- Configure an IPv6 static route to subnet 120::/64 on Switch A.
- Configure an IPv6 static route to subnet 121::/64 on Switch B.
- Enable BFD for both routes.
- Configure an IPv6 static route to subnet 120::/64 and an IPv6 static route to subnet 121::/64 on both Switch C and Switch D.

When the link between Switch A and Switch B through Switch D fails, BFD can detect the failure immediately and Switch A and Switch B can communicate through Switch C.

Figure 3 Network diagram

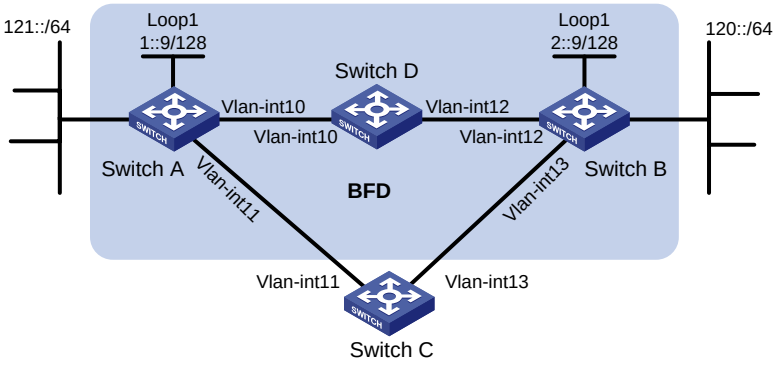

Table 2 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	12::1/64
Switch A	Vlan-int11	10::102/64
Switch A	Loop1	1::9/128
Switch B	Vlan-int12	11::2/64

Device	Interface	IPv6 address
Switch B	Vlan-int13	13::1/64
Switch B	Loop1	2::9/128
Switch C	Vlan-int11	10::100/64
Switch C	Vlan-int13	13::2/64
Switch D	Vlan-int10	12::2/64
Switch D	Vlan-int12	11::1/64

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure IPv6 static routes and BFD:

   # Configure IPv6 static routes on Switch A and enable BFD control packet mode for the IPv6 static route that traverses Switch D.

```
<SwitchA> system-view
[SwitchA] bfd multi-hop min-control-interval 500
[SwitchA] bfd multi-hop detect-multiplier 9
[SwitchA] ipv6 route-static 120:: 64 2::9 bfd control-packet bfd-source 1::9
[SwitchA] ipv6 route-static 120:: 64 10::100 preference 65
[SwitchA] ipv6 route-static 2::9 128 12::2
[SwitchA] quit
```

   # Configure IPv6 static routes on Switch B and enable BFD control packet mode for the static route that traverses Switch D.

```
<SwitchB> system-view
[SwitchB] bfd multi-hop min-control-interval 500
[SwitchB] bfd multi-hop detect-multiplier 9
[SwitchB] ipv6 route-static 121:: 64 1::9 bfd control-packet bfd-source 2::9
[SwitchB] ipv6 route-static 121:: 64 13::2 preference 65
[SwitchB] ipv6 route-static 1::9 128 11::1
[SwitchB] quit
```

   # Configure IPv6 static routes on Switch C.

```
<SwitchC> system-view
[SwitchC] ipv6 route-static 120:: 64 13::1
[SwitchC] ipv6 route-static 121:: 64 10::102
```

   # Configure IPv6 static routes on Switch D.

```
<SwitchD> system-view
[SwitchD] ipv6 route-static 120:: 64 11::2
[SwitchD] ipv6 route-static 121:: 64 12::1
[SwitchD] ipv6 route-static 2::9 128 11::2
[SwitchD] ipv6 route-static 1::9 128 12::1
```

Verifying the configuration

Display the BFD sessions on Switch A.

```
<SwitchA> display bfd session
 Total sessions: 1        Up sessions: 1        Init mode: Active

 IPv6 session working in control packet mode:
```

```
       Local Discr: 513                Remote Discr: 33
         Source IP: 1::9
    Destination IP: 2::9
     Session State: Up                      Interface: N/A
         Hold Time: 2012ms
```

The output shows that the BFD session has been created.

Display the IPv6 static routes on Switch A.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

Destination: 120::/64                                  Protocol  : Static
NextHop    : 2::9                                      Preference: 60
Interface  : Vlan10                                    Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display IPv6 static routes on Switch A again.

```
<SwitchA> display ipv6 routing-table protocol static

Summary count : 1

Static Routing table status : <Active>
Summary count : 1

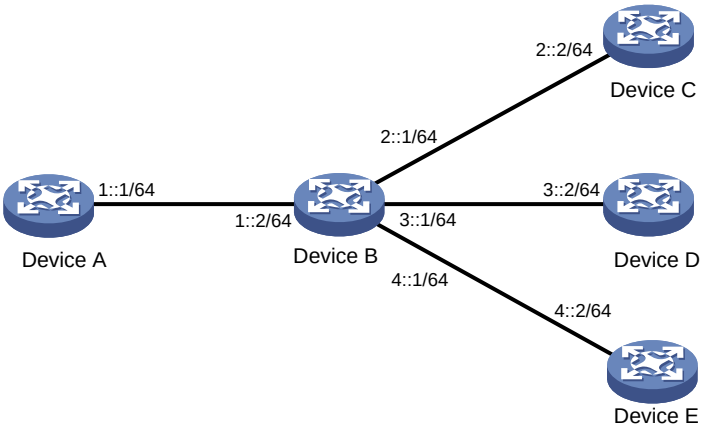
Destination: 120::/64                                  Protocol  : Static
NextHop    : 10::100                                   Preference: 65
Interface  : Vlan11                                    Cost      : 0

Static Routing table status : <Inactive>
Summary count : 0
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Configuring an IPv6 default route

A default IPv6 route is used to forward packets that match no entry in the routing table.



A default IPv6 route can be configured in either of the following ways:

- The network administrator can configure a default route with a destination prefix of **::/0**. For more information, see "Configuring IPv6 static routing."
- Some dynamic routing protocols (such as OSPFv3, IPv6 IS-IS, and RIPng) can generate a default IPv6 route. For example, an upstream router running OSPFv3 can generate a default IPv6 route and advertise it to other routers. These routers install the default IPv6 route with the next hop being the upstream router. For more information, see the respective chapters on those routing protocols in this configuration guide.

As shown in Figure 4, Device B is the next hop for packets from Device A to Device C, Device D, and Device E. You can configure a default route on Device A to replace the three IPv6 static routes from Device A to Device C, Device D, and Device E, respectively.

The next hop address, destination address, and subnet mask of the IPv6 default route configured on Device A are 1::2, ::, and 0, respectively.

Configuring RIPng

About RIPng

RIP next generation (RIPng), as an extension of RIP-2 for support of IPv6, is a distance vector routing protocol. It employs UDP to exchange route information through port 521. Most RIP concepts are applicable to RIPng.

RIPng routing metrics

RIPng uses a hop count to measure the distance to a destination. The hop count is the metric or cost. The hop count from a router to a directly connected network is 0. The hop count between two directly connected routers is 1. When the hop count is greater than or equal to 16, the destination network or host is unreachable.

RIPng route entries

RIPng stores route entries in a database. Each route entry contains the following elements:

- **Destination address**—IPv6 address of a destination host or a network.
- **Next hop address**—IPv6 address of the next hop.
- **Egress interface**—Egress interface of the route.
- **Metric**—Cost from the local router to the destination.
- **Route time**—Time elapsed since the most recent update. The time is reset to 0 every time the route entry is updated.
- **Route tag**—Used for route control. For more information, see "Configuring routing policies."

RIPng packets and advertisement

RIPng multicasts request and response packets to exchange routing information. It uses FF02::9 as the destination address and link-local address FE80::/10 as the source address. RIPng exchanges routing information as follows:

1. When RIPng starts or needs to update some route entries, it sends a multicast request packet to neighbors.
2. When a RIPng neighbor receives the request packet, it sends back a response packet that contains the local routing table. RIPng can also advertise route updates in response packets periodically or advertise a triggered update caused by a route change.
3. After RIPng receives the response, it checks the validity of the response before adding routes to its routing table, including the following details:
   - Whether the source IPv6 address is the link-local address.
   - Whether the port number is correct.
4. A response packet that fails the check is discarded.

Protocols and standards

- RFC 2080, *RIPng for IPv6*
- RFC 2081, *RIPng Protocol Applicability Statement*

RIPng tasks at a glance

To configure RIPng, perform the following tasks:

1. Configuring basic RIPng
   a. Enabling RIPng
   b. (Optional.) Suppressing an interface
2. (Optional.) Configuring RIPng route control
   - Configuring an additional routing metric
   - Configuring RIPng route summarization
   - Advertising a default route
   - Configuring received/redistributed route filtering
   - Setting a preference for RIPng
   - Configuring RIPng route redistribution
3. (Optional.) Tuning and optimizing the RIPng network
   - Setting RIPng timers
   - Configuring split horizon and poison reverse
   - Setting the maximum number of ECMP routes
   - Configuring the RIPng packet sending rate
   - Setting the interval for sending triggered updates
4. (Optional.) Enhancing RIPng availability
   - Configuring RIPng GRConfiguring RIPng NSR
   - Enabling BFD for RIPng FRR
   - Configuring RIPng FRR
5. (Optional.) Enhancing RIPng security
   - Configuring zero field check for RIPng packetsApplying an IPsec profile

Configuring basic RIPng

Enabling RIPng

1. Enter system view.
   system-view
2. Enable RIPng and enter its view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
   By default, RIPng is disabled.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable RIPng on the interface.
   ripng *process-id* **enable**
   By default, RIPng is disabled on the interface.
   If RIPng is not enabled on an interface, the interface does not send or receive any RIPng route.

Suppressing an interface

About this task

Perform this task to disable interfaces from sending RIPng messages. The interfaces can still receive RIPng messages.

Procedure

1. Enter system view.

   system-view
2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Suppress an interface.

   silent-interface { *interface-type interface-number* | **all** }

   By default, all RIPng-enabled interfaces can send RIP messages.

   The suppressed interface can still receive RIP messages and respond to unicast requests containing unknown ports.

Configuring RIPng route control

Configuring an additional routing metric

About this task

An additional routing metric (hop count) can be added to the metric of an inbound or outbound RIPng route.

- An outbound additional metric is added to the metric of a sent route, and it does not change the route's metric in the routing table.
- An inbound additional metric is added to the metric of a received route before the route is added into the routing table, and the route's metric is changed.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Specify an inbound additional routing metric.

   ripng metricin *value*

   The default additional metric of an inbound route is 0.
4. Specify an outbound additional routing metric.

   ripng metricout *value*

   The default additional metric of an outbound route is 1.

Configuring RIPng route summarization

About this task

RIPng route summarization is interface-based. RIPng advertises a summary route based on the longest match.

RIPng route summarization improves network scalability, reduces routing table size, and increases routing table lookup efficiency.

RIPng advertises a summary route with the smallest metric of all the specific routes.

For example, RIPng has two specific routes to be advertised through an interface: 1:11:11::24 with a metric of a 2 and 1:11:12::34 with a metric of 3. Configure route summarization on the interface, so RIPng advertises a single route 11::0/16 with a metric of 2.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Advertise a summary IPv6 prefix.

   ripng summary-address *ipv6-address prefix-length*

   By default, no summary IPv6 prefix is configured on the interface.

Advertising a default route

About this task

You can configure RIPng to advertise a default route with the specified cost to its neighbors.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure RIPng to advertise a default route.

   ripng default-route { **only** | **originate** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not advertise a default route.

   This command advertises a default route on the current interface regardless of whether the default route exists in the local IPv6 routing table.

Configuring received/redistributed route filtering

About this task

Perform this task to filter received or redistributed routes by using an IPv6 ACL, IPv6 prefix list, or routing policy. You can also configure RIPng to filter routes redistributed from other routing protocols and routes from a specified neighbor.

Procedure

1. Enter system view.

   system-view
2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Configure a filter policy to filter received routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

By default, RIPng does not filter received routes.

4. Configure a filter policy to filter redistributed routes.

   filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } **export** [*protocol* [*process-id*]]

   By default, RIPng does not filter redistributed routes.

Setting a preference for RIPng

About this task

Routing protocols each have a preference. When they find routes to the same destination, the route found by the routing protocol with the highest preference is selected as the optimal route. You can manually set a preference for RIPng. The smaller the value, the higher the preference.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set a preference for RIPng.

   preference { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of RIPng is 100.

Configuring RIPng route redistribution

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Configure route redistribution.

   - Redistribute routes from BGP4+.

     import-route bgp4+ [*as-number*] [**allow-ibgp**] [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   - Redistribute direct or static routes.

     import-route { **direct** | **static** } [**cost** *cost-value* | **route-policy** *route-policy-name*] *

   - Redistribute routes from OSPFv3, IPv6 IS-IS, or other RIPng processes.

     import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id*] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name*] *

   By default, RIPng does not redistribute routes.

4. (Optional.) Set a default routing metric for redistributed routes.

   default cost *cost-value*

   The default metric of redistributed routes is 0.

Tuning and optimizing the RIPng network

Setting RIPng timers

About this task

You can adjust RIPng timers to optimize the performance of the RIPng network.

Restrictions and guidelines

When you adjust RIPng timers, consider the network performance, and perform unified configurations on routers running RIPng to avoid unnecessary network traffic or route oscillation.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set RIPng timers.

   timers { **garbage-collect** *garbage-collect-value* | **suppress** *suppress-value* | **timeout** *timeout-value* | **update** *update-value* } *

   The default settings are as follows:

   - The update timer is 30 seconds.
   - The timeout timer is 180 seconds.
   - The suppress timer is 120 seconds.
   - The garbage-collect timer is 120 seconds.

Configuring split horizon and poison reverse

Restrictions and guidelines for split horizon and poison reverse

When you configure split horizon and poison reverse, following these restrictions and guidelines:

- If both split horizon and poison reverse are configured, only the poison reverse feature takes effect.
- Split horizon disables RIPng from sending routes through the interface where the routes were learned to prevent routing loops between neighbors. As a best practice, enable split horizon to prevent routing loops in normal cases.
- Poison reverse enables a route learned from an interface to be advertised through the interface. However, the metric of the route is set to 16, which means the route is unreachable.

Configuring split horizon

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable split horizon.

   ripng split-horizon

   By default, split horizon is enabled.

Configuring poison reverse

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable poison reverse.
   ripng poison-reverse
   By default, poison reverse is disabled.

Setting the maximum number of ECMP routes

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Set the maximum number of RIPng ECMP routes.
   maximum load-balancing *number*
   By default, the maximum number of RIPng ECMP routes equals the maximum number of ECMP routes, which is configurable by using the **max-ecmp-num** command.

Configuring the RIPng packet sending rate

About this task

Perform this task to specify the interval for sending RIPng packets and the maximum number of RIPng packets that can be sent at each interval. This feature can avoid excessive RIPng packets from affecting system performance and consuming too much bandwidth.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
3. Configuring the RIPng packet sending rate.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in RIPng view:
     ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
     output-delay *time* **count** *count*
     By default, an interface that runs the RIPng process sends a maximum of three RIPng packets every 20 milliseconds.
   - Execute the following commands in sequence to configure the RIPng packet sending rate in interface view:
     interface *interface-type interface-number*
     ripng output-delay *time* **count** *count*
     By default, an interface uses the RIPng packet sending rate of the RIPng process that it runs.

Setting the interval for sending triggered updates

About this task

Perform this task to avoid network overhead and reduce system resource consumption caused by frequent RIPng triggered updates.

You can use the **timer triggered** command to set the maximum interval, minimum interval, and incremental interval for sending RIPng triggered updates.

For a stable network, the minimum interval is used. If network changes become frequent, the triggered update sending interval is incremented by the incremental interval × 2^{n-2} for each triggered update until the maximum interval is reached. The value *n* is the number of triggered update times.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Set the interval for sending triggered updates.

   timer triggered *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   The default maximum interval is 5 seconds, the default minimum interval is 50 milliseconds, and the default incremental interval is 200 milliseconds.

Configuring RIPng GR

About this task

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must have GR capability.
- **GR helper**—A neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

After RIPng restarts on a router, the router must learn RIPng routes again and updates its FIB table, which causes network disconnections and route reconvergence.

With the GR feature, the restarting router (known as the GR restarter) can notify the event to its GR capable neighbors. GR capable neighbors (known as GR helpers) maintain their adjacencies with the router within a configurable GR interval. During this process, the FIB table of the router does not change. After the restart, the router contacts its neighbors to retrieve its FIB.

By default, a RIPng-enabled device acts as the GR helper. Perform this task on the GR restarter.

Procedure

1. Enter system view.

   system-view

2. Enable RIPng and enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable the GR capability for RIPng.

   graceful-restart

   By default, RIPng GR is disabled.

4. (Optional.) Set the GR interval.

   graceful-restart interval *interval*

   The default GR interval is 60 seconds.

Configuring RIPng NSR

About this task

Nonstop routing (NSR) backs up RIPng routing information from the active process to the standby process. After an active/standby switchover, NSR can complete route regeneration without tearing down adjacencies or impacting forwarding services.

To use RIPng NSR, the system must have a minimum of two IRF member devices. NSR ensures nonstop services when RIPng has redundant processes on multiple IRF member devices.

In contrast to GR, NSR does not require a neighbor device to recover routing information.

Restrictions and guidelines

When both GR and NSR are configured for RIPng, the following rules apply:

- NSR has a higher priority than GR. When the active RIPng process goes down, the device does not act as the GR restarter and performs RIPng NSR to ensure nonstop forwarding.
- The device can participate in a GR process only when it acts as the GR helper. If it performs an active/standby RIPng process switchover before the GR process finishes, the GR process might fail even if RIPng NSR is enabled on the device.

RIPng NSR enabled for a RIPng process takes effect only on that process. As a best practice, enable RIPng NSR for each process if multiple RIPng processes exist.

Procedure

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable RIPng NSR.

   non-stop-routing

   By default, RIPng NSR is disabled.

Configuring BFD for RIPng

About this task

Configuring BFD for RIPng

About this task

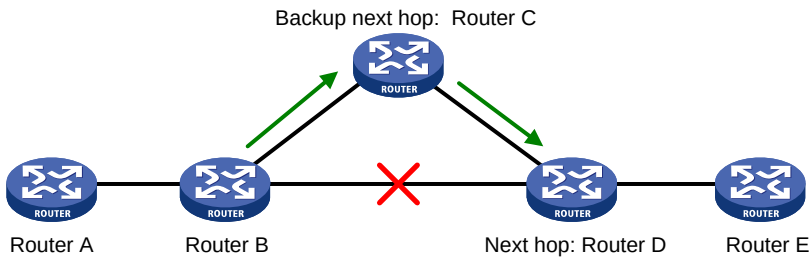
RIPng detects route failures by periodically sending requests. If it receives no response for a route within a certain time, RIPng considers the route unreachable. To speed up convergence, perform this task to enable BFD for RIPng. For more information about BFD, see *High Availability Configuration Guide*.

RIPng supports BFD in control packet mode. In this mode, a BFD session is established only when both ends have routes to send and BFD is enabled on the receiving interface.

Restrictions and guidelines

You need to perform this task to configure control-mode BFD detection on both the local and peer ends.

Procedure



1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD for RIPng.
   ripng bfd enable
   By default, BFD for RIPng is disabled.

Configuring RIPng FRR

About RIPng FRR

A link or router failure on a path can cause packet loss and even routing loop until RIPng completes routing convergence based on the new network topology. FRR enables fast rerouting to minimize the impact of link or node failures.

Figure 1 Network diagram for RIPng FRR

As shown in Figure 1, configure FRR on Router B by using a routing policy to specify a backup next hop. When the primary link fails, RIPng directs packets to the backup next hop. At the same time, RIPng calculates the shortest path based on the new network topology. Then, the device forwards packets over that path after network convergence.

Restrictions and guidelines for RIPng FRR

RIPng FRR is available only when the state of the primary link (with Layer 3 interfaces staying up) changes from bidirectional to unidirectional or down.

RIPng FRR is only effective for RIPng routes that are learned from directly connected neighbors.

Equal-cost routes do not support RIPng FRR.

Enabling RIPng FRR

1. Enter system view.
   system-view
2. Configure a routing policy.

You must specify a next hop by using the **apply ipv6 fast-reroute backup-interface** command in a routing policy and specify the routing policy for FRR.

For more information about routing policy configuration, see "Configuring routing policies."

3. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]
4. Enable RIPng FRR.
   fast-reroute route-policy *route-policy-name*

   By default, RIPng FRR is disabled.

Enabling BFD for RIPng FRR

About this task

By default, RIPng FRR does not use BFD to detect primary link failures. For quicker RIPng FRR, use BFD on the primary link of redundant links to detect link failure.

Procedure

1. Enter system view.
   system-view
2. Configure the source IP address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*

   By default, the source IP address of BFD echo packets is not configured.

   As a best practice, do not configure the source IP address on the same network segment as any local interfaces.

   Execute this command only when configuring echo-packet-mode BFD sessions.

   For more information about this command, see *High Availability Command Reference*.
3. Enter interface view.
   interface *interface-type interface-number*
4. Enable BFD for RIPng FRR.
   ripng primary-path-detect bfd { **ctrl** | **echo** }

   By default, BFD is disabled for RIPng FRR.

Enhancing RIPng security

Configuring zero field check for RIPng packets

About this task

Some fields in the RIPng packet header must be zero. These fields are called zero fields. You can enable zero field check for incoming RIPng packets. If a zero field of a packet contains a non-zero value, RIPng does not process the packets. If you are certain that all packets are trustworthy, disable the zero field check to save CPU resources.

Procedure

1. Enter system view.
   system-view
2. Enter RIPng view.
   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Enable the zero field check for incoming RIPng packets.

   checkzero

   By default, zero field check for incoming RIPng packets is enabled.

Applying an IPsec profile

About this task

To protect routing information and prevent attacks, you can configure RIPng to authenticate protocol packets by using an IPsec profile.

An IPsec profile contains inbound and outbound security parameter indexes (SPIs). RIPng compares the inbound SPI defined in the IPsec profile with the outbound SPI in the received packets. Two RIPng devices accept the packets from each other and establish a neighbor relationship only if the SPIs are the same and the relevant IPsec profiles match.

For more information about IPsec profiles, see *Security Configuration Guide*.

Restrictions and guidelines

You can apply an IPsec profile to a RIPng process or to an interface. If an interface and its process each have an IPsec profile, the IPsec profile applied to the interface takes effect.

Applying an IPsec profile to a process

1. Enter system view.

   system-view

2. Enter RIPng view.

   ripng [*process-id*] [**vpn-instance** *vpn-instance-name*]

3. Apply an IPsec profile to the process.

   enable ipsec-profile *profile-name*

   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Apply an IPsec profile to the interface.

   ripng ipsec-profile *profile-name*

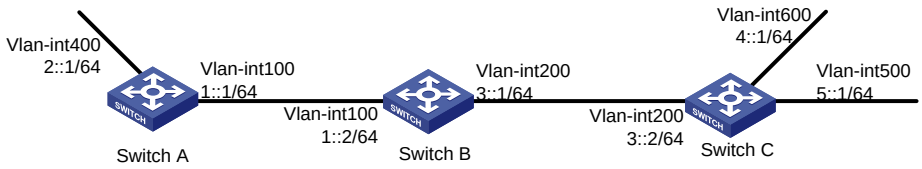
   By default, no IPsec profile is applied.

Display and maintenance commands for RIPng

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display configuration information for a RIPng process.	**display ripng** [*process-id*]
Display RIPng GR information.	**display ripng** [*process-id*] **graceful-restart**
Display RIPng NSR information.	**display ripng** [*process-id*]

Task	Command
	non-stop-routing
Display routes in the RIPng database.	**display ripng** *process-id* **database** [*ipv6-address prefix-length*]
Display interface information for a RIPng process.	**display ripng** *process-id* **interface** [*interface-type interface-number*]
Display neighbor information for a RIPng process.	**display ripng** *process-id* **neighbor** [*interface-type interface-number*]
Display the routing information for a RIPng process.	**display ripng** *process-id* **route** [*ipv6-address prefix-length* [**verbose**] | **peer** *ipv6-address* | **statistics**]
Restart a RIPng process.	**reset ripng** *process-id* **process**
Clear statistics for a RIPng process.	**reset ripng** *process-id* **statistics**



RIPng configuration examples

Example: Configuring basic RIPng

Network configuration

As shown in Figure 2, Switch A, Switch B, and Switch C run RIPng. Configure route filtering on Switch B to accept all received routes except the route 2::/64 and to advertise only the route 4::/64.

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ripng 1
   [SwitchA-ripng-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ripng 1 enable
   [SwitchA-Vlan-interface100] quit
   [SwitchA] interface vlan-interface 400
   [SwitchA-Vlan-interface400] ripng 1 enable
   [SwitchA-Vlan-interface400] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ripng 1
   ```

```
[SwitchB-ripng-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ripng 1 enable
[SwitchB-Vlan-interface200] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Configure Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 1
[SwitchC-ripng-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] ripng 1 enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 500
[SwitchC-Vlan-interface500] ripng 1 enable
[SwitchC-Vlan-interface500] quit
[SwitchC] interface vlan-interface 600
[SwitchC-Vlan-interface600] ripng 1 enable
[SwitchC-Vlan-interface600] quit
```

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::20F:E2FF:FE23:82F5 on Vlan-interface100
 Destination 2::/64,
     via FE80::20F:E2FF:FE23:82F5, cost 1, tag 0, AOF, 6 secs
 Peer FE80::20F:E2FF:FE00:100  on Vlan-interface200
 Destination 4::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::20F:E2FF:FE00:100, cost 1, tag 0, AOF, 11
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
```

Display the RIPng routing table on Switch A.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::200:2FF:FE64:8904 on Vlan-interface100
 Destination 3::/64,
     via FE80::200:2FF:FE64:8904, cost 1, tag 0, AOF, 31 secs
```

```
 Destination 4::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Destination 5::/64,
     via FE80::200:2FF:FE64:8904, cost 2, tag 0, AOF, 31 secs
 Local route
 Destination 2::/64,
     via ::, cost 0, tag 0, DOF
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
```

3. Configure route filtering:

Use IPv6 prefix lists on Switch B to filter received and redistributed routes.

```
[SwitchB] ipv6 prefix-list aaa permit 4:: 64
[SwitchB] ipv6 prefix-list bbb deny 2:: 64
[SwitchB] ipv6 prefix-list bbb permit :: 0 less-equal 128
[SwitchB] ripng 1
[SwitchB-ripng-1] filter-policy prefix-list aaa export
[SwitchB-ripng-1] filter-policy prefix-list bbb import
[SwitchB-ripng-1] quit
```

Display RIPng routing tables on Switch B and Switch A.

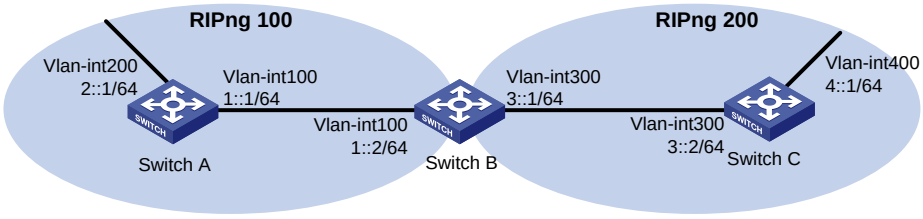
```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------

 Peer FE80::1:100 on Vlan-interface100

 Peer FE80::3:200 on Vlan-interface200
 Destination 4::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Destination 5::/64,
     via FE80::2:200, cost 1, tag 0, AOF, 11 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 3::/64,
     via ::, cost 0, tag 0, DOF
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D – Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------

 Peer FE80::2:100 on Vlan-interface100
 Destination 4::/64,
     via FE80::1:100, cost 2, tag 0, AOF, 2 secs
 Local route
 Destination 1::/64,
     via ::, cost 0, tag 0, DOF
 Destination 2::/64,
```

```
via ::, cost 0, tag 0, DOF
```



Example: Configuring RIPng route redistribution

Network configuration

As shown in Figure 3, Switch B communicates with Switch A through RIPng 100 and with Switch C through RIPng 200.

Configure route redistribution on Switch B, so the two RIPng processes can redistribute routes from each other.

Figure 3 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Enable RIPng 100 on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 100
[SwitchA-ripng-100] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 100 enable
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ripng 100 enable
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng 100 and RIPng 200 on Switch B.

```
<SwitchB> system-view
[SwitchB] ripng 100
[SwitchB-ripng-100] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 100 enable
[SwitchB-Vlan-interface100] quit
[SwitchB] ripng 200
[SwitchB-ripng-200] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ripng 200 enable
[SwitchB-Vlan-interface300] quit
```

   # Enable RIPng 200 on Switch C.

```
<SwitchC> system-view
[SwitchC] ripng 200
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ripng 200 enable
```

```
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ripng 200 enable
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch A.

```
[SwitchA] display ipv6 routing-table

Destinations : 7 Routes : 7

Destination: ::1/128                                Protocol  : Direct
NextHop    : ::1                                    Preference: 0

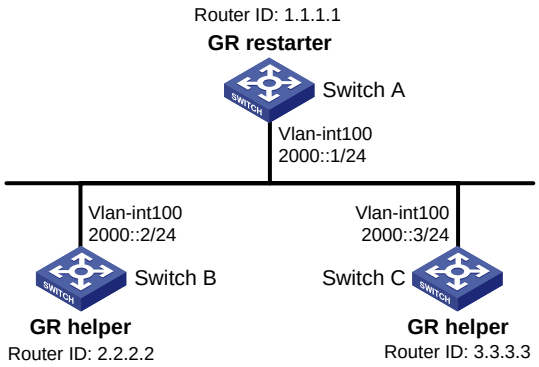
Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```



Example: Configuring RIPng GR

Network configuration

As shown in Figure 4, Switch A, Switch B, and Switch C learn IPv6 routing information through RIPng.

Configure Switch A as the GR restarter. Configure Switch B and Switch C as the GR helpers to synchronize their routing tables with Switch A by using GR.

Figure 4 Network diagram

Procedure

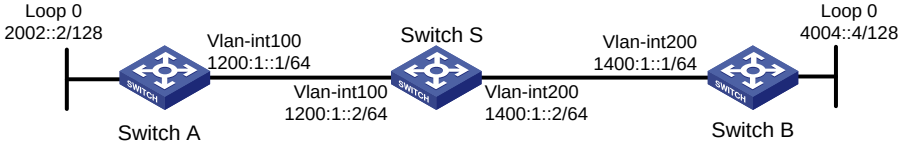
1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch A, Switch B, and Switch C can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng GR on Switch A.

```
<SwitchA> system-view
[SwitchA] ripng 1
[SwitchA-ripng-1] graceful-restart
```

Verifying the configuration

Restart RIPng or trigger an active/standby switchover, and then display GR status on Switch A.

```
<SwitchA> display ripng 1 graceful-restart
RIPng process: 1
 Graceful Restart capability     : Enabled
 Current GR state                : Normal
 Graceful Restart period         : 60  seconds
 Graceful Restart remaining time: 0   seconds
```



Example: Configuring RIPng NSR

Network configuration

As shown in Figure 5, Switch S, Switch A, and Switch B learn IPv6 routing information through RIPng.

Enable RIPng NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)

2. Configure RIPng on the switches to ensure the following: (Details not shown.)
   - Switch S, Switch A, and Switch B can communicate with each other at Layer 3.
   - Dynamic route update can be implemented among them with RIPng.
3. Enable RIPng NSR.

   # Enable RIPng NSR on Switch S.

```
<SwitchS> system-view
[SwitchS] ripng 1
[SwitchS-ripng-1] non-stop-routing
[SwitchS-ripng-1] quit
```

Verifying the configuration

Perform an active/standby switchover on Switch S.

```

```

During the switchover period, display RIPng neighbors on Switch A to verify the neighbor relationship between Switch A and Switch S.

```
[SwitchA] display ripng 1 neighbor
 Neighbor Address: FE80::AE45:5CE7:422E:2867
     Interface  : Vlan-interface100
     Version    : RIPng version 1     Last update: 00h00m23s
     BFD session: None
     Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch A to verify if Switch A has a route to the loopback interface on Switch B.

```
[SwitchA] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::AE45:5CE7:422E:2867 on Vlan-interface100
 Destination 1400:1::/64,
     via FE80::AE45:5CE7:422E:2867, cost 1, tag 0, AOF, 1 secs
 Destination 4004::4/128,
```

```
    via FE80::AE45:5CE7:422E:2867, cost 2, tag 0, AOF, 1 secs
 Local route
 Destination 2002::2/128,
    via ::, cost 0, tag 0, DOF
 Destination 1200:1::/64,
    via ::, cost 0, tag 0, DOF
```

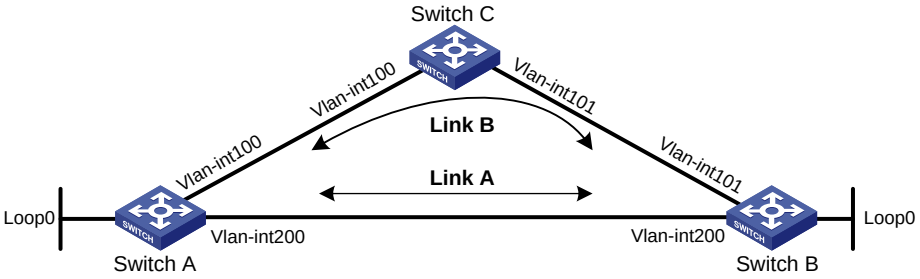
Display RIPng neighbors on Switch B to verify the neighbor relationship between Switch B and Switch S.

```
[SwitchB] display ripng 1 neighbor
 Neighbor Address: FE80::20C:29FF:FECE:6277
    Interface  : Vlan-interface200
    Version    : RIPng version 1     Last update: 00h00m18s
    BFD session: None
    Bad packets: 0                   Bad routes : 0
```

Display RIPng routes on Switch B to verify if Switch B has a route to the loopback interface on Switch A.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ----------------------------------------------------------------
 Peer FE80::20C:29FF:FECE:6277 on Vlan-interface200
 Destination 2002::2/128,
    via FE80::20C:29FF:FECE:6277, cost 2, tag 0, AOF, 24 secs
 Destination 1200:1::/64,
    via FE80::20C:29FF:FECE:6277, cost 1, tag 0, AOF, 24 secs
 Local route
 Destination 4004::4/128,
    via ::, cost 0, tag 0, DOF
 Destination 1400:1::/64,
    via ::, cost 0, tag 0, DOF
```

The output shows the following when an active/standby switchover occurs on Switch S:



- The neighbor relationships and routing information on Switch A and Switch B have not changed.
- The traffic from Switch A to Switch B has not been impacted.

Example: Configuring RIPng FRR

Network configuration

As shown in Figure 6, Switch A, Switch B, and Switch C run RIPng. Configure RIPng FRR so that when Link A becomes unidirectional, traffic can be switched to Link B immediately.

Figure 6 Network diagram

Device	Interface	IP address
Switch A	VLAN-interface 100	1::1/64
Switch A	VLAN-interface 200	2::1/64
Switch A	Loopback 0	10::1/128
Switch B	VLAN-interface 101	3::1/64
Switch B	VLAN-interface 200	2::2/64
Switch B	Loopback 0	20::1/128
Switch C	VLAN-interface 100	1::2/64
Switch C	VLAN-interface 101	3::2/64

Procedure

1. Configure IPv6 addresses for the interfaces on the switches. (Details not shown.)
2. Configure RIPng on the switches to make sure Switch A, Switch B, and Switch C can communicate with each other at Layer 3. (Details not shown.)
3. Configure RIPng FRR:

   # Configure Switch A.

```
<SwitchA> system-view
[SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
[SwitchA] route-policy frr permit node 10
[SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 100 backup-nexthop fe80::6eab:8bff:fed4:205
[SwitchA-route-policy-frr-10] quit
[SwitchA] ripng 1
[SwitchA-ripng-1] fast-reroute route-policy frr
[SwitchA-ripng-1] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop fe80::6eab:8bff:fed4:206
[SwitchB-route-policy-frr-10] quit
[SwitchB] ripng 1
[SwitchB-ripng-1] fast-reroute route-policy frr
```

```
[SwitchB-ripng-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

Example: Configuring RIPng IPsec profile

Network configuration

As shown in Figure 7, configure RIPng on the switches, and configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 7 Network diagram

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic RIPng settings:

   # Configure Switch A.

   ```
   <SwitchA> system-view
   [SwitchA] ripng 1
   [SwitchA-ripng-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ripng 1 enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Configure Switch B.

   ```
   <SwitchB> system-view
   [SwitchB] ripng 1
   [SwitchB-ripng-1] quit
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] ripng 1 enable
   [SwitchB-Vlan-interface200] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ripng 1 enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Configure Switch C.

   ```
   <SwitchC> system-view
   [SwitchC] ripng 1
   [SwitchC-ripng-1] quit
   [SwitchC] interface vlan-interface 200
   [SwitchC-Vlan-interface200] ripng 1 enable
   [SwitchC-Vlan-interface200] quit
   ```

3. Configure RIPng IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchA] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  [SwitchA-ipsec-transform-set-protrf1] esp authentication-algorithm md5
  ```

  # Specify transport mode for encapsulation.

  ```
   [SwitchA-ipsec-transform-set-protrf1] encapsulation-mode transport
  [SwitchA-ipsec-transform-set-protrf1] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Reference IPsec transform set **protrf1**.

  ```
  [SwitchA-ipsec-profile-profile001-manual] transform-set protrf1
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-profile001-manual] sa spi inbound esp 256
  [SwitchA-ipsec-profile-profile001-manual] sa spi outbound esp 256
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
  [SwitchA-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
  [SwitchA-ipsec-profile-profile001-manual] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchB] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  [SwitchB-ipsec-transform-set-protrf1] esp authentication-algorithm md5
  ```

  # Specify transport mode for encapsulation.

  ```
   [SwitchB-ipsec-transform-set-protrf1] encapsulation-mode transport
  [SwitchB-ipsec-transform-set-protrf1] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Reference IPsec transform set **protrf1**.

  ```
  [SwitchB-ipsec-profile-profile001-manual] transform-set protrf1
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchB-ipsec-profile-profile001-manual] sa spi inbound esp 256
  [SwitchB-ipsec-profile-profile001-manual] sa spi outbound esp 256
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchB-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
  [SwitchB-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
  [SwitchB-ipsec-profile-profile001-manual] quit
  ```

- On Switch C:

  # Create an IPsec transform set named **protrf1**.

  ```
  [SwitchC] ipsec transform-set protrf1
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchC-ipsec-transform-set-protrf1] esp encryption-algorithm 3des-cbc
  ```

```
[SwitchC-ipsec-transform-set-protrf1] esp authentication-algorithm md5
```

Specify transport mode for encapsulation.

```
 [SwitchC-ipsec-transform-set-protrf1] encapsulation-mode transport
[SwitchC-ipsec-transform-set-protrf1] quit
```

Create a manual IPsec profile named **profile001**.

```
[SwitchC] ipsec profile profile001 manual
```

Reference IPsec transform set **protrf1**.

```
[SwitchC-ipsec-profile-profile001-manual] transform-set protrf1
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa spi inbound esp 256
[SwitchC-ipsec-profile-profile001-manual] sa spi outbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-profile001-manual] sa string-key inbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] sa string-key outbound esp simple abc
[SwitchC-ipsec-profile-profile001-manual] quit
```

4. Apply the IPsec profiles to the RIPng process on each device:
   - On Switch A:

     ```
     [SwitchA] ripng 1
     [SwitchA-ripng-1] enable ipsec-profile profile001
     [SwitchA-ripng-1] quit
     ```

   - On Switch B:

     ```
     [SwitchB] ripng 1
     [SwitchB-ripng-1] enable ipsec-profile profile001
     [SwitchB-ripng-1] quit
     ```

   - On Switch C:

     ```
     [SwitchC] ripng 1
     [SwitchC-ripng-1] enable ipsec-profile profile001
     [SwitchC-ripng-1] quit
     ```

Verifying the configuration

Verify that the RIPng packets between Switches A, B and C are protected by IPsec. (Details not shown.)

Configuring OSPFv3

About OSPFv3

This chapter describes how to configure Open Shortest Path First version 3 (OSPFv3) for an IPv6 network.

Comparison of OSPFv3 with OSPFv2

OSPFv3 and OSPFv2 have the following in common:

- 32-bit router ID and area ID.
- Hello, Database Description (DD), Link State Request (LSR), Link State Update (LSU), Link State Acknowledgment (LSAck).
- Mechanisms for finding neighbors and establishing adjacencies.
- Mechanisms for advertising and aging LSAs.

OSPFv3 and OSPFv2 have the following differences:

- OSPFv3 runs on a per-link basis and uses link-local addresses for neighbor relationship establishment and LSA database synchronization. All OSPFv3 interfaces use their link-local addresses to forward packets except for virtual links.
- OSPFv3 supports running multiple processes on an interface, but OSPFv2 does not support.
- OSPFv3 identifies neighbors by router ID. OSPFv2 identifies neighbors by IP address.

For more information about OSPFv2, see "Configuring OSPF."

OSPFv3 packets

OSPFv3 uses the following packet types:

- **Hello**—Periodically sent to find and maintain neighbors, containing timer values, information about the DR, BDR, and known neighbors.
- **DD**—Describes the digest of each LSA in the LSDB, exchanged between two routers for data synchronization.
- **LSR**—Requests needed LSAs from the neighbor. After exchanging the DD packets, the two routers know which LSAs of the neighbor are missing from their LSDBs. They then send an LSR packet to each other, requesting the missing LSAs. The LSA packet contains the digest of the missing LSAs.
- **LSU**—Transmits the requested LSAs to the neighbor.
- **LSAck**—Acknowledges received LSU packets.

OSPFv3 LSA types

OSPFv3 sends routing information in LSAs. The following LSAs are commonly used:

- **Router LSA**—Type-1 LSA, originated by all routers. This LSA describes the collected states of the router's interfaces to an area, and is flooded throughout a single area only.
- **Network LSA**—Type-2 LSA, originated for broadcast and NBMA networks by the DR. This LSA contains the list of routers connected to the network, and is flooded throughout a single area only.

- **Inter-Area-Prefix LSA**—Type-3 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Prefix LSA describes a route with IPv6 address prefix to a destination outside the area, yet still inside the AS.
- **Inter-Area-Router LSA**—Type-4 LSA, originated by ABRs and flooded throughout the LSA's associated area. Each Inter-Area-Router LSA describes a route to ASBR.
- **AS External LSA**—Type-5 LSA, originated by ASBRs, and flooded throughout the AS, except stub areas and Not-So-Stubby Areas (NSSAs). Each AS External LSA describes a route to another AS. A default route can be described by an AS External LSA.
- **NSSA LSA**—Type-7 LSA, originated by ASBRs in NSSAs and flooded throughout a single NSSA. NSSA LSAs describe routes to other ASs.
- **Link LSA**—Type-8 LSA. A router originates a separate Link LSA for each attached link. Link LSAs have link-local flooding scope. Each Link LSA describes the IPv6 address prefix of the link and Link-local address of the router.
- **Intra-Area-Prefix LSA**—Type-9 LSA. Each Intra-Area-Prefix LSA contains IPv6 prefix information on a router, stub area, or transit area information, and has area flooding scope. It was introduced because Router LSAs and Network LSAs contain no address information.
- **Grace LSA**—Type-11 LSA, generated by a GR restarter at reboot and transmitted on the local link. The GR restarter describes the cause and interval of the reboot in the Grace LSA to notify its neighbors that it performs a GR operation.

Protocols and standards

- RFC 7166, *Supporting Authentication Trailer for OSPFv3*

OSPFv3 tasks at a glance

To configure OSPFv3, perform the following tasks:

1. Enabling OSPFv3
2. (Optional.) Establishing OSPFv3 neighbor relationships on an M-LAG network
3. (Optional.) Configuring OSPFv3 area parameters
   - Configuring a stub area
   - Configuring an NSSA area
   - Configuring an OSPFv3 virtual link

     Perform this task on an ABR to create a virtual link when connectivity cannot be maintained between a non-backbone area and the backbone, or within the backbone.

4. (Optional.) Configuring OSPFv3 network types
   - Setting the broadcast network type for an OSPFv3 interface
   - Setting the NBMA network type for an OSPFv3 interface
   - Setting the P2MP network type for an OSPFv3 interface
   - Setting the P2P network type for an OSPFv3 interface
5. (Optional.) Configuring OSPFv3 route control
   - Configuring OSPFv3 inter-area route summarization
   - Configuring redistributed route summarization
   - Configuring OSPFv3 received route filtering
   - Configuring Inter-Area-Prefix LSA filtering
   - Setting an OSPFv3 cost for an interface
   - Advertising the maximum link cost to neighbors within the specified period
   - Associating OSPFv3 with Track
   - Setting the maximum number of OSPFv3 ECMP routes
   - Setting a preference for OSPFv3
   - Configuring OSPFv3 route redistribution
6. (Optional.) Setting OSPFv3 timers
   - Setting OSPFv3 packet timers
   - Setting the LSA transmission delay
   - Setting the OSPFv3 route calculation interval
   - Setting the LSA generation interval
   - Setting the LSU transmit rate
7. (Optional.) Setting a DR priority for an interface
8. (Optional.) Configuring OSPFv3 packet parameters
   - Ignoring MTU check for DD packets
   - Disabling interfaces from receiving and sending OSPFv3 packets
9. (Optional.) Configuring prefix suppression
10. (Optional.) Configuring OSPFv3 advanced features
    - Configuring a stub router
    - Configuring OSPFv3 isolation
    - Configuring OSPFv3 shutdown
11. (Optional.) Enhancing OSPFv3 availability
    - Configuring OSPFv3 GR
    - Configuring OSPFv3 NSR
    - Configuring BFD for OSPFv3
    - Configuring OSPFv3 FRR
12. (Optional.) Enhancing OSPFv3 security
    - Configuring OSPFv3 authentication
    - Applying an IPsec profile for authenticating OSPFv3 packets
13. (Optional.) Configuring OSPFv3 logging and SNMP notifications
    - Enabling logging for neighbor state changes
    - Setting the maximum number of OSPFv3 logs
    - Configuring OSPFv3 network management

Enabling OSPFv3

About this task

To enable an OSPFv3 process on a router:

1. Enable the OSPFv3 process globally.
2. Assign the OSPFv3 process a router ID.
3. Enable the OSPFv3 process on related interfaces.

An OSPFv3 process ID has only local significance. Process 1 on a router can exchange packets with process 2 on another router.

OSPFv3 requires you to manually specify a router ID for each router in an AS. Make sure all assigned router IDs in the AS are unique.

Restrictions and guidelines

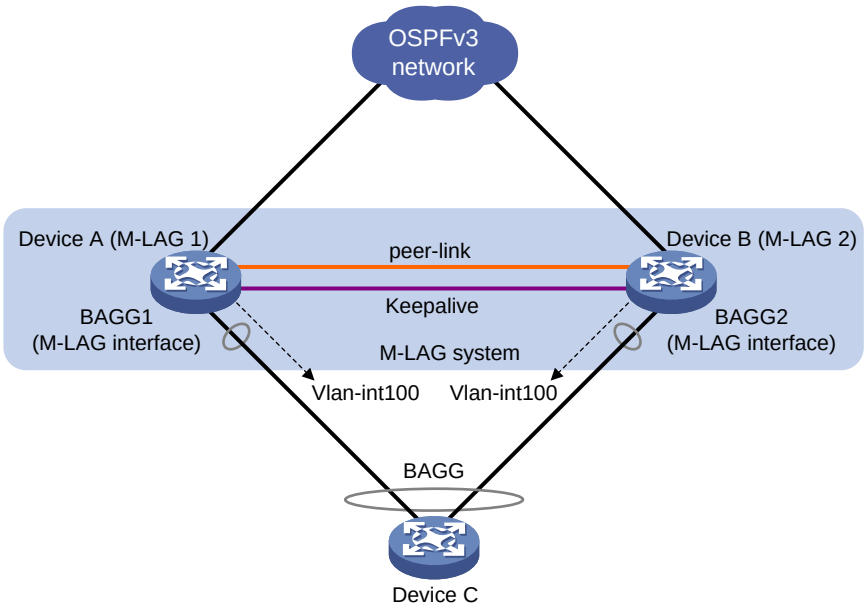
If a router runs multiple OSPFv3 processes, you must specify a unique router ID for each process.

Procedure

1. Enter system view.
   system-view
2. Enable an OSPFv3 process and enter its view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
   By default, no OSPFv3 processes are enabled.
3. Specify a router ID.
   router-id *router-id*
   By default, no router ID is configured.
4. (Optional.) Configure a description for the OSPFv3 process.
   description *text*
   By default, no description is configured for an OSPFv3 process.
   To identify and manage different OSPFv3 processes, configure a unique description for each process.
5. Return to system view.
   quit
6. Enter interface view.
   interface *interface-type interface-number*
7. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
   By default, no OSPFv3 processes are enabled on an interface.

Establishing OSPFv3 neighbor relationships on an M-LAG network

About this task



When a customer-side device accesses the OSPFv3 network through both M-LAG member devices in an M-LAG system, the M-LAG member devices provide Layer 3 gateway services. The gateway interfaces (such as VLAN interfaces) on different M-LAG member devices might generate the same link-local address because they have the same IP address and MAC address. In this case, the

M-LAG member devices cannot establish OSPFv3 neighbor relationships with the customer-side device.

To resolve this issue, configure the gateway interfaces to use M-LAG virtual IPv6 addresses for OSPFv3 neighbor relationship establishment. The M-LAG virtual IPv6 address configured for a gateway interface must be a link-local address because OSPFv3 uses link-local addresses for OSPFv3 neighbor relationship establishment. For more information about M-LAG, see M-LAG configuration in *Layer 2—LAN Switching Configuration Guide*.

As shown in Figure 1, Device C accesses the OSPFv3 network through the M-LAG system that consists of Device A and Device B. Device A and Device B provide Layer 3 gateway services. The gateway interface VLAN-interface 100 on Device A and the gateway interface VLAN-interface 100 on Device B have the same IP address and the same MAC address. To ensure that both Device A and Device B can establish an OSPFv3 neighbor relationship with Device C, configure different M-LAG virtual IPv6 addresses for the VLAN interfaces on Device A and Device B.

Figure 1 OSPFv3 neighbor relationship establishment on an M-LAG network

Procedure

1. Enter system view.
   `system-view`
2. Enter interface view.
   `interface` *`interface-type interface-number`*
3. Specify a link-local address as the M-LAG virtual IPv6 address to be assigned to the interface.
   `port m-lag ipv6 virtual-ip` *`ipv6-address`* **`link-local`**
   By default, no M-LAG virtual IPv6 address is assigned to an interface.
   For more information about this command, see M-LAG commands in *Layer 2—LAN Switching Ethernet Command Reference*.

Configuring OSPFv3 area parameters

About OSPFv3 areas

OSPFv3 has the same stub area, NSSA area, and virtual link features as OSPFv2.

After you split an OSPFv3 AS into multiple areas, the LSA number is reduced and OSPFv3 applications are extended. To further reduce the size of routing tables and the number of LSAs, configure the non-backbone areas at an AS edge as stub areas.

A stub area cannot import external routes, but an NSSA area can import external routes into the OSPFv3 routing domain while retaining other stub area characteristics.

Non-backbone areas exchange routing information through the backbone area, so the backbone and non-backbone areas (including the backbone itself) must be fully meshed. If no connectivity can be achieved, configure virtual links.

Configuring a stub area

Restrictions and guidelines

To configure a stub area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as a stub area.
   stub [**default-route-advertise-always** | **no-summary**] *
   By default, no area is configured as a stub area.
   The **no-summary** keyword is only available on the ABR of a stub area. If you specify the **no-summary** keyword, the ABR only advertises a default route in an Inter-Area-Prefix LSA into the stub area.
5. (Optional.) Set a cost for the default route advertised to the stub area.
   default-cost *cost-value*
   By default, the cost for the default route advertised to the stub area is 1.

Configuring an NSSA area

Restrictions and guidelines

To configure an NSSA area, you must perform this task on all routers attached to the area.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure the area as an NSSA area.
   nssa [**default-route-advertise** [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] * |

no-import-route | **no-summary** | [**translate-always** | **translate-never**] | **suppress-fa** | **translator-stability-interval** *value*] *

By default, no area is configured as an NSSA area.

To configure a totally NSSA area, execute the **nssa no-summary** command on the ABR. The ABR of a totally NSSA area does not advertise inter-area routes into the area.

5. (Optional.) Set a cost for the default route advertised to the NSSA area.

   default-cost *cost-value*

   By default, the cost for the default route advertised to the NSSA area is 1.

   This command takes effect only on the ABR/ASBR of an NSSA or totally NSSA area.

Configuring an OSPFv3 virtual link

About this task

You can configure a virtual link to maintain connectivity between a non-backbone area and the backbone, or in the backbone itself.

Restrictions and guidelines

Both ends of a virtual link are ABRs that must be configured with the **vlink-peer** command.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Configure a virtual link.

   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | **keychain** *keychain-name* | **retransmit** *seconds* | **trans-delay** *seconds*] *

Configuring OSPFv3 network types

Restrictions and guidelines for OSPFv3 network type configuration

Based on the link layer protocol, OSPFv3 classifies networks into different types, including broadcast, NBMA, P2MP, and P2P.

- If any routers in a broadcast network do not support multicasting, you can change the network type to NBMA.
- If only two routers running OSPFv3 exist on a network segment, you can change the network type to P2P to save costs.

Setting the broadcast network type for an OSPFv3 interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to broadcast for the OSPFv3 interface.

   ospfv3 network-type broadcast [**instance** *instance-id*]

   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

Setting the NBMA network type for an OSPFv3 interface

Restrictions and guidelines

For NBMA interfaces, you must specify the link-local IP addresses and DR priorities for their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to NBMA for the OSPFv3 interface.

   ospfv3 network-type nbma [**instance** *instance-id*]

   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

4. (Optional.) Set the router priority for the interface

   ospfv3 dr-priority *priority*

   By default, an interface has a router priority of 1.

   An interface's router priority determines its privilege in DR/BDR selection.

5. Specify an NBMA neighbor.

   ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

   By default, no link-local address is specified for the neighbor interface.

Setting the P2MP network type for an OSPFv3 interface

Restrictions and guidelines

For P2MP interfaces (only when in unicast mode), you must specify the link-local IP addresses of their neighbors because these interfaces cannot find neighbors by broadcasting hello packets.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the network type to P2MP for the OSPFv3 interface.

   ospfv3 network-type p2mp [**unicast**] [**instance** *instance-id*]

   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

4. Specify a P2MP unicast neighbor.

ospfv3 peer *ipv6-address* [**cost** *cost-value* | **dr-priority** *priority*] [**instance** *instance-id*]

By default, no link-local address is specified for the neighbor interface.

Setting the P2P network type for an OSPFv3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the network type to P2P for the OSPFv3 interface.
   ospfv3 network-type p2p [**instance** *instance-id*]
   By default, the network type of an OSPFv3 interface depends on the encapsulated link layer protocol.

Configuring OSPFv3 route control

Configuring OSPFv3 inter-area route summarization

About this task

If contiguous network segments exist in an area, you can summarize them into one network segment on the ABR. The ABR will advertise only the summary route. Any LSA on the specified network segment will not be advertised, reducing the LSDB size in other areas.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Configure route summarization on the ABR.
   abr-summary *ipv6-address prefix-length* [**not-advertise**] [**cost** *cost-value*]
   By default, route summarization is not configured on an ABR.

Configuring redistributed route summarization

About this task

Perform this task to enable an ASBR to summarize external routes within the specified address range into a single route.

An ASBR can summarize routes in the following LSAs:

- Type-5 LSAs.
- Type-7 LSAs in an NSSA area.

- Type-5 LSAs translated from Type-7 LSAs in an NSSA area if the ASBR (also an ABR) is a translator. If the ASBR is not a translator, it cannot summarize routes in Type-5 LSAs translated from Type-7 LSAs.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure route summarization on an ASBR.

   asbr-summary *ipv6-address prefix-length* [**cost** *cost-value* | **not-advertise** | **nssa-only** | **tag** *tag*] *

   By default, route summarization is not configured on an ASBR.

Configuring OSPFv3 received route filtering

About this task

This task allows you to filter routes calculated by using received LSAs.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 to filter routes calculated by using received LSAs.

   filter-policy { *ipv6-acl-number* [**gateway** *prefix-list-name*] | **prefix-list** *prefix-list-name* [**gateway** *prefix-list-name*] | **gateway** *prefix-list-name* | **route-policy** *route-policy-name* } **import**

   By default, OSPFv3 accepts all routes calculated by using received LSAs.

   This command can only filter routes computed by OSPFv3. Only routes not filtered out can be added into the local routing table.

Configuring Inter-Area-Prefix LSA filtering

Restrictions and guidelines

The **filter** command takes effect only on ABRs.

Procedure

1. Enter system view.

   system-view
2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.

   area *area-id*
4. Configure OSPFv3 to filter Inter-Area-Prefix LSAs.

   filter { *ipv6-acl-number* | **prefix-list** *prefix-list-name* | **route-policy** *route-policy-name* } { **export** | **import** }

By default, OSPFv3 accepts all Inter-Area-Prefix LSAs.

Advertising the maximum link cost to neighbors within the specified period

About this task

On an OSPFv3 network, when a link recovers from failures or the state of an interface changes, OSPFv3 will re-establish neighbor relationships and perform route convergence. During the route convergence process, routing loops and traffic loss might occur because the convergence speeds of the nodes are different. To address this issue, enable OSPFv3 to advertise the maximum link cost (65535) to neighbors within the specified period, so the traffic forwarding path remains unchanged. After the specified period, OSPFv3 advertises the original link cost to neighbors and performs optimal route selection again.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the duration of the maximum link cost advertisement.

   ospfv3 peer hold-max-cost duration *timer* [**instance** *instance-id*]

   By default, OSPFv3 advertises the original link cost to neighbors during a route convergence.

Setting an OSPFv3 cost for an interface

About this task

You can set an OSPFv3 cost for an interface with one of the following methods:

- Set the cost value in interface view.
- Set a bandwidth reference value for the interface, and OSPFv3 computes the cost automatically based on the bandwidth reference value by using the following formula:

  Interface OSPFv3 cost = Bandwidth reference value (100 Mbps) / Interface bandwidth (Mbps)
  - If the calculated cost is greater than 65535, the value of 65535 is used.
  - If the calculated cost is smaller than 1, the value of 1 is used.
- If no cost is set for an interface, OSPFv3 automatically computes the cost for the interface.

Setting a cost in interface view

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set an OSPFv3 cost for the interface.

   ospfv3 cost *cost-value* [**instance** *instance-id*]

   By default, the OSPFv3 cost is 1 for a VLAN interface, is 0 for a loopback interface. The OSPFv3 cost is automatically computed according to the interface bandwidth for other interfaces.

Setting a bandwidth reference value

1. Enter system view.

system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

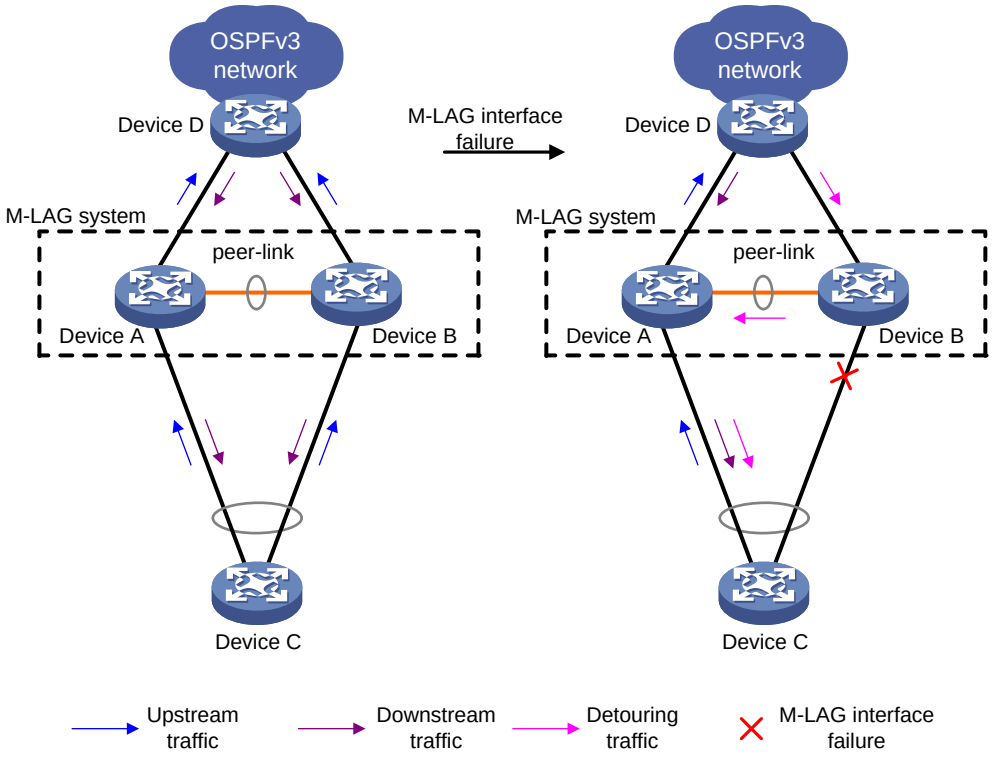
3. Set a bandwidth reference value.

   bandwidth-reference *value*

   The default bandwidth reference value is 100 Mbps.

Associating OSPFv3 with Track

About this task



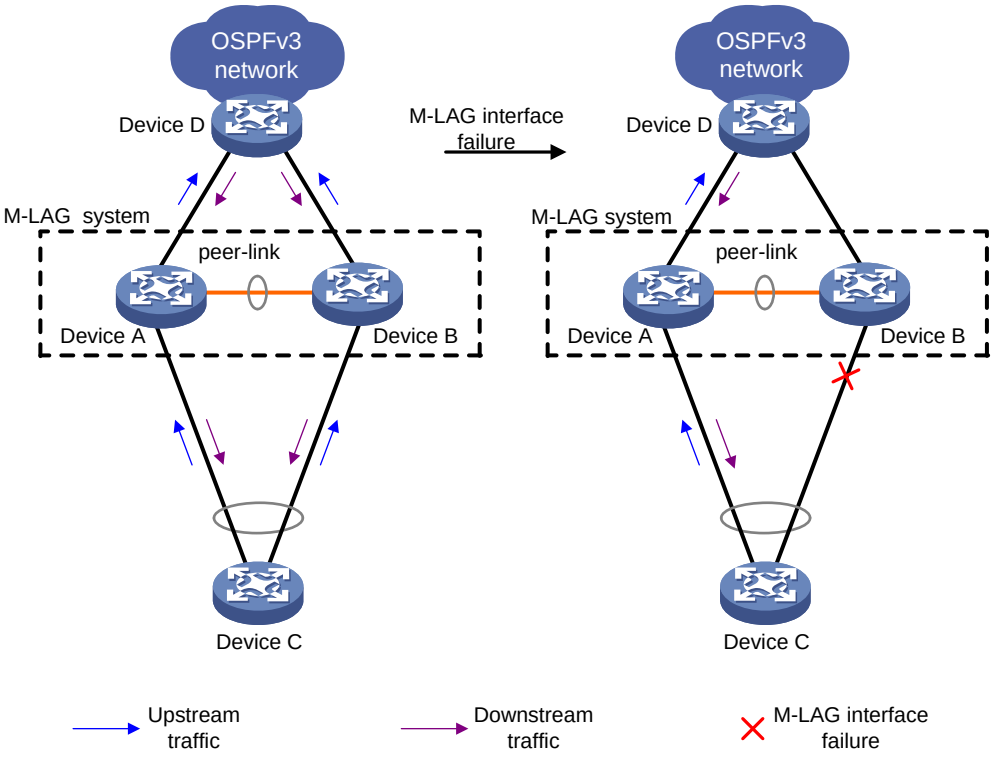
Perform this task to associate an OSPFv3 interface with a track entry to adjust the cost of the interface as follows:

- When the track entry state becomes negative, OSPFv3 increases the cost of the interface.
- When the track entry state becomes positive, OSPFv3 restores the cost of the interface to the original value.

When a customer side device is dual-homed to an OSPFv3 network through M-LAG, you can configure this feature to prevent the traffic from detouring through the M-LAG peer link. As shown in Figure 2, customer-side device Device C is dual-homed to the OSPFv3 network through an M-LAG system formed by Device A and Device B. Device A and Device B share the traffic load between Device D and Device C. When the M-LAG interface that connects Device B to Device C fails, the upstream traffic and downstream traffic are forwarded as follows:

- Device C detects the M-LAG interface failure, and traffic from Device C to Device D is switched from path Device C->Device B->Device D to path Device C->Device A->Device D.
- Device D cannot detect the M-LAG interface failure and still forwards traffic through Device B. Because the link between Device B and Device C fails, traffic from Device D to Device C is switched from path Device D->Device B->Device C to path Device D->Device B->Device A->Device C.

