:1
         Diag Info: No Diagnostic
```

The output shows that a BFD session has been established between Switch A and Switch C.

Display BGP peer information on Switch C.

```
<SwitchC> display bgp peer ipv6

 BGP local router ID: 3.3.3.3
 Local AS number: 200
 Total number of peers: 2                 Peers in established state: 2

  * - Dynamically created peer
  ^ - Peer created through link-local address
  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  2000::1                200        8        8    0       0 00:04:45 Established
  3000::1                200        5        4    0       0 00:01:53 Established
```

The output shows that Switch C has established two BGP connections with Switch A, and both connections are in Established state.

Display route 1200::0/64 on Switch C.

```
<SwitchC> display ipv6 routing-table 1200::0 64 verbose

Summary count : 1

Destination: 1200::/64
   Protocol: BGP4+           Process ID: 0
  SubProtID: 0x1                    Age: 00h01m07s
       Cost: 50              Preference: 255
```

```
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x1               OrigVrf: default-vrf
    TableID: 0xa                OrigAs: 0
      NibID: 0x25000001         LastAs: 0
     AttrID: 0x1              Neighbor: 3000::1
      Flags: 0x10060        OrigNextHop: 3000::1
      Label: NULL           RealNextHop: FE80::20C:29FF:FE4A:3873
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface101
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
```

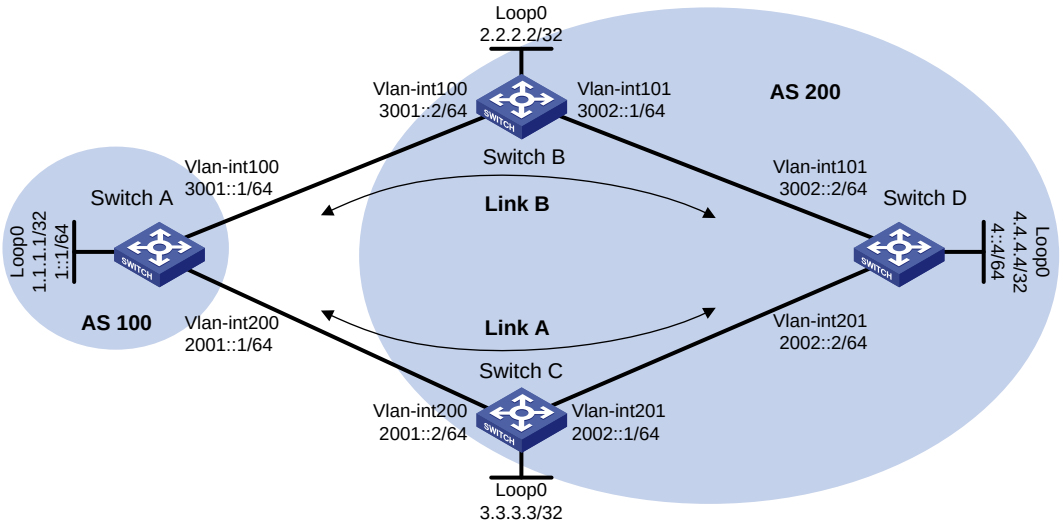
The output shows that Switch C communicates with network 1200::0/64 through the path Switch C<—>Switch B<—>Switch A.

Break down the path Switch C<—>Switch B<—>Switch A and then display route 1200::0/64 on Switch C.

```
<SwitchC> display ipv6 routing-table 1200::0 64 verbose

Summary count : 1

Destination: 1200::/64
   Protocol: BGP4+           Process ID: 0
  SubProtID: 0x1                    Age: 00h00m57s
       Cost: 100             Preference: 255
      IpPre: N/A             QosLocalID: N/A
        Tag: 0                    State: Active Adv
  OrigTblID: 0x1               OrigVrf: default-vrf
    TableID: 0xa                OrigAs: 0
      NibID: 0x25000000         LastAs: 0
     AttrID: 0x0              Neighbor: 2000::1
      Flags: 0x10060        OrigNextHop: 2000::1
      Label: NULL           RealNextHop: FE80::20C:29FF:FE40:715
    BkLabel: NULL             BkNextHop: N/A
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface201
BkTunnel ID: Invalid        BkInterface: N/A
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
```



The output shows that Switch C communicates with network 1200::0/64 through the path Switch C<—>Switch D<—>Switch A.

Example: Configuring IPv6 BGP FRR

Network configuration

As shown in Figure 38, configure BGP FRR so that when Link B fails, BGP uses Link A to forward traffic.

Figure 38 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 in AS 200 to ensure connectivity among Switch B, Switch C, and Switch D. (Details not shown.)
3. Configure BGP connections:

   # Configure Switch A to establish EBGP sessions to Switch B and Switch C, and advertise network 1::/64.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA] router-id 1.1.1.1
[SwitchA-bgp-default] peer 3001::2 as-number 200
[SwitchA-bgp-default] peer 2001::2 as-number 200
[SwitchA-bgp-default] address-family ipv6 unicast
[SwitchA-bgp-default-ipv6] peer 3001::2 enable
[SwitchA-bgp-default-ipv6] peer 2001::2 enable
[SwitchA-bgp-default-ipv6] network 1:: 64
[SwitchA-bgp-default-ipv6] quit
[SwitchA-bgp-default] quit
```

   # Configure Switch B to establish an EBGP session to Switch A, and an IBGP session to Switch D.

```
<SwitchB> system-view
[SwitchB] bgp 200
[SwitchB] router-id 2.2.2.2
[SwitchB-bgp-default] peer 3001::1 as-number 100
[SwitchB-bgp-default] peer 3002::2 as-number 200
[SwitchB-bgp-default] address-family ipv6 unicast
```

```
[SwitchB-bgp-default-ipv6] peer 3001::1 enable
[SwitchB-bgp-default-ipv6] peer 3002::2 enable
[SwitchB-bgp-default-ipv6] peer 3002::2 next-hop-local
[SwitchB-bgp-default-ipv6] quit
[SwitchB-bgp-default] quit
```

Configure Switch C to establish an EBGP session to Switch A, and an IBGP session to Switch D.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC] router-id 3.3.3.3
[SwitchC-bgp-default] peer 2001::1 as-number 100
[SwitchC-bgp-default] peer 2002::2 as-number 200
[SwitchC-bgp-default] address-family ipv6 unicast
[SwitchC-bgp-default-ipv6] peer 2001::1 enable
[SwitchC-bgp-default-ipv6] peer 2002::2 enable
[SwitchC-bgp-default-ipv6] peer 2002::2 next-hop-local
[SwitchC-bgp-default-ipv6] quit
[SwitchC-bgp-default] quit
```

Configure Switch D to establish IBGP sessions to Switch B and Switch C, and advertise network 4::/64.

```
<SwitchD> system-view
[SwitchD] bgp 200
[SwitchD-bgp-default] peer 3002::1 as-number 200
[SwitchD-bgp-default] peer 2002::1 as-number 200
[SwitchD-bgp-default] address-family ipv6 unicast
[SwitchD-bgp-default-ipv6] peer 3002::1 enable
[SwitchD-bgp-default-ipv6] peer 2002::1 enable
[SwitchD-bgp-default-ipv6] network 4:: 64
[SwitchD-bgp-default-ipv6] quit
[SwitchD-bgp-default] quit
```

4. Configure preferred values so Link B is used to forward traffic between Switch A and Switch D:

Configure Switch A to set the preferred value to 100 for routes received from Switch B.

```
[SwitchA-bgp-default-ipv6] peer 3001::2 preferred-value 100
[SwitchA-bgp-default-ipv6] quit
[SwitchA-bgp-default] quit
```

Configure Switch D to set the preferred value to 100 for routes received from Switch B.

```
[SwitchD-bgp-default-ipv6] peer 3002::1 preferred-value 100
[SwitchD-bgp-default-ipv6] quit
[SwitchD-bgp-default] quit
```

5. Configure BGP FRR:

On Switch A, create routing policy **frr** to set a backup next hop 2001::2 (Switch C) for the route destined for 4::/64.

```
<SwitchA> system-view
[SwitchA] ipv6 prefix-list abc index 10 permit 4:: 64
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy] if-match ipv6 address prefix-list abc
[SwitchA-route-policy] apply ipv6 fast-reroute backup-nexthop 2001::2
[SwitchA-route-policy] quit
```

Apply the routing policy to BGP FRR for BGP IPv6 unicast address family.

```
[SwitchA] bgp 100
[SwitchA-bgp-default] address-family ipv6 unicast
[SwitchA-bgp-default-ipv6] fast-reroute route-policy frr
[SwitchA-bgp-default-ipv6] quit
[SwitchA-bgp-default] quit
```

On Switch D, create routing policy **frr** to set a backup next hop 2002::1 (Switch C) for the route destined for 1::/64.

```
<SwitchD> system-view
[SwitchD] ipv6 prefix-list abc index 10 permit 1:: 64
[SwitchD] route-policy frr permit node 10
[SwitchD-route-policy] if-match ipv6 address prefix-list abc
[SwitchD-route-policy] apply ipv6 fast-reroute backup-nexthop 2002::1
[SwitchD-route-policy] quit
```

Apply the routing policy to BGP FRR for BGP IPv6 unicast address family.

```
[SwitchD] bgp 200
[SwitchD-bgp-default] address-family ipv6 unicast
[SwitchD-bgp-default-ipv6] fast-reroute route-policy frr
[SwitchD-bgp-default-ipv6] quit
[SwitchD-bgp-default] quit
```

Verifying the configuration

Display detailed information about the route to 4::/64 on Switch A. The output shows the backup next hop for the route.

```
[SwitchA] display ipv6 routing-table 4:: 64 verbose

Summary count : 1

Destination: 4::/64
   Protocol: BGP4+           Process ID: 0
  SubProtID: 0x2                    Age: 00h00m58s
       Cost: 0              Preference: 255
      IpPre: N/A            QosLocalID: N/A
        Tag: 0                   State: Active Adv
  OrigTblID: 0x0               OrigVrf: default-vrf
    TableID: 0xa                OrigAs: 200
      NibID: 0x25000003         LastAs: 200
     AttrID: 0x3              Neighbor: 3001::2
      Flags: 0x10060        OrigNextHop: 3001::2
      Label: NULL           RealNextHop: 3001::2
    BkLabel: NULL             BkNextHop: 2001::2
    SRLabel: NULL             BkSRLabel: NULL
   SIDIndex: NULL               InLabel: NULL
  Tunnel ID: Invalid          Interface: Vlan-interface 100
BkTunnel ID: Invalid        BkInterface: Vlan-interface 200
   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                 PathID: 0x0
```

Display detailed information about the route to 1::/64 on Switch D. The output shows the backup next hop for the route.

```
[SwitchD] display ipv6 routing-table 1:: 64 verbose

Summary count : 1

Destination: 1::/64
   Protocol: BGP4+           Process ID: 0

   FtnIndex: 0x0           TrafficIndex: N/A
  Connector: N/A                PathID: 0x0
```

Configuring extended BGP features

Extended BGP feature configuration tasks at a glance

To configure extended BGP features, perform the following tasks:

- Configuring BMP
- Configuring BGP LS
  - Configuring basic BGP LS
  - (Optional.) Configuring BGP LS route reflection
  - (Optional.) Specifying an AS number and a router ID for BGP LS messages
  - (Optional.) Performing manual soft-reset for BGP sessions of LS address family
- Configuring BGP dedicated routes
  - Configuring basic BGP dedicated route settings
  - (Optional.) Configuring BGP dedicated route reflection
  - (Optional.) Resetting BGP sessions in dedicated address family

Configuring BMP

About this task

The BGP monitoring protocol (BMP) enables a BGP router (BMP client) to send session status information of the specified peers to BMP servers for monitoring. The session status information includes peer relationship establishment and termination as well as routing information. The BMP client communicates with the BMP servers through TCP connections.

Procedure

1. Enter system view.
   system-view
2. Create a BMP server and enter BMP server view.
   bmp server *server-number*
3. Configure an IP address and port number for the BMP server.
   server address *ipv4-address* **port** *port-number*
   By default, no IP address and port number are configured for the BMP server.
4. Set the interval at which BGP sends statistics information to the BMP server.
   statistics-interval *value*
   By default, BGP does not send statistics information to the BMP server.
5. (Optional.) Specify a VPN instance for the BMP server.
   server vpn-instance *vpn-instance-name*
   By default, no VPN instance is specified for the BMP server. The BMP server belongs to the public network.
6. (Optional.) Specify the source interface of TCP connections to the BMP server.
   server connect-interface *interface-type interface-number*

By default, BGP uses the primary IPv4 address of the output interface in the optimal route to the BMP server as the source address of TCP connections to the BMP server.
This command does not take effect if the specified interface's VPN instance is different from that configured in the **server vpn-instance** command for the same server.

7. (Optional.) Configure BGP to send routes advertised to the monitored peer or peer group to the BMP server.

   route-mode adj-rib-out

   By default, BGP does not send routes advertised to the monitored peer or peer group to the BMP server.

8. (Optional.) Configure BGP to send the optimal routes in the routing table to the BMP server.

   route-mode loc-rib

   By default, BGP does not send the optimal routes in the routing table to the BMP server.

   With this feature configured, BGP sends all routes to the BMP server first. If routes update later, BGP sends only the optimal routes to the server.

9. Return to system view.

   quit

10. Enter BGP instance view or BGP-VPN instance view.
    - Enter BGP instance view.

      bgp *as-number* [**instance** *instance-name*]
    - Enter BGP-VPN instance view.

      bgp *as-number* [**instance** *instance-name*]

      ip vpn-instance *vpn-instance-name*

11. Specify a peer or peer group to be monitored. Choose one command as needed:

    peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | *link-local-address* **interface** *interface-type interface-number* } **bmp server** *server-number-list*

    interface-peer *interface-type interface-number* **bmp server** *server-number-list*

    By default, no peer or peer group is specified.

    If you execute this command multiple times for a peer or peer group, the most recent configuration takes effect.

Configuring BGP LS

About BGP LS

The BGP Link State (LS) feature implements inter-domain and inter-AS advertisement of link state database (LSDB) and TE database (TEDB) information.

The device sends the collected link state information to the controller, which implements end-to-end traffic management and scheduling and meets the requirements of intended applications.

Configuring basic BGP LS

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Specify an AS number for an LS peer or peer group.

   peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

   By default, no AS number is specified.

4. Create the BGP LS address family and enter its view.

   address-family link-state

5. Enable the device to exchange LS information with the peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **enable**

   By default, the device cannot exchange LS information with the peer or peer group.

6. (Optional.) Set the optimal route selection delay timer for BGP LS routes.

   route-select delay *delay-value*

   By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed.

Configuring BGP LS route reflection

About this task

Perform this task to configure a BGP route reflector and its clients. The route reflector and its clients automatically form a cluster identified by the router ID of the route reflector. The route reflector forwards route updates among its clients.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP LS address family view.

   address-family link-state

4. Configure BGP LS route reflection.
   - Configure the device as a route reflector and specify a peer or peer group as its client.

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**

     By default, no route reflector or client is configured.
   - (Optional.) Enable route reflection between clients.

     reflect between-clients

     By default, route reflection between clients is enabled.

     This command can reduce the number of IBGP connections in an AS.
   - (Optional.) Configure the cluster ID of the route reflector.

     reflector cluster-id { *cluster-id* | *ipv4-address* }

     By default, a route reflector uses its own router ID as the cluster ID.

Specifying an AS number and a router ID for BGP LS messages

1. Enter system view.

system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP LS address family view.

   address-family link-state

4. Specify an AS number and a router ID for BGP LS messages.

   domain-distinguisher *as-number:router-id*

   By default, the AS number and router ID of the current BGP process are used.

   Configure this command to ensure that LS messages sent by devices in the same AS have the same AS number and router ID.

Performing manual soft-reset for BGP sessions of LS address family

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enable BGP route refresh.

   - Enable BGP route refresh for a peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise route-refresh**

   - Enable the BGP route refresh, multi-protocol extension, and 4-byte AS number features for a peer or peer group.

     undo peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **capability-advertise conventional**

   By default, the BGP route refresh, multi-protocol extension, and 4-byte AS number features are enabled.

4. Perform manual soft-reset for BGP sessions of LS address family:

   a. Return to system view.

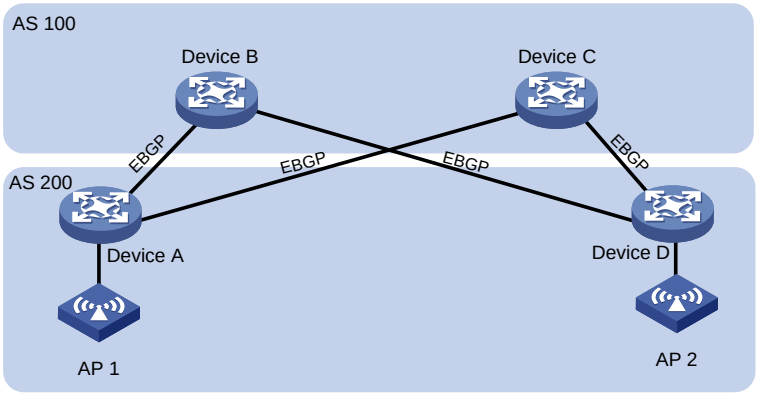
      quit

   b. Return to user view.

      quit

   c. Perform manual soft-reset for BGP sessions of LS address family.

      refresh bgp [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **link-state**



Configuring BGP dedicated routes

About BGP dedicated routes

As shown in Figure 39, Device B and Device C are EBGP peers of both Device A and Device D, and the EBGP peers can exchange dedicated routes. Both Device A and Device D are enabled with IPSG. When a client accesses Device A through AP 1, Device A generates an IPSG binding for the client based on the DHCP, DHCPv6, or ND snooping entry. Then, Device B and Device C

synchronize the IPSG binding of the client through BGP dedicated routes, and they synchronize the IPSG binding to Device D. When the client migrates from Device A to Device D, the client can quickly come online based on the synchronized IPSG binding. For more information about IPSG and IPSG bindings, see IP source guard configuration in *Security Configuration Guide*.

Figure 39 Network diagram

Configuring basic BGP dedicated route settings

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Specify an AS number for a peer or peer group.

   peer { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

   By default, no AS number is specified for a peer or peer group.

4. Create the BGP dedicated address family and enter its view.

   address-family dedicated

5. Enable BGP to exchange dedicated routes with a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP cannot exchange dedicated routes with a peer or peer group.

6. (Optional.) Specify the router as the next hop for routes sent to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **next-hop-local**

   By default, the router sets itself as the next hop for routes sent to an EBGP peer or peer group. It does not set itself as the next hop for routes sent to an IBGP peer or peer group.

7. (Optional.) Permit the local AS number to appear in routes from a peer or peer group and set the appearance times.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **allow-as-loop** [*number*]

   By default, the local AS number is not allowed in routes from a peer or peer group.

Configuring BGP dedicated route reflection

About this task

Perform this task to configure a BGP route reflector and its clients. The route reflector and its clients automatically form a cluster identified by the router ID of the route reflector. The route reflector forwards route updates among its clients.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP dedicated address family view.
   address-family dedicated
4. Configure the device as a route reflector and specify a peer or peer group as its client.
   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **reflect-client**
   By default, no route reflector or client is configured.
5. (Optional.) Enable route reflection between clients.
   reflect between-clients
   By default, route reflection between clients is enabled.
   This command can reduce the number of IBGP connections in an AS.
6. (Optional.) Configure the cluster ID of the route reflector.
   reflector cluster-id { *cluster-id* | *ipv4-address* }
   By default, a route reflector uses its own router ID as the cluster ID.

Resetting BGP sessions in dedicated address family

Execute one command in user view.

- Perform manual soft-reset on BGP sessions of the dedicated address family.
  refresh bgp [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **dedicated**
- Reset BGP sessions of the dedicated address family.
  reset bgp [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } **dedicated**

Display and maintenance commands for extended BGP features

Displaying BGP

Execute **display** commands in any view.

Displaying BGP (IPv4 unicast address family)

Task	Command
Display BMP server information.	**display bgp** [**instance** *instance-name*] **bmp server** *server-number*
Display BGP policy accounting information for IPv4 traffic.	**display bgp-policy ip statistics** { **input** | **output** } [**interface** *interface-type interface-number*]

Displaying BGP (IPv6 unicast address family)

Task	Command
Display BGP policy accounting information for IPv6 traffic.	**display bgp-policy ipv6 statistics** { **input** | **output** } [**interface** *interface-type interface-number*]

Displaying BGP (LS address family)

Task	Command
Display BGP LS peer group information.	**display bgp** [**instance** *instance-name*] **group link-state** [**group-name** *group-name*]
Display BGP LS information.	**display bgp** [**instance** *instance-name*] **link-state** [*ls-prefix* [**advertise-info**] | **peer** { *ipv4-address* | *ipv6-address* } { **advertised** | **received** } [**statistics**] | **statistics**]
Display BGP LS peer or peer group information.	**display bgp** [**instance** *instance-name*] **peer link-state** [*ipv4-address mask-length* | *ipv6-address prefix-length* | { *ipv4-address* | *ipv6-address* | **group-name** *group-name* } **log-info** | [*ipv4-address* | *ipv6-address*] **verbose**]
Display BGP LS address family update group information.	**display bgp** [**instance** *instance-name*] **update-group link-state** [*ipv4-address* | *ipv6-address*]

Displaying BGP (dedicated address family)

Task	Command
Display BGP dedicated peer group information.	**display bgp** [**instance** *instance-name*] **group dedicated** [**group-name** *group-name*]
Display BGP dedicated peer or peer group information.	**display bgp** [**instance** *instance-name*] **peer dedicated** [{ *ipv4-address mask-length* | *ipv6-address prefix-length* } | { *ipv4-address* | *ipv6-address* | **group-name** *group-name* } **log-info** | [*ipv4-address* | *ipv6-address*] **verbose**]

Task	Command
Display BGP dedicated address family update group information.	**display bgp** [**instance** *instance-name*] **update-group dedicated** [*ipv4-address* | *ipv6-address*]

Resetting BGP sessions

CAUTION:
A reset operation tears down BGP sessions for a short period of time.

Execute **reset** commands in user view.

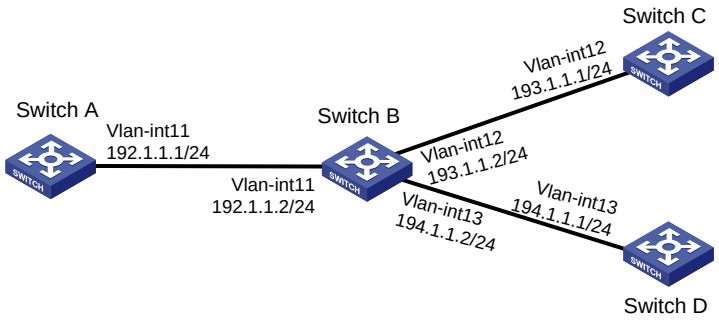
Task	Command
Reset BGP sessions for LS address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } **link-state**
Reset BGP sessions for dedicated address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } **dedicated**
Perform manual soft-reset on BGP sessions of the dedicated address family.	**refresh bgp** [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **dedicated**

Clearing BGP information

Execute **reset** commands in user view.

Task	Command
Clear BMP server statistics.	**reset bgp** [**instance** *instance-name*] **bmp server** *server-number* **statistics**

Extended BGP feature configuration examples



Example: Configuring BGP LS

Network configuration

As shown in Figure 40, all switches run BGP. Run IBGP between Switch A and Switch B, between Switch B and Switch C, and between Switch B and Switch D.

Configure Switch B as a route reflector with client Switch A to allow Switch A to learn LS information advertised by Switch C and Switch D.

Figure 40 Network diagram

Procedure

1. Configure IP addresses for interfaces and configure OSPF on Switch C and Switch D. (Details not shown.)
2. Configure BGP connections:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] peer 192.1.1.2 as-number 100
[SwitchA-bgp-default] address-family link-state
[SwitchA-bgp-default-ls] peer 192.1.1.2 enable
[SwitchA-bgp-default-ls] quit
[SwitchA-bgp-default] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 100
[SwitchB-bgp-default] peer 192.1.1.1 as-number 100
[SwitchB-bgp-default] peer 193.1.1.1 as-number 100
[SwitchB-bgp-default] peer 194.1.1.1 as-number 100
[SwitchB-bgp-default] address-family link-state
[SwitchB-bgp-default-ls] peer 192.1.1.1 enable
[SwitchB-bgp-default-ls] peer 193.1.1.1 enable
[SwitchB-bgp-default-ls] peer 194.1.1.1 enable
[SwitchB-bgp-default-ls] quit
[SwitchB-bgp-default] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 100
[SwitchC-bgp-default] peer 193.1.1.2 as-number 100
[SwitchC-bgp-default] address-family link-state
[SwitchC-bgp-default-ls] peer 193.1.1.2 enable
[SwitchC-bgp-default-ls] quit
[SwitchC-bgp-default] quit
[SwitchC] ospf
[SwitchC-ospf-1] distribute bgp-ls
[SwitchC-ospf-1] area 0
```

```
[SwitchC-ospf-1-area-0.0.0.0] network 0.0.0.0 0.0.0.0
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] bgp 100
[SwitchD-bgp-default] peer 194.1.1.2 as-number 100
[SwitchD-bgp-default] address-family link-state
[SwitchD-bgp-default-ls] peer 194.1.1.2 enable
[SwitchD-bgp-default-ls] quit
[SwitchD-bgp-default] quit
[SwitchD] ospf
[SwitchD-ospf-1] distribute bgp-ls
[SwitchD-ospf-1] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 0.0.0.0 0.0.0.0
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

3. Configure Switch B as the route reflector.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] address-family link-state
[SwitchB-bgp-default-ls] peer 192.1.1.1 reflect-client
[SwitchB-bgp-default-ls] quit
[SwitchB-bgp-default] quit
```

Verifying the configuration

Verify that Switch A has learned LS information advertised by Switch C and Switch D.

```
[SwitchA] display bgp link-state

 Total number of routes: 4

 BGP local Switch ID is 192.1.1.1

Example: Configuring BGP dedicated routes

Network configuration

As shown in Figure 41, all switches run BGP. Configure Switch B and Switch C as EBGP peers of both Switch A and Switch D. Switch A and Switch D provide access services to clients through AP 1 and AP 2. To ensure that a client can quickly come online on the access devices after migration, perform the following tasks:

- Configure IPSG on Switch A and Switch D to enable Switch A and Switch D to generate an IPSG binding for the client after the client comes online.
- Enable BGP to exchange dedicated routes with its peers and peer groups. Then, Switch B and Switch C can synchronize IPSG bindings from Switch A and Switch D, and Switch A and Switch D can withdraw expired IPSG bindings.

Figure 41 Network diagram

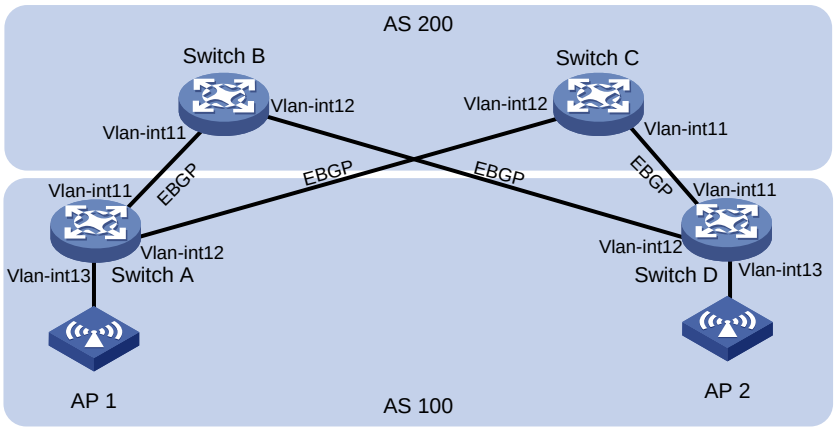

Table 7 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int11	11.11.11.11/24	Switch C	Vlan-int12	22.22.22.22/24
	Vlan-int12	22.22.22.11/24		Vlan-int11	44.44.44.11/24
Switch B	Vlan-int11	11.11.11.22/24	Switch D	Vlan-int11	44.44.44.22/24
	Vlan-int12	33.33.33.11/24		Vlan-int12	33.33.33.22/24

Procedure

1. Configure IP addresses for interfaces. (Details not shown.)
2. Configure BGP connections:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] bgp 100
[SwitchA-bgp-default] peer 11.11.11.22 as-number 200
[SwitchA-bgp-default] peer 22.22.22.22 as-number 200
[SwitchA-bgp-default] address-family dedicated
[SwitchA-bgp-default-dedicated] peer 11.11.11.22 enable
[SwitchA-bgp-default-dedicated] peer 22.22.22.22 enable
[SwitchA-bgp-default-dedicated] quit
[SwitchA-bgp-default] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] bgp 200
[SwitchB-bgp-default] peer 11.11.11.11 as-number 100
[SwitchB-bgp-default] peer 33.33.33.22 as-number 100
[SwitchB-bgp-default] address-family dedicated
[SwitchB-bgp-default-dedicated] peer 11.11.11.11 enable
[SwitchB-bgp-default-dedicated] peer 33.33.33.22 enable
[SwitchB-bgp-default-dedicated] quit
[SwitchB-bgp-default] quit
```

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] bgp 200
[SwitchC-bgp-default] peer 22.22.22.11 as-number 100
[SwitchC-bgp-default] peer 44.44.44.22 as-number 100
[SwitchC-bgp-default] address-family dedicated
[SwitchC-bgp-default-dedicated] peer 22.22.22.11 enable
[SwitchC-bgp-default-dedicated] peer 44.44.44.22 enable
[SwitchC-bgp-default-dedicated] quit
[SwitchC-bgp-default] quit
```

   # Configure Switch D.

```
<SwitchD> system-view
[SwitchD] bgp 100
[SwitchD-bgp-default] peer 33.33.33.11 as-number 200
[SwitchD-bgp-default] peer 44.44.44.11 as-number 200
[SwitchD-bgp-default] address-family dedicated
[SwitchD-bgp-default-dedicated] peer 33.33.33.11 enable
```

```
[SwitchD-bgp-default-dedicated] peer 44.44.44.11 enable
```

On Switch D, enable BGP to permit the local AS number to appear in routes from Switch A.

```
[SwitchD-bgp-default-dedicated] peer 33.33.33.11 allow-as-loop 1
[SwitchD-bgp-default-dedicated] peer 44.44.44.11 allow-as-loop 1
[SwitchD-bgp-default-dedicated] quit
[SwitchD-bgp-default] quit
```

3. Configure IPv4SG on Switch A and Switch D.

Configure Switch A.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 13
[SwitchA-Vlan-interface13] ip verify source ip-address mac-address
```

Configure Switch D.

```
<SwitchD> system-view
[SwitchD] interface vlan-interface 13
[SwitchD-Vlan-interface13] ip verify source ip-address mac-address
```

Verifying the configuration

View IPv4SG bindings on Switch A.

```
[SwitchA] display ip source binding
Total entries found: 3
IP Address      MAC Address    Interface               VLAN Type
192.168.100.4   1234-5678-9abc Vlan-interface14         N/A  DHCP relay
192.168.100.5   1234-5678-9abd Vlan-interface14         N/A  DHCP relay
192.168.100.6   1234-5678-9abe Vlan-interface14         N/A  DHCP relay

Configuring PBR

About PBR

Policy-based routing (PBR) uses user-defined policies to route packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop and output interface.

Packet forwarding process

When the device receives a packet, the device searches the PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  1. **a.** Uses the next hops or output interfaces specified on the node to forward the packet.
  2. **b.** Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
     - No next hops or output interfaces are specified on the node.
     - Forwarding failed based on the next hops or output interfaces.
  3. **c.** Uses the default route to forward the packet if one of the following conditions exists:
     - No default next hops or default output interfaces are specified on the node.
     - The forwarding failed based on the default next hops or default output interfaces.
- The device performs routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

PBR types

PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface.

Policy

A policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

A policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup.

Relationship between if-match clauses

PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about relationship between **`apply`** clauses, see "Configuring actions for a node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	Permit	**Deny**
Yes.	• If the node contains **`apply`** clauses, PBR executes the **`apply`** clauses on the node. ○ If PBR-based forwarding succeeds, PBR does not compare the packet with the next node. ○ If PBR-based forwarding fails, PBR does not compare the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No.	PBR compares the packet with the next node.	PBR compares the packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

PBR and Track

PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or output interface.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: PBR configuration

If a packet destined for the local device matches a PBR policy, PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure a PBR policy, be careful to avoid this situation.

PBR tasks at a glance

To configure PBR, perform the following tasks:

1. Configuring a policy
   a. Creating a node
   b. Setting match criteria for a node
   c. Configuring actions for a node
2. Specifying a policy for PBR

   Choose the following tasks as needed:
   - Specifying a policy for local PBR
   - Specifying a policy for interface PBR
   - Specifying a policy for global PBR

Configuring a policy

Creating a node

1. Enter system view.

   system-view
2. Create a node for a policy, and enter its view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the policy node.

   description *text*

   By default, no description is configured for a policy node.

Setting match criteria for a node

Procedure

1. Enter system view.

   system-view
2. Enter policy node view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl { *acl-number* | **name** *acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

     When using the ACL to match packets, PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.

Configuring actions for a node

About this task

The **apply** clauses allow you to specify the actions to be taken on matching packets on a node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**

PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in PBR

Clause	Meaning	Remarks
apply loadshare next-hop	Enables load sharing among multiple next hops.	Multiple next hop options operate in either primary/backup or load sharing mode. • **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple next hops are configured, the first configured next hop is selected. When the selected next hop fails, the next available next hop takes over. • **Load sharing mode**—Matching traffic is distributed across the available options. Mulitple next hops load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry. By default, the primary/backup mode applies. For the load sharing mode to take effect, make sure multiple next hops are set in the policy.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.

Restrictions and guidelines

If you specify a next hop, PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if PBR does not update the route immediately after its availability status changes.

Configuring actions to direct packet forwarding

1. Enter system view.

   system-view

2. Enter policy node view.

   policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions.

   - Set next hops.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ip-address* [**direct**] [**track** *track-entry-number*] }&<1-4>

     By default, no next hops are specified.

     On a node, you can specify a maximum of eight next hops for backup or load sharing in one command line or by executing this command multiple times.

If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

- Enable load sharing among multiple next hops.

  apply loadshare next-hop

  By default, the next hops operate in primary/backup mode.
- Set output interfaces.

  apply output-interface null 0

  By default, no output interfaces are specified.

Specifying a policy for PBR

Specifying a policy for local PBR

About this task

Perform this task to specify a policy for local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

Local PBR might affect local services such as ping and Telnet. When you use local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view
2. Specify a policy for local PBR.

   ip local policy-based-route *policy-name*

   By default, local PBR is not enabled.

Specifying a policy for interface PBR

About this task

Perform this task to apply a policy to an interface to guide the forwarding of packets received on the interface.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you can apply a new interface PBR policy to an interface, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*

3. Specify a policy for interface PBR.

   ip policy-based-route *policy-name*

   By default, no interface policy is applied to an interface.

Specifying a policy for global PBR

About this task

Perform this task to apply a policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one policy for global PBR and the specified policy must already exist. Before you can apply a new policy, you must first remove the current policy.

Interface PBR takes precedence over global PBR on an interface. When they are both configured and packets fail to match the interface PBR policy, global PBR applies.

Procedure

1. Enter system view.

   system-view

2. Specify a policy for global PBR.

   ip global policy-based-route *policy-name*

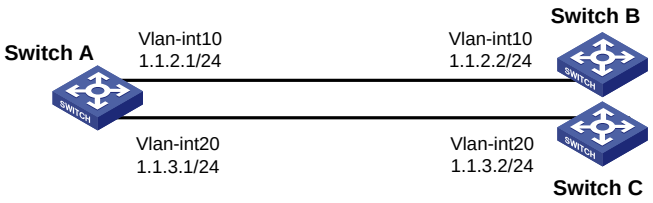
   By default, no policy is specified for global PBR.

Display and maintenance commands for PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PBR policy information.	**display ip policy-based-route** [**policy** *policy-name*]
Display global PBR configuration and statistics.	**display ip policy-based-route global** [**slot** *slot-number*]
Display interface PBR configuration and statistics.	**display ip policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display local PBR configuration and statistics.	**display ip policy-based-route local** [**slot** *slot-number*]
Display PBR configuration.	**display ip policy-based-route setup**
Clear PBR statistics.	**reset ip policy-based-route statistics** [**policy** *policy-name*]

PBR configuration examples



Example: Configuring packet type-based local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets to the next hop 1.1.2.2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IP addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ip address 1.1.2.1 24
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.3.1 24
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3101 to match TCP packets.

   ```
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule permit tcp
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

   ```
   [SwitchA] policy-based-route aaa permit node 5
   [SwitchA-pbr-aaa-5] if-match acl 3101
   [SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
   [SwitchA-pbr-aaa-5] quit
   ```

   # Configure local PBR by applying the policy **aaa** to Switch A.

   ```
   [SwitchA] ip local policy-based-route aaa
   ```

2. Configure Switch B:

   # Create VLAN 10.

   ```
   <SwitchB> system-view
   [SwitchB] vlan 10
   ```

```
[SwitchB-vlan10] quit
```

Configure the IP address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ip address 1.1.2.2 24
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IP address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ip address 1.1.3.2 24
```

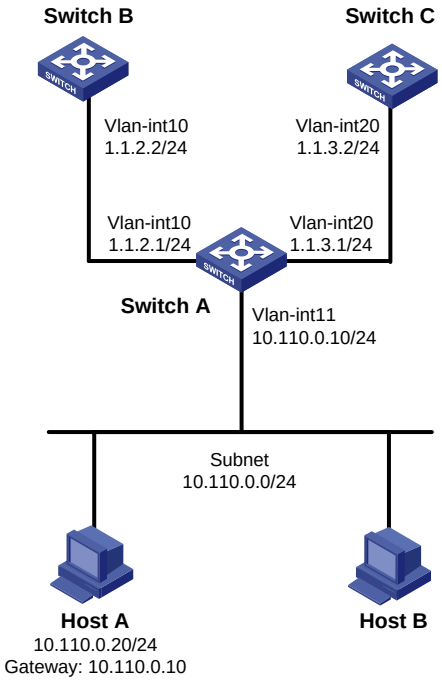
Verifying the configuration

1. Perform telnet operations to verify that local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1.1.2.2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IP addresses and unicast routing protocol settings to make sure Switch B and Switch C can reach Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3101 to match TCP packets.

   ```
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule permit tcp
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Configure Node 5 for the policy **aaa** to forward TCP packets to next hop 1.1.2.2.

   ```
   [SwitchA] policy-based-route aaa permit node 5
   [SwitchA-pbr-aaa-5] if-match acl 3101
   [SwitchA-pbr-aaa-5] apply next-hop 1.1.2.2
   [SwitchA-pbr-aaa-5] quit
   ```

   # Configure interface PBR by applying the policy **aaa** to VLAN-interface 11.

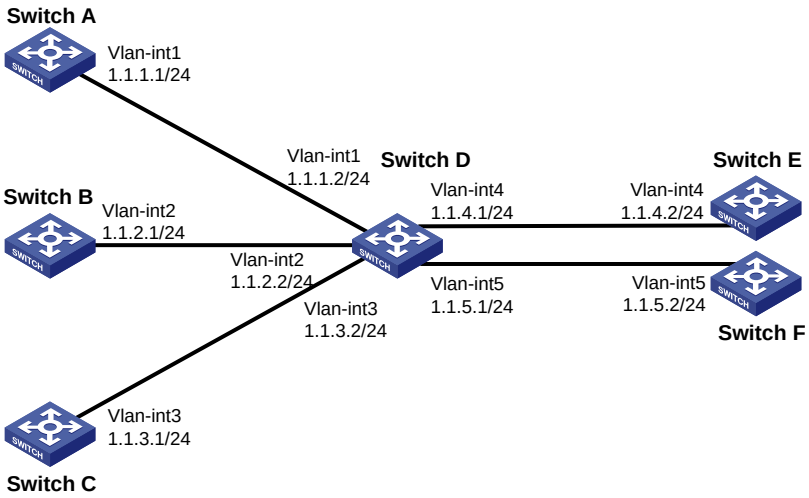
   ```
   [SwitchA] interface vlan-interface 11
   [SwitchA-Vlan-interface11] ip policy-based-route aaa
   [SwitchA-Vlan-interface11] quit
   ```

Verifying the configuration

1. Perform telnet operations to verify that interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1.1.2.2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Host A. (Details not shown.)
2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)



Example: Configuring packet type-based global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure global PBR on Switch D to forward TCP packets to the next hop 1.1.4.2 (Switch E).

Figure 3 Network diagram

Procedure

1. Configure IP addresses for the interfaces. Make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
2. Configure Switch D:

   # Configure ACL 3101 to match TCP packets sourced from networks 1.1.1.0/24, 1.1.2.0/24, and 1.1.3.0/24.

   ```
   <SwitchD> system-view
   [SwitchD] acl advanced 3101
   [SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.1.0 0.0.0.255
   [SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.2.0 0.0.0.255
   [SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.3.0 0.0.0.255
   [SwitchD-acl-ipv4-adv-3101] quit
   ```

   # Configure node 5 in PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 1.1.4.2.

   ```
   [SwitchD] policy-based-route aaa permit node 5
   [SwitchD-pbr-aaa-5] if-match acl 3101
   [SwitchD-pbr-aaa-5] apply next-hop 1.1.4.2
   [SwitchD-pbr-aaa-5] quit
   ```

   # Specify PBR policy **aaa** as the global PBR policy.

   ```
   [SwitchD] ip global policy-based-route aaa
   ```

Verifying the configuration

1. Perform telnet operations to verify that global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 1.1.4.2 (Switch E), as follows:

   # Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)
2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Configuring IPv6 static routing

About IPv6 static routing

Static routes are manually configured and cannot adapt to network topology changes. If a fault or a topological change occurs in the network, the network administrator must modify the static routes manually. IPv6 static routing works well in a simple IPv6 network.

Configuring an IPv6 static route

1. Enter system view.

   system-view

2. Configure an IPv6 static route.

   Public network:

   ipv6 route-static *ipv6-address prefix-length interface-type interface-number* [*next-hop-address*] [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text* | **recursive-lookup**]

   ipv6 route-static *ipv6-address prefix-length* { *next-hop-address* [**recursive-lookup** [**host-route**]] | **vpn-instance** *d-vpn-instance-name next-hop-address* [**recursive-lookup** [**host-route**]] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no IPv6 static route is configured.

   VPN:

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length interface-type interface-number* [*next-hop-address*] [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text* | **recursive-lookup**]

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *nexthop-address* [**recursive-lookup** [**host-route**]] [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* [**recursive-lookup** [**host-route**]] } [**permanent** | **track** *track-entry-number*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, no IPv6 static route is configured.

3. (Optional.) Set the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default setting is 60.

Deleting IPv6 static routes

About this task

To delete an IPv6 static route, use the **undo ipv6 route-static** command. To delete all IPv6 static routes including the default route, use the **delete ipv6 static-routes all** command.

Procedure

1. Enter system view.
   system-view
2. Delete all IPv6 static routes, including the default route.
   delete ipv6 [**vpn-instance** *vpn-instance-name*] **static-routes all**

CAUTION:
This command might interrupt network communication and cause packet forwarding failure. Before executing the command, make sure you fully understand the potential impact on the network.

Configuring BFD for IPv6 static routes

About BFD for IPv6 static routes

BFD provides a general purpose, standard, and medium- and protocol-independent fast failure detection mechanism. It can uniformly and quickly detect the failures of the bidirectional forwarding paths between two routers for protocols, such as routing protocols. BFD for IPv6 static routes tests the reachability of the next hop for each IPv6 static route. If a next hop is unreachable, BFD deletes the associated IPv6 static route.

For more information about BFD, see *High Availability Configuration Guide*.

Restrictions and guidelines for BFD

When you configure BFD for IPv6 static routes, follow these restrictions and guidelines:

- If you specify a source IPv6 address for BFD packets on the local device, you must specify that IPv6 address as the next hop IPv6 address on the peer device.
- If you specify a non-P2P output interface and a direct next hop, specify the **bfd-source** *ipv6-address* option as a best practice. Make sure the source IPv6 address of BFD packets meets the following requirements:
  - The address is the same as the IPv6 address of the output interface.
  - The address is on the same network segment as the next hop IPv6 address of the same type.

    For example, if the next hop IPv6 address is a link-local address, the source IPv6 address of BFD packets must also be a link-local address.
- Enabling BFD for a flapping route could worsen the situation.

Configuring BFD control packet mode

About this task

This mode uses BFD control packets to detect the status of a link bidirectionally at a millisecond level.

BFD control packet mode can be applied to IPv6 static routes with a direct next hop or with an indirect next hop.

Restrictions and guidelines for BFD control packet mode

If you configure BFD control packet mode at the local end, you must also configure this mode at the peer end.

Configuring BFD control packet mode for an IPv6 static route (direct next hop)

1. Enter system view.

   system-view

2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd control-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD control packet mode for an IPv6 static route (indirect next hop)

1. Enter system view.

   system-view

2. Configure BFD control packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length* [**vpn-instance** *d-vpn-instance-name*] { *next-hop-address* [**recursive-lookup host-route**] **bfd control-packet bfd-source** *ipv6-address* } [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD control packet mode for an IPv6 static route is not configured.

Configuring BFD echo packet mode

About this task

With BFD echo packet mode enabled for a static route, the output interface sends BFD echo packets to the destination device, which loops the packets back to test the link reachability.

Restrictions and guidelines

You do not need to configure BFD echo packet mode at the peer end.

Do not use BFD for a static route with the output interface in spoofing state.

Procedure

1. Enter system view.

   system-view

2. Configure the source address of echo packets.

   bfd echo-source-ipv6 *ipv6-address*

   By default, the source address of echo packets is not configured.

   The source address of echo packets must be a global unicast address.

   As a best practice to avoid network congestion caused by excessive ICMPv6 redirect packets from the peer, use this command. Make sure the source IPv6 address is not on the subnet of any interfaces on the device.

   For more information about this command, see *High Availability Command Reference*.

3. Configure BFD echo packet mode for an IPv6 static route.

   ipv6 route-static [**vpn-instance** *s-vpn-instance-name*] *ipv6-address prefix-length interface-type interface-number next-hop-address* **bfd echo-packet** [**bfd-source** *ipv6-address*] [**preference** *preference*] [**tag** *tag-value*] [**description** *text*]

   By default, BFD echo packet mode for an IPv6 static route is not configured.

   The next hop IPv6 address must be a global unicast address.

Enabling periodic sending of ND requests to the next hops of IPv6 static routes

About this task

When the following conditions exist, a recursive IPv6 static route becomes inactive:

- The IPv6 static route uses a host route to reach its direct next hop.
- The host route is obtained either by specifying the **recursive-lookup host-route** keyword in the **ipv6 route-static** command or by routing policy-based recursive lookup.
- The host route is unavailable because no ND entry exists for that host route on the device.

To resolve this issue, you can perform this task to enable the device to periodically send ND requests to the direct next hop. When the device receives an ND response from the direct next hop, it stops sending ND requests and activates the recursive IPv6 static route.

This task applies only to a recursive IPv6 static route that meets the following requirements:

- The IPv6 static route has no output interface specified.
- The IPv6 static route fails the next-hop recursion.

For more information about ND, see IPv6 neighbor discovery in *Layer 3—IP Services Configuration Guide*.

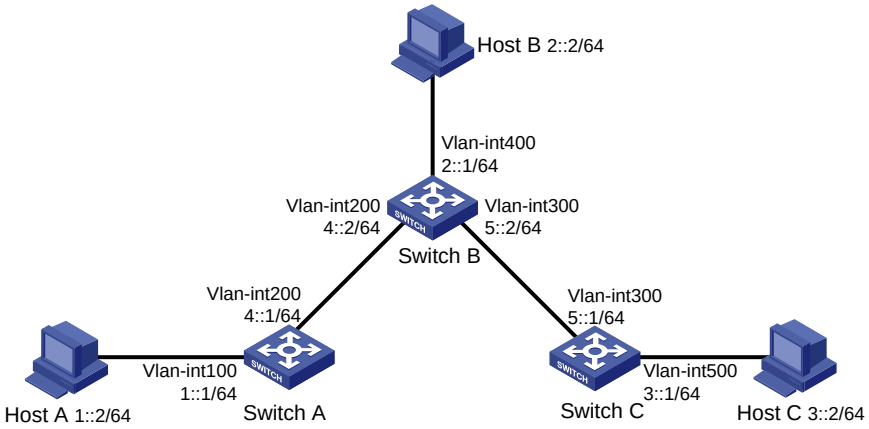
Procedure

1. Enter system view.
   system-view
2. Enable periodic sending of ND requests to the next hops of IPv6 static routes.
   ipv6 route-static nd-request [**interval** *interval*]
   By default, periodic sending of ND requests to the next hops of IPv6 static routes is disabled.

Display and maintenance commands for IPv6 static routing

Execute **display** commands in any view.

Task	Command
Display IPv6 static route next hop information.	**display ipv6 route-static nib** [*nib-id*] [**verbose**]
Display IPv6 static routing table information.	**display ipv6 route-static routing-table** [**vpn-instance** *vpn-instance-name*] [*ipv6-address prefix-length*]
Display IPv6 static route information.	**display ipv6 routing-table protocol static** [**inactive** | **verbose**]



IPv6 static routing configuration examples

Example: Configuring basic IPv6 static route

Network configuration

As shown in Figure 1, configure IPv6 static routes so that hosts can reach one another.

Figure 1 Network diagram

Procedure

1. Configure the IPv6 addresses for all VLAN interfaces. (Details not shown.)
2. Configure IPv6 static routes:

   # Configure a default IPv6 static route on Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 route-static :: 0 4::2
   ```

   # Configure two IPv6 static routes on Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 route-static 1:: 64 4::1
   [SwitchB] ipv6 route-static 3:: 64 5::1
   ```

   # Configure a default IPv6 static route on Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 route-static :: 0 5::2
   ```

3. Configure the IPv6 addresses for all the hosts and configure the default gateway of Host A, Host B, and Host C as 1::1, 2::1, and 3::1.

Verifying the configuration

Display the IPv6 static route information on Switch A.

```
[SwitchA] display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: ::/0                                   Protocol  : Static
NextHop    : 4::2                                   Preference: 60
```

```
Interface  : Vlan200                                  Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Display the IPv6 static route information on Switch B.

```
[SwitchB] display ipv6 routing-table protocol static

Summary count : 2

Static Routing table status : <Active>
Summary count : 2

Destination: 1::/64                                  Protocol  : Static
NextHop    : 4::1                                    Preference: 60
Interface  : Vlan200                                 Cost      : 0

Destination: 3::/64                                  Protocol  : Static
NextHop    : 5::1                                    Preference: 60
Interface  : Vlan300                                 Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

Use the **ping** command to test the reachability.

```
[SwitchA] ping ipv6 3::1
Ping6(56 data bytes) 4::1 --> 3::1, press CTRL+C to break
56 bytes from 3::1, icmp_seq=0 hlim=62 time=0.700 ms
56 bytes from 3::1, icmp_seq=1 hlim=62 time=0.351 ms
56 bytes from 3::1, icmp_seq=2 hlim=62 time=0.338 ms

```

Example: Configuring BFD for IPv6 static routes (direct next hop)

Network configuration

As shown in Figure 2:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on Switch C.

When the link between Switch A and Switch B through the Layer 2 switch fails, BFD can detect the failure immediately, and Switch A and Switch B can communicate through Switch C.

Figure 2 Network diagram

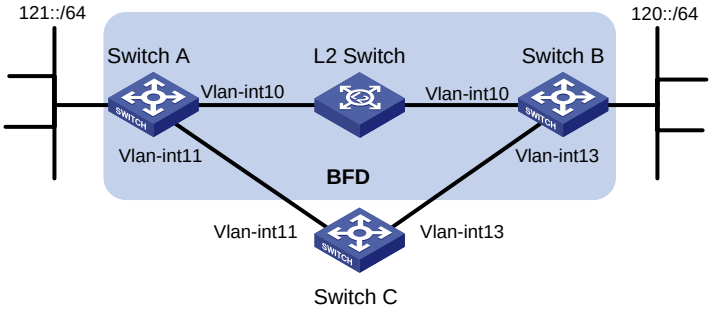

Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch B	Vlan-int10	12::2/64
Switch B	Vlan-int13	13::1/64
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 10
[SwitchA-vlan-interface10] bfd min-transmit-interval 500
[SwitchA-vlan-interface10] bfd min-receive-interval 500
[SwitchA-vlan-interface10] bfd detect-multiplier 9
[SwitchA-vlan-interface10] quit
[SwitchA] ipv6 route-static 120:: 64 vlan-interface 10 12::2 bfd control-packet
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses the Layer 2 switch.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 10
[SwitchB-vlan-interface10] bfd min-transmit-interval 500
[SwitchB-vlan-interface10] bfd min-receive-interval 500
[SwitchB-vlan-interface10] bfd detect-multiplier 9
[SwitchB-vlan-interface10] quit
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 10 12::1 bfd control-packet
[SwitchB] ipv6 route-static 121:: 64 vlan-interface 13 13::2 preference 65
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 session working in control packet mode:

       Local Discr: 513                Remote Discr: 33
         Source IP: 12::1
    Destination IP: 12::2
     Session State: Up                      Interface: Vlan10
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 12::2                                     Preference: 60
Interface  : Vlan10                                    Cost      : 0

Direct Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 10::100                                   Preference: 65
Interface  : Vlan11                                    Cost      : 0

Static Routing table status : < Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring BFD for IPv6 static routes (indirect next hop)

Network configuration

As shown in Figure 3:

- Switch A has a route to interface Loopback 1 (2::9/128) on Switch B, and the output interface is VLAN-interface 10.
- Switch B has a route to interface Loopback 1 (1::9/128) on Switch A, and the output interface is VLAN-interface 12.
- Switch D has a route to 1::9/128, and the output interface is VLAN-interface 10. It also has a route to 2::9/128, and the output interface is VLAN-interface 12.

Configure the following:

- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on both Switch C and Switch D.

When the link between Switch A and Switch B through Switch D fails, BFD can detect the failure immediately and Switch A and Switch B can communicate through Switch C.

Figure 3 Network diagram

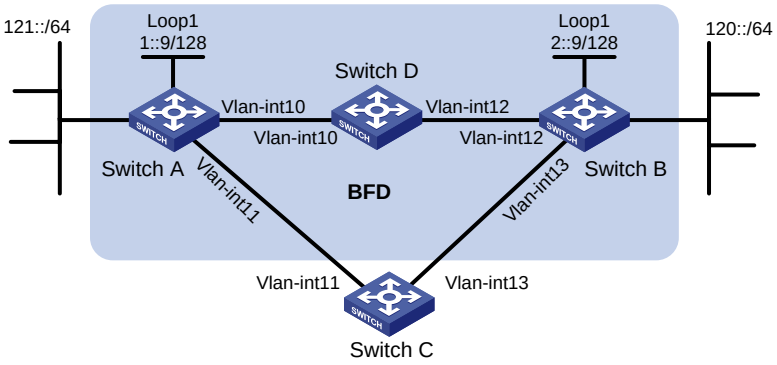

Table 2 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch A	Loop1	1::9/128
Switch B	Vlan-int12	11::2/64
Switch B	Vlan-int13	13::1/64
Switch B	Loop1	2::9/128
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64

Device	Interface	IPv6 address
Switch D	Vlan-int10	12::2/64
Switch D	Vlan-int12	11::1/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the IPv6 static route that traverses Switch D.

```
<SwitchA> system-view
[SwitchA] bfd multi-hop min-transmit-interval 500
[SwitchA] bfd multi-hop min-receive-interval 500
[SwitchA] bfd multi-hop detect-multiplier 9
[SwitchA] ipv6 route-static 120:: 64 2::9 bfd control-packet bfd-source 1::9
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] ipv6 route-static 2::9 128 12::2
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses Switch D.

```
<SwitchB> system-view
[SwitchB] bfd multi-hop min-transmit-interval 500
[SwitchB] bfd multi-hop min-receive-interval 500
[SwitchB] bfd multi-hop detect-multiplier 9
[SwitchB] ipv6 route-static 121:: 64 1::9 bfd control-packet bfd-source 2::9
[SwitchB] ipv6 route-static 121:: 64 13::2 preference 65
[SwitchB] ipv6 route-static 1::9 128 11::1
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

   # Configure IPv6 static routes on Switch D.

```
<SwitchD> system-view
[SwitchD] ipv6 route-static 120:: 64 11::2
[SwitchD] ipv6 route-static 121:: 64 12::1
[SwitchD] ipv6 route-static 2::9 128 11::2
[SwitchD] ipv6 route-static 1::9 128 12::1
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session

 Total Session Num: 1     Up Session Num: 1     Init Mode: Active

 IPv6 session working in control packet mode:

       Local Discr: 513                Remote Discr: 33
         Source IP: 1::9
```

```
    Destination IP: 2::9
     Session State: Up                         Interface: N/A
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display the IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                   Protocol  : Static
NextHop    : 2::9                                       Preference: 60
Interface  : Vlan10                                     Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                   Protocol  : Static
NextHop    : 10::100                                    Preference: 65
Interface  : Vlan11                                     Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Configuring an IPv6 default route

A default IPv6 route is used to forward packets that match no entry in the routing table.

A default IPv6 route can be configured in either of the following ways:

- The network administrator can configure a default route with a destination prefix of **::/0**. For more information, see "Configuring IPv6 static routing."
- Some dynamic routing protocols (such as OSPFv3, IPv6 IS-IS, and RIPng) can generate a default IPv6 route. For example, an upstream router running OSPFv3 can generate a default IPv6 route and advertise it to other routers. These routers install the default IPv6 route with the next hop being the upstream router. For more information, see the respective chapters on those routing protocols in this configuration guide.

Configuring RIPng

About RIPng

RIP next generation (RIPng), as an extension of RIP-2 for support of IPv6, is a distance vector routing protocol. It employs UDP to exchange route information through port 521. Most RIP concepts are applicable to RIPng.

RIPng routing metrics

RIPng uses a hop count to measure the distance to a destination. The hop count is the metric or cost. The hop count from a router to a directly connected network is 0. The hop count between two directly connected routers is 1. When the hop count is greater than or equal to 16, the destination network or host is unreachable.

RIPng route entries

RIPng stores route entries in a database. Each route entry contains the following elements:

- **Destination address**—IPv6 address of a destination host or a network.
- **Next hop address**—IPv6 address of the next hop.
- **Egress interface**—Egress interface of the route.
- **Metric**—Cost from the local router to the destination.
- **Route time**—Time elapsed since the most recent update. The time is reset to 0 every time the route entry is updated.
- **Route tag**—Used for route control. For more information, see "Configuring routing policies."

RIPng packets and advertisement

RIPng multicasts request and response packets to exchange routing information. It uses FF02::9 as the destination address and link-local address FE80::/10 as the source address. RIPng exchanges routing information as follows:

1. When RIPng starts or needs to update some route entries, it sends a multicast request packet to neighbors.
2. When a RIPng neighbor receives the request packet, it sends back a response packet that contains the local routing table. RIPng can also advertise route updates in response packets periodically or advertise a triggered update caused by a route change.
3. After RIPng receives the response, it checks the validity of the response before adding routes to its routing table, including the following details:
   - Whether the source IPv6 address is the link-local address.
   - Whether the port number is correct.
4. A response packet that fails the check is discarded.

Protocols and standards

- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*

RIPng tasks at a glance

To configure RIPng, perform the following tasks:

1. Configuring basic RIPng
2. (Optional.) Configuring RIPng route control
   - Configuring an additional routing metric
   - Configuring RIPng route summarization
   - Advertising a default route
   - Configuring received/redistributed route filtering
   - Setting a preference for RIPng
   - Configuring RIPng route redistribution
3. (Optional.) Tuning and optimizing the RIPng network
   - Setting RIPng timers
   - Configuring split horizon and poison reverse
   - Setting the maximum number of ECMP routes
   - Configuring the RIPng packet sending rate
   - Setting the interval for sending triggered updates
4. (Optional.) Enhancing RIPng availability
   - Configuring RIPng GR
   - Configuring RIPng NSR
   - Configuring RIPng FRR
5. (Optional.) Enhancing RIPng security
   - Configuring zero field check for RIPng packets
   - Applying an IPsec profile

Configuring basic RIPng

1. Enter system view.
   system-view
2. Enable RIPng and enter its view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
   By default, RIPng is disabled.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on the interface.
   If RIPng is not enabled on an interface, the interface does not send or receive any RIPng route.

Configuring RIPng route control

Configuring an additional routing metric

About this task

An additional routing metric (hop count) can be added to the metric of an inbound or outbound RIPng route.

- An outbound additional metric is added to the metric of a sent route, and it does not change the route's metric in the routing table.
- An inbound additional metric is added to the metric of a received route before the route is added into the routing table, and the route's metric is changed.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify an inbound additional routing metric.

   ripng metricin *value*

   The default additional metric of an inbound route is 0.
4. Specify an outbound additional routing metric.

   ripng metricout *value*

   The default additional metric of an outbound route is 1.

Configuring RIPng route summarization

About this task

RIPng route summarization is interface-based. RIPng advertises a summary route based on the longest match.

RIPng route summarization improves network scalability, reduces routing table size, and increases routing table lookup efficiency.

RIPng advertises a summary route with the smallest metric of all the specific routes.

For example, RIPng has two specific routes to be advertised through an interface: 1:11:11::24 with a metric of a 2 and 1:11:12::34 with a metric of 3. Configure route summarization on the interface, so RIPng advertises a single route 11::0/16 with a metric of 2.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Advertise a summary IPv6 prefix.

   ripng summary-address *ipv6-address prefix-length*

   By default, no summary IPv6 prefix is configured on the interface.

Advertising a default route

About this task

You can configure RIPng to advertise a default route with the specified cost to its neighbors.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure RIPng to advertise a default route.

   ripng default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not advertise a default route.

   This command advertises a default route on the current interface regardless of whether the default route exists in the local IPv6 routing table.

Configuring received/redistributed route filtering

About this task

Perform this task to filter received or redistributed routes by using an IPv6 ACL or IPv6 prefix list. You can also configure RIPng to filter routes redistributed from other routing protocols and routes from a specified neighbor.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configure a filter policy to filter received routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **import**

   By default, RIPng does not filter received routes.

4. Configure a filter policy to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [*protocol* [*process-id*]]

   By default, RIPng does not filter redistributed routes.

Setting a preference for RIPng

About this task

Routing protocols each have a preference. When they find routes to the same destination, the route found by the routing protocol with the highest preference is selected as the optimal route. You can manually set a preference for RIPng. The smaller the value, the higher the preference.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set a preference for RIPng.
   preference { *preference* | **route-policy** *route-policy-name* } *
   By default, the preference of RIPng is 100.

Configuring RIPng route redistribution

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Configure route redistribution.
   - Redistribute routes from BGP4+.
     import-route bgp4+ [*as-number*] [**allow-ibgp**] [**cost** *cost-value* | **route-policy** *route-policy-name*] *
   - Redistribute direct or static routes.
     import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *
   - Redistribute routes from other RIPng processes, from IPv6 IS-IS, or from OSPFv3.
     import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not redistribute routes.
4. (Optional.) Set a default routing metric for redistributed routes.
   default cost *cost-value*
   The default metric of redistributed routes is 0.

Tuning and optimizing the RIPng network

Setting RIPng timers

About this task

You can adjust RIPng timers to optimize the performance of the RIPng network.

Restrictions and guidelines

When you adjust RIPng timers, consider the network performance, and perform unified configurations on routers running RIPng to avoid unnecessary network traffic or route oscillation.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set RIPng timers.
   timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *

The default settings are as follows:

- The update timer is 30 seconds.
- The timeout timer is 180 seconds.
- The suppress timer is 120 seconds.
- The garbage-collect timer is 120 seconds.

Configuring split horizon and poison reverse

Restrictions and guidelines for split horizon and poison reverse

When you configure split horizon and poison reverse, following these restrictions and guidelines:

- If both split horizon and poison reverse are configured, only the poison reverse feature takes effect.
- Split horizon disables RIPng from sending routes through the interface where the routes were learned to prevent routing loops between neighbors. As a best practice, enable split horizon to prevent routing loops in normal cases.
- Poison reverse enables a route learned from an interface to be advertised through the interface. However, the metric of the route is set to 16, which means the route is unreachable.

Configuring split horizon

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable split horizon.
   `ripng split-horizon`
   By default, split horizon is enabled.

Configuring poison reverse

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Enable poison reverse.
   `ripng poison-reverse`
   By default, poison reverse is disabled.

Setting the maximum number of ECMP routes

1. Enter system view.
   `system-view`
2. Enter RIPng view.
   `ripng` [*`process-id`*] [**`vpn-instance`** *`vpn-instance-name`*]
3. Set the maximum number of RIPng ECMP routes.
   `maximum load-balancing` *`number`*
   By default, the maximum number of RIPng ECMP routes equals the maximum number of ECMP routes, which is configurable by using the **`max-ecmp-num`** command.

Configuring the RIPng packet sending rate

About this task

Perform this task to specify the interval for sending RIPng packets and the maximum number of RIPng packets that can be sent at each interval. This feature can avoid excessive RIPng packets from affecting system performance and consuming too much bandwidth.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configuring the RIPng packet sending rate.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in RIPng view:

     ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

     output-delay *time* **count** *count*

     By default, an interface that runs the RIPng process sends a maximum of three RIPng packets every 20 milliseconds.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in interface view:

     interface *interface-type interface-number*

     ripng output-delay *time* **count** *count*

     By default, an interface uses the RIPng packet sending rate of the RIPng process that it runs.

Setting the interval for sending triggered updates

About this task

Perform this task to avoid network overhead and reduce system resource consumption caused by frequent RIPng triggered updates.

You can use the **timer triggered** command to set the maximum interval, minimum interval, and incremental interval for sending RIPng triggered updates.

For a stable network, the minimum interval is used. If network changes become frequent, the triggered update sending interval is incremented by the incremental interval × 2^{n-2} for each triggered update until the maximum interval is reached. The value *n* is the number of triggered update times.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set the interval for sending triggered updates.

   timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   The default maximum interval is 5 seconds, the default minimum interval is 50 milliseconds, and the default incremental interval is 200 milliseconds.

Configuring RIPng GR

About this task

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

After RIPng restarts on a router, the router must learn RIPng routes again and updates its FIB table, which causes network disconnections and route reconvergence.

With the GR feature, the restarting router (known as the GR restarter) can notify the event to its GR capable neighbors. GR capable neighbors (known as GR helpers) maintain their adjacencies with the router within a configurable GR interval. During this process, the FIB table of the router does not change. After the restart, the router contacts its neighbors to retrieve its FIB.

By default, a RIPng-enabled device acts as the GR helper. Perform this task on the GR restarter.

Restrictions and guidelines

You cannot enable RIPng NSR on a device that acts as GR restarter.

Procedure

1. Enter system view.
   system-view
2. Enable RIPng and enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable the GR capability for RIPng.
   graceful-restart
   By default, RIPng GR is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   The default GR interval is 60 seconds.

Configuring RIPng NSR

About this task

Nonstop routing (NSR) backs up RIPng routing information from the active process to the standby process. After an active/standby switchover, NSR can complete route regeneration without tearing down adjacencies or impacting forwarding services.

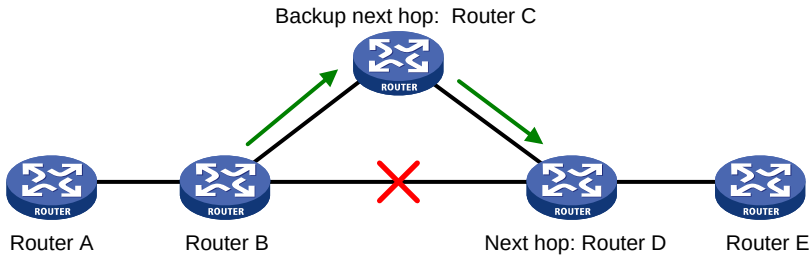
NSR does not require the cooperation of neighboring devices to recover routing information, and it is typically used more often than GR.

Restrictions and guidelines

RIPng NSR enabled for a RIPng process takes effect only on that process. If multiple RIPng processes exist, enable RIPng NSR for each process as a best practice.

A device that has RIPng NSR enabled cannot act as GR restarter.

Procedure



1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Enable RIPng NSR.
   non-stop-routing
   By default, RIPng NSR is disabled.

Configuring RIPng FRR

About RIPng FRR

A link or router failure on a path can cause packet loss and even routing loop until RIPng completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 1 Network diagram for RIPng FRR

As shown in Figure 1, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, RIPng directs packets to the backup next hop. At the same time, RIPng calculates the shortest path based on the new network topology. Then, the device forwards packets over that path after network convergence.

Restrictions and guidelines for RIPng FRR

RIPng FRR is available only when the state of the primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down.

RIPng FRR is only effective for RIPng routes that are learned from directly connected neighbors.

Equal-cost routes do not support RIPng FRR.

Enabling RIPng FRR

1. Enter system view.
   system-view
2. Configure a routing policy.
   You must specify a next hop by using the **apply ipv6 fast-reroute backup-interface** command in a routing policy and specify the routing policy for FRR.
   For more information about routing policy configuration, see "Configuring routing policies."
3. Enter RIPng view.

ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

4. Enable RIPng FRR.

   fast-reroute route-policy *route-policy-name*

   By default, RIPng FRR is disabled.

Enabling BFD for RIPng FRR

About this task

By default, RIPng FRR does not use BFD to detect primary link failures. For quicker RIPng FRR, use BFD single-hop echo detection on the primary link of redundant links to detect link failure.

Procedure

1. Enter system view.

   system-view

2. Configure the source IP address of BFD echo packets.

   bfd echo-source-ipv6 *ipv6-address*

   By default, the source IP address of BFD echo packets is not configured.

   As a best practice, do not configure the source IP address on the same network segment as any local interfaces.

   For more information about this command, see *High Availability Command Reference*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD single-hop echo detection for RIPng FRR.

   ripng primary-path-detect bfd echo

   By default, BFD single-hop echo detection is disabled for RIPng FRR.

Enhancing RIPng security

Configuring zero field check for RIPng packets

About this task

Some fields in the RIPng packet header must be zero. These fields are called zero fields. You can enable zero field check for incoming RIPng packets. If a zero field of a packet contains a non-zero value, RIPng does not process the packets. If you are certain that all packets are trustworthy, disable the zero field check to save CPU resources.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable the zero field check for incoming RIPng packets.

   checkzero

   By default, zero field check for incoming RIPng packets is enabled.

Applying an IPsec profile

About this task

To protect routing information and prevent attacks, you can configure RIPng to authenticate protocol packets by using an IPsec profile.

An IPsec profile contains inbound and outbound security parameter indexes (SPIs). RIPng compares the inbound SPI defined in the IPsec profile with the outbound SPI in the received packets. Two RIPng devices accept the packets from each other and establish a neighbor relationship only if the SPIs are the same and the relevant IPsec profiles match.

For more information about IPsec profiles, see *Security Configuration Guide*.

Restrictions and guidelines

You can apply an IPsec profile to a RIPng process or to an interface. If an interface and its process each have an IPsec profile, the IPsec profile applied to the interface takes effect.

Applying an IPsec profile to a process

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Apply an IPsec profile to the process.
   enable ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

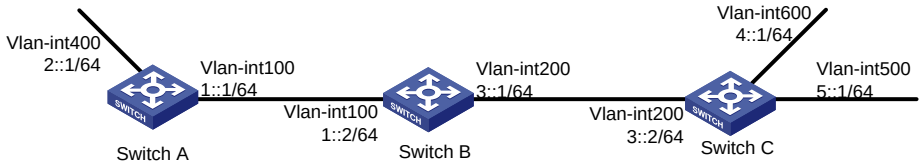
1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ripng ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Display and maintenance commands for RIPng

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information for a RIPng process.	**display ripng** [*process-id*]
Display RIPng GR information.	**display ripng** [*process-id*] **graceful-restart**
Display RIPng NSR information.	**display ripng** [*process-id*] **non-stop-routing**
Display routes in the RIPng database.	**display ripng** *process-id* **database** [*ipv6-address prefix-length*]
Display interface information for a RIPng	**display ripng** *process-id* **interface**

Task	Command
process.	[*interface-type interface-number*]
Display neighbor information for a RIPng process.	**display ripng** *process-id* **neighbor** [*interface-type interface-number*]
Display the routing information for a RIPng process.	**display ripng** *process-id* **route** [*ipv6-address prefix-length* [**verbose**] | **peer** *ipv6-address* | **statistics**]
Restart a RIPng process.	**reset ripng** *process-id* **process**
Clear statistics for a RIPng process.	**reset ripng** *process-id* **statistics**



RIPng configuration examples

Example: Configuring basic RIPng

Network configuration

As shown in Figure 2, Switch A, Switch B, and Switch C run RIPng. Configure route filtering on Switch B to accept all received routes except the route 2::/64 and to advertise only the route 4::/64.

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 400
[SwitchA-Vlan-interface400] ripng 1 enable
[SwitchA-Vlan-interface400] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 1
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
```

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 500
[SwitchC-Vlan-interface500] ripng 1 enable
[SwitchC-Vlan-interface500] quit
[SwitchC] interface vlan-interface 600
[SwitchC-Vlan-interface600] ripng 1 enable
[SwitchC-Vlan-interface600] quit
```

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::20F:E2FF:FE23:82F5 on Vlan-interface100
 Destination 2::/64,
     via FE80::20F:E2FF:FE23:82F5, cost 1, tag 0, AOF, 6 secs
 Peer FE80::20F:E2FF:FE00:100  on Vlan-interface200
 Destination 4::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
```

Display the RIPng routing table on Switch A.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::200:2FF:FE64:8904 on Vlan-interface100
 Destination 3::/64,
     via FE80::200:2FF:FE64:8904, cost 1, tag 0, AOF, 31 secs
 Destination 4::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Destination 5::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
```

```
 Local route
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
```

3. Configure route filtering:

Use IPv6 prefix lists on Switch B to filter received and redistributed routes.

```
[SwitchB] ipv6 prefix-list aaa permit 4:: 64
[SwitchB] ipv6 prefix-list bbb deny 2:: 64
[SwitchB] ipv6 prefix-list bbb permit :: 0 less-equal 128
[SwitchB] ripng 1
[SwitchB-ripng-1] filter-policy prefix-list aaa export
[SwitchB-ripng-1] filter-policy prefix-list bbb import
[SwitchB-ripng-1] quit
```

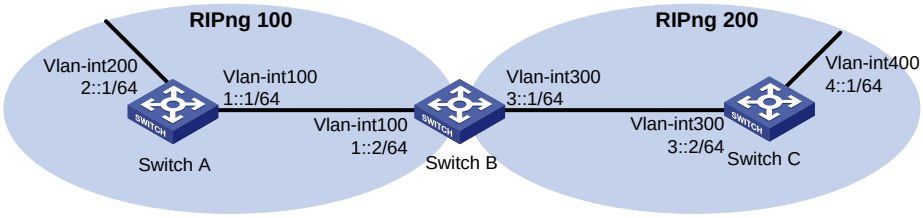
Display RIPng routing tables on Switch B and Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::1:100 on Vlan-interface100

 Peer FE80::3:200 on Vlan-interface200
 Destination 4::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::2:100 on Vlan-interface100
 Destination 4::/64,
     via FE80::1:100, cost 2, tag 0, AOF, 2 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
```



Example: Configuring RIPng route redistribution

Network configuration

As shown in Figure 3, Switch B communicates with Switch A through RIPng 100 and with Switch C through RIPng 200.

Configure route redistribution on Switch B, so the two RIPng processes can redistribute routes from each other.

Figure 3 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Enable RIPng 100 on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 100
[SwitchA-ripng-100] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 100 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ripng 100 enable
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng 100 and RIPng 200 on Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 100
[SwitchB-ripng-100] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 100 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] ripng 200
[SwitchB-ripng-200] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ripng 200 enable
[SwitchB-Vlan-interface300] quit
```

   # Enable RIPng 200 on Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 200
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ripng 200 enable
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
```

```
[SwitchC-Vlan-interface400] ripng 200 enable
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch A.

```
[SwitchA] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: ::1/128                                Protocol  : Direct

```

Example: Configuring RIPng GR

Network configuration

As shown in Figure 4, Switch A, Switch B, and Switch C learn IPv6 routing information through RIPng.

Configure Switch A as the GR restarter. Configure Switch B and Switch C as the GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 4 Network diagram

Procedure

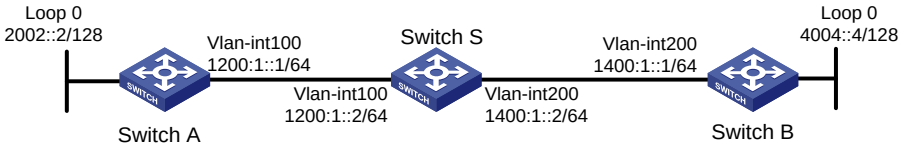
1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng GR on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] graceful-restart
```

Verifying the configuration

Restart RIPng or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display ripng 1 graceful-restart
RIPng process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time: 0   seconds
```



Example: Configuring RIPng NSR

Network configuration

As shown in Figure 5, Switch S, Switch A, and Switch B learn IPv6 routing information through RIPng.

Enable RIPng NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)

2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ripng 1
[SwitchS-ripng-1] non-stop-routing
[SwitchS-ripng-1] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

During the switchover period, display RIPng neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
[SwitchA] display ripng 1 neighbor
 Neighbor Address: FE80::AE45:5CE7:422E:2867
     Interface  : Vlan-interface100
     Version    : RIPng version 1     Last update: 00h00m23s
     Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch A to verify if Switch A has a route to the loopback interface on Switch B.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::AE45:5CE7:422E:2867 on Vlan-interface100
 Destination 1400:1::/64,
     via FE80::AE45:5CE7:422E:2867, cost 1, tag 0, AOF, 1 secs
 Destination 4004::4/128,
     via FE80::AE45:5CE7:422E:2867, cost 2, tag 0, AOF, 1 secs
 Local route
 Destination 2002::2/128,
```

```
    via ::, cost 0, tag 0, DOF
 Destination 1200:1::/64,
    via ::, cost 0, tag 0, DOF
```

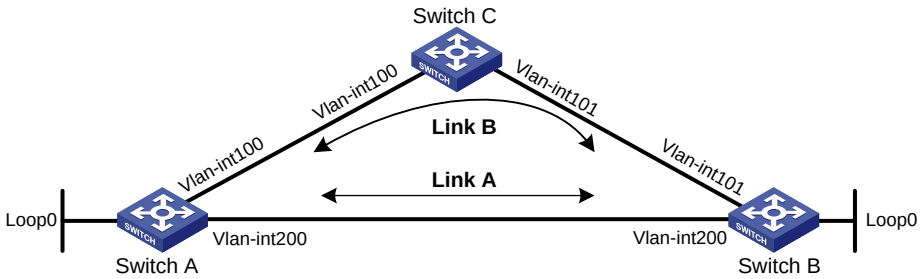
Display RIPng neighbors on Switch B to verify the neighbor relationship between Switch B and Switch S.

```
[SwitchB] display ripng 1 neighbor
 Neighbor Address: FE80::20C:29FF:FECE:6277
    Interface  : Vlan-interface200
    Version    : RIPng version 1     Last update: 00h00m18s
    Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch B to verify if Switch B has a route to the loopback interface on Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::20C:29FF:FECE:6277 on Vlan-interface200
 Destination 2002::2/128,
    via FE80::20C:29FF:FECE:6277, cost 2, tag 0, AOF, 24 secs
 Destination 1200:1::/64,
    via FE80::20C:29FF:FECE:6277, cost 1, tag 0, AOF, 24 secs
 Local route
 Destination 4004::4/128,
    via ::, cost 0, tag 0, DOF
 Destination 1400:1::/64,
    via ::, cost 0, tag 0, DOF
```

The output shows the following when an active/standby switchover occurs on Switch S:



- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring RIPng FRR

Network configuration

As shown in Figure 6, Switch A, Switch B, and Switch C run RIPng. Configure RIPng FRR so that when Link A becomes unidirectional, traffic can be switched to Link B immediately.

Figure 6 Network diagram

Device	Interface	IP address
Switch A	VLAN-interface 100	1::1/64
Switch A	VLAN-interface 200	2::1/64
Switch A	Loopback 0	10::1/128
Switch B	VLAN-interface 101	3::1/64
Switch B	VLAN-interface 200	2::2/64
Switch B	Loopback 0	20::1/128
Switch C	VLAN-interface 100	1::2/64
Switch C	VLAN-interface 101	3::2/64

Procedure

1. Configure IPv6 addresses for the interfaces on the switches. (Details not shown.)
2. Configure RIPng on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure RIPng FRR:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 100 backup-nexthop 1::2
[SwitchA-route-policy-frr-10] quit
[SwitchA] ripng 1
[SwitchA-ripng-1] fast-reroute route-policy frr
[SwitchA-ripng-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop 3::2
[SwitchB-route-policy-frr-10] quit
[SwitchB] ripng 1
[SwitchB-ripng-1] fast-reroute route-policy frr
[SwitchB-ripng-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

Destination: 20::1/128
   Protocol: RIPng
```

```

```

Example: Configuring RIPng IPsec profile

Network configuration

As shown in Figure 7, configure RIPng on the switches, and configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 7 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ripng 1
   [SwitchA-ripng-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ripng 1 enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ripng 1
   [SwitchB-ripng-1] quit
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] ripng 1 enable
   [SwitchB-Vlan-interface200] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ripng 1 enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ripng 1
   [SwitchC-ripng-1] quit
   [SwitchC] interface vlan-interface 200
   [SwitchC-Vlan-interface200] ripng 1 enable
   [SwitchC-Vlan-interface200] quit
   ```

3. Configure RIPng IPsec profiles:
   - On Switch A:

     # Create an IPsec transform set named **protrf1**.

     ```
     [SwitchA] ipsec transform-set protrf1
     ```

     # Specify the ESP encryption and authentication algorithms.

     ```
     [SwitchA-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
     [SwitchA-ipsec-transform-set-protrf1] esp authentication-algorithm md5
     ```

     # Specify transport mode for encapsulation.

     ```
     [SwitchA-ipsec-transform-set-protrf1] encapsulation-mode transport
     ```

```
[SwitchA-ipsec-transform-set-protrf1] quit
```
Create a manual IPsec profile named **profile001**.
```
[SwitchA] ipsec profile profile001 manual
```
Reference IPsec transform set **protrf1**.
```
[SwitchA-ipsec-profile-profile001-manual] transform-set protrf1
```
Configure the inbound and outbound SPIs for ESP.
```
[SwitchA-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchA-ipsec-profile-profile001-manual] sa spi outbound esp 256
```
Configure the inbound and outbound SA keys for ESP.
```
[SwitchA-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchA-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchA-ipsec-profile-profile001-manual] quit
```

- On Switch B:

Create an IPsec transform set named **protrf1**.
```
[SwitchB] ipsec transform-set protrf1
```
Specify the ESP encryption and authentication algorithms.
```
[SwitchB-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
[SwitchB-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```
Specify transport mode for encapsulation.
```
 [SwitchB-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchB-ipsec-transform-set-protrf1] quit
```
Create a manual IPsec profile named **profile001**.
```
[SwitchB] ipsec profile profile001 manual
```
Reference IPsec transform set **protrf1**.
```
[SwitchB-ipsec-profile-profile001-manual] transform-set protrf1
```
Configure the inbound and outbound SPIs for ESP.
```
[SwitchB-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchB-ipsec-profile-profile001-manual] sa spi outbound esp 256
```
Configure the inbound and outbound SA keys for ESP.
```
[SwitchB-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchB-ipsec-profile-profile001-manual] quit
```

- On Switch C:

Create an IPsec transform set named **protrf1**.
```
[SwitchC] ipsec transform-set protrf1
```
Specify the ESP encryption and authentication algorithms.
```
[SwitchC-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
[SwitchC-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```
Specify transport mode for encapsulation.
```
 [SwitchC-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchC-ipsec-transform-set-protrf1] quit
```
Create a manual IPsec profile named **profile001**.
```
[SwitchC] ipsec profile profile001 manual
```
Reference IPsec transform set **protrf1**.
```
[SwitchC-ipsec-profile-profile001-manual] transform-set protrf1
```
Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchC-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] quit
```

4. Apply the IPsec profiles to the RIPng process on each device:
   - On Switch A:

     ```
     [SwitchA] ripng 1
     [SwitchA-ripng-1] enable ipsec-profile profile001
     [SwitchA-ripng-1] quit
     ```

   - On Switch B:

     ```
     [SwitchB] ripng 1
     [SwitchB-ripng-1] enable ipsec-profile profile001
     [SwitchB-ripng-1] quit
     ```

   - On Switch C:

     ```
     [SwitchC] ripng 1
     [SwitchC-ripng-1] enable ipsec-profile profile001
     [SwitchC-ripng-1] quit
     ```

Verifying the configuration

Verify that the RIPng packets between Switches A, B and C are protected by IPsec. (Details not shown.)

Configuring OSPFv3

About OSPFv3

This chapter describes how to configure Open Shortest Path First version 3 (OSPFv3) for an IPv6 network.

Comparison of OSPFv3 with OSPFv2

OSPFv3 and OSPFv2 have the following in common:

- 32-bit router ID and area ID.
- Hello, Database Description (DD), Link State Request (LSR), Link State Update (LSU), Link State Acknowledgment (LSAck).
- Mechanisms for finding neighbors and establishing adjacencies.
- Mechanisms for advertising and aging LSAs.

OSPFv3 and OSPFv2 have the following differences:

- OSPFv3 runs on a per-link basis. OSPFv2 runs on a per-IP-subnet basis.
- OSPFv3 supports running multiple processes on an interface, but OSPFv2 does not support.
- OSPFv3 identifies neighbors by router ID. OSPFv2 identifies neighbors by IP address.

For more information about OSPFv2, see "Configuring OSPF."

OSPFv3 packets

OSPFv3 uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **DD**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **LSR**—Requests needed LSAs from the neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then send an LSR packet to each other, requesting the missing LSAs. The LSA packet contains the digest of the missing LSAs.
- **LSU**—Transmits the requested LSAs to the neighbor.
- **LSAck**—Acknowledges received LSU packets.

OSPFv3 LSA types

OSPFv3 sends routing information in LSAs. The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers. This LSA describes the collected states of the router's interfaces to an area, and is flooded throughout a single area only.
- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the DR. This LSA contains the list of routers connected to the network, and is flooded throughout a single area only.
- **Inter-Area-Prefix LSA**—Type-3 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Prefix LSA describes a route with IPv6 address prefix to a destination outside the area, yet still inside the AS.

- **Inter-Area-Router LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Router LSA describes a route to ASBR.
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS, except stub areas and Not-So-Stubby Areas (NSSAs). Each AS External LSA describes a route to another AS. A default route can be described by an AS External LSA.
- **NSSA LSA**—Type-7 LSA, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Link LSA**—Type-8 LSA. A router originates a separate Link LSA for each attached link. Link LSAs have link-local flooding scope. Each Link LSA describes the IPv6 address prefix of the link and Link-local address of the router.
- **Intra-Area-Prefix LSA**—Type-9 LSA. Each Intra-Area-Prefix LSA contains IPv6 prefix information on a router, stub area, or transit area information, and has area flooding scope. It was introduced because Router LSAs and Network LSAs contain no address information.
- **Grace LSA**—Type-11 LSA, generated by a GR restarter at reboot and transmitted on the local link. The GR restarter describes the cause and interval of the reboot in the Grace LSA to notify its neighbors that it performs a GR operation.

Protocols and standards

- RFC 7166, *Supporting Authentication Trailer for OSPFv3*

OSPFv3 tasks at a glance

To configure OSPFv3, perform the following tasks:

1. Enabling OSPFv3
2. (Optional.) Configuring OSPFv3 area parameters
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring an OSPFv3 virtual link

     Perform this task on an ABR to create a virtual link when connectivity cannot be maintained between a non-backbone area and the backbone, or within the backbone.
3. (Optional.) Configuring OSPFv3 network types
   - Setting the broadcast network type for an OSPFv3 interface
   - Setting the NBMA network type for an OSPFv3 interface

- Setting the P2MP network type for an OSPFv3 interface
- Setting the P2P network type for an OSPFv3 interface

4. (Optional.) Configuring OSPFv3 route control
   - Configuring OSPFv3 inter-area route summarization
   - Configuring redistributed route summarization
   - Configuring OSPFv3 received route filtering
   - Configuring Inter-Area-Prefix LSA filtering
   - Setting an OSPFv3 cost for an interface
   - Advertising the maximum link cost to neighbors within the specified period
   - Setting the maximum number of OSPFv3 ECMP routes
   - Setting a preference for OSPFv3
   - Configuring OSPFv3 route redistribution
5. (Optional.) Setting OSPFv3 timers
   - Setting OSPFv3 packet timers
   - Setting the LSA transmission delay
   - Setting the OSPFv3 route calculation interval
   - Setting the LSA generation interval
   - Setting the LSU transmit rate
6. (Optional.) Setting a DR priority for an interface
7. (Optional.) Configuring OSPFv3 packet parameters
   - Ignoring MTU check for DD packets
   - Disabling interfaces from receiving and sending OSPFv3 packets
8. (Optional.) Configuring prefix suppression
9. (Optional.) Configuring OSPFv3 advanced features
   - Configuring a stub router
   - Configuring OSPFv3 isolation
10. (Optional.) Enhancing OSPFv3 availability
    - Configuring OSPFv3 GR
    - Configuring OSPFv3 NSR
    - Configuring BFD for OSPFv3
    - Configuring OSPFv3 FRR
11. (Optional.) Enhancing OSPFv3 security
    - Configuring OSPFv3 authentication
    - Applying an IPsec profile for authenticating OSPFv3 packets
12. (Optional.) Configuring OSPFv3 logging and SNMP notifications
    - Enabling logging for neighbor state changes
    - Setting the maximum number of OSPFv3 logs
    - Configuring OSPFv3 network management

Enabling OSPFv3

About this task

To enable an OSPFv3 process on a router:

1. Enable the OSPFv3 process globally.

2. Assign the OSPFv3 process a router ID.
3. Enable the OSPFv3 process on related interfaces.

An OSPFv3 process ID has only local significance. Process 1 on a router can exchange packets with process 2 on another router.

OSPFv3 requires you to manually specify a router ID for each router in an AS. Make sure all assigned router IDs in the AS are unique.

Restrictions and guideline

If a router runs multiple OSPFv3 processes, you must specify a unique router ID for each process.

Procedure

1. Enter system view.
   system-view
2. Enable an OSPFv3 process and enter its view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
   By default, no OSPFv3 processes are enabled.
3. Specify a router ID.
   router-id *router-id*
   By default, no router ID is configured.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, no OSPFv3 processes are enabled on an interface.

Configuring OSPFv3 area parameters

About OSPFv3 areas

OSPFv3 has the same stub area, NSSA area, and virtual link features as OSPFv2.

After you split an OSPFv3 AS into multiple areas, the LSA number is reduced and OSPFv3 applications are extended. To further reduce the size of routing tables and the number of LSAs, configure the non-backbone areas at an AS edge as stub areas.

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPFv3 routing domain while retaining other stub area characteristics.

Non-backbone areas exchange routing information through the backbone area, so the backbone and non-backbone areas (including the backbone itself) must be fully meshed. If no connectivity can be achieved, configure virtual links.

Configuring a stub area

Restrictions and guidelines

To configure a stub area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no area is configured as a stub area.
   The **no-summary** keyword is only available on the ABR of a stub area. If you specify the **no-summary** keyword, the ABR only advertises a default route in an Inter-Area-Prefix LSA into the stub area.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.

Configuring an NSSA area

Restrictions and guidelines

To configure an NSSA area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as an NSSA area.
   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] * | **no-import-route** | **no-summary** | [**translate-always** | **translate-never**] | **suppress-fa** | **translator-stability-interval** *value*] *
   By default, no area is configured as an NSSA area.
   To configure a totally NSSA area, execute the **nssa no-summary** command on the ABR. The ABR of a totally NSSA area does not advertise inter-area routes into the area.
5. (Optional.) Set a cost for the default route advertised to the NSSA area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the NSSA area is 1.
   This command takes effect only on the ABR/ASBR of an NSSA or totally NSSA area.

Configuring an OSPFv3 virtual link

About this task

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

Both ends of a virtual link are ABRs that must be configured with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **keychain** *keychain-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *

Configuring OSPFv3 network types

Restrictions and guidelines for OSPFv3 network type configuration

Based on the link layer protocol, OSPFv3 classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

- If any routers in a broadcast network do not support multicasting, you can change the network type to NBMA.
- If only two routers running OSPFv3 exist on a network segment, you can change the network type to P2P to save costs.

Setting the broadcast network type for an OSPFv3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to broadcast for the OSPFv3 interface.
   ospfv3 network-type broadcast [**instance** *instance-id*]
   By default, the network type of an interface is broadcast.

Setting the NBMA network type for an OSPFv3 interface

Restrictions and guidelines

For NBMA interfaces, you must specify the link-local IP addresses and DR priorities for their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to NBMA for the OSPFv3 interface.
   ospfv3 network-type nbma [**instance** *instance-id*]
   By default, the network type of an interface is broadcast.
4. (Optional.) Set the router priority for the interface
   ospfv3 dr-priority *priority*
   By default, an interface has a router priority of 1.
   An interface's router priority determines its privilege in DR/BDR selection.
5. Specify an NBMA neighbor.
   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]
   By default, no link-local address is specified for the neighbor interface.

Setting the P2MP network type for an OSPFv3 interface

Restrictions and guidelines

For P2MP interfaces (only when in unicast mode), you must specify the link-local IP addresses of their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to P2MP for the OSPFv3 interface.
   ospfv3 network-type p2mp [**unicast**] [**instance** *instance-id*]
   By default, the network type of an interface is broadcast.
4. Specify a P2MP unicast neighbor.
   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]
   By default, no link-local address is specified for the neighbor interface.

Setting the P2P network type for an OSPFv3 interface

1. Enter system view.
   system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to P2P for the OSPFv3 interface.
   ospfv3 network-type p2p [**instance** *instance-id*]
   By default, the network type of an interface is broadcast.

Configuring OSPFv3 route control

Configuring OSPFv3 inter-area route summarization

About this task

If contiguous network segments exist in an area, you can summarize them into one network segment on the ABR. The ABR will advertise only the summary route. Any LSA on the specified network segment will not be advertised, reducing the LSDB size in other areas.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure route summarization on the ABR.
   abr-summary *ipv6-address prefix-length* [**not-advertise**] [**cost** *cost-value*]
   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About this task

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.
- Type-5 LSAs translated from Type-7 LSAs in an NSSA area if the ASBR (also an ABR) is a translator. If the ASBR is not a translator, it cannot summarize routes in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure route summarization on an ASBR.

asbr-summary *ipv6-address prefix-length* [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

By default, route summarization is not configured on an ASBR.

Configuring OSPFv3 received route filtering

About this task

This task allows you to filter routes calculated by using received LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure OSPFv3 to filter routes calculated by using received LSAs.

   filter-policy { *ipv6-acl-number* [**gateway** *prefix-list-name*] | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

   By default, OSPFv3 accepts all routes calculated by using received LSAs.

   This command can only filter routes computed by OSPFv3. Only routes not filtered out can be added into the local routing table.

Configuring Inter-Area-Prefix LSA filtering

Restrictions and guidelines

The **filter** command takes effect only on ABRs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Configure OSPFv3 to filter Inter-Area-Prefix LSAs.

   filter { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

   By default, OSPFv3 accepts all Inter-Area-Prefix LSAs.

Advertising the maximum link cost to neighbors within the specified period

About this task

On an OSPFv3 network, when a link recovers from failures or the state of an interface changes, OSPFv3 will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable OSPFv3 to advertise the maximum link cost

(65535) to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, OSPFv3 advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the duration of the maximum link cost advertisement.
   ospfv3 peer hold-max-cost duration *timer* [**instance** *instance-id*]
   By default, OSPFv3 advertises the original link cost to neighbors during a route convergence.

Setting an OSPFv3 cost for an interface

About this task

You can set an OSPFv3 cost for an interface with one of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface, and OSPFv3 computes the cost automatically based on the bandwidth reference value by using the following formula:
  Interface OSPFv3 cost = Bandwidth reference value (100 Mbps) / Interface bandwidth (Mbps)
  - If the calculated cost is greater than 65535, the value of 65535 is used.
  - If the calculated cost is smaller than 1, the value of 1 is used.
- If no cost is set for an interface, OSPFv3 automatically computes the cost for the interface.

Setting a cost in interface view

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set an OSPFv3 cost for the interface.
   ospfv3 cost *cost-value* [**instance** *instance-id*]
   By default, the OSPFv3 cost is 1 for a VLAN interface, is 0 for a loopback interface. The OSPFv3 cost is automatically computed according to the interface bandwidth for other interfaces.

Setting a bandwidth reference value

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a bandwidth reference value.
   bandwidth-reference *value*
   The default bandwidth reference value is 100 Mbps.

Setting the maximum number of OSPFv3 ECMP routes

About this task

OSPFv3 might find multiple equal-cost routes to the same destination, which can be used to share the traffic load. This task allows you to set the maximum number of ECMP routes.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of ECMP routes.

   maximum load-balancing *number*

   The maximum number of OSPFv3 ECMP routes equals the maximum number of ECMP routes supported by the system.

Setting a preference for OSPFv3

About this task

A router can run multiple routing protocols. The system assigns a priority for each protocol. When these routing protocols find the same route, the route found by the protocol with the highest priority is selected.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set a preference for OSPFv3.

   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPFv3 internal routes is 10, and the preference of OSPFv3 external routes is 150.

Configuring OSPFv3 route redistribution

Restrictions and guidelines

Because OSPFv3 is a link state routing protocol, it cannot directly filter LSAs to be advertised. OSPFv3 filters only redistributed routes. Only routes that are not filtered out can be advertised in LSAs.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure route redistribution.

import-route bgp4+ [*as-number*] [**allow-ibgp**] [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

By default, OSPFv3 does not redistribute routes.

The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command redistributes both EBGP and IBGP routes, which might cause routing loops. There, use the **import-route bgp4+ allow-ibgp** command with caution.

4. (Optional.) Configure OSPFv3 to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [**bgp4+** | **direct** | { **isisv6** | **ospfv3** | **ripng** } [*process-id*] | **static**]

   By default, OSPFv3 accepts all redistributed routes.

   This command filters only routes redistributed by the **import-route** command. If no routes are redistributed by the **import-route** command, this command does not take effect.

5. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Configuring default route redistribution

About this task

The **import-route** command cannot redistribute a default external route. To redistribute a default route, perform this task.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no default route is redistributed.

4. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Setting OSPFv3 timers

Setting OSPFv3 packet timers

1. Enter system view.

system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospfv3 timer hello *seconds* [**instance** *instance-id*]

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the dead interval.

   ospfv3 timer dead *seconds* [**instance** *instance-id*]

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

   The dead interval set on neighboring interfaces cannot be too short. If the interval is too short, a neighbor is easily down.

5. Set the poll interval.

   ospfv3 timer poll *seconds* [**instance** *instance-id*]

   By default, the poll interval is 120 seconds.

6. Set the LSA retransmission interval.

   ospfv3 timer retransmit *interval* [**instance** *instance-id*]

   The default LSA retransmission interval is 5 seconds.

   The LSA retransmission interval cannot be too short. If the interval is too short, unnecessary retransmissions will occur.

Setting the LSA transmission delay

About this task

Each LSA in the LSDB has an age that increases by 1 every second, but the age does not change during transmission. Therefore, it is necessary to add a transmission delay into the age time, especially for low-speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospfv3 trans-delay *seconds* [**instance** *instance-id*]

   By default, the LSA transmission delay is 1 second.

Setting the OSPFv3 route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.

- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for subsequent route calculations is *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPFv3.

   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the LSA generation interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA generation interval settings for OSPFv3.

By default, the LSA generation interval is fixed at 5 seconds for OSPFv3.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The LSA generation interval is fixed at *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA generation is *minimum-interval*.

- The interval for subsequent LSA generations is *maximum-interval*.

- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA generation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Setting the LSU transmit rate

About this task

Sending large numbers of LSU packets affects router performance and consumes a large amount of network bandwidth. You can configure the router to send LSU packets at an interval and to limit the maximum number of LSU packets sent out of an OSPFv3 interface at each interval.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSU transmit rate.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPFv3 interface sends a maximum of three LSU packets every 20 milliseconds.

Setting a DR priority for an interface

About this task

The router priority is used for DR election. Interfaces having the priority 0 cannot become a DR or BDR.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set a router priority.

ospfv3 dr-priority *priority* [**instance** *instance-id*]

The default router priority is 1.

Configuring OSPFv3 packet parameters

Ignoring MTU check for DD packets

About this task

When LSAs are few in DD packets, it is unnecessary to check the MTU in DD packets to improve efficiency.

Restrictions and guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Ignore MTU check for DD packets.
   ospfv3 mtu-ignore [**instance** *instance-id*]
   By default, OSPFv3 does not ignore MTU check for DD packets.

Disabling interfaces from receiving and sending OSPFv3 packets

About this task

After an OSPFv3 interface is set to **silent**, direct routes of the interface can still be advertised in Intra-Area-Prefix LSAs through other interfaces, but other OSPFv3 packets cannot be advertised. No neighboring relationship can be established on the interface. This feature can enhance the adaptability of OSPFv3 networking.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable interfaces from receiving and sending OSPFv3 packets.
   silent-interface { *interface-type interface-number* | **all** }
   By default, the interfaces can receive and send OSPFv3 packets.
   This command disables only the interfaces that run the current process. However, multiple OSPFv3 processes can disable the same interface from receiving and sending OSPFv3 packets.

Configuring prefix suppression

About prefix suppression

By default, an OSPFv3 interface advertises all of its prefixes in LSAs. To speed up OSPFv3 convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-8 LSAs.
- On broadcast and NBMA networks, the DR does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-2 LSAs.
- On P2P and P2MP networks, OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPFv3 routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPFv3 process

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable prefix suppression for the OSPFv3 process.

   prefix-suppression

   By default, prefix suppression is disabled for an OSPFv3 process.

   Enabling prefix suppression for an OSPFv3 process does not suppress the prefixes of loopback interfaces and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable prefix suppression for the interface.

   ospfv3 prefix-suppression [**disable**] [**instance** *instance-id*]

   By default, prefix suppression is disabled for an interface.

Configuring OSPFv3 advanced features

Configuring a stub router

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPFv3 routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Use either of the following methods to configure a router as a stub router:

- Clear the R-bit of the Option field in Type-1 LSAs. When the R-bit is clear, the OSPFv3 router can participate in OSPFv3 topology distribution without forwarding traffic.
- Use the OSPFv3 max-metric router LSA feature. This feature enables OSPFv3 to advertise its locally generated Type-1 LSAs with a maximum cost of 65535. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure the router as a stub router.
   - Configure the router as a stub router and clear the R-bit of the Option field in Type-1 LSAs.

     stub-router r-bit [**include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *
   - Configure the router as a stub router and advertise the locally generated Type-1 LSAs with the maximum cost of 65535.

     stub-router max-metric [**external-lsa** [*max-metric-value*] | **summary-lsa** [*max-metric-value*] | **include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPFv3 isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPFv3 isolation works as follows:

1. After OSPFv3 isolation is enabled for a device, OSPFv3 increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is set to 65535.
   - The link cost in Type-9 LSAs (Intra-area-prefix LSAs) that reference Type-1 LSAs is set to 65535.
   - The link cost in the following LSAs is set to 16711680:
     - Type-3 LSAs (Inter-area-prefix LSAs).

- Type-4 LSAs (Inter-area-router LSAs).
- Type-5 LSAs (AS external LSAs).
- Type-7 LSAs (NSSA LSAs).

2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPFv3 isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router max-metric external-lsa** 16711680 **summary-lsa** 16711680 **include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router max-metric** commands, follow these restrictions and guidelines:

- When both the isolation feature and the stub router feature take effect, Type-3 LSAs, Type-4 LSAs, Type-5 LSAs, and Type-7 LSAs each use the higher one of the two LSA-specific link costs provided by those features.
- If the **on-startup** keyword is specified in the **stub-router max-metric** command, traffic forwarding path selection is affected only by the isolation feature when the stub router does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 isolation.
   - Enable OSPFv3 isolation to gracefully isolate the device from the network.
     isolate enable
   - Disable OSPFv3 isolation to gracefully add the device back to the network.
     undo isolate enable

   By default, OSPFv3 isolation is disabled.

Configuring OSPFv3 GR

About OSPFv3 GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must be Graceful Restart capable.
- **GR helper**—The neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

After the active/standby switchover, the GR restarter sends a Grace LSA to tell its neighbors that it performs a GR. Upon receiving the Grace LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Restrictions and guidelines for OSPFv3 GR

You cannot enable OSPFv3 NSR on a device that acts as GR restarter.

Configuring GR restarter

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR capability.
   graceful-restart enable [**global** | **planned-only**] *
   By default, OSPFv3 GR restarter capability is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring GR helper

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, the GR helper capability is enabled.
4. Enable strict LSA checking.
   graceful-restart helper strict-lsa-checking
   By default, strict LSA checking is disabled.

Triggering OSPFv3 GR

About this task

OSPFv3 GR is triggered by an active/standby switchover or when this task is performed.