Figure 2 Traffic forwarding path after M-LAG interface failure



To prevent the downstream traffic from detouring through the M-LAG peer link, perform the following tasks on Device B:

1. Execute the **track interface** command to create a track entry and associate it with the link state of the M-LAG interface. For more information about the **track interface** command, see track commands in *High Availability Command Reference*.
2. Execute the **ospfv3 track adjust-cost** command to associate the gateway interface with the track entry.

Then, Device B adjusts the cost of the gateway interface based on the state of the associated track entry:

- When the M-LAG interface fails, the track entry state becomes negative, and OSPFv3 increases the cost of the gateway interface. Then, traffic from Device D to Device C is switched to path Device D->Device A->Device C.
- When the M-LAG interface recovers, the track entry state becomes positive, and OSPFv3 restores the cost of the gateway interface to the original value. Then, traffic from Device D to Device C is switched back to path Device D->Device B->Device C.

Figure 3 Traffic forwarding path after associating OSPFv3 with Track

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Associate the OSPFv3 interface with a track entry to adjust the cost of the interface based on the track entry state.

   ospfv3 track *track-entry-number* **adjust-cost** { *cost-offset* | **max** }

   By default, an OSPFv3 interface is not associated with any track entry.

Setting the maximum number of OSPFv3 ECMP routes

About this task

OSPFv3 might find multiple equal-cost routes to the same destination, which can be used to share the traffic load. This task allows you to set the maximum number of ECMP routes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the maximum number of ECMP routes.

   maximum load-balancing *number*

By default, the maximum number of OSPFv3 ECMP routes equals the maximum number of ECMP routes supported by the system.

Setting a preference for OSPFv3

About this task

A router can run multiple routing protocols. The system assigns a priority for each protocol. When these routing protocols find the same route, the route found by the protocol with the highest priority is selected.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set a preference for OSPFv3.

   preference [**ase**] { *preference* | **route-policy** *route-policy-name* } *

   By default, the preference of OSPFv3 internal routes is 10, and the preference of OSPFv3 external routes is 150.

Configuring OSPFv3 route redistribution

Restrictions and guidelines

Because OSPFv3 is a link state routing protocol, it cannot directly filter LSAs to be advertised. OSPFv3 filters only redistributed routes. Only routes that are not filtered out can be advertised in LSAs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure route redistribution.

   import-route bgp4+ [*as-number*] [**allow-ibgp**] [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **direct** | **static** } [[**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   import-route { **isisv6** | **ospfv3** | **ripng** } [*process-id* | **all-processes**] [**allow-direct** | [**cost** *cost-value* | **inherit-cost**] | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, OSPFv3 does not redistribute routes.

   The **import-route bgp4+** command redistributes only EBGP routes. The **import-route bgp4+ allow-ibgp** command redistributes both EBGP and IBGP routes, which might cause routing loops. Therefore, use the **import-route bgp4+ allow-ibgp** command with caution.

4. (Optional.) Configure OSPFv3 to filter redistributed routes.

filter-policy { *ipv6-acl-number* | **prefix-list** *prefix-list-name* } **export** [**bgp4+** | **direct** | { **isisv6** | **ospfv3** | **ripng** } [*process-id*] | **static**]

By default, OSPFv3 accepts all redistributed routes.

This command filters only routes redistributed by the **import-route** command. If no routes are redistributed by the **import-route** command, this command does not take effect.

5. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Configuring default route redistribution

About this task

The **import-route** command cannot redistribute a default external route. To redistribute a default route, perform this task.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Redistribute a default route.

   default-route-advertise [[**always** | **permit-calculate-other**] | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no default route is redistributed.

4. Set a tag for redistributed routes.

   default tag *tag*

   By default, the tag of redistributed routes is 1.

Setting OSPFv3 timers

Setting OSPFv3 packet timers

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the hello interval.

   ospfv3 timer hello *seconds* [**instance** *instance-id*]

   The default hello interval on P2P and broadcast interfaces is 10 seconds. The default hello interval on P2MP and NBMA interfaces is 30 seconds.

4. Set the dead interval.

   ospfv3 timer dead *seconds* [**instance** *instance-id*]

   The default dead interval on P2P and broadcast interfaces is 40 seconds. The default dead interval on P2MP and NBMA interfaces is 120 seconds.

The dead interval set on neighboring interfaces cannot be too short. If the interval is too short, a neighbor is easily down.

5. Set the poll interval.

   ospfv3 timer poll *seconds* [**instance** *instance-id*]

   By default, the poll interval is 120 seconds.

6. Set the LSA retransmission interval.

   ospfv3 timer retransmit *interval* [**instance** *instance-id*]

   The default LSA retransmission interval is 5 seconds.

   The LSA retransmission interval cannot be too short. If the interval is too short, unnecessary retransmissions will occur.

Setting the LSA transmission delay

About this task

Each LSA in the LSDB has an age that increases by 1 every second, but the age does not change during transmission. Therefore, it is necessary to add a transmission delay into the age time, especially for low-speed links.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the LSA transmission delay.

   ospfv3 trans-delay *seconds* [**instance** *instance-id*]

   By default, the LSA transmission delay is 1 second.

Setting the OSPFv3 route calculation interval

About this task

LSDB changes result in SPF calculations. When the topology changes frequently, a large amount of network and router resources are occupied by SPF calculation. You can adjust the route calculation interval to reduce the impact.

The default route calculation interval settings are as follows:

- The interval for the first route calculation is 50 milliseconds.
- The interval for the nth (n ≥ 2) route calculation is 50 + (200 x 2^{n-2}) milliseconds, and cannot exceed 5 seconds.

The **spf-schedule-interval** command functions as follows:

- If the **spf-schedule-interval** *maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The route calculation interval is fixed at *maximum-interval*.
- If the **spf-schedule-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first route calculation is *minimum-interval*.

- The interval for subsequent route calculations is *maximum-interval*.

- If the **spf-schedule-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first route calculation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) route calculation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Set the route calculation interval for OSPFv3.
   spf-schedule-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]
   By default, the maximum interval is 5 seconds, the minimum interval is 50 milliseconds, and the incremental interval is 200 milliseconds.

Setting the LSA generation interval

About this task

If network changes become frequent, bandwidth resources and router resources might be overconsumed. To avoid this issue, use the **lsa-generation-interval** command to adjust the LSA generation interval settings for OSPFv3.

By default, the LSA generation interval is fixed at 5 seconds for OSPFv3.

The **lsa-generation-interval** command functions as follows:

- If the **lsa-generation**-*interval maximum-interval* command is executed:
  - The values for the *minimum-interval* and *incremental-interval* arguments are both 0.
  - The LSA generation interval is fixed at *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval* command is executed:
  - The value for the *incremental-interval* argument is 0.
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for subsequent LSA generations is *maximum-interval*.
- If the **lsa-generation-interval** *maximum-interval minimum-interval incremental-interval* command is executed:
  - The interval for the first LSA generation is *minimum-interval*.
  - The interval for the nth (n ≥ 2) LSA generation is *minimum-interval* + *incremental-interval* x 2^{n-2}, and cannot exceed *maximum-interval*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSA generation interval.

   lsa-generation-interval *maximum-interval* [*minimum-interval* [*incremental-interval*]]

   By default, the maximum interval is 5 seconds, the minimum interval is 0 milliseconds, and the incremental interval is 0 milliseconds.

Setting the LSU transmit rate

About this task

Sending large numbers of LSU packets affects router performance and consumes a large amount of network bandwidth. You can configure the router to send LSU packets at an interval and to limit the maximum number of LSU packets sent out of an OSPFv3 interface at each interval.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the LSU transmit rate.

   transmit-pacing interval *interval* **count** *count*

   By default, an OSPFv3 interface sends a maximum of three LSU packets every 20 milliseconds.

Setting a DR priority for an interface

About this task

The router priority is used for DR election. Interfaces having the priority 0 cannot become a DR or BDR.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set a router priority.

   ospfv3 dr-priority *priority* [**instance** *instance-id*]

   The default router priority is 1.

Configuring OSPFv3 packet parameters

Ignoring MTU check for DD packets

About this task

When LSAs are few in DD packets, it is unnecessary to check the MTU in DD packets to improve efficiency.

Restrictions and guidelines

A neighbor relationship can be established only if the interface's MTU is the same as that of the peer.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Ignore MTU check for DD packets.
   ospfv3 mtu-ignore [**instance** *instance-id*]
   By default, OSPFv3 does not ignore MTU check for DD packets.

Disabling interfaces from receiving and sending OSPFv3 packets

About this task

After an OSPFv3 interface is set to **silent**, direct routes of the interface can still be advertised in Intra-Area-Prefix LSAs through other interfaces, but other OSPFv3 packets cannot be advertised. No neighboring relationship can be established on the interface. This feature can enhance the adaptability of OSPFv3 networking.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable interfaces from receiving and sending OSPFv3 packets.
   silent-interface { *interface-type interface-number* | **all** }
   By default, the interfaces can receive and send OSPFv3 packets.
   This command disables only the interfaces that run the current process. However, multiple OSPFv3 processes can disable the same interface from receiving and sending OSPFv3 packets.

Configuring prefix suppression

About prefix suppression

By default, an OSPFv3 interface advertises all of its prefixes in LSAs. To speed up OSPFv3 convergence, you can suppress interfaces from advertising all of their prefixes. This feature helps improve network security by preventing IP routing to the suppressed networks.

When prefix suppression is enabled:

- OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-8 LSAs.
- On broadcast and NBMA networks, the DR does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-2 LSAs.
- On P2P and P2MP networks, OSPFv3 does not advertise the prefixes of suppressed interfaces in Type-9 LSAs that reference Type-1 LSAs.

Restrictions and guidelines for prefix suppression

As a best practice, configure prefix suppression on all OSPFv3 routers if you want to use prefix suppression.

Configuring prefix suppression for an OSPFv3 process

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable prefix suppression for the OSPFv3 process.
   prefix-suppression
   By default, prefix suppression is disabled for an OSPFv3 process.
   Enabling prefix suppression for an OSPFv3 process does not suppress the prefixes of loopback interfaces and passive interfaces.

Configuring prefix suppression for an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable prefix suppression for the interface.
   ospfv3 prefix-suppression [**disable**] [**instance** *instance-id*]
   By default, prefix suppression is disabled for an interface.

Configuring OSPFv3 advanced features

Configuring a stub router

About this task

A stub router is used for traffic control. It reports its status as a stub router to neighboring OSPFv3 routers. The neighboring routers can have a route to the stub router, but they do not use the stub router to forward data.

Use either of the following methods to configure a router as a stub router:

- Clear the R-bit of the Option field in Type-1 LSAs. When the R-bit is clear, the OSPFv3 router can participate in OSPFv3 topology distribution without forwarding traffic.
- Use the OSPFv3 max-metric router LSA feature. This feature enables OSPFv3 to advertise its locally generated Type-1 LSAs with a maximum cost of 65535. Neighbors do not send packets to the stub router as long as they have a route with a smaller cost.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.

ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Configure the router as a stub router.
   - Configure the router as a stub router and clear the R-bit of the Option field in Type-1 LSAs.

     stub-router r-bit [**include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *
   - Configure the router as a stub router and advertise the locally generated Type-1 LSAs with the maximum cost of 65535.

     stub-router max-metric [**external-lsa** [*max-metric-value*] | **summary-lsa** [*max-metric-value*] | **include-stub** | **on-startup** { *seconds* | **wait-for-bgp** [*seconds*] }] *

   By default, the router is not configured as a stub router.

   A stub router is not related to a stub area.

Configuring OSPFv3 isolation

About this task

Isolation is a method used for network device maintenance. It gracefully removes a device from the packet forwarding path for maintenance and gracefully adds the device to the network after maintenance.

To reduce impact on traffic forwarding, you can isolate a device before upgrading it. OSPFv3 isolation works as follows:

1. After OSPFv3 isolation is enabled for a device, OSPFv3 increases the link cost in LSAs advertised by the device based on the following rules:
   - The link cost in Type-1 LSAs (Router LSAs) is set to 65535.
   - The link cost in Type-9 LSAs (Intra-area-prefix LSAs) that reference Type-1 LSAs is set to 65535.
   - The link cost in the following LSAs is set to 16711680:
     - Type-3 LSAs (Inter-area-prefix LSAs).
     - Type-4 LSAs (Inter-area-router LSAs).
     - Type-5 LSAs (AS external LSAs).
     - Type-7 LSAs (NSSA LSAs).
2. Each neighbor of the device reselects an optimal route based on the LSAs and stops forwarding traffic to the device. The device is fully isolated from the network and you can upgrade the device.
3. After the maintenance, disable OSPFv3 isolation on the device to restore its link cost and gracefully add it back to the network.

Restrictions and guidelines

Both the **isolate enable** and **stub-router max-metric external-lsa 16711680 summary-lsa 16711680 include-stub** commands can isolate the device from the network.

When you execute both the **isolate enable** and **stub-router max-metric** commands, follow these restrictions and guidelines:

- If you specify the **external-lsa** and **summary-lsa** keywords in the **stub-router max-metric** command, the higher one of the two link costs provided by the isolation feature and the stub router feature takes effect.
- If the **on-startup** keyword is specified in the **stub-router max-metric** command, traffic forwarding path selection is affected only by the isolation feature when the stub router feature does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 isolation.
   - Enable OSPFv3 isolation to gracefully isolate the device from the network.
     isolate enable
   - Disable OSPFv3 isolation to gracefully add the device back to the network.
     undo isolate enable

   By default, OSPFv3 isolation is disabled.

Configuring OSPFv3 shutdown

About this task

For maintenance purposes, you can use this feature to shut down processes on the device with small impact on the network. If you shut down an OSPFv3 process, it will perform the following operations:

- Send 1-way hello packets to its neighbors.

  On receipt of the packets, the neighbors disconnect from the process and use the backup path to forward traffic.
- Stop receiving and sending OSPFv3 packets.
- Clear its neighbor, LSDB, and OSPFv3 route information.

After maintenance, you can use the **undo shutdown process** command to restart the process for neighbor relationship re-establishment.

This feature shuts down an OSPFv3 process while retaining the process-associated settings to facilitate your maintenance.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Configure OSPFv3 shutdown for OSPFv3 maintenance.
   a. Shut down an OSPFv3 process to isolate it from the network.
      shutdown process
   b. Restart the OSPFv3 process to add it back to the network.
      undo shutdown process

   By default, the OSPFv3 process is not shut down.

Configuring OSPFv3 GR

About OSPFv3 GR

GR ensures forwarding continuity when a routing protocol restarts or an active/standby switchover occurs.

Two routers are required to complete a GR process. The following are router roles in a GR process:

- **GR restarter**—Graceful restarting router. It must be Graceful Restart capable.
- **GR helper**—The neighbor of the GR restarter. It helps the GR restarter to complete the GR process.

To prevent service interruption after a master/backup switchover, a GR restarter running OSPFv3 must perform the following tasks:

- Keep the GR restarter forwarding entries stable during reboot.
- Establish all adjacencies and obtain complete topology information after reboot.

After the active/standby switchover, the GR restarter sends a Grace LSA to tell its neighbors that it performs a GR. Upon receiving the Grace LSA, the neighbors with the GR helper capability enter the helper mode (and are called GR helpers). Then, the GR restarter retrieves its adjacencies and LSDB with the help of the GR helpers.

Restrictions and guidelines for OSPFv3 GR

You cannot enable OSPFv3 NSR on a device that acts as GR restarter.

Configuring GR restarter

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR capability.
   graceful-restart enable [**global** | **planned-only**] *
   By default, OSPFv3 GR restarter capability is disabled.
4. (Optional.) Set the GR interval.
   graceful-restart interval *interval*
   By default, the GR interval is 120 seconds.

Configuring GR helper

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable the GR helper capability.
   graceful-restart helper enable [**planned-only**]
   By default, the GR helper capability is enabled.

4. Enable strict LSA checking.

   graceful-restart helper strict-lsa-checking

   By default, strict LSA checking is disabled.

Triggering OSPFv3 GR

About this task

OSPFv3 GR is triggered by an active/standby switchover or when this task is performed.

Procedure

To trigger OSPFv3 GR, execute the **reset ospfv3** [*process-id*] **process graceful-restart** command in user view.

Configuring OSPFv3 NSR

About this task

Nonstop routing (NSR) backs up OSPFv3 link state information from the active process to the standby process. After an active/standby switchover, NSR can complete link state recovery and route regeneration without tearing down adjacencies or impacting forwarding services.

Choose OSPFv3 NSR or OSPFv3 GR according to the actual situation and make sure data forwarding is not interrupted. The differences between OSPFv3 NSR and OSPFv3 GR as follows:

- **Device requirements**—The active and standby processes of OSPFv3 must run on different IRF member devices. To run OSPFv3 NSR, you must set up an IRF fabric that contains a minimum of two member devices. To run OSPFv3 GR, IRF fabric setup is not required. If an IRF fabric already exists, you can run OSPFv3 GR when the IRF fabric contains only one member device.
- **OSPFv3 neighbor requirements**—When you use OSPFv3 NSR, OSPFv3 neighbors cannot detect process restart or active/standby switchover on the local device. OSPFv3 NSR can recover OSPFv3 route information without requiring the cooperation of OSPFv3 neighbors. OSPFv3 GR requires OSPFv3 neighbors to have the GR helper capability to help the GR restarter complete the GR process.

Restrictions and guidelines

When both GR and NSR are configured for OSPFv3 on a device, the following rules apply:

- OSPFv3 NSR has a higher priority than OSPFv3 GR. When the active process goes down, the device does not act as the GR restarter and performs NSR to ensure nonstop forwarding.
- When the following conditions exist, the GR process might fail even if NSR is enabled on the GR helper:
  - OSPFv3 is restarted through GR.
  - An active/standby switchover is triggered on the GR helper before the GR process finishes.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enable OSPFv3 NSR.

   non-stop-routing

   By default, OSPFv3 NSR is enabled.

This command takes effect only for the current process. As a best practice, enable OSPFv3 NSR for each process if multiple OSPFv3 processes exist.

Configuring BFD for OSPFv3

About this task

Bidirectional forwarding detection (BFD) provides a mechanism to quickly detect the connectivity of links between OSPFv3 neighbors, improving the convergence speed of OSPFv3. For more information about BFD, see *High Availability Configuration Guide*.

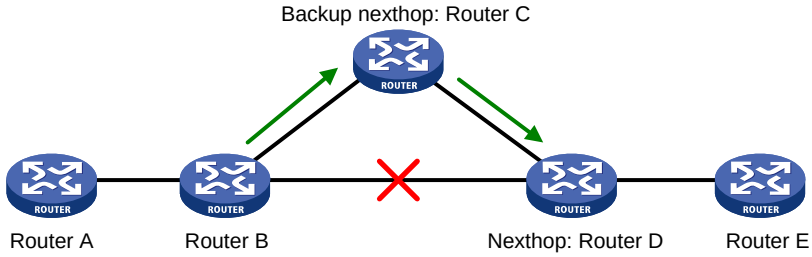
After discovering neighbors by sending hello packets, OSPFv3 notifies BFD of the neighbor addresses, and BFD uses these addresses to establish sessions. Before a BFD session is established, it is in the down state. In this state, BFD control packets are sent at an interval of no less than 1 second to reduce BFD control packet traffic. After the BFD session is established, BFD control packets are sent at the negotiated interval, thereby implementing fast fault detection.

To configure BFD for OSPFv3, you need to configure OSPFv3 first.

Restrictions and guidelines

In the current software version, this feature is not supported on VSI interfaces.

Procedure



1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Specify a router ID.
   router-id *router-id*
4. Quit the OSPFv3 view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Enable an OSPFv3 process on the interface.
   ospfv3 *process-id* **area** *area-id* [**instance** *instance-id*]
7. Enable BFD on the interface.
   ospfv3 bfd enable [**instance** *instance-id*]
   By default, BFD is disabled on the OSPFv3 interface.

Configuring OSPFv3 FRR

About OSPFv3 FRR

A primary link failure can cause packet loss and even a routing loop until OSPFv3 completes routing convergence based on the new network topology. OSPFv3 FRR enables fast rerouting to minimize the failover time.

Figure 4 Network diagram for OSPFv3 FRR

As shown in Figure 4, configure FRR on Router B. OSPFv3 FRR automatically calculates a backup next hop or specifies a backup next hop by using a routing policy. When the primary link fails, OSPFv3 directs packets to the backup next hop. At the same time, OSPFv3 calculates the shortest path based on the new network topology. It forwards packets over the path after network convergence.

You can configure OSPFv3 FRR to calculate a backup next hop by using the loop free alternate (LFA) algorithm, or specify a backup next hop by using a routing policy.

Configuring OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop

Restrictions and guidelines

Do not use the **fast-reroute lfa** command together with the **vlink-peer** command.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface on which LFA is enabled can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Enable OSPFv3 FRR to use the LFA algorithm to calculate a backup next hop.
   fast-reroute lfa [**abr-only**]
   By default, OSPFv3 FRR is disabled.
   If **abr-only** is specified, the route to the ABR is selected as the backup path.

Configuring OSPFv3 FRR to use a backup next hop in a routing policy

About this task

Before you perform this task, use the **apply ipv6 fast-reroute backup-interface** command to specify a backup next hop in the routing policy to be used. For more information about

the **apply ipv6 fast-reroute backup-interface** command and routing policy configuration, see "Configuring routing policies."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. (Optional.) Disable LFA on an interface.
   ospfv3 fast-reroute lfa-backup exclude
   By default, the interface is enabled with LFA and it can be selected as a backup interface.
4. Return to system view.
   quit
5. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
6. Configure OSPFv3 FRR to use a backup next hop in a routing policy.
   fast-reroute route-policy *route-policy-name*
   By default, OSPFv3 FRR is disabled.

Configuring BFD for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD control packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on both OSPFv3 routers on the link.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable BFD control packet mode for OSPFv3 FRR.
   ospfv3 primary-path-detect bfd ctrl [**instance** *instance-id*]
   By default, BFD control packet mode is disabled for OSPFv3 FRR.

Configuring BFD echo packet mode for OSPFv3 FRR

About this task

By default, OSPFv3 FRR does not use BFD to detect primary link failures. To speed up OSPFv3 convergence, enable BFD echo packet mode for OSPFv3 FRR to detect primary link failures. This mode requires BFD configuration on one OSPFv3 router on the link.

Procedure

1. Enter system view.
   system-view
2. Configure the source IPv6 address of BFD echo packets.
   bfd echo-source-ipv6 *ipv6-address*

By default, the source IPv6 address of BFD echo packets is not configured.

The source IPv6 address cannot be on the same network segment as any local interface's IP address.

For more information about this command, see *High Availability Command Reference*.

3. Enter interface view.

   interface *interface-type interface-number*

4. Enable BFD echo packet mode for OSPFv3 FRR.

   ospfv3 primary-path-detect bfd echo [**instance** *instance-id*]

   By default, BFD echo packet mode is disabled for OSPFv3 FRR.

Enhancing OSPFv3 security

Configuring OSPFv3 authentication

About this task

OSPFv3 uses keychain authentication to prevent routing information from being leaked and routers from being attacked.

OSPFv3 adds the Authentication Trailer option into outgoing packets, and uses the authentication information in the option to authenticate incoming packets. Only packets that pass the authentication can be received. If a packet fails the authentication, the OSPFv3 neighbor relationship cannot be established.

Restrictions and guidelines

The authentication mode specified for an OSPFv3 interface has a higher priority than the mode specified for an OSPFv3 area.

OSPFv3 supports only the HMAC-SHA-256 and HMAC-SM3 authentication algorithms.

The ID of keys used for authentication can only be in the range of 0 to 65535.

Configuring OSPFv3 area authentication

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Specify an authentication mode for the area.

   For HMAC-SHA-256/HMAC-SM3 authentication:

   authentication-mode { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string*

   For keychain authentication:

   authentication-mode keychain *keychain-name*

   By default, no authentication is performed for the area.

   For more information about keychains, see *Security Configuration Guide*.

Configuring OSPFv3 interface authentication

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Specify an authentication mode for the interface.

   For HMAC-SHA-256/HMAC-SM3 authentication:

   ospfv3 authentication-mode { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string* [**instance** *instance-id*]

   For keychain authentication:

   ospfv3 authentication-mode keychain *keychain-name* [**instance** *instance-id*]

   By default, no authentication is performed for the interface.

   For more information about keychains, see *Security Configuration Guide*.

Applying an IPsec profile for authenticating OSPFv3 packets

About this task

To protect routing information and prevent attacks, OSPFv3 can authenticate protocol packets by using an IPsec profile. For more information about IPsec profiles, see *Security Configuration Guide*.

Outbound OSPFv3 packets carry the Security Parameter Index (SPI) defined in the relevant IPsec profile. A device compares the SPI carried in a received packet with the configured IPsec profile. If they match, the device accepts the packet. Otherwise, the device discards the packet and will not establish a neighbor relationship with the sending device.

Restrictions and guidelines for applying an IPsec profile

You can configure an IPsec profile for an area, an interface, or a virtual link .

- To implement area-based IPsec protection, configure the same IPsec profile on the routers in the target area.
- To implement interface-based IPsec protection, configure the same IPsec profile on the interfaces between two neighboring routers.
- To implement virtual link-based IPsec protection, configure the same IPsec profile on the two routers connected over the virtual link.
- If an interface and its area each have an IPsec profile configured, the interface uses its own IPsec profile.
- If a virtual link and area 0 each have an IPsec profile configured, the virtual link uses its own IPsec profile.

Applying an IPsec profile to an area

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Enter OSPFv3 area view.

   area *area-id*

4. Apply an IPsec profile to the area.

   enable ipsec-profile *profile-name*

   By default, no IPsec profile is applied.

Applying an IPsec profile to an interface

1. Enter system view.

system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Apply an IPsec profile to the interface.
   ospfv3 ipsec-profile *profile-name* [**instance** *instance-id*]
   By default, no IPsec profile is applied.

Applying an IPsec profile to a virtual link

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enter OSPFv3 area view.
   area *area-id*
4. Apply an IPsec profile to a virtual link.
   vlink-peer *router-id* [**dead** *seconds* | **hello** *seconds* | **instance** *instance-id* | **ipsec-profile** *profile-name* | { { **hmac-sha-256** | **hmac-sm3** } *key-id* { **cipher** | **plain** } *string* | **keychain** *keychain-name* } | **retransmit** *seconds* | **trans-delay** *seconds*] *
   By default, no IPsec profile is applied.

Configuring OSPFv3 logging and SNMP notifications

Enabling logging for neighbor state changes

About this task

With this feature enabled, the router delivers logs about neighbor state changes to its information center. The information center processes logs according to user-defined output rules (whether to output logs and where to output). For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter OSPFv3 view.
   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *
3. Enable logging for neighbor state changes.
   log-peer-change
   By default, this feature is enabled.

Setting the maximum number of OSPFv3 logs

About this task

OSPFv3 logs include route calculation logs, neighbor logs, and LSA aging logs.

Procedure

1. Enter system view.

   system-view

2. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

3. Set the maximum number of OSPFv3 logs.

   event-log { **lsa-flush** | **peer** | **spf** } **size** *count*

   By default, the maximum number of LSA aging logs, neighbor logs, or route calculation logs is 10.

Configuring OSPFv3 network management

About this task

This task involves the following configurations:

- Bind an OSPFv3 process to MIB so that you can use network management software to manage the specified OSPFv3 process.
- Enable SNMP notifications for OSPFv3 to report important events.
- Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

To report critical OSPFv3 events to an NMS, enable SNMP notifications for OSPFv3. For SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

The standard OSPFv3 MIB provides only single-instance MIB objects. To identify multiple OSPFv3 processes in the standard OSPFv3 MIB, you must assign a unique context name to each OSPFv3 process.

Context is a method introduced to SNMPv3 for multiple-instance management. For SNMPv1/v2c, you must specify a community name as a context name for protocol identification.

Procedure

1. Enter system view.

   system-view

2. Bind MIB to an OSPFv3 process.

   ospfv3 mib-binding *process-id*

   By default, MIB is bound to the process with the smallest process ID.

3. Enable SNMP notifications for OSPFv3.

   snmp-agent trap enable ospfv3 [**grhelper-status-change** | **grrestarter-status-change** | **if-bad-pkt** | **if-cfg-error** | **if-networktype-mismatch** | **if-state-change** | **inter-area-router-id-conflict** | **intra-area-router-id-conflict** | **last-auth-key-expiry** | **neighbor-state-change** | **nssatranslator-status-change** | **virtgrhelper-status-change** | **virtif-bad-pkt** | **virtif-cfg-error** | **virtif-state-change** | **virtneighbor-state-change**]*

   By default, SNMP notifications for OSPFv3 are enabled.

4. Enter OSPFv3 view.

   ospfv3 [*process-id* | **vpn-instance** *vpn-instance-name*] *

5. Configure an SNMP context for the OSPFv3 process.

snmp context-name *context-name*

By default, no SNMP context is configured for the OSPFv3 process.

6. (Optional.) Set the SNMP notification output interval and the maximum number of SNMP notifications that can be output at each interval.

   snmp trap rate-limit interval *trap-interval* **count** *trap-number*

   By default, OSPFv3 outputs a maximum of seven SNMP notifications within 10 seconds.

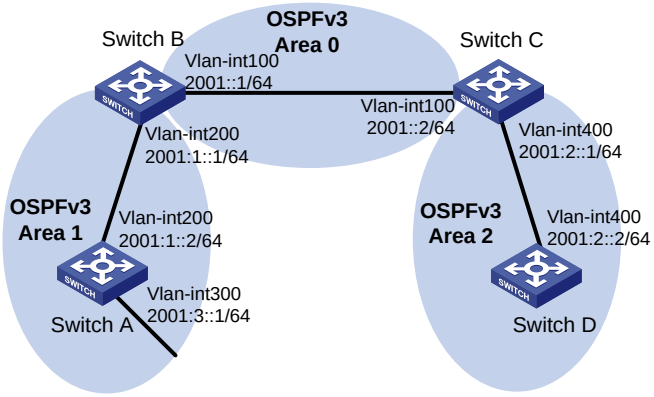
Display and maintenance commands for OSPFv3

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display summary route information on the OSPFv3 ABR.	**display ospfv3** [*process-id*] [**area** *area-id*] **abr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 neighbor information.	**display ospfv3** [*process-id*] [**area** *area-id*] **peer** [[*interface-type interface-number*] [**verbose**] | *peer-router-id* | **statistics**]
Display OSPFv3 request list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **request-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 retransmission list information.	**display ospfv3** [*process-id*] [**area** *area-id*] **retrans-queue** [*interface-type interface-number*] [*neighbor-id*]
Display OSPFv3 topology information.	**display ospfv3** [*process-id*] [**area** *area-id*] **spf-tree** [**verbose**]
Display OSPFv3 process information.	**display ospfv3** [*process-id*] [**verbose**]
Display information about the routes to OSPFv3 ABR and ASBR.	**display ospfv3** [*process-id*] **abr-asbr**
Display summary route information on the OSPFv3 ASBR.	**display ospfv3** [*process-id*] **asbr-summary** [*ipv6-address prefix-length*] [**verbose**]
Display OSPFv3 log information.	**display ospfv3** [*process-id*] **event-log** { **lsa-flush** | **peer** | **spf** }
Display OSPFv3 GR information.	**display ospfv3** [*process-id*] **graceful-restart** [**verbose**]
Display OSPFv3 interface information.	**display ospfv3** [*process-id*] **interface** [*interface-type interface-number* | **verbose**]
Display OSPFv3 LSDB information.	**display ospfv3** [*process-id*] **lsdb** [{ **e-inter-prefix** | **e-inter-router** | **e-router** | **external** | **grace** | **inter-prefix** | **inter-router** | **intra-prefix** | **intra-te** | **link** | **locator** | **network** | **nssa** | **router** | **router-information** | **unknown** [*type*] } [*link-state-id*] [**originate-router** *router-id* | **self-originate**] | **statistics** | **total** | **verbose**]

Task	Command
Display OSPFv3 next hop information.	**display ospfv3** [*process-id*] **nexthop**
Display OSPFv3 NSR information.	**display ospfv3** [*process-id*] **non-stop-routing**
Display OSPFv3 routing information.	**display ospfv3** [*process-id*] **routing** [*ipv6-address prefix-length*]
Display OSPFv3 statistics.	**display ospfv3** [*process-id*] **statistics** [**error**]
Display OSPFv3 virtual link information.	**display ospfv3** [*process-id*] **vlink**
Clear OSPFv3 log information.	**reset ospfv3** [*process-id*] **event-log** [**lsa-flush** | **peer** | **spf**]
Restart an OSPFv3 process.	**reset ospfv3** [*process-id*] **process** [**graceful-restart**]
Restart OSPFv3 route redistribution.	**reset ospfv3** [*process-id*] **redistribution**
Clear OSPFv3 statistics.	**reset ospfv3** [*process-id*] **statistics**

OSPFv3 configuration examples



Example: Configuring OSPFv3 stub area

Network configuration

As shown in Figure 5:

- Enable OSPFv3 on all switches.
- Split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 2 as a stub area to reduce LSAs in the area without affecting route reachability.

Figure 5 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)

2. Configure basic OSPFv3:

On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] ospfv3 1 area 1
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2

 *Destination: 2001:2::/64
  Type       : I                         Area       : 0.0.0.2
  AdvRouter  : 4.4.4.4                   Preference : 10
  NibID      : 0x23000001                Cost       : 1
  Interface  : Vlan400                   BkInterface: N/A
  Nexthop    : ::
  BkNexthop  : N/A
  Status     : Direct
  Delay Flag : N/A

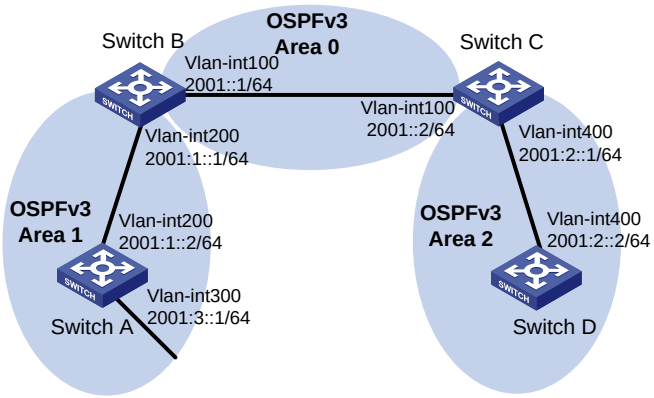
 Total: 2
 Intra area: 1         Inter area: 1         ASE: 0         NSSA: 0
```

The output shows that route entries are reduced. All indirect routes are removed, except the default route.



Example: Configuring OSPFv3 NSSA area

Network configuration

As shown in Figure 6:

- Configure OSPFv3 on all switches and split the AS into three areas.
- Configure Switch B and Switch C as ABRs to forward routing information between areas.
- Configure Area 1 as an NSSA area and configure Switch A as an ASBR to redistribute static routes into the AS.

Figure 6 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3 (see "Example: Configuring OSPFv3 stub area").
3. Configure Area 1 as an NSSA area:

   # Configure Switch A.

```
[SwitchA] ospfv3
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] nssa
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

   # Configure Switch B.

```
[SwitchB] ospfv3
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] nssa
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

   # Display OSPFv3 routing information on Switch D.

```
[SwitchD] display ospfv3 1 routing

                OSPFv3 Process 1 with Router ID 4.4.4.4
------------------------------------------------------------------------

```
 BkNexthop  : N/A
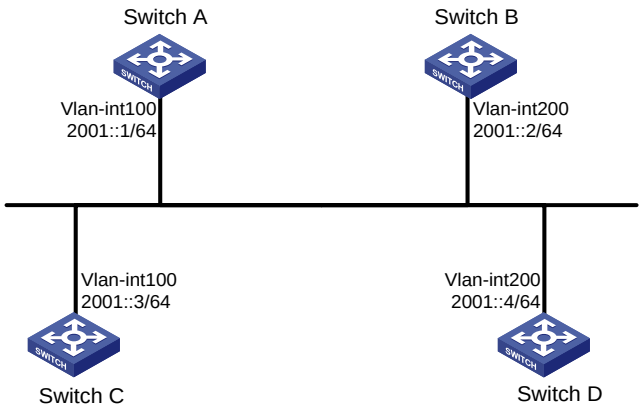
 Status     : Normal

Total: 5
Intra area: 1         Inter area: 3         ASE: 1         NSSA: 0
```

The output shows an AS external route imported from the NSSA area exists on Switch D.



Example: Configuring OSPFv3 DR election

Network configuration

As shown in Figure 7:

- Configure router priority 100 for Switch A, the highest priority on the network, so it will become the DR.
- Configure router priority 2 for Switch C, the second highest priority on the network, so it will become the BDR.
- Configure router priority 0 for Switch B, so it cannot become a DR or BDR.
- Switch D uses the default router priority 1.

Figure 7 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 0
[SwitchA-Vlan-interface100] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
```

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 0
[SwitchB-Vlan-interface200] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

On Switch D, enable OSPFv3 and specify the router ID as 4.4.4.4.

```
<SwitchD> system-view
[SwitchD] ospfv3
[SwitchD-ospfv3-1] router-id 4.4.4.4
[SwitchD-ospfv3-1] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ospfv3 1 area 0
[SwitchD-Vlan-interface200] quit
```

Display neighbor information on Switch A. The switches have the same default DR priority 1, so Switch D (the switch with the highest router ID) is elected as the DR, and Switch C is the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         1   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. The neighbor states are all full.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         1   Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         1   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         1   Full/BDR          00:00:31  0      Vlan100
```

3. Configure router priorities for interfaces:

Set the router priority of VLAN-interface 100 to 100 on Switch A.

```
[SwitchA] interface Vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 dr-priority 100
[SwitchA-Vlan-interface100] quit
```

Set the router priority of VLAN-interface 200 to 0 on Switch B.

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 dr-priority 0
[SwitchB-Vlan-interface200] quit
```

Set the router priority of VLAN-interface 100 to 2 on Switch C.

```
[SwitchC] interface Vlan-interface 100
[SwitchC-Vlan-interface100] ospfv3 dr-priority 2
[SwitchC-Vlan-interface100] quit
```

Display neighbor information on Switch A. Router priorities have been updated, but the DR and BDR are not changed.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   2-Way/DROther     00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan200
 4.4.4.4         1   Full/DR           00:00:33  0      Vlan200
```

Display neighbor information on Switch D. Switch D is still the DR.

```
[SwitchD] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 1.1.1.1         100 Full/DROther      00:00:30  0      Vlan100
 2.2.2.2         0   Full/DROther      00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:31  0      Vlan100
```

4. Restart DR and BDR election:

Use the **shutdown** and **undo shutdown** commands on interfaces to restart DR and BDR election. (Details not shown.)

Display neighbor information on Switch A. The output shows that Switch C becomes the BDR.

```
[SwitchA] display ospfv3 peer

              OSPFv3 Process 1 with Router ID 1.1.1.1

 Area: 0.0.0.0
--------------------------------------------------------------------------
 Router ID       Pri State             Dead-Time InstID Interface
 2.2.2.2         0   Full/DROther      00:00:36  0      Vlan200
 3.3.3.3         2   Full/BDR          00:00:35  0      Vlan100
 4.4.4.4         1   Full/DROther      00:00:33  0      Vlan200
```

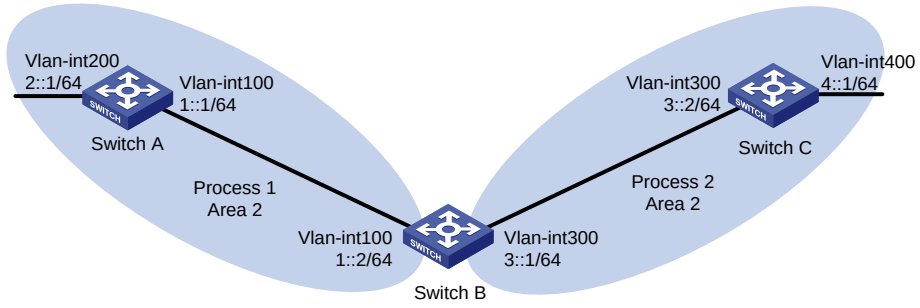
Display neighbor information on Switch D.

```
[SwitchD] display ospfv3 peer
```

```
                OSPFv3 Process 1 with Router ID 4.4.4.4

 Area: 0.0.0.0
------------------------------------------------------------------------
 Router ID       Pri State            Dead-Time InstID Interface
 1.1.1.1         100 Full/DR          00:00:30  0      Vlan100
 2.2.2.2         0   2-Way/DROther    00:00:37  0      Vlan200
 3.3.3.3         2   Full/BDR         00:00:31  0      Vlan100
```

The output shows that Switch A becomes the DR.



Example: Configuring OSPFv3 route redistribution

Network configuration

As shown in Figure 8:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2.
- Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B, and set the metric for redistributed routes to 3. Switch C can then learn the routes destined for 1::0/64 and 2::0/64, and Switch A cannot learn the routes destined for 3::0/64 or 4::0/64.

Figure 8 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

   # Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
```

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 7 Routes : 7

Example: Configuring OSPFv3 route summarization

Network configuration

As shown in Figure 9:

- Switch A, Switch B, and Switch C are in Area 2.
- OSPFv3 process 1 and OSPFv3 process 2 run on Switch B. Switch B communicates with Switch A and Switch C through OSPFv3 process 1 and OSPFv3 process 2, respectively.
- On Switch A, configure IPv6 addresses 2:1:1::1/64, 2:1:2::1/64, and 2:1:3::1/64 for VLAN-interface 200.
- On Switch B, configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1. Switch C can then learn the routes destined for 2::/64, 2:1:1::/64, 2:1:2::/64, and 2:1:3::/64.
- On Switch B, configure route summarization to advertise only summary route 2::/16 to Switch C.

Figure 9 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3:

   # Enable OSPFv3 process 1 on Switch A.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ospfv3 1 area 2
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 2:1:1::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:2::1 64
[SwitchA-Vlan-interface200] ipv6 address 2:1:3::1 64
```

```
[SwitchA-Vlan-interface200] ospfv3 1 area 2
[SwitchA-Vlan-interface200] quit
```

Enable OSPFv3 process 1 and OSPFv3 process 2 on Switch B.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 2
[SwitchB-Vlan-interface100] quit
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] router-id 3.3.3.3
[SwitchB-ospfv3-2] quit
[SwitchB] interface vlan-interface 300
[SwitchB-Vlan-interface300] ospfv3 2 area 2
[SwitchB-Vlan-interface300] quit
```

Enable OSPFv3 process 2 on Switch C.

```
<SwitchC> system-view
[SwitchC] ospfv3 2
[SwitchC-ospfv3-2] router-id 4.4.4.4
[SwitchC-ospfv3-2] quit
[SwitchC] interface vlan-interface 300
[SwitchC-Vlan-interface300] ospfv3 2 area 2
[SwitchC-Vlan-interface300] quit
[SwitchC] interface vlan-interface 400
[SwitchC-Vlan-interface400] ospfv3 2 area 2
[SwitchC-Vlan-interface400] quit
```

3. Configure OSPFv3 route redistribution:

Configure OSPFv3 process 2 to redistribute direct routes and the routes from OSPFv3 process 1 on Switch B.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] import-route ospfv3 1
[SwitchB-ospfv3-2] import-route direct
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 12 Routes : 12

Interface  : NULL0                                  Cost      : 0

Destination: FF00::/8                               Protocol  : Direct
NextHop    : ::                                     Preference: 0
Interface  : NULL0                                  Cost      : 0
```

4. Configure ASBR route summarization:

On Switch B, configure OSPFv3 process 2 to advertise a single route 2::/16.

```
[SwitchB] ospfv3 2
[SwitchB-ospfv3-2] asbr-summary 2:: 16
[SwitchB-ospfv3-2] quit
```

Display the routing table on Switch C.

```
[SwitchC] display ipv6 routing-table

Destinations : 9 Routes : 9
```

```
Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: 1::/64                                     Protocol  : O_ASE2

Interface  : NULL0                                      Cost      : 0
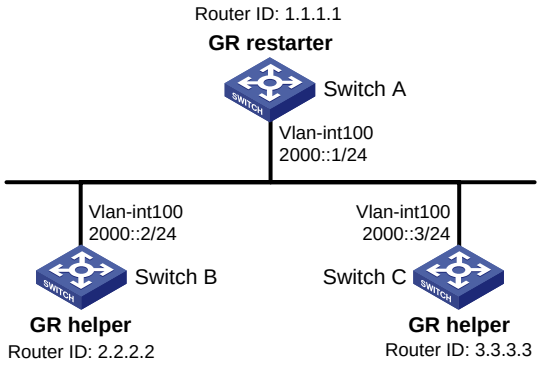
```



Example: Configuring OSPFv3 GR

Network configuration

As shown in Figure 10:

- Switch A, Switch B, and Switch C that reside in the same AS and the same OSPFv3 routing domain are GR capable.
- Switch A acts as the GR restarter. Switch B and Switch C act as the GR helpers, and synchronize their LSDBs with Switch A through GR.

Figure 10 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 process 1, enable GR, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] graceful-restart enable
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

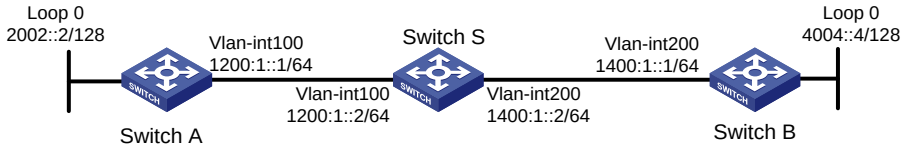
   # On Switch B, enable OSPFv3 and set the router ID to 2.2.2.2. (By default, GR helper is enabled on Switch B.)

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] ospfv3 1 area 1
   [SwitchB-Vlan-interface100] quit
   ```

   # On Switch C, enable OSPFv3 and set the router ID to 3.3.3.3. (By default, GR helper is enabled on Switch C.)

   ```
   <SwitchC> system-view
   [SwitchC] ospfv3 1
   [SwitchC-ospfv3-1] router-id 3.3.3.3
   [SwitchC-ospfv3-1] quit
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] ospfv3 1 area 1
   [SwitchC-Vlan-interface100] quit
   ```

Verifying the configuration



Perform a master/backup switchover on Switch A to trigger an OSPFv3 GR operation. (Details not shown.)

Example: Configuring OSPFv3 NSR

Network configuration

As shown in Figure 11, Switch S, Switch A, and Switch B belong to the same OSPFv3 routing domain. Enable OSPFv3 NSR on Switch S to ensure correct routing when an active/standby switchover occurs on Switch S.

Figure 11 Network diagram

Procedure

1. Configure IP addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch S, Switch A, and Switch B can communicate with each other at Layer 3. (Details not shown.)
3. Configure OSPFv3:

   # On Switch A, enable OSPFv3, and set the router ID to 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3 1
   [SwitchA-ospfv3-1] router-id 1.1.1.1
   [SwitchA-ospfv3-1] quit
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] ospfv3 1 area 1
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable OSPFv3, and set the router ID to 2.2.2.2.

   ```
   <SwitchB> system-view
   [SwitchB] ospfv3 1
   [SwitchB-ospfv3-1] router-id 2.2.2.2
   [SwitchB-ospfv3-1] quit
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] ospfv3 1 area 1
   [SwitchB-Vlan-interface200] quit
   ```

   # On Switch S, enable OSPFv3, and set the router ID to 3.3.3.3.

   ```
   <SwitchS> system-view
   [SwitchS] ospfv3 1
   [SwitchS-ospfv3-1] router-id 3.3.3.3
   [SwitchS-ospfv3-1] quit
   [SwitchS] interface vlan-interface 100
   [SwitchS-Vlan-interface100] ospfv3 1 area 1
   [SwitchS-Vlan-interface100] quit
   [SwitchS] interface vlan-interface 200
   [SwitchS-Vlan-interface200] ospfv3 1 area 1
   [SwitchS-Vlan-interface200] quit
   ```

4. Configure OSPFv3 NSR:

   # Enable OSPFv3 NSR on Switch S.

```
[SwitchS] ospfv3 1
[SwitchS-ospfv3-1] non-stop-routing
[SwitchS-ospfv3-1] quit
```

Verifying the configuration

Verify the following:

- When an active/standby switchover occurs on Switch S, the neighbor relationships and routing information on Switch A and Switch B have not changed. (Details not shown.)
- The traffic from Switch A to Switch B has not been impacted. (Details not shown.)

Example: Configuring BFD for OSPFv3

Network configuration

As shown in Figure 12:

- Configure OSPFv3 on Switch A, Switch B and Switch C and configure BFD over the link Switch A<—>L2 Switch<—>Switch B.
- After the link Switch A<—>L2 Switch<—>Switch B fails, BFD can quickly detect the failure and notify OSPFv3 of the failure. Then Switch A and Switch B communicate through Switch C.

Figure 12 Network diagram

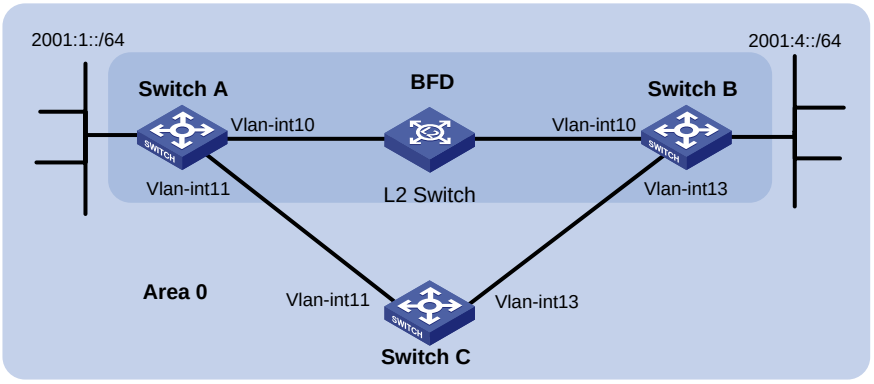


Table 1 Interface and IP address assignment

Device	Interface	IPv6 address
Switch A	Vlan-int10	2001::1/64
Switch A	Vlan-int11	2001:2::1/64
Switch B	Vlan-int10	2001::2/64
Switch B	Vlan-int13	2001:3::2/64
Switch C	Vlan-int11	2001:2::2/64
Switch C	Vlan-int13	2001:3::1/64

Procedure

1. Configure IPv6 addresses for the interfaces. (Details not shown.)
2. Configure basic OSPFv3:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

   ```
   <SwitchA> system-view
   [SwitchA] ospfv3
   ```

```
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 1 area 0
[SwitchA-Vlan-interface10] quit
[SwitchA] interface vlan-interface 11
[SwitchA-Vlan-interface11] ospfv3 1 area 0
[SwitchA-Vlan-interface11] quit
```

On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 1 area 0
[SwitchB-Vlan-interface10] quit
[SwitchB] interface vlan-interface 13
[SwitchB-Vlan-interface13] ospfv3 1 area 0
[SwitchB-Vlan-interface13] quit
```

On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 11
[SwitchC-Vlan-interface11] ospfv3 1 area 0
[SwitchC-Vlan-interface11] quit
[SwitchC] interface vlan-interface 13
[SwitchC-Vlan-interface13] ospfv3 1 area 0
[SwitchC-Vlan-interface13] quit
```

3. Configure BFD:

Enable BFD and configure BFD parameters on Switch A.

```
[SwitchA] bfd session init-mode active
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ospfv3 bfd enable
[SwitchA-Vlan-interface10] bfd min-transmit-interval 500
[SwitchA-Vlan-interface10] bfd min-receive-interval 500
[SwitchA-Vlan-interface10] bfd detect-multiplier 7
[SwitchA-Vlan-interface10] quit
```

Enable BFD and configure BFD parameters on Switch B.

```
[SwitchB] bfd session init-mode active
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ospfv3 bfd enable
[SwitchB-Vlan-interface10] bfd min-transmit-interval 500
[SwitchB-Vlan-interface10] bfd min-receive-interval 500
[SwitchB-Vlan-interface10] bfd detect-multiplier 6
[SwitchB-Vlan-interface10] quit
```

Verifying the configuration

Display the BFD information on Switch A.

```
[SwitchA] display bfd session

 Total sessions: 1     Up sessions: 1     Init mode: Active

 IPv6 session working in control packet mode:

          Local discr: 1441                      Remote discr: 1450
            Source IP: FE80::20F:FF:FE00:1202 (link-local address of VLAN-interface 10
on Switch A)
       Destination IP: FE80::20F:FF:FE00:1200 (link-local address of VLAN-interface 10
on Switch B)
         Session state: Up                           Interface: Vlan10
             Hold time: 2319ms
```

Display routes destined for 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::20F:FF:FE00:1200                     Preference: 10
Interface  : Vlan10                                     Cost      : 1
```

The output information shows that Switch A communicates with Switch B through VLAN-interface 10. The link over VLAN-interface 10 fails.

Display routes to 2001:4::0/64 on Switch A.

```
[SwitchA] display ipv6 routing-table 2001:4::0 64

Summary count : 1

Destination: 2001:4::/64                                Protocol  : O_INTRA
NextHop    : FE80::BAAF:67FF:FE27:DCD0                  Preference: 10
Interface  : Vlan11                                     Cost      : 2
```

The output shows that Switch A communicates with Switch B through VLAN-interface 11.

Example: Configuring OSPFv3 FRR

Network configuration

As shown in Figure 13, Switch A, Switch B, and Switch C reside in the same OSPFv3 domain. Configure OSPFv3 FRR so that when Link A fails, traffic is immediately switched to Link B.

Figure 13 Network diagram

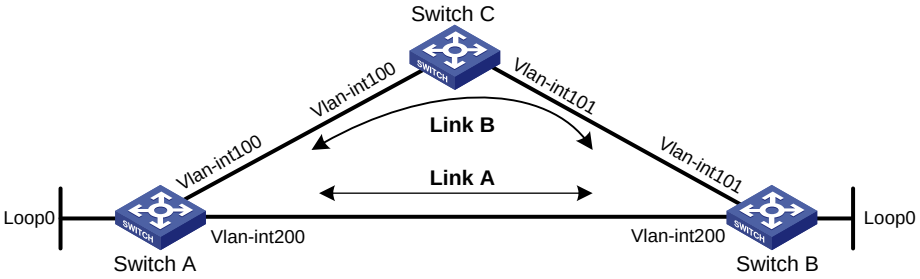

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	1::1/64	Switch B	Vlan-int101	3::1/64
	Vlan-int200	2::1/64		Vlan-int200	2::2/64
	Loop0	10::1/128		Loop0	20::1/128
Switch C	Vlan-int100	1::2/64			
	Vlan-int101	3::2/64			

Procedure

1. Configure IPv6 addresses and subnet masks for interfaces on the switches. (Details not shown.)
2. Configure OSPFv3 on the switches to ensure that Switch A, Switch B, and Switch C can communicate with each other at the network layer. (Details not shown.)
3. Configure OSPFv3 FRR to automatically calculate the backup next hop:

   You can enable OSPFv3 FRR to either calculate a backup next hop by using the LFA algorithm, or specify a backup next hop by using a routing policy.

   - (Method 1.) Enable OSPFv3 FRR to calculate the backup next hop by using the LFA algorithm:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ospfv3 1
     [SwitchA-ospfv3-1] fast-reroute lfa
     [SwitchA-ospfv3-1] quit
     ```

     # Configure Switch B.

     ```
     <SwitchB> system-view
     [SwitchB] ospfv3 1
     [SwitchB-ospfv3-1] fast-reroute lfa
     [SwitchB-ospfv3-1] quit
     ```

   - (Method 2.) Enable OSPFv3 FRR to designate a backup next hop by using a routing policy:

     # Configure Switch A.

     ```
     <SwitchA> system-view
     [SwitchA] ipv6 prefix-list abc index 10 permit 20::1 128
     [SwitchA] route-policy frr permit node 10
     [SwitchA-route-policy-frr-10] if-match ipv6 address prefix-list abc
     [SwitchA-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
     vlan-interface 100 backup-nexthop fe80::6eab:8bff:fed4:205
     ```

```
[SwitchA-route-policy-frr-10] quit
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] fast-reroute route-policy frr
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
<SwitchB> system-view
[SwitchB] ipv6 prefix-list abc index 10 permit 10::1 128
[SwitchB] route-policy frr permit node 10
[SwitchB-route-policy-frr-10] if-match ipv6 address prefix-list abc
[SwitchB-route-policy-frr-10] apply ipv6 fast-reroute backup-interface
vlan-interface 101 backup-nexthop fe80::6eab:8bff:fed4:206
[SwitchB-route-policy-frr-10] quit
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] fast-reroute route-policy frr
[SwitchB-ospfv3-1] quit
```

Verifying the configuration

Display the route 20::1/128 on Switch A to view the backup next hop information.

```
[SwitchA] display ipv6 routing-table 20::1 128 verbose

Summary count : 1

Destination: 20::1/128
    Protocol: O_INTRA
  Process ID: 1
   SubProtID: 0x1                    Age: 00h03m45s

Example: Configuring OSPFv3 IPsec profile

Network configuration

As shown in Figure 14, all switches run OSPFv3, and the AS is divided into two areas.

Configure IPsec profiles on the switches to authenticate and encrypt protocol packets.

Figure 14 Network diagram

Procedure

1. Configure IPv6 addresses for interfaces. (Details not shown.)
2. Configure OSPFv3 basic features:

   # On Switch A, enable OSPFv3 and specify the router ID as 1.1.1.1.

```
<SwitchA> system-view
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] router-id 1.1.1.1
[SwitchA-ospfv3-1] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ospfv3 1 area 1
[SwitchA-Vlan-interface200] quit
```

   # On Switch B, enable OSPFv3 and specify the router ID as 2.2.2.2.

```
<SwitchB> system-view
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] router-id 2.2.2.2
[SwitchB-ospfv3-1] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ospfv3 1 area 0
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] ospfv3 1 area 1
[SwitchB-Vlan-interface200] quit
```

   # On Switch C, enable OSPFv3 and specify the router ID as 3.3.3.3.

```
<SwitchC> system-view
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] router-id 3.3.3.3
[SwitchC-ospfv3-1] quit
[SwitchC] interface vlan-interface 100
```

```
[SwitchC-Vlan-interface100] ospfv3 1 area 0
[SwitchC-Vlan-interface100] quit
```

3. Configure OSPFv3 IPsec profiles:

- On Switch A:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchA] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchA-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchA-ipsec-transform-set-trans] protocol esp
  [SwitchA-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchA-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchA-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchA] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchA-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchA-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchA-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] sa string-key inbound esp simple
  abcdefg
  [SwitchA-ipsec-profile-manual-profile001] quit
  ```

- On Switch B:

  # Create an IPsec transform set named **trans**.

  ```
  [SwitchB] ipsec transform-set trans
  ```

  # Specify the encapsulation mode as **transport**.

  ```
  [SwitchB-ipsec-transform-set-trans] encapsulation-mode transport
  ```

  # Specify the ESP encryption and authentication algorithms.

  ```
  [SwitchB-ipsec-transform-set-trans] protocol esp
  [SwitchB-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
  [SwitchB-ipsec-transform-set-trans] esp authentication-algorithm sha1
  [SwitchB-ipsec-transform-set-trans] quit
  ```

  # Create a manual IPsec profile named **profile001**.

  ```
  [SwitchB] ipsec profile profile001 manual
  ```

  # Use IPsec transform set **trans**.

  ```
  [SwitchB-ipsec-profile-manual-profile001] transform-set trans
  ```

  # Configure the inbound and outbound SPIs for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa spi outbound esp 123456
  [SwitchB-ipsec-profile-manual-profile001] sa spi inbound esp 123456
  ```

  # Configure the inbound and outbound SA keys for ESP.

  ```
  [SwitchB-ipsec-profile-manual-profile001] sa string-key outbound esp simple
  abcdefg
  ```

```
[SwitchB-ipsec-profile-manual-profile001] sa string-key inbound esp simple
abcdefg
[SwitchB-ipsec-profile-manual-profile001] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchB] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchB-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchB-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchB-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchB-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchB-ipsec-profile-manual-profile002] quit
```

- On Switch C:

Create an IPsec transform set named **trans**.

```
[SwitchC] ipsec transform-set trans
```

Specify the encapsulation mode as **transport**.

```
[SwitchC-ipsec-transform-set-trans] encapsulation-mode transport
```

Specify the ESP encryption and authentication algorithms.

```
[SwitchC-ipsec-transform-set-trans] protocol esp
[SwitchC-ipsec-transform-set-trans] esp encryption-algorithm aes-cbc-128
[SwitchC-ipsec-transform-set-trans] esp authentication-algorithm sha1
[SwitchC-ipsec-transform-set-trans] quit
```

Create a manual IPsec profile named **profile002**.

```
[SwitchC] ipsec profile profile002 manual
```

Use IPsec transform set **trans**.

```
[SwitchC-ipsec-profile-manual-profile002] transform-set trans
```

Configure the inbound and outbound SPIs for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa spi outbound esp 256
[SwitchC-ipsec-profile-manual-profile002] sa spi inbound esp 256
```

Configure the inbound and outbound SA keys for ESP.

```
[SwitchC-ipsec-profile-manual-profile002] sa string-key outbound esp simple
byebye
[SwitchC-ipsec-profile-manual-profile002] sa string-key inbound esp simple byebye
[SwitchC-ipsec-profile-manual-profile002] quit
```

4. Apply the IPsec profiles to areas:

Configure Switch A.

```
[SwitchA] ospfv3 1
[SwitchA-ospfv3-1] area 1
[SwitchA-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchA-ospfv3-1-area-0.0.0.1] quit
[SwitchA-ospfv3-1] quit
```

Configure Switch B.

```
[SwitchB] ospfv3 1
[SwitchB-ospfv3-1] area 0
```

```
[SwitchB-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] area 1
[SwitchB-ospfv3-1-area-0.0.0.1] enable ipsec-profile profile001
[SwitchB-ospfv3-1-area-0.0.0.1] quit
[SwitchB-ospfv3-1] quit
```

Configure Switch C.

```
[SwitchC] ospfv3 1
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] enable ipsec-profile profile002
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
```

Verifying the configuration

Verify that OSPFv3 packets between Switches A, B, and C are protected by IPsec. (Details not shown.)

Configuring IPv6 PBR

About IPv6 PBR

IPv6 policy-based routing (PBR) uses user-defined policies to route IPv6 packets. A policy can specify parameters for packets that match specific criteria such as ACLs. The parameters include the next hop and default next hop.

IPv6 packet forwarding process

When the device receives an IPv6 packet, the device searches the IPv6 PBR policy for a matching node to forward that packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
    - No next hops are specified on the node.
    - Forwarding failed based on the next hops.

  c. Uses the default next hops specified on the node to forward the packet if one of the following conditions exists:
    - No matching route was found in the routing table.
    - The routing table-based forwarding failed.

  d. Uses the default route to forward the packet if one of the following conditions exists:
    - No default next hops are specified on the node.
    - The forwarding failed based on the default next hops.
- The device perfoms routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

IPv6 PBR types

IPv6 PBR includes the following types:

- **Local PBR**—Guides the forwarding of locally generated packets, such as the ICMP packets generated by using the **`ping`** command.
- **Interface PBR**—Guides the forwarding of packets received on an interface only.

Policy

An IPv6 policy includes match criteria and actions to be taken on the matching packets. A policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.

- A node has a match mode of **permit** or **deny**.

An IPv6 policy compares packets with nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup for the packet.

Relationship between if-match clauses

IPv6 PBR supports only the **`if-match acl`** clause to set an ACL match criterion. On a node, you can specify only one **`if-match`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about the relationship between the **`apply`** clauses, see "Configuring actions for an IPv6 node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match **clauses on the node?**	**Match mode**	
	In permit mode	**In deny mode**
Yes	• If the node contains **`apply`** clauses, IPv6 PBR executes the **`apply`** clauses on the node. ○ If IPv6 PBR-based forwarding succeeds, IPv6 PBR does not compare the packet with the next node. ○ If IPv6 PBR-based forwarding fails, IPv6 PBR compares the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No	IPv6 PBR compares the packet with the next node.	IPv6 PBR compares the packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

IPv6 PBR and Track

IPv6 PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or default next hop.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and IPv6 PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: IPv6 PBR configuration

If a packet destined for the local device matches an IPv6 PBR policy, IPv6 PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure an IPv6 PBR policy, be careful to avoid this situation.

IPv6 PBR tasks at a glance

To configure IPv6 PBR, perform the following tasks:

1. Configuring an IPv6 policy
   a. Creating an IPv6 node
   b. Setting match criteria for an IPv6 node
   c. Configuring actions for an IPv6 node
2. Specifying a policy for IPv6 PBR

   Choose the following tasks as needed:
   - Specifying an IPv6 policy for IPv6 local PBR
   - Specifying an IPv6 policy for IPv6 interface PBR
   - Specifying an IPv6 policy for IPv6 global PBR

Configuring an IPv6 policy

Creating an IPv6 node

1. Enter system view.

   system-view
2. Create an IPv6 policy or policy node and enter its view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the IPv6 policy node.

   description *text*

   By default, no description is configured for an IPv6 policy node.

Setting match criteria for an IPv6 node

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl [**user-defined**] { *ipv6-acl-number* | **name** *ipv6-acl-name* }

     By default, no ACL match criterion is set.

     The ACL match criterion cannot match Layer 2 information.

When using the ACL to match packets, IPv6 PBR ignores the action (**permit** or **deny**) and time range settings in the ACL. If the specified ACL does not exist, no packets will match this criterion.

- Set a local QoS ID match criterion.
  if-match qos-local-id *local-id-value*
  By default, no local QoS ID match criterion is set.

Configuring actions for an IPv6 node

About this task

The **apply** clauses allow you to specify actions to take on matching packets on a node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**
- **apply default-next-hop**

IPv6 PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in IPv6 PBR

Clause	Meaning	Remarks
apply precedence	Sets an IP precedence.	This clause is always executed.
apply loadshare next-hop	Enables load sharing among multiple next hops.	Multiple next hop options operate in either primary/backup or load sharing mode. • **Primary/backup mode**—One option is selected from all options in configuration order for packet forwarding, with all remaining options as backups. For example, if multiple next hops are configured, the first configured next hop is selected. When the selected next hop fails, the next available next hop takes over. • **Load sharing mode**—Matching traffic is distributed across the available options. They load share traffic in round robin manner, starting from the first configured option. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry. After you configure the **apply loadshare-mode** command, the load sharing mode specified in the command applies. By default, the primary/backup mode applies. For the load sharing mode to take effect, make sure multiple next hops are set in the policy.
apply	Specifies the load sharing mode for	Specify one of the following load sharing

loadshare-modenext-hop robin	multiple next hops.	modes for multiple next hops: • **robin**: Selects load-shared links randomly based on packets.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.
apply default-next-hop	Sets default next hops.	The configuration take effect only in the following cases: • No next hops or output interfaces are set or the next hops and output interfaces are invalid. • The IPv6 packet does not match any route in the routing table.
apply statistics	Counts successful matches and matching bytes on the IPv6 policy node.	To include the number of successful matches and matching bytes on an IPv6 policy node in the statistics displayed by a **display** command, execute this command. This clause is always executed for matching packets.

Restrictions and guidelines for action configuration

If you specify a next hop, IPv6 PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if IPv6 PBR does not update the route immediately after its availability status changes.

If you configure the **apply loadshare-mode** command, you cannot specify next hop addresses as VXLAN tunnel addresses.

In an IPv6 policy node, if you configure per-packet forwarding with the **apply loadshare-mode** command, and apply the policy locally with the **ip local policy-based-route** command, per-packet forwarding does not take effect. Instead, per-flow forwarding still takes effect. As a best practice to have IPv6 PBR take effect correctly, configure other IPv6 PBR types with the policy.

Setting an IP preference

1. Enter system view.
   system-view
2. Enter IPv6 policy node view.
   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set an IP precedence.
   apply precedence { *type* | *value* }
   By default, no IP precedence is specified.

Configuring actions for a node

1. Enter system view.
   system-view
2. Enter IPv6 policy node view.
   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Configure actions for a node.
   - Set next hops for permitted IPv6 packets.
     apply next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] } &<1-8>

By default, no next hops are specified.

You can specify multiple next hops for backup or load sharing in one command line or by executing this command multiple times. You can specify a maximum of eight next hops for a node.

If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

- Enable load sharing among multiple next hops.

  apply loadshare next-hop

  By default, the next hops operate in primary/backup mode.
- Specify the load sharing mode for multiple next hops.

  apply loadshare-mode next-hop robin

  By default, multiple next hops load share traffic in round robin manner, starting from the first configured next hop. They perform per-packet load sharing for traffic that does not match any fast forwarding entry, and perform per-flow load sharing for traffic that matches a fast forwarding entry.
- Set output interfaces.

  apply output-interface NULL 0

  By default, no output interfaces are specified.
- Set default next hops.

  apply default-next-hop [**vpn-instance** *vpn-instance-name*] { *ipv6-address* [**direct**] [**track** *track-entry-number*] }&<1-4>

  By default, no default next hops are specified.

  You can specify multiple default next hops for backup in one command line or by executing this command multiple times. You can specify a maximum of eight default next hops for a node.

Collecting statistics

1. Enter system view.

   system-view
2. Enter IPv6 policy node view.

   ipv6 policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Count successful matches and matching bytes on the IPv6 policy node.

   apply statistics

   By default, counting successful matches is disabled on IPv6 policy nodes.

Specifying a policy for IPv6 PBR

Specifying an IPv6 policy for IPv6 local PBR

About this task

Perform this task to specify an IPv6 policy for IPv6 local PBR to guide the forwarding of locally generated packets.

Restrictions and guidelines

You can specify only one policy for IPv6 local PBR and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy.

IPv6 local PBR might affect local services, such as ping and Telnet. When you use IPv6 local PBR, make sure you fully understand its impact on local services of the device.

Procedure

1. Enter system view.
   system-view
2. Specify an IPv6 policy for IPv6 local PBR.
   ipv6 local policy-based-route *policy-name*
   By default, IPv6 local PBR is not enabled.

Specifying an IPv6 policy for IPv6 interface PBR

About this task

Perform this task to apply an IPv6 policy to an interface to guide the forwarding of packets received on the interface only.

Restrictions and guidelines

You can apply only one policy to an interface and must make sure the specified policy already exists. Before you apply a new policy, you must first remove the current policy from the interface.

You can apply a policy to multiple interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IPv6 policy for IPv6 interface PBR.
   ipv6 policy-based-route *policy-name*
   By default, no IPv6 policy is applied to the interface.

Specifying an IPv6 policy for IPv6 global PBR

About this task

Perform this task to apply an IPv6 policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one IPv6 policy for IPv6 global PBR and the specified IPv6 policy must already exist. Before you can apply a new IPv6 policy, you must first remove the current IPv6 policy.

IPv6 interface PBR takes precedence over IPv6 global PBR on an interface. When they are both configured and packets fail to match the IPv6 interface PBR policy, IPv6 global PBR applies.

Procedure

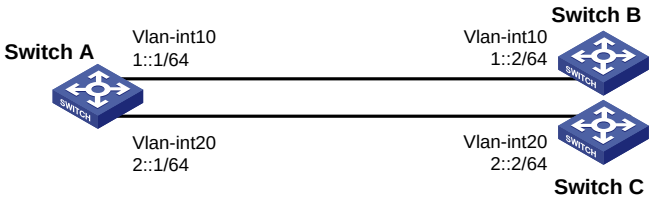
1. Enter system view.
   system-view
2. Specify an IPv6 policy for IPv6 global PBR.
   ipv6 global policy-based-route *policy-name*
   By default, no IPv6 policy is specified for IPv6 global PBR.

Display and maintenance commands for IPv6 PBR

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PBR policy information.	**display ipv6 policy-based-route** [**policy** *policy-name*]
Display IPv6 global PBR configuration and statistics.	**display ipv6 policy-based-route global** [**slot** *slot-number*]
Display IPv6 interface PBR configuration and statistics.	**display ipv6 policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display IPv6 local PBR configuration and statistics.	**display ipv6 policy-based-route local** [**slot** *slot-number*]
Display IPv6 PBR configuration.	**display ipv6 policy-based-route setup**
Clear IPv6 PBR statistics.	**reset ipv6 policy-based-route statistics** [**policy** *policy-name*]

IPv6 PBR configuration examples



Example: Configuring packet type-based IPv6 local PBR

Network configuration

As shown in Figure 1, Switch B and Switch C are connected through Switch A. Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets to the next hop 1::2 (Switch B).

Figure 1 Network diagram

Procedure

1. Configure Switch A:

   # Create VLAN 10 and VLAN 20.

   ```
   <SwitchA> system-view
   [SwitchA] vlan 10
   [SwitchA-vlan10] quit
   [SwitchA] vlan 20
   [SwitchA-vlan20] quit
   ```

   # Configure the IPv6 addresses of VLAN-interface 10 and VLAN-interface 20.

   ```
   [SwitchA] interface vlan-interface 10
   [SwitchA-Vlan-interface10] ipv6 address 1::1 64
   [SwitchA-Vlan-interface10] quit
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 2::1 64
   [SwitchA-Vlan-interface20] quit
   ```

   # Configure ACL 3001 to match TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 local PBR by applying policy **aaa** to Switch A.

   ```
   [SwitchA] ipv6 local policy-based-route aaa
   ```

2. Configure Switch B:

   # Create VLAN 10.

   ```
   <SwitchB> system-view
   [SwitchB] vlan 10
   ```

```
[SwitchB-vlan10] quit
```

Configure the IPv6 address of VLAN-interface 10.

```
[SwitchB] interface vlan-interface 10
[SwitchB-Vlan-interface10] ipv6 address 1::2 64
[SwitchB-Vlan-interface10] quit
```

3. Configure Switch C:

Create VLAN 20.

```
<SwitchC> system-view
[SwitchC] vlan 20
[SwitchC-vlan20] quit
```

Configure the IPv6 address of VLAN-interface 20.

```
[SwitchC] interface vlan-interface 20
[SwitchC-Vlan-interface20] ipv6 address 2::2 64
[SwitchC-Vlan-interface20] quit
```

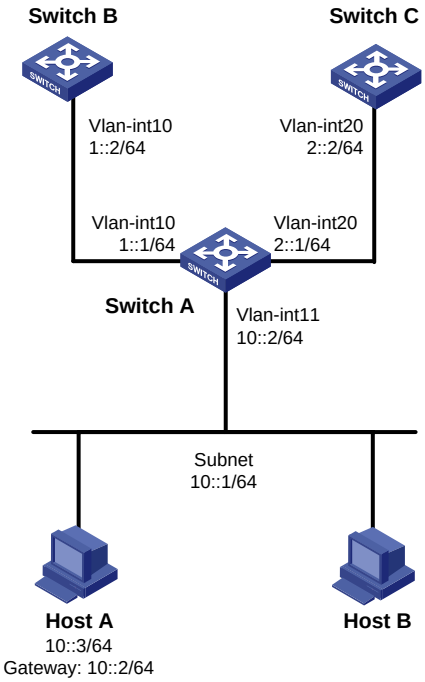
Verifying the configuration

1. Perform telnet operations to verify that IPv6 local PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

   # Verify that you can telnet to Switch B from Switch A successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch C from Switch A. (Details not shown.)

2. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Switch A. (Details not shown.)



Example: Configuring packet type-based IPv6 interface PBR

Network configuration

As shown in Figure 2, Switch B and Switch C do not have a route to reach each other.

Configure IPv6 PBR on Switch A to forward all TCP packets received on VLAN-interface 11 to the next hop 1::2 (Switch B).

Figure 2 Network diagram

Procedure

1. Configure IPv6 addresses and unicast routing protocol settings to make sure that Switch B and Switch C each have a route to reach Host A. (Details not shown.)
2. Configure Switch A:

   # Configure ACL 3001 to match TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl ipv6 advanced 3001
   [SwitchA-acl-ipv6-adv-3001] rule permit tcp
   [SwitchA-acl-ipv6-adv-3001] quit
   ```

   # Configure Node 5 for policy **aaa** to forward TCP packets to next hop 1::2.

   ```
   [SwitchA] ipv6 policy-based-route aaa permit node 5
   [SwitchA-pbr6-aaa-5] if-match acl 3001
   [SwitchA-pbr6-aaa-5] apply next-hop 1::2
   [SwitchA-pbr6-aaa-5] quit
   ```

   # Configure IPv6 interface PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   [SwitchA-Vlan-interface11] ipv6 policy-based-route aaa
   [SwitchA-Vlan-interface11] quit
   ```

Verifying the configuration

1. Enable IPv6 and configure the IPv6 address 10::3 for Host A.

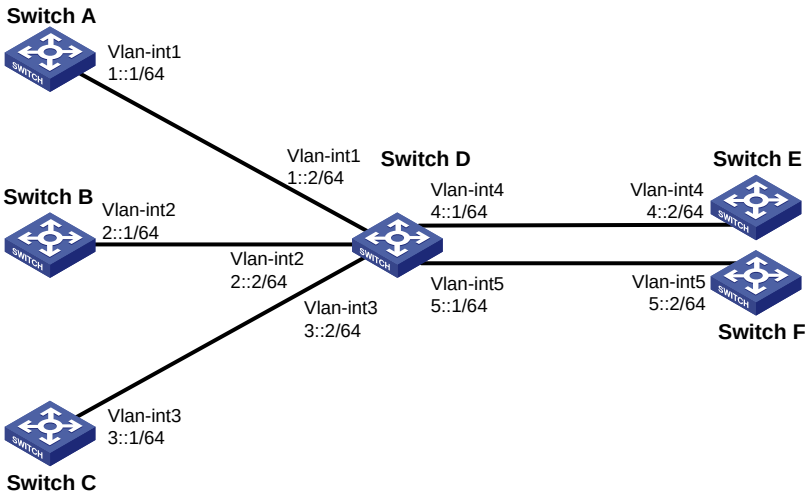
   ```
   C:\>ipv6 install
   Installing...
   Succeeded.
   C:\>ipv6 adu 4/10::3
   ```

2. Perform telnet operations to verify that IPv6 interface PBR on Switch A operates as configured to forward the matching TCP packets to the next hop 1::2 (Switch B), as follows:

Verify that you can telnet to Switch B from Host A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C from Host A. (Details not shown.)

3. Verify that Switch A forwards packets other than TCP packets through VLAN-interface 20. For example, verify that you can ping Switch C from Host A. (Details not shown.)



Example: Configuring packet type-based IPv6 global PBR

Network configuration

As shown in Figure 3, Switch E and Switch F do not have a route to reach each other.

Configure IPv6 global PBR on Switch D to forward TCP packets to the next hop 4::2 (Switch E).

Figure 3 Network diagram

Procedure

1. Assign IPv6 addresses to the interfaces, as shown in Figure 3. (Details not shown.)
2. Configure unicast routing protocol settings to make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
3. Configure Switch D:

   # Configure IPv6 ACL 3101 to match TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

   ```
   <SwitchD> system-view
   [SwitchD] acl ipv6 advanced 3101
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 1::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 2::0 64
   [SwitchD-acl-ipv6-adv-3101] rule permit tcp source 3::0 64
   [SwitchD-acl-ipv6-adv-3101] quit
   ```

   # Configure node 5 in IPv6 PBR policy **aaa** to forward TCP packets that match ACL 3101 to next hop 4::2.

   ```
   [SwitchD] ipv6 policy-based-route aaa permit node 5
   [SwitchD-pbr6-aaa-5] if-match acl 3101
   [SwitchD-pbr6-aaa-5] apply next-hop 4::2
   [SwitchD-pbr6-aaa-5] quit
   ```

   # Specify IPv6 PBR policy **aaa** as the IPv6 global PBR policy.

   ```
   [SwitchD] ipv6 global policy-based-route aaa
   ```

Verifying the configuration

1. Perform telnet operations to verify that IPv6 global PBR on Switch D operates as configured to forward the matching TCP packets to the next hop 4::2 (Switch E), as follows:

   # Verify that you can telnet to Switch E from Switch A, Switch B, and Switch C successfully. (Details not shown.)

   # Verify that you cannot telnet to Switch F from Switch A, Switch B, or Switch C. (Details not shown.)

2. Verify that Switch D forwards packets other than TCP packets as long as a route is available. For example, verify that you can ping Switch F from Switch A, Switch B, and Switch C. (Details not shown.)

Configuring routing policies

About routing policies

Routing policies control routing paths by filtering and modifying routing information.

Routing policies can filter advertised, received, and redistributed routes, and modify attributes for specific routes.

Implementation of a routing policy

To configure a routing policy:

1. **Define route filters**—Configure filters based on route attributes.
2. **Apply route filters**—Create a routing policy and apply filters to the routing policy.

Filters

Routing policies can use the following filters to match routes.

ACL

An Access Control List (ACL) can match the destination or next hop of routes.

For more information about ACLs, see ACL configuration in *ACL and QoS Configuration Guide*.

IP prefix list

An IP prefix list matches the destination address of routes.

An IP prefix list can contain multiple items that specify prefix ranges. Each destination IP address prefix of a route is compared with these items in ascending order of their index numbers. A prefix matches the IP prefix list if it matches one item in the list.

AS path list

An AS path list matches the AS_PATH attribute of BGP routes. The AS_PATH attribute identifies the ASs through which a route has passed.

For more information about the AS_PATH attribute, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Community list

A community list matches the COMMUNITY attribute of BGP routes. The COMMUNITY attribute identifies the community of BGP routes.

A route can carry one or more COMMUNITY attribute values (each of which is represented by a 4-byte integer). A router uses the COMMUNITY attribute to determine whether to advertise the route and the advertising scope without using complex filters such as ACLs. This mechanism simplifies routing policy configuration and network maintenance.

For more information about community lists, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Extended community list

An extended community list matches the extended community attribute of BGP routes.

The device supports the link bandwidth extended community attribute, route target (also called VPN target) extended community attribute, and Site of Origin (SoO) extended community attribute. The extended community list is actually a route filter based on these attributes.

For more information about extended community lists, see *MCE Configuration Guide.*

RD list

A route distinguisher (RD) list matches the RD of routes. After you add an RD as a prefix to an IPv4 address prefix, the address prefix becomes a unique VPN-IPv4 address prefix.

An RD list is identified by an RD list number and can contain multiple items that specify RD ranges. Each item is identified by an index number. The RD of a route is compared with these items in ascending order of their index numbers. An RD matches the RD list if it matches one item in the list.

For information about RD, see MCE configuration in *MCE Configuration Guide*.

Routing policy

A routing policy can contain multiple nodes, which are in a logical OR relationship. A node with a smaller number is matched first. A route matches the routing policy if it matches one node (except the node configured with the **continue** clause) in the routing policy.

Each node has a match mode of **permit** or **deny**.

- **permit**—Specifies the **permit** match mode for a routing policy node. If a route meets all the **if-match** clauses of the node, it is handled by the **apply** clauses of the node. The route is not compared with the next node unless the **continue** clause is configured. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.
- **deny**—Specifies the **deny** match mode for a routing policy node. The **apply** and **continue** clauses of a deny node are never executed. If a route meets all the **if-match** clauses of the node, it is denied without being compared with the next node. If a route does not meet all the **if-match** clauses of the node, it is compared with the next node.

A node can contain a set of **if-match**, **apply**, and **continue** clauses.

- **if-match** clauses—Specify the match criteria that match the attributes of routes. The **if-match** clauses of different types are in a logical AND relationship and the **if-match** clauses of the same type are in a logical OR relationship. A route must meet **if-match** clauses of all types to match the node.
- **apply** clauses—Specify the actions to be taken on permitted routes, such as modifying a route attribute.
- **continue** clause—Specifies the next node. A route that matches the current node (permit node) must match the specified next node in the same routing policy. The **continue** clause combines the **if-match** and **apply** clauses of the two nodes to improve flexibility of the routing policy. After you configure a **continue** clause, a route can pass the routing policy even if it does not match the specified next node. To reject such a route, add a **deny** node without clauses.

Follow these guidelines when you configure **if-match**, **apply**, and **continue** clauses:

- If you only want to filter routes, do not configure **apply** clauses.
- If you do not configure any **if-match** clauses for a permit node, the node will permit all routes.
- Configure a permit node containing no **if-match** or **apply** clauses following multiple deny nodes to allow unmatched routes to pass.

Routing policy tasks at a glance

To configure a routing policy, perform the following tasks:

1. (Optional.) Configure filters:
   - Configuring an IPv4 prefix list
   - Configuring an IPv6 prefix list
   - Configuring an AS path list
   - Configuring a community list

- Configuring an extended community list
- Configuring an RD list

2. Configuring a routing policy:
   a. Creating a routing policy
   b. Configuring if-match clauses
   c. Configuring apply clauses
   d. Configuring the continue clause
3. (Optional.) Configuring the routing policy change delay timer

Configuring an IPv4 prefix list

About this task

An IPv4 prefix list is used to filter IPv4 addresses. It can contain multiple items, each of which specifies a range of IPv4 prefixes. The relation between the items is logical OR. A route can pass an IPv4 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv4 prefix list cannot be passed.

Restrictions and guidelines

If the *ip-address mask-length* argument is specified as **0.0.0.0 0**, only the default route will be matched. To match all routes, use **0.0.0.0 0 less-equal 32**.

If all the items are set to deny mode, no routes can pass the IPv4 prefix list. To permit IPv4 routes that do not match any of the items, you must configure the **permit 0.0.0.0 0 less-equal 32** item following multiple deny items.

Procedure

1. Enter system view.

   system-view
2. Configure an IPv4 prefix list.

   ip prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ip-address mask-length* [**greater-equal** *min-mask-length*] [**less-equal** *max-mask-length*]

Configuring an IPv6 prefix list

About this task

An IPv6 prefix list is used to filter IPv6 addresses. It can contain multiple items, each of which specifies a range of IPv6 prefixes. The relation between the items is logical OR. A route can pass an IPv6 prefix list as long as it successfully matches an item. If the route cannot match any item, the IPv6 prefix list cannot be passed.

Restrictions and guidelines

If the *ipv6-address prefix-length* argument is specified as :: 0, only the default route matches. To match all routes, configure :: 0 **less-equal** 128.

If all items are set to **deny** mode, no routes can pass the IPv6 prefix list. To permit IPv6 routes that do not match any of the items, you must configure the **permit** :: 0 **less-equal** 128 item following multiple **deny** items.

Procedure

1. Enter system view.

system-view

2. Configure an IPv6 prefix list.

   ipv6 prefix-list *prefix-list-name* [**index** *index-number*] { **deny** | **permit** } *ipv6-address* { **inverse** *inverse-prefix-length* | *prefix-length* [**greater-equal** *min-prefix-length*] [**less-equal** *max-prefix-length*] }

Configuring an AS path list

About this task

The AS_PATH attribute identifies the ASs through which a BGP route has passed. Figure 1 shows the AS_PATH attribute format in the BGP routing table.

Figure 1 AS_PATH attribute

The AS_PATH attribute value is a character string containing digits, parentheses, brackets, braces, and spaces. It is a sequence of the following AS path segments:

- **AS_CONFED_SEQUENCE**—Ordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_CONFED_SET**—Unordered set of member AS numbers in the local confederation that the UPDATE message has traversed.
- **AS_SEQUENCE**—Ordered set of ASs a route in the UPDATE message has traversed.
- **AS_SET**—Unordered set of ASs a route in the UPDATE message has traversed.

NOTE:

The AS_PATH attribute of a BGP route might not contain all of the four AS path segments.

An AS path list consists of regular expressions used for filtering BGP routes by their AS_PATH attributes. A regular expression can contain the special characters described in Table 1.

Table 1 Special characters supported in a regular expression

Character	Description	Example
^	Matches the beginning of a line.	Match a local route if its AS_PATH attribute is null: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^$**
$	Matches the end of a line.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **100$**
.	Matches any single character.	Match a route if it has passed AS 100 but is not originated or received from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **. 100 .**

Character	Description	Example
*	Matches the preceding character or string zero, one, or multiple times.	Match a route if it has an AS_PATH attribute: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **.***
+	Matches the preceding character or string one or multiple times.	Match a route if its AS_PATH attribute value contains **5**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **5+**
x|y	Matches the preceding or succeeding string.	Match a route if it is originated from AS 100 or AS 200: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **100$\|200$**
( )	Matches the string in the parentheses, usually used together with the plus sign (+) or asterisk sign (*).	Match a route if its AS_PATH attribute value contains **123**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **(123)+**
[xyz]	Matches a single character in the brackets.	Match a route if it is received from AS 10 through AS 19: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^1[0-9]**$
[^xyz]	Matches a single character that is not in the brackets.	Match a route if its originating AS number does not end with **2** or **4**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **[^24]$**
{n}	Matches the preceding character *n* times. The number *n* must be a nonnegative integer.	Match a route if its AS_PATH attribute value contains two **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2}
{n,}	Matches the preceding character *n* times or more. The number *n* must be a nonnegative integer.	Match a route if its AS_PATH attribute value contains two or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{2,}
{n,m}	Matches the preceding character *n* to *m* times or more. The numbers *n* and *m* must be nonnegative integers and *n* cannot be greater than *m*.	Match a route if its AS_PATH attribute value contains one or more consecutive **5**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 5{1,2}
[a-z]	Matches a single character within the specified range for only once.	Match a route if its AS_PATH attribute value contains **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }[0-2]

Character	Description	Example
[^a-z]	Matches a single character that is not in the specified range.	Match a route if its AS_PATH attribute value contains digits other than **0**, **1**, or **2**: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** }^ [^0-2]$
_	Matches a punctuation. The expression can begin or end with _.	Match a route if it has passed AS101 100: **ip as-path** { *as-path-number* | *as-path-name* } { **deny** | **permit** } 101_100_
\b	Matches a word that starts with the pattern following \b or ends with the pattern preceding \b.	Match a route if it is originated from AS 100: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **\b100$**
\B	Matches a word that contains the pattern but does not start or end with the pattern.	Match a route if its AS_PATH attribute value starts with **1**: **ip as-path** { *as-path-number*| *as-path-name* } { **deny** | **permit** } **^1\B**
\	Escape character. If a special character listed in this table follows \, the specific meaning of the character is removed.	N/A
\w	Same as [A-Za-z0-9_], matches a digit, letter, or underscore.	Match a route if its AS_PATH attribute value contains double digits: **ip as-path** { *as-path-number* | *as-path-name* } \w{2}
\W	Same as [^A-Za-z0-9_], matches a character that is not a digit, letter, or underscore.	N/A
\index	Matches the specified string in the parentheses followed by \ twice. Each string in the parentheses is numbered from 1 in order. The *index* argument represents the sequence number of the string you want to match. If the parentheses contain *n* strings, you can specify the sequence number of the string in the range of 1 to *n*.	Match a route if its AS_PATH attribute value contains two consecutive **1**: **ip as-path** { *as-path-number* | *as-path-name* } (1)\1

NOTE:

The regular expressions shown in Table 1 are used for illustration only. Other regular expressions might be available to achieve the same effect.

Restrictions and guidelines

You can configure multiple items for an AS path list that is identified by a number. The relationship between the items is logical OR. A route matches the AS path list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an AS path list.

   ip as-path { *as-path-number*| *as-path-name* } { **deny** | **permit** } *regular-expression*

Configuring a community list

About this task

You can configure multiple items for a community list that is identified by a number. The relationship between the items is logical OR. A route matches the community list if it matches one item in the list.

An advanced community list matches the community attributes of BGP routes based on regular expressions. For more information about regular expressions, see the table that describes the special characters supported in a regular expression in "Configuring an AS path list."

Procedure

1. Enter system view.

   system-view

2. Configure a community list.
   - Configure a basic community list.

     ip community-list { *basic-comm-list-num* | **basic** *basic-comm-list-name* } { **deny** | **permit** } [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] *
   - Configure an advanced community list.

     ip community-list { *adv-comm-list-num* | **advanced** *adv-comm-list-name* } { **deny** | **permit** } *regular-expression*

Configuring an extended community list

About this task

You can configure multiple items for an extended community list that is identified by a number. The relationship between the items is logical OR. A route matches the extended community list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an extended community list.

   ip extcommunity-list *ext-comm-list-number* [**index** *index-number*] { **deny** | **permit** } { **bandwidth** *link-bandwidth-value* | **rt** *route-target* | **soo** *site-of-origin* }&<1-32>

Configuring an RD list

About this task

RD lists are used to filter VPN routing information. You can configure multiple items for an RD list that is identified by a number. The relationship between the items is logical OR. A route matches the RD list if it matches one item in the list.

Procedure

1. Enter system view.

   system-view

2. Configure an RD list.

   ip rd-list *rd-list-number* [**index** *index-number*] { **deny** | **permit** } *route-distinguisher*&<1-10>

Configuring a routing policy

Creating a routing policy

About this task

A routing policy must have a minimum of one permit node. If all the nodes are in **deny** mode, no routes can pass the routing policy.

Procedure

1. Enter system view.

   system-view

2. Create a routing policy and a node, and enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. (Optional.) Enable consistency check between the IP version in routing information and the IP version of the prefix list specified by an **if-match** clause. Routing information with a different IP version does not match the clause.

   a. Return to system view.

      quit

   b. Enable consistency check between the IP version in routing information and the IP version of the prefix list specified by an **if-match** clause. Routing information with a different IP version does not match the clause.

      route-policy prefix-protocol-check

      By default, routing policies do not check the consistency between the IP version in routing information and the IP version of the prefix list specified by an if-match clause:

      - If the if-match clause uses an IPv6 address prefix list, all IPv4 routes can match the clause.
      - If the if-match clause uses an IPv4 address prefix list, all IPv6 routes can match the clause.

Configuring if-match clauses

About this task

You can either specify no **if-match** clauses or multiple **if-match** clauses for a routing policy node. If no **if-match** clause is specified for a permit node, all routes can pass the node. If no **if-match** clause is specified for a deny node, no routes can pass the node.

Restrictions and guidelines

When you configure **if-match** clauses, follow these restrictions and guidelines:

- The **if-match** clauses of a routing policy node have a logical AND relationship. A route must meet all **if-match** clauses before it can be executed by the **apply** clauses of the node. If an **if-match** command exceeds the maximum length, multiple **if-match** clauses of the same type are generated. These clauses have a logical OR relationship. A route only needs to meet one of them.
- All IPv4 routes match a node if the **if-match** clauses of the node use only IPv6 ACLs. All IPv6 routes match a node if the **if-match** clauses of the node use only IPv4 ACLs.
- If the ACL used by an **if-match** clause does not exist or the ACL is not configured with any rules, the clause is always matched. When the ACL of an **if-match** clause is configured with rules, a route cannot match the **if-match** clause in one of the following scenarios:
  - The route cannot match any rule of the specified ACL.
  - The route matches a deny-mode rule of the specified ACL.
- If the prefix list, AS path list, community list, extended community list, MAC list, or RD list used by an **if-match** clause does not exist, the clause is always matched. The clause is not matched if one of the following conditions exists:
  - No rules of the specified prefix list, AS path list, community list, extended community list, MAC list, or RD list are matched.
  - The specified prefix list, AS path list, community list, extended community list, MAC list, or RD list is in **deny** mode.
- The **rule** [*rule-id*] **permit ip source** *sour-addr sour-wildcard* **destination** *dest-addr dest-wildcard* command can create a rule for an advanced ACL to match specific routes. The **source** *sour-addr sour-wildcard* option represents the destination network address and the **destination** *dest-addr dest-wildcard* option represents the mask in dotted decimal notation. For example, to match route 3.3.3.0/24, the rule configuration should be **rule** [*rule-id*] **permit ip source** 3.3.3.0 0.0.0.255 **destination** 255.255.255.0 0.0.0.255.

Procedure

1. Enter system view.

   system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Match routes whose destination, next hop, or source address matches an ACL or prefix list.

   IPv4:

   if-match ip { **address** | **next-hop** | **route-source** } { **acl** *ipv4-acl-number* | **prefix-list** *prefix-list-name* }

   IPv6:

   if-match ipv6 { **address** | **next-hop** | **route-source** } { **acl** *ipv6-acl-number* | **prefix-list** *prefix-list-name* }

   By default, no ACL or prefix list match criterion is configured.

   The ACL specified in an **if-match** clause must be a non-VPN ACL.

4. Configure BGP route match criteria.
   - Match BGP routes whose AS_PATH attribute matches a specified AS path list.
     if-match as-path { *as-path-number*&<1-32> | *as-path-name* }
   - Match BGP routes whose COMMUNITY attribute matches a specified community list.
     if-match community { { *basic-community-list-number* | **name** *comm-list-name* } [**whole-match**] | *adv-community-list-number* }&<1-32>
   - Match BGP routes whose extended community attribute matches a specified extended community list.
     if-match extcommunity *ext-comm-list-number*&<1-32>
   - Match BGP routes having the specified local preference.
     if-match local-preference *preference*
   - Match BGP routes with the specified RPKI validation state.
     if-match rpki { **invalid** | **not-found** | **valid** }

   By default, no BGP route match criteria are configured.
5. Configure route match criteria.
   - Match routes having the specified cost.
     if-match cost *cost-value*
   - Match routes having the specified output interface.
     if-match interface { *interface-type interface-number* }&<1-16>

     This command is not supported by BGP.
   - Match routes having the specified route type.
     if-match route-type { **external-type1** | **external-type1or2** | **external-type2** | **internal** | **is-is-level-1** | **is-is-level-2** | **nssa-external-type1** | **nssa-external-type1or2** | **nssa-external-type2** } *
   - Match IGP routes having the specified tag value.
     if-match tag *tag-value*

   By default, no route match criteria are configured.
6. Match routes whose RD matches the specified RD list.
   if-match rd-list *rd-list-number*

   By default, no RD match criterion is configured.
7. Match IPv6 route prefixes of the specified length whose last bit is an odd or even number.
   - Match IPv6 route prefixes of the specified length whose last bit is an odd number.
     if-match ipv6 odd-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.
   - Match IPv6 route prefixes of the specified length whose last bit is an even number.
     if-match ipv6 even-prefix-length *prefix-length-number*

     By default, no match criterion is configured to match the length and last bit of IPv6 route prefixes.

Configuring apply clauses

1. Enter system view.

system-view

2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

3. Configure BGP route attributes.

   - Set the AS_PATH attribute for BGP routes.

     apply as-path { *as-number*&<1-32> [**delete** | **replace**] | **clear** }

   - Delete the specified COMMUNITY attribute for BGP routes.

     apply comm-list { *comm-list-number* | *comm-list-name* } **delete**

     By default, no COMMUNITY attribute is deleted for BGP routes.

   - Set the specified COMMUNITY attribute for BGP routes.

     apply community { **none** | **additive** | { *community-number*&<1-32> | *aa:nn*&<1-32> | **internet** | **no-advertise** | **no-export** | **no-export-subconfed** } * [**additive**] }

   - Set the link bandwidth extended community attribute for BGP routes.

     apply extcommunity bandwidth *link-bandwidth-value* [**additive**]

   - Set the RT extended community attribute for BGP routes.

     apply extcommunity { **rt** *route-target* }&<1-32> [**additive**]

   - Set the SoO extended community attribute for BGP routes.

     apply extcommunity soo *site-of-origin*&<1-32> [**additive**]

   - Set a local preference for BGP routes.

     apply local-preference *preference*

   - Set the ORIGIN attribute for BGP routes.

     apply origin { **egp** *as-number* | **igp** | **incomplete** }

   - Set a preferred value for BGP routes.

     apply preferred-value *preferred-value*

   - Set a traffic index for BGP routes.

     apply traffic-index { *value* | **clear** }

   By default, no BGP route attributes are configured.

4. Configure the route cost and cost type.

   - Set a cost for routes.

     apply cost [**+** | **-**] *cost-value*

     By default, no cost is set for routes.

   - Set a cost type for routes.

     apply cost-type { **external** | **inherit-link-cost** | **internal** | **internal-inc-ibgp** | **med-plus-igp** | **type-1** | **type-2** }

     By default, no cost type is set for routes.

5. Set the next hop for routes.

   IPv4:

   apply ip-address next-hop *ip-address* [**public** | **vpn-instance** *vpn-instance-name*]

   IPv6:

   apply ipv6 next-hop *ipv6-address*

   By default, no next hop is set for routes.

   The configuration does not apply to redistributed routes.

6. Configure route priorities.
   - Set an IP precedence for matching routes.
     apply ip-precedence { *value* | **clear** }
     By default, no IP precedence is set.
   - Set a preference.
     apply preference *preference*
     By default, no preference is set.
   - Set a prefix priority.
     apply prefix-priority { **critical** | **high** | **medium** }
     By default, the prefix priority is low.
7. Associate a Track entry with BGP routes.
   apply track *track-entry-number*
   By default, no track entry is associated with BGP routes.
8. Redistribute routes to the specified IS-IS level.
   apply isis { **level-1** | **level-1-2** | **level-2** }
   By default, routes are not redistributed into the specified IS-IS level.
9. Set a tag value for IGP routes.
   apply tag *tag-value*
   By default, no tag value is set for IGP routes.
10. Set a backup link for fast reroute (FRR).
    IPv4:
    apply fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ip-address*] | **backup-nexthop** *ip-address* }
    IPv6:
    apply ipv6 fast-reroute { **backup-interface** *interface-type interface-number* [**backup-nexthop** *ipv6-address*] | **backup-nexthop** *ipv6-address* }
    By default, no backup link is set for FRR.

Configuring the continue clause

Restrictions and guidelines

When you configure the **continue** clause to combine multiple nodes, follow these restrictions and guidelines:

- If you configure an **apply** clause that sets different attribute values on all the nodes, the **apply** clause of the node configured most recently takes effect.
- If you configure the following **apply** clauses on all the nodes, the **apply** clause of each node takes effect:
  - **apply as-path** without the **replace** or **clear** keyword.
  - **apply cost** with the **+** or **–** keyword.
  - **apply community** with the **additive** keyword.
  - **apply extcommunity** with the **additive** keyword.
- The **apply comm-list delete** clause configured on the current node cannot delete the community attributes set by the **apply community** clauses of the preceding nodes.

- The **apply as-path delete** or **apply as-path clear** clause configured on the current node will delete or clear the AS numbers added or replaced by the **apply as-path** clauses of the preceding nodes.

Procedure

1. Enter system view.

   system-view
2. Enter routing policy node view.

   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
3. Specify the next node to be matched.

   continue [*node-number*]

   By default, no continue clause is configured.

   The specified next node must have a larger number than the current node.

Configuring the routing policy change delay timer

About this task

This feature makes a routing policy take effect after a delayed time interval, which prevents incomplete routing policy configuration from being issued to cause incorrect route advertisement. The system automatically starts the timer when a routing policy changes. The changes will not take effect on the policy until the change delay timer expires.

A routing policy changes when one of the following events occurs:

- A routing policy is created.
- A routing policy node, **if-match** clause, or **apply** clause is added, modified, or deleted for a routing policy.
- You add, modify, or delete one of the following lists:
  - IPv4 prefix list.
  - IPv6 prefix list.
  - AS path list.
  - Community list.
  - Extended community list.
- The ACL used by an **if-match** clause changes.

Procedure

1. Enter system view.

   system-view
2. Set the routing policy change delay timer.

   route-policy-change delay-time { *time-value* | **unlimited** }

   By default, routing policy changes immediately take effect, but the routing protocol waits five seconds before processing routes from the new routing policy.

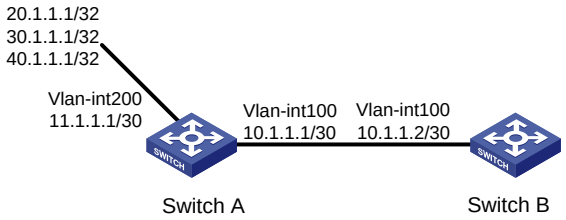
   When the delay timer expires, the routing protocol waits five seconds before processing routes from the new routing policy.

Display and maintenance commands for routing policies

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display BGP AS path list information.	**display ip as-path** [*as-path-number* | *as-path-name*]
Display BGP community list information.	**display ip community-list** [*basic-community-list-number* | *adv-community-list-number* | **name** *comm-list-name*]
Display BGP extended community list information.	**display ip extcommunity-list** [*ext-comm-list-number*]
Display IPv4 prefix list statistics.	**display ip prefix-list** [**name** *prefix-list-name*]
Display RD list information.	**display ip rd-list** [*rd-list-number*]
Display IPv6 prefix list statistics.	**display ipv6 prefix-list** [**name** *prefix-list-name*]
Display routing policy information.	**display route-policy** [**name** *route-policy-name*]
Clear BGP AS path list statistics.	**reset ip as-path** [*as-path-number* | *as-path-name*]
Clear IPv4 prefix list statistics.	**reset ip prefix-list** [*prefix-list-name*]
Clear IPv6 prefix list statistics.	**reset ipv6 prefix-list** [*prefix-list-name*]

Routing policy configuration examples



Example: Configuring a routing policy for redistributing static routes to RIP

Network configuration

As shown in Figure 2, Switch A exchanges routing information with Switch B by using RIP.

On Switch A, configure three static routes. Use a routing policy to configure Switch B to redistribute networks 20.1.1.1/32 and 40.1.1.1/32 and block network 30.1.1.1/32.

Figure 2 Network diagram

Procedure

1. Configure Switch A:

Configure IP addresses for interfaces VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-vlan-interface100] ip address 10.1.1.1 30
[SwitchA-vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-vlan-interface200] ip address 11.1.1.1 30
[SwitchA-vlan-interface200] quit
```

Enable RIP on interface VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-vlan-interface100] rip 1 enable
[SwitchA-vlan-interface100] quit
```

Configure three static routes and set the next hop of the three routes to 11.1.1.2.

```
[SwitchA] ip route-static 20.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 30.1.1.1 32 11.1.1.2
[SwitchA] ip route-static 40.1.1.1 32 11.1.1.2
```

Configure a routing policy.

```
[SwitchA] ip prefix-list a index 10 permit 30.1.1.1 32
[SwitchA] route-policy static2rip deny node 0
[SwitchA-route-policy-static2rip-0] if-match ip address prefix-list a
[SwitchA-route-policy-static2rip-0] quit
[SwitchA] route-policy static2rip permit node 10
[SwitchA-route-policy-static2rip-10] quit
```

Enable RIP and apply routing policy **static2rip** to filter redistributed static routes.

```
[SwitchA] rip
[SwitchA-rip-1] import-route static route-policy static2rip
```

2. Configure Switch B:

Configure an IP address for interface VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-vlan-interface100] ip address 10.1.1.2 30
```

Enable RIP.

```
[SwitchB] rip
[SwitchB-rip-1] quit
```

Enable RIP on the interface.

```
[SwitchB] interface vlan-interface 100
```

```
[SwitchB-vlan-interface100] rip 1 enable
[SwitchB-vlan-interface100] quit
```

Verifying the configuration

Display the routing table information on Switch B.

```
<SwitchB> display ip routing-table

Destinations : 14       Routes : 14

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0

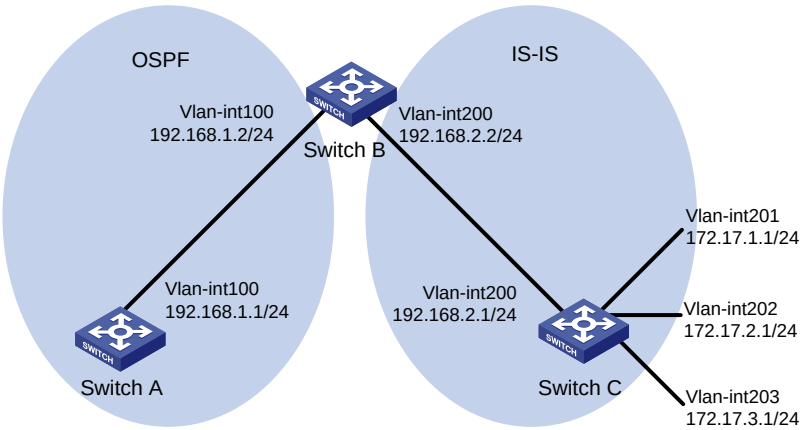
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop
```



Example: Configuring a routing policy for redistributing IS-IS routes to OSPF

Network configuration

As shown in Figure 3, Switch B exchanges routing information with Switch A by using OSPF and with Switch C by using IS-IS.

On Switch B, enable route redistribution from IS-IS to OSPF. Use a routing policy to set the cost of route 172.17.1.0/24 to 100 and the tag of route 172.17.2.0/24 to 20.

Figure 3 Network diagram

Procedure

1. Specify IP addresses for interfaces. (Details not shown.)
2. Configure IS-IS:

   # Configure Switch C.

```
<SwitchC> system-view
[SwitchC] isis
[SwitchC-isis-1] is-level level-2
[SwitchC-isis-1] network-entity 10.0000.0000.0001.00
[SwitchC-isis-1] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] isis enable
[SwitchC-Vlan-interface200] quit
[SwitchC] interface vlan-interface 201
[SwitchC-Vlan-interface201] isis enable
[SwitchC-Vlan-interface201] quit
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] isis enable
[SwitchC-Vlan-interface202] quit
[SwitchC] interface vlan-interface 203
[SwitchC-Vlan-interface203] isis enable
[SwitchC-Vlan-interface203] quit
```

   # Configure Switch B.

```
<SwitchB> system-view
[SwitchB] isis
[SwitchB-isis-1] is-level level-2
[SwitchB-isis-1] network-entity 10.0000.0000.0002.00
[SwitchB-isis-1] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] isis enable
[SwitchB-Vlan-interface200] quit
```

3. Configure OSPF and route redistribution:

   # Configure OSPF on Switch A.

```
<SwitchA> system-view
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

   # On Switch B, configure OSPF and enable route redistribution from IS-IS to OSPF.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 192.168.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] import-route isis 1
[SwitchB-ospf-1] quit
```

   # Display the OSPF routing table on Switch A to view redistributed routes.

```
[SwitchA] display ospf routing
```

```
          OSPF Process 1 with Router ID 192.168.1.1
                  Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop        AdvRouter     Area
 192.168.1.0/24     1        Stub    192.168.1.1    192.168.1.1   0.0.0.0

 Routing for ASEs
 Destination        Cost     Type    Tag        NextHop        AdvRouter
 172.17.1.0/24      1        Type2   1          192.168.1.2    192.168.2.2
 172.17.2.0/24      1        Type2   1          192.168.1.2    192.168.2.2
 172.17.3.0/24      1        Type2   1          192.168.1.2    192.168.2.2

 Total Nets: 4
 Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

4. Configure filtering lists:

Configure IPv4 basic ACL 2002 to permit route 172.17.2.0/24.

```
[SwitchB] acl basic 2002
[SwitchB-acl-ipv4-basic-2002] rule permit source 172.17.2.0 0.0.0.255
[SwitchB-acl-ipv4-basic-2002] quit
```

Configure IP prefix list **prefix-a** to permit route 172.17.1.0/24.

```
[SwitchB] ip prefix-list prefix-a index 10 permit 172.17.1.0 24
```

5. Configure a routing policy.

```
[SwitchB] route-policy isis2ospf permit node 10
[SwitchB-route-policy-isis2ospf-10] if-match ip address prefix-list prefix-a
[SwitchB-route-policy-isis2ospf-10] apply cost 100
[SwitchB-route-policy-isis2ospf-10] quit
[SwitchB] route-policy isis2ospf permit node 20
[SwitchB-route-policy-isis2ospf-20] if-match ip address acl 2002
[SwitchB-route-policy-isis2ospf-20] apply tag 20
[SwitchB-route-policy-isis2ospf-20] quit
[SwitchB] route-policy isis2ospf permit node 30
[SwitchB-route-policy-isis2ospf-30] quit
```

6. Apply the routing policy to route redistribution:

On Switch B, enable route redistribution from IS-IS to OSPF and apply the routing policy.

```
[SwitchB] ospf
[SwitchB-ospf-1] import-route isis 1 route-policy isis2ospf
[SwitchB-ospf-1] quit
```

Display the OSPF routing table on Switch A.

```
[SwitchA] display ospf routing

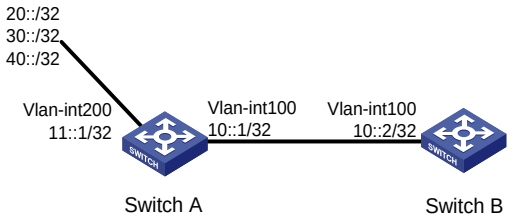
          OSPF Process 1 with Router ID 192.168.1.1
                  Routing Tables

 Routing for Network
 Destination        Cost     Type    NextHop         AdvRouter     Area
 192.168.1.0/24     1        Transit 192.168.1.1     192.168.1.1   0.0.0.0
```

```
Routing for ASEs
Destination        Cost     Type    Tag         NextHop       AdvRouter
172.17.1.0/24      100      Type2   1           192.168.1.2   192.168.2.2
172.17.2.0/24      1        Type2   20          192.168.1.2   192.168.2.2
172.17.3.0/24      1        Type2   1           192.168.1.2   192.168.2.2

Total Nets: 4
Intra Area: 1  Inter Area: 0  ASE: 3  NSSA: 0
```

The output shows that the cost of route 172.17.1.0/24 is 100 and the tag of route 172.17.2.0/24 is 20.



Example: Configuring a routing policy for IPv6 route redistribution

Network configuration

As shown in Figure 4:

- Run RIPng on Switch A and Switch B.
- Configure three static routes on Switch A.
- On Switch A, apply a routing policy to redistribute static routes 20::/32 and 40::/32 and deny route 30::/32.

Figure 4 Network diagram

Procedure

1. Configure Switch A:

   # Configure IPv6 addresses for VLAN-interface 100 and VLAN-interface 200.

```
<SwitchA> system-view
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 address 10::1 32
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] ipv6 address 11::1 32
[SwitchA-Vlan-interface200] quit
```

   # Enable RIPng on VLAN-interface 100.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ripng 1 enable
[SwitchA-Vlan-interface100] quit
```

   # Configure three static routes with next hop 11::2, and make sure the static routes are active.

```
[SwitchA] ipv6 route-static 20:: 32 11::2
[SwitchA] ipv6 route-static 30:: 32 11::2
```

```
[SwitchA] ipv6 route-static 40:: 32 11::2
```

Configure a routing policy.

```
[SwitchA] ipv6 prefix-list a index 10 permit 30:: 32
[SwitchA] route-policy static2ripng deny node 0
[SwitchA-route-policy-static2ripng-0] if-match ipv6 address prefix-list a
[SwitchA-route-policy-static2ripng-0] quit
[SwitchA] route-policy static2ripng permit node 10
[SwitchA-route-policy-static2ripng-10] quit
```

Enable RIPng and apply the routing policy to static route redistribution.

```
[SwitchA] ripng
[SwitchA-ripng-1] import-route static route-policy static2ripng
```

2. Configure Switch B:

Configure the IPv6 address for VLAN-interface 100.

```
<SwitchB> system-view
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ipv6 address 10::2 32
```

Enable RIPng.

```
[SwitchB] ripng
[SwitchB-ripng-1] quit
```

Enable RIPng on VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] ripng 1 enable
[SwitchB-Vlan-interface100] quit
```

Verifying the configuration

Display the RIPng routing table on Switch B.

```
[SwitchB] display ripng 1 route
   Route Flags: A - Aging, S - Suppressed, G - Garbage-collect, D - Direct
                O - Optimal, F - Flush to RIB
 ------------------------------------------------------------------

 Peer FE80::7D58:0:CA03:1 on Vlan-interface 100
 Destination 20::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 8 secs
 Destination 40::/32,
     via FE80::7D58:0:CA03:1, cost 1, tag 0, A, 3 secs
 Local route
 Destination 10::/32,
     via ::, cost 0, tag 0, DOF
```

Configuring DCN

About DCN

Data communication network (DCN) is built for the network management system (NMS) to implement operation, administration, and maintenance (OAM) on the network elements (NEs).

On large-scaled networks with DCN configured, the NMS remotely manages and controls all NEs through the gateway network element (GNE), which reduces operation and maintenance costs.

On the DCN network, all NEs must operate in Area 0 of OSPF process 65535.

Basic concepts

NE

A network device managed by the NMS on the DCN network.

GNE

The NE that is directly connected to the NMS. The NSM communicates with the GNE at the network layer or application layer and manages the NEs through the GNE.

NE table

Stores the NE ID-to-NE IP mappings for each NE in the DCN domain. After DCN is enabled, an NE encapsulates its NE ID and NE IP in a Type-10 Opaque LSA. It floods the LSA to synchronize the mappings with other NEs in the DCN domain.

The NE IP in the Type-10 Opaque LSA might be inconsistent with the NE's router ID when DCN is enabled on an OSPF network. Devices from other vendors will fail to identify the NE. To avoid this problem, make sure the following requirements are met:

- Change the router ID by modifying the NE IP. Do not change the default IP address of the DCN's loopback interface.
- Do not associate other loopback interfaces with the DCN VPN instance.

GNE

The GNE allows the NMS to access NEs on the DCN network. The GNE provides the NE ID-to-NE IP mappings of all NEs for the Telnet users to access the target NE remotely.

NE search

The NE search feature allows the NMS to search for all NEs that are connected to the GNE. With this feature, the GNE can report information about all NEs in its NE table and the GNE itself to the NMS.

Automatic report

The automatic report feature enables the GNE to automatically report online or offline events of NEs to the NMS.

DCN tasks at a glance

To configure DCN, perform the following tasks:

1. Enabling DCN
2. (Optional.) Configuring the NE ID and NE IP
3. Configuring DCN VPN
4. (Optional.) Enabling the automatic report feature
5. Configuring the LLDP features
   a. (Optional.) Configuring the source MAC address of LLDP frames
   b. Advertising the LLDP management address
   c. Enabling the device to generate ARP entries for received management address LLDP TLVs

Enabling DCN

About this task

After DCN is enabled, the device assigns an NE IP to the loopback interface with the largest interface number and uses the interface for communication. The NE IP is specified as the management address and advertised in an LLDP frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Enter system view.
   `system-view`
2. Enable DCN and enter DCN view.
   `dcn`
   By default, DCN is disabled.

Configuring the NE ID and NE IP

About this task

Typically an NE automatically generates an NE IP according to its NE ID. The automatically generated NE IP changes when the NE ID changes. When you replan your network or an NE ID conflict occurs, you can manually configure the NE ID and NE IP. The manually configured NE IP does not change when the NE ID changes.

Procedure

1. Enter system view.
   `system-view`
2. Enter DCN view.
   `dcn`
3. Configure the NE ID.
   `ne-id` *`id-number`*
   By default, the NE ID is automatically generated by using the 24 low-order bits of the bridge MAC address.
4. Configure the NE IP.
   `ne-ip` *`ip-address`* { *`mask-length`* | *`mask`* }

By default, the NE IP is automatically generated by using 129 as the eight high-order bits and the NE ID as the rest 16 bits. The mask length is 32.

Configuring DCN VPN

About this task

Perform this task to ensure the independence of DCN services. For more information about VPN instances, see MCE configuration in *MCE Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter its view, or enter the view of an existing VPN instance.
   ip vpn-instance *vpn-instance-name*
   For more information about this command, see MCE commands in *MCE Command Reference*.
3. Quit VPN instance view.
   quit
4. Create a loopback interface and enter its view, or enter the view of an existing loopback interface.
   interface loopback *interface-number*
5. Associate the loopback interface with a VPN instance.
   ip binding vpn-instance *vpn-instance-name*
   By default, the loopback interface is not associated with a VPN instance.
   For more information about this command, see MCE commands in *MCE Command Reference*.

Enabling the automatic report feature

Restrictions and guidelines

Perform this task only on GNE to enable it to automatically report online or offline events of NEs to the NMS.

Procedure

1. Enter system view.
   system-view
2. Enter DCN view.
   dcn
3. Enable the automatic report feature.
   auto-report
   By default, the automatic report feature is disabled.

Configuring the LLDP features

Configuring the source MAC address of LLDP frames

About this task

Perform this task to configure the MAC address of the specified Layer 3 Ethernet interface as the source MAC address of LLDP frames. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Restrictions and guidelines

This feature is supported only on Layer 3 physical interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 3 Ethernet interface view.

   interface *interface-type interface-number*

3. Configure the MAC address of the Dot1q termination-enabled specified Layer 3 Ethernet interface as the source MAC address of LLDP frames.

   lldp source-mac vlan *vlan-id*

   By default, the MAC address of the current Ethernet interface is specified as the source MAC address of LLDP frames.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Advertising the LLDP management address

About this task

An NE on the DCN network learns the MAC address of its neighbor through LLDP. Perform this task to enable an NE to advertise the IP address of the specified loopback interface (management address) for ARP entry learning. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Restrictions and guidelines

This feature is supported only on Layer 3 physical interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Advertise the LLDP management address.

   lldp tlv-enable basic-tlv management-address-tlv [*ip-address* | **interface loopback** *interface-number*]

   By default, the LLDP management address is not advertised.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Command Reference*.

Enabling the device to generate ARP entries for received management address LLDP TLVs

About this task

This feature enables the device to generate an ARP entry for a received LLDP frame that meets the following requirements:

- The LLDP frame carries a management address TLV.
- The management address TLV contains an IPv4 address.

The generated ARP entry contains the management address and the source MAC address of the frame. For more information about LLDP, see LLDP configuration in *Layer 2—LAN Switching Configuration Guide*.

Restrictions and guidelines

This feature is supported only on Layer 3 physical interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the device to generate an ARP entry when receiving a management address LLDP TLV.

   lldp management-address arp-learning [**vlan** *vlan-id*]

   By default, the device does not generate an ARP entry when receiving a management address LLDP TLV.

   The device uses the current Layer 3 Ethernet subinterface as the output interface for generated ARP entries.

   For more information about this command, see LLDP commands in *Layer 2—LAN Switching Configuration Guide*.

Display and maintenance commands for DCN

Execute the **display** commands in any view.

Task	Command
Display the brief DCN information.	**display dcn**
Display information about all online NEs on the DCN network.	**display dcn ne-info**

DCN configuration examples

Example: Configuring DCN

Network configuration

As shown in Figure 1, the GNE, Device A, and Device B run DCN in the same VPN instance. The NMS uses SNMP to manage the GNE, and the GNE automatically sends notifications to the NMS to report online or offline events of NEs.

Figure 1 Network diagram

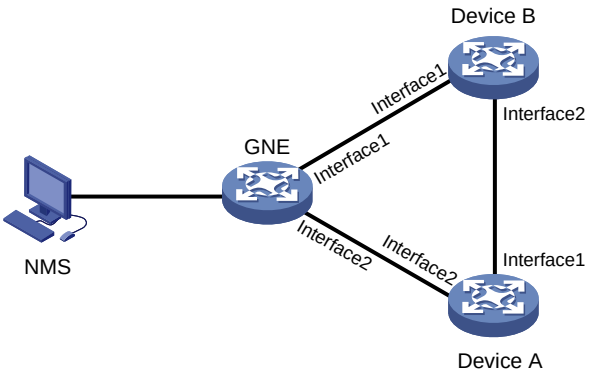

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Procedure

1. Configure the GNE:

   # Enable SNMP on the GNE. (Details not shown. For more information, see *Network Management and Monitoring Configuration Guide*.)

   # Enable DCN, configure the NE ID as 100001 and NE IP as 11.1.1.1/32, and enable the automatic report feature.

   ```
   <GNE> system-view
   [GNE] dcn
   [GNE-dcn] ne-id 100001
   [GNE-dcn] ne-ip 11.1.1.1 32
   [GNE-dcn] auto-report
   [GNE-dcn] quit
   ```

   # Create a VPN instance named **dcn_vpn**.

   ```
   [GNE] ip vpn-instance dcn_vpn
   [GNE-vpn-instance-dcn_vpn] quit
   ```

   # Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

   ```
   [GNE] interface loopback 1023
   [GNE-LoopBack1023] ip binding vpn-instance dcn_vpn
   [GNE-LoopBack1023] quit
   ```

   # Enable LLDP globally.

```
[GNE] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[GNE] interface gigabitethernet 1/0/1
[GNE-GigabitEthernet1/0/1] port access vlan 3001
[GNE-GigabitEthernet1/0/1] lldp source-mac vlan 3001
[GNE-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3001 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[GNE-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
[GNE-GigabitEthernet1/0/1] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[GNE] interface gigabitethernet 1/0/2
[GNE-GigabitEthernet1/0/2] port access vlan 3002
[GNE-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[GNE-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3002 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[GNE-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[GNE-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ip binding vpn-instance dcn_vpn
[GNE-Vlan-interface3001] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3001] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

```
[GNE] interface Vlan-interface 3002
[GNE-Vlan-interface3002] ip binding vpn-instance dcn_vpn
[GNE-Vlan-interface3002] ip address unnumbered interface loopback 1023
[GNE-Vlan-interface3002] quit
```

Enable OSPF process 65535 and create area 0.

```
[GNE] ospf 65535 vpn-instance dcn_vpn
[GNE-ospf-65535] area 0
[GNE-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[GNE-ospf-65535-area-0.0.0.0] quit
[GNE-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[GNE] interface Vlan-interface 3001
[GNE-Vlan-interface3001] ospf network-type p2p
[GNE-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[GNE] interface Vlan-interface 3002
```

```
[GNE-Vlan-interface3002] ospf network-type p2p
[GNE-Vlan-interface3002] quit
```

2. Configure Device A:

Enable DCN, configure the NE ID as 200002 and NE IP as 22.2.2.2/32.

```
<DeviceA> system-view
[DeviceA] dcn
[DeviceA-dcn] ne-id 200002
[DeviceA-dcn] ne-ip 22.2.2.2 32
[DeviceA-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceA] ip vpn-instance dcn_vpn
[DeviceA-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceA] interface loopback 1023
[DeviceA-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceA-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceA] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface gigabitethernet 1/0/2
[DeviceA-GigabitEthernet1/0/2] port access vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp source-mac vlan 3002
[DeviceA-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3002 in Dot1q termination after GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3002
[DeviceA-GigabitEthernet1/0/2] quit
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address.

```
[DeviceA] interface gigabitethernet 1/0/1
[DeviceA-GigabitEthernet1/0/1] port access vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp source-mac vlan 3003
[DeviceA-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
```

Configure the system to issue the generated ARP entry to the Layer 3 Ethernet subinterface associated with VLAN 3003 in Dot1q termination after GigabitEthernet 1/0/1 receives an LLDP frame.

```
[DeviceA-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3003
[DeviceA-GigabitEthernet1/0/1] quit
```

Create VLAN-interface 3002 that borrows the IP address of Loopback 1023.

```
[DeviceA] interface Vlan-interface 3002
[DeviceA-Vlan-interface3002] ip binding vpn-instance dcn_vpn
[DeviceA-Vlan-interface3002] ip address unnumbered interface loopback 1023
[DeviceA-Vlan-interface3002] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ip binding vpn-instance dcn_vpn
[DeviceA-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceA-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceA] ospf 65535 vpn-instance dcn_vpn
[DeviceA-ospf-65535] area 0
[DeviceA-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceA-ospf-65535-area-0.0.0.0] quit
[DeviceA-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3002 to P2P.

```
[DeviceA] interface Vlan-interface 3002
[DeviceA-Vlan-interface3002] ospf network-type p2p
[DeviceA-Vlan-interface3002] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceA] interface Vlan-interface 3003
[DeviceA-Vlan-interface3003] ospf network-type p2p
[DeviceA-Vlan-interface3003] quit
```

3. Configure Device B:

Enable DCN, configure the NE ID as 300003 and NE IP as 33.3.3.3/32.

```
<DeviceB> system-view
[DeviceB] dcn
[DeviceB-dcn] ne-id 300003
[DeviceB-dcn] ne-ip 33.3.3.3 32
[DeviceB-dcn] quit
```

Create a VPN instance named **dcn_vpn**.

```
[DeviceB] ip vpn-instance dcn_vpn
[DeviceB-vpn-instance-dcn_vpn] quit
```

Create interface Loopback 1023, and associate it with VPN instance **dcn_vpn**.

```
[DeviceB] interface loopback 1023
[DeviceB-LoopBack1023] ip binding vpn-instance dcn_vpn
[DeviceB-LoopBack1023] quit
```

Enable LLDP globally.

```
[DeviceB] lldp global enable
```

Enable the nearest bridge agents on GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to advertise basic LLDP TLVs and management address TLVs. The IP address of interface Loopback 1023 is specified as the management address. Configure the system to issue the generated ARP entry after GigabitEthernet 1/0/1 or GigabitEthernet 1/0/2 receives an LLDP frame.

```
[DeviceB] interface gigabitethernet 1/0/1
[DeviceB-GigabitEthernet1/0/1] port link-mode route
[DeviceB-GigabitEthernet1/0/1] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
[DeviceB-GigabitEthernet1/0/1] lldp management-address arp-learning vlan 3001
[DeviceB-GigabitEthernet1/0/1] quit
[DeviceB] interface gigabitethernet 1/0/2
[DeviceB-GigabitEthernet1/0/2] port link-mode route
```

```
[DeviceB-GigabitEthernet1/0/2] lldp tlv-enable basic-tlv management-address-tlv
interface loopback 1023
[DeviceB-GigabitEthernet1/0/2] lldp management-address arp-learning vlan 3003
[DeviceB-GigabitEthernet1/0/2] quit
```

Create VLAN-interface 3001 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ip binding vpn-instance dcn_vpn
[DeviceB-Vlan-interface3001] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3001] quit
```

Create VLAN-interface 3003 that borrows the IP address of Loopback 1023.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ip binding vpn-instance dcn_vpn
[DeviceB-Vlan-interface3003] ip address unnumbered interface loopback 1023
[DeviceB-Vlan-interface3003] quit
```

Enable OSPF process 65535 and create area 0.

```
[DeviceB] ospf 65535 vpn-instance dcn_vpn
[DeviceB-ospf-65535] area 0
[DeviceB-ospf-65535-area-0.0.0.0] network 0.0.0.0 255.255.255.255
[DeviceB-ospf-65535-area-0.0.0.0] quit
[DeviceB-ospf-65535] quit
```

Set the OSPF network type for VLAN-interface 3001 to P2P.

```
[DeviceB] interface Vlan-interface 3001
[DeviceB-Vlan-interface3001] ospf network-type p2p
[DeviceB-Vlan-interface3001] quit
```

Set the OSPF network type for VLAN-interface 3003 to P2P.