Procedure

To trigger OSPFv3 GR, execute the **reset ospfv3** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPFv3 NSR

About this task

Nonstop routing (NSR) backs up OSPFv3 link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPFv3 NSR or OSPFv3 GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPFv3 NSR and OSPFv3 GR as follows:

- **Device requirements**—The active and standby processes of OSPFv3 must run on different IRF member devices. To run OSPFv3 NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPFv3 GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPFv3 GR when the IRF fabric contains only one member device. (Centralized IRF devices.)
- **OSPFv3 neighbor requirements**—When you use OSPFv3 NSR, OSPFv3 neighbors cannot detect process restart or active/standby switchover on the local device. OSPFv3 NSR can recover OSPFv3 route information without requiring the cooperation of OSPFv3 neighbors. OSPFv3 GR requires OSPFv3 neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

A device that has OSPFv3 NSR enabled cannot act as GR restarter.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable OSPFv3 NSR.

   non-stop-routing

   By default, OSPFv3 NSR is disabled.

   This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

Configuring BFD for OSPFv3

About this task

Bidirectional forwarding detection (BFD) provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3. For more information about BFD, see *High Availability Configuration Guide*.

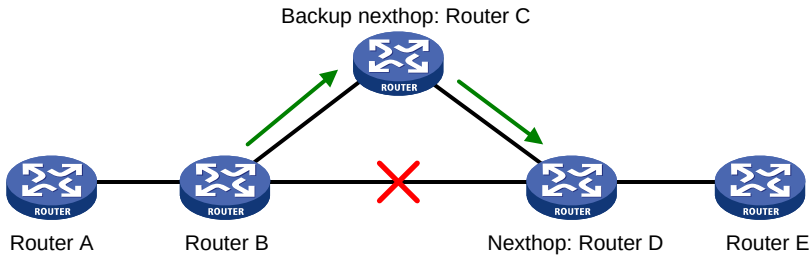
After discovering neighbors by sending hello packets, OSPFv3 notifies BFD of the neighbor addresses, and BFD uses these addresses to establish sessions. Before a BFD session is established, it is in the down state. In this state, BFD control packets are sent at an interval of no less than 1 second to reduce BFD control packet traffic. After the BFD session is established, BFD control packets are sent at the negotiated interval, thereby implementing fast fault detection.

To configure BFD for OSPFv3, you need to configure OSPFv3 first.

Procedure

1. Enter system view.

   system-view



2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Specify a router ID.
   router-id *router-id*
4. Quit the OSPFv3 view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
7. Enable BFD on the interface.
   ospfv3 bfd enable [**instance** *instance-id*]
   By default, BFD is disabled on the OSPFv3 interface.

Configuring OSPFv3 FRR

About OSPFv3 FRR

A primary link failure can cause packet loss and even a routing loop until OSPFv3 completes routing convergence based on the new network topology. OSPFv3 FRR enables fast rerouting to minimize the failover time.

Figure 1 Network diagram for OSPFv3 FRR

As shown in Figure 1, configure FRR on Router B. OSPFv3 FRR automatically calculates a backup next hop or specifies a backup next hop by using a routing policy. When the primary link fails, OSPFv3 directs packets to the backup next hop. At the same time, OSPFv3 calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPFv3 FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Configuring OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Procedure

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface on which LFA is enabled can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Enable OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop.
   fast-reroute lfa [**abr-only**]
   By default, OSPFv3 FRR is disabled.
   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPFv3 FRR to use a backup next hop in a routing policy

About this task

Before you perform this task, use the **apply ipv6 fast-reroute backup-interface** command to specify a backup next hop in the routing policy to be used. For more information about the **apply ipv6 fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Configure OSPFv3 FRR to use a backup next hop in a routing policy.
   fast-reroute route-policy *route-policy-name*
   By default, OSPFv3 FRR is disabled.

Configuring BFD control packet mode for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD control packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on both OSPFv3 routers on the link.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd ctrl [**instance** *instance-id*]
   By default, BFD control packet mode is disabled for OSPFv3 FRR.

Configuring BFD echo packet mode for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD echo packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on one OSPFv3 router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IPv6 address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*
   By default, the source IPv6 address of BFD echo packets is not configured.
   The source IPv6 address cannot be on the same network segment as any local interface's IP address.
   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD echo packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd echo [**instance** *instance-id*]
   By default, BFD echo packet mode is disabled for OSPFv3 FRR.

Enhancing OSPFv3 security

Configuring OSPFv3 authentication

About this task

OSPFv3 uses keychain authentication to prevent routing information from being leaked and routers from being attacked.

OSPFv3 adds the Authentication Trailer option into outgoing packets, and uses the authentication information in the option to authenticate incoming packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPFv3 neighbor relationship cannot be established.

Restrictions and guidelines

The authentication mode specified for an OSPFv3 interface has a higher priority than the mode specified for an OSPFv3 area.

OSPFv3 supports only the HMAC-SHA-256 authentication algorithm.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Configuring OSPFv3 area authentication

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Specify an authentication mode for the area.
   authentication-mode keychain *keychain-name*

   By default, no authentication is performed for the area.

   For more information about keychains, see *Security Configuration Guide*.

Configuring OSPFv3 interface authentication

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an authentication mode for the interface.
   ospfv3 authentication-mode keychain *keychain-name* [**instance** *instance-id*]

   By default, no authentication is performed for the interface.

   For more information about keychains, see *Security Configuration Guide*.

Applying an IPsec profile for authenticating OSPFv3 packets

About this task

To protect routing information and prevent attacks, OSPFv3 can authenticate protocol packets by using an IPsec profile. For more information about IPsec profiles, see *Security Configuration Guide*.

Outbound OSPFv3 packets carry the Security Parameter Index (SPI) defined in the relevant IPsec profile. A device compares the SPI carried in a received packet with the configured IPsec profile. If they match, the device accepts the packet. Otherwise, the device discards the packet and will not establish a neighbor relationship with the sending device.

Restrictions and guidelines for applying an IPsec profile

You can configure an IPsec profile for an area, an interface, or a virtual link.

- To implement area-based IPsec protection, configure the same IPsec profile on the routers in the target area.

- To implement interface-based IPsec protection, configure the same IPsec profile on the interfaces between two neighboring routers.
- To implement virtual link-based IPsec protection, configure the same IPsec profile on the two routers connected over the virtual link.
- If an interface and its area each have an IPsec profile configured, the interface uses its own IPsec profile.
- If a virtual link and area 0 each have an IPsec profile configured, the virtual link uses its own IPsec profile.

Applying an IPsec profile to an area

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Apply an IPsec profile to the area.
   enable ipsec-profile *profile-name*
   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ospfv3 ipsec-profile *profile-name* [**instance** *instance-id*]
   By default, no IPsec profile is applied.

Applying an IPsec profile to a virtual link

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Apply an IPsec profile to a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **keychain** *keychain-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *
   By default, no IPsec profile is applied.

Configuring OSPFv3 logging and SNMP notifications

Enabling logging for neighbor state changes

About this task

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable logging for neighbor state changes.
   log-peer-change
   By default, this feature is enabled.

Setting the maximum number of OSPFv3 logs

About this task

OSPFv3 logs include route calculation logs, neighbor logs, and LSA aging logs.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the maximum number of OSPFv3 logs.
   event-log { **lsa-flush** | **peer** | **spf** } **size** *count*
   By default, the maximum number of LSA aging logs, neighbor logs, or route calculation logs is 10.

Configuring OSPFv3 network management

About this task

This task involves the following configurations:

- Bind an OSPFv3 process to MIB so that you can use network management software to manage the specified OSPFv3 process.
- Enable SNMP notifications for OSPFv3 to report important events.
- Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPFv3 events to an NMS, enable SNMP notifications for OSPFv3. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information

about SNMP configuration, see the network management and monitoring configuration guide for the device.

The standard OSPFv3 MIB provides only single-instance MIB objects. To identify multiple OSPFv3 processes in the standard OSPFv3 MIB, you must assign a unique context name to each OSPFv3 process.

Context is a method introduced to SNMPv3 for multiple-instance management. For SNMPv1/v2c, you must specify a community name as a context name for protocol identification.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPFv3 process.

   ospfv3 mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPFv3.

   snmp-agent trap enable ospfv3 [**grrestarter-status-change** | **grhelper-status-change** | **if-state-change** | **if-cfg-error** | **if-bad-pkt** | **neighbor-state-change** | **nssatranslator-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtgrhelper-status-change** | **virtneighbor-state-change**]*

   By default, SNMP notifications for OSPFv3 are enabled.

4. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

5. Configure an SNMP context for the OSPFv3 process.

   snmp context-name *context-name*

   By default, no SNMP context is configured for the OSPFv3 process.

6. (Optional.) Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPFv3 outputs a maximum of seven SNMP notifications within 10 seconds.

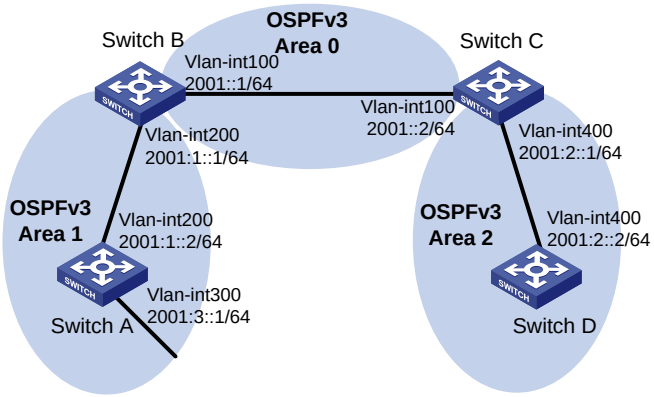
Display and maintenance commands for OSPFv3

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPFv3 ABR.	**display ospfv3** [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 neighbor information.	**display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]
Display OSPFv3 request list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 retransmission list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type*

Task	Command
	interface-number] [*neighbor-id*]
Display OSPFv3 topology information.	**display ospfv3** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPFv3 process information.	**display ospfv3** [*process-id*] [**verbose**]
Display information about the routes to OSPFv3 ABR and ASBR.	**display ospfv3** [*process-id*] **abr-asbr**
Display summary route information on the OSPFv3 ASBR.	**display ospfv3** [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 log information.	**display ospfv3** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPFv3 GR information.	**display ospfv3** [*process-id*] **graceful-restart** [**verbose**]
Display OSPFv3 interface information.	**display ospfv3** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display OSPFv3 LSDB information.	**display ospfv3** [*process-id*] **lsdb** [{ **e-inter-prefix** | **e-inter-router** | **e-router** | **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **link** | **network** | **nssa** | **router** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]
Display OSPFv3 next hop information.	**display ospfv3** [*process-id*] **nexthop**
Display OSPFv3 NSR information.	**display ospfv3** [*process-id*] **non-stop-routing**
Display OSPFv3 routing information.	**display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length*]
Display OSPFv3 statistics.	**display ospfv3** [*process-id*] **statistics** [**error**]
Display OSPFv3 virtual link information.	**display ospfv3** [*process-id*] **vlink**
Clear OSPFv3 log information.	**reset ospfv3** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Restart an OSPFv3 process.	**reset ospfv3** [*process-id*] **process** [**graceful-restart**]
Restart OSPFv3 route redistribution.	**reset ospfv3** [*process-id*] **redistribution**
Clear OSPFv3 statistics.	**reset ospfv3** [*process-id*] **statistics**

OSPFv3 configuration examples



Example: Configuring OSPFv3 stub area

Network configuration

As shown in Figure 2:

- Enable OSPFv3 on all switches.
- Split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 2 as a stub area to reduce LSAs in the area without affecting route reachability.

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ospfv3 1 area 1
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
```

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 1 area 2
[SwitchC-Vlan-interface400] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] ospfv3 1 area 2
[SwitchD-Vlan-interface400] quit
```

Display OSPFv3 neighbors on Switch B.

```
[SwitchB] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 2.2.2.2

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 3.3.3.3         1   Full/BDR          00:00:40  0      Vlan100

 Area: 0.0.0.1
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DR           00:00:40  0      Vlan200
```

Display OSPFv3 neighbors on Switch C.

```
[SwitchC] display ospfv3 peer

 AdvRouter  : 4.4.4.4                    Preference : 10
 NibID      : 0x23000001                 Cost       : 1
 Interface  : Vlan400                    BkInterface: N/A
 Nexthop    : ::
```

```
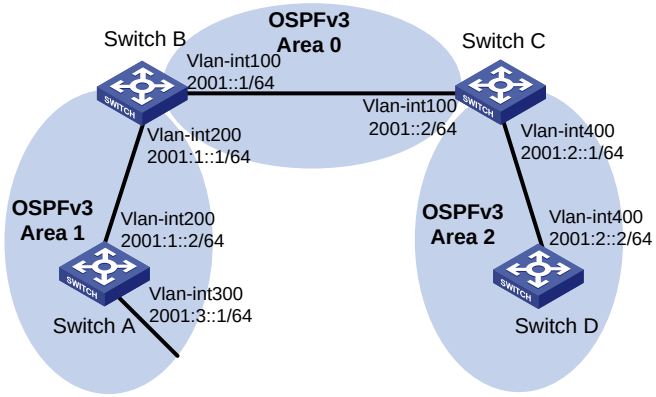
  BkNexthop   : N/A
  Status      : Direct

 Total: 2
 Intra area: 1         Inter area: 1         ASE: 0         NSSA: 0
```

The output shows that route entries are reduced. All indirect routes are removed, except the default route.



Example: Configuring OSPFv3 NSSA area

Network configuration

As shown in Figure 3:

- Configure OSPFv3 on all switches and split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch A as an ASBR to redistribute static routes into the AS.

Figure 3 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3 (see "Example: Configuring OSPFv3 stub area").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

   ```
   [SwitchA] ospfv3
   [SwitchA-ospfv3-1] area 1
   [SwitchA-ospfv3-1-area-0.0.0.1] nssa
   [SwitchA-ospfv3-1-area-0.0.0.1] quit
   [SwitchA-ospfv3-1] quit
   ```

   # Configure Switch B.

   ```
   [SwitchB] ospfv3
   [SwitchB-ospfv3-1] area 1
   [SwitchB-ospfv3-1-area-0.0.0.1] nssa
   [SwitchB-ospfv3-1-area-0.0.0.1] quit
   [SwitchB-ospfv3-1] quit
   ```

   # Display OSPFv3 routing information on Switch D.

   ```
   [SwitchD] display ospfv3 1 routing
   ```

```

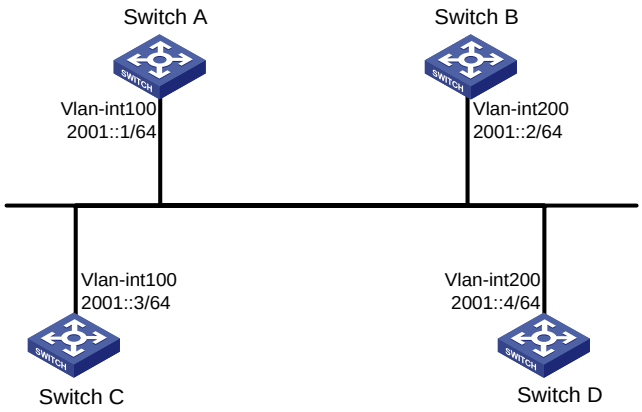
Intra area: 1         Inter area: 3         ASE: 1         NSSA: 0
```

The output shows an AS external route imported from the NSSA area exists on Switch D.



Example: Configuring OSPFv3 DR election

Network configuration

As shown in Figure 4:

- Configure router priority 100 for Switch A, the highest priority on the network, so it will become the DR.
- Configure router priority 2 for Switch C, the second highest priority on the network, so it will become the BDR.
- Configure router priority 0 for Switch B, so it cannot become a DR or BDR.
- Switch D uses the default router priority 1.

Figure 4 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 0
[SwitchA-Vlan-interface100] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 0
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ospfv3 1 area 0
[SwitchD-Vlan-interface200] quit
```

Display neighbor information on Switch A. The switches have the same default DR priority 1, so Switch D (the switch with the highest router ID) is elected as the DR, and Switch C is the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. The neighbor states are all full.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DROther      00:00:30  0      Vlan100
```

```
 2.2.2.2         1   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:31  0      Vlan100
```

3. Configure router priorities for interfaces:

Set the router priority of VLAN-interface 100 to 100 on Switch A.

```
[SwitchA] interface Vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 dr-priority 100
[SwitchA-Vlan-interface100] quit
```

Set the router priority of VLAN-interface 200 to 0 on Switch B.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 dr-priority 0
[SwitchB-Vlan-interface200] quit
```

Set the router priority of VLAN-interface 100 to 2 on Switch C.

```
[SwitchC] interface Vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 dr-priority 2
[SwitchC-Vlan-interface100] quit
```

Display neighbor information on Switch A. Router priorities have been updated, but the DR and BDR are not changed.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan200
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. Switch D is still the DR.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         0   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

4. Restart DR and BDR election:

Use the **shutdown** and **undo shutdown** commands on interfaces to restart DR and BDR election. (Details not shown.)

Display neighbor information on Switch A. The output shows that Switch C becomes the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
```

```
 Router ID       Pri State            Dead-Time InstID Interface
 2.2.2.2         0   Full/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR         00:00:35  0      Vlan100
 4.4.4.4         1   Full/DROther     00:00:33  0      Vlan200
```

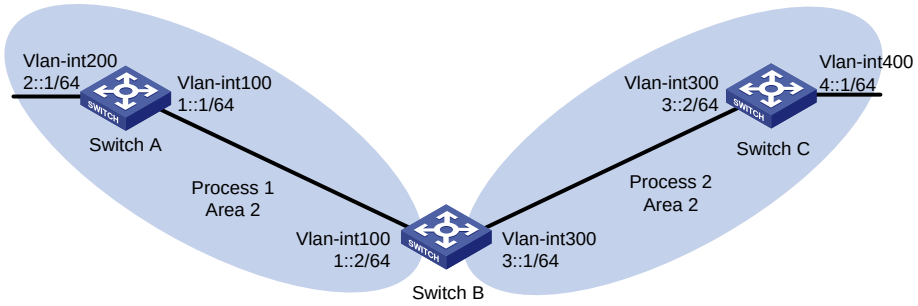
Display neighbor information on Switch D.

```
[SwitchD] display ospfv3 peer

             OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
------------------------------------------------------------------------
 Router ID       Pri State            Dead-Time InstID Interface
 1.1.1.1         100 Full/DR          00:00:30  0      Vlan100
 2.2.2.2         0   2-Way/DROther    00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR         00:00:31  0      Vlan100
```

The output shows that Switch A becomes the DR.



Example: Configuring OSPFv3 route redistribution

Network configuration

As shown in Figure 5:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2.
- Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3. Switch C can then learn the routes destined for 1::0/64 and 2::0/64, and Switch A cannot learn the routes destined for 3::0/64 or 4::0/64.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0

Interface  : NULL0                                  Cost      : 0
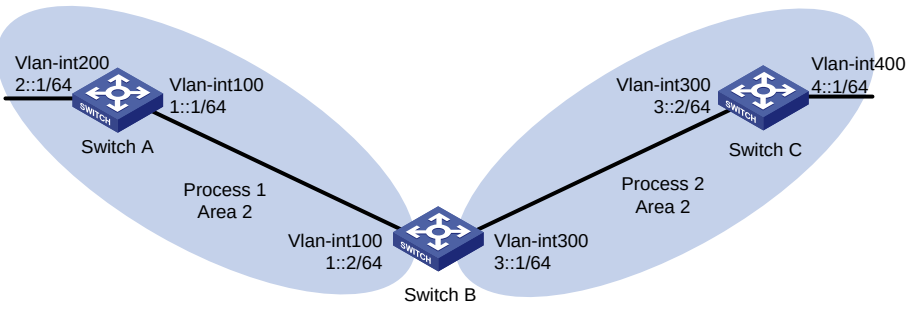
```



Example: Configuring OSPFv3 route summarization

Network configuration

As shown in Figure 6:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2, respectively.
- On Switch A, configure IPv6 addresses 2:1:1::1/64, 2:1:2::1/64, and 2:1:3::1/64 for VLAN-interface 200.
- On Switch B, configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1. Switch C can then learn the routes destined for 2::/64, 2:1:1::/64, 2:1:2::/64, and 2:1:3::/64.
- On Switch B, configure route summarization to advertise only summary route 2::/16 to Switch C.

Figure 6 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
```

```
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 2:1:1::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:2::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:3::1 64
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1
[SwitchB-ospfv3-2] import-route direct
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 12 Routes : 12

Destination: ::1/128                                Protocol  : Direct

Interface  : NULL0                                    Cost      : 0
```

4. Configure ASBR route summarization:

On Switch B, configure OSPFv3 process 2 to advertise a single route 2::/16.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] asbr-summary 2:: 16
```

```
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0

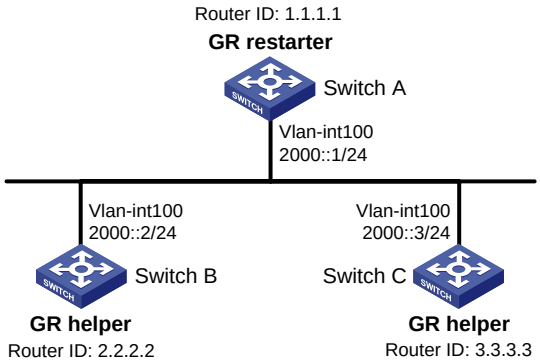
```

Example: Configuring OSPFv3 GR



Network configuration

As shown in Figure 7:

- Switch A, Switch B, and Switch C that reside in the same AS and the same OSPFv3 routing domain are GR capable.

- Switch A acts as the GR restarter. Switch B and Switch C act as the GR helpers, and synchronize their LSDBs with Switch A through GR.

Figure 7 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 process 1, enable GR, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] graceful-restart enable
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

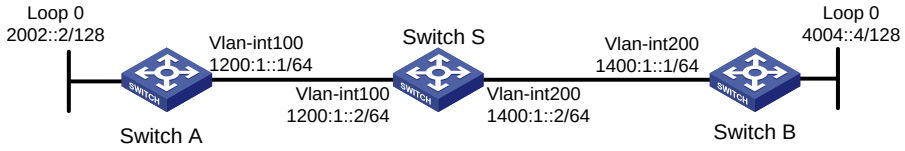
   # On Switch B, enable OSPFv3 and set the router ID to 2.2.2.2. (By default, GR helper is enabled on Switch B.)

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ospfv3 1 area 1
   [SwitchB-Vlan-interface100] quit
   ```

   # On Switch C, enable OSPFv3 and set the router ID to 3.3.3.3. (By default, GR helper is enabled on Switch C.)

   ```
   <SwitchC> system-view
   [SwitchC] ospfv3 1
   [SwitchC-ospfv3-1] router-id 3.3.3.3
   [SwitchC-ospfv3-1] quit
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] ospfv3 1 area 1
   [SwitchC-Vlan-interface100] quit
   ```

Verifying the configuration



Perform a master/backup switchover on Switch A to trigger an OSPFv3 GR operation. (Details not shown.)

Example: Configuring OSPFv3 NSR

Network configuration

As shown in Figure 8, Switch S, Switch A, and Switch B belong to the same OSPFv3 routing domain. Enable OSPFv3 NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 8 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch S, Switch A, and Switch B can communicate with each other at Layer 3. (Details not shown.)
3. Configure OSPFv3:

   # On Switch A, enable OSPFv3, and set the router ID to 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 1
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3, and set the router ID to 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch S, enable OSPFv3, set the router ID to 3.3.3.3, and enable NSR.

```
<SwitchS> system-view
[SwitchS] ospfv3 1
[SwitchS-ospfv3-1] router-id 3.3.3.3
[SwitchS-ospfv3-1] non-stop-routing
[SwitchS-ospfv3-1] quit
[SwitchS] interface vlan-interface 100
[SwitchS-Vlan-interface100] ospfv3 1 area 1
[SwitchS-Vlan-interface100] quit
[SwitchS] interface vlan-interface 200
[SwitchS-Vlan-interface200] ospfv3 1 area 1
[SwitchS-Vlan-interface200] quit
```

Verifying the configuration

Verify the following:

- When an active/standby switchover occurs on Switch S, the neighbor relationships and routing information on Switch A and Switch B have not changed. (Details not shown.)
- The traffic from Switch A to Switch B has not been impacted. (Details not shown.)

Example: Configuring BFD for OSPFv3

Network configuration

As shown in Figure 9:

- Configure OSPFv3 on Switch A, Switch B and Switch C and configure BFD over the link Switch A<—>L2 Switch<—>Switch B.
- After the link Switch A<—>L2 Switch<—>Switch B fails, BFD can quickly detect the failure and notify OSPFv3 of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 9 Network diagram

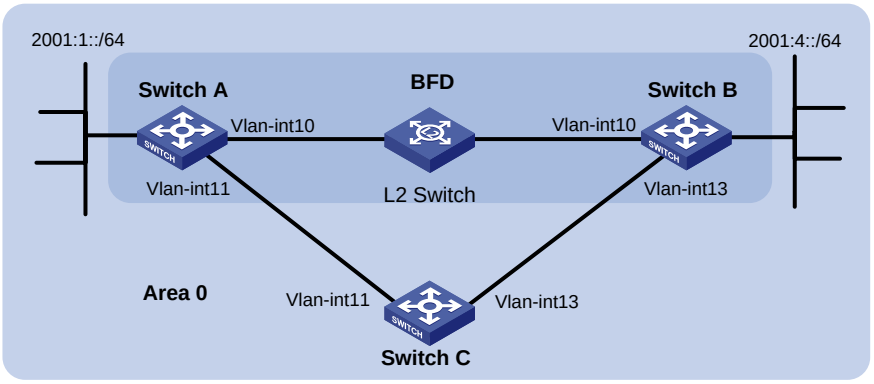


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64
Switch A	Vlan-int11	2001:2::1/64
Switch B	Vlan-int10	2001::2/64
Switch B	Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64
Switch C	Vlan-int13	2001:3::1/64

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 10
```

```
[SwitchA-Vlan-interface10] ospfv3 1 area 0
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ospfv3 1 area 0
[SwitchA-Vlan-interface11] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 1 area 0
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] ospfv3 1 area 0
[SwitchB-Vlan-interface13] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] ospfv3 1 area 0
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] ospfv3 1 area 0
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] return
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
```

Verifying the configuration

Display the BFD information on Switch A.

```
<SwitchA> display bfd session
```

```
Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv6 session working in control packet mode:

          Local discr: 1441                       Remote discr: 1450
            Source IP: FE80::20F:FF:FE00:1202 (link-local address of VLAN-interface 10
on Switch A)
       Destination IP: FE80::20F:FF:FE00:1200 (link-local address of VLAN-interface 10
on Switch B)
         Session state: Up                            Interface: Vlan10
             Hold time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                              Protocol  : O_INTRA
NextHop    : FE80::20F:FF:FE00:1200                   Preference: 10
Interface  : Vlan10                                   Cost      : 1
```

The output information shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display routes to 2001:4::0/64 on Switch A.

```
<SwitchA> display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                              Protocol  : O_INTRA
NextHop    : FE80::BAAF:67FF:FE27:DCD0                Preference: 10
Interface  : Vlan11                                   Cost      : 2
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPFv3 FRR

Network configuration

As shown in Figure 10, Switch A, Switch B, and Switch C reside in the same OSPFv3 domain. Configure OSPFv3 FRR so that when Link A fails, traffic is immediately switched to Link B.

Figure 10 Network diagram

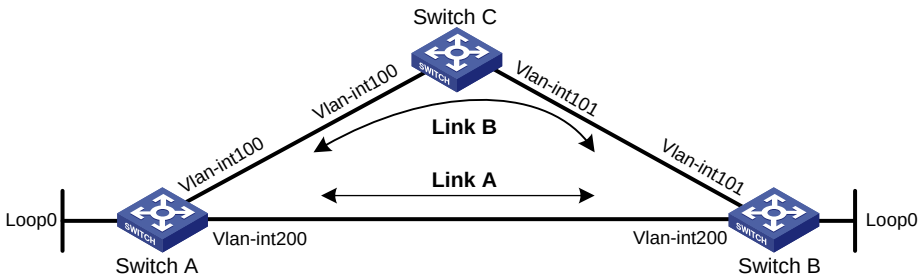

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	1::1/64	Switch B	Vlan-int101	3::1/64
	Vlan-int200	2::1/64		Vlan-int200	2::2/64
	Loop0	10::1/128		Loop0	20::1/128
Switch C	Vlan-int100	1::2/64			
	Vlan-int101	3::2/64			

Procedure

1. Configure IPv6 addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPFv3 FRR to automatically calculate the backup next hop:

   You can enable OSPFv3 FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPFv3 FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute lfa
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospfv3 1
     [SwitchB-ospfv3-1] fast-reroute lfa
     [SwitchB-ospfv3-1] quit
     ```

   - (Method 2.) Enable OSPFv3 FRR to designate a backup next hop by using a routing policy:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 100 backup-nexthop 1::2
     [SwitchA-route-policy-frr-10] quit
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute route-policy frr
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
     [SwitchB] route-policy frr permit node 10
     [SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
     ```

```
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop 3::2
[SwitchB-route-policy-frr-10] quit
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] fast-reroute route-policy frr
[SwitchB-ospfv3-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

Destination: 20::1/128
   Protocol: O_INTRA
 Process ID: 1
  SubProtID: 0x1                  Age: 00h03m45s
       Cost: 6              Preference: 10
      IpPre: N/A            QosLocalID: N/A

```

Example: Configuring OSPFv3 IPsec profile

Network configuration

As shown in Figure 11, all switches run OSPFv3, and the AS is divided into two areas.

Configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 11 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 basic features:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 200
   [SwitchA-Vlan-interface200] ospfv3 1 area 1
   [SwitchA-Vlan-interface200] quit
   ```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 100
   ```

```
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

3. Configure OSPFv3 IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchA] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchA-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-trans] protocol esp
  [SwitchA-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchA-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchA-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchA-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchB] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchB-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-trans] protocol esp
  [SwitchB-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchB-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchB-ipsec-transform-set-trans] quit
  ```

Create a manual IPsec profile named **profile001**.

```
[SwitchB] ipsec profile profile001 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile001] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
[SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchB] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchB-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchB-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchB-ipsec-profile-manual-profile002] quit
```

- On Switch C:

Create an IPsec transform set named **trans**.

```
[SwitchC] ipsec transform-set trans
```

Specify the encapsulation mode as **transport**.

```
[SwitchC-ipsec-transform-set-trans] encapsulation-mode transport
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchC-ipsec-transform-set-trans] protocol esp
[SwitchC-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
[SwitchC-ipsec-transform-set-trans] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-trans] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchC] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchC-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchC-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchC-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchC-ipsec-profile-manual-profile002] quit
```

4. Apply the IPsec profiles to areas:

Configure Switch A.

```
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] area 0
[SwitchB-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Configure Switch C.

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
```

Verifying the configuration

Verify that OSPFv3 packets between Switches A, B, and C are protected by IPsec. (Details not shown.)

Configuring IPv6 PBR

About IPv6 PBR

IPv6 policy-based routing (PBR) uses user-defined policies to route IPv6 packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop or output interface.

IPv6 packet forwarding process

When the device receives an IPv6 packet, the device searches the IPv6 PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops or output interfaces specified on the node to forward the packet.
  b. Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
    - No next hops or output interfaces are specified on the node.
    - Forwarding failed based on the next hops or output interfaces.

  c. Uses the default route to forward the packet if one of the following conditions exists:
    - No default next hops or default output interfaces are specified on the node.
    - The forwarding failed based on the default next hops or default output interfaces.
- The device performs routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

IPv6 PBR types

IPv6 PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as the ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface only.

Policy

An IPv6 policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

An IPv6 policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup for the packet.

Relationship between if-match clauses

IPv6 PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about the relationship between the **`apply`** clauses, see "Configuring actions for an IPv6 node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match clauses on the node?	Match mode	
	In permit mode	**In deny mode**
Yes	• If the node contains **`apply`** clauses, IPv6 PBR executes the **`apply`** clauses on the node. ○ If IPv6 PBR-based forwarding succeeds, IPv6 PBR does not compare the packet with the next node. ○ If IPv6 PBR-based forwarding fails, IPv6 PBR compares the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No	IPv6 PBR compares the packet with the next node.	IPv6 PBR compares the packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

IPv6 PBR and Track

IPv6 PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or output interface.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and IPv6 PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: IPv6 PBR configuration

If a packet destined for the local device matches an IPv6 PBR policy, IPv6 PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure an IPv6 PBR policy, be careful to avoid this situation.

IPv6 PBR tasks at a glance

To configure IPv6 PBR, perform the following tasks:

1. Configuring an IPv6 policy
   a. Creating an IPv6 node
   b. Setting match criteria for an IPv6 node
   c. Configuring actions for an IPv6 node
2. Specifying a policy for IPv6 PBR

   Choose the following tasks as needed:
   - Specifying an IPv6 policy for IPv6 local PBR
   - Specifying an IPv6 policy for IPv6 interface PBR
   - Specifying an IPv6 policy for IPv6 global PBR

Configuring an IPv6 policy

Creating an IPv6 node

1. Enter system view.

   system-view
2. Create an IPv6 policy or policy node and enter its view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the IPv6 policy node.

   description *text*

   By default, no description is configured for an IPv6 policy node.

Setting match criteria for an IPv6 node

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

When using the ACL to match packets, IPv6 PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.

Configuring actions for an IPv6 node

About this task

The **apply** clauses allow you to specify actions to take on matching packets on a node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**

IPv6 PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in IPv6 PBR

Clause	Meaning	Remarks
apply loadshare next-hop	Enables load sharing among multiple next hops.	Multiple next hop options operate in either primary/backup or load sharing mode. • **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple next hops are configured, the first configured next hop is selected. When the selected next hop fails, the next available next hop takes over. • **Load sharing mode**—Matching traffic is distributed across the available options. Multiple next hops load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry. By default, the primary/backup mode applies. For the load sharing mode to take effect, make sure multiple next hops are set in the policy.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.

Restrictions and guidelines for action configuration

If you specify a next hop, IPv6 PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if IPv6 PBR does not update the route immediately after its availability status changes.

Configuring actions for a node

1. Enter system view.
   system-view

2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions for a node.
   - Set next hops for permitted IPv6 packets.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-4>

     By default, no next hops are specified.

     You can specify multiple next hops for backup or load sharing in one command line or by executing this command multiple times. You can specify a maximum of eight next hops for a node.

     If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.
   - Enable load sharing among multiple next hops.

     apply loadshare next-hop

     By default, the next hops operate in primary/backup mode.
   - Set output interfaces.

     apply output-interface null 0

     By default, no output interfaces are specified.

Specifying a policy for IPv6 PBR

Specifying an IPv6 policy for IPv6 local PBR

About this task

Perform this task to specify an IPv6 policy for IPv6 local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for IPv6 local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR might affect local services, such as ping and Telnet. When you use IPv6 local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.

   system-view

2. Specify an IPv6 policy for IPv6 local PBR.

   ipv6 local policy-based-route *policy-name*

   By default, IPv6 local PBR is not enabled.

Specifying an IPv6 policy for IPv6 interface PBR

About this task

Perform this task to apply an IPv6 policy to an interface to guide the forwarding of packets received on the interface only.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IPv6 policy for IPv6 interface PBR.
   ipv6 policy-based-route *policy-name*
   By default, no IPv6 policy is applied to the interface.

Specifying an IPv6 policy for IPv6 global PBR

About this task

Perform this task to apply an IPv6 policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one IPv6 policy for IPv6 global PBR and the specified IPv6 policy must already exist. Before you can apply a new IPv6 policy, you must first remove the current IPv6 policy.

IPv6 interface PBR takes precedence over IPv6 global PBR on an interface. When they are both configured and packets fail to match the IPv6 interface PBR policy, IPv6 global PBR applies.

Procedure

1. Enter system view.
   system-view
2. Specify an IPv6 policy for IPv6 global PBR.
   ipv6 global policy-based-route *policy-name*
   By default, no IPv6 policy is specified for IPv6 global PBR.

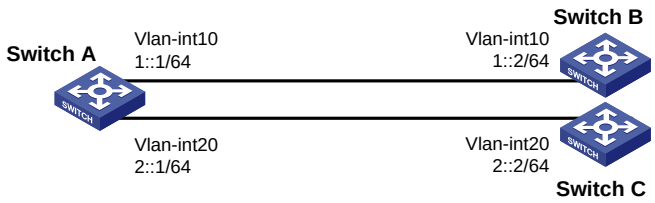
Display and maintenance commands for IPv6 PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PBR policy information.	**display ipv6 policy-based-route** [**policy** *policy-name*]
Display IPv6 global PBR configuration and statistics.	**display ipv6 policy-based-route global** [**slot** *slot-number*]
Display IPv6 interface PBR configuration and statistics.	**display ipv6 policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]

Task	Command
Display IPv6 local PBR configuration and statistics.	**display ipv6 policy-based-route local** [**slot** *slot-number*]
Display IPv6 PBR configuration.	**display ipv6 policy-based-route setup**
Clear IPv6 PBR statistics.	**reset ipv6 policy-based-route statistics** [**policy** *policy-name*]

IPv6 PBR configuration examples



Example: Configuring packet type-based IPv6 local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C are connected through Switch A. Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets to the next hop 1::2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IPv6 addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ipv6 address 1::1 64
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 2::1 64
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3001 to match TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   ```

```
[SwitchA-pbr6-aaa-5] if-match acl 3001
[SwitchA-pbr6-aaa-5] apply next-hop 1::2
[SwitchA-pbr6-aaa-5] quit
```

Configure IPv6 local PBR by applying policy **aaa** to Switch A.

```
[SwitchA] ipv6 local policy-based-route aaa
```

2. Configure Switch B:

Create VLAN 10.

```
<SwitchB> system-view
[SwitchB] vlan 10
[SwitchB-vlan10] quit
```

Configure the IPv6 address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IPv6 address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
```

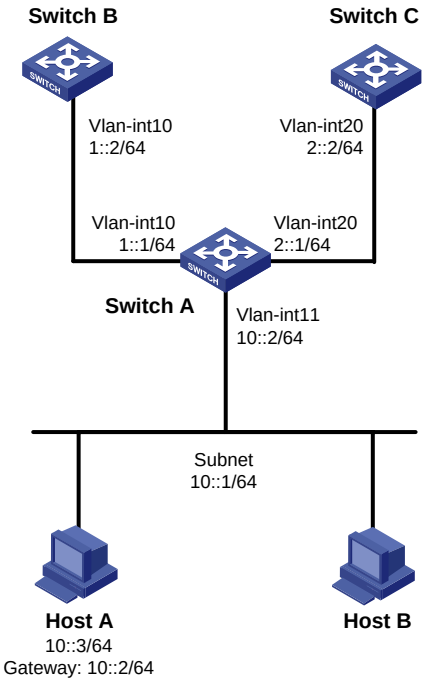
Verifying the configuration

1. Perform telnet operations to verify that IPv6 local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based IPv6 interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1::2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses and unicast routing protocol settings to make sure Switch B and Switch C can communicate with Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3001 to match TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 interface PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   [SwitchA-Vlan-interface11] ipv6 policy-based-route aaa
   ```

Verifying the configuration

1. Enable IPv6 and configure the IPv6 address 10::3 for Host A.

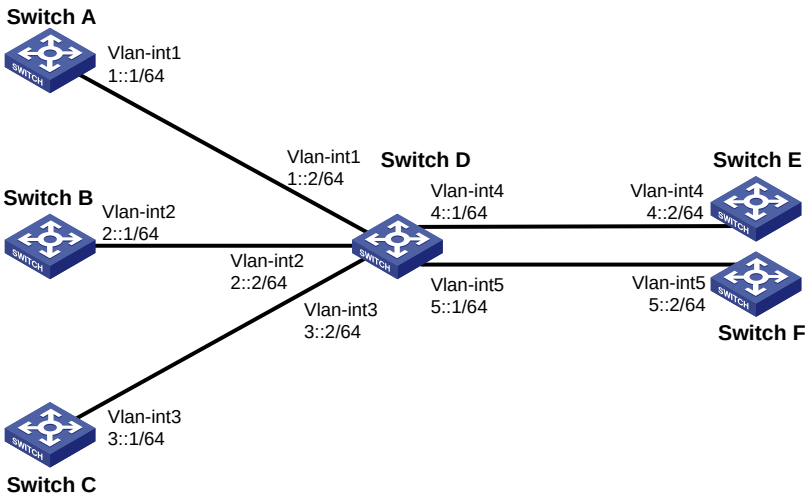
   ```
   C:\>ipv6 install
   Installing...
   Succeeded.
   C:\>ipv6 adu 4/10::3
   ```

2. Perform telnet operations to verify that IPv6 interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

3. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)



Example: Configuring packet type-based IPv6 global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure IPv6 global PBR on Switch D to forward TCP packets to the next hop 4::2 (Switch E).

Figure 3 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. Make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
2. Configure Switch D:

   # Configure IPv6 ACL 3101 to match TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

   ```
   <SwitchD> system-view
   [SwitchD] acl ipv6 advanced 3101
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 1::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 2::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 3::0 64
   [SwitchD-acl-ipv6-adv-3101] quit
   ```

   # Configure node 5 in IPv6 PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 4::2.

   ```
   [SwitchD] ipv6 policy-based-route aaa permit node 5
   [SwitchD-pbr6-aaa-5] if-match acl 3101
   [SwitchD-pbr6-aaa-5] apply next-hop 4::2
   [SwitchD-pbr6-aaa-5] quit
   ```

   # Specify IPv6 PBR policy **aaa** as the IPv6 global PBR policy.

   ```
   [SwitchD] ipv6 global policy-based-route aaa
   ```

Verifying the configuration

1. Perform telnet operations to verify that IPv6 global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 4::2 (Switch E), as follows:

Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)

2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Configuring routing policies

About routing policies

Routing policies control routing paths by filtering and modifying routing information.

Routing policies can filter advertised, received, and redistributed routes, and modify attributes for specific routes.

Implementation of a routing policy

To configure a routing policy:

1. Configure filters based on route attributes.
2. Create a routing policy and apply filters to the routing policy.

Filters

Routing policies can use the following filters to match routes.

ACL

An ACL can match the destination or next hop of routes.

For more information about ACLs, see *ACL and QoS Configuration Guide*.

IP prefix list

An IP prefix list matches the destination address of routes.

An IP prefix list can contain multiple items that specify prefix ranges. Each destination IP address prefix of a route is compared with these items in ascending order of their index numbers. A prefix matches the IP prefix list if it matches one item in the list.

AS path list

An AS path list matches the AS_PATH attribute of BGP routes. The AS_PATH attribute identifies the ASs through which a route has passed.

For more information about AS path lists, see "Configuring BGP."

Community list

A community list matches the COMMUNITY attribute of BGP routes. The COMMUNITY attribute identifies the community of BGP routes.

For more information about community lists, see "Configuring BGP."

Extended community list

An extended community list matches the extended community attribute (Route-Target for VPN and Site of Origin) of BGP routes.

For more information about extended community lists, see *MCE Configuration Guide.*

RD list

A route distinguisher (RD) list matches the RD of routes.

An RD list is identified by an RD list number and can contain multiple items that specify RD ranges. Each item is identified by an index number. The RD of a route is compared with these items in ascending order of their index numbers. An RD matches the RD list if it matches one item in the list.

Routing policy

A routing policy can contain multiple nodes, which are in a logical OR relationship. A node with a smaller number is matched first. A route matches the routing policy if it matches one node (except the node configured with the **continue** clause) in the routing policy.

Each node has a match mode of **permit** or **deny**.

- **permit**—Specifies the **permit** match mode for a routing policy node. If a route meets all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. The route is not compared with the next node unless the **continue** clause is configured. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.
- **deny**—Specifies the **deny** match mode for a routing policy node. The **apply** and **continue** clauses of a deny node are never executed. If a route meets all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.

A node can contain a set of **if-match**, **apply**, and **continue** clauses.

- **if-match** clauses—Specify the match criteria that match the attributes of routes. The **if-match** clauses of different types are in a logical AND relationship and the **if-match** clauses of the same type are in a logical OR relationship. A route must meet **if-match** clauses of all types to match the node.
- **apply** clauses—Specify the actions to be taken on permitted routes, such as modifying a route attribute.
- **continue** clause—Specifies the next node. A route that matches the current node (permit node) must match the specified next node in the same routing policy. The **continue** clause combines the **if-match** and **apply** clauses of the two nodes to improve flexibility of the routing policy. After you configure a **continue** clause, a route can pass the routing policy even if it does not match the specified next node. To reject such a route, add a **deny** node without clauses.

Follow these guidelines when you configure **if-match**, **apply**, and **continue** clauses:

- If you only want to filter routes, do not configure **apply** clauses.
- If you do not configure any **if-match** clauses for a permit node, the node will permit all routes.
- Configure a permit node containing no **if-match** or **apply** clauses following multiple deny nodes to allow unmatched routes to pass.

Routing policy tasks at a glance

To configure a routing policy, perform the following tasks:

1. (Optional.) Configure filters:
   - Configuring an IPv4 prefix list
   - Configuring an IPv6 prefix list
   - Configuring an AS path list
   - Configuring a community list
   - Configuring an extended community list
   - Configuring an RD list
2. Configuring a routing policy:
   a. Creating a routing policy
   b. Configuring if-match clauses
   c. Configuring apply clauses
   d. Configuring the continue clause

Configuring an IPv4 prefix list

Restrictions and guidelines

If all the items are set to **deny** mode, no routes can pass the IPv4 prefix list. To permit unmatched IPv4 routes, you must configure the **permit** 0.0.0.0 0 **less-equal** 32 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

Configuring an IPv6 prefix list

Restrictions and guidelines

If all items are set to **deny** mode, no routes can pass the IPv6 prefix list. To permit unmatched IPv6 routes, you must configure the **permit** :: 0 **less-equal** 128 item following multiple **deny** items.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 prefix list.

   ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { **inverse** *inverse-prefix-length* | *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] }

Configuring an AS path list

About this task

The AS_PATH attribute identifies the ASs through which a BGP route has passed. Figure 1 shows the AS_PATH attribute format in the BGP routing table.

Figure 1 AS_PATH attribute

The AS_PATH attribute value is a character string containing digits, parentheses, brackets, braces, and spaces. It is a sequence of the following AS path segments:

- **AS_CONFED_SEQUENCE**—Ordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_CONFED_SET**—Unordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_SEQUENCE**—Ordered set of ASs a route in the UPDATE message has traversed.

- **AS_SET**—Unordered set of ASs a route in the UPDATE message has traversed.

NOTE:

The AS_PATH attribute of a BGP route might not contain all of the four AS path segments.

An AS path list consists of regular expressions used for filtering BGP routes by their AS_PATH attributes. A regular expression can contain the special characters described in Table 1.

Table 1 Special characters supported in a regular expression

Character	Description	Example
^	Matches the beginning of a line.	Match a local route if its AS_PATH attribute is null: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } ^$
$	Matches the end of a line.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } 100$
.	Matches any single character.	Match a route if it has passed AS 100 but is not originated or received from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **. 100 .**
*	Matches the preceding character or string zero, one, or multiple times.	Match a route if it has an AS_PATH attribute: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **.***
+	Matches the preceding character or string one or multiple times.	Match a route if its AS_PATH attribute value contains **5**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } 5+
x|y	Matches the preceding or succeeding string.	Match a route if it is originated from AS 100 or AS 200: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } 100$\|200$
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	Match a route if its AS_PATH attribute value contains **123**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **(123)+**
[xyz]	Matches a single character in the brackets.	Match a route if it is received from AS 10 through AS 19: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } ^1[0-9]$
[^xyz]	Matches a single character that is not in the brackets.	Match a route if its originating AS number does not end with **2** or **4**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } [^24]$
{n}	Matches the preceding character	Match a route if its AS_PATH attribute value

Character	Description	Example
	n times. The number *n* must be a nonnegative integer.	contains two **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2}
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	Match a route if its AS_PATH attribute value contains two or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2,}
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	Match a route if its AS_PATH attribute value contains one or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{1,2}
[a-z]	Matches a single character within the specified range for only once.	Match a route if its AS_PATH attribute value contains **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }[0-2]
[^a-z]	Matches a single character that is not in the specified range.	Match a route if its AS_PATH attribute value contains digits other than **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }^[^0-2]$
_	Matches a punctuation. The expression can begin or end with _.	Match a route if it has passed AS101 100: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 101_100_
\b	Matches a word that starts with the pattern following \b or ends with the pattern preceding \b.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } \b100$
\B	Matches a word that contains the pattern but does not start or end with the pattern.	Match a route if its AS_PATH attribute value starts with **1**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } ^1\B
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	N/A
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	Match a route if its AS_PATH attribute value contains double digits: **ip as-path** { *as-path-number* | *as-path-name* } \w{2}
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	N/A
\index	Matches the specified string in the parentheses followed by \ twice. Each string in the parentheses is numbered from 1 in order. The *index* argument represents the	Match a route if its AS_PATH attribute value contains two consecutive **1**: **ip as-path** { *as-path-number* | *as-path-name* } (1)\1

Character	Description	Example
	sequence number of the string you want to match. If the parentheses contain *n* strings, you can specify the sequence number of the string in the range of 1 to *n*.	

NOTE:

The regular expressions shown in Table 1 are used for illustration only. Other regular expressions might be available to achieve the same effect.

Restrictions and guidelines

You can configure multiple items for an AS path list that is identified by a number. The relationship between the items is logical OR. A route matches the AS path list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an AS path list.

   ip as-path { *as-path-number* | *as-path-name* } { **deny** | **permit** } *regular-expression*

Configuring a community list

About this task

You can configure multiple items for a community list that is identified by a number. The relationship between the items is logical OR. A route matches the community list if it matches one item in the list.

An advanced community list consists of regular expressions used for filtering BGP routes by their community attributes. For more information about regular expression, see "Configuring an AS path list."

Procedure

1. Enter system view.

   system-view

2. Configure a community list.
   - Configure a basic community list.

     ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } { **deny** | **permit** } [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *

   - Configure an advanced community list.

     ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } { **deny** | **permit** } *regular-expression*

Configuring an extended community list

About this task

You can configure multiple items for an extended community list that is identified by a number. The relationship between the items is logical OR. A route matches the extended community list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an extended community list.

   ip extcommunity-list *ext-comm-list-number* [**index** *index-number*] { **deny** | **permit** } { **rt** *route-target* | **soo** *site-of-origin* }&<1-32>

Configuring an RD list

About this task

You can configure multiple items for an RD list that is identified by a number. The relationship between the items is logical OR. A route matches the RD list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an RD list.

   ip rd-list *rd-list-number* [**index** *index-number*] { **deny** | **permit** } *route-distinguisher*&<1-10>

Configuring a routing policy

Creating a routing policy

About this task

A routing policy must have a minimum of one permit node. If all the nodes are in **deny** mode, no routes can pass the routing policy.

Procedure

1. Enter system view.

   system-view

2. Create a routing policy and a node, and enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

Configuring if-match clauses

About this task

You can either specify no **if-match** clauses or multiple **if-match** clauses for a routing policy node. If no **if-match** clause is specified for a permit node, all routes can pass the node. If no **if-match** clause is specified for a deny node, no routes can pass the node.

Restrictions and guidelines

When you configure **if-match** clauses, follow these restrictions and guidelines:

- The **if-match** clauses of a routing policy node have a logical AND relationship. A route must meet all **if-match** clauses before it can be executed by the **apply** clauses of the node. If an **if-match** command exceeds the maximum length, multiple **if-match** clauses of the same type are generated. These clauses have a logical OR relationship. A route only needs to meet one of them.
- All IPv4 routes match a node if the **if-match** clauses of the node use only IPv6 ACLs. All IPv6 routes match a node if the **if-match** clauses of the node use only IPv4 ACLs.
- If the ACL used by an **if-match** clause does not exist or the ACL is not configured with any rules, the clause is always matched. When the ACL of an **if-match** clause is configured with rules, a route cannot match the **if-match** clause in one of the following scenarios:
  - The route cannot match any rule of the ACL.
  - The route matches a deny-mode rule of the ACL.
- If the prefix list, community list, or extended community list used by an **if-match** clause does not exist, the clause is always matched. If no rules of the specified prefix list, community list, or extended community list are matched, the clause is not matched.
- The **rule** [*rule-id*] **permit ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command can create a rule for an advanced ACL to match specific routes. The **source** *sour-addr sour-wildcard* option represents the destination network address and the **destination** *dest-addr dest-wildcard* option represents the mask in dotted decimal notation. For example, to match route 3.3.3.0/24, the rule configuration should be **rule** [*rule-id*] **permit ip source** 3.3.3.0 0.0.0.255 **destination** 255.255.255.0 0.0.0.255.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Match routes whose destination, next hop, or source address matches an ACL or prefix list.

   IPv4:

   if-match ip { **address** | **next-hop** | **route-source** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

   IPv6:

   if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name* }

   By default, no ACL or prefix list match criterion is configured.

   The ACL specified in an **if-match** clause must be a non-VPN ACL.

4. Configure BGP route match criteria.
   - Match BGP routes whose AS_PATH attribute matches a specified AS path list.

     if-match as-path { *as-path-number*&<1-32> | *as-path-name* }
   - Match BGP routes whose COMMUNITY attribute matches a specified community list.

     if-match community { { *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number* }&<1-32>
   - Match BGP routes whose extended community attribute matches a specified extended community list.

     if-match extcommunity *ext-comm-list-number*&<1-32>

- Match BGP routes having the specified local preference.
  if-match local-preference *preference*
- Match BGP routes with the specified RPKI validation state.
  if-match rpki { **invalid** | **not-found** | **valid** }

By default, no BGP route match criteria are configured.

5. Configure route match criteria.
   - Match routes having the specified cost.
     if-match cost *cost-value*
   - Match routes having the specified output interface.
     if-match interface { *interface-type interface-number* }&<1-16>

     This command is not supported by BGP.
   - Match routes having the specified route type.
     if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *
   - Match IGP routes having the specified tag value.
     if-match tag *tag-value*

   By default, no route match criteria are configured.
6. Match routes whose RD matches the specified RD list.
   if-match rd-list *rd-list-number*

   By default, no RD match criterion is configured.
7. Match IPv6 route prefixes of the specified length whose last bit is an odd or even number.
   - Match IPv6 route prefixes of the specified length whose last bit is an odd number.
     if-match ipv6 odd-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.
   - Match IPv6 route prefixes of the specified length whose last bit is an even number.
     if-match ipv6 even-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.

Configuring apply clauses

1. Enter system view.
   system-view
2. Enter routing policy node view.
   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
3. Configure BGP route attributes.
   - Set the AS_PATH attribute for BGP routes.
     apply as-path { *as-number*&<1-32> [**replace** | **delete**] | **clear** }
   - Delete the specified COMMUNITY attribute for BGP routes.
     apply comm-list { *comm-list-number* | *comm-list-name* } **delete**

     By default, no COMMUNITY attribute is deleted for BGP routes.
   - Set the specified COMMUNITY attribute for BGP routes.

apply community { **none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**] }

- Set the RT extended community attribute for BGP routes.

  apply extcommunity { **rt** *route-target* }&<1-32> [**additive**]

- Set the SoO extended community attribute for BGP routes.

  apply extcommunity soo *site-of-origin*&<1-32> [**additive**]

- Set a local preference for BGP routes.

  apply local-preference *preference*

- Set the ORIGIN attribute for BGP routes.

  apply origin { **egp** *as-number* | **igp** | **incomplete** }

- Set a preferred value for BGP routes.

  apply preferred-value *preferred-value*

- Set a traffic index for BGP routes.

  apply traffic-index { *value* | **clear** }

By default, no BGP route attributes are configured.

4. Configure the route cost and cost type.

- Set a cost for routes.

  apply cost [**+** | **-**] *cost-value*

  By default, no cost is set for routes.

- Set a cost type for routes.

  apply cost-type { **external** | **inherit-link-cost** | **internal** | **type-1** | **type-2** }

  By default, no cost type is set for routes.

5. Set the next hop for routes.

IPv4:

apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

IPv6:

apply ipv6 next-hop *ipv6-address*

By default, no next hop is set for routes.

The configuration does not apply to redistributed routes.

6. Configure route priorities.

- Set an IP precedence for matching routes.

  apply ip-precedence { *value* | **clear** }

  By default, no IP precedence is set.

- Set a preference.

  apply preference *preference*

  By default, no preference is set.

- Set a prefix priority.

  apply prefix-priority { **critical** | **high** | **medium** }

  By default, the prefix priority is low.

7. Redistribute routes to the specified IS-IS level.

apply isis { **level-1** | **level-1-2** | **level-2** }

By default, routes are not redistributed into the specified IS-IS level.

8. Set a local QoS ID for matching routes.

   apply qos-local-id { *local-id-value* | **clear** }

   By default, no local QoS ID is set.

9. Set a tag value for IGP routes.

   apply tag *tag-value*

   By default, no tag value is set for IGP routes.

10. Set a backup link for fast reroute (FRR).

    IPv4:

    apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }

    IPv6:

    apply ipv6 fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ipv6-address*] | **backup-nexthop** *ipv6-address* }

    By default, no backup link is set for FRR.

Configuring the continue clause

Restrictions and guidelines

When you configure the **continue** clause to combine multiple nodes, follow these restrictions and guidelines:

- If you configure an **apply** clause that sets different attribute values on all the nodes, the **apply** clause of the node configured most recently takes effect.
- If you configure the following **apply** clauses on all the nodes, the **apply** clause of each node takes effect:
  - **apply as-path** without the **replace** or **clear** keyword.
  - **apply cost** with the **+** or **–** keyword.
  - **apply community** with the **additive** keyword.
  - **apply extcommunity** with the **additive** keyword.
- The **apply comm-list delete** clause configured on the current node cannot delete the community attributes set by the **apply community** clauses of the preceding nodes.
- The **apply as-path delete** or **apply as-path clear** clause configured on the current node will delete or clear the AS numbers added or replaced by the **apply as-path** clauses of the preceding nodes.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Specify the next node to be matched.

   continue [*node-number*]

   By default, no continue clause is configured.

   The specified next node must have a larger number than the current node.

Configuring the routing policy change delay timer

About this task

This feature makes a routing policy take effect after a delayed time interval, which prevents incomplete routing policy configuration from being issued to cause incorrect route advertisement. The system automatically starts the timer when a routing policy changes. The changes will not take effect on the policy until the change delay timer expires.

A routing policy changes when one of the following events occurs:

- A routing policy is created.
- A routing policy node, **if-match** clause, or **apply** clause is added, modified, or deleted for a routing policy.
- You add, modify, or delete one of the following lists:
  - IPv4 prefix list.
  - IPv6 prefix list.
  - AS path list.
  - Community list.
  - Extended community list.
- The ACL used by an **if-match** clause changes.

Procedure

1. Enter system view.

   system-view
2. Set the routing policy change delay timer.

   route-policy-change delay-time { *time-value* | **unlimited** }

   By default, routing policy changes immediately take effect, but the routing protocol waits five seconds before processing routes from the new routing policy.

   When the delay timer expires, the routing protocol waits five seconds before processing routes from the new routing policy.

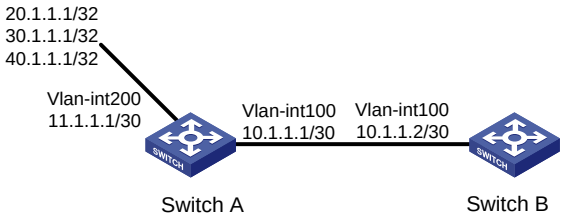
Display and maintenance commands for routing policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display BGP AS path list information.	**display ip as-path** [*as-path-number* | *as-path-name*]
Display BGP community list information.	**display ip community-list** [*basic-community-list-number* | *adv-community-list-number* | **name** *comm-list-name*]
Display BGP extended community list information.	**display ip extcommunity-list** [*ext-comm-list-number*]
Display IPv4 prefix list statistics.	**display ip prefix-list** [**name** *prefix-list-name*]

Task	Command
Display RD list information.	**display ip rd-list** [*rd-list-number*]
Display IPv6 prefix list statistics.	**display ipv6 prefix-list** [**name** *prefix-list-name*]
Display routing policy information.	**display route-policy** [**name** *route-policy-name*]
Clear BGP AS path list statistics.	**reset ip as-path** [*as-path-number* | *as-path-name*]
Clear IPv4 prefix list statistics.	**reset ip prefix-list** [*prefix-list-name*]
Clear IPv6 prefix list statistics.	**reset ipv6 prefix-list** [*prefix-list-name*]

Routing policy configuration examples



Example: Configuring a routing policy for redistributing static routes to RIP

Network configuration

As shown in Figure 2, Switch A exchanges routing information with Switch B by using RIP.

On Switch A, configure three static routes. Use a routing policy to configure Switch B to redistribute networks 20.1.1.1/32 and 40.1.1.1/32 and block network 30.1.1.1/32.

Figure 2 Network diagram

Procedure

1. Configure Switch A:

   # Configure IP addresses for interfaces VLAN-interface 100 and VLAN-interface 200.

   ```
   <SwitchA> system-view
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] ip address 10.1.1.1 30
   [SwitchA-vlan-interface100] quit
   [SwitchA] interface vlan-interface 200
   [SwitchA-vlan-interface200] ip address 11.1.1.1 30
   [SwitchA-vlan-interface200] quit
   ```

   # Enable RIP on interface VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-vlan-interface100] rip 1 enable
   [SwitchA-vlan-interface100] quit
   ```

Configure three static routes and set the next hop of the three routes to 11.1.1.2.

```
[SwitchA] ip route-static 20.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 30.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 40.1.1.1 32 11.1.1.2
```

Configure a routing policy.

```
[SwitchA] ip prefix-list a index 10 permit 30.1.1.1 32
[SwitchA] route-policy static2rip deny node 0
[SwitchA-route-policy-static2rip-0] if-match ip address prefix-list a
[SwitchA-route-policy-static2rip-0] quit
[SwitchA] route-policy static2rip permit node 10
[SwitchA-route-policy-static2rip-10] quit
```

Enable RIP and apply routing policy **static2rip** to filter redistributed static routes.

```
[SwitchA] rip
[SwitchA-rip-1] import-route static route-policy static2rip
```

2. Configure Switch B:

Configure an IP address for interface VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] ip address 10.1.1.2 30
```

Enable RIP.

```
[SwitchB] rip
[SwitchB-rip-1] quit
```

Enable RIP on the interface.

```
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] rip 1 enable
[SwitchB-vlan-interface100] quit
```

Verifying the configuration

Display the routing table information on Switch B.

```
<SwitchB> display ip routing-table

Destinations : 14       Routes : 14

Destination/Mask   Proto   Pre Cost        NextHop         Interface

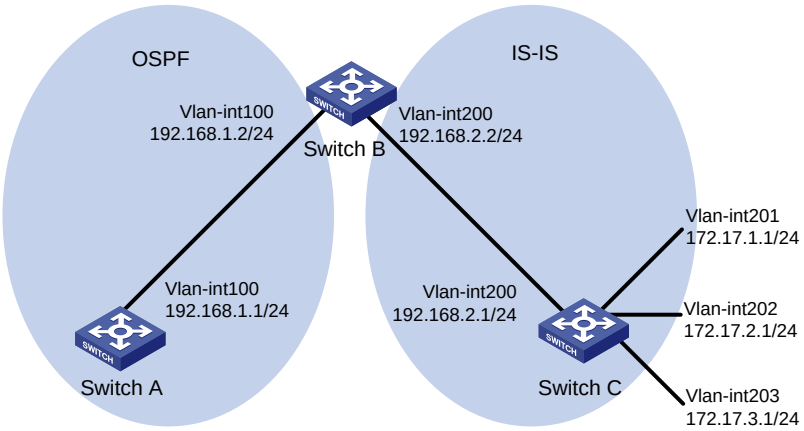
```



Example: Configuring a routing policy for redistributing IS-IS routes to OSPF

Network configuration

As shown in Figure 3, Switch B exchanges routing information with Switch A by using OSPF and with Switch C by using IS-IS.

On Switch B, enable route redistribution from IS-IS to OSPF. Use a routing policy to set the cost of route 172.17.1.0/24 to 100 and the tag of route 172.17.2.0/24 to 20.

Figure 3 Network diagram

Procedure

1. Specify IP addresses for interfaces. (Details not shown.)
2. Configure IS-IS:

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis
[SwitchC-isis-1] is-level level-2
[SwitchC-isis-1] network-entity 10.0000.0000.0001.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 201
[SwitchC-Vlan-interface201] isis enable
[SwitchC-Vlan-interface201] quit
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] isis enable
[SwitchC-Vlan-interface202] quit
[SwitchC] interface vlan-interface 203
[SwitchC-Vlan-interface203] isis enable
[SwitchC-Vlan-interface203] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis
```

```
[SwitchB-isis-1] is-level level-2
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable
[SwitchB-Vlan-interface200] quit
```

3. Configure OSPF and route redistribution:

Configure OSPF on Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

On Switch B, configure OSPF and enable route redistribution from IS-IS to OSPF.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] import-route isis 1
[SwitchB-ospf-1] quit
```

Display the OSPF routing table on Switch A to view redistributed routes.

```
[SwitchA] display ospf routing

          OSPF Process 1 with Router ID 192.168.1.1
                   Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop         AdvRouter     Area
 192.168.1.0/24     1        Stub    192.168.1.1     192.168.1.1   0.0.0.0

 Routing for ASEs
 Destination        Cost     Type    Tag         NextHop         AdvRouter
 172.17.1.0/24      1        Type2   1           192.168.1.2     192.168.2.2
 172.17.2.0/24      1        Type2   1           192.168.1.2     192.168.2.2
 172.17.3.0/24      1        Type2   1           192.168.1.2     192.168.2.2

 Total Nets: 4
 Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

4. Configure filtering lists:

Configure IPv4 basic ACL 2002 to permit route 172.17.2.0/24.

```
[SwitchB] acl basic 2002
[SwitchB-acl-ipv4-basic-2002] rule permit source 172.17.2.0 0.0.0.255
[SwitchB-acl-ipv4-basic-2002] quit
```

Configure IP prefix list **prefix-a** to permit route 172.17.1.0/24.

```
[SwitchB] ip prefix-list prefix-a index 10 permit 172.17.1.0 24
```

5. Configure a routing policy.

```
[SwitchB] route-policy isis2ospf permit node 10
```

```
[SwitchB-route-policy-isis2ospf-10] if-match ip address prefix-list prefix-a
[SwitchB-route-policy-isis2ospf-10] apply cost 100
[SwitchB-route-policy-isis2ospf-10] quit
[SwitchB] route-policy isis2ospf permit node 20
[SwitchB-route-policy-isis2ospf-20] if-match ip address acl 2002
[SwitchB-route-policy-isis2ospf-20] apply tag 20
[SwitchB-route-policy-isis2ospf-20] quit
[SwitchB] route-policy isis2ospf permit node 30
[SwitchB-route-policy-isis2ospf-30] quit
```

6. Apply the routing policy to route redistribution:

   # On Switch B, enable route redistribution from IS-IS to OSPF and apply the routing policy.

```
[SwitchB] ospf
[SwitchB-ospf-1] import-route isis 1 route-policy isis2ospf
[SwitchB-ospf-1] quit
```

   # Display the OSPF routing table on Switch A.

```
[SwitchA] display ospf routing

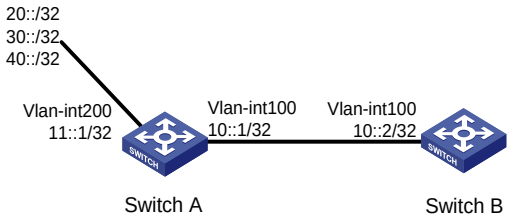
          OSPF Process 1 with Router ID 192.168.1.1
                   Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop         AdvRouter     Area
 192.168.1.0/24     1        Transit 192.168.1.1     192.168.1.1   0.0.0.0

 Routing for ASEs
 Destination        Cost     Type    Tag         NextHop       AdvRouter
 172.17.1.0/24      100      Type2   1           192.168.1.2   192.168.2.2
 172.17.2.0/24      1        Type2   20          192.168.1.2   192.168.2.2
 172.17.3.0/24      1        Type2   1           192.168.1.2   192.168.2.2

 Total Nets: 4
 Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

   The output shows that the cost of route 172.17.1.0/24 is 100 and the tag of route 172.17.2.0/24 is 20.



Example: Configuring a routing policy for IPv6 route redistribution

Network configuration

As shown in Figure 4:

- Run RIPng on Switch A and Switch B.
- Configure three static routes on Switch A.
- On Switch A, apply a routing policy to redistribute static routes 20::/32 and 40::/32 and deny route 30::/32.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

Configure IPv6 addresses for VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 address 10::1 32
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 11::1 32
[SwitchA-Vlan-interface200] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

Configure three static routes with next hop 11::2, and make sure the static routes are active.

```
[SwitchA] ipv6 route-static 20:: 32 11::2
[SwitchA] ipv6 route-static 30:: 32 11::2
[SwitchA] ipv6 route-static 40:: 32 11::2
```

Configure a routing policy.

```
[SwitchA] ipv6 prefix-list a index 10 permit 30:: 32
[SwitchA] route-policy static2ripng deny node 0
[SwitchA-route-policy-static2ripng-0] if-match ipv6 address prefix-list a
[SwitchA-route-policy-static2ripng-0] quit
[SwitchA] route-policy static2ripng permit node 10
[SwitchA-route-policy-static2ripng-10] quit
```

Enable RIPng and apply the routing policy to static route redistribution.

```
[SwitchA] ripng
[SwitchA-ripng-1] import-route static route-policy static2ripng
```

2. Configure Switch B:

Configure the IPv6 address for VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipv6 address 10::2 32
```

Enable RIPng.

```
[SwitchB] ripng
[SwitchB-ripng-1] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
```

```
[SwitchB-Vlan-interface100] quit
```

Verifying the configuration

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------

 Peer FE80::7D58:0:CA03:1 on Vlan-interface 100
 Destination 20::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 8 secs
 Destination 40::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 3 secs
 Local route
 Destination 10::/32,
     via ::, cost 0, tag 0, DOF
```

H3C shall not be liable for technical or editorial errors or omissions contained herein.

Preface

This configuration guide describes the IP multicast fundamentals and configuration procedures. It covers the IGMP snooping configuration, PIM snooping configuration, and multicast VLAN configuration.

This configuration guide describes features and tasks that help you get started with the switch, including:

- CLI.
- RBAC, switch login, and switch access control.
- Management of the switch, file system, and configuration files.
- FTP and TFTP.
- Tcl and Python.
- Common software upgrade.
- Automatic configuration.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.

Convention	Description
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.

Convention	Description
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

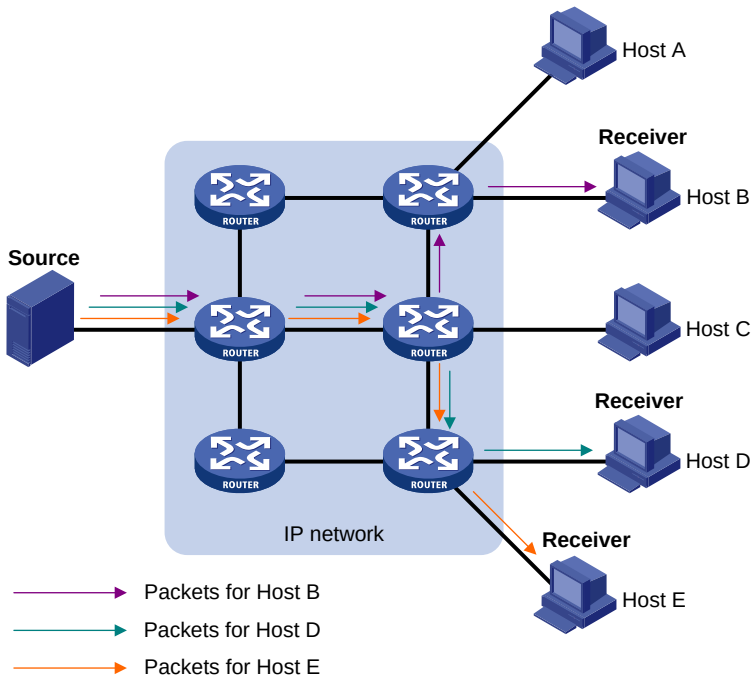
Multicast overview

Introduction to multicast

As a technique that coexists with unicast and broadcast, the multicast technique effectively addresses the issue of point-to-multipoint data transmission. By enabling high-efficiency point-to-multipoint data transmission over a network, multicast greatly saves network bandwidth and reduces network load.

By using multicast technology, a network operator can easily provide bandwidth-critical and time-critical information services. These services include live webcasting, Web TV, distance learning, telemedicine, Web radio, and real-time video conferencing.



Information transmission techniques

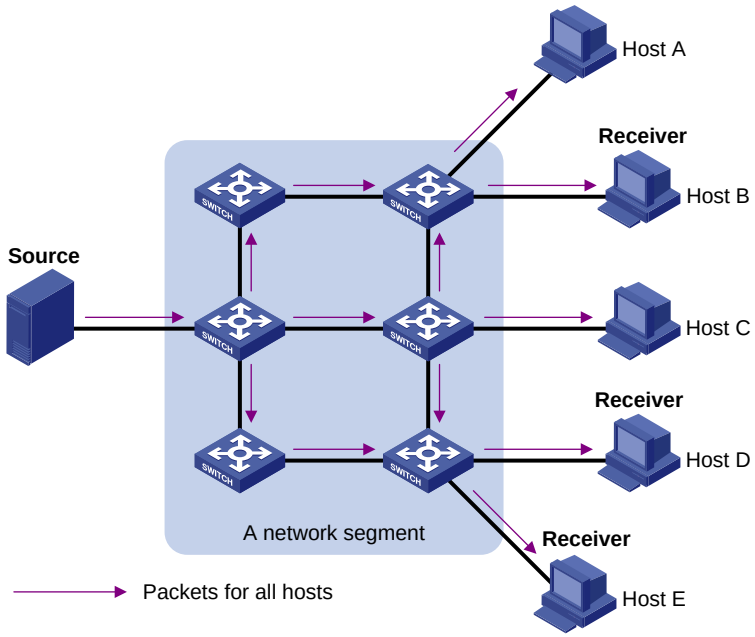
The information transmission techniques include unicast, broadcast, and multicast.

Unicast

In unicast transmission, the information source must send a separate copy of information to each host that needs the information.

Figure 1 Unicast transmission

In Figure 1, Host B, Host D, and Host E need the information. A separate transmission channel must be established from the information source to each of these hosts.



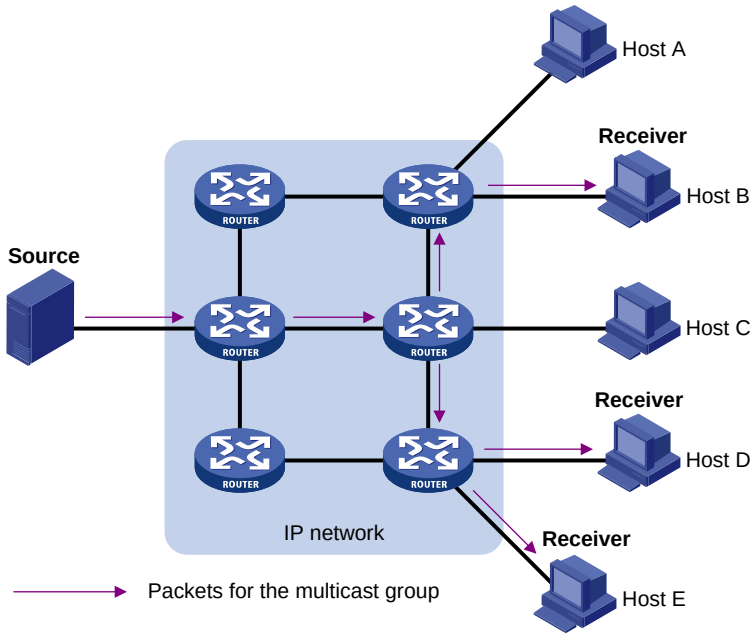
In unicast transmission, the traffic transmitted over the network is proportional to the number of hosts that need the information. If a large number of hosts need the information, the information source must send a separate copy of the same information to each of these hosts. Sending many copies can place a tremendous pressure on the information source and the network bandwidth.

Unicast is not suitable for batch transmission of information.

Broadcast

In broadcast transmission, the information source sends information to all hosts on the subnet, even if some hosts do not need the information.

Figure 2 Broadcast transmission



In Figure 2, only Host B, Host D, and Host E need the information. If the information is broadcast to the subnet, Host A and Host C also receive it. In addition to information security issues, broadcasting to hosts that do not need the information also causes traffic flooding on the same subnet.

Broadcast is disadvantageous in transmitting data to specific hosts. Moreover, broadcast transmission is a significant waste of network resources.

Multicast

Multicast provides point-to-multipoint data transmissions with the minimum network consumption. When some hosts on the network need multicast information, the information sender, or multicast source, sends only one copy of the information. Multicast distribution trees are built through multicast routing protocols, and the packets are replicated only on nodes where the trees branch.

Figure 3 Multicast transmission

In Figure 3, the multicast source sends only one copy of the information to a multicast group. Host B, Host D, and Host E, which are information receivers, must join the multicast group. The routers on the network duplicate and forward the information based on the distribution of the group members. Finally, the information is correctly delivered to Host B, Host D, and Host E.

To summarize, multicast has the following advantages:

- **Advantages over unicast**—Multicast data is replicated and distributed until it flows to the farthest-possible node from the source. The increase of receiver hosts will not remarkably increase the load of the source or the usage of network resources.
- **Advantages over broadcast**—Multicast data is sent only to the receivers that need it. This saves network bandwidth and enhances network security. In addition, multicast data is not confined to the same subnet.

Multicast features

- A multicast group is a multicast receiver set identified by an IP multicast address. Hosts must join a multicast group to become members of the multicast group before they receive the multicast data addressed to that multicast group. Typically, a multicast source does not need to join a multicast group.
- A multicast source is an information sender. It can send data to multiple multicast groups at the same time. Multiple multicast sources can send data to the same multicast group at the same time.
- The group memberships are dynamic. Hosts can join or leave multicast groups at any time. Multicast groups are not subject to geographic restrictions.
- Multicast routers or Layer 3 multicast devices are routers or Layer 3 switches that support Layer 3 multicast. They provide multicast routing and manage multicast group memberships on stub subnets with attached group members. A multicast router itself can be a multicast group member.

For a better understanding of the multicast concept, you can compare multicast transmission to the transmission of TV programs.

Table 1 Comparing TV program transmission and multicast transmission

TV program transmission	Multicast transmission
A TV station transmits a TV program through a channel.	A multicast source sends multicast data to a multicast group.
A user tunes the TV set to the channel.	A receiver joins the multicast group.
The user starts to watch the TV program transmitted by the TV station on the channel.	The receiver starts to receive the multicast data sent by the source to the multicast group.
The user turns off the TV set or tunes to another channel.	The receiver leaves the multicast group or joins another group.

Multicast benefits and applications

Multicast benefits

- **Enhanced efficiency**—Reduces the processor load of information source servers and network devices.
- **Optimal performance**—Reduces redundant traffic.
- **Distributed application**—Enables point-to-multipoint applications at the price of minimum network resources.

Multicast applications

- Multimedia and streaming applications, such as Web TV, Web radio, and real-time video/audio conferencing
- Communication for training and cooperative operations, such as distance learning and telemedicine
- Data warehouse and financial applications (stock quotes)
- Any other point-to-multipoint application for data distribution

Multicast models

Based on how the receivers treat the multicast sources, the multicast models include any-source multicast (ASM), source-filtered multicast (SFM), and source-specific multicast (SSM).

ASM model

In the ASM model, any multicast sources can send information to a multicast group. Receivers can join a multicast group and get multicast information addressed to that multicast group from any multicast sources. In this model, receivers do not know the positions of the multicast sources in advance.

SFM model

The SFM model is derived from the ASM model. To a multicast source, the two models appear to have the same multicast membership architecture.

The SFM model functionally extends the ASM model. The upper-layer software checks the source address of received multicast packets and permits or denies multicast traffic from specific sources. The receivers obtain the multicast data from only part of the multicast sources. To a receiver, multicast sources are not all valid, but are filtered.

SSM model

The SSM model provides a transmission service that enables multicast receivers to specify the multicast sources in which they are interested.

In the SSM model, receivers have already determined the locations of the multicast sources. This is the main difference between the SSM model and the ASM model. In addition, the SSM model uses a different multicast address range than the ASM/SFM model. Dedicated multicast forwarding paths are established between receivers and the specified multicast sources.

Multicast addresses

IP multicast addresses

IPv4 multicast addresses

IANA assigned the Class D address block (224.0.0.0 to 239.255.255.255) to IPv4 multicast.

Table 2 Class D IP address blocks and description

Address block	Description
224.0.0.0 to 224.0.0.255	Reserved permanent group addresses. The IP address 224.0.0.0 is reserved. Other IP addresses can be used by routing protocols and for topology searching, protocol maintenance, and so on. Table 3 lists common permanent group addresses. A packet destined for an address in this block will not be forwarded beyond the local subnet regardless of the TTL value in the IP header.
224.0.1.0 to 238.255.255.255	Globally scoped group addresses. This block includes the following types of designated group addresses: • **232.0.0.0/8**—SSM group addresses. • **233.0.0.0/8**—Glop group addresses.
239.0.0.0 to 239.255.255.255	Administratively scoped multicast addresses. These addresses are considered locally unique rather than globally unique. You can reuse them in domains administered by different organizations without causing conflicts. For more information, see RFC 2365.

NOTE:

Glop is a mechanism for assigning multicast addresses between different ASs. By filling an AS number into the middle two bytes of 233.0.0.0, you get 255 multicast addresses for that AS. For more information, see RFC 2770.

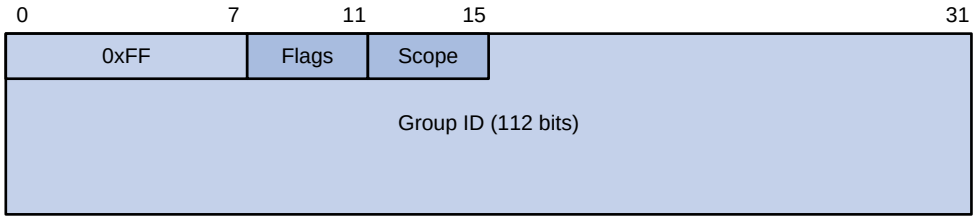


Table 3 Common permanent multicast group addresses

Address	Description
224.0.0.1	All systems on this subnet, including hosts and routers.
224.0.0.2	All multicast routers on this subnet.
224.0.0.3	Unassigned.
224.0.0.4	DVMRP routers.
224.0.0.5	OSPF routers.
224.0.0.6	OSPF designated routers and backup designated routers.
224.0.0.7	Shared Tree (ST) routers.

Address	Description
224.0.0.8	ST hosts.
224.0.0.9	RIPv2 routers.
224.0.0.11	Mobile agents.
224.0.0.12	DHCP server/relay agent.
224.0.0.13	All Protocol Independent Multicast (PIM) routers.
224.0.0.14	RSVP encapsulation.
224.0.0.15	All Core-Based Tree (CBT) routers.
224.0.0.16	Designated SBM.
224.0.0.17	All SBMs.
224.0.0.18	VRRP.

IPv6 multicast addresses

Figure 4 IPv6 multicast format

The following describes the fields of an IPv6 multicast address:

- **0xFF**—The most significant eight bits are 11111111.
- **Flags**—The Flags field contains four bits.

  Figure 5 Flags field format

  Table 4 Flags field description

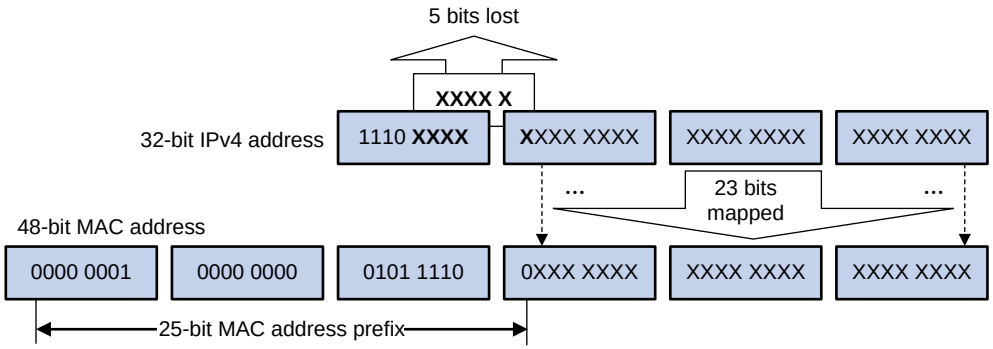
Bit	Description
0	Reserved, set to 0.
R	• When set to 0, this address is an IPv6 multicast address without an embedded RP address. • When set to 1, this address is an IPv6 multicast address with an embedded RP address. (The P and T bits must also be set to 1.)
P	• When set to 0, this address is an IPv6 multicast address not based on a unicast prefix. • When set to 1, this address is an IPv6 multicast address based on a unicast prefix. (The T bit must also be set to 1.)
T	• When set to 0, this address is an IPv6 multicast address permanently-assigned by IANA. • When set to 1, this address is a transient or dynamically assigned IPv6 multicast address.

- **Scope**—The Scope field contains four bits, which represent the scope of the IPv6 internetwork for which the multicast traffic is intended.

  Table 5 Values of the Scope field

Value	Meaning
0, F	Reserved.
1	Interface-local scope.
2	Link-local scope.
3	Subnet-local scope.
4	Admin-local scope.
5	Site-local scope.
6, 7, 9 through D	Unassigned.
8	Organization-local scope.
E	Global scope.

- **Group ID**—The Group ID field contains 112 bits. It uniquely identifies an IPv6 multicast group in the scope that the Scope field defines.



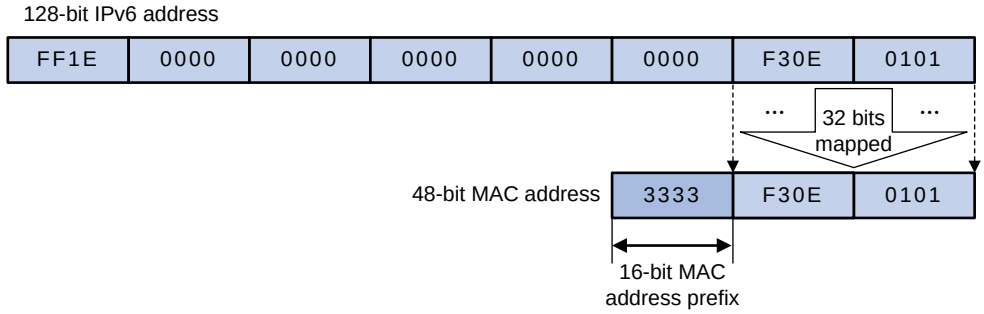
Ethernet multicast MAC addresses

An Ethernet multicast MAC address identifies receivers that belong to the same multicast group at the data link layer.

IPv4 multicast MAC addresses

As defined by IANA, the most significant 24 bits of an IPv4 multicast MAC address are 0x01005E. Bit 25 is 0, and the other 23 bits are the least significant 23 bits of an IPv4 multicast address.

Figure 6 IPv4-to-MAC address mapping



The most significant four bits of an IPv4 multicast address are fixed at 1110. In an IPv4-to-MAC address mapping, five bits of the IPv4 multicast address are lost. As a result, 32 IPv4 multicast addresses are mapped to the same IPv4 multicast MAC address. A device might receive unwanted multicast data at Layer 2 processing, which needs to be filtered by the upper layer.

IPv6 multicast MAC addresses

As defined by IANA, the most significant 16 bits of an IPv6 multicast MAC address are 0x3333. The least significant 32 bits are mapped from the least significant 32 bits of an IPv6 multicast address. Therefore, the problem of duplicate IPv6-to-MAC address mapping also arises like IPv4-to-MAC address mapping.

Figure 7 IPv6-to-MAC address mapping

IMPORTANT:

Because of the duplicate mapping from multicast IP address to multicast MAC address, the device might inadvertently send multicast protocol packets as multicast data in Layer 2 forwarding. To avoid this, do not use the IP multicast addresses that are mapped to multicast MAC addresses 0100-5E00-00xx and 3333-0000-00xx (where "x" represents any hexadecimal number from 0 to F).

Multicast protocols

NOTE:

MBGP and IPv6 MBGP are not supported in the current software version.

Multicast protocols include the following categories:

- Layer 3 and Layer 2 multicast protocols:
  - Layer 3 multicast refers to IP multicast operating at the network layer.

    Layer 3 multicast protocols—IGMP, MLD, PIM, IPv6 PIM, MSDP, MBGP, and IPv6 MBGP.
  - Layer 2 multicast refers to IP multicast operating at the data link layer.

    Layer 2 multicast protocols—IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.
- IPv4 and IPv6 multicast protocols:
  - **For IPv4 networks**—IGMP snooping, PIM snooping, multicast VLAN, IGMP, PIM, MSDP, and MBGP.
  - **For IPv6 networks**—MLD snooping, IPv6 PIM snooping, IPv6 multicast VLAN, MLD, IPv6 PIM, and IPv6 MBGP.

This section provides only general descriptions about applications and functions of the Layer 2 and Layer 3 multicast protocols in a network. For more information about these protocols, see the related chapters.

Layer 3 multicast protocols

In Figure 8, Layer 3 multicast protocols include multicast group management protocols and multicast routing protocols.

Figure 8 Positions of Layer 3 multicast protocols

- Multicast group management protocols:

  Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) protocol are multicast group management protocols. Typically, they run between hosts and Layer 3 multicast devices that directly connect to the hosts to establish and maintain multicast group memberships.

- Multicast routing protocols:

  A multicast routing protocol runs on Layer 3 multicast devices to establish and maintain multicast routes and correctly and efficiently forward multicast packets. Multicast routes constitute loop-free data transmission paths (also known as multicast distribution trees) from a data source to multiple receivers.

  In the ASM model, multicast routes include intra-domain routes and inter-domain routes.

  - An intra-domain multicast routing protocol discovers multicast sources and builds multicast distribution trees within an AS to deliver multicast data to receivers. Among a variety of mature intra-domain multicast routing protocols, PIM is most widely used. Based on the forwarding mechanism, PIM has dense mode (often referred to as PIM-DM) and sparse mode (often referred to as PIM-SM).
  - An inter-domain multicast routing protocol is used for delivering multicast information between two ASs. So far, mature solutions include Multicast Source Discovery Protocol (MSDP) and MBGP. MSDP propagates multicast source information among different ASs. MBGP is an extension of the MP-BGP for exchanging multicast routing information among different ASs.

  For the SSM model, multicast routes are not divided into intra-domain routes and inter-domain routes. Because receivers know the positions of the multicast sources, channels established through PIM-SM are sufficient for the transport of multicast information.

Layer 2 multicast protocols

In Figure 9, Layer 2 multicast protocols include IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.

Figure 9 Positions of Layer 2 multicast protocols

- IGMP snooping and MLD snooping:

  IGMP snooping and MLD snooping are multicast constraining mechanisms that run on Layer 2 devices. They manage and control multicast groups by monitoring and analyzing IGMP or MLD messages exchanged between the hosts and Layer 3 multicast devices. This effectively controls the flooding of multicast data in Layer 2 networks.

- PIM snooping and IPv6 PIM snooping:

  PIM snooping and IPv6 PIM snooping run on Layer 2 devices. They work with IGMP snooping or MLD snooping to analyze received PIM messages. Then, they add the ports that are interested in specific multicast data to a PIM snooping routing entry or IPv6 PIM snooping routing entry. In this way, multicast data can be forwarded to only the ports that are interested in the data.

- Multicast VLAN and IPv6 multicast VLAN:

  Multicast VLAN or IPv6 multicast VLAN runs on a Layer 2 device in a multicast network where multicast receivers for the same group exist in different VLANs. With these protocols, the Layer 3 multicast device sends only one copy of multicast to the multicast VLAN or IPv6 multicast VLAN on the Layer 2 device. This method avoids waste of network bandwidth and extra burden on the Layer 3 device.

Multicast packet forwarding mechanism

In a multicast model, receiver hosts of a multicast group are usually located at different areas on the network. They are identified by the same multicast group address. To deliver multicast packets to these receivers, a multicast source encapsulates the multicast data in an IP packet with the multicast group address as the destination address. Multicast routers on the forwarding paths forward multicast packets that an incoming interface receives through multiple outgoing interfaces. Compared to a unicast model, a multicast model is more complex in the following aspects:

- To ensure multicast packet transmission on the network, different routing tables are used to guide multicast forwarding. These routing tables include unicast routing tables, routing tables for multicast (for example, the MBGP routing table), and static multicast routing tables.
- To process the same multicast information from different peers received on different interfaces, the multicast device performs an RPF check on each multicast packet. The RPF check result determines whether the packet will be forwarded or discarded. The RPF check mechanism is the basis for most multicast routing protocols to implement multicast forwarding.

For more information about the RPF mechanism, see "Configuring multicast routing and forwarding" and "Configuring IPv6 multicast routing and forwarding."

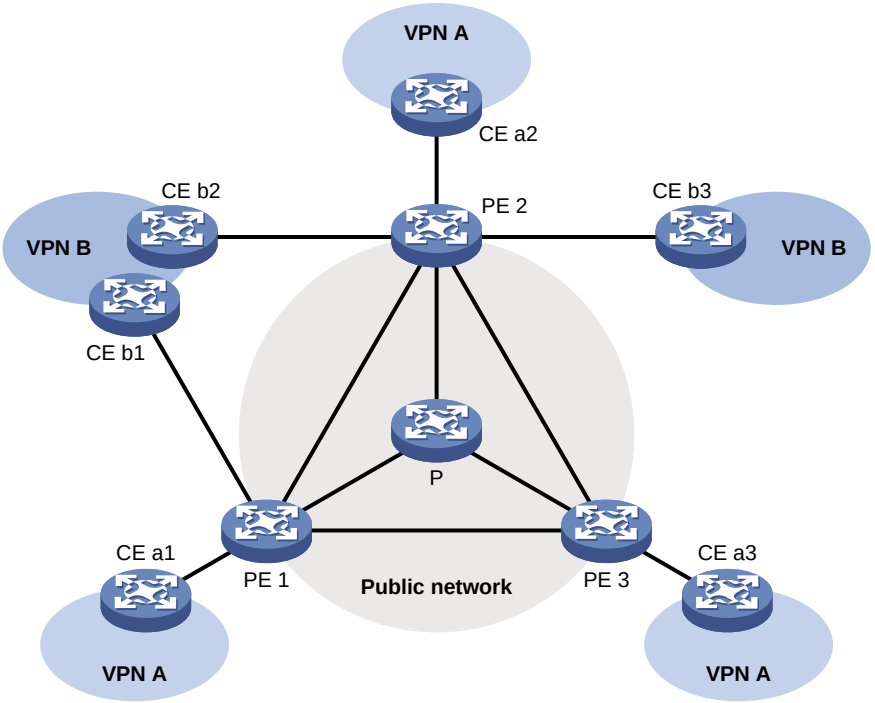
IP multicast architecture

IP multicast addresses the following issues:

- Where should the multicast source transmit information to? (Multicast addressing.)
- What receivers exist on the network? (Host registration.)
- Where is the multicast source that will provide data to the receivers? (Multicast source discovery.)
- How is the information transmitted to the receivers? (Multicast routing.)

IP multicast is an end-to-end service. The multicast architecture involves the following parts:

- **Addressing mechanism**—A multicast source sends information to a group of receivers through a multicast address.
- **Host registration**—Receiver hosts can join and leave multicast groups dynamically. This mechanism is the basis for management of group memberships.
- **Multicast routing**—A multicast distribution tree (a forwarding path tree for multicast data on the network) is constructed for delivering multicast data from a multicast source to receivers.
- **Multicast applications**—A software system that supports multicast applications, such as video conferencing, must be installed on multicast sources and receiver hosts. The TCP/IP stack must support reception and transmission of multicast data.



Multicast support for VPNs

Multicast support for VPNs refers to multicast applied in VPNs.

Introduction to VPN instances

VPNs are isolated from one another and from the public network. As shown in Figure 10, VPN A and VPN B separately access the public network through PE devices.

Figure 10 VPN networking diagram

- The P device belongs to the public network. The CE devices belong to their respective VPNs. Each CE device serves its own VPN and maintains only one set of forwarding mechanisms.
- The PE devices connect to the public network and the VPNs. Each PE device must strictly distinguish the information for different networks, and maintain a separate forwarding mechanism for each network. On a PE device, a set of software and hardware that serve the same network forms an instance. Multiple instances can exist on the same PE device, and an instance can reside on different PE devices. On a PE device, the instance for the public network is called the public network instance, and those for VPNs are called VPN instances.

Multicast application in VPNs

A PE device that supports multicast for VPNs performs the following operations:

- Maintains an independent set of multicast forwarding mechanisms for each VPN, including the multicast protocols, PIM neighbor information, and multicast routing table. In a VPN, the device forwards multicast data based on the forwarding table or routing table for that VPN.
- Implements the isolation between different VPNs.
- Implements information exchange and data conversion between the public network and VPN instances.

For example, as shown in Figure 10, a multicast source in VPN A sends multicast data to a multicast group. Only receivers that belong to both the multicast group and VPN A can receive the multicast data. The multicast data is multicast both in VPN A and on the public network. If you configure MVPN extranet, multicast data can be transmitted across different VPNs.

Common notations in multicast

The following notations are commonly used in multicast transmission:

- **(*, G)**—Rendezvous point tree (RPT), or a multicast packet that any multicast source sends to multicast group G. The asterisk (*) represents any multicast source, and "G" represents a specific multicast group.
- **(S, G)**—Shortest path tree (SPT), or a multicast packet that multicast source "S" sends to multicast group "G." "S" represents a specific multicast source, and "G" represents a specific multicast group.

For more information about the concepts RPT and SPT, see "PIM overview" and "IPv6 PIM overview."

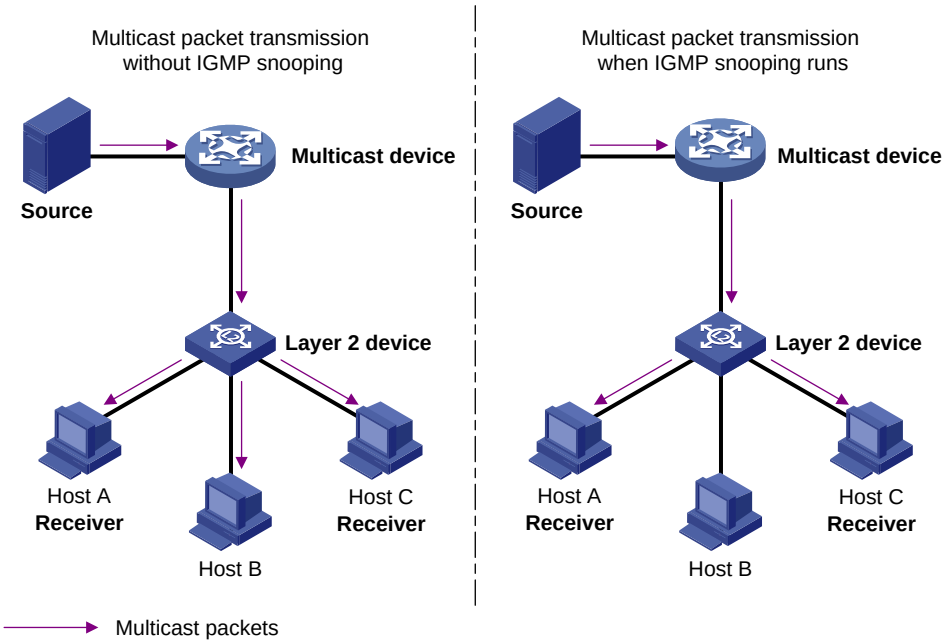
Configuring IGMP snooping



About IGMP snooping

IGMP snooping runs on a Layer 2 device as a multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from IGMP packets that are exchanged between the hosts and the Layer 3 device.

Fundamentals of IGMP snooping

As shown in Figure 1, when IGMP snooping is not enabled, the Layer 2 switch floods multicast packets to all hosts in a VLAN. When IGMP snooping is enabled, the Layer 2 switch forwards multicast packets of known multicast groups to only the receivers.

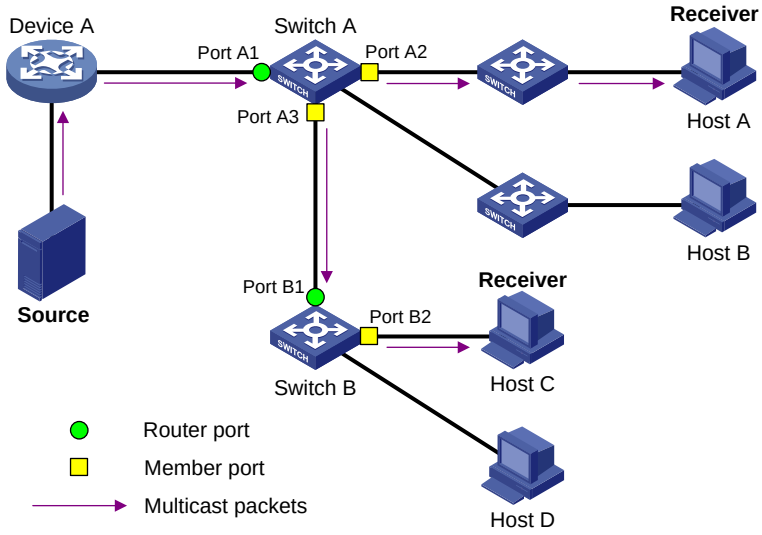


Figure 1 Multicast packet transmission without and with IGMP snooping

IGMP snooping ports

As shown in Figure 2, IGMP snooping runs on Switch A and Switch B, and Host A and Host C are receivers in a multicast group. IGMP snooping ports are divided into member ports and router ports.

Figure 2 IGMP snooping ports

Router ports

On an IGMP snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an IGMP general query whose source address is not 0.0.0.0 or receives a PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in IGMP snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in IGMP snooping is a Layer 2 interface.

Member ports

On an IGMP snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an IGMP report, it is added to the associated dynamic IGMP snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an IGMP report before the timer expires, the timer is reset. If the port does not receive an IGMP report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static IGMP snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How IGMP snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

IGMP messages types include general query, IGMP report, and leave message. An IGMP snooping-enabled Layer 2 device performs differently depending on the message types.

General query

The IGMP querier periodically sends IGMP general queries to all hosts and devices on the local subnet to check for the existence of multicast group members.

After receiving an IGMP general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

IGMP report

A host sends an IGMP report to the IGMP querier for the following purposes:

- Responds to queries if the host is a multicast group member.
- Applies for a multicast group membership.

After receiving an IGMP report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the address of the reported multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an IGMP report through a non-router port because of the host IGMP report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their IGMP reports upon receiving IGMP reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Leave message

An IGMPv1 receiver host does not send any leave messages when it leaves a multicast group. The Layer 2 device cannot immediately update the status of the port that connects to the receiver host. The Layer 2 device does not remove the port from the outgoing interface list in the associated forwarding entry until the aging time for the group expires.

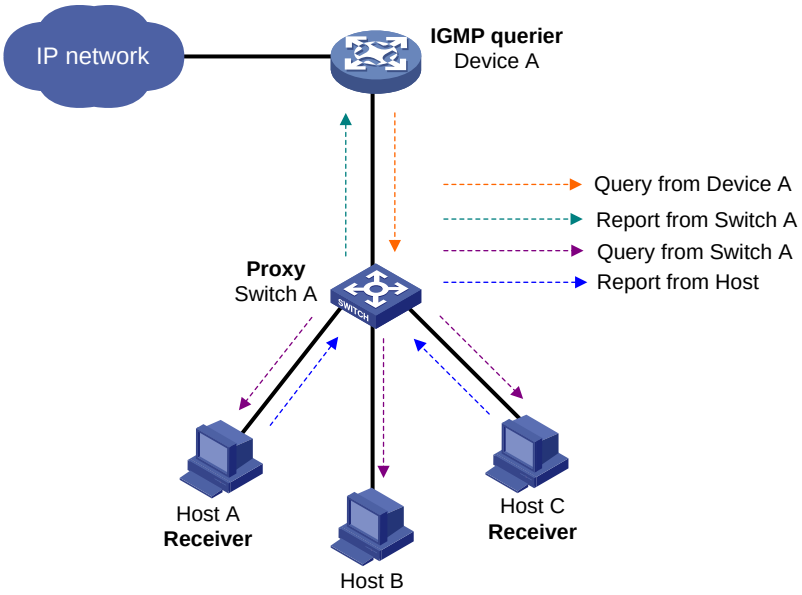
An IGMPv2 or IGMPv3 host sends an IGMP leave message when it leaves a multicast group.

When the Layer 2 device receives an IGMP leave message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the group address in the message.

- If no match is found, the Layer 2 device discards the IGMP leave message.

- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the IGMP leave message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the IGMP leave message.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.
- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the IGMP leave message to all router ports in the VLAN.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.

After receiving the IGMP leave message on a port, the IGMP querier resolves the multicast group address in the message. Then, it sends an IGMP group-specific query to the multicast group through the receiving port.



After receiving the IGMP group-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding IGMP report from the directly connected hosts. For the dynamic member port that received the leave message, the Layer 2 device also performs one of the following actions:

- If the port receives an IGMP report before the aging timer expires, the Layer 2 device resets the aging timer.
- If the port does not receive an IGMP report when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the multicast group.

IGMP snooping proxying

As shown in Figure 3, to reduce the number of IGMP report and leave messages received by the upstream device, you can enable IGMP snooping proxying on the edge device. With IGMP snooping proxying enabled, the edge device acts as a host for the upstream IGMP snooping querier to send IGMP report and leave messages to Device A. The host IGMP report suppression mechanism on the edge device does not take effect. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Figure 3 IGMP snooping proxying

The IGMP snooping proxy device processes different IGMP messages as follows:

- General query.

  After receiving an IGMP general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an IGMP report based on the local membership information and sends the report to all router ports.