```
[DeviceB] interface Vlan-interface 3003
[DeviceB-Vlan-interface3003] ospf network-type p2p
[DeviceB-Vlan-interface3003] quit
```

Verifying the configuration

Display brief DCN information on the GNE.

```
[GNE] display dcn

              DCN Brief Information

 NE ID        : 0x100001
 NE IP        : 11.1.1.1
 Mask         : 255.255.255.255
 DCN interface: LoopBack1023
 Auto report  : Enabled
```

Display all DCN NE information on the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

 NE ID          NE IP            Metric   Device Type
 0x100001       11.1.1.1         0        H3C S5590-EI
 0x200002       22.2.2.2         1        H3C S5590-EI
```

```
0x300003       33.3.3.3         1        H3C S5590-EI

Total number: 3
```

The output shows that GNE, Device A, and Device B are online. The GNE notifies the NMS of the online event. You can successfully ping the NE IP addresses of Device A and Device B from the GNE.

Remove Device B from the DCN network and display all DCN NE information for the GNE.

```
[GNE] display dcn ne-info

              DCN Network Elements Information

NE ID          NE IP            Metric   Device Type
0x100001       11.1.1.1         0        H3C S5590-EI
0x200002       22.2.2.2         1        H3C S5590-EI

Total number: 2
```

The output shows that GNE and Device A are online. The GNE notifies the NMS of the offline event of Device B. You can still successfully ping the NE IP address of Device A from the GNE.

Configuring dual-stack PBR

About dual-stack PBR

Dual-stack policy-based routing (dual-stack PBR) uses user-defined policies to route packets. A policy can specify parameters for IPv4 or IPv6 packets that match specific criteria such as ACLs. The parameters include the next hop , output interface, and default next hop.

Dual-stack policy

A dual-stack PBR policy includes match criteria and actions to be taken on the matching packets. A dual-stack PBR policy can have one or multiple nodes as follows:

- Each node is identified by a node number. A smaller node number has a higher priority.
- A node contains **`if-match`** and **`apply`** clauses. An **`if-match`** clause specifies a match criterion, and an **`apply`** clause specifies an action.
- A node has a match mode of **permit** or **deny**.

A dual-stack PBR policy compares packets with dual stack PBR policy nodes in priority order. If a packet matches the criteria on a node, it is processed by the action on the node. If the packet does not match any criteria on the node, it goes to the next node for a match. If the packet does not match the criteria on any node, the device performs a routing table lookup.

Relationship between if-match clauses

On a node, you can specify only one **`if-match acl`** clause.

Relationship between apply clauses

You can specify multiple **`apply`** clauses for a node, but some of them might not be executed. For more information about relationship between **`apply`** clauses, see "Configuring actions for a dual-stack policy node."

Relationship between the match mode and clauses on the node

Does a packet match all the if-match **clauses on the node?**	**Match mode**	
	Permit	**Deny**
Yes.	• If the node contains **`apply`** clauses, dual-stack PBR executes the **`apply`** clauses on the node. ○ If dual-stack PBR-based forwarding succeeds, dual-stack PBR does not compare the packet with the next node. ○ If dual-stack PBR-based forwarding fails, dual-stack PBR does not compare the packet with the next node. • If the node does not contain **`apply`** clauses, the device performs a routing table lookup for the packet.	The device performs a routing table lookup for the packet.
No.	Dual-stack PBR compares the packet	Dual-stack PBR compares the

Does a packet match all the if-match clauses on the node?	Match mode	
	Permit	**Deny**
	with the next node.	packet with the next node.

NOTE:

A node that has no **`if-match`** clauses matches any packet.

Packet forwarding process

You can apply a dual-stack PBR policy to an interface or to all interfaces on the device. Once the policy is applied, the device searches the policy for a matching node to forward that packet upon receiving a packet.

- If a matching node is found and its match mode is **permit**, the device performs the following operations:
  a. Uses the next hops specified on the node to forward the packet.
  b. Searches the routing table for a route (except the default route) to forward the packet if one of the following conditions exists:
    – No next hops are specified on the node.
    – Forwarding failed based on the next hops.
  c. Uses the default route to forward the packet if no matching route was found in the routing table.
- The device performs routing table lookup to forward the packet in either of the following conditions:
  - No matching node is found.
  - A matching node is found, but its match mode is **deny**.

Dual-stack PBR and Track

Dual-stack PBR can work with the Track feature to dynamically adapt the availability status of an **`apply`** clause to the link status of a tracked object. The tracked object can be a next hop or default next hop.

- When the track entry associated with an object changes to **Negative**, the **`apply`** clause is invalid.
- When the track entry changes to **Positive** or **NotReady**, the **`apply`** clause is valid.

For more information about Track and dual-stack PBR collaboration, see *High Availability Configuration Guide*.

Restrictions and guidelines: Dual-stack PBR configuration

If a packet destined for the local device matches a dual-stack PBR policy, dual-stack PBR will execute the apply clauses in the policy, including the clause for forwarding. When you configure a dual-stack PBR policy, be careful to avoid this situation.

Dual-stack PBR tasks at a glance

To configure dual-stack PBR, perform the following tasks:

1. Configuring a dual-stack PBR policy
   d. Creating a dual-stack policy node
   e. Setting match criteria for a dual-stack policy node
   f. Configuring actions for a dual-stack policy node
2. Specifying a policy for dual-stack PBR

   Choose the following tasks as needed:
   - Specifying a policy for interface dual-stack PBR
   - Specifying a policy for global dual-stack PBR

     A global dual-stack PBR policy applies to all interfaces on the device.

Configuring a dual-stack PBR policy

Creating a dual-stack policy node

1. Enter system view.

   system-view
2. Create a node for a dual-stack policy, and enter its view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. (Optional.) Configure a description for the policy node.

   description *text*

   By default, no description is configured for a dual-stack policy node.

Setting match criteria for a dual-stack policy node

1. Enter system view.

   system-view
2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*
3. Set match criteria.
   - Set an ACL match criterion.

     if-match acl { **ipv4** | **ipv6** } { *acl-number* | **name** *acl-name* }

     By default, no ACL match criterion is set.

     When using the ACL to match packets, dual-stack PBR ignores the action (**permit** or **deny**) and time range settings in the ACL.
   - Set a local QoS ID match criterion.

     if-match qos-local-id *local-id-value*

     By default, no local QoS ID match criterion is set.

Configuring actions for a dual-stack policy node

About this task

The **apply** clauses allow you to specify the actions to be taken on matching packets on a dual-stack policy node.

The following **apply** clauses determine the packet forwarding paths in a descending order:

- **apply next-hop**
- **apply output-interface**
- **apply default-next-hop**

Dual-stack PBR supports the **apply** clauses in Table 1.

Table 1 Apply clauses supported in PBR

Clause	Meaning	Remarks
apply precedence	Sets an IP precedence.	This clause is always executed.
apply next-hop and **apply output-interface**	Sets next hops and sets output interfaces.	If both clauses are configured, only the **apply next-hop** clause is executed.
apply default-next-hop	Sets default next hops	The clause takes effect only in the following cases: • No next hops are set or the next hops are invalid. • The packet does not match any route in the routing table.
apply statistics	Counts successful matches and matching bytes on the policy node.	To include the number of successful matches and matching bytes on a policy node in the statistics displayed by a **display** command, execute this command. This clause is always executed for matching packets.

Restrictions and guidelines

If you specify a next hop, dual-stack PBR periodically performs FIB table lookup to determine its availability. Temporary service interruption might occur if dual-stack PBR does not update the route immediately after its availability status changes.

Configuring actions to set the IP precedence for packets

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Set an IP precedence for packets.

   apply precedence { *type* | *value* }

   By default, no IP precedence is specified for packets.

Configuring actions to direct packet forwarding

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Configure actions.

   - Set next hops.

     apply next-hop [**vpn-instance** *vpn-instance-name*] { { *ipv4-address* | *ipv6-address* } [**direct**] [**track** *track-entry-number*] }&<1-4>

     By default, no next hops are specified.

     On a node, you can specify a maximum of four next hops for backup in one command line or by executing this command multiple times.

     If multiple next hops on the same subnet are specified for backup, the device first uses the subnet route for the next hops to forward packets when the primary next hop fails. If the subnet route is not available, the device selects a backup next hop.

   - Set output interfaces.

     apply output-interface NULL 0

     By default, no output interfaces are specified.

   - Set default next hops.

     apply default-next-hop [**vpn-instance** *vpn-instance-name*] { { *ipv4-address* | *ipv6-address* } [**direct**] [**track** *track-entry-number*] }&<1-4>

     By default, no default next hops are specified.

     On a node, you can specify a maximum of four default next hops for backup in one command line or by executing this command multiple times.

Collecting policy node statistics

1. Enter system view.

   system-view

2. Enter dual-stack policy node view.

   dual-stack policy-based-route *policy-name* [**deny** | **permit**] **node** *node-number*

3. Count successful matches and matching bytes on the policy node.

   apply statistics

   By default, matching counting is disabled on policy nodes.

Specifying a policy for dual-stack PBR

Specifying a policy for interface dual-stack PBR

About this task

Perform this task to apply a dual-stack policy to an interface to guide the forwarding of packets received on the interface.

Restrictions and guidelines

You can apply only one dual-stack policy to an interface and make sure the specified policy already exists. Before you can apply a new dual-stack PBR policy to an interface, you must first remove the current dual-stack policy from the interface.

You can apply a dual-stack policy to multiple interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify a dual-stack policy for interface PBR.
   dual-stack policy-based-route *policy-name*
   By default, no interface dual-stack policy is applied to an interface.

Specifying a policy for global dual-stack PBR

About this task

Perform this task to apply a dual-stack policy to all interfaces on the device to guide the forwarding of packets received on the interfaces.

Restrictions and guidelines

You can apply only one policy for global dual-stack PBR and the specified policy must already exist. Before you can apply a new policy, you must first remove the current policy.

Interface dual-stack PBR takes precedence over global dual-stack PBR on an interface. When they are both configured and packets fail to match the interface dual-stack PBR policy, global dual-stack PBR applies.

Procedure

1. Enter system view.
   system-view
2. Specify a policy for global dual-stack PBR.
   dual-stack global policy-based-route *policy-name*
   By default, no policy is specified for global dual-stack PBR.

Display and maintenance commands for dual-stack PBR

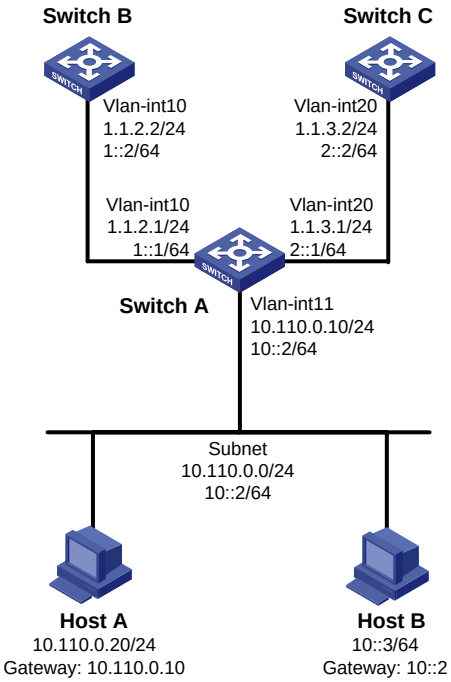
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display dual-stack PBR policy information.	**display dual-stack policy-based-route** [**policy** *policy-name*]

Task	Command
Display global dual-stack PBR configuration and statistics.	**display dual-stack policy-based-route global** [**slot** *slot-number*]
Display interface dual-stack PBR configuration and statistics.	**display dual-stack policy-based-route interface** *interface-type interface-number* [**slot** *slot-number*]
Display dual-stack PBR configuration.	**display dual-stack policy-based-route setup**
Clear dual-stack PBR statistics.	**reset dual-stack policy-based-route statistics** [**policy** *policy-name*]

Dual-stack PBR configuration examples

Example: Configuring packet type-based interface dual-stack PBR



Network configuration

As shown in Figure 1, Switch B and Switch C do not have a route to reach each other.

Configure dual-stack PBR on Switch A to implement the following requirements:

- Forward all IPv4 TCP packets received on VLAN-interface 11 to next hop 1.1.2.2 (Switch B).
- Forward all IPv6 TCP packets received on VLAN-interface 11 to next hop 2::2 (Switch C).

Figure 1 Network diagram

Procedure

1. Assign IP addresses to the interfaces as shown in Figure 1. (Details not shown.)
2. Configure static or dynamic routing protocol settings to make sure Host A and B can communicate with Switch B and Switch C, respectively. (Details not shown.)
3. Configure dual-stack PBR on Switch A:

   # Configure ACL 3101 to match IPv4 TCP packets.

   ```
   <SwitchA> system-view
   [SwitchA] acl advanced 3101
   [SwitchA-acl-ipv4-adv-3101] rule permit tcp
   [SwitchA-acl-ipv4-adv-3101] quit
   ```

   # Configure ACL 3102 to match IPv6 TCP packets.

   ```
   [SwitchA] acl ipv6 advanced 3102
   [SwitchA-acl-ipv6-adv-3102] rule permit tcp
   [SwitchA-acl-ipv6-adv-3102] quit
   ```

   # Configure Node 5 for the dual-stack policy **aaa** to forward IPv4 TCP packets to next hop 1.1.2.2.

   ```
   [SwitchA] dual-stack policy-based-route aaa permit node 5
   [SwitchA-pbrdual-aaa-5] if-match acl ipv4 3101
   [SwitchA-pbrdual-aaa-5] apply next-hop 1.1.2.2
   [SwitchA-pbrdual-aaa-5] quit
   ```

   # Configure Node 10 for the dual-stack policy **aaa** to forward IPv6 TCP packets to next hop 2::2.

   ```
   [SwitchA] dual-stack policy-based-route aaa permit node 10
   [SwitchA-pbrdual-aaa-10] if-match acl ipv6 3102
   [SwitchA-pbrdual-aaa-10] apply next-hop 2::2
   [SwitchA-pbrdual-aaa-10] quit
   ```

   # Configure interface dual-stack PBR by applying policy **aaa** to VLAN-interface 11.

   ```
   [SwitchA] interface vlan-interface 11
   ```

```
[SwitchA-Vlan-interface11] dual-stack policy-based-route aaa
[SwitchA-Vlan-interface11] quit
```

Verifying the configuration

Perform telnet and ping operations to verify that interface dual-stack PBR on Switch A operates as configured to perform packet forwarding as follows:

- Forwards the matching IPv4 TCP packets to the next hop 1.1.2.2 (Switch B).
- Forwards the matching IPv6 TCP packets to the next hop 2::2 (Switch C).

Verify that you can telnet to Switch B (1.1.2.2) from Host A successfully. (Details not shown.)

Verify that you cannot telnet to Switch C (1.1.3.2) from Host A. (Details not shown.)

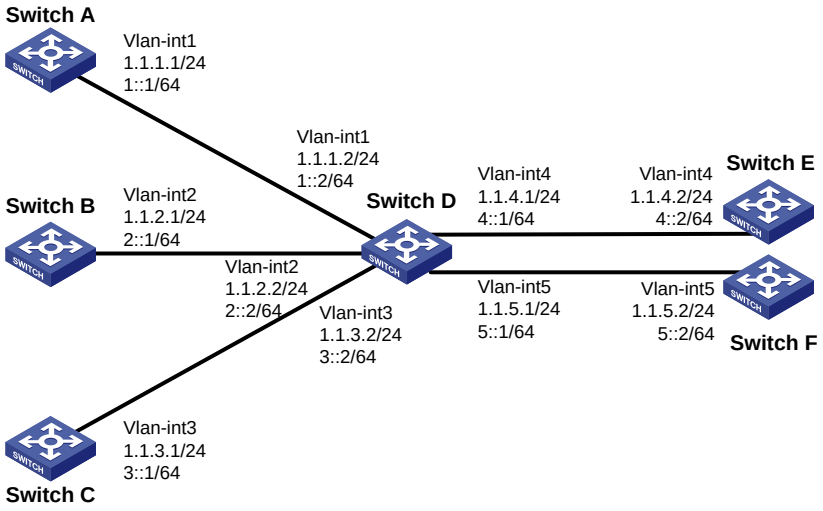
Verify that you can ping Switch C (1.1.3.2) from Host A successfully. (Details not shown.)

Verify that you can telnet to Switch C (2::2) from Host B successfully. (Details not shown.)

Verify that you cannot telnet to Switch B (1::2) from Host B. (Details not shown.)

Verify that you can ping Switch B (1::2) from Host B successfully. (Details not shown.)

Example: Configuring packet type-based global dual-stack PBR



Network configuration

As shown in Figure 2, Switch E and Switch F do not have a route to reach each other.

Configure global dual-stack PBR on Switch D to implement the following requirements:

- Forward IPv4 TCP packets to next hop 1.1.4.2 (Switch E).
- Forward IPv6 TCP packets to next hop 5::2 (Switch F).

Figure 2 Network diagram

Procedure

1. Assign IP addresses to the interfaces, as shown in Figure 2. (Details not shown.)
2. Configure static or dynamic routing protocol settings to make sure Switch A, B and C can communicate with Switch E and Switch F, respectively. (Details not shown.)
3. Configure dual-stack PBR on Switch D:

Configure ACL 3101 to match IPv4 TCP packets sourced from networks 1.1.1.0/24, 1.1.2.0/24, and 1.1.3.0/24.

```
<SwitchD> system-view
[SwitchD] acl advanced 3101
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.2.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] rule permit tcp source 1.1.3.0 0.0.0.255
[SwitchD-acl-ipv4-adv-3101] quit
```

Configure ACL 3102 to match IPv6 TCP packets sourced from networks 1::0/64, 2::0/64, and 3::0/64.

```
<RouterD> system-view
[RouterD] acl ipv6 advanced 3102
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 1::0 64
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 2::0 64
[RouterD-acl-ipv6-adv-3102] rule permit tcp source 3::0 64
[RouterD-acl-ipv6-adv-3102] quit
```

Configure node 5 in dual-stack PBR policy **aaa** to forward IPv4 TCP packets that match ACL 3101 to next hop 1.1.4.2.

```
[SwitchD] dual-stack policy-based-route aaa permit node 5
[SwitchD-pbrdual-aaa-5] if-match acl ipv4 3101
[SwitchD-pbrdual-aaa-5] apply next-hop 1.1.4.2
[SwitchD-pbrdual-aaa-5] quit
```

Configure node 10 in dual-stack PBR policy **aaa** to forward IPv6 TCP packets that match ACL 3102 to next hop 5::2.

```
[SwitchD] dual-stack policy-based-route aaa permit node 10
[SwitchD-pbrdual-aaa-10] if-match acl ipv6 3102
[SwitchD-pbrdual-aaa-10] apply next-hop 5::2
[SwitchD-pbrdual-aaa-10] quit
```

Specify dual-stack PBR policy **aaa** as the global PBR policy.

```
[SwitchD] dual-stack global policy-based-route aaa
```

Verifying the configuration

Perform telnet and ping operations to verify that global dual-stack PBR on Switch D operates as configured to perform packet forwarding as follows:

- Forwards the matching IPv4 TCP packets to the next hop 1.1.4.2 (Switch E).
- Forwards the matching IPv6 TCP packets to the next hop 5::2 (Switch F).

Verify that you can telnet to Switch E (1.1.4.2) successfully and cannot telnet to Switch F (1.1.5.2), from Switch A, B, and C. (Details not shown.)

Verify that you can ping Switch F (1.1.5.2) from Switch A, B and C successfully. (Details not shown.)

Verify that you can telnet to Switch F (5::2) successfully and cannot telnet to Switch E (4::2/64), from Switch A, B, and C. (Details not shown.)

Verify that you can ping Switch F (4::2) from Switch A, B and C successfully. (Details not shown.)

Preface

This configuration guide describes IP multicast fundamentals and configuration procedures. It covers the IPv4 multicast configuration and IPv6 multicast configuration. With multicast, you can implement efficient point-to-multipoint data transmission in your network.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** >

	Folder.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

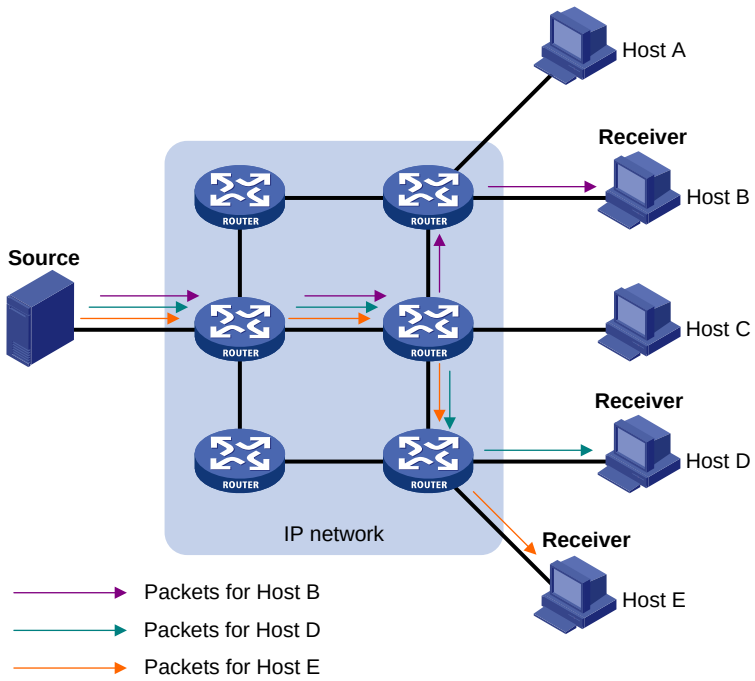
Multicast overview

Introduction to multicast

As a technique that coexists with unicast and broadcast, the multicast technique effectively addresses the issue of point-to-multipoint data transmission. By enabling high-efficiency point-to-multipoint data transmission over a network, multicast greatly saves network bandwidth and reduces network load.

By using multicast technology, a network operator can easily provide bandwidth-critical and time-critical information services. These services include live webcasting, Web TV, distance learning, telemedicine, Web radio, and real-time video conferencing.



Information transmission techniques

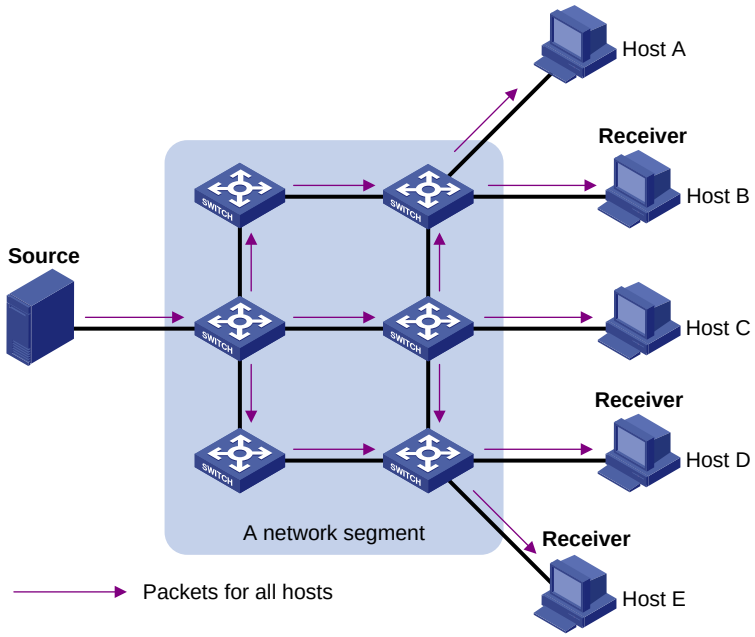
The information transmission techniques include unicast, broadcast, and multicast.

Unicast

In unicast transmission, the information source must send a separate copy of information to each host that needs the information.

Figure 1 Unicast transmission

In Figure 1, Host B, Host D, and Host E need the information. A separate transmission channel must be established from the information source to each of these hosts.



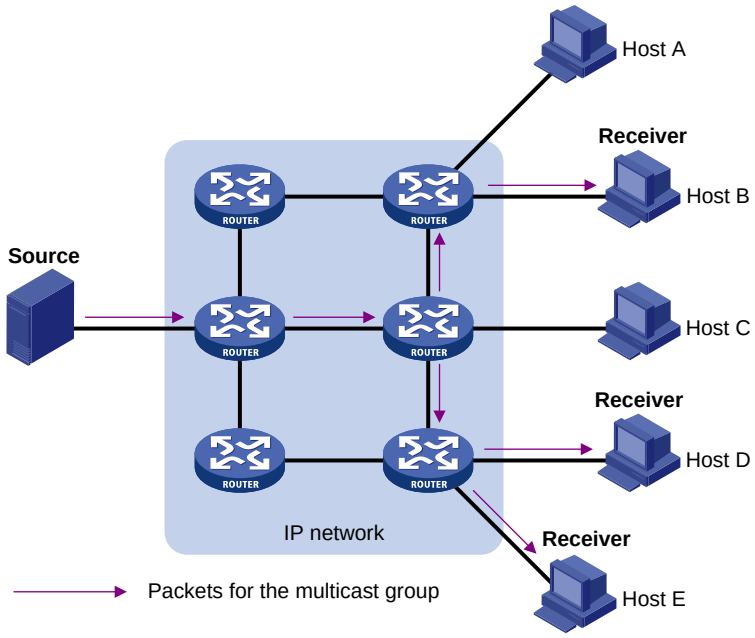
In unicast transmission, the traffic transmitted over the network is proportional to the number of hosts that need the information. If a large number of hosts need the information, the information source must send a separate copy of the same information to each of these hosts. Sending many copies can place a tremendous pressure on the information source and the network bandwidth.

Unicast is not suitable for batch transmission of information.

Broadcast

In broadcast transmission, the information source sends information to all hosts on the subnet, even if some hosts do not need the information.

Figure 2 Broadcast transmission



In Figure 2, only Host B, Host D, and Host E need the information. If the information is broadcast to the subnet, Host A and Host C also receive it. In addition to information security issues, broadcasting to hosts that do not need the information also causes traffic flooding on the same subnet.

Broadcast is disadvantageous in transmitting data to specific hosts. Moreover, broadcast transmission is a significant waste of network resources.

Multicast

Multicast provides point-to-multipoint data transmissions with the minimum network consumption. When some hosts on the network need multicast information, the information sender, or multicast source, sends only one copy of the information. Multicast distribution trees are built through multicast routing protocols, and the packets are replicated only on nodes where the trees branch.

Figure 3 Multicast transmission

In Figure 3, the multicast source sends only one copy of the information to a multicast group. Host B, Host D, and Host E, which are information receivers, must join the multicast group. The routers on the network duplicate and forward the information based on the distribution of the group members. Finally, the information is correctly delivered to Host B, Host D, and Host E.

To summarize, multicast has the following advantages:

- **Advantages over unicast**—Multicast data is replicated and distributed until it flows to the farthest-possible node from the source. The increase of receiver hosts will not remarkably increase the load of the source or the usage of network resources.
- **Advantages over broadcast**—Multicast data is sent only to the receivers that need it. This saves network bandwidth and enhances network security. In addition, multicast data is not confined to the same subnet.

Multicast features

- A multicast group is a multicast receiver set identified by an IP multicast address. Hosts must join a multicast group to become members of the multicast group before they receive the multicast data addressed to that multicast group. Typically, a multicast source does not need to join a multicast group.
- A multicast source is an information sender. It can send data to multiple multicast groups at the same time. Multiple multicast sources can send data to the same multicast group at the same time.
- The group memberships are dynamic. Hosts can join or leave multicast groups at any time. Multicast groups are not subject to geographic restrictions.
- Multicast routers or Layer 3 multicast devices are routers or Layer 3 switches that support Layer 3 multicast. They provide multicast routing and manage multicast group memberships on stub subnets with attached group members. A multicast router itself can be a multicast group member.

For a better understanding of the multicast concept, you can compare multicast transmission to the transmission of TV programs.

Table 1 Comparing TV program transmission and multicast transmission

TV program transmission	Multicast transmission
A TV station transmits a TV program through a channel.	A multicast source sends multicast data to a multicast group.
A user tunes the TV set to the channel.	A receiver joins the multicast group.
The user starts to watch the TV program transmitted by the TV station on the channel.	The receiver starts to receive the multicast data sent by the source to the multicast group.
The user turns off the TV set or tunes to another channel.	The receiver leaves the multicast group or joins another group.

Multicast benefits and applications

Multicast benefits

- **Enhanced efficiency**—Reduces the processor load of information source servers and network devices.
- **Optimal performance**—Reduces redundant traffic.
- **Distributed application**—Enables point-to-multipoint applications at the price of minimum network resources.

Multicast applications

- Multimedia and streaming applications, such as Web TV, Web radio, and real-time video/audio conferencing
- Communication for training and cooperative operations, such as distance learning and telemedicine
- Data warehouse and financial applications (stock quotes)
- Any other point-to-multipoint application for data distribution

Multicast models

Based on how the receivers treat the multicast sources, the multicast models include any-source multicast (ASM), source-filtered multicast (SFM), and source-specific multicast (SSM).

ASM model

In the ASM model, any multicast sources can send information to a multicast group. Receivers can join a multicast group and get multicast information addressed to that multicast group from any multicast sources. In this model, receivers do not know the positions of the multicast sources in advance.

SFM model

The SFM model is derived from the ASM model. To a multicast source, the two models appear to have the same multicast membership architecture.

The SFM model functionally extends the ASM model. The upper-layer software checks the source address of received multicast packets and permits or denies multicast traffic from specific sources.

The receivers obtain the multicast data from only part of the multicast sources. To a receiver, multicast sources are not all valid, but are filtered.

SSM model

The SSM model provides a transmission service that enables multicast receivers to specify the multicast sources in which they are interested.

In the SSM model, receivers have already determined the locations of the multicast sources. This is the main difference between the SSM model and the ASM model. In addition, the SSM model uses a different multicast address range than the ASM/SFM model. Dedicated multicast forwarding paths are established between receivers and the specified multicast sources.

Multicast addresses

IP multicast addresses

IPv4 multicast addresses

IANA assigned the Class D address block (224.0.0.0 to 239.255.255.255) to IPv4 multicast.

Table 2 Class D IP address blocks and description

Address block	Description
224.0.0.0 to 224.0.0.255	Reserved permanent group addresses. The IP address 224.0.0.0 is reserved. Other IP addresses can be used by routing protocols and for topology searching, protocol maintenance, and so on. Table 3 lists common permanent group addresses. A packet destined for an address in this block will not be forwarded beyond the local subnet regardless of the TTL value in the IP header.
224.0.1.0 to 238.255.255.255	Globally scoped group addresses. This block includes the following types of designated group addresses: • **232.0.0.0/8**—SSM group addresses. • **233.0.0.0/8**—Glop group addresses.
239.0.0.0 to 239.255.255.255	Administratively scoped multicast addresses. These addresses are considered locally unique rather than globally unique. You can reuse them in domains administered by different organizations without causing conflicts. For more information, see RFC 2365.

NOTE:

Glop is a mechanism for assigning multicast addresses between different ASs. By filling an AS number into the middle two bytes of 233.0.0.0, you get 255 multicast addresses for that AS. For more information, see RFC 2770.

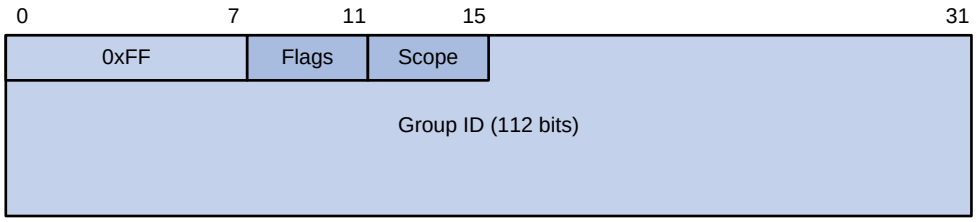


Table 3 Common permanent multicast group addresses

Address	Description
224.0.0.1	All systems on this subnet, including hosts and routers.
224.0.0.2	All multicast routers on this subnet.
224.0.0.3	Unassigned.
224.0.0.4	DVMRP routers.
224.0.0.5	OSPF routers.

Address	Description
224.0.0.6	OSPF designated routers and backup designated routers.
224.0.0.7	Shared Tree (ST) routers.
224.0.0.8	ST hosts.
224.0.0.9	RIPv2 routers.
224.0.0.11	Mobile agents.
224.0.0.12	DHCP server/relay agent.
224.0.0.13	All Protocol Independent Multicast (PIM) routers.
224.0.0.14	This protocol is not supported in the current software version. RSVP encapsulation.
224.0.0.15	All Core-Based Tree (CBT) routers.
224.0.0.16	Designated SBM.
224.0.0.17	All SBMs.
224.0.0.18	VRRP.

IPv6 multicast addresses

Figure 4 IPv6 multicast format

The following describes the fields of an IPv6 multicast address:

- **0xFF**—The most significant eight bits are 11111111.
- **Flags**—The Flags field contains four bits.

  Figure 5 Flags field format

  Table 4 Flags field description

Bit	Description
0	Reserved, set to 0.
R	• When set to 0, this address is an IPv6 multicast address without an embedded RP address. • When set to 1, this address is an IPv6 multicast address with an embedded RP address. (The P and T bits must also be set to 1.)
P	• When set to 0, this address is an IPv6 multicast address not based on a unicast prefix. • When set to 1, this address is an IPv6 multicast address based on a unicast prefix. (The T bit must also be set to

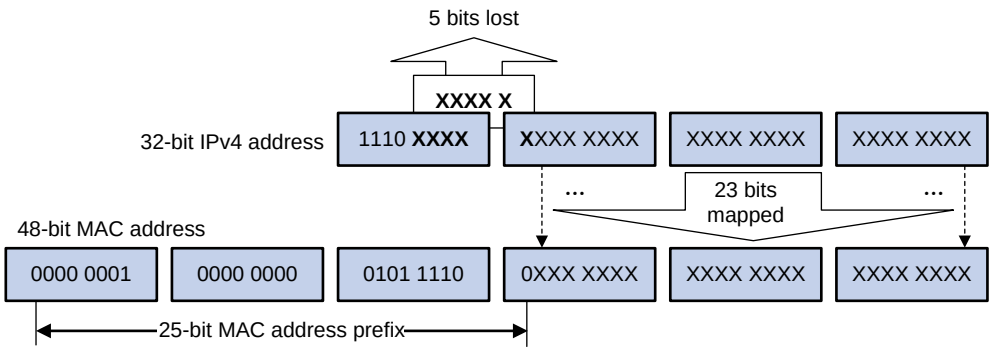
Bit	Description
	1.)
T	• When set to 0, this address is an IPv6 multicast address permanently-assigned by IANA. • When set to 1, this address is a transient or dynamically assigned IPv6 multicast address.

- **Scope**—The Scope field contains four bits, which represent the scope of the IPv6 internetwork for which the multicast traffic is intended.

  Table 5 Values of the Scope field

Value	Meaning
0, F	Reserved.
1	Interface-local scope.
2	Link-local scope.
3	Subnet-local scope.
4	Admin-local scope.
5	Site-local scope.
6, 7, 9 through D	Unassigned.
8	Organization-local scope.
E	Global scope.

- **Group ID**—The Group ID field contains 112 bits. It uniquely identifies an IPv6 multicast group in the scope that the Scope field defines.



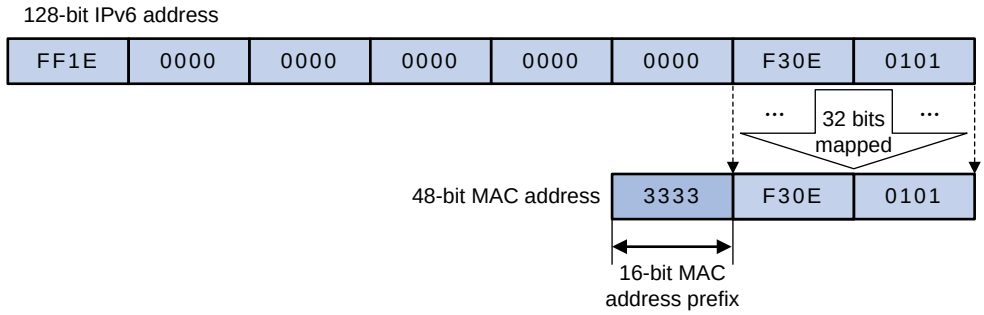
Ethernet multicast MAC addresses

An Ethernet multicast MAC address identifies receivers that belong to the same multicast group at the data link layer.

IPv4 multicast MAC addresses

As defined by IANA, the most significant 24 bits of an IPv4 multicast MAC address are 0x01005E. Bit 25 is 0, and the other 23 bits are the least significant 23 bits of an IPv4 multicast address.

Figure 6 IPv4-to-MAC address mapping



The most significant four bits of an IPv4 multicast address are fixed at 1110. In an IPv4-to-MAC address mapping, five bits of the IPv4 multicast address are lost. As a result, 32 IPv4 multicast addresses are mapped to the same IPv4 multicast MAC address. A device might receive unwanted multicast data at Layer 2 processing, which needs to be filtered by the upper layer.

IPv6 multicast MAC addresses

As defined by IANA, the most significant 16 bits of an IPv6 multicast MAC address are 0x3333. The least significant 32 bits are mapped from the least significant 32 bits of an IPv6 multicast address. Therefore, the problem of duplicate IPv6-to-MAC address mapping also arises like IPv4-to-MAC address mapping.

Figure 7 IPv6-to-MAC address mapping

IMPORTANT:

Because of the duplicate mapping from multicast IP address to multicast MAC address, the device might inadvertently send multicast protocol packets as multicast data in Layer 2 forwarding. To avoid this, do not use the IP multicast addresses that are mapped to multicast MAC addresses 0100-5E00-00xx and 3333-0000-00xx (where "x" represents any hexadecimal number from 0 to F).

Multicast protocols

Multicast protocols include the following categories:

- Layer 3 and Layer 2 multicast protocols:
  - Layer 3 multicast refers to IP multicast operating at the network layer.

    Layer 3 multicast protocols—IGMP, MLD, PIM, IPv6 PIM, MSDP, MBGP, and IPv6 MBGP.
  - Layer 2 multicast refers to IP multicast operating at the data link layer.

    Layer 2 multicast protocols—IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.
- IPv4 and IPv6 multicast protocols:
  - **For IPv4 networks**—IGMP snooping, PIM snooping, multicast VLAN, IGMP, PIM, MSDP, and MBGP.
  - **For IPv6 networks**—MLD snooping, IPv6 PIM snooping, IPv6 multicast VLAN, MLD, IPv6 PIM, and IPv6 MBGP.

This section provides only general descriptions about applications and functions of the Layer 2 and Layer 3 multicast protocols in a network. For more information about these protocols, see the related chapters.

Layer 3 multicast protocols

In Figure 8, Layer 3 multicast protocols include multicast group management protocols and multicast routing protocols.

Figure 8 Positions of Layer 3 multicast protocols

- Multicast group management protocols:

  Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) protocol are multicast group management protocols. Typically, they run between hosts and Layer 3 multicast devices that directly connect to the hosts to establish and maintain multicast group memberships.

- Multicast routing protocols:

  A multicast routing protocol runs on Layer 3 multicast devices to establish and maintain multicast routes and correctly and efficiently forward multicast packets. Multicast routes constitute loop-free data transmission paths (also known as multicast distribution trees) from a data source to multiple receivers.

  In the ASM model, multicast routes include intra-domain routes and inter-domain routes.

  - An intra-domain multicast routing protocol discovers multicast sources and builds multicast distribution trees within an AS to deliver multicast data to receivers. Among a variety of mature intra-domain multicast routing protocols, PIM is most widely used. Based on the forwarding mechanism, PIM has dense mode (often referred to as PIM-DM) and sparse mode (often referred to as PIM-SM).
  - An inter-domain multicast routing protocol is used for delivering multicast information between two ASs. So far, mature solutions include Multicast Source Discovery Protocol (MSDP) and MBGP. MSDP propagates multicast source information among different ASs. MBGP is an extension of the MP-BGP for exchanging multicast routing information among different ASs.

  For the SSM model, multicast routes are not divided into intra-domain routes and inter-domain routes. Because receivers know the positions of the multicast sources, channels established through PIM-SM are sufficient for the transport of multicast information.

Layer 2 multicast protocols

In Figure 9, Layer 2 multicast protocols include IGMP snooping, MLD snooping, PIM snooping, IPv6 PIM snooping, multicast VLAN, and IPv6 multicast VLAN.

Figure 9 Positions of Layer 2 multicast protocols

- IGMP snooping and MLD snooping:

  IGMP snooping and MLD snooping are multicast constraining mechanisms that run on Layer 2 devices. They manage and control multicast groups by monitoring and analyzing IGMP or MLD messages exchanged between the hosts and Layer 3 multicast devices. This effectively controls the flooding of multicast data in Layer 2 networks.

- PIM snooping and IPv6 PIM snooping:

  PIM snooping and IPv6 PIM snooping run on Layer 2 devices. They work with IGMP snooping or MLD snooping to analyze received PIM messages. Then, they add the ports that are interested in specific multicast data to a PIM snooping routing entry or IPv6 PIM snooping routing entry. In this way, multicast data can be forwarded to only the ports that are interested in the data.

- Multicast VLAN and IPv6 multicast VLAN:

  Multicast VLAN or IPv6 multicast VLAN runs on a Layer 2 device in a multicast network where multicast receivers for the same group exist in different VLANs. With these protocols, the Layer 3 multicast device sends only one copy of multicast to the multicast VLAN or IPv6 multicast VLAN on the Layer 2 device. This method avoids waste of network bandwidth and extra burden on the Layer 3 device.

Multicast packet forwarding mechanism

In a multicast model, receiver hosts of a multicast group are usually located at different areas on the network. They are identified by the same multicast group address. To deliver multicast packets to these receivers, a multicast source encapsulates the multicast data in an IP packet with the multicast group address as the destination address. Multicast routers on the forwarding paths forward multicast packets that an incoming interface receives through multiple outgoing interfaces. Compared to a unicast model, a multicast model is more complex in the following aspects:

- To ensure multicast packet transmission on the network, different routing tables are used to guide multicast forwarding. These routing tables include unicast routing tables, routing tables for multicast (for example, the MBGP routing table), and static multicast routing tables.
- To process the same multicast information from different peers received on different interfaces, the multicast device performs an RPF check on each multicast packet. The RPF check result determines whether the packet will be forwarded or discarded. The RPF check mechanism is the basis for most multicast routing protocols to implement multicast forwarding.

For more information about the RPF mechanism, see "Configuring multicast routing and forwarding" and "Configuring IPv6 multicast routing and forwarding."

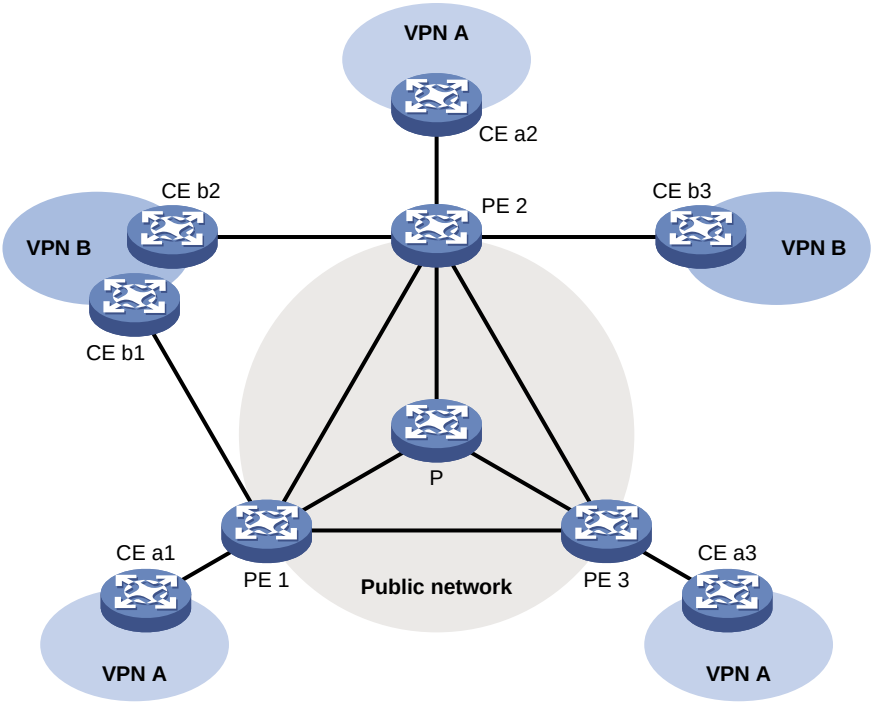
IP multicast architecture

IP multicast addresses the following issues:

- Where should the multicast source transmit information to? (Multicast addressing.)
- What receivers exist on the network? (Host registration.)
- Where is the multicast source that will provide data to the receivers? (Multicast source discovery.)
- How is the information transmitted to the receivers? (Multicast routing.)

IP multicast is an end-to-end service. The multicast architecture involves the following parts:

- **Addressing mechanism**—A multicast source sends information to a group of receivers through a multicast address.
- **Host registration**—Receiver hosts can join and leave multicast groups dynamically. This mechanism is the basis for management of group memberships.
- **Multicast routing**—A multicast distribution tree (a forwarding path tree for multicast data on the network) is constructed for delivering multicast data from a multicast source to receivers.
- **Multicast applications**—A software system that supports multicast applications, such as video conferencing, must be installed on multicast sources and receiver hosts. The TCP/IP stack must support reception and transmission of multicast data.



Multicast support for VPNs

Multicast support for VPNs refers to multicast applied in VPNs.

Introduction to VPN instances

VPNs are isolated from one another and from the public network. As shown in Figure 10, VPN A and VPN B separately access the public network through PE devices.

Figure 10 VPN networking diagram

- The P device belongs to the public network. The CE devices belong to their respective VPNs. Each CE device serves its own VPN and maintains only one set of forwarding mechanisms.
- The PE devices connect to the public network and the VPNs. Each PE device must strictly distinguish the information for different networks, and maintain a separate forwarding mechanism for each network. On a PE device, a set of software and hardware that serve the same network forms an instance. Multiple instances can exist on the same PE device, and an instance can reside on different PE devices. On a PE device, the instance for the public network is called the public network instance, and those for VPNs are called VPN instances.

Multicast application in VPNs

A PE device that supports multicast for VPNs performs the following operations:

- Maintains an independent set of multicast forwarding mechanisms for each VPN, including the multicast protocols, PIM neighbor information, and multicast routing table. In a VPN, the device forwards multicast data based on the forwarding table or routing table for that VPN.
- Implements the isolation between different VPNs.
- Implements information exchange and data conversion between the public network and VPN instances.

For example, as shown in Figure 10, a multicast source in VPN A sends multicast data to a multicast group. Only receivers that belong to both the multicast group and VPN A can receive the multicast data. The multicast data is multicast both in VPN A and on the public network. If you configure MVPN extranet, multicast data can be transmitted across different VPNs.

Common notations in multicast

The following notations are commonly used in multicast transmission:

- **(*, G)**—Rendezvous point tree (RPT), or a multicast packet that any multicast source sends to multicast group G. The asterisk (*) represents any multicast source, and "G" represents a specific multicast group.

- **(S, G)**—Shortest path tree (SPT), or a multicast packet that multicast source "S" sends to multicast group "G." "S" represents a specific multicast source, and "G" represents a specific multicast group.

For more information about the concepts RPT and SPT, see "PIM overview" and "IPv6 PIM overview."

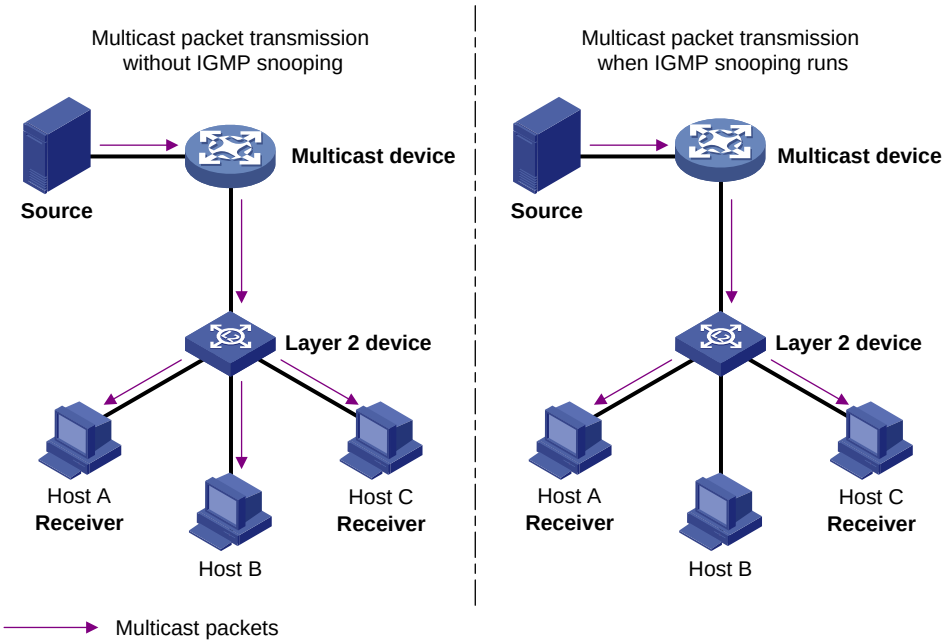
Configuring IGMP snooping



About IGMP snooping

IGMP snooping runs on a Layer 2 device as a multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from IGMP packets that are exchanged between the hosts and the Layer 3 device.

Fundamentals of IGMP snooping

As shown in Figure 1, when IGMP snooping is not enabled, the Layer 2 switch floods multicast packets to all hosts in a VLAN or VSI. When IGMP snooping is enabled, the Layer 2 switch forwards multicast packets of known multicast groups to only the receivers.

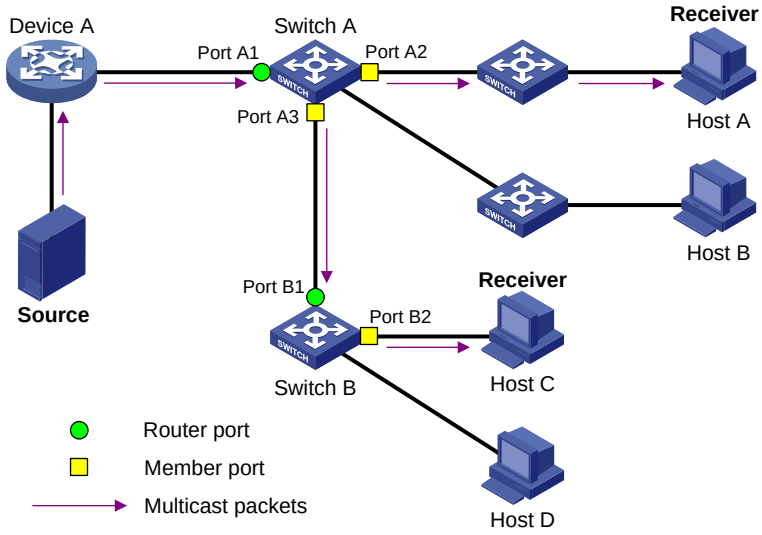


Figure 1 Multicast packet transmission without and with IGMP snooping

IGMP snooping ports

As shown in Figure 2, IGMP snooping runs on Switch A and Switch B, and Host A and Host C are receivers in a multicast group. IGMP snooping ports are divided into member ports and router ports.

Figure 2 IGMP snooping ports

Router ports

On an IGMP snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an IGMP general query whose source address is not 0.0.0.0 or receives a PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives either of the messages before the timer expires, the timer is reset. If the port does not receive an IGMP general query whose source address is not 0.0.0.0 or a PIM hello message when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in IGMP snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in IGMP snooping is a Layer 2 interface.

Member ports

On an IGMP snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an IGMP report, it is added to the associated dynamic IGMP snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an IGMP report before the timer expires, the timer is reset. If the port does not receive an IGMP report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static IGMP snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How IGMP snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

IGMP messages types include general query, IGMP report, and leave message. An IGMP snooping-enabled Layer 2 device performs differently depending on the message types.

General query

The IGMP querier periodically sends IGMP general queries to all hosts and devices on the local subnet to check for the existence of multicast group members.

After receiving an IGMP general query, the Layer 2 device forwards the query to all ports in the VLAN or VSI except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

IGMP report

A host sends an IGMP report to the IGMP querier for the following purposes:

- Responds to queries if the host is a multicast group member.
- Applies for a multicast group membership.

After receiving an IGMP report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN or VSI. It also resolves the address of the reported multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an IGMP report through a non-router port because of the host IGMP report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their IGMP reports upon receiving IGMP reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Leave message

An IGMPv1 receiver host does not send any leave messages when it leaves a multicast group. The Layer 2 device cannot immediately update the status of the port that connects to the receiver host. The Layer 2 device does not remove the port from the outgoing interface list in the associated forwarding entry until the aging time for the group expires.

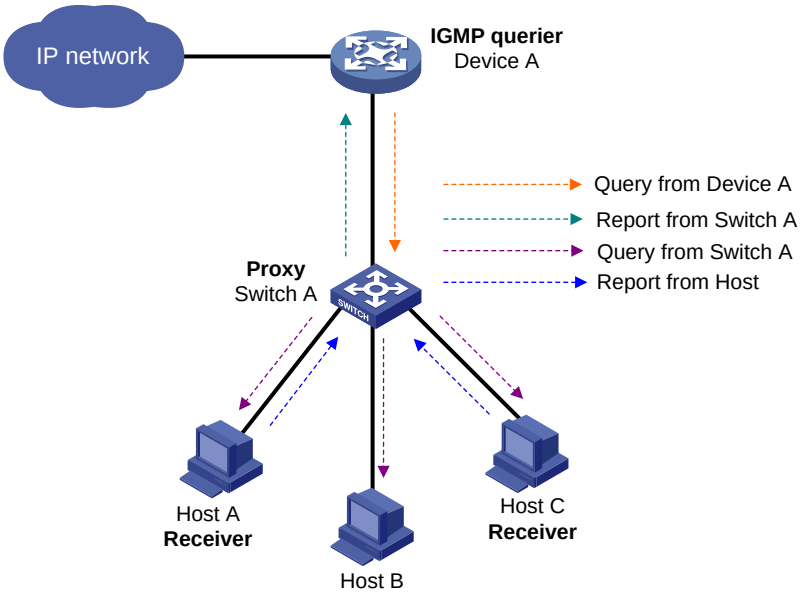
An IGMPv2 or IGMPv3 host sends an IGMP leave message when it leaves a multicast group.

When the Layer 2 device receives an IGMP leave message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the group address in the message.

- If no match is found, the Layer 2 device discards the IGMP leave message.

- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the IGMP leave message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Discards the IGMP leave message.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.
- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the IGMP leave message to all router ports in the VLAN or VSI.
  - Sends an IGMP group-specific query to identify whether the group has active receivers attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the IGMP last member query interval.

After receiving the IGMP leave message on a port, the IGMP querier resolves the multicast group address in the message. Then, it sends an IGMP group-specific query to the multicast group through the receiving port.



After receiving the IGMP group-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN or VSI. Then, it waits for the responding IGMP report from the directly connected hosts. For the dynamic member port that received the leave message, the Layer 2 device also performs one of the following actions:

- If the port receives an IGMP report before the aging timer expires, the Layer 2 device resets the aging timer.
- If the port does not receive an IGMP report when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the multicast group.

IGMP snooping proxying

As shown in Figure 3, to reduce the number of IGMP report and leave messages received by the upstream device, you can enable IGMP snooping proxying on the edge device. With IGMP snooping proxying enabled, the edge device acts as a host for the upstream IGMP snooping querier to send IGMP report and leave messages to Device A. The host IGMP report suppression mechanism on the edge device does not take effect. For more information about the IGMP report suppression mechanism, see "Configuring IGMP."

Figure 3 IGMP snooping proxying

The IGMP snooping proxy device processes different IGMP messages as follows:

- General query.

  After receiving an IGMP general query, the device forwards the query to all ports in the VLAN or VSI except the receiving port. The device also generates an IGMP report based on the local membership information and sends the report to all router ports.

- Group-specific query or group-and-source-specific query.

  After receiving an IGMP group-specific query or group-and-source-specific query, the device forwards the query to all ports in the VLAN or VSI except the receiving port. If the forwarding entry has a member port, the device sends a report to all router ports in the VLAN or VSI.

- Report.

  After receiving an IGMP report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Leave message.

  After receiving the IGMP leave message on a port, the device sends an IGMP group-specific query through the receiving port. The device sends the IGMP leave message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: IGMP snooping configuration

The IGMP snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in IGMP-snooping view. The configuration made in VLAN view and the configuration made in IGMP-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in IGMP-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for a VSI in VSI view or globally for all VSIs in IGMP-snooping view. The VSI-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in IGMP-snooping view. The interface-specific configuration takes priority over the configuration made in IGMP-snooping view.

VLAN-based IGMP snooping tasks at a glance

To configure IGMP snooping for VLANs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for VLANs
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Configuring static multicast MAC address entries
   - Setting the IGMP last member query interval
4. (Optional.) Configuring IGMP snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Specifying the Layer 2 multicast forwarding mode
6. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses
   - Enabling the device to send IGMP general queries upon a path change

- Enabling the device to send IGMP general queries upon a port state change

7. (Optional.) Enabling IGMP snooping proxying
8. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
9. (Optional.) Configuring IGMP snooping policies
   - Configuring a multicast group policy
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
   - Setting the maximum number of multicast groups on a port
   - Enabling multicast group replacement
   - Enabling host tracking
10. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
11. (Optional.) Enabling SNMP notifications for IGMP snooping
12. (Optional.) Configuring IGMP snooping logging
    - Enabling IGMP snooping logging
    - Enabling IGMP snooping logging suppression

VSI-based IGMP snooping tasks at a glance

To configure IGMP snooping for VSIs, perform the following tasks:

1. Enabling the IGMP snooping feature
2. Enabling IGMP snooping

   Choose the following tasks as needed:
   - Enabling IGMP snooping globally
   - Enabling IGMP snooping for a VSI
3. (Optional.) Configuring basic IGMP snooping features
   - Specifying an IGMP snooping version
   - Setting the maximum number of IGMP snooping forwarding entries
   - Setting the IGMP last member query interval
4. (Optional.) Setting aging timers for dynamic ports
5. (Optional.) Configuring the IGMP snooping querier
   - Enabling the IGMP snooping querier
   - Enabling IGMP snooping querier election
   - Configuring parameters for IGMP general queries and responses
   - Enabling the device to send IGMP general queries upon a path change
6. (Optional.) Enabling IGMP snooping proxying
7. (Optional.) Configuring parameters for IGMP messages
   - Configuring source IP addresses for IGMP messages
   - Setting the 802.1p priority for IGMP messages
8. (Optional.) Configuring IGMP snooping policies
   - Enabling dropping unknown multicast data
   - Enabling IGMP report suppression
9. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets

10. (Optional.) Enabling SNMP notifications for IGMP snooping
11. (Optional.) Configuring IGMP snooping logging
    - Enabling IGMP snooping logging
    - Enabling IGMP snooping logging suppression

Enabling the IGMP snooping feature

About this task

You must enable the IGMP snooping feature before you configure other IGMP snooping features.

Procedure

1. Enter system view.
   `system-view`
2. Enable the IGMP snooping feature and enter IGMP-snooping view.
   `igmp-snooping`
   By default, the IGMP snooping feature is disabled.

Enabling IGMP snooping

Enabling IGMP snooping globally

About this task

After you enable IGMP snooping globally, IGMP snooping is enabled for all VLANs or VSIs. You can disable IGMP snooping for a VLAN or VSI when IGMP snooping is globally enabled.

Restrictions and guidelines

To configure other IGMP snooping features for VLANs or VSIs, you must enable IGMP snooping for the specific VLANs or VSIs even though IGMP snooping is enabled globally.

The VLAN-specific or VSI-specific IGMP snooping configuration takes priority over the global IGMP snooping configuration. For example, if you enable IGMP snooping globally and then use the **`igmp-snooping disable`** command to disable IGMP snooping for a VLAN, IGMP snooping is disabled in the VLAN.

Procedure

1. Enter system view.
   `system-view`
2. Enter IGMP-snooping view.
   `igmp-snooping`
3. Enable IGMP snooping globally.
4. **`global-enable`**
   By default, IGMP snooping is disabled globally.
5. (Optional.) Disable IGMP snooping for a VLAN or VSI.
   a. Return to system view.
      `quit`
   b. Enter VLAN view.
      `vlan` *`vlan-id`*

c. Disable IGMP snooping for the VLAN or VSI.

igmp-snooping disable

By default, the IGMP snooping status in a VLAN or VSI is consistent with the global IGMP snooping status.

Enabling IGMP snooping for VLANs

Restrictions and guidelines

You can enable IGMP snooping for multiple VLANs by using the **enable vlan** command in IGMP-snooping view or for a VLAN by using the **igmp-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in IGMP-snooping view.

IGMP snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling IGMP snooping for multiple VLANs

1. Enter system view.

   system-view
2. Enter IGMP-snooping view.

   igmp-snooping
3. Enable IGMP snooping for the specified VLANs.

   enable vlan *vlan-list*

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable IGMP snooping for the VLAN.

   igmp-snooping enable

   By default, the IGMP snooping status in a VLAN is consistent with the global IGMP snooping status.

Enabling IGMP snooping for a VSI

Restrictions and guidelines

For VSIs, you can only enable IGMP snooping for a VSI by using the **igmp-snooping enable** command in VSI view.

IGMP snooping configuration in a VSI takes effect only on the member ports in the VSI.

On an EVPN M-LAG network, you must enable both IGMP snooping and IGMP snooping proxying for VSIs. For more information about EVPN M-LAG, see EVPN VXLAN configuration in *EVPN Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter VSI view.

vsi *vsi-name*

3. Enable IGMP snooping for the VSI.

   igmp-snooping enable

   By default, the IGMP snooping status in a VSI is consistent with the global IGMP snooping status.

Configuring basic IGMP snooping features

Specifying an IGMP snooping version

About this task

Different IGMP snooping versions process different versions of IGMP messages.

- IGMPv2 snooping processes IGMPv1 messages, IGMPv2 messages, and IGMPv3 queries, but it floods IGMPv3 reports in the VLAN or VSI instead of processing them.
- IGMPv3 snooping processes IGMPv1, IGMPv2, and IGMPv3 messages.

Restrictions and guidelines

If you change the IGMP snooping version from 2 to 3, the device performs the following actions:

- Clears all IGMP snooping forwarding entries that are dynamically created.
- Keeps static IGMPv3 snooping forwarding entries (*, G).
- Clears static IGMPv3 snooping forwarding entries (S, G), which will be restored when the IGMP snooping version is switched back to 3.

For more information about static IGMP snooping forwarding entries, see "Configuring a static member port."

Specifying an IGMP snooping version for multiple VLANs

1. Enter system view.

   system-view

2. Enter IGMP-snooping view.

   igmp-snooping

3. Specify an IGMP snooping version for multiple VLANs.

   version *version-number* **vlan** *vlan-list*

   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Specify an IGMP snooping version for the VLAN.

   igmp-snooping version *version-number*

   By default, the IGMP snooping version for a VLAN is 2.

Specifying an IGMP snooping version for a VSI

1. Enter system view.

   system-view

2. Enter VSI view.

vsi *vsi-name*

3. Specify an IGMP snooping version for the VSI.
   igmp-snooping version *version-number*
   By default, the IGMP snooping version for a VSI is 2.

Setting the maximum number of IGMP snooping forwarding entries

About this task

You can modify the maximum number of IGMP snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum number of IGMP snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of IGMP snooping forwarding entries is 4294967295.

Configuring static multicast MAC address entries

About this task

In Layer 2 multicast, multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as IGMP snooping). You can also manually configure static multicast MAC address entries by binding multicast MAC addresses and ports to control the destination ports of the multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*

- Enter Layer 2 aggregate interface view.
  interface bridge-aggregation *interface-number*

3. Configure a static multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the IGMP last member query interval

About this task

A receiver host starts a report delay timer for a multicast group when it receives an IGMP group-specific query for the group. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the group.

The IGMP last member query interval defines the maximum response time advertised in IGMP group-specific queries. Set an appropriate value for the IGMP last member query interval to speed up hosts' responses to IGMP group-specific queries and avoid IGMP report traffic bursts.

Setting the IGMP last member query interval globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the IGMP last member query interval globally.
   last-member-query-interval *interval*

   By default, the global IGMP last member query interval is 1 second.

Setting the IGMP last member query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP last member query interval for the VLAN.
   igmp-snooping last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second for a VLAN.

Setting the IGMP last member query interval for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Set the IGMP last member query interval for the VSI.
   igmp-snooping last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second for a VSI.

Configuring IGMP snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an IGMP general query or PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an IGMP report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports. For example, if the memberships of multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports. If the memberships of multicast groups rarely change, set a relatively large value.

If a dynamic router port receives a PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **router-aging-time** or **igmp-snooping router-aging-time** command does not take effect on the port.

IGMP group-specific queries originated by the Layer 2 device trigger the adjustment of aging timers for dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the IGMP last member query interval. For more information about setting the IGMP last member query interval on the Layer 2 device, see "Setting the IGMP last member query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the global aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   igmp-snooping router-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic router ports.
4. Set the aging timer for dynamic member ports in the VLAN.
   igmp-snooping host-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic member ports.

Setting the aging timers for dynamic ports in a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Set the aging timer for dynamic router ports in the VSI.
   igmp-snooping router-aging-time *seconds*
   By default, a VSI uses the global aging timer for dynamic router ports.
4. Set the aging timer for dynamic member ports in the VSI.
   igmp-snooping host-aging-time *seconds*
   By default, a VSI uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for a multicast group so that hosts attached to the port can always receive multicast for the group. The static member port does not respond to IGMP queries. When you complete or cancel this configuration on a port, the port does not send an unsolicited IGMP report or leave message.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.
   igmp-snooping static-group *group-address* [**source-ip** *source-address*] { **vlan** *vlan-id* | **service-instance** *instance-id* }
   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for a multicast group so that all multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

interface bridge-aggregation *interface-number*

3. Configure the port as a static router port.

   igmp-snooping static-router-port vlan *vlan-id*

   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited IGMP report when you complete the configuration.
- It responds to IGMP general queries with IGMP reports.
- It sends an IGMP leave message when you cancel the configuration.

The version of IGMP running on the simulated member host is the same as the version of IGMP snooping running on the port. The port ages out in the same way as a dynamic member port.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*

3. Configure the port as a simulated member host.

   igmp-snooping host-join *group-address* [**source-ip** *source-address*] **vlan** *vlan-id*

   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for a multicast group when the port receives a leave massage. The Layer 2 device no longer sends or forwards IGMP group-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts in a VLAN. If you do so, the remaining receivers cannot receive multicast data for a group after a receiver leaves the group.

On a network where both Layer 2 multicast and Layer 3 multicast are enabled, when multicast group members on a port need to leave, you only need to enable fast-leave processing on the Layer 2 port. To avoid multicast service interruption on the other ports in the same VLAN, do not enable fast-leave processing for Layer 3 multicast group members at the same time (by using the **igmp fast leave** command). For more information about the **igmp fast leave** command, see IGMP commands in *IP Multicast Command Reference*.

Enabling fast-leave processing globally

1. Enter system view.

system-view

2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable fast-leave processing on the port.
   igmp-snooping fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send IGMP general queries or PIM hello messages for testing purposes. On the Layer 2 device, the port that receives either of the messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive multicast data that it does not want to receive.
- The port forwards the IGMP general queries or PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the IGMP querier or M-LAG election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable a port from becoming a dynamic router port. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.

igmp-snooping router-port-deny [**vlan** *vlan-list*]

By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an IGMP snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable IGMP snooping in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   igmp-snooping router-port-discard
   By default, the device forwards multicast data to static router ports in a VLAN.

Specifying the Layer 2 multicast forwarding mode

About Layer 2 multicast forwarding modes

The device supports the following Layer 2 multicast forwarding modes:

- **MAC-based mode**—The device forwards Layer 2 multicast packets based on the multicast MAC addresses in the packets.
- **IP-based mode**—The device forwards Layer 2 multicast packets based on the IP addresses (multicast source addresses and multicast group addresses) in the packets.

To display Layer 2 multicast IP forwarding entries, use the **display l2-multicast ip forwarding** command.

To display Layer 2 multicast MAC forwarding entries, use the **display l2-multicast mac forwarding** command.

Restrictions and guidelines for specifying the Layer 2 multicast forwarding mode

Multiple multicast IP addresses might be mapped to the same multicast MAC address. This causes that non-members of a multicast group receive the multicast data of this group if the device uses the MAC-based forwarding mode. As a best practice, specify the IP-based Layer 2 multicast forwarding mode on Layer 3 multicast devices.

As a best practice, specify the IP-based Layer 2 multicast forwarding mode on the device if a device running IGMPv3 exists in the network.

Specifying the Layer 2 multicast forwarding mode for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify the Layer 2 multicast forwarding mode.
   igmp-snooping forwarding-mode { **ip** | **mac** }
   By default, the device forwards Layer 2 multicast packets based on the MAC addresses in the packets.

Configuring the IGMP snooping querier

Enabling the IGMP snooping querier

About this task

This feature enables the Layer 2 device to periodically send IGMP general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an IGMP snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the IGMP snooping querier on a multicast network that runs IGMP. An IGMP snooping querier does not take part in IGMP querier elections. However, it might affect IGMP querier elections if it sends IGMP general queries with a low source IP address. For more information about IGMP querier, see "Configuring IGMP."

On a VXLAN network, the IGMP snooping querier in a VSI does not include VLAN tags in IGMP general queries. As a best practice, do not enable the IGMP snooping querier in a VSI if the VSI uses the Ethernet access mode. For more information about the Ethernet access mode, see *VXLAN Configuration Guide*.

Enabling the IGMP snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the IGMP snooping querier for the VLAN.
   igmp-snooping querier
   By default, the IGMP snooping querier is disabled for a VLAN.

Enabling the IGMP snooping querier for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable the IGMP snooping querier for the VSI.
   igmp-snooping querier

By default, the IGMP snooping querier is disabled for a VSI.

Enabling IGMP snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN or VSI, configure multiple queriers in the VLAN or VSI and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for IGMP snooping querier election is the same as that for IGMP querier election. For more information about IGMP querier election, see "Configuring IGMP."

Prerequisites for enabling IGMP snooping querier election

Before you enable IGMP snooping querier election, you must complete the following tasks:

- Enable the IGMP snooping querier for a VLAN or VSI. For more information about enabling the IGMP snooping querier, see "Enabling the IGMP snooping querier."
- Configure the source IP address for IGMP general queries as an IP address different from 0.0.0.0 and the local querier IP address. An IGMP snooping querier performs querier election only if the source IP address of a received IGMP general query is not 0.0.0.0 or its own IP address.
- Make sure the candidate IGMP snooping queriers run the same IGMP snooping version. To specify the IGMP snooping version, use the **igmp-snooping version** command.

Enabling IGMP snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping querier election for the VLAN.
   igmp-snooping querier-election
   By default, IGMP snooping querier election is disabled for a VLAN.

Enabling IGMP snooping querier election for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable IGMP snooping querier election for the VSI.
   igmp-snooping querier-election
   By default, IGMP snooping querier election is disabled for a VSI.

Configuring parameters for IGMP general queries and responses

About this task

You can modify the IGMP general query interval based on the actual condition of the network.

A receiver host starts a report delay timer for each multicast group that it has joined when it receives an IGMP general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an IGMP report to the corresponding multicast group.

Set an appropriate value for the maximum response time for IGMP general queries to speed up hosts' responses to IGMP general queries and avoid IGMP report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting multicast group members, make sure the IGMP general query interval is greater than the maximum response time for IGMP general queries.

Configuring parameters for IGMP general queries and responses globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the maximum response time for IGMP general queries.
   max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds.

Configuring parameters for IGMP general queries and responses in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the IGMP general query interval in the VLAN.
   igmp-snooping query-interval *interval*
   By default, the IGMP general query interval is 125 seconds for a VLAN.
4. Set the maximum response time for IGMP general queries in the VLAN.
   igmp-snooping max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds for a VLAN.

Configuring parameters for IGMP general queries and responses in a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Set the IGMP general query interval in the VSI.
   igmp-snooping query-interval *interval*
   By default, the IGMP general query interval is 125 seconds for a VSI.
4. Set the maximum response time for IGMP general queries in the VSI.
   igmp-snooping max-response-time *seconds*
   By default, the maximum response time for IGMP general queries is 10 seconds for a VSI.

Enabling the device to send IGMP general queries upon a path change

About this task

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN or VSI when a path changes. This feature ensures that the device can update the

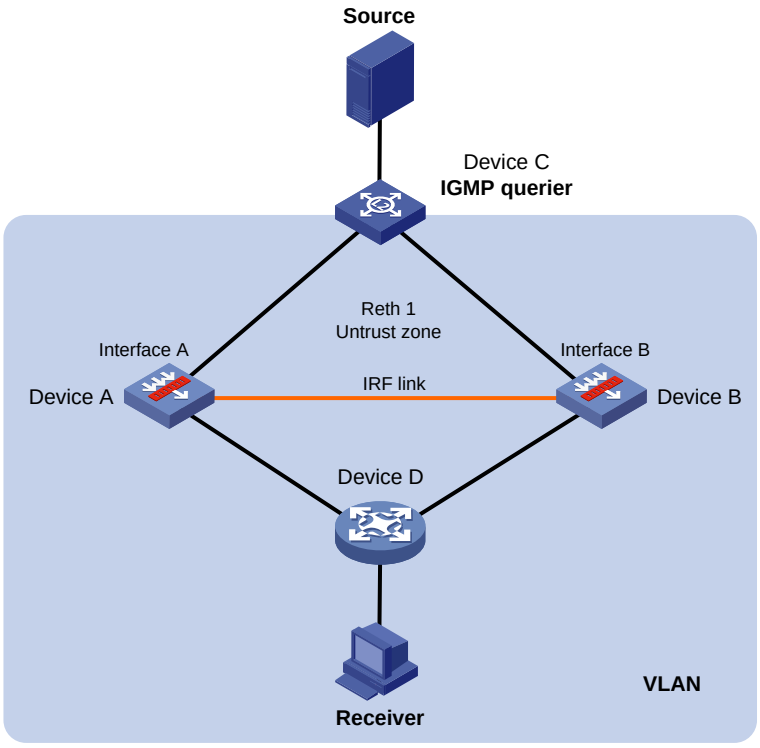
member port information in multicast forwarding entries and switch multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the IGMP snooping querier in a network of which the topology frequently changes.

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enter IGMP-snooping view.
   ```
   igmp-snooping
   ```
3. Enable the device to send IGMP general queries upon a path change.
   ```
   send-query enable
   ```
   By default, the device does not send IGMP general queries upon a path change.



Enabling the device to send IGMP general queries upon a port state change

About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an IGMP general query immediately and cannot update interface B to multicast forwarding entries.

Perform this task to enable the device to immediately send an IGMP general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send IGMP general queries upon a port state change.
   igmp-snooping triggered-query enable { **port-down** | **port-up** } *
   By default, the device does not send IGMP general queries upon a port state change.

Enabling IGMP snooping proxying

About enabling IGMP snooping proxying

The device enabled with IGMP snooping proxying is called an IGMP snooping proxy. The IGMP snooping proxy acts as a host to the upstream device. Enabled with IGMP snooping querier, the IGMP snooping proxy acts as the router to downstream devices and receives report and leave messages on behalf of the upstream device. As a best practice, enable IGMP snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling IGMP snooping proxying

Before you enable IGMP snooping proxying for a VLAN or VSI, you must first enable IGMP snooping globally and enable IGMP snooping for the VLAN or VSI. IGMP snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with IGMP snooping querier. For more information about enabling IGMP snooping querier, see "Enabling the IGMP snooping querier."

Enabling IGMP snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable IGMP snooping proxying for the VLAN.
   igmp-snooping proxy enable
   By default, IGMP snooping proxying is disabled for a VLAN.

Enabling IGMP snooping proxying for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable IGMP snooping proxying for the VSI.
   igmp-snooping proxy enable
   By default, IGMP snooping proxying is disabled for a VSI.

Configuring parameters for IGMP messages

Configuring source IP addresses for IGMP messages

About this task

The IGMP snooping querier might send IGMP general queries with the source IP address 0.0.0.0. The port that receives such queries will not be maintained as a dynamic router port. This might prevent the associated dynamic IGMP snooping forwarding entry from being correctly created at the data link layer and eventually cause multicast traffic forwarding failures. To avoid this problem, you can configure a non-all-zero IP address as the source IP address of the IGMP queries on the IGMP snooping querier. This configuration might affect the IGMP querier election within the subnet.

You can also change the source IP address of IGMP reports or leave messages sent by a simulated member host or an IGMP snooping proxy.

Configuring the source IP addresses for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Configure the source IP address for IGMP general queries.
   igmp-snooping general-query source-ip *ip-address*
   By default, the source IP address of IGMP general queries is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

4. Configure the source IP address for IGMP group-specific queries.

   igmp-snooping special-query source-ip *ip-address*

   By default, the source IP address of IGMP group-specific queries is one of the following:

   - The source address of IGMP group-specific queries if the IGMP snooping querier of the VLAN has received IGMP general queries.
   - The IP address of the current VLAN interface if the IGMP snooping querier does not receive an IGMP general query.
   - 0.0.0.0 if the IGMP snooping querier does not receive an IGMP general query and the current VLAN interface does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

   By default, the source IP address of IGMP leave messages is the IP address of the current VLAN interface. If the current VLAN interface does not have an IP address, the source IP address is 0.0.0.0.

Configuring the source IP addresses for IGMP messages in a VSI

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Configure the source IP address for IGMP general queries.

   igmp-snooping general-query source-ip *ip-address*

   By default, the source IP address of IGMP general queries is the IP address of the gateway interface for a VSI. If the gateway interface does not have an IP address, the source IP address is 0.0.0.0.

4. Configure the source IP address for IGMP group-specific queries.

   igmp-snooping special-query source-ip *ip-address*

   By default, the source IP address of IGMP group-specific queries is one of the following:

   - The source IP address of IGMP general queries if the IGMP snooping querier of a VSI has received IGMP general queries.
   - The IP address of the gateway interface for the VSI if the IGMP snooping querier does not receive an IGMP general query.
   - 0.0.0.0 if the gateway interface of the VSI does not have an IP address.

5. Configure the source IP address for IGMP reports.

   igmp-snooping report source-ip *ip-address*

   By default, the source IP address of IGMP reports is the IP address of the gateway interface for a VSI. If the gateway interface does not have an IP address, the source IP address is 0.0.0.0.

6. Configure the source IP address for IGMP leave messages.

   igmp-snooping leave source-ip *ip-address*

   By default, the source IP address of IGMP leave messages is the IP address of the gateway interface for a VSI. If the gateway interface does not have an IP address, the source IP address is 0.0.0.0.

Setting the 802.1p priority for IGMP messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards IGMP messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to IGMP messages that are created or forwarded by the device.

Restrictions and guidelines

The configuration in IGMP-snooping view takes effect only for all VLANs. For VSIs, you can set the 802.1p priority for IGMP messages only in VSI view.

Setting the 802.1p priority for IGMP messages globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Set the 802.1p priority for IGMP messages.
   dot1p-priority *priority*
   By default, the global 802.1p priority is not set.

Setting the 802.1p priority for IGMP messages in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the 802.1p priority for IGMP messages in the VLAN.
   igmp-snooping dot1p-priority *priority*
   By default, the 802.1p priority is not set.

Configuring IGMP snooping policies

Configuring a multicast group policy

About this task

This feature enables the Layer 2 device to filter IGMP reports by using an ACL that specifies the multicast groups and the optional sources. It is used to control the multicast groups that hosts can join. This configuration takes effect only on the multicast groups that ports join dynamically.

In a multicast application, a host sends an unsolicited IGMP report when a user requests a multicast program. The Layer 2 device uses the multicast group policy to filter the IGMP report. The host can join the multicast group only if the IGMP report is permitted by the multicast group policy.

Configuring a multicast group policy globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Configure a multicast group policy globally.

group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

By default, no multicast group policies are configured, and hosts can join any multicast groups.

Configuring a multicast group policy on a port

1. Enter system view.

   system-view

2. **Enter Layer 2 interface view.**
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Configure a multicast group policy on the port.

   igmp-snooping group-policy *ipv4-acl-number* [**vlan** *vlan-list*]

   By default, no multicast group policies are configured on a port, and hosts attached to the port can join any multicast groups.

Enabling dropping unknown multicast data

About this task

Unknown multicast data refers to multicast data for which no forwarding entries exist in the IGMP snooping forwarding table. This feature enables the device to forward unknown multicast data only to the router port. If the device does not have a router port, unknown multicast data will be dropped.

If you do not enable this feature, the unknown multicast data is flooded in the VLAN or VSI to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv4 multicast data is enabled, the device also drops unknown IPv6 multicast data.

When this feature is enabled for a VLAN or VSI, the device still forwards unknown multicast data out of router ports except the receiving router port in this VLAN or VSI.

Enabling dropping unknown multicast data for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Enable dropping unknown multicast data for the VLAN.

   igmp-snooping drop-unknown

   By default, dropping unknown multicast data is disabled for a VLAN. Unknown multicast data is flooded in the VLAN.

Enabling dropping unknown multicast data for a VSI

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Enable dropping unknown multicast data for the VSI.

   igmp-snooping drop-unknown

By default, dropping unknown multicast data is disabled for a VSI. Unknown multicast data is flooded in the VSI.

Enabling IGMP report suppression

About this task

This feature enables the Layer 2 device to forward only the first IGMP report for a multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable IGMP report suppression.
   report-aggregation
   By default, IGMP report suppression is enabled.

Setting the maximum number of multicast groups on a port

About this task

You can set the maximum number of multicast groups on a port to regulate the port traffic. This feature takes effect only on the multicast groups that a port joins dynamically.

If the number of multicast groups on a port exceeds the limit, the system removes all the forwarding entries associated with the port. The receiver hosts attached to that port can join multicast groups again before the number of multicast groups on the port reaches the limit. When the number of multicast groups on the port reaches the limit, the port automatically drops IGMP reports for new groups.

Procedure

1. Enter system view.
   system-view
2. **Enter Layer 2 interface view.**
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of multicast groups on the port.
   igmp-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of multicast groups on a port.

Enabling multicast group replacement

About this task

When multicast group replacement is enabled, the port does not drop IGMP reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves the

multicast group that has the lowest IP address and joins the new group contained in the IGMP report. The multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that a port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the IGMP snooping forwarding entries on the device reaches the upper limit.
- The multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling multicast group replacement globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled globally.

Enabling multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable multicast group replacement on the port.
   igmp-snooping overflow-replace [**vlan** *vlan-list*]
   By default, multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving multicast data. The information includes IP addresses of the hosts, length of time elapsed since the hosts joined multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Restrictions and guidelines

The global configuration does not take effect on VSIs.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter IGMP-snooping view.
   igmp-snooping
3. Enable host tracking globally.

host-tracking

By default, host tracking is disabled globally.

Enabling host tracking for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable host tracking for the VLAN.

   igmp-snooping host-tracking

   By default, host tracking is disabled for a VLAN.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view
2. Enter IGMP snooping view.

   igmp-snooping
3. Set the DSCP value for outgoing IGMP protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP snooping

About this task

To report critical IGMP snooping events to an SNMP NMS, enable SNMP notifications for IGMP snooping.

For IGMP snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.

   system-view
2. Enable SNMP notifications for IGMP snooping.

   snmp-agent trap enable igmp-snooping [**entry-refresh-failed**]

   By default, SNMP notifications are enabled for IGMP snooping.

Configuring IGMP snooping logging

Enabling IGMP snooping logging

About this task

This feature enables the IGMP snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable IGMP snooping logging or use the **igmp-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP snooping view.
   igmp-snooping
3. Enable IGMP snooping logging.
   igmp-snooping log enable [**group**]
   By default, IGMP snooping logging is enabled.

Enabling IGMP snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the IGMP snooping module to the information center.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP snooping view.
   igmp-snooping
3. Enable IGMP snooping logging suppression.
   igmp-snooping log suppress [**group**]
   By default, IGMP snooping logging suppression is enabled.

Display and maintenance commands for IGMP snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IGMP snooping status.	**display igmp-snooping** [**global** | **vlan** *vlan-id* | **vsi** *vsi-name*]

Task	Command
Display dynamic IGMP snooping group entries.	**display igmp-snooping group** [*group-address* | *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display igmp-snooping host-tracking vlan** *vlan-id* **group** *group-address* [**source** *source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display igmp-snooping router-port** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]
Display static IGMP snooping group entries.	**display igmp-snooping static-group** [*group-address* | *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display igmp-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the IGMP messages and PIMv2 hello messages learned by IGMP snooping.	**display igmp-snooping statistics**
Display Layer 2 multicast fast forwarding entries.	**display l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*source-address* | *group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IP multicast groups.	**display l2-multicast ip** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display Layer 2 IP multicast group entries.	**display l2-multicast ip forwarding** [**group** *group-address* | **source** *source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display information about Layer 2 MAC multicast groups.	**display l2-multicast mac** [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display Layer 2 MAC multicast group entries.	**display l2-multicast mac forwarding** [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display static multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Clear dynamic IGMP snooping group entries.	**reset igmp-snooping group** { *group-address* [*source-address*] | **all** } [**vlan** *vlan-id* | **vsi** *vsi-name*]
Clear dynamic router port information.	**reset igmp-snooping router-port** { **all** | **vlan** *vlan-id* | **vsi** *vsi-name* }

Task	Command
Clear statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping.	**reset igmp-snooping statistics**
Clear Layer 2 multicast fast forwarding entries.	**reset l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]

IGMP snooping configuration examples

Example: Configuring VLAN-based IGMP snooping group polices and simulated joining

Network configuration

As shown in Figure 5, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping.

Configure a multicast group policy and simulated joining to meet the following requirements:

- Host A and Host B receive only the multicast data addressed to multicast group 224.1.1.1. Multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

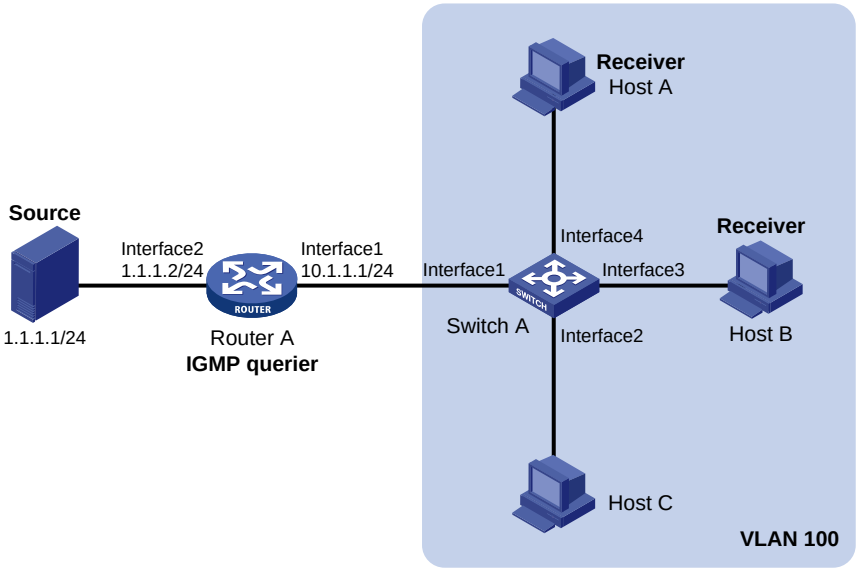


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Router A:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname RouterA
[RouterA] multicast routing
[RouterA-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
[RouterA-GigabitEthernet1/0/1] igmp enable
[RouterA-GigabitEthernet1/0/1] quit
```

Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping drop-unknown
[SwitchA-vlan100] quit
```

Configure a multicast group policy so that hosts in VLAN 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] group-policy 2001 vlan 100
[SwitchA-igmp-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts of multicast group 224.1.1.1.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

```
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] igmp-snooping host-join 224.1.1.1 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.2.2.2. (Details not shown.)

Display dynamic IGMP snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                              (00:03:23)
      GE1/0/4                              (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined multicast group 224.1.1.1 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join multicast group 224.2.2.2.

Configuration files

- Router A:

```
#
 sysname RouterA
#
interface GigabitEthernet1/0/1
 port link-mode route
 ip address 10.1.1.1 255.255.255.0
 igmp enable
#
interface GigabitEthernet1/0/2
 port link-mode route
 ip address 1.1.1.2 255.255.255.0
 pim dm
#
multicast routing
#
return
```

- Switch A:

```
#
 sysname SwitchA
#
igmp-snooping
 group-policy 2001 vlan 100
#
vlan 100
 igmp-snooping enable
```

```
 igmp-snooping drop-unknown
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#

 port link-mode bridge
 port access vlan 100
 igmp-snooping host-join 224.1.1.1 vlan 100
#
interface GigabitEthernet1/0/4
 port link-mode bridge
 port access vlan 100
 igmp-snooping host-join 224.1.1.1 vlan 100
#
acl basic 2001
 rule 5 permit source 224.1.1.1 0
#
return
```

Example: Configuring VLAN-based IGMP snooping static ports

Network configuration

As shown in Figure 6:

- Router A runs IGMPv2 and acts as the IGMP querier. Switch A, Switch B, and Switch C run IGMPv2 snooping.
- Host A and host C are permanent receivers of multicast group 224.1.1.1.

Configure static ports to meet the following requirements:

- To enhance the reliability of multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for multicast group 224.1.1.1.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. Multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one IGMP query-response cycle must be completed before multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, multicast data can flow to the receivers nearly uninterruptedly along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

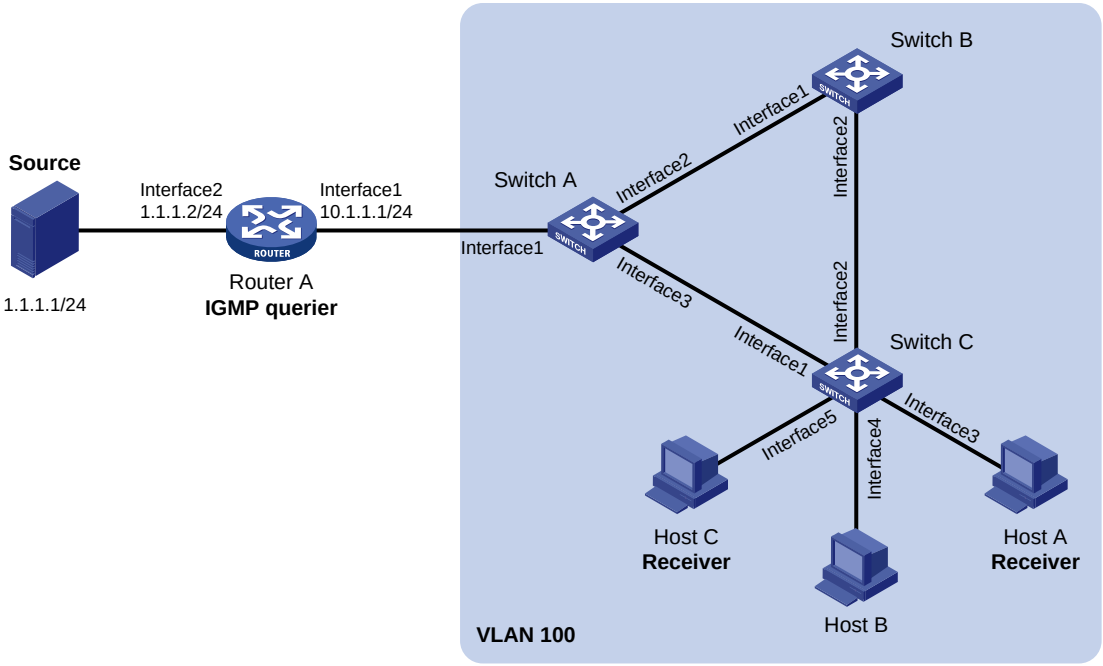

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4
Interface5	GigabitEthernet1/0/5

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

   ```
   <Sysname> system-view
   [Sysname] sysname RouterA
   [RouterA] multicast routing
   [RouterA-mrib] quit
   ```

   # Enable IGMP on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
   [RouterA-GigabitEthernet1/0/1] igmp enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
   [RouterA-GigabitEthernet1/0/2] pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] igmp-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

Configure STP.

```
[SwitchA] stp region-configuration
[SwitchA-mst-region] instance 1 vlan 100
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

3. Configure Switch B:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable IGMP snooping for VLAN 100.

```
[SwitchB-vlan100] igmp-snooping enable
[SwitchB-vlan100] quit
```

Configure STP.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] instance 1 vlan 100
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

4. Configure Switch C:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable IGMP snooping for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for multicast group 224.1.1.1.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] igmp-snooping static-group 224.1.1.1 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Configure STP.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] instance 1 vlan 100
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display igmp-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static IGMP snooping group entries for VLAN 100 on Switch C.

```
[SwitchC] display igmp-snooping static-group vlan 100
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of multicast group 224.1.1.1.

Example: Configuring the VLAN-based IGMP snooping querier

Network configuration

As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Host A and Host C are receivers of multicast group 224.1.1.1, and Host B and Host D are receivers of multicast group 225.1.1.1.
- All host receivers run IGMPv2, and all switches run IGMPv2 snooping. Switch A (which is close to the multicast sources) acts as the IGMP snooping querier.

Configure the switches to meet the following requirements:

- To prevent the switches from flooding unknown data in the VLAN, enable all the switches to drop unknown multicast data.
- A switch does not mark a port that receives an IGMP query with source IP address 0.0.0.0 as a dynamic router port. This adversely affects the establishment of Layer 2 forwarding entries and multicast traffic forwarding. To avoid this, configure the source IP address of IGMP queries as a non-zero IP address.

Figure 7 Network diagram

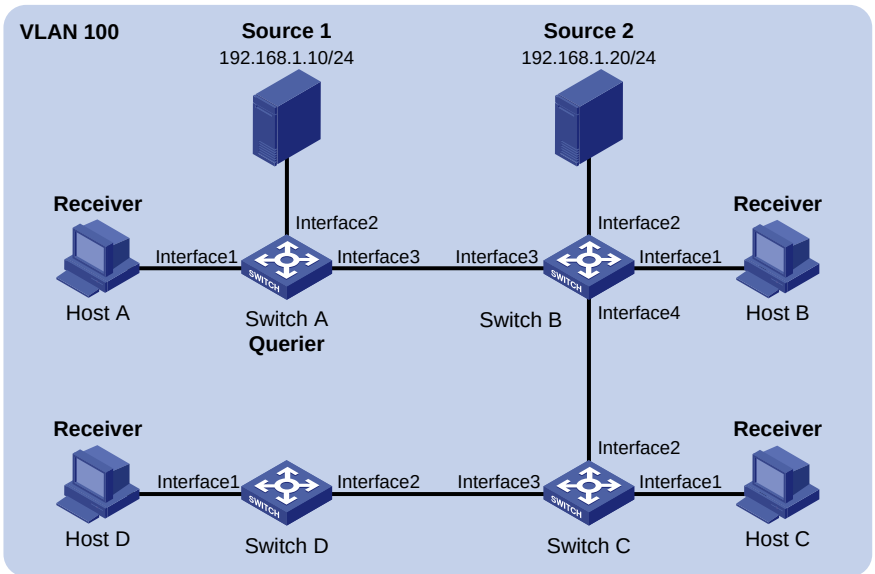

Table 3 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable the IGMP snooping feature.

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchA
   [SwitchA] igmp-snooping
   [SwitchA-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] igmp-snooping enable
   [SwitchA-vlan100] igmp-snooping drop-unknown
   ```

   # Configure Switch A as the IGMP snooping querier.

   ```
   [SwitchA-vlan100] igmp-snooping querier
   [SwitchA-vlan100] quit
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP general queries.

   ```
   [SwitchA-vlan100] igmp-snooping general-query source-ip 192.168.1.1
   ```

   # In VLAN 100, specify 192.168.1.1 as the source IP address of IGMP group-specific queries.

   ```
   [SwitchA-vlan100] igmp-snooping special-query source-ip 192.168.1.1
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the IGMP snooping feature.

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchB
   [SwitchB] igmp-snooping
   [SwitchB-igmp-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchB] vlan 100
   [SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

   ```
   [SwitchB-vlan100] igmp-snooping enable
   [SwitchB-vlan100] igmp-snooping drop-unknown
   [SwitchB-vlan100] quit
   ```

3. Configure Switch C:

   # Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] igmp-snooping
[SwitchC-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchC-vlan100] igmp-snooping enable
[SwitchC-vlan100] igmp-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[SwitchD] igmp-snooping
[SwitchD-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable IGMP snooping, and enable dropping unknown multicast data for VLAN 100.

```
[SwitchD-vlan100] igmp-snooping enable
[SwitchD-vlan100] igmp-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for IGMP messages and PIMv2 hello messages learned through IGMP snooping on Switch B.

```
[SwitchB] display igmp-snooping statistics
Received IGMP messages:
  IGMP general queries: 19
    M-LAG: 19
  IGMPv2 specific queries: 10
    M-LAG: 0
  IGMPv3 specific queries: 0
    M-LAG: 0
  IGMPv3 specific sg queries: 0
    M-LAG: 0
  IGMPv1 reports: 0
    M-LAG: 0
  IGMPv2 reports: 19
    M-LAG: 19
  IGMPv3 reports: 0
    M-LAG: 0
  IGMPv3 reports with right and wrong records: 0
    M-LAG: 0
  IGMP leaves: 5
    M-LAG: 5
```

```
  Error IGMP messages: 1
    M-LAG: 1
Sent IGMP messages:
  IGMPv2 specific queries: 0
  IGMPv3 specific queries: 0
  IGMPv3 specific sg queries: 0
Received PIMv2 hello : 0
```

The output shows that all switches except Switch A can receive the IGMP general queries after Switch A acts as the IGMP snooping querier.

Configuration files

- Switch A:

```
#
 sysname SwitchA
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping drop-unknown
 igmp-snooping querier
 igmp-snooping general-query source-ip 192.168.1.1
 igmp-snooping special-query source-ip 192.168.1.1
#
interface GigabitEthernet1/0/1
 port link-mode bridge

 port link-mode bridge
 port access vlan 100
#
return
```

- Switch D:

```
#
 sysname SwitchD
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping drop-unknown
```

```
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#
return
```

Example: Configuring VLAN-based IGMP snooping proxying

Network configuration

As shown in Figure 8, Router A runs IGMPv2 and acts as the IGMP querier. Switch A runs IGMPv2 snooping. Configure IGMP snooping proxying so that Switch A can perform the following actions:

- Forward IGMP report and leave messages to Router A.
- Respond to IGMP queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

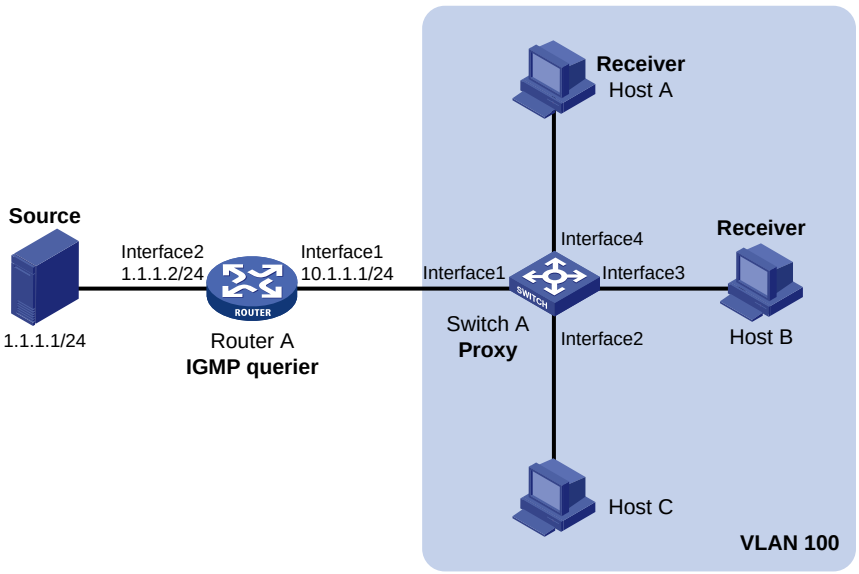

Table 4 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Router A:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname RouterA
[RouterA] multicast routing
[RouterA-mrib] quit
```

Enable IGMP and PIM-DM on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.1 24
[RouterA-GigabitEthernet1/0/1] igmp enable
[RouterA-GigabitEthernet1/0/1] pim dm
[RouterA-GigabitEthernet1/0/1] quit
```

Enable PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/1] ip address 10.1.1.2 24
[RouterA-GigabitEthernet1/0/2] pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the IGMP snooping feature.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and IGMP snooping proxying for the VLAN.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] igmp-snooping proxy enable
[SwitchA-vlan100] quit
```

Verifying the configuration

Send IGMP reports from Host A and Host B to join multicast groups 224.1.1.1 and 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
 Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:00)
      GE1/0/4                                  (00:04:04)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of multicast group 224.1.1.1. Host A and Host B become receivers of the group.

Display IGMP group membership information on Router A.

```
[RouterA] display igmp group
IGMP groups in total: 1
```

```
 GigabitEthernet1/0/1(10.1.1.1):
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   224.1.1.1       0.0.0.0         00:00:31    00:02:03
```

Send an IGMP leave message from Host A to leave multicast group 224.1.1.1. (Details not shown.)

Display brief information about IGMP snooping group entries on Switch A.

```
[SwitchA] display igmp-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of multicast group 224.1.1.1. Only Host B remains as the receiver of the group.

Configuration files

- Router A:

```
#
 sysname RouterA
#
interface GigabitEthernet1/0/1
 port link-mode route
 ip address 10.1.1.1 255.255.255.0
 pim dm
 igmp enable
#
interface GigabitEthernet1/0/2
 port link-mode route
 ip address 1.1.1.2 255.255.255.0
 pim dm
#
multicast routing
#
return
```

- Switch A:

```
#
 sysname SwitchA
#
igmp-snooping
#
vlan 100
 igmp-snooping enable
 igmp-snooping proxy enable
#
interface GigabitEthernet1/0/1
 port link-mode bridge
 port access vlan 100
```

```
#
interface GigabitEthernet1/0/2
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/3
 port link-mode bridge
 port access vlan 100
#
interface GigabitEthernet1/0/4
 port link-mode bridge
 port access vlan 100
#
return
```

Troubleshooting IGMP snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function on the Layer 2 device.

Solution

To resolve the problem:

1. Use the **display igmp-snooping** command to display IGMP snooping status.
2. If IGMP snooping is not enabled, use the **igmp-snooping** command in system view to enable the IGMP snooping feature. Then, use the **igmp-snooping enable** command in VLAN view or VSI view to enable IGMP snooping for the VLAN or VSI.
3. If IGMP snooping is enabled globally but not enabled for the VLAN or VSI, use the **igmp-snooping enable** command in VLAN view or VSI view to enable IGMP snooping for the VLAN or VSI.
4. If the problem persists, contact H3C Support.

Multicast group policy does not work

Symptom

Hosts can receive multicast data for multicast groups that are not permitted by the multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl** command to verify that the configured ACL meets the multicast group policy requirements.
2. Use the **display this** command in IGMP-snooping view or in a corresponding interface view to verify that the correct multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **igmp-snooping group-policy** command to apply the correct multicast group policy.

3. Use the **display igmp-snooping** command to verify that dropping unknown multicast data is enabled. If it is not, use the **igmp-snooping drop-unknown** command to enable dropping unknown multicast data.
4. If the problem persists, contact H3C Support.

Configuring PIM snooping

About PIM snooping

PIM snooping runs on Layer 2 devices. It works with IGMP snooping to analyze received PIM messages, and adds the ports that are interested in specific multicast data to a PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the PIM routers are in the same VLAN or VSI.

- When the Layer 2 switch runs only IGMP snooping, it performs the following actions:
  - **a.** Maintains the router ports according to the received PIM hello messages that PIM routers send.
  - **b.** Floods all other types of received PIM messages except PIM hello messages in the VLAN or VSI.

c. Forwards all multicast data to all router ports in the VLAN or VSI.

Each PIM router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all PIM messages except PIM hello messages.

- When the Layer 2 switch runs both IGMP snooping and PIM snooping, it performs the following actions:

  d. Examines whether a PIM router is interested in the multicast data addressed to a multicast group according to the received PIM messages that the router sends.

  e. Adds only the ports that connect to the router and are interested in the data to a PIM snooping routing entry.

  f. Forwards PIM messages and multicast data to only the routers that are interested in the data, which saves network bandwidth.

For more information about IGMP snooping and the router port, see "Configuring IGMP snooping."

Restrictions and guidelines: PIM snooping configuration

Make sure the maximum size of a PIM join or prune message is smaller than the path MTU of devices connected to PIM snooping devices. Otherwise, fragmented PIM join or prune messages prevent PIM snooping from correctly forwarding multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring PIM."

PIM snooping is supported only for PIM-SM and PIM-SSM. As a best practice, do not configure PIM snooping for PIM-DM and BIDIR-PIM. For more information about PIM, see "PIM overview."

After you configure PIM snooping for a VLAN or VSI, PIM snooping takes effect only on ports that belong to the VLAN or VSI.

PIM snooping tasks at a glance

To configure PIM snooping, perform the following tasks:

1. Enabling PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling PIM snooping

Restrictions and guidelines

You must enable the IGMP snooping feature and enable IGMP snooping for a VLAN or VSI before you enable PIM snooping for the VLAN or VSI.

PIM snooping does not take effect on sub-VLANs of a multicast VLAN.

Procedure

1. Enter system view.

   `system-view`

2. Enable the IGMP snooping feature and enter IGMP-snooping view.

   `igmp-snooping`

   By default, IGMP snooping is disabled.

For more information about this command, see IGMP snooping commands in *IP Multicast Command Reference*.

3. Return to system view.

   quit

4. Enter VLAN view or VSI view.
   - Enter VLAN view.

     vlan *vlan-id*
   - Enter VSI view.

     vsi *vsi-name*

5. Enable IGMP snooping for the VLAN or VSI.

   igmp-snooping enable

   By default, IGMP snooping is disabled in a VLAN or VSI.

   For more information about this command, see *IP Multicast Command Reference*.

6. Enable PIM snooping for the VLAN or VSI.

   pim-snooping enable

   By default, PIM snooping is disabled in a VLAN or VSI.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface, AC, N-PW, and U-PW. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 multicast data interruption caused by the aging of PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives a PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives a PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.

   system-view

2. Enter VLAN view or VSI view.
   - Enter VLAN view.

     vlan *vlan-id*
   - Enter VSI view.

     vsi *vsi-name*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view

2. Enter VLAN view or VSI view.
   - Enter VLAN view.

     vlan *vlan-id*
   - Enter VSI view.

     vsi *vsi-name*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display PIM snooping neighbor information.	**display pim-snooping neighbor** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping router port information.	**display pim-snooping router-port** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display PIM snooping routing entries.	**display pim-snooping routing-table** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display statistics for the PIM messages learned through PIM snooping.	**display pim-snooping statistics**
Clear statistics for the PIM messages learned through PIM snooping.	**reset pim-snooping statistics**

PIM snooping configuration examples

Example: Configuring PIM snooping

Network configuration

As shown in Figure 2:

- OSPF runs on the network.
- Source 1 and Source 2 send multicast data to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Receiver 1 and Receiver 2 belong to multicast groups 224.1.1.1 and 225.1.1.1, respectively.
- Router C and Router D run IGMP on GigabitEthernet 1/0/1. Router A, Router B, Router C, and Router D run PIM-SM.
- GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure IGMP snooping and PIM snooping on Switch A. Then, Switch A forwards PIM protocol packets and multicast data packets only to the routers that are connected to receivers.

Figure 2 Network diagram

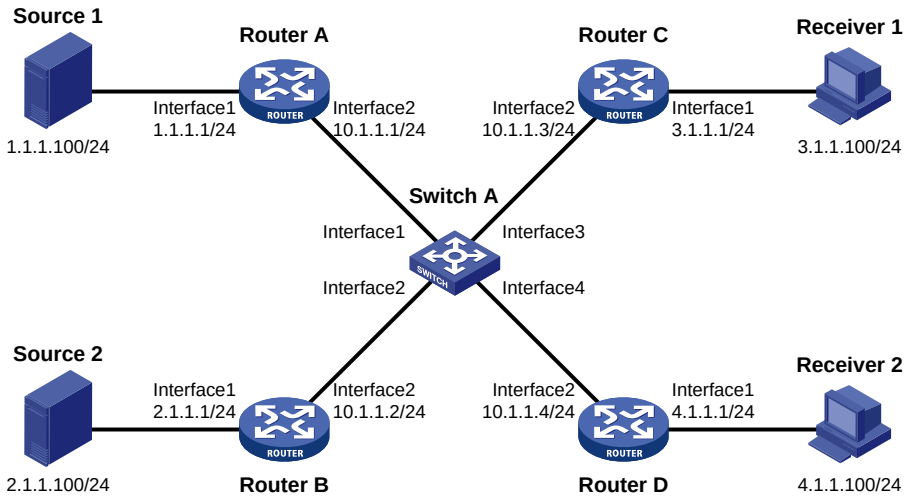

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 2, and configure OSPF on the routers.

Procedure

1. Configure Router A:

   # Enable IP multicast routing.

```
<RouterA> system-view
[RouterA] multicast routing
[RouterA-mrib] quit
```

Enable PIM-SM on each interface.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] pim sm
[RouterA-GigabitEthernet1/0/1] quit
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] pim sm
[RouterA-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

```
[RouterA] pim
[RouterA-pim] c-bsr 10.1.1.1
[RouterA-pim] c-rp 10.1.1.1
[RouterA-pim] quit
```

2. Configure Router B:

Enable IP multicast routing.

```
<RouterB> system-view
[RouterB] multicast routing
[RouterB-mrib] quit
```

Enable PIM-SM on each interface.

```
[RouterB] interface gigabitethernet 1/0/1
[RouterB-GigabitEthernet1/0/1] pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IP multicast routing.

```
<RouterC> system-view
[RouterC] multicast routing
[RouterC-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] igmp enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IP multicast routing.

```
<RouterD> system-view
[RouterD] multicast routing
[RouterD-mrib] quit
```

Enable IGMP on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
```

```
[RouterD-GigabitEthernet1/0/1] igmp enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the IGMP snooping feature.

```
<SwitchA> system-view
[SwitchA] igmp-snooping
[SwitchA-igmp-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable IGMP snooping and PIM snooping for VLAN 100.

```
[SwitchA-vlan100] igmp-snooping enable
[SwitchA-vlan100] pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  10.1.1.1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  10.1.1.2
    Ports (1 in total):
      GE1/0/2                 (00:32:43)
  10.1.1.3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  10.1.1.4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are PIM snooping neighbors.

On Switch A, display PIM snooping routing entries for VLAN 100.

```
[SwitchA] display pim-snooping routing-table vlan 100
Total 4 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 4 entries.
  (*, 224.1.1.1)
    Upstream neighbor: 10.1.1.1
      Upstream Ports (1 in total):
```

```
      GE1/0/1
    Downstream Ports (1 in total):
      GE1/0/3
        Expires: 00:03:01, FSM: J
(1.1.1.100, 224.1.1.1)
  Upstream neighbor: 10.1.1.1
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/1
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/3
        Expires: 00:02:33, FSM: J
(*, 225.1.1.1)
  Upstream neighbor: 10.1.1.1
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/1
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:03:11, FSM: J
(2.1.1.100, 225.1.1.1)
  Upstream neighbor: 10.1.1.2
    Upstream Slots (0 in total):
    Upstream Ports (1 in total):
      GE1/0/2
    Downstream Slots (0 in total):
    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:02:34, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for multicast group 224.1.1.1 only to Router C.
- Switch A will forward the multicast data intended for multicast group 225.1.1.1 only to Router D.

Troubleshooting PIM snooping

PIM snooping does not work on a Layer 2 device

Symptom

PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about IGMP snooping and PIM snooping.

2. If IGMP snooping is not enabled, enable the IGMP snooping feature, and then enable IGMP snooping and PIM snooping for the VLAN or VSI.
3. If PIM snooping is not enabled, enable PIM snooping for the VLAN or VSI.
4. If the problem persists, contact H3C Support.

Configuring multicast VLANs

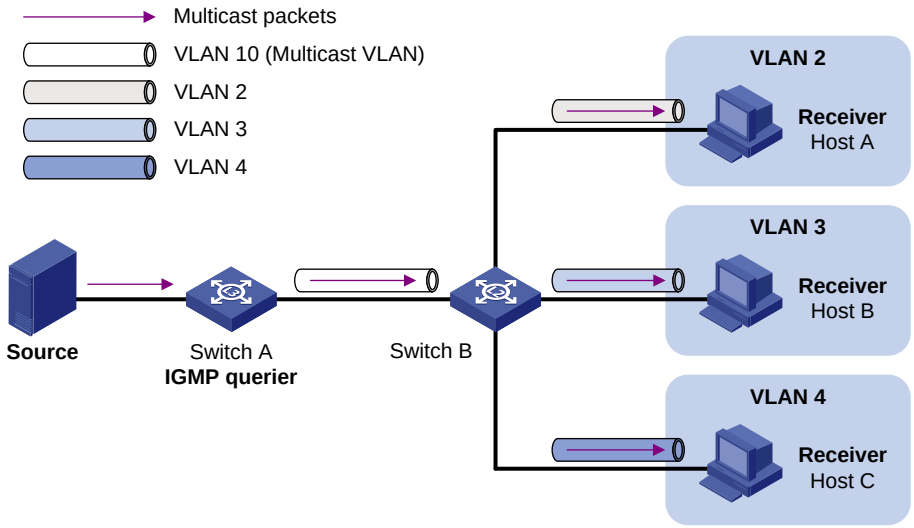
Multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in three different VLANs and the same multicast group. When Switch A (Layer 3 device) receives multicast data for that group, it sends three copies of the multicast data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the multicast VLAN feature

After a multicast VLAN is configured on Switch B, Switch A sends only one copy of the multicast data to the multicast VLAN on Switch B. This method saves network bandwidth and lessens the burden on the Layer 3 device.

Multicast VLAN implementations



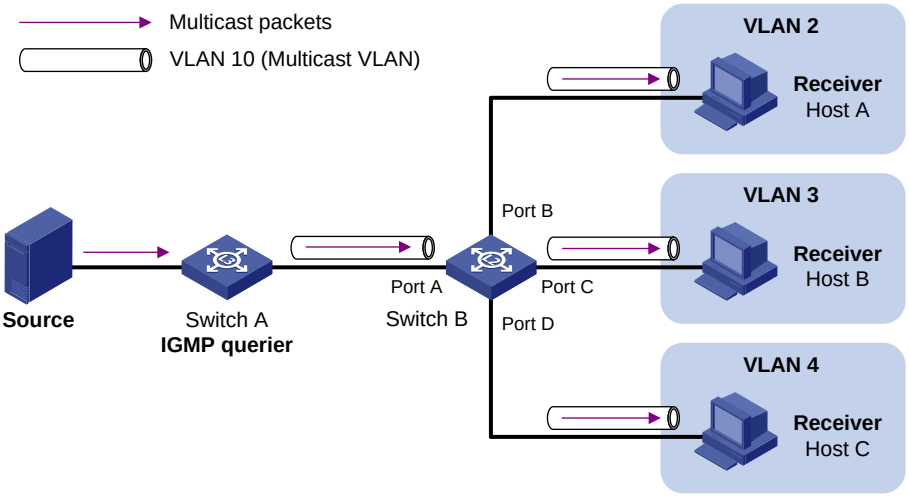
Multicast VLANs include sub-VLAN-based multicast VLANs and port-based multicast VLANs.

Sub-VLAN-based multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



IGMP snooping manages router ports in the multicast VLAN and member ports in each sub-VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN in the multicast VLAN.

Port-based multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is a multicast VLAN. All the user ports are hybrid ports and are assigned to VLAN 10.
- IGMP snooping is enabled for the multicast VLAN and VLAN 2 through VLAN 4.

Figure 3 Port-based multicast VLAN

IGMP snooping manages the router ports and member ports in the multicast VLAN. When Switch A receives multicast data from the multicast source, it sends only one copy of the multicast data to the multicast VLAN on Switch B. Switch B sends a separate copy to each user port in the multicast VLAN.

Restrictions and guidelines: Multicast VLAN configuration

The VLAN to be configured as a multicast VLAN must exist.

If you have configured both a sub-VLAN-based multicast VLAN and a port-based multicast VLAN on a device, the port-based multicast VLAN configuration takes effect.

Do not configure a multicast VLAN on a device that is enabled with IP multicast routing. Otherwise, the system displays errors. Do not enable IP multicast routing on a device that is configured with multicast VLANs. Otherwise, multicast forwarding exceptions occur.

Do not configure a VLAN as a multicast VLAN or a multicast sub-VLAN if the VLAN interface is enabled with PIM or IGMP. Otherwise, the system displays errors. Do not enable PIM or IGMP on a VLAN interface if the VLAN interface belongs to a multicast VLAN or a multicast sub-VLAN. Otherwise, multicast forwarding exceptions occur.

Configuring a sub-VLAN-based multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of a multicast VLAN must exist and cannot be multicast VLANs or sub-VLANs of any other multicast VLAN.

Prerequisites

Before you configure a sub-VLAN-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign VLANs to the multicast VLAN as sub-VLANs.
   subvlan *vlan-list*

Configuring a port-based multicast VLAN

Restrictions and guidelines

You can assign user ports to a multicast VLAN in multicast VLAN view or assign a user port to a multicast VLAN in interface view. These configurations have the same priority.

A user port can belong to only one multicast VLAN.

Prerequisites

Before you configure a port-based multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable IGMP snooping for the VLAN to be configured as the multicast VLAN.

- Enable IGMP snooping for all the VLANs that contain multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to a multicast VLAN in multicast VLAN view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Assign ports to the multicast VLAN.
   port *interface-list*

Assigning user ports to a multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure a VLAN as a multicast VLAN and enter multicast VLAN view.
   multicast-vlan *vlan-id*
   By default, a VLAN is not a multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the multicast VLAN.
   port multicast-vlan *vlan-id*
   By default, a port does not belong to any multicast VLAN.

Setting the maximum number of multicast VLAN forwarding entries

About this task

You can set the maximum number of multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of multicast VLAN forwarding entries.
   multicast-vlan entry-limit *limit*
   By default, the maximum number of multicast VLAN forwarding entries is 8192.

Display and maintenance commands for multicast VLAN

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about multicast VLANs.	**display multicast-vlan** [*vlan-id*]
Display information about multicast VLAN forwarding entries.	**display multicast-vlan forwarding-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask** { *mask-length* | *mask* }] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about multicast groups in multicast VLANs.	**display multicast-vlan group** [*source-address* | *group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear multicast groups in multicast VLANs.	**reset multicast-vlan group** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **vlan** *vlan-id*] *

Multicast VLAN configuration examples

Example: Configuring sub-VLAN-based multicast VLAN

Network configuration

As shown in Figure 4:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

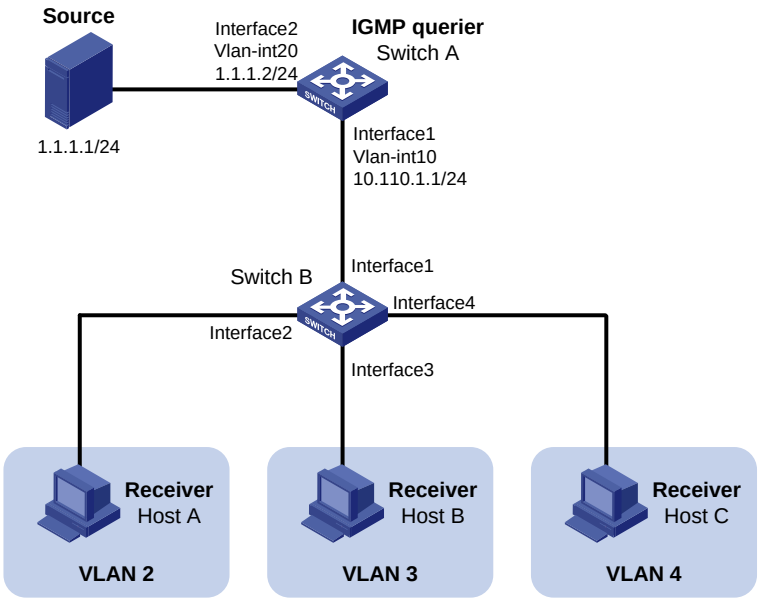


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

Enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ip address 1.1.1.2 24
[SwitchA-Vlan-interface20] pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable IGMP snooping in the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as a multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] multicast-vlan 10
[SwitchB-mvlan-10] subvlan 2 to 4
[SwitchB-mvlan-10] quit
```

Verifying the configuration

Display information about all multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about multicast groups in multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan group
Total 1 entries.

Multicast VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that multicast group 224.1.1.1 belongs to multicast VLAN 10. Multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based multicast VLAN

Network configuration

As shown in Figure 5:

- Layer 3 device Switch A runs IGMPv2 and acts as the IGMP querier. Layer 2 device Switch B runs IGMPv2 snooping.
- The multicast source sends multicast data to multicast group 224.1.1.1. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based multicast VLAN on Switch B to meet the following requirements:

- Switch A sends multicast data to Switch B through the multicast VLAN.
- Switch B forwards the multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

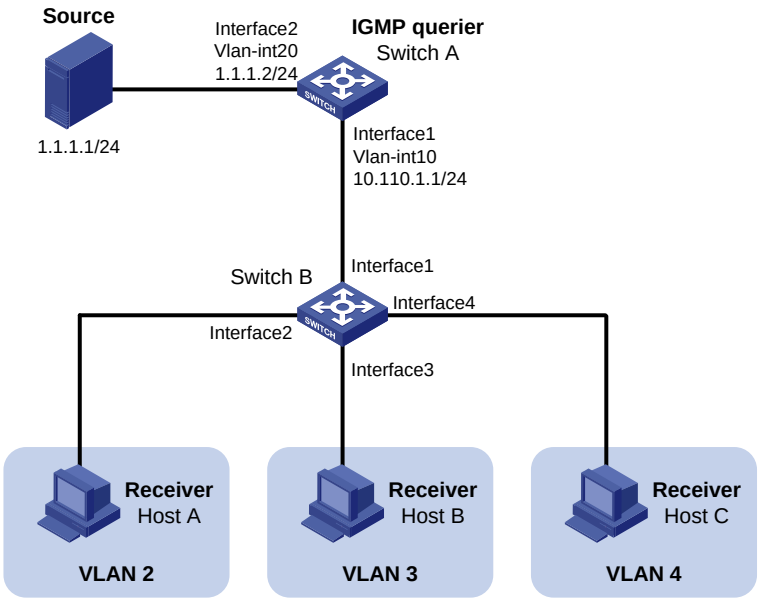

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IP address to VLAN-interface 20, and enable PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ip address 1.1.1.2 24
   [SwitchA-Vlan-interface20] pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] port gigabitethernet 1/0/1
   [SwitchA-vlan10] quit
   ```

   # Assign an IP address to VLAN-interface 10, and enable IGMP on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ip address 10.110.1.1 24
[SwitchA-Vlan-interface10] igmp enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the IGMP snooping feature.

```
<SwitchB> system-view
[SwitchB] igmp-snooping
[SwitchB-igmp-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] igmp-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] igmp-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] igmp-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable IGMP snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] igmp-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
```

```
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as a multicast VLAN.

```
[SwitchB] multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about multicast VLANs on Switch B.

```
[SwitchB] display multicast-vlan
Total 1 multicast VLANs.

Multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic IGMP snooping forwarding entries on Switch B.