- Group-specific query or group-and-source-specific query.

  After receiving an IGMP group-specific query or group-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a report to all router ports in the VLAN.

- Report.

  After receiving an IGMP report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Leave message.

  After receiving the IGMP leave message on a port, the device sends an IGMP group-specific query through the receiving port. The device sends the IGMP leave message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: IGMP snooping configuration

For IGMP reports received from secondary VLANs, the associated IGMP snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable IGMP snooping only for the primary VLAN. The IGMP snooping configuration made in secondary VLANs does not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The IGMP snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in IGMP-snooping view. The configuration made in VLAN view and the configuration made in IGMP-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in IGMP-snooping view. The interface-specific configuration takes priority over the configuration made in IGMP-snooping view.

VLAN-based IGMP snooping tasks at a glance

To configure IGMP snooping for VLANs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for VLANs
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Configuring static multicast MAC address entries
   - Setting the IGMP last member query interval
4. (Optional.) Configuring IGMP snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
5. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses

- Enabling the device to send IGMP general queries upon a path change

6. (Optional.) Enabling IGMP snooping proxying
7. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
8. (Optional.) Configuring IGMP snooping policies
   - Configuring a multicast group policy
   - Enabling multicast source port filtering
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
   - Setting the maximum number of multicast groups on a port
   - Enabling multicast group replacement
   - Enabling host tracking
9. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets

Enabling the IGMP snooping feature

About this task

You must enable the IGMP snooping feature before you configure other IGMP snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, the IGMP snooping feature is disabled.

Enabling IGMP snooping

Enabling IGMP snooping globally

About this task

After you enable IGMP snooping globally, IGMP snooping is enabled for all VLANs. You can disable IGMP snooping for a VLAN when IGMP snooping is globally enabled.

Restrictions and guidelines

To configure other IGMP snooping features for VLANs, you must enable IGMP snooping for the specific VLANs even though IGMP snooping is enabled globally.

The VLAN-specific IGMP snooping configuration takes priority over the global IGMP snooping configuration. For example, if you enable IGMP snooping globally and then use the **`igmp-snooping disable`** command to disable IGMP snooping for a VLAN, IGMP snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable IGMP snooping globally.

   global-enable

   By default, IGMP snooping is disabled globally.

4. (Optional.) Disable IGMP snooping for a VLAN.

   a. Return to system view.

      quit

   b. Enter VLAN view.

      vlan *vlan-id*

   c. Disable IGMP snooping for the VLAN.

      igmp-snooping disable

      By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for VLANs

Restrictions and guidelines

You can enable IGMP snooping for multiple VLANs by using the **enable vlan** command in IGMP-snooping view or for a VLAN by using the **igmp-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view.

IGMP snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling IGMP snooping for multiple VLANs

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Enable IGMP snooping for the specified VLANs.

   enable vlan *vlan-list*

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Configuring basic IGMP snooping features

Specifying an IGMP snooping version

About this task

Different IGMP snooping versions process different versions of IGMP messages.

- IGMPv2 snooping processes IGMPv1 messages, IGMPv2 messages, and IGMPv3 queries, but it floods IGMPv3 reports in the VLAN instead of processing them.
- IGMPv3 snooping processes IGMPv1, IGMPv2, and IGMPv3 messages.

Restrictions and guidelines

If you change the IGMP snooping version from 2 to 3, the device performs the following actions:

- Clears all IGMP snooping forwarding entries that are dynamically created.
- Keeps static IGMPv3 snooping forwarding entries (*, G).
- Clears static IGMPv3 snooping forwarding entries (S, G), which will be restored when the IGMP snooping version is switched back to 3.

For more information about static IGMP snooping forwarding entries, see "Configuring a static member port."

Specifying an IGMP snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Specify an IGMP snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an IGMP snooping version for the VLAN.
   igmp-snooping version *version-number*
   By default, the IGMP snooping version for a VLAN is 2.

Setting the maximum number of IGMP snooping forwarding entries

About this task

You can modify the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum number of IGMP snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of IGMP snooping forwarding entries is 4294967295.

Configuring static multicast MAC address entries

About this task

In Layer 2 multicast, multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as IGMP snooping). You can also manually configure static multicast MAC address entries by binding multicast MAC addresses and ports to control the destination ports of the multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the IGMP last member query interval

About this task

A receiver host starts a report delay timer for a multicast group when it receives an IGMP group-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the group.

The IGMP last member query interval defines the maximum response time advertised in IGMP group-specific queries. Set an appropriate value for the IGMP last member query interval to speed up hosts' responses to IGMP group-specific queries and avoid IGMP report traffic bursts.

Setting the IGMP last member query interval globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the IGMP last member query interval globally.
   last-member-query-interval *interval*
   By default, the global IGMP last member query interval is 1 second.

Setting the IGMP last member query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP last member query interval for the VLAN.
   igmp-snooping last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second for a VLAN.

Configuring IGMP snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an IGMP general query or PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an IGMP report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports. For example, if the memberships of multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports. If the memberships of multicast groups rarely change, set a relatively large value.

If a dynamic router port receives a PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **router-aging-time** or **igmp-snooping router-aging-time** command does not take effect on the port.

IGMP group-specific queries originated by the Layer 2 device trigger the adjustment of aging timers for dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the IGMP last member query interval. For more information about setting the IGMP last member query interval on the Layer 2 device, see "Setting the IGMP last member query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.

igmp-snooping

3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the global aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   igmp-snooping router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports in the VLAN.
   igmp-snooping host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Configuring a static member port

About this task

You can configure a port as a static member port for a multicast group so that hosts attached to the port can always receive multicast for the group. The static member port does not respond to IGMP queries. When you complete or cancel this configuration on a port, the port does not send an unsolicited IGMP report or leave message.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.
   igmp-snooping static-group *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*
   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for a multicast group so that all multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.
   igmp-snooping static-router-port vlan *vlan-id*
   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited IGMP report when you complete the configuration.
- It responds to IGMP general queries with IGMP reports.
- It sends an IGMP leave message when you cancel the configuration.

The version of IGMP running on the simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*
   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave massage. The Layer 2 device no longer sends or forwards IGMP group-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts in a VLAN. If you do so, the remaining receivers cannot receive multicast data for a group after a receiver leaves the group.

As a best practice to avoid multicast service interruption on other ports in the same VLAN, enable only IGMP snooping fast-leave processing on a port on a network configured with both IGMP snooping and IGMP. Do not use the **igmp fast-leave** command to enable IGMP fast-leaving processing. For more information about the **igmp fast leave** command, see IGMP commands in *IP Multicast Command Reference*.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   igmp-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send IGMP general queries or PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive multicast data that it does not want to receive.
- The port forwards the IGMP general queries or PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the IGMP querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable a port from becoming a dynamic router port. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.

- Enter Layer 2 Ethernet interface view.
  interface *interface-type interface-number*
- Enter Layer 2 aggregate interface view.
  interface bridge-aggregation *interface-number*

3. Disable the port from becoming a dynamic router port.
   igmp-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Configuring the IGMP snooping querier

Enabling the IGMP snooping querier

About this task

This feature enables the Layer 2 device to periodically send IGMP general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an IGMP snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the IGMP snooping querier on a multicast network that runs IGMP. An IGMP snooping querier does not take part in IGMP querier elections. However, it might affect IGMP querier elections if it sends IGMP general queries with a low source IP address. For more information about IGMP querier, see "Configuring IGMP."

Enabling the IGMP snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the IGMP snooping querier for the VLAN.
   igmp-snooping querier
   By default, the IGMP snooping querier is disabled for a VLAN.

Enabling IGMP snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for IGMP snooping querier election is the same as that for IGMP querier election. For more information about IGMP querier election, see "Configuring IGMP."

Prerequisites for enabling IGMP snooping querier election

Before you enable IGMP snooping querier election, you must complete the following tasks:

- Enable the IGMP snooping querier for a VLAN. For more information about enabling the IGMP snooping querier, see "Enabling the IGMP snooping querier."
- Configure the source IP address for IGMP general queries as an IP address different from 0.0.0.0 and the local querier IP address. An IGMP snooping querier performs querier election only if the source IP address of a received IGMP general query is not 0.0.0.0 or its own IP address.

- Make sure the candidate IGMP snooping queriers run the same IGMP snooping version. To specify the IGMP snooping version, use the **igmp-snooping version** command.

Enabling IGMP snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping querier election for the VLAN.
   igmp-snooping querier-election
   By default, IGMP snooping querier election is disabled for a VLAN.

Configuring parameters for IGMP general queries and responses

About this task

You can modify the IGMP general query interval based on the actual condition of the network.

A receiver host starts a report delay timer for each multicast group that it has joined when it receives an IGMP general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the corresponding multicast group.

Set an appropriate value for the maximum response time for IGMP general queries to speed up hosts' responses to IGMP general queries and avoid IGMP report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting multicast group members, make sure the IGMP general query interval is greater than the maximum response time for IGMP general queries.

Configuring parameters for IGMP general queries and responses globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum response time for IGMP general queries.
   max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds.

Configuring parameters for IGMP general queries and responses in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP general query interval in the VLAN.
   igmp-snooping query-interval *interval*
   By default, the IGMP general query interval is 125 seconds for a VLAN.
4. Set the maximum response time for IGMP general queries in the VLAN.
   igmp-snooping max-response-time *seconds*

By default, the maximum response time for IGMP general queries is 10 seconds for a VLAN.

Enabling the device to send IGMP general queries upon a path change

About this task

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when a path changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the IGMP snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.
   `system-view`
2. Enter IGMP-snooping view.
   `igmp-snooping`
3. Enable the device to send IGMP general queries upon a path change.
   `send-query enable`
   By default, the device does not send IGMP general queries upon a path change.

Enabling IGMP snooping proxying

About enabling IGMP snooping proxying

The device enabled with IGMP snooping proxying is called an IGMP snooping proxy. The IGMP snooping proxy acts as a host to the upstream device. Enabled with IGMP snooping querier, the IGMP snooping proxy acts as the router to downstream devices and receives report and leave messages on behalf of the upstream device. As a best practice, enable IGMP snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling IGMP snooping proxying

Before you enable IGMP snooping proxying for a VLAN, you must first enable IGMP snooping globally and enable IGMP snooping for the VLAN. IGMP snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with IGMP snooping querier. For more information about enabling IGMP snooping querier, see "Enabling the IGMP snooping querier."

Enabling IGMP snooping proxying for a VLAN

1. Enter system view.
   `system-view`
2. Enter VLAN view.
   `vlan` *`vlan-id`*

3. Enable IGMP snooping proxying for the VLAN.

   igmp-snooping proxy enable

   By default, IGMP snooping proxying is disabled for a VLAN.

Configuring parameters for IGMP messages

Configuring source IP addresses for IGMP messages

About this task

The IGMP snooping querier might send IGMP general queries with the source IP address 0.0.0.0. The port that receives such queries will not be maintained as a dynamic router port. This might prevent the associated dynamic IGMP snooping forwarding entry from being correctly created at the data link layer and eventually cause multicast traffic forwarding failures. To avoid this problem, you can configure a non-all-zero IP address as the source IP address of the IGMP queries on the IGMP snooping querier. This configuration might affect the IGMP querier election within the subnet.

You can also change the source IP address of IGMP reports or leave messages sent by a simulated member host or an IGMP snooping proxy.

Configuring the source IP addresses for IGMP messages in a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Configure the source IP address for IGMP general queries.

   igmp-snooping general-query source-ip *ip-address*

   By default, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

4. Configure the source IP address for IGMP group-specific queries.

   igmp-snooping special-query source-ip *ip-address*

   By default, the source IP address of IGMP group-specific queries is one of the following:

   - The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
   - The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
   - 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

   By default, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

Setting the 802.1p priority for IGMP messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards IGMP messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to IGMP messages that are created or forwarded by the device.

Setting the 802.1p priority for IGMP messages globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the 802.1p priority for IGMP messages.
   dot1p-priority *priority*
   By default, the 802.1p priority for IGMP messages is not set.

Setting the 802.1p priority for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the 802.1p priority for IGMP messages in the VLAN.
   igmp-snooping dot1p-priority *priority*
   By default, the 802.1p priority for IGMP messages is not set.

Configuring IGMP snooping policies

Configuring a multicast group policy

About this task

This feature enables the Layer 2 device to filter IGMP reports by using an ACL that specifies the multicast groups and the optional sources. It is used to control the multicast groups that hosts can join. This configuration takes effect only on the multicast groups that ports join dynamically.

In a multicast application, a host sends an unsolicited IGMP report when a user requests a multicast program. The Layer 2 device uses the multicast group policy to filter the IGMP report. The host can join the multicast group only if the IGMP report is permitted by the multicast group policy.

Configuring a multicast group policy globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Configure a multicast group policy globally.
   group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured, and hosts can join any multicast groups.

Configuring a multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a multicast group policy on the port.
   igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]
   By default, no multicast group policies are configured on a port, and hosts attached to the port can join any multicast groups.

Enabling multicast source port filtering

About this task

This feature enables the Layer 2 device to discard all multicast data packets and to accept multicast protocol packets. You can enable this feature on ports that connect only to multicast receivers.

Restrictions and guidelines

The configuration made for multiple interfaces in IGMP-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling multicast source port filtering in IGMP-snooping view

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast source port filtering.
   source-deny port *interface-list*
   By default, multicast source port filtering is disabled.

Enabling multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable multicast source port filtering.
   igmp-snooping source-deny
   By default, multicast source port filtering is disabled.

Enabling dropping unknown multicast data

About this task

Unknown multicast data refers to multicast data for which no forwarding entries exist in the IGMP snooping forwarding table. This feature enables the device to forward unknown multicast data only to the router port. If the device does not have a router port, unknown multicast data will be dropped.

If you do not enable this feature, the unknown multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv4 multicast data is enabled, the device also drops unknown IPv6 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown multicast data out of router ports except the receiving router port in this VLAN.

This feature cannot drop multicast data packets that have inconsistent destination multicast MAC address and destination multicast IPv4 address.

Unknown multicast packets for the 239.x.x.x and 224.x.x.x networks cannot be immediately dropped after this feature is enabled.

Enabling dropping unknown multicast data for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable dropping unknown multicast data for the VLAN.
   igmp-snooping drop-unknown
   By default, dropping unknown multicast data is disabled for a VLAN. Unknown multicast data is flooded in the VLAN.

Enabling IGMP report suppression

About this task

This feature enables the Layer 2 device to forward only the first IGMP report for a multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable IGMP report suppression.
   report-aggregation
   By default, IGMP report suppression is enabled.

Setting the maximum number of multicast groups on a port

About this task

You can set the maximum number of multicast groups on a port to regulate the port traffic. This feature takes effect only on the multicast groups that a port joins dynamically.

If the number of multicast groups on a port exceeds the limit, the system removes all the forwarding entries associated with the port. The receiver hosts attached to that port can join multicast groups again before the number of multicast groups on the port reaches the limit. When the number of multicast groups on the port reaches the limit, the port automatically drops IGMP reports for new groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of multicast groups on the port.
   igmp-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of multicast groups on a port.

Enabling multicast group replacement

About this task

When multicast group replacement is enabled, the port does not drop IGMP reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves the multicast group that has the lowest IP address and joins the new group contained in the IGMP report. The multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that a port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the IGMP snooping forwarding entries on the device reaches the upper limit.
- The multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling multicast group replacement globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled globally.

Enabling multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable multicast group replacement on the port.
   igmp-snooping overflow-replace [**vlan** *vlan-list*]

By default, multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving multicast data. The information includes IP addresses of the hosts, length of time elapsed since the hosts joined multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   `system-view`
2. Enter IGMP-snooping view.
   `igmp-snooping`
3. Enable host tracking globally.
   `host-tracking`
   By default, host tracking is disabled globally.

Enabling host tracking for a VLAN

1. Enter system view.
   `system-view`
2. Enter VLAN view.
   `vlan` *`vlan-id`*
3. Enable host tracking for the VLAN.
   `igmp-snooping host-tracking`
   By default, host tracking is disabled for a VLAN.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   `system-view`
2. Enter IGMP snooping view.
   `igmp-snooping`
3. Set the DSCP value for outgoing IGMP protocol packets.
   `dscp` *`dscp-value`*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Display and maintenance commands for IGMP snooping

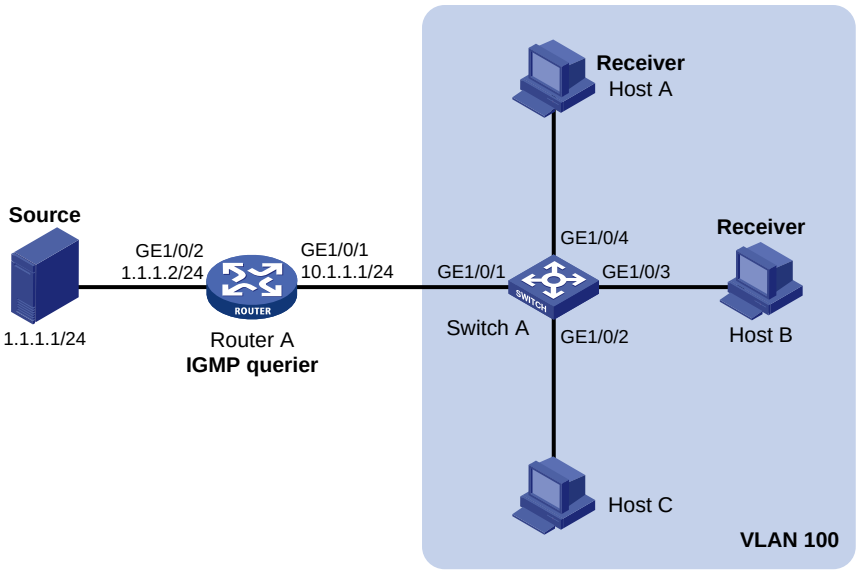
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IGMP snooping status.	**display igmp-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic IGMP snooping group entries.	**display igmp-snooping group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display igmp-snooping host-tracking vlan** *vlan-id* **group** *group-address* [**source** *source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display igmp-snooping router-port** [**vlan** *vlan-id* [**verbose**] [**slot** *slot-number*]
Display static IGMP snooping group entries.	**display igmp-snooping static-group** [*group-address* | *source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display igmp-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the IGMP messages and PIMv2 hello messages learned by IGMP snooping.	**display igmp-snooping statistics**
Display Layer 2 multicast fast forwarding entries.	**display l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*source-address* | *group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IP multicast groups.	**display l2-multicast ip** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IP multicast group entries.	**display l2-multicast ip forwarding** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 MAC multicast groups.	**display l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 MAC multicast group entries.	**display l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Clear dynamic IGMP snooping group entries.	**reset igmp-snooping group** { *group-address*

Task	Command
	[*source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset igmp-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping.	**reset igmp-snooping statistics**
Clear Layer 2 multicast fast forwarding entries.	**reset l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]

IGMP snooping configuration examples

Example: Configuring VLAN-based IGMP snooping group polices and simulated joining



Network configuration

As shown in Figure 4, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping.

Configure a multicast group policy and simulated joining to meet the following requirements:

- Host A and Host B receive only the multicast data addressed to multicast group 224.1.1.1. Multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown multicast data instead of flooding it in VLAN 100.

Figure 4 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 4.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

```
<RouterA> system-view
[RouterA] multicast routing
[RouterA-mrib] quit
```

   # Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] igmp enable
[RouterA-GigabitEthernet1/0/1] quit
```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping drop-unknown
[SwitchA-vlan100] quit
```

   # Configure a multicast group policy so that hosts in VLAN 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] group-policy 2001 vlan 100
[SwitchA-igmp-snooping] quit
```

   # Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts of multicast group 224.1.1.1.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.2.2.2. (Details not shown.)

Display dynamic IGMP snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

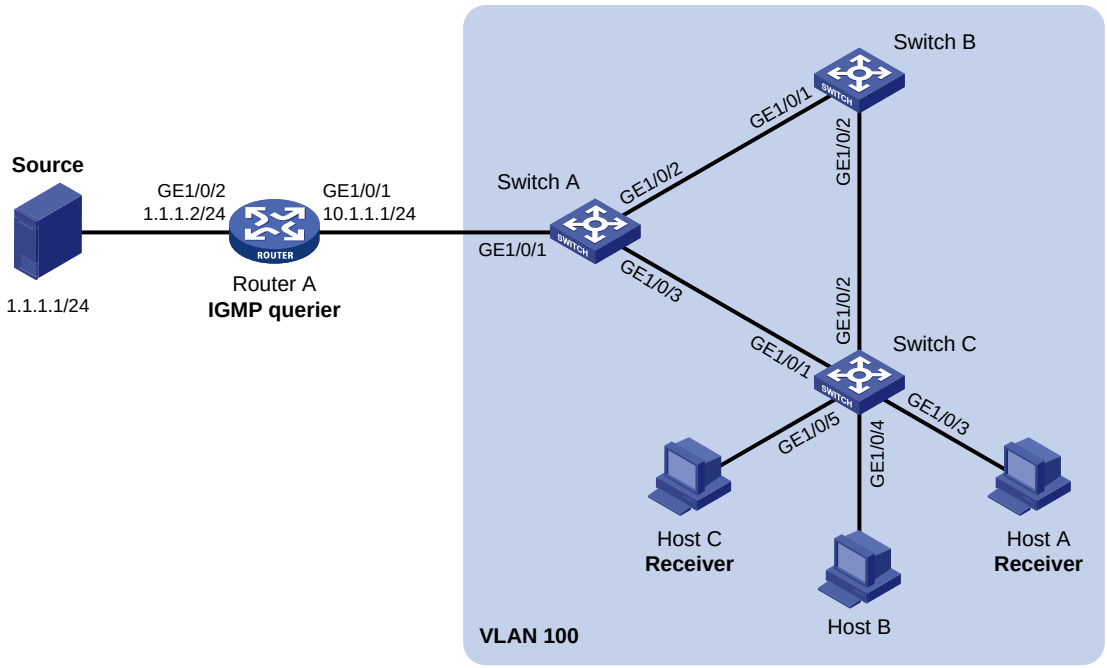
The output shows the following information:

- Host A and Host B have joined multicast group 224.1.1.1 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join multicast group 224.2.2.2.

Example: Configuring VLAN-based IGMP snooping static ports

Network configuration

As shown in Figure 5:



- Router A runs IGMPv2 and acts as the IGMP querier. Switch A, Switch B, and Switch C run IGMPv2 snooping.
- Host A and host C are permanent receivers of multicast group 224.1.1.1.

Configure static ports to meet the following requirements:

- To enhance the reliability of multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for multicast group 224.1.1.1.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. Multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one IGMP query-response cycle must be completed before multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, multicast data can flow to the receivers nearly uninterruptedly along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   ```

```
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable IGMP snooping for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable IGMP snooping for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for multicast group 224.1.1.1.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static IGMP snooping group entries for VLAN 100 on Switch C.

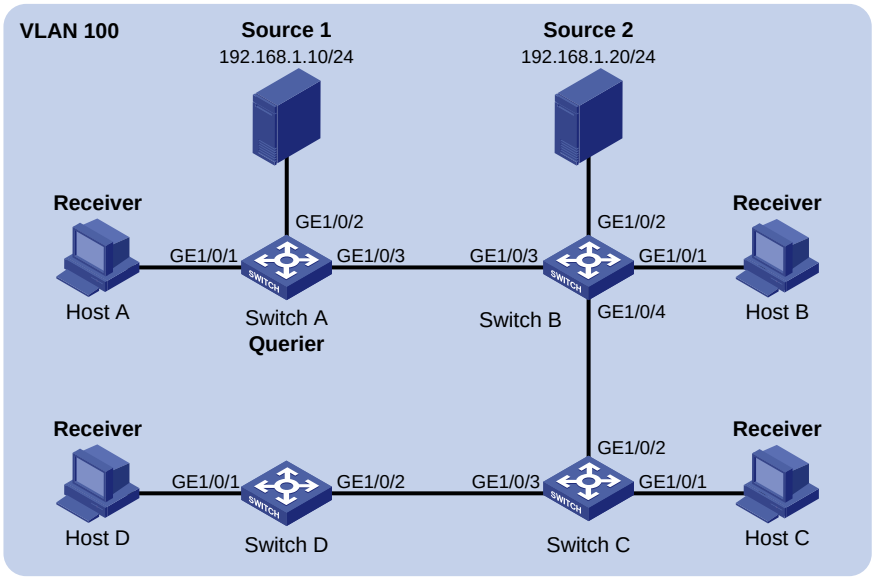
```
[SwitchC] display igmp-snooping static-group vlan 100
Total 1 entries.
```

```
VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of multicast group 224.1.1.1.

Example: Configuring the VLAN-based IGMP snooping querier

Network configuration



As shown in Figure 6:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Host A and Host C are receivers of multicast group 224.1.1.1, and Host B and Host D are receivers of multicast group 225.1.1.1.
- All host receivers run IGMPv2, and all switches run IGMPv2 snooping. Switch A (which is close to the multicast sources) acts as the IGMP snooping querier.

Configure the switches to meet the following requirements:

- To prevent the switches from flooding unknown data in the VLAN, enable all the switches to drop unknown multicast data.
- A switch does not mark a port that receives an IGMP query with source IP address 0.0.0.0 as a dynamic router port. This adversely affects the establishment of Layer 2 forwarding entries and multicast traffic forwarding. To avoid this, configure the source IP address of IGMP queries as a non-zero IP address.

Figure 6 Network diagram

Procedure

1. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping drop-unknown
```

Configure Switch A as the IGMP snooping querier.

```
[SwitchA-vlan100] igmp-snooping querier
[SwitchA-vlan100] quit
```

In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP general queries.

```
[SwitchA-vlan100] igmp-snooping general-query source-ip 192.168.1.1
```

In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP group-specific queries.

```
[SwitchA-vlan100] igmp-snooping special-query source-ip 192.168.1.1
[SwitchA-vlan100] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] igmp-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the IGMP snooping feature.

```
<SwitchC> system-view
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] igmp-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the IGMP snooping feature.

```
<SwitchD> system-view
[SwitchD] igmp-snooping
[SwitchD-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

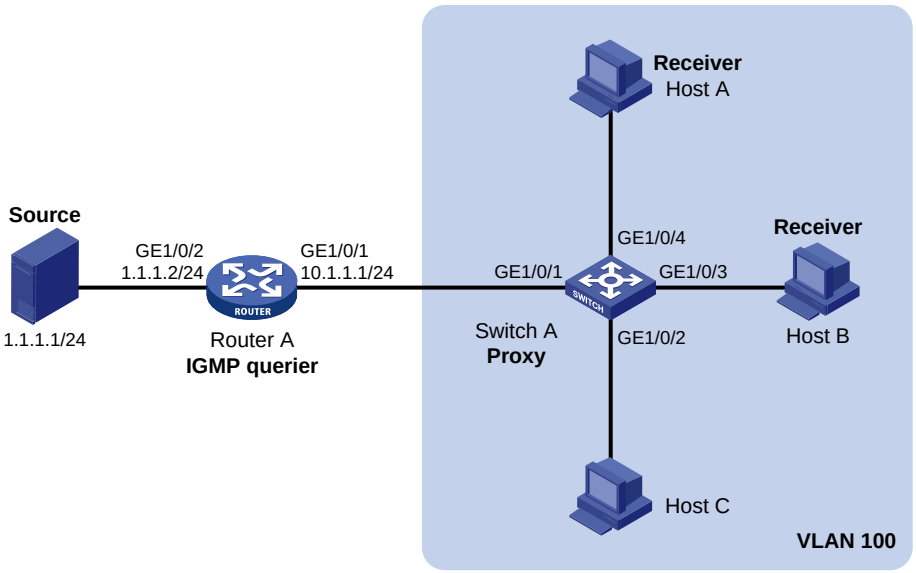
```
[SwitchD-vlan100] igmp-snooping enable
[SwitchD-vlan100] igmp-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping on Switch B.

```
[SwitchB] display igmp-snooping statistics
Received IGMP messages:
  IGMP general queries: 19
  IGMPv2 specific queries: 10
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
  IGMPv1 reports: 0
  IGMPv2 reports: 19
  IGMPv3 reports: 0
  IGMPv3 reports with right and wrong records: 0
  IGMP leaves: 5
  Error IGMP messages: 1
Sent IGMP messages:
  IGMPv2 specific queries: 0
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
Received PIMv2 hello : 0
```

The output shows that all switches except Switch A can receive the IGMP general queries after Switch A acts as the IGMP snooping querier.



Example: Configuring VLAN-based IGMP snooping proxying

Network configuration

As shown in Figure 7, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping. Configure IGMP snooping proxying so that Switch A can perform the following actions:

- Forward IGMP report and leave messages to Router A.
- Respond to IGMP queries sent by Router A and forward the queries to downstream hosts.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP and PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping and IGMP snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping proxy enable
   ```

```
[SwitchA-vlan100] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:00)
      GE1/0/4                                  (00:04:04)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of multicast group 224.1.1.1. Host A and Host B become receivers of the group.

Display IGMP group membership information on Router A.

```
[RouterA] display igmp group
IGMP groups in total: 1
 GigabitEthernet1/0/1(10.1.1.1):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   224.1.1.1       0.0.0.0         00:00:31    00:02:03
```

Send an IGMP leave message from Host A to leave multicast group 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1. Only Host B remains as the receiver of the group.

Troubleshooting IGMP snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function on the Layer 2 device.

Solution

To resolve the problem:

1. Use the **display igmp-snooping** command to display IGMP snooping status.

2. If IGMP snooping is not enabled, use the **igmp-snooping** command in system view to enable the IGMP snooping feature. Then, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
3. If IGMP snooping is enabled globally but not enabled for the VLAN, use the **igmp-snooping enable** command in VLAN view to enable IGMP snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Multicast group policy does not work

Symptom

Hosts can receive multicast data for multicast groups that are not permitted by the multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl** command to verify that the configured ACL meets the multicast group policy requirements.
2. Use the **display this** command in IGMP-snooping view or in a corresponding interface view to verify that the correct multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **igmp-snooping group-policy** command to apply the correct multicast group policy.
3. Use the **display igmp-snooping** command to verify that dropping unknown multicast data is enabled. If it is not, use the **igmp-snooping drop-unknown** command to enable dropping unknown multicast data.
4. If the problem persists, contact H3C Support.

Configuring PIM snooping

About PIM snooping

PIM snooping runs on Layer 2 devices. It works with IGMP snooping to analyze received PIM messages, and adds the ports that are interested in specific multicast data to a PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the PIM routers are in the same VLAN.

- When the Layer 2 switch runs only IGMP snooping, it performs the following actions:
  - **a.** Maintains the router ports according to the received PIM hello messages that PIM routers send.
  - **b.** Floods all other types of received PIM messages except PIM hello messages in the VLAN.
  - **c.** Forwards all multicast data to all router ports in the VLAN.

Each PIM router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all PIM messages except PIM hello messages.

- When the Layer 2 switch runs both IGMP snooping and PIM snooping, it performs the following actions:
  a. Examines whether a PIM router is interested in the multicast data addressed to a multicast group according to the received PIM messages that the router sends.
  b. Adds only the ports that connect to the router and are interested in the data to a PIM snooping routing entry.
  c. Forwards PIM messages and multicast data to only the routers that are interested in the data, which saves network bandwidth.

For more information about IGMP snooping and the router port, see "Configuring IGMP snooping."

Restrictions and guidelines: PIM snooping configuration

PIM snooping does not take effect on secondary VLANs. As a best practice, do not configure PIM snooping for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of a PIM join or prune message is smaller than the path MTU of devices connected to PIM snooping devices. Otherwise, fragmented PIM join or prune messages prevent PIM snooping from correctly forwarding multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring PIM."

PIM snooping is supported only for PIM-SM and PIM-SSM. As a best practice, do not configure PIM snooping for PIM-DM and BIDIR-PIM. For more information about PIM, see "PIM overview."

After you configure PIM snooping for a VLAN, PIM snooping takes effect only on ports that belong to the VLAN.

PIM snooping tasks at a glance

To configure PIM snooping, perform the following tasks:

1. Enabling PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling PIM snooping

Restrictions and guidelines

You must enable the IGMP snooping feature and enable IGMP snooping for a VLAN before you enable PIM snooping for the VLAN.

PIM snooping does not take effect on sub-VLANs of a multicast VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`

By default, IGMP snooping is disabled.

For more information about this command, see IGMP snooping commands in *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter VLAN view.

   vlan *vlan-id*

5. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, IGMP snooping is disabled in a VLAN.

   For more information about this command, see *IP Multicast Command Reference*.

6. Enable PIM snooping for the VLAN.

   pim-snooping enable

   By default, PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 multicast data interruption caused by the aging of PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives a PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives a PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.
   pim-snooping graceful-restart join-aging-time *seconds*
   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for PIM snooping

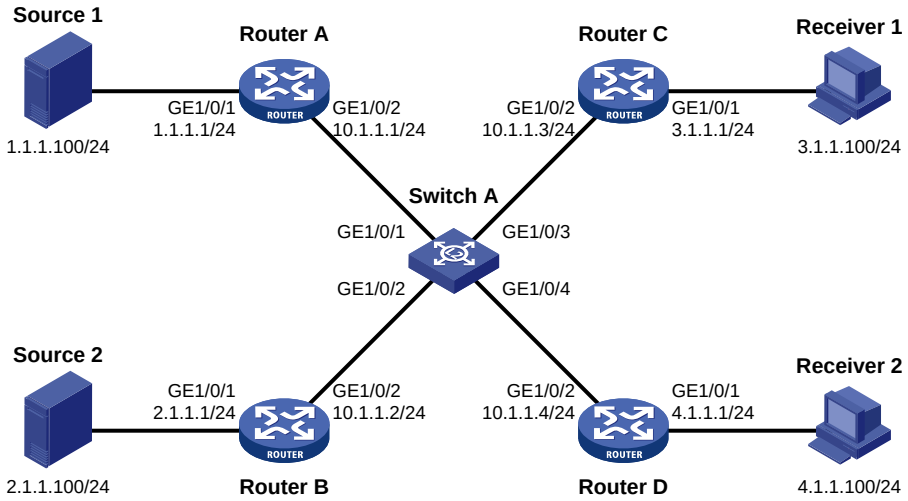
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PIM snooping neighbor information.	**display pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping router port information.	**display pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping routing entries.	**display pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the PIM messages learned through PIM snooping.	**display pim-snooping statistics**
Clear statistics for the PIM messages learned through PIM snooping.	**reset pim-snooping statistics**

PIM snooping configuration examples

Example: Configuring PIM snooping

Network configuration



As shown in Figure 2:

- OSPF runs on the network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Receiver 1 and Receiver 2 belong to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Router C and Router D run IGMP on GigabitEthernet 1/0/1. Router A, Router B, Router C, and Router D run PIM-SM.

- GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure IGMP snooping and PIM snooping on Switch A. Then, Switch A forwards PIM protocol packets and multicast data packets only to the routers that are connected to receivers.

Figure 2 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 2, and configure OSPF on the routers.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <RouterA> system-view
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] pim
   [RouterA-pim] c-bsr 10.1.1.1
   [RouterA-pim] c-rp 10.1.1.1
   [RouterA-pim] quit
   ```

2. Configure Router B:

   # Enable IP multicast routing.

   ```
   <RouterB> system-view
   [RouterB] multicast routing
   [RouterB-mrib] quit
   ```

   # Enable PIM-SM on each interface.

   ```
   [RouterB] interface gigabitethernet 1/0/1
   ```

```
[RouterB-GigabitEthernet1/0/1] pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IP multicast routing.

```
<RouterC> system-view
[RouterC] multicast routing
[RouterC-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] igmp enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IP multicast routing.

```
<RouterD> system-view
[RouterD] multicast routing
[RouterD-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] igmp enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and PIM snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display pim-snooping neighbor vlan 100
```

```
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  10.1.1.1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  10.1.1.2
    Ports (1 in total):
      GE1/0/2                 (00:32:43)
  10.1.1.3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  10.1.1.4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are PIM snooping neighbors.

On Switch A, display PIM snooping routing entries for VLAN 100.

```
[SwitchA] display pim-snooping routing-table vlan 100
Total 2 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Ports (1 in total):
        GE1/0/1
      Downstream Ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, 225.1.1.1)
    Upstream neighbor: 10.1.1.2
      Upstream Ports (1 in total):
        GE1/0/2
      Downstream Ports (1 in total):
        GE1/0/4
          Expires: 00:03:11, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for multicast group 224.1.1.1 only to Router C.
- Switch A will forward the multicast data intended for multicast group 225.1.1.1 only to Router D.

Troubleshooting PIM snooping

PIM snooping does not work on a Layer 2 device

Symptom

PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about IGMP snooping and PIM snooping.
2. If IGMP snooping is not enabled, enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for the VLAN.
3. If PIM snooping is not enabled, enable PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Configuring multicast VLANs

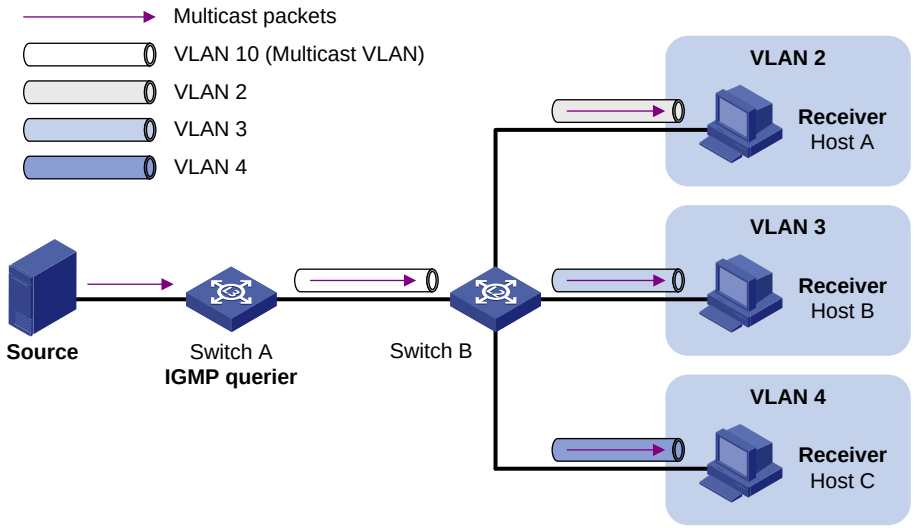
Multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in three different VLANs and the same multicast group. When Switch A (Layer 3 device) receives multicast data for that group, it sends three copies of the multicast data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the multicast VLAN feature

After a multicast VLAN is configured on Switch B, Switch A sends only one copy of the multicast data to the multicast VLAN on Switch B. This method saves network bandwidth and lessens the burden on the Layer 3 device.

Multicast VLAN implementations



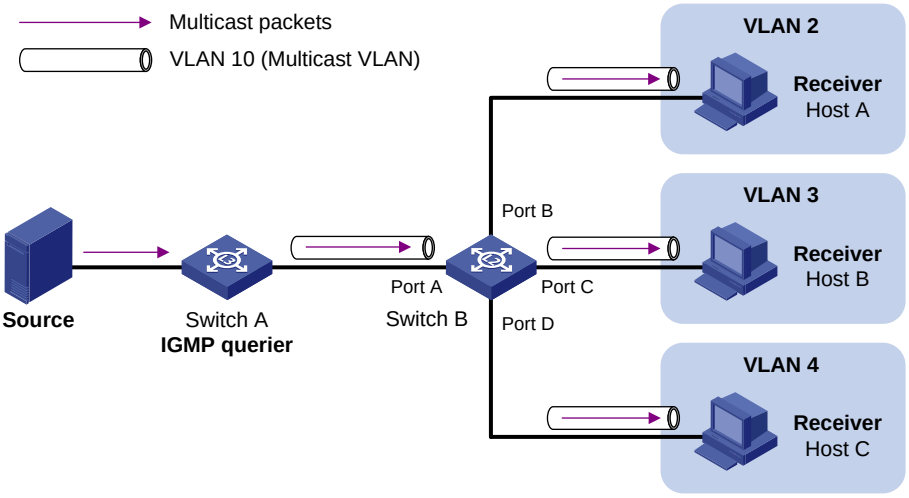
Multicast VLANs include sub-VLAN-based multicast VLANs and port-based multicast VLANs.

Sub-VLAN-based multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



IGMP snooping manages router ports in the multicast VLAN and member ports in each sub-VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN in the multicast VLAN.

Port-based multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. All the user ports are hybrid ports and are assigned to VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and VLAN 2 through VLAN 4.

Figure 3 Port-based multicast VLAN

IGMP snooping manages the router ports and member ports in the multicast VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Switch B sends a separate copy to each user port in the multicast VLAN.

Restrictions and guidelines: Multicast VLAN configuration

The VLAN to be configured as a multicast VLAN must exist.

If you have configured both a sub-VLAN-based multicast VLAN and a port-based multicast VLAN on a device, the port-based multicast VLAN configuration takes effect.

Do not configure a multicast VLAN on a device that is enabled with IP multicast routing. Otherwise, the system displays errors. Do not enable IP multicast routing on a device that is configured with multicast VLANs. Otherwise, multicast forwarding exceptions occur.

Do not configure a VLAN as a multicast VLAN or a multicast sub-VLAN if the VLAN interface is enabled with PIM or IGMP. Otherwise, the system displays errors. Do not enable PIM or IGMP on a VLAN interface if the VLAN interface belongs to a multicast VLAN or a multicast sub-VLAN. Otherwise, multicast forwarding exceptions occur.

The multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the multicast VLAN feature for secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of a multicast VLAN must exist and cannot be multicast VLANs or sub-VLANs of any other multicast VLAN.

Prerequisites

Before you configure a sub-VLAN-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.

   multicast-vlan *vlan-id*

   By default, a VLAN is not a multicast VLAN.
3. Assign VLANs to the multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

Configuring a port-based multicast VLAN

Restrictions and guidelines

You can assign user ports to a multicast VLAN in multicast VLAN view or assign a user port to a multicast VLAN in interface view. These configurations have the same priority.

A user port can belong to only one multicast VLAN.

Prerequisites

Before you configure a port-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN.
- Enable IGMP snooping for all the VLANs that contain multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to a multicast VLAN in multicast VLAN view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign ports to the multicast VLAN.
   port *interface-list*

Assigning user ports to a multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the multicast VLAN.
   port multicast-vlan *vlan-id*
   By default, a port does not belong to any multicast VLAN.

Setting the maximum number of multicast VLAN forwarding entries

About this task

You can set the maximum number of multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.

system-view

2. Set the maximum number of multicast VLAN forwarding entries.
   multicast-vlan entry-limit *limit*
   By default, the maximum number of multicast VLAN forwarding entries is 2000.

Display and maintenance commands for multicast VLAN

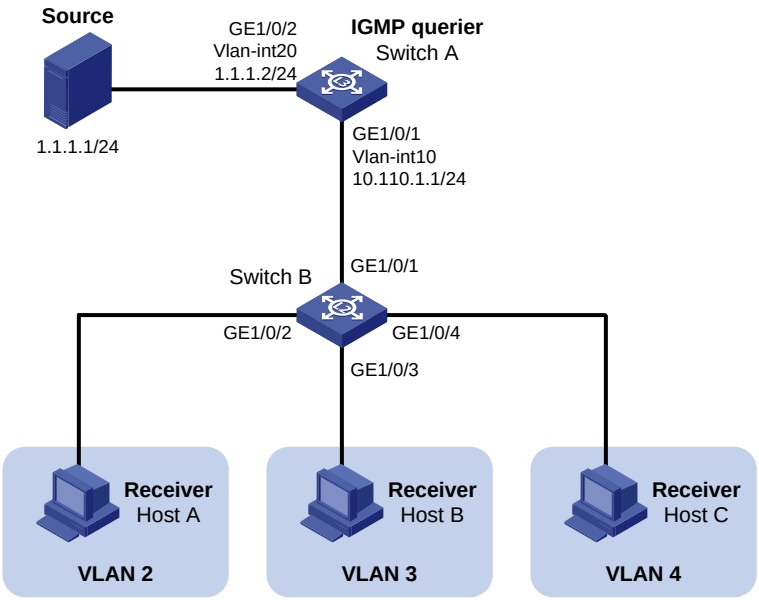
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about multicast VLANs.	**display multicast-vlan** [*vlan-id*]
Display information about multicast VLAN forwarding entries.	**display multicast-vlan forwarding-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about multicast groups in multicast VLANs.	**display multicast-vlan group** [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear multicast groups in multicast VLANs.	**reset multicast-vlan group** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Multicast VLAN configuration examples

Example: Configuring sub-VLAN-based multicast VLAN

Network configuration



As shown in Figure 4:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface20] pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] port link-type hybrid
   [SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
   [SwitchA-GigabitEthernet1/0/1] quit
   ```

   # Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ip address 10.110.1.1 24
   [SwitchA-Vlan-interface10] igmp enable
   [SwitchA-Vlan-interface10] quit
   ```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as a multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] multicast-vlan 10
[SwitchB-mvlan-10] subvlan 2 to 4
[SwitchB-mvlan-10] quit
```

Verifying the configuration

Display information about all multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about multicast groups in multicast VLANs on Switch B.

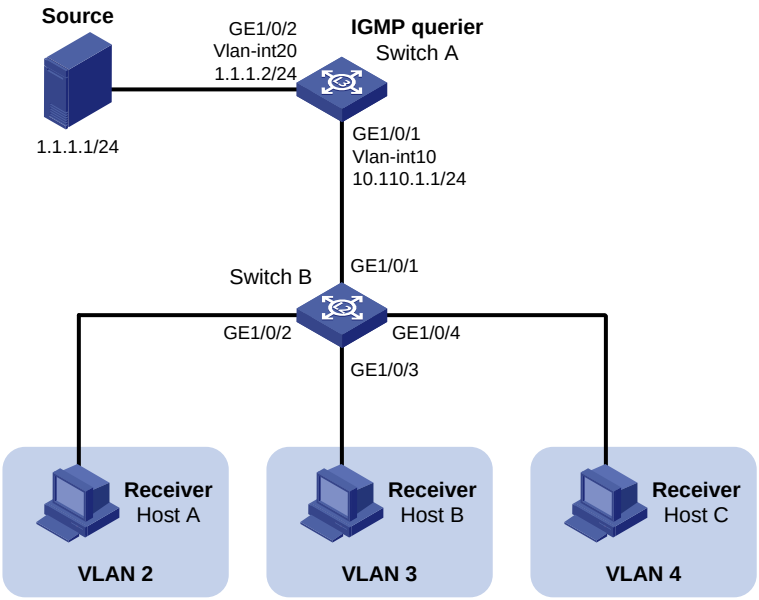
```
[SwitchB] display multicast-vlan group
Total 1 entries.

Multicast VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that multicast group 224.1.1.1 belongs to multicast VLAN 10. Multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based multicast VLAN

Network configuration



As shown in Figure 5:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.1.2 24
[SwitchA-Vlan-interface20] pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as a multicast VLAN.

```
[SwitchB] multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic IGMP snooping forwarding entries on Switch B.

```
[SwitchB] display igmp-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(0.0.0.0, 224.1.1.1)
  Host ports (3 in total):
    GE1/0/2        (00:03:23)
    GE1/0/3        (00:04:07)
    GE1/0/4        (00:04:16)
```

The output shows that IGMP snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the multicast data of VLAN 10 through these user ports.

Configuring multicast routing and forwarding

About multicast routing and forwarding

Each multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the multicast routing protocols and statically configured multicast routing entries are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general multicast routing table. The optimal multicast routing entries in the general multicast routing table are added to the multicast forwarding table to guide multicast data forwarding.

RPF check mechanism

A multicast routing protocol uses reverse path forwarding (RPF) check to ensure the multicast data delivery along the correct path and to avoid data loops.

RPF check process

A multicast device performs the RPF check on a multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the unicast and static multicast routing tables.

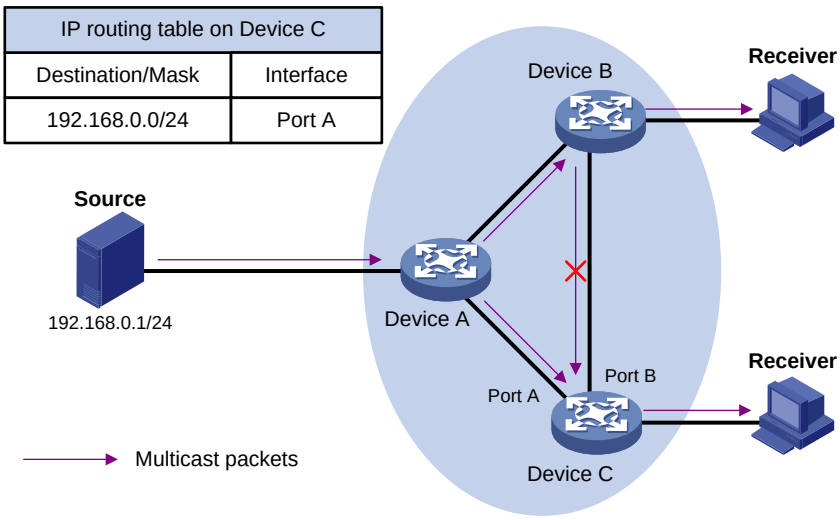
   The term "packet source" means different things in different situations:

   - For a packet that travels along the SPT, the packet source is the multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "PIM overview."
2. Selects one of the three optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with the highest subnet mask becomes the RPF route. If the routes have the same mask, the route with the highest route preference becomes the RPF route. If the routes have the same route preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with the highest route preference becomes the RPF route. If the routes have the same preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

   The RPF route contains the RPF interface and RPF neighbor information.
   - If the RPF route is a unicast route route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
   - If the RPF route is a static multicast route, the RPF interface and RPF neighbor are specified in the route.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.



- If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in multicast

Implementing an RPF check on each received multicast packet brings a big burden to the device. The use of a multicast forwarding table is the solution to this issue. When the device creates a multicast forwarding entry for an (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up the multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source and the RPF interface. Then, it creates a forwarding entry with the RPF interface as the incoming interface and makes the following judgments:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all the outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all the outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following actions:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

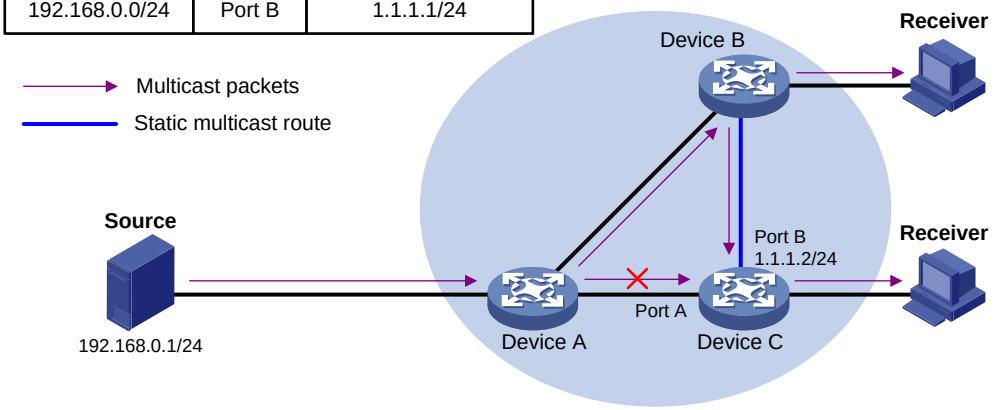
Figure 1 RPF check process

As shown in Figure 1, assume that unicast routes are available on the network, and no static multicast routes have been configured on Device C. Multicast packets travel along the SPT from the multicast source to the receivers. The multicast forwarding table on Device C contains the (S, G) entry, with Port A as the incoming interface.

- If a multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.

- If a multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its unicast routing table and finds that the outgoing interface to the source (the RPF interface) is Port A. In this case, the (S, G) entry is correct, but the packet traveled along a wrong path. The packet fails the RPF check and Device C discards the packet.

Usages of static multicast routes



A static multicast route can change an RPF route or create an RPF route.

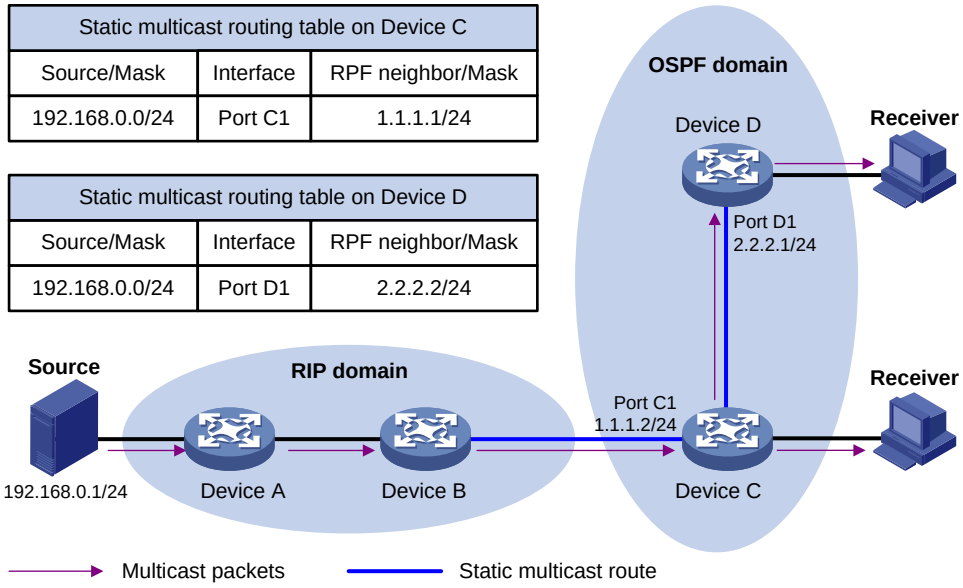
Changing an RPF route

Typically, the topology structure of a multicast network is the same as that of a unicast network, and multicast traffic follows the same transmission path as unicast traffic does. You can configure a static multicast route for a multicast source to change the RPF route. As a result, the device creates a transmission path for multicast traffic that is different from the transmission path for unicast traffic.

Figure 2 Changing an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port B	1.1.1.1/24

As shown in Figure 2, when no static multicast route is configured, Device C's RPF neighbor on the path back to the source is Device A. The multicast data from the source travels through Device A to Device C. You can configure a static multicast route on Device C and specify Device B as Device C's RPF neighbor on the path back to the source. The multicast data from the source travels along the path: Device A to Device B and then to Device C.



Creating an RPF route

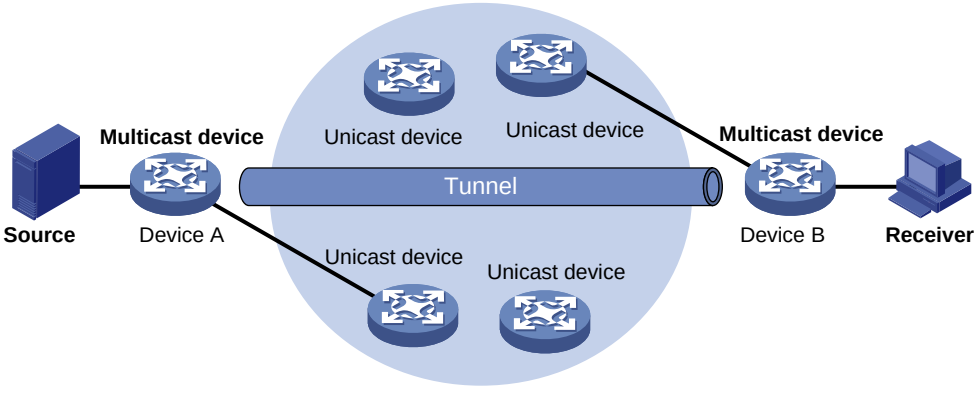
When a unicast route is blocked, multicast forwarding might be stopped due to lack of an RPF route. You can configure a static multicast route to create an RPF route. In this way, a multicast routing entry is created to guide multicast forwarding.

Figure 3 Creating an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port C1	1.1.1.1/24

Static multicast routing table on Device D		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port D1	2.2.2.2/24

As shown in Figure 3, the RIP domain and the OSPF domain are unicast isolated from each other. For the receiver hosts in the OSPF domain to receive multicast packets from the multicast source in the RIP domain, you must configure Device C and Device D as follows:



- On Device C, configure a static multicast route for the multicast source and specify Device B as the RPF neighbor.
- On Device D, configure a static multicast route for the multicast source and specify Device C as the RPF neighbor.

Multicast forwarding across unicast subnets

Multicast data transmission over a 6to4 tunnel is not supported in the current software version.

Devices forward the multicast data from a multicast source hop by hop along the forwarding tree, but some devices might not support multicast protocols in a network. When the multicast data is forwarded to a device that does not support IP multicast, the forwarding path is blocked. In this case, you can enable multicast forwarding across two unicast subnets by establishing a tunnel between the devices at the edges of the two unicast subnets.

Figure 4 Multicast data transmission through a tunnel

As shown in Figure 4, a tunnel is established between Device A and Device B. Device A encapsulates the multicast data in unicast IP packets, and forwards them to Device B across the

tunnel through unicast devices. Then, Device B strips off the unicast IP header and continues to forward the multicast data to the receiver.

To use this tunnel only for multicast traffic, configure the tunnel as the outgoing interface only for multicast routes.

Mtrace

Mtrace is a traceroute facility used to trace the path along which multicast group data travels from a source to a destination.

Device roles

Mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has a multicast-enabled interface on the same subnet as the destination and can forward specific multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the multicast source.
- **Client**—A client is a router that initiates an mtrace.

Process

The mtrace process is as follows:

1. The client sends an mtrace Query message (with a **hops** field indicating the maximum number of hops to trace) to the destination.
2. The LHR turns the received Query message to an mtrace Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

   If the client does not receive a Reply message within the waiting time, the client initiates a hop-by-hop trace to determine which device on the path encountered an error. It sends a Query message with the **hops** field set to 1 and waits for a Reply message. If it does not receive a Reply message within the waiting time, the client determines that this hop encountered an error. If the client receives a Reply message within the waiting time, it sends a Query message with the **hops** field value increased by 1 and waits for a Reply message. This process continues until the client does not receive a Reply message within the waiting time any more.

Restrictions and guidelines: Multicast routing and forwarding configuration

The device can route and forward multicast data only through the primary IP addresses of interfaces, rather than their secondary addresses or unnumbered IP addresses. For more information about primary and secondary IP addresses, and IP unnumbered, see *Layer 3—IP Services Configuration Guide*.

Multicast routing and forwarding tasks at a glance

To configure multicast routing and forwarding, perform the following tasks:

1. Enabling IP multicast routing
2. (Optional.) Configuring static multicast routes

3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring multicast load splitting
5. (Optional.) Configuring a multicast forwarding boundary
6. (Optional.) Using mtrace to trace a multicast path
7. (Optional.) Setting the maximum number of cached unknown multicast packets

Prerequisites for multicast routing and forwarding

Before you configure multicast routing and forwarding, configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IP multicast routing

About this task

Enable IP multicast routing before you configure any Layer 3 multicast functionality on the public network or VPN instance.

Procedure

1. Enter system view.

   system-view
2. Enable IP multicast routing and enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

   By default, IP multicast routing is disabled.

Configuring static multicast routes

About this task

To configure a static multicast route for a multicast source, you can specify an RPF interface or an RPF neighbor for the multicast traffic from that source.

Restrictions and guidelines

Static multicast routes take effect only on the multicast devices on which they are configured, and will not be advertised throughout the network or redistributed to other devices.

Procedure

1. Enter system view.

   system-view
2. Configure a static multicast route.

   ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]
3. (Optional.) Delete all static multicast routes.

   delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

   You can use the **undo ip rpf-route-static** command to delete a specific static multicast route or use the **delete ip rpf-route-static** command to delete all static multicast routes.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Specify the longest prefix match principle.
   longest-match
   By default, the route preference principle is used.

Configuring multicast load splitting

About this task

You can enable the device to split multiple data flows on a per-source basis or on a per-source-and-group basis. This optimizes the traffic delivery.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Configure multicast load splitting.
   load-splitting { **source** | **source-group** }
   By default, multicast load splitting is disabled.

Configuring a multicast forwarding boundary

About this task

You can configure an interface as a multicast forwarding boundary for a multicast group range. The interface cannot receive or forward multicast packets for the group range.

Restrictions and guidelines

You do not need to enable IP multicast before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a multicast forwarding boundary for a multicast group range.
   multicast boundary *group-address* { *mask-length* | *mask* }

By default, an interface is not a multicast forwarding boundary.

Using mtrace to trace a multicast path

Using mtrace1 to trace a multicast path

To use mtrace version 1 (mtrace1) to trace a multicast path, execute the following command in any view:

mtrace [**v1**] [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address*] [**verbose**]

Using mtrace2 to trace a multicast path

Restrictions and guidelines

For successful mtrace, do not specify a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Specify the UDP port number used by mtrace.

   mtrace-service port *number*

   By default, mtrace uses UDP port number 10240.

3. Use mtrace version 2 (mtrace2) to trace a multicast path.

   mtrace v2 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]

   Execute this command in any view.

   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown multicast packets

About this task

The device caches a multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **multicast forwarding-table cache-unknown total** command to be far greater than the value in the **multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of unknown multicast packets that can be cached for an (S, G) entry.
   multicast forwarding-table cache-unknown per-entry *per-entry-limit*
   By default, the device can cache only one unknown multicast packet for an (S, G) entry.
3. Set the maximum number of unknown multicast packets that can be cached in total.
   multicast forwarding-table cache-unknown total *total-limit*
   By default, the device can cache 1024 unknown multicast packets in total.

Display and maintenance commands for multicast routing and forwarding

CAUTION:
The **reset** commands might cause multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display multicast hardware resource mode information.	**display hardware-resource** [**mcast**]
Display information about the interfaces maintained by the MRIB.	**display mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display multicast boundary information.	**display multicast** [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]
Display multicast fast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*source-address* | *group-address*] * [**slot** *slot-number*]
Display statistics for multicast forwarding events.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display multicast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *
Display multicast routing entries.	**display multicast** [**vpn-instance**

Task	Command
	vpn-instance-name] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]
Display RPF information for a multicast source.	**display multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]
Clear multicast fast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for multicast forwarding events.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear multicast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear multicast routing entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* } * | **all** }

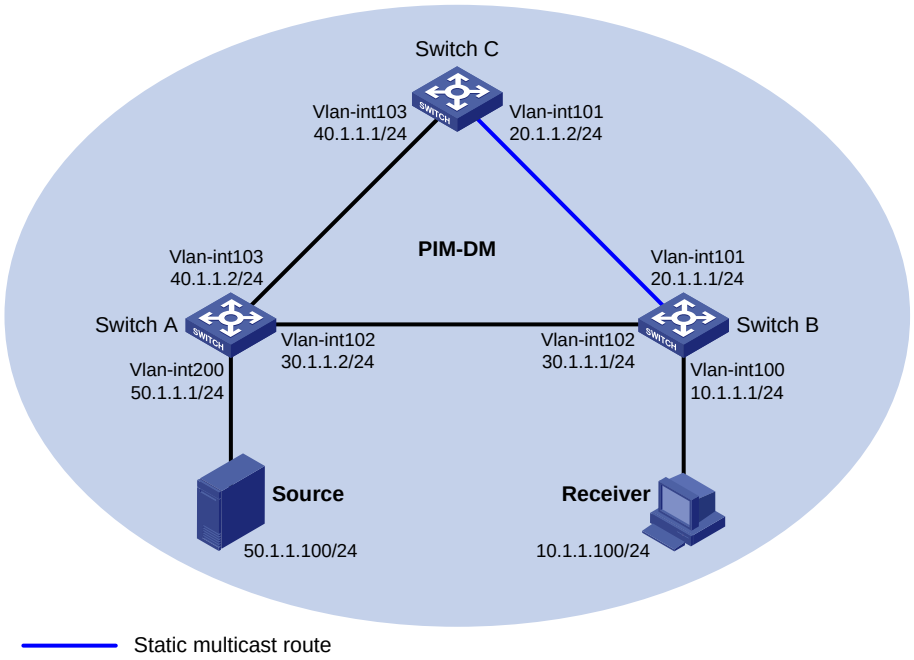
NOTE:

- When you clear a multicast routing entry, the associated multicast forwarding entry is also cleared.
- When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Multicast routing and forwarding configuration examples

Example: Changing an RPF route

Network configuration



As shown in Figure 5:

- PIM-DM runs on the network.

- All switches on the network support multicast.
- Switch A, Switch B and Switch C run OSPF.
- Typically, the receiver host can receive the multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the multicast data from the source travels to the receiver through the path: Switch A to Switch C to Switch B. This is different from the unicast route.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 5, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable PIM-DM on other interfaces.

   ```
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] pim dm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] pim dm
   [SwitchB-Vlan-interface102] quit
   ```

   # On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim dm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing and PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. Configure a static multicast route on Switch B and specify Switch C as its RPF neighbor on the route to the source.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 20.1.1.2
```

Verifying the configuration

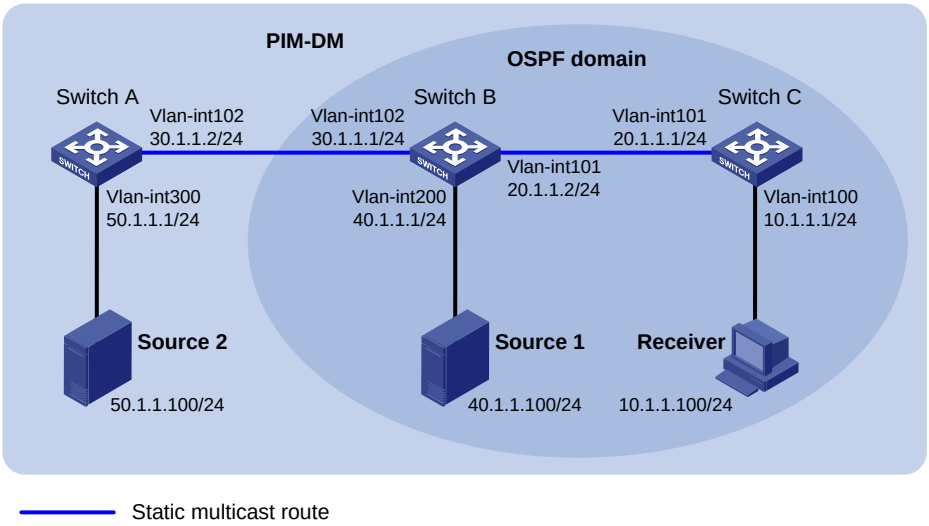
Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route



Network configuration

As shown in Figure 6:

- PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPF, and have no unicast routes to Switch A.
- Typically, the receiver host receives the multicast data from Source 1 in the OSPF domain.

Configure the switches so that the receiver host receives multicast data from Source 2, which is outside the OSPF domain.

Figure 6 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 6, and configure OSPF on Switch B and Switch C.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch C, enable IP multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] multicast routing
   [SwitchC-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] igmp enable
   [SwitchC-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] pim dm
   [SwitchC-Vlan-interface101] quit
   ```

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] pim dm
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing and PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display multicast rpf-info 50.1.1.100
[SwitchC] display multicast rpf-info 50.1.1.100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B or Switch C.

3. Configure a static multicast route:

Configure a static multicast route on Switch B and specify Switch A as its RPF neighbor on the route to Source 2.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 30.1.1.2
```

Configure a static multicast route on Switch C and specify Switch B as its RPF neighbor on the route to Source 2.

```
[SwitchC] ip rpf-route-static 10.1.1.0 24 20.1.1.2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

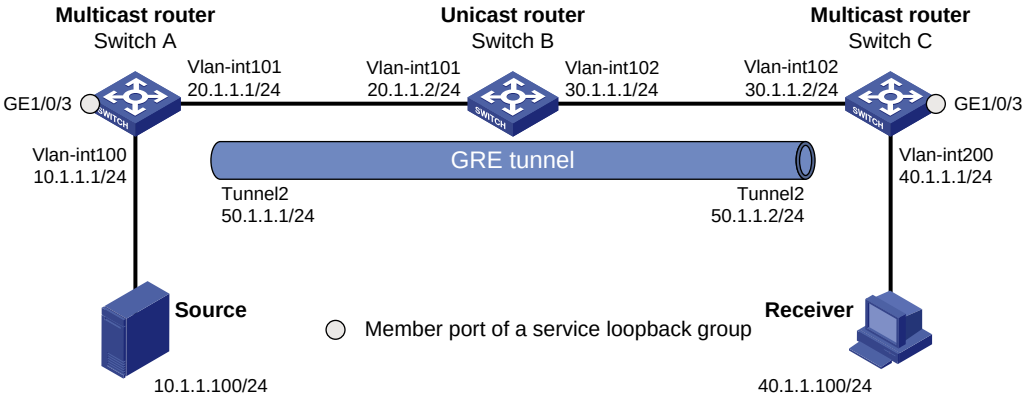
```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. The routes are the configured static routes.

Example: Configuring multicast forwarding over a GRE tunnel



Network configuration

As shown in Figure 7:

- Multicast routing and PIM-DM are enabled on Switch A and Switch C.
- Switch B does not support multicast.
- Switch A, Switch B, and Switch C run OSPF.

Configure the switches so that the receiver host can receive the multicast data from the source.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 7, and configure OSPF on all switches.

Procedure

1. Configure a GRE tunnel:

   # Create a GRE tunnel interface Tunnel 2, and specify the tunnel mode as GRE/IPv4.

   ```
   [SwitchA] interface tunnel 2 mode gre
   ```

   # Assign an IP address to interface Tunnel 2, and specify its source and destination addresses.

   ```
   [SwitchA-Tunnel2] ip address 50.1.1.1 24
   [SwitchA-Tunnel2] source 20.1.1.1
   [SwitchA-Tunnel2] destination 30.1.1.2
   [SwitchA-Tunnel2] quit
   ```

   # Create a GRE tunnel interface Tunnel 2, and specify the tunnel mode as GRE/IPv4.

   ```
   [SwitchC] interface tunnel 2 mode gre
   ```

   # Assign an IP address for interface Tunnel 2, and specify its source and destination addresses.

   ```
   [SwitchC-Tunnel2] ip address 50.1.1.2 24
   [SwitchC-Tunnel2] source 30.1.1.2
   [SwitchC-Tunnel2] destination 20.1.1.1
   [SwitchC-Tunnel2] quit
   ```

2. Enable IP multicast routing, PIM-DM, and IGMP:

   # On Switch A, enable multicast routing.

   ```
   [SwitchA] multicast routing
   ```

```
[SwitchA-mrib] quit
```

Enable PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim dm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim dm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface tunnel 2
[SwitchA-Tunnel2] pim dm
[SwitchA-Tunnel2] quit
```

On Switch C, enable multicast routing.

```
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on the receiver-side interface VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 102.

```
[SwitchC] interface vlan-interface 102
[SwitchC-Vlan-interface102] pim dm
[SwitchC-Vlan-interface102] quit
```

Enable PIM-DM on Tunnel 2.

```
[SwitchC] interface tunnel 2
[SwitchC-Tunnel2] pim dm
[SwitchC-Tunnel2] quit
```

3. On Switch C, configure a static multicast route to the source and specify Switch A as the RPF neighbor.

```
[SwitchC] ip rpf-route-static 50.1.1.0 24 50.1.1.1
```

Verifying the configuration

Send an IGMP report from Receiver to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from the source to multicast group 225.1.1.1. (Details not shown.)

Display PIM routing entries on Switch C.

```
[SwitchC] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface200
             Protocol: igmp, UpTime: 00:04:25, Expires: -
```

```
(10.1.1.100, 225.1.1.1)
    Protocol: pim-dm, Flag: ACT
    UpTime: 00:06:14
    Upstream interface: Tunnel2
        Upstream neighbor: 50.1.1.1
        RPF prime neighbor: 50.1.1.1
    Downstream interface(s) information:
    Total number of downstreams: 1
        1: Vlan-interface200
            Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

The output shows that Switch A is the RPF neighbor of Switch C and the multicast data from Switch A is delivered over the GRE tunnel to Switch C.

Troubleshooting multicast routing and forwarding

Static multicast route failure

Symptom

No dynamic routing protocol is enabled on the device, and the physical status and link layer status of interfaces are both up, but the static multicast route fails.

Solution

To resolve the problem:

1. Use the **`display multicast routing-table static`** command to display information about static multicast routes. Verify that the static multicast route has been correctly configured and that the route entry exists in the static multicast routing table.
2. Check the type of interface that connects the static multicast route to the RPF neighbor. If the interface is not a point-to-point interface, be sure to specify the address for the RPF neighbor.
3. If the problem persists, contact H3C Support.

Configuring IGMP

About IGMP

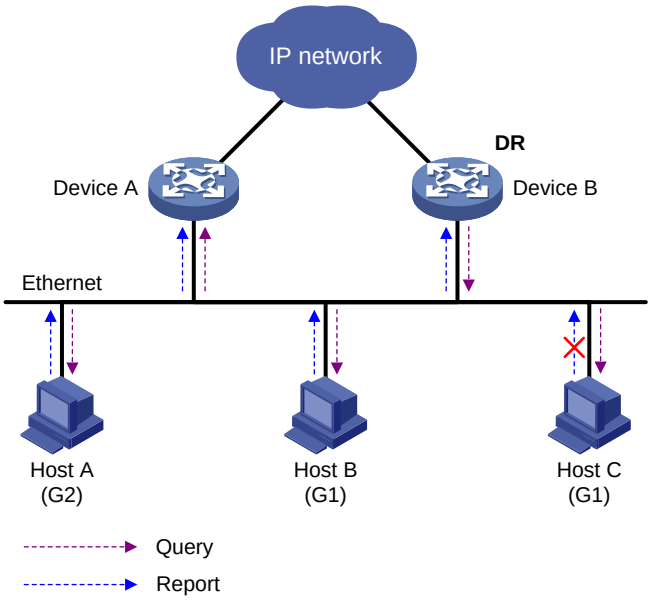
Internet Group Management Protocol (IGMP) establishes and maintains the multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

IGMP versions

IGMP has the following versions:

- IGMPv1 (defined by RFC 1112).
- IGMPv2 (defined by RFC 2236).
- IGMPv3 (defined by RFC 3376).

All IGMP versions support the ASM model. IGMPv3 can directly implement the SSM model. IGMPv1 and IGMPv2 must work with the IGMP SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."



IGMPv1 overview

IGMPv1 manages multicast group memberships based on the query and response mechanism.

All devices that run IGMP on the same subnet can get IGMP membership report messages (called reports) from hosts. However, only one device can act as the IGMP querier to send IGMP query messages (called queries). The querier election mechanism determines which device acts as the IGMP querier on the subnet.

In IGMPv1, the DR elected by the multicast routing protocol (such as PIM) acts as the IGMP querier. For more information about DR, see "PIM overview."

Figure 1 IGMP queries and reports

As shown in Figure 1, Host B and Host C are interested in the multicast data addressed to the multicast group G1. Host A is interested in the multicast data addressed to G2. The following process

describes how the hosts join the multicast groups and how the IGMP querier (Device B in Figure 1) maintains the multicast group memberships:

1. The hosts send unsolicited IGMP reports to the multicast groups they want to join without having to wait for the IGMP queries.
2. The IGMP querier periodically multicasts IGMP queries (with the destination address of 224.0.0.1) to all hosts and devices on the local subnet.
3. After receiving a query message, the host whose report delay timer expires first sends an IGMP report to multicast group G1 to announce its membership for G1. In this example, Host B sends the report message. After receiving the report from Host B, Host C suppresses its own report for G1.

   Because IGMP devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host IGMP report suppression, helps reduce traffic on the local subnet.
4. At the same time, Host A sends a report to the multicast group G2 after receiving a query.
5. Through the query and response process, the IGMP devices (Device A and Device B) determine that the local subnet has members of G1 and G2. The multicast routing protocol (PIM, for example) on the devices generates (*, G1) and (*, G2) multicast forwarding entries, where asterisk (*) represents any multicast source. These entries are the basis for subsequent multicast forwarding.
6. When the multicast data addressed to G1 or G2 reaches an IGMP device, the device looks up the multicast forwarding table. Based on the (*, G1) or (*, G2) entries, the device forwards the multicast data to the local subnet. Then, the receivers on the subnet can receive the data.

IGMPv1 does not define a leave group message (often called a leave message). When an IGMPv1 host is leaving a multicast group, it stops sending reports to that multicast group. If the subnet has no members for a multicast group, the IGMP devices will not receive any report addressed to that multicast group. In this case, the devices clear the information for that multicast group after a period of time.

IGMPv2 enhancements

Backwards-compatible with IGMPv1, IGMPv2 has introduced a querier election mechanism and a leave-group mechanism.

Querier election mechanism

In IGMPv1, the DR elected by the Layer 3 multicast routing protocol (such as PIM) acts as the querier.

IGMPv2 introduced an independent querier election mechanism. The querier election process is as follows:

1. Initially, every IGMPv2 device assumes itself to be the querier. Each device sends IGMP general query messages (called general queries) to all hosts and devices on the local subnet. The destination address is 224.0.0.1.
2. After receiving a general query, every IGMPv2 device compares the source IP address of the query with its own interface address. The device with the lowest IP address becomes the querier. All the other IGMPv2 devices become non-queriers.
3. All the non-queriers start the other querier present timer. If a device receives an IGMP query from the querier before the timer expires, it resets this timer. Otherwise, the device considers that the querier has timed out. In this case, the device initiates a new querier election process.

"Leave group" mechanism

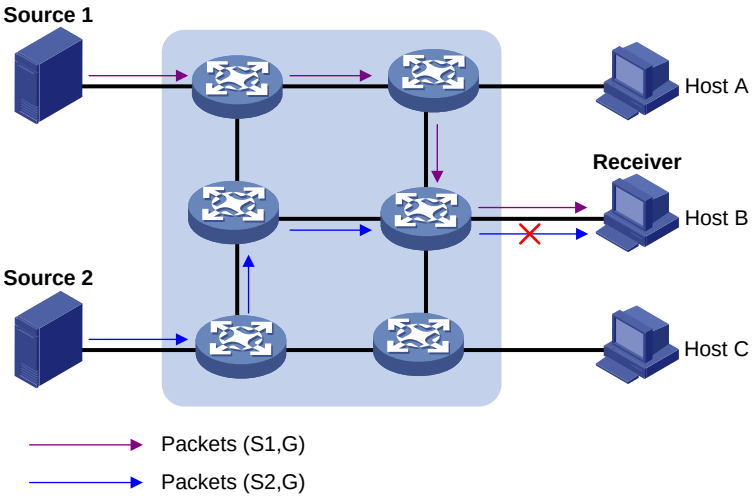
In IGMPv1, when a host leaves a multicast group, it does not send any notification to the multicast devices. The multicast devices determine whether a group has members by using the maximum response time. This adds to the leave latency.

In IGMPv2, when a host is leaving a multicast group, the following process occurs:

1. The host sends a leave message to all devices on the local subnet. The destination address of leave messages is 224.0.0.2.
2. After receiving the leave message, the querier sends a configurable number of IGMP group-specific queries to the group that the host is leaving. Both the destination address field and the group address field of the message are the address of the multicast group that is being queried.
3. One of the remaining members (if any on the subnet) in the group should send a report within the maximum response time advertised in the group-specific queries.
4. If the querier receives a report for the group before the maximum response timer expires, it maintains the memberships for the group. Otherwise, the querier assumes that the local subnet has no member hosts for the group and stops maintaining the memberships for the group.

IGMPv3 enhancements

IGMPv3 is based on and is compatible with IGMPv1 and IGMPv2. It enhances the control capabilities of hosts and the query and report capabilities of IGMP devices.



Enhancements in control capability of hosts

IGMPv3 introduced two source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified multicast sources. When a host joins a multicast group, one of the following occurs:

- If the host expects to receive multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host expects to reject multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two multicast sources: Source 1 (S1) and Source 2 (S2). Both of these sources can send multicast data to the multicast group G. Host B wants to receive the multicast data addressed to G from Source 1 but not from Source 2.

Figure 2 Flow paths of source-and-group-specific multicast traffic

In IGMPv1 or IGMPv2, Host B cannot select multicast sources when it joins the multicast group G. The multicast streams from both Source 1 and Source 2 flow to Host B whether or not it needs them.

In IGMPv3, Host B can explicitly express that it needs to receive multicast data destined to the multicast group G from Source 1 but not from Source 2.

Enhancements in query and report capabilities

IGMPv3 introduces IGMP group-and-source queries and IGMP reports carrying group records.

- Query message carrying the source addresses

  IGMPv3 is compatible with IGMPv1 and IGMPv2 and supports IGMP general queries and IGMP group-specific queries. It also introduces IGMP group-and-source-specific queries.

  - A general query does not carry a group address or a source address.
  - A group-specific query carries a group address, but no source address.
  - A group-and-source-specific query carries a group address and one or more source addresses.

- Reports containing multiple group records

  Unlike an IGMPv1 or IGMPv2 report, an IGMPv3 report is destined to 224.0.0.22 and contains one or more group records. Each group record contains a multicast group address and a multicast source address list.

  Group records include the following categories:

  - **IS_IN**—The current filtering mode is Include. The report sender requests the multicast data only from the sources specified in the Source Address field.
  - **IS_EX**—The current filtering mode is Exclude. The report sender requests the multicast data from any sources except those specified in the Source Address field.
  - **TO_IN**—The filtering mode has changed from Exclude to Include.
  - **TO_EX**—The filtering mode has changed from Include to Exclude.
  - **ALLOW**—The Source Address field contains a list of additional sources from which the receiver wants to obtain data. If the current filtering mode is Include, these sources are added to the multicast source list. If the current filtering mode is Exclude, these sources are deleted from the multicast source list.
  - **BLOCK**—The Source Address field contains a list of the sources from which the receiver no longer wants to obtain data. If the current filtering mode is Include, these sources are deleted from the multicast source list. If the current filtering mode is Exclude, these sources are added to the multicast source list.

IGMP SSM mapping

An IGMPv3 host can explicitly specify multicast sources in its IGMPv3 reports. From the reports, the IGMP device can obtain the multicast source addresses and directly provide the SSM service. However, an IGMPv1 or IGMPv2 host cannot specify multicast sources in its IGMPv1 or IGMPv2 reports.

The IGMP SSM mapping feature enables the IGMP device to provide SSM support for IGMPv1 or IGMPv2 hosts. The device translates (*, G) in IGMPv1 or IGMPv2 reports into (G, INCLUDE, (S1, S2...)) based on the configured IGMP SSM mappings.

Figure 3 IGMP SSM mapping

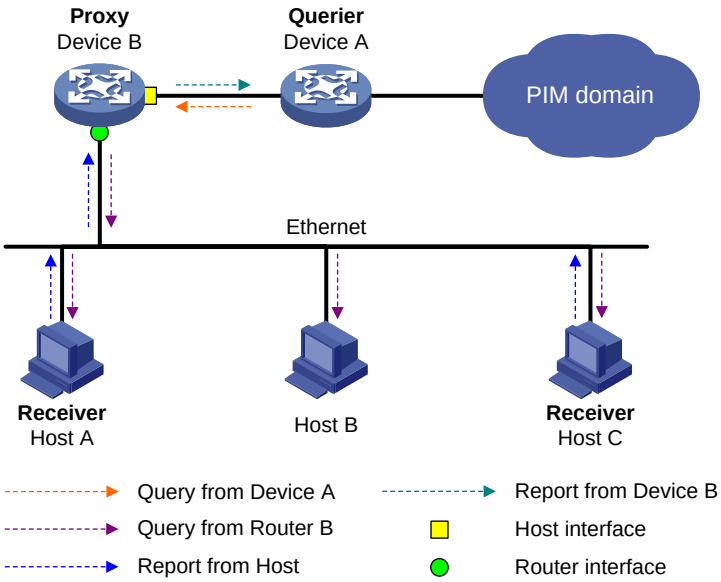
As shown in Figure 3, on an SSM network, Host A, Host B, and Host C run IGMPv1, IGMPv2, and IGMPv3, respectively. To provide the SSM service for Host A and Host B, you must configure the IGMP SSM mapping feature on Device A.

After IGMP SSM mappings are configured, Device A checks the multicast group address G in the received IGMPv1 or IGMPv2 report, and performs the following operations:

- If G is not in the SSM group range, Device A provides the ASM service.
- If G is in the SSM group range but does not match any IGMP SSM mapping, Device A drops the report.
- If G is in the SSM group range and matches IGMP SSM mappings, Device A translates (*, G) in the report into (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The IGMP SSM mapping feature does not process IGMPv3 reports.



For more information about SSM group ranges, see "PIM overview" and "Configuring PIM."

IGMP proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to run multicast routing protocols, such as PIM, on edge devices. Instead, you can configure IGMP proxying on these devices. With IGMP proxying configured, the edge device acts as an IGMP proxy:

- For the upstream IGMP querier, the IGMP proxy device acts as a host.
- For the downstream receiver hosts, the IGMP proxy device acts as an IGMP querier.

Figure 4 IGMP proxying

The following types of interfaces are defined in IGMP proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running IGMP. IGMP proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running IGMP. IGMP must be configured on this interface.

An IGMP proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or send join/leave messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received IGMP reports.

IGMP support for VPNs

IGMP maintains group memberships on a per-interface basis. After receiving an IGMP message on an interface, IGMP processes the packet within the VPN to which the interface belongs. IGMP only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 1112, *Host Extensions for IP Multicasting*
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 3376, *Internet Group Management Protocol, Version 3*

IGMP tasks at a glance

To configure IGMP, perform the following tasks:

1. Enabling IGMP
2. (Optional.) Configuring basic IGMP features
   - Specifying an IGMP version
   - Configuring a static group member
   - Configuring a multicast group policy
3. (Optional.) Adjusting IGMP performance
   - Configuring IGMP query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring IGMP SSM mappings
5. (Optional.) Configuring IGMP proxying
   - Enabling IGMP proxying
   - Enabling multicast forwarding on a non-querier interface
   - Configuring multicast load splitting for IGMP proxy interfaces
6. (Optional.) Enabling IGMP NSR
7. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets

Prerequisites for IGMP

Before you configure IGMP, you must configure any unicast routing protocol so that all devices can interoperate at the network layer.

Enabling IGMP

Restrictions and guidelines

Enable IGMP on interfaces where the multicast group memberships are established and maintained.

For IGMP to take effect on an interface, you must configure the primary IP address for the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable IGMP.
   `igmp enable`
   By default, IGMP is disabled.

Configuring basic IGMP features

Specifying an IGMP version

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IGMP version on the interface.
   igmp version *version-number*
   By default, the IGMP version on an interface is IGMPv2.

CAUTION:
For IGMP to operate correctly, specify the same IGMP version for all devices on the same subnet.

Configuring a static group member

About this task

You can configure an interface as a static group member of a multicast group. Then, the interface can always receive multicast data addressed to the specified multicast group.

A static group member does not respond to IGMP queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited IGMP report or leave message.

Restrictions and guidelines

The interface to be configured as a static group member has the following restrictions:

- If the interface is IGMP and PIM-SM enabled, it must be a PIM-SM DR.
- If the interface is IGMP enabled but not PIM-SM enabled, it must be an IGMP querier.

For more information about PIM-SM and DR, see "PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a static group member.
   igmp static-group *group-address* [**source** *source-address*]

Configuring a multicast group policy

About this task

This feature enables an interface to filter IGMP reports by using an ACL that specifies multicast groups and the optional sources. It is used to control the multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send IGMP reports.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a multicast group policy.
   igmp group-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* } [*version-number*]

Adjusting IGMP performance

Configuring IGMP query and response parameters

About this task

The following are IGMP query and response parameters:

- **IGMP querier's robustness variable**—Number of times for retransmitting IGMP queries in case of packet loss. A higher robustness variable makes the IGMP querier more robust, but increases the timeout time for multicast groups.
- **IGMP startup query interval**—Interval at which an IGMP querier sends IGMP general queries at startup.
- **IGMP startup query count**—Number of IGMP general queries that an IGMP querier sends at startup.
- **IGMP general query interval**—Interval at which an IGMP querier sends IGMP general queries to check for multicast group members on the network.
- **IGMP last member query interval**—In IGMPv2, it sets the interval at which a querier sends group-specific queries after receiving a leave message. In IGMPv3, it sets the interval at which a querier sends group-and-source-specific queries after receiving a report that changes multicast source and group mappings.
- **IGMP last member query count**—In IGMPv2, it sets the number of group-specific queries that a querier sends after receiving a leave message. In IGMPv3, it sets the number of group-and-source-specific queries that a querier sends after receiving a report that changes multicast source and group mappings.
- **IGMP maximum response time**—Maximum time before a receiver responds with a report to an IGMP general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the IGMP query. When the timer value for a group decreases to 0, the receiver sends an IGMP report to the group.
- **IGMP other querier present timer**—Lifetime for an IGMP querier after a non-querier receives an IGMP general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

To avoid frequent IGMP querier changes, set the IGMP other querier present timer greater than the IGMP general query interval. In addition, configure the same IGMP other querier present timer for all IGMP devices on the same subnet.

To avoid mistakenly deleting multicast receivers, set the IGMP general query interval greater than the maximum response time for IGMP general queries.

To speed up the response to IGMP queries and avoid simultaneous timer expirations that cause IGMP report traffic bursts, set an appropriate maximum response time.

- For IGMP general queries, the maximum response time is set by the **max-response-time** command.
- For IGMP group-specific queries and IGMP group-and-source-specific queries, the maximum response time equals the IGMP last member query interval.

The following configurations take effect only on the devices that run IGMPv2 and IGMPv3:

- Maximum response time for IGMP general queries.
- IGMP last member query interval.
- IGMP last member query count.
- IGMP other querier present interval.

You can configure the IGMP query and response parameters globally for all interfaces in IGMP view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the IGMP query and response parameters globally

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the IGMP querier's robustness variable.
   robust-count *count*
   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.
   startup-query-interval *interval*
   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.
   startup-query-count *count*
   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.
   query-interval *interval*
   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.
   last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.
   last-member-query-count *count*
   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.
   max-response-time *time*
   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.
    other-querier-present-interval *interval*

By default, the IGMP other querier present timer is calculated by using the following formula: [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Configuring the IGMP query and response parameters on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the IGMP querier's robustness variable.

   igmp robust-count *count*

   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.

   igmp startup-query-interval *interval*

   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.

   igmp startup-query-count *count*

   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.

   igmp query-interval *interval*

   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.

   igmp last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.

   igmp last-member-query-count *count*

   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.

   igmp max-response-time *time*

   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.

    igmp other-querier-present-interval *interval*

    By default, the IGMP other querier present timer is calculated by using the following formula: [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an IGMP querier to send leave notifications to the upstream without sending group-specific or group-and-source-specific queries after receiving a leave message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Restrictions and guidelines

The fast-leave processing configuration takes effect only when the device runs IGMPv2 or IGMPv3.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   igmp fast-leave [**group-policy** *ipv4-acl-number*]
   By default, fast-leave processing is disabled.

Configuring IGMP SSM mappings

About this task

This feature enables the device to provide SSM services for IGMPv1 or IGMPv2 hosts.

Restrictions and guidelines

This feature does not process IGMPv3 messages. Enable IGMPv3 on the receiver-side interface to ensure that IGMPv3 reports can be processed..

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Configure an IGMP SSM mapping.
   ssm-mapping *source-address* { *ipv4-acl-number* | **name** *ipv4-acl-name* }

Configuring IGMP proxying

Prerequisites for configuring IGMP proxying

Before you configure IGMP proxying, determine the router interfaces and host interfaces based on the network topology, and enable IGMP on the router interfaces.

Enabling IGMP proxying

Restrictions and guidelines

Enable IGMP proxying on the receiver-side interfaces.

On an interface enabled with IGMP proxying, only the **igmp version** command takes effect and other IGMP commands do not take effect.

If you enable both IGMP proxying and a multicast routing protocol (such as PIM or MSDP) on the same device, the multicast routing protocol does not take effect.

In IGMPv1, the DR is elected by PIM and acts as the IGMP querier. Because PIM does not take effect on a proxy device, a router interface running IGMPv1 cannot be elected as the DR. To ensure that the downstream receiver hosts on the router interface can receive multicast data, you must enable multicast forwarding on the interface. For more information, see "Enabling multicast forwarding on a non-querier interface."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IGMP proxying.
   igmp proxying enable
   By default, IGMP proxying is disabled.

Enabling multicast forwarding on a non-querier interface

About this task

Typically, only IGMP queriers can forward multicast traffic and non-queriers cannot. This prevents multicast data from being repeatedly forwarded. If a router interface on an IGMP proxy device failed in the querier election, enable multicast forwarding on the interface to forward multicast data to attached receiver hosts.

Restrictions and guidelines

A shared-media network might have multiple IGMP proxies, including one proxy acting as a querier. To avoid duplicate multicast traffic, do not enable multicast forwarding on any of the non-querier IGMP proxies for the network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable multicast forwarding on the interface.
   igmp proxy forwarding
   By default, multicast forwarding is disabled on a non-querier interface.

Configuring multicast load splitting for IGMP proxy interfaces

About this task

If multiple IGMP proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards multicast traffic. You can enable multicast load splitting for IGMP proxy interfaces so that all the proxy interfaces can share multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Enable multicast load splitting for IGMP proxy interfaces.
   proxy multipath
   By default, multicast load splitting is disabled for IGMP proxy interfaces.

Enabling IGMP NSR

About this task

This feature backs up information about IGMP interfaces and IGMP multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP NSR.
   igmp non-stop-routing
   By default, IGMP NSR is disabled.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Display and maintenance commands for IGMP

CAUTION:
The **reset igmp group** command might cause multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

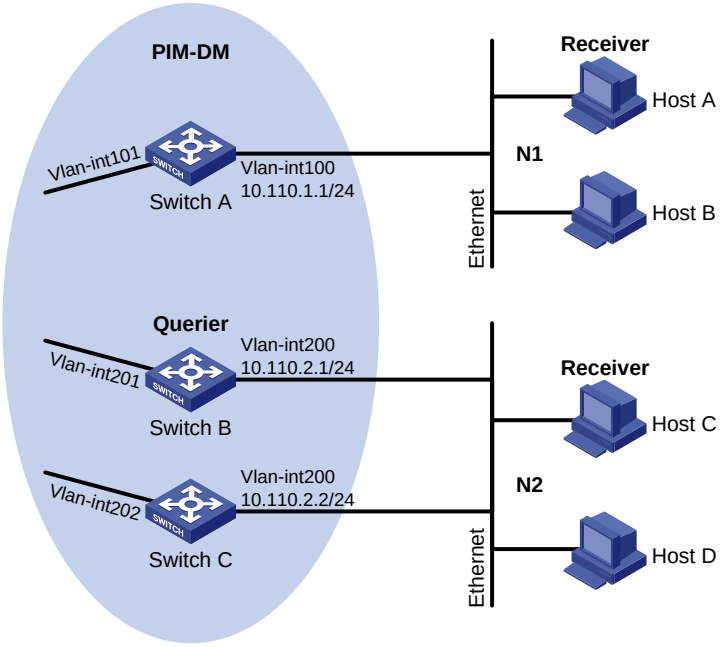
Task	Command
Display information about IGMP multicast groups.	**display igmp** [**vpn-instance** *vpn-instance-name*] **group** [*group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display IGMP information for interfaces.	**display igmp** [**vpn-instance** *vpn-instance-name*] **interface**

Task	Command
	[*interface-type interface-number*] [**proxy**] [**verbose**]
Display multicast group membership information maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display multicast routing entries maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]
Display IGMP SSM mappings.	**display igmp** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*
Clear dynamic IGMP multicast group entries.	**reset igmp** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

IGMP configuration examples

Example: Configuring basic IGMP features

Network configuration



As shown in Figure 5:

- OSPF and PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are receiver hosts in N1 and N2, respectively.
- IGMPv2 runs between Switch A and N1, and between the other two switches and N2. Switch A acts as the IGMP querier in N1. Switch B acts as the IGMP querier in N2 because it has a lower IP address.

Configure the routers to meet the following requirements:

- The hosts in N1 can join only multicast group 224.1.1.1.
- The hosts in N2 can join any multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches in the PIM-DM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   [SwitchB-Vlan-interface200] quit
   ```

   # Enable PIM-DM on VLAN-interface 201.

   ```
   [SwitchB] interface vlan-interface 201
   ```

```
[SwitchB-Vlan-interface201] pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IP multicast routing.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure a multicast group policy on Switch A so that hosts connected to VLAN-interface 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display IGMP information for VLAN-interface 200 on Switch B.

```
[SwitchB] display igmp interface vlan-interface 200
 Vlan-interface200(10.110.2.1):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
   Maximum query response time for IGMP: 10s
   Querier for IGMP: 10.110.2.1 (This router)
  IGMP groups reported in total: 1
```

Example: Configuring IGMP SSM mapping

Network configuration

As shown in Figure 6:

- OSPF runs on the network.
- The PIM-SM domain uses the SSM model for multicast delivery. The SSM group range is 232.1.1.0/24.
- IGMPv3 runs on VLAN-interface 400 of Switch D. The receiver host runs IGMPv2, and does not support IGMPv3. The receiver host cannot specify multicast sources in its membership reports.
- Source 1, Source 2, and Source 3 send multicast packets to multicast groups in the SSM group range 232.1.1.0/24.

Configure the IGMP SSM mapping feature on Switch D so that the receiver host can receive multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

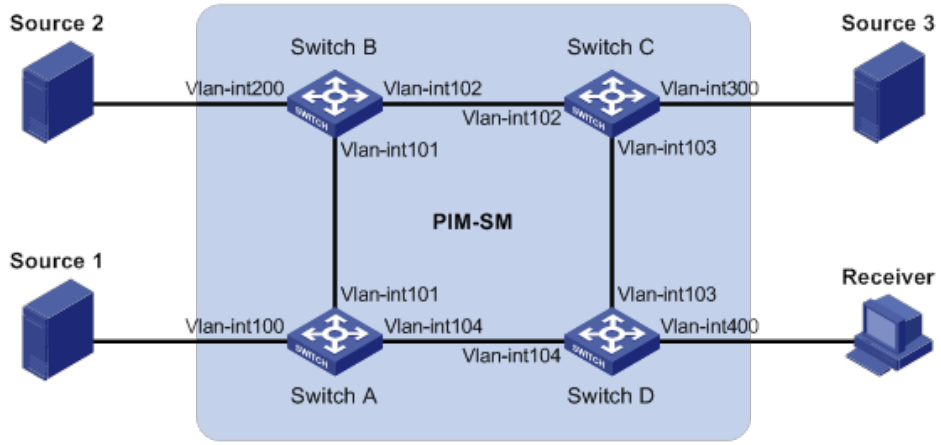


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	133.133.1.1/24	Source 3	—	133.133.3.1/24
Source 2	—	133.133.2.1/24	Receiver	—	133.133.4.1/24
Switch A	Vlan-int100	133.133.1.2/24	Switch C	Vlan-int300	133.133.3.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Vlan-int103	192.168.3.1/24
Switch A	Vlan-int104	192.168.4.2/24	Switch C	Vlan-int102	192.168.2.2/24
Switch B	Vlan-int200	133.133.2.2/24	Switch D	Vlan-int400	133.133.4.2/24
Switch B	Vlan-int101	192.168.1.2/24	Switch D	Vlan-int103	192.168.3.2/24
Switch B	Vlan-int102	192.168.2.1/24	Switch D	Vlan-int104	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches in the PIM-SM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP:

   # On Switch D, enable IP multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] multicast routing
   [SwitchD-mrib] quit
   ```

   # Enable IGMPv3 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] igmp enable
   [SwitchD-Vlan-interface400] igmp version 3
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable PIM-SM on the other interfaces.

   ```
   [SwitchD] interface vlan-interface 103
   [SwitchD-Vlan-interface103] pim sm
   [SwitchD-Vlan-interface103] quit
   [SwitchD] interface vlan-interface 104
   ```

```
[SwitchD-Vlan-interface104] pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

On Switch D, specify 232.1.1.0/24 as the SSM group range.

```
[SwitchD] acl basic 2000
[SwitchD-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-basic-2000] quit
[SwitchD] pim
[SwitchD-pim] ssm-policy 2000
[SwitchD-pim] quit
```

Configure the SSM group range on Switch A, Switch B, and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure IGMP SSM mappings on Switch D.

```
[SwitchD] igmp
[SwitchD-igmp] ssm-mapping 133.133.1.1 2000
[SwitchD-igmp] ssm-mapping 133.133.3.1 2000
[SwitchD-igmp] quit
```

Verifying the configuration

Display IGMP SSM mappings for multicast group 232.1.1.1 on Switch D.

```
[SwitchD] display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        133.133.1.1
        133.133.3.1
```

On Switch D, display information about IGMP multicast groups that hosts have dynamically joined.

```
[SwitchD] display igmp group
IGMP groups in total: 1
 Vlan-interface400(133.133.4.2):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   232.1.1.1       133.133.4.1     00:02:04    off
```

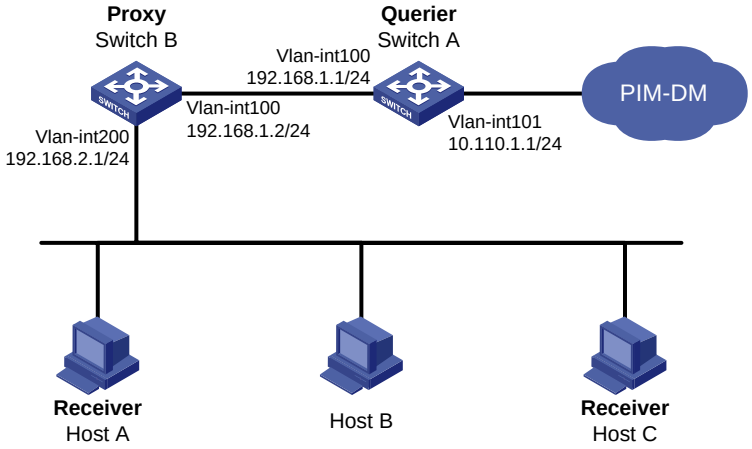
Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (133.133.1.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: 192.168.4.2
         RPF prime neighbor: 192.168.4.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -

 (133.133.3.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.3.1
         RPF prime neighbor: 192.168.3.1
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -
```

Example: Configuring IGMP proxying



Network configuration

As shown in Figure 7:

- PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information sent to multicast group 224.1.1.1.

Configure the IGMP proxying feature on Switch B so that Switch B can maintain group memberships and forward multicast traffic without running PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Enable IP multicast routing, PIM-DM, IGMP, and IGMP proxying:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp proxy enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   [SwitchB-Vlan-interface200] quit
   ```

Verifying the configuration

Display multicast group membership information maintained by the IGMP proxy on Switch B.

```
[SwitchB] display igmp proxy group
IGMP proxy group records in total: 1
```

```
Vlan-interface100(192.168.1.2):
 IGMP proxy group records in total: 1
  Group address      Member state      Expires
  224.1.1.1          Delay             00:00:02
```

Troubleshooting IGMP

No membership information on the receiver-side device

Symptom

When a host sends a report for joining multicast group G, no membership information of multicast group G exists on the device closest to that host.

Solution

To resolve the problem:

1. Use the **display igmp interface** command to verify that the networking, interface connection, and IP address configuration are correct.
2. Use the **display current-configuration** command to verify that multicast routing is enabled. If it is not enabled, use the **multicast routing** command in system view to enable IP multicast routing. In addition, verify that IGMP is enabled on the associated interfaces.
3. Use the **display igmp interface** command to verify that the IGMP version on the interface is lower than that on the host.
4. Use the **display current-configuration interface** command to verify that no multicast group policies have been configured to filter IGMP reports for multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different IGMP devices on the same subnet.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IGMP information on the interfaces. Make sure the devices on the subnet have the same IGMP settings on their interfaces.
2. Use the **display igmp interface** command on all devices on the same subnet to verify the IGMP-related timer settings. Make sure the settings are consistent on all the devices.
3. Use the **display igmp interface** command to verify that all devices on the same subnet are running the same IGMP version.
4. If the problem persists, contact H3C Support.

PIM overview

Protocol Independent Multicast (PIM) provides IP multicast forwarding by leveraging unicast static routes or unicast routing tables generated by any unicast routing protocol. PIM uses the underlying unicast routing to generate a multicast routing table without relying on any particular unicast routing protocol. PIM uses the RPF mechanism to implement multicast forwarding. For more information about RPF, see "Configuring multicast routing and forwarding."

PIM modes

Based on the implementation mechanism, PIM includes the following modes:

- Protocol Independent Multicast–Dense Mode (PIM-DM).
- Protocol Independent Multicast–Sparse Mode (PIM-SM).
- Protocol Independent Multicast Source-Specific Multicast (PIM-SSM).

In this document, a PIM domain refers to a network that contains PIM devices.

PIM-DM

PIM-DM uses the push mode for multicast forwarding, and is suitable for small-sized networks with densely distributed multicast members.

PIM-DM assumes that all downstream nodes want to receive multicast data from a source, so multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees. When a pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In PIM-DM, the multicast forwarding paths for a multicast group constitutes a forwarding tree. The forwarding tree is rooted at the multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the multicast source to the receivers, it is also called a "shortest path tree (SPT)."

PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

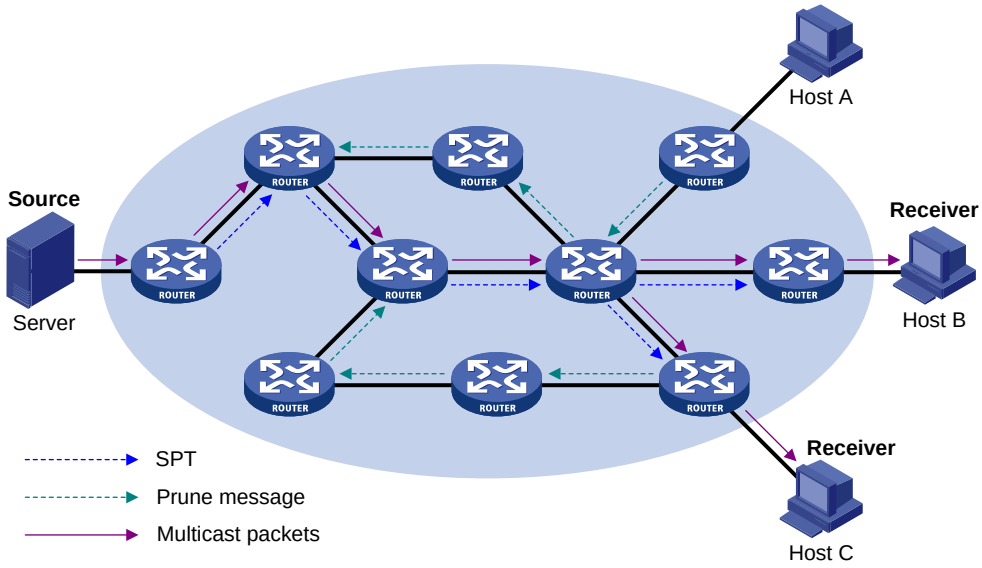
Neighbor discovery

In a PIM domain, each PIM interface on a device periodically multicasts PIM hello messages to all other PIM devices (identified by the address 224.0.0.13) on the local subnet. Through the exchanging of hello messages, all PIM devices on the subnet determine their PIM neighbors, maintain PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In a PIM-DM domain, the multicast data from the multicast source S to the multicast group G is flooded throughout the domain. A device performs an RPF check on the multicast data. If the RPF check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes on the network. In the flooding process, all the devices in the PIM-DM domain create the (S, G) entry.
2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all PIM devices on the subnet. When an upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In



this way, the upstream stream node stops forwarding subsequent packets addressed to that multicast group down to this node.

NOTE:

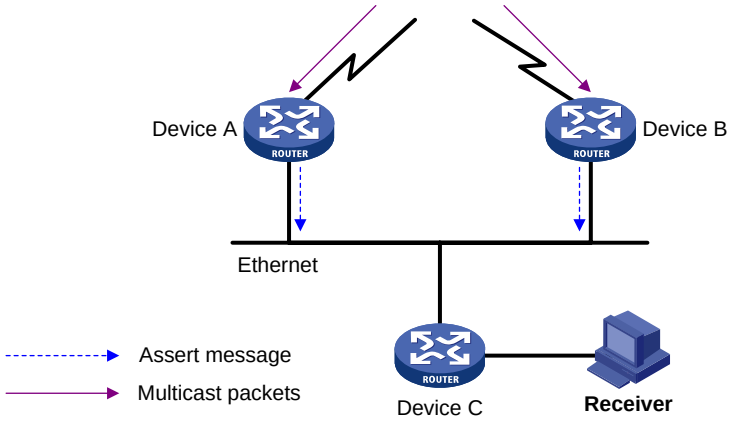
An (S, G) entry contains a multicast source address S, a multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the multicast source. This prune process goes on until only necessary branches are left in the PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all PIM devices (224.0.0.13) on the local subnet through the interface that received the packet. The assert message contains the multicast source address (S), the multicast group address (G), and the metric preference and metric of the unicast route/static multicast route to the multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the shared-media LAN. The comparison process is as follows:

1. The device with a higher metric preference to the multicast source wins.
2. If both devices have the same metric preference, the device with a smaller metric wins.
3. If both devices have the same metric, the device with a higher IP address on the downstream interface wins.

PIM-SM

PIM-DM uses the flood-and-prune cycles to build SPTs for multicast data forwarding. Although an SPT has the shortest paths from the multicast source to the receivers, it is built with a low efficiency. Therefore, PIM-DM is not suitable for large and medium-sized networks. PIM-SM uses the pull mode for multicast forwarding, and it is suitable for large- and medium-sized networks with sparsely and widely distributed multicast group members.

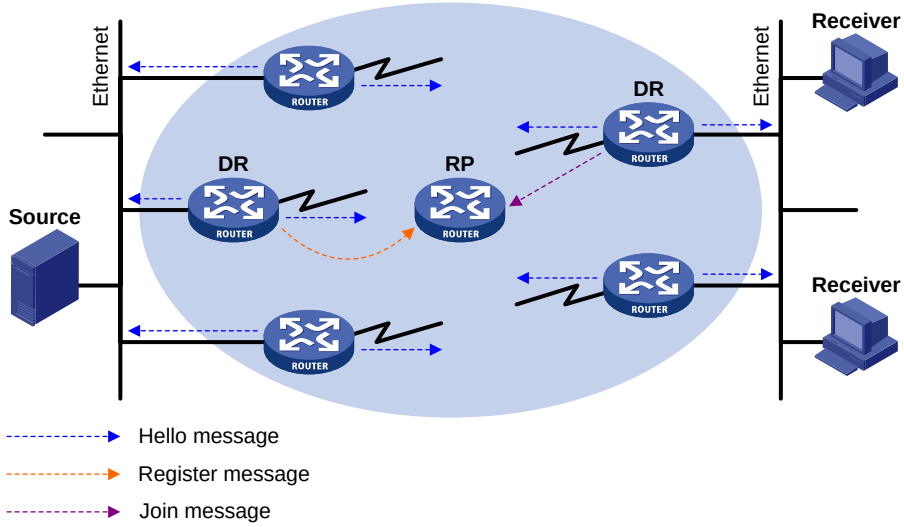
PIM-SM assumes that no hosts need multicast data. A multicast receiver must express its interest in the multicast data for a multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of a PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement multicast data forwarding. An SPT is rooted at the multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

PIM-SM uses the same neighbor discovery mechanism as PIM-DM does. For more information, see "Neighbor discovery."

DR election



A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the multicast receivers to send join messages to the RP.

PIM-DM does not require a DR. However, if IGMPv1 runs on any shared-media LAN in a PIM-DM domain, a DR must be elected to act as the IGMPv1 querier for the LAN. For more information about IGMP, see "Configuring IGMP."

IMPORTANT:

IGMP must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any multicast groups.

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IP address wins the DR election under one of following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its PIM neighbor lifetime expires and the other devices will initiate to elect a new DR.

RP discovery

An RP is the core of a PIM-SM domain. A multicast group can have only one RP for multicast forwarding, and an RP can be designated to multiple multicast groups.

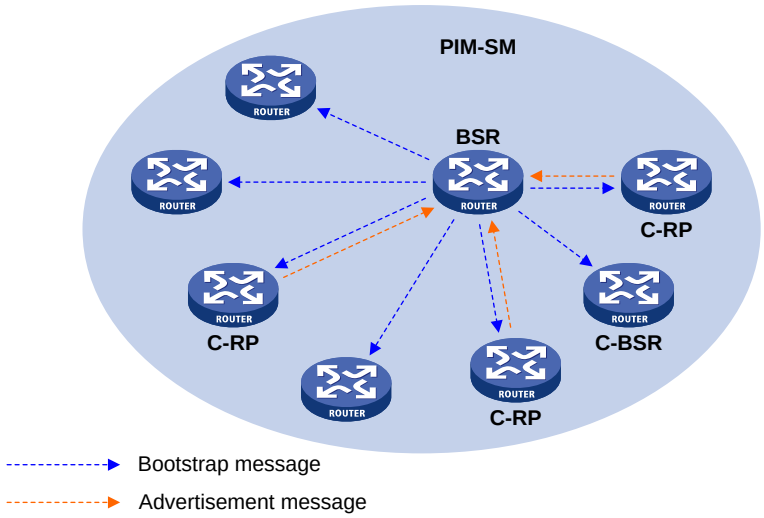
RP selection

An RP can be statically configured or dynamically elected. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.

- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs



A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election

Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to a multicast group.
- **BSR**—A BSR is the core of the administrative core of the PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. A PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

1. Each C-BSR sends a bootstrap message (BSM) to other devices in the PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IP address wins. The loser uses the winner's BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.
3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the multicast group range to which it is designated.
4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between multicast groups and RPs. The BSR encapsulates the RP-set information in the bootstrap messages (BSMs) and floods the BSMs to the entire PIM-SM domain.
5. All devices in the PIM-SM domain select an RP for a multicast group based on the following rules:
   a. The C-RP that is designated to the smallest multicast group range wins.

b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.

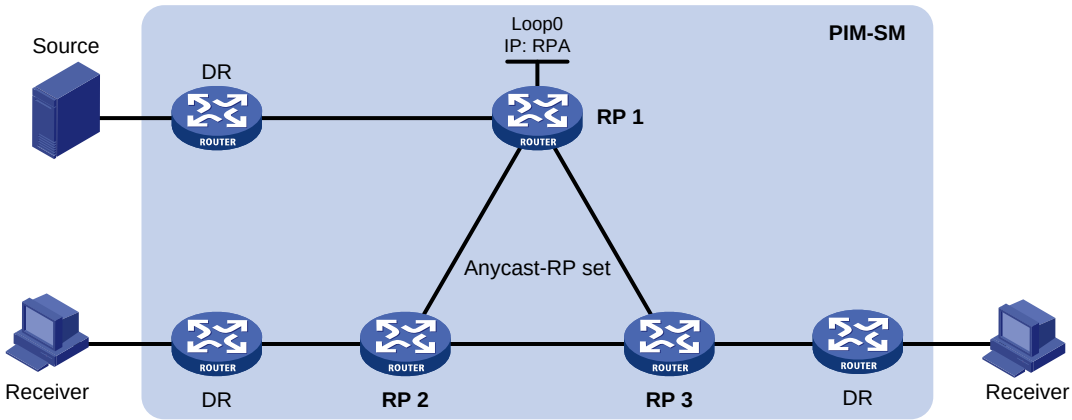
c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.

d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Anycast RP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IP address. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—A multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented in either of the following methods:

- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through PIM-SM**—In this method, you can configure multiple RPs for one multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IP address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IP address of the Anycast RP set for communication within the PIM-SM domain. It is also known as RPA.

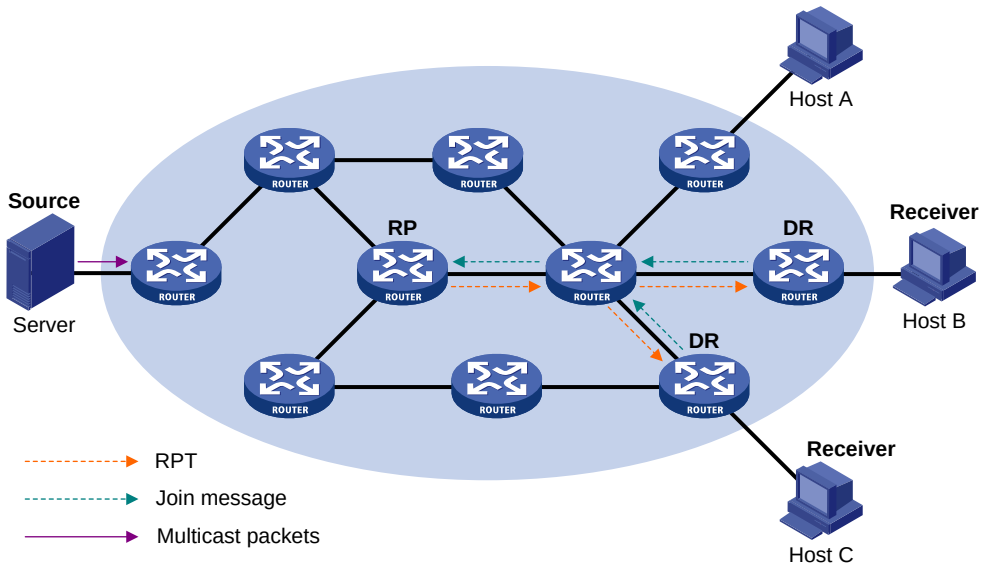
  As shown in Figure 5, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 5 Anycast RP through PIM-SM

The following describes how Anycast RP through PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the

DR. RP 1 changes the source IP address of the register message to its own address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

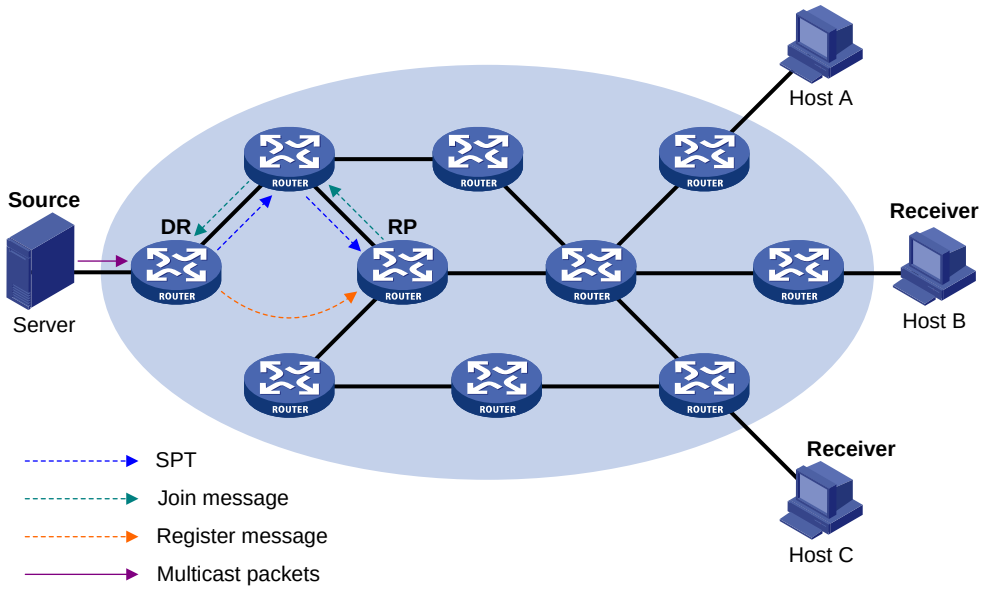
In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize multicast source information.

RPT building

Figure 6 RPT building in a PIM-SM domain

As shown in Figure 6, the process of building an RPT is as follows:

1. When a receiver wants to join the multicast group G, it uses an IGMP message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any multicast source. The RP is the root of the RPT, and the DR is a leaf of the RPT.



When the multicast data addressed to the multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT, and finally to the receiver.

When a receiver is no longer interested in the multicast data addressed to the multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that multicast group. If no receivers for the multicast group exist, the device continues to forward the prune message to its upstream device.

Multicast source registration

The multicast source uses the registration process to inform an RP of its presence.

Figure 7 Multicast source registration

As shown in Figure 7, the multicast source registers with the RP as follows:

1. The multicast source S sends the first multicast packet to the multicast group G. When receiving the multicast packet, the source-side DR encapsulates the packet into a PIM register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates the register message and forwards the register message down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the multicast source. The devices along the path from the RP to the multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent multicast data from the multicast source are forwarded to the RP along the established SPT. When the multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

This section takes a router as an example. As compared with the switchover to SPT on a router, switchover to SPT is implemented in a simpler way on a switch.

In a PIM-SM domain, only one RP and one RPT provide services for a specific multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

Multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for a multicast packet might not be the shortest one.
- The RP might be overloaded by multicast traffic bursts.

To eliminate these weaknesses, PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives multicast traffic, it sends an (S, G) source-specific join message toward the multicast source. The routers along the path from the RP to the multicast source constitute an

SPT. The subsequent multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

For more information about the switchover to SPT initiated by the RP, see "Multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the multicast source. The routers along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the router where the RPT and the SPT branches, the router drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent multicast packets travel along the SPT from the multicast source to the receiver hosts.

With the switchover to SPT, PIM-SM builds SPTs more economically than PIM-DM does.

Assert

PIM-SM uses a similar assert mechanism as PIM-DM does. For more information, see "Assert."

Administrative scoping

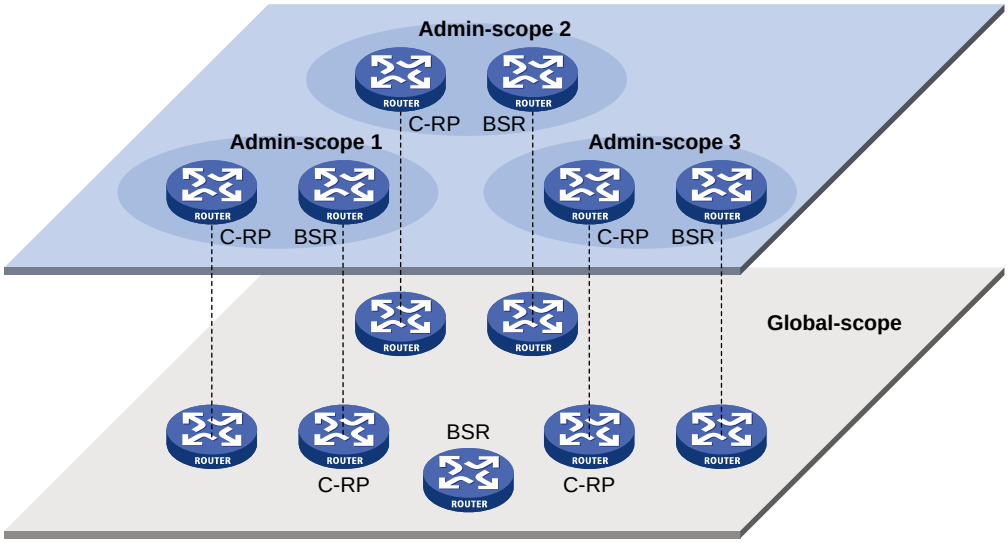
Administrative scoping mechanism

Administrative scoping mechanisms for PIM-SM include non-scoped BSR mechanism and administrative scoping mechanism.

- **Non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **Administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

Admin-scoped zones are divided for multicast groups. Zone border devices (ZBRs) form the boundary of an admin-scoped zone. Each admin-scoped zone maintains one BSR for multicast groups within a specific range. Multicast protocol packets, such as assert messages and BSMs, for a specific group range cannot cross the boundary of the admin-scoped zone for the group range. Multicast group ranges that are associated with different admin-scoped zones can have intersections. However, the multicast groups in an admin-scoped zone are valid only within the local zone, and theses multicast groups are regarded as private group addresses.

The global-scoped zone maintains a BSR for the multicast groups that do not belong to any admin-scoped zones.



Relationship between admin-scoped zones and the global-scoped zone

The global-scoped zone and each admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each admin-scoped zone has its own boundary. The multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the global-scoped zone and admin-scoped zones based on geographical locations and multicast group address ranges.

- In view of geographical locations:

  An admin-scoped zone is a logical zone for particular multicast groups. The multicast packets for such multicast groups are confined within the local admin-scoped zone and cannot cross the boundary of the zone.

  Figure 8 Relationship in view of geographical locations

  As shown in Figure 8, for the multicast groups in a specific group address range, the admin-scoped zones must be geographically separated and isolated. A device cannot belong to multiple admin-scoped zones. An admin-scoped zone cannot contain a device that belongs to any other admin-scoped zone. However, the global-scoped zone includes all devices in the PIM-SM domain. Multicast packets that do not belong to any admin-scoped zones are forwarded in the entire PIM-SM domain.

- In view of multicast group address ranges:

  Each admin-scoped zone is designated to specific multicast groups, of which the multicast group addresses are valid only within the local zone. The multicast groups of different admin-scoped zones might have intersections. All the multicast groups other than those of the admin-scoped zones use the global-scoped zone.

Figure 9 Relationship in view of multicast group address ranges

As shown in Figure 9, the admin-scoped zones 1 and 2 have no intersection, but the admin-scoped zone 3 is a subset of the admin-scoped zone 1. The global-scoped zone provides services for all the multicast groups that are not covered by the admin-scoped zones 1 and 2, G−G1−G2 in this case.

PIM-SSM

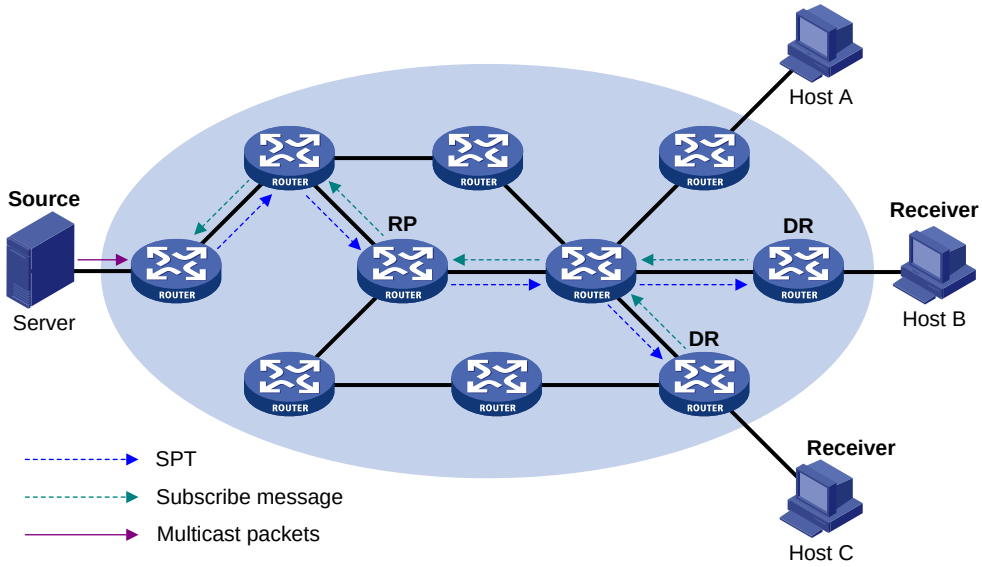
The ASM model includes PIM-DM and PIM-SM. The SSM model can be implemented by leveraging part of the PIM-SM technique. It is also called "PIM-SSM."

The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through IGMPv3.

In actual applications, part of IGMPv3 and PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located a multicast source, no RP or RPT is required. Multicast sources do not register with the RP, and the MSDP is not needed for discovering multicast sources in other PIM domains.

PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery



PIM-SSM uses the same neighbor discovery mechanism as PIM-SM. For more information, see "Neighbor discovery."

DR election

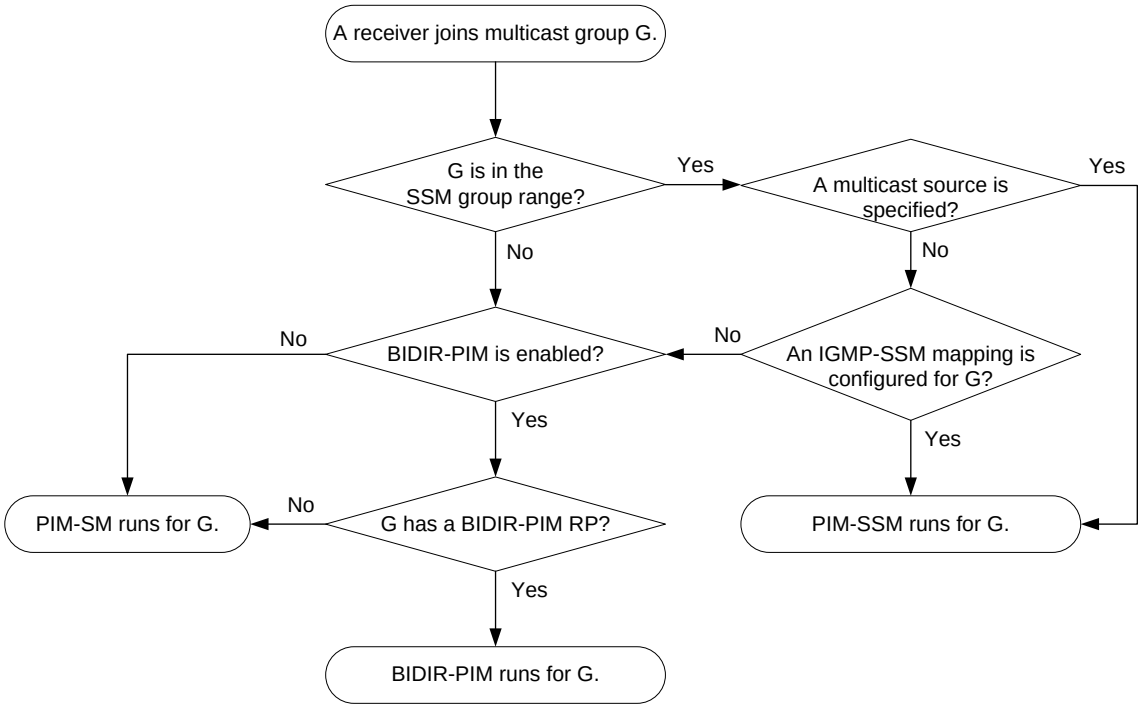
PIM-SSM uses the same DR election mechanism as PIM-SM. For more information, see "DR election."

SPT building

Figure 10 SPT building in PIM-SSM

As shown in Figure 10, the following is the process for building an SPT:

1. Host B and Host C are receivers. They send IGMPv3 report messages to their DRs to express their interest in the multicast information that the multicast source S sends to the multicast group G.
2. After receiving a report message, the DR sends a subscribe message hop by hop toward the multicast source S.
3. All devices along the path from the DR to the source create an (S, G) entry to build an SPT. The SPT is rooted at the multicast source S and has the receivers as its leaves. This SPT is the transmission channel in PIM-SSM.



In PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among PIM protocols

In a PIM network, PIM-DM cannot run together with PIM-SM, BIDIR-PIM, or PIM-SSM. However, PIM-SM, BIDIR-PIM, and PIM-SSM can run together. (BIDIR-PIM is not supported in the current software version.) Figure 11 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about IGMP SSM mapping, see "Configuring IGMP."

Figure 11 Relationship among PIM protocols

PIM support for VPNs

To support PIM for VPNs, a multicast device that runs PIM maintains an independent set of PIM neighbor table, multicast routing table, BSR information, and RP-set information for each VPN.

After receiving a multicast data packet, the multicast device checks which VPN the data packet belongs to. Then, the device forwards the packet according to the multicast routing table for that VPN or creates a multicast routing entry for that VPN.

Protocols and standards

- RFC 3973, *Protocol Independent Multicast-Dense Mode (PIM-DM): Protocol Specification(Revised)*
- RFC 4601, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification (Revised)*

Configuring PIM

Restrictions and guidelines: PIM configuration

All the interfaces on a device must operate in the same PIM mode on the public network or the same VPN instance.

Configuring PIM-DM

PIM-DM tasks at a glance

To configure PIM-DM, perform the following tasks:

1. Enabling PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the PIM-DM graft retry timer
4. (Optional.) Configuring common PIM timers

Prerequisites for PIM-DM

Before you configure PIM-DM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-DM

About this task

With PIM-DM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-DM on all non-border interfaces of the devices when you deploy a PIM-DM domain.

For PIM-DM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-DM.
   pim dm
   By default, PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the PIM device directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. It prevents the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can configure the time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own PIM-DM state, and resets the waiting timer.
- **TTL value of state refresh messages**—The TTL value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the TTL value comes down to 0. A state refresh message with a large TTL value might cycle on a small network.

  To effectively control the propagation scope of state refresh messages, configure an appropriate TTL value based on the network size on the device directly connected with the multicast source.

Restrictions and guidelines

Perform this task on all devices in the PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the state refresh feature.
   pim state-refresh-capable
   By default, the state refresh feature is enabled.
4. Return to system view.
   quit
5. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
6. Set the state refresh interval.
   state-refresh-interval *interval*
   The default setting is 60 seconds.
   Perform this task on the device directly connected to the multicast source.
7. Set the amount of time that the device must wait to accept a new state refresh message.

state-refresh-rate-limit *time*

The default setting is 30 seconds.

8. Set the TTL value of state refresh messages.

   state-refresh-ttl *ttl-value*

   The default setting is 255.

Setting the PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the graft retry timer.

   pim timer graft-retry *interval*

   The default setting is 3 seconds.

Configuring PIM-SM

PIM-SM tasks at a glance

To configure PIM-SM, perform the following tasks:

1. Enabling PIM-SM
2. Configuring static RPs

   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring a PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple PIM devices exist in the network.

   You can configure static RPs, dynamic RPs, or both.
4. (Optional.) Enabling Auto-RP listening
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring common PIM features

Prerequisites for PIM-SM

Before you configure PIM-SM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-SM

About this task

With PIM-SM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SM domain.

For PIM-SM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-SM.
   pim sm
   By default, PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth because of frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In a PIM-SM domain, you can configure the same static RP for different multicast groups by using the same RP address but different ACLs.

You do not need to enable PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for a multicast group, only the static RP with the highest IP address takes effect.

The static RP configuration must be the same on all devices in the PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP.

   static-rp *rp-address* [{ *ipv4-acl-number* | **name** *ipv4-acl-number* } | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword in the **static-rp** command to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the PIM-SM domain because every C-BSR might become the BSR.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv4-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses. It is used to prevent the legal BSR from being replaced by a malicious host.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-BSRs and other devices.

The C-BSR configuration on the devices in the PIM-SM domain must be the same.

For a successful RPF check, configure static multicast routes to ensure that the next hop to a C-BSR is a tunnel interface when C-BSRs connect to other PIM devices through tunnels. For more information about static multicast routes, see "Configuring multicast routing and forwarding."

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a C-BSR.

   c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *
4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv4-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring a PIM domain border

About this task

A PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different PIM-SM domains.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure a PIM domain border.

   pim bsr-boundary

   By default, an interface is not a PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.
   undo bsm-fragment enable
   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.
   undo bsm-reflection enable
   By default, the device forwards BSMs out of their incoming interfaces.

Enabling Auto-RP listening

About this task

This feature enables the device to receive Auto-RP announcement and discovery messages and learn RP information. The destination IP addresses for Auto-RP announcement and discovery messages are 224.0.1.39 and 224.0.1.40, respectively.

Restrictions and guidelines

After this feature is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.

pim [**vpn-instance** *vpn-instance-name*]

3. Enable Auto-RP listening.

   auto-rp enable

   By default, Auto-RP listening is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for exmaple, loopback interface) with the same IP address. The IP address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IP address of a loopback interface as the RP member address.

If you configure IP addresses of multiple interfaces on the same device as RP member addresses, the lowest IP address takes effect. The rest of the interface addresses become backup RP member addresses.

An Anycast RP address must be a host address with subnet mask 255.255.255.255.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RP or C-RPs in the PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure Anycast RP.

   anycast-rp *anycast-rp-address member-rp-address*

   By default, Anycast RP is not configured.

   You can repeat this command to add multiple RP member addresses to the Anycast RP set.

Configuring multicast source registration

About this task

- **PIM register policy**—A PIM register policy enables an RP to filter register messages by using an ACL that specifies the multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.

- **Register suppression time—**The source-side DR stops sending register messages encapsulated with multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. Otherwise, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is fixed to 5 seconds. You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure a PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a PIM register policy.

   register-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM register policy is configured. All PIM register messages are regarded as legal.

4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.

5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate multicast data in register messages destined to the RP. As a best practice to avoid multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure RPT to SPT switchover.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

   By default, the first multicast data packet triggers the RPT to SPT switchover.

Configuring PIM-SSM

PIM-SSM tasks at a glance

To configure PIM-SSM, perform the following tasks:

1. Enabling PIM-SM
2. (Optional.) Configuring the SSM group range
3. (Optional.) Configuring common PIM features

Prerequisites for PIM-SSM

Before you configure PIM-SSM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable PIM-SM.
- Enable IGMPv3 on PIM devices that connect to multicast receivers.

Enabling PIM-SM

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SSM domain.

Procedure

1. Enter system view.
   system-view
2. Enable multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-SM.
   pim sm
   By default, PIM-SM is disabled.

Configuring the SSM group range

About this task

When a PIM-SM enabled interface receives a multicast packet, it checks whether the multicast group address of the packet is in the SSM group range. If the multicast group address is in this range, the PIM mode for this packet is PIM-SSM. If the multicast group address is not in this range, the PIM mode is PIM-SM.

Restrictions and guidelines

Configure the same SSM group range on all devices in the entire PIM-SSM domain. Otherwise, multicast information cannot be delivered through the SSM model.

When a member of a multicast group in the SSM group range sends an IGMPv1 or IGMPv2 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the SSM group range.
   ssm-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }
   By default, the SSM group range is 232.0.0.0/8.

Configuring common PIM features

Common PIM feature tasks at a glance

All the following tasks are optional.

- Configuring a multicast source policy
- Configuring a PIM hello policy
- Configuring PIM hello message options
- Dropping hello messages without the Generation ID option
- Configuring common PIM timers
- Setting the maximum size of a join or prune message
- Configuring a PIM join policy
- Setting the DSCP value for outgoing PIM protocol packets
- Enabling BFD for PIM
- Enabling PIM passive mode
- Enabling PIM NSR
- Enabling SNMP notifications for PIM

Configuring a multicast source policy

About this task

This feature enables the device to filter multicast data by using an ACL that specifies the multicast sources and the optional groups. It filters not only data packets but also register messages with multicast data encapsulated. It controls the information available to downstream receivers.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a multicast source policy.

   source-policy *ipv4-acl-number*

   By default, no multicast source policy is configured. The device does not filter multicast data packets.

Configuring a PIM hello policy

About this task

This feature enables the device to filter PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against PIM message attacks and to establish correct PIM neighboring relationships.

If hello messages of an existing PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure a PIM hello policy.

   pim neighbor-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM hello policy is configured on an interface. All PIM hello messages are regarded as legal.

Configuring PIM hello message options

About this task

In either a PIM-DM domain or a PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the multicast source or the receivers.
- **Holdtime**—PIM neighbor lifetime. If a device does not receive a hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the PIM message propagation delay. The override interval defines a period for a device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.

- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different PIM devices on a shared-media LAN are different, the largest ones apply.

If you want to enable neighbor tracking, you must enable it on all PIM devices on a shared-media LAN. Otherwise, the upstream device cannot track join messages from every downstream devices.

You can configure hello message options for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

Configuring hello message options globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.
   hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the PIM message propagation delay for a shared-media LAN.
   hello-option lan-delay *delay*
   The default setting is 500 milliseconds.
6. Set the override interval.
   hello-option override-interval *interval*
   The default setting is 2500 milliseconds.
7. Enable neighbor tracking.
   hello-option neighbor-tracking
   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the DR priority.
   pim hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   pim hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the PIM message propagation delay.
   pim hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with PIM. The generation ID is a random value, but it changes only when the status of the device changes. If a PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

   pim require-genid

   By default, an interface accepts hello messages without the Generation ID option.

Configuring common PIM timers

About this task

The following are common PIM timers:

- **Hello interval**—Interval at which a PIM device sends hello messages to discover PIM neighbors, and maintain PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, a PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join/Prune interval**—Interval at which a PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which a PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is specified in a join or prune message.
- **Multicast source lifetime**—Lifetime that a PIM device maintains for a multicast source. If a device does not receive subsequent multicast data from the multicast source S when the timer expires, it deletes the (S, G) entry for the multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common PIM timers for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common PIM timers globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.
   timer hello *interval*
   The default setting is 30 seconds.
4. Set the join or prune interval.
   timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.
   holdtime join-prune *time*
   The default setting is 210 seconds.
6. Set the multicast source lifetime.
   source-lifetime *time*
   The default setting is 210 seconds.

Configuring common PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

About this task

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the maximum size of a join or prune message.

   jp-pkt-size *size*

   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring a PIM join policy

About this task

The PIM join policy filters joined multicast sources and groups in PIM join or prune messages to protect the device against invalid PIM join or prune message attacks. The policy identifies valid joined multicast source and groups in PIM join or prune messages and filters out invalid joined multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined multicast sources and groups.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure a PIM join policy to filter joined multicast sources and groups in PIM join or prune messages.

   pim join-policy { { *ipv4-acl-number* | **name** *ipv4-acl-name* } | [**asm** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **ssm** { *ipv4-acl-number* | **name** *ipv4-acl-number* }] * }

   By default, no PIM join policy is configured and joined multicast sources and groups in PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing PIM protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing PIM protocol packets.

Enabling BFD for PIM

About this task

If a DR on a shared-media network fails, a new DR election process does not start until the DR ages out. In addition, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, enable BFD for PIM to detect link failures among PIM neighbors.

You must enable BFD for PIM on all PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for PIM.

   pim bfd enable

   By default, BFD is disabled for PIM.

Enabling PIM passive mode

About this task

To guard against PIM hello spoofing, you can enable PIM passive mode on a receiver-side interface. The PIM passive interface cannot receive or forward PIM protocol messages (excluding register, register-stop, and C-RP-Adv messages), and it acts as the DR on the subnet.

Restrictions and guidelines

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple PIM devices.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable PIM passive mode on the interface.

   pim passive

   By default, PIM passive mode is disabled on an interface.

Enabling PIM NSR

About this task

This feature enables PIM to back up protocol state information and data, including PIM neighbor information and routes, from the active process to the standby process. The standby process

immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable PIM NSR.
   pim non-stop-routing
   By default, PIM NSR is disabled.

Enabling SNMP notifications for PIM

About this task

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for PIM.
   snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *
   By default, SNMP notifications for PIM are enabled.

Display and maintenance commands for PIM

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description** | **down**]]
Display BSR information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by PIM.	**display pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*source-address*]
Display C-RP information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display PIM information on an interface.	**display pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]
Display PIM neighbor information.	**display pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display PIM routing entries.	**display pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*group-address* [**mask**

Task	Command
	{ *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* |**extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *
Display RP information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **rp-info** [*group-address*]
Display statistics for PIM packets.	**display pim statistics**

PIM configuration examples

Example: Configuring PIM-DM

Network configuration

As shown in Figure 12:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the dense mode.
- Host A and Host C are multicast receivers on two stub networks.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 12 Network diagram

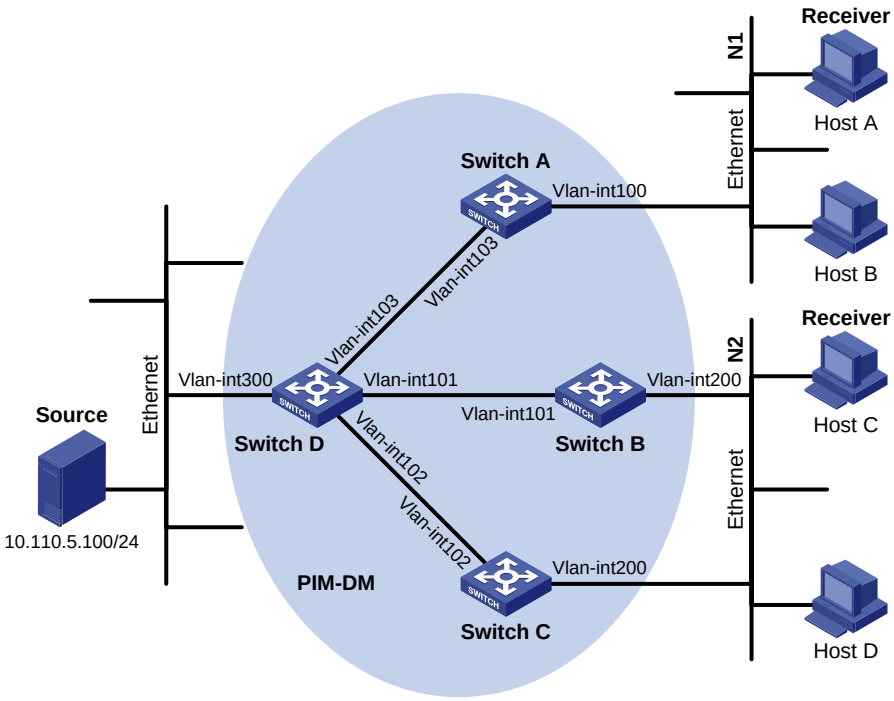

Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int102	192.168.3.1/24
Switch A	Vlan-int103	192.168.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch B	Vlan-int200	10.110.2.1/24	Switch D	Vlan-int103	192.168.1.2/24
Switch B	Vlan-int101	192.168.2.1/24	Switch D	Vlan-int101	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch D	Vlan-int102	192.168.3.2/24

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 12, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
```

```
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing, IGMP, and PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IP multicast routing, and enable PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display PIM information on Switch D.

```
[SwitchD] display pim interface
 Interface           NbrCnt HelloInt   DR-Pri     DR-Address
 Vlan300             0      30         1          10.110.5.1     (local)
 Vlan103             1      30         1          192.168.1.2    (local)
 Vlan101             1      30         1          192.168.2.2    (local)
 Vlan102             1      30         1          192.168.3.2    (local)
```

Display PIM neighboring relationships on Switch D.

```
[SwitchD] display pim neighbor
 Total Number of Neighbors = 3

 Neighbor        Interface           Uptime   Expires  Dr-Priority Mode
 192.168.1.1     Vlan103             00:02:22 00:01:27 1
 192.168.2.1     Vlan101             00:00:22 00:01:29 3
 192.168.3.1     Vlan102             00:00:23 00:01:31 5
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from multicast source 10.110.5.100/24 to multicast group 225.1.1.1. (Details not shown.)

Display PIM routing entries on Switch A.

```
[SwitchA] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
```

```
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: igmp, UpTime: 00:04:25, Expires: -

 (10.110.5.100, 225.1.1.1)
    Protocol: pim-dm, Flag: ACT
    UpTime: 00:06:14
    Upstream interface: Vlan-interface103
        Upstream neighbor: 192.168.1.2
        RPF prime neighbor: 192.168.1.2
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 225.1.1.1)
    Protocol: pim-dm, Flag: LOC ACT
    UpTime: 00:03:27
    Upstream interface: Vlan-interface300
        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 2
        1: Vlan-interface103
            Protocol: pim-dm, UpTime: 00:03:27, Expires: -
        2: Vlan-interface102
            Protocol: pim-dm, UpTime: 00:03:27, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has the correct (*, G) entry.

Example: Configuring non-scoped PIM-SM

Network configuration

As shown in Figure 13:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist on each stub network.
- The entire PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers on two stub networks N1 and N2.

- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to multicast group range 225.1.1.0/24. Specify VLAN-interface 101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 13 Network diagram

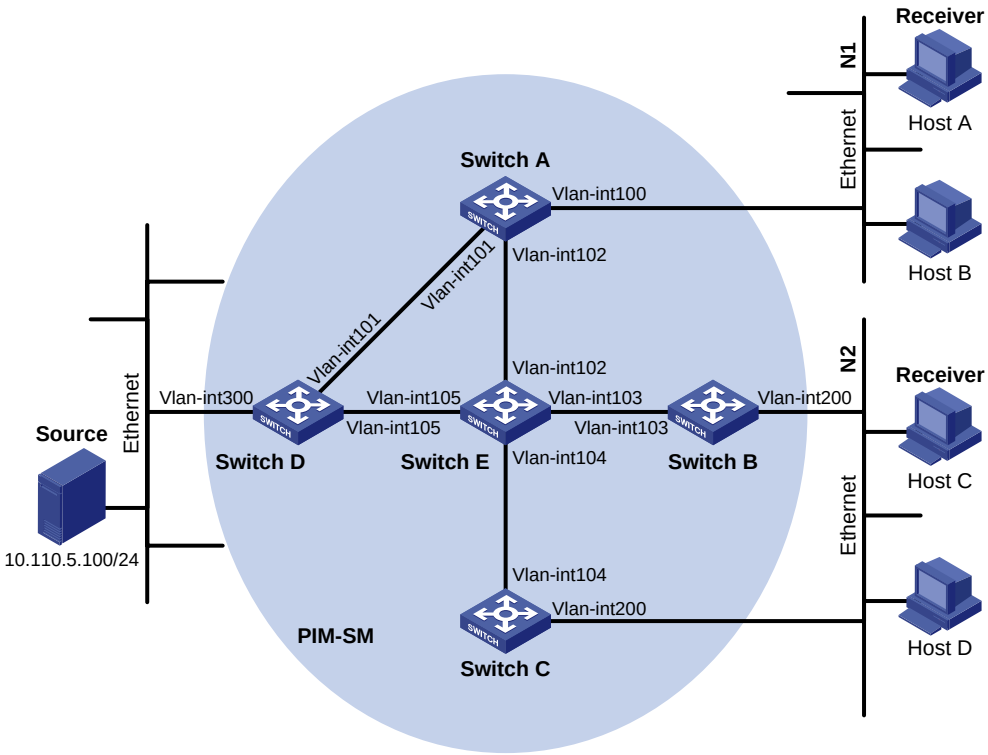

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 13, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   ```

```
[SwitchA-mrib] quit
```

Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and the static RP:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl basic 2005
[SwitchE-acl-ipv4-basic-2005] rule permit source 225.1.1.0 0.0.0.255
[SwitchE-acl-ipv4-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP.

```
[SwitchE] pim
[SwitchE-pim] c-bsr 192.168.9.2
[SwitchE-pim] c-rp 192.168.9.2 group-policy 2005
```

Configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE-pim] static-rp 192.168.1.2
[SwitchE-pim] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchA] pim
[SwitchA-pim] static-rp 192.168.1.2
[SwitchA-pim] quit
```

Configure the static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface           NbrCnt HelloInt   DR-Pri     DR-Address
 Vlan101             1      30         1          192.168.1.2
 Vlan102             1      30         1          192.168.9.2
```

Display BSR information on Switch A.

```
[SwitchA] display pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
```

```
      Priority: 64
      Hash mask length: 30
      Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
     Candidate BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch A.

```
[SwitchA] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 225.1.1.0/24
       RP address               Priority  HoldTime  Uptime    Expires
       192.168.9.2              192       180       00:51:45  00:02:22

Static RP information:
       RP address               ACL   Mode    Preferred
       192.168.1.2              ----  pim-sm  No
```

Example: Configuring admin-scoped PIM-SM

Network configuration

As shown in Figure 14:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The entire PIM-SM domain is divided into admin-scoped zone 1, admin-scoped zone 2, and the global-scoped zone. Switch B, Switch C, and Switch D are ZBRs of the three zones, respectively.
- Source 1 and Source 2 send different multicast data to the multicast group 239.1.1.1. Host A receives the multicast data only from Source 1, and Host B receives the multicast data only from Source 2. Source 3 sends multicast data to multicast group 224.1.1.1. Host C is a multicast receiver for the multicast group 224.1.1.1.
- VLAN-interface 101 of Switch B acts as a C-BSR and a C-RP for admin-scoped zone 1, and VLAN-interface 105 of Switch D acts as a C-BSR and a C-RP for admin-scoped zone 2. Both of the two interfaces are designated to multicast group range 239.0.0.0/8. VLAN-interface 109 of Switch F acts as a C-BSR and a C-RP for the global-scoped zone, and is designated to all the multicast groups that are not in the range 239.0.0.0/8.
- IGMPv2 runs between Switch A, Switch E, Switch I, and the receivers that directly connect to them, respectively.

Figure 14 Network diagram

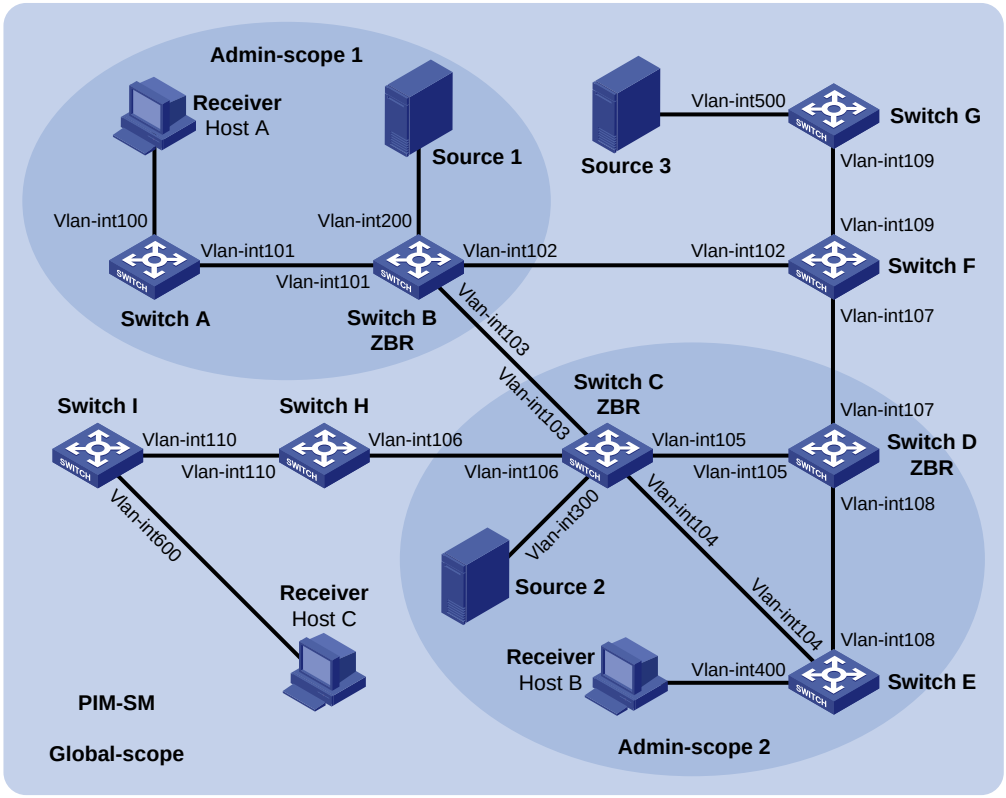

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	192.168.1.1/24	Switch D	Vlan-int105	10.110.5.2/24
Switch A	Vlan-int101	10.110.1.1/24	Switch D	Vlan-int108	10.110.7.1/24
Switch B	Vlan-int200	192.168.2.1/24	Switch D	Vlan-int107	10.110.8.1/24
Switch B	Vlan-int101	10.110.1.2/24	Switch E	Vlan-int400	192.168.4.1/24
Switch B	Vlan-int103	10.110.2.1/24	Switch E	Vlan-int104	10.110.4.2/24
Switch B	Vlan-int102	10.110.3.1/24	Switch E	Vlan-int108	10.110.7.2/24
Switch C	Vlan-int300	192.168.3.1/24	Switch F	Vlan-int109	10.110.9.1/24
Switch C	Vlan-int104	10.110.4.1/24	Switch F	Vlan-int107	10.110.8.2/24
Switch C	Vlan-int105	10.110.5.1/24	Switch F	Vlan-int102	10.110.3.2/24
Switch C	Vlan-int103	10.110.2.2/24	Switch G	Vlan-int500	192.168.5.1/24
Switch C	Vlan-int106	10.110.6.1/24	Switch G	Vlan-int109	10.110.9.2/24
Switch H	Vlan-int110	10.110.10.1/24	Source 1	—	192.168.2.10/24
Switch H	Vlan-int106	10.110.6.2/24	Source 2	—	192.168.3.10/24
Switch I	Vlan-int600	192.168.6.1/24	Source 3	—	192.168.5.10/24
Switch I	Vlan-int110	10.110.10.2/24			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 14, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 100).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on VLAN-interface 101.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch E and Switch I in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IP multicast routing, and enable PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] pim sm
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] pim sm
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim sm
[SwitchB-Vlan-interface103] quit
```

Enable IP multicast routing and PIM-SM on Switch C, Switch D, Switch F, Switch G, and Switch H in the same way Switch B is configured. (Details not shown.)

2. Configure admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 102 and VLAN-interface 103 as the boundaries of admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface102] quit
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface103] quit
```

On Switch C, configure VLAN-interface 103 and VLAN-interface 106 as the boundaries of admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface103] quit
[SwitchC] interface vlan-interface 106
[SwitchC-Vlan-interface106] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface106] quit
```

On Switch D, configure VLAN-interface 107 as the boundary of admin-scoped zone 2.

```
<SwitchD> system-view
[SwitchD] interface vlan-interface 107
[SwitchD-Vlan-interface107] multicast boundary 239.0.0.0 8
[SwitchD-Vlan-interface107] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure the service scope of RP advertisements.

```
[SwitchB] acl basic 2001
[SwitchB-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchB-acl-ipv4-basic-2001] quit
```

Configure VLAN-interface 101 as a C-BSR and a C-RP for admin-scoped zone 1.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 10.110.1.2 scope 239.0.0.0 8
[SwitchB-pim] c-rp 10.110.1.2 group-policy 2001
[SwitchB-pim] quit
```

On Switch D, configure the service scope of RP advertisements.

```
[SwitchD] acl basic 2001
[SwitchD-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchD-acl-ipv4-basic-2001] quit
```

Configure VLAN-interface 105 as a C-BSR and a C-RP for admin-scoped zone 2.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 10.110.5.2 scope 239.0.0.0 8
[SwitchD-pim] c-rp 10.110.5.2 group-policy 2001
[SwitchD-pim] quit
```

On Switch F, configure VLAN-interface 109 as a C-BSR and a C-RP for the global-scoped zone.

```
<SwitchF> system-view
[SwitchF] pim
[SwitchF-pim] c-bsr 10.110.9.1
[SwitchF-pim] c-rp 10.110.9.1
[SwitchF-pim] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 10.110.9.1

```

Example: Configuring PIM-SSM

Network configuration

As shown in Figure 15:

- OSPF runs on the network.
- The receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the SSM mode.
- Host A and Host C are multicast receivers on two stub networks.
- The SSM group range is 232.1.1.0/24.
- IGMPv3 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 15 Network diagram

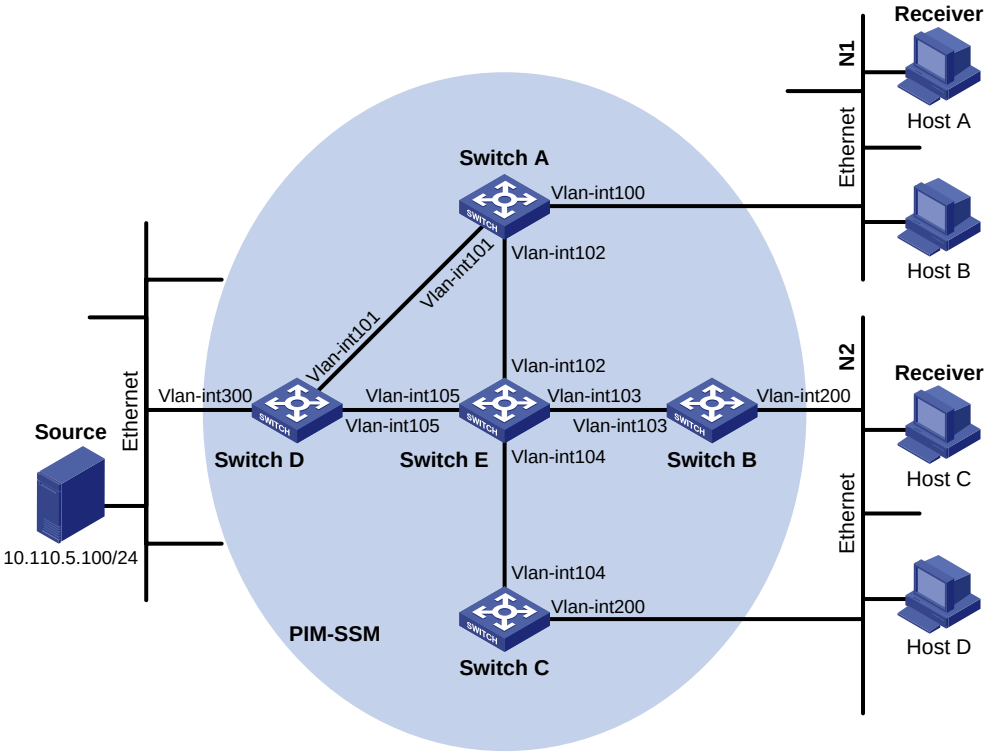

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 15, and configure OSPF on the switches in the PIM-SSM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMPv3 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] igmp version 3
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

Configure the SSM group range 232.1.1.0/24 on Switch A.

```
[SwitchA] acl basic 2000
[SwitchA-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchA-acl-ipv4-basic-2000] quit
[SwitchA] pim
[SwitchA-pim] ssm-policy 2000
[SwitchA-pim] quit
```

Configure the SSM group range on Switch B, Switch C, Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface           NbrCnt HelloInt   DR-Pri     DR-Address
 Vlan101             1      30         1          192.168.1.2
 Vlan102             1      30         1          192.168.9.2
```

Send an IGMPv3 report from Host A to join the multicast source and group (10.110.5.100/24, 232.1.1.1). (Details not shown.)

Display the PIM routing table on Switch A.

```
[SwitchA] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:13:25
     Upstream interface: Vlan-interface101
         Upstream neighbor: 192.168.1.2
         RPF prime neighbor: 192.168.1.2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: igmp, UpTime: 00:13:25, Expires: 00:03:25
```

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
```

```
Total 0 (*, G) entry; 1 (S, G) entry

(10.110.5.100, 232.1.1.1)
    Protocol: pim-ssm, Flag: LOC
    UpTime: 00:12:05
    Upstream interface: Vlan-interface300
        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface105
            Protocol: pim-ssm, UpTime: 00:12:05, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting PIM

A multicast distribution tree cannot be correctly built

Symptom

No multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in a PIM network. This means that a multicast distribution tree cannot be built correctly.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the multicast source or the RP is available.
2. Use the **display pim interface** command to verify PIM information on each interface, especially on the RPF interface. If PIM is not enabled on the interfaces, use the **pim dm** or **pim sm** command to enable PIM-DM or PIM-SM for the interfaces.
3. Use the **display pim neighbor** command to verify that the RPF neighbor is a PIM neighbor.
4. Verify that PIM and IGMP are enabled on the interfaces that directly connect to the multicast sources or the receivers.
5. Use the **display pim interface verbose** command to verify that the same PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same PIM mode is enabled on all devices. For PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

Multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives multicast data but does not create an (S, G) entry in the PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the multicast forwarding boundary settings. Use the **multicast boundary** command to change the multicast forwarding boundary settings to make the multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the multicast source.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the RP is available on each device.
2. Use the **display pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or multicast source registration fails in PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command on each device to view routing table information. Verify that unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display pim bsr-info** command to verify that the BSR information exists on each device.

3. Use the **display pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display pim neighbor** command to verify that PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

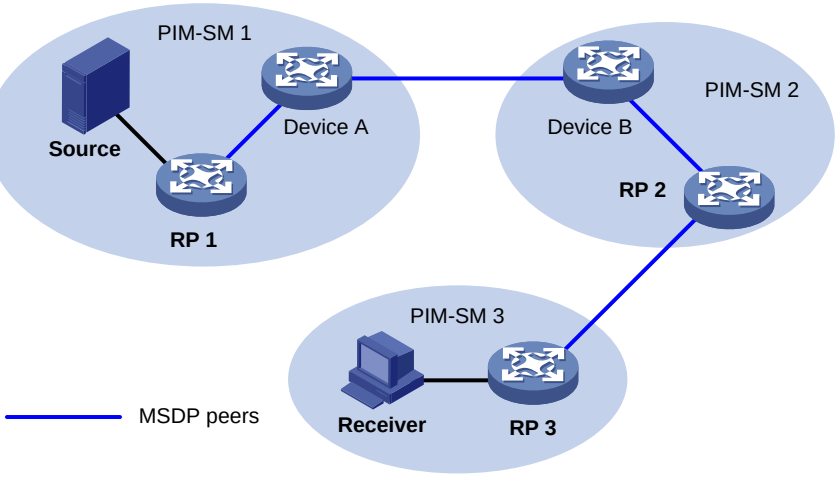
Configuring MSDP

About MSDP

Multicast Source Discovery Protocol (MSDP) is an inter-domain multicast solution that addresses the interconnection of PIM-SM domains. It discovers multicast source information in other PIM-SM domains.

MSDP is applicable only to the ASM model.

How MSDP works



MSDP peer relationships are established between appropriate devices on the network, so that the RPs of different PIM-SM domains are interconnected with one another. These MSDP peers exchange source active (SA) messages, so that the multicast source information is shared among these domains.

For more information about DRs, BSRs, C-BSRs, RPs, C-RPs, SPTs, and RPTs, see "PIM overview."

MSDP peers

One or more pairs of MSDP peers on the network form an MSDP interconnection map.

Figure 1 MSDP peer locations on the network

As shown in Figure 1, an MSDP peer can be created on any PIM-SM device. MSDP peers created on PIM-SM devices that assume different roles function differently.

- MSDP peers created on RPs:
  - **Source-side MSDP peer**—MSDP peer closest to the multicast source, such as RP 1. The source-side RP creates and sends SA messages to its remote MSDP peer to notify the MSDP peer of the locally registered multicast source information.

    A source-side MSDP peer must be created on the source-side RP. Otherwise, it cannot advertise the multicast source information out of the PIM-SM domain.
  - **Receiver-side MSDP peer**—MSDP peer closest to the receivers, typically the receiver-side RP, such as RP 3. After receiving an SA message, the receiver-side MSDP peer resolves the multicast source information carried in the message. Then, it joins the SPT rooted at the multicast source across the PIM-SM domains. When multicast data from the multicast

source arrives, the receiver-side MSDP peer forwards the data to the receivers along the RPT.

- **Intermediate MSDP peer**—MSDP peer with multiple remote MSDP peers, such as RP 2. An intermediate MSDP peer forwards SA messages received from one remote MSDP peer to other remote MSDP peers. It acts as a relay for forwarding multicast source information.

- MSDP peers created on PIM-SM devices that are not RPs:

  Device A and Device B are MSDP peers on multicast devices that are not RPs. Such MSDP peers only forward SA messages.

In a PIM-SM network using the BSR mechanism, the RP is dynamically elected from C-RPs. A PIM-SM network typically has multiple C-RPs to ensure network robustness. Because the RP election result is unpredictable, MSDP peering relationships must be built between all C-RPs to always keep the winning C-RP on the MSDP interconnection map. Losing C-RPs assume the role of common PIM-SM devices on this map.

Inter-domain multicast delivery through MSDP

As shown in Figure 2, an active source (Source) exists in the domain PIM-SM 1, and RP 1 has learned the existence of Source through multicast source registration. RPs in PIM-SM 2 and PIM-SM 3 also seek the location of Source so that multicast traffic from Source can be sent to their receivers. MSDP peering relationships must be established between RP 1 and RP 3 and between RP 3 and RP 2.

Figure 2 Inter-domain multicast delivery through MSDP

The process of implementing PIM-SM inter-domain multicast delivery by leveraging MSDP peers is as follows:

1. When the multicast source in PIM-SM 1 sends the first multicast packet to multicast group G, DR 1 encapsulates the data within a register message. It sends the register message to RP 1, and RP 1 obtains information about the multicast source.
2. As the source-side RP, RP 1 creates SA messages and periodically sends them to its MSDP peer.

   An SA message contains the address of the multicast source (S), the multicast group address (G), and the address of the RP that has created this SA message (RP 1, in this example).

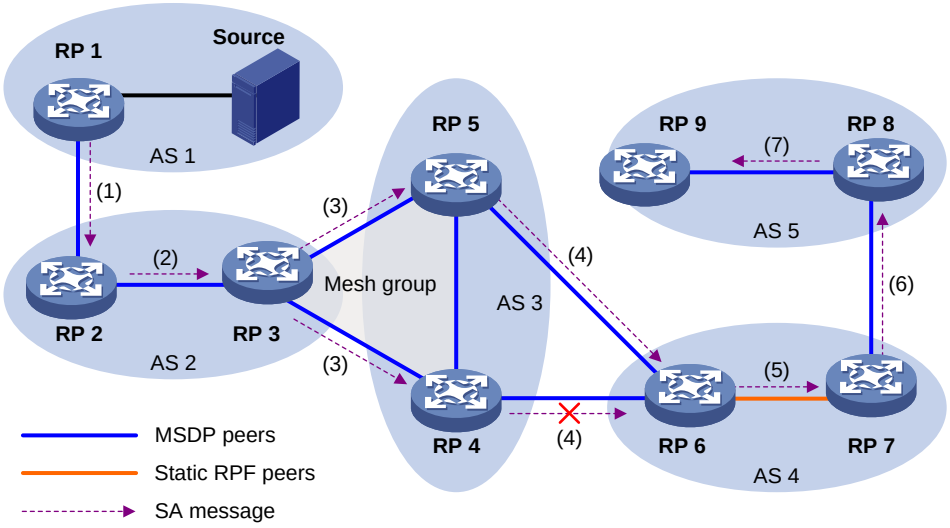
3. On MSDP peers, each SA message undergoes an RPF check and multicast policy-based filtering. Only SA messages that have arrived along the correct path and passed the filtering are received and forwarded. This avoids delivery loops of SA messages. In addition, you can configure MSDP peers into an MSDP mesh group to avoid SA message flooding between MSDP peers. An MSDP mesh group refers to a group of MSDP peers that establish MSDP peering relationships with each other and share the same group name.
4. SA messages are forwarded from one MSDP peer to another. Finally, information about the multicast source traverses all PIM-SM domains with MSDP peers (PIM-SM 2 and PIM-SM 3, in this example).
5. After receiving the SA message that RP 1 created, RP 2 in PIM-SM 2 examines whether any receivers for the multicast group exist in the domain.
   - If a receiver exists in the domain, the RPT for the multicast group G is maintained between RP 2 and the receivers. RP 2 creates an (S, G) entry and sends an (S, G) join message. The join message travels hop by hop toward the multicast source, and the SPT is established across the PIM-SM domains.

     The subsequent multicast data flows to RP 2 along the SPT, and from RP 2 to the receiver-side DR along the RPT. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.
   - If no receivers exist in the domain, RP 2 neither creates an (S, G) entry nor sends a join message toward the multicast source.

In inter-domain multicasting using MSDP, once an RP gets information about a multicast source in another PIM-SM domain, it no longer relies on RPs in other PIM-SM domains. The receivers can override the RPs in other domains and directly join the multicast SPT rooted at the source.

MSDP peer-RPF forwarding

The MSDP peer-RPF check is used for forwarding SA messages on a network that runs MSDP. If the peer-RPF check succeeds, the SA message is accepted and forwarded. Otherwise, the SA message is discarded.



As shown in Figure 3:

- There are five ASs on the network. IGP runs within each AS, and BGP runs between these ASs.
- Each AS contains a minimum of one PIM-SM domain, and each PIM-SM domain contains a minimum of one RP.
- MSDP peering relationship has been established among these RPs.

  RP 3, RP 4, and RP 5 are in the same MSDP mesh group.

  RP 6 is configured as the static RPF peer of RP 7.

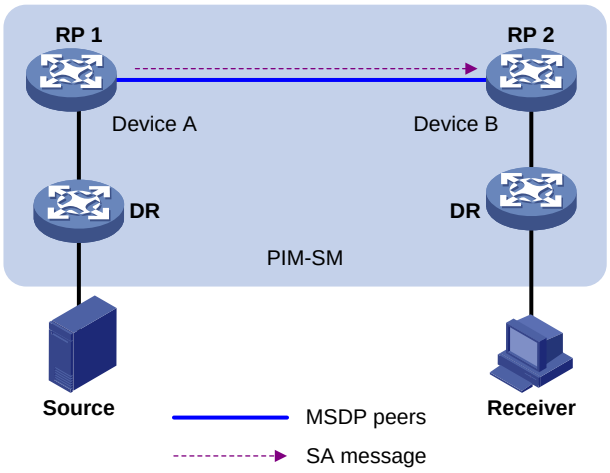
Figure 3 MSDP peer-RPF forwarding

The process of peer-RPF forwarding is as follows:

1. RP 1 creates an SA message and forwards it to its peer RP 2.
2. RP 2 determines that RP 1 is the RP that creates the SA message because the RP address in the SA message is the same as that of RP 1. Then, RP 2 accepts and forwards the SA message.
3. RP 3 accepts and forwards the SA message, because RP 2 and RP 3 reside in the same AS and RP 2 is the next hop of RP 3 to RP 1.
4. RP 4 and RP 5 accept the SA message, because RP 3 is in the same mesh group with them. Then, RP 4 and RP 5 forward the SA message to their peer RP 6 rather than other members of the mesh group.
5. RP 4 and RP 5 reside in the closest AS in the route to RP 1. However, RP 6 accepts and forwards only the SA message from RP 5, because the IP address of RP 5 is higher than that of RP 4.
6. RP 7 accepts and forwards the SA message, because RP 6 is its static RPF peer.
7. RP 8 accepts and forwards the SA message, because RP 7 is the EBGP next hop of the peer-RPF route to RP 1.
8. RP 9 accepts the SA message, because RP 8 is the only RP of RP 9.

Anycast RP through MSDP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup between two or more RPs by configuring multiple RPs with the same IP address for one multicast group. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.



For Anycast RP implemented through MSDP, all member RPs in the Anycast RP set have the same IP address, and MSDP peering connections are established between the RPs.

As shown in Figure 4, within a PIM-SM domain, a multicast source sends multicast data to multicast group G, and the receiver joins the multicast group. To implement Anycast RP through MSDP, complete the following tasks:

1. Assign the same IP address (known as Anycast RP address, typically a private address) to an interface on Device A and Device B.
2. Configure the interfaces as C-RPs.

3. Establish an MSDP peering relationship between Device A and Device B.

Figure 4 Anycast RP through MSDP

The following describes how Anycast RP through MSDP is implemented:

1. After receiving the multicast data from Source, the source-side DR registers with the closest RP (RP 1 in this example).
2. After receiving the IGMP report message from the receiver, the receiver-side DR sends a join message toward the closest RP (RP 2 in this example). An RPT rooted at this RP is established.
3. The RPs share the registered multicast source information through SA messages. After obtaining the multicast source information, RP 2 sends an (S, G) source-specific join message toward the source to create an SPT.
4. When the multicast data reaches RP 2 along the SPT, the RP forwards the data along the RPT to the receiver. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.

MSDP support for VPNs

Interfaces on the multicast devices in a VPN can set up MSDP peering relationships with each other. With the SA messages exchanged between MSDP peers, the multi-instance VPN implements the forwarding of multicast data across different PIM-SM domains.

To support MSDP for VPNs, a multicast device that runs MSDP maintains an independent set of MSDP mechanism for each VPN that it supports. These mechanisms include SA message cache, peering connection, timers, sending cache, and cache for exchanging PIM messages.

One VPN is isolated from another, and MSDP and PIM-SM messages can be exchanged only within the same VPN.

Protocols and standards

- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*

MSDP tasks at a glance

1. Enabling MSDP

2. Creating an MSDP peer
3. (Optional.) Configuring a static RPF peer
4. (Optional.) Configuring an MSDP mesh group
5. (Optional.) Controlling MSDP peering connections
   - Tearing down MSDP peering connections
   - Setting the keepalive timer and peer hold timer for MSDP sessions
   - Setting the MSDP connection retry interval
   - Enabling MD5 authentication for TCP connection establishment
6. (Optional.) Configuring SA message-related parameters
   - Enabling multicast data encapsulation in SA messages
   - Configuring the originating RP of SA messages
   - Configuring SA request messages
   - Configuring SA message policies
   - Configuring the SA cache mechanism
7. (Optional.) Configuring MSDP-based Anycast RP
8. (Optional.) Enabling MSDP NSR
9. (Optional.) Setting the DSCP value for outgoing MSDP protocol packets

Prerequisites for MSDP

Before you configure MSDP, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Configure PIM-SM to enable intra-domain multicast.

Enabling MSDP

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enable MSDP and enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
   By default, MSDP is disabled.

Creating an MSDP peer

About this task

An MSDP peering relationship is identified by an address pair (the addresses of the local MSDP peer and the remote MSDP peer). To create an MSDP peering connection, you must perform the following operation on both devices that are a pair of MSDP peers.

You can configure a description for an MSDP peer to easily distinguish an MSDP peer from other MSDP peers.

Restrictions and guidelines

If an MSDP peer and a BGP peer share the same interface, specify the MSDP peer and the BGP peer by using the same IP address.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Create an MSDP peer.
   peer *peer-address* **connect-interface** *interface-type interface-number*
4. (Optional.) Configure a description for the MSDP peer.
   peer *peer-address* **description** *text*

Configuring a static RPF peer

About this task

You can configure a static RPF peer, so the static RPF peer does not perform RPF check on received SA messages. This simplifies the RPF check mechanism for SA messages.

Restrictions and guidelines

If only one MSDP peer is configured on a device, this MSDP peer is considered to be a static RPF peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure a static RPF peer.
   static-rpf-peer *peer-address* [**rp-policy** *ip-prefix-name*]

Configuring an MSDP mesh group

About this task

This feature avoids SA message flooding among MSDP peers within an AS. It also simplifies the RPF check mechanism because you do not need to run BGP between these MSDP peers.

When receiving an SA message from outside the mesh group, a member MSDP peer performs the RPF check on the SA message. If the SA message passes the RPF check, the member MSDP peer floods the message to the other members in the mesh group. When receiving an SA message from another member, the MSDP peer neither performs an RPF check on the message nor forwards the message to the other members.

To organize multiple MSDP peers in a mesh group, assign the same mesh group name to these MSDP peers.

Restrictions and guidelines

Before you configure an MSDP mesh group, make sure the devices are interconnected with one another.

If you assign an MSDP peer to multiple MSDP mesh groups, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an MSDP mesh group.
   peer *peer-address* **mesh-group** *name*
   By default, an MSDP peer does not belong to any mesh group.

Controlling MSDP peering connections

Tearing down MSDP peering connections

About this task

MSDP peers are interconnected over TCP (port number 639). You can tear down or re-establish MSDP peering connections to control SA message exchange between the MSDP peers. When the connection between two MSDP peers is torn down, SA messages are no longer delivered between them. No attempt is made to re-establish the connection. The configuration information for the peer remains unchanged.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Tear down an MSDP peering connection.
   shutdown *peer-address*
   By default, an MSDP peering connection is active.

Setting the keepalive timer and peer hold timer for MSDP sessions

About this task

MSDP peers periodically send keepalive messages to each other to keep a session alive. When a session is established, an MSDP peer sends a keepalive message to its peer and starts a keepalive timer and a peer hold timer. When the keepalive timer expires, the MSDP peer sends a new keepalive message. If the MSDP peer receives an MSDP message from its peer before the peer hold timer expires, it resets the peer hold timer. Otherwise, the MSDP peer tears down the session.

Because MSDP peers cannot negotiate the keepalive timer and peer hold timer, you must configure the same keepalive timer and peer hold timer for the MSDP peers of a session. The keepalive timer must be smaller than the peer hold timer.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the keepalive timer and peer hold timer for MSDP sessions.

   timer keepalive *keepalive holdtime*

   By default, the keepalive timer and peer hold timer are 60 seconds and 75 seconds, respectively.

   This command immediately takes effect on an established session.

Setting the MSDP connection retry interval

About this task

A TCP connection is required when one of the following conditions exists:

- A new MSDP peer is created.
- A previously deactivated MSDP peering connection is reactivated.
- A previously failed MSDP peer attempts to resume operation.

Perform this task to adjust the interval between MSDP peering connection attempts.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the MSDP connection retry interval.

   timer retry *interval*

   The default setting is 30 seconds.

Enabling MD5 authentication for TCP connection establishment

About this task

To enhance MSDP security, enable MD5 authentication for both MSDP peers to establish a TCP connection. If the MD5 authentication fails, the TCP connection cannot be established.

Restrictions and guidelines

Configure the same authentication method and key for the MSDP peers involved in MD5 authentication to avoid authentication and TCP connection failures.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Configure the device to perform MD5 authentication when establishing a TCP connection with an MSDP peer.

   peer *peer-address* **password** { **cipher** | **simple** } *password*

   By default, the device does not perform MD5 authentication when establishing a TCP connection with an MSDP peer.

Configuring SA message-related parameters

Enabling multicast data encapsulation in SA messages

About this task

Some multicast sources send multicast data at an interval longer than the aging time of (S, G) entries. In this case, the source-side DR must encapsulate multicast data packet-by-packet in register messages and send them to the source-side RP. The source-side RP transmits the (S, G) information to the remote RP through SA messages. Then, the remote RP sends join messages to the source-side DR and builds an SPT. Because the (S, G) entries have timed out, remote receivers can never receive the multicast data from the multicast source.

To avoid this problem, you can enable the source-side RP to encapsulate multicast data in SA messages. As a result, the source-side RP can forward the multicast data in SA messages to its remote MSDP peers. After receiving the SA messages, the remote RP decapsulates the SA messages and forwards the multicast data to the receivers in the local domain along the RPT.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Enable multicast data encapsulation in SA messages.

   encap-data-enable

   By default, an SA message contains only (S, G) entries, but not the multicast data.

Configuring the originating RP of SA messages

About this task

This feature enables an interface to originate SA messages and to use its IP address as the RP address in SA messages. It is typically used in the Anycast-RP application.

By default, the RP address in SA messages originated by a member Anycast-RP is the Anycast-RP address. The SA messages will fail the RPF check on the other members because the RP address in SA messages is the same as the local RP address. In this case, source information cannot be exchanged within the Anycast-RP. To solve the problem, you must specify an interface other than the interface where the member Anycast-RP resides as the originating RP of SA messages.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an interface as the originating RP of SA messages.

   originating-rp *interface-type interface-number*

   By default, SA messages are originated by the actual RPs.

Configuring SA request messages

About this task

By default, after receiving a new join message, a device waits for an SA message to obtain the multicast source information and to join the SPT. You can enable the device to request source information by sending SA request messages to an MSDP peer. This reduces the join latency.

An SA request policy enables the device to filter SA request messages from an MSDP peer by using an ACL that specifies the multicast groups.

Prerequisites

Before you enable the device to send SA requests, make sure you have disabled the SA message cache mechanism by the **undo cache-sa-enable** command.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the device to send SA request messages to an MSDP peer.

   peer *peer-address* **request-sa-enable**

   By default, after receiving a new join message, a device does not send an SA request message to any MSDP peer. Instead, it waits for the next SA message from its MSDP peer.
4. Configure an SA request policy for an MSDP peer.

   peer *peer-address* **sa-request-policy** [**acl** *ipv4-acl-number*]

   By default, no SA request policy exists, and all SA request from an MSDP peer are permitted.

Configuring SA message policies

About this task

To control the propagation of multicast source information, you can configure the following policies:

- **SA creation policy**—Limits the multicast source information advertised in SA messages. This policy enables the device to advertise (S, G) entries based on the used ACL that specifies the multicast sources and groups.
- **SA incoming or outgoing policy**—Limits the receipt or forwarding of SA messages. This policy enables the device to receive or forward SA messages based on the used ACL that specifies the multicast sources and groups.
- **The lower TTL threshold for multicast data packets encapsulated in SA messages**—By default, multicast data packets are encapsulated in SA messages and forwarded to MSDP peers only if the TTL values in the packets are larger than zero. You can set the lower TTL threshold for multicast data packets encapsulated in SA messages that are sent to an MSDP peer. Then, only multicast data packets whose TTL values are larger than or equal to the configured value are encapsulated in SA messages. Only SA messages whose TTL values are larger than or equal to the configured value are forwarded to the specified MSDP peer. This controls the multicast data packet encapsulation and limits the propagation range of the SA messages.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an SA creation policy.

   import-source [**acl** *ipv4-acl-number*]
4. Configure an SA incoming or outgoing policy.

   peer *peer-address* **sa-policy** { **export** | **import** } [**acl** *ipv4-acl-number*]

   By default, no SA incoming or outgoing policy is configured. The device does not filter incoming or outgoing SA messages.
5. Set the lower TTL threshold for multicast data packets encapsulated in SA messages.

   peer *peer-address* **minimum-ttl** *ttl-value*

   The default setting is 0.

Configuring the SA cache mechanism

About this task

The SA cache mechanism enables the device to locally cache (S, G) entries contained in SA messages. It reduces the time for obtaining multicast source information, but increases memory occupation.

With the SA cache mechanism enabled, when the device receives a new (*, G) join message, it searches its SA message cache first.

- If no matching (S, G) entry is found, the device waits for the SA message that its MSDP peer sends in the next cycle.
- If a matching (S, G) entry is found in the cache, the device joins the SPT rooted at S.

To protect the device against DoS attacks, you can set a limit on the number of (S, G) entries in the SA cache from an MSDP peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the SA cache mechanism.
   cache-sa-enable
   By default, the SA message cache mechanism is enabled. The device caches the (S, G) entries contained in the received SA messages.
4. (Optional.) Set the maximum number of (S, G) entries in the SA cache from an MSDP peer.
   peer *peer-address* **sa-cache-maximum** *sa-limit*
   The default setting is 4294967295.

Configuring MSDP-based Anycast RP

1. Configure the same RP on multiple devices.
   For more information about configuring RP, see "Configuring PIM."
2. Establish MSDP peer relationship between the devices. The RP address must be different from the MSDP peer address.
   For more information about establishing MSDP peer relationships, see "Creating an MSDP peer."
   The IP address for establishing MSDP peer relationship must be different from the Anycast RP address.

Enabling MSDP NSR

About this task

This feature enables MSDP to back up protocol state information and data, such as MSDP peer and remote multicast source information, from the active process to standby processes. A standby process seamlessly takes over when the active process fails. Use this feature to avoid forwarding interruption for MSDP when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable MSDP NSR.
   msdp non-stop-routing
   By default, MSDP NSR is disabled.

Setting the DSCP value for outgoing MSDP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MSDP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MSDP protocol packets.

Display and maintenance commands for MSDP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display brief information about MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **brief** [**state** { **connect** | **disabled** | **established** | **listen** | **shutdown** }]
Display MSDP NSR status information.	**display msdp non-stop-routing status**
Display detailed status of MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **peer-status** [*peer-address*]
Display (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address* | *source-address* | *as-number*] *
Display the number of (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-count** [*as-number*]
Reset the TCP connection with an MSDP peer and clear statistics for the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **peer** [*peer-address*]
Delete (S, G) entries in the SA cache.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address*]
Clear statistics for an MSDP peer without resetting the TCP connection with the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **statistics** [*peer-address*]

MSDP configuration examples

Example: Configuring PIM-SM inter-domain multicast

Network configuration

As shown in Figure 5:

- OSPF runs within AS 100 and AS 200 and BGP runs between them.
- Each PIM-SM domain has a minimum of one multicast source or receiver.

Set up MSDP peering relationships between the RPs in the PIM-SM domains to share multicast source information among the PIM-SM domains.

Figure 5 Network diagram

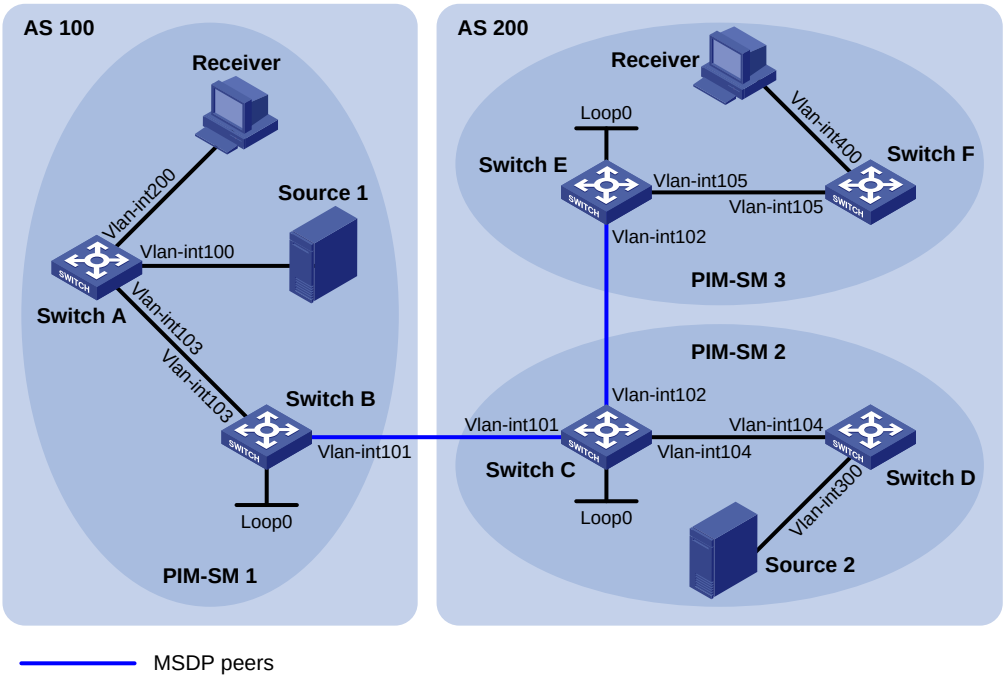


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int103	10.110.1.2/24	Switch D	Vlan-int104	10.110.4.2/24
Switch A	Vlan-int100	10.110.2.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int200	10.110.3.1/24	Switch E	Vlan-int105	10.110.6.1/24
Switch B	Vlan-int103	10.110.1.1/24	Switch E	Vlan-int102	192.168.3.2/24
Switch B	Vlan-int101	192.168.1.1/24	Switch E	Loop0	3.3.3.3/32
Switch B	Loop0	1.1.1.1/32	Switch F	Vlan-int105	10.110.6.2/24
Switch C	Vlan-int104	10.110.4.1/24	Switch F	Vlan-int400	10.110.7.1/24
Switch C	Vlan-int102	192.168.3.1/24	Source 1	—	10.110.2.100/24
Switch C	Vlan-int101	192.168.1.2/24	Source 2	—	10.110.5.100/24
Switch C	Loop0	2.2.2.2/32	Switch D	Vlan-int104	10.110.4.2/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches in the ASs.

Procedure

1. Enable IP multicast routing and PIM-SM, and configure PIM-SM domain borders:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-SM on VLAN-interface 103 and VLAN-interface 100.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim sm
[SwitchA-Vlan-interface103] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 200).

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] igmp enable
[SwitchA-Vlan-interface200] quit
```

Enable IP multicast routing and PIM-SM on Switch B, Switch C, Switch D, Switch E, and Switch F in the same way Switch A is configured. (Details not shown.)

Configure a PIM domain border on Switch B.

```
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] pim bsr-boundary
[SwitchB-Vlan-interface101] quit
```

Configure a PIM domain border on Switch C and Switch E in the same way Switch B is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

Configure Loopback 0 as a C-BSR and a C-RP on Switch B.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 1.1.1.1
[SwitchB-pim] c-rp 1.1.1.1
[SwitchB-pim] quit
```

Configure C-BSRs and C-RPs on Switch C and Switch E in the same way Switch B is configured. (Details not shown.)

3. Configure BGP for mutual route redistribution between BGP and OSPF:

On Switch B, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchB] bgp 100
[SwitchB-bgp] router-id 1.1.1.1
[SwitchB-bgp] peer 192.168.1.2 as-number 200
[SwitchB-bgp] address-family ipv4 unicast
[SwitchB-bgp-ipv4] import-route ospf 1
[SwitchB-bgp-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-ipv4] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchC] bgp 200
```

```
[SwitchC-bgp] router-id 2.2.2.2
[SwitchC-bgp] peer 192.168.1.1 as-number 100
[SwitchC-bgp] address-family ipv4 unicast
[SwitchC-bgp-ipv4] import-route ospf 1
[SwitchC-bgp-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-ipv4] quit
```

Redistribute BGP routes into OSPF on Switch B.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

Redistribute BGP routes into OSPF on Switch C.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

4. Configure MSDP peers:

Configure an MSDP peer on Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] peer 192.168.1.2 connect-interface vlan-interface 101
[SwitchB-msdp] quit
```

Configure an MSDP peer on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 101
[SwitchC-msdp] peer 192.168.3.2 connect-interface vlan-interface 102
[SwitchC-msdp] quit
```

Configure MSDP peers on Switch E.

```
[SwitchE] msdp
[SwitchE-msdp] peer 192.168.3.1 connect-interface vlan-interface 102
[SwitchE-msdp] quit
```

Verifying the configuration

Display information about BGP peer groups on Switch B.

```
[SwitchB] display bgp peer ipv4

 BGP local router ID: 1.1.1.1
 Local AS number: 100
 Total number of peers: 1                 Peers in established state: 1

  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State

  192.168.1.2             200 24       21      0    6       00:20:07 Established
```

Display information about BGP peer groups on Switch C.

```
[SwitchC] display bgp peer ipv4

 BGP local router ID: 2.2.2.2
 Local AS number: 1
 Total number of peers: 1                 Peers in established state: 1

  Peer                    AS  MsgRcvd  MsgSent OutQ PrefRcv Up/Down  State
```

```
  192.168.1.1             100 18       16      0    1       00:20:07 Established
```

Display the BGP routing table on Switch C.

```
[SwitchC] display bgp routing-table ipv4

 Total number of routes: 5

 BGP local router ID is 2.2.2.2
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >  1.1.1.1/32         192.168.1.1     0                     0       100?
* >i 2.2.2.2/32         0.0.0.0         0                     0       ?
* >  192.168.1.0        0.0.0.0         0                     0       ?
* >  192.168.1.1/32     0.0.0.0         0                     0       ?
* >  192.168.1.2/32     0.0.0.0         0                     0       ?
```

Verify that hosts in PIM-SM 1 and PIM-SM 3 can receive the multicast data from Source 1 in PIM-SM 1 and Source 2 in PIM-SM 2. (Details not shown.)

Display brief information about MSDP peer groups on Switch B.

```
[SwitchB] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
192.168.1.2     Established 00:12:57        200        13         0
```

Display brief information about MSDP peer groups on Switch C.

```
[SwitchC] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
192.168.3.2     Established 01:43:57        ?          8          0
192.168.1.1     Established 01:43:57        ?          13         0
```

Display brief information about MSDP peer groups on Switch E.

```
[SwitchE] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
192.168.3.1     Established 01:07:57        200        8          0
```

Display detailed MSDP peer information on Switch B.

```
[SwitchB] display msdp peer-status
MSDP Peer 192.168.1.2; AS 200
 Description:
 Information about connection status:
```

```
  State: Established
  Up/down time: 00:15:47
  Resets: 0
  Connection interface: Vlan-interface101 (192.168.1.1)
  Received/sent messages: 16/16
  Discarded input messages: 0
  Discarded output messages: 0
  Elapsed time since last connection or counters clear: 00:17:40
  Mesh group peer joined: momo
  Last disconnect reason: Hold timer expired with truncated message
  Truncated packet: 5 bytes in buffer, type: 1, length: 20, without packet time: 75s
Information about (Source, Group)-based SA filtering policy:
  Import policy: None
  Export policy: None
Information about SA-Requests:
  Policy to accept SA-Requests: None
  Sending SA-Requests status: Disable
Minimum TTL to forward SA with encapsulated data: 0
SAs learned from this peer: 0, SA cache maximum for the peer: 4294967295
Input queue size: 0, Output queue size: 0
Counters for MSDP messages:
  RPF check failure: 0
  Incoming/outgoing SA: 0/0
  Incoming/outgoing SA-Request: 0/0
  Incoming/outgoing SA-Response: 0/0
  Incoming/outgoing Keepalive: 867/867
  Incoming/outgoing Notification: 0/0
  Incoming/outgoing Traceroutes in progress: 0/0
  Incoming/outgoing Traceroute reply: 0/0
  Incoming/outgoing Unknown: 0/0
  Incoming/outgoing data packet: 0/0
```

Example: Configuring inter-AS multicast by leveraging static RPF peers

Network configuration

As shown in Figure 6:

- The network has two ASs: AS 100 and AS 200. OSPF runs within each AS. BGP runs between the two ASs.
- PIM-SM 1 belongs to AS 100, and PIM-SM 2 and PIM-SM 3 belong to AS 200. Each PIM-SM domain has a minimum of one multicast source or receiver.

Configure inter-AS multicast as follows:

- Configure Loopback 0 as the C-BSR and C-RP of the related PIM-SM domain on Switch A, Switch D and Switch G.
- According to the peer-RPF forwarding rule, the switches accept SA messages that pass the filtering policy from its static RPF peers. To share multicast source information among PIM-SM domains without changing the unicast topology structure, configure MSDP peering

relationships for the RPs of the PIM-SM domains and configure the static RPF peering relationships.

Figure 6 Network diagram

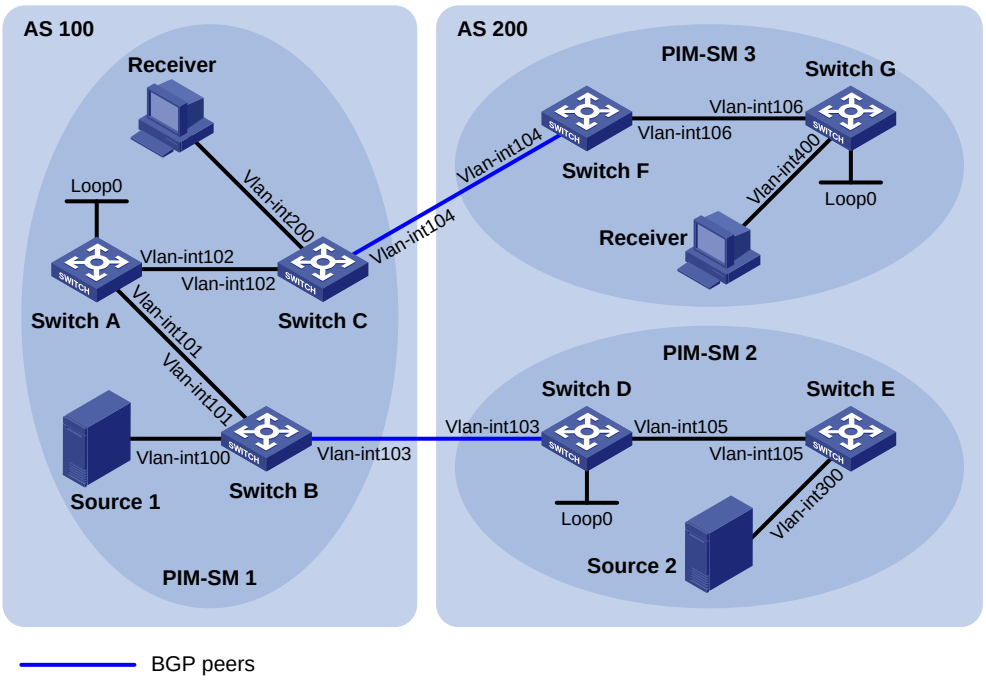

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	192.168.1.100/24	Switch D	Vlan-int105	10.110.5.1/24
Source 2	—	192.168.3.100/24	Switch D	Vlan-int103	10.110.3.2/24
Switch A	Vlan-int101	10.110.1.1/24	Switch D	Loop0	2.2.2.2/32
Switch A	Vlan-int102	10.110.2.1/24	Switch E	Vlan-int105	10.110.5.2/24
Switch A	Loop0	1.1.1.1/32	Switch E	Vlan-int300	192.168.3.1/24
Switch B	Vlan-int101	10.110.1.2/24	Switch F	Vlan-int106	10.110.6.1/24
Switch B	Vlan-int100	192.168.1.1/24	Switch F	Vlan-int104	10.110.4.2/24
Switch B	Vlan-int103	10.110.3.1/24	Switch G	Vlan-int106	10.110.6.2/24
Switch C	Vlan-int102	10.110.2.2/24	Switch G	Vlan-int400	192.168.4.1/24
Switch C	Vlan-int200	192.168.2.1/24	Switch G	Loop0	3.3.3.3/32
Switch C	Vlan-int104	10.110.4.1/24			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Table 2, and configure OSPF on the switches in the ASs.

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP, and configure PIM-SM domain borders:

   # On Switch C, enable IP multicast routing.

   ```
   <SwitchC> system-view
   ```

```
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable PIM-SM on each interface, and enable IGMP on the receiver-side interface (VLAN-interface 200).

```
[SwitchC] interface vlan-interface 102
[SwitchC-Vlan-interface102] pim sm
[SwitchC-Vlan-interface102] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 104
[SwitchC-Vlan-interface104] pim sm
[SwitchC-Vlan-interface104] quit
```

Configure Switch A, Switch B, Switch D, Switch E, Switch F, and Switch G in the same way Switch C is configured. (Details not shown.)

On Switch B, configure the PIM domain borders.

```
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim bsr-boundary
[SwitchB-Vlan-interface103] quit
```

Configure the PIM domain borders on Switch C, Switch D, and Switch F in the same way Switch B is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

On Switch A, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchA] pim
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

Configure C-BSRs and C-RPs on Switch D and Switch G in the same way Switch A is configured. (Details not shown.)

3. Configure BGP, and redistribute BGP routing information into OSPF and OSPF routing information into BGP:

On Switch B, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchB] bgp 100
[SwitchB-bgp] router-id 1.1.1.2
[SwitchB-bgp] peer 10.110.3.2 as-number 200
[SwitchB-bgp] address-family ipv4 unicast
[SwitchB-bgp-ipv4] peer 10.110.3.2 enable
[SwitchB-bgp-ipv4] import-route ospf 1
[SwitchB-bgp-ipv4]quit
[SwitchB-bgp] quit
```

On Switch D, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchD] bgp 200
[SwitchD-bgp] router-id 2.2.2.2
[SwitchD-bgp] peer 10.110.3.1 as-number 100
[SwitchD-bgp] address-family ipv4 unicast
[SwitchD-bgp-ipv4] peer 10.110.3.1 enable
[SwitchD-bgp-ipv4] import-route ospf 1
[SwitchD-bgp-ipv4]quit
```

```
[SwitchD-bgp] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchC] bgp 100
[SwitchC-bgp] router-id 1.1.1.3
[SwitchC-bgp] peer 10.110.4.2 as-number 200
[SwitchC-bgp] address-family ipv4 unicast
[SwitchC-bgp-ipv4] peer 10.110.4.2 enable
[SwitchC-bgp-ipv4] import-route ospf 1
[SwitchC-bgp-ipv4]quit
[SwitchC-bgp] quit
```

On Switch F, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchF] bgp 200
[SwitchF-bgp] router-id 3.3.3.1
[SwitchF-bgp] peer 10.110.4.1 as-number 100
[SwitchF-bgp] address-family ipv4 unicast
[SwitchF-bgp-ipv4] peer 10.110.4.1 enable
[SwitchF-bgp-ipv4] import-route ospf 1
[SwitchF-bgp-ipv4]quit
[SwitchF-bgp] quit
```

On Switch B, redistribute BGP routing information into OSPF.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

On Switch D, redistribute BGP routing information into OSPF.

```
[SwitchD] ospf 1
[SwitchD-ospf-1] import-route bgp
[SwitchD-ospf-1] quit
```

On Switch C, redistribute BGP routing information into OSPF.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route bgp
[SwitchC-ospf-1] quit
```

On Switch F, redistribute BGP routing information into OSPF.

```
[SwitchF] ospf 1
[SwitchF-ospf-1] import-route bgp
[SwitchF-ospf-1] quit
```

4. Configure MSDP peers and static RPF peers:

On Switch A, configure Switch D and Switch G as the MSDP peers and static RPF peers.

```
[SwitchA] ip prefix-list list-dg permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchA] msdp
[SwitchA-msdp] peer 10.110.3.2 connect-interface vlan-interface 101
[SwitchA-msdp] peer 10.110.6.2 connect-interface vlan-interface 102
[SwitchA-msdp] static-rpf-peer 10.110.3.2 rp-policy list-dg
[SwitchA-msdp] static-rpf-peer 10.110.6.2 rp-policy list-dg
[SwitchA-msdp] quit
```

On Switch D, configure Switch A as the MSDP peer and static RPF peer.

```
[SwitchD] ip prefix-list list-a permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchD] msdp
```

```
[SwitchD-msdp] peer 10.110.1.1 connect-interface vlan-interface 103
[SwitchD-msdp] static-rpf-peer 10.110.1.1 rp-policy list-a
[SwitchD-msdp] quit
```

On Switch G, configure Switch A as the MSDP peer and static RPF peer.

```
[SwitchG] ip prefix-list list-a permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchG] msdp
[SwitchG-msdp] peer 10.110.2.1 connect-interface vlan-interface 106
[SwitchG-msdp] static-rpf-peer 10.110.2.1 rp-policy list-a
[SwitchG-msdp] quit
```

Verifying the configuration

Display the BGP peering relationships on Switch A.

```
[SwitchA] display bgp peer
```

No information is output, because no BGP peering relationship has been established between Switch A and Switch D, or between Switch A and Switch G. This means that the unicast topology is not changed.

Display brief information about MSDP peers on Switch A.

```
[SwitchA] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
2            2            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
10.110.3.2      Established 01:07:08        ?          8          0
10.110.6.2      Established 00:16:39        ?          13         0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
10.110.1.1      Established 01:07:09        ?          8          0
```

Display brief information about MSDP peers on Switch G.

```
[SwitchG] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled

```

Verify that receivers in PIM-SM 1 and PIM-SM 3 can receive the multicast data from Source 1 and Source 2 to a multicast group. (Details not shown.)

Example: Configuring Anycast RP

Network configuration

As shown in Figure 7, OSPF runs within the domain to provide unicast routes.

Configure the Anycast RP application so that the receiver-side DRs and the source-side DRs can initiate a join process to their respective RPs that are topologically closest to them.

Configure the router IDs of Switch B and Switch D as 1.1.1.1 and 2.2.2.2, respectively. Set up an MSDP peering relationship between Switch B and Switch D.

Figure 7 Network diagram

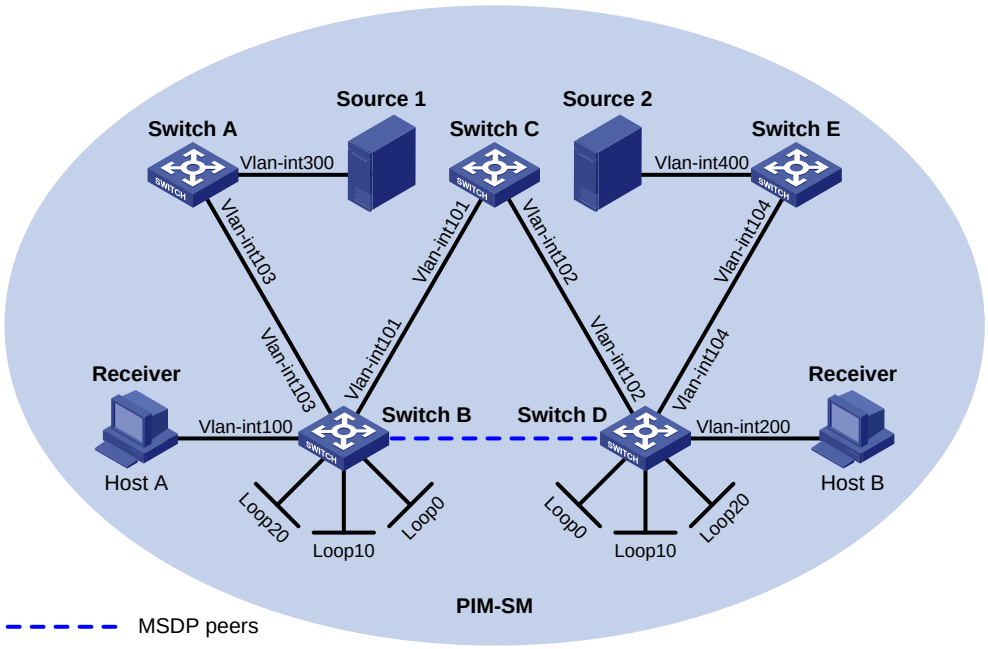

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.5.100/24	Switch C	Vlan-int101	192.168.1.2/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int102	192.168.2.2/24
Switch A	Vlan-int300	10.110.5.1/24	Switch D	Vlan-int200	10.110.3.1/24
Switch A	Vlan-int103	10.110.2.2/24	Switch D	Vlan-int104	10.110.4.1/24
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int102	192.168.2.1/24
Switch B	Vlan-int103	10.110.2.1/24	Switch D	Loop0	2.2.2.2/32
Switch B	Vlan-int101	192.168.1.1/24	Switch D	Loop10	4.4.4.4/32
Switch B	Loop0	1.1.1.1/32	Switch D	Loop20	10.1.1.1/32
Switch B	Loop10	3.3.3.3/32	Switch E	Vlan-int400	10.110.6.1/24
Switch B	Loop20	10.1.1.1/32	Switch E	Vlan-int104	10.110.4.2/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 7, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

Enable IGMP on the receiver-side interface (VLAN-interface 100).

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] igmp enable
[SwitchB-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim sm
[SwitchB-Vlan-interface103] quit
[SwitchB] interface Vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] pim sm
[SwitchB-LoopBack0] quit
[SwitchB] interface loopback 10
[SwitchB-LoopBack10] pim sm
[SwitchB-LoopBack10] quit
[SwitchB] interface loopback 20
[SwitchB-LoopBack20] pim sm
[SwitchB-LoopBack20] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch A, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

Configure Loopback 10 as a C-BSR and Loopback 20 as a C-RP on Switch B.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 3.3.3.3
[SwitchB-pim] c-rp 10.1.1.1
[SwitchB-pim] quit
```

Configure a C-BSR and a C-RP on Switch D in the same way Switch B is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Loopback 0 of Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] originating-rp loopback 0
[SwitchB-msdp] peer 2.2.2.2 connect-interface loopback 0
[SwitchB-msdp] quit
```

Configure an MSDP peer on Loopback 0 of Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] originating-rp loopback 0
[SwitchD-msdp] peer 1.1.1.1 connect-interface loopback 0
[SwitchD-msdp] quit
```

Verifying the configuration

Display brief information about MSDP peers on Switch B.

```
[SwitchB] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0
```

```
Peer address    State       Up/Down time    AS         SA count   Reset count
2.2.2.2         Established 00:10:57        ?          0          0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
1.1.1.1         Established 00:10:57        ?          0          0
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from Source 1 to multicast group 225.1.1.1. (Details not shown.)

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
```

No information is output on Switch D.

Display the PIM routing table on Switch B.