```
[SwitchB] display igmp-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
  (0.0.0.0, 224.1.1.1)
    Host ports (3 in total):
      GE1/0/2        (00:03:23)
      GE1/0/3        (00:04:07)
      GE1/0/4        (00:04:16)
```

The output shows that IGMP snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the multicast data of VLAN 10 through these user ports.

PIM overview

About PIM

Protocol Independent Multicast (PIM) provides IP multicast forwarding by leveraging unicast static routes or unicast routing tables generated by any unicast routing protocol. PIM uses the underlying unicast routing to generate a multicast routing table without relying on any particular unicast routing protocol. PIM uses the RPF mechanism to implement multicast forwarding. For more information about RPF, see "Configuring multicast routing and forwarding."

PIM modes

Based on the implementation mechanism, PIM includes the following modes:

- Protocol Independent Multicast–Dense Mode (PIM-DM).
- Protocol Independent Multicast–Sparse Mode (PIM-SM).
- Bidirectional Protocol Independent Multicast (BIDIR-PIM).
- Protocol Independent Multicast Source-Specific Multicast (PIM-SSM).

In this document, a PIM domain refers to a network that contains PIM devices.

PIM-DM

PIM-DM uses the push mode for multicast forwarding, and is suitable for small-sized networks with densely distributed multicast members.

PIM-DM assumes that all downstream nodes want to receive multicast data from a source, so multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees. When a pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In PIM-DM, the multicast forwarding paths for a multicast group constitutes a forwarding tree. The forwarding tree is rooted at the multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the multicast source to the receivers, it is also called a "shortest path tree (SPT)."

PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

Neighbor discovery

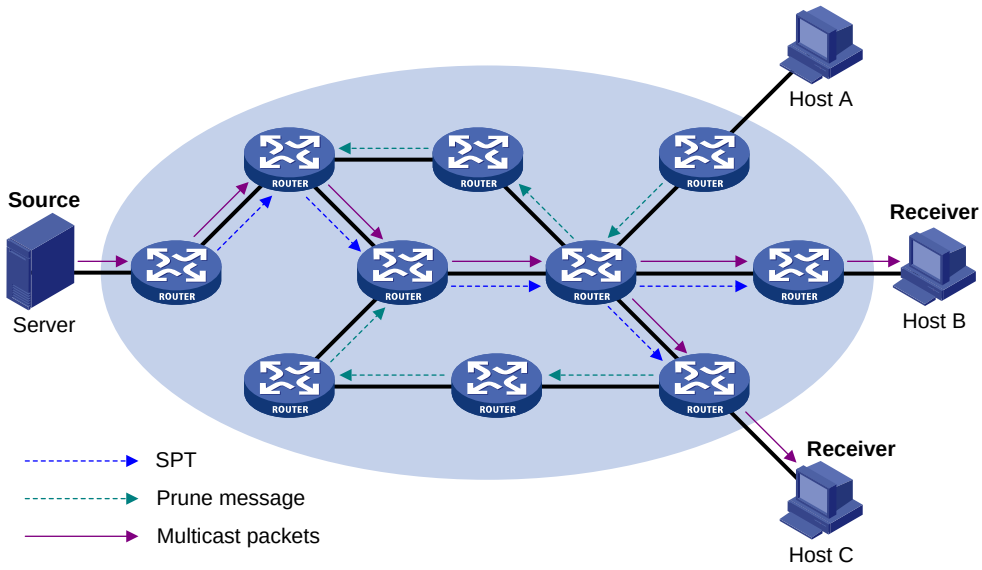
In a PIM domain, each PIM interface on a device periodically multicasts PIM hello messages to all other PIM devices (identified by the address 224.0.0.13) on the local subnet. Through the exchanging of hello messages, all PIM devices on the subnet determine their PIM neighbors, maintain PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In a PIM-DM domain, the multicast data from the multicast source S to the multicast group G is flooded throughout the domain. A device performs an RPF check on the multicast data. If the RPF check succeeds, the device creates an (S, G) entry and forwards the data to all

downstream nodes on the network. In the flooding process, all the devices in the PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all PIM devices on the subnet. When an upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that multicast group down to this node.

NOTE:

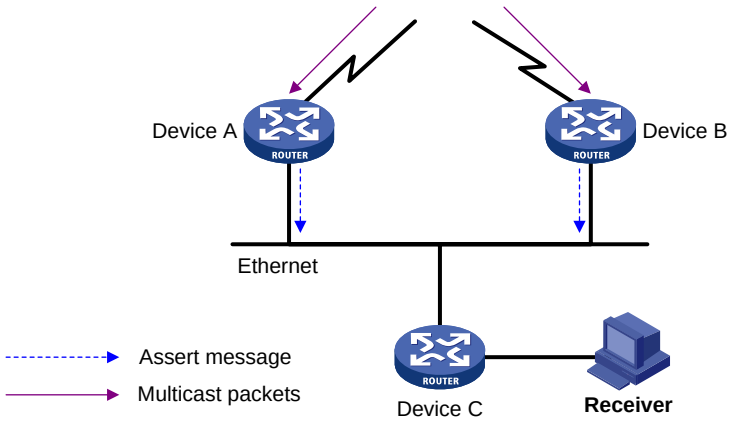
An (S, G) entry contains a multicast source address S, a multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the multicast source. This prune process goes on until only necessary branches are left in the PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all PIM devices (224.0.0.13) on the local subnet through the interface that received the packet. The assert message contains the multicast source address (S), the multicast group address (G), and the metric preference and metric of the unicast route/MBGP route/static multicast route to the multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the shared-media LAN. The comparison process is as follows:

1. The device with a higher metric preference to the multicast source wins.
2. If both devices have the same metric preference, the device with a smaller metric wins.
3. If both devices have the same metric, the device with a higher IP address on the downstream interface wins.

PIM-SM

PIM-DM uses the flood-and-prune cycles to build SPTs for multicast data forwarding. Although an SPT has the shortest paths from the multicast source to the receivers, it is built with a low efficiency. Therefore, PIM-DM is not suitable for large and medium-sized networks. PIM-SM uses the pull mode for multicast forwarding, and it is suitable for large- and medium-sized networks with sparsely and widely distributed multicast group members.

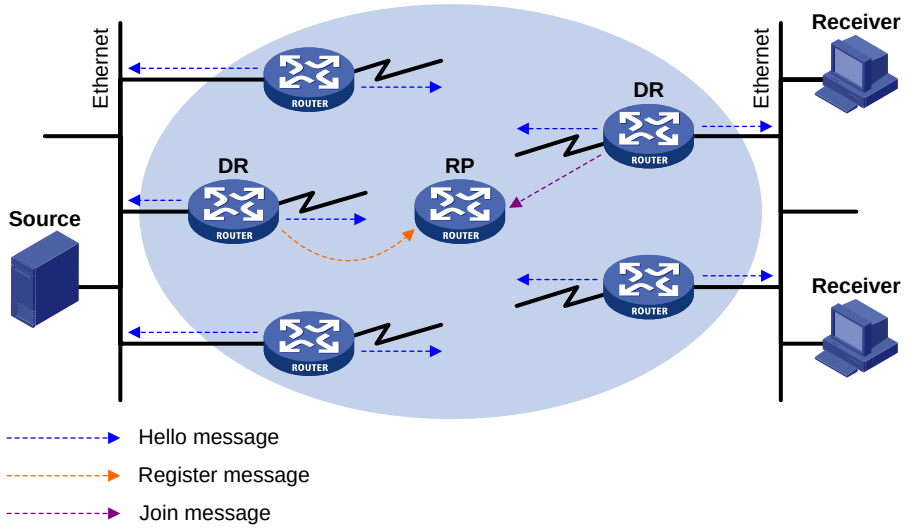
PIM-SM assumes that no hosts need multicast data. A multicast receiver must express its interest in the multicast data for a multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of a PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement multicast data forwarding. An SPT is rooted at the multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

PIM-SM uses the same neighbor discovery mechanism as PIM-DM does. For more information, see "Neighbor discovery."

DR election



A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the multicast receivers to send join messages to the RP.

PIM-DM does not require a DR. However, if IGMPv1 runs on any shared-media LAN in a PIM-DM domain, a DR must be elected to act as the IGMPv1 querier for the LAN. For more information about IGMP, see "Configuring IGMP."

IMPORTANT:

IGMP must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any multicast groups.

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

1. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
2. The device with the highest IP address wins the DR election under one of following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its PIM neighbor lifetime expires and the other devices will initiate to elect a new DR.

RP discovery

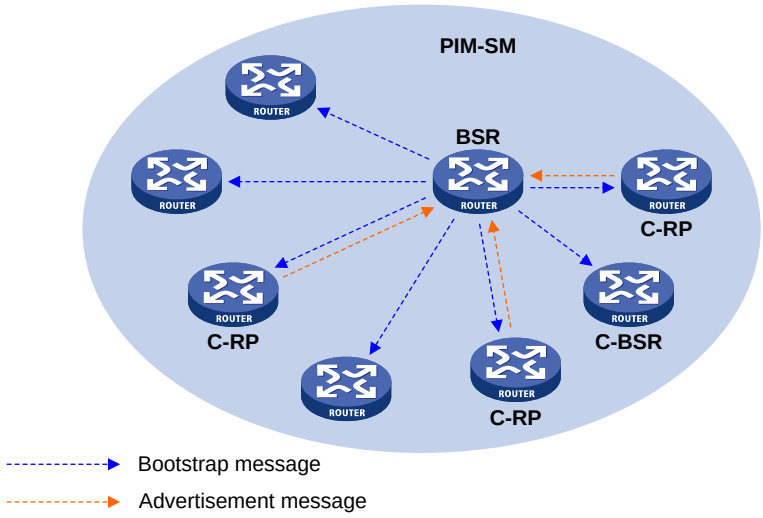
An RP is the core of a PIM-SM domain. A multicast group can have only one RP for multicast forwarding, and an RP can be designated to multiple multicast groups.

RP selection

An RP can be statically configured or dynamically elected. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs



A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election

Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to a multicast group.
- **BSR**—A BSR is the core of the administrative core of the PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. A PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

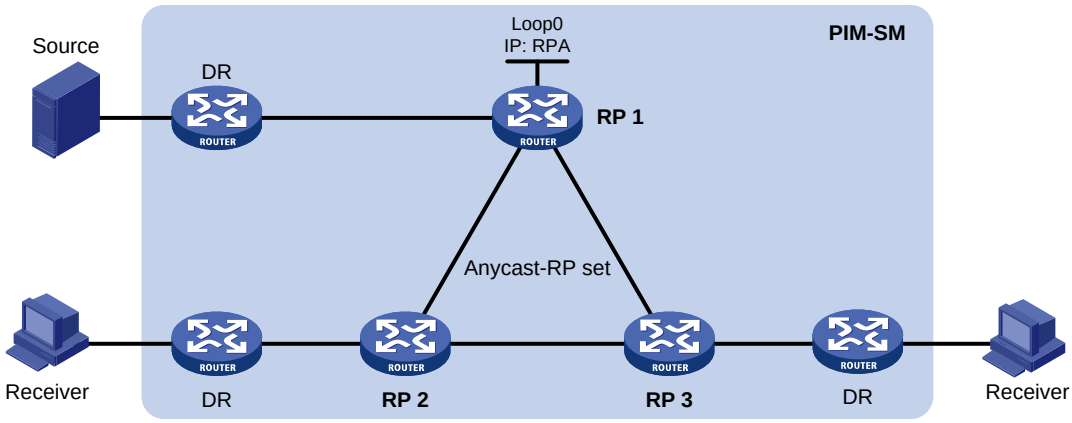
1. Each C-BSR sends a bootstrap message (BSM) to other devices in the PIM-SM domain.
2. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IP address wins. The loser uses the winner's BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.
3. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the multicast group range to which it is designated.

4. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between multicast groups and RPs. The BSR encapsulates the RP-set information in the bootstrap messages (BSMs) and floods the BSMs to the entire PIM-SM domain.
5. All devices in the PIM-SM domain select an RP for a multicast group based on the following rules:
   a. The C-RP that is designated to the smallest multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Anycast RP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IP address. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—A multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented in either of the following methods:

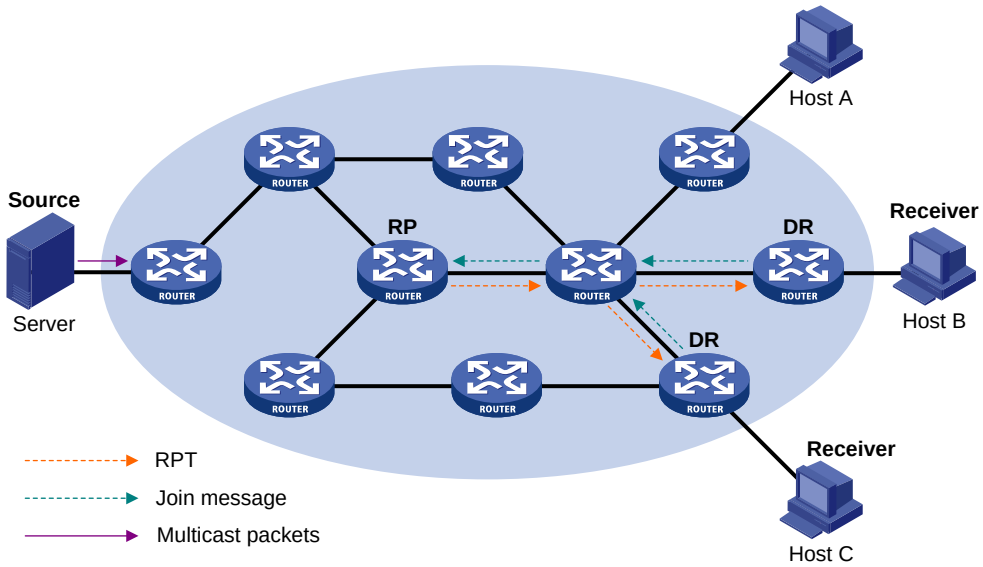
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through PIM-SM**—In this method, you can configure multiple RPs for one multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IP address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IP address of the Anycast RP set for communication within the PIM-SM domain. It is also known as RPA.

  As shown in Figure 5, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 5 Anycast RP through PIM-SM

The following describes how Anycast RP through PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IP address of the register message to its own address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

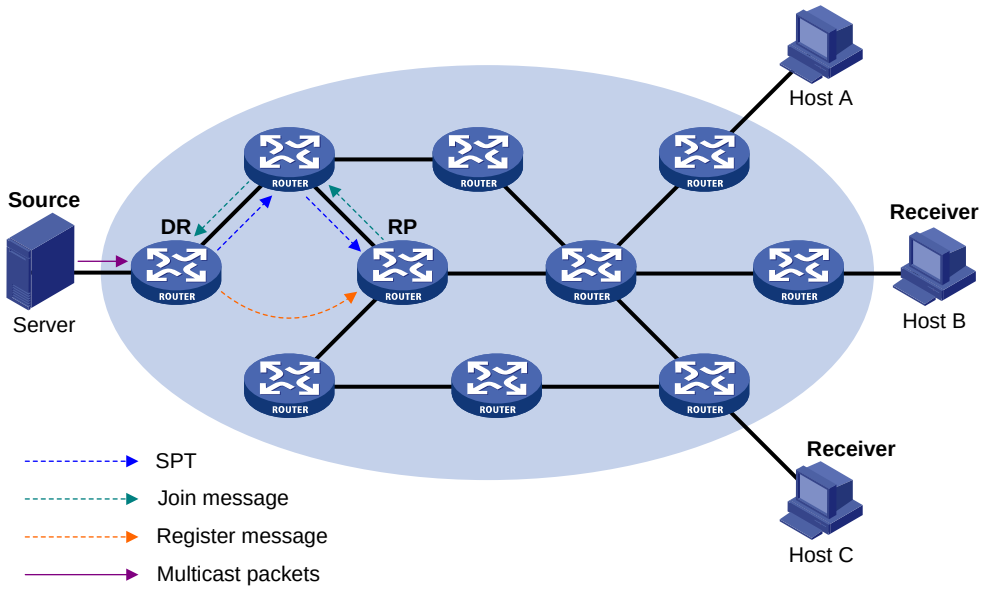
In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize multicast source information.

RPT building

Figure 6 RPT building in a PIM-SM domain

As shown in Figure 6, the process of building an RPT is as follows:

1. When a receiver wants to join the multicast group G, it uses an IGMP message to inform the receiver-side DR.
2. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the multicast group.
3. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any multicast source. The RP is the root of the RPT, and the DR is a leaf of the RPT.



When the multicast data addressed to the multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT, and finally to the receiver.

When a receiver is no longer interested in the multicast data addressed to the multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that multicast group. If no receivers for the multicast group exist, the device continues to forward the prune message to its upstream device.

Multicast source registration

The multicast source uses the registration process to inform an RP of its presence.

Figure 7 Multicast source registration

As shown in Figure 7, the multicast source registers with the RP as follows:

1. The multicast source S sends the first multicast packet to the multicast group G. When receiving the multicast packet, the source-side DR encapsulates the packet into a PIM register message and unicasts the message to the RP.
2. After the RP receives the register message, it decapsulates the register message and forwards the register message down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the multicast source. The devices along the path from the RP to the multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
3. The subsequent multicast data from the multicast source are forwarded to the RP along the established SPT. When the multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

This section takes a router as an example. As compared with the switchover to SPT on a router, switchover to SPT is implemented in a simpler way on a switch.

In a PIM-SM domain, only one RP and one RPT provide services for a specific multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

Multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for a multicast packet might not be the shortest one.
- The RP might be overloaded by multicast traffic bursts.

To eliminate these weaknesses, PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives multicast traffic, it sends an (S, G) source-specific join message toward the multicast source. The routers along the path from the RP to the multicast source constitute an SPT. The subsequent multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

  For more information about the switchover to SPT initiated by the RP, see "Multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the multicast source. The routers along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the router where the RPT and the SPT branches, the router drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent multicast packets travel along the SPT from the multicast source to the receiver hosts.

With the switchover to SPT, PIM-SM builds SPTs more economically than PIM-DM does.

Assert

PIM-SM uses a similar assert mechanism as PIM-DM does. For more information, see "Assert."

BIDIR-PIM

In some many-to-many applications, such as a multi-side video conference, multiple receivers of a multicast group might be interested in the multicast data from multiple multicast sources. With PIM-DM or PIM-SM, each device along the SPT must create an (S, G) entry for each multicast source, consuming a lot of system resources.

BIDIR-PIM addresses the problem. Derived from PIM-SM, BIDIR-PIM builds and maintains a bidirectional RPT, which is rooted at the RP and connects the multicast sources and the receivers. Along the bidirectional RPT, the multicast sources send multicast data to the RP, and the RP

forwards the data to the receivers. Each device along the bidirectional RPT needs to maintain only one (*, G) entry, saving system resources.

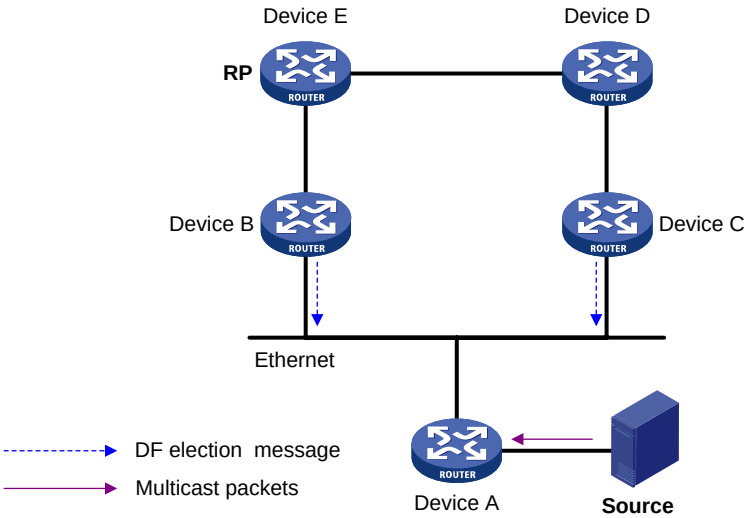
BIDIR-PIM is suitable for a network with dense multicast sources and receivers.

BIDIR-PIM mechanisms include neighbor discovery, RP discovery, DF election, and bidirectional RPT building.

Neighbor discovery

BIDIR-PIM uses the same neighbor discovery mechanism as PIM-SM does. For more information, see "Neighbor discovery."

RP discovery



BIDIR-PIM uses the same RP discovery mechanism as PIM-SM does. For more information, see "RP discovery." In BIDIR-PIM, an RPF interface is the interface toward an RP, and an RPF neighbor is the address of the next hop to the RP.

DF election

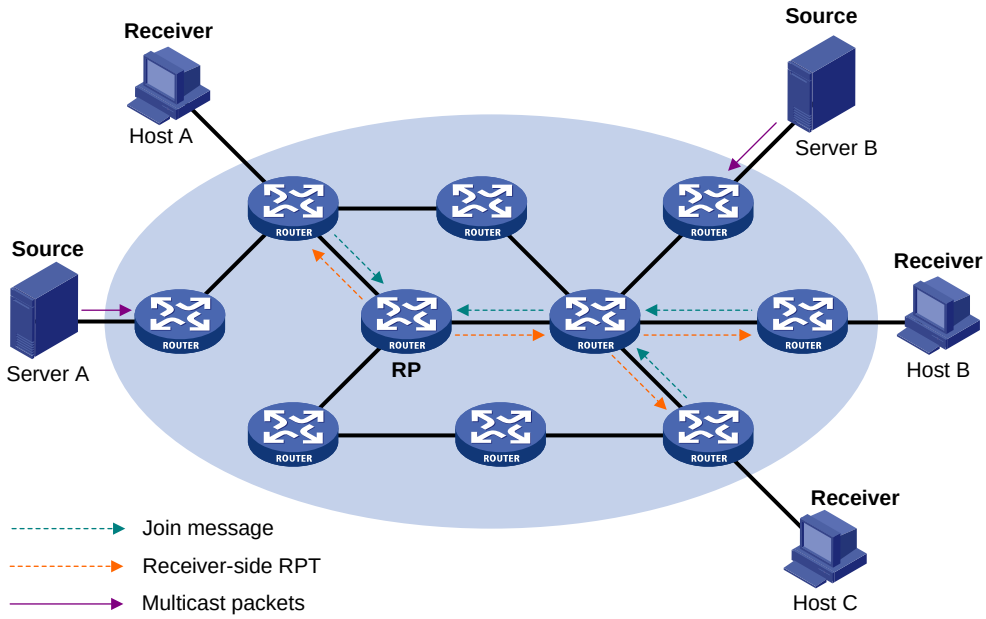
On a subnet with multiple multicast devices, duplicate multicast packets might be forwarded to the RP. To address this issue, BIDIR-PIM uses a designated forwarder (DF) election mechanism to elect a unique DF for each RP on a subnet. Only the DFs can forward multicast data to the RP.

DF election is not necessary for an RPL.

Figure 8 DF election

As shown in Figure 8, without the DF election mechanism, both Device B and Device C can receive multicast packets from Route A. They also can forward the packets to downstream devices on the local subnet. As a result, the RP (Device E) receives duplicate multicast packets.

With the DF election mechanism, once receiving the RP information, Device B and Device C multicast a DF election message to all PIM devices (224.0.0.13) to initiate a DF election process. The election message carries the RP's address, and the route preference and the metric of the unicast route, MBGP route, or static multicast route to the RP. A DF is elected as follows:



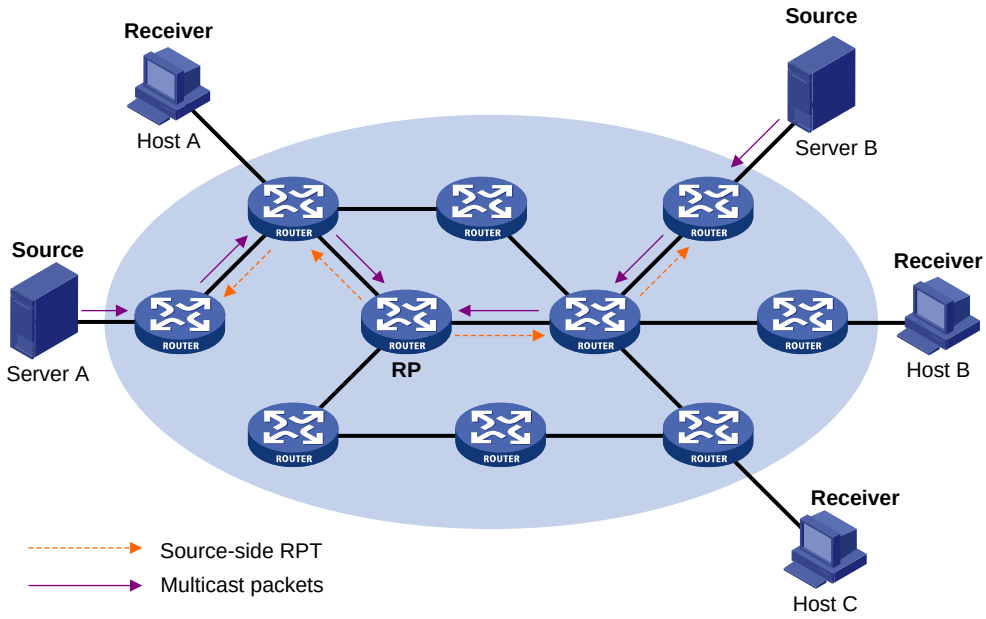
1. The device with a higher route preference becomes the DF.
2. If the devices have the same route preference, the device with a lower metric becomes the DF.

3. If the devices have the same metric, the device with a higher IP address becomes the DF.

Bidirectional RPT building

A bidirectional RPT comprises a receiver-side RPT and a source-side RPT. The receiver-side RPT is rooted at the RP and takes the devices that directly connect to the receivers as leaves. The source-side RPT is also rooted at the RP but takes the devices that directly connect to the sources as leaves. The processes for building these two RPTs are different.

Figure 9 RPT building at the receiver side



As shown in Figure 9, the process for building a receiver-side RPT is the same as the process for building an RPT in PIM-SM:

1. When a receiver wants to join the multicast group G, it uses an IGMP message to inform the directly connected device.
2. After receiving the message, the device sends a join message, which is forwarded hop by hop to the RP for the multicast group.
3. The devices along the path from the receiver's directly connected device to the RP form an RPT branch. Each device on this branch adds a (*, G) entry to its forwarding table.

After a receiver host leaves the multicast group G, the directly connected device multicasts a prune message to all PIM devices on the subnet. The prune message goes hop by hop along the reverse direction of the RPT to the RP. After receiving the prune message, an upstream node removes the interface that connects to the downstream node from the outgoing interface list. At the same time, the upstream device checks the existence of receivers for that multicast group. If no receivers for the multicast group exist, the device continues to forward the prune message to its upstream device.

Figure 10 RPT building at the multicast source side

As shown in Figure 10, the process for building a source-side RPT is relatively simple:

4. When a multicast source sends multicast packets to the multicast group G, the DF in each subnet unconditionally forwards the packets to the RP.
5. The devices along the path from the source's directly connected device to the RP constitute an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry.

After a bidirectional RPT is built, the multicast sources send multicast traffic to the RP along the source-side RPT. Then, the RP forwards the traffic to the receivers along the receiver-side RPT.

IMPORTANT:

If a receiver and a multicast source are at the same side of the RP, the source-side RPT and the receiver-side RPT might meet at a node before reaching the RP. In this case, the multicast packets from the multicast source to the receiver are directly forwarded by the node, instead of by the RP.

Administrative scoping

Administrative scoping mechanism

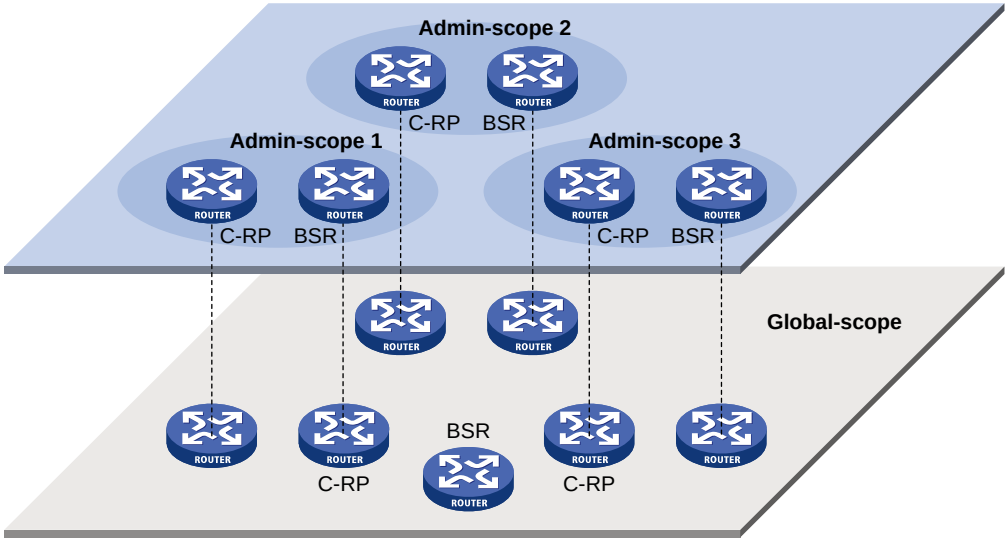
Administrative scoping mechanisms for PIM-SM/BIDIR-PIM include non-scoped BSR mechanism and administrative scoping mechanism.

- **Non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **Administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

Admin-scoped zones are divided for multicast groups. Zone border devices (ZBRs) form the boundary of an admin-scoped zone. Each admin-scoped zone maintains one BSR for multicast groups within a specific range. Multicast protocol packets, such as assert messages and BSMs, for a

specific group range cannot cross the boundary of the admin-scoped zone for the group range. Multicast group ranges that are associated with different admin-scoped zones can have intersections. However, the multicast groups in an admin-scoped zone are valid only within the local zone, and theses multicast groups are regarded as private group addresses.

The global-scoped zone maintains a BSR for the multicast groups that do not belong to any admin-scoped zones.



Relationship between admin-scoped zones and the global-scoped zone

The global-scoped zone and each admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each admin-scoped zone has its own boundary. The multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the global-scoped zone and admin-scoped zones based on geographical locations and multicast group address ranges.

- In view of geographical locations:

  An admin-scoped zone is a logical zone for particular multicast groups. The multicast packets for such multicast groups are confined within the local admin-scoped zone and cannot cross the boundary of the zone.

  Figure 11 Relationship in view of geographical locations

  As shown in Figure 11, for the multicast groups in a specific group address range, the admin-scoped zones must be geographically separated and isolated. A device cannot belong to multiple admin-scoped zones. An admin-scoped zone cannot contain a device that belongs to any other admin-scoped zone. However, the global-scoped zone includes all devices in the PIM-SM domain or BIDIR-PIM domain. Multicast packets that do not belong to any admin-scoped zones are forwarded in the entire PIM-SM domain or BIDIR-PIM domain.

- In view of multicast group address ranges:

  Each admin-scoped zone is designated to specific multicast groups, of which the multicast group addresses are valid only within the local zone. The multicast groups of different admin-scoped zones might have intersections. All the multicast groups other than those of the admin-scoped zones use the global-scoped zone.

Figure 12 Relationship in view of multicast group address ranges

As shown in Figure 12, the admin-scoped zones 1 and 2 have no intersection, but the admin-scoped zone 3 is a subset of the admin-scoped zone 1. The global-scoped zone provides services for all the multicast groups that are not covered by the admin-scoped zones 1 and 2, G—G1—G2 in this case.

PIM-SSM

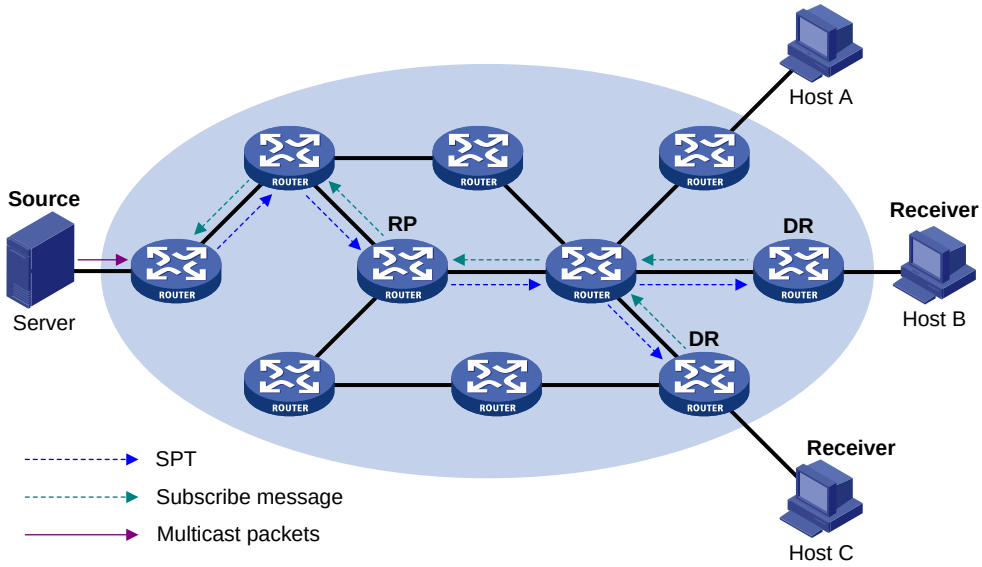
The ASM model includes PIM-DM and PIM-SM. The SSM model can be implemented by leveraging part of the PIM-SM technique. It is also called "PIM-SSM."

The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through IGMPv3.

In actual applications, part of IGMPv3 and PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located a multicast source, no RP or RPT is required. Multicast sources do not register with the RP, and the MSDP is not needed for discovering multicast sources in other PIM domains.

PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery



PIM-SSM uses the same neighbor discovery mechanism as PIM-SM. For more information, see "Neighbor discovery."

DR election

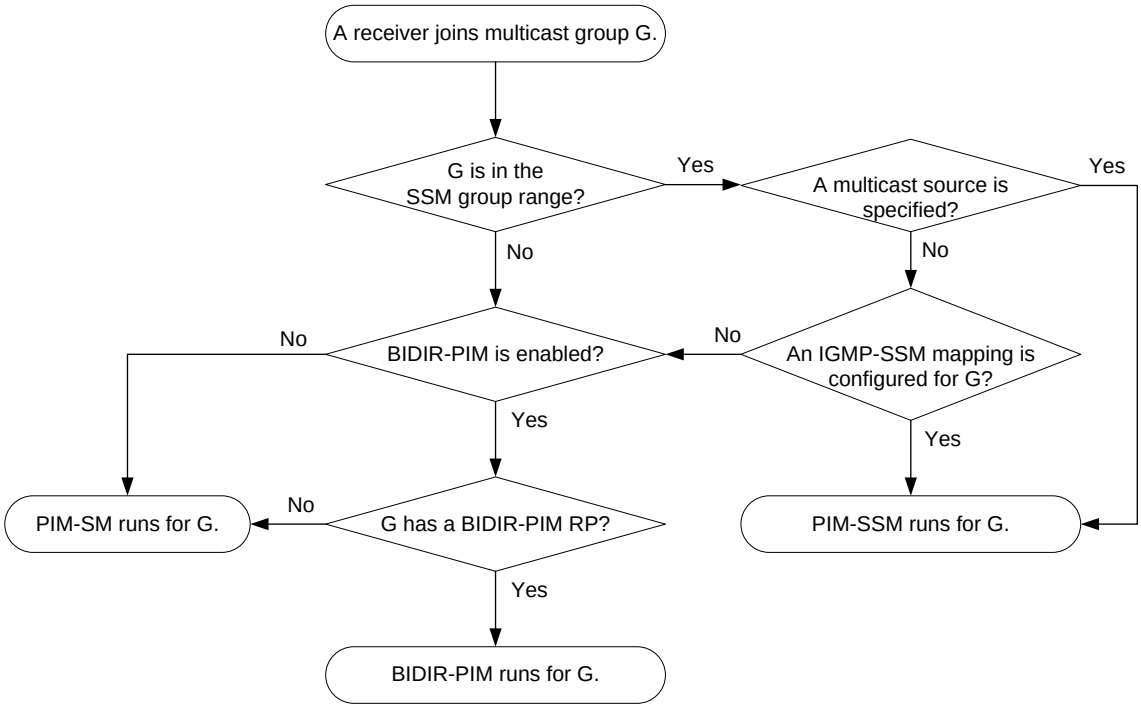
PIM-SSM uses the same DR election mechanism as PIM-SM. For more information, see "DR election."

SPT building

Figure 13 SPT building in PIM-SSM

As shown in Figure 13, an SPT is built as follows:

1. Host B and Host C are receivers. They send IGMPv3 report messages to their DRs to express their interest in the multicast information that the multicast source S sends to the multicast group G.
2. After receiving a report message, the DR sends a subscribe message hop by hop toward the multicast source S. All devices along the path from the DR to the source create an (S, G) entry to build an SPT. The SPT is rooted at the multicast source S and has the receivers as its leaves. This SPT is the transmission channel in PIM-SSM.



In PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among PIM protocols

In a PIM network, PIM-DM cannot run together with PIM-SM, BIDIR-PIM, or PIM-SSM. However, PIM-SM, BIDIR-PIM, and PIM-SSM can run together. Figure 14 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about IGMP SSM mapping, see "Configuring IGMP."

Figure 14 Relationship among PIM protocols

PIM support for VPNs

To support PIM for VPNs, a multicast device that runs PIM maintains an independent set of PIM neighbor table, multicast routing table, BSR information, and RP-set information for each VPN.

After receiving a multicast data packet, the multicast device checks which VPN the data packet belongs to. Then, the device forwards the packet according to the multicast routing table for that VPN or creates a multicast routing entry for that VPN.

Protocols and standards

- RFC 3973, *Protocol Independent Multicast-Dense Mode (PIM-DM): Protocol Specification(Revised)*
- RFC 4601, *Protocol Independent Multicast-Sparse Mode (PIM-SM): Protocol Specification (Revised)*
- RFC 4610, *Anycast-RP Using Protocol Independent Multicast (PIM)*
- RFC 5015, *Bidirectional Protocol Independent Multicast (BIDIR-PIM)*
- RFC 5059, *Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)*
- RFC 4607, *Source-Specific Multicast for IP*
- Draft-ietf-ssm-overview-05, *An Overview of Source-Specific Multicast (SSM)*

Configuring PIM

Restrictions and guidelines: PIM configuration

All the interfaces on a device must operate in the same PIM mode on the public network or the same VPN instance.

When both PIM-SM and BIDIR-PIM run on the PIM network, do not use the same RP to provide services for PIM-SM and BIDIR-PIM. Otherwise, exceptions might occur to the PIM routing table.

Configuring PIM-DM

PIM-DM tasks at a glance

To configure PIM-DM, perform the following tasks:

1. Enabling PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the PIM-DM graft retry timer
4. (Optional.) Configuring common PIM timers

Prerequisites for PIM-DM

Before you configure PIM-DM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-DM

About this task

With PIM-DM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-DM on all non-border interfaces of the devices when you deploy a PIM-DM domain.

For PIM-DM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.

   system-view
2. Enable IP multicast routing and enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

   By default, IP multicast routing is disabled.

   For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable PIM-DM.
   pim dm
   By default, PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the PIM device directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. It prevents the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can configure the time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own PIM-DM state, and resets the waiting timer.
- **TTL value of state refresh messages**—The TTL value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the TTL value comes down to 0. A state refresh message with a large TTL value might cycle on a small network.

  To effectively control the propagation scope of state refresh messages, configure an appropriate TTL value based on the network size on the device directly connected with the multicast source.

Restrictions and guidelines

Perform this task on all devices in the PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the state refresh feature.
   pim state-refresh-capable
   By default, the state refresh feature is enabled.
4. Return to system view.
   quit
5. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
6. Set the state refresh interval.
   state-refresh-interval *interval*
   The default setting is 60 seconds.

Perform this task on the device directly connected to the multicast source.

7. Set the amount of time that the device must wait to accept a new state refresh message.
   state-refresh-rate-limit *time*
   The default setting is 30 seconds.
8. Set the TTL value of state refresh messages.
   state-refresh-ttl *ttl-value*
   The default setting is 255.

Setting the PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the graft retry timer.
   pim timer graft-retry *interval*
   The default setting is 3 seconds.

Configuring PIM-SM

PIM-SM tasks at a glance

To configure PIM-SM, perform the following tasks:

1. Enabling PIM-SM
2. Configuring static RPs
   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring a PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple PIM devices exist in the network.
   You can configure static RPs, dynamic RPs, or both.
4. (Optional.) Enabling Auto-RP listening
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring multicast source registration
7. (Optional.) Configuring the switchover to SPT

8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common PIM features

Prerequisites for PIM-SM

Before you configure PIM-SM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IP multicast routing.

Enabling PIM-SM

About this task

With PIM-SM enabled on interfaces, devices can establish PIM neighbor relationship and process PIM messages from their PIM neighbors.

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SM domain.

For PIM-SM to take effect on an interface, you must configure the primary IP address of the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable PIM-SM.
   `pim sm`
   By default, PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth because of frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In a PIM-SM domain, you can configure the same static RP for different multicast groups by using the same RP address but different ACLs.

You do not need to enable PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for a multicast group, only the static RP with the highest IP address takes effect.

The static RP configuration must be the same on all devices in the PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP.

   static-rp *rp-address* [{ *ipv4-acl-number* | **name** *ipv4-acl-number* } | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword in the **static-rp** command to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the PIM-SM domain because every C-BSR might become the BSR.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv4-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses. It is used to prevent the legal BSR from being replaced by a malicious host.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the PIM-SM domain, reserve a large bandwidth between C-BSRs and other devices.

The C-BSR configuration on the devices in the PIM-SM domain must be the same.

For a successful RPF check, configure static multicast routes to ensure that the next hop to a C-BSR is a tunnel interface when C-BSRs connect to other PIM devices through tunnels. For more information about static multicast routes, see "Configuring multicast routing and forwarding."

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv4-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.

system-view

2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits BSMs from the BSR for 130 seconds before sending BSMs.

Configuring a PIM domain border

About this task

A PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different PIM-SM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a PIM domain border.

pim bsr-boundary

By default, an interface is not a PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Enabling Auto-RP listening

About this task

This feature enables the device to receive Auto-RP announcement and discovery messages and learn RP information. The destination IP addresses for Auto-RP announcement and discovery messages are 224.0.1.39 and 224.0.1.40, respectively.

Restrictions and guidelines

After this feature is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Enable Auto-RP listening.
   auto-rp enable
   By default, Auto-RP listening is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IP address. The IP address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IP address of a loopback interface as the RP member address.

If you configure IP addresses of multiple interfaces on the same device as RP member addresses, the lowest IP address takes effect. The rest of the interface addresses become backup RP member addresses.

An Anycast RP address must be a host address with subnet mask 255.255.255.255.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RP or C-RPs in the PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *anycast-rp-address member-rp-address*

By default, Anycast RP is not configured.

You can repeat this command to add multiple RP member addresses to the Anycast RP set.

Configuring multicast source registration

About this task

- **PIM register policy**—A PIM register policy enables an RP to filter register messages by using an ACL that specifies the multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time—**The source-side DR stops sending register messages encapsulated with multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. Otherwise, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is fixed to 5 seconds. You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure a PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

As a best practice, set the suppression time to be longer than or equal to 11 seconds.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure a PIM register policy.

   register-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM register policy is configured. All PIM register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate multicast data in register messages destined to the RP. As a best practice to avoid multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure RPT to SPT switchover.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv4-acl-number*]

   By default, the first multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring BIDIR-PIM

BIDIR-PIM tasks at a glance

To configure BIDIR-PIM, perform the following tasks:

1. Enabling BIDIR-PIM

2. Configuring static RPs

   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring a PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple PIM devices exist in the network.

   You can configure static RPs, dynamic RPs, or both.
4. (Optional.) Setting the maximum number of BIDIR-PIM RPs
5. (Optional.) Enabling Auto-RP listening
6. (Optional.) Configuring common PIM features

Prerequisites for BIDIR-PIM

Before you configure BIDIR-PIM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable PIM-SM.

Enabling BIDIR-PIM

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a BIDIR-PIM domain.

Procedure

1. Enter system view.

   `system-view`
2. Enable IP multicast routing and enter MRIB view.

   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]

   By default, IP multicast routing is disabled.

   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

   `quit`
4. Enter interface view.

   `interface` *`interface-type interface-number`*
5. Enable PIM-SM.

   `pim sm`

   By default, PIM-SM is disabled.
6. Return to system view.

   `quit`

7. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

8. Enable BIDIR-PIM.

   bidir-pim enable

   By default, BIDIR-PIM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid bandwidth waste caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

The static RP configuration must be the same on all devices in the BIDIR-PIM domain.

In a BIDIR-PIM domain, you can configure the same static RP for different multicast groups by using the same RP address but different ACLs.

You must enable PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for a multicast group, only the static RP with the highest IP address takes effect.

You can specify an unused IP address for a static RP. This address must be on the same subnet with the link on which the static RP is configured. For example, if the IP addresses of the interfaces at the two ends of a link are 10.1.1.1/24 and 10.1.1.2/24, you can specify the interface with IP address 10.1.1.100/24 as a static RP. As a result, the link becomes an RPL.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for BIDIR-PIM.

   static-rp *rp-address* **bidir** [{ *ipv4-acl-number* | **name** *ipv4-acl-number* } | **preferred**] *

   By default, no static RPs exist.

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword in the **static-rp** command to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To guard against C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast groups.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the BIDIR-PIM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the BIDIR-PIM domain because every C-BSR might become the BSR.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP to provide services for BIDIR-PIM.

   c-rp *ip-address* [**advertisement-interval** *adv-interval* | **group-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **holdtime** *hold-time* | **priority** *priority*] * **bidir**

   By default, no C-RPs exist.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone device.

Because the BSR and other devices exchange a large amount of information in the BIDIR-PIM domain, reserve a large bandwidth between the C-BSRs and other devices.

The C-BSR configuration on the devices in the BIDIR-PIM domain must be the same.

For a successful RPF check, configure static multicast routes to ensure that the next hop to a C-BSR is a tunnel interface when C-BSRs connect to other PIM devices through tunnels. For more information about static multicast routes, see "Configuring multicast routing and forwarding."

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ip-address* [**scope** *group-address* { *mask-length* | *mask* }] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv4-acl-number*

   By default, no BSR policy is configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

In a BIDIR-PIM network with active and backup RPs, when the link for the active RP fails, the backup RP must wait the active RP to age out before taking over. The aging time of the active RP is long because it must be longer than the sending interval of bootstrap messages, and the sending interval of BSMs is not configurable. You can use this command to set a smaller sending interval.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.

   system-view
2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.

   c-bsr interval *interval*

   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits for BSMs from the BSR for 130 seconds before sending BSMs.

Configuring a PIM domain border

About this task

A PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different BIDIR-PIM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a PIM domain border.
   pim bsr-boundary
   By default, an interface is not a PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device presents in the BIDIR-PIM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]

3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Setting the maximum number of BIDIR-PIM RPs

About this task

In a BIDIR-PIM domain, one DF election per RP is implemented on all PIM-enabled interfaces. To avoid unnecessary DF elections, do not configure multiple RPs for BIDIR-PIM.

This configuration sets a limit on the number of BIDIR-PIM RPs. If the number of RPs exceeds the limit, excess RPs do not take effect and can be used only for DF election rather than multicast data forwarding. The system does not delete the excess RPs. They must be deleted manually.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the maximum number of BIDIR-PIM RPs.

   bidir-rp-limit *limit*

   By default, the maximum number of BIDIR-PIM RPs is 6.

Enabling Auto-RP listening

About this task

This feature enables the device to receive Auto-RP announcement and discovery messages and learn RP information. The destination IP addresses for Auto-RP announcement and discovery messages are 224.0.1.39 and 224.0.1.40, respectively.

Restrictions and guidelines

After this feature is enabled, the device can receive and forward Auto-RP announcement and discovery messages, but it cannot send these messages unsolicitedly.

Procedure

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Enable Auto-RP listening.
   auto-rp enable
   By default, Auto-RP listening is disabled.

Configuring PIM-SSM

PIM-SSM tasks at a glance

To configure PIM-SSM, perform the following tasks:

1. Enabling PIM-SM
2. (Optional.) Configuring the SSM group range
3. (Optional.) Configuring the delay time for DR election
4. (Optional.) Configuring common PIM features

Prerequisites for PIM-SSM

Before you configure PIM-SSM, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable PIM-SM.
- Enable IGMPv3 on PIM devices that connect to multicast receivers.

Enabling PIM-SM

Restrictions and guidelines

As a best practice, enable PIM-SM on all non-border interfaces of devices when you deploy a PIM-SSM domain.

Procedure

1. Enter system view.
   system-view
2. Enable multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit

4. Enter interface view.

   interface *interface-type interface-number*

5. Enable PIM-SM.

   pim sm

   By default, PIM-SM is disabled.

Configuring the SSM group range

About this task

When a PIM-SM enabled interface receives a multicast packet, it checks whether the multicast group address of the packet is in the SSM group range. If the multicast group address is in this range, the PIM mode for this packet is PIM-SSM. If the multicast group address is not in this range, the PIM mode is PIM-SM.

Restrictions and guidelines

Configure the same SSM group range on all devices in the entire PIM-SSM domain. Otherwise, multicast information cannot be delivered through the SSM model.

When a member of a multicast group in the SSM group range sends an IGMPv1 or IGMPv2 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure the SSM group range.

   ssm-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, the SSM group range is 232.0.0.0/8.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with IGMP) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending PIM hello messages.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

interface *interface-type interface-number*

3. Configure the delay time for DR election.

   pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common PIM features

Common PIM feature tasks at a glance

All the following tasks are optional.

- Configuring a multicast source policy
- Configuring a PIM hello policy
- Configuring PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common PIM timers
- Setting the maximum size of a join or prune message
- Configuring a PIM join policy
- Setting the DSCP value for outgoing PIM protocol packets
- Enabling BFD for PIM
- Enabling PIM passive mode
- Enabling PIM NSR
- Enabling SNMP notifications for PIM
- Enabling PIM logging
- Enabling log message suppression for PIM

Configuring a multicast source policy

About this task

This feature enables the device to filter multicast data by using an ACL that specifies the multicast sources and the optional groups. It filters not only data packets but also register messages with multicast data encapsulated. It controls the information available to downstream receivers.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Configure a multicast source policy.

   source-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no multicast source policy is configured. The device does not filter multicast data packets.

Configuring a PIM hello policy

About this task

This feature enables the device to filter PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against PIM message attacks and to establish correct PIM neighboring relationships.

If hello messages of an existing PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure a PIM hello policy.

   pim neighbor-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* }

   By default, no PIM hello policy is configured on an interface. All PIM hello messages are regarded as legal.

Configuring PIM hello message options

About this task

In either a PIM-DM domain or a PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the multicast source or the receivers.
- **Holdtime**—PIM neighbor lifetime. If a device does not receive a hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the PIM message propagation delay. The override interval defines a period for a device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different PIM devices on a shared-media LAN are different, the largest ones apply.

If you want to enable neighbor tracking, you must enable it on all PIM devices on a shared-media LAN. Otherwise, the upstream device cannot track join messages from every downstream devices.

You can configure hello message options for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

Configuring hello message options globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.
   hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the PIM message propagation delay for a shared-media LAN.
   hello-option lan-delay *delay*
   The default setting is 500 milliseconds.
6. Set the override interval.
   hello-option override-interval *interval*
   The default setting is 2500 milliseconds.
7. Enable neighbor tracking.
   hello-option neighbor-tracking
   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the DR priority.
   pim hello-option dr-priority *priority*
   The default setting is 1.
4. Set the neighbor lifetime.
   pim hello-option holdtime *time*
   The default setting is 105 seconds.
5. Set the PIM message propagation delay.
   pim hello-option lan-delay *delay*
   The default setting is 500 milliseconds.
6. Set the override interval.
   pim hello-option override-interval *interval*
   The default setting is 2500 milliseconds.
7. Enable neighbor tracking.

pim hello-option neighbor-tracking

By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with PIM. The generation ID is a random value, but it changes only when the status of the device changes. If a PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

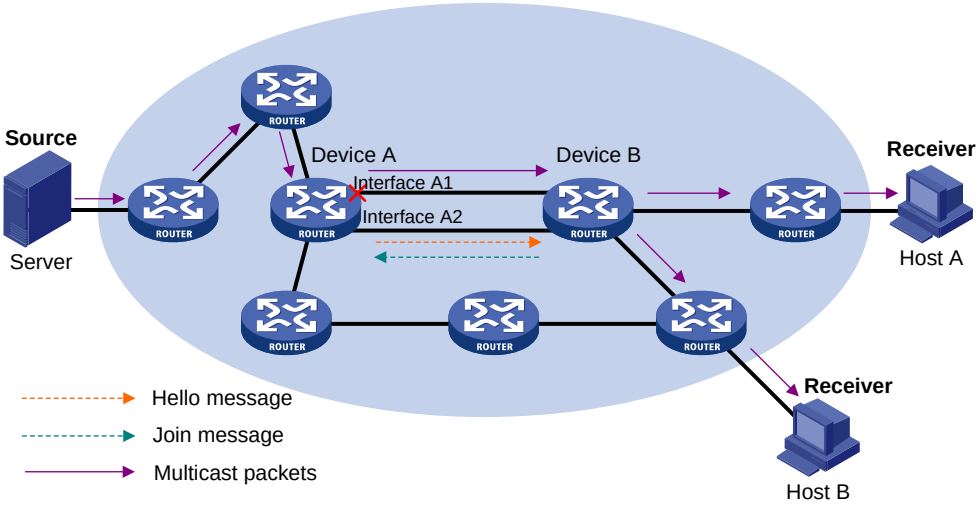
1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Enable the interface to drop hello messages without the Generation ID option.

   pim require-genid

   By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 15, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send a PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 15 Network diagram

Procedure

1. Enter system view.
   ```
   system-view
   ```
2. Enter VLAN interface view.
   ```
   interface vlan-interface interface-number
   ```
3. Enable the interface to send hello messages with a different Generation ID upon a port state change.
   ```
   pim triggered-hello enable { port-down | port-up } *
   ```
   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common PIM timers

About this task

The following are common PIM timers:

- **Hello interval**—Interval at which a PIM device sends hello messages to discover PIM neighbors, and maintain PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, a PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join/Prune interval**—Interval at which a PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which a PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is specified in a join or prune message.
- **Multicast source lifetime**—Lifetime that a PIM device maintains for a multicast source. If a device does not receive subsequent multicast data from the multicast source S when the timer expires, it deletes the (S, G) entry for the multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common PIM timers for all interfaces in PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common PIM timers globally

1. Enter system view.
   system-view
2. Enter PIM view.
   pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.
   timer hello *interval*
   The default setting is 30 seconds.
4. Set the join or prune interval.
   timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.
   holdtime join-prune *time*
   The default setting is 210 seconds.
6. Set the multicast source lifetime.
   source-lifetime *time*
   The default setting is 210 seconds.

Configuring common PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

About this task

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the maximum size of a join or prune message.

   jp-pkt-size *size*

   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring a PIM join policy

About this task

The PIM join policy filters joined multicast sources and groups in PIM join or prune messages to protect the device against invalid PIM join or prune message attacks. The policy identifies valid joined multicast source and groups in PIM join or prune messages and filters out invalid joined multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined multicast sources and groups.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure a PIM join policy to filter joined multicast sources and groups in PIM join or prune messages.

   pim join-policy { { *ipv4-acl-number* | **name** *ipv4-acl-name* } | [**asm** { *ipv4-acl-number* | **name** *ipv4-acl-name* } | **ssm** { *ipv4-acl-number* | **name** *ipv4-acl-number* }] * }

   By default, no PIM join policy is configured and joined multicast sources and groups in PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter PIM view.

   pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing PIM protocol packets.

   dscp *dscp-value*

   By d efault, the DSCP value is 48 for outgoing PIM protocol packets.

Enabling BFD for PIM

About this task

If a DR on a shared-media network fails, a new DR election process does not start until the DR ages out. In addition, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, enable BFD for PIM to detect link failures among PIM neighbors.

You must enable BFD for PIM on all PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for PIM.

   pim bfd enable

   By default, BFD is disabled for PIM.

Enabling PIM passive mode

About this task

To guard against PIM hello spoofing, you can enable PIM passive mode on a receiver-side interface. The PIM passive interface cannot receive or forward PIM protocol messages (excluding register, register-stop, and C-RP-Adv messages), and it acts as the DR on the subnet.

Restrictions and guidelines

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple PIM devices.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable PIM passive mode on the interface.

   pim passive

   By default, PIM passive mode is disabled on an interface.

Enabling PIM NSR

About this task

This feature enables PIM to back up protocol state information and data, including PIM neighbor information and routes, from the active process to the standby process. The standby process

immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.

   system-view

2. Enable PIM NSR.

   pim non-stop-routing

   By default, PIM NSR is disabled.

3. (Optional.) Specify a reserved VLAN for the peer link in an M-LAG system.

   m-lag peer-link reserved

   By default, no reserved VLAN is specified for the peer link in an M-LAG system.

   Execute this command in the view of the VLAN to be specified as the reserved VLAN. For more information about this command, see *Layer 2—LAN Switching Command Reference*.

Enabling SNMP notifications for PIM

About this task

To report critical PIM events to an NMS, enable SNMP notifications for PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for PIM.

   snmp-agent trap enable pim [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **interface-election** | **invalid-join-prune** | **invalid-register** | **neighbor-loss** | **private-interface-election** | **private-neighbor-loss** | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

   By default, SNMP notifications for PIM are enabled.

Enabling PIM logging

About this task

To report critical PIM events to the information center, enable PIM logging. For PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable PIM logging or use the **pim log suppress** command to enable log message suppression for PIM.

Procedure

1. Enter system view.

   system-view

2. Enable PIM logging.

pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *

PIM logging is enabled by default.

Enabling log message suppression for PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for PIM. With this feature configured, the speed of sending PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure PIM logging has been enabled using the **pim log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for PIM.
   pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *
   By default, log message suppression is enabled for PIM.

Display and maintenance commands for PIM

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description** | **down**]]
Display BSR information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by PIM.	**display pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*source-address*]
Display C-RP information in the PIM-SM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display DF information in the BIDIR-PIM domain.	**display pim** [**vpn-instance** *vpn-instance-name*] **df-info** [*rp-address*]
Display PIM information on an interface.	**display pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]
Display PIM neighbor information.	**display pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display PIM routing entries.	**display pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*group-address* [**mask** { *mask-length* | *mask* }] | *source-address* [**mask**

Task	Command
	{ *mask-length* | *mask* }] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **proxy** | **extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *

Display statistics for PIM packets.	**display pim statistics**

PIM configuration examples

Example: Configuring PIM-DM

Network configuration

As shown in Figure 16:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the dense mode.
- Host A and Host C are multicast receivers on two stub networks.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 16 Network diagram

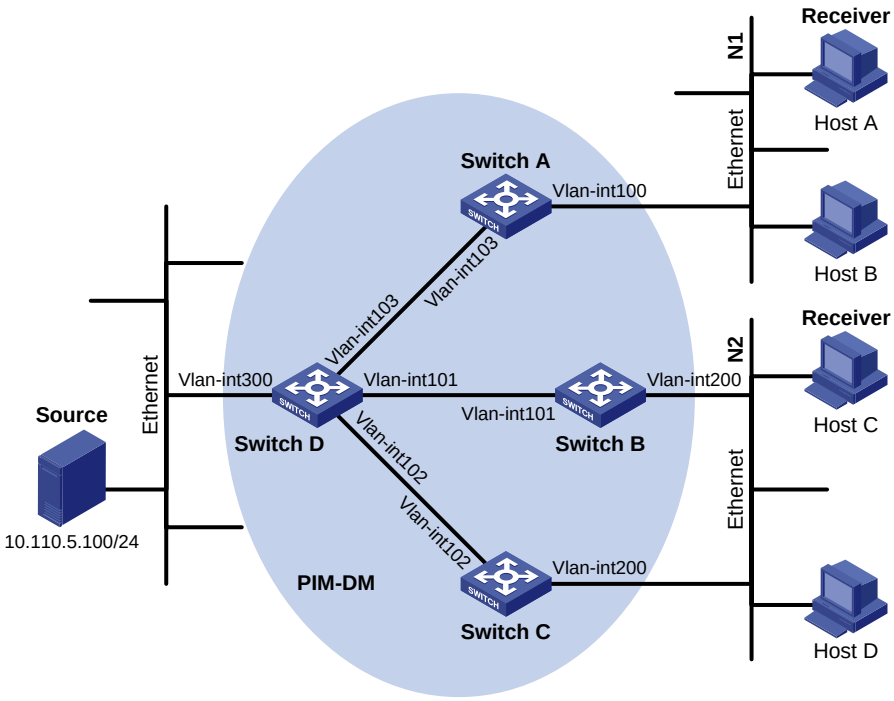

Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int102	192.168.3.1/24
Switch A	Vlan-int103	192.168.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch B	Vlan-int200	10.110.2.1/24	Switch D	Vlan-int103	192.168.1.2/24
Switch B	Vlan-int101	192.168.2.1/24	Switch D	Vlan-int101	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch D	Vlan-int102	192.168.3.2/24

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 16, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp enable
[SwitchA-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
```

```
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing, IGMP, and PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IP multicast routing, and enable PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display PIM information on Switch D.

```
[SwitchD] display pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: 10.110.5.1 (local)
 Interface: Vlan103
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2 (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.2.2 (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.3.2 (local)
```

Display PIM neighboring relationships on Switch D.

```
[SwitchD] display pim neighbor
 Total pim neighbors: 3
  Neighbor: 192.168.1.1
    Interface: Vlan103
    Uptime: 00:02:22
```

```
    Expiry time: 00:01:27
    DR priority: 1
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan101
    Uptime: 00:00:22
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: 192.168.2.1
    Interface: Vlan102
    Uptime: 00:00:23
    Expiry time: 00:01:31
    DR priority: 5
    Mode: N/A
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from multicast source 10.110.5.100/24 to multicast group 225.1.1.1. (Details not shown.)

Display PIM routing entries on Switch A.

```
[SwitchA] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:04:25
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: igmp, UpTime: 00:04:25, Expires: -

 (10.110.5.100, 225.1.1.1)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:06:14
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.1.2
         RPF prime neighbor: 192.168.1.2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: pim-dm, UpTime: 00:04:25, Expires: -
```

Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 225.1.1.1)
```

```
Protocol: pim-dm, Flag: LOC ACT
UpTime: 00:03:27
Upstream interface: Vlan-interface300
    Upstream neighbor: NULL
    RPF prime neighbor: NULL
Downstream interface(s) information:
Total number of downstream interfaces: 2
    1: Vlan-interface103
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
    2: Vlan-interface102
        Protocol: pim-dm, UpTime: 00:03:27, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has the correct (*, G) entry.

Example: Configuring non-scoped PIM-SM

Network configuration

As shown in Figure 17:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist on each stub network.
- The entire PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers on two stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to multicast group range 225.1.1.0/24. Specify VLAN-interface 101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- IGMPv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 17 Network diagram

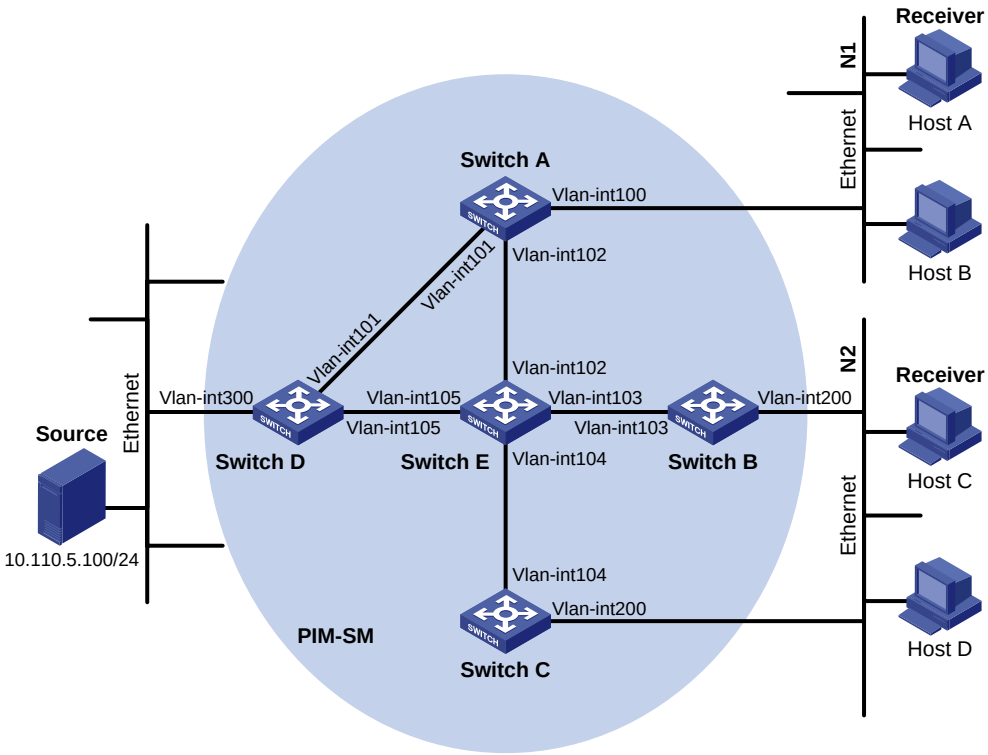

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 17, and configure OSPF on all switches in the PIM-SM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and the static RP:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl basic 2005
[SwitchE-acl-ipv4-basic-2005] rule permit source 225.1.1.0 0.0.0.255
[SwitchE-acl-ipv4-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP.

```
[SwitchE] pim
[SwitchE-pim] c-bsr 192.168.9.2
[SwitchE-pim] c-rp 192.168.9.2 group-policy 2005
```

Configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE-pim] static-rp 192.168.1.2
[SwitchE-pim] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as the static RP.

```
<SwitchA> system-view
[SwitchA] pim
[SwitchA-pim] static-rp 192.168.1.2
[SwitchA-pim] quit
```

Configure the static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.9.2
```

Display BSR information on Switch A.

```
[SwitchA] display pim bsr-info
```

```
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:01:44
     Elected BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:11:18
     Candidate BSR address: 192.168.9.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch A.

```
[SwitchA] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 225.1.1.0/24
       RP address               Priority  HoldTime  Uptime    Expires
       192.168.9.2              192       180       00:51:45  00:02:22

Static RP information:
       RP address               ACL   Mode    Preferred
       192.168.1.2              ----  pim-sm  No
```

Example: Configuring admin-scoped PIM-SM

Network configuration

As shown in Figure 18:

- VOD streams are sent to receiver hosts in multicast. The entire PIM-SM domain is divided into admin-scoped zone 1 and the global-scoped zone. Switch B and Switch C are ZBRs of admin-scoped zone 1.
- Source 1 sends multicast data to the multicast group 224.1.1.1, and Host A is a multicast receiver. Source 2 sends multicast data to multicast group 239.1.1.1, and Host B is a multicast receiver.
- VLAN-interface 20 of Switch B acts as a C-BSR and a C-RP for admin-scoped zone 1, and is designated to multicast group range 239.0.0.0/8. VLAN-interface 50 of Switch D acts as a C-BSR and a C-RP for the global-scoped zone, and is designated to all the multicast groups that are not in the range 239.0.0.0/8.
- IGMPv2 runs between Switch A, Switch C, and the receivers that directly connect to them, respectively.

Figure 18 Network diagram

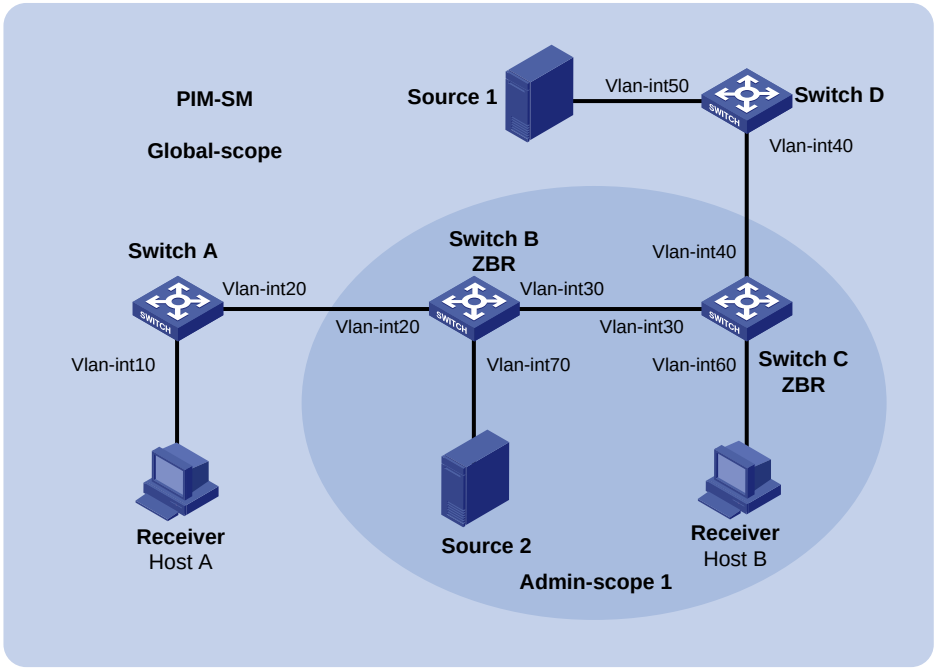

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.5.100/24	Source 2	—	10.110.6.100/24
Switch A	Vlan-int10	192.168.1.1/24	Switch D	Vlan-int50	10.110.5.2/24
Switch A	Vlan-int20	10.110.1.1/24	Switch D	Vlan-int40	10.110.7.1/24
Switch B	Vlan-int70	10.110.6.1/24	Switch C	Vlan-int30	10.110.2.2/24
Switch B	Vlan-int20	10.110.1.2/24	Switch C	Vlan-int60	10.110.4.1/24
Switch B	Vlan-int30	10.110.2.1/24	Switch C	Vlan-int40	10.110.7.2/24

Prerequisites

Assign an IP address and subnet mask to each interface, and make sure the switches in the PIM-DM domain can reach other.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface (VLAN-interface 20).