```
[SwitchB] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     RP: 10.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 00:15:04
     Upstream interface: Register-Tunnel0

         1: Vlan-interface200
             Protocol: pim-sm, UpTime:  - , Expires:  -
```

The output shows that Switch D now acts as the RP for Source 2 and Host B.

Example: Configuring SA message filtering

Network configuration

As shown in Figure 8:

- OSPF runs within and among the PIM-SM domains to provide unicast routing.
- Set up an MSDP peering relationship between Switch A and Switch C and between Switch C and Switch D.
- Source 1 sends multicast data to multicast groups 225.1.1.0/30 and 226.1.1.0/30, and Source 2 sends multicast data to the multicast group 227.1.1.0/30.

Configure SA message policies so that:

- Host A and Host B receive the multicast data only addressed to multicast groups 225.1.1.0/30 and 226.1.1.0/30.
- Host C receives the multicast data only addressed to multicast groups 226.1.1.0/30 and 227.1.1.0/30.

Figure 8 Network diagram

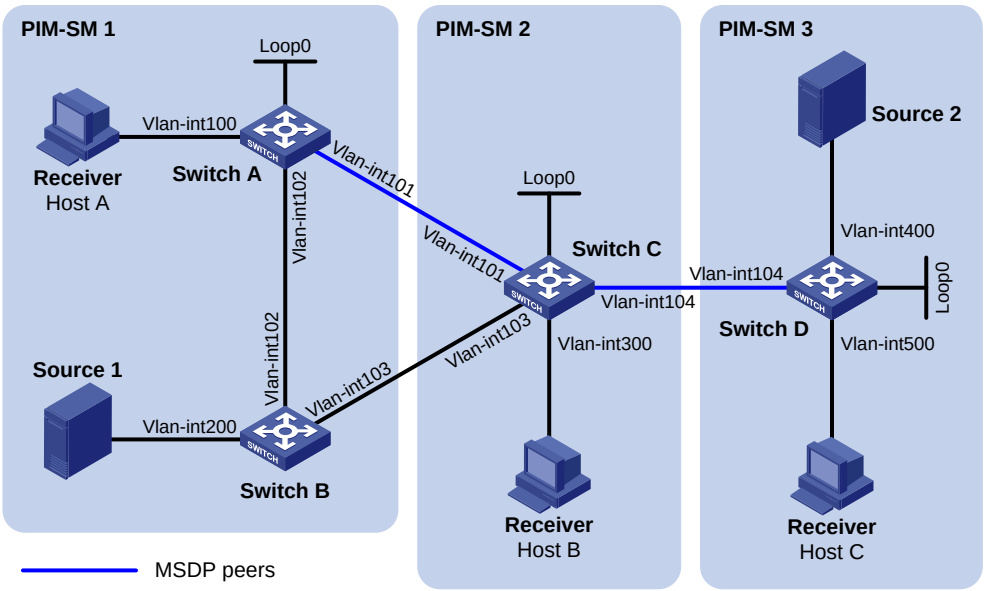

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.3.100/24	Switch C	Vlan-int300	10.110.4.1/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int104	10.110.5.1/24
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	10.110.2.1/24	Switch C	Vlan-int103	192.168.2.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Loop0	2.2.2.2/32
Switch A	Loop0	1.1.1.1/32	Switch D	Vlan-int400	10.110.6.1/24
Switch B	Vlan-int200	10.110.3.1/24	Switch D	Vlan-int500	10.110.7.1/24
Switch B	Vlan-int102	10.110.2.2/24	Switch D	Vlan-int104	10.110.5.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch D	Loop0	3.3.3.3/32

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 8, and configure OSPF on the switches in the PIM-SM domains.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM, and configure PIM domain borders:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface (VLAN-interface 100).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] pim sm
[SwitchA-LoopBack0] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Configure a PIM domain border on Switch C.

```
[SwitchC] interface vlan-interface 101
[SwitchC-Vlan-interface101] pim bsr-boundary
[SwitchC-Vlan-interface101] quit
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] pim bsr-boundary
[SwitchC-Vlan-interface103] quit
[SwitchC] interface vlan-interface 104
[SwitchC-Vlan-interface104] pim bsr-boundary
[SwitchC-Vlan-interface104] quit
```

Configure PIM domain borders on Switch A, Switch B, and Switch D in the same way Switch C is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

Configure Loopback 0 as a C-BSR and a C-RP on Switch A.

```
[SwitchA] pim
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

Configure C-BSRs and C-RPs on Switch C and Switch D in the same way Switch A is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Switch A.

```
[SwitchA] msdp
[SwitchA-msdp] peer 192.168.1.2 connect-interface vlan-interface 101
[SwitchA-msdp] quit
```

Configure MSDP peers on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 101
[SwitchC-msdp] peer 10.110.5.2 connect-interface vlan-interface 104
[SwitchC-msdp] quit
```

Configure an MSDP peer on Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] peer 10.110.5.1 connect-interface vlan-interface 104
[SwitchD-msdp] quit
```

4. Configure SA message policies:

Configure an SA accepting and forwarding policy on Switch C so that Switch C will not forward SA messages for (Source 1, 225.1.1.0/30) to Switch D.

```
[SwitchC] acl advanced 3001
[SwitchC-acl-ipv4-adv-3001] rule deny ip source 10.110.3.100 0 destination 225.1.1.0
0.0.0.3
[SwitchC-acl-ipv4-adv-3001] rule permit ip source any destination any
[SwitchC-acl-ipv4-adv-3001] quit
[SwitchC] msdp
[SwitchC-msdp] peer 10.110.5.2 sa-policy export acl 3001
[SwitchC-msdp] quit
```

Configure an SA creation policy on Switch D so that Switch D will not create SA messages for Source 2.

```
[SwitchD] acl basic 2001
[SwitchD-acl-ipv4-basic-2001] rule deny source 10.110.6.100 0
[SwitchD-acl-ipv4-basic-2001] quit
[SwitchD] msdp
[SwitchD-msdp] import-source acl 2001
[SwitchD-msdp] quit
```

Verifying the configuration

Display the (S, G) entries in the SA message cache on Switch C.

```
[SwitchC] display msdp sa-cache
 MSDP Total Source-Active Cache - 8 entries
 Matched 8 entries

Source        Group          Origin RP       Pro  AS     Uptime   Expires
10.110.3.100  225.1.1.0      1.1.1.1         ?    ?      02:03:30 00:05:31

```

Troubleshooting MSDP

This section describes common MSDP problems and how to troubleshoot them.

MSDP peers stay in disabled state

Symptom

The configured MSDP peers stay in disabled state.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Use the **display current-configuration** command to verify that the local interface address and the MSDP peer address of the remote device are the same.
4. If the problem persists, contact H3C Support.

No SA entries exist in the device's SA message cache

Symptom

MSDP fails to send (S, G) entries through SA messages.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Verify the configuration of the **import-source** command and its *ipv4-acl-number* argument, and make sure the ACL rule filters appropriate (S, G) entries.
4. If the problem persists, contact H3C Support.

No exchange of locally registered (S, G) entries between RPs

Symptom

RPs fail to exchange their locally registered (S, G) entries with one another in the Anycast RP application.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will establish an MSDP peering relationship.
3. Verify the configuration of the **originating-rp** command. In the Anycast RP application environment, use the **originating-rp** command to configure the RP address in the SA messages, which must be the local interface address.
4. Verify that the C-BSR address is different from the Anycast RP address.
5. If the problem persists, contact H3C Support.

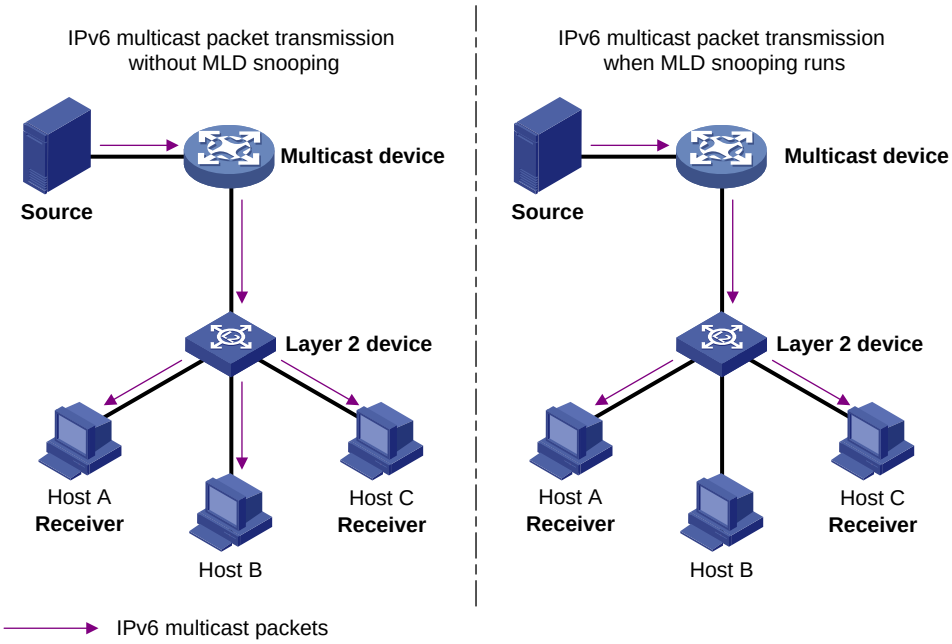
Configuring MLD snooping



About MLD snooping

MLD snooping runs on a Layer 2 device as an IPv6 multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from MLD messages that are exchanged between the hosts and the Layer 3 device.

Fundamentals of MLD snooping

As shown in Figure 1, when MLD snooping is not enabled, the Layer 2 switch floods IPv6 multicast packets all hosts in a VLAN. When MLD snooping is enabled, the Layer 2 switch forwards multicast packets of known IPv6 multicast groups to only the receivers.

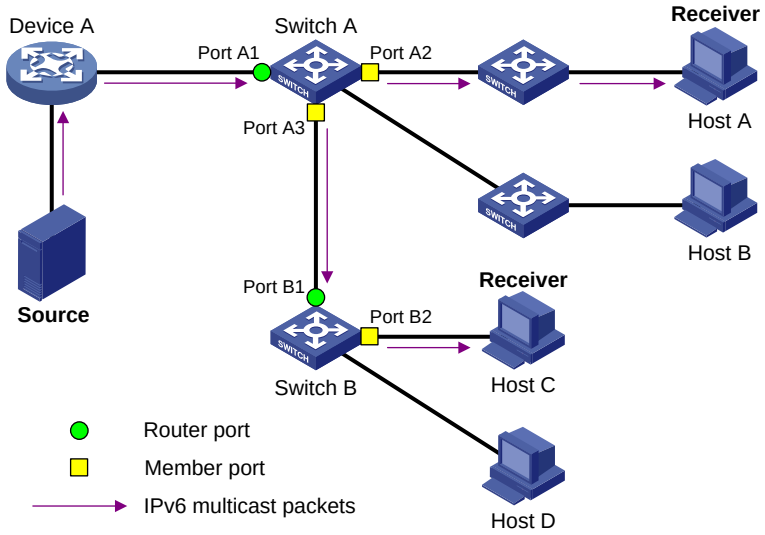


Figure 1 Multicast packet transmission processes without and with MLD snooping

MLD snooping ports

As shown in Figure 2, MLD snooping runs on Switch A and Switch B, and Host A and Host C are receiver hosts in an IPv6 multicast group. MLD snooping ports are divided into member ports and router ports.

Figure 2 MLD snooping ports

Router ports

On an MLD snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an MLD general query whose source address is not 0::0 or receives an IPv6 PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in MLD snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in MLD snooping is a Layer 2 interface.

Member ports

On an MLD snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an MLD report, it is added to the associated dynamic MLD snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an MLD report before the timer expires, the timer is reset. If the port does not receive an MLD report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static MLD snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How MLD snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

MLD messages include general query, MLD report, and done message. An MLD snooping-enabled Layer 2 device performs differently depending on the MLD message types.

General query

The MLD querier periodically sends MLD general queries to all hosts and devices on the local subnet to check for the existence of IPv6 multicast group members.

After receiving an MLD general query, the Layer 2 device forwards the query to all ports in the VLAN except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the router port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

MLD report

A host sends an MLD report to the MLD querier for the following purposes:

- Responds to queries if the host is an IPv6 multicast group member.
- Applies for an IPv6 multicast group membership.

After receiving an MLD report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN. It also resolves the IPv6 address of the reported IPv6 multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry for the group with the receiving port an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the port as a dynamic member port to the forwarding entry and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an MLD report through a non-router port because of the host MLD report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their MLD reports upon receiving MLD reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Done message

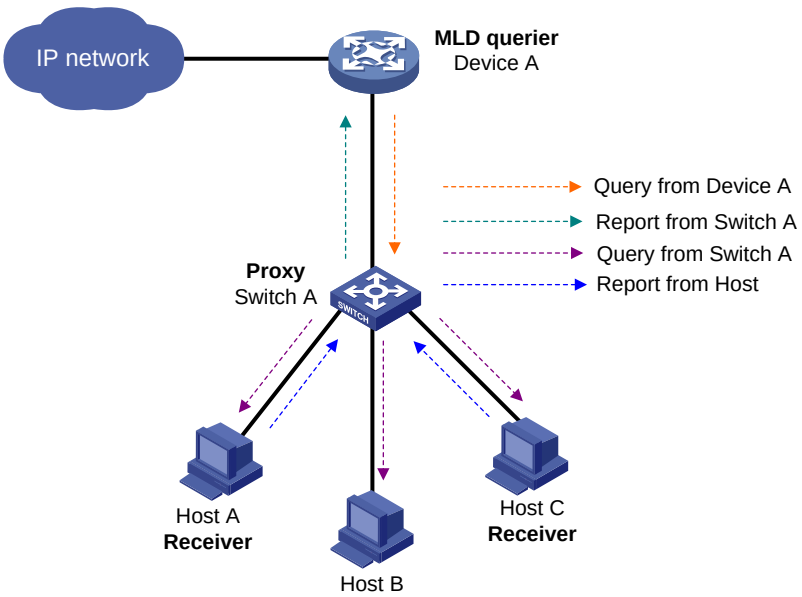
When a host leaves an IPv6 multicast group, the host sends an MLD done message to the Layer 3 devices. When the Layer 2 device receives the MLD done message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the IPv6 multicast group address in the message.

- If no match is found, the Layer 2 device discards the MLD done message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the MLD done message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:

- Discards the MLD done message.
- Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
- Sets the aging timer for the receiving port to twice the MLD last listener query interval.

- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the MLD done message to all router ports in the VLAN.
  - Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the MLD last listener query interval.

After receiving the MLD done message on a port, the MLD querier resolves the IPv6 multicast group address in the message. Then, it sends an MLD multicast-address-specific query to the IPv6 multicast group through the receiving port.



After receiving the MLD multicast-address-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN. Then, it waits for the responding MLD report from the directly connected hosts. For the dynamic member port that received the done message, the Layer 2 device also performs one of the following actions:

- If the port receives an MLD report before the aging timer expires, the Layer 2 device resets the aging timer for the port.
- If the port does not receive any MLD report messages when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the IPv6 multicast group.

MLD snooping proxying

As shown in Figure 3, to reduce the number of MLD report and done messages received by the upstream device, you can enable MLD snooping proxying on the edge device. With MLD snooping proxying enabled, the edge device acts as a host for the upstream MLD snooping querier to send MLD report and done messages to Device A. The host MLD report suppression mechanism on the edge device does not take effect. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Figure 3 MLD snooping proxying

The MLD snooping proxy device processes different MLD messages as follows:

- General query.

  After receiving an MLD general query, the device forwards the query to all ports in the VLAN except the receiving port. The device also generates an MLD report based on the local membership information and sends the report to all router ports.

- Multicast-address-specific query or multicast-address-and-source-specific query.

  After receiving an MLD multicast-address-specific query or multicast-address-and-source-specific query, the device forwards the query to all ports in the VLAN except the receiving port. If the forwarding entry has a member port, the device sends a response to all router ports in the VLAN.

- Report.

  After receiving an MLD report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Done message.

  After receiving the MLD done message on a port, the device sends an MLD multicast-address-specific query through the receiving port. The device sends the MLD done message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: MLD snooping configuration

For MLD reports received from secondary VLANs, the relevant MLD snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable MLD snooping only for the primary VLAN. The configuration made in secondary VLANs will not take effect. For more information about primary VLANs and secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

The MLD snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in MLD-snooping view. The VLAN-specific configuration and the configuration made in MLD-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in MLD-snooping view. The interface-specific configuration takes priority over the configuration made in MLD-snooping view.

VLAN-based MLD snooping tasks at a glance

To configure MLD snooping for VLANs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:
   - Enabling MLD snooping globally
   - Enabling MLD snooping for VLANs
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Configuring static IPv6 multicast MAC address entries
   - Setting the MLD last listener query interval
4. (Optional.) Configuring MLD snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
5. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
   - Enabling the device to send MLD general queries upon a path change
6. (Optional.) Enabling MLD snooping proxying
7. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
8. (Optional.) Configuring MLD snooping policies
   - Configuring an IPv6 multicast group policy
   - Enabling IPv6 multicast source port filtering
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
   - Setting the maximum number of IPv6 multicast groups on a port
   - Enabling IPv6 multicast group replacement
   - Enabling host tracking
9. (Optional.) Setting the DSCP value for outgoing MLD protocol packets

Enabling the MLD snooping feature

About this task

You must enable the MLD snooping feature before you configure other MLD snooping features.

Procedure

1. Enter system view.
   system-view
2. Enable the MLD snooping feature and enter MLD-snooping view.
   mld-snooping
   By default, the MLD snooping feature is disabled.

Enabling MLD snooping

Enabling MLD snooping globally

About this task

After you enable MLD snooping globally, MLD snooping is enabled for all VLANs. You can disable MLD snooping for a VLAN when MLD snooping is globally enabled.

Restrictions and guidelines

To configure other MLD snooping features for VLANs, you must enable MLD snooping for the specific VLANs even though MLD snooping is enabled globally.

The VLAN-specific MLD snooping configuration takes priority over the global MLD snooping configuration. For example, if you enable MLD snooping globally and then use the **mld-snooping disable** command to disable MLD snooping for a VLAN, MLD snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping globally.
   global-enable
   By default, MLD snooping is disabled globally.
4. (Optional.) Disable MLD snooping for a VLAN.
   a. Return to system view.
      quit
   b. Enter VLAN view.
      vlan *vlan-id*
   c. Disable MLD snooping for the VLAN.
      mld-snooping disable
      By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for VLANs

Restrictions and guidelines

You can enable MLD snooping for multiple VLANs by using the **enable vlan** command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view.

MLD snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling MLD snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping for multiple VLANs.
   enable vlan *vlan-list*

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping for the VLAN.
   mld-snooping enable

   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Configuring basic MLD snooping features

Specifying an MLD snooping version

About this task

Different MLD snooping versions can process different versions of MLD messages:

- MLDv1 snooping can process MLDv1 messages and MLDv2 queries, but it floods MLDv2 reports in the VLAN instead of processing them.
- MLDv2 snooping can process MLDv1 and MLDv2 messages.

Restrictions and guidelines

If you change the version of MLD snooping from 2 to 1, the system performs the following actions:

- Clears all MLD snooping forwarding entries that are dynamically created.
- Keeps static MLDv2 snooping forwarding entries (*, G).
- Clears static MLDv2 snooping forwarding entries (S, G), which will be restored when MLD snooping is switched back to MLDv2 snooping.

For more information about static MLD snooping forwarding entries, see "Configuring a static member port."

Specifying an MLD snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Specify an MLD snooping version for multiple VLANs.

version *version-number* **vlan** *vlan-list*

By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an MLD snooping version for the VLAN.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VLAN is 1.

Setting the maximum number of MLD snooping forwarding entries

About this task

You can modify the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum number of MLD snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of MLD snooping forwarding entries is 4294967295.

Configuring static IPv6 multicast MAC address entries

About this task

In Layer 2 IPv6 multicast, IPv6 multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as MLD snooping). You can also manually configure static IPv6 multicast MAC address entries by binding IPv6 multicast MAC addresses and ports to control the destination ports of the IPv6 multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static IPv6 multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static IPv6 multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static IPv6 multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the MLD last listener query interval

About this task

A receiver host starts a report delay timer for an IPv6 multicast group when it receives an MLD multicast-address-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the group.

The MLD last listener query interval defines the maximum response time advertised in MLD multicast-address-specific queries. Set an appropriate value for the MLD last listener query interval to speed up hosts' responses to MLD multicast-address-specific queries and avoid MLD report traffic bursts.

Setting the MLD last listener query interval globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the MLD last listener query interval globally.
   last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.

Setting the MLD last listener query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD last listener query interval for the VLAN
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VLAN.

Configuring MLD snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an MLD general query or IPv6 PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an MLD report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports based on the actual network requirement. For example, if the memberships of IPv6 multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports.

If a dynamic router port receives an IPv6 PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **mld-snooping router-aging-time** command does not take effect on the port.

MLD multicast-address-specific queries originated by the Layer 2 device trigger the adjustment of aging timers of dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the MLD last listener query interval. For more information about setting the MLD last listener query interval on the Layer 2 device, see "Setting the MLD last listener query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   mld-snooping router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds for a VLAN.
4. Set the aging timer for dynamic member ports in the VLAN.
   mld-snooping host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds for a VLAN.

Configuring a static member port

About this task

You can configure a port as a static member port for an IPv6 multicast group so that all hosts attached to the port can always receive IPv6 multicast data for the group. The static member port does not respond to MLD queries. When you complete or cancel this configuration, the port does not send an unsolicited report or done message.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.
   mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*
   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for an IPv6 multicast group so that all IPv6 multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.
   mld-snooping static-router-port vlan *vlan-id*
   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited MLD report when you complete the configuration.
- It responds to MLD general queries with MLD reports.

- It sends an MLD done message when you remove the configuration.

The version of MLD running on the simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same ways as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*

   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message. The device no longer sends or forwards MLD multicast-address-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts attached in a VLAN. If you do so, the remaining receivers cannot receive IPv6 multicast data for a group after a receiver leaves the group.

As a best practice to avoid multicast service interruption on other ports in the same VLAN, enable only MLD snooping fast-leave processing on a port on a network configured with both MLD snooping and MLD. Do not use the **mld fast-leave** command to enable MLD fast-leaving processing. For more information about the **mld fast-leave** command, see MLD commands in *IP Multicast Command Reference*.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]

   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*

- Enter Layer 2 aggregate interface view.
  interface bridge-aggregation *interface-number*

3. Enable fast-leave processing on the port.
   mld-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send MLD general queries or IPv6 PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All IPv6 multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive IPv6 multicast data that it does not expect.
- The port forwards the MLD general queries or IPv6 PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the MLD querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable the port from becoming a dynamic router port when receiving either of the messages. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.
   mld-snooping router-port-deny [**vlan** *vlan-list*]
   By default, a port is allowed to become a dynamic router port.

Configuring the MLD snooping querier

Enabling the MLD snooping querier

About this task

This feature enables the Layer 2 device to periodically send MLD general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an MLD snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the MLD snooping querier on an IPv6 multicast network that runs MLD. An MLD snooping querier does not participate in MLD querier elections. However, it might affect MLD querier elections if it sends MLD general queries with a low source IPv6 address. For more information about MLD queries, see "Configuring MLD."

Enabling the MLD snooping querier for a VLAN

1. Enter system view.
   `system-view`
2. Enter VLAN view.
   `vlan` *`vlan-id`*
3. Enable the MLD snooping querier for the VLAN.
   `mld-snooping querier`
   By default, the MLD snooping querier is disabled for a VLAN.

Enabling MLD snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN, configure multiple queriers in the VLAN and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for MLD snooping querier election is the same as that for MLD querier election. For more information about MLD querier election, see "Configuring MLD."

Prerequisites

Before you enable MLD snooping querier election, you must complete the following tasks:

- Enable the MLD snooping querier for a VLAN. For more information about enabling the MLD snooping querier, see "Enabling the MLD snooping querier."
- Configure the source IPv6 address for MLD general queries as an IPv6 address different from :: and the local querier IPv6 address. An MLD snooping querier performs querier election only if the source IPv6 address of a received MLD general query is not :: or its own IPv6 address.
- Make sure the candidate MLD snooping queriers run the same MLD snooping version. To specify the MLD snooping version, use the **`mld-snooping version`** command.

Enabling MLD snooping querier election for a VLAN

1. Enter system view.
   `system-view`
2. Enter VLAN view.
   `vlan` *`vlan-id`*
3. Enable MLD snooping querier election for the VLAN.
   `mld-snooping querier-election`
   By default, MLD snooping querier election is disabled for a VLAN.

Configuring parameters for MLD general queries and responses

About this task

You can modify the MLD general query interval based on the actual network conditions.

A receiver host starts a report delay timer for each IPv6 multicast group that it has joined when it receives an MLD general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the corresponding IPv6 multicast group.

Set an appropriate value for the maximum response time for MLD general queries to speed up hosts' responses to MLD general queries and avoid MLD report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting IPv6 multicast group members, make sure the MLD general query interval is greater than the maximum response time for MLD general queries.

Configuring parameters for MLD general queries and responses globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum response time for MLD general queries.
   max-response-time *seconds*

   By default, the maximum response time for MLD general queries is 10 seconds.

Configuring parameters for MLD general queries and responses for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD general query interval in the VLAN.
   mld-snooping query-interval *interval*

   By default, the MLD general query interval for a VLAN is 125 seconds.
4. Set the maximum response time for MLD general queries in the VLAN.
   mld-snooping max-response-time *seconds*

   By default, the maximum response time for MLD general queries for a VLAN is 10 seconds.

Enabling the device to send MLD general queries upon a path change

About this task

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the path changes. This feature ensures that the device can update the member port information in IPv6 multicast forwarding entries and switch IPv6 multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the MLD snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.

mld-snooping

3. Enable the device to send MLD general queries upon a path change.

   send-query enable

   By default, the device does not send MLD general queries upon a path change.

Enabling MLD snooping proxying

About MLD snooping proxying

The device enabled with MLD snooping proxying is called an MLD snooping proxy. The MLD snooping proxy acts as a host to the upstream device. Enabled with MLD snooping querier, the MLD snooping proxy acts as the router to downstream devices and receives report and done messages on behalf of the upstream device. As a best practice, enable MLD snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling MLD snooping proxying

Before you enable MLD snooping proxying for a VLAN, you must first enable MLD snooping globally and enable MLD snooping for the VLAN. MLD snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with MLD snooping querier. For more information about enabling MLD snooping querier, see "Enabling the MLD snooping querier."

Enabling MLD snooping proxying for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable MLD snooping proxying for the VLAN.

   mld-snooping proxy enable

   By default, MLD snooping proxying is disabled for a VLAN.

Configuring parameters for MLD messages

Configuring source IPv6 addresses for MLD messages

About this task

You can change the source IPv6 address of the MLD queries sent by an MLD snooping querier. This configuration might affect MLD querier election within the subnet.

You can also change the source IPv6 address of MLD reports or done messages sent by a simulated member host or an MLD snooping proxy.

Configuring the source IPv6 addresses for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Configure the source IPv6 address for MLD general queries.

   mld-snooping general-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

4. Configure the source IPv6 address for MLD multicast-address-specific queries.

   mld-snooping special-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

   - The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.
   - The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
   - FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.

5. Configure the source IPv6 address for MLD reports.

   mld-snooping report source-ip *ipv6-address*

   By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Setting the 802.1p priority for MLD messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards MLD messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to MLD messages that are created or forwarded by the device.

Setting the 802.1p priority for MLD messages globally

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Set the 802.1p priority for MLD messages globally.

   dot1p-priority *priority*

   By default, the 802.1p priority for MLD messages is not set.

Setting the 802.1p priority for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

vlan *vlan-id*

3. Set the 802.1p priority for MLD messages in the VLAN.
   mld-snooping dot1p-priority *priority*
   By default, the 802.1p priority for MLD messages is not set.

Configuring MLD snooping policies

Configuring an IPv6 multicast group policy

About this task

This feature enables the Layer 2 device to filter MLD reports by using an ACL that specifies the IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that receiver hosts can join. This configuration takes effect on the IPv6 multicast groups that ports join dynamically.

In an IPv6 multicast application, a host sends an unsolicited MLD report when a user requests an IPv6 multicast program. The Layer 2 device uses the IPv6 multicast group policy to filter the MLD report. The host can join the IPv6 multicast group only if the MLD report is permitted by the IPv6 multicast group policy.

Configuring an IPv6 multicast group policy globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Configure an IPv6 multicast group policy globally.
   group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Configuring an IPv6 multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure an IPv6 multicast group policy on the port.
   mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist on a port. Hosts attached to the port can join any IPv6 multicast groups.

Enabling IPv6 multicast source port filtering

About this task

This feature enables the Layer 2 device to discard all IPv6 multicast data packets and to accept IPv6 multicast protocol packets. You can enable this feature on ports that connect to only IPv6 multicast receivers.

The configuration made in MLD-snooping view has the same priority over the interface-specific configuration.

Restrictions and guidelines

When IPv6 multicast source port filtering is enabled, the device automatically enables IPv4 multicast source port filtering.

The configuration made in MLD-snooping view has the same priority as the interface-specific configuration, and the most recent configuration takes effect.

Enabling IPv6 multicast source port filtering in MLD-snooping view

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast source port filtering globally.
   source-deny port *interface-list*
   By default, IPv6 multicast source port filtering is disabled globally.

Enabling IPv6 multicast source port filtering in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 Ethernet interface view.
   interface *interface-type interface-number*
3. Enable IPv6 multicast source port filtering on the port.
   mld-snooping source-deny
   By default, IPv6 multicast source port filtering is disabled on a port.

Enabling dropping unknown IPv6 multicast data

About this task

Unknown IPv6 multicast data refers to IPv6 multicast data for which no forwarding entries exist in the MLD snooping forwarding table. This feature enables the device to forward unknown IPv6 multicast data only to the router port. If the device does not have a router port, unknown IPv6 multicast data will be dropped.

If you do not enable this feature, the unknown IPv6 multicast data is flooded in the VLAN to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv6 multicast data is enabled, the device also drops unknown IPv4 multicast data.

When this feature is enabled for a VLAN, the device still forwards unknown IPv6 multicast data out of router ports (except the receiving router port) in this VLAN.

If the outgoing ports of the IPv6 multicast forwarding entry for a Layer 3 IPv6 multicast packet are in the same VLAN, enable dropping unknown IPv6 multicast data for the VLAN as a best practice. This restriction prevents the device from flooding the Layer 3 IPv6 multicast packet in the VLAN.

This feature cannot drop IPv6 multicast data packets that have inconsistent destination multicast MAC address and destination multicast IPv6 address.

Enabling dropping unknown IPv6 multicast data globally

1. Enter system view.

system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Enable dropping unknown IPv6 multicast data globally.

   drop-unknown

   By default, this feature is disabled, and unknown IPv6 multicast data is flooded.

   Support for this command depends on the device model.

Enabling dropping unknown IPv6 multicast data for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable dropping unknown IPv6 multicast data for the VLAN.

   mld-snooping drop-unknown

   By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling MLD report suppression

About this task

This feature enables the Layer 2 device to forward only the first MLD report for an IPv6 multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce the multicast traffic.

Procedure

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Enable MLD report suppression.

   report-aggregation

   By default, MLD report suppression is enabled.

Setting the maximum number of IPv6 multicast groups on a port

About this task

You can set the maximum number of IPv6 multicast groups on a port to regulate the port traffic. This feature takes effect only on the IPv6 multicast groups that the port joins dynamically.

If the number of IPv6 multicast groups on a port exceeds the limit, the system removes all the forwarding entries related to that port. In this case, the receiver hosts attached to that port can join IPv6 multicast groups again before the number of IPv6 multicast groups on the port reaches the limit. When the number of IPv6 multicast groups on the port reaches the limit, the port automatically drops MLD reports for new IPv6 multicast groups.

Procedure

1. Enter system view.

system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of IPv6 multicast groups on the port.
   mld-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of IPv6 multicast groups on a port.

Enabling IPv6 multicast group replacement

About this task

When IPv6 multicast group replacement is enabled, the port does not drop MLD reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves an IPv6 multicast group that has the lowest IPv6 address and joins the new group contained in the MLD report. The IPv6 multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that the port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the MLD snooping forwarding entries on the device reaches the upper limit.
- The IPv6 multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling IPv6 multicast group replacement globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled globally.

Enabling IPv6 multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable IPv6 multicast group replacement on the port.
   mld-snooping overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving IPv6 multicast data. The information includes IPv6 addresses of the hosts, length of time elapsed since the hosts joined IPv6 multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   mld-snooping host-tracking
   By default, host tracking is disabled in a VLAN.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Display and maintenance commands for MLD snooping

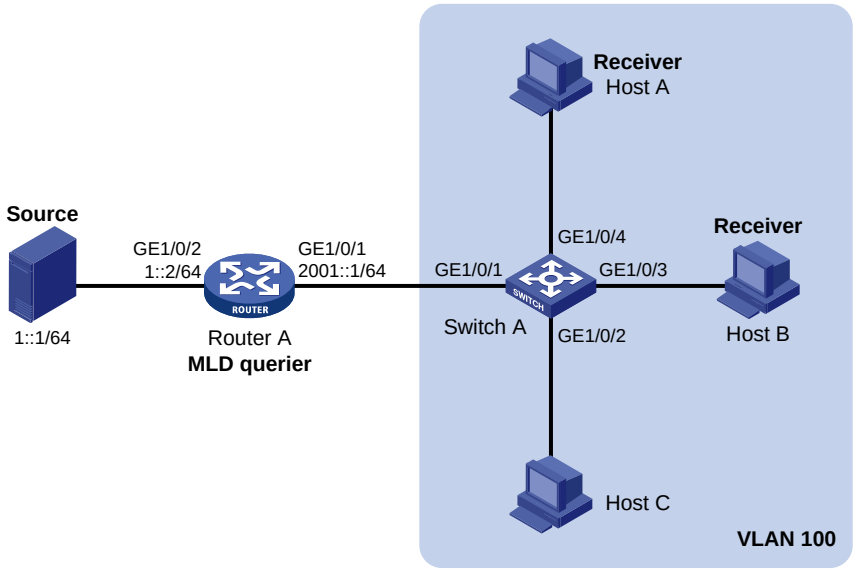
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display Layer 2 IPv6 multicast fast forwarding entries.	**display ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IPv6 multicast groups.	**display ipv6 l2-multicast ip** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 multicast group entries.	**display ipv6 l2-multicast ip forwarding** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id*] [**slot** *slot-number*]
Display information about Layer 2 IPv6 MAC multicast groups.	**display ipv6 l2-multicast mac** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display Layer 2 IPv6 MAC multicast group entries.	**display ipv6 l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id*] [**slot** *slot-number*]
Display static IPv6 multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Display MLD snooping status.	**display mld-snooping** [**global** | **vlan** *vlan-id*]
Display dynamic MLD snooping group entries.	**display mld-snooping group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display mld-snooping host-tracking vlan** *vlan-id* **group** *ipv6-group-address* [**source** *ipv6-source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display mld-snooping router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static MLD snooping group entries.	**display mld-snooping static-group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display mld-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**display mld-snooping statistics**

Task	Command
Clear Layer 2 IPv6 multicast fast forwarding entries.	**reset ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear dynamic MLD snooping group entries.	**reset mld-snooping group** { *ipv6-group-address* [*ipv6-source-address*] | **all** } [**vlan** *vlan-id*]
Clear dynamic router port information.	**reset mld-snooping router-port** { **all** | **vlan** *vlan-id* }
Clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**reset mld-snooping statistics**

MLD snooping configuration examples

Example: Configuring VLAN-based IPv6 group policy and simulated joining



Network configuration

As shown in Figure 4, Router A runs MLDv1 and acts as the MLD querier, and Switch A runs MLDv1 snooping.

Configure the group policy and simulate joining to meet the following requirements:

- Host A and Host B receive only the IPv6 multicast data addressed to the IPv6 multicast group FF1E::101. IPv6 multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown IPv6 multicast data instead of flooding it in VLAN 100.

Figure 4 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 4.

Procedure

1. Configure Router A:

Enable IPv6 multicast routing.

```
<RouterA> system-view
[RouterA] ipv6 multicast routing
[RouterA-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] mld enable
[RouterA-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] ipv6 pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping, and enable dropping IPv6 unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] mld-snooping drop-unknown
[SwitchA-vlan100] quit
```

Configure an IPv6 multicast group policy so that hosts in VLAN 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] mld-snooping
[SwitchA–mld-snooping] group-policy 2001 vlan 100
[SwitchA–mld-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts to join IPv6 multicast group FF1E::101.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast groups FF1E::101 and FF1E::202. (Details not shown.)

Display dynamic MLD snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

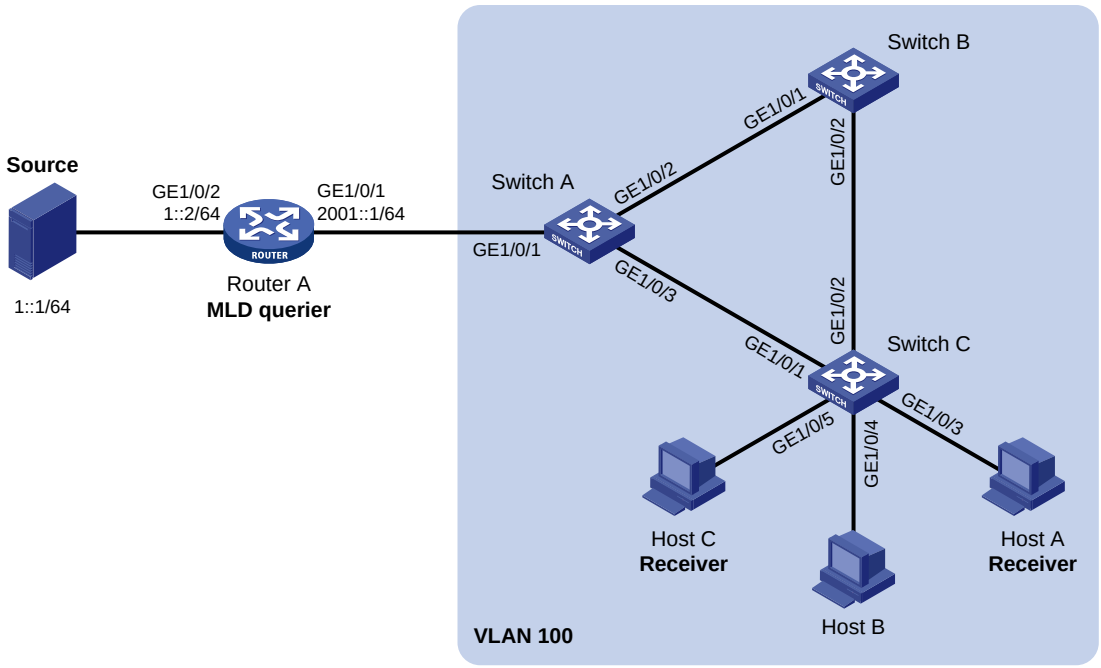
The output shows the following information:

- Host A and Host B have joined IPv6 multicast group FF1E::101 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join the multicast group FF1E::202.

Example: Configuring VLAN-based static ports

Network configuration

As shown in Figure 5:



- Router A runs MLDv1 and acts as the MLD querier. Switch A, Switch B, and Switch C run MLDv1 snooping.
- Host A and Host C are permanent receivers of IPv6 multicast group FF1E::101.

Configure static ports to meet the following requirements:

- To enhance the reliability of IPv6 multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for IPv6 multicast group FF1E::101.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. IPv6 multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one MLD query-response cycle must be completed before IPv6 multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, IPv6 multicast data can flow to the receivers nearly uninterrupted along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   ```

```
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable MLD snooping for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable MLD snooping for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for IPv6 multicast group FF1E::101.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

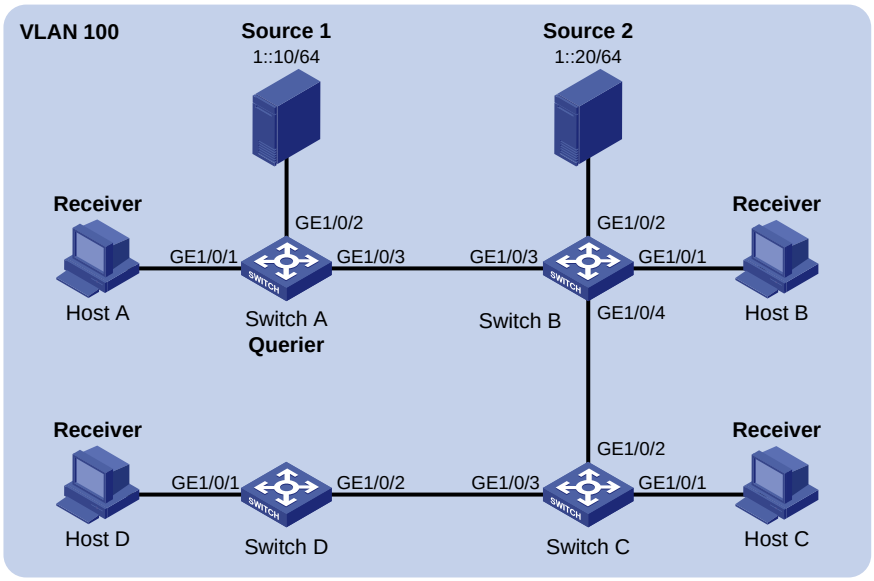
Display static MLD snooping group entries in VLAN 100 on Switch C.

```
[SwitchC] display mld-snooping static-group vlan 100
Total 1 entries).
```

```
VLAN 100: Total 1 entries).
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of IPv6 multicast group FF1E::101.

Example: Configuring the VLAN-based MLD snooping querier



Network configuration

As shown in Figure 6:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to IPv6 multicast groups FF1E::101 and FF1E::102, respectively.
- Host A and Host C are receivers of IPv6 multicast group FF1E::101, and Host B and Host D are receivers of IPv6 multicast group FF1E::102.
- All host receivers run MLDv1 and all switches run MLDv1 snooping. Switch A (which is close to the multicast sources) acts as the MLD snooping querier.

To prevent the switches from flooding unknown IPv6 packets in the VLAN, enable all the switches to drop unknown IPv6 multicast packets.

Figure 6 Network diagram

Procedure

1. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] mld-snooping drop-unknown
```

Configure Switch A as the MLD snooping querier.

```
[SwitchA-vlan100] MLD-snooping querier
[SwitchA-vlan100] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] mld-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] mld-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the MLD snooping feature.

```
<SwitchD> system-view
[SwitchD] mld-snooping
[SwitchD-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

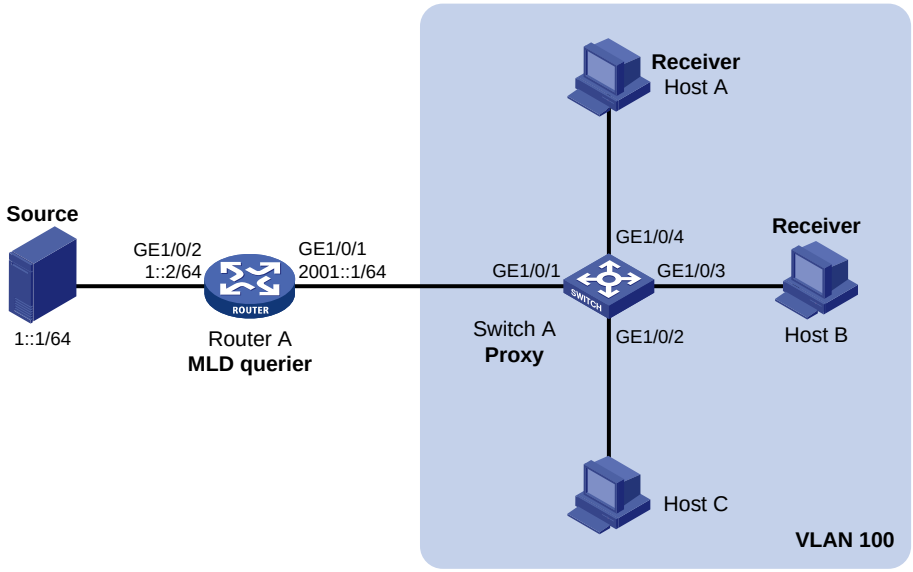
```
[SwitchD-vlan100] mld-snooping enable
[SwitchD-vlan100] mld-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping on Switch B.

```
[SwitchB] display mld-snooping statistics
Received MLD messages:
  MLD general queries: 19
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
  MLDv1 reports: 19
  MLDv2 reports: 0
  MLDv2 reports with right and wrong records: 0
  MLD dones: 5
  Error MLD messages: 1
Sent MLD messages:
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
Received IPv6 PIM hello: 0
```

The output shows that all switches except Switch A can receive the MLD general queries after Switch A acts as the MLD snooping querier.



Example: Configuring VLAN-based MLD snooping proxying

Network configuration

As shown in Figure 7, Router A runs MLDv1 and acts as the MLD querier. Switch A runs MLDv1 snooping. Configure MLD snooping proxying so that Switch A can perform the following actions:

- Forward MLD report and done messages to Router A.
- Respond to MLD queries sent by Router A and forward the queries to downstream hosts.

Figure 7 Network diagram

Prerequisites

Assign an IPv6 address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD and IPv6 PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping and MLD snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping proxy enable
   [SwitchA-vlan100] quit
   ```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                 (00:04:09)
      GE1/0/4                                 (00:03:06)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of IPv6 multicast group FF1E::101. Host A and Host B will receive IPv6 multicast data for the group.

Display MLD group membership information on Router A.

```
[RouterA] display mld group
```

```
MLD groups in total: 1
 GigabitEthernet1/0/1(2001::1):
  MLD groups reported in total: 1
   Group address: FF1E::101
    Last reporter: FE80::2FF:FFFF:FE00:1
    Uptime: 00:00:31
    Expires: 00:03:48
```

Send an MLD done message from Host A to leave IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101. Only Host B will receive IPv6 multicast data for the group.

Troubleshooting MLD snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function through MLD snooping.

Solution

To resolve the problem:

1. Use the **display mld-snooping** command to display MLD snooping status.
2. If MLD snooping is not enabled, use the **mld-snooping** command in system view to enable the MLD snooping feature. Then, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
3. If MLD snooping is enabled globally but not enabled for the VLAN, use the **mld-snooping enable** command in VLAN view to enable MLD snooping for the VLAN.
4. If the problem persists, contact H3C Support.

IPv6 multicast group policy does not work

Symptom

Hosts can receive IPv6 multicast data for IPv6 multicast groups that are not permitted by the IPv6 multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl ipv6** command to verify that the configured IPv6 ACL meets the IPv6 multicast group policy requirements.

2. Use the **display this** command in MLD-snooping view or in interface view to verify that the correct IPv6 multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **mld-snooping group-policy** command to apply the correct IPv6 multicast group policy.
3. Use the **display mld-snooping** command to verify that dropping unknown IPv6 multicast data is enabled. If it is not, use the **mld-snooping drop-unknown** command to enable dropping unknown IPv6 multicast data.
4. If the problem persists, contact H3C Support.

Configuring IPv6 PIM snooping

About IPv6 PIM snooping

IPv6 PIM snooping runs on Layer 2 devices. It works with MLD snooping to analyze received IPv6 PIM messages, and adds the ports that are interested in specific multicast data to an IPv6 PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with IPv6 PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the IPv6 PIM-capable routers are in the same VLAN.

- When the Layer 2 switch only runs MLD snooping, it performs the following actions:
  a. Maintains the router ports according to the received IPv6 PIM hello messages that IPv6 PIM-capable routers send.

b. Floods all other types of received IPv6 PIM messages except PIM hello messages in the VLAN.

c. Forwards all multicast data to all router ports in the VLAN.

Each IPv6 PIM-capable router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all IPv6 PIM messages except IPv6 PIM hello messages.

- When the Layer 2 switch runs both MLD snooping and IPv6 PIM snooping, it performs the following actions:

  a. Examines whether an IPv6 PIM router is interested in the multicast data destined for a multicast group according to the received IPv6 PIM messages that the router sends.

  b. Adds only the ports that connect to the router and are interested in the data to an IPv6 PIM snooping routing entry.

  c. Forwards IPv6 PIM messages and the multicast data only to the router according to the multicast forwarding entry, which saves network bandwidth.

For more information about MLD snooping and the router port, see "Configuring MLD snooping."

Restrictions and guidelines: IPv6 PIM snooping configuration

As a best practice, do not configure IPv6 PIM snooping for secondary VLANs because IPv6 PIM snooping does not take effect on secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of an IPv6 PIM join or prune message is smaller than the path MTU of devices connected to IPv6 PIM snooping devices. Otherwise, fragmented IPv6 PIM join or prune messages prevent IPv6 PIM snooping from correctly forwarding IPv6 multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring IPv6 PIM."

IPv6 PIM snooping is supported only for IPv6 PIM-SM and IPv6 PIM-SSM. As a best practice, do not configure IPv6 PIM snooping in the IPv6 PIM-DM or IPv6 BIDIR-PIM network. For more information about IPv6 PIM, see "IPv6 PIM overview."

After you enable IPv6 PIM snooping for a VLAN, IPv6 PIM snooping takes effect only on ports that belong to the VLAN.

IPv6 PIM snooping tasks at a glance

To configure IPv6 PIM snooping, perform the following tasks:

1. Enabling IPv6 PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling IPv6 PIM snooping

1. Enter system view.

   `system-view`

2. Enable the MLD snooping feature and enter MLD -snooping view.

   `mld-snooping`

   By default, MLD snooping is disabled.

For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.
   quit
4. Enter VLAN view.
   vlan *vlan-id*
5. Enable MLD snooping for the VLAN.
   mld-snooping enable
   By default, MLD snooping is disabled in a VLAN.
   For more information about this command, see *IP Multicast Command Reference*.
6. Enable IPv6 PIM snooping for the VLAN.
   ipv6 pim-snooping enable
   By default, IPv6 PIM snooping is disabled in a VLAN.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 IPv6 multicast data interruption caused by the aging of IPv6 PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives an IPv6 PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives an IPv6 PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging time for global neighbor ports after a master/subordinate switchover.
   pim-snooping graceful-restart neighbor-aging-time *seconds*
   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.
   pim-snooping graceful-restart join-aging-time *seconds*
   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for IPv6 PIM snooping

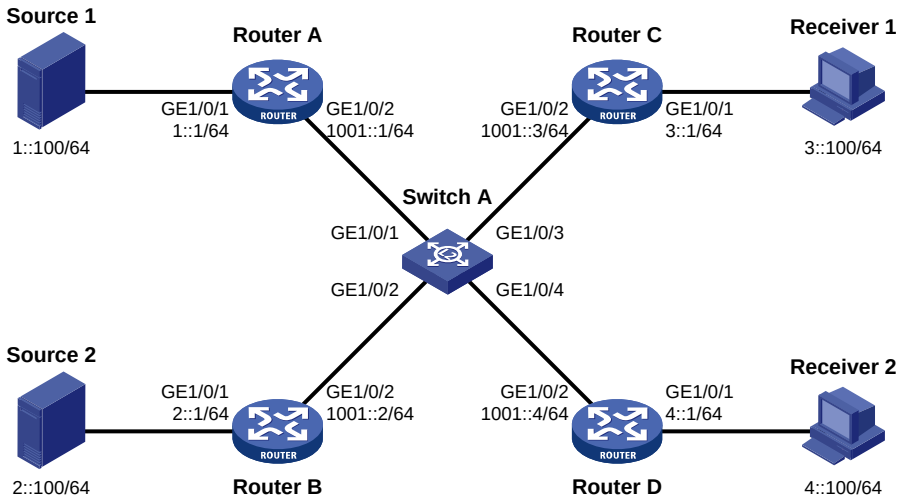
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PIM snooping neighbor information.	**display ipv6 pim-snooping neighbor** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping router port information.	**display ipv6 pim-snooping router-port** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping routing entries.	**display ipv6 pim-snooping routing-table** [**vlan** *vlan-id*] [**slot** *slot-number*] [**verbose**]
Display statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**display ipv6 pim-snooping statistics**
Clear statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**reset ipv6 pim-snooping statistics**

IPv6 PIM snooping configuration examples

Example: Configuring IPv6 PIM snooping

Network configuration



As shown in Figure 2:

- OSPFv3 runs on the network.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Receiver 1 and Receiver 2 belong to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Router C and Router D run MLD on GigabitEthernet 1/0/1.

- Router A, Router B, Router C, and Router D run IPv6 PIM-SM. GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure MLD snooping and IPv6 PIM snooping on Switch A. Then, Switch A forwards IPv6 PIM protocol packets and IPv6 multicast data packets only to routers that are connected to receivers.

Figure 2 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 2, and then configure OSPFv3 on the routers.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/1] quit
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim sm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

   # Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

   ```
   [RouterA] ipv6 pim
   [RouterA-pim6] c-bsr 1001::1
   [RouterA-pim6] c-rp 1001::1
   [RouterA-pim6] quit
   ```

2. Configure Router B:

   # Enable IPv6 multicast routing.

   ```
   <RouterB> system-view
   [RouterB] ipv6 multicast routing
   [RouterB-mrib6] quit
   ```

   # Enable IPv6 PIM-SM on each interface.

```
[RouterB] interface gigabitethernet 1/0/1
[RouterB-GigabitEthernet1/0/1] ipv6 pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] ipv6 pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IPv6 multicast routing.

```
<RouterC> system-view
[RouterC] ipv6 multicast routing
[RouterC-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] mld enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] ipv6 pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IPv6 multicast routing.

```
<RouterD> system-view
[RouterD] ipv6 multicast routing
[RouterD-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] mld enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] ipv6 pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and IPv6 PIM snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] ipv6 pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display IPv6 PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  FE80::1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  FE80::2
   Ports (1 in total):
      GE1/0/2                 (00:32:43)
  FE80::3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  FE80::4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are IPv6 PIM snooping neighbors.

On Switch A, display IPv6 PIM snooping routing entries for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping routing-table vlan 100
Total 2 entries.
FSM flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 2 entries.
  (*, FF1E::101)
    Upstream neighbor: FE80::1
      Upstream ports (1 in total):
        GE1/0/1
      Downstream ports (1 in total):
        GE1/0/3
          Expires: 00:03:01, FSM: J
  (*, FF2E::101)
    Upstream neighbor: FE80::2
      Upstream ports (1 in total):
        GE1/0/2
      Downstream ports (1 in total):
        GE1/0/4
          Expires: 00:03:01, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for IPv6 multicast group FF1E::101 to only Router C.
- Switch A will forward the multicast data intended for IPv6 multicast group FF2E::101 to only Router D.

Troubleshooting IPv6 PIM snooping

This section describes common IPv6 PIM snooping problems and how to troubleshoot them.

IPv6 PIM snooping does not work on a Layer 2 device

Symptom

IPv6 PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about MLD snooping and IPv6 PIM snooping.
2. If MLD snooping is not enabled, enable the MLD snooping feature, and then enable MLD snooping and IPv6 PIM snooping for the VLAN.
3. If IPv6 PIM snooping is not enabled, enable IPv6 PIM snooping for the VLAN.
4. If the problem persists, contact H3C Support.

Configuring IPv6 multicast VLANs

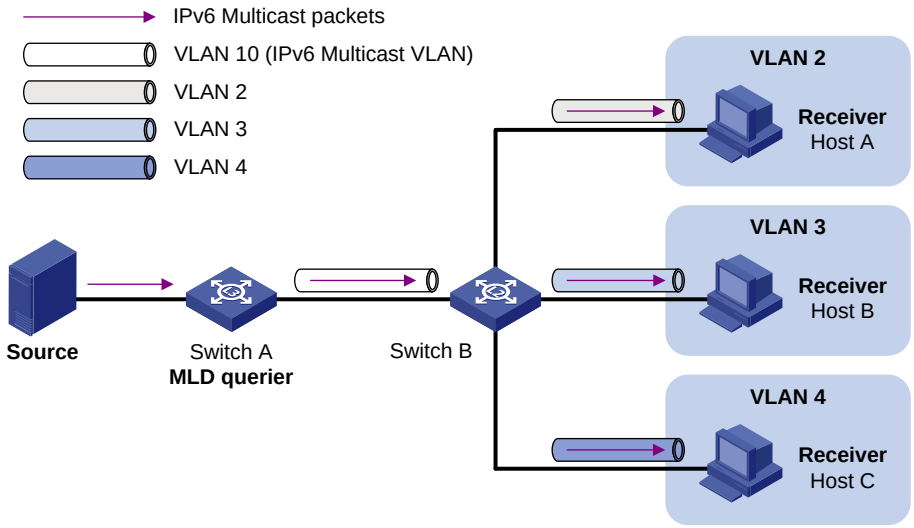
IPv6 multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in different VLANs and the same IPv6 multicast group. When Switch A (Layer 3 device) receives IPv6 multicast data for that group, it forwards three copies of the data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the IPv6 multicast VLAN feature

After an IPv6 multicast VLAN is configured on Switch B, Switch A sends one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. This saves network bandwidth and lessens the burden on the Layer 3 device.

IPv6 multicast VLAN methods



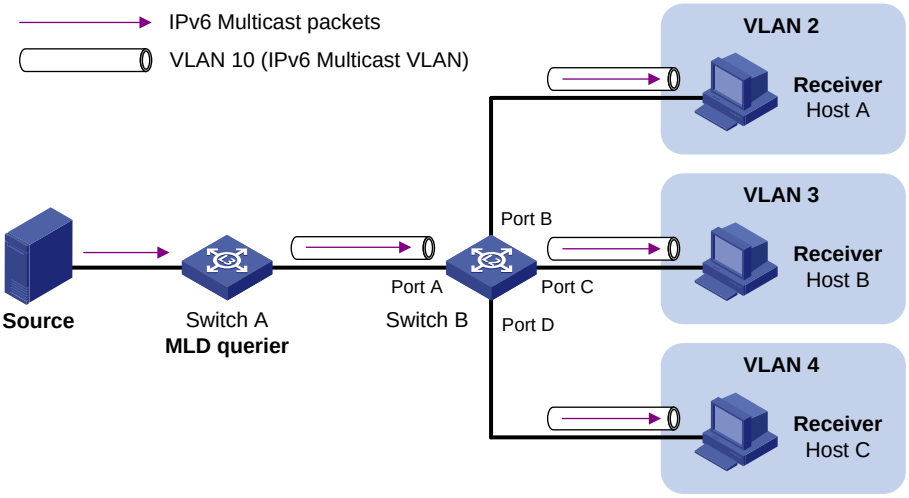
IPv6 multicast VLANs support sub-VLAN-based IPv6 multicast VLANs and port-based IPv6 multicast VLANs.

Sub-VLAN-based IPv6 multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- MLD snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



MLD snooping manages router ports in the IPv6 multicast VLAN and member ports in each sub-VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN of the IPv6 multicast VLAN.

Port-based IPv6 multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively. All the user ports (ports with attached hosts) on Switch B are hybrid ports.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. All the user ports are assigned to VLAN 10.
- MLD snooping is enabled for the IPv6 multicast VLAN and its sub-VLANs.

Figure 3 Port-based IPv6 multicast VLAN

MLD snooping manages the router ports and member ports in the IPv6 multicast VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each user port in the IPv6 multicast VLAN.

Restrictions and guidelines: IPv6 multicast VLAN configuration

The VLAN to be configured as an IPv6 multicast VLAN must exist.

If you have configured both a sub-VLAN-based IPv6 multicast VLAN and a port-based IPv6 multicast VLAN on a device, the port-based IPv6 multicast VLAN configuration takes effect.

Do not configure an IPv6 multicast VLAN on a device that is enabled with IPv6 multicast routing. Otherwise, the system displays errors. Do not enable IPv6 multicast routing on a device that is configured with IPv6 multicast VLANs. Otherwise, IPv6 multicast forwarding exceptions occur.

Do not configure a VLAN as an IPv6 multicast VLAN or an IPv6 sub-VLAN if the VLAN interface is enabled with IPv6 PIM or MLD. Otherwise, the system displays errors. Do not enable IPv6 PIM or MLD on a VLAN interface if the VLAN interface belongs to an IPv6 multicast VLAN or an IPv6 multicast sub-VLAN. Otherwise, IPv6 multicast forwarding exceptions occur.

The IPv6 multicast VLAN feature does not take effect on secondary VLANs. As a best practice, do not configure the IPv6 multicast VLAN feature for secondary VLANs. For more information about secondary VLAN, see *Layer 2—LAN Switching Configuration Guide.*

Configuring a sub-VLAN-based IPv6 multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN must exist and cannot be IPv6 multicast VLANs or sub-VLANs of any other IPv6 multicast VLANs.

Prerequisites

Before you configure a sub-VLAN-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN, and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.

   ipv6 multicast-vlan *vlan-id*

   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign VLANs to the IPv6 multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

   By default, an IPv6 multicast VLAN does not have any sub-VLANs.

Configuring a port-based IPv6 multicast VLAN

Restrictions and guidelines

You can assign user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view or assign a user port to an IPv6 multicast VLAN in interface view.

A user port can belong to only one IPv6 multicast VLAN.

Prerequisites

Before you configure a port-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN.
- Enable MLD snooping for all the VLANs that contain the multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the IPv6 multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign ports to the IPv6 multicast VLAN as user ports.
   port *interface-list*

Assigning user ports to an IPv6 multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the IPv6 multicast VLAN as a user port.
   ipv6 port multicast-vlan *vlan-id*
   By default, a port does not belong to any IPv6 multicast VLAN.

Setting the maximum number of IPv6 multicast VLAN forwarding entries

About this task

You can set the maximum number of IPv6 multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create IPv6 multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of IPv6 multicast VLAN forwarding entries.
   ipv6 multicast-vlan entry-limit *limit*
   By default, the maximum number of IPv6 multicast VLAN forwarding entries is 500.

Display and maintenance commands for IPv6 multicast VLANs

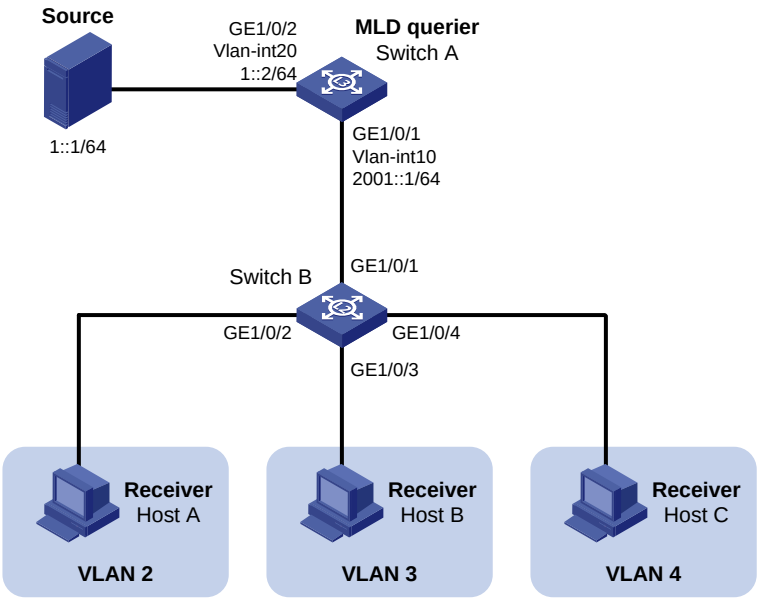
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IPv6 multicast VLANs.	**display ipv6 multicast-vlan** [*vlan-id*]
Display IPv6 multicast VLAN forwarding entries.	**display ipv6 multicast-vlan forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about information about IPv6 multicast group entries in IPv6 multicast VLANs.	**display ipv6 multicast-vlan group** [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear IPv6 multicast group entries in IPv6 multicast VLANs.	**reset ipv6 multicast-vlan group** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

IPv6 multicast VLAN configuration examples

Example: Configuring sub-VLAN-based IPv6 multicast VLAN

Network configuration



As shown in Figure 4:

- Layer 3 device Switch A runs MLD and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 1::2 64
   [SwitchA-Vlan-interface20] ipv6 pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   ```

   # Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

   ```
   [SwitchA] interface gigabitethernet 1/0/1
   [SwitchA-GigabitEthernet1/0/1] port link-type hybrid
   [SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
   [SwitchA-GigabitEthernet1/0/1] quit
   ```

   # Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ipv6 address 2001::1 64
   [SwitchA-Vlan-interface10] mld enable
   [SwitchA-Vlan-interface10] quit
   ```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] ipv6 multicast-vlan 10
[SwitchB-ipv6-mvlan-10] subvlan 2 to 4
[SwitchB-ipv6-mvlan-10] quit
```

Verifying the configuration

Display information about all IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about IPv6 multicast groups in IPv6 multicast VLANs on Switch B.

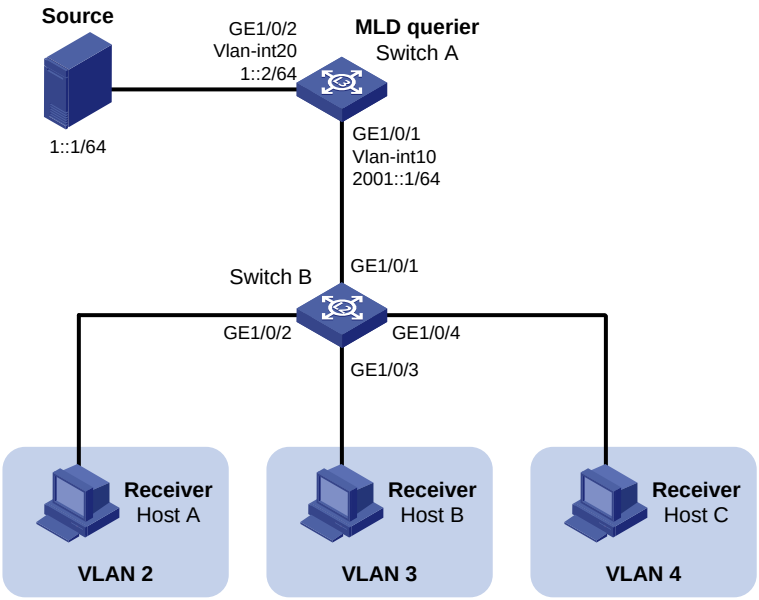
```
[SwitchB] display ipv6 multicast-vlan group
Total 1 entries.

IPv6 multicast VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that IPv6 multicast group FF1E::101 belongs to IPv6 multicast VLAN 10. IPv6 multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the IPv6 multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based IPv6 multicast VLAN

Network configuration



As shown in Figure 5:

- Layer 3 device Switch A runs MLDv1 and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   ```

```
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

```
[SwitchA] vlan 10
[SwitchA-vlan10] port gigabitethernet 1/0/1
[SwitchA-vlan10] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN.

```
[SwitchB] ipv6 multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-ipv6-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-ipv6-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic MLD snooping forwarding entries on Switch B.

```
[SwitchB] display mld-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
```

```
(::, FF1E::101)
  Host ports (3 in total):
    GE1/0/2         (00:03:23)
    GE1/0/3         (00:04:07)
    GE1/0/4         (00:04:16)
```

The output shows that MLD snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the IPv6 multicast data of VLAN 10 through these user ports.

Configuring IPv6 multicast routing and forwarding

About IPv6 multicast routing and forwarding

Each IPv6 multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the IPv6 multicast routing protocols are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general IPv6 multicast routing table. The optimal IPv6 multicast routing entries in the general IPv6 multicast routing table are added to the IPv6 multicast forwarding table to guide IPv6 multicast data forwarding.

RPF check mechanism

An IPv6 multicast routing protocol uses the reverse path forwarding (RPF) check mechanism to ensure IPv6 multicast data delivery along the correct path and to avoid data loops.

RPF check process

An IPv6 multicast device performs the RPF check on an IPv6 multicast packet as follows:

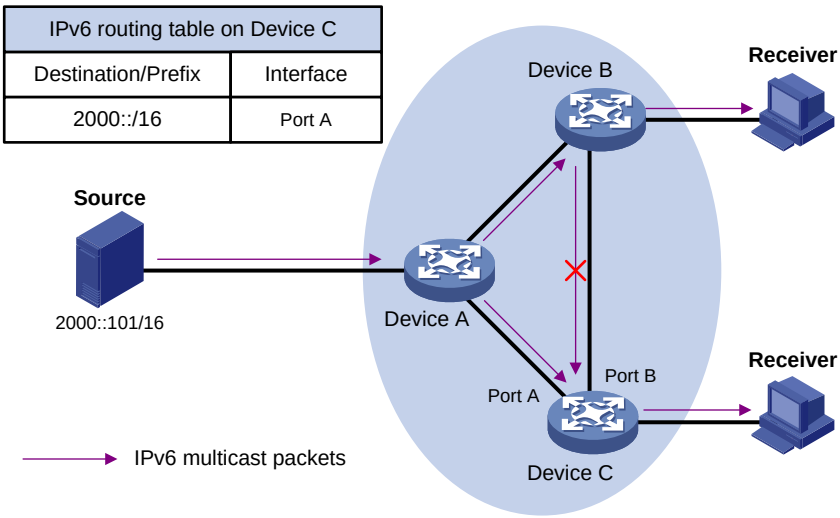
1. Chooses an optimal route back to the packet source from the IPv6 unicast routing table as the RPF route.

   In RPF check, the "packet source" means difference things in difference situations:

   - For a packet that travels along the SPT, the packet source is the IPv6 multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "IPv6 PIM overview."

   In the RPF route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
2. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.
   - If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.



RPF check implementation in IPv6 multicast

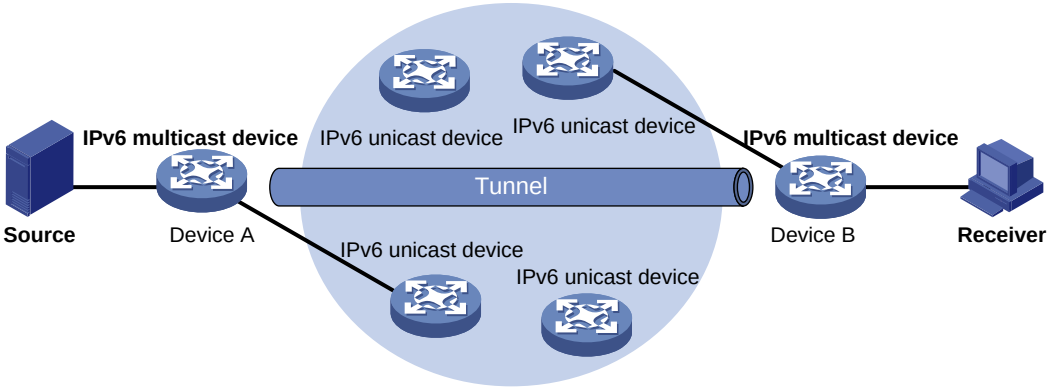
Implementing an RPF check on each received IPv6 multicast packet would heavily burden the device. The use of an IPv6 multicast forwarding table is the solution to this issue. When the device creates an IPv6 multicast forwarding entry for an IPv6 (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up its IPv6 multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source. Then, it creates a forwarding entry with the RPF interface as the incoming interface and performs one of the following tasks:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.

- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following tasks:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

Figure 1 RPF check process

As shown in Figure 1, assume that IPv6 unicast routes are available on the network. IPv6 multicast packets travel along the SPT from the multicast source to the receivers. The IPv6 multicast forwarding table on Device C contains the (S, G) entry, with Port A as the RPF interface.



- If an IPv6 multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.
- If an IPv6 multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its IPv6 unicast routing table and finds that the outgoing interface to the source (the RPF interface) is Port A. This means that the (S, G) entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and Device C discards the packet.

IPv6 multicast forwarding across IPv6 unicast subnets

IPv6 multicast data transmission over a 6to4 tunnel is not supported in the current software version.

Devices forward the IPv6 multicast data from an IPv6 multicast source hop by hop along the forwarding tree, but some devices might not support IPv6 multicast protocols in a network. When the IPv6 multicast data is forwarded to a device that does not support IPv6 multicast, the forwarding path is blocked. In this case, you can enable IPv6 multicast data forwarding across the IPv6 unicast subnets by establishing a tunnel between the devices at both ends of the IPv6 unicast subnets.

Figure 2 IPv6 multicast data transmission through a tunnel

As shown in Figure 2, a tunnel is established between Device A and Device B. Device A encapsulates the IPv6 multicast data in unicast IPv6 packets, and forwards them to Device B across the tunnel through unicast devices. Then, Device B strips off the unicast IPv6 header and continues to forward the IPv6 multicast data down toward the receivers.

IPv6 mtrace

IPv6 mtrace uses mtrace2 to trace the path along which IPv6 multicast group data travels from a source to a destination.

Device roles

IPv6 mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has an IPv6 multicast-enabled interface on the same subnet as the destination and can forward specific IPv6 multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the IPv6 multicast source.
- **Client**—A client is a router that initiates an mtrace2.

Process

The IPv6 mtrace process is as follows:

1. The client sends an mtrace2 Query message (with a **hops** field indicating the maximum number of hops to be traced) to the destination.
2. The LHR turns the received Query message to an mtrace2 Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace2 Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

IPv6 multicast routing and forwarding tasks at a glance

To configure IPv6 multicast routing and forwarding, perform the following tasks:

1. Enabling IPv6 multicast routing

2. (Optional.) Configuring static IPv6 multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring IPv6 multicast load splitting
5. (Optional.) Configuring an IPv6 multicast forwarding boundary
6. (Optional.) Using mtrace2 to trace an IPv6 multicast path
7. (Optional.) Setting the maximum number of cached unknown IPv6 multicast packets

Prerequisites for IPv6 multicast routing and forwarding

Before you configure multicast routing and forwarding, configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IPv6 multicast routing

About this task

Enable IPv6 multicast routing before you configure any Layer 3 IPv6 multicast functionality in the public network or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.

Configuring static IPv6 multicast routes

About this task

When configuring a static IPv6 multicast route for an IPv6 multicast source, you can specify an RPF interface or an RPF neighbor for the IPv6 multicast traffic from that source.

Restrictions and guidelines

Static IPv6 multicast routes take effect only on the IPv6 multicast devices on which they are configured, and will not be broadcast or redistributed to other devices.

Procedure

1. Enter system view.
   system-view
2. Configure a static multicast route.
   ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*] *ipv6-source-address prefix-length* { *rpf-nbr-address* | *interface-type interface-number* } [**preference** *preference*]
3. (Optional.) Delete all static IPv6 multicast routes.
   delete ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*]
   To delete a single static IPv6 multicast route, use the **undo ip rpf-route-static** command.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Specify the longest prefix match principle for RPF route selection.
   longest-match
   By default, the route preference principle is used.

Configuring IPv6 multicast load splitting

About this task

You can enable the device to split multiple IPv6 multicast data flows on a per-source basis or on a per-source-and-group basis.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Configure IPv6 multicast load splitting.
   load-splitting { **source** | **source-group** }
   By default, IPv6 multicast load splitting is disabled.

Configuring an IPv6 multicast forwarding boundary

About this task

You can configure an interface as an IPv6 multicast forwarding boundary for an IPv6 multicast group range. The interface cannot receive or forward IPv6 multicast packets for the groups in the range.

Restrictions and guidelines

You do not need to enable IPv6 multicast routing before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 multicast forwarding boundary.

ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }

By default, an interface is not an IPv6 multicast forwarding boundary for any IPv6 multicast groups.

Using mtrace2 to trace an IPv6 multicast path

Restrictions and guidelines

For successful IPv6 mtrace, do not use a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.

   system-view

2. (Optional.) Specify the UDP port number used by IPv6 mtrace.

   ipv6 mtrace-service port *number*

   By default, IPv6 mtrace uses UDP port number 10240.

3. Use mtrace2 to trace an IPv6 multicast path.

   mtrace v2 ipv6 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]

   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown IPv6 multicast packets

About this task

The device caches an IPv6 multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping IPv6 multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **ipv6 multicast forwarding-table cache-unknown total** command to be far greater than the value in the **ipv6 multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry.

   ipv6 multicast forwarding-table cache-unknown per-entry *per-entry-limit*

By default, the device can cache only one unknown IPv6 multicast packet for an (S, G) entry.

3. Set the maximum number of unknown IPv6 multicast packets that can be cached in total.
   ipv6 multicast forwarding-table cache-unknown total *total-limit*
   By default, the device can cache 1024 unknown IPv6 multicast packets in total.

Display and maintenance commands for IPv6 multicast routing and forwarding

CAUTION:
The **reset** commands might cause IPv6 multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the IPv6 MRIB.	**display ipv6 mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display IPv6 multicast boundary information.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]
Display IPv6 multicast fast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display statistics for IPv6 multicast forwarding events.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display IPv6 multicast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **slot** *slot-number* | **statistics**] *
Display IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static**

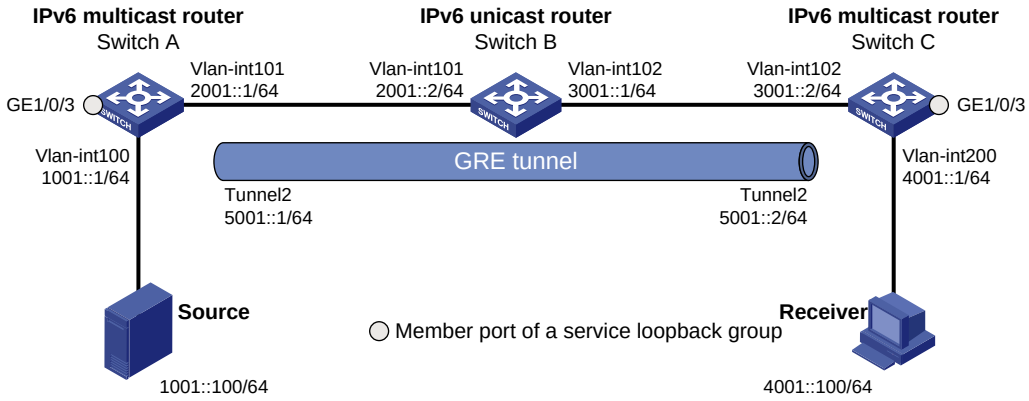
Task	Command
	[*ipv6-source-address* [*prefix-length*]]
Display RPF information for an IPv6 multicast source.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]
Clear IPv6 multicast fast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for IPv6 multicast forwarding events.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear IPv6 multicast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear IPv6 multicast routing entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.
- When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

IPv6 multicast routing and forwarding configuration examples

Example: Configuring IPv6 multicast forwarding over a GRE tunnel



Network configuration

As shown in Figure 3:

- IPv6 multicast routing and IPv6 PIM-DM are enabled on Switch A and Switch C.
- Switch B does not support IPv6 multicast.
- Switch A, Switch B, and Switch C run OSPFv3. The source-side interface VLAN-interface 100 on Switch A does not run OSPFv3.

Configure the switches so that the receiver host can receive the IPv6 multicast data from Source.

Figure 3 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 3, and configure OSPFv3 on the switches (Do not run OSPFv3 on VLAN-interface 100 on Switch A.)

Procedure

1. Configure a GRE tunnel:

Create a GRE tunnel interface Tunnel 2, and specify the tunnel mode as GRE/IPv6.

```
[SwitchA] interface tunnel 2 mode gre ipv6
```

Assign an IPv6 address to interface Tunnel 2, and specify its source and destination addresses.

```
[SwitchA-Tunnel2] ipv6 address 5001::1 64
[SwitchA-Tunnel2] source 2001::1
[SwitchA-Tunnel2] destination 3001::2
[SwitchA-Tunnel2] quit
```

Create a GRE tunnel interface Tunnel 2, and specify the tunnel mode as GRE/IPv6.

```
[SwitchC] interface tunnel 2 mode gre ipv6
```

Assign an IPv6 address to interface Tunnel 2, and specify its source and destination addresses.

```
[SwitchC-Tunnel2] ipv6 address 5001::2 64
[SwitchC-Tunnel2] source 3001::2
[SwitchC-Tunnel2] destination 2001::1
[SwitchC-Tunnel2] quit
```

2. Enable IPv6 multicast routing, IPv6 PIM-DM, and MLD:

On Switch A, enable IPv6 multicast routing, and enable IPv6 PIM-DM on each interface.

```
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim dm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim dm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface tunnel 2
[SwitchA-Tunnel2] ipv6 pim dm
[SwitchA-Tunnel2] quit
```

On Switch C, enable IPv6 multicast routing.

```
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
```

Enable MLD on the receiver-side interface VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] mld enable
[SwitchC-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 102.

```
[SwitchC] interface vlan-interface 102
[SwitchC-Vlan-interface102] ipv6 pim dm
[SwitchC-Vlan-interface102] quit
[SwitchC] interface tunnel 2
[SwitchC-Tunnel2] ipv6 pim dm
[SwitchC-Tunnel2] quit
```

3. On Switch C, configure a static IPv6 route with the destination address 1001::1/64 and the outgoing interface Tunnel 2.

```
[SwitchC] ipv6 route-static 1001::1 64 tunnel 2
```

Verifying the configuration

Send an MLD report from Receiver to join the IPv6 multicast group FF1E::101. (Details not shown.)

Send IPv6 multicast data from Source to the IPv6 multicast group FF1E::101. (Details not shown.)

Display IPv6 PIM routing entries on Switch C.

```
[SwitchC] display ipv6 pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, FF1E::101)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface200
             Protocol: mld, UpTime: 00:04:25, Expires: -

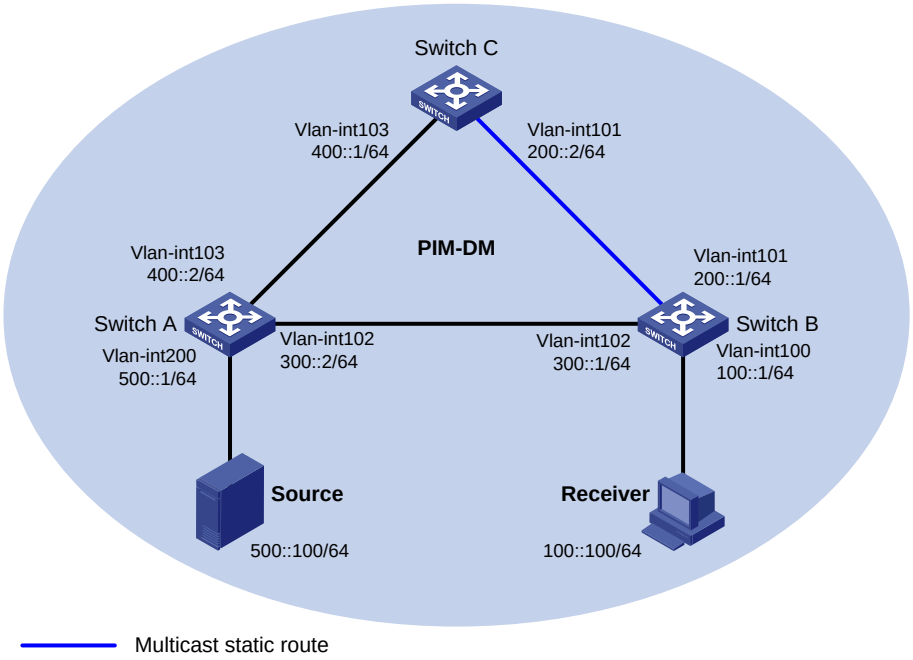
 (1001::100, FF1E::101)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:06:14
     Upstream interface: Tunnel2
         Upstream neighbor: FE80::A01:101:1
         RPF prime neighbor: FE80::A01:101:1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface200
             Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

The output shows the following information:

- Switch A is the RPF neighbor of Switch C.

- IPv6 multicast data from Switch A is delivered over the GRE tunnel to Switch C.

Example: Changing an RPF route



Network configuration

As shown in Figure 4:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IPv6 multicast.
- Switch A, Switch B, and Switch C run OSPFv3.
- Typically, the receiver host can receive the IPv6 multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the IPv6 multicast data from the source travels to the receiver along the following path: Switch A to Switch C to Switch B. This path is different from the unicast route.

Figure 4 Network diagram

Prerequisites

1. Assign an IP address and prefix length for each interface, as shown in Figure 4.
2. Configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] mld enable
   [SwitchB-Vlan-interface100] quit
   ```

Enable IPv6 PIM-DM on the other interfaces.

```
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] ipv6 pim dm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] ipv6 pim dm
[SwitchB-Vlan-interface102] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 pim dm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. On Switch B, configure a static IPv6 multicast route to the source and specify Switch C as the RPF neighbor.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for the source on Switch B.

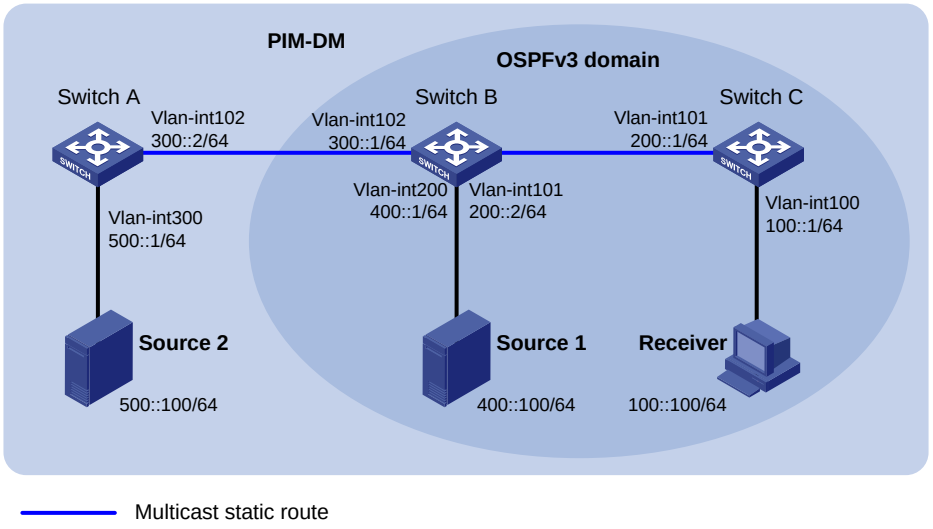
```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
```

```
Source AS: 0
C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static IPv6 multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route



Network configuration

As shown in Figure 5:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPFv3, and have no unicast routes to Switch A.
- Typically, the receiver host receives the IPv6 multicast data from the source 1 in the OSPFv3 domain.

Configure the switches so that the receiver host can receive IPv6 multicast data from Source 2, which is outside the OSPFv3 domain.

Figure 5 Network diagram

Prerequistes

1. Assign an IP address and subnet mask for each interface, as shown in Figure 5.
2. Configure OSPFv3 on Switch B and Switch C.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch C, enable IPv6 multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 multicast routing
   [SwitchC-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] mld enable
   ```

```
[SwitchC-Vlan-interface100] quit
```

Enable IPv6 PIM-DM on VLAN-interface 101.

```
[SwitchC] interface vlan-interface 101
[SwitchC-Vlan-interface101] ipv6 pim dm
[SwitchC-Vlan-interface101] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ipv6 pim dm
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
[SwitchC] display ipv6 multicast rpf-info 500::100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B and Switch C.

3. Configure a static IPv6 multicast route:

Configure a static IPv6 multicast route on Switch B and specify Switch A as its RPF neighbor to Source 2.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 300::2
```

Configure a static IPv6 multicast route on Switch C and specify Switch B as its RPF neighbor to Source 2.

```
[SwitchC] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 50::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
```

```
Route selection rule: preference-preferred
Load splitting rule: disable
Source AS: 0
C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. These RPF routes are the configured static IPv6 multicast routes.

Configuring MLD

About MLD

Multicast Listener Discovery (MLD) establishes and maintains IPv6 multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

MLD versions

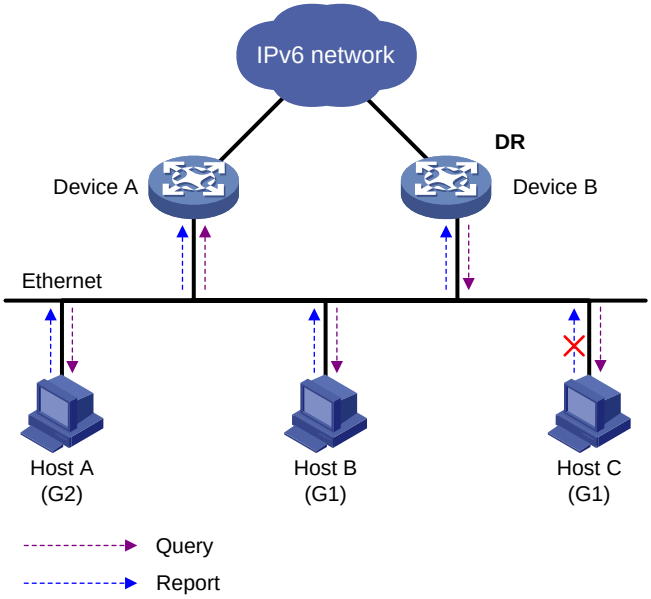
MLD has the following versions:

- MLDv1 (defined by RFC 2710), which is derived from IGMPv2.
- MLDv2 (defined by RFC 3810), which is derived from IGMPv3.

MLDv1 and MLDv2 support the ASM model. MLDv2 can directly implement the SSM model, but MLDv1 must work with the MLD SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."

How MLDv1 works

MLDv1 implements IPv6 multicast listener management based on the query and response mechanism.



Electing the MLD querier

All IPv6 multicast devices that run MLD on the same subnet can monitor MLD listener report messages (often called reports) from hosts. However, only one device can act as the MLD querier to send MLD query messages (often called queries). A querier election mechanism determines which device acts as the MLD querier on the subnet.

1. Initially, every MLD device assumes itself as the querier. Each device sends MLD general query messages (often called general queries) to all hosts and devices on the local subnet. The destination address of the general queries is FF02::1.
2. After receiving a general query, every MLD device compares the source IPv6 address of the query with its own link-local interface address. The device with the lowest IPv6 address wins the querier election and becomes the querier. All the other devices become non-queriers.
3. All the non-queriers start a timer called the "other querier present timer." If a device receives an MLD query from the querier before the timer expires, it resets this timer. Otherwise, it considers that the querier has timed out. In this case, the device initiates a new querier election process.

Joining an IPv6 multicast group

Figure 1 MLD queries and reports

As shown in Figure 1, Host B and Host C want to receive the IPv6 multicast data addressed to IPv6 multicast group G1. Host A wants to receive the IPv6 multicast data addressed to G2. The following process describes how the hosts join the IPv6 multicast groups and how the MLD querier (Device B in Figure 1) maintains the IPv6 multicast group memberships:

1. The hosts send unsolicited MLD reports to the IPv6 multicast groups they want to join without having to wait for the MLD queries.
2. The MLD querier periodically multicasts MLD queries (with the destination address FF02::1) to all hosts and devices on the local subnet.
3. After receiving a query, the host whose report delay timer expires first sends an MLD report to the IPv6 multicast group G1 to announce its membership for G1. In this example, Host B sends the report. After hearing the report from Host B, Host C, which is on the same subnet as Host B, suppresses its own report for G1.

   Because the MLD devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host MLD report suppression, helps reduce traffic on the local subnet.
4. At the same time, because Host A is interested in G2, it sends a report to the IPv6 multicast group G2.
5. Through the query/report process, the MLD devices determine that G1 and G2 have members on the local subnet. The IPv6 multicast routing protocol (for example, IPv6 PIM) that is running on the devices generates (*, G1) and (*, G2) multicast forwarding entries. These entries are the basis for subsequent IPv6 multicast forwarding. The asterisk (*) represents any IPv6 multicast source.
6. When the IPv6 multicast data addressed to G1 or G2 reaches an MLD device, the device looks up the IPv6 multicast forwarding table. Based on the (*, G1) and (*, G2) entries, the device forwards the IPv6 multicast data to the local subnet. Then, the receivers on the subnet receive the data.

Leaving an IPv6 multicast group

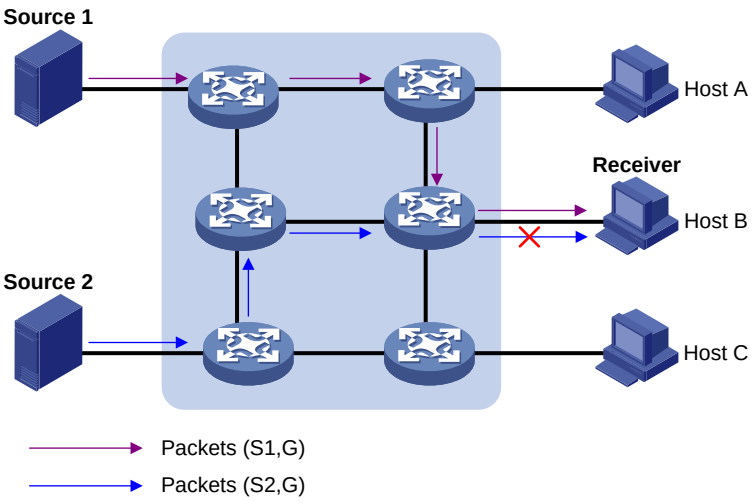
When a host is leaving an IPv6 multicast group, the following process occurs:

1. The host sends an MLD done message to all IPv6 multicast devices on the local subnet. The destination address of done messages is FF02::2.

2. After receiving the MLD done message, the querier sends a configurable number of multicast-address-specific queries to the group that the host is leaving. The IPv6 multicast addresses queried include both the destination address field and the group address field of the message.
3. One of the remaining members (if any on the subnet) in the group sends a report within the time of the maximum response time advertised in the multicast-address-specific queries.
4. If the querier receives a report for the group within the maximum response time, it maintains the memberships of the IPv6 multicast group. Otherwise, the querier assumes that no hosts on the subnet are interested in IPv6 multicast traffic addressed to that group and stops maintaining the memberships of the group.

MLDv2 enhancements

MLDv2 is based on and backwards-compatible with MLDv1. MLDv2 provides hosts with enhanced control capabilities and enhances the MLD state.



Enhancements in control capability of hosts

MLDv2 has introduced IPv6 multicast source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified IPv6 multicast sources. When a host joins an IPv6 multicast group, one of the following occurs:

- If the host expects IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host does not expect IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two IPv6 multicast sources, Source 1 (S1) and Source 2 (S2). Both of the sources can send IPv6 multicast data to IPv6 multicast group G. Host B wants to receive IPv6 multicast data addressed to G from Source 1 but not from Source 2.

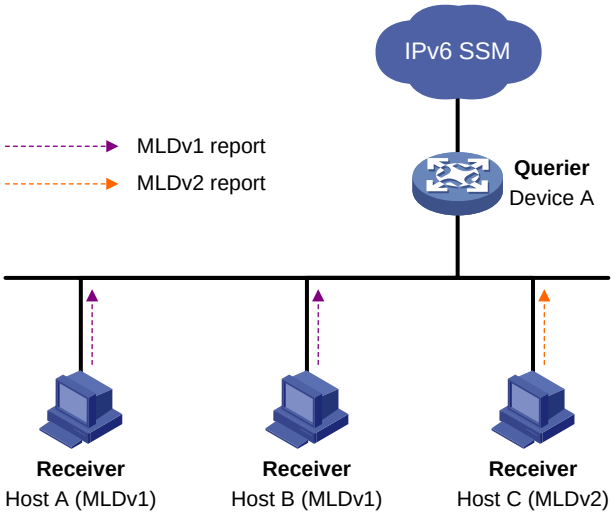
Figure 2 Flow paths of multicast-address-and-source-specific multicast traffic

In MLDv1, Host B cannot select IPv6 multicast sources when it joins IPv6 multicast group G. The IPv6 multicast streams from both Source 1 and Source 2 flow to Host B whether it needs them or not.

In MLDv2, Host B can explicitly express its interest in IPv6 multicast data destined to G from Source 1 but not from Source 2. Then, Host B receives only IPv6 multicast data from Source 1.

Enhancement in MLD state

A multicast device that is running MLDv2 maintains the multicast address state for each multicast address on each attached subnet. The multicast address state consists of the following information:



- **Filter mode**—Device keeps tracing the Include or Exclude state.
- **List of sources**—Device keeps tracing the newly added or deleted IPv6 multicast source.
- **Timers**—Filter timers, which include the time that the device waits before switching to the Include mode after an IPv6 multicast address times out, and source timers for source recording.

MLD SSM mapping

An MLDv2 host can explicitly specify multicast sources in its MLDv2 reports. From the reports, the MLD device can obtain the multicast source addresses and directly provide the SSM service. However, an MLDv1 host cannot specify multicast sources in its MLDv1 reports.

The MLD SSM mapping feature enables the MLD device to provide SSM support for MLDv1 receiver host. The device translates (*, G) in MLDv1 reports into (G, INCLUDE, (S1, S2...)) based on the configured MLD SSM mappings.

Figure 3 Network diagram

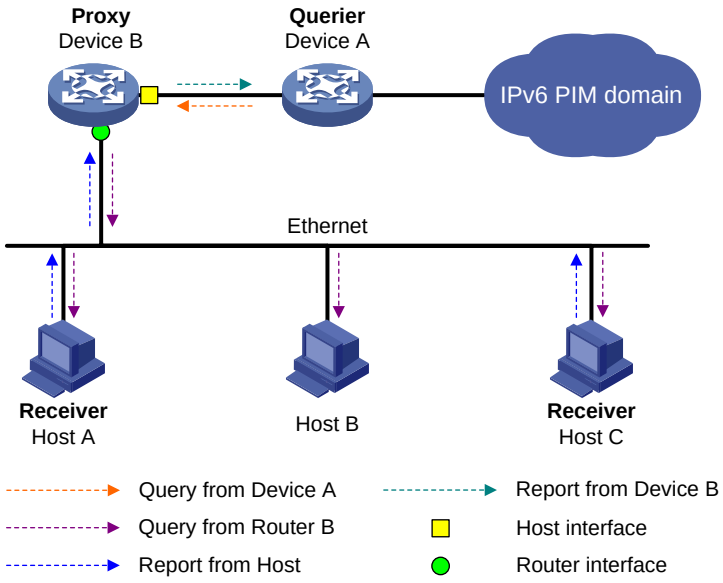
As shown in Figure 3, Host A and Host B on the IPv6 SSM network run MLDv1, and Host C runs MLDv2. To provide the SSM service for Host A and Host B, you must configure the MLD SSM mapping feature on Device A.

After MLD SSM mappings are configured, Device A checks the IPv6 multicast group address G carried in the message, and performs the following operations:

- If G is not in the IPv6 SSM group range, Device A provides the ASM service.
- If G is in the IPv6 SSM group range but does not match any MLD SSM mapping, Device A drops the report.
- If G is in the IPv6 SSM group range and matches MLD SSM mappings, Device A translates (*, G) in the report to (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The MLD SSM mapping feature does not process MLDv2 reports.



For more information about the IPv6 SSM group ranges, see "IPv6 PIM overview" and "Configuring IPv6 PIM."

MLD proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to configure IPv6 multicast routing protocols, such as IPv6 PIM, on edge devices. Instead, you can configure MLD proxying on these devices. With MLD proxying configured, the edge device acts as an MLD proxy:

- For the upstream MLD querier, the MLD proxy device acts as a host.
- For the downstream receiver hosts, the MLD proxy device acts as an MLD querier.

Figure 4 Network diagram

The following interfaces are defined in MLD proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running MLD. MLD proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running MLD. MLD must be configured on this interface.

An MLD proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or sends join/done messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received MLD reports.

MLD support for VPNs

MLD maintains group memberships on a per-interface basis. After receiving an MLD message on an interface, MLD processes the packet within the VPN to which the interface belongs. MLD only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*

- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*

MLD tasks at a glance

To configure MLD, perform the following tasks:

1. Enabling MLD
2. (Optional.) Configuring basic MLD features
   - Specifying an MLD version
   - Configuring a static group member
   - Configuring an IPv6 multicast group policy
3. (Optional.) Adjusting MLD performance
   - Configuring MLD query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring MLD SSM mappings
5. (Optional.) Configuring MLD proxying
   - Enabling MLD proxying
   - Enabling IPv6 multicast forwarding on a non-querier interface
   - Enabling IPv6 multicast load splitting for MLD proxy interfaces
6. (Optional.) Enabling MLD NSR
7. (Optional.) Setting the DSCP value for outgoing MLD protocol packets

Prerequisites for MLD

Before you configure MLD, you must configure an IPv6 unicast routing protocol so that all devices can interoperate at the network layer.

Enabling MLD

Restrictions and guidelines

Perform this task on interfaces where IPv6 multicast group memberships are created and maintained.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable MLD.
   mld enable

By default, MLD is disabled.

Configuring basic MLD features

Specifying an MLD version

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an MLD version on the interface.
   mld version *version-number*
   By default, the MLD version on an interface is MLDv1.

CAUTION:
For MLD to operate correctly, specify the same MLD version for all devices on the same subnet.

Configuring a static group member

About this task

You can configure an interface as a static member of an IPv6 multicast group. Then, the interface can always receive IPv6 multicast data for the group.

A static group member does not respond to MLD queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited MLD report or done message.

Restrictions and guidelines

The interface to be configured as a static member of an IPv6 multicast group has the following restrictions:

- If the interface is MLD and IPv6 PIM-SM enabled, it must be an IPv6 PIM-SM DR.
- If the interface is MLD enabled but not IPv6 PIM-SM enabled, it must be an MLD querier.

For more information about IPv6 PIM-SM and DR, see "IPv6 PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a static group member.
   mld static-group *ipv6-group-address* [**source** *ipv6-source-address*]

Configuring an IPv6 multicast group policy

About this task

This feature enables an interface to filter MLD reports by using an ACL that specifies IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send MLD reports.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 multicast group policy on the interface.
   mld group-policy *ipv6-acl-number* [*version-number*]

Adjusting MLD performance

Configuring MLD query and response parameters

About this task

The following are MLD query and response parameters:

- **MLD querier's robustness variable**—Number of times for retransmitting MLD queries in case of packet loss. A higher robustness variable makes the MLD querier more robust, but increases the timeout time for IPv6 multicast groups.
- **MLD startup query interval**—Interval at which an MLD querier sends MLD general queries at startup.
- **MLD startup query count**—Number of MLD general queries that an MLD querier sends at startup.
- **MLD general query interval**—Interval at which an MLD querier sends MLD general queries to check for IPv6 multicast group members on the network.
- **MLD last listener query interval**—In MLDv1, it sets the interval at which a querier sends multicast-address-specific queries after receiving a done message. In MLDv2, it sets the interval at which a querier sends multicast-address-and-source-specific queries after receiving a report that changes IPv6 multicast source and group mappings.
- **MLD last listener query count**—In MLDv1, it sets the number of multicast-address-specific queries that the querier sends after receiving a done message. In MLDv2, it sets the number of multicast-address-and-source-specific queries that the querier sends after receiving a report that changes IPv6 multicast group and source mappings.
- **MLD maximum response time**—Maximum time before a receiver responds with a report to an MLD general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the MLD query. When the timer value decreases to 0, the receiver sends an MLD report to the group.
- **MLD other querier present timer**—Lifetime for an MLD querier after a non-querier receives an MLD general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

- To avoid frequent MLD querier changes, set the MLD other querier present timer greater than the MLD general query interval. In addition, configure the same MLD other querier present timer for all MLD devices on the same subnet.
- To speed up the response to MLD queries and avoid simultaneous timer expirations that cause MLD report traffic bursts, you must set an appropriate maximum response time.
  - For MLD general queries, the maximum response time is set by the **max-response-time** command.
  - For MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, the maximum response time equals the MLD last listener query interval.
- You can configure MLD query and response parameters globally for all interfaces in MLD view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the MLD query and response parameters globally

1. Enter system view.

   system-view
2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]
3. Set the MLD querier's robustness variable.

   robust-count *count*

   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.

   startup-query-interval *interval*

   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.

   startup-query-count *count*

   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.

   query-interval *interval*

   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.

   last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.

   last-listener-query-count *count*

   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.

   max-response-time *time*

   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.

    other-querier-present-timeout *time*

    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Configuring the MLD query and response parameters on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the MLD querier's robustness variable.
   mld robust-count *count*
   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.
   mld startup-query-interval *interval*
   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.
   mld startup-query-count *count*
   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.
   mld query-interval *interval*
   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.
   mld last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.
   mld last-listener-query-count *count*
   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.
   mld max-response-time *time*
   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.
    mld other-querier-present-timeout *time*
    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an MLD querier to send leave notifications to the upstream without sending multicast-address-specific or multicast-address-and-source-specific queries after receiving a done message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*

3. Enable fast-leave processing.

   mld fast-leave [**group-policy** *ipv6-acl-number*]

   By default, fast-leave processing is disabled.

Configuring MLD SSM mappings

About this task

This feature enables the device to provide SSM services for MLDv1 hosts.

Restrictions and guidelines

This feature does not process MLDv2 messages. Enable MLDv2 on the receiver-side interface to ensure that MLDv2 reports from MLDv2 receiver hosts can be processed.

Procedure

1. Enter system view.

   system-view

2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]

3. Configure an MLD SSM mapping.

   ssm-mapping *ipv6-source-address ipv6-acl-number*

Configuring MLD proxying

Prerequisites for MLD proxying

Before you configure MLD proxying, determine the router interfaces and host interface based on the network topology. Then, enable MLD on the router interfaces.

Enabling MLD proxying

Restrictions and guidelines

- Enable MLD proxying on the receiver-side interfaces.
- On an interface enabled with MLD proxying, only the **mld version** command takes effect and other MLD commands do not take effect.
- If you enable both MLD proxying and an IPv6 multicast routing protocol on the same device, the IPv6 multicast routing protocol does not take effect.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable MLD proxying.

   mld proxy enable

   By default, MLD proxying is disabled.

Enabling IPv6 multicast forwarding on a non-querier interface

About this task

Typically, only MLD queriers can forward IPv6 multicast traffic and non-queriers cannot. This prevents IPv6 multicast data from being repeatedly forwarded. If a router interface on the MLD proxy failed the querier election, enable IPv6 multicast forwarding on the interface to forward IPv6 multicast data to downstream receivers.

Restrictions and guidelines

A shared-media network might have multiple MLD proxies, including one proxy acting as a querier. To avoid duplicate IPv6 multicast traffic, do not enable IPv6 multicast forwarding on any of the non-querier MLD proxies for the network.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable IPv6 multicast forwarding on a non-querier interface.

   mld proxy forwarding

   By default, IPv6 multicast forwarding is disabled on a non-querier interface.

Enabling IPv6 multicast load splitting for MLD proxy interfaces

About this task

If multiple MLD proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards IPv6 multicast traffic. You can enable IPv6 multicast load splitting on the device so that all the proxy interfaces can share IPv6 multicast traffic.

Procedure

1. Enter system view.

   system-view
2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]
3. Enable IPv6 multicast load splitting for MLD proxy interfaces.

   proxy multipath

   By default, IPv6 multicast load splitting is disabled for MLD proxy interfaces.

Enabling MLD NSR

About this task

This feature backs up information about MLD interfaces and MLD multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the IPv6 multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable MLD NSR.
   mld non-stop-routing
   By default, MLD NSR is disabled.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Display and maintenance commands for MLD

CAUTION:
The **reset mld group** command might cause IPv6 multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

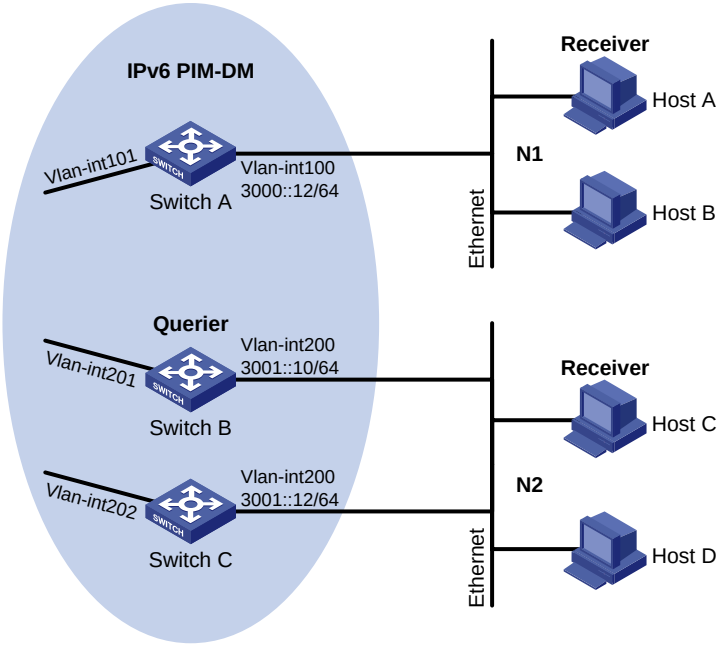
Task	Command
Display information about MLD multicast groups.	**display mld** [**vpn-instance** *vpn-instance-name*] **group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display MLD information for interfaces.	**display mld** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**proxy**] [**verbose**]
Display IPv6 multicast routing entries maintained by the MLD proxy.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**verbose**]

Task	Command
Display information about the MLD proxy routing table.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*]] * [**verbose**]
Display MLD SSM mappings.	**display mld** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*
Clear dynamic MLD multicast group entries.	**reset mld** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

MLD configuration examples

Example: Configuring basic MLD features

Network configuration



As shown in Figure 5:

- OSPFv3 and IPv6 PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are multicast receiver hosts in N1 and N2, respectively.
- MLDv1 runs between Switch A and N1, and between the other two switches (Switch B and Switch C) and N2.
- Switch A acts as the MLD querier in N1. Switch B acts as the MLD querier in N2 because it has a lower IPv6 address.

Configure the switches to meet the following requirements:

- The hosts in N1 can join only IPv6 multicast group FF1E::101.
- The hosts in N2 can join any IPv6 multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 5, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable the IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] mld enable
   [SwitchB-Vlan-interface200] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 201.

   ```
   [SwitchB] interface vlan-interface 201
   ```

```
[SwitchB-Vlan-interface201] ipv6 pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IPv6 multicast routing.

```
<SwitchC> system-view
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] mld enable
[SwitchC-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] ipv6 pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure an IPv6 multicast group policy on Switch A so that the hosts connected to VLAN-interface 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display MLD information for VLAN-interface 200 on Switch B.

```
[SwitchB] display mld interface vlan-interface 200
 Vlan-interface200(FE80::200:5EFF:FE66:5100):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
   Other querier present time for MLD: 255s
   Maximum query response time for MLD: 10s
   Querier for MLD: FE80::200:5EFF:FE66:5100 (This router)
  MLD groups reported in total: 1
```

Example: Configuring MLD SSM mapping

Network configuration

As shown in Figure 6:

- OSPFv3 runs on the network.
- The IPv6 PIM-SM domain uses the SSM model for IPv6 multicast delivery. The SSM group range is FF3E::/64.
- MLDv2 runs on VLAN-interface 400 of Switch D. The receiver host runs MLDv1, and does not support MLDv2. The receiver host cannot specify IPv6 multicast sources in its membership reports.
- Source 1, Source 2, and Source 3 send IPv6 multicast packets to multicast groups in IPv6 SSM group range FF3E::/64.

Configure the MLD SSM mapping feature on Switch D so that the receiver host will receive IPv6 multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

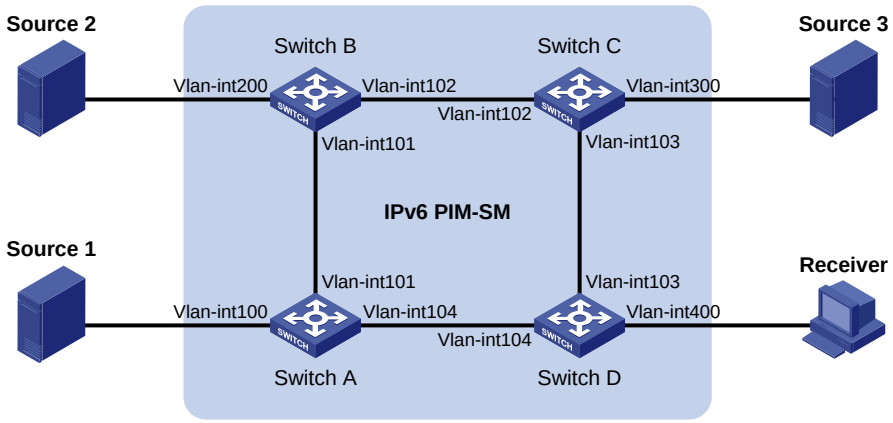


Table 1 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	1001::1/64	Source 3	—	3001::1/64
Source 2	—	2001::1/64	Receiver	—	4001::1/64
Switch A	Vlan-int100	1001::2/64	Switch C	Vlan-int300	3001::2/64
Switch A	Vlan-int101	1002::1/64	Switch C	Vlan-int103	3002::1/64
Switch A	Vlan-int104	1003::1/64	Switch C	Vlan-int102	2002::2/64
Switch B	Vlan-int200	2001::2/64	Switch D	Vlan-int400	4001::2/64
Switch B	Vlan-int101	1002::2/64	Switch D	Vlan-int103	3002::2/64
Switch B	Vlan-int102	2002::1/64	Switch D	Vlan-int104	1003::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Table 1, and configure OSPFv3 on the switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, and enable IPv6 PIM-SM and MLD:

   # On Switch D, enable IPv6 multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] ipv6 multicast routing
   [SwitchD-mrib6] quit
   ```

   # Enable MLDv2 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] mld enable
   [SwitchD-Vlan-interface400] mld version 2
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

   ```
   [SwitchD] interface vlan-interface 103
   [SwitchD-Vlan-interface103] ipv6 pim sm
   [SwitchD-Vlan-interface103] quit
   ```

```
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] ipv6 pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] ipv6 pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range:

On Switch D, specify FF3E::/64 as the IPv6 SSM group range.

```
[SwitchD] acl ipv6 basic 2000
[SwitchD-acl-ipv6-basic-2000] rule permit source ff3e:: 64
[SwitchD-acl-ipv6-basic-2000] quit
[SwitchD] pim ipv6
[SwitchD-pim6] ssm-policy 2000
[SwitchD-pim6] quit
```

Configure Switch A, Switch B and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure MLD SSM mappings on Switch D.

```
[SwitchD] mld
[SwitchD-mld] ssm-mapping 1001::1 2000
[SwitchD-mld] ssm-mapping 3001::1 2000
[SwitchD-mld] quit
```

Verifying the configuration

Display MLD SSM mappings for IPv6 multicast group FF3E::101 on Switch D.

```
[SwitchD] display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
        1001::1
        3001::1
```

On Switch D, display information about MLD multicast groups that hosts have dynamically joined.

```
[SwitchD] display mld group
MLD groups in total: 1
 Vlan-interface400(FE80::101):
  MLD groups reported in total: 1
   Group address: FF3E::101
    Last reporter: FE80::1
```

```
    Uptime: 00:02:04
    Expires: Off
```

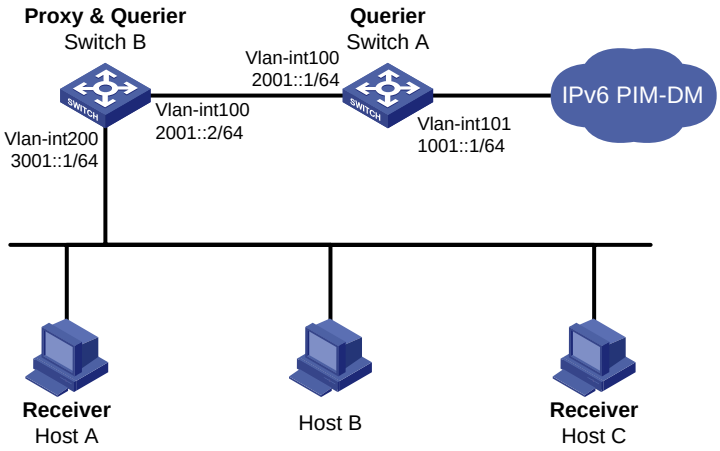
Display IPv6 PIM routing entries on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (1001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -

 (3001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -
```

Example: Configuring MLD proxying



Network configuration

As shown in Figure 7:

- IPv6 PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information destined to IPv6 multicast group FF3E::101.

Configure the MLD proxying feature on Switch B so that Switch B can maintain group memberships and forward IPv6 multicast traffic without running IPv6 PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 7.

Procedure

1. Enable IPv6 multicast routing, IPv6 PIM-DM, MLD, and MLD proxying:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

Verifying the configuration

Display IPv6 multicast group membership information maintained by the MLD proxy on Switch B.

```
[SwitchB] display mld proxy group
MLD proxy group records in total: 1
```

```
Vlan-interface100(FE80::16:1):
 MLD proxy group records in total: 1
  Group address: FF1E::1
   Member state: Delay
   Expires: 00:00:02
```

Troubleshooting MLD

No member information exists on the receiver-side device

Symptom

When a host sends a message to announce that it is joining IPv6 multicast group G, no member information of multicast group G exists on the immediate device.

Solution

To resolve the problem:

1. Use the **`display mld interface`** command to verify that the networking, interface connections, and IP address configuration are correct.
2. Use the **`display current-configuration`** command to verify that the IPv6 multicast routing is enabled. If it is not enabled, use the **`ipv6 multicast routing`** command in system view to enable IPv6 multicast routing. In addition, verify that MLD is enabled on the associated interfaces.
3. Use the **`display mld interface`** command to verify that the MLD version on the interface is lower than that on the host.
4. Use the **`display current-configuration interface`** command to verify that no IPv6 multicast group policies have been configured to filter MLD reports for IPv6 multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different MLD devices on the same subnet.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to verify the MLD information on the interface. Make sure the devices on the subnet have the same MLD settings on their interfaces.
2. Use the **`display mld interface`** command on all devices on the same subnet to check the MLD timers for inconsistent configurations.
3. Use the **`display mld interface`** command to verify that all devices are running the same MLD version.
4. If the problem persists, contact H3C Support.

IPv6 PIM overview

IPv6 Protocol Independent Multicast (IPv6 PIM) provides IPv6 multicast forwarding by leveraging IPv6 unicast static routes or IPv6 unicast routing tables generated by any IPv6 unicast routing protocol. IPv6 PIM uses the underlying IPv6 unicast routing to generate an IPv6 multicast routing table without relying on any particular IPv6 unicast routing protocol.

IPv6 PIM uses the RPF mechanism to implement IPv6 multicast forwarding. For more information about RPF, see "Configuring IPv6 multicast routing and forwarding."

IPv6 PIM modes

Based on the implementation mechanism, IPv6 PIM includes the following modes:

- IPv6 Protocol Independent Multicast–Dense Mode (IPv6 PIM-DM).
- IPv6 Protocol Independent Multicast–Sparse Mode (IPv6 PIM-SM).
- IPv6 Protocol Independent Multicast Source-Specific Multicast (IPv6 PIM-SSM).

In this document, an IPv6 PIM domain refers to a network composed of IPv6 PIM devices.

IPv6 PIM-DM

IPv6 PIM-DM uses the push mode for multicast forwarding and is suitable for small networks with densely distributed IPv6 multicast members.

IPv6 PIM-DM assumes that all downstream nodes want to receive IPv6 multicast data from a source, so IPv6 multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees, leaving only those branches that contain receivers. When the pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In IPv6 PIM-DM, the multicast forwarding paths for an IPv6 multicast group constitute a forwarding tree. The forwarding tree is rooted at the IPv6 multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the IPv6 multicast source to the receivers, it is also called a "shortest path tree (SPT)."

IPv6 PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

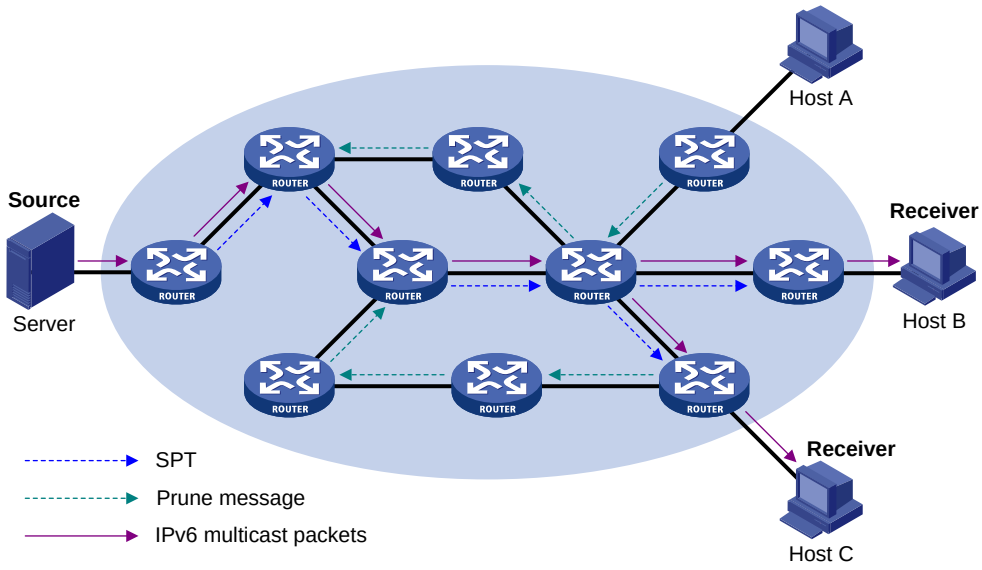
Neighbor discovery

In an IPv6 PIM domain, each IPv6 PIM interface periodically multicasts IPv6 PIM hello messages to all other IPv6 PIM devices on the local subnet. Through the exchanging of hello messages, all IPv6 PIM devices determine their IPv6 PIM neighbors, maintain IPv6 PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In an IPv6 PIM-DM domain, the IPv6 multicast data from the IPv6 multicast source S to the IPv6 multicast group G is flooded throughout the domain. A device performs an RPF check on the IPv6 multicast data. If the check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes in the network. In the flooding process, all the devices in the IPv6 PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all IPv6 PIM devices on the subnet. When the upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that IPv6 multicast group down to this node.

NOTE:

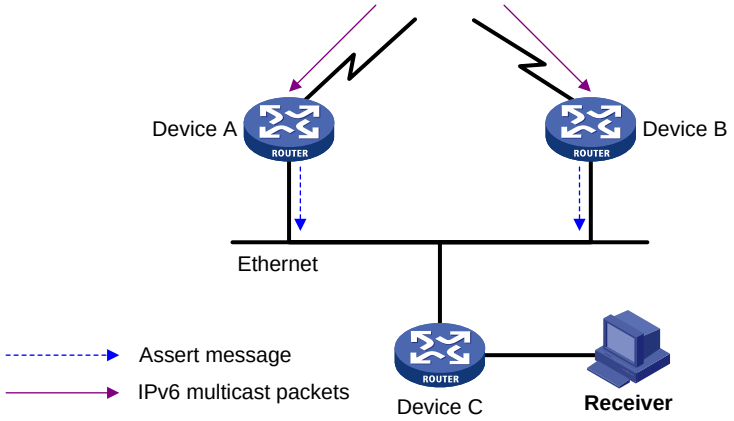
An (S, G) entry contains an IPv6 multicast source address S, an IPv6 multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the IPv6 multicast source. This prune process goes on until only necessary branches are left in the IPv6 PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, IPv6 multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the IPv6 multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all IPv6 PIM devices on the local subnet through the interface that received the packet. The assert message contains the IPv6 multicast source address (S), the IPv6 multicast group address (G), and the metric preference and metric of the IPv6 unicast route/static multicast route to the IPv6 multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the subnet. The comparison process is as follows:

1. The device with a higher metric preference to the IPv6 multicast source wins.
2. If both devices have the same metric preference to the IPv6 multicast source, the device with a smaller metric to the IPv6 multicast source wins.
3. If both devices have the same metric, the device with a higher IPv6 link-local address on the downstream interface wins.

IPv6 PIM-SM

IPv6 PIM-DM uses the flood-and-prune cycles to build SPTs for IPv6 multicast data forwarding. Although an SPT has the shortest paths from the IPv6 multicast source to the receivers, it is built with a low efficiency. Therefore, IPv6 PIM-DM is not suitable for large- and medium-sized networks.

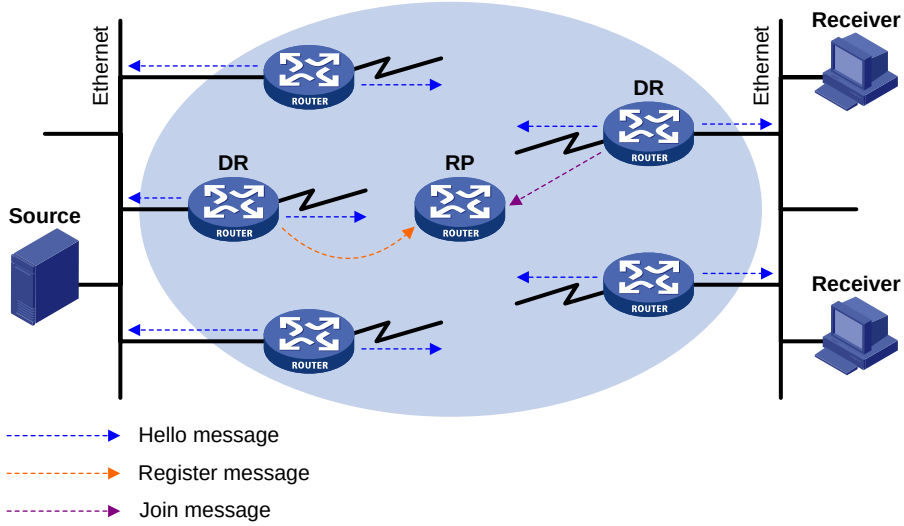
IPv6 PIM-SM uses the pull mode for IPv6 multicast forwarding, and it is suitable for large-sized and medium-sized networks with sparsely and widely distributed IPv6 multicast group members.

IPv6 PIM-SM assumes that no hosts need IPv6 multicast data. A multicast receiver must express its interest in the IPv6 multicast data for an IPv6 multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of an IPv6 PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement IPv6 multicast data forwarding. An SPT is rooted at the IPv6 multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

IPv6 PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

IPv6 PIM-SM uses the same neighbor discovery mechanism as IPv6 PIM-DM does. For more information, see "Neighbor discovery."



DR election

A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the IPv6 multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the receiver hosts to send join messages to the RP.

IMPORTANT:

MLD must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any IPv6 multicast groups. For more information about MLD, see "Configuring MLD."

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IPv6 link-local address wins the DR election under one of the following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its IPv6 PIM neighbor lifetime expires, and the other devices initiate a new DR election.

RP discovery

An RP is the core of an IPv6 PIM-SM domain. An IPv6 multicast group can have only one RP for IPv6 multicast forwarding, and an RP can be designated to multiple IPv6 multicast groups.

RP selection mechanism

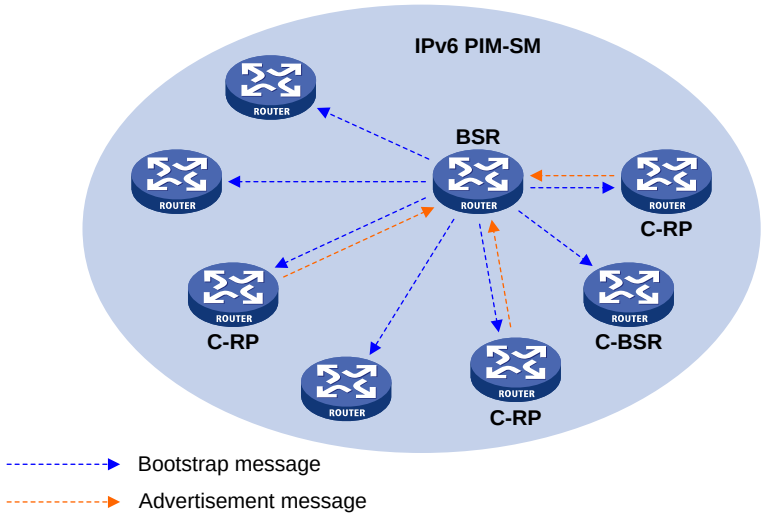
An RP can be statically configured, dynamically elected, or extracted from an IPv6 multicast address with embedded RP. The embedded RP takes precedence over the static RP and the dynamic RP. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs

A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election



Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to an IPv6 multicast group.
- **BSR**—A BSR is the core of the administrative core of the IPv6 PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. An IPv6 PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the IPv6 PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

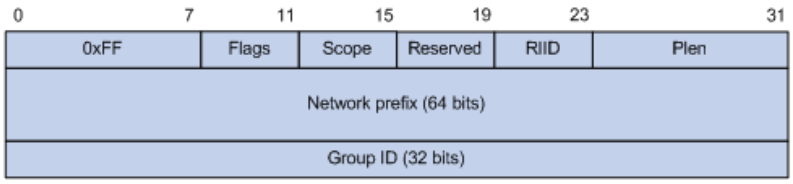
NOTE:

A device can act as a C-RP and a C-BSR at the same time.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

1. Each C-BSR sends a BSM to other devices in the IPv6 PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IPv6 address wins. The loser uses the winner's



BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.

3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the IPv6 multicast group range to which it is designated.
4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between IPv6 multicast groups and RPs. The BSR encapsulates the RP-set information in the BSMs and advertises the BSMs to the entire IPv6 PIM-SM domain.
5. All devices in the IPv6 PIM-SM domain select an RP for an IPv6 multicast group based on the following rules:
   a. The C-RP that is designated to the smallest IPv6 multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Embedded RP

The embedded RP mechanism enables a device to resolve the RP address from an IPv6 multicast group address to map the IPv6 multicast group to an RP. This RP can take the place of the configured static RP or the RP dynamically elected by the bootstrap mechanism. A DR does not need to learn the RP address beforehand. Figure 5 shows the format of an IPv6 multicast group address with embedded RP.

Figure 5 Format of an IPv6 multicast address with embedded RP

As shown in Figure 5, the requirements for each field are as follows:

- **First 8 bits**—Fixed to 0xFF.
- **Flags**—The R, P, and T bits must be set to 1.
- **Reserved**—Contains 4 bits and must be set to 0.
- **RIID**—Contains 4 bits and indicates the RP interface ID.
- **Plen**—Contains 8 bits and indicates the valid length (in bits) of the RP address prefix. This field value cannot be greater than 64 and cannot be 0.
- **Network prefix**—Contains 64 bits and indicates the prefix of the RP address. The valid length of the prefix is determined by the Plen field.
- **Group ID**—Reduced to 32 bits and indicates the ID of the IPv6 multicast group.

The process of discovering an embedded RP is as follows:

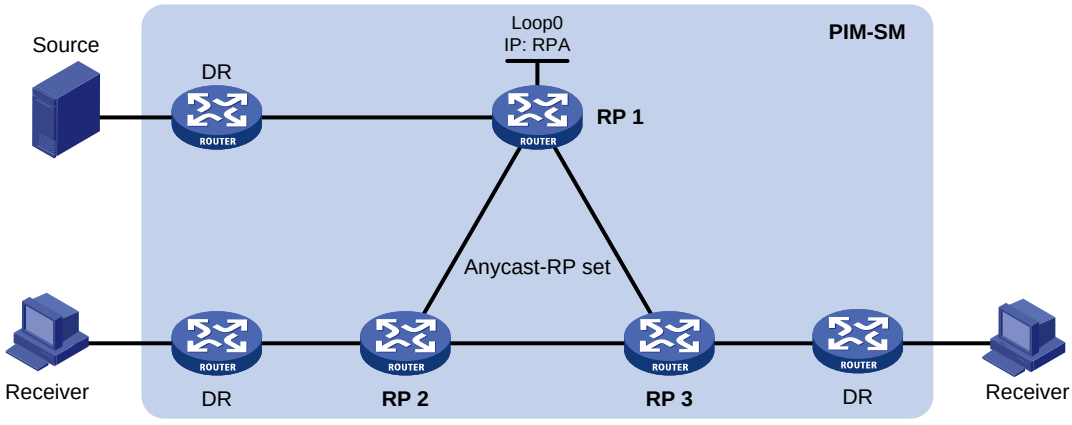
- At the receiver side, a receiver host initiates an MLD report to join an IPv6 multicast group. Upon receiving the MLD report, the receiver-side DR resolves the RP address embedded in the IPv6 multicast group address and uses the RP for the IPv6 multicast group.
- At the IPv6 multicast source side, the IPv6 multicast source sends an IPv6 multicast packet to an IPv6 multicast group. Upon receiving the IPv6 multicast packet, the source-side DR resolves

the RP address embedded in the IPv6 multicast address and uses the RP for the IPv6 multicast group.

Anycast RP

IPv6 PIM-SM requires only one active RP to serve each IPv6 multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IPv6 address for one multicast group. An IPv6 multicast source registers with the closest RP or a receiver-side DR joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—An IPv6 multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented by using either of the following methods:

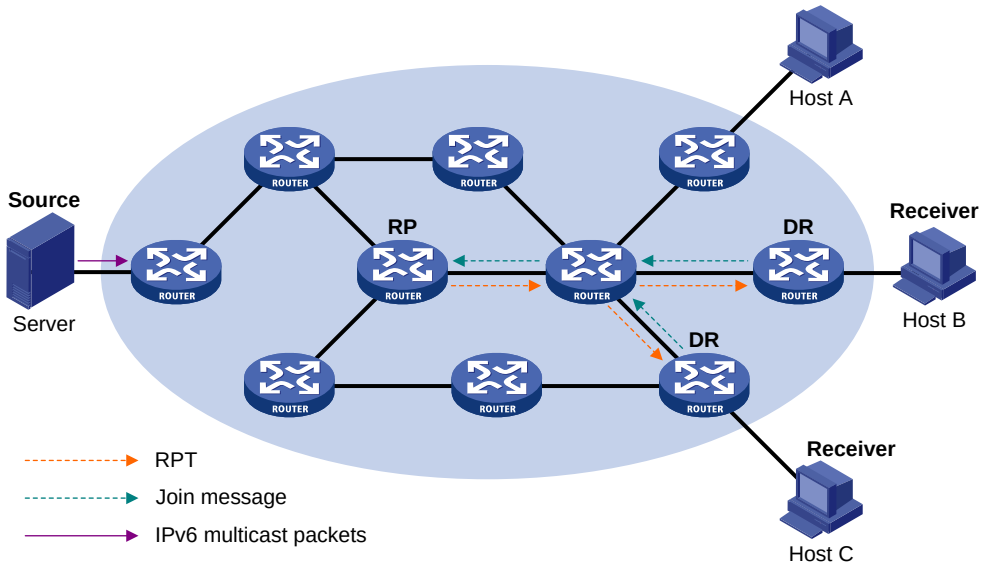
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through IPv6 PIM-SM**—In this method, you can configure multiple RPs for one IPv6 multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same IPv6 multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IPv6 address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IPv6 address of the Anycast RP set for communication within the IPv6 PIM-SM domain. It is also known as RPA.

  As shown in Figure 6, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 6 Anycast RP through IPv6 PIM-SM

The following describes how Anycast RP through IPv6 PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IPv6 address of the register message to its own IPv6 address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

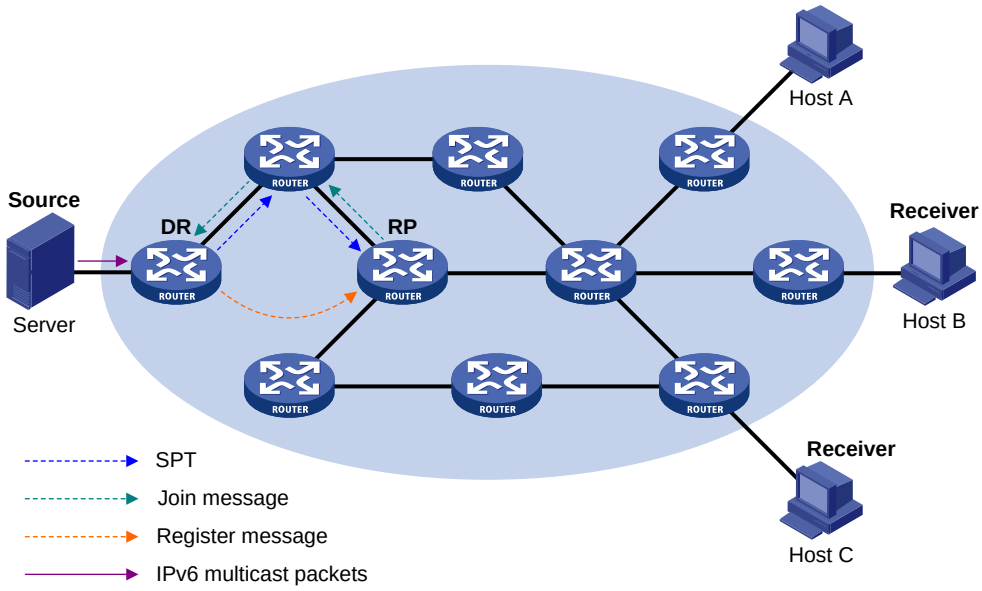
In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize IPv6 multicast source information.

RPT building

Figure 7 RPT building in an IPv6 PIM-SM domain

As shown in Figure 7, the process of building an RPT is as follows:

1. When a receiver wants to join the IPv6 multicast group G, it uses an MLD message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the IPv6 multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any IPv6 multicast source. The RPT is rooted at the RP and has the DR as its leaf.



When the IPv6 multicast data addressed to the IPv6 multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT. Finally, the DR forwards the IPv6 multicast data to the receiver hosts.

When a receiver is no longer interested in the IPv6 multicast data addressed to the IPv6 multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that IPv6 multicast group. If no receivers for the IPv6 multicast group exist, the device continues to forward the prune message to its upstream device.

IPv6 multicast source registration

The IPv6 multicast source uses the registration process to inform an RP of its presence.

Figure 8 IPv6 multicast source registration

As shown in Figure 8, the IPv6 multicast source registers with the RP as follows:

1. The IPv6 multicast source S sends the first multicast packet to the IPv6 multicast group G. When receiving the multicast packet, the source-side DR that directly connects to the IPv6 multicast source encapsulates the packet into a register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates it and forwards it down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent IPv6 multicast data from the IPv6 multicast source are forwarded to the RP along the SPT. When the IPv6 multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

In an IPv6 PIM-SM domain, only one RP and one RPT provide services for a specific IPv6 multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all IPv6 multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

IPv6 multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for an IPv6 multicast packet might not be the shortest one.
- The RP might be overloaded by IPv6 multicast traffic bursts.

To eliminate these weaknesses, IPv6 PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives IPv6 multicast traffic:

- The RP initiates the switchover to SPT:

  If the RP receives IPv6 multicast traffic, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. The subsequent IPv6 multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

For more information about the switchover to SPT initiated by the RP, see "IPv6 multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives IPv6 multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the device where the RPT and the SPT branches, the device drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the IPv6 multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent IPv6 multicast packets for the IPv6 multicast group travel along the SPT from the IPv6 multicast source to the receiver hosts.

With the switchover to SPT, IPv6 PIM-SM builds SPTs more economically than IPv6 PIM-DM does.

Assert

IPv6 PIM-SM uses a similar assert mechanism as IPv6 PIM-DM does. For more information, see "Assert."

IPv6 administrative scoping

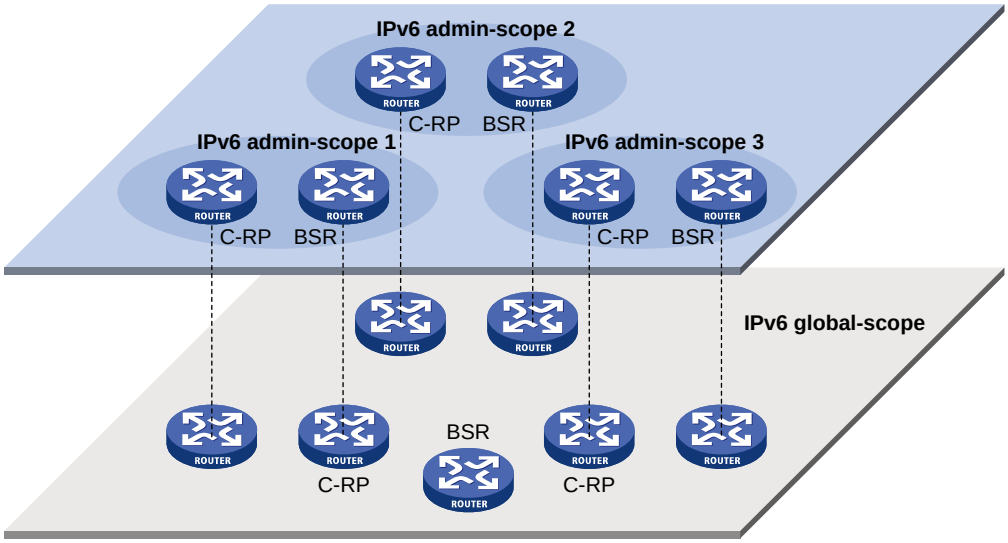
IPv6 administrative scoping mechanism

IPv6 administrative scoping mechanisms for IPv6 PIM-SM include IPv6 non-scoped BSR mechanism and IPv6 administrative scoping mechanism.

- **IPv6 non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **IPv6 administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (IPv6 admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

An IPv6 admin-scoped zone is designated to particular IPv6 multicast groups with the same scope field value in their group addresses. Zone border routers (ZBRs) form the boundary of an IPv6 admin-scoped zone. Each IPv6 admin-scoped zone maintains one BSR for IPv6 multicast groups with the same scope field value. IPv6 multicast protocol packets, such as assert messages and BSMs, of these IPv6 multicast groups cannot cross the boundary of the IPv6 admin-scoped zone for the group range. The IPv6 multicast group ranges to which different IPv6 admin-scoped zones are designated can have intersections. However, the IPv6 multicast groups in an IPv6 admin-scoped zone are valid only within its local zone, and theses IPv6 multicast groups are regarded as private group addresses.

The IPv6 global-scoped zone can be regarded as a special IPv6 admin-scoped zone, and it maintains a BSR for the IPv6 multicast groups with the scope field value as 14.



Relationship between IPv6 admin-scoped zones and the IPv6 global-scoped zone

The IPv6 global-scoped zone and each IPv6 admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each IPv6 admin-scoped zone has its own boundary. The IPv6 multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the IPv6 global-scoped zone and IPv6 admin-scoped zones based on geographical locations and the scope field values.

- In view of geographical locations:

  An IPv6 admin-scoped zone is a logical zone for particular IPv6 multicast groups with the same scope field value. The IPv6 multicast packets for such IPv6 multicast groups are confined within the local IPv6 admin-scoped zone and cannot cross the boundary of the zone.

  Figure 9 Relationship in view of geographical locations

  As shown in Figure 9, for the IPv6 multicast groups with the same scope field value, the IPv6 admin-scoped zones must be geographically separated and isolated. The IPv6 global-scoped zone includes all devices in the IPv6 PIM-SM domain. IPv6 multicast packets that do not belong to any IPv6 admin-scoped zones are forwarded in the entire IPv6 PIM-SM domain.

- In view of the scope field values:

  In terms of the scope field values, the scope field in an IPv6 multicast group address shows the zone to which the IPv6 multicast group belongs.

  Figure 10 IPv6 multicast address format

  An IPv6 admin-scoped zone with a larger scope field value contains an IPv6 admin-scoped zone with a smaller scope field value. The zone with the scope field value of E is the IPv6 global-scoped zone. Table 1 lists the possible values of the scope field.

Table 1 Values of the Scope field

Value	Meaning	Remarks
0, F	Reserved	N/A
1	Interface-local scope	N/A
2	Link-local scope	N/A
3	Subnet-local scope	IPv6 admin-scoped zone.
4	Admin-local scope	IPv6 admin-scoped zone.
5	Site-local scope	IPv6 admin-scoped zone.
6, 7, 9 through D	Unassigned	IPv6 admin-scoped zone.
8	Organization-local scope	IPv6 admin-scoped zone.
E	Global scope	IPv6 global-scoped zone.

IPv6 PIM-SSM

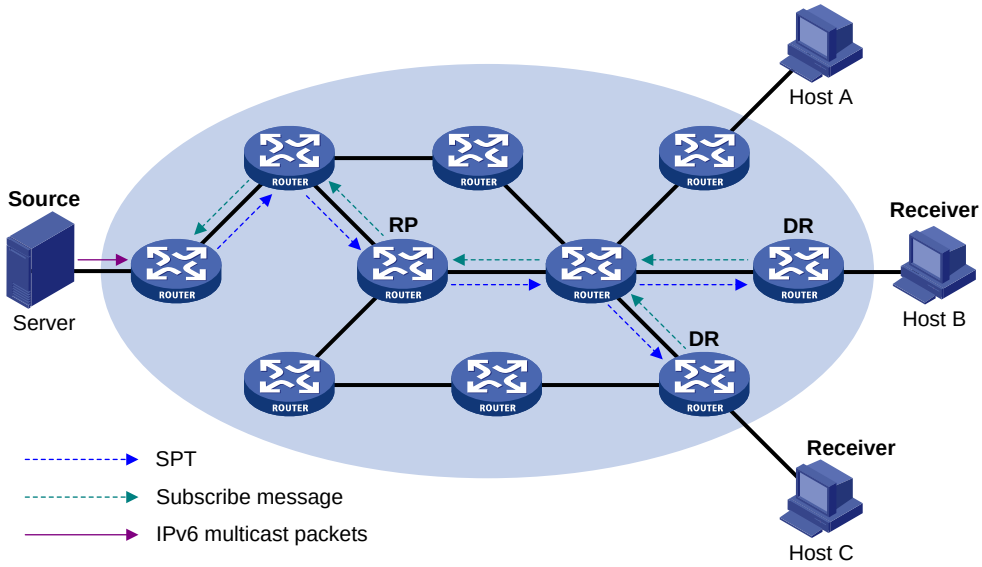
The ASM model includes IPv6 PIM-DM and IPv6 PIM-SM. The SSM model can be implemented by leveraging part of the IPv6 PIM-SM technique. It is also called "IPv6 PIM-SSM."

The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through MLDv2.

In actual applications, part of MLDv2 and IPv6 PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located an IPv6 multicast source, no RP or RPT is required. No source registration process is required for discovering IPv6 multicast sources in other IPv6 PIM domains.

IPv6 PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery



IPv6 PIM-SSM uses the same neighbor discovery mechanism as IPv6 PIM-SM. For more information, see "Neighbor discovery."

DR election

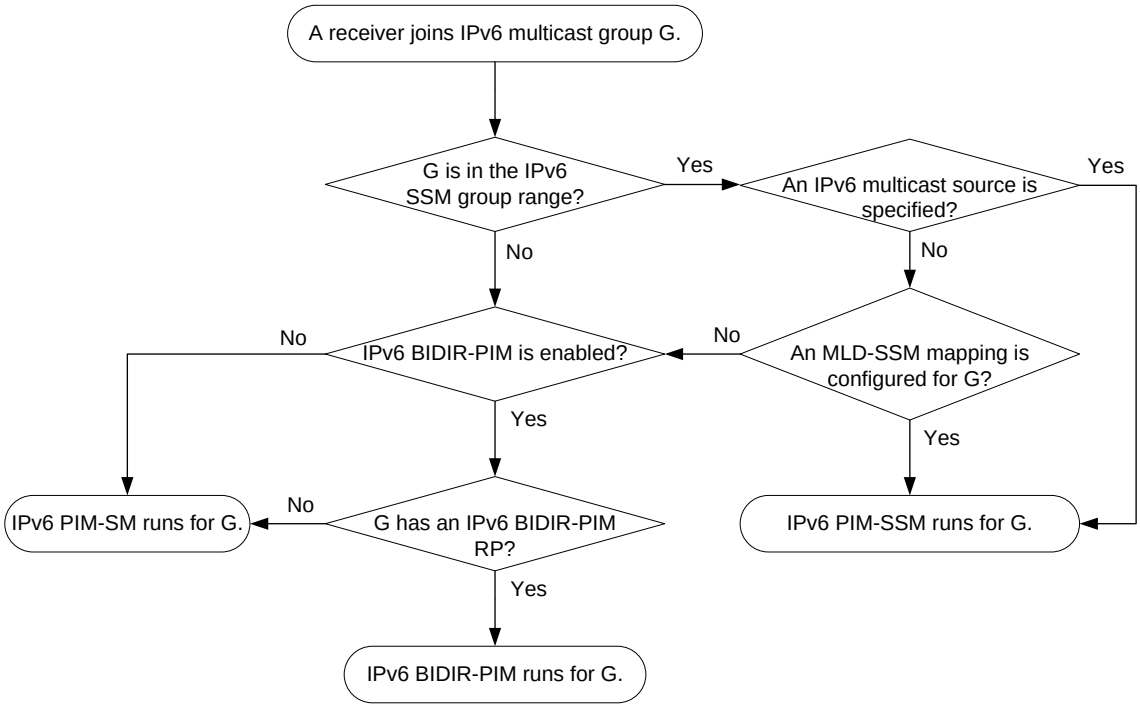
IPv6 PIM-SSM uses the same DR election mechanism as IPv6 PIM-SM. For more information, see "DR election."

SPT building

Figure 11 SPT building in IPv6 PIM-SSM

As shown in Figure 11, the following is the process for building an SPT:

1. Host B and Host C are receivers. They send MLDv2 report messages to their DRs to express their interest in the multicast information that the IPv6 multicast source S sends to the IPv6 multicast group G.
2. After receiving a report message, the DR sends a subscribe message hop by hop toward the IPv6 multicast source S. All devices along the path from the DR to the IPv6 multicast source create an (S, G) entry to build an SPT. The SPT is rooted the IPv6 multicast source S and has the receivers as its leaves. This SPT is the transmission channel in IPv6 PIM-SSM.



In IPv6 PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among IPv6 PIM protocols

In an IPv6 PIM network, IPv6 PIM-DM cannot run together with IPv6 PIM-SM, IPv6 BIDIR-PIM, or IPv6 PIM-SSM. However, IPv6 PIM-SM, IPv6 BIDIR-PIM, and IPv6 PIM-SSM can run together. (IPv6 BIDIR-PIM is not supported in the current software version.) Figure 12 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about MLD SSM mapping, see "Configuring MLD."

Figure 12 Relationship among IPv6 PIM protocols

IPv6 PIM support for VPNs

To support IPv6 PIM for VPNs, a multicast device that runs IPv6 PIM maintains an independent set of IPv6 PIM neighbor table, IPv6 multicast routing table, BSR information, and RP-set information for each VPN.

After receiving an IPv6 multicast data packet, the multicast device checks which VPN the IPv6 data packet belongs to. Then, the device forwards the IPv6 packet according to the IPv6 multicast routing table for that VPN or creates an IPv6 multicast routing entry for that VPN.

Configuring IPv6 PIM

Restrictions and guidelines: IPv6 PIM configuration

All the interfaces on a device must operate in the same IPv6 PIM mode on the public network or the same VPN instance.

Configuring IPv6 PIM-DM

IPv6 PIM-DM tasks at a glance

To configure IPv6 PIM-DM, perform the following tasks:

1. Enabling IPv6 PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the IPv6 PIM-DM graft retry timer
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-DM

Before you configure IPv6 PIM-DM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-DM

About this task

With IPv6 PIM-DM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-DM on all non-border interfaces of devices when you deploy an IPv6 PIM-DM domain.

Procedure

1. Enter system view.
   `system-view`
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   `ipv6 multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-DM.
   ipv6 pim dm
   By default, IPv6 PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the IPv6 PIM device that is directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. Use this feature to prevent the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can adjust the amount of time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own IPv6 PIM-DM state, and resets the waiting timer.
- **Hop limit value of state refresh messages**—The hop limit value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the hop limit comes down to 0. A state refresh message with a large hop limit value might cycle on a small network. To control the propagation scope of state refresh messages, configure an appropriate hop limit value based on the network size on the device directly connected with the IPv6 multicast source.

Restrictions and guidelines

Perform this task on all devices in the IPv6 PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the state refresh feature.
   ipv6 pim state-refresh-capable
   By default, the state refresh feature is enabled.
4. Return to system view.
   quit
5. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
6. Set the state refresh interval.
   state-refresh-interval *interval*
   The default setting is 60 seconds.
7. Set the amount of time that the device must wait to accept a new state refresh message.
   state-refresh-rate-limit *time*
   The default setting is 30 seconds.

8. Set the hop limit value of state refresh messages.
   state-refresh-hoplimit *hoplimit-value*
   The default setting is 255.

Setting the IPv6 PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv6 PIM-DM graft retry timer.
   ipv6 pim timer graft-retry *interval*
   By default, the IPv6 PIM-DM graft retry timer is 3 seconds.

Configuring IPv6 PIM-SM

IPv6 PIM-SM tasks at a glance

To configure IPv6 PIM-SM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. Configuring static RPs
   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configure dynamic RP election:
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring an IPv6 PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple IPv6 PIM devices exist in the network.
4. Enabling embedded RP
   Enable embedded RP on each device for inter-domain communication when the devices are located in different IPv6 PIM-SM domains.
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring IPv6 multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SM

Before you configure IPv6 PIM-SM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-SM

About this task

With IPv6 PIM-SM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SM domain.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.
   ipv6 pim sm
   By default, IPv6 PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In the IPv6 PIM-SM domain, you can configure the same static RP for multiple IPv6 multicast groups by using the same RP address but different ACLs.

You do not need to enable IPv6 PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for an IPv6 multicast group, only the static RP with the highest IPv6 address takes effect.

The static RP configuration must be the same on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.

ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for IPv6 PIM-SM.

   static-rp *ipv6-rp-address* [*ipv6-acl-number* | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the IPv6 PIM-SM domain because every C-BSR might become the BSR.

The device might use the BSR RP hash algorithm described in RFC 4601 or in RFC 2362 to calculate the RP for a multicast group. To ensure consistent group-to-RP mappings on all PIM devices in the IPv6 PIM-SM domain, specify the same BSR RP hash algorithm on the devices.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** *ipv6-acl-number* | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv6-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

5. (Optional.) Configure the device to use the BSR RP hash algorithm described in RFC 2362.

   bsr-rp-mapping rfc2362

   By default, the device uses the BSR RP hash algorithm described in RFC 4601.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between the C-BSR and other devices.

The C-BSR configuration on the devices in the IPv6 PIM-SM domain must be the same.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure a C-BSR.

   c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *
4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv6-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring an IPv6 PIM domain border

About this task

An IPv6 PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of IPv6 PIM domain border interfaces partition a network into different IPv6 PIM-SM domains.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure an IPv6 PIM domain border.

   ipv6 pim bsr-boundary

   By default, an interface is not an IPv6 PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the IPv6 PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.
   undo bsm-fragment enable
   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated IPv6 multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.
   undo bsm-reflection enable
   By default, the device forwards BSMs out of their incoming interfaces.

Enabling embedded RP

Restrictions and guidelines

This feature is supported only for IPv6 multicast group addresses in the range of FF7x::/12 or FFFx::/12 and in compliance with RFC 3956.

Enable this feature on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim[**vpn-instance** *vpn-instance-name*]
3. Enable embedded RP.
   embedded-rp [*ipv6-acl-number*]
   By default, embedded RP is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IPv6 address. The IPv6 address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IPv6 address of a loopback interface as the RP member address.

If you configure IPv6 addresses of multiple interfaces on the same device as RP member addresses, the lowest IPv6 address takes effect. The rest of the interface addresses become backup RP member addresses.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RPs or C-RPs in the IPv6 PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *ipv6-anycast-rp-address ipv6-member-address*
   You can repeat this command to add multiple RP member addresses to an Anycast RP set.

Configuring IPv6 multicast source registration

About this task

- **IPv6 PIM register policy**—An IPv6 PIM register policy enables an RP to filter register messages by using an ACL that specifies the IPv6 multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time**—The source-side DR stops sending register messages encapsulated with IPv6 multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated IPv6 multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. If the DR does not receive a register-stop

message when the register probe timer expires, the DR starts sending register messages with encapsulated data again.

The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is (5 seconds). You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure an IPv6 PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure an IPv6 PIM register policy.

   register-policy *ipv6-acl-number*

   By default, no IPv6 register policy is configured. All IPv6 register messages are regarded as legal.

4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.

5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate IPv6 multicast data in register messages destined to the RP. As a best practice to avoid IPv6 multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure the switchover to SPT.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv6-acl-number*]

   By default, the first IPv6 multicast data packet triggers the RPT to SPT switchover.

Configuring IPv6 PIM-SSM

IPv6 PIM-SSM tasks at a glance

To configure IPv6 PIM-SSM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. (Optional.) Configuring an IPv6 PIM hello policy
3. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SSM

Before you configure IPv6 PIM-SSM, you must complete the following tasks:

- Configure an IPv6 unicast IPv6 routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 PIM-SM.
- Enable MLDv2 on the IPv6 PIM devices that connect to IPv6 multicast receivers.

Enabling IPv6 PIM-SM

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SSM domain.

Procedure

1. Enter system view.
   `system-view`
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   `ipv6 multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable IPv6 PIM-SM.
   `ipv6 pim sm`
   By default, IPv6 PIM-SM is disabled.

Specifying the IPv6 SSM group range

About this task

When an IPv6 PIM-SM enabled interface receives an IPv6 multicast packet, it checks whether the IPv6 multicast group address of the packet is in the IPv6 SSM group range. If the IPv6 multicast group address is in this range, the IPv6 PIM mode for this packet is IPv6 PIM-SSM. If the IPv6 multicast group address is not in this range, the IPv6 PIM mode is IPv6 PIM-SM.

Restrictions and guidelines

Configure the same IPv6 SSM group range on all devices in the entire IPv6 PIM-SM domain. Otherwise, IPv6 multicast information cannot be delivered through the IPv6 SSM model.

When a member of an IPv6 multicast group in the IPv6 SSM group range sends an MLDv1 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the IPv6 SSM group range.
   ssm-policy *ipv6-acl-number*
   The default range is FF3x::/32, where x can be any valid scope.

Configuring common IPv6 PIM features

Common IPv6 PIM feature tasks at a glance

All the following tasks are optional.

- Configuring an IPv6 PIM hello policy
- Configuring IPv6 PIM hello message options
- Dropping hello messages without the Generation ID option
- Configuring common IPv6 PIM timers
- Setting the maximum size of a join or prune message
- Configuring an IPv6 PIM join policy
- Setting the DSCP value for outgoing IPv6 PIM protocol packets
- Enabling BFD for IPv6 PIM
- Enabling IPv6 PIM passive mode
- Enabling IPv6 PIM NSR
- Enabling SNMP notifications for IPv6 PIM

Configuring an IPv6 multicast source policy

About this task

This feature enables the device to filter IPv6 multicast data by using an ACL that specifies the IPv6 multicast sources and the optional groups. It filters not only IPv6 multicast data packets but also IPv6 PIM register messages with IPv6 multicast data encapsulated. This also reduces the IPv6 multicast traffic on the network.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 multicast source policy.

source-policy *ipv6-acl-number*

By default, no IPv6 multicast source policy is configured. The device does not filter IPv6 multicast data packets.

Configuring an IPv6 PIM hello policy

About this task

This feature enables the device to filter IPv6 PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against IPv6 PIM message attacks and to establish correct IPv6 PIM neighboring relationships.

If hello messages of an existing IPv6 PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 PIM hello policy.

   ipv6 pim neighbor-policy *ipv6-acl-number*

   By default, no IPv6 PIM hello policy is configured on an interface. All IPv6 PIM hello messages are regarded as legal.

Configuring IPv6 PIM hello message options

About this task

In either an IPv6 PIM-DM domain or an IPv6 PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for IPv6 PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the IPv6 multicast source or the receivers.
- **Holdtime**—IPv6 PIM neighbor lifetime. If a device receives no hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the IPv6 PIM message propagation delay. The override interval defines a time period for a downstream device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different IPv6 PIM devices on a shared-media LAN is different, the largest ones apply.

If you enable neighbor tracking, you must enable it on all IPv6 PIM devices on a shared-media LAN or the upstream device to track join messages from every downstream device.

You can configure hello message options for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

Configuring hello message options globally

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.
   hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the IPv6 PIM message propagation delay for a shared-media LAN.
   hello-option lan-delay *delay*
   The default setting is 500 milliseconds.
6. Set the override interval.
   hello-option override-interval *interval*
   The default setting is 2500 milliseconds.
7. Enable neighbor tracking.
   hello-option neighbor-tracking
   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the DR priority.
   ipv6 pim hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   ipv6 pim hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the IPv6 PIM message propagation delay.
   ipv6 pim hello-option lan-delay *delay*
   The default setting is 500 milliseconds.
6. Set the override interval.

ipv6 pim hello-option override-interval *interval*

The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   ipv6 pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with IPv6 PIM. The generation ID is a random value, but it changes only when the status of the device changes. If an IPv6 PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

   ipv6 pim require-genid

   By default, an interface accepts hello messages without the Generation ID option.

Configuring common IPv6 PIM timers

About this task

The following are common IPv6 PIM timers:

- **Hello interval**—Interval at which an IPv6 PIM device sends hello messages to discover IPv6 PIM neighbors and maintain IPv6 PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, an IPv6 PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join or prune interval**—Interval at which an IPv6 PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which an IPv6 PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is contained in a join or prune message.
- **IPv6 multicast source lifetime**—Lifetime that an IPv6 PIM device maintains for an IPv6 multicast source. If a device does not receive subsequent IPv6 multicast data from the IPv6 multicast source S when the timer expires, it deletes the (S, G) entry for the IPv6 multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common IPv6 PIM timers for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common IPv6 PIM timers globally

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.
   timer hello *interval*
   By default, the interval to send hello messages is 30 seconds.
4. Set the join or prune interval.
   timer join-prune *interval*
   By default, the interval to send join or prune messages is 60 seconds.
   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.
   holdtime join-prune *time*
   By default, the joined/pruned state holdtime timer is 210 seconds.
6. Set the IPv6 multicast source lifetime.
   source-lifetime *time*
   By default, the IPv6 multicast source lifetime is 210 seconds.

Configuring common IPv6 PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   ipv6 pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   ipv6 pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   ipv6 pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   ipv6 pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

Restrictions and guidelines

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the maximum size of a join or prune message.

   jp-pkt-size *size*

   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring an IPv6 PIM join policy

About this task

The IPv6 PIM join policy filters joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages to protect the device against invalid IPv6 PIM join or prune message attacks. The policy identifies valid joined IPv6 multicast source and groups in IPv6 PIM join or prune messages and filters out invalid joined IPv6 multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined IPv6 multicast sources and groups.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 PIM join policy to filter joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages.

   ipv6 pim join-policy { *ipv6-acl-number* | [**asm** *ipv6-acl-number* | **ssm** *ipv6-acl-number*] * }

   By default, no IPv6 PIM join policy is configured and joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing IPv6 PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing IPv6 PIM protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IPv6 PIM protocol packets.

Enabling BFD for IPv6 PIM

About this task

If a DR on a shared-media network fails, a new DR election process will start after the DR ages out. However, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, you can enable BFD for IPv6 PIM to detect link failures among IPv6 PIM neighbors.

You must enable BFD for IPv6 PIM on all IPv6 PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

You must enable IPv6 PIM-DM or IPv6 PIM-SM on an interface before you configure this feature on the interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for IPv6 PIM.

   ipv6 pim bfd enable

   By default, BFD is disabled for IPv6 PIM.

Enabling IPv6 PIM passive mode

About this task

To guard against IPv6 PIM hello spoofing, you can enable IPv6 PIM passive mode on a receiver-side interface. The interface cannot receive or forward IPv6 PIM protocol messages (excluding register, register-stop and C-RP-Adv messages), and acts as the DR on the subnet.

Restrictions and guidelines

This feature takes effect only when IPv6 PIM-DM or IPv6 PIM-SM is enabled on the interface.

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple IPv6 PIM devices.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface i*nterface-type interface-number*

3. Enable IPv6 PIM passive mode on the interface.

   ipv6 pim passive

   By default, IPv6 PIM passive mode is disabled on an interface.

Enabling IPv6 PIM NSR

About this task

This feature enables IPv6 PIM to back up protocol state information, including IPv6 PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for IPv6 PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 PIM NSR.
   ipv6 pim non-stop-routing
   By default, IPv6 PIM NSR is disabled.

Enabling SNMP notifications for IPv6 PIM

About this task

To report critical IPv6 PIM events to an NMS, enable SNMP notifications for IPv6 PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IPv6 PIM.
   snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **neighbor-loss**] *
   By default, SNMP notifications for IPv6 PIM are enabled.

Display and maintenance commands for IPv6 PIM

Execute **display** commands in any view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description**| **down**]]
Display BSR information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by IPv6 PIM.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*ipv6-source-address*]
Display C-RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display IPv6 PIM information on an interface.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type*

Task	Command
	interface-number] [**verbose**]
Display IPv6 PIM neighbor information.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*ipv6-neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display IPv6 PIM routing entries.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *
Display RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **rp-info** [*ipv6-group-address*]
Display statistics for IPv6 PIM packets.	**display ipv6 pim statistics**

IPv6 PIM configuration examples

Example: Configuring IPv6 PIM-DM

Network configuration

As shown in Figure 13:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain is operating in the dense mode.
- Host A and Host C are multicast receivers in two stub networks N1 and N2.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 13 Network diagram

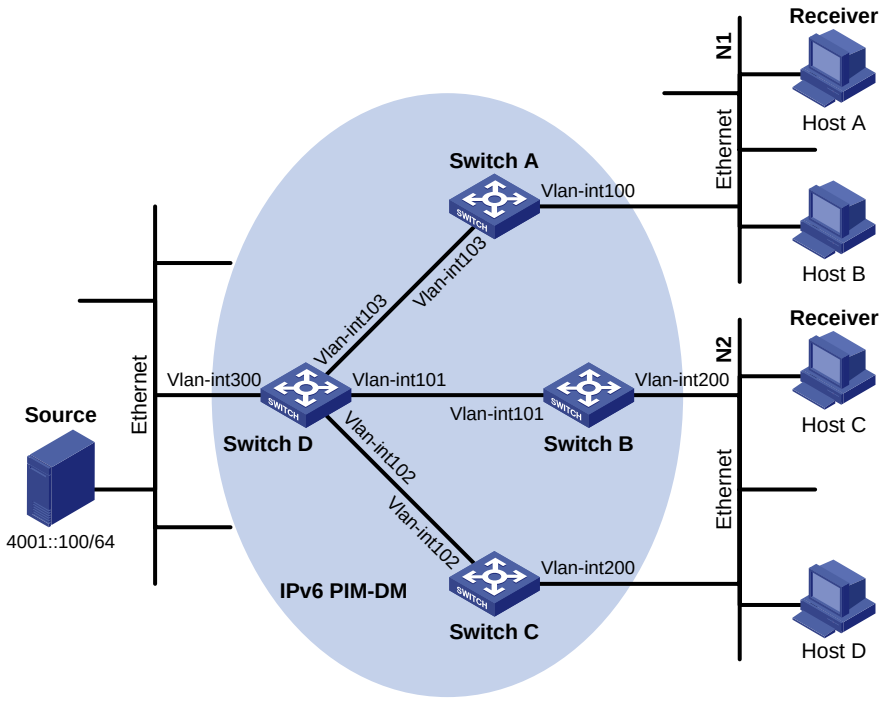

Table 2 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int103	1002::1/64	Switch D	Vlan-int103	1002::2/64
Switch B	Vlan-int200	2001::1/64	Switch D	Vlan-int101	2002::2/64
Switch B	Vlan-int101	2002::1/64	Switch D	Vlan-int102	3001::2/64
Switch C	Vlan-int200	2001::2/64	Switch D	Vlan-int300	4001::1/64
Switch C	Vlan-int102	3001::1/64	Switch D	Vlan-int103	1002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 13, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 103.

   ```
   [SwitchA] interface vlan-interface 103
   ```

```
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IPv6 multicast routing, and enable IPv6 PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] ipv6 pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] ipv6 pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] ipv6 pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display IPv6 PIM information on Switch D.

```
[SwitchD] display ipv6 pim interface
 Interface          NbrCnt HelloInt   DR-Pri     DR-Address
 Vlan300            0      30         1          FE80::A01:201:1
                                                 (local)
 Vlan103            0      30         1          FE80::A01:201:2
                                                 (local)
 Vlan101            1      30         1          FE80::A01:201:3
                                                 (local)
 Vlan102            1      30         1          FE80::A01:201:4
                                                 (local)
```

Display IPv6 PIM neighboring relationship on Switch D.

```
[SwitchD] display ipv6 pim neighbor
 Total Number of Neighbors = 3

 Neighbor        Interface           Uptime   Expires  Dr-Priority Mode
 FE80::A01:101:1 Vlan103             00:04:00 00:01:29 1
 FE80::B01:102:2 Vlan101             00:04:16 00:01:29 3
 FE80::C01:103:3 Vlan102             00:03:54 00:01:17 5
```

Send an MLD report from Host A to join IPv6 multicast group FF0E::101. (Details not shown.)

Send IPv6 multicast data from IPv6 multicast source 4001::100/64 to IPv6 multicast group FF0E::101. (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry
```

```
 (*, FF0E::101)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:01:24
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:01:20, Expires: -

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:01:20
     Upstream interface: Vlan-interface103
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: pim-dm, UpTime: 00:01:20, Expires: -
```

Display IPv6 PIM multicast routing table information on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: LOC ACT
     UpTime: 00:02:19
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 2
         1: Vlan-interface103
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
         2: Vlan-interface102
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has a correct (*, G) entry.

Example: Configuring non-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 14:

- OSPFv3 runs on the network.

- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist in each stub network. The entire IPv6 PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers in the stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to the IPv6 multicast group range FF0E::101/64. Specify VLAN-interface101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 14 Network diagram

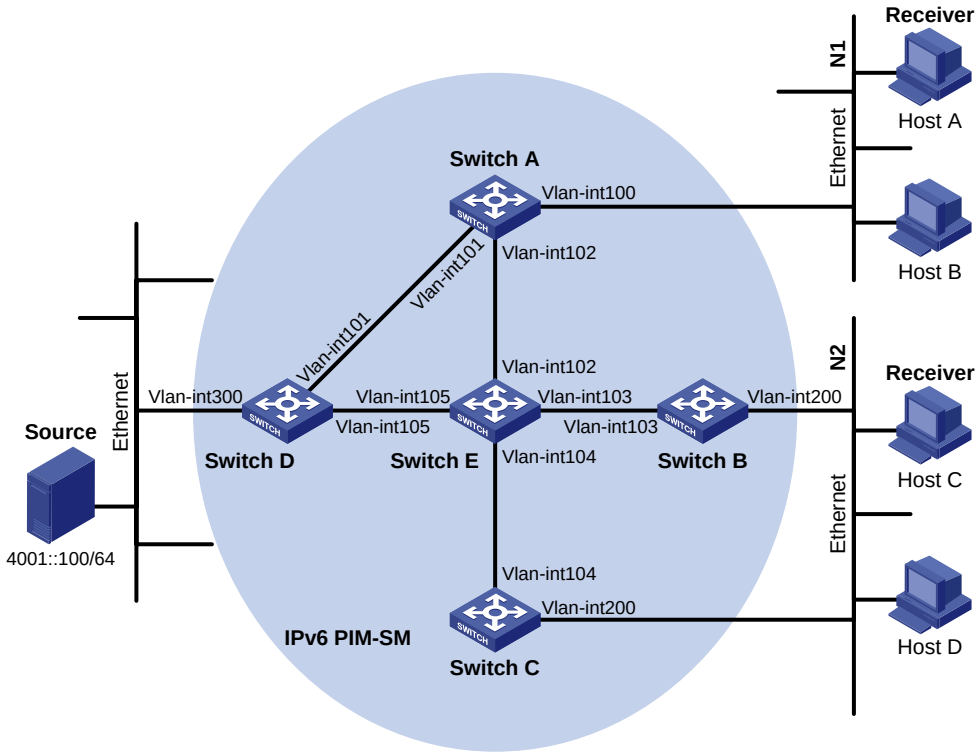

Table 3 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 14, and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and static RPs:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl ipv6 basic 2005
[SwitchE-acl-ipv6-basic-2005] rule permit source ff0e::101 64
[SwitchE-acl-ipv6-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP, and configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE] ipv6 pim
[SwitchE-pim6] c-bsr 1003::2
[SwitchE-pim6] c-rp 1003::2 group-policy 2005
[SwitchE-pim6] static-rp 1002::2
[SwitchE-pim6] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as a static RP.

```
[SwitchA] ipv6 pim
[SwitchA-pim6] static-rp 1002::2
[SwitchA-pim6] quit
```

Configure a static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface            NbrCnt HelloInt   DR-Pri    DR-Address
 Vlan101              1      30         1         FE80::A01:201:2
 Vlan102              1      30         1         FE80::A01:201:3
```

Display BSR information on Switch A.

```
[SwitchA] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 1003::2
       Priority: 64
       Hash mask length: 126
       Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:01:44
     Elected BSR address: 1003::2
       Priority: 64
       Hash mask length: 126
       Uptime: 00:11:18
     Candidate BSR address: 1003::2
       Priority: 64
       Hash mask length: 126
```

Display RP information on Switch A.

```
[SwitchA] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF0E::101/64
       RP address                Priority  HoldTime  Uptime    Expires
       1003::2                   192       180       00:05:19  00:02:11

Static RP information:
       RP address                ACL   Mode    Preferred
       1002::2                   ----  pim-sm  No
```

Example: Configuring admin-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 15:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The entire IPv6 PIM-SM domain is divided into IPv6 admin-scoped zone 1, IPv6 admin-scoped zone 2, and the IPv6 global-scoped zone. Switch B, Switch C, and Switch D are ZBRs of the three zones, respectively.
- Source 1 and Source 2 send different IPv6 multicast data to the IPv6 multicast group FF14::101. Host A receives the IPv6 multicast data only from Source 1, and Host B receives the IPv6 multicast data only from Source 2. Source 3 sends IPv6 multicast data to the IPv6 multicast group FF1E::202. Host C is an IPv6 multicast receiver for the IPv6 multicast group FF1E::202.
- VLAN-interface 101 of Switch B acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 1, and VLAN-interface 105 of Switch D acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 2. Both of the two interfaces are designated to the IPv6 multicast groups with the scope field value of 4. VLAN-interface 109 of Switch F acts as a C-BSR and a C-RP for the IPv6

global-scoped zone, and it is designated to the IPv6 multicast groups with the scope field value of 14.

- MLDv1 runs between Switch A, Switch E, Switch I, and the receivers that directly connect to them, respectively.

Figure 15 Network diagram

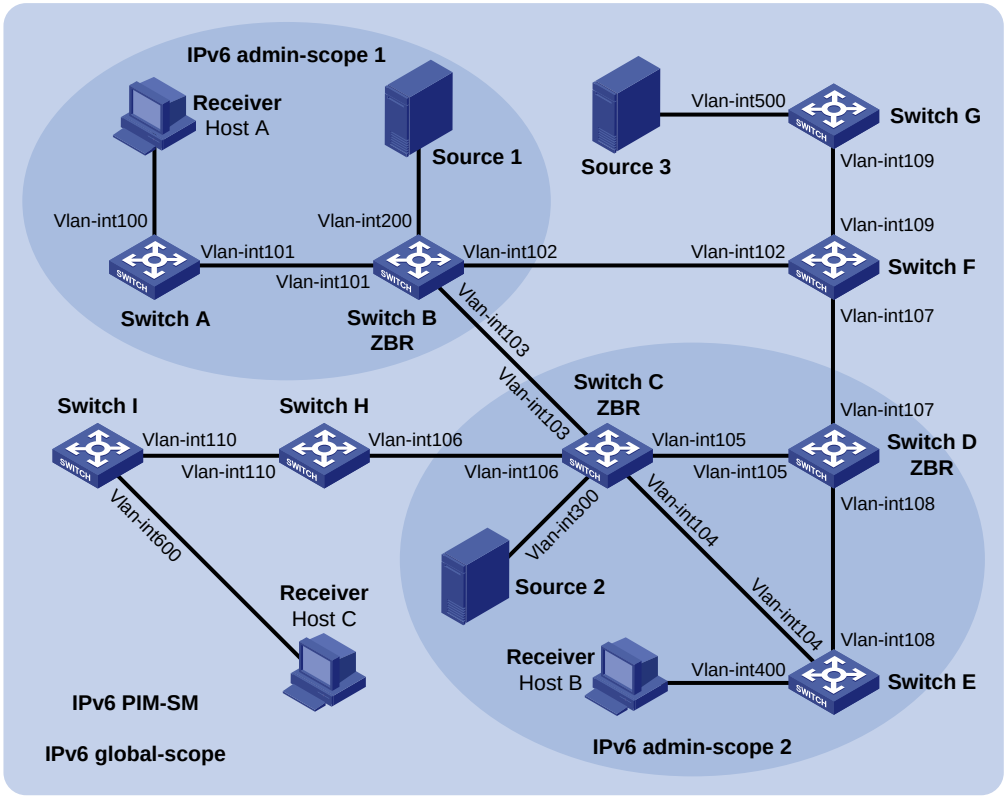

Table 4 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch E	Vlan-int104	3002::2/64
Switch A	Vlan-int101	1002::1/64	Switch E	Vlan-int108	6001::2/64
Switch B	Vlan-int200	2001::1/64	Switch F	Vlan-int109	8001::1/64
Switch B	Vlan-int101	1002::2/64	Switch F	Vlan-int107	6002::2/64
Switch B	Vlan-int103	2002::1/64	Switch F	Vlan-int102	2003::2/64
Switch B	Vlan-int102	2003::1/64	Switch G	Vlan-int500	9001::1/64
Switch C	Vlan-int300	3001::1/64	Switch G	Vlan-int109	8001::2/64
Switch C	Vlan-int104	3002::1/64	Switch H	Vlan-int110	4001::1/64

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch E	Vlan-int400	7001::1/64			

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 15., and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface (VLAN-interface 100).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-SM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim sm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch E and Switch I in the same way Switch A is configured. (Details not shown.)

   # On Switch B, enable IPv6 multicast routing, and enable IPv6 PIM-SM on each interface.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] ipv6 pim sm
   [SwitchB-Vlan-interface200] quit
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] ipv6 pim sm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] ipv6 pim sm
   [SwitchB-Vlan-interface102] quit
   [SwitchB] interface vlan-interface 103
   [SwitchB-Vlan-interface103] ipv6 pim sm
   [SwitchB-Vlan-interface103] quit
   ```

   # Enable IPv6 multicast routing and IPv6 PIM-SM on Switch C, Switch D, Switch F, Switch G, and Switch H in the same way Switch B is configured. (Details not shown.)

2. Configure IPv6 admin-scoped zone boundaries:

   # On Switch B, configure VLAN-interface 102 and VLAN-interface 103 as the boundaries of IPv6 admin-scoped zone 1.

   ```
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] ipv6 multicast boundary scope 4
   [SwitchB-Vlan-interface102] quit
   [SwitchB] interface vlan-interface 103
   ```

```
[SwitchB-Vlan-interface103] ipv6 multicast boundary scope 4
[SwitchB-Vlan-interface103] quit
```

On Switch C, configure VLAN-interface 103 and VLAN-interface 106 as the boundaries of IPv6 admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface103] quit
[SwitchC] interface vlan-interface 106
[SwitchC-Vlan-interface106] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface106] quit
```

On Switch D, configure VLAN-interface 107 as the boundary of IPv6 admin-scoped zone 2.

```
<SwitchD> system-view
[SwitchD] interface vlan-interface 107
[SwitchD-Vlan-interface107] ipv6 multicast boundary scope 4
[SwitchD-Vlan-interface107] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure VLAN-interface 101 as a C-BSR and a C-RP for IPv6 admin-scoped zone 1.

```
[SwitchB] ipv6 pim
[SwitchB-pim6] c-bsr 1002::2 scope 4
[SwitchB-pim6] c-rp 1002::2 scope 4
[SwitchB-pim6] quit
```

On Switch D, configure VLAN-interface 105 as a C-BSR and a C-RP for IPv6 admin-scoped zone 2.

```
[SwitchD] ipv6 pim
[SwitchD-pim6] c-bsr 3003::2 scope 4
[SwitchD-pim6] c-rp 3003::2 scope 4
[SwitchD-pim6] quit
```

On Switch F, configure VLAN-interface 109 as a C-BSR and a C-RP for the IPv6 global-scoped zone.

```
<SwitchF> system-view
[SwitchF] ipv6 pim
[SwitchF-pim6] c-bsr 8001::1
[SwitchF-pim6] c-rp 8001::1
[SwitchF-pim6] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:25
     Elected BSR address: 8001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45

 Scope: 4
```

```
    State: Elected
    Bootstrap timer: 00:00:06
    Elected BSR address: 1002::2
      Priority: 64

  Group/MaskLen: FFF4::/16
    RP address               Priority  HoldTime  Uptime    Expires
```

```
    1002::2 (local)          192       180       00:02:03  00:02:56
  Group/MaskLen: FF04::/16
    RP address               Priority  HoldTime  Uptime    Expires
    1002::2 (local)          192       180       00:02:03  00:02:56
```

Display RP information on Switch F.

```
[SwitchF] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address               Priority  HoldTime  Uptime    Expires
       8001::1 (local)          192       180       00:10:28  00:02:31
```

Example: Configuring IPv6 PIM-SSM

Network configuration

As shown in Figure 16:

- OSPFv3 runs on the network.
- Receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain operates in the SSM mode.
- Host A and Host C are IPv6 multicast receivers on two stub networks N1 and N2.
- The SSM group range is FF3E::/64.
- MLDv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 16 Network diagram

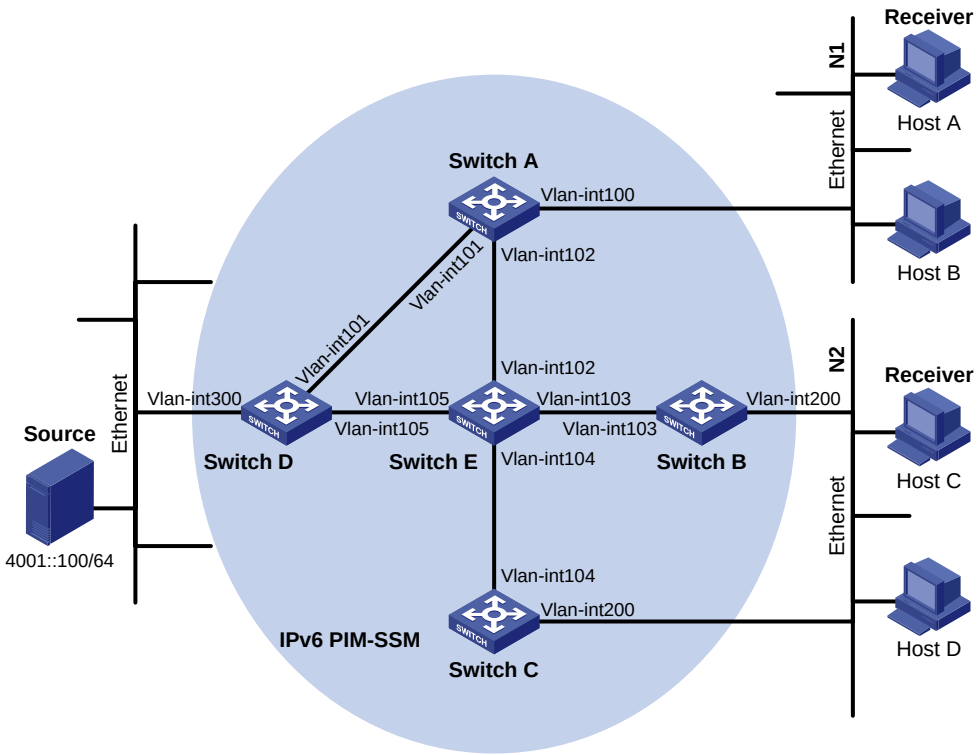

Table 5 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 16, and configure OSPFv3 on the switches in the IPv6 PIM-SSM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLDv2 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] mld version 2
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] ipv6 pim sm
   [SwitchA-Vlan-interface102] quit
   ```

   # Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

   # Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range FF3E::/64 on Switch A.

   ```
   [SwitchA] acl ipv6 basic 2000
   [SwitchA-acl-ipv6-basic-2000] rule permit source ff3e:: 64
   [SwitchA-acl-ipv6-basic-2000] quit
   [SwitchA] ipv6 pim
   [SwitchA-pim6] ssm-policy 2000
   [SwitchA-pim6] quit
   ```

3. Configure the IPv6 SSM group range on Switch B, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface            NbrCnt HelloInt   DR-Pri   DR-Address
 Vlan101              1      30         1        FE80::A01:201:2
 Vlan102              1      30         1        FE80::A01:201:3
```

Send an MLDv2 report from Host A to join the IPv6 multicast source and group (4001::100/64, FF3E::101). (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:00:11
     Upstream interface: Vlan-interface101
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:00:11, Expires: 00:03:25
```

Display IPv6 PIM multicast routing table information on Switch B.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: LOC
     UpTime: 00:08:02
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface105
             Protocol: pim-ssm, UpTime: 00:08:02, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting IPv6 PIM

A multicast distribution tree cannot be correctly built

Symptom

No IPv6 multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in an IPv6 PIM network. This means that an IPv6 multicast distribution tree cannot be correctly built.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the IPv6 multicast source or the RP is available.
2. Use the **display ipv6 pim interface** command to verify IPv6 PIM information on each interface, especially on the RPF interface. If IPv6 PIM is not enabled on the interfaces, use **ipv6 pim dm** or **ipv6 pim sm** to command enable IPv6 PIM-DM or IPv6 PIM-SM for the interfaces.
3. Use the **display ipv6 pim neighbor** command to verify that the RPF neighbor is an IPv6 PIM neighbor.
4. Verify that IPv6 PIM and MLD are enabled on the interfaces that directly connect to the IPv6 multicast sources or the receivers.
5. Use the **display ipv6 pim interface verbose** command to verify that the same IPv6 PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same IPv6 PIM mode is enabled on all devices on the network. For IPv6 PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

IPv6 multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive IPv6 multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives IPv6 multicast data but does not create an (S, G) entry in the IPv6 PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IPv6 multicast forwarding boundary settings. Use the **ipv6 multicast boundary** command to change the multicast forwarding boundary settings to make the IPv6 multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the IPv6 multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the IPv6 multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in IPv6 PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the IPv6 multicast source.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the RP is available on each device.

2. Use the **display ipv6 pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display ipv6 pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or IPv6 multicast source registration fails in IPv6 PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no IPv6 unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the IPv6 multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command on each device to view routing table information. Verify that IPv6 unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display ipv6 pim bsr-info** command to verify that the BSR information exists on each device.
3. Use the **display ipv6 pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display ipv6 pim neighbor** command to verify that IPv6 PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

Preface

This configuration guide describes the MCE fundamentals and configuration procedures.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring MCE

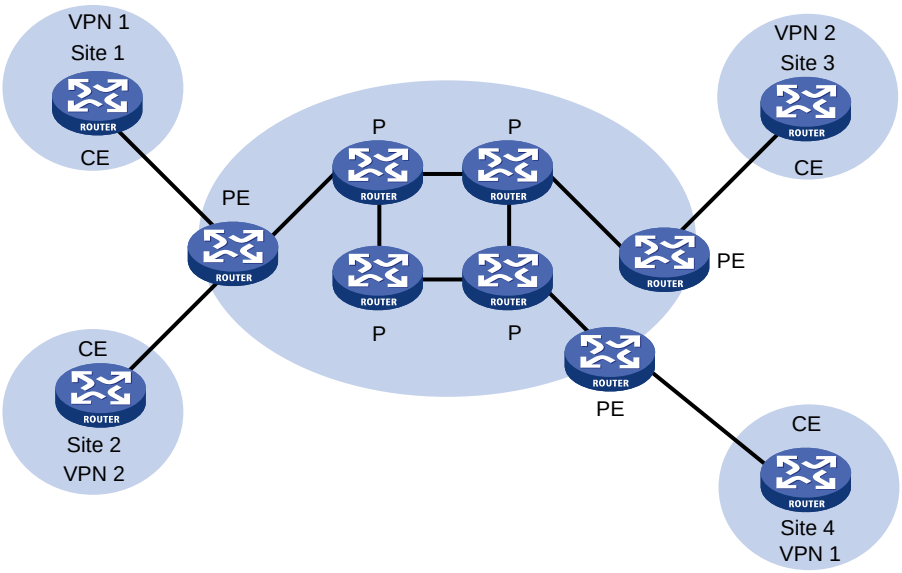
About MCE

The Multi-VPN Instance Customer Edge (MCE) feature allows multiple VPNs to share a CE with ensured data security in an MPLS L3VPN network. MCE provides traffic separation between VPNs by distinguishing routes of the VPNs.

MPLS L3VPN problems solved by MCE

MPLS L3VPN is a L3VPN technology used to interconnect geographically dispersed VPN sites. MPLS L3VPN uses BGP to advertise VPN routes and uses MPLS to forward VPN packets over a service provider backbone.

In conventional MPLS L3VPN, a VPN site must exclusively use a CE to connect a PE. With increasing business, a private network must be divided into multiple VPNs and the VPNs must be isolated from one another for data security. Using a CE exclusively for each VPN costs much in buying and maintaining the network devices. Using a common CE for multiple VPNs cannot ensure data security because the VPNs use the same routing table.



The MCE feature offers balance between cost and security. It creates multiple VPN instances on a CE to provide logically separated routing tables and address spaces for the VPNs, so the VPNs can share the CE. This CE is called the MCE device.

Basic MPLS L3VPN architecture

A basic MPLS L3VPN architecture has the following types of devices:

- **Customer edge device**—A CE device resides on a customer network and has one or more interfaces directly connected to a service provider network. It does not support MPLS.
- **Provider edge device**—A PE device resides at the edge of a service provider network and is connected to one or more CEs. All MPLS VPN services are processed on PEs.
- **Provider device**—A P device is a core device on a service provider network. It is not directly connected to any CEs. A P device has only basic MPLS forwarding capability and does not handle VPN routing information.

Figure 1 Basic MPLS L3VPN architecture

MCE-related MPLS L3VPN concepts

Site

A site has the following features:

- A site is a group of IP systems with IP connectivity that does not rely on any service provider networks.
- The classification of a site depends on the topology relationship of the devices, rather than the geographical positions. However, the devices at a site are, in most cases, adjacent to each other geographically.
- The devices at a site can belong to multiple VPNs, which means that a site can belong to multiple VPNs.
- A site is connected to a provider network through one or more CEs. A site can contain multiple CEs, but a CE can belong to only one site.

Sites connected to the same provider network can be classified into different sets by policies. Only the sites in the same set can access each other through the provider network. Such a set is called a VPN.

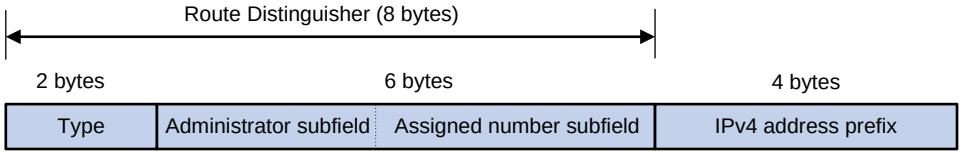
VPN instance

VPN instances implement route isolation, data independence, and data security for VPNs.

A VPN instance has the following components:

- A separate Label Forwarding Information Base (LFIB).
- An IP routing table.
- Interfaces bound to the VPN instance.
- VPN instance administration information, including route distinguishers (RDs), route targets (RTs), and route filtering policies.

To associate a site with a VPN instance, bind the VPN instance to the PE's interface connected to the site. A site can be associated with only one VPN instance, and different sites can be associated with the same VPN instance. A VPN instance contains the VPN membership and routing rules of associated sites.



VPN-IPv4 address

Each VPN independently manages its address space. The address spaces of VPNs might overlap. For example, if both VPN 1 and VPN 2 use the addresses on subnet 10.110.10.0/24, address space overlapping occurs.

Multiprotocol BGP (MP-BGP) can solve this problem by advertising VPN-IPv4 addresses (also called VPNv4 addresses).

As shown in Figure 2, a VPN-IPv4 address consists of 12 bytes. The first eight bytes represent the RD, followed by a four-byte IPv4 prefix. The RD and the IPv4 prefix form a unique VPN-IPv4 prefix.

Figure 2 VPN-IPv4 address structure

An RD can be in one of the following formats:

- When the Type field is 0, the Administrator subfield occupies two bytes, the Assigned number subfield occupies four bytes, and the RD format is *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- When the Type field is 1, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit IPv4 address*:*16-bit user-defined number*. For example, 172.1.1.1:1.
- When the Type field is 2, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the Administrator subfield to any private AS number or private IP address.

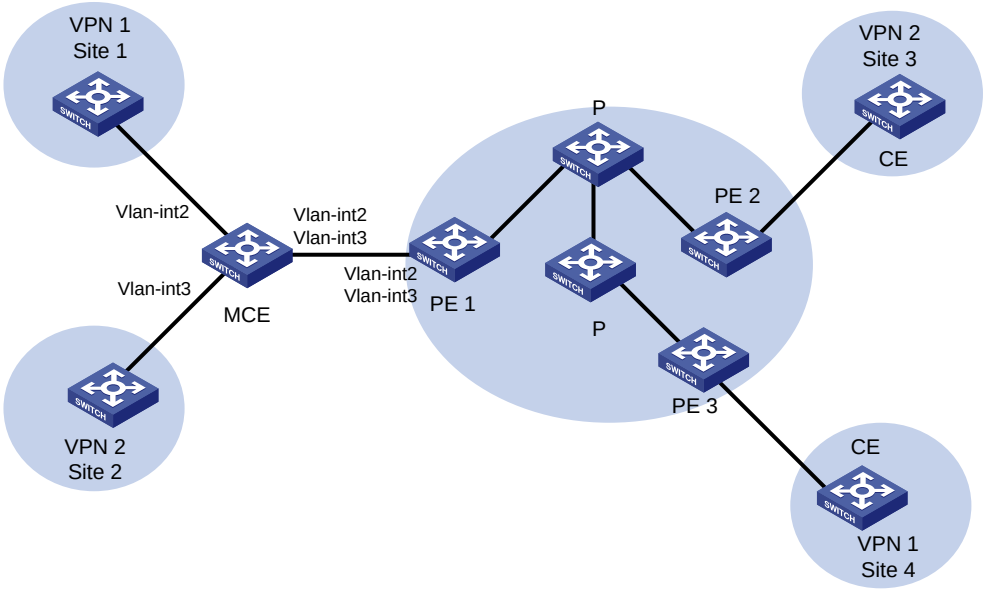
Route target attribute

MPLS L3VPN uses route target community attributes to control the advertisement of VPN routing information. A VPN instance on a PE supports the following types of route target attributes:

- **Export target attribute**—A PE sets the export target attribute for VPN-IPv4 routes learned from directly connected sites before advertising them to other PEs.
- **Import target attribute**—A PE checks the export target attribute of VPN-IPv4 routes received from other PEs. If the export target attribute matches the import target attribute of a VPN instance, the PE adds the routes to the routing table of the VPN instance.

Route target attributes define which sites can receive VPN-IPv4 routes, and from which sites a PE can receive routes.

Like RDs, route target attributes can be one of the following formats:



- *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- *32-bit IPv4 address:16-bit user-defined number*. For example, 172.1.1.1:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

MCE working mechanism

As shown in Figure 3, the MCE exchanges private routes with VPN sites and PE 1, and adds the private routes to the routing tables of corresponding VPN instances.

- **Route exchange between MCE and VPN site**—Create VPN instances VPN 1 and VPN 2 on the MCE. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE adds a received route to the routing table of the VPN instance that is bound to the receiving interface.
- **Route exchange between MCE and PE**—The MCE connects to PE 1 through trunk links. On PE 1, create VPN instances for VPN 1 and VPN 2. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE and PE add a received route to the routing table of the VPN instance that is bound to the receiving interface.

Figure 3 Network diagram for the MCE feature

You can configure static routes, RIP, OSPF, IS-IS, EBGP, or IBGP between an MCE and a VPN site and between an MCE and a PE.

NOTE:

To implement dynamic IP assignment for DHCP clients in private networks, you can configure DHCP server or DHCP relay agent on the MCE. When the MCE functions as the DHCP server, the IP addresses assigned to different private networks cannot overlap.

Restrictions and guidelines: MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

MCE tasks at a glance

To configure MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site

3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter VPN instance view.
   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for a VPN instance.
4. (Optional.) Configure a description for the VPN instance.
   description *text*
   By default, no description is configured for a VPN instance.
5. (Optional.) Configure a VPN ID for the VPN instance.
   vpn-id *vpn-id*
   By default, no VPN ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   This interface connects the device to the CE.
3. Associate a VPN instance with the interface.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:
Associating an interface with a VPN instance or disassociating an interface from a VPN instance will clear the IP address and routing protocol settings on the interface.

Configuration of this command deletes the IP address of the current interface. You must reconfigure an IP address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv4 address family view, IPv4 VPN uses the configuration in VPN instance IPv4 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv4 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Execute the following commands in sequence to enter VPN instance IPv4 address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from learning too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through a static route. Static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding a static route to a VPN instance, so that the static routes of different VPN instances can be isolated from each other.

Perform this configuration on the MCE. On the VPN site, configure a common static route.

Procedure

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

3. (Optional.) Configure the default preference for static routes.

   ip route-static default-preference *default-preference*

   The default preference is 60.

Configuring RIP between an MCE and a VPN site

About this task

Binding RIP processes to VPN instances can isolate routes of different VPNs. For more information about RIP, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common RIP process.

Procedure

1. Enter system view.

   system-view

2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*

   A RIP process can belong to only one VPN instance.

3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.

4. Redistribute remote site routes advertised by the PE into RIP.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no route is redistributed into RIP.

Configuring OSPF between an MCE and a VPN site

About this task

Binding OSPF processes to VPN instances can isolate routes of different VPNs. For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common OSPF process.

Procedure

1. Enter system view.

   system-view

2. Create an OSPF process for a VPN instance and enter OSPF view.

ospf [*process-id*] **router-id** *router-id* **vpn-instance** *vpn-instance-name*

Keywords	Usage guidelines
router-id *router-id*	An OSPF process that is bound to a VPN instance does not use the public network router ID configured in system view. Therefore, you must specify a router ID when creating a process or configure an IP address for a minimum of one interface in the VPN instance.
vpn-instance *vpn-instance-name*	An OSPF process can belong to only one VPN instance. If you delete a VPN instance, all OSPF processes of the VPN instance are also deleted.

3. Redistribute remote site routes advertised by the PE into OSPF.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
4. Create an OSPF area and enter OSPF area view.

   area *area-id*
5. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to any area nor runs OSPF.

Configuring IS-IS between an MCE and a VPN site

About this task

Binding IS-IS processes to VPN instances can isolate routes of different VPNs. For more information about IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure a common IS-IS process.

Procedure

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

   An IS-IS process can belong to only one VPN instance.
3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.
4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
5. Redistribute remote site routes advertised by the PE into IS-IS.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the IS-IS process on the interface.
   isis enable [*process-id*]
   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a VPN site

About this task

To run EBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise the VPN network addresses it can reach to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
   Commands in BGP-VPN instance view are the same as those in BGP instance view. For more information, see *Layer 3—IP Routing Configuration Guide*.
4. Configure the VPN site as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. (Optional.) Allow the local AS number to appear in the AS_PATH attribute of routes received from the peer, and set the maximum number of repetitions.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop** [*number*]
   By default, BGP discards incoming route updates that contain the local AS number.
8. Redistribute remote site routes advertised by the PE into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

system-view

2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the MCE as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
4. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
5. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
6. Redistribute the IGP routes of the VPN into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a VPN site

About this task

To run IBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise VPN network addresses to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
7. (Optional.) Configure the local device as the RR, and specify the peer as the client of the RR.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**
   By default, no RR or RR client is configured.
   After you configure a VPN site as an IBGP peer, the MCE does not advertise the BGP routes learned from the VPN site to other IBGP peers, including VPNv4 peers. The MCE advertises

routes learned from a VPN site only when you configure the VPN site as a client of the RR (the MCE).

8. Redistribute remote site routes advertised by the PE into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Configure the MCE as an IBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

4. Enter BGP IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

5. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

6. Redistribute the IGP routes of the VPN into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes these tasks:

- Binding the MCE-PE interfaces to VPN instances.
- Performing route configurations.
- Redistributing VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring static routing between an MCE and a PE

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

3. (Optional.) Set the default preference for static routes.

ip route-static default-preference *default-preference*

The default preference is 60.

Configuring RIP between an MCE and a PE

1. Enter system view.

   system-view
2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*
3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no routes are redistributed into RIP.

Configuring OSPF between an MCE and a PE

1. Enter system view.

   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable routing loop detection.

   vpn-instance-capability simple

   By default, routing loop detection is enabled and the MCE does not receive OSPF routes from the PE.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
5. Create an OSPF area and enter OSPF area view.

   area *area-id*
6. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to an area nor runs OSPF.

Configuring IS-IS between an MCE and a PE

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.

4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

5. Redistribute VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IS-IS process on the interface.

   isis enable [*process-id*]

   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an EBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

5. Enter BGP-VPN IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

6. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

7. Redistribute the VPN routes of the VPN site.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a PE

1. Enter system view.

system-view

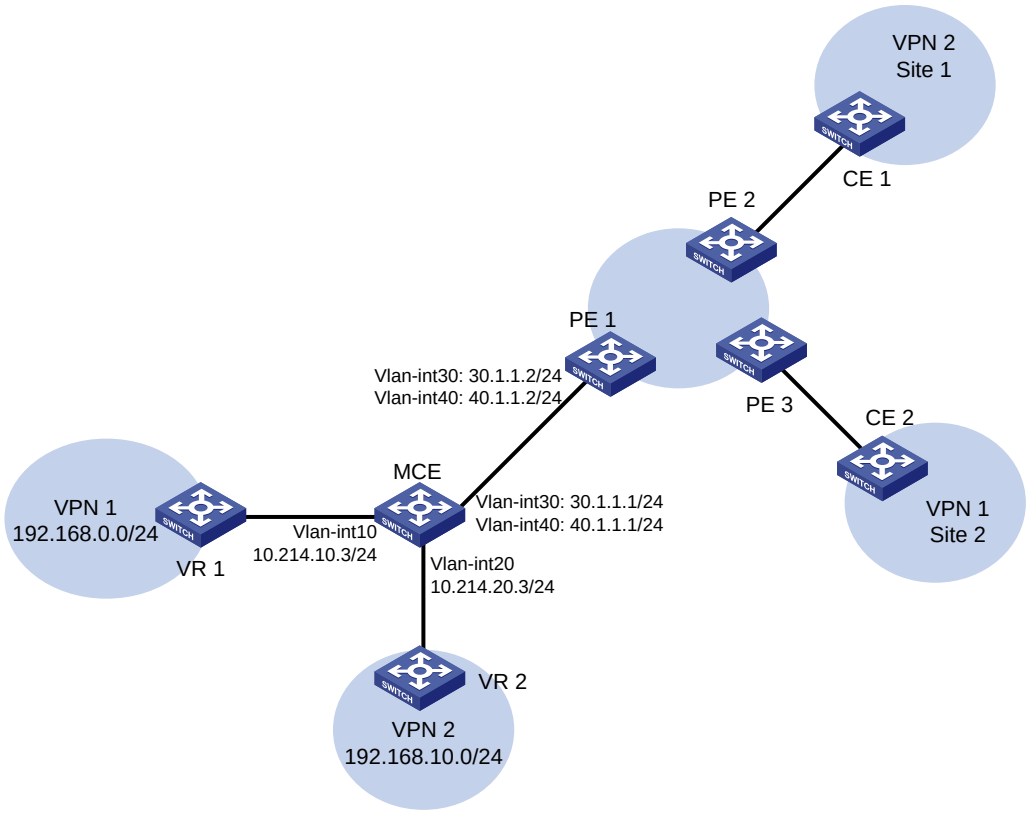
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the PE as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. Redistribute the VPN routes of the VPN site.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Display and maintenance commands for MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



MCE configuration examples

Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE

Network configuration

As shown in Figure 4, VPN 2 runs OSPF. The edge devices of VPN 1 and VPN 2 are VR 1 and VR 2, respectively. Configure the MCE device to separate routes from different VPNs and to advertise the VPN routes to PE 1 through OSPF.

Figure 4 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   [MCE-vpn-instance-vpn2] vpn-target 20:1
   [MCE-vpn-instance-vpn2] quit
   ```

   # Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 10
   [MCE-Vlan-interface10] ip binding vpn-instance vpn1
   [MCE-Vlan-interface10] ip address 10.214.10.3 24
   [MCE-Vlan-interface10] quit
   ```

   # Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 20
   [MCE-Vlan-interface20] ip binding vpn-instance vpn2
   [MCE-Vlan-interface20] ip address 10.214.20.3 24
   ```

```
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure static routes.

On VR 1, assign IP address 10.214.10.2/24 to the interface connected to MCE and 192.168.0.1/24 to the interface connected to VPN 1. Add ports to VLANs correctly. (Details not shown.)

On VR 1, configure a default route with the next hop being 10.214.10.3.

```
<VR1> system-view
[VR1] ip route-static 0.0.0.0 0.0.0.0 10.214.10.3
```

On the MCE, configure a static route to 192.168.0.0/24 with the next hop 10.214.10.2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ip route-static vpn-instance vpn1 192.168.0.0 24 10.214.10.2
```

On the MCE, display the routing information maintained for VPN instance **vpn1**.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24     Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32     Direct  0   0           10.214.10.3     Vlan10
10.214.10.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32   Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24     Static  60  0           10.214.10.2     Vlan10
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has a static route for VPN instance **vpn1**.

Run OSPF in VPN 2. Create OSPF process 20 and bind it to VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ospf 2 vpn-instance vpn2
```

Advertise subnet 10.214.20.0.

```
[MCE-ospf-2] area 0
[MCE-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[MCE-ospf-2-area-0.0.0.0] quit
[MCE-ospf-2] quit
```

On VR 2, assign IP address 10.214.20.2/24 to the interface connected to MCE and 192.168.10.1/24 to the interface connected to VPN 2. (Details not shown.)

Configure OSPF process 2, and advertise subnets 192.168.10.0 and 10.214.20.0.

```
<VR2> system-view
[VR2] ospf 2
[VR2-ospf-2] area 0
[VR2-ospf-2-area-0.0.0.0] network 192.168.10.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] quit
[VR2-ospf-2] quit
```

On the MCE, display the routing information maintained for VPN instance **vpn2**.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.20.0/24     Direct  0   0           10.214.20.3     Vlan20
10.214.20.0/32     Direct  0   0           10.214.20.3     Vlan20
10.214.20.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.20.255/32   Direct  0   0           10.214.20.3     Vlan20
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.10.0/24    O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private routes of VPN 2. The MCE maintains the routes of VPN 1 and those of VPN2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ip address 30.1.1.1 24
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ip address 40.1.1.1 24
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ip address 30.1.1.2 24
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ip address 40.1.1.2 24
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPF process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospf 10 router-id 101.101.10.1 vpn-instance vpn1
```

Disable OSPF routing loop detection for the VPN instance.

```
[MCE-ospf-10] vpn-instance-capability simple
```

Set the domain ID to 10.

```
[MCE-ospf-10] domain-id 10
```

On the MCE, advertise subnet 30.1.1.0 in area 0, and redistribute the static route of VPN 1.

```
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] import-route static
```

On PE 1, enable OSPF process 10, and bind the process to VPN instance **vpn1**.

```
[PE1] ospf 10 router-id 100.100.10.1 vpn-instance vpn1
```

Set the domain ID to 10.

```
[PE1-ospf-10] domain-id 10
```

Advertise subnet 30.1.1.0 in area 0.

```
[PE1-ospf-10] area 0
[PE1-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[PE1-ospf-10-area-0.0.0.0] quit
[PE1-ospf-10] quit
```

Use similar procedures to configure OSPF process 20 between MCE and PE 1 and redistribute VPN 2's routing information. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the static route of VPN 1 through OSPF.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
30.1.1.0/24        Direct  0   0           30.1.1.2        Vlan30
30.1.1.0/32        Direct  0   0           30.1.1.2        Vlan30
30.1.1.2/32        Direct  0   0           127.0.0.1       InLoop0
```

```
30.1.1.255/32      Direct  0   0           30.1.1.2        Vlan30

255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

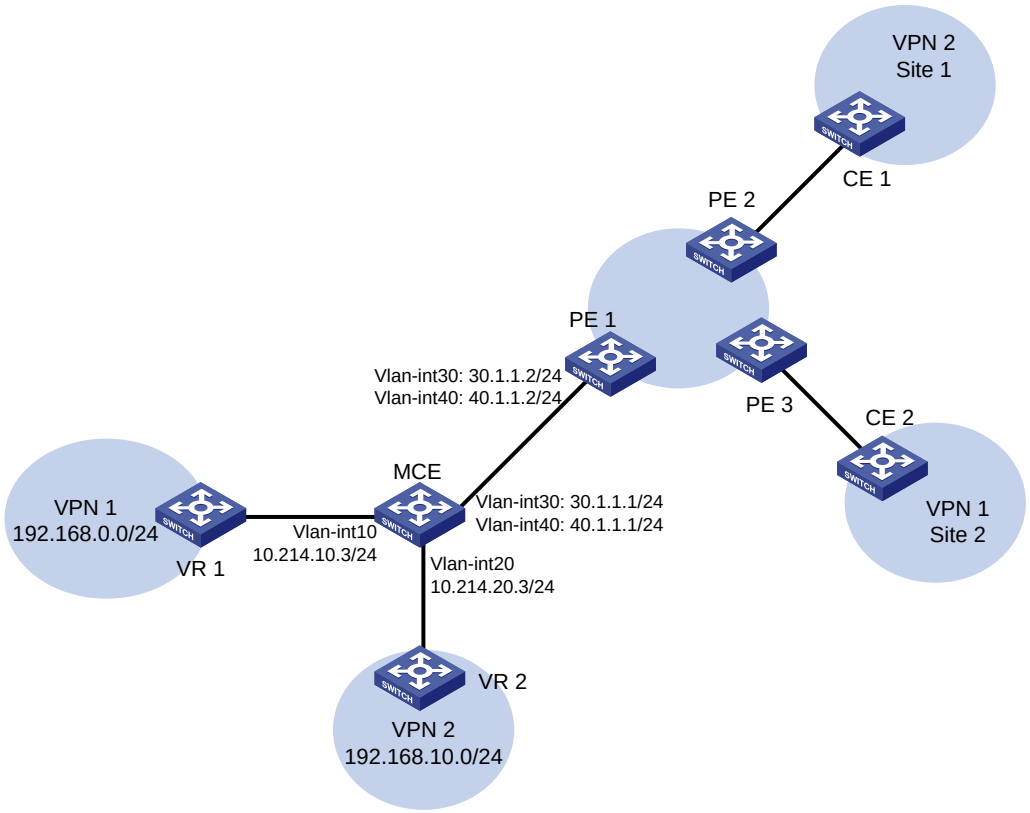
The routing information for the two VPNs has been redistributed into the routing tables on PE 1.



Example: Configuring the MCE that uses EBGP to advertise VPN routes to the PE

Network configuration

As shown in Figure 5, configure the MCE to advertise the routes of VPNs 1 and 2 to PE 1, so that the sites of each VPN can communicate with each other over the MPLS backbone.

Run OSPF in both VPN 1 and VPN 2. Run EBGP between the MCE and PE 1.

Figure 5 Network diagram

Procedure

1. Create VPN instances on the MCE and PE 1, and bind the VPN instances to VLAN interfaces. For the configuration procedure, see "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE."
2. Configure routing between the MCE and VPN sites:

   # Enable an OSPF process on the devices in the two VPNs, and advertise the subnets. (Details not shown.)

   # Configure OSPF on the MCE, and bind OSPF process 10 to VPN instance **vpn1** to learn the routes of VPN 1.