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] igmp enable
   [SwitchA-Vlan-interface20] quit
   ```

   # Enable PIM-SM on VLAN-interface 10.

   ```
   [SwitchA] interface vlan-interface 10
   ```

```
[SwitchA-Vlan-interface10] pim sm
[SwitchA-Vlan-interface10] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch C in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IP multicast routing, and enable PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 70
[SwitchB-Vlan-interface70] pim sm
[SwitchB-Vlan-interface70] quit
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] pim sm
[SwitchB-Vlan-interface20] quit
[SwitchB] interface vlan-interface 30
[SwitchB-Vlan-interface30] pim sm
[SwitchB-Vlan-interface30] quit
```

Enable IP multicast routing and PIM-SM on Switch D in the same way Switch B is configured. (Details not shown.)

2. Configure admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 20 as the boundary of admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] multicast boundary 239.0.0.0 8
[SwitchB-Vlan-interface20] quit
```

On Switch C, configure VLAN-interface 40 as the boundary of the global-scoped zone.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 40
[SwitchC-Vlan-interface40] multicast boundary 239.0.0.0 8
[SwitchC-Vlan-interface40] quit
```

3. Configure C-BSRs and C-RPs:

On Switch B, configure the service scope of RP advertisements, and configure VLAN-interface 20 as a C-BSR and a C-RP for admin-scoped zone 1.

```
[SwitchB] acl basic 2001
[SwitchB-acl-ipv4-basic-2001] rule permit source 239.0.0.0 0.255.255.255
[SwitchB-acl-ipv4-basic-2001] quit
[SwitchB] pim
[SwitchB-pim] c-bsr 10.110.1.2 scope 239.0.0.0 8
[SwitchB-pim] c-rp 10.110.1.2 group-policy 2001
[SwitchB-pim] quit
```

Configure VLAN-interface 50 as a C-BSR and a C-RP for admin-scoped zone 2.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 10.110.5.2
[SwitchD-pim] c-rp 10.110.5.2
[SwitchD-pim] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display pim bsr-info
```

```
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:17
     Elected BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:05:02
 Scope: 239.0.0.0/8
     State: Elected
     Bootstrap timer: 00:00:26
     Elected BSR address: 10.110.1.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:05:48
     Candidate BSR address: 10.110.1.2
       Priority: 64
       Hash mask length: 30
```

Display BSR information on Switch D.

```
[SwitchD] display pim bsr-info
 Scope: non-scoped
     State: Elected
     Bootstrap timer: 00:00:38
     Elected BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
       Uptime: 00:06:31
     Candidate BSR address: 10.110.5.2
       Priority: 64
       Hash mask length: 30
```

Display RP information on Switch B.

```
[SwitchB] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.5.2               192       180       00:07:05  00:02:54
   Scope: 239.0.0.0/8
     Group/MaskLen: 239.0.0.0/8
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.1.2 (local)       192       180       00:07:47  00:02:13
```

Display RP information on Switch D.

```
[SwitchD] display pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: 224.0.0.0/4
       RP address               Priority  HoldTime  Uptime    Expires
       10.110.5.2 (local)       192       180       00:08:20  00:02:39
```

Example: Configuring BIDIR-PIM

Network configuration

As shown in Figure 19:

- OSPF runs on the network.
- VOD streams are sent to receiver hosts in multicast.
- Source 1 and Source 2 send multicast data to multicast group 225.1.1.1.
- Host A and Host B are receivers of this multicast group.
- VLAN-interface 102 of Switch C acts as the C-BSR. Loopback 0 of Switch C acts as the C-RP.
- IGMPv2 runs between Switch B and Host A, and between Switch D and Host B.

Figure 19 Network diagram

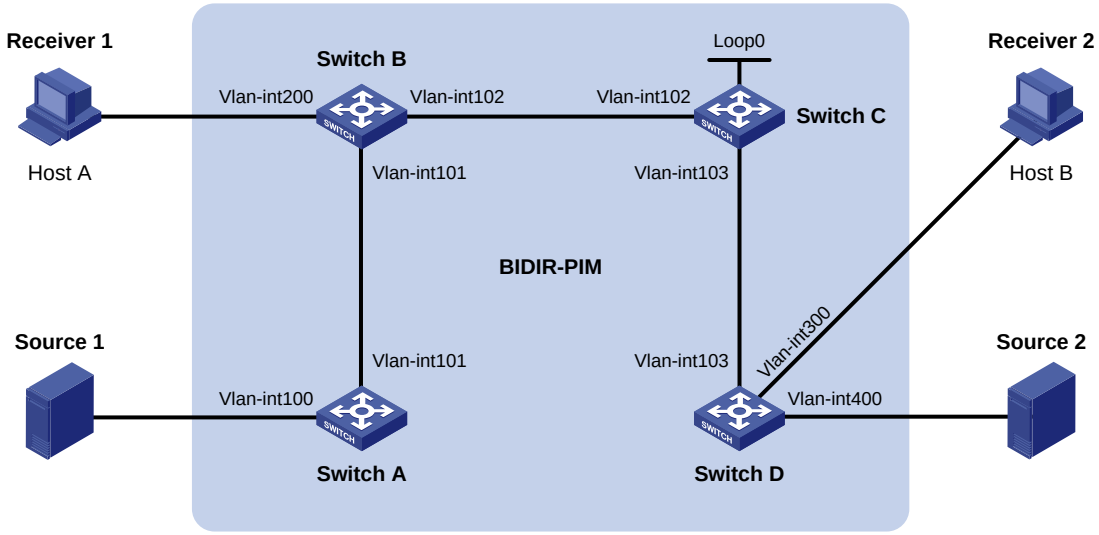

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	192.168.1.1/24	Switch D	Vlan-int300	192.168.3.1/24
Switch A	Vlan-int101	10.110.1.1/24	Switch D	Vlan-int400	192.168.4.1/24
Switch B	Vlan-int200	192.168.2.1/24	Switch D	Vlan-int103	10.110.3.2/24
Switch B	Vlan-int101	10.110.1.2/24	Source 1	—	192.168.1.100/24
Switch B	Vlan-int102	10.110.2.1/24	Source 2	—	192.168.4.100/24
Switch C	Vlan-int102	10.110.2.2/24	Receiver 1	—	192.168.2.100/24
Switch C	Vlan-int103	10.110.3.1/24	Receiver 2	—	192.168.3.100/24
Switch C	Loop0	1.1.1.1/32			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 19, and configure OSPF on the switches in the BIDIR-PIM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, PIM-SM, BIDIR-PIM, and IGMP:

On Switch A, enable IP multicast routing, enable PIM-SM on each interface, and enable BIDIR-PIM.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] pim
[SwitchA-pim] bidir-pim enable
[SwitchA-pim] quit
```

On Switch B, enable IP multicast routing.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 200).

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] igmp enable
[SwitchB-Vlan-interface200] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] pim sm
[SwitchB-Vlan-interface102] quit
```

Enable BIDIR-PIM.

```
[SwitchB] pim
[SwitchB-pim] bidir-pim enable
[SwitchB-pim] quit
```

On Switch C, enable IP multicast routing, enable PIM-SM on each interface, and enable BIDIR-PIM.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
[SwitchC] interface vlan-interface 102
[SwitchC-Vlan-interface102] pim sm
[SwitchC-Vlan-interface102] quit
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] pim sm
[SwitchC-Vlan-interface103] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] pim sm
[SwitchC-LoopBack0] quit
[SwitchC] pim
```

```
[SwitchC-pim] bidir-pim enable
```

On Switch D, enable IP multicast routing.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 300).

```
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] igmp enable
[SwitchD-Vlan-interface300] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] pim sm
[SwitchD-Vlan-interface400] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim sm
[SwitchD-Vlan-interface103] quit
```

Enable BIDIR-PIM.

```
[SwitchD] pim
[SwitchD-pim] bidir-pim enable
[SwitchD-pim] quit
```

2. On Switch C, configure VLAN interface 102 as a C-BSR, and Loopback 0 as a C-RP for the entire BIDIR-PIM domain.

```
<SwitchC> system-view
[SwitchC-pim] c-bsr 10.110.2.2
[SwitchC-pim] c-rp 1.1.1.1 bidir
[SwitchC-pim] quit
```

Verifying the configuration

1. Display BIDIR-PIM DF information:

Display BIDIR-PIM DF information on Switch A.

```
[SwitchA] display pim df-info
RP address: 1.1.1.1
  Interface: Vlan-interface100
    State     : Win        DF preference: 100
    DF metric : 2          DF uptime    : 01:08:50
    DF address: 192.168.1.1 (local)
  Interface: Vlan-interface101
    State     : Lose       DF preference: 100
    DF metric : 1          DF uptime    : 01:07:49
    DF address: 10.110.1.2
```

Display BIDIR-PIM DF information on Switch B.

```
[SwitchB] display pim df-info
RP address: 1.1.1.1
  Interface: Vlan-interface200
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 01:24:09
    DF address: 192.168.2.1 (local)
  Interface: Vlan-interface101
```

```
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 01:24:09
    DF address: 10.110.1.2 (local)
  Interface: Vlan-interface102
    State     : Lose       DF preference: 0
    DF metric : 0          DF uptime    : 01:23:12
    DF address: 10.110.2.2
```

Display BIDIR-PIM DF information on Switch C.

```
[SwitchC] display pim df-info
RP address: 1.1.1.1
  Interface: Loop0
    State     : -          DF preference: -
    DF metric : -          DF uptime    : -
    DF address: -
  Interface: Vlan-interface102
    State     : Win        DF preference: 0
    DF metric : 0          DF uptime    : 01:06:07
    DF address: 10.110.2.2 (local)
  Interface: Vlan-interface103
    State     : Win        DF preference: 0
    DF metric : 0          DF uptime    : 01:06:07
    DF address: 10.110.3.1 (local)
```

Display BIDIR-PIM DF information on Switch D.

```
[SwitchD] display pim df-info
RP address: 1.1.1.1
  Interface: Vlan-interface300
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 01:19:53
    DF address: 192.168.3.1 (local)
  Interface: Vlan-interface400
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 00:39:34
    DF address: 192.168.4.1 (local)
  Interface: Vlan-interface103
    State     : Lose       DF preference: 0
    DF metric : 0          DF uptime    : 01:21:40
    DF address: 10.110.3.1
```

2. Display information about DFs for multicast forwarding:

Display information about DFs for multicast forwarding on Switch A.

```
[SwitchA] display multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 1.1.1.1
     Flags: 0x0
     Uptime: 00:08:32
     RPF interface: Vlan-interface101
     List of 1 DF interfaces:
       1: Vlan-interface100
```

Display information about DFs for multicast forwarding on Switch B.

```
[SwitchB] display multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 1.1.1.1
     Flags: 0x0
     Uptime: 00:06:24
     RPF interface: Vlan-interface102
     List of 2 DF interfaces:
       1: Vlan-interface101
       2: Vlan-interface200
```

Display information about DFs for multicast forwarding on Switch C.

```
[SwitchC] display multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 1.1.1.1
     Flags: 0x0
     Uptime: 00:07:21
     RPF interface: LoopBack0
     List of 2 DF interfaces:
       1: Vlan-interface102
       2: Vlan-interface103
```

Display information about DFs for multicast forwarding on Switch D.

```
[SwitchD] display multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 1.1.1.1
     Flags: 0x0
     Uptime: 00:05:12
     RPF interface: Vlan-interface103
     List of 2 DF interfaces:
       1: Vlan-interface300
       2: Vlan-interface400
```

Example: Configuring PIM-SSM

Network configuration

As shown in Figure 20:

- OSPF runs on the network.
- The receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist on each stub network.
- The entire PIM domain operates in the SSM mode.
- Host A and Host C are multicast receivers on two stub networks.
- The SSM group range is 232.1.1.0/24.
- IGMPv3 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 20 Network diagram

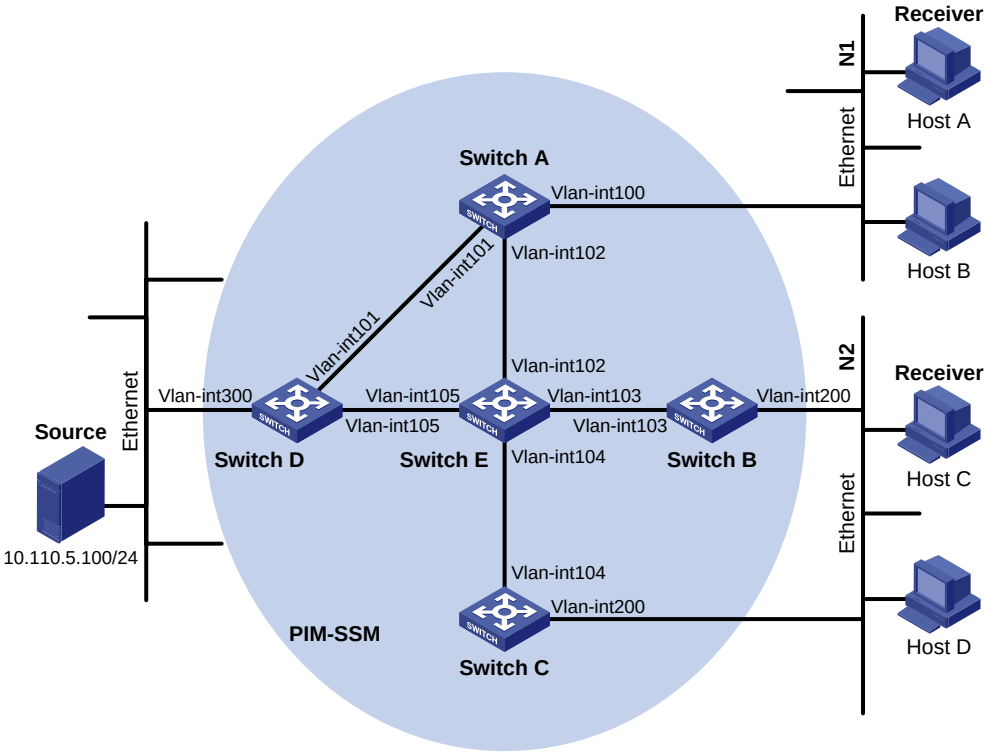

Table 5 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int300	10.110.5.1/24
Switch A	Vlan-int101	192.168.1.1/24	Switch D	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	192.168.9.1/24	Switch D	Vlan-int105	192.168.4.2/24
Switch B	Vlan-int200	10.110.2.1/24	Switch E	Vlan-int104	192.168.3.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch E	Vlan-int103	192.168.2.2/24
Switch C	Vlan-int200	10.110.2.2/24	Switch E	Vlan-int102	192.168.9.2/24
Switch C	Vlan-int104	192.168.3.1/24	Switch E	Vlan-int105	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 20, and configure OSPF on the switches in the PIM-SSM domain.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMPv3 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   ```

```
[SwitchA-Vlan-interface100] igmp version 3
[SwitchA-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IP multicast routing and PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

Configure the SSM group range 232.1.1.0/24 on Switch A.

```
[SwitchA] acl basic 2000
[SwitchA-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchA-acl-ipv4-basic-2000] quit
[SwitchA] pim
[SwitchA-pim] ssm-policy 2000
[SwitchA-pim] quit
```

Configure the SSM group range on Switch B, Switch C, Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display PIM information on Switch A.

```
[SwitchA] display pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.1.2
 Interface: Vlan102
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: 192.168.9.2
```

Send an IGMPv3 report from Host A to join the multicast source and group (10.110.5.100/24, 232.1.1.1). (Details not shown.)

Display the PIM routing table on Switch A.

```
[SwitchA] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:13:25
     Upstream interface: Vlan-interface101
         Upstream neighbor: 192.168.1.2
```

```
        RPF prime neighbor: 192.168.1.2
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: igmp, UpTime: 00:13:25, Expires: 00:03:25
```

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (10.110.5.100, 232.1.1.1)
    Protocol: pim-ssm, Flag: LOC
    UpTime: 00:12:05
    Upstream interface: Vlan-interface300
        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface105
            Protocol: pim-ssm, UpTime: 00:12:05, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Example: Configuring a multicast source policy

Network configuration

As shown in Figure 21:

- Source 1 and Source 3 send multicast data with different content to multicast group 225.0.0.1, and Source 2 sends multicast data to multicast group 225.0.0.2.
- Host A acts as a receiver and belongs to both multicast group 225.0.0.1 and multicast group 225.0.0.2.
- IGMPv2 runs between Device B and Host A.
- Device A discards multicast data from multicast source 10.110.7.2 and multicast data destined for multicast group 225.0.0.2.

Figure 21 Network diagram

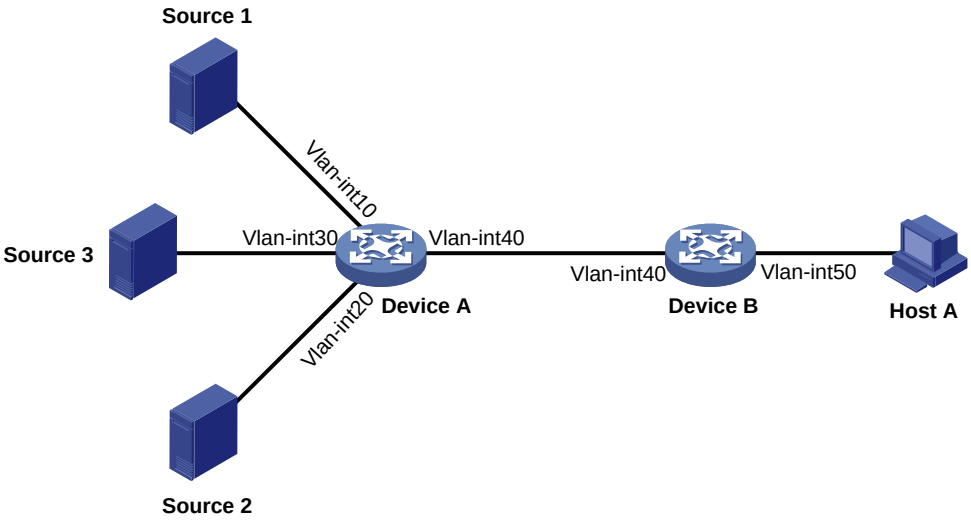

Table 6 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1		192.168.50.1/24	Device A	Vlan-int10	192.168.50.2/24
Source 2		192.168.56.1/24	Device A	Vlan-int20	192.168.56.2/24
Source 3		10.110.7.2/24	Device A	Vlan-int30	10.110.7.10/24
Device B	Vlan-int50	192.168.1.1/24	Device A	Vlan-int40	10.110.5.2/24
Device B	Vlan-int40	10.110.5.1/24			

Procedure

1. Configure Device A:

Enable IP multicast routing.

```
<DeviceA> system-view
[DeviceA] multicast routing
[DeviceA-mrib] quit
```

Configure OSPF.

```
[DeviceA] ospf 1
[DeviceA-ospf-1] area 0
[DeviceA-ospf-1-area-0.0.0.0] quit
[DeviceA-ospf-1] quit
```

Assign IP addresses to VLAN-interface 10, VLAN-interface 20, VLAN-interface 30, and VLAN-interface 40. Enable PIM-SM and OSPF on the interfaces.

```
[DeviceA] interface Vlan-interface10
[DeviceA-Vlan-interface10] ip address 192.168.50.2 255.255.255.0
[DeviceA-Vlan-interface10] pim sm
[DeviceA-Vlan-interface10] ospf 1 area 0
[DeviceA-Vlan-interface10] quit
[DeviceA] interface Vlan-interface20
[DeviceA-Vlan-interface20] ip address 192.168.56.2 255.255.255.0
[DeviceA-Vlan-interface20] pim sm
```

```
[DeviceA-Vlan-interface20] ospf 1 area 0
[DeviceA-Vlan-interface20] quit
[DeviceA] interface Vlan-interface30
[DeviceA-Vlan-interface30] ip address 10.110.7.10 255.255.255.0
[DeviceA-Vlan-interface30] pim sm
[DeviceA-Vlan-interface30] ospf 1 area 0
[DeviceA-Vlan-interface30] quit
[DeviceA] interface Vlan-interface40
[DeviceA-Vlan-interface40] ip address 10.110.5.2 255.255.255.0
[DeviceA-Vlan-interface40] pim sm
[DeviceA-Vlan-interface40] ospf 1 area 0
[DeviceA-Vlan-interface40] quit
```

Configure a multicast source policy to discard multicast data from multicast source 10.110.7.2 and multicast data destined for multicast group 225.0.0.2.

```
[DeviceA] acl advanced 3000
[DeviceA-acl-ipv4-adv-3000] rule 0 deny ip source 10.110.7.2 0
[DeviceA-acl-ipv4-adv-3000] rule 5 deny ip destination 225.0.0.2 0
[DeviceA-acl-ipv4-adv-3000] rule 10 permit ip
[DeviceA-acl-ipv4-adv-3000] quit
[DeviceA] pim
[DeviceA-pim] source-policy 3000
[DeviceA] quit
```

2. Configure Device B:

Enable IP multicast routing.

```
<DeviceB> system-view
[DeviceB] multicast routing
[DeviceB-mrib] quit
```

Configure OSPF.

```
[DeviceB] ospf 1
[DeviceB-ospf-1] area 0
[DeviceB-ospf-1-area-0.0.0.0] quit
[DeviceB-ospf-1] quit
```

Assign an IP address to VLAN-interface 50, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface Vlan-interface50
[DeviceB-Vlan-interface50] ip address 192.168.1.1 255.255.255.0
[DeviceB-Vlan-interface50] igmp enable
[DeviceB-Vlan-interface50] ospf 1 area 0
[DeviceB-Vlan-interface50] quit
```

Assign an IP address to VLAN-interface 40, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface Vlan-interface40
[DeviceB-Vlan-interface40] ip address 10.110.5.1 255.255.255.0
[DeviceB-Vlan-interface40] pim sm
[DeviceB-Vlan-interface40] ospf 1 area 0
[DeviceB-Vlan-interface40] quit
```

Assign an IP address to Loopback 0, and enable IGMP and OSPF on the interface.

```
[DeviceB] interface LoopBack0
[DeviceB-LoopBack0] ip address 1.1.1.1 255.255.255.255
[DeviceB-LoopBack0] pim sm
```

```
[DeviceB-LoopBack0] ospf 1 area 0
[DeviceB-LoopBack0] quit
```

Configure Loopback 0 as a C-BSR and a C-RP.

```
[DeviceB] pim
[DeviceB-pim] c-bsr 1.1.1.1
[DeviceB-pim] c-rp 1.1.1.1
[DeviceB-pim] quit
```

Verifying the configuration

Display the PIM routing table on Device B.

```
[DeviceB] display pim routing-table
 Total 2 (*, G) entries; 1 (S, G) entries

 (*, 225.0.0.1)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 16:27:44
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: igmp, UpTime: 16:27:44, Expires: -

 (192.168.50.1, 225.0.0.1)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: SPT 2MSDP ACT 2MVPN
     UpTime: 00:00:37
     Upstream interface: Vlan-interface40
         Upstream neighbor: 10.110.5.2
         RPF prime neighbor: 10.110.5.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: pim-sm, UpTime: 00:00:37, Expires: -

 (*, 225.0.0.2)
     RP: 1.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 16:27:52
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface50
             Protocol: igmp, UpTime: 16:27:52, Expires: -
```

The output shows that Host A can receive multicast data from only Source 1.

Troubleshooting PIM

A multicast distribution tree cannot be correctly built

Symptom

No multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in a PIM network. This means that a multicast distribution tree cannot be built correctly.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the multicast source or the RP is available.
2. Use the **display pim interface** command to verify PIM information on each interface, especially on the RPF interface. If PIM is not enabled on the interfaces, use the **pim dm** or **pim sm** command to enable PIM-DM or PIM-SM for the interfaces.
3. Use the **display pim neighbor** command to verify that the RPF neighbor is a PIM neighbor.
4. Verify that PIM and IGMP are enabled on the interfaces that directly connect to the multicast sources or the receivers.
5. Use the **display pim interface verbose** command to verify that the same PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **display current-configuration** command to verify that the same PIM mode is enabled on all devices. For PIM-SM, verify that the BSR and C-RPs are correctly configured.
7. If the problem persists, contact H3C Support.

Multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives multicast data but does not create an (S, G) entry in the PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the multicast forwarding boundary settings. Use the **multicast boundary** command to change the multicast forwarding boundary settings to make the multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the multicast source.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that a unicast route to the RP is available on each device.
2. Use the **display pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or multicast source registration fails in PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command on each device to view routing table information. Verify that unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.
2. Use the **display pim bsr-info** command to verify that the BSR information exists on each device.
3. Use the **display pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display pim neighbor** command to verify that PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

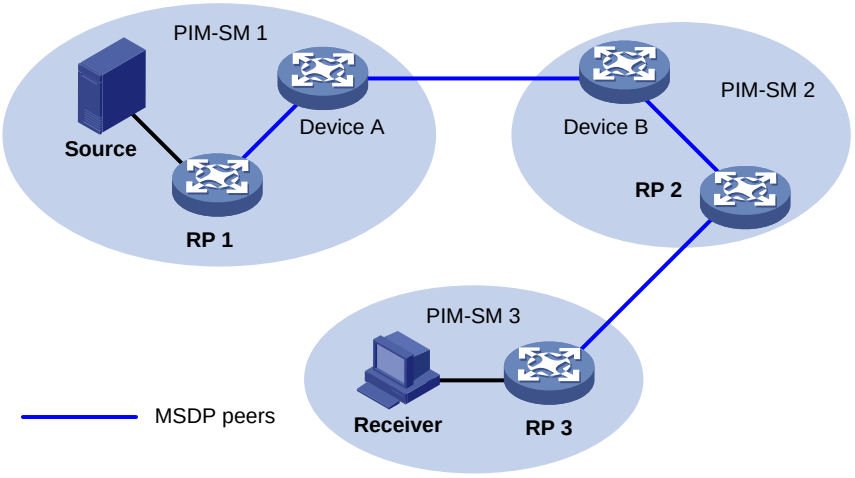
Configuring MSDP

About MSDP

Multicast Source Discovery Protocol (MSDP) is an inter-domain multicast solution that addresses the interconnection of PIM-SM domains. It discovers multicast source information in other PIM-SM domains.

MSDP is applicable only to the ASM model.

How MSDP works



MSDP peer relationships are established between appropriate devices on the network, so that the RPs of different PIM-SM domains are interconnected with one another. These MSDP peers exchange source active (SA) messages, so that the multicast source information is shared among these domains.

For more information about DRs, BSRs, C-BSRs, RPs, C-RPs, SPTs, and RPTs, see "PIM overview."

MSDP peers

One or more pairs of MSDP peers on the network form an MSDP interconnection map.

Figure 1 MSDP peer locations on the network

As shown in Figure 1, an MSDP peer can be created on any PIM-SM device. MSDP peers created on PIM-SM devices that assume different roles function differently.

- MSDP peers created on RPs:
  - **Source-side MSDP peer**—MSDP peer closest to the multicast source, such as RP 1. The source-side RP creates and sends SA messages to its remote MSDP peer to notify the MSDP peer of the locally registered multicast source information.

    A source-side MSDP peer must be created on the source-side RP. Otherwise, it cannot advertise the multicast source information out of the PIM-SM domain.
  - **Receiver-side MSDP peer**—MSDP peer closest to the receivers, typically the receiver-side RP, such as RP 3. After receiving an SA message, the receiver-side MSDP peer resolves the multicast source information carried in the message. Then, it joins the SPT rooted at the multicast source across the PIM-SM domains. When multicast data from the multicast

source arrives, the receiver-side MSDP peer forwards the data to the receivers along the RPT.

- **Intermediate MSDP peer**—MSDP peer with multiple remote MSDP peers, such as RP 2. An intermediate MSDP peer forwards SA messages received from one remote MSDP peer to other remote MSDP peers. It acts as a relay for forwarding multicast source information.

- MSDP peers created on PIM-SM devices that are not RPs:

  Device A and Device B are MSDP peers on multicast devices that are not RPs. Such MSDP peers only forward SA messages.

In a PIM-SM network using the BSR mechanism, the RP is dynamically elected from C-RPs. A PIM-SM network typically has multiple C-RPs to ensure network robustness. Because the RP election result is unpredictable, MSDP peering relationships must be built between all C-RPs to always keep the winning C-RP on the MSDP interconnection map. Losing C-RPs assume the role of common PIM-SM devices on this map.

Inter-domain multicast delivery through MSDP

As shown in Figure 2, an active source (Source) exists in the domain PIM-SM 1, and RP 1 has learned the existence of Source through multicast source registration. RPs in PIM-SM 2 and PIM-SM 3 also seek the location of Source so that multicast traffic from Source can be sent to their receivers. MSDP peering relationships must be established between RP 1 and RP 3 and between RP 3 and RP 2.

Figure 2 Inter-domain multicast delivery through MSDP

The process of implementing PIM-SM inter-domain multicast delivery by leveraging MSDP peers is as follows:

1. When the multicast source in PIM-SM 1 sends the first multicast packet to multicast group G, DR 1 encapsulates the data within a register message. It sends the register message to RP 1, and RP 1 obtains information about the multicast source.
2. As the source-side RP, RP 1 creates SA messages and periodically sends them to its MSDP peer.

   An SA message contains the address of the multicast source (S), the multicast group address (G), and the address of the RP that has created this SA message (RP 1, in this example).

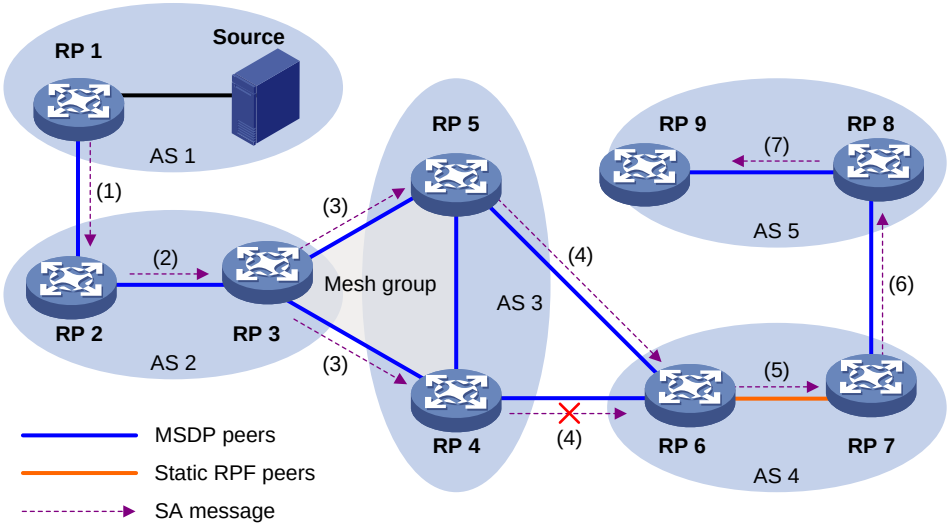
3. On MSDP peers, each SA message undergoes an RPF check and multicast policy-based filtering. Only SA messages that have arrived along the correct path and passed the filtering are received and forwarded. This avoids delivery loops of SA messages. In addition, you can configure MSDP peers into an MSDP mesh group to avoid SA message flooding between MSDP peers. An MSDP mesh group refers to a group of MSDP peers that establish MSDP peering relationships with each other and share the same group name.
4. SA messages are forwarded from one MSDP peer to another. Finally, information about the multicast source traverses all PIM-SM domains with MSDP peers (PIM-SM 2 and PIM-SM 3, in this example).
5. After receiving the SA message that RP 1 created, RP 2 in PIM-SM 2 examines whether any receivers for the multicast group exist in the domain.
    - If a receiver exists in the domain, the RPT for the multicast group G is maintained between RP 2 and the receivers. RP 2 creates an (S, G) entry and sends an (S, G) join message. The join message travels hop by hop toward the multicast source, and the SPT is established across the PIM-SM domains.

      The subsequent multicast data flows to RP 2 along the SPT, and from RP 2 to the receiver-side DR along the RPT. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.
    - If no receivers exist in the domain, RP 2 neither creates an (S, G) entry nor sends a join message toward the multicast source.

In inter-domain multicasting using MSDP, once an RP gets information about a multicast source in another PIM-SM domain, it no longer relies on RPs in other PIM-SM domains. The receivers can override the RPs in other domains and directly join the multicast SPT rooted at the source.

MSDP peer-RPF forwarding

The MSDP peer-RPF check is used for forwarding SA messages on a network that runs MSDP. If the peer-RPF check succeeds, the SA message is accepted and forwarded. Otherwise, the SA message is discarded.



As shown in Figure 3:

- There are five ASs on the network. IGP runs within each AS, and BGP or MBGP runs between these ASs.
- Each AS contains a minimum of one PIM-SM domain, and each PIM-SM domain contains a minimum of one RP.
- MSDP peering relationship has been established among these RPs.

  RP 3, RP 4, and RP 5 are in the same MSDP mesh group.

  RP 6 is configured as the static RPF peer of RP 7.

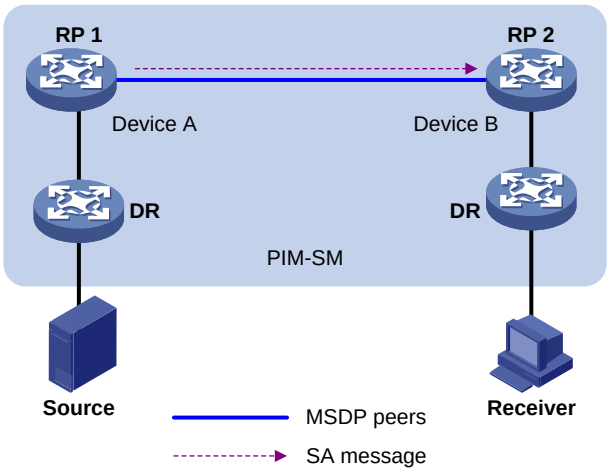
Figure 3 MSDP peer-RPF forwarding

The process of peer-RPF forwarding is as follows:

1. RP 1 creates an SA message and forwards it to its peer RP 2.
2. RP 2 determines that RP 1 is the RP that creates the SA message because the RP address in the SA message is the same as that of RP 1. Then, RP 2 accepts and forwards the SA message.
3. RP 3 accepts and forwards the SA message, because RP 2 and RP 3 reside in the same AS and RP 2 is the next hop of RP 3 to RP 1.
4. RP 4 and RP 5 accept the SA message, because RP 3 is in the same mesh group with them. Then, RP 4 and RP 5 forward the SA message to their peer RP 6 rather than other members of the mesh group.
5. RP 4 and RP 5 reside in the closest AS in the route to RP 1. However, RP 6 accepts and forwards only the SA message from RP 5, because the IP address of RP 5 is higher than that of RP 4.
6. RP 7 accepts and forwards the SA message, because RP 6 is its static RPF peer.
7. RP 8 accepts and forwards the SA message, because RP 7 is the EBGP or MBGP next hop of the peer-RPF route to RP 1.
8. RP 9 accepts the SA message, because RP 8 is the only RP of RP 9.

Anycast RP through MSDP

PIM-SM requires only one active RP to serve each multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup between two or more RPs by configuring multiple RPs with the same IP address for one multicast group. A multicast source registers with the closest RP or a receiver joins the closest RP to implement source information synchronization.



For Anycast RP implemented through MSDP, all member RPs in the Anycast RP set have the same IP address, and MSDP peering connections are established between the RPs.

As shown in Figure 4, within a PIM-SM domain, a multicast source sends multicast data to multicast group G, and the receiver joins the multicast group. To implement Anycast RP through MSDP, complete the following tasks:

1. Assign the same IP address (known as Anycast RP address, typically a private address) to an interface on Device A and Device B.
2. Configure the interfaces as C-RPs.

3. Establish an MSDP peering relationship between Device A and Device B.

Figure 4 Anycast RP through MSDP

The following describes how Anycast RP through MSDP is implemented:

4. After receiving the multicast data from Source, the source-side DR registers with the closest RP (RP 1 in this example).
5. After receiving the IGMP report message from the receiver, the receiver-side DR sends a join message toward the closest RP (RP 2 in this example). An RPT rooted at this RP is established.
6. The RPs share the registered multicast source information through SA messages. After obtaining the multicast source information, RP 2 sends an (S, G) source-specific join message toward the source to create an SPT.
7. When the multicast data reaches RP 2 along the SPT, the RP forwards the data along the RPT to the receiver. After receiving the multicast data, the receiver-side DR determines whether to initiate an RPT-to-SPT switchover process based on its configuration.

MSDP support for VPNs

Interfaces on the multicast devices in a VPN can set up MSDP peering relationships with each other. With the SA messages exchanged between MSDP peers, the multi-instance VPN implements the forwarding of multicast data across different PIM-SM domains.

To support MSDP for VPNs, a multicast device that runs MSDP maintains an independent set of MSDP mechanism for each VPN that it supports. These mechanisms include SA message cache, peering connection, timers, sending cache, and cache for exchanging PIM messages.

One VPN is isolated from another, and MSDP and PIM-SM messages can be exchanged only within the same VPN.

Protocols and standards

- RFC 3618, *Multicast Source Discovery Protocol (MSDP)*
- RFC 3446, *Anycast Rendezvous Point (RP) mechanism using Protocol Independent Multicast (PIM) and Multicast Source Discovery Protocol (MSDP)*

MSDP tasks at a glance

1. Enabling MSDP

2. Creating an MSDP peer
3. (Optional.) Configuring a static RPF peer
4. (Optional.) Configuring an MSDP mesh group
5. (Optional.) Controlling MSDP peering connections
   - Tearing down MSDP peering connections
   - Setting the keepalive timer and peer hold timer for MSDP sessions
   - Setting the MSDP connection retry interval
   - Enabling MD5 authentication for TCP connection establishment
6. (Optional.) Configuring SA message-related parameters
   - Enabling multicast data encapsulation in SA messages
   - Configuring the originating RP of SA messages
   - Configuring SA request messages
   - Configuring SA message policies
   - Configuring the SA cache mechanism
7. (Optional.) Configuring MSDP-based Anycast RP
8. (Optional.) Enabling MSDP NSR
9. (Optional.) Setting the DSCP value for outgoing MSDP protocol packets

Prerequisites for MSDP

Before you configure MSDP, complete the following tasks:

- Configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Configure PIM-SM to enable intra-domain multicast.

Enabling MSDP

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enable MSDP and enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
   By default, MSDP is disabled.

Creating an MSDP peer

About this task

An MSDP peering relationship is identified by an address pair (the addresses of the local MSDP peer and the remote MSDP peer). To create an MSDP peering connection, you must perform the following operation on both devices that are a pair of MSDP peers.

You can configure a description for an MSDP peer to easily distinguish an MSDP peer from other MSDP peers.

Restrictions and guidelines

If an MSDP peer and a BGP or MBGP peer share the same interface, specify the MSDP peer and the BGP or MBGP peer by using the same IP address.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Create an MSDP peer.
   peer *peer-address* **connect-interface** *interface-type interface-number*
4. (Optional.) Configure a description for the MSDP peer.
5. **peer** *peer-address* **description** *text*
6. By default, an MSDP peer does not have a description.

Configuring a static RPF peer

About this task

You can configure a static RPF peer, so the static RPF peer does not perform RPF check on received SA messages. This simplifies the RPF check mechanism for SA messages.

Restrictions and guidelines

If only one MSDP peer is configured on a device, this MSDP peer is considered to be a static RPF peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure a static RPF peer.
   static-rpf-peer *peer-address* [**rp-policy** *ip-prefix-name*]

Configuring an MSDP mesh group

About this task

This feature avoids SA message flooding among MSDP peers within an AS. It also simplifies the RPF check mechanism because you do not need to run BGP or MBGP between these MSDP peers.

When receiving an SA message from outside the mesh group, a member MSDP peer performs the RPF check on the SA message. If the SA message passes the RPF check, the member MSDP peer floods the message to the other members in the mesh group. When receiving an SA message from another member, the MSDP peer neither performs an RPF check on the message nor forwards the message to the other members.

To organize multiple MSDP peers in a mesh group, assign the same mesh group name to these MSDP peers.

Restrictions and guidelines

Before you configure an MSDP mesh group, make sure the devices are interconnected with one another.

If you assign an MSDP peer to multiple MSDP mesh groups, the most recent configuration takes effect.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an MSDP mesh group.
   peer *peer-address* **mesh-group** *name*
   By default, an MSDP peer does not belong to any mesh group.

Controlling MSDP peering connections

Tearing down MSDP peering connections

About this task

MSDP peers are interconnected over TCP (port number 639). You can tear down or re-establish MSDP peering connections to control SA message exchange between the MSDP peers. When the connection between two MSDP peers is torn down, SA messages are no longer delivered between them. No attempt is made to re-establish the connection. The configuration information for the peer remains unchanged.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Tear down an MSDP peering connection.
   shutdown *peer-address*
   By default, an MSDP peering connection is active.

Setting the keepalive timer and peer hold timer for MSDP sessions

About this task

MSDP peers periodically send keepalive messages to each other to keep a session alive. When a session is established, an MSDP peer sends a keepalive message to its peer and starts a keepalive timer and a peer hold timer. When the keepalive timer expires, the MSDP peer sends a new keepalive message. If the MSDP peer receives an MSDP message from its peer before the peer hold timer expires, it resets the peer hold timer. Otherwise, the MSDP peer tears down the session.

Because MSDP peers cannot negotiate the keepalive timer and peer hold timer, you must configure the same keepalive timer and peer hold timer for the MSDP peers of a session. The keepalive timer must be smaller than the peer hold timer.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the keepalive timer and peer hold timer for MSDP sessions.

   timer keepalive *keepalive holdtime*

   By default, the keepalive timer and peer hold timer are 60 seconds and 75 seconds, respectively.

   This command immediately takes effect on an established session.

Setting the MSDP connection retry interval

About this task

A TCP connection is required when one of the following conditions exists:

- A new MSDP peer is created.
- A previously deactivated MSDP peering connection is reactivated.
- A previously failed MSDP peer attempts to resume operation.

Perform this task to adjust the interval between MSDP peering connection attempts.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the MSDP connection retry interval.

   timer retry *interval*

   The default setting is 30 seconds.

Enabling MD5 authentication for TCP connection establishment

About this task

To enhance MSDP security, enable MD5 authentication for both MSDP peers to establish a TCP connection. If the MD5 authentication fails, the TCP connection cannot be established.

Restrictions and guidelines

Configure the same authentication method and key for the MSDP peers involved in MD5 authentication to avoid authentication and TCP connection failures.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Configure the device to perform MD5 authentication when establishing a TCP connection with an MSDP peer.

   peer *peer-address* **password** { **cipher** | **simple** } *password*

   By default, the device does not perform MD5 authentication when establishing a TCP connection with an MSDP peer.

Configuring SA message-related parameters

Enabling multicast data encapsulation in SA messages

About this task

Some multicast sources send multicast data at an interval longer than the aging time of (S, G) entries. In this case, the source-side DR must encapsulate multicast data packet-by-packet in register messages and send them to the source-side RP. The source-side RP transmits the (S, G) information to the remote RP through SA messages. Then, the remote RP sends join messages to the source-side DR and builds an SPT. Because the (S, G) entries have timed out, remote receivers can never receive the multicast data from the multicast source.

To avoid this problem, you can enable the source-side RP to encapsulate multicast data in SA messages. As a result, the source-side RP can forward the multicast data in SA messages to its remote MSDP peers. After receiving the SA messages, the remote RP decapsulates the SA messages and forwards the multicast data to the receivers in the local domain along the RPT.

Procedure

1. Enter system view.

   system-view

2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]

3. Enable multicast data encapsulation in SA messages.

   encap-data-enable

   By default, an SA message contains only (S, G) entries, but not the multicast data.

Configuring the originating RP of SA messages

About this task

This feature enables an interface to originate SA messages and to use its IP address as the RP address in SA messages. It is typically used in the Anycast-RP application.

By default, the RP address in SA messages originated by a member Anycast-RP is the Anycast-RP address. The SA messages will fail the RPF check on the other members because the RP address in SA messages is the same as the local RP address. In this case, source information cannot be exchanged within the Anycast-RP. To solve the problem, you must specify an interface other than the interface where the member Anycast-RP resides as the originating RP of SA messages.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an interface as the originating RP of SA messages.
   originating-rp *interface-type interface-number*
   By default, SA messages are originated by the actual RPs.

Configuring SA request messages

About this task

By default, after receiving a new join message, a device waits for an SA message to obtain the multicast source information and to join the SPT. You can enable the device to request source information by sending SA request messages to an MSDP peer. This reduces the join latency.

An SA request policy enables the device to filter SA request messages from an MSDP peer by using an ACL that specifies the multicast groups.

Prerequisites

Before you enable the device to send SA requests, make sure you have disabled the SA message cache mechanism by the **undo cache-sa-enable** command.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the device to send SA request messages to an MSDP peer.
   peer *peer-address* **request-sa-enable**
   By default, after receiving a new join message, a device does not send an SA request message to any MSDP peer. Instead, it waits for the next SA message from its MSDP peer.
4. Configure an SA request policy for an MSDP peer.
   peer *peer-address* **sa-request-policy** [**acl** *ipv4-acl-number*]
   By default, no SA request policy exists, and all SA request from an MSDP peer are permitted.

Configuring SA message policies

About this task

To control the propagation of multicast source information, you can configure the following policies:

- **SA creation policy**—Limits the multicast source information advertised in SA messages. This policy enables the device to advertise (S, G) entries based on the used ACL that specifies the multicast sources and groups.
- **SA incoming or outgoing policy**—Limits the receipt or forwarding of SA messages. This policy enables the device to receive or forward SA messages based on the used ACL that specifies the multicast sources and groups.
- **The lower TTL threshold for multicast data packets encapsulated in SA messages**—By default, multicast data packets are encapsulated in SA messages and forwarded to MSDP peers only if the TTL values in the packets are larger than zero. You can set the lower TTL threshold for multicast data packets encapsulated in SA messages that are sent to an MSDP peer. Then, only multicast data packets whose TTL values are larger than or equal to the configured value are encapsulated in SA messages. Only SA messages whose TTL values are larger than or equal to the configured value are forwarded to the specified MSDP peer. This controls the multicast data packet encapsulation and limits the propagation range of the SA messages.

Procedure

1. Enter system view.

   system-view
2. Enter MSDP view.

   msdp [**vpn-instance** *vpn-instance-name*]
3. Configure an SA creation policy.

   import-source [**acl** *ipv4-acl-number*]
4. Configure an SA incoming or outgoing policy.

   peer *peer-address* **sa-policy** { **export** | **import** } [**acl** *ipv4-acl-number*]

   By default, no SA incoming or outgoing policy is configured. The device does not filter incoming or outgoing SA messages.
5. Set the lower TTL threshold for multicast data packets encapsulated in SA messages.

   peer *peer-address* **minimum-ttl** *ttl-value*

   The default setting is 0.

Configuring the SA cache mechanism

About this task

The SA cache mechanism enables the device to locally cache (S, G) entries contained in SA messages. It reduces the time for obtaining multicast source information, but increases memory occupation.

With the SA cache mechanism enabled, when the device receives a new (*, G) join message, it searches its SA message cache first.

- If no matching (S, G) entry is found, the device waits for the SA message that its MSDP peer sends in the next cycle.
- If a matching (S, G) entry is found in the cache, the device joins the SPT rooted at S.

To protect the device against DoS attacks, you can set a limit on the number of (S, G) entries in the SA cache from an MSDP peer.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Enable the SA cache mechanism.
   cache-sa-enable
   By default, the SA message cache mechanism is enabled. The device caches the (S, G) entries contained in the received SA messages.
4. (Optional.) Set the maximum number of (S, G) entries in the SA cache from an MSDP peer.
   peer *peer-address* **sa-cache-maximum** *sa-limit*
   The default setting is 4294967295.

Configuring MSDP-based Anycast RP

1. Configure the same RP on multiple devices.
   For more information about configuring RP, see "Configuring PIM."
2. Establish MSDP peer relationship between the devices. The RP address must be different from the MSDP peer address.
   For more information about establishing MSDP peer relationships, see "Creating an MSDP peer."
   The IP address for establishing MSDP peer relationship must be different from the Anycast RP address.

Enabling MSDP NSR

About this task

This feature enables MSDP to back up protocol state information and data, such as MSDP peer and remote multicast source information, from the active process to standby processes. A standby process seamlessly takes over when the active process fails. Use this feature to avoid forwarding interruption for MSDP when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable MSDP NSR.
   msdp non-stop-routing
   By default, MSDP NSR is disabled.

Setting the DSCP value for outgoing MSDP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MSDP view.
   msdp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MSDP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MSDP protocol packets.

Display and maintenance commands for MSDP

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display brief information about MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **brief** [**state** { **connect** | **disabled** | **established** | **listen** | **shutdown** }]
Display MSDP NSR status information.	**display msdp non-stop-routing status**
Display detailed status of MSDP peers.	**display msdp** [**vpn-instance** *vpn-instance-name*] **peer-status** [*peer-address*]
Display (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address* | *source-address* | *as-number*] *
Display the number of (S, G) entries in the SA cache.	**display msdp** [**vpn-instance** *vpn-instance-name*] **sa-count** [*as-number*]
Reset the TCP connection with an MSDP peer and clear statistics for the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **peer** [*peer-address*]
Delete (S, G) entries in the SA cache.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **sa-cache** [*group-address*]
Clear statistics for an MSDP peer without resetting the TCP connection with the MSDP peer.	**reset msdp** [**vpn-instance** *vpn-instance-name*] **statistics** [*peer-address*]

MSDP configuration examples

Example: Configuring PIM-SM inter-domain multicast

Network configuration

As shown in Figure 5:

- OSPF runs within AS 100 and AS 200 and BGP runs between them.
- Each PIM-SM domain has a minimum of one multicast source or receiver.

Set up MSDP peering relationships between the RPs in the PIM-SM domains to share multicast source information among the PIM-SM domains.

Figure 5 Network diagram

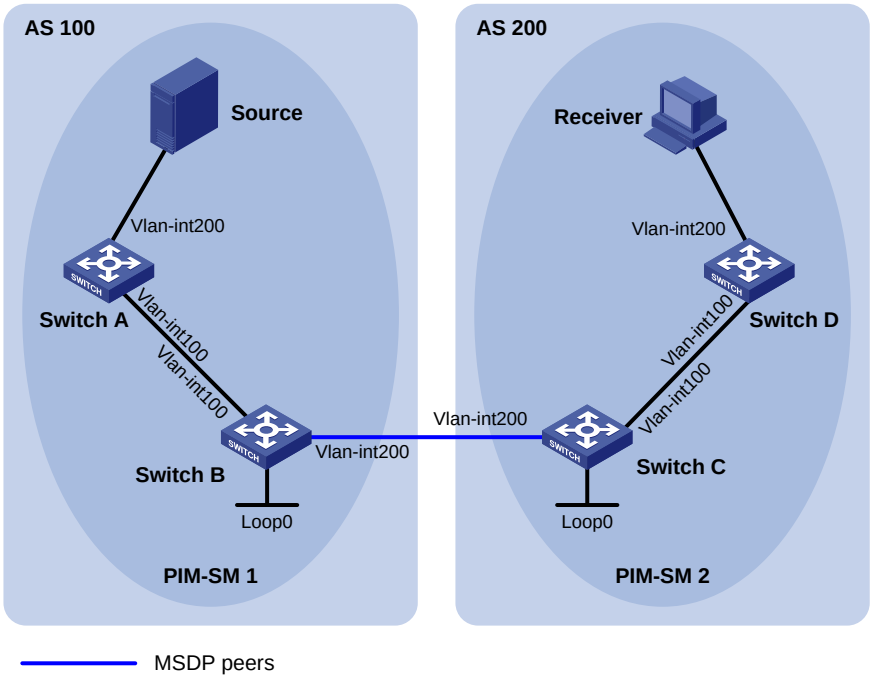


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source	N/A	10.110.2.100/24	Switch C	Vlan-int100	10.110.4.1/24
Switch A	Vlan-int100	10.110.1.2/24	Switch C	Vlan-int200	192.168.1.2/24
Switch A	Vlan-int200	10.110.2.1/24	Switch C	Loop0	2.2.2.2/32
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int100	10.110.4.2/24
Switch B	Vlan-int200	192.168.1.1/24	Switch D	Vlan-int200	10.110.5.1/24
Switch B	Loop0	1.1.1.1/32			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing and PIM-SM, and configure PIM-SM domain borders:

   # On Switch A, enable IP multicast routing, and enable PIM-SM on interfaces.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim sm
[SwitchA-Vlan-interface200] quit
```

   # On Router D, enable IP multicast routing, enable IGMP on the receiver-side interface, and enable PIM-SM on the source-side interface.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] pim sm
[SwitchD-Vlan-interface100] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] igmp enable
[SwitchD-Vlan-interface200] quit
```

   # On Router B, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] pim sm
[SwitchB-Vlan-interface100] quit
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] pim sm
[SwitchB-Vlan-interface200] pim bsr-boundary
[SwitchB-Vlan-interface200] quit
[SwitchB] interface LoopBack0
[SwitchB-LoopBack0] pim sm
[SwitchB-LoopBack0] quit
```

   # On Router C, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] pim sm
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] pim sm
```

```
[SwitchC-Vlan-interface200] pim bsr-boundary
[SwitchC-Vlan-interface200] quit
[SwitchC] interface LoopBack0
[SwitchC-LoopBack0] pim sm
[SwitchC-LoopBack0] quit
```

2. Configure C-BSRs and C-RPs:

On Switch B, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 1.1.1.1
[SwitchB-pim] c-rp 1.1.1.1
[SwitchB-pim] quit
```

On Switch C, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchC] pim
[SwitchC-pim] c-bsr 2.2.2.2
[SwitchC-pim] c-rp 2.2.2.2
[SwitchC-pim] quit
```

3. Configure BGP for mutual route redistribution between BGP and OSPF:

On Switch B, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] router-id 1.1.1.1
[SwitchB-bgp-default] peer 192.168.1.2 as-number 200
[SwitchB-bgp-default] address-family ipv4
[SwitchB-bgp-default-ipv4] import-route ospf 1
[SwitchB-bgp-default-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] address-family ipv4 multicast
[SwitchB-bgp-default-mul-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-mul-ipv4] quit
[SwitchB-bgp-default] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routes.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 2.2.2.2
[SwitchC-bgp-default] peer 192.168.1.1 as-number 100
[SwitchC-bgp-default] address-family ipv4
[SwitchC-bgp-default-ipv4] import-route ospf 1
[SwitchC-bgp-default-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] address-family ipv4 multicast
[SwitchC-bgp-default-mul-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-mul-ipv4] quit
[SwitchC-bgp-default] quit
```

Redistribute BGP routes into OSPF on Switch B.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

Redistribute BGP routes into OSPF on Switch C.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route bgp
```

```
[SwitchC-ospf-1] quit
```

4. Configure MSDP peers:

Configure an MSDP peer on Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] peer 192.168.1.2 connect-interface vlan-interface 200
[SwitchB-msdp] quit
```

Configure an MSDP peer on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 200
[SwitchC-msdp] quit
```

Verifying the configuration

Display information about BGP peer groups on Switch B.

```
[SwitchB] display bgp peer ipv4

 BGP local router ID: 1.1.1.1
 Local AS number: 100
 Total number of peers: 1                 Peers in established state: 1

[SwitchB] display msdp peer-status
MSDP Peer 192.168.1.2; AS 200
 Description:
 Information about connection status:
   State: Established
   Up/down time: 00:15:47
   Resets: 0
   Connection interface: Vlan-interface200 (192.168.1.1)
   Received/sent messages: 16/16
   Discarded input messages: 0
   Discarded output messages: 0
   Elapsed time since last connection or counters clear: 00:17:40
   Mesh group peer joined: momo
   Last disconnect reason: Hold timer expired with truncated message
   Truncated packet: 5 bytes in buffer, type: 1, length: 20, without packet time: 75s
 Information about (Source, Group)-based SA filtering policy:
   Import policy: None
   Export policy: None
 Information about SA-Requests:
   Policy to accept SA-Requests: None
   Sending SA-Requests status: Disable
 Minimum TTL to forward SA with encapsulated data: 0
 SAs learned from this peer: 0, SA cache maximum for the peer: 4294967295
 Input queue size: 0, Output queue size: 0
 Counters for MSDP messages:
   RPF check failure: 0
   Incoming/outgoing SA: 0/0
   Incoming/outgoing SA-Request: 0/0
   Incoming/outgoing SA-Response: 0/0
   Incoming/outgoing Keepalive: 867/867
   Incoming/outgoing Notification: 0/0
   Incoming/outgoing Traceroutes in progress: 0/0
   Incoming/outgoing Traceroute reply: 0/0
   Incoming/outgoing Unknown: 0/0
   Incoming/outgoing data packet: 0/0
```

Example: Configuring inter-AS multicast by leveraging static RPF peers

Network configuration

As shown in Figure 6:

- The network has two ASs: AS 100 and AS 200. OSPF runs within each AS. BGP runs between the two ASs.
- PIM-SM 1 belongs to AS 100, and PIM-SM 2 belongs to AS 200. Each PIM-SM domain has a minimum of one multicast source or receiver.

Configure inter-AS multicast as follows:

- Configure Loopback 0 as the C-BSR and C-RP of the related PIM-SM domain on Switch A and Switch D.
- According to the peer-RPF forwarding rule, the switches accept SA messages that pass the filtering policy from its static RPF peers. To share multicast source information among PIM-SM domains without changing the unicast topology structure, configure MSDP peering relationships for the RPs of the PIM-SM domains and configure the static RPF peering relationships.

Figure 6 Network diagram

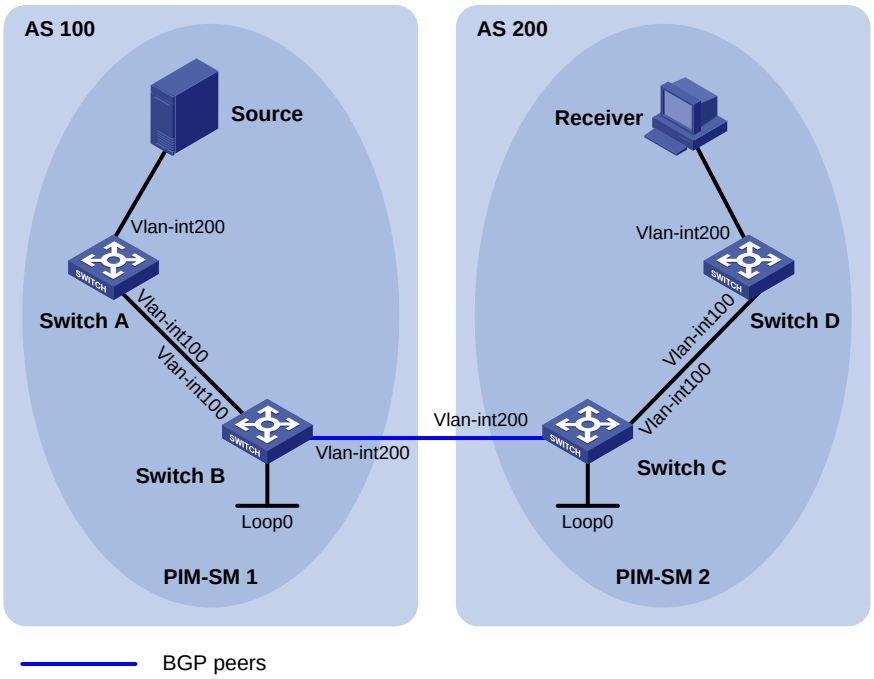

Table 2 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source	N/A	10.110.2.100/24	Switch C	Vlan-int100	10.110.4.1/24
Switch A	Vlan-int100	10.110.1.2/24	Switch C	Vlan-int200	192.168.1.2/24
Switch A	Vlan-int200	10.110.2.1/24	Switch C	Vlan-int100	10.110.4.2/24
Switch B	Loop0	1.1.1.1/32	Switch D	Vlan-int200	10.110.5.1/24
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Loop0	2.2.2.2/32
Switch B	Vlan-int200	192.168.1.1/24			

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP, and configure PIM-SM domain borders:

   # On Switch C, enable IP multicast routing, and enable PIM-SM on interfaces.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim sm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface LoopBack0
[SwitchA-LoopBack0] pim sm
[SwitchA-LoopBack0] quit
```

On Switch C, enable IP multicast routing, enable PIM-SM on interfaces, and configure the receiver-side interface as a PIM-SM domain border.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] pim sm
[SwitchC-Vlan-interface100] quit
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] pim sm
[SwitchC-Vlan-interface200] pim bsr-boundary
[SwitchC-Vlan-interface200] quit
```

On Switch D, enable IP multicast routing, enable IGMP on the receiver-side interface, and enable PIM-SM on other interfaces.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
[SwitchD] interface vlan-interface 100
[SwitchD-Vlan-interface100] pim sm
[SwitchD-Vlan-interface100] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] igmp enable
[SwitchD-Vlan-interface200] quit
[SwitchD] interface LoopBack0
[SwitchD-LoopBack0] pim sm
[SwitchD-LoopBack0] quit
```

2. Configure C-BSRs and C-RPs:

On Switch A, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchA] pim
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

On Switch D, configure Loopback 0 as a C-BSR and a C-RP.

```
[SwitchD] pim
[SwitchD-pim] c-bsr 2.2.2.2
[SwitchD-pim] c-rp 2.2.2.2
[SwitchD-pim] quit
```

3. Configure BGP, and redistribute BGP routing information into OSPF and OSPF routing information into BGP:

On Switch B, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchB] bgp 100
[SwitchB-bgp-default] router-id 1.1.1.1
[SwitchB-bgp-default] peer 192.168.1.2 as-number 200
[SwitchB-bgp-default] address-family ipv4 unicast
[SwitchB-bgp-default-ipv4] peer 192.168.1.2 enable
[SwitchB-bgp-default-ipv4] import-route direct
[SwitchB-bgp-default-ipv4] import-route ospf 1
[SwitchB-bgp-default-ipv4] quit
[SwitchB-bgp-default] quit
```

On Switch C, configure an EBGP peer, and redistribute OSPF routing information.

```
[SwitchC] bgp 200
[SwitchC-bgp-default] router-id 2.2.2.2
[SwitchC-bgp-default] peer 192.168.1.1 as-number 100
[SwitchC-bgp-default] address-family ipv4 unicast
[SwitchC-bgp-default-ipv4] peer 192.168.1.1 enable
[SwitchC-bgp-default-ipv4] import-route direct
[SwitchC-bgp-default-ipv4] import-route ospf 1
[SwitchC-bgp-default-ipv4] quit
[SwitchC-bgp-default] quit
```

On Switch B, redistribute BGP routing information into OSPF.

```
[SwitchB] ospf 1
[SwitchB-ospf-1] import-route bgp
[SwitchB-ospf-1] quit
```

On Switch C, redistribute BGP routing information into OSPF.

```
[SwitchC] ospf 1
[SwitchC-ospf-1] import-route bgp
[SwitchC-ospf-1] quit
```

4. Configure MSDP peers and static RPF peers:

On Switch A, configure Switch D and Switch G as the MSDP peers and static RPF peers.

```
[SwitchA] ip prefix-list list-dg permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchA] msdp
[SwitchA-msdp] peer 10.110.4.2 connect-interface vlan-interface 100
[SwitchA-msdp] static-rpf-peer 10.110.4.2 rp-policy list-dg
[SwitchA-msdp] quit
```

On Switch D, configure Switch A as the MSDP peer and static RPF peer.

```
[SwitchD] ip prefix-list list-a permit 10.110.0.0 16 greater-equal 16 less-equal 32
[SwitchD] msdp
[SwitchD-msdp] peer 10.110.1.2 connect-interface vlan-interface 100
[SwitchD-msdp] static-rpf-peer 10.110.1.2 rp-policy list-a
[SwitchD-msdp] quit
```

Verifying the configuration

Display the BGP peering relationships on Switch A.

```
[SwitchA] display bgp peer
```

No information is output, because no BGP peering relationship has been established between Switch A and Switch D. This means that the unicast topology is not changed.

Display brief information about MSDP peers on Switch A.

```
[SwitchA] display msdp brief
Configured    Established  Listen       Connect      Shutdown     Disabled
1             1            0            0            0            0

Peer address     State       Up/Down time    AS         SA count    Reset count
10.110.4.2       Established 01:07:08        ?          8           0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured    Established  Listen       Connect      Shutdown     Disabled
1             1            0            0            0            0

Peer address     State       Up/Down time    AS         SA count    Reset count
10.110.1.2       Established 01:07:09        ?          8           0
```

Example: Configuring Anycast RP

Network configuration

As shown in Figure 7, OSPF runs within the domain to provide unicast routes.

Configure the Anycast RP application so that the receiver-side DRs and the source-side DRs can initiate a join process to their respective RPs that are topologically closest to them.

Configure the router IDs of Switch B and Switch D as 1.1.1.1 and 2.2.2.2, respectively. Set up an MSDP peering relationship between Switch B and Switch D.