```
<MCE> system-view
[MCE] ospf 10 router-id 10.10.10.1 vpn-instance vpn1
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 10.214.10.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] quit
```

   # Display the routing table of VPN 1 on the MCE.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24      Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32      Direct  0   0           10.214.10.3     Vlan10
```

10.214.10.3/32      Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32    Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8         Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32        Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24      O_INTRA 10  2           10.214.10.2     Vlan10
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private route of VPN 1 through OSPF process 10.

On the MCE, bind OSPF process 20 to VPN instance **vpn2** to learn the routes of VPN 2. The configuration procedure is similar to that for OSPF process 10.

The output shows that the MCE has learned the private route of VPN 2 through OSPF.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface

127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
192.168.10.0/24     O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

3. Configure routing between the MCE and PE 1:

Configure the ports between the MCE and PE 1 as trunk ports. The configuration procedure is similar to that described in "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE." (Details not shown.)

Enable BGP in AS 100 on the MCE.

```
[MCE] bgp 100
```

Enter the BGP-VPN instance view of VPN instance **vpn1**.

```
[MCE-bgp-default] ip vpn-instance vpn1
```

Specify the EBGP peer PE 1 in AS 200.

```
[MCE-bgp-default-vpn1] peer 30.1.1.2 as-number 200
```

Activate the EBGP VPNv4 peer PE 1, and redistribute routing information from OSPF process 10 to BGP.

```
[MCE-bgp-default-vpn1] address-family ipv4
[MCE-bgp-default-ipv4-vpn1] peer 30.1.1.2 enable
[MCE-bgp-default-ipv4-vpn1] import-route ospf 10
```

On PE 1, enable BGP in AS 200, and specify the MCE as its EBGP peer.

```
[PE1] bgp 200
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.1.1.1 as-number 100
[PE1-bgp-default-vpn1] address-family ipv4
[PE1-bgp-default-ipv4-vpn1] peer 30.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Use similar procedures to configure VPN 2 settings on MCE and PE 1. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the OSPF route of VPN 1 through BGP.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0

```

The MCE has redistributed the OSPF routes of the two VPN instances into the EBGP routing tables of PE 1.

Configuring IPv6 MCE

About IPv6 MCE

IPv6 MCE provides traffic separation between VPNs by distinguishing routes of the VPNs. It allows multiple VPNs to share the same CE with ensured data security in an IPv6 MPLS L3VPN network.

IPv6 MPLS L3VPN uses BGP to advertise IPv6 VPN routes and uses MPLS to forward IPv6 VPN packets on the service provider backbone.

IPv6 MCE uses the same working mechanism as MCE. It advertises IPv6 routes and exchanges IPv6 packets between the internal network and the PE.

Restrictions and guidelines: IPv6 MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

IPv6 MCE tasks at a glance

To configure IPv6 MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site
3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.

   system-view
2. Create a VPN instance and enter VPN instance view.

   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.

   route-distinguisher *route-distinguisher*

By default, no RD is configured for a VPN instance.

4. (Optional.) Configure a description for the VPN instance.

   description *text*

   By default, no description is configured for a VPN instance.

   The description should contain the VPN instance's related information, such as its relationship with a certain VPN.

5. (Optional.) Set an ID for the VPN instance.

   vpn-id *vpn-id*

   By default, no ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

   This interface connects the device to the CE.

3. Associate a VPN instance with the interface.

   ip binding vpn-instance *vpn-instance-name*

   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:

Associating an interface with a VPN instance or disassociating an interface from a VPN instance will clear the IP address and routing protocol settings on the interface.

Configuration of this command deletes the IPv6 address of the current interface. You must reconfigure an IPv6 address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv6 address family view, IPv6 VPN uses the configurations in VPN instance IPv6 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv6 address family view.

   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*

   - Enter VPN instance IPv6 address family view.

     ip vpn-instance *vpn-instance-name*

     address-family ipv6

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from storing too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring IPv6 static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through an IPv6 static route. IPv6 static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding an IPv6 static route with an IPv6 VPN instance, so that the IPv6 static routes of different IPv6 VPN instances can be isolated from each other.

Perform this configuration on the MCE. On a VPN site, configure normal IPv6 static routes.

Procedure

1. Enter system view.

   system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Configure the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default preference for IPv6 static routes is 60.

Configuring RIPng between an MCE and a VPN site

About this task

By configuring RIPng process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different VPNs to be exchanged between the MCE and the sites through different RIPng processes, ensuring the separation and security of IPv6 VPN routes.

For more information about RIPng, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure normal RIPng.

Procedure

1. Enter system view.
   system-view
2. Create a RIPng process for a VPN instance and enter RIPng view.
   ripng [*process-id*] **vpn-instance** *vpn-instance-name*
   A RIPng process can belong to only one IPv6 VPN instance.
3. Redistribute remote site routes advertised by the PE.
   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *
   By default, no routes are redistributed into RIPng.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled.

Configuring OSPFv3 between an MCE and a VPN site

About this task

By configuring OSPFv3 process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different IPv6 VPNs to be exchanged between the MCE and the sites through different OSPFv3 processes, ensuring the separation and security of IPv6 VPN routes.

For more information about OSPFv3, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure common OSPFv3.

Procedure

1. Enter system view.
   system-view
2. Create an OSPFv3 process for a VPN instance and enter OSPFv3 view.
   ospfv3 [process-id | **vpn-instance** vpn-instance-name] *
   An OSPFv3 process can belong to only one IPv6 VPN instance.
   Deleting a VPN instance also deletes all related OSPFv3 processes.
3. Set the router ID.
   router-id *router-id*
4. Redistribute remote site routes advertised by the PE.

import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

By default, no routes are redistributed into OSPFv3.

5. Return to system view.

   quit

6. Enter interface view.

   interface *interface-type interface-number*

7. Enable OSPFv3 on the interface.

   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]

   By default, OSPFv3 is disabled on an interface.

Configuring IPv6 IS-IS between an MCE and a VPN site

About this task

By configuring IPv6 IS-IS process-to-IPv6 VPN instance bindings on a MCE, you allow routes of different IPv6 VPNs to be exchanged between the MCE and the sites through different IPv6 IS-IS processes. This ensures the separation and security of IPv6 VPN routes. For more information about IPv6 IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure common IPv6 IS-IS.

Procedure

1. Enter system view.

   system-view

2. Create an IPv6 IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

   An IPv6 IS-IS process can belong to only one IPv6 VPN instance.

3. Configure a network entity title for the IS-IS process.

   network-entity *net*

   By default, no NET is configured.

4. Create the IS-IS IPv6 unicast address family and enter its view.

   address-family ipv6 [**unicast**]

5. (Optional.) Redistribute remote site routes advertised by the PE.

   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no routes are redistributed to IPv6 IS-IS.

   If you do not specify the route level in the command, redistributed routes are added to the level-2 routing table.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IPv6 IS-IS process on the interface.

   isis ipv6 enable [*process-id*]

   By default, no IPv6 IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a VPN site

About this task

To use EBGP between an MCE and IPv6 VPN sites, you must configure a BGP peer for each IPv6 VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the IPv6 VPN sites.

For more information about IPv6 BGP, see *Layer 3—IP Routing Configuration Guide*.

Restrictions and guidelines

A VPN site must advertise IPv6 VPN network addresses it can reach to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an EBGP peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the specified peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with any peer.
7. Redistribute remote site routes advertised by the PE.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no route redistribution is configured.

Configuring the VPN site

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Configure the MCE as an EBGP peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
4. Enter BGP IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
5. Enable BGP to exchange IPv6 unicast routes with the specified peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with any peer.
6. Redistribute the IGP routes of the VPN.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a VPN site

About this task

To use IBGP between an MCE and a VPN site, you must configure a BGP peer for each IPv6 VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

A VPN site must advertise VPN network addresses to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an IBGP peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with any peer.
7. (Optional.) Configure the local device as the RR, and specify the peer as the client of the RR.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **reflect-client**
   By default, no RR or RR client is configured.
   After you configure a VPN site as an IBGP peer, the MCE does not advertise the BGP routes learned from the VPN site to other IBGP peers, including VPNv6 peers. The MCE advertises routes learned from a VPN site only when you configure the VPN site as a client of the RR (the MCE).
8. Redistribute remote site routes advertised by the PE into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the MCE as an IBGP peer.

peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

4. Enter BGP IPv6 unicast address family view.

   address-family ipv6 [**unicast**]

5. Enable BGP to exchange IPv6 unicast routes with the peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with any peer.

6. Redistribute the IGP routes of the VPN into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes the following tasks:

- Binding the MCE-PE interfaces to IPv6 VPN instances.
- Performing routing configurations.
- Redistributing IPv6 VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring IPv6 static routing between an MCE and a PE

1. Enter system view.

   system-view

2. Configure an IPv6 static route for an IPv6 VPN instance.

   ipv6 route-static vpn-instance *s-vpn-instance-name ipv6-address prefix-length* { *interface-type interface-number* [*next-hop-address*] | *nexthop-address* [**public**] | **vpn-instance** *d-vpn-instance-name nexthop-address* }

3. (Optional.) Set the default preference for IPv6 static routes.

   ipv6 route-static default-preference *default-preference*

   The default value is 60.

Configuring RIPng between an MCE and a PE

1. Enter system view.

   system-view

2. Create a RIPng process for an IPv6 VPN instance and enter RIPng view.

   ripng [*process-id*] **vpn-instance** *vpn-instance-name*

3. Redistribute VPN routes.

   import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, no routes are redistributed into RIPng.

4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable the RIPng process on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on an interface.

Configuring OSPFv3 between an MCE and a PE

1. Enter system view.
   system-view
2. Create an OSPFv3 process for an IPv6 VPN instance and enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the router ID.
   router-id *router-id*
4. Disable routing loop detection.
   vpn-instance-capability simple
   By default, routing loop detection is enabled and the MCE does not receive OSPFv3 routes from the PE.
5. Redistribute VPN routes.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *
   By default, no routes are redistributed into OSPFv3.
6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, OSPFv3 is disabled on an interface.

Configuring IPv6 IS-IS between an MCE and a PE

1. Enter system view.
   system-view
2. Create an IS-IS process for an IPv6 VPN instance and enter IS-IS view.
   isis [*process-id*] **vpn-instance** *vpn-instance-name*
3. Configure a network entity title.
   network-entity *net*
   By default, no NET is configured.
4. Create the IS-IS IPv6 unicast address family and enter its view.
   address-family ipv6 [**unicast**]
5. Redistribute VPN routes.

import-route *protocol* [*as-number* | *process-id*] [**allow-ibgp**] [**allow-direct** | **cost** *cost-value* | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

By default, IPv6 IS-IS does not redistribute routes from any other routing protocol.

If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IPv6 IS-IS process on the interface.

   isis ipv6 enable [*process-id*]

   By default, no IPv6 IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an EBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

5. Enter BGP-VPN IPv6 unicast address family view.

   address-family ipv6 [**unicast**]

6. Enable BGP to exchange IPv6 unicast routes with the specified peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**

   By default, BGP does not exchange IPv6 unicast routes with peers.

7. Redistribute VPN routes.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an IBGP peer.

   peer { *group-name* | *ipv6-address* [*prefix-length*] } **as-number** *as-number*

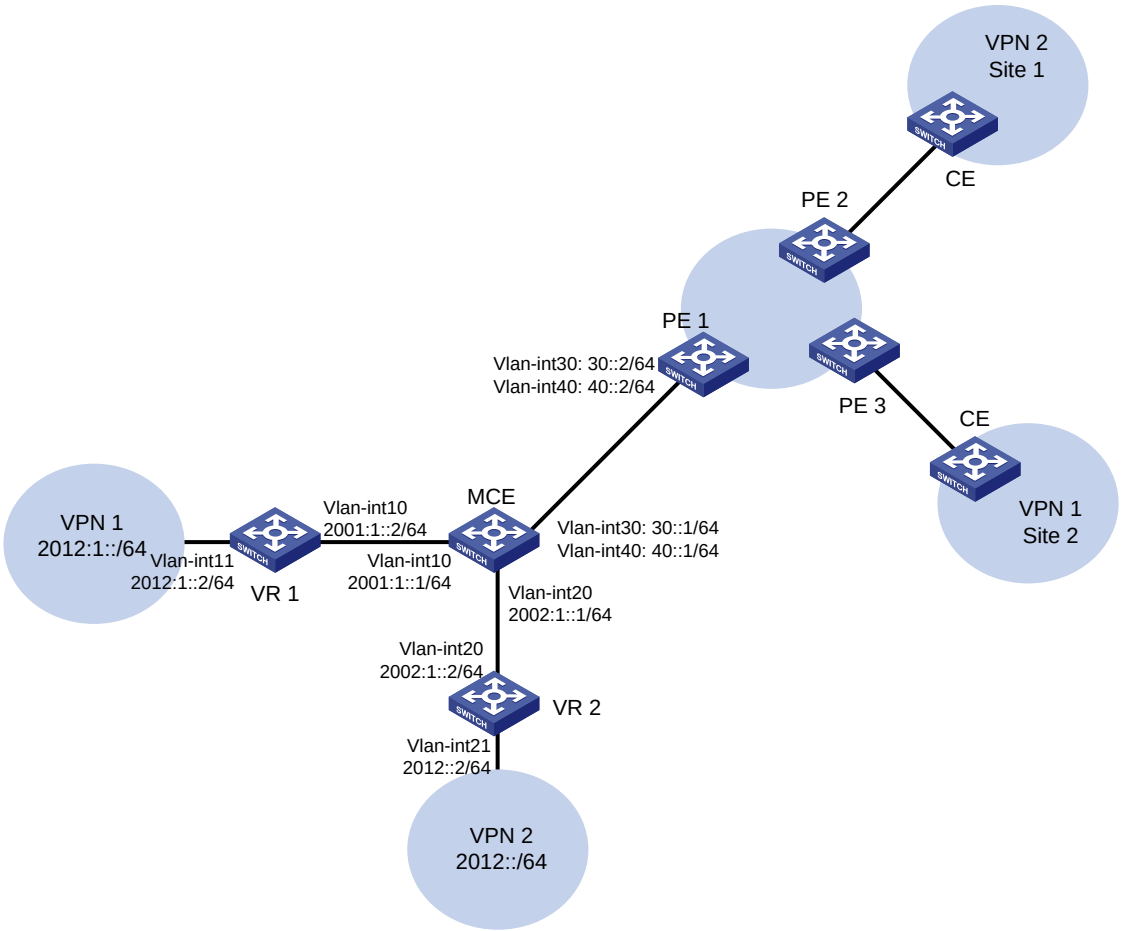
5. Enter BGP-VPN IPv6 unicast address family view.
   address-family ipv6 [**unicast**]
6. Enable BGP to exchange IPv6 unicast routes with the specified peer.
   peer { *group-name* | *ipv6-address* [*prefix-length*] } **enable**
   By default, BGP does not exchange IPv6 unicast routes with peers.
7. Redistribute the VPN routes of the VPN site.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Display and maintenance commands for IPv6 MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



IPv6 MCE configuration examples

Example: Configuring IPv6 MCE

Network configuration

As shown in Figure 6, RIPng runs in VPN 2. The edge routers of VPN 1 and VPN 2 are VR1 and VR2, respectively. Configure the MCE device to separate routes from different VPNs and advertise VPN routes to PE 1 through OSPFv3.

Figure 6 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   [MCE-vpn-instance-vpn2] vpn-target 20:1
   [MCE-vpn-instance-vpn2] quit
   ```

   # Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 10
   [MCE-Vlan-interface10] ip binding vpn-instance vpn1
   [MCE-Vlan-interface10] ipv6 address 2001:1::1 64
   [MCE-Vlan-interface10] quit
   ```

   # Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ip binding vpn-instance vpn2
[MCE-Vlan-interface20] ipv6 address 2002:1::1 64
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure IPv6 static routes.

On VR 1, assign IPv6 address 2001:1::2/64 to the interface connected to the MCE and 2012:1::2/64 to the interface connected to VPN 1. Add ports to VLANs. (Details not shown.)

On VR 1, configure a default route with the next hop being 2001:1::1.

```
<VR1> system-view
[VR1] ipv6 route-static :: 0 2001:1::1
```

On the MCE, configure an IPv6 static route to 2012:1::/64 with the next hop 2001:1::2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ipv6 route-static vpn-instance vpn1 2012:1:: 64 2001:1::2
```

Run RIPng in VPN 2. Configure RIPng process 20 for VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ripng 20 vpn-instance vpn2
```

Advertise subnet 2002:1::/64 through RIPng.

```
[MCE] interface vlan-interface 20
[MCE-Vlan-interface20] ripng 20 enable
[MCE-Vlan-interface20] quit
```

On VR 2, assign IPv6 address 2002:1::2/64 to the interface connected to the MCE and 2012::2/64 to the interface connected to VPN 2. (Details not shown.)

Configure RIPng, and advertise subnets 2012::/64 and 2002:1::/64.

```
<VR2> system-view
[VR2] ripng 20
[VR2-ripng-20] quit
[VR2] interface vlan-interface 20
[VR2-Vlan-interface20] ripng 20 enable
[VR2-Vlan-interface20] quit
[VR2] interface vlan-interface 21
[VR2-Vlan-interface21] ripng 20 enable
[VR2-Vlan-interface21] quit
```

On the MCE, display the routing tables of VPN instances **vpn1** and **vpn2**.

```
[MCE] display ipv6 routing-table vpn-instance vpn1
```

```

Destination: 2012::/64                                  Protocol  : RIPng
NextHop    : FE80::20C:29FF:FE40:701                    Preference: 100
Interface  : Vlan20                                     Cost      : 1

Destination: FE80::/10                                  Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

```
Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

The output shows that the MCE has learned the private route of VPN 2. The MCE maintains the routes of VPN 1 and VPN 2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ipv6 address 30::1 64
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ipv6 address 40::1 64
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ipv6 address 30::2 64
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IPv6 address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ipv6 address 40::2 64
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPFv3 process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospfv3 10 vpn-instance vpn1
```

Redistribute the IPv6 static route of VPN 1.

```
[MCE-ospf-10] router-id 101.101.10.1
[MCE-ospf-10] import-route static
[MCE-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ospfv3 10 area 0.0.0.0
[MCE-Vlan-interface30] quit
```

On PE 1, enable OSPFv3 process 10 and bind the process to VPN instance **vpn1**.

```
[PE1] ospfv3 10 vpn-instance vpn1
[PE1-ospf-10] router-id 100.100.10.1
[PE1-ospf-10] quit
```

Enable OSPFv3 on VLAN-interface 30.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ospfv3 10 area 0.0.0.0
[PE1-Vlan-interface30] quit
```

Configure OSPFv3 process 20 between the MCE and PE 1. (Details not shown.)

Redistribute VPN 2's routes from RIPng process 20 into the OSPFv3 routing table of the MCE. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the private route of VPN 1 through OSPFv3.

```
[PE1] display ipv6 routing-table vpn-instance vpn1

Destinations : 6 Routes : 6

Destination: ::1/128                                Protocol  : Direct

Destination: FE80::/10                                  Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0

Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

The routing information for the two VPNs has been added into the routing tables on PE 1.

Notice

The information in this document is subject to change without notice. All contents in this document, including statements, information, and recommendations, are believed to be accurate, but they are presented without warranty of any kind, express or implied. H3C shall not be liable for technical or editorial errors or omissions contained herein.

Preface

This configuration guide describes fundamentals and configuration procedures for ACL, QoS, time range, and data buffer.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring ACLs

About ACLs

An access control list (ACL) is a set of rules for identifying traffic based on criteria such as source IP address, destination IP address, and port number. The rules are also called permit or deny statements.

ACLs are primarily used for packet filtering. You can also use ACLs in QoS, security, routing, and other modules for identifying traffic. The packet drop or forwarding decisions depend on the modules that use ACLs.

Numbering and naming ACLs

When creating an ACL, you must assign it a number or name for identification. You can specify an existing ACL by its number or name. Each ACL type has a unique range of ACL numbers.

For basic or advanced ACLs with the same number, you must use the **`ipv6`** keyword to distinguish them. For ACLs with the same name, you must use the **`ipv6`** and **`mac`** keywords to distinguish them.

ACL types

Type	ACL number	IP version	Match criteria
Basic ACLs	2000 to 2999	IPv4	Source IPv4 address.
		IPv6	Source IPv6 address.
Advanced ACLs	3000 to 3999	IPv4	Source IPv4 address, destination IPv4 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
		IPv6	Source IPv6 address, destination IPv6 address, packet priority, protocol number, and other Layer 3 and Layer 4 header fields.
Layer 2 ACLs	4000 to 4999	IPv4 and IPv6	Layer 2 header fields, such as source and destination MAC addresses, 802.1p priority, and link layer protocol type.

Match order

The rules in an ACL are sorted in a specific order. When a packet matches a rule, the device stops the match process and performs the action defined in the rule. If an ACL contains overlapping or conflicting rules, the matching result and action to take depend on the rule order.

The following ACL match orders are available:

- **config**—Sorts ACL rules in ascending order of rule ID. A rule with a lower ID is matched before a rule with a higher ID. If you use this method, check the rules and their order carefully.
- **auto**—Sorts ACL rules in depth-first order. Depth-first ordering makes sure any subset of a rule is always matched before the rule. Table 1 lists the sequence of tie breakers that depth-first ordering uses to sort rules for each type of ACL.

Table 1 Sort ACL rules in depth-first order

ACL type	Sequence of tie breakers
IPv4 basic ACL	**1.** VPN instance. **2.** More 0s in the source IPv4 address wildcard (more 0s means a narrower IPv4 address range). **3.** Rule configured earlier.
IPv4 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** More 0s in the source IPv4 address wildcard mask. **4.** More 0s in the destination IPv4 address wildcard. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
IPv6 basic ACL	**1.** VPN instance. **2.** Longer prefix for the source IPv6 address (a longer prefix means a narrower IPv6 address range). **3.** Rule configured earlier.
IPv6 advanced ACL	**1.** VPN instance. **2.** Specific protocol number. **3.** Longer prefix for the source IPv6 address. **4.** Longer prefix for the destination IPv6 address. **5.** Narrower TCP/UDP service port number range. **6.** Rule configured earlier.
Layer 2 ACL	**1.** More 1s in the source MAC address mask (more 1s means a smaller MAC address). **2.** More 1s in the destination MAC address mask. **3.** Rule configured earlier.

A wildcard mask, also called an inverse mask, is a 32-bit binary number represented in dotted decimal notation. In contrast to a network mask, the 0 bits in a wildcard mask represent "do care" bits, and the 1 bits represent "don't care" bits. If the "do care" bits in an IP address are identical to the "do care" bits in an IP address criterion, the IP address matches the criterion. All "don't care" bits are ignored. The 0s and 1s in a wildcard mask can be noncontiguous. For example, 0.255.0.255 is a valid wildcard mask.

Comments and remarks for rules

An ACL can have multiple rules. To identify rules, you can add a comment for each rule one by one, or add the same remark for multiple rules.

- For rules requiring different identification, you can add a comment for a particular rule or add a different comment for each rule.
- For a range of rules requiring the same identification, you can insesrt a remark before the start rule and a remark after the end rule. This configuration mode eliminates the need for configuring a comment for each rule one by one and improves configuration efficiency.

Rule numbering

ACL rules can be manually numbered or automatically numbered. This section describes how automatic ACL rule numbering works.

Rule numbering step

If you do not assign an ID to the rule you are creating, the system automatically assigns it a rule ID. The rule numbering step sets the increment by which the system automatically numbers rules. For

example, the default ACL rule numbering step is 5. If you do not assign IDs to rules you are creating, they are automatically numbered 0, 5, 10, 15, and so on. The wider the numbering step, the more rules you can insert between two rules.

By introducing a gap between rules rather than contiguously numbering rules, you have the flexibility of inserting rules in an ACL. This feature is important for a config-order ACL, where ACL rules are matched in ascending order of rule ID.

The rule numbering step sets the increment by which the system numbers rules automatically. If you do not specify a rule ID when creating an ACL rule, the system automatically assigns it a rule ID. This rule ID is the nearest higher multiple of the numbering step to the current highest rule ID, starting from the start rule ID. For example, if the rule numbering step is 5 and the current highest rule ID is 12, the rule is numbered 15.

The wider the numbering step, the more rules you can insert between two rules. Whenever the step or start rule ID changes, the rules are renumbered, starting from the start rule ID. For example, if there are five rules numbered 0, 5, 9, 10, and 15, changing the step from 5 to 2 causes the rules to be renumbered 0, 2, 4, 6, and 8.

Automatic rule numbering and renumbering

The ID automatically assigned to an ACL rule takes the nearest higher multiple of the numbering step to the current highest rule ID, starting with 0.

For example, if the step is 5, and there are five rules numbered 0, 5, 9, 10, and 12, the newly defined rule is numbered 15. If the ACL does not contain a rule, the first rule is numbered 0.

Whenever the step changes, the rules are renumbered, starting from 0. For example, changing the step from 5 to 2 renumbers rules 5, 10, 13, and 15 as rules 0, 2, 4, and 6.

For an ACL of the match order **auto**, rules are sorted in depth-first order, and are renumbered based on the match order. For example, rules are in the match order of 0, 10, and 5. Changing the numbering step to 2 renumbers rules 0, 10, and 5 (not 0, 5, and 10) as rules 0, 2, 4.

Fragment filtering with ACLs

Traditional packet filtering matches only first fragments of packets, and allows all subsequent non-first fragments to pass through. Attackers can fabricate non-first fragments to attack networks.

To avoid risks, the ACL feature is designed as follows:

- Filters all fragments by default, including non-first fragments.
- Allows for matching criteria modification for efficiency. For example, you can configure the ACL to filter only non-first fragments.

Restrictions and guidelines: ACL configuration

- If you create a numbered ACL, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **number** *acl-number*.
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } *acl-number*.
- If you create a ACL by using the **acl** [**ipv6**] **number** *acl-number* **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** [**ipv6**] **number** *acl-number* [**name** *acl-name*].
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*.

- If you create a named ACL by using the **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name* command, you can enter the view of the ACL by using either of the following commands:
  - **acl** [**ipv6**] **name** *acl-name* (for only basic ACLs and advanced ACLs).
  - **acl** { [**ipv6**] { **advanced** | **basic** } | **mac** } **name** *acl-name*.
- Matching packets are forwarded through slow forwarding if an ACL rule contains match criteria or has functions enabled in addition to the following match criteria and functions:
  - Source and destination IP addresses.
  - Source and destination ports.
  - Transport layer protocol.
  - ICMP or ICMPv6 message type, message code, and message name.
  - VPN instance.
  - Logging.
  - Time range.

  Slow forwarding requires packets to be sent to the control plane for forwarding entry calculation, which affects the device forwarding performance.

ACL tasks at a glance

To configure an ACL, perform the following tasks:

- Configure ACLs according to the characteristics of the packets to be matched
  - Configuring a basic ACL
  - Configuring an advanced ACL
  - Configuring a Layer 2 ACL
- (Optional.) Copying an ACL
- (Optional.) Configuring packet filtering with ACLs

Configuring a basic ACL

About basic ACLs

Basic ACLs match packets based only on source IP addresses.

Configuring an IPv4 basic ACL

1. Enter system view.

   system-view
2. Create an IPv4 basic ACL and enter its view. Choose one option as needed:
   - Create an IPv4 basic ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 basic ACL by specifying the **basic** keyword.

     acl basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the IPv4 basic ACL.

description *text*

By default, an IPv4 basic ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **source** { *source-address source-wildcard* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Configuring an IPv6 basic ACL

8. Enter system view.

   system-view

9. Create an IPv6 basic ACL view and enter its view. Choose one option as needed:

   - Create an IPv6 basic ACL by specifying an ACL number.

     acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

   - Create an IPv6 basic ACL by specifying the **basic** keyword.

     acl ipv6 basic { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

10. (Optional.) Configure a description for the IPv6 basic ACL.

    description *text*

    By default, an IPv6 basic ACL does not have a description.

11. (Optional.) Set the rule numbering step.

    step *step-value* [**start** *start-value*]

    By default, the rule numbering step is 5 and the start rule ID is 0.

12. Create or edit a rule.

    rule [*rule-id*] { **deny** | **permit** } [**counting** | **fragment** | **logging**| **routing** [**type** *routing-type*] | **source** { *source-address source-prefix* | *source-address*/*source-prefix* | **any** } | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

    The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

13. (Optional.) Add or edit a rule comment.

    rule *rule-id* **comment** *text*

    By default, no rule comment is configured.

14. (Optional.) Add a rule remark.

rule [*rule-id*] **remark** *text*

By default, no rule remark is configured.

Configuring an advanced ACL

About advanced ACLs

Advanced ACLs match packets based on the following criteria:

- Source IP addresses.
- Destination IP addresses.
- Packet priorities.
- Protocol types.
- Other protocol header information, such as TCP/UDP source and destination port numbers, TCP flags, ICMP message types, and ICMP message codes.

Compared to basic ACLs, advanced ACLs allow more flexible and accurate filtering.

Configuring an IPv4 advanced ACL

1. Enter system view.

   system-view

2. Create an IPv4 advanced ACL and enter its view. Choose one option as needed:
   - Create a numbered IPv4 advanced ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create an IPv4 advanced ACL by specifying the **advanced** keyword.

     acl advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv4 advanced ACL.

   description *text*

   By default, an IPv4 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-wildcard* | **any** } | **destination-port** *operator port1* [*port2*] | { **dscp** *dscp* | { **precedence** *precedence* | **tos** *tos* } * } | **fragment** | **icmp-type** { *icmp-type* [*icmp-code*] | *icmp-message* } | **logging** | **source** { *source-address source-wildcard* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

   The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

rule *rule-id* **comment** *text*

By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

rule [*rule-id*] **remark** *text*

By default, no rule remark is configured.

Configuring an IPv6 advanced ACL

1. Enter system view.

system-view

2. Create an IPv6 advanced ACL and enter its view. Choose one option as needed:

- Create a numbered IPv6 advanced ACL by specifying an ACL number.

acl ipv6 number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]

- Create an IPv6 advanced ACL by specifying the **advanced** keyword.

acl ipv6 advanced { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]

3. (Optional.) Configure a description for the IPv6 advanced ACL.

description *text*

By default, an IPv6 advanced ACL does not have a description.

4. (Optional.) Set the rule numbering step.

step *step-value* [**start** *start-value*]

By default, the rule numbering step is 5 and the start rule ID is 0.

5. Create or edit a rule.

rule [*rule-id*] { **deny** | **permit** } *protocol* [{ { **ack** *ack-value* | **fin** *fin-value* | **psh** *psh-value* | **rst** *rst-value* | **syn** *syn-value* | **urg** *urg-value* } * | **established** } | **counting** | **destination** { *dest-address dest-prefix* | *dest-address/dest-prefix* | **any** } | **destination-port** *operator port1* [*port2*] | | **dscp** *dscp* | **flow-label** *flow-label-value* | **fragment** | **icmp6-type** { *icmp6-type icmp6-code* | *icmp6-message* } | **logging**| **routing** [**type** *routing-type*] | **hop-by-hop** [**type** *hop-type*] | **source** { *source-address source-prefix* | *source-address/source-prefix* | **any** } | **source-port** *operator port1* [*port2*] | **time-range** *time-range-name* | **vpn-instance** *vpn-instance-name*] *

The **logging** keyword takes effect only when the module (for example, packet filtering) that uses the ACL supports logging.

6. (Optional.) Add or edit a rule comment.

rule *rule-id* **comment** *text*

By default, no rule comment is configured.

7. (Optional.) Add a rule remark.

rule [*rule-id*] **remark** *text*

By default, no rule remark is configured.

Configuring a Layer 2 ACL

About this task

Layer 2 ACLs, also called Ethernet frame header ACLs, match packets based on Layer 2 Ethernet header fields, such as:

- Source MAC address.
- Destination MAC address.
- 802.1p priority (VLAN priority).
- Link layer protocol type.
- Encapsulation type.

Procedure

1. Enter system view.

   system-view
2. Create a Layer 2 ACL and enter its view. Choose one option as needed:
   - Create a Layer 2 ACL by specifying an ACL number.

     acl number *acl-number* [**name** *acl-name*] [**match-order** { **auto** | **config** }]
   - Create a Layer 2 ACL by specifying the **mac** keyword.

     acl mac { *acl-number* | **name** *acl-name* } [**match-order** { **auto** | **config** }]
3. (Optional.) Configure a description for the Layer 2 ACL.

   description *text*

   By default, a Layer 2 ACL does not have a description.
4. (Optional.) Set the rule numbering step.

   step *step-value* [**start** *start-value*]

   By default, the rule numbering step is 5 and the start rule ID is 0.
5. Create or edit a rule.

   rule [*rule-id*] { **deny** | **permit** } [**cos** *dot1p* | **counting** | **dest-mac** *dest-address dest-mask* | { **lsap** *lsap-type lsap-type-mask* | **type** *protocol-type protocol-type-mask* } | **source-mac** *source-address source-mask* | **time-range** *time-range-name*] *
6. (Optional.) Add or edit a rule comment.

   rule *rule-id* **comment** *text*

   By default, no rule comment is configured.
7. (Optional.) Add a rule remark.

   rule [*rule-id*] **remark** *text*

   By default, no rule remark is configured.

Copying an ACL

About this task

You can create an ACL by copying an existing ACL (source ACL). The new ACL (destination ACL) has the same properties and content as the source ACL, but uses a different number or name than the source ACL.

Restrictions and guidelines

To successfully copy an ACL, make sure:

- The destination ACL is the same type as the source ACL.
- The source ACL already exists, but the destination ACL does not.

Procedure

1. Enter system view.
   system-view
2. Copy an existing ACL to create a new ACL.
   acl [**ipv6** | **mac**] **copy** { *source-acl-number* | **name** *source-acl-name* } **to** { *dest-acl-number* | **name** *dest-acl-name* }

Configuring packet filtering with ACLs

About packet filtering with ACLs

This section describes procedures for using an ACL to filtering packets. For example, you can apply an ACL to an interface to filter incoming or outgoing packets.

Restrictions and guidelines for packet filtering with ACLs configuration

A packet filter does not take effect on Layer 3 Telnet packets or Layer 3 SSH packets in the inbound direction.

Applying an ACL to an interface for packet filtering

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an ACL to the interface to filter packets.
   packet-filter [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } { **inbound** | **outbound** } [**hardware-count**]
   By default, an interface does not filter packets.

Configuring the applicable scope of packet filtering on a VLAN interface

About this task

You can configure the packet filtering on a VLAN interface to filter the following packets:

- Packets forwarded at Layer 3 by the VLAN interface.
- All packets, including packets forwarded at Layer 3 by the VLAN interface and packets forwarded at Layer 2 by the physical ports associated with the VLAN interface.

Procedure

1. Enter system view.
   system-view
2. Create a VLAN interface and enter its view.
   interface vlan-interface *vlan-interface-id*
   If the VLAN interface already exists, you directly enter its view.
   By default, no VLAN interface exists.
3. Specify the applicable scope of packet filtering on the VLAN interface.
   packet-filter filter { **route** | **all** }
   By default, the packet filtering filters packets forwarded at Layer 3.

Configuring logging and SNMP notifications for packet filtering

About this task

You can configure the ACL module to generate log entries or SNMP notifications for packet filtering and output them to the information center or SNMP module at the output interval. When the first packet of a flow matches an ACL rule, the output interval starts. At the end of the interval, the device outputs a log entry or notification to record the number of matching packets and the matched ACL rule during the interval.

For more information about the information center and SNMP, see *Network Management and Monitoring Configuration Guide.*

Procedure

1. Enter system view.
   system-view
2. Set the interval for outputting packet filtering logs or notifications.
   acl { **logging** | **trap** } **interval** *interval*
   The default setting is 0 minutes. By default, the device does not generate log entries or SNMP notifications for packet filtering.

Setting the packet filtering default action

1. Enter system view.
   system-view
2. Set the packet filtering default action to deny.
   packet-filter default deny
   By default, the packet filter permits packets that do not match any ACL rule to pass.

Display and maintenance commands for ACL

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ACL configuration and match statistics.	**display acl** [**ipv6** | **mac**] { *acl-number* | **all** | **name** *acl-name* }

Task	Command
Display ACL rules in the ACL whitelist.	**display acl whitelist** [**ipv6**] **slot** *slot-number*
Display ACL application information for packet filtering.	**display packet-filter interface** [*interface-type interface-number*] [**inbound** | **outbound**] } [**slot** *slot-number*]
Display match statistics for packet filtering ACLs.	**display packet-filter statistics interface** *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**brief**]
Display the accumulated statistics for packet filtering ACLs.	**display packet-filter statistics sum** { **inbound** | **outbound** } [**ipv6** | **mac**] { *acl-number* | **name** *acl-name* } [**brief**]
Display detailed ACL packet filtering information.	**display packet-filter verbose interface** *interface-type interface-number* { **inbound** | **outbound** } [[**ipv6** | **mac**] { *acl-number* | **name** *acl-name* }] [**slot** *slot-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Clear ACL statistics.	**reset acl** [**ipv6** | **mac**] **counter** { *acl-number* | **all** | **name** *acl-name* }

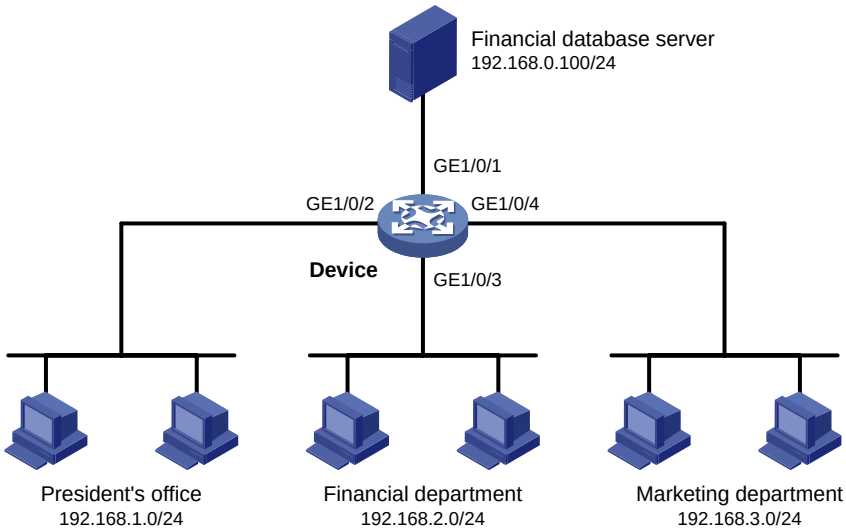
ACL configuration examples



Example: Configuring interface-based packet filter

Network configuration

A company interconnects its departments through the device. Configure a packet filter to:

- Permit access from the President's office at any time to the financial database server.
- Permit access from the Finance department to the database server only during working hours (from 8:00 to 18:00) on working days.
- Deny access from any other department to the database server.

Figure 1 Network diagram

Procedure

Create a periodic time range from 8:00 to 18:00 on working days.

```
<Device> system-view
[Device] time-range work 08:0 to 18:00 working-day
```

Create an IPv4 advanced ACL numbered 3000.

```
[Device] acl advanced 3000
```

Configure a rule to permit access from the President's office to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.1.0 0.0.0.255 destination
192.168.0.100 0
```

Configure a rule to permit access from the Finance department to the database server during working hours.

```
[Device-acl-ipv4-adv-3000] rule permit ip source 192.168.2.0 0.0.0.255 destination
192.168.0.100 0 time-range work
```

Configure a rule to deny access to the financial database server.

```
[Device-acl-ipv4-adv-3000] rule deny ip source any destination 192.168.0.100 0
[Device-acl-ipv4-adv-3000] quit
```

Apply IPv4 advanced ACL 3000 to filter outgoing packets on interface GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] packet-filter 3000 outbound
[Device-GigabitEthernet1/0/1] quit
```

Verifying the configuration

Verify that a PC in the Finance department can ping the database server during working hours. (All PCs in this example use Windows XP).

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Reply from 192.168.0.100: bytes=32 time=1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255
```

```
Reply from 192.168.0.100: bytes=32 time<1ms TTL=255

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Verify that a PC in the Marketing department cannot ping the database server during working hours.

```
C:\> ping 192.168.0.100

Pinging 192.168.0.100 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.0.100:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

Display configuration and match statistics for IPv4 advanced ACL 3000 on the device during working hours.

```
[Device] display acl 3000
Advanced IPv4 ACL 3000, 3 rules,
ACL's step is 5
 rule 0 permit ip source 192.168.1.0 0.0.0.255 destination 192.168.0.100 0
 rule 5 permit ip source 192.168.2.0 0.0.0.255 destination 192.168.0.100 0 time-range work (Active)
 rule 10 deny ip destination 192.168.0.100 0
```

The output shows that rule 5 is active. Rule 5 and rule 10 have been matched four times as the result of the ping operations.

QoS overview

In data communications, Quality of Service (QoS) provides differentiated service guarantees for diversified traffic in terms of bandwidth, delay, jitter, and drop rate, all of which can affect QoS.

QoS manages network resources and prioritizes traffic to balance system resources.

The following section describes typical QoS service models and widely used QoS techniques.

QoS service models

This section describes several typical QoS service models.

Best-effort service model

The best-effort model is a single-service model. The best-effort model is not as reliable as other models and does not guarantee delay-free delivery.

The best-effort service model is the default model for the Internet and applies to most network applications. It uses the First In First Out (FIFO) queuing mechanism.

IntServ model

The integrated service (IntServ) model is a multiple-service model that can accommodate diverse QoS requirements. This service model provides the most granularly differentiated QoS by identifying and guaranteeing definite QoS for each data flow.

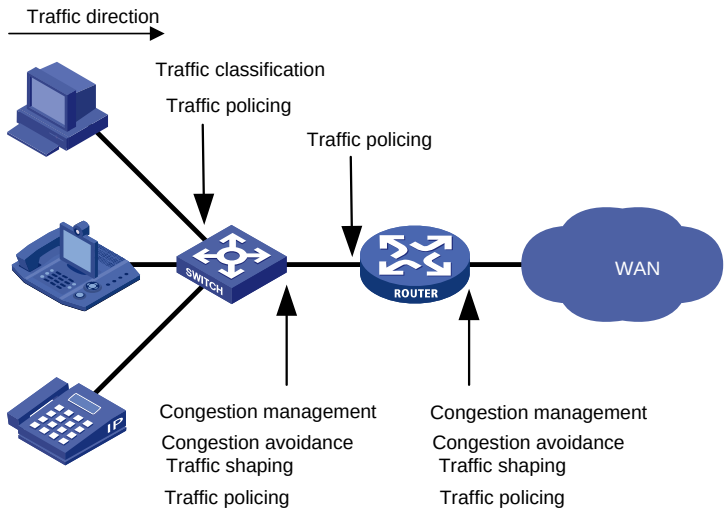
In the IntServ model, an application must request service from the network before it sends data. IntServ signals the service request with the RSVP. All nodes receiving the request reserve resources as requested and maintain state information for the application flow.

The IntServ model demands high storage and processing capabilities because it requires all nodes along the transmission path to maintain resource state information for each flow. This model is suitable for small-sized or edge networks. However, it is not suitable for large-sized networks, for example, the core layer of the Internet, where billions of flows are present.

DiffServ model

The differentiated service (DiffServ) model is a multiple-service model that can meet diverse QoS requirements. It is easy to implement and extend. DiffServ does not signal the network to reserve resources before sending data, as IntServ does.

QoS techniques in a network



The QoS techniques include the following features:

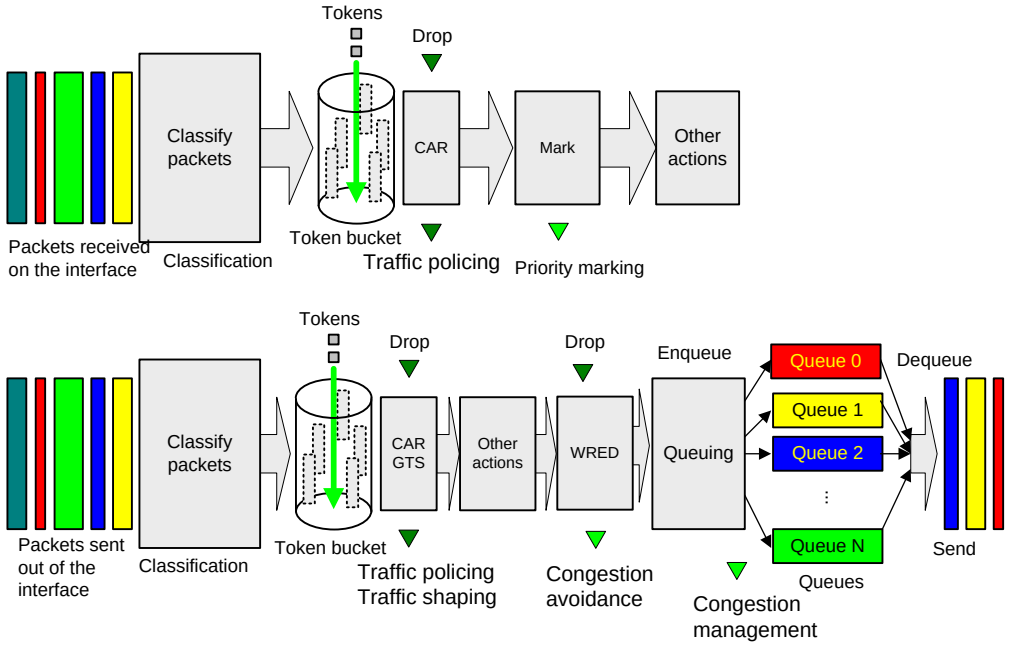
- Traffic classification.
- Traffic policing.
- Traffic shaping.
- Rate limit.
- Congestion management.
- Congestion avoidance.

The following section briefly introduces these QoS techniques.

All QoS techniques in this document are based on the DiffServ model.

Figure 1 Position of the QoS techniques in a network

As shown in Figure 1, traffic classification, traffic shaping, traffic policing, congestion management, and congestion avoidance mainly implement the following functions:



- **Traffic classification**—Uses match criteria to assign packets with the same characteristics to a traffic class. Based on traffic classes, you can provide differentiated services.
- **Traffic policing**—Polices flows and imposes penalties to prevent aggressive use of network resources. You can apply traffic policing to both incoming and outgoing traffic of a port.
- **Traffic shaping**—Adapts the output rate of traffic to the network resources available on the downstream device to eliminate packet drops. Traffic shaping usually applies to the outgoing traffic of a port.
- **Congestion management**—Provides a resource scheduling policy to determine the packet forwarding sequence when congestion occurs. Congestion management usually applies to the outgoing traffic of a port.
- **Congestion avoidance**—Monitors the network resource usage. It is usually applied to the outgoing traffic of a port. When congestion worsens, congestion avoidance reduces the queue length by dropping packets.

QoS processing flow in a device

Figure 2 briefly describes how the QoS module processes traffic.

1. Traffic classifier identifies and classifies traffic for subsequent QoS actions.
2. The QoS module takes various QoS actions on classified traffic as configured, depending on the traffic processing phase and network status. For example, you can configure the QoS module to perform the following operations:
   - Traffic policing for incoming traffic.
   - Traffic shaping for outgoing traffic.
   - Congestion avoidance before congestion occurs.
   - Congestion management when congestion occurs.

Figure 2 QoS processing flow

QoS configuration approaches

You can configure QoS by using the MQC approach or non-MQC approach.

In the modular QoS configuration (MQC) approach, you configure QoS service parameters by using QoS policies. A QoS policy defines QoS actions to take on different classes of traffic and can be applied to an object (such as an interface) to control traffic.

In the non-MQC approach, you configure QoS service parameters without using a QoS policy. For example, you can use the rate limit feature to set a rate limit on an interface without using a QoS policy.

Configuring a QoS policy

About QoS policies

A QoS policy has the following components:

- **Traffic class**—Defines criteria to match packets.
- **Traffic behavior**—Defines QoS actions to take on matching packets.

By associating a traffic class with a traffic behavior, a QoS policy can perform the QoS actions on matching packets.

A QoS policy can have multiple class-behavior associations.

QoS policy tasks at a glance

To configure a QoS policy, perform the following tasks:

1. Defining a traffic class
2. Defining a traffic behavior
3. Defining a QoS policy
4. Applying the QoS policy
   - Applying the QoS policy to an interface
   - Applying the QoS policy to VLANs
   - Applying the QoS policy globally
   - Applying the QoS policy to a user profile

Defining a traffic class

1. Enter system view.
   system-view
2. Create a traffic class and enter traffic class view.
   traffic classifier *classifier-name* [**operator** { **and** | **or** }]
3. (Optional.) Configure a description for the traffic class.
   description *text*

   By default, no description is configured for a traffic class.
4. Configure a match criterion.
   if-match *match-criteria*

   By default, no match criterion is configured.

   For more information, see the **if-match** command in *ACL and QoS Command Reference*.

Defining a traffic behavior

1. Enter system view.
   system-view
2. Create a traffic behavior and enter traffic behavior view.

traffic behavior *behavior-name*

3. Configure an action in the traffic behavior.

   By default, no action is configured for a traffic behavior.

   For more information about configuring an action, see the subsequent chapters for traffic policing, traffic filtering, priority marking, class-based accounting, and so on.

Defining a QoS policy

1. Enter system view.

   system-view

2. Create a QoS policy and enter QoS policy view.

   qos policy *policy-name*

3. Associate a traffic class with a traffic behavior to create a class-behavior association in the QoS policy.

   classifier *classifier-name* **behavior** *behavior-name* [**insert-before** *before-classifier-name*]

   By default, a traffic class is not associated with a traffic behavior.

Applying the QoS policy

Application destinations

You can apply a QoS policy to the following destinations:

- **Interface**—The QoS policy can be applied to the traffic sent or received on the interface.
- **VLAN**—The QoS policy can be applied to the traffic sent or received on all ports in the VLAN.
- **Globally**—The QoS policy can be applied to the traffic sent or received on all ports.
- **User profile**—The QoS policy can be applied to the traffic sent or received by the online users of the user profile.

Restrictions and guidelines for applying a QoS policy

You can modify traffic classes, traffic behaviors, and class-behavior associations in a QoS policy even after it is applied (except that it is applied to a user profile). If a traffic class uses an ACL for traffic classification, you can delete or modify the ACL.

If a traffic behavior is configured with multiple actions and one of these actions does not take effect, the whole class-behavior association does not take effect.

When a QoS policy containing a CAR action is applied to the outbound direction of multiple interfaces, the actual rate limit that takes effect depends on the locations of these interfaces. By default, the actual rate limit that takes effect is the CIR plus the PIR specified in the CAR action multiplied by the number of IRF member devices where the interfaces reside.

Applying the QoS policy to an interface

Restrictions and guidelines

A QoS policy can be applied to multiple interfaces. However, only one QoS policy can be applied to one direction (inbound or outbound) of an interface.

The QoS policy applied to the outgoing traffic on an interface does not regulate local packets. Local packets refer to critical protocol packets sent by the local system for operation maintenance.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Apply the QoS policy to the interface.
   qos apply policy *policy-name* { **inbound** | **outbound**
   By default, no QoS policy is applied to an interface.

Applying the QoS policy to VLANs

About this task

You can apply a QoS policy to VLANs to regulate the traffic on all ports of the VLANs.

Restrictions and guidelines

QoS policies cannot be applied to dynamic VLANs, including VLANs created by GVRP.

When you apply a QoS policy to VLANs, the QoS policy is applied to the specified VLANs on all IRF member devices. If the hardware resources of an IRF member device are insufficient, applying a QoS policy to VLANs might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, use the **undo qos vlan-policy vlan** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.
   system-view
2. Apply the QoS policy to VLANs.
   qos vlan-policy *policy-name* **vlan** *vlan-id-list* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a VLAN.

Applying the QoS policy globally

About this task

You can apply a QoS policy globally to the inbound or outbound direction of all ports.

Restrictions and guidelines

If the hardware resources of an IRF member device are insufficient, applying a QoS policy globally might fail on the IRF member device. The system does not automatically roll back the QoS policy configuration already applied to other IRF member devices. To ensure consistency, you must use the **undo qos apply policy global** command to manually remove the QoS policy configuration applied to them.

Procedure

1. Enter system view.
   system-view
2. Apply the QoS policy globally.
   qos apply policy *policy-name* **global** { **inbound** | **outbound**

By default, no QoS policy is applied globally.

Applying the QoS policy to a user profile

About this task

When a user profile is configured, you can perform traffic policing based on users. After a user passes authentication, the authentication server sends the name of the user profile associated with the user to the device. The QoS policy configured in user profile view takes effect only when users come online.

Restrictions and guidelines

You can apply a QoS policy to multiple user profiles. In one direction of each user profile, only one policy can be applied. To modify a QoS policy already applied to a direction, first remove the applied QoS policy.

Procedure

1. Enter system view.
   system-view
2. Enter user profile view.
   user-profile *profile-name*
3. Apply the QoS policy to the user profile.
   qos apply policy *policy-name* { **inbound** | **outbound** }
   By default, no QoS policy is applied to a user profile.

Parameter	Description
inbound	Applies a QoS policy to the traffic received by the device from the user profile.
outbound	Applies a QoS policy to the traffic sent by the device to the user profile.

Display and maintenance commands for QoS policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display QoS policy configuration.	**display qos policy user-defined** [*policy-name* [**classifier** *classifier-name*]] [**slot** *slot-number*]
Display information about QoS policies applied globally.	**display qos policy global** [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to interfaces.	**display qos policy interface** [*interface-type interface-number*] [**slot** *slot-number*] [**inbound** | **outbound**]
Display information about QoS policies applied to VLANs.	**display qos vlan-policy** { **name** *policy-name* | **vlan** [*vlan-id*] } [**slot** *slot-number*] [**inbound** | **outbound**]

Task	Command
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*] [**slot** *slot-number*]
Display traffic class configuration.	**display traffic classifier user-defined** [*classifier-name*] [**slot** *slot-number*]
Clear the statistics for a QoS policy applied globally.	**reset qos policy global** [**inbound** | **outbound**]
Clear the statistics of the QoS policy applied in a certain direction of a VLAN.	**reset qos vlan-policy** [**vlan** *vlan-id*] [**inbound** | **outbound**]

Configuring priority mapping

About priority mapping

When a packet arrives, a device assigns a set of QoS priority parameters to the packet based on either of the following:

- A priority field carried in the packet.
- The port priority of the incoming port.

This process is called priority mapping. During this process, the device can modify the priority of the packet according to the priority mapping rules. The set of QoS priority parameters decides the scheduling priority and forwarding priority of the packet.

Priority mapping is implemented with priority maps and involves the following priorities:

- 802.11e priority.
- 802.1p priority.
- DSCP.
- EXP.
- IP precedence.
- Local precedence.
- Drop priority.

About priorities

Priorities include the following types: priorities carried in packets, and priorities locally assigned for scheduling only.

Packet-carried priorities include 802.1p priority, DSCP precedence, and IP precedence. These priorities have global significance and affect the forwarding priority of packets across the network. For more information about these priorities, see "Appendixes."

Locally assigned priorities only have local significance. They are assigned by the device only for scheduling. These priorities include the local precedence, drop priority, and user priority, as follows:

- **Local precedence**—Used for queuing. A local precedence value corresponds to an output queue. A packet with higher local precedence is assigned to a higher priority output queue to be preferentially scheduled.
- **Drop priority**—Used for making packet drop decisions. Packets with the highest drop priority are dropped preferentially.

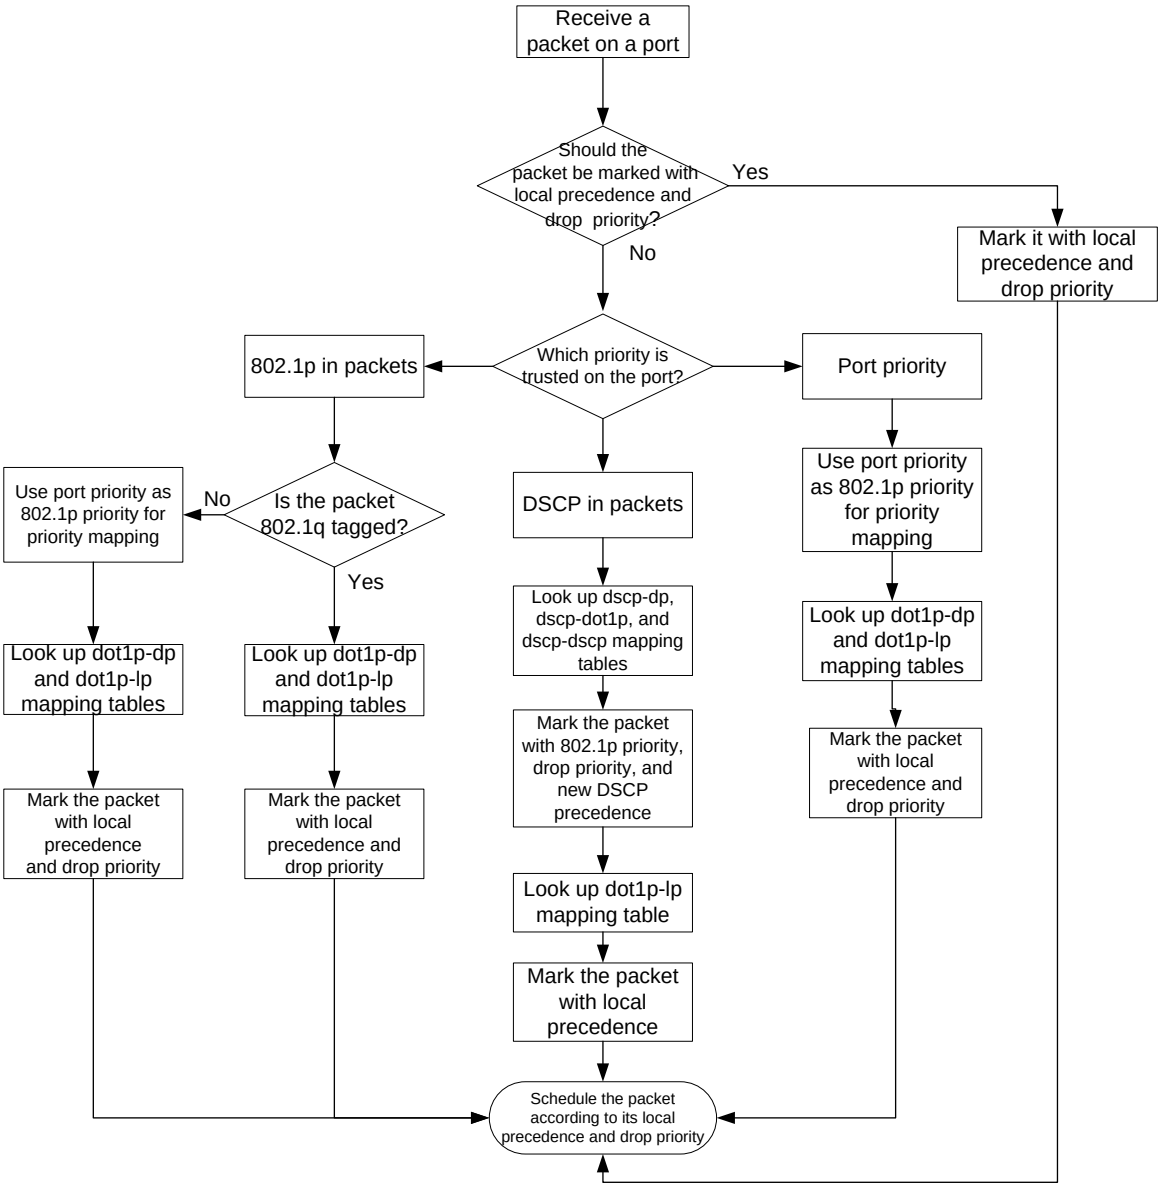
The device supports only local precedence and drop priority for scheduling.

Priority maps

The device provides various types of priority maps. By looking through a priority map, the device decides which priority value to assign to a packet for subsequent packet processing.

The default priority maps (as shown in Appendix B Default priority maps) are available for priority mapping. They are adequate in most cases. If a default priority map cannot meet your requirements, you can modify the priority map as required.

Priority mapping configuration methods



You can configure priority mapping by using any of the following methods:

- **Configuring priority trust mode**—In this method, you can configure a port to look up a trusted priority type (802.1p, for example) in incoming packets in the priority maps. Then, the system maps the trusted priority to the target priority types and values.
- **Changing port priority**—If no packet priority is trusted, the port priority of the incoming port is used. By changing the port priority of a port, you change the priority of the incoming packets on the port.

Priority mapping process

On receiving an Ethernet packet on a port, the switch marks the scheduling priorities (local precedence and drop precedence) for the Ethernet packet. This procedure is done according to the priority trust mode of the receiving port and the 802.1Q tagging status of the packet, as shown in Figure 3.

Figure 3 Priority mapping process for an Ethernet packet

For information about priority marking, see "Configuring priority marking."

Restrictions and guidelines: Priority mapping configuration

To mark packets with a local precedence value through a QoS policy, make sure the mapping for the local precedence value has been configured in the dot1p-lp priority map. Additionally, do not modify the mapping after applying the QoS policy.

Priority mapping tasks at a glance

To configure priority mapping, perform the following tasks:

1. (Optional.) Configuring a priority map

2. Configure a priority mapping method:
   - Configuring a port to trust packet priority for priority mapping
   - Changing the port priority of an interface

Configuring a priority map

1. Enter system view.

   system-view
2. Enter priority map view.

   qos map-table { **dot1p-dp** | **dot1p-lp** | **dscp-dot1p** | **dscp-dp** | **dscp-dscp** }
3. Configure mappings for the priority map.

   import *import-value-list* **export** *export-value*

   By default, the default priority maps are used. For more information, see "Appendix B Default priority maps."

   If you execute this command multiple times, the most recent configuration takes effect.

Configuring a port to trust packet priority for priority mapping

About this task

You can configure the device to trust a particular priority field carried in packets for priority mapping on ports or globally. When you configure the trusted packet priority type on an interface, use the following available keywords:

- **dot1p**—Uses the 802.1p priority of received packets for mapping.
- **dscp**—Uses the DSCP precedence of received IP packets for mapping.

Restrictions and guidelines

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Interface Configuration Guide*).

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the trusted packet priority type.

   qos trust { **dot1p** | **dscp** }

   By default, an interface does not trust any packet priority and uses the port priority as the 802.1p priority for mapping.

Changing the port priority of an interface

About this task

If an interface does not trust any packet priority, the device uses its port priority to look for priority parameters for the incoming packets. By changing port priority, you can prioritize traffic received on different interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the port priority of the interface.
   qos priority [**dscp**] *priority-value*
   By default, the port priority of the interface is 0, and the DSCP value of the interface is not set.

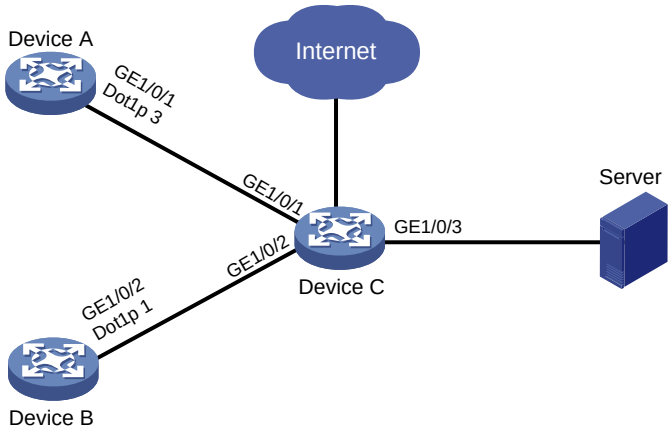
Display and maintenance commands for priority mapping

Execute **display** commands in any view.

Task	Command
Display priority map configuration.	**display qos map-table** [**dot1p-dp** | **dot1p-lp** | **dscp-dot1p** | **dscp-dp** | **dscp-dscp**]
Display the trusted packet priority type on a port.	**display qos trust interface** [*interface-type interface-number*]

Priority mapping configuration examples

Example: Configuring a priority trust mode



Network configuration

As shown in Figure 4:

- The 802.1p priority of traffic from Device A to Device C is 3.
- The 802.1p priority of traffic from Device B to Device C is 1.

Configure Device C to preferentially process packets from Device A to the server when GigabitEthernet 1/0/3 of Device C is congested.

Figure 4 Network diagram

Procedure

(Method 1) Configure Device C to trust packet priority

Configure GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to trust the 802.1p priority for priority mapping.

```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos trust dot1p
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos trust dot1p
[DeviceC-GigabitEthernet1/0/2] quit
```

(Method 2) Configure Device C to trust port priority

Assign port priority to GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2. Make sure the following requirements are met:

- The priority of GigabitEthernet 1/0/1 is higher than that of GigabitEthernet 1/0/2.
- No trusted packet priority type is configured on GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2.

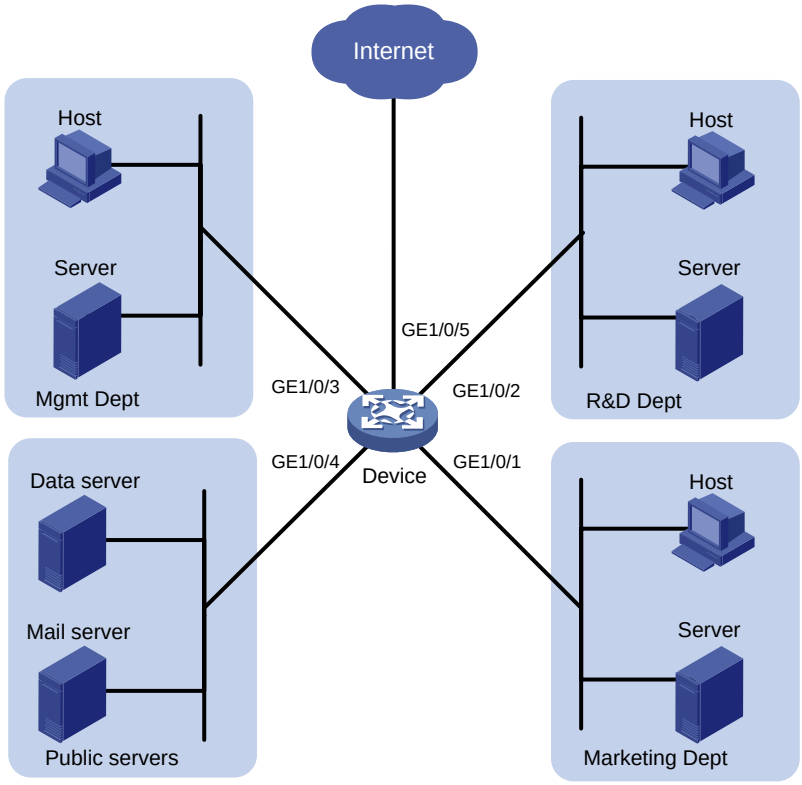
```
<DeviceC> system-view
[DeviceC] interface gigabitethernet 1/0/1
[DeviceC-GigabitEthernet1/0/1] qos priority 3
[DeviceC-GigabitEthernet1/0/1] quit
[DeviceC] interface gigabitethernet 1/0/2
[DeviceC-GigabitEthernet1/0/2] qos priority 1
[DeviceC-GigabitEthernet1/0/2] quit
```

Example: Configuring priority mapping tables and priority marking

Network configuration

As shown in Figure 5:

- The Marketing department connects to GigabitEthernet 1/0/1 of Device, which sets the 802.1p priority of traffic from the Marketing department to 3.
- The R&D department connects to GigabitEthernet 1/0/2 of Device, which sets the 802.1p priority of traffic from the R&D department to 4.



- The Management department connects to GigabitEthernet 1/0/3 of Device, which sets the 802.1p priority of traffic from the Management department to 5.

Configure port priority, 802.1p-to-local mapping table, and priority marking to implement the plan as described in Table 1.

Table 1 Configuration plan

Traffic destination	Traffic priority order	Queuing plan		
		Traffic source	Output queue	Queue priority
Public servers	R&D department > Management department > Marketing department	R&D department	6	High
		Management department	4	Medium
		Marketing department	2	Low
Internet	Management department > Marketing department > R&D department	R&D department	2	Low
		Management department	6	High
		Marketing department	4	Medium

Figure 5 Network diagram

Procedure

1. Configure trusting port priority:

   # Set the port priority of GigabitEthernet 1/0/1 to 3.

   ```
   <Device> system-view
   [Device] interface gigabitethernet 1/0/1
   [Device-GigabitEthernet1/0/1] qos priority 3
   ```

```
[Device-GigabitEthernet1/0/1] quit
```

Set the port priority of GigabitEthernet 1/0/2 to 4.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos priority 4
[Device-GigabitEthernet1/0/2] quit
```

Set the port priority of GigabitEthernet 1/0/3 to 5.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos priority 5
[Device-GigabitEthernet1/0/3] quit
```

2. Configure the 802.1p-to-local mapping table to map 802.1p priority values 3, 4, and 5 to local precedence values 2, 6, and 4.

This guarantees the R&D department, Management department, and Marketing department decreased priorities to access the public servers.

```
[Device] qos map-table dot1p-lp
[Device-maptbl-dot1p-lp] import 3 export 2
[Device-maptbl-dot1p-lp] import 4 export 6
[Device-maptbl-dot1p-lp] import 5 export 4
[Device-maptbl-dot1p-lp] quit
```

3. Configure priority marking to mark the packets from Management department, Marketing department, and R&D department to the Internet with 802.1p priority values 4, 5, and 3.

This guarantees the Management department, Marketing department, and R&D department decreased priorities to access the Internet.

Create ACL 3000, and configure a rule to match HTTP packets.

```
[Device] acl advanced 3000
[Device-acl-adv-3000] rule permit tcp destination-port eq 80
[Device-acl-adv-3000] quit
```

Create a traffic class named **http**, and use ACL 3000 as a match criterion.

```
[Device] traffic classifier http
[Device-classifier-http] if-match acl 3000
[Device-classifier-http] quit
```

Create a traffic behavior named **admin**, and configure a marking action for the Management department.

```
[Device] traffic behavior admin
[Device-behavior-admin] remark dot1p 4
[Device-behavior-admin] quit
```

Create a QoS policy named **admin**, and associate traffic class **http** with traffic behavior **admin** in QoS policy **admin**.

```
[Device] qos policy admin
[Device-qospolicy-admin] classifier http behavior admin
[Device-qospolicy-admin] quit
```

Apply QoS policy **admin** to the inbound direction of GigabitEthernet 1/0/3.

```
[Device] interface gigabitethernet 1/0/3
[Device-GigabitEthernet1/0/3] qos apply policy admin inbound
```

Create a traffic behavior named **market**, and configure a marking action for the Marketing department.

```
[Device] traffic behavior market
[Device-behavior-market] remark dot1p 5
[Device-behavior-market] quit
```

Create a QoS policy named **market**, and associate traffic class **http** with traffic behavior **market** in QoS policy **market**.

```
[Device] qos policy market
[Device-qospolicy-market] classifier http behavior market
[Device-qospolicy-market] quit
```

Apply QoS policy **market** to the inbound direction of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy market inbound
```

Create a traffic behavior named **rd**, and configure a marking action for the R&D department.

```
[Device] traffic behavior rd
[Device-behavior-rd] remark dot1p 3
[Device-behavior-rd] quit
```

Create a QoS policy named **rd**, and associate traffic class **http** with traffic behavior **rd** in QoS policy **rd**.

```
[Device] qos policy rd
[Device-qospolicy-rd] classifier http behavior rd
[Device-qospolicy-rd] quit
```

Apply QoS policy **rd** to the inbound direction of GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] qos apply policy rd inbound
```

Configuring traffic policing, GTS, and rate limit

About traffic policing, GTS, and rate limit

Traffic limit helps assign network resources (including bandwidth) and increase network performance. For example, you can configure a flow to use only the resources committed to it in a certain time range. This avoids network congestion caused by burst traffic.

Traffic policing, Generic Traffic Shaping (GTS), and rate limit control the traffic rate and resource usage according to traffic specifications. You can use token buckets for evaluating traffic specifications.

Traffic evaluation and token buckets

Token bucket features

A token bucket is analogous to a container that holds a certain number of tokens. Each token represents a certain forwarding capacity. The system puts tokens into the bucket at a constant rate. When the token bucket is full, the extra tokens cause the token bucket to overflow.

Evaluating traffic with the token bucket

A token bucket mechanism evaluates traffic by looking at the number of tokens in the bucket. If the number of tokens in the bucket is enough for forwarding the packets:

- The traffic conforms to the specification (called conforming traffic).
- The corresponding tokens are taken away from the bucket.

Otherwise, the traffic does not conform to the specification (called excess traffic).

A token bucket has the following configurable parameters:

- Mean rate at which tokens are put into the bucket, which is the permitted average rate of traffic. It is usually set to the committed information rate (CIR).
- Burst size or the capacity of the token bucket. It is the maximum traffic size permitted in each burst. It is usually set to the committed burst size (CBS). The set burst size must be greater than the maximum packet size.

Each arriving packet is evaluated.

Complicated evaluation

You can set two token buckets, bucket C and bucket E, to evaluate traffic in a more complicated environment and achieve more policing flexibility. The following are main mechanisms used for complicated evaluation:

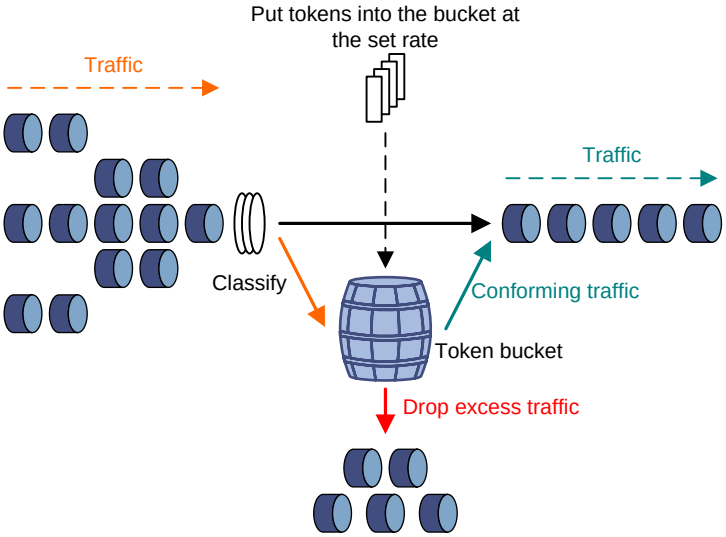
- **Single rate two color**—Uses one token bucket and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens to forward the packet, the packet is colored green.
  - Otherwise, the packet is colored red.
- **Single rate three color**—Uses two token buckets and the following parameters:

- **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
- **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
- **EBS**—Size of bucket E minus size of bucket C, which specifies the transient burst of traffic that bucket E can forward. The EBS cannot be 0. The size of E bucket is the sum of the CBS and EBS.

When a packet arrives, the following rules apply:

- If bucket C has enough tokens, the packet is colored green.
- If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
- If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.



- **Two rate three color**—Uses two token buckets and the following parameters:
  - **CIR**—Rate at which tokens are put into bucket C. It sets the average packet transmission or forwarding rate allowed by bucket C.
  - **CBS**—Size of bucket C, which specifies the transient burst of traffic that bucket C can forward.
  - **PIR**—Rate at which tokens are put into bucket E, which specifies the average packet transmission or forwarding rate allowed by bucket E.
  - **EBS**—Size of bucket E, which specifies the transient burst of traffic that bucket E can forward.

  When a packet arrives, the following rules apply:
  - If bucket C has enough tokens, the packet is colored green.
  - If bucket C does not have enough tokens but bucket E has enough tokens, the packet is colored yellow.
  - If neither bucket C nor bucket E has sufficient tokens, the packet is colored red.

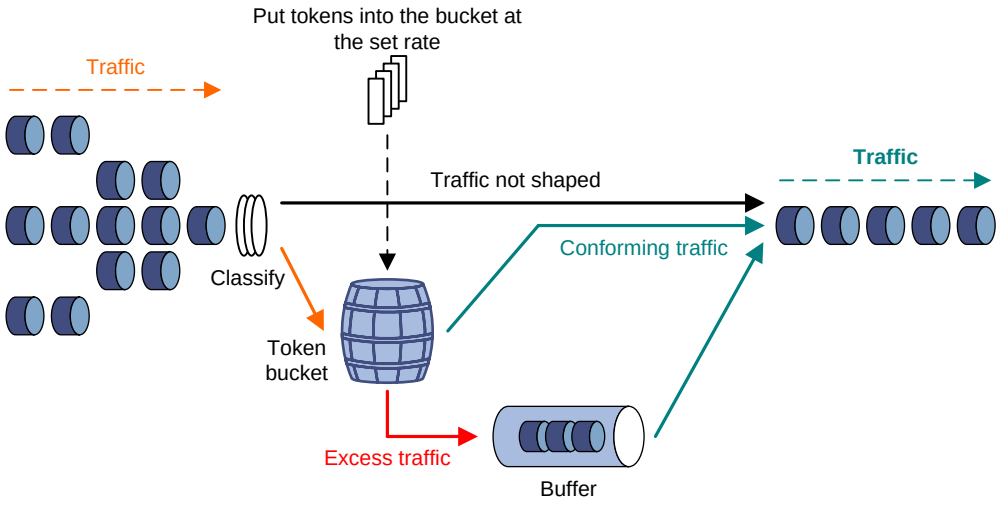
Traffic policing

A typical application of traffic policing is to supervise the specification of traffic entering a network and limit it within a reasonable range. Another application is to "discipline" the extra traffic to prevent aggressive use of network resources by an application. For example, you can limit bandwidth for HTTP packets to less than 50% of the total. If the traffic of a session exceeds the limit, traffic policing can drop the packets or reset the IP precedence of the packets. Figure 6 shows an example of policing outbound traffic on an interface.

Figure 6 Traffic policing

Traffic policing can classify the policed traffic and take predefined policing actions on each packet depending on the evaluation result:

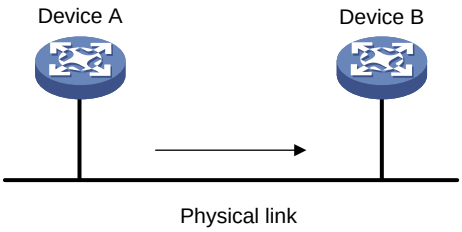
- Forwarding the packet.
- Dropping the packet.
- Forwarding the packet with its precedence re-marked.
- Delivering the packet to next-level traffic policing with its precedence re-marked.



GTS

GTS limits the traffic rate by buffering exceeding traffic. You can use GTS to adapt the traffic output rate on a device to the input traffic rate of its connected device to avoid packet loss.

The differences between traffic policing and GTS are as follows:

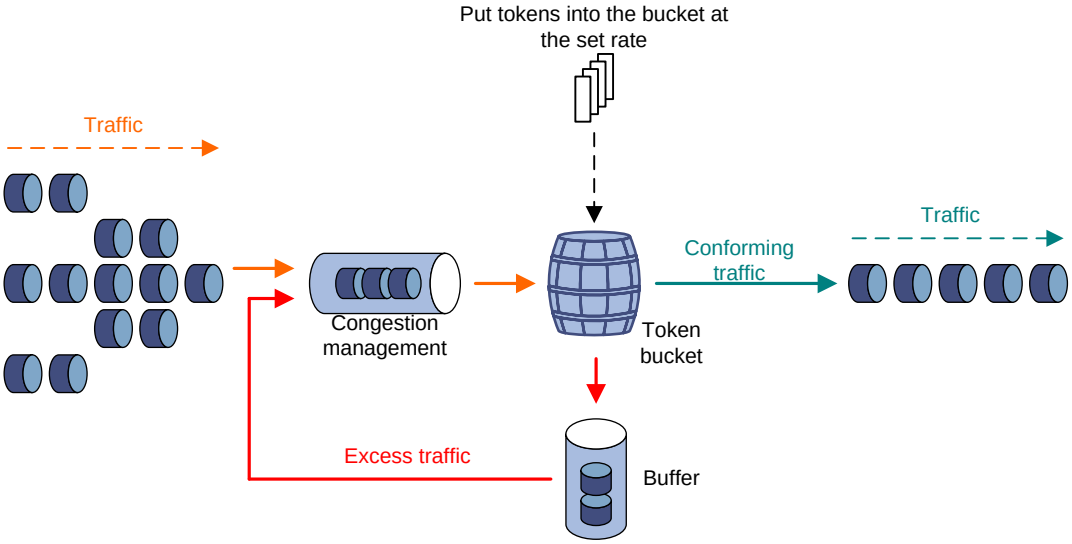


- Packets to be dropped with traffic policing are retained in a buffer or queue with GTS, as shown in Figure 7. When enough tokens are in the token bucket, the buffered packets are sent at an even rate.
- GTS can result in additional delay and traffic policing does not.

Figure 7 GTS

For example, in Figure 8, Device B performs traffic policing on packets from Device A and drops packets exceeding the limit. To avoid packet loss, you can perform GTS on the outgoing interface of Device A so that packets exceeding the limit are cached in Device A. Once resources are released, GTS takes out the cached packets and sends them out.

Figure 8 GTS application



Rate limit

The rate limit of an interface or PW specifies the maximum rate for forwarding packets (excluding critical packets).

Rate limit also uses token buckets for traffic control. When rate limit is configured on an interface, a token bucket handles all packets to be sent through the interface for rate limiting. If enough tokens are in the token bucket, packets can be forwarded. Otherwise, packets are put into QoS queues for congestion management. In this way, the traffic passing the interface is controlled.

Figure 9 Rate limit implementation

The token bucket mechanism limits traffic rate when accommodating bursts. It allows bursty traffic to be transmitted if enough tokens are available. If tokens are scarce, packets cannot be transmitted until efficient tokens are generated in the token bucket. It restricts the traffic rate to the rate for generating tokens.

Rate limit controls the total rate of all packets on an interface. It is easier to use than traffic policing in controlling the total traffic rate.

Restrictions and guidelines: Traffic policing, GTS, and rate limit configuration

The specified CIR does not take traffic transmitted in interframe gaps into account, and the actually allowed rate on an interface is greater than the specified CIR.

An interframe gap is a time interval for transmitting 12 bits between frames. This gap serves the following roles:

- Allows the device to differentiate one frame from another.
- Allows for time for the device to process the current frame and to prepare for receiving the next frame.

Configuring traffic policing

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

For more information about the **if-match** command, see *ACL and QoS Command Reference*.

c. Return to system view.

quit

3. Define a traffic behavior.

a. Create a traffic behavior and enter traffic behavior view.

traffic behavior *behavior-name*

b. Configure a traffic policing action.

car cir *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

car cir *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

By default, no traffic policing action is configured.

c. Return to system view.

quit

4. Define a QoS policy.

a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

Configuring traffic policing for a user profile

About this task

When a user profile is configured, you can perform traffic policing based on users. After a user passes authentication, the authentication server sends the name of the user profile associated with the user to the device. When any user of the user profile logs in, the authentication server automatically applies the CAR parameters configured for the user profile to the user. When the user logs off, the system automatically removes the CAR configuration without manual intervention.

Procedure

1. Enter system view.

system-view

2. Enter user profile view.

user-profile *profile-name*

3. Configure a CAR policy for the user profile.

qos car { **inbound** | **outbound** } **any cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]]

qos car { **inbound** | **outbound** } **any cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*]

By default, no CAR policy is configured for a user profile.

Enabling ACL whitelist-based traffic policing for a control plane

About this task

To protect the control plane against attacks, the device uses system-defined traffic rate limits to limit the protocol packets to the control plane. After you enable this feature, the device generates a dynamic whitelist based on configured BGP sessions. The whitelist contains ACL rules, and the device assigns a rate limit to the traffic that matches an ACL rule instead of using the default rate limit.

Hardware and feature compatibility

This feature is supported only in Release 1132 and later.

Procedure

1. Enter system view.

   system-view
2. Enter control plane view.

   control-plane slot *slot-number*
3. Enable ACL whitelist-based traffic policing for the control plane.

   qos car whitelist [**ipv6**] **enable**

   By default, ACL whitelist-based traffic policing for the control plane is disabled.

Configuring GTS

Restrictions and guidelines

A queue-based GTS action takes effect only on outgoing traffic in the specified queue.

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Interface Configuration Guide*).

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure GTS for a queue.

   qos gts queue *queue-id* **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

   undo qos gts queue *queue-id*

   By default, GTS is not configured on an interface queue.

Configuring the rate limit

Restrictions and guidelines

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*).

The actual outbound rate limit might be smaller than the configured outbound rate limit if a queue scheduling profile configured with the minimum guaranteed bandwidth is applied to the same interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure the rate limit for the interface.

   qos lr { **inbound** | **outbound** } **cir** *committed-information-rate* [**cbs** *committed-burst-size*]

   By default, no rate limit is configured on an interface.

Display and maintenance commands for traffic policing, GTS, and rate limit

Execute **display** commands in any view.

Task	Command
Display ACL rules in the ACL whitelist.	**display acl whitelist** [**ipv6**] **slot** *slot-number*
Display ACL whitelist-based control plane CAR configuration and statistics.	**display qos car control-plane whitelist** [**ipv6**] **slot** *slot-number*
Display GTS configuration and statistics for interfaces.	**display qos gts interface** [*interface-type interface-number*]
Display rate limit configuration and statistics.	**display qos lr interface** [*interface-type interface-number*]
Display QoS and ACL resource usage.	**display qos-acl resource** [**slot** *slot-number*]
Display traffic behavior configuration.	**display traffic behavior user-defined** [*behavior-name*]
Clear ACL whitelist-based control plane CAR statistics.	**reset qos car control-plane whitelist** [**ipv6**] **slot** *slot-number*

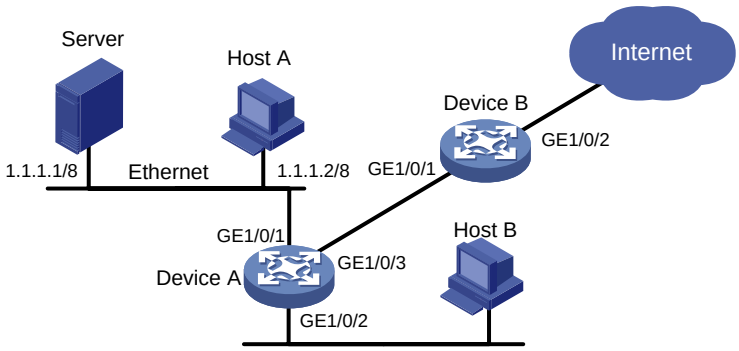
Traffic policing configuration examples

Example: Configuring traffic policing

Network requirements

As shown in Figure 10:

- The server, Host A, and Host B can access the Internet through Device A and Device B.
- The server, Host A, and GigabitEthernet 1/0/1 of Device A are in the same network segment.
- Host B and GigabitEthernet 1/0/2 of Device A are in the same network segment.



Perform traffic control for the packets that GigabitEthernet 1/0/1 of Device A receives from the server and Host A using the following guidelines:

- Limit the rate of packets from the server to 10240 kbps. When the traffic rate is below 10240 kbps, the traffic is forwarded. When the traffic rate exceeds 10240 kbps, the excess packets are marked with DSCP value 0 and then forwarded.
- Limit the rate of packets from Host A to 2560 kbps. When the traffic rate is below 2560 kbps, the traffic is forwarded. When the traffic rate exceeds 2560 kbps, the excess packets are dropped.

Perform traffic control on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 of Device B using the following guidelines:

- Limit the incoming traffic rate on GigabitEthernet 1/0/1 to 20480 kbps, and the excess packets are dropped.
- Limit the outgoing traffic rate on GigabitEthernet 1/0/2 to 10240 kbps, and the excess packets are dropped.

Figure 10 Network diagram

Configuration procedure

1. Configure Device A:

   # Configure ACL 2001 and ACL 2002 to permit the packets from the server and Host A, respectively.

   ```
   <DeviceA> system-view
   [DeviceA] acl basic 2001
   [DeviceA-acl-ipv4-basic-2001] rule permit source 1.1.1.1 0
   [DeviceA-acl-ipv4-basic-2001] quit
   [DeviceA] acl basic 2002
   [DeviceA-acl-ipv4-basic-2002] rule permit source 1.1.1.2 0
   [DeviceA-acl-ipv4-basic-2002] quit
   ```

   # Create a traffic class named **server**, and use ACL 2001 as the match criterion.

```
[DeviceA] traffic classifier server
[DeviceA-classifier-server] if-match acl 2001
[DeviceA-classifier-server] quit
```

Create a traffic class named **host**, and use ACL 2002 as the match criterion.

```
[DeviceA] traffic classifier host
[DeviceA-classifier-host] if-match acl 2002
[DeviceA-classifier-host] quit
```

Create a traffic behavior named **server**, and configure a traffic policing action (CIR 10240 kbps).

```
[DeviceA] traffic behavior server
[DeviceA-behavior-server] car cir 10240 red remark-dscp-pass 0
[DeviceA-behavior-server] quit
```

Create a traffic behavior named **host**, and configure a traffic policing action (CIR 2560 kbps).

```
[DeviceA] traffic behavior host
[DeviceA-behavior-host] car cir 2560
[DeviceA-behavior-host] quit
```

Create a QoS policy named **car**, and associate traffic classes **server** and **host** with traffic behaviors **server** and **host** in QoS policy **car**, respectively.

```
[DeviceA] qos policy car
[DeviceA-qospolicy-car] classifier server behavior server
[DeviceA-qospolicy-car] classifier host behavior host
[DeviceA-qospolicy-car] quit
```

Apply QoS policy **car** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy car inbound
```

2. Configure Device B:

Create ACL 3001, and configure a rule to match HTTP packets.

```
<DeviceB> system-view
[DeviceB] acl advanced 3001
[DeviceB-acl-adv-3001] rule permit tcp destination-port eq 80
[DeviceB-acl-adv-3001] quit
```

Create a traffic class named **http**, and use ACL 3001 as a match criterion.

```
[DeviceB] traffic classifier http
[DeviceB-classifier-http] if-match acl 3001
[DeviceB-classifier-http] quit
```

Create a traffic class named **class**, and configure the traffic class to match all packets.

```
[DeviceB] traffic classifier class
[DeviceB-classifier-class] if-match any
[DeviceB-classifier-class] quit
```

Create a traffic behavior named **car_inbound**, and configure a traffic policing action (CIR 20480 kbps).

```
[DeviceB] traffic behavior car_inbound
[DeviceB-behavior-car_inbound] car cir 20480
[DeviceB-behavior-car_inbound] quit
```

Create a traffic behavior named **car_outbound**, and configure a traffic policing action (CIR 10240 kbps).

```
[DeviceB] traffic behavior car_outbound
[DeviceB-behavior-car_outbound] car cir 10240
```

```
[DeviceB-behavior-car_outbound] quit
```

Create a QoS policy named **car_inbound**, and associate traffic class **class** with traffic behavior **car_inbound** in QoS policy **car_inbound**.

```
[DeviceB] qos policy car_inbound
[DeviceB-qospolicy-car_inbound] classifier class behavior car_inbound
[DeviceB-qospolicy-car_inbound] quit
```

Create a QoS policy named **car_outbound**, and associate traffic class **http** with traffic behavior **car_outbound** in QoS policy **car_outbound**.

```
[DeviceB] qos policy car_outbound
[DeviceB-qospolicy-car_outbound] classifier http behavior car_outbound
[DeviceB-qospolicy-car_outbound] quit
```

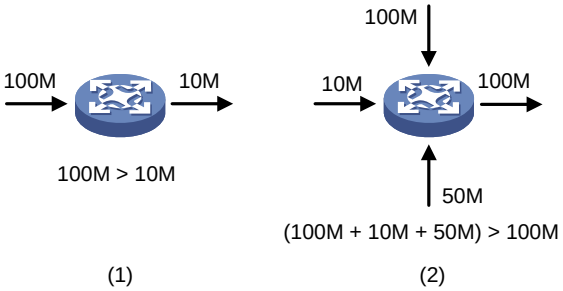
Apply QoS policy **car_inbound** to the inbound direction of GigabitEthernet 1/0/1.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] qos apply policy car_inbound inbound
```

Apply QoS policy **car_outbound** to the outbound direction of GigabitEthernet 1/0/2.

```
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] qos apply policy car_outbound outbound
```

Configuring congestion management



About congestion management

Cause, negative results, and countermeasure of congestion

Congestion occurs on a link or node when traffic size exceeds the processing capability of the link or node. It is typical of a statistical multiplexing network and can be caused by link failures, insufficient resources, and various other causes.

Figure 11 shows two typical congestion scenarios.

Figure 11 Traffic congestion scenarios

Congestion produces the following negative results:

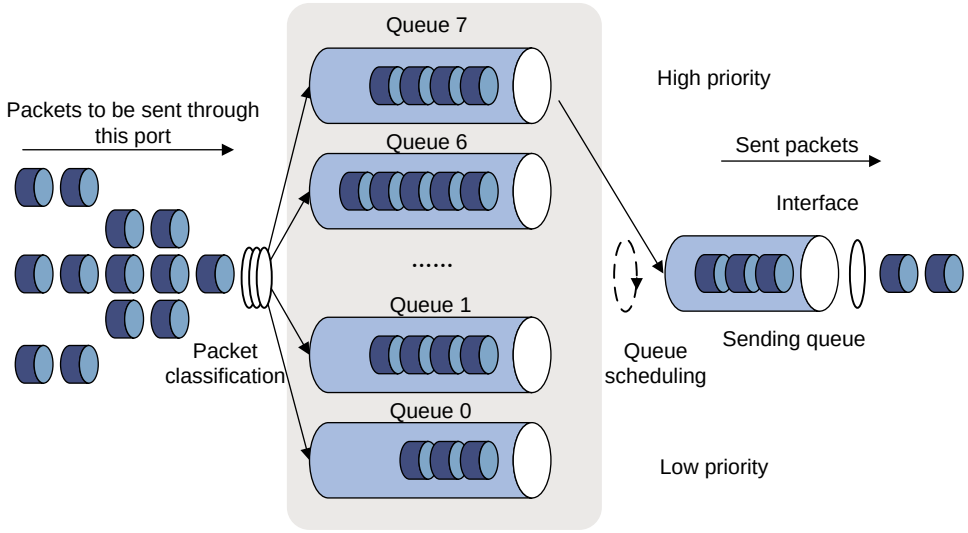
- Increased delay and jitter during packet transmission.
- Decreased network throughput and resource use efficiency.
- Network resource (memory, in particular) exhaustion and even system breakdown.

Congestion is unavoidable in switched networks and multiuser application environments. To improve the service performance of your network, take measures to manage and control it.

The key to congestion management is defining a resource dispatching policy to prioritize packets for forwarding when congestion occurs.

Congestion management methods

Congestion management uses queuing and scheduling algorithms to classify and sort traffic leaving a port.



The device supports the following queuing mechanisms:

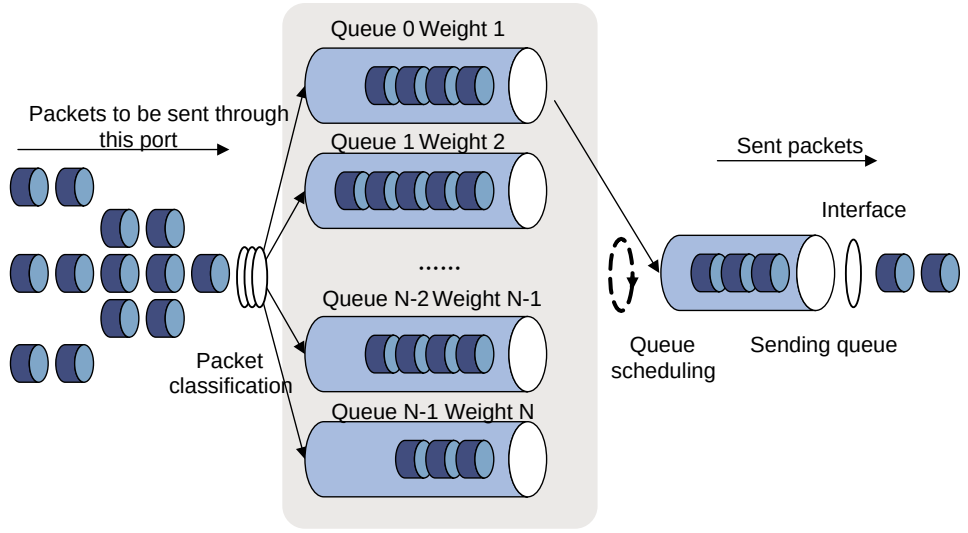
- SP.
- WRR.
- WFQ.

SP queuing

SP queuing is designed for mission-critical applications that require preferential service to reduce the response delay when congestion occurs.

Figure 12 SP queuing

In Figure 12, SP queuing classifies eight queues on a port into eight classes, numbered 7 to 0 in descending priority order.



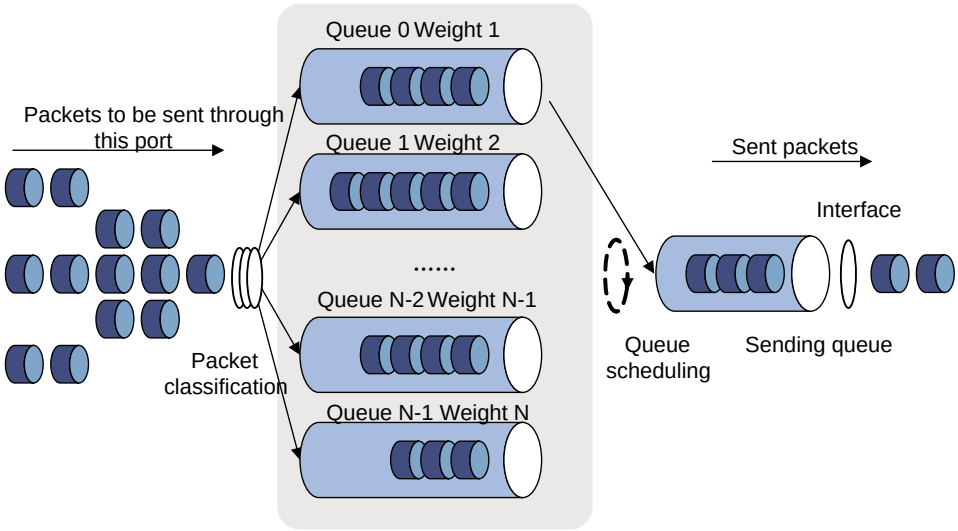
SP queuing schedules the eight queues in the descending order of priority. SP queuing sends packets in the queue with the highest priority first. When the queue with the highest priority is empty, it sends packets in the queue with the second highest priority, and so on. You can assign mission-critical packets to a high priority queue to make sure they are always served first. Common service packets can be assigned to low priority queues to be transmitted when high priority queues are empty.

The disadvantage of SP queuing is that packets in the lower priority queues cannot be transmitted if packets exist in the higher priority queues. In the worst case, lower priority traffic might never get serviced.

WRR queuing

WRR queuing schedules all the queues in turn to ensure that every queue is served for a certain time, as shown in Figure 13.

Figure 13 WRR queuing



Assume a port provides eight output queues. WRR assigns each queue a weight value (represented by w7, w6, w5, w4, w3, w2, w1, or w0). The weight value of a queue decides the proportion of resources assigned to the queue. On a 100 Mbps port, you can set the weight values to 50, 30, 10, 10, 50, 30, 10, and 10 for w7 through w0. In this way, the queue with the lowest priority can get a minimum of 5 Mbps of bandwidth. WRR solves the problem that SP queuing might fail to serve packets in low-priority queues for a long time.

Another advantage of WRR queuing is that when the queues are scheduled in turn, the service time for each queue is not fixed. If a queue is empty, the next queue will be scheduled immediately. This improves bandwidth resource use efficiency.

On an interface enabled with group-based WRR queuing, you can assign queues to the SP group. Queues in the SP group are scheduled with SP. The SP group has higher scheduling priority than the WRR groups.

WFQ queuing

Figure 14 WFQ queuing

WFQ is similar to WRR. WFQ queuing includes basic WFQ queuing and group-based WFQ queuing. Only WFQ group 1 is supported in the current software version.

On an interface with group-based WFQ queuing enabled, you can also assign queues to the SP group. The difference is that WFQ enables you to set guaranteed bandwidth that a WFQ queue can get during congestion.

SP+WFQ queuing schedules traffic in the following order:

1. Schedules the traffic conforming to the minimum guaranteed bandwidth of each queue in the WFQ group.
2. Schedules the queues in the SP group based on their priorities.
3. Schedules the traffic in each queue in the WFQ group according to the configured weights when all queues in the SP group are empty.

Congestion management tasks at a glance

To configure congestion management, perform the following tasks:

- Configuring queuing on an interface
  - Configuring SP queuing
  - Configuring WRR queuing

    - Configuring WFQ queuing
    - Configuring SP+WRR queuing
    - Configuring SP+WFQ queuing
- Configuring a queue scheduling profile

Configuring queuing on an interface

Restrictions and guidelines for queuing configuration

The term "interface" in this section refers to Layer 2 and Layer 3 Ethernet interfaces.

Configuring SP queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure SP queuing.
   qos sp
   By default, an interface uses WRR queuing.

Configuring WRR queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable WRR queuing.
   qos wrr { **byte-count** | **weight** }
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to a WRR group, and configure scheduling parameters for the queue.
   qos wrr *queue-id* **group 1** { **byte-count** | **weight** } *schedule-value*
   By default, all queues are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring WFQ queuing

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable WFQ queuing.
   qos wfq { **byte-count** | **weight** }
   By default, an interface uses packet-count WRR queuing.
4. Assign a queue to a WFQ group, and configure scheduling parameters for the queue.

qos wfq *queue-id* **group 1** { **byte-count** | **weight** } *schedule-value*

By default, all queues are in WFQ group 1 and have a weight of 1.

Configuring SP+WRR queuing

Restrictions and guidelines

To configure the scheduling weight, you must specify the same scheduling unit as specified when enabling WRR queuing.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable byte-count or packet-count WRR queuing.

   qos wrr { **byte-count** | **weight** }

   By default, an interface uses byte-count WRR queuing.

4. Assign a queue to the SP group.

   qos wrr *queue-id* **group sp**

   By default, all queues are in WRR group 1.

5. Assign a queue to a WRR group, and configure a scheduling weight for the queue.

   qos wrr *queue-id* **group 1** { **byte-count** | **weight** } *schedule-value*

   By default, all queues are in WRR group 1, and queues 0 through 7 have a weight of 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

Configuring SP+WFQ queuing

Restrictions and guidelines

To configure the scheduling weight, you must specify the same scheduling unit as specified when enabling WFQ queuing.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable byte-count or packet-count WFQ queuing.

   qos wfq [**byte-count** | **weight**]

   By default, an interface uses WRR queuing.

4. Assign a queue to the SP group.

   qos wfq *queue-id* **group sp**

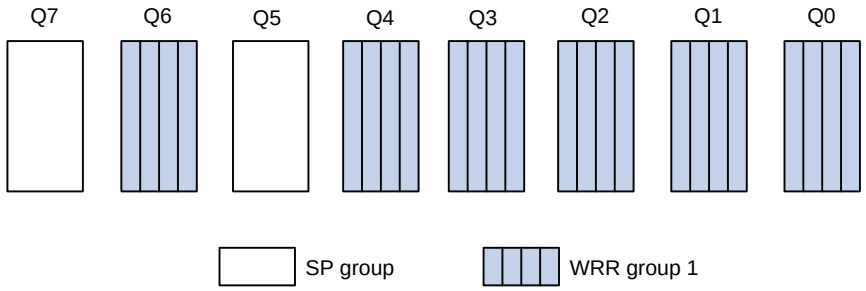
   By default, all queues are in WFQ group 1.

5. Assign a queue to a WFQ queue scheduling group, and configure a scheduling weight for the queue.

   qos wfq *queue-id* **group 1** { **byte-count** | **weight** } *schedule-value*

   By default, all queues are in WFQ group 1 and the weights of queues 0 through 7 are 1, 2, 3, 4, 5, 9, 13, and 15, respectively.

6. (Optional.) Set the minimum guaranteed bandwidth for a queue.
   qos bandwidth queue *queue-id* **min** *bandwidth-value*
   The default setting is 64 kbps.



Configuring a queue scheduling profile

About queue scheduling profiles

In a queue scheduling profile, you can configure scheduling parameters for each queue. By applying the queue scheduling profile to an interface or session group profile, you can implement congestion management on the interface or session group profile.

Queue scheduling profiles support three queue scheduling algorithms: SP, WRR, and WFQ. In a queue scheduling profile, you can configure SP + WRR or SP + WFQ. For information about each scheduling algorithm, see "About congestion management." When SP and WRR groups are configured in a queue scheduling profile, Figure 15 shows the scheduling order.

Figure 15 Queue scheduling profile configured with both SP and WRR

- Queue 7 has the highest priority in the SP group. Its packets are sent preferentially.
- Queue 5 has the second highest priority in the SP group. Packets in queue 5 are sent when queue 7 is empty.
- All queues in WRR group 1 are scheduled according to their weights. When queue 7 and queue 5 are empty, WRR group 1 is scheduled.

Restrictions and guidelines for queue scheduling profile configuration

When you configure a queue scheduling profile, follow these restrictions and guidelines:

- The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Layer 2—LAN Switching Configuration Guide*).
- The actual outbound rate limit might be smaller than the configured outbound rate limit if a queue scheduling profile configured with the minimum guaranteed bandwidth is applied to the same interface.
- Only one queue scheduling profile can be applied to an interface or session group profile.
- You can modify the scheduling parameters in a queue scheduling profile already applied to an interface, the switching fabric module, or a session group profile.

Configuring a queue scheduling profile

1. Enter system view.
   system-view
2. Create a queue scheduling profile and enter queue scheduling profile view.
   qos qmprofile *profile-name*
3. (Optional.) Configure queue scheduling parameters.
   - Configure a queue to use SP.
     queue *queue-id* **sp**
   - Configure a queue to use WRR.
     queue *queue-id* **wrr group** *group-id* { **weight** | **byte-count** } *schedule-value*
   - Configure a queue to use WFQ.
     queue *queue-id* **wfq** { **weight** | **byte-count** } *schedule-value*

   By default, all queues in a queue scheduling profile use SP queuing.
4. (Optional.) Set the minimum guaranteed bandwidth for a WFQ queue.
   bandwidth queue *queue-id* **min** *bandwidth-value*

   The default setting is 64 kbps.

Applying a queue scheduling profile

1. Enter system view.
   system-view
1. Execute the following commands in sequence to apply the queue scheduling profile to the outbound direction of an interface:
   interface *interface-type interface-number*

   qos apply qmprofile *profile-name*

   By default, no queue scheduling profile is applied to an interface.

Example: Configuring a queue scheduling profile

Network configuration

Configure a queue scheduling profile to meet the following requirements on GigabitEthernet 1/0/1:

- Queue 7 has the highest priority, and its packets are sent preferentially.
- Queue 0 through queue 6 are in the WRR group and are scheduled according to their packet-count weights, which are 2, 1, 2, 4, 6, 8, and 10, respectively. When queue 7 is empty, the WRR group is scheduled.

Procedure

Enter system view.

```
<Sysname> system-view
```

Create a queue scheduling profile named **qm1**.

```
[Sysname] qos qmprofile qm1
[Sysname-qmprofile-qm1]
```

Configure queue 7 to use SP queuing.

```
[Sysname-qmprofile-qm1] queue 7 sp
```

Assign queue 0 through queue 6 to WRR group 1, with their packet-count weights as 2, 1, 2, 4, 6, 8, and 10, respectively.

```
[Sysname-qmprofile-qm1] queue 0 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 1 wrr group 1 weight 1
[Sysname-qmprofile-qm1] queue 2 wrr group 1 weight 2
[Sysname-qmprofile-qm1] queue 3 wrr group 1 weight 4
[Sysname-qmprofile-qm1] queue 4 wrr group 1 weight 6
[Sysname-qmprofile-qm1] queue 5 wrr group 1 weight 8
[Sysname-qmprofile-qm1] queue 6 wrr group 1 weight 10
[Sysname-qmprofile-qm1] quit
```

Apply queue scheduling profile **qm1** to GigabitEthernet 1/0/1.

```
[Sysname] interface gigabitethernet 1/0/1
[Sysname-GigabitEthernet1/0/1] qos apply qmprofile qm1
```

After the configuration is completed, GigabitEthernet 1/0/1 performs queue scheduling as specified in queue scheduling profile **qm1**.

Display and maintenance commands for congestion management

Execute **display** commands in any view.

Task	Command
Display the configuration of queue scheduling profiles.	**display qos qmprofile configuration** [*profile-name*] [**slot** *slot-number*]
Display the queue scheduling profiles applied to interfaces.	**display qos qmprofile interface** [*interface-type interface-number*]
Display outbound queue-based traffic statistics for interfaces.	**display qos queue-statistics interface outbound**
Display SP queuing configuration.	**display qos queue sp interface** [*interface-type interface-number*]
Display WFQ queuing configuration.	**display qos queue wfq interface** [*interface-type interface-number*]
Display WRR queuing configuration.	**display qos queue wrr interface** [*interface-type interface-number*]

Configuring congestion avoidance

About congestion avoidance

Avoiding congestion before it occurs is a proactive approach to improving network performance. As a flow control mechanism, congestion avoidance:

- Actively monitors network resources (such as queues and memory buffers).
- Drops packets when congestion is expected to occur or deteriorate.

When dropping packets from a source end, congestion avoidance cooperates with the flow control mechanism at the source end to regulate the network traffic size. The combination of the local packet drop policy and the source-end flow control mechanism implements the following functions:

- Maximizes throughput and network use efficiency.
- Minimizes packet loss and delay.

Tail drop

Congestion management techniques drop all packets that are arriving at a full queue. This tail drop mechanism results in global TCP synchronization. If packets from multiple TCP connections are dropped, these TCP connections go into the state of congestion avoidance and slow start to reduce traffic. However, traffic peak occurs later. Consequently, the network traffic jitters all the time.

RED and WRED

You can use Random Early Detection (RED) or Weighted Random Early Detection (WRED) to avoid global TCP synchronization.

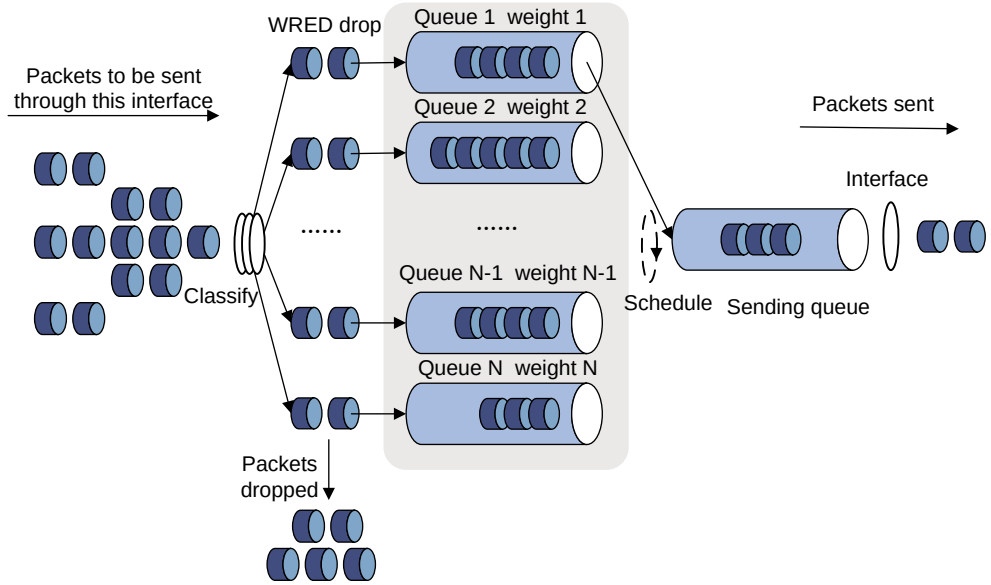
Both RED and WRED avoid global TCP synchronization by randomly dropping packets. When the sending rates of some TCP sessions slow down after their packets are dropped, other TCP sessions remain at high sending rates. Link bandwidth is efficiently used, because TCP sessions at high sending rates always exist.

The RED or WRED algorithm sets an upper threshold and lower threshold for each queue, and processes the packets in a queue as follows:

- When the queue size is shorter than the lower threshold, no packet is dropped.
- When the queue size reaches the upper threshold, all subsequent packets are dropped.
- When the queue size is between the lower threshold and the upper threshold, the received packets are dropped at random. The drop probability in a queue increases along with the queue size under the maximum drop probability.

If the current queue size is compared with the upper threshold and lower threshold to determine the drop policy, burst traffic is not fairly treated. To solve this problem, WRED compares the average queue size with the upper threshold and lower threshold to determine the drop probability.

The average queue size reflects the queue size change trend but is not sensitive to burst queue size changes, and burst traffic can be fairly treated.



When WFQ queuing is used, you can set the following parameters for packets with different precedence values to provide differentiated drop policies:

- Exponent for average queue size calculation.
- Upper threshold.
- Lower threshold.

- Drop probability.

Relationship between WRED and queuing mechanisms

Figure 16 Relationship between WRED and queuing mechanisms

Through combining WRED with WFQ, the flow-based WRED can be realized. Each flow has its own queue after classification.

- A flow with a smaller queue size has a lower packet drop probability.
- A flow with a larger queue size has a higher packet drop probability.

In this way, the benefits of the flow with a smaller queue size are protected.

WRED parameters

Determine the following parameters before configuring WRED:

- **Upper threshold and lower threshold**—When the average queue size is smaller than the lower threshold, packets are not dropped. When the average queue size is between the lower threshold and the upper threshold, the packets are dropped at random. The longer the queue, the higher the drop probability. When the average queue size exceeds the upper threshold, subsequent packets are dropped.
- **Drop precedence**—A parameter used for packet drop. The value 0 corresponds to green packets, the value 1 corresponds to yellow packets, and the value 2 corresponds to red packets. Red packets are dropped preferentially.
- **Exponent for average queue size calculation**—The greater the exponent, the less sensitive the average queue size is to real-time queue size changes. The formula for calculating the average queue size is:

  Average queue size = (previous average queue size x $(1 – 2^{-n})$) + (current queue size x 2^{-n}), where n is the exponent.
- **Drop probability**—Drop probability in percentage. The greater the value, the higher the drop probability. (Applicable when you configure a WRED table on an interface.)

Configuring and applying a queue-based WRED table

Restrictions and guidelines

By using a WRED table, WRED randomly drops packets during congestion based on the queues that hold packets.

One WRED table can be applied to multiple interfaces. You can modify the parameters of a WRED table applied to an interface, but you cannot delete the WRED table.

The term "interface" in this section collectively refers to Layer 2 and Layer 3 Ethernet interfaces. You can use the **port link-mode** command to configure an Ethernet port as a Layer 2 or Layer 3 interface (see *Interface Configuration Guide*).

Procedure

1. Enter system view.
   system-view
2. Create a WRED table and enter its view.
   qos wred queue table *table-name*
3. (Optional.) Set the WRED exponent for average queue size calculation.
   queue *queue-id* **weighting-constant** *exponent*
   The default setting is 9.
4. (Optional.) Configure the other WRED parameters.
   queue *queue-id* [**drop-level** *drop-level*] **low-limit** *low-limit* **high-limit** *high-limit* [**discard-probability** *discard-prob*]
   By default, the lower limit is 100, the higher limit is 1000, and the drop probability is 10%.
5. Return to system view.
   quit
6. Enter interface view.
   interface *interface-type interface-number*
7. Apply the WRED table to the interface.
   qos wred apply [*table-name*]
   By default, no WRED table is applied to an interface, and tail drop is used on an interface.

Example: Configuring and applying a queue-based WRED table

Network configuration

Apply a WRED table to GigabitEthernet 1/0/2, so that the packets are dropped as follows when congestion occurs:

- For the interface to preferentially forward higher-priority traffic, set a lower drop probability for a queue with a greater queue number. Set different drop parameters for queue 0, queue 3, and queue 7.
- Drop packets according to their colors.

- In queue 0, set the drop probability to 25%, 50%, and 75% for green, yellow, and red packets, respectively.
- In queue 3, set the drop probability to 5%, 10%, and 25% for green, yellow, and red packets, respectively.
- In queue 7, set the drop probability to 1%, 5%, and 10% for green, yellow, and red packets, respectively.

Procedure

Configure a queue-based WRED table, and set different drop parameters for packets with different drop levels in different queues.

```
<Sysname> system-view
[Sysname] qos wred queue table queue-table1
[Sysname-wred-table-queue-table1] queue 0 drop-level 0 low-limit 128 high-limit 512
discard-probability 25
[Sysname-wred-table-queue-table1] queue 0 drop-level 1 low-limit 128 high-limit 512
discard-probability 50
[Sysname-wred-table-queue-table1] queue 0 drop-level 2 low-limit 128 high-limit 512
discard-probability 75
[Sysname-wred-table-queue-table1] queue 3 drop-level 0 low-limit 256 high-limit 640
discard-probability 5
[Sysname-wred-table-queue-table1] queue 3 drop-level 1 low-limit 256 high-limit 640
discard-probability 10
[Sysname-wred-table-queue-table1] queue 3 drop-level 2 low-limit 256 high-limit 640
discard-probability 25
[Sysname-wred-table-queue-table1] queue 7 drop-level 0 low-limit 512 high-limit 1024
discard-probability 1
[Sysname-wred-table-queue-table1] queue 7 drop-level 1 low-limit 512 high-limit 1024
discard-probability 5
[Sysname-wred-table-queue-table1] queue 7 drop-level 2 low-limit 512 high-limit 1024
discard-probability 10
[Sysname-wred-table-queue-table1] quit
```

Apply the queue-based WRED table to GigabitEthernet 1/0/2.

```
[Sysname] interface gigabitethernet 1/0/2
[Sysname-GigabitEthernet1/0/2] qos wred apply queue-table1
[Sysname-GigabitEthernet1/0/2] quit
```

Display and maintenance commands for WRED

Execute **display** commands in any view.

Task	Command
Display WRED configuration and statistics for an interface.	**display qos wred interface** [*interface-type interface-number*]
Display the configuration of a WRED table or all WRED tables.	**display qos wred table** [**name** *table-name*] [**slot** *slot-number*]

Configuring traffic filtering

About traffic filtering

You can filter in or filter out traffic of a class by associating the class with a traffic filtering action. For example, you can filter packets sourced from an IP address according to network status.

Procedure

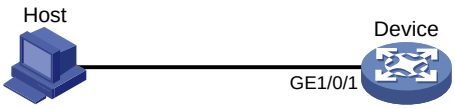
1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about configuring match criteria, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure the traffic filtering action.
      filter { **deny** | **permit** }
      By default, no traffic filtering action is configured.
      If a traffic behavior has the **filter deny** action, all other actions in the traffic behavior except class-based accounting do not take effect.
      If a traffic behavior has the **filter permit** action, matching packets will not dropped by a lower-priority configuration even if the action of the lower-priority configuration is drop.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.
      classifier *classifier-name* **behavior** *behavior-name*
      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.
      quit
5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display the traffic filtering configuration.

   display traffic behavior user-defined [*behavior-name*]

   This command is available in any view.



Traffic filtering configuration examples

Example: Configuring traffic filtering

Network configuration

As shown in Figure 17, configure traffic filtering on GigabitEthernet 1/0/1 to deny the incoming packets with destination port number 21.

Figure 17 Network diagram

Procedure

Create advanced ACL 3000, and configure a rule to match packets whose destination port number is 21.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule 0 permit tcp destination-port eq 21
[Device-acl-ipv4-adv-3000] quit
```

Create a traffic class named **classifier_1**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 3000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the traffic filtering action to drop packets.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] filter deny
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
```

Configuring priority marking

About priority marking

Priority marking sets the priority fields or flag bits of packets to modify the priority of packets. For example, you can use priority marking to set IP precedence or DSCP for a class of IP packets to control the forwarding of these packets.

To configure priority marking to set the priority fields or flag bits for a class of packets, perform the following tasks:

1. Configure a traffic behavior with a priority marking action.
2. Associate the traffic class with the traffic behavior.

Priority marking can be used together with priority mapping. For more information, see "Configuring priority mapping."

Configuring priority marking

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.

      traffic behavior *behavior-name*
   b. Configure a priority marking action.

      For configurable priority marking actions, see the **remark** commands in *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.

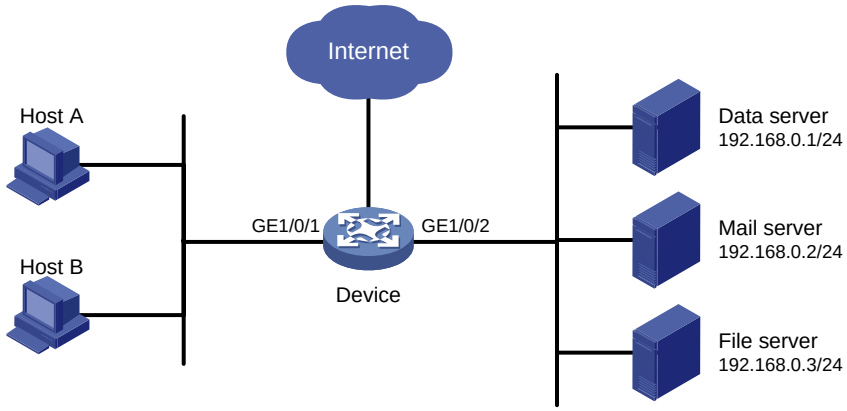
      classifier *classifier-name* **behavior** *behavior-name*

      By default, a traffic class is not associated with a traffic behavior.
   c. Return to system view.

quit

5. Apply the QoS policy.
   For more information, see "Applying the QoS policy."
   By default, no QoS policy is applied.
6. (Optional.) Display the priority marking configuration.
   display traffic behavior user-defined [*behavior-name*]
   This command is available in any view.

Priority marking configuration examples



Example: Configuring priority marking

Network configuration

As shown in Figure 18, configure priority marking on the device to meet the following requirements:

Traffic source	Destination	Processing priority
Host A, B	Data server	High
Host A, B	Mail server	Medium
Host A, B	File server	Low

Figure 18 Network diagram

Procedure

Create advanced ACL 3000, and configure a rule to match packets with destination IP address 192.168.0.1.

```
<Device> system-view
[Device] acl advanced 3000
[Device-acl-ipv4-adv-3000] rule permit ip destination 192.168.0.1 0
[Device-acl-ipv4-adv-3000] quit
```

Create advanced ACL 3001, and configure a rule to match packets with destination IP address 192.168.0.2.

```
[Device] acl advanced 3001
[Device-acl-ipv4-adv-3001] rule permit ip destination 192.168.0.2 0
[Device-acl-ipv4-adv-3001] quit
```

Create advanced ACL 3002, and configure a rule to match packets with destination IP address 192.168.0.3.

```
[Device] acl advanced 3002
[Device-acl-ipv4-adv-3002] rule permit ip destination 192.168.0.3 0
[Device-acl-ipv4-adv-3002] quit
```

Create a traffic class named **classifier_dbserver**, and use ACL 3000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_dbserver
[Device-classifier-classifier_dbserver] if-match acl 3000
[Device-classifier-classifier_dbserver] quit
```

Create a traffic class named **classifier_mserver**, and use ACL 3001 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_mserver
[Device-classifier-classifier_mserver] if-match acl 3001
[Device-classifier-classifier_mserver] quit
```

Create a traffic class named **classifier_fserver**, and use ACL 3002 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_fserver
[Device-classifier-classifier_fserver] if-match acl 3002
[Device-classifier-classifier_fserver] quit
```

Create a traffic behavior named **behavior_dbserver**, and configure the action of setting the local precedence value to 4.

```
[Device] traffic behavior behavior_dbserver
[Device-behavior-behavior_dbserver] remark local-precedence 4
[Device-behavior-behavior_dbserver] quit
```

Create a traffic behavior named **behavior_mserver**, and configure the action of setting the local precedence value to 3.

```
[Device] traffic behavior behavior_mserver
[Device-behavior-behavior_mserver] remark local-precedence 3
[Device-behavior-behavior_mserver] quit
```

Create a traffic behavior named **behavior_fserver**, and configure the action of setting the local precedence value to 2.

```
[Device] traffic behavior behavior_fserver
[Device-behavior-behavior_fserver] remark local-precedence 2
[Device-behavior-behavior_fserver] quit
```

Create a QoS policy named **policy_server**, and associate traffic classes with traffic behaviors in the QoS policy.

```
[Device] qos policy policy_server
[Device-qospolicy-policy_server] classifier classifier_dbserver behavior
behavior_dbserver
[Device-qospolicy-policy_server] classifier classifier_mserver behavior
behavior_mserver
[Device-qospolicy-policy_server] classifier classifier_fserver behavior
behavior_fserver
[Device-qospolicy-policy_server] quit
```

Apply QoS policy **policy_server** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy policy_server inbound
```

```
[Device-GigabitEthernet1/0/1] quit
```

Configuring traffic redirecting

About traffic redirecting

Traffic redirecting redirects packets matching the specified match criteria to a location for processing.

You can redirect packets to the following destinations:

- CPU.
- Interface.

Restrictions and guidelines: Traffic redirecting configuration

- A traffic redirecting action takes effect only when a QoS policy is applied to an interface, VLAN, or globally in the inbound direction.
- If you execute the **redirect** command multiple times, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured for a traffic class.
      For more information about the match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure a traffic redirecting action.
      redirect { **cpu** | **interface** *interface-type interface-number* }
      By default, no traffic redirecting action is configured for a traffic behavior.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.

qos policy *policy-name*

b. Associate the traffic class with the traffic behavior in the QoS policy.
classifier *classifier-name* **behavior** *behavior-name*
By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.
quit

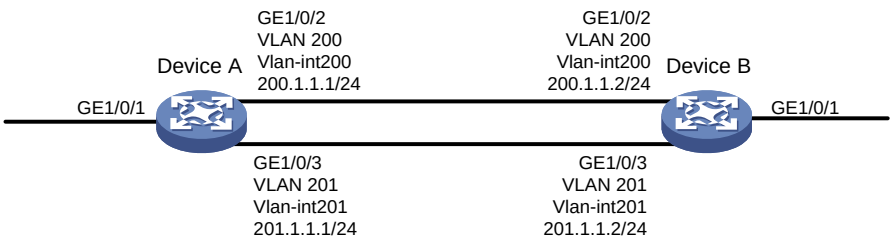
5. Apply the QoS policy.
For more information, see "Applying the QoS policy."
By default, no QoS policy is applied.

6. (Optional.) Display traffic redirecting configuration.
display traffic behavior user-defined [*behavior-name*]
This command is available in any view.

Traffic redirecting configuration examples

Example: Configuring traffic redirecting

Network configuration



As shown in Figure 19:

- Device A is connected to Device B through two links. Device A and Device B are each connected to other devices.
- GigabitEthernet 1/0/1 of Device A is a trunk port and belongs to VLAN 200 and VLAN 201.
- GigabitEthernet 1/0/2 of Device A and GigabitEthernet 1/0/2 of Device B belong to VLAN 200.
- GigabitEthernet 1/0/3 of Device A and GigabitEthernet 1/0/3 of Device B belong to VLAN 201.
- On Device A, the IP address of VLAN-interface 200 is 200.1.1.1/24, and that of VLAN-interface 201 is 201.1.1.1/24.
- On Device B, the IP address of VLAN-interface 200 is 200.1.1.2/24, and that of VLAN-interface 201 is 201.1.1.2/24.

Configure the actions of redirecting traffic to an interface to meet the following requirements:

- Packets with source IP address 2.1.1.1 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/2.
- Packets with source IP address 2.1.1.2 received on GigabitEthernet 1/0/1 of Device A are forwarded to GigabitEthernet 1/0/3.
- Other packets received on GigabitEthernet 1/0/1 of Device A are forwarded according to the routing table.

Figure 19 Network diagram

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 2.1.1.1.

```
<DeviceA> system-view
[DeviceA] acl basic 2000
[DeviceA-acl-ipv4-basic-2000] rule permit source 2.1.1.1 0
[DeviceA-acl-ipv4-basic-2000] quit
```

Create basic ACL 2001, and configure a rule to match packets with source IP address 2.1.1.2.

```
[DeviceA] acl basic 2001
[DeviceA-acl-ipv4-basic-2001] rule permit source 2.1.1.2 0
[DeviceA-acl-ipv4-basic-2001] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_1
[DeviceA-classifier-classifier_1] if-match acl 2000
[DeviceA-classifier-classifier_1] quit
```

Create a traffic class named **classifier_2**, and use ACL 2001 as the match criterion in the traffic class.

```
[DeviceA] traffic classifier classifier_2
[DeviceA-classifier-classifier_2] if-match acl 2001
[DeviceA-classifier-classifier_2] quit
```

Create a traffic behavior named **behavior_1**, and configure the action of redirecting traffic to GigabitEthernet 1/0/2.

```
[DeviceA] traffic behavior behavior_1
[DeviceA-behavior-behavior_1] redirect interface gigabitethernet 1/0/2
[DeviceA-behavior-behavior_1] quit
```

Create a traffic behavior named **behavior_2**, and configure the action of redirecting traffic to GigabitEthernet 1/0/3.

```
[DeviceA] traffic behavior behavior_2
[DeviceA-behavior-behavior_2] redirect interface gigabitethernet 1/0/3
[DeviceA-behavior-behavior_2] quit
```

Create a QoS policy named **policy**.

```
[DeviceA] qos policy policy
```

Associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_1 behavior behavior_1
```

Associate traffic class **classifier_2** with traffic behavior **behavior_2** in the QoS policy.

```
[DeviceA-qospolicy-policy] classifier classifier_2 behavior behavior_2
[DeviceA-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] qos apply policy policy inbound
```

Configuring global CAR

About global CAR

Global committed access rate (CAR) is an approach to policing traffic flows globally. It adds flexibility to common CAR where traffic policing is performed only on a per-traffic class or per-interface basis. In this approach, CAR actions are created in system view and each can be used to police multiple traffic flows as a whole.

Global CAR provides the following CAR actions: aggregate CAR and hierarchical CAR.

Aggregate CAR

An aggregate CAR action is created globally. It can be directly applied to interfaces or used in the traffic behaviors associated with different traffic classes to police multiple traffic flows as a whole. The total rate of the traffic flows must conform to the traffic policing specifications set in the aggregate CAR action.

Hierarchical CAR

A hierarchical CAR action is created globally. It must be used in conjunction with a common CAR or aggregate CAR action. With a hierarchical CAR action, you can limit the total traffic of multiple traffic classes.

A hierarchical CAR action can be used in the common or aggregate CAR action for a traffic class in either AND mode or OR mode.

- In AND mode, the rate of the traffic class is strictly limited under the common or aggregate CAR. This mode applies to flows that must be strictly rate limited.
- In OR mode, the traffic class can use idle bandwidth of other traffic classes associated with the hierarchical CAR. This mode applies to high priority, bursty traffic like video.

By using the two modes appropriately, you can improve bandwidth efficiency.

For example, suppose two flows exist: a low priority data flow and a high priority, bursty video flow. Their total traffic rate cannot exceed 4096 kbps and the video flow must be assured of at least 2048 kbps bandwidth. You can perform the following tasks:

- Configure common CAR actions to set the traffic rate to 2048 kbps for the two flows.
- Configure a hierarchical CAR action to limit their total traffic rate to 4096 kbps.
- Use the action in AND mode in the common CAR action for the data flow.
- Use the action in OR mode in the common CAR action for the video flow.

The video flow is assured of 2048 kbps bandwidth and can use idle bandwidth of the data flow.

In a bandwidth oversubscription scenario, the uplink port bandwidth is lower than the total downlink port traffic rate. You can use hierarchical CAR to meet the following requirements:

- Limit the total rate of downlink port traffic.
- Allow each downlink port to forward traffic at the maximum rate when the other ports are idle.

For example, you can perform the following tasks:

- Use common CAR actions to limit the rates of Internet access flow 1 and flow 2 to both 128 kbps.
- Use a hierarchical CAR action to limit their total traffic rate to 192 kbps.

- Use the hierarchical CAR action for both flow 1 and flow 2 in AND mode.

When flow 1 is not present, flow 2 is transmitted at the maximum rate, 128 kbps. When both flows are present, the total rate of the two flows cannot exceed 192 kbps. As a result, the traffic rate of flow 2 might drop below 128 kbps.

Restrictions and guidelines: Global CAR configuration

Only aggregate CAR is supported in the current software version.

You can apply a QoS policy that contains an aggregate CAR action to the inbound direction of interfaces.

When a QoS policy containing an aggregate CAR action is applied on an IRF fabric, the traffic matching the QoS policy might enter the IRF fabric through interfaces on different IRF member devices. In this case, the actual rate limit that takes effect is the sum of the CIR and PIR in the aggregate CAR action multiplied by the number of involved IRF member devices by default.

Configuring aggregate CAR

1. Enter system view.

   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.

      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.

      if-match *match-criteria*

      By default, no match criterion is configured.

      For configurable match criteria, see the **if-match** command in *ACL and QoS Command Reference*.
   c. Return to system view.

      quit
3. Configure an aggregate CAR action.

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size* [**ebs** *excess-burst-size*]] [**green** *action* | **red** *action* | **yellow** *action*] *

   qos car *car-name* **aggregative cir** *committed-information-rate* [**cbs** *committed-burst-size*] **pir** *peak-information-rate* [**ebs** *excess-burst-size*] [**green** *action* | **red** *action* | **yellow** *action*] *

   By default, no aggregate CAR action is configured.
4. Define a traffic behavior.
   a. Enter traffic behavior view.

      traffic behavior *behavior-name*
   b. Use the aggregate CAR in the traffic behavior.

      car name *car-name*

      By default, no aggregate CAR action is used in a traffic behavior.
5. Apply the QoS policy.

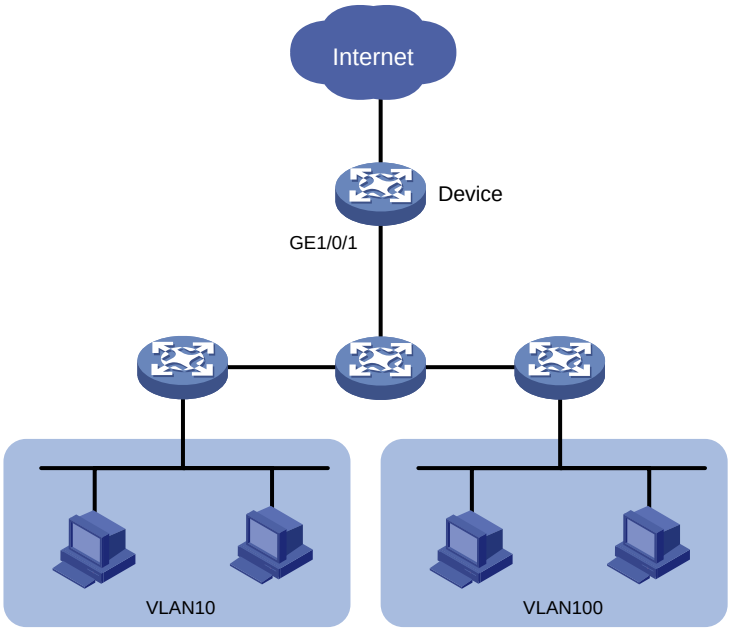
For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

Display and maintenance commands for global CAR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display statistics for global CAR actions.	**display qos car name** [*car-name*]
Clear statistics for global CAR actions.	**reset qos car name** [*car-name*]



Global CAR configuration examples

Example: Configuring MQC aggregate CAR

Network configuration

As shown in Figure 20, configure MQC aggregate CAR to limit the total rate of traffic in VLAN 10 and VLAN 100 to CIR 2560 kbps and CBS 20480 bytes and drop the exceeding packets.

Figure 20 Network diagram

Procedure

Configure an aggregate CAR action according to the rate limit requirements.

```
<Device> system-view
[Device] qos car aggcar-1 aggregative cir 2560 cbs 20480 red discard
```

Create traffic class 1, and use VLAN ID 10 as the match criterion in the traffic class.

```
[Device] traffic classifier 1
[Device-classifier-1] if-match service-vlan-id 10
[Device-classifier-1] quit
```

Create traffic behavior 1, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 1
[Device-behavior-1] car name aggcar-1
[Device-behavior-1] quit
```

Create traffic class 2, and use VLAN ID 100 as the match criterion in the traffic class.

```
[Device] traffic classifier 2
[Device-classifier-2] if-match service-vlan-id 100
[Device-classifier-2] quit
```

Create traffic behavior 2, and use the aggregate CAR action in the traffic behavior.

```
[Device] traffic behavior 2
[Device-behavior-2] car name aggcar-1
[Device-behavior-2] quit
```

Create a QoS policy named **car**, and associate traffic classes 1 and 2 with traffic behaviors 1 and 2 in the QoS policy, respectively.

```
[Device] qos policy car
[Device-qospolicy-car] classifier 1 behavior 1
[Device-qospolicy-car] classifier 2 behavior 2
[Device-qospolicy-car] quit
```

Apply QoS policy **car** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
[Device-GigabitEthernet1/0/1] qos apply policy car inbound
```

Configuring class-based accounting

About class-based accounting

Class-based accounting collects statistics on a per-traffic class basis. For example, you can define the action to collect statistics for traffic sourced from a certain IP address. By analyzing the statistics, you can determine whether anomalies have occurred and what action to take.

Restrictions and guidelines: Class-based accounting configuration

A class-based accounting action takes effect only when a QoS policy is applied to the following application destinations:

- Interface.
- VLANs.
- Globally.

Procedure

1. Enter system view.
   system-view
2. Define a traffic class.
   a. Create a traffic class and enter traffic class view.
      traffic classifier *classifier-name* [**operator** { **and** | **or** }]
   b. Configure a match criterion.
      if-match *match-criteria*
      By default, no match criterion is configured.
      For more information about the **if-match** command, see *ACL and QoS Command Reference*.
   c. Return to system view.
      quit
3. Define a traffic behavior.
   a. Create a traffic behavior and enter traffic behavior view.
      traffic behavior *behavior-name*
   b. Configure an accounting action.
      accounting { **byte** | **packet** }
      By default, no traffic accounting action is configured.
   c. Return to system view.
      quit
4. Define a QoS policy.
   a. Create a QoS policy and enter QoS policy view.
      qos policy *policy-name*
   b. Associate the traffic class with the traffic behavior in the QoS policy.

classifier *classifier-name* **behavior** *behavior-name*

By default, a traffic class is not associated with a traffic behavior.

c. Return to system view.

quit

5. Apply the QoS policy.

For more information, see "Applying the QoS policy."

By default, no QoS policy is applied.

6. (Optional.) Display the class-based accounting configuration.

display traffic behavior user-defined [*behavior-name*]

Class-based accounting configuration examples

Example: Configuring class-based accounting

Network configuration

As shown in Figure 21, configure class-based accounting on GigabitEthernet 1/0/1 to collect statistics for incoming traffic from 1.1.1.1/24.

Figure 21 Network diagram

Procedure

Create basic ACL 2000, and configure a rule to match packets with source IP address 1.1.1.1.

```
<Device> system-view
[Device] acl basic 2000
[Device-acl-ipv4-basic-2000] rule permit source 1.1.1.1 0
[Device-acl-ipv4-basic-2000] quit
```

Create a traffic class named **classifier_1**, and use ACL 2000 as the match criterion in the traffic class.

```
[Device] traffic classifier classifier_1
[Device-classifier-classifier_1] if-match acl 2000
[Device-classifier-classifier_1] quit
```

Create a traffic behavior named **behavior_1**, and configure the class-based accounting action.

```
[Device] traffic behavior behavior_1
[Device-behavior-behavior_1] accounting packet
[Device-behavior-behavior_1] quit
```

Create a QoS policy named **policy**, and associate traffic class **classifier_1** with traffic behavior **behavior_1** in the QoS policy.

```
[Device] qos policy policy
[Device-qospolicy-policy] classifier classifier_1 behavior behavior_1
[Device-qospolicy-policy] quit
```

Apply QoS policy **policy** to the incoming traffic of GigabitEthernet 1/0/1.

```
[Device] interface gigabitethernet 1/0/1
```

```
[Device-GigabitEthernet1/0/1] qos apply policy policy inbound
[Device-GigabitEthernet1/0/1] quit
```

Display traffic statistics to verify the configuration.

```
[Device] display qos policy interface gigabitethernet 1/0/1
Interface: GigabitEthernet1/0/1
  Direction: Inbound
  Policy: policy
   Classifier: classifier_1
     Operator: AND
     Rule(s) :
      If-match acl 2000
     Behavior: behavior_1
      Accounting enable:
        28529 (Packets)
```

Appendixes

Appendix A Acronyms

Table 2 Appendix A Acronyms

Acronym	Full spelling
AF	Assured Forwarding
BE	Best Effort
BQ	Bandwidth Queuing
CAR	Committed Access Rate
CBS	Committed Burst Size
CBQ	Class Based Queuing
CE	Congestion Experienced
CIR	Committed Information Rate
CQ	Custom Queuing
DCBX	Data Center Bridging Exchange Protocol
DiffServ	Differentiated Service
DSCP	Differentiated Services Code Point
EBS	Excess Burst Size
ECN	Explicit Congestion Notification
EF	Expedited Forwarding
FIFO	First in First out
FQ	Fair Queuing
GMB	Guaranteed Minimum Bandwidth
GTS	Generic Traffic Shaping
INT	Inband Network Telemetry
IntServ	Integrated Service
ISP	Internet Service Provider
LLQ	Low Latency Queuing
LSP	Label Switched Path
MPLS	Multiprotocol Label Switching
PE	Provider Edge
PIR	Peak Information Rate
PQ	Priority Queuing
PW	Pseudowire
QoS	Quality of Service
QPPB	QoS Policy Propagation Through the Border Gateway Protocol

Acronym	Full spelling
RED	Random Early Detection
RSVP	Resource Reservation Protocol
RTP	Real-Time Transport Protocol
SP	Strict Priority
ToS	Type of Service
VoIP	Voice over IP
VPN	Virtual Private Network
WFQ	Weighted Fair Queuing
WRED	Weighted Random Early Detection
WRR	Weighted Round Robin

Appendix B Default priority maps

For the default **dscp-dscp** priority map, an input value yields a target value equal to it.

Table 3 Default dot1p-lp and dot1p-dp maps

Input priority value	dot1p-lp map	dot1p-dp map
dot1p	**lp**	**dp**
0	2	0
1	0	0
2	1	0
3	3	0
4	4	0
5	5	0
6	6	0
7	7	0

Table 4 Default dscp-dp and dscp-dot1p priority maps

Input priority value	dscp-dp map	dscp-dot1p map
dscp	**dp**	**dot1p**
0 to 7	0	0
8 to 15	0	1
16 to 23	0	2
24 to 31	0	3
32 to 39	0	4
40 to 47	0	5
48 to 55	0	6

Input priority value	dscp-dp map	dscp-dot1p map
56 to 63	0	7

Port priority	Local precedence
0	0
1	1
2	2
3	3
4	4
5	5
6	6
7	7

Appendix C Introduction to packet precedence

IP precedence and DSCP values

Figure 22 ToS and DS fields

As shown in Figure 22, the ToS field in the IP header contains 8 bits. The first 3 bits (0 to 2) represent IP precedence from 0 to 7. According to RFC 2474, the ToS field is redefined as the differentiated services (DS) field. A DSCP value is represented by the first 6 bits (0 to 5) of the DS field and is in the range 0 to 63. The remaining 2 bits (6 and 7) are reserved.

Table 6 IP precedence

IP precedence (decimal)	IP precedence (binary)	Description
0	000	Routine
1	001	priority
2	010	immediate
3	011	flash
4	100	flash-override
5	101	critical

IP precedence (decimal)	IP precedence (binary)	Description
6	110	internet
7	111	network

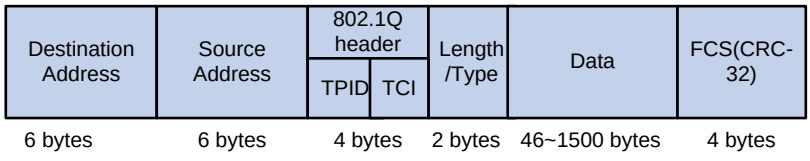

Table 7 DSCP values

DSCP value (decimal)	DSCP value (binary)	Description
46	101110	ef

24	011000	cs3
32	100000	cs4
40	101000	cs5
48	110000	cs6
56	111000	cs7
0	000000	be (default)

802.1p priority

802.1p priority lies in the Layer 2 header. It applies to occasions where Layer 3 header analysis is not needed and QoS must be assured at Layer 2.

Figure 23 An Ethernet frame with an 802.1Q tag header

As shown in Figure 23, the 4-byte 802.1Q tag header contains the 2-byte tag protocol identifier (TPID) and the 2-byte tag control information (TCI). The value of the TPID is 0x8100. Figure 24 shows the format of the 802.1Q tag header. The Priority field in the 802.1Q tag header is called 802.1p priority, because its use is defined in IEEE 802.1p. Table 8 shows the values for 802.1p priority.

Figure 24 802.1Q tag header

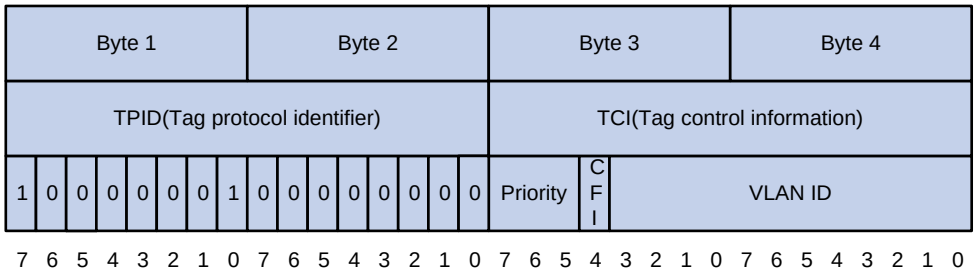

Table 8 Description on 802.1p priority

802.1p priority (decimal)	802.1p priority (binary)	Description
0	000	best-effort
1	001	background

Configuring data buffers 1

Enabling the Burst feature 1
Display and maintenance commands for data buffers 1

Configuring data buffers

Enabling the Burst feature

About this task

The Burst feature enables the device to automatically allocate cell and packet resources. It is well suited to the following scenarios:

- Broadcast or multicast traffic is intensive, resulting in bursts of traffic.
- Traffic comes in and goes out in one of the following ways:
  - Enters a device from a high-speed interface and goes out of a low-speed interface.
  - Enters from multiple same-rate interfaces at the same time and goes out of an interface with the same rate.

Procedure

1. Enter system view.
   `system-view`
2. Enable the Burst feature.
   `burst-mode enable`
   By default, the Burst feature is disabled.

Display and maintenance commands for data buffers

Execute **`display`** commands in any view.

Task	Command
Display data buffer usage.	**`display buffer usage`** [**`slot`** *`slot-number`*]

Configuring time ranges 1
About time ranges 1
Restrictions and guidelines: Time range configuration 1
Procedure 1
Display and maintenance commands for time ranges 1
Time range configuration examples 2
Example: Configuring a time range 2

Configuring time ranges

About time ranges

You can implement a service based on the time of the day by applying a time range to it. A time-based service takes effect only in time periods specified by the time range. For example, you can implement time-based ACL rules by applying a time range to them.

The following basic types of time ranges are available:

- **Periodic time range**—Recurs periodically on a day or days of the week.
- **Absolute time range**—Represents only a period of time and does not recur.

The active period of a time range is calculated as follows:

1. Combining all periodic statements.
2. Combining all absolute statements.
3. Taking the intersection of the two statement sets as the active period of the time range.

Restrictions and guidelines: Time range configuration

When you configure the ACL hardware mode, follow these restrictions and guidelines:

- If a time range does not exist, the service based on the time range does not take effect.
- You can create a maximum of 1024 time ranges, each with a maximum of 32 periodic statements and 12 absolute statements.

Procedure

1. Enter system view.

   system-view

2. Create or edit a time range.

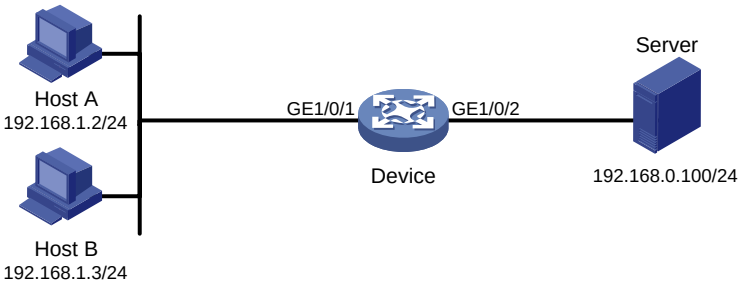
   time-range *time-range-name* { *start-time* **to** *end-time days* [**from** *time1 date1*] [**to** *time2 date2*] | **from** *time1 date1* [**to** *time2 date2*] | **to** *time2 date2* }

   If an existing time range name is provided, this command adds a statement to the time range.

Display and maintenance commands for time ranges

Execute the **display** command in any view.

Task	Command
Display time range configuration and status.	**display time-range** { *time-range-name* | **all** }



Time range configuration examples

Example: Configuring a time range

Network configuration

As shown in Figure 1, configure an ACL on the device to allow Host A to access the server only during 8:00 and 18:00 on working days from June 2015 to the end of the year.

Figure 1 Network diagram

Procedure

Create a periodic time range during 8:00 and 18:00 on working days from June 2015 to the end of the year.

```
<Device> system-view
[Device] time-range work 8:0 to 18:0 working-day from 0:0 6/1/2015 to 24:00 12/31/2015
```

Create an IPv4 basic ACL numbered 2001, and configure a rule in the ACL to permit packets only from 192.168.1.2/32 during the time range **work**.

```
[Device] acl basic 2001
[Device-acl-ipv4-basic-2001] rule permit source 192.168.1.2 0 time-range work
[Device-acl-ipv4-basic-2001] rule deny source any time-range work
[Device-acl-ipv4-basic-2001] quit
```

Apply IPv4 basic ACL 2001 to filter outgoing packets on GigabitEthernet 1/0/2.

```
[Device] interface gigabitethernet 1/0/2
[Device-GigabitEthernet1/0/2] packet-filter 2001 outbound
[Device-GigabitEthernet1/0/2] quit
```

Verifying the configuration

Verify that the time range **work** is active on the device.

```
[Device] display time-range all
Current time is 13:58:35 6/19/2015 Friday

Time-range : work (Active)
 08:00 to 18:00 working-day
 from 00:00 6/1/2015 to 00:00 1/1/2016
```

The information in this document is subject to change without notice. All contents in this document, including statements, information, and recommendations, are believed to be accurate, but they are presented without warranty of any kind, express or implied. H3C shall not be liable for technical or editorial errors or omissions contained herein.

Preface

This configuration guide describes the security fundamentals and configuration procedures, including:

- Identity authentication features (such as AAA and PKI).
- Data security features (such as public key management, IPsec, and SSH).
- Attack protection features (such as IP source guard and ARP attack protection).

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For

	example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

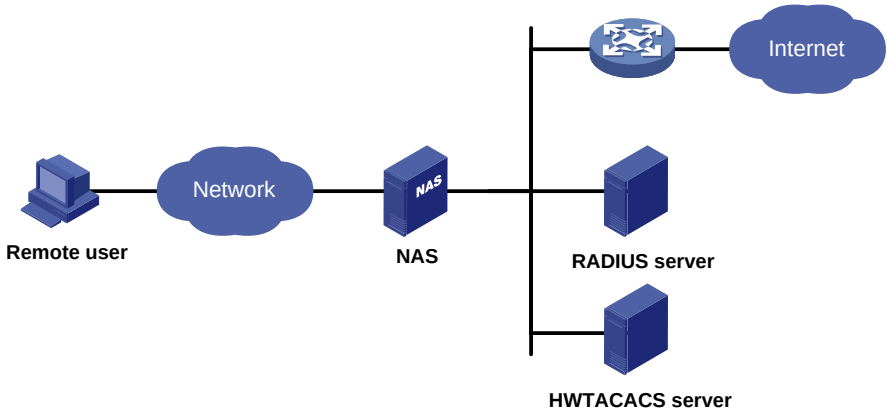
Configuring AAA

About AAA

AAA implementation



Authentication, Authorization, and Accounting (AAA) provides a uniform framework for implementing network access management. This feature specifies the following security functions:

- **Authentication**—Identifies users and verifies their validity.
- **Authorization**—Grants different users different rights, and controls the users' access to resources and services. For example, you can permit office users to read and print files and prevent guests from accessing files on the device.
- **Accounting**—Records network usage details of users, including the service type, start time, and traffic. This function enables time-based and traffic-based charging and user behavior auditing.

AAA network diagram

AAA uses a client/server model. The client runs on the access device, or the network access server (NAS), which authenticates user identities and controls user access. The server maintains user information centrally. See Figure 1.

Figure 1 AAA network diagram

To access networks or resources beyond the NAS, a user sends its identity information to the NAS. The NAS transparently passes the user information to AAA servers and waits for the authentication, authorization, and accounting result. Based on the result, the NAS determines whether to permit or deny the access request.

AAA has various implementations, including HWTACACS, LDAP, and RADIUS. RADIUS is most often used.

You can use different servers to implement different security functions. For example, you can use an HWTACACS server for authentication and authorization, and use a RADIUS server for accounting.

You can choose the security functions provided by AAA as needed. For example, if your company wants employees to be authenticated before they access specific resources, you would deploy an authentication server. If network usage information is needed, you would also configure an accounting server.

The device performs dynamic password authentication.

RADIUS

Remote Authentication Dial-In User Service (RADIUS) is a distributed information interaction protocol that uses a client/server model. The protocol can protect networks against unauthorized access and is often used in network environments that require both high security and remote user access.

The RADIUS authorization process is combined with the RADIUS authentication process, and user authorization information is piggybacked in authentication responses. RADIUS uses UDP port 1812 for authentication and UDP port 1813 for accounting.

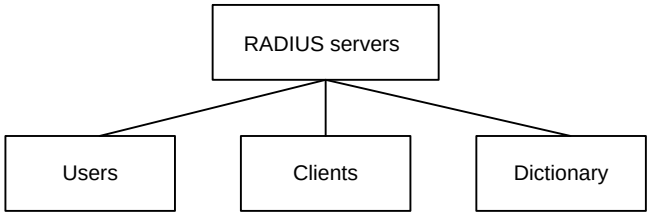
RADIUS was originally designed for dial-in user access, and has been extended to support additional access methods, such as Ethernet and ADSL.

Client/server model

The RADIUS client runs on the NASs located throughout the network. It passes user information to RADIUS servers and acts on the responses to, for example, reject or accept user access requests.

The RADIUS server runs on the computer or workstation at the network center and maintains information related to user authentication and network service access.

The RADIUS server operates using the following process:



1. Receives authentication, authorization, and accounting requests from RADIUS clients.
2. Performs user authentication, authorization, or accounting.
3. Returns user access control information (for example, rejecting or accepting the user access request) to the clients.

The RADIUS server can also act as the client of another RADIUS server to provide authentication proxy services.

The RADIUS server maintains the following databases:

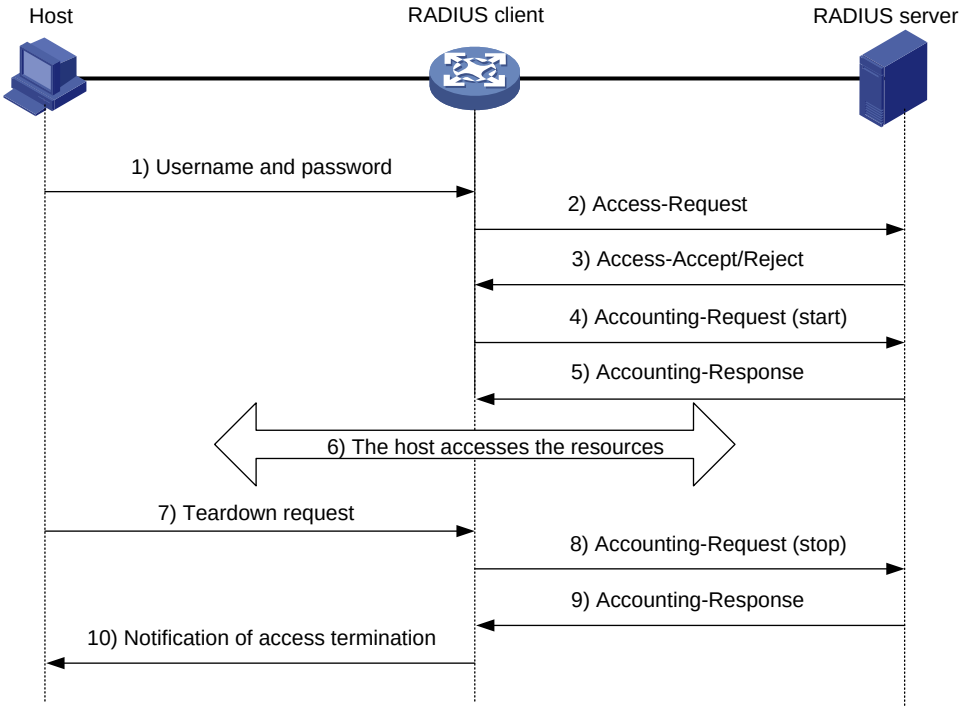
- **Users**—Stores user information, such as the usernames, passwords, applied protocols, and IP addresses.
- **Clients**—Stores information about RADIUS clients, such as shared keys and IP addresses.
- **Dictionary**—Stores RADIUS protocol attributes and their values.

Figure 2 RADIUS server databases

Information exchange security mechanism

The RADIUS client and server exchange information between them with the help of shared keys, which are preconfigured on the client and server. A RADIUS packet has a 16-byte field called Authenticator. This field includes a signature generated by using the MD5 algorithm, the shared key, and some other information. The receiver of the packet verifies the signature and accepts the packet only when the signature is correct. This mechanism ensures the security of information exchanged between the RADIUS client and server.

The shared keys are also used to encrypt user passwords that are included in RADIUS packets.



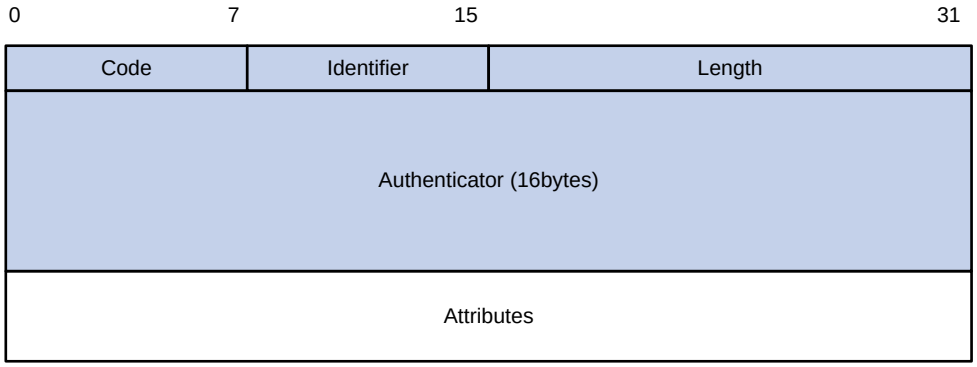
User authentication methods

The RADIUS server supports multiple user authentication methods, such as PAP, CHAP, and EAP.

Basic RADIUS packet exchange process

Figure 3 illustrates the interactions between a user host, the RADIUS client, and the RADIUS server.

Figure 3 Basic RADIUS packet exchange process



RADIUS uses in the following workflow:

1. The host sends a connection request that includes the user's username and password to the RADIUS client.
2. The RADIUS client sends an authentication request (Access-Request) to the RADIUS server. The request includes the user's password, which has been processed by the MD5 algorithm and shared key.
3. The RADIUS server authenticates the username and password. If the authentication succeeds, the server sends back an Access-Accept packet that contains the user's authorization information. If the authentication fails, the server returns an Access-Reject packet.
4. The RADIUS client permits or denies the user according to the authentication result. If the result permits the user, the RADIUS client sends a start-accounting request (Accounting-Request) packet to the RADIUS server.
5. The RADIUS server returns an acknowledgment (Accounting-Response) packet and starts accounting.
6. The user accesses the network resources.
7. The host requests the RADIUS client to tear down the connection.
8. The RADIUS client sends a stop-accounting request (Accounting-Request) packet to the RADIUS server.
9. The RADIUS server returns an acknowledgment (Accounting-Response) and stops accounting for the user.
10. The RADIUS client notifies the user of the termination.

RADIUS packet format

RADIUS uses UDP to transmit packets. The protocol also uses a series of mechanisms to ensure smooth packet exchange between the RADIUS server and the client. These mechanisms include the timer mechanism, the retransmission mechanism, and the backup server mechanism.

Figure 4 RADIUS packet format

Descriptions of the fields are as follows:

- The Code field (1 byte long) indicates the type of the RADIUS packet. Table 1 gives the main values and their meanings.

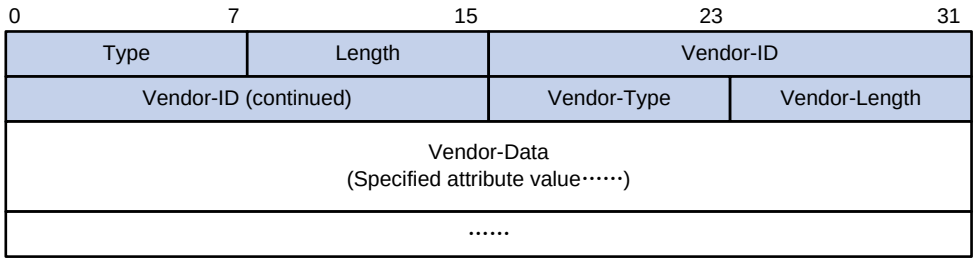
  Table 1 Main values of the Code field

Code	Packet type	Description
1	Access-Request	From the client to the server. A packet of this type includes user information for the server to authenticate the user. It must contain the User-Name attribute and can optionally contain the attributes of NAS-IP-Address, User-Password, and NAS-Port.
2	Access-Accept	From the server to the client. If all attribute values included in the Access-Request are acceptable, the authentication succeeds, and the server sends an Access-Accept response.
3	Access-Reject	From the server to the client. If any attribute value included in the Access-Request is unacceptable, the authentication fails, and the server sends an Access-Reject response.
4	Accounting-Request	From the client to the server. A packet of this type includes user information for the server to start or stop accounting for the user. The Acct-Status-Type attribute in the packet indicates whether to start or stop accounting.
5	Accounting-Response	From the server to the client. The server sends a packet of this type to notify the client that it has received the Accounting-Request and has successfully recorded the accounting information.

- The Identifier field (1 byte long) is used to match response packets with request packets and to detect duplicate request packets. The request and response packets of the same exchange process for the same purpose (such as authentication or accounting) have the same identifier.
- The Length field (2 bytes long) indicates the length of the entire packet (in bytes), including the Code, Identifier, Length, Authenticator, and Attributes fields. Bytes beyond this length are considered padding and are ignored by the receiver. If the length of a received packet is less than this length, the packet is dropped.
- The Authenticator field (16 bytes long) is used to authenticate responses from the RADIUS server and to encrypt user passwords. There are two types of authenticators: request authenticator and response authenticator.

- The Attributes field (variable in length) includes authentication, authorization, and accounting information. This field can contain multiple attributes, each with the following subfields:
  - **Type**—Type of the attribute.
  - **Length**—Length of the attribute in bytes, including the Type, Length, and Value subfields.
  - **Value**—Value of the attribute. Its format and content depend on the Type subfield.

Extended RADIUS attributes



The RADIUS protocol features excellent extensibility. The Vendor-Specific attribute (attribute 26) allows a vendor to define extended attributes. The extended attributes can implement functions that the standard RADIUS protocol does not provide.

A vendor can encapsulate multiple subattributes in the TLV format in attribute 26 to provide extended functions. As shown in Figure 5, a subattribute encapsulated in attribute 26 consists of the following parts:

- **Vendor-ID**—ID of the vendor. The most significant byte is 0. The other three bytes contains a code compliant to RFC 1700.
- **Vendor-Type**—Type of the subattribute.
- **Vendor-Length**—Length of the subattribute.
- **Vendor-Data**—Contents of the subattribute.

The device supports private RADIUS subattributes with a vendor ID of 25506. For more information, see "Appendix C RADIUS subattributes (vendor ID 25506)."

Figure 5 Format of attribute 26

HWTACACS

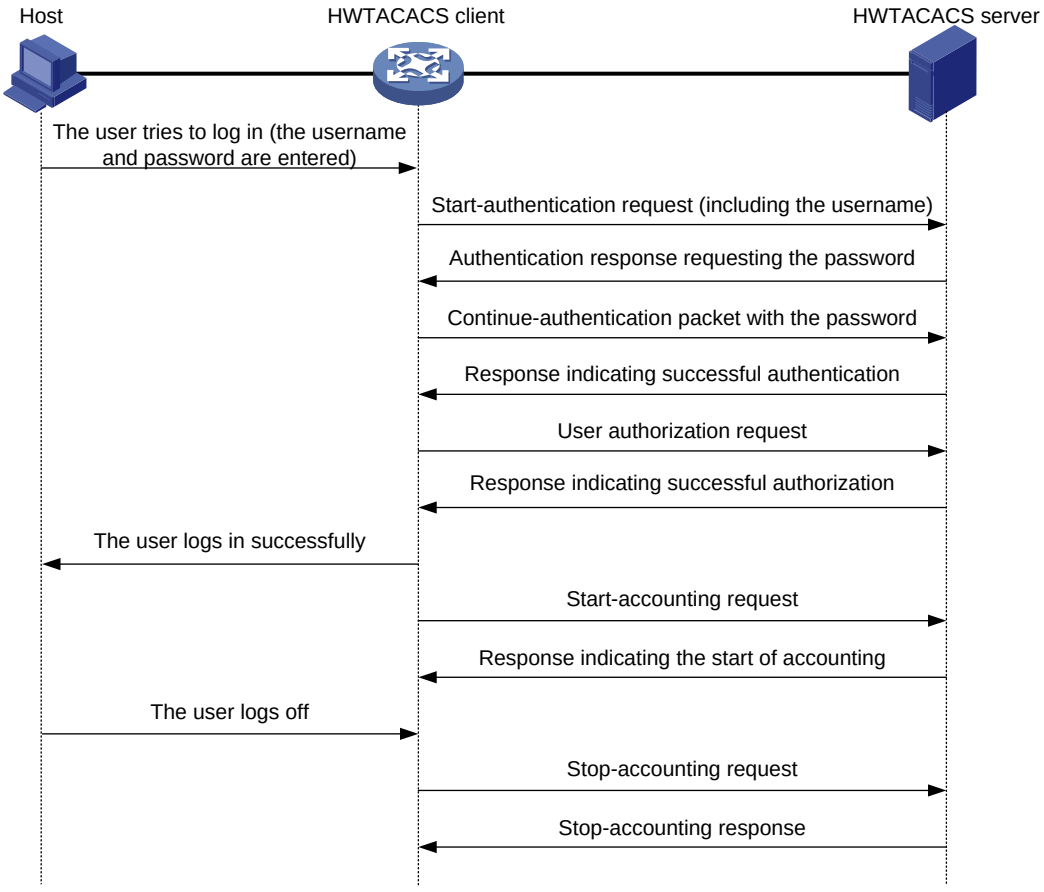
HW Terminal Access Controller Access Control System (HWTACACS) is an enhanced security protocol based on TACACS (RFC 1492). HWTACACS is similar to RADIUS, and uses a client/server model for information exchange between the NAS and the HWTACACS server.

HWTACACS typically provides AAA services for PPP, VPDN, and terminal users. In a typical HWTACACS scenario, terminal users need to log in to the NAS. Working as the HWTACACS client, the NAS sends users' usernames and passwords to the HWTACACS server for authentication. After passing authentication and obtaining authorized rights, a user logs in to the device and performs operations. The HWTACACS server records the operations that each user performs.

Differences between HWTACACS and RADIUS

HWTACACS and RADIUS have many features in common, such as using a client/server model, using shared keys for data encryption, and providing flexibility and scalability. Table 2 lists the primary differences between HWTACACS and RADIUS.

Table 2 Primary differences between HWTACACS and RADIUS



HWTACACS	RADIUS
Uses TCP, which provides reliable network	Uses UDP, which provides high transport efficiency.

HWTACACS	RADIUS
transmission.	
Encrypts the entire packet except for the HWTACACS header.	Encrypts only the user password field in an authentication packet.
Protocol packets are complicated and authorization is independent of authentication. Authentication and authorization can be deployed on different HWTACACS servers.	Protocol packets are simple and the authorization process is combined with the authentication process.
Supports authorization of configuration commands. Access to commands depends on both the user's roles and authorization. A user can use only commands that are permitted by the user roles and authorized by the HWTACACS server.	Does not support authorization of configuration commands. Access to commands solely depends on the user's roles. For more information about user roles, see *Fundamentals Configuration Guide*.

Basic HWTACACS packet exchange process

Figure 6 describes how HWTACACS performs user authentication, authorization, and accounting for a Telnet user.

Figure 6 Basic HWTACACS packet exchange process for a Telnet user

HWTACACS operates using in the following workflow:

1. A Telnet user requests to Telnet to the device (HWTACACS client) and provides the username and password as instructed by the system.
2. The HWTACACS client sends a start-authentication request that includes the username to the HWTACACS server when it receives the Telnet request.

3. The HWTACACS server sends back an authentication response to request the login password.
4. The HWTACACS client sends the HWTACACS server a continue-authentication packet that includes the login password.
5. If the authentication succeeds, the HWTACACS server sends back an authentication response to indicate that the user has passed authentication.
6. The HWTACACS client sends a user authorization request packet to the HWTACACS server.
7. If the authorization succeeds, the HWTACACS server sends back an authorization response, indicating that the user is now authorized.
8. Knowing that the user is now authorized, the HWTACACS client pushes its CLI to the user and permits the user to log in.
9. The HWTACACS client sends a start-accounting request to the HWTACACS server.
10. The HWTACACS server sends back an accounting response, indicating that it has received the start-accounting request.
11. The user logs off.
12. The HWTACACS client sends a stop-accounting request to the HWTACACS server.
13. The HWTACACS server sends back a stop-accounting response, indicating that the stop-accounting request has been received.

LDAP

The Lightweight Directory Access Protocol (LDAP) provides standard multiplatform directory service. LDAP was developed on the basis of the X.500 protocol. It improves the following functions of X.500:

- Read/write interactive access.
- Browse.
- Search.

LDAP is suitable for storing data that does not often change. The protocol is used to store user information. For example, LDAP server software Active Directory Server is used in Microsoft Windows operating systems. The software stores the user information and user group information for user login authentication and authorization.

LDAP directory service

LDAP uses directories to maintain the organization information, personnel information, and resource information. The directories are organized in a tree structure and include entries. An entry is a set of attributes with distinguished names (DNs). The attributes are used to store information such as usernames, passwords, emails, computer names, and phone numbers.

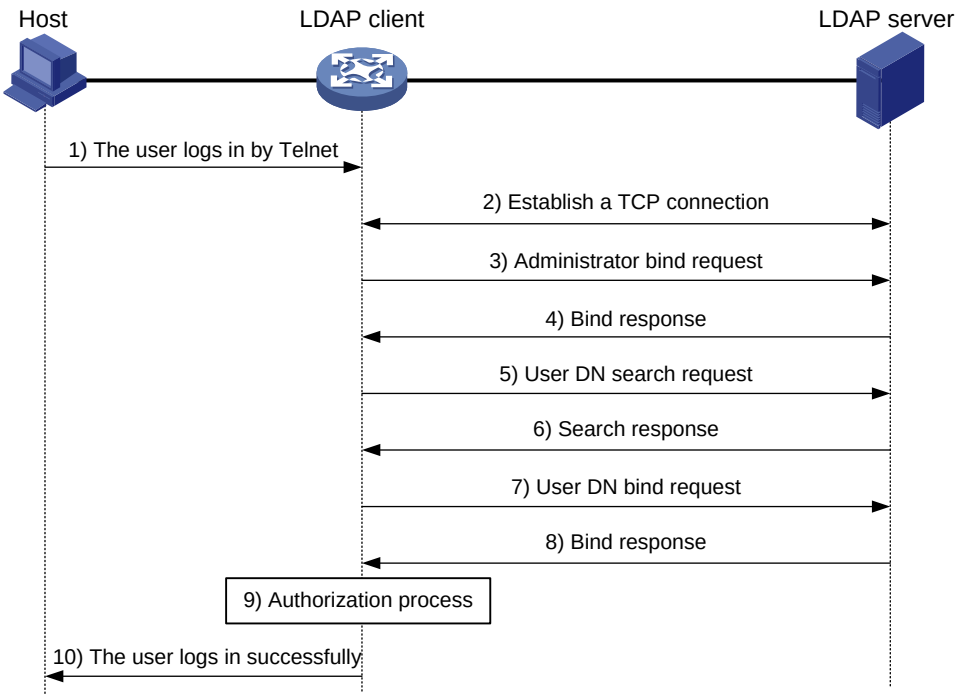
LDAP uses a client/server model, and all directory information is stored in the LDAP server. Commonly used LDAP server products include Microsoft Active Directory Server, IBM Tivoli Directory Server, and Sun ONE Directory Server.

LDAP authentication and authorization

AAA can use LDAP to provide authentication and authorization services for users. LDAP defines a set of operations to implement its functions. The main operations for authentication and authorization are the bind operation and search operation.

- The bind operation allows an LDAP client to perform the following operations:
  - Establish a connection with the LDAP server.
  - Obtain the access rights to the LDAP server.
  - Check the validity of user information.
- The search operation constructs search conditions and obtains the directory resource information of the LDAP server.

In LDAP authentication, the client completes the following tasks:



1. Uses the LDAP server administrator DN to bind with the LDAP server. After the binding is created, the client establishes a connection to the server and obtains the right to search.
2. Constructs search conditions by using the username in the authentication information of a user. The specified root directory of the server is searched and a user DN list is generated.
3. Binds with the LDAP server by using each user DN and password. If a binding is created, the user is considered legal.

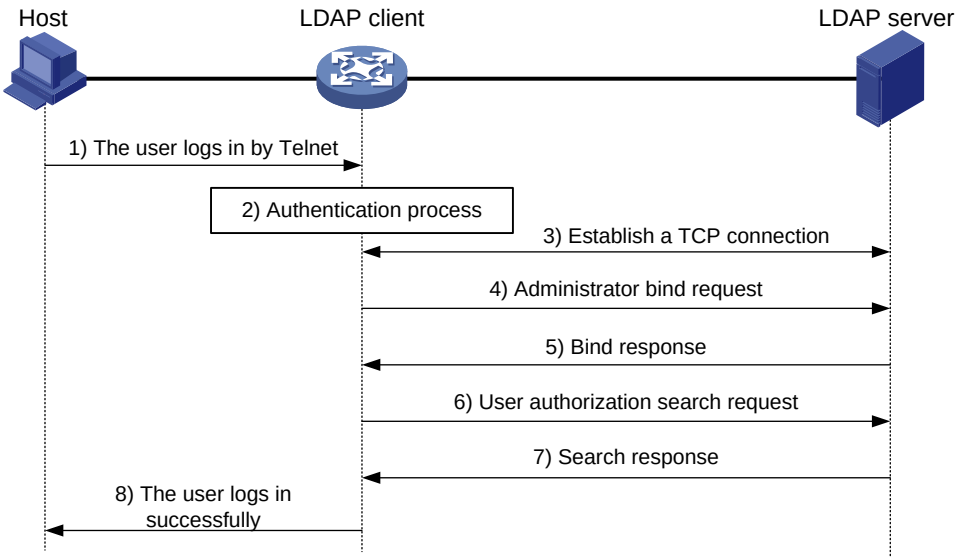
In LDAP authorization, the client performs the same tasks as in LDAP authentication. When the client constructs search conditions, it obtains both authorization information and the user DN list.

Basic LDAP authentication process

The following example illustrates the basic LDAP authentication process for a Telnet user.

Figure 7 Basic LDAP authentication process for a Telnet user

The following shows the basic LDAP authentication process:



1. A Telnet user initiates a connection request and sends the username and password to the LDAP client.
2. After receiving the request, the LDAP client establishes a TCP connection with the LDAP server.
3. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
4. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.
5. The LDAP client sends a user DN search request with the username of the Telnet user to the LDAP server.
6. After receiving the request, the LDAP server searches for the user DN by the base DN, search scope, and filtering conditions. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search. There might be one or more user DNs found.
7. The LDAP client uses the obtained user DN and the entered user password as parameters to send a user DN bind request to the LDAP server. The server will check whether the user password is correct.

8. The LDAP server processes the request, and sends a response to notify the LDAP client of the bind operation result. If the bind operation fails, the LDAP client uses another obtained user DN as the parameter to send a user DN bind request to the LDAP server. This process continues until a DN is bound successfully or all DNs fail to be bound. If all user DNs fail to be bound, the LDAP client notifies the user of the login failure and denies the user's access request.
9. The LDAP client saves the user DN that has been bound and exchanges authorization packets with the authorization server.
   - If LDAP authorization is used, see the authorization process shown in Figure 8.
   - If another method is expected for authorization, the authorization process of that method applies.
10. After successful authorization, the LDAP client notifies the user of the successful login.

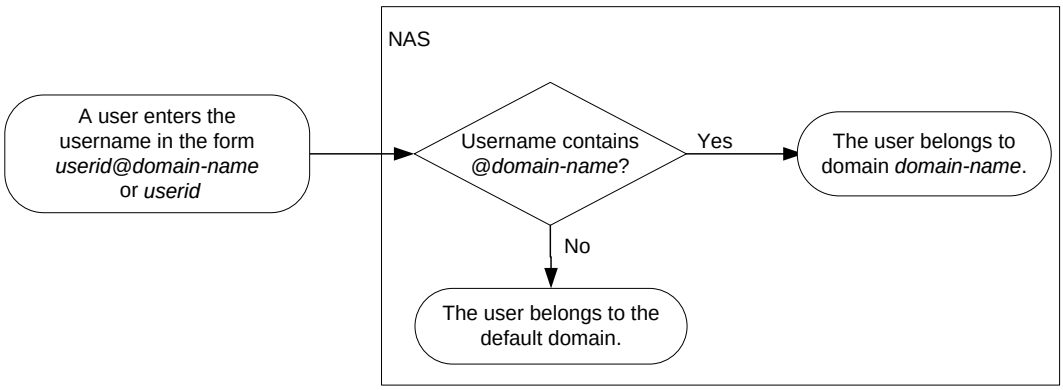
Basic LDAP authorization process

The following example illustrates the basic LDAP authorization process for a Telnet user.

Figure 8 Basic LDAP authorization process for a Telnet user

The following shows the basic LDAP authorization process:

1. A Telnet user initiates a connection request and sends the username and password to the device. The device will act as the LDAP client during authorization.
2. After receiving the request, the device exchanges authentication packets with the authentication server for the user:
   - If LDAP authentication is used, see the authentication process shown in Figure 7.
     - If the device (the LDAP client) uses the same LDAP server for authentication and authorization, skip to step 6.
     - If the device (the LDAP client) uses different LDAP servers for authentication and authorization, skip to step 4.
   - If another authentication method is used, the authentication process of that method applies. The device acts as the LDAP client. Skip to step 3.
3. The LDAP client establishes a TCP connection with the LDAP authorization server.
4. To obtain the right to search, the LDAP client uses the administrator DN and password to send an administrator bind request to the LDAP server.
5. The LDAP server processes the request. If the bind operation is successful, the LDAP server sends an acknowledgment to the LDAP client.



6. The LDAP client sends an authorization search request with the username of the Telnet user to the LDAP server. If the user uses the same LDAP server for authentication and authorization, the client sends the request with the saved user DN of the Telnet user to the LDAP server.
7. After receiving the request, the LDAP server searches for the user information by the base DN, search scope, filtering conditions, and LDAP attributes. If a match is found, the LDAP server sends a response to notify the LDAP client of the successful search.
8. After successful authorization, the LDAP client notifies the user of the successful login.

User management based on ISP domains and user access types

AAA manages users based on the users' ISP domains and access types.

On a NAS, each user belongs to one ISP domain. The NAS determines the ISP domain to which a user belongs based on the username entered by the user at login.

Figure 9 Determining the ISP domain for a user by username

AAA manages users in the same ISP domain based on the users' access types. The device supports the following user access types:

- **LAN**—LAN users must pass 802.1X or MAC authentication to come online.
- **Login**—Login users include SSH, Telnet, FTP, and terminal users that log in to the device. Terminal users can access through a console port.
- **Portal**—Portal users must pass portal authentication to access the network.
- **HTTP/HTTPS**—Users log in to the device through HTTP or HTTPS.

The device also provides authentication modules (such as 802.1X) for implementation of user authentication management policies. If you configure these authentication modules, the ISP domains for users of the access types depend on the configuration of the authentication modules.

Authentication, authorization, and accounting methods

AAA supports configuring different authentication, authorization, and accounting methods for different types of users in an ISP domain. The NAS determines the ISP domain and access type of a user. The NAS also uses the methods configured for the access type in the domain to control the user's access.

AAA also supports configuring a set of default methods for an ISP domain. These default methods are applied to users for whom no AAA methods are configured.

Authentication methods

The device supports the following authentication methods:

- **No authentication**—This method trusts all users and does not perform authentication. For security purposes, do not use this method.
- **Local authentication**—The NAS authenticates users by itself, based on the locally configured user information including the usernames, passwords, and attributes. Local authentication allows high speed and low cost, but the amount of information that can be stored is limited by the size of the storage space.
- **Remote authentication**—The NAS works with a remote server to authenticate users. The NAS communicates with the remote server through the RADIUS, LDAP, or HWTACACS protocol. The server manages user information in a centralized manner. Remote authentication provides high capacity, reliable, and centralized authentication services for multiple NASs. You can configure backup methods to be used when the remote server is not available.

Authorization methods

The device supports the following authorization methods:

- **No authorization**—The NAS performs no authorization exchange. The following default authorization information applies after users pass authentication:
  - Login users obtain the level-0 user role. For more information about the level-0 user role, see RBAC configuration in *Fundamentals Configuration Guide*.
  - The working directory for FTP, SFTP, and SCP login users is the root directory of the NAS. However, the users do not have permission to access the root directory.
  - Non-login users can access the network.
- **Local authorization**—The NAS performs authorization according to the user attributes locally configured for users.
- **Remote authorization**—The NAS works with a remote server to authorize users. RADIUS authorization is bound with RADIUS authentication. RADIUS authorization can work only after RADIUS authentication is successful, and the authorization information is included in the Access-Accept packet. HWTACACS or LDAP authorization is separate from authentication, and the authorization information is included in the authorization response after successful authentication. You can configure backup methods to be used when the remote server is not available.

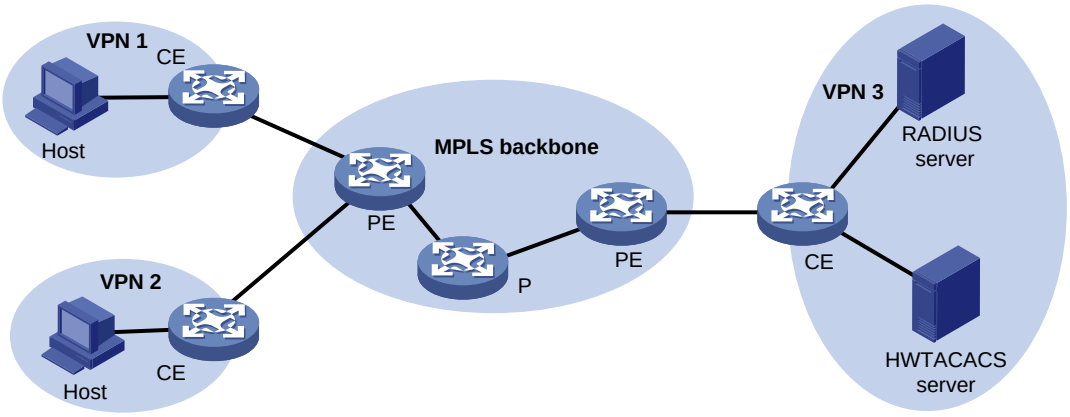
Accounting methods

The device supports the following accounting methods:

- **No accounting**—The NAS does not perform accounting for the users.
- **Local accounting**—Local accounting is implemented on the NAS. It counts and controls the number of concurrent users that use the same local user account, but does not provide statistics for charging.
- **Remote accounting**—The NAS works with a RADIUS server or HWTACACS server for accounting. You can configure backup methods to be used when the remote server is not available.

AAA extended functions

The device provides the following login services to enhance device security:



- **Command authorization**—Enables the NAS to let the authorization server determine whether a command entered by a login user is permitted. Login users can execute only commands permitted by the authorization server. For more information about command authorization, see *Fundamentals Configuration Guide*.
- **Command accounting**—When command authorization is disabled, command accounting enables the accounting server to record all valid commands executed on the device. When command authorization is enabled, command accounting enables the accounting server to record all authorized commands. For more information about command accounting, see *Fundamentals Configuration Guide*.

- **User role authentication**—Authenticates each user that wants to obtain another user role without logging out or getting disconnected. For more information about user role authentication, see *Fundamentals Configuration Guide*.

AAA for VPNs

You can deploy AAA across VPNs to enable forwarding of authentication, authorization, and accounting packets across VPNs. For example, as shown in Figure 10, the PE at the left side of the MPLS backbone acts as a NAS. The NAS transparently delivers the AAA packets of private users in VPN 1 and VPN 2 to the AAA servers in VPN 3 for centralized authentication. Authentication packets of private users in different VPNs do not affect each other.

Figure 10 Network diagram

This feature can also help an MCE to implement portal authentication for VPNs. For more information about MCE, see *MCE Configuration Guide*. For more information about portal authentication, see "Configuring portal authentication."

Protocols and standards

- RFC 2865, *Remote Authentication Dial In User Service (RADIUS)*
- RFC 2866, *RADIUS Accounting*

- RFC 2868, *RADIUS Attributes for Tunnel Protocol Support*
- RFC 2869, *RADIUS Extensions*
- RFC 3576, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 4818, *RADIUS Delegated-IPv6-Prefix Attribute*
- RFC 5176, *Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)*
- RFC 1492, *An Access Control Protocol, Sometimes Called TACACS*
- RFC 1777, *Lightweight Directory Access Protocol*
- RFC 2251, *Lightweight Directory Access Protocol (v3)*

FIPS compliance

The device supports the FIPS mode that complies with NIST FIPS 140-2 requirements. Support for features, commands, and parameters might differ in FIPS mode (see "Configuring FIPS") and non-FIPS mode.

AAA tasks at a glance

To configure AAA, perform the following tasks:

1. Configuring AAA schemes

   If local authentication is used, configure local users and the related attributes. If remote authentication is used, configure the required RADIUS, LDAP, or HWTACACS schemes.

   - Configuring local users
   - Configuring RADIUS
   - Configuring HWTACACS
   - Configuring LDAP
2. Configuring an ISP domain
   a. Creating an ISP domain
   b. Configuring ISP domain attributes
3. Configuring AAA methods for an ISP domain

   Configure authentication, authorization, and accounting methods for an ISP domain as needed. These methods use existing AAA schemes.

   - Configuring authentication methods for an ISP domain
   - Configuring authorization methods for an ISP domain
   - Configuring accounting methods for an ISP domain
4. (Optional.) Configuring advanced AAA features
   - Configuring AAA fail-permit and recovery
   - Setting the maximum number of concurrent login users
   - Configuring local BYOD authorization
   - Configuring a NAS-ID
   - Configuring the device ID
   - Enabling password change prompt logging
   - Configuring the connection recording policy
   - Configuring the AAA test feature

Configuring local users

About local users

To implement local authentication, authorization, and accounting, create local users and configure user attributes on the device. The local users and attributes are stored in the local user database on the device. A local user is uniquely identified by the combination of a username and a user type.

Local users are classified into the following types:

- **Device management user**—User that logs in to the device for device management.
- **Network access user**—User that accesses network resources through the device.

The following shows the configurable local user attributes:

- **Description**—Descriptive information of the user.
- **Service type**—Services that the user can use. Local authentication checks the service types of a local user. If none of the service types is available, the user cannot pass authentication.
- **User state**—Whether or not a local user can request network services. There are two user states: active and blocked. A user in active state can request network services, but a user in blocked state cannot.
- **Upper limit of concurrent logins using the same user name**—Maximum number of users that can concurrently access the device by using the same user name. When the number reaches the upper limit, no more local users can access the device by using the user name.
- **User group**—Each local user belongs to a local user group and has all attributes of the group. The attributes include the password control attributes and authorization attributes. For more information about local user group, see "Configuring user group attributes."
- **Binding attributes**—Binding attributes control the scope of users, and are checked during local authentication of a user. If the attributes of a user do not match the binding attributes configured for the local user account, the user cannot pass authentication.
- **Authorization attributes**—Authorization attributes indicate the user's rights after it passes local authentication.

  Configure the authorization attributes based on the service type of local users.

  You can configure an authorization attribute in user group view or local user view. The setting of an authorization attribute in local user view takes precedence over the attribute setting in user group view.

  The attribute configured in user group view takes effect on all local users in the user group.

  The attribute configured in local user view takes effect only on the local user.
- **Password control attributes**—Password control attributes help control password security for local users. Password control attributes include password aging time, minimum password length, password composition checking, password complexity checking, and login attempt limit.

  You can configure a password control attribute in system view, user group view, or local user view. A password control attribute with a smaller effective range has a higher priority. For more information about password management and global password configuration, see "Configuring password control."
- **Validity period**—Time period in which a network access user is considered valid for authentication.

Local user configuration tasks at a glance

To configure local users, perform the following tasks:

1. Configuring local user attributes
   - Configuring attributes for device management users
   - Configuring attributes for network access users
2. (Optional.) Configuring user group attributes
3. (Optional.) Configuring the local user auto-delete feature

Configuring attributes for device management users

Restrictions and guidelines

When you configure the interface binding attribute for a device management user, follow these restrictions and guidelines to avoid authentication failure:

- Specify the actual access interface of the user as the binding interface for the user.

- Make sure the user's authentication packets include the user's access interface.

If password control is globally enabled for device management users by using the **password-control enable** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for device management users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Procedure

1. Enter system view.

   system-view

2. Add a device management user and enter device management user view.

   local-user *user-name* **class manage**

   If the device starts without loading any configuration, the default values of the software features are used, and no local users exist.

   If the device starts with factory settings, the factory values of the software features are used, as shown in Figure 11:

   Figure 11 Local user factory settings

Hardware series	Feature	Factory settings	Applicable versions
S5570S-EI series	Local user	No local user exists.	All software versions
S5500V3-SI series	Local user	No local user exists.	Versions earlier than Release 1115
		A local management user named **clouduser** exists, with the user type as HTTP, the password as **admin**, and the user role as **network-admin**.	Release 1115 and later versions

   For more infromation about starting without loading any configuration and starting with factory settings, see *Fundamentals Configuration Guide*.

3. Configure a password for the device management user.

   In non-FIPS mode:

   password [{ **hash** | **simple** } *string*]

   A non-password-protected user passes authentication if the user provides the correct username and passes attribute checks. To enhance security, configure a password for each device management user.

   In FIPS mode:

   password

   Only password-protected users can pass authentication. You must set the password in interactive mode for a device management user.

4. Assign services to the device management user.

   In non-FIPS mode:

   service-type { **ftp** | { **http** | **https** | **ssh** | **telnet** | **terminal** } * }

   In FIPS mode:

   service-type { **https** | **ssh** | **terminal** } *

   By default, no services are authorized to a device management user.

5. (Optional.) Set the status of the device management user.

   state { **active** | **block** }

   By default, a device management user is in active state and can request network services.

6. (Optional.) Set the upper limit of concurrent logins using the device management username.

   access-limit *max-user-number*

   By default, the number of concurrent logins is not limited for a device management user.

   This command takes effect only when local accounting is configured for device management users. This command does not apply to FTP, SFTP, or SCP users that do not support accounting.

7. (Optional.) Configure the interface binding attribute for the device management user.

   bind-attribute location interface *interface-type interface-number*

   By default, no interface binding attribute is configured for a device management user.

8. (Optional.) Configure authorization attributes for the device management user.

   authorization-attribute { **idle-cut** *minutes* | **user-role** *role-name* | **work-directory** *directory-name* } *

   The following default settings apply:

   - The working directory for FTP, SFTP, and SCP users is the root directory of the NAS. However, the users do not have permission to access the root directory.
   - The network-operator user role is assigned to local users that are created by a network-admin or level-15 user.

9. (Optional.) Configure password control attributes for the device management user. Choose the following tasks as needed:

   - Set the password aging time.

     password-control aging *aging-time*

   - Set the minimum password length.

     password-control length *length*

   - Configure the password composition policy.

     password-control composition type-number *type-number* [**type-length** *type-length*]

   - Configure the password complexity checking policy.

     password-control complexity { **same-character** | **user-name** } **check**

   - Configure the maximum login attempts and the action to take if there is a login failure.

     password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

   By default, a device management user uses password control attributes of the user group to which the user belongs.

10. (Optional.) Assign the device management user to a user group.

    group *group-name*

    By default, a device management user belongs to user group **system**.

Configuring attributes for network access users

Restrictions and guidelines

If password control is globally enabled for network access users by using the **password-control enable network-class** command, the device neither displays local user passwords nor retains them in the running configuration. When you globally disable password control for network access

users, local user passwords are automatically restored to the running configuration. To display the running configuration, use the **display current-configuration** command.

You can configure authorization attributes and password control attributes in local user view or user group view. The setting in local user view takes precedence over the setting in user group view.

Configure the **location** binding attribute based on the service types of users.

- For 802.1X users, specify the 802.1X-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For MAC authentication users, specify the MAC authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For Web authentication users, specify the Web authentication-enabled Layer 2 Ethernet interfaces through which the users access the device.
- For portal users, specify the portal-enabled interfaces through which the users access the device. Specify the Layer 2 Ethernet interfaces if portal is enabled on VLAN interfaces and the **portal roaming enable** command is not used.

Procedure

1. Enter system view.
   system-view
2. Add a network access user and enter network access user view.
   local-user *user-name* **class network**
3. (Optional.) Configure a password for the network access user.
   password { **cipher** | **simple** } *string*
4. (Optional.) Configure a description for the network access user.
   description *text*
   By default, no description is configured for a local user.
5. Assign services to the network access user.
   service-type { **lan-access** | **portal** }
   By default, no services are authorized to a network access user.
6. (Optional.) Set the status of the network access user.
   state { **active** | **block** }
   By default, a network access user is in active state and can request network services.
7. (Optional.) Set the upper limit of concurrent logins using the network access username.
   access-limit *max-user-number*
   By default, the number of concurrent logins is not limited for a network access user.
8. (Optional.) Configure binding attributes for the network access user.
   bind-attribute { **ip** *ip-address* | **location interface** *interface-type interface-number* | **mac** *mac-address* | **vlan** *vlan-id* } *
   By default, no binding attributes are configured for a network access user.
9. (Optional.) Configure authorization attributes for the network access user.
   authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **user-profile** *profile-name* | **vlan** *vlan-id* } *
   By default, a network access user does not have authorization attributes.
10. (Optional.) Configure password control attributes for the network access user. Choose the following tasks as needed:
    - Set the minimum password length.

password-control length *length*

- Configure the password composition policy.

  password-control composition type-number *type-number* [**type-length** *type-length*]

- Configure the password complexity checking policy.

  password-control complexity { **same-character** | **user-name** } **check**

By default, a network access user uses password control attributes of the user group to which the user belongs.

11. (Optional.) Assign the network access user to a user group.

group *group-name*

By default, a network access user belongs to user group **system**.

12. (Optional.) specify the validity period for the local user.

validity-datetime { **from** *start-date start-time* **to** *expiration-date expiration-time* | **from** *start-date start-time* | **to** *expiration-date expiration-time* }

By default, the validity period for a network access user does not expire.

Configuring user group attributes

About this task

User groups simplify local user configuration and management. A user group contains a group of local users and has a set of local user attributes. You can configure local user attributes for a user group to implement centralized user attributes management for the local users in the group. Local user attributes that are manageable include authorization attributes.

Procedure

1. Enter system view.

system-view

2. Create a user group and enter user group view.

user-group *group-name*

By default, a system-defined user group exists. The group name is **system**.

3. Configure authorization attributes for the user group.

authorization-attribute { **acl** *acl-number* | **idle-cut** *minutes* | **ip-pool** *ipv4-pool-name* | **ipv6-pool** *ipv6-pool-name* | **session-timeout** *minutes* | **user-profile** *profile-name* | **vlan** *vlan-id* **work-directory** *directory-name* } *

By default, no authorization attributes are configured for a user group.

4. (Optional.) Configure password control attributes for the user group. Choose the following tasks as needed:

- Set the password aging time.

  password-control aging *aging-time*

- Set the minimum password length.

  password-control length *length*

- Configure the password composition policy.

  password-control composition type-number *type-number* [**type-length** *type-length*]

- Configure the password complexity checking policy.

password-control complexity { **same-character** | **user-name** } **check**

- Configure the maximum login attempts and the action to take for login failures.

  password-control login-attempt *login-times* [**exceed** { **lock** | **lock-time** *time* | **unlock** }]

By default, a user group uses the global password control settings. For more information, see "Configuring password control."

Configuring the local user auto-delete feature

About this task

This feature enables the device to examine the validity of local users at fixed time periods of 10 minutes and automatically delete expired local users.

Procedure

1. Enter system view

   system-view

2. Enable the local user auto-delete feature.

   local-user auto-delete enable

   By default, the local user auto-delete feature is disabled.

Display and maintenance commands for local users and local user groups

Execute **display** commands in any view.

NOTE:
Only Release 1112 and later versions support the **byod-authorization** keyword.

Task	Command
Display the local user configuration and online user statistics.	**display local-user** [**class** { **manage** | **network** } | **idle-cut** { **disable** | **enable** } | **service-type** { **ftp** | **hikagent** | **http** | **https** | **lan-access** | **portal** | **ssh** | **telnet** | **terminal** } | **state** { **active** | **block** } | **user-name** *user-name* **class** { **manage** | **network** } | **vlan** *vlan-id*]
Display user group configuration.	**display user-group** { **all** | **name** *group-name* [**byod-authorization**] }

Configuring RADIUS

RADIUS tasks at a glance

To configure RADIUS, perform the following tasks:

1. Configuring an EAP profile

To perform EAP-based RADIUS server status detection, you must configure an EAP profile and specify the EAP profile in a test profile.

2. Configuring a test profile for RADIUS server status detection

   To detect the status of a RADIUS server, you must configure a test profile and configure the RADIUS server to use the test profile in a RADIUS scheme.
3. Creating a RADIUS scheme
4. Specifying RADIUS authentication servers
5. Specifying the RADIUS accounting servers
6. Specifying the shared keys for secure RADIUS communication

   Perform this task if no shared keys are specified when configuring RADIUS authentication or accounting servers.
7. Specifying the MPLS L3VPN instance for a RADIUS scheme

   Perform this task if no MPLS L3VPN instances are specified when configuring RADIUS authentication or accounting servers.
8. (Optional.) Setting the status of RADIUS servers
9. (Optional.) Setting RADIUS timers
10. (Optional.) Configuring parameters for RADIUS packets
    - Specifying the source IP address for outgoing RADIUS packets
    - Setting the username format and traffic statistics units
    - Setting the maximum number of RADIUS request transmission attempts
    - Setting the maximum number of real-time accounting attempts
    - Setting the DSCP priority for RADIUS packets
11. (Optional.) Configuring parameters for RADIUS attributes
    - Configuring the Login-Service attribute check method for SSH, FTP, and terminal users
    - Interpreting the RADIUS class attribute as CAR parameters
    - Configuring the MAC address format for RADIUS attribute 31
    - Setting the data measurement unit for the Remanent_Volume attribute
    - Including subattribute 218 of vendor 25506 in outgoing RADIUS packets
    - Configuring the RADIUS attribute translation feature
12. (Optional.) Configuring extended RADIUS features
    - Configuring RADIUS stop-accounting packet buffering
    - Enabling forcibly sending stop-accounting packets
    - Enabling the RADIUS server load sharing feature
    - Specifying a RADIUS server selection mode for reauthentication
    - Configuring the RADIUS accounting-on feature
    - Configuring the RADIUS session-control feature
    - Configuring the RADIUS DAS feature
    - Enabling SNMP notifications for RADIUS
    - Disabling the RADIUS service

Configuring an EAP profile

About this task

An EAP profile is a collection of EAP authentication settings, including the EAP authentication method and the CA certificate file to be used for some EAP authentication methods.

Restrictions and guidelines

You can specify an EAP profile in multiple test profiles.

You can configure a maximum of 16 EAP profiles.

Prerequisites

Before you specify a CA certificate file, use FTP or TFTP to transfer the CA certificate file to the root directory of the default storage medium on the device.

In an IRF fabric, make sure the CA certificate file exists in the root directory of the default storage medium on the master device before you specify the file.

Procedure

1. Enter system view.
   system-view
2. Create an EAP profile and enter EAP profile view.
   eap-profile *eap-profile-name*
3. Specify the EAP authentication method.
   method { **md5** | **peap-gtc** | **peap-mschapv2** | **ttls-gtc** | **ttls-mschapv2** }
   By default, the EAP authentication method is MD5-challenge.
4. Specify a CA certificate file for EAP authentication.
   ca-file *file-name*
   By default, no CA certificate file is specified for EAP authentication.
   You must specify a CA certificate file to verify the RADIUS server certificate if the EAP authentication method is PEAP-GTC, PEAP-MSCHAPv2, TTLS-GTC, or TTLS-MSCHAPv2.

Configuring a test profile for RADIUS server status detection

About this task

To detect the reachability or availability of a RADIUS authentication server, specify a test profile for the RADIUS server when you specify the server in a RADIUS scheme. With the test profile, the device refreshes the RADIUS server status at each detection interval according to the detection result. If the server is unreachable or unavailable, the device sets the status of the server to blocked. If the server is reachable or available, the device sets the status of the server to active.

The device supports the following RADIUS server status detection methods:

- **Simple detection**—For a RADIUS server, the device simulates an authentication request with the username and password specified in the test profile used by the server. The authentication request is sent to the RADIUS server within each detection interval. The device determines that the RADIUS server is reachable if the device receives a response from the server within the interval.
- **EAP-based detection**—For a RADIUS server, the device simulates an EAP authentication with the username and password specified in the test profile used by the server. The simulated EAP authentication starts at the beginning of each detection interval. If the EAP authentication completes within a detection interval, the device determines that the RADIUS server is available.

Simulating a complete EAP authentication process, EAP-based detection provides more reliable detection results than simple detection. As a best practice, configure EAP-based detection on a network environment where EAP authentication is configured.

Restrictions and guidelines

You can configure multiple test profiles in the system.

The device starts detecting the status of a RADIUS authentication server only if an existing test profile is specified for the server.

If you specify a nonexistent EAP profile in a test profile, the device performs simple detection for the RADIUS servers that use the test profile. After the EAP profile is configured, the device will start EAP-based detection at the next detection interval.

The device stops detecting the status of a RADIUS server when one of the following operations is performed:

- The RADIUS server is removed from the RADIUS scheme.
- The test profile configuration for the RADIUS server is removed in RADIUS scheme view.
- The test profile specified for the RADIUS server is deleted.
- The RADIUS server is manually set to the blocked state.
- The RADIUS scheme that contains the RADIUS server is deleted.

Procedure

1. Enter system view.

   system-view

2. Configure a test profile for detecting the status of RADIUS authentication servers.

   radius-server test-profile *profile-name* **username** *name* [**password** { **cipher** | **simple** } *string*] [**interval** *interval*] [**eap-profile** *eap-profile-name*]

Creating a RADIUS scheme

Restrictions and guidelines

You can configure a maximum of 16 RADIUS schemes. A RADIUS scheme can be used by multiple ISP domains.

Procedure

1. Enter system view.

   system-view

2. Create a RADIUS scheme and enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

Specifying RADIUS authentication servers

About this task

A RADIUS authentication server completes authentication and authorization together, because authorization information is piggybacked in authentication responses sent to RADIUS clients.

You can specify one primary authentication server and a maximum of 16 secondary authentication servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unreachable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an authentication request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS authentication server can function as the primary authentication server for one scheme and a secondary authentication server for another scheme at the same time.

Two authentication servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS authentication server.

   primary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS authentication server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS authentication server.

   secondary authentication { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **test-profile** *profile-name* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS authentication servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the RADIUS accounting servers

About this task

You can specify one primary accounting server and a maximum of 16 secondary accounting servers for a RADIUS scheme. Secondary servers provide AAA services when the primary server becomes unavailable. The device searches for an active server in the order the secondary servers are configured.

When RADIUS server load sharing is enabled, the device distributes the workload over all servers without considering the primary and secondary server roles. The device checks the weight value and number of currently served users for each active server, and then determines the most appropriate server in performance to receive an accounting request.

Restrictions and guidelines

If redundancy is not required, specify only the primary server.

A RADIUS accounting server can function as the primary accounting server for one scheme and a secondary accounting server for another scheme at the same time.

Two accounting servers in a scheme, primary or secondary, cannot have the same combination of VPN instance, host name, IP address, and port number.

RADIUS does not support accounting for FTP, SFTP, and SCP users.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify the primary RADIUS accounting server.
   primary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no primary RADIUS accounting server is specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

4. (Optional.) Specify a secondary RADIUS accounting server.

   secondary accounting { *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **key** { **cipher** | **simple** } *string* | **vpn-instance** *vpn-instance-name* | **weight** *weight-value*] *

   By default, no secondary RADIUS accounting servers are specified.

   The **weight** keyword takes effect only when the RADIUS server load sharing feature is enabled for the RADIUS scheme.

Specifying the shared keys for secure RADIUS communication

About this task

The RADIUS client and server use the MD5 algorithm and shared keys to generate the Authenticator value for packet authentication and user password encryption. The client and server must use the same key for each type of communication.

A key configured in this task is for all servers of the same type (accounting or authentication) in the scheme. The key has a lower priority than a key configured individually for a RADIUS server.

Restrictions and guidelines

The shared key configured on the device must be the same as the shared key configured on the RADIUS server.

Procedure

1. Enter system view.

   system-view

2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*

3. Specify a shared key for secure RADIUS communication.

   key { **accounting** | **authentication** } { **cipher** | **simple** } *string*

   By default, no shared key is specified for secure RADIUS communication.

Specifying the MPLS L3VPN instance for a RADIUS scheme

About this task

The VPN instance specified for a RADIUS scheme applies to all authentication and accounting servers in that scheme. If a VPN instance is also configured for an individual RADIUS server, the VPN instance specified for the RADIUS scheme does not take effect on that server.

Procedure

1. Enter system view.

system-view

2. Enter RADIUS scheme view.
   radius scheme *radius-scheme-name*
3. Specify a VPN instance for the RADIUS scheme.
   vpn-instance *vpn-instance-name*
   By default, a RADIUS scheme belongs to the public network.

Setting the status of RADIUS servers

About this task

To control the RADIUS servers with which the device communicates when the current servers are no longer available, set the status of RADIUS servers to blocked or active. You can specify one primary RADIUS server and multiple secondary RADIUS servers. The secondary servers function as the backup of the primary server. When the RADIUS server load sharing feature is disabled, the device chooses servers based on the following rules:

- When the primary server is in active state, the device first tries to communicate with the primary server. If the primary server is unreachable, the device searches for an active secondary server in the order the servers are configured.
- When one or more servers are in active state, the device tries to communicate with these active servers only, even if the servers are unavailable.
- When all servers are in blocked state, the device only tries to communicate with the primary server.
- If a server is unreachable, the device performs the following operations:
  - Changes the server status to blocked.
  - Starts a quiet timer for the server.
  - Tries to communicate with the next secondary server in active state that has the highest priority.
- When the quiet timer of a server expires or you manually set the server to the active state, the status of the server changes back to active. The device does not check the server again during the authentication or accounting process.
- The search process continues until the device finds an available secondary server or has checked all secondary servers in active state. If no server is reachable, the device considers the authentication or accounting attempt a failure.
- When you remove a server in use, communication with the server times out. The device looks for a server in active state by first checking the primary server, and then checking secondary servers in the order they are configured.
- When a RADIUS server's status changes automatically, the device changes this server's status accordingly in all RADIUS schemes in which this server is specified.
- When a RADIUS server is manually set to blocked, server detection is disabled for the server, regardless of whether a test profile has been specified for the server. When the RADIUS server is set to active state, server detection is enabled for the server on which an existing test profile is specified.

By default, the device sets the status of all RADIUS servers to active. However, in some situations, you must change the status of a server. For example, if a server fails, you can change the status of the server to blocked to avoid communication attempts to the server.

Restrictions and guidelines

The configured server status cannot be saved to any configuration file, and can only be viewed by using the **display radius scheme** command.

After the device restarts, all servers are restored to the active state.

The device selects a reachable server for the authentication or accounting of a new user according to the server selection rules in this section if the RADIUS server load sharing feature is disabled. However, these rules are inapplicable to the reauthentication of online users if the RADIUS server selection mode for reauthentication is set to inherit by using the **reauthentication server-select inherit** command.

Procedure

1. Enter system view.

   system-view
2. Enter RADIUS scheme view.

   radius scheme *radius-scheme-name*
3. Set the RADIUS server status. Choose the following tasks as needed:
   - Set the status of the primary RADIUS authentication server.

     state primary authentication { **active** | **block** }
   - Set the status of the primary RADIUS accounting server.

     state primary accounting { **active** | **block** }
   - Set the status of a secondary RADIUS authentication server.

     state secondary authentication [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }
   - Set the status of a secondary RADIUS accounting server.

     state secondary accounting [{ *host-name* | *ipv4-address* | **ipv6** *ipv6-address* } [*port-number* | **vpn-instance** *vpn-instance-name*] *] { **active** | **block** }

   By default, a RADIUS server is in active state.

Setting RADIUS timers

About this task

The device uses the following types of timers to control communication with a RADIUS server:

- **Server response timeout timer** (**response-timeout**)—Defines the RADIUS request retransmission interval. The timer starts immediately after a RADIUS request is sent. If the device does not receive a response from the RADIUS server before the timer expires, it resends the request.
- **Server quiet timer** (**quiet**)—Defines the duration to keep an unreachable server in blocked state. If one server is not reachable, the device changes the server status to blocked, starts this timer for the server, and tries to communicate with another server in active state. After the server quiet timer expires, the device changes the status of the server back to active.
- **Real-time accounting timer** (**realtime-accounting**)—Defines the interval at which the device sends real-time accounting packets to the RADIUS accounting server for online users.

Restrictions and guidelines

Consider the number of secondary servers when you configure the maximum number of RADIUS packet transmission attempts and the RADIUS server response timeout timer. If the RADIUS scheme includes many secondary servers, the retransmission process might be too long and the client connection in the access module, such as Telnet, can time out.

When the client connections have a short timeout period, a large number of secondary servers can cause the initial authentication or accounting attempt to fail. In this case, reconnect the client rather than adjusting the RADIUS packet transmission attempts and server response timeout timer.

Typically, the next attempt will succeed, because the device has blocked the unreachable servers to shorten the time to find a reachable server.