Figure 7 Network diagram

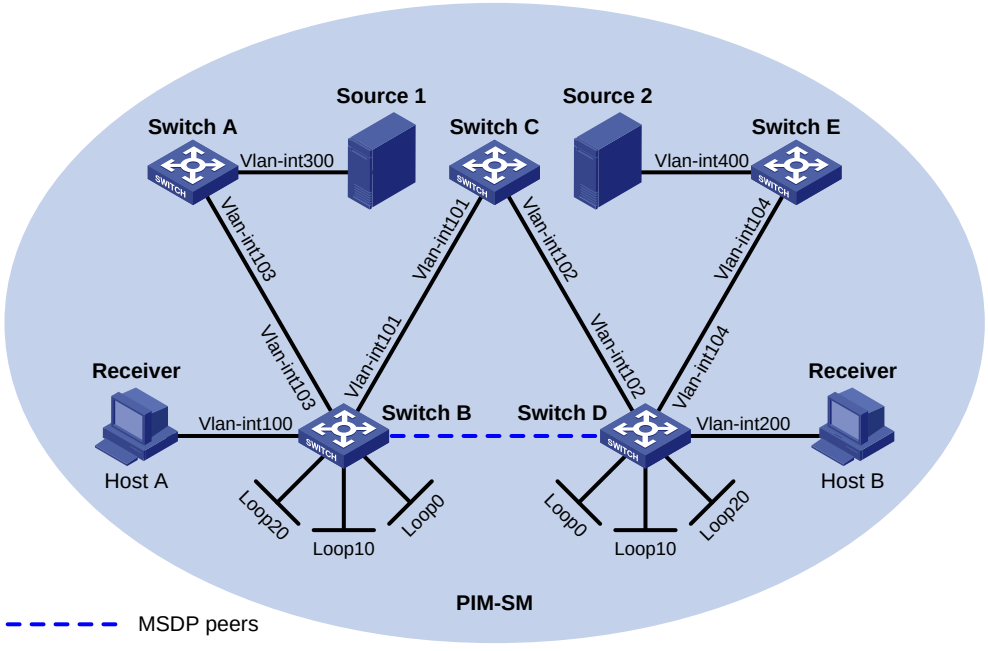

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.5.100/24	Switch C	Vlan-int101	192.168.1.2/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int102	192.168.2.2/24

Device	Interface	IP address	Device	Interface	IP address
Switch A	Vlan-int300	10.110.5.1/24	Switch D	Vlan-int200	10.110.3.1/24
Switch A	Vlan-int103	10.110.2.2/24	Switch D	Vlan-int104	10.110.4.1/24
Switch B	Vlan-int100	10.110.1.1/24	Switch D	Vlan-int102	192.168.2.1/24
Switch B	Vlan-int103	10.110.2.1/24	Switch D	Loop0	2.2.2.2/32
Switch B	Vlan-int101	192.168.1.1/24	Switch D	Loop10	4.4.4.4/32
Switch B	Loop0	1.1.1.1/32	Switch D	Loop20	10.1.1.1/32
Switch B	Loop10	3.3.3.3/32	Switch E	Vlan-int400	10.110.6.1/24
Switch B	Loop20	10.1.1.1/32	Switch E	Vlan-int104	10.110.4.2/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 7, and configure OSPF on the switches.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM:

On Switch B, enable IP multicast routing.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable IGMP on the receiver-side interface (VLAN-interface 100).

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] igmp enable
[SwitchB-Vlan-interface100] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchB] interface vlan-interface 103
[SwitchB-Vlan-interface103] pim sm
[SwitchB-Vlan-interface103] quit
[SwitchB] interface Vlan-interface 101
[SwitchB-Vlan-interface101] pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] pim sm
[SwitchB-LoopBack0] quit
[SwitchB] interface loopback 10
[SwitchB-LoopBack10] pim sm
[SwitchB-LoopBack10] quit
[SwitchB] interface loopback 20
[SwitchB-LoopBack20] pim sm
[SwitchB-LoopBack20] quit
```

Enable IP multicast routing, IGMP, and PIM-SM on Switch A, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

Configure Loopback 10 as a C-BSR and Loopback 20 as a C-RP on Switch B.

```
[SwitchB] pim
[SwitchB-pim] c-bsr 3.3.3.3
```

```
[SwitchB-pim] c-rp 10.1.1.1
[SwitchB-pim] quit
```

Configure a C-BSR and a C-RP on Switch D in the same way Switch B is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Loopback 0 of Switch B.

```
[SwitchB] msdp
[SwitchB-msdp] originating-rp loopback 0
[SwitchB-msdp] peer 2.2.2.2 connect-interface loopback 0
[SwitchB-msdp] quit
```

Configure an MSDP peer on Loopback 0 of Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] originating-rp loopback 0
[SwitchD-msdp] peer 1.1.1.1 connect-interface loopback 0
[SwitchD-msdp] quit
```

Verifying the configuration

Display brief information about MSDP peers on Switch B.

```
[SwitchB] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
2.2.2.2         Established 00:10:57        ?          0          0
```

Display brief information about MSDP peers on Switch D.

```
[SwitchD] display msdp brief
Configured   Established  Listen       Connect      Shutdown     Disabled
1            1            0            0            0            0

Peer address    State       Up/Down time    AS         SA count   Reset count
1.1.1.1         Established 00:10:57        ?          0          0
```

Send an IGMP report from Host A to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from Source 1 to multicast group 225.1.1.1. (Details not shown.)

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table
```

No information is output on Switch D.

Display the PIM routing table on Switch B.

```
[SwitchB] display pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, 225.1.1.1)
     RP: 10.1.1.1 (local)
     Protocol: pim-sm, Flag: WC
     UpTime: 00:15:04
     Upstream interface: Register-Tunnel0
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
```

```
    Downstream interface(s) information:
    Total number of downstream interfaces: 1

```

The output shows that Switch B now acts as the RP for Source 1 and Host A.

Send an IGMP leave message from Host A to leave multicast group 225.1.1.1. (Details not shown.),

Send an IGMP report from Host B to join multicast group 225.1.1.1. (Details not shown.)

Send multicast data from Source 2 to multicast group 225.1.1.1. (Details not shown.)

Display the PIM routing table on Switch B.

```
[SwitchB] display pim routing-table
```

No information is output on Switch B.

Display the PIM routing table on Switch D.

```
[SwitchD] display pim routing-table

    1: Vlan-interface200
        Protocol: pim-sm, UpTime:  - , Expires:  -
```

The output shows that Switch D now acts as the RP for Source 2 and Host B.

Example: Configuring SA message filtering

Network configuration

As shown in Figure 8:

- OSPF runs within and among the PIM-SM domains to provide unicast routing.
- Set up an MSDP peering relationship between Switch A and Switch C and between Switch C and Switch D.
- Source 1 sends multicast data to multicast groups 225.1.1.0/30 and 226.1.1.0/30, and Source 2 sends multicast data to the multicast group 227.1.1.0/30.

Configure SA message policies so that:

- Host A and Host B receive the multicast data only addressed to multicast groups 225.1.1.0/30 and 226.1.1.0/30.
- Host C receives the multicast data only addressed to multicast groups 226.1.1.0/30 and 227.1.1.0/30.

Figure 8 Network diagram

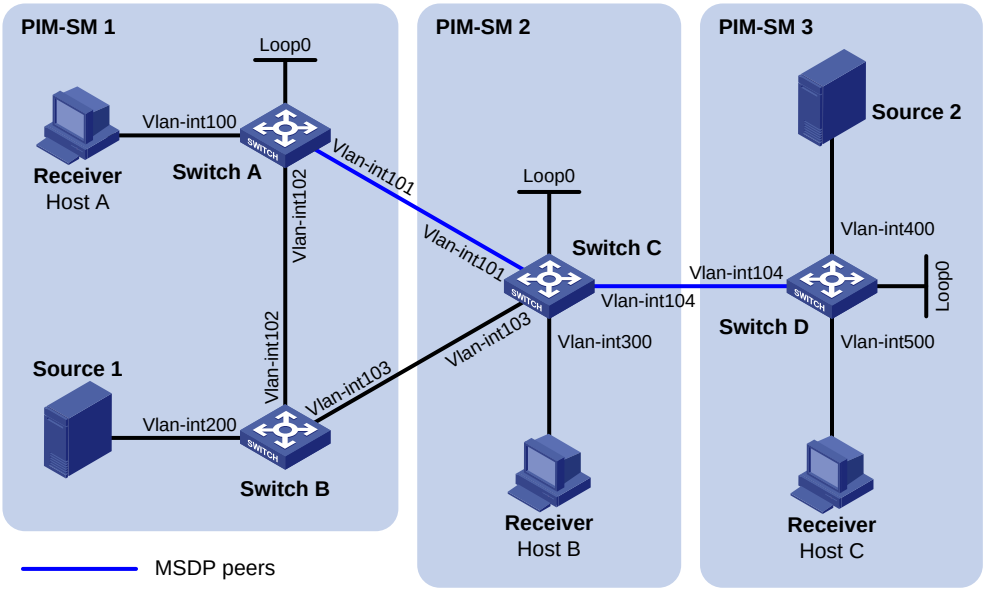

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	10.110.3.100/24	Switch C	Vlan-int300	10.110.4.1/24
Source 2	—	10.110.6.100/24	Switch C	Vlan-int104	10.110.5.1/24
Switch A	Vlan-int100	10.110.1.1/24	Switch C	Vlan-int101	192.168.1.2/24
Switch A	Vlan-int102	10.110.2.1/24	Switch C	Vlan-int103	192.168.2.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Loop0	2.2.2.2/32

Device	Interface	IP address	Device	Interface	IP address
Switch A	Loop0	1.1.1.1/32	Switch D	Vlan-int400	10.110.6.1/24
Switch B	Vlan-int200	10.110.3.1/24	Switch D	Vlan-int500	10.110.7.1/24
Switch B	Vlan-int102	10.110.2.2/24	Switch D	Vlan-int104	10.110.5.2/24
Switch B	Vlan-int103	192.168.2.1/24	Switch D	Loop0	3.3.3.3/32

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 8, and configure OSPF on the switches in the PIM-SM domains.

Procedure

1. Enable IP multicast routing, IGMP, and PIM-SM, and configure PIM domain borders:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on the receiver-side interface (VLAN-interface 100).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-SM on the other interfaces.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim sm
   [SwitchA-Vlan-interface101] quit
   [SwitchA] interface vlan-interface 102
   [SwitchA-Vlan-interface102] pim sm
   [SwitchA-Vlan-interface102] quit
   [SwitchA] interface loopback 0
   [SwitchA-LoopBack0] pim sm
   [SwitchA-LoopBack0] quit
   ```

   # Enable IP multicast routing, IGMP, and PIM-SM on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

   # Configure a PIM domain border on Switch C.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] pim bsr-boundary
   [SwitchC-Vlan-interface101] quit
   [SwitchC] interface vlan-interface 103
   [SwitchC-Vlan-interface103] pim bsr-boundary
   [SwitchC-Vlan-interface103] quit
   [SwitchC] interface vlan-interface 104
   [SwitchC-Vlan-interface104] pim bsr-boundary
   [SwitchC-Vlan-interface104] quit
   ```

   # Configure PIM domain borders on Switch A, Switch B, and Switch D in the same way Switch C is configured. (Details not shown.)

2. Configure C-BSRs and C-RPs:

   # Configure Loopback 0 as a C-BSR and a C-RP on Switch A.

   ```
   [SwitchA] pim
   ```

```
[SwitchA-pim] c-bsr 1.1.1.1
[SwitchA-pim] c-rp 1.1.1.1
[SwitchA-pim] quit
```

Configure C-BSRs and C-RPs on Switch C and Switch D in the same way Switch A is configured. (Details not shown.)

3. Configure MSDP peers:

Configure an MSDP peer on Switch A.

```
[SwitchA] msdp
[SwitchA-msdp] peer 192.168.1.2 connect-interface vlan-interface 101
[SwitchA-msdp] quit
```

Configure MSDP peers on Switch C.

```
[SwitchC] msdp
[SwitchC-msdp] peer 192.168.1.1 connect-interface vlan-interface 101
[SwitchC-msdp] peer 10.110.5.2 connect-interface vlan-interface 104
[SwitchC-msdp] quit
```

Configure an MSDP peer on Switch D.

```
[SwitchD] msdp
[SwitchD-msdp] peer 10.110.5.1 connect-interface vlan-interface 104
[SwitchD-msdp] quit
```

4. Configure SA message policies:

Configure an SA accepting and forwarding policy on Switch C so that Switch C will not forward SA messages for (Source 1, 225.1.1.0/30) to Switch D.

```
[SwitchC] acl advanced 3001
[SwitchC-acl-ipv4-adv-3001] rule deny ip source 10.110.3.100 0 destination 225.1.1.0
0.0.0.3
[SwitchC-acl-ipv4-adv-3001] rule permit ip source any destination any
[SwitchC-acl-ipv4-adv-3001] quit
[SwitchC] msdp
[SwitchC-msdp] peer 10.110.5.2 sa-policy export acl 3001
[SwitchC-msdp] quit
```

Configure an SA creation policy on Switch D so that Switch D will not create SA messages for Source 2.

```
[SwitchD] acl basic 2001
[SwitchD-acl-ipv4-basic-2001] rule deny source 10.110.6.100 0
[SwitchD-acl-ipv4-basic-2001] quit
[SwitchD] msdp
[SwitchD-msdp] import-source acl 2001
[SwitchD-msdp] quit
```

Verifying the configuration

Display the (S, G) entries in the SA message cache on Switch C.

```
[SwitchC] display msdp sa-cache
 MSDP Total Source-Active Cache - 8 entries
 Matched 8 entries

Source        Group          Origin RP       Pro  AS     Uptime   Expires

Troubleshooting MSDP

This section describes common MSDP problems and how to troubleshoot them.

MSDP peers stay in disabled state

Symptom

The configured MSDP peers stay in disabled state.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Use the **display current-configuration** command to verify that the local interface address and the MSDP peer address of the remote device are the same.
4. If the problem persists, contact H3C Support.

No SA entries exist in the device's SA message cache

Symptom

MSDP fails to send (S, G) entries through SA messages.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will become MSDP peers to each other.
3. Verify the configuration of the **import-source** command and its *ipv4-acl-number* argument, and make sure the ACL rule filters appropriate (S, G) entries.

4. If the problem persists, contact H3C Support.

No exchange of locally registered (S, G) entries between RPs

Symptom

RPs fail to exchange their locally registered (S, G) entries with one another in the Anycast RP application.

Solution

To resolve the problem:

1. Use the **display ip routing-table** command to verify that the unicast route between the devices is reachable.
2. Verify that a unicast route is available between the two devices that will establish an MSDP peering relationship.
3. Verify the configuration of the **originating-rp** command. In the Anycast RP application environment, use the **originating-rp** command to configure the RP address in the SA messages, which must be the local interface address.
4. Verify that the C-BSR address is different from the Anycast RP address.
5. If the problem persists, contact H3C Support.

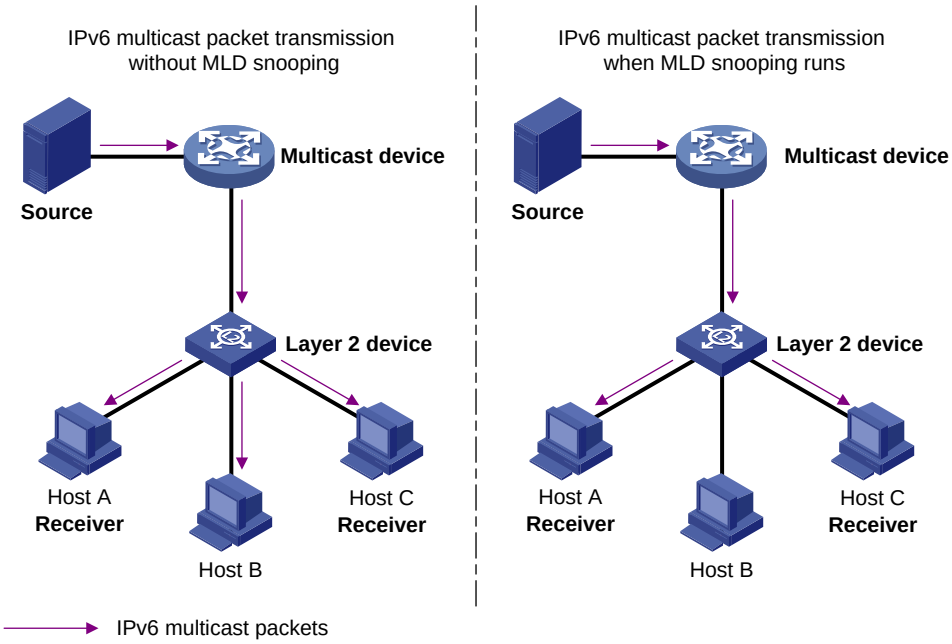
Configuring MLD snooping



About MLD snooping

MLD snooping runs on a Layer 2 device as an IPv6 multicast constraining mechanism to improve multicast forwarding efficiency. It creates Layer 2 multicast forwarding entries from MLD messages that are exchanged between the hosts and the Layer 3 device.

Fundamentals of MLD snooping

As shown in Figure 1, when MLD snooping is not enabled, the Layer 2 switch floods IPv6 multicast packets all hosts in a VLAN or VSI. When MLD snooping is enabled, the Layer 2 switch forwards multicast packets of known IPv6 multicast groups to only the receivers.

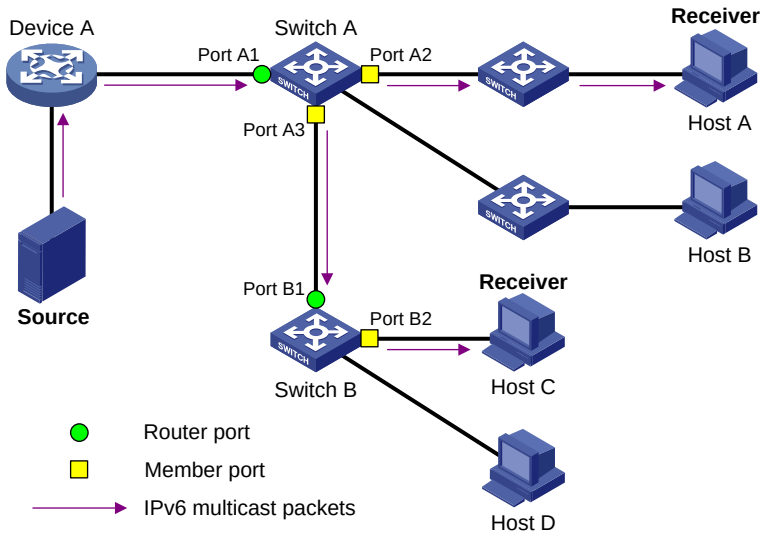


Figure 1 Multicast packet transmission processes without and with MLD snooping

MLD snooping ports

As shown in Figure 2, MLD snooping runs on Switch A and Switch B, and Host A and Host C are receiver hosts in an IPv6 multicast group. MLD snooping ports are divided into member ports and router ports.

Figure 2 MLD snooping ports

Router ports

On an MLD snooping Layer 2 device, the ports toward Layer 3 multicast devices are called router ports. In Figure 2, Port A1 of Switch A and Port B1 of Switch B are router ports.

Router ports contain the following types:

- **Dynamic router port**—When a port receives an MLD general query whose source address is not 0::0 or receives an IPv6 PIM hello message, the port is added into the dynamic router port list. At the same time, an aging timer is started for the port. If the port receives an MLD general query whose source address is not 0::0 or an IPv6 PIM hello message before the timer expires, the timer is reset. If the port does not receive either of the messages when the timer expires, the port is removed from the dynamic router port list.
- **Static router port**—When a port is statically configured as a router port, it is added into the static router port list. The static router port does not age out, and it can be deleted only manually.

Do not confuse the "router port" in MLD snooping with the "routed interface" commonly known as the "Layer 3 interface." The router port in MLD snooping is a Layer 2 interface.

Member ports

On an MLD snooping Layer 2 device, the ports toward receiver hosts are called member ports. In Figure 2, Port A2 and Port A3 of Switch A and Port B2 of Switch B are member ports.

Member ports contain the following types:

- **Dynamic member port**—When a port receives an MLD report, it is added to the associated dynamic MLD snooping forwarding entry as an outgoing interface. At the same time, an aging timer is started for the port. If the port receives an MLD report before the timer expires, the timer is reset. If the port does not receive an MLD report when the timer expires, the port is removed from the associated dynamic forwarding entry.
- **Static member port**—When a port is statically configured as a member port, it is added to the associated static MLD snooping forwarding entry as an outgoing interface. The static member port does not age out, and it can be deleted only manually.

Unless otherwise specified, router ports and member ports in this document include both static and dynamic router ports and member ports.

How MLD snooping works

The ports in this section are dynamic ports. For information about how to configure and remove static ports, see "Configuring a static member port" and "Configuring a static router port."

MLD messages include general query, MLD report, and done message. An MLD snooping-enabled Layer 2 device performs differently depending on the MLD message types.

General query

The MLD querier periodically sends MLD general queries to all hosts and devices on the local subnet to check for the existence of IPv6 multicast group members.

After receiving an MLD general query, the Layer 2 device forwards the query to all ports in the VLAN or VSI except the receiving port. The Layer 2 device also performs one of the following actions:

- If the receiving port is a dynamic router port in the dynamic router port list, the Layer 2 device restarts the aging timer for the router port.
- If the receiving port does not exist in the dynamic router port list, the Layer 2 device adds the port to the dynamic router port list. It also starts an aging timer for the port.

MLD report

A host sends an MLD report to the MLD querier for the following purposes:

- Responds to queries if the host is an IPv6 multicast group member.
- Applies for an IPv6 multicast group membership.

After receiving an MLD report from a host, the Layer 2 device forwards the report through all the router ports in the VLAN or VSI. It also resolves the IPv6 address of the reported IPv6 multicast group, and looks up the forwarding table for a matching entry as follows:

- If no match is found, the Layer 2 device creates a forwarding entry for the group with the receiving port an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
- If a match is found but the matching forwarding entry does not contain the receiving port, the Layer 2 device adds the receiving port to the outgoing interface list. It also marks the port as a dynamic member port to the forwarding entry and starts an aging timer for the port.
- If a match is found and the matching forwarding entry contains the receiving port, the Layer 2 device restarts the aging timer for the port.

NOTE:

A Layer 2 device does not forward an MLD report through a non-router port because of the host MLD report suppression mechanism. If a non-router port has member host attached, the member hosts suppress their MLD reports upon receiving MLD reports forwarded by the non-router port. The Layer 2 device cannot know the existence of the member hosts attached to the non-router port. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Done message

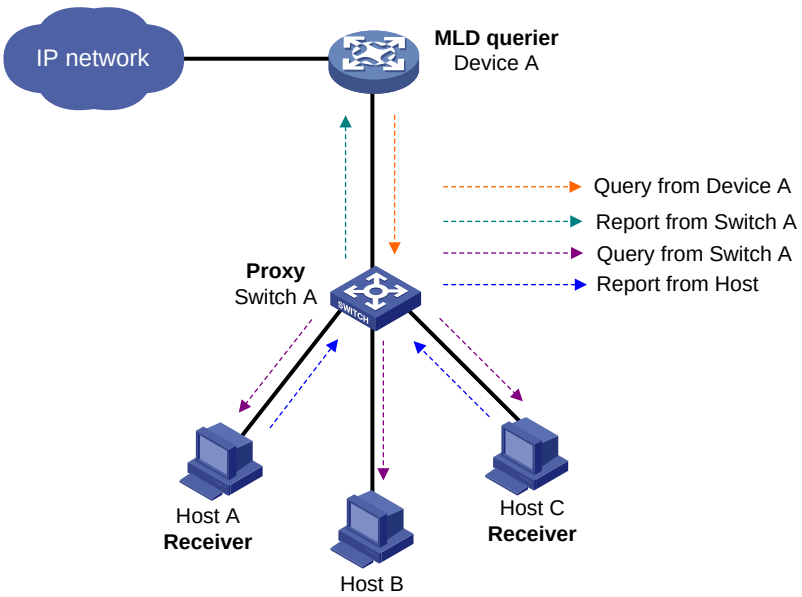
When a host leaves an IPv6 multicast group, the host sends an MLD done message to the Layer 3 devices. When the Layer 2 device receives the MLD done message on a dynamic member port, the Layer 2 device first examines whether a forwarding entry matches the IPv6 multicast group address in the message.

- If no match is found, the Layer 2 device discards the MLD done message.
- If a match is found but the receiving port is not an outgoing interface in the forwarding entry, the Layer 2 device discards the MLD done message.
- If a match is found and the receiving port is not the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:

- Discards the MLD done message.
- Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
- Sets the aging timer for the receiving port to twice the MLD last listener query interval.

- If a match is found and the receiving port is the only outgoing interface in the forwarding entry, the Layer 2 device performs the following actions:
  - Forwards the MLD done message to all router ports in the VLAN or VSI.
  - Sends an MLD multicast-address-specific query to identify whether the group has active listeners attached to the receiving port.
  - Sets the aging timer for the receiving port to twice the MLD last listener query interval.

After receiving the MLD done message on a port, the MLD querier resolves the IPv6 multicast group address in the message. Then, it sends an MLD multicast-address-specific query to the IPv6 multicast group through the receiving port.



After receiving the MLD multicast-address-specific query, the Layer 2 device forwards the query through all router ports and member ports of the group in the VLAN or VSI. Then, it waits for the responding MLD report from the directly connected hosts. For the dynamic member port that received the done message, the Layer 2 device also performs one of the following actions:

- If the port receives an MLD report before the aging timer expires, the Layer 2 device resets the aging timer for the port.
- If the port does not receive any MLD report messages when the aging timer expires, the Layer 2 device removes the port from the forwarding entry for the IPv6 multicast group.

MLD snooping proxying

As shown in Figure 3, to reduce the number of MLD report and done messages received by the upstream device, you can enable MLD snooping proxying on the edge device. With MLD snooping proxying enabled, the edge device acts as a host for the upstream MLD snooping querier to send MLD report and done messages to Device A. The host MLD report suppression mechanism on the edge device does not take effect. For more information about the MLD report suppression mechanism, see "Configuring MLD."

Figure 3 MLD snooping proxying

The MLD snooping proxy device processes different MLD messages as follows:

- General query.

  After receiving an MLD general query, the device forwards the query to all ports in the VLAN or VSI except the receiving port. The device also generates an MLD report based on the local membership information and sends the report to all router ports.

- Multicast-address-specific query or multicast-address-and-source-specific query.

  After receiving an MLD multicast-address-specific query or multicast-address-and-source-specific query, the device forwards the query to all ports in the VLAN or VSI except the receiving port. If the forwarding entry has a member port, the device sends a response to all router ports in the VLAN or VSI.

- Report.

  After receiving an MLD report from a host, the device looks up the forwarding table for a matching entry as follows:

  - If a match is found and the matching forwarding entry contains the receiving port, the device resets the aging timer for the port.
  - If a match is found but the matching forwarding entry does not contain the receiving port, the device adds the receiving port to the outgoing interface list. It also marks the receiving port as a dynamic member port and starts an aging timer for the port.
  - If no match is found, the device creates a forwarding entry with the receiving port as an outgoing interface. It also marks the receiving port as a dynamic member port and starts an aging timer for the port. Then it sends the report to all router ports.

- Done message.

  After receiving the MLD done message on a port, the device sends an MLD multicast-address-specific query through the receiving port. The device sends the MLD done message to all router ports only when the last member port is removed from the forwarding entry.

Protocols and standards

RFC 4541, *Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches*

Restrictions and guidelines: MLD snooping configuration

For MLD reports received from secondary VLANs, the relevant MLD snooping forwarding entries are maintained by the primary VLAN. Therefore, you need to enable MLD snooping only for the primary VLAN. The configuration made in secondary VLANs will not take effect..

The MLD snooping configurations made on Layer 2 aggregate interfaces do not interfere with the configurations made on member ports. In addition, the configurations made on Layer 2 aggregate interfaces do not take part in aggregation calculations. The configuration made on a member port of the aggregate group takes effect after the port leaves the aggregate group.

Some features can be configured for a VLAN in VLAN view or for multiple VLANs in MLD-snooping view. The VLAN-specific configuration and the configuration made in MLD-snooping view have the same priority, and the most recent configuration takes effect.

Some features can be configured for a VLAN in VLAN view or globally for all VLANs in MLD-snooping view. The VLAN-specific configuration takes priority over the global configuration.

Some features can be configured for a VSI in VSI view or globally for all VSIs in MLD-snooping view. The VSI-specific configuration takes priority over the global configuration.

Some features can be configured for an interface in interface view or for all interfaces of the specified VLANs in MLD-snooping view. The interface-specific configuration takes priority over the configuration made in MLD-snooping view.

VLAN-based MLD snooping tasks at a glance

To configure MLD snooping for VLANs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:
   - Enabling MLD snooping globally
   - Enabling MLD snooping for VLANs
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Configuring static IPv6 multicast MAC address entries
   - Setting the MLD last listener query interval
4. (Optional.) Configuring MLD snooping port features
   - Setting aging timers for dynamic ports
   - Configuring a static member port
   - Configuring a static router port
   - Configuring a port as a simulated member host
   - Enabling fast-leave processing
   - Disabling a port from becoming a dynamic router port
   - Preventing the device from forwarding multicast data to router ports in a VLAN
5. (Optional.) Specifying the Layer 2 IPv6 multicast forwarding mode
6. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
   - Enabling the device to send MLD general queries upon a path change
   - Enabling the device to send MLD general queries upon a port state change
7. (Optional.) Enabling MLD snooping proxying
8. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
9. (Optional.) Configuring MLD snooping policies
   - Configuring an IPv6 multicast group policy
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
   - Setting the maximum number of IPv6 multicast groups on a port
   - Enabling IPv6 multicast group replacement
   - Enabling host tracking
10. (Optional.) Setting the DSCP value for outgoing MLD protocol packets

11. (Optional.) Enabling SNMP notifications for MLD snooping
12. (Optional.) Configuring MLD snooping logging
    - Enabling MLD snooping logging
    - Enabling MLD snooping logging suppression

VSI-based MLD snooping tasks at a glance

To configure MLD snooping for VSIs, perform the following tasks:

1. Enabling the MLD snooping feature
2. Enabling MLD snooping

   Choose the following tasks as needed:
   - Enabling MLD snooping globally
   - Enabling MLD snooping for a VSI
3. (Optional.) Configuring basic MLD snooping features
   - Specifying an MLD snooping version
   - Setting the maximum number of MLD snooping forwarding entries
   - Setting the MLD last listener query interval
4. (Optional.) Setting aging timers for dynamic ports
5. (Optional.) Configuring the MLD snooping querier
   - Enabling the MLD snooping querier
   - Enabling MLD snooping querier election
   - Configuring parameters for MLD general queries and responses
   - Enabling the device to send MLD general queries upon a path change
6. (Optional.) Enabling MLD snooping proxying
7. (Optional.) Configuring parameters for MLD messages
   - Configuring source IPv6 addresses for MLD messages
   - Setting the 802.1p priority for MLD messages
8. (Optional.) Configuring MLD snooping policies
   - Enabling dropping unknown IPv6 multicast data
   - Enabling MLD report suppression
9. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
10. (Optional.) Enabling SNMP notifications for MLD snooping
11. (Optional.) Configuring MLD snooping logging
    - Enabling MLD snooping logging
    - Enabling MLD snooping logging suppression

Enabling the MLD snooping feature

About this task

You must enable the MLD snooping feature before you configure other MLD snooping features.

Procedure

1. Enter system view.

   `system-view`

2. Enable the MLD snooping feature and enter MLD-snooping view.

   mld-snooping

   By default, the MLD snooping feature is disabled.

Enabling MLD snooping

Enabling MLD snooping globally

About this task

After you enable MLD snooping globally, MLD snooping is enabled for all VLANs or VSIs. You can disable MLD snooping for a VLAN or VSI when MLD snooping is globally enabled.

Restrictions and guidelines

To configure other MLD snooping features for VLANs or VSIs, you must enable MLD snooping for the specific VLANs or VSIs even though MLD snooping is enabled globally.

The VLAN-specific or VSI-specific MLD snooping configuration takes priority over the global MLD snooping configuration. For example, if you enable MLD snooping globally and then use the **mld-snooping disable** command to disable MLD snooping for a VLAN, MLD snooping is disabled in the VLAN.

Procedure

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Enable MLD snooping globally.
4. **global-enable**

   By default, MLD snooping is disabled globally.

5. (Optional.) Disable MLD snooping for a VLAN or VSI.
   a. Return to system view.

      quit

   b. Enter VLAN or VSI view.

      vlan *vlan-id*

      vsi *vsi-name*

   c. Disable MLD snooping for the VLAN or VSI.

      mld-snooping disable

      By default, the MLD snooping status in a VLAN or VSI is consistent with the global MLD snooping status.

Enabling MLD snooping for VLANs

Restrictions and guidelines

You can enable MLD snooping for multiple VLANs by using the **enable vlan** command in MLD-snooping view or for a VLAN by using the **mld-snooping enable** command in VLAN view. The configuration in VLAN view has the same priority as the configuration in MLD-snooping view.

MLD snooping configuration in a VLAN takes effect only on the member ports in the VLAN.

Enabling MLD snooping for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable MLD snooping for multiple VLANs.
   enable vlan *vlan-list*
   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping for the VLAN.
   mld-snooping enable
   By default, the MLD snooping status in a VLAN is consistent with the global MLD snooping status.

Enabling MLD snooping for a VSI

Restrictions and guidelines

For VSIs, you can only enable MLD snooping for a VSI by using the **mld-snooping enable** command in VSI view.

MLD snooping configuration in a VSI takes effect only on the member ports in the VSI.

On an EVPN M-LAG network, you must enable both MLD snooping and MLD snooping proxying for VSIs. For more information about EVPN M-LAG, see EVPN VXLAN configuration in *EVPN Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable MLD snooping for the VSI.
   mld-snooping enable
   By default, the MLD snooping status in a VSI is consistent with the global MLD snooping status.

Configuring basic MLD snooping features

Specifying an MLD snooping version

About this task

Different MLD snooping versions can process different versions of MLD messages:

- MLDv1 snooping can process MLDv1 messages and MLDv2 queries, but it floods MLDv2 reports in the VLAN or VSI instead of processing them.
- MLDv2 snooping can process MLDv1 and MLDv2 messages.

Restrictions and guidelines

If you change the version of MLD snooping from 2 to 1, the system performs the following actions:

- Clears all MLD snooping forwarding entries that are dynamically created.
- Keeps static MLDv2 snooping forwarding entries (*, G).
- Clears static MLDv2 snooping forwarding entries (S, G), which will be restored when MLD snooping is switched back to MLDv2 snooping.

For more information about static MLD snooping forwarding entries, see "Configuring a static member port."

Specifying an MLD snooping version for multiple VLANs

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Specify an MLD snooping version for multiple VLANs.
   version *version-number* **vlan** *vlan-list*
   By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify an MLD snooping version for the VLAN.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VLAN is 1.

Specifying an MLD snooping version for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Specify an MLD snooping version for the VSI.
   mld-snooping version *version-number*
   By default, the MLD snooping version for a VSI is 1.

Setting the maximum number of MLD snooping forwarding entries

About this task

You can modify the maximum number of MLD snooping forwarding entries, including dynamic entries and static entries. When the number of forwarding entries on the device reaches the upper

limit, the device does not automatically remove any existing entries. To allow new entries to be created, remove some entries manually.

Procedure

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the maximum number of MLD snooping forwarding entries.
   entry-limit *limit*
   By default, the maximum number of MLD snooping forwarding entries is 4294967295.

Configuring static IPv6 multicast MAC address entries

About this task

In Layer 2 IPv6 multicast, IPv6 multicast MAC address entries can be dynamically created through Layer 2 multicast protocols (such as MLD snooping). You can also manually configure static IPv6 multicast MAC address entries by binding IPv6 multicast MAC addresses and ports to control the destination ports of the IPv6 multicast data.

Restrictions and guidelines

You must specify an unused multicast MAC address when configuring a static IPv6 multicast MAC address entry. A multicast MAC address is the MAC address in which the least significant bit of the most significant octet is 1.

Configuring a static IPv6 multicast MAC address entry in system view

1. Enter system view.
   system-view
2. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **interface** *interface-list* **vlan** *vlan-id*

Configuring a static IPv6 multicast MAC address entry in interface view

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure a static IPv6 multicast MAC address entry.
   mac-address multicast *mac-address* **vlan** *vlan-id*

Setting the MLD last listener query interval

About this task

A receiver host starts a report delay timer for an IPv6 multicast group when it receives an MLD multicast-address-specific query for the group. This timer is set to a random value in the range of 0 to

the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the group.

The MLD last listener query interval defines the maximum response time advertised in MLD multicast-address-specific queries. Set an appropriate value for the MLD last listener query interval to speed up hosts' responses to MLD multicast-address-specific queries and avoid MLD report traffic bursts.

Setting the MLD last listener query interval globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the MLD last listener query interval globally.
   last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.

Setting the MLD last listener query interval for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the MLD last listener query interval for the VLAN
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VLAN.

Setting the MLD last listener query interval for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Set the MLD last listener query interval for the VSI.
   mld-snooping last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second for a VSI.

Configuring MLD snooping port features

Setting aging timers for dynamic ports

About this task

A dynamic router port is removed from the dynamic router port list if it does not receive an MLD general query or IPv6 PIM hello message when its aging timer expires.

A dynamic member port is removed from the dynamic member port if it does not receive an MLD report when its aging timer expires.

Restrictions and guidelines

Set an appropriate value for the aging timers of dynamic ports based on the actual network requirement. For example, if the memberships of IPv6 multicast groups frequently change, set a relatively small value for the aging timer of the dynamic member ports.

If a dynamic router port receives an IPv6 PIMv2 hello message, the aging timer for the port is specified by the hello message. In this case, the **mld-snooping router-aging-time** command does not take effect on the port.

MLD multicast-address-specific queries originated by the Layer 2 device trigger the adjustment of aging timers of dynamic member ports. If a dynamic member port receives such a query, its aging timer is set to twice the MLD last listener query interval. For more information about setting the MLD last listener query interval on the Layer 2 device, see "Setting the MLD last listener query interval."

Setting the aging timers for dynamic ports globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Set the aging timer for dynamic router ports globally.
   router-aging-time *seconds*
   By default, the aging timer for dynamic router ports is 260 seconds.
4. Set the aging timer for dynamic member ports globally.
   host-aging-time *seconds*
   By default, the aging timer for dynamic member ports is 260 seconds.

Setting the aging timers for dynamic ports in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Set the aging timer for dynamic router ports in the VLAN.
   mld-snooping router-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic router ports.
4. Set the aging timer for dynamic member ports in the VLAN.
   mld-snooping host-aging-time *seconds*
   By default, a VLAN uses the global aging timer for dynamic member ports.

Setting the aging timers for dynamic ports in a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Set the aging timer for dynamic router ports in the VSI.
   mld-snooping router-aging-time *seconds*
   By default, a VSI uses the global aging timer for dynamic router ports.
4. Set the aging timer for dynamic member ports in the VSI.
   mld-snooping host-aging-time *seconds*
   By default, a VSI uses the global aging timer for dynamic member ports.

Configuring a static member port

About this task

You can configure a port as a static member port for an IPv6 multicast group so that all hosts attached to the port can always receive IPv6 multicast data for the group. The static member port does not respond to MLD queries. When you complete or cancel this configuration, the port does not send an unsolicited report or done message.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static member port.
   mld-snooping static-group *ipv6-group-address* [**source-ip** *ipv6-source-address*] { **vlan** *vlan-id* | **service-instance** *instance-id* }
   By default, a port is not a static member port.

Configuring a static router port

About this task

You can configure a port as a static router port for an IPv6 multicast group so that all IPv6 multicast data for the group received on the port will be forwarded.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a static router port.
   mld-snooping static-router-port vlan *vlan-id*
   By default, a port is not a static router port.

Configuring a port as a simulated member host

About this task

When a port is configured as a simulated member host, it is equivalent to an independent host in the following ways:

- It sends an unsolicited MLD report when you complete the configuration.
- It responds to MLD general queries with MLD reports.

- It sends an MLD done message when you remove the configuration.

The version of MLD running on the simulated member host is the same as the version of MLD snooping running on the port. The port ages out in the same ways as a dynamic member port.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure the port as a simulated member host.
   mld-snooping host-join *ipv6-group-address* [**source-ip** *ipv6-source-address*] **vlan** *vlan-id*
   By default, the port is not a simulated member host.

Enabling fast-leave processing

About this task

This feature enables the Layer 2 device to immediately remove a port from the forwarding entry for an IPv6 multicast group when the port receives a done message. The device no longer sends or forwards MLD multicast-address-specific queries for the group to the port.

Restrictions and guidelines

Do not enable fast-leave processing on a port that has multiple receiver hosts attached in a VLAN. If you do so, the remaining receivers cannot receive IPv6 multicast data for a group after a receiver leaves the group.

As a best practice to avoid multicast service interruption on other ports in the same VLAN, enable only MLD snooping fast-leave processing on a port on a network configured with both MLD snooping and MLD. Do not use the **mld fast-leave** command to enable MLD fast-leaving processing.

Enabling fast-leave processing globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable fast-leave processing globally.
   fast-leave [**vlan** *vlan-list*]
   By default, fast-leave processing is disabled globally.

Enabling fast-leave processing on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

interface bridge-aggregation *interface-number*

3. Enable fast-leave processing on the port.

   mld-snooping fast-leave [**vlan** *vlan-list*]

   By default, fast-leave processing is disabled on a port.

Disabling a port from becoming a dynamic router port

About this task

A receiver host might send MLD general queries or IPv6 PIM hello messages for testing purposes. On the Layer 2 device, the port that receives MLD general queries or IPv6 PIM hello messages becomes a dynamic router port. Before the aging timer for the port expires, the following problems might occur:

- All IPv6 multicast data for the VLAN to which the port belongs flows to the port. Then, the port forwards the data to attached receiver hosts. The receiver hosts will receive IPv6 multicast data that it does not expect.
- The port forwards the MLD general queries or IPv6 PIM hello messages to its upstream Layer 3 devices. These messages might affect the multicast routing protocol state (such as the MLD querier or DR election) on the Layer 3 devices. This might further cause network interruption.

To solve these problems, you can disable the port from becoming a dynamic router port when receiving MLD general queries or IPv6 PIM hello messages. This also improves network security and the control over receiver hosts.

Restrictions and guidelines

This configuration and the static router port configuration do not interfere with each other.

Procedure

1. Enter system view.

   system-view

2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.

     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.

     interface bridge-aggregation *interface-number*
3. Disable the port from becoming a dynamic router port.

   mld-snooping router-port-deny [**vlan** *vlan-list*]

   By default, a port is allowed to become a dynamic router port.

Preventing the device from forwarding multicast data to router ports in a VLAN

About this task

If all ports on an MLD snooping Layer 2 device are statically configured as router ports, the Layer 2 device will forwards multicast data from Layer 3 multicast devices to all its router ports. This wastes bandwidth resources. Perform this task to not forward multicast data to router ports in a VLAN if they are not interested in receiving the data.

Prerequisites

Before performing this task, you must enable MLD snooping in the VLAN.

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Prevent the device from forwarding multicast data to static router ports in the VLAN.
   mld-snooping router-port-discard
   By default, the device forwards multicast data to static router ports in a VLAN.

Specifying the Layer 2 IPv6 multicast forwarding mode

About Layer 2 IPv6 multicast forwarding modes

The device supports the following Layer 2 IPv6 multicast forwarding modes:

- **MAC-based mode**—The device forwards Layer 2 IPv6 multicast packets based on the IPv6 multicast MAC addresses in the packets.
- **IP-based mode**—The device forwards Layer 2 IPv6 multicast packets based on the IPv6 addresses (IPv6 multicast source addresses and IPv6 multicast group addresses) in the packets.

To display Layer 2 IPv6 multicast IP forwarding entries, use the **display ipv6 l2-multicast ip forwarding** command.

To display Layer 2 IPv6 multicast MAC forwarding entries, use the **display ipv6 l2-multicast mac forwarding** command.

Restrictions and guidelines for specifying the Layer 2 IPv6 multicast forwarding mode

Multiple IPv6 multicast addresses might be mapped to the same IPv6 multicast MAC address. This causes that non-members of an IPv6 multicast group receive the multicast data of this IPv6 group if the device uses the MAC-based forwarding mode. As a best practice, specify the IP-based Layer 2 IPv6 multicast forwarding mode on Layer 3 multicast devices.

As a best practice, specify the IP-based Layer 2 IPv6 multicast forwarding mode on the device if a device running MLDv2 exists in the network.

Specifying the Layer 2 IPv6 multicast forwarding mode for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Specify the Layer 2 IPv6 multicast forwarding mode.
   mld-snooping forwarding-mode { **ip** | **mac** }

By default, the device forwards Layer 2 IPv6 multicast packets based on the MAC addresses in the packets.

Configuring the MLD snooping querier

Enabling the MLD snooping querier

About this task

This feature enables the Layer 2 device to periodically send MLD general queries to establish and maintain multicast forwarding entries at the data link Layer. You can configure an MLD snooping querier on a network without Layer 3 multicast devices.

Restrictions and guidelines

Do not enable the MLD snooping querier on an IPv6 multicast network that runs MLD. An MLD snooping querier does not participate in MLD querier elections. However, it might affect MLD querier elections if it sends MLD general queries with a low source IPv6 address. For more information about MLD queries, see "Configuring MLD."

On a VXLAN network, the MLD snooping querier in a VSI does not include VLAN tags in MLD general queries. As a best practice, do not enable the MLD snooping querier in a VSI if the VSI uses the Ethernet access mode. For more information about the Ethernet access mode, see *VXLAN Configuration Guide*.

Enabling the MLD snooping querier for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the MLD snooping querier for the VLAN.
   mld-snooping querier
   By default, the MLD snooping querier is disabled for a VLAN.

Enabling the MLD snooping querier for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable the MLD snooping querier for the VSI.
   mld-snooping querier
   By default, the MLD snooping querier is disabled for a VSI.

Enabling MLD snooping querier election

About this task

To avoid traffic interruption caused by the failure of a single querier in a VLAN or VSI, configure multiple queriers in the VLAN or VSI and enable querier election. When the elected querier fails, the device starts a new querier election to ensure multicast forwarding. The mechanism for MLD snooping querier election is the same as that for MLD querier election. For more information about MLD querier election, see "Configuring MLD."

Prerequisites

Before you enable MLD snooping querier election, you must complete the following tasks:

- Enable the MLD snooping querier for a VLAN or VSI. For more information about enabling the MLD snooping querier, see "Enabling the MLD snooping querier."
- Configure the source IPv6 address for MLD general queries as an IPv6 address different from :: and the local querier IPv6 address. An MLD snooping querier performs querier election only if the source IPv6 address of a received MLD general query is not :: or its own IPv6 address.
- Make sure the candidate MLD snooping queriers run the same MLD snooping version. To specify the MLD snooping version, use the **mld-snooping version** command.

Enabling MLD snooping querier election for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping querier election for the VLAN.
   mld-snooping querier-election
   By default, MLD snooping querier election is disabled for a VLAN.

Enabling MLD snooping querier election for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable MLD snooping querier election for the VSI.
   mld-snooping querier-election
   By default, MLD snooping querier election is disabled for a VSI.

Configuring parameters for MLD general queries and responses

About this task

You can modify the MLD general query interval based on the actual network conditions.

A receiver host starts a report delay timer for each IPv6 multicast group that it has joined when it receives an MLD general query. This timer is set to a random value in the range of 0 to the maximum response time advertised in the query. When the timer value decreases to 0, the host sends an MLD report to the corresponding IPv6 multicast group.

Set an appropriate value for the maximum response time for MLD general queries to speed up hosts' responses to MLD general queries and avoid MLD report traffic bursts.

Restrictions and guidelines

To avoid mistakenly deleting IPv6 multicast group members, make sure the MLD general query interval is greater than the maximum response time for MLD general queries.

Configuring parameters for MLD general queries and responses globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.

mld-snooping

3. Set the maximum response time for MLD general queries.

   max-response-time *seconds*

   By default, the maximum response time for MLD general queries is 10 seconds.

Configuring parameters for MLD general queries and responses for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Set the MLD general query interval in the VLAN.

   mld-snooping query-interval *interval*

   By default, the MLD general query interval for a VLAN is 125 seconds.

4. Set the maximum response time for MLD general queries in the VLAN.

   mld-snooping max-response-time *seconds*

   By default, the maximum response time for MLD general queries for a VLAN is 10 seconds.

Configuring parameters for MLD general queries and responses for a VSI

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Set the MLD general query interval in the VSI.

   mld-snooping query-interval *interval*

   By default, the MLD general query interval for a VSI is 125 seconds.

4. Set the maximum response time for MLD general queries in the VSI.

   mld-snooping max-response-time *seconds*

   By default, the maximum response time for MLD general queries for a VSI is 10 seconds.

Enabling the device to send MLD general queries upon a path change

About this task

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN or VSI when the path changes. This feature ensures that the device can update the member port information in IPv6 multicast forwarding entries and switch IPv6 multicast traffic to the new path promptly.

Restrictions and guidelines

Perform this task on the MLD snooping querier in a network of which the topology frequently changes.

Procedure

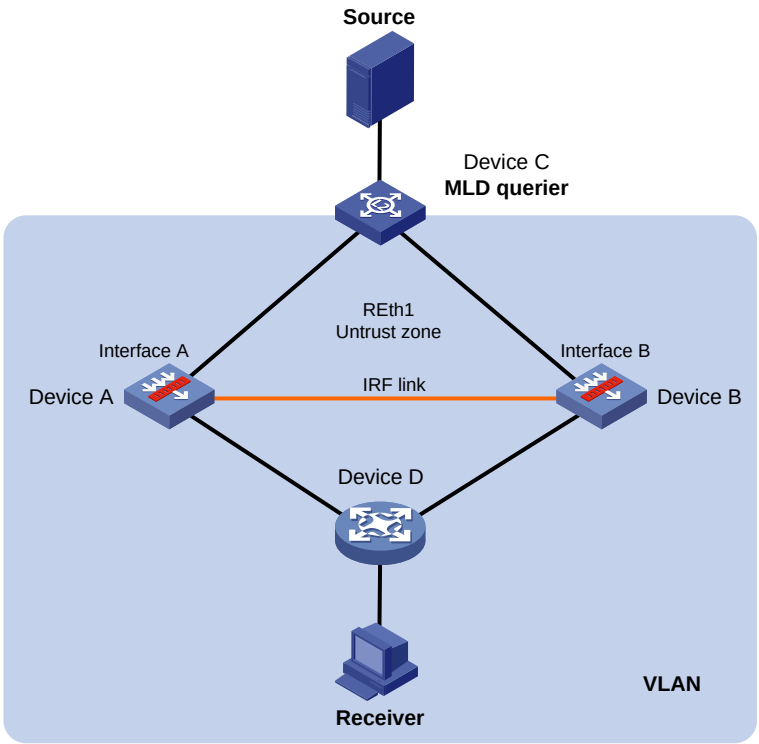
1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Enable the device to send MLD general queries upon a path change.
   send-query enable
   By default, the device does not send MLD general queries upon a path change.



Enabling the device to send MLD general queries upon a port state change

About this task

As shown in Figure 4, the receiver side's devices connect to the Layer 2 multicast device through a Reth interface for high availability. Interface A and interface B are member interfaces of the Reth interface, and interface A is active. Multicast data is sent to the receivers through Device A. When interface A fails, Device C does not send an MLD general query immediately and cannot update interface B to multicast forwarding entries. For information about Reth interfaces, see *High Availability Configuration Guide*.

Perform this task to enable the device to immediately send an MLD general query to all ports in the affected VLAN when the state of a port changes. This feature ensures that the device can update the member port information in multicast forwarding entries and switch multicast traffic to the new link promptly.

Figure 4 Network diagram

Procedure

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable the device to send MLD general queries upon a port state change.
   mld-snooping triggered-query enable { **port-down** | **port-up** } *

By default, the device does not send MLD general queries upon a port state change.

Enabling MLD snooping proxying

About MLD snooping proxying

The device enabled with MLD snooping proxying is called an MLD snooping proxy. The MLD snooping proxy acts as a host to the upstream device. Enabled with MLD snooping querier, the MLD snooping proxy acts as the router to downstream devices and receives report and done messages on behalf of the upstream device. As a best practice, enable MLD snooping proxy on the edge device to alleviate the effect caused by excessive packets.

Restrictions and guidelines for enabling MLD snooping proxying

Before you enable MLD snooping proxying for a VLAN or VSI, you must first enable MLD snooping globally and enable MLD snooping for the VLAN or VSI. MLD snooping proxying does not take effect on sub VLANs of a multicast VLAN.

Use this feature with MLD snooping querier. For more information about enabling MLD snooping querier, see "Enabling the MLD snooping querier."

Enabling MLD snooping proxying for a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable MLD snooping proxying for the VLAN.
   mld-snooping proxy enable
   By default, MLD snooping proxying is disabled for a VLAN.

Enabling MLD snooping proxying for a VSI

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable MLD snooping proxying for the VSI.
   mld-snooping proxy enable
   By default, MLD snooping proxying is disabled for a VSI.

Configuring parameters for MLD messages

Configuring source IPv6 addresses for MLD messages

About this task

You can change the source IPv6 address of the MLD queries sent by an MLD snooping querier. This configuration might affect MLD querier election within the subnet.

You can also change the source IPv6 address of MLD reports or done messages sent by a simulated member host or an MLD snooping proxy.

Configuring the source IPv6 addresses for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

   vlan *vlan-id*

3. Configure the source IPv6 address for MLD general queries.

   mld-snooping general-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

4. Configure the source IPv6 address for MLD multicast-address-specific queries.

   mld-snooping special-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

   - The source address of MLD general queries if the MLD snooping querier of the VLAN has received MLD general queries.
   - The IPv6 link-local address of the current VLAN interface if the MLD snooping querier does not receive an MLD general query.
   - FE80::02FF:FFFF:FE00:0001 if the MLD snooping querier does not receive an MLD general query and the current VLAN interface does not have an IPv6 link-local address.

5. Configure the source IPv6 address for MLD reports.

   mld-snooping report source-ip *ipv6-address*

   By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the current VLAN interface. If the current VLAN interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Configuring the source IPv6 addresses for MLD messages for a VSI

1. Enter system view.

   system-view

2. Enter VLAN view.

   vsi *vsi-name*

3. Configure the source IPv6 address for MLD general queries.

mld-snooping general-query source-ip *ipv6-address*

By default, the source IPv6 address of MLD general queries is the IPv6 link-local address of the gateway interface for a VSI. If the gateway interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

4. Configure the source IPv6 address for MLD multicast-address-specific queries.

   mld-snooping special-query source-ip *ipv6-address*

   By default, the source IPv6 address of MLD multicast-address-specific queries is one of the following:

   - The source address of MLD general queries if the MLD snooping querier of the VSI has received MLD general queries.
   - IPv6 link-local address of the gateway interface for the VSI if the MLD snooping querier does not receive an MLD general query.
   - FE80::02FF:FFFF:FE00:0001 if the gateway interface does not have an IPv6 link-local address.

5. Configure the source IPv6 address for MLD reports.

   mld-snooping report source-ip *ipv6-address*

   By default, the source IPv6 address of MLD reports is the IPv6 link-local address of the gateway interface for a VSI. If the gateway interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

6. Configure the source IPv6 address for MLD done messages.

   mld-snooping done source-ip *ipv6-address*

   By default, the source IPv6 address of MLD done messages is the IPv6 link-local address of the gateway interface for a VSI. If the gateway interface does not have an IPv6 link-local address, the source IPv6 address is FE80::02FF:FFFF:FE00:0001.

Setting the 802.1p priority for MLD messages

About this task

When congestion occurs on outgoing ports of the Layer 2 device, it forwards MLD messages in their 802.1p priority order, from highest to lowest. You can assign a higher 802.1p priority to MLD messages that are created or forwarded by the device.

Restrictions and guidelines

The configuration in MLD-snooping view takes effect only for VLANs. For VSIs, you can set the 802.1p priority for MLD messages only in VSI view.

Setting the 802.1p priority for MLD messages globally

1. Enter system view.

   system-view

2. Enter MLD-snooping view.

   mld-snooping

3. Set the 802.1p priority for MLD messages globally.

   dot1p-priority *priority*

   By default, the global 802.1p priority is not set for MLD messages.

Setting the 802.1p priority for MLD messages for a VLAN

1. Enter system view.

   system-view

2. Enter VLAN view.

vlan *vlan-id*

3. Set the 802.1p priority for MLD messages in the VLAN.
   mld-snooping dot1p-priority *priority*
   By default, the 802.1p priority is not set for MLD messages.

Configuring MLD snooping policies

Configuring an IPv6 multicast group policy

About this task

This feature enables the Layer 2 device to filter MLD reports by using an ACL that specifies the IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that receiver hosts can join. This configuration takes effect on the IPv6 multicast groups that ports join dynamically.

In an IPv6 multicast application, a host sends an unsolicited MLD report when a user requests an IPv6 multicast program. The Layer 2 device uses the IPv6 multicast group policy to filter the MLD report. The host can join the IPv6 multicast group only if the MLD report is permitted by the IPv6 multicast group policy.

Configuring an IPv6 multicast group policy globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Configure an IPv6 multicast group policy globally.
   group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist. Hosts can join any IPv6 multicast groups.

Configuring an IPv6 multicast group policy on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - *Enter* Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Configure an IPv6 multicast group policy on the port.
   mld-snooping group-policy *ipv6-acl-number* [**vlan** *vlan-list*]
   By default, no IPv6 multicast group policies exist on a port. Hosts attached to the port can join any IPv6 multicast groups.

Enabling dropping unknown IPv6 multicast data

About this task

Unknown IPv6 multicast data refers to IPv6 multicast data for which no forwarding entries exist in the MLD snooping forwarding table. This feature enables the device to forward unknown IPv6 multicast

data only to the router port. If the device does not have a router port, unknown IPv6 multicast data will be dropped.

If you do not enable this feature, the unknown IPv6 multicast data is flooded in the VLAN or VSI to which the data belongs.

Restrictions and guidelines

When dropping unknown IPv6 multicast data is enabled, the device also drops unknown IPv4 multicast data.

When this feature is enabled for a VLAN or VSI, the device still forwards unknown IPv6 multicast data out of router ports (except the receiving router port) in this VLAN or VSI.

If the outgoing ports of the IPv6 multicast forwarding entry for a Layer 3 IPv6 multicast packet are in the same VLAN, enable dropping unknown IPv6 multicast data for the VLAN as a best practice. This restriction prevents the device from flooding the Layer 3 IPv6 multicast packet in the VLAN.

Enabling dropping unknown IPv6 multicast data for a VLAN

1. Enter system view.

   system-view
2. Enter VLAN view.

   vlan *vlan-id*
3. Enable dropping unknown IPv6 multicast data for the VLAN.

   mld-snooping drop-unknown

   By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling dropping unknown IPv6 multicast data for a VSI

1. Enter system view.

   system-view
2. Enter VSI view.

   vsi *vsi-name*
3. Enable dropping unknown IPv6 multicast data for the VSI.

   mld-snooping drop-unknown

   By default, dropping unknown IPv6 multicast data is disabled. Unknown IPv6 multicast data is flooded.

Enabling MLD report suppression

About this task

This feature enables the Layer 2 device to forward only the first MLD report for an IPv6 multicast group to its directly connected Layer 3 device. Other reports for the same group in the same query interval are discarded. Use this feature to reduce the multicast traffic.

Procedure

1. Enter system view.

   system-view
2. Enter MLD-snooping view.

   mld-snooping
3. Enable MLD report suppression.

   report-aggregation

   By default, MLD report suppression is enabled.

Setting the maximum number of IPv6 multicast groups on a port

About this task

You can set the maximum number of IPv6 multicast groups on a port to regulate the port traffic. This feature takes effect only on the IPv6 multicast groups that the port joins dynamically.

If the number of IPv6 multicast groups on a port exceeds the limit, the system removes all the forwarding entries related to that port. In this case, the receiver hosts attached to that port can join IPv6 multicast groups again before the number of IPv6 multicast groups on the port reaches the limit. When the number of IPv6 multicast groups on the port reaches the limit, the port automatically drops MLD reports for new IPv6 multicast groups.

Procedure

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Set the maximum number of IPv6 multicast groups on the port.
   mld-snooping group-limit *limit* [**vlan** *vlan-list*]
   By default, no limit is placed on the maximum number of IPv6 multicast groups on a port.

Enabling IPv6 multicast group replacement

About this task

When IPv6 multicast group replacement is enabled, the port does not drop MLD reports for new groups if the number of multicast groups on the port reaches the upper limit. Instead, the port leaves an IPv6 multicast group that has the lowest IPv6 address and joins the new group contained in the MLD report. The IPv6 multicast group replacement feature is typically used in the channel switching application.

Restrictions and guidelines

This feature takes effect only on the multicast groups that the port joins dynamically.

This feature does not take effect if the following conditions exist:

- The number of the MLD snooping forwarding entries on the device reaches the upper limit.
- The IPv6 multicast group that the port newly joins is not included in the multicast group list maintained by the device.

Enabling IPv6 multicast group replacement globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable IPv6 multicast group replacement globally.
   overflow-replace [**vlan** *vlan-list*]

By default, IPv6 multicast group replacement is disabled globally.

Enabling IPv6 multicast group replacement on a port

1. Enter system view.
   system-view
2. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Enable IPv6 multicast group replacement on the port.
   mld-snooping overflow-replace [**vlan** *vlan-list*]
   By default, IPv6 multicast group replacement is disabled on a port.

Enabling host tracking

About this task

This feature enables the Layer 2 device to record information about member hosts that are receiving IPv6 multicast data. The information includes IPv6 addresses of the hosts, length of time elapsed since the hosts joined IPv6 multicast groups, and remaining timeout time for the hosts. This feature facilitates monitoring and managing member hosts.

Restrictions and guidelines

The configuration made in MLD-snooping view does not take effect on VSIs.

Enabling host tracking globally

1. Enter system view.
   system-view
2. Enter MLD-snooping view.
   mld-snooping
3. Enable host tracking globally.
   host-tracking
   By default, host tracking is disabled globally.

Enabling host tracking in a VLAN

1. Enter system view.
   system-view
2. Enter VLAN view.
   vlan *vlan-id*
3. Enable host tracking for the VLAN.
   mld-snooping host-tracking
   By default, host tracking is disabled in a VLAN.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD snooping

About this task

To report critical MLD snooping events to an SNMP NMS, enable SNMP notifications for MLD snooping.

For MLD snooping SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see Network Management and Monitoring Configuration Guide.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for MLD snooping.
   snmp-agent trap enable mld-snooping [**entry-refresh-failed**]
   By default, SNMP notifications are enabled for MLD snooping.

Configuring MLD snooping logging

Enabling MLD snooping logging

About this task

This feature enables the MLD snooping module to send log messages to the information center for troubleshooting. With the information center, you can set log message filtering and output rules, including output destinations. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Excessive number of logs affects the device performance. You can disable MLD snooping logging or use the **mld-snooping log suppress** command to limit the rate of log messages sent.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Enable MLD snooping logging.
   mld-snooping log enable [**group**]
   By default, MLD snooping logging is enabled.

Enabling MLD snooping logging suppression

About this task

Excessive number of logs affects the device performance. This feature limits the rate of log messages sent from the MLD snooping module to the information center.

Procedure

1. Enter system view.
   system-view
2. Enter MLD snooping view.
   mld-snooping
3. Enable MLD snooping logging suppression.
   mld-snooping log suppress [**group**]
   By default, MLD snooping logging suppression is enabled.

Display and maintenance commands for MLD snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display Layer 2 IPv6 multicast fast forwarding entries.	**display ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] [*ipv6-source-address* | *ipv6-group-address*] * [**slot** *slot-number*]
Display information about Layer 2 IPv6 multicast groups.	**display ipv6 l2-multicast ip** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display Layer 2 IPv6 multicast group entries.	**display ipv6 l2-multicast ip forwarding** [**group** *ipv6-group-address* | **source** *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display information about Layer 2 IPv6 MAC multicast groups.	**display ipv6 l2-multicast mac** [*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display Layer 2 IPv6 MAC multicast	**display ipv6 l2-multicast mac forwarding**

Task	Command
group entries.	[*mac-address*] [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*]
Display static IPv6 multicast MAC address entries.	**display mac-address** [*mac-address* [**vlan** *vlan-id*] | [**multicast**] [**vlan** *vlan-id*] [**count**]]
Display MLD snooping status.	**display mld-snooping** [**global** | **vlan** *vlan-id* | **vsi** *vsi-name*]
Display dynamic MLD snooping group entries.	**display mld-snooping group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**interface** *interface-type interface-number* | [**verbose**] [**slot** *slot-number*]]
Display host tracking information.	**display mld-snooping host-tracking vlan** *vlan-id* **group** *ipv6-group-address* [**source** *ipv6-source-address*] [**slot** *slot-number*]
Display dynamic router port information.	**display mld-snooping router-port** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]
Display static MLD snooping group entries.	**display mld-snooping static-group** [*ipv6-group-address* | *ipv6-source-address*] * [**vlan** *vlan-id* | **vsi** *vsi-name*] [**verbose**] [**slot** *slot-number*]
Display static router port information.	**display mld-snooping static-router-port** [**vlan** *vlan-id*] [**verbose**] [**slot** *slot-number*]
Display statistics for the MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**display mld-snooping statistics**
Clear Layer 2 IPv6 multicast fast forwarding entries.	**reset ipv6 l2-multicast fast-forwarding cache** [**vlan** *vlan-id*] { { *ipv6-source-address* | *ipv6-group-address* } * | **all** } [**slot** *slot-number*]
Clear dynamic MLD snooping group entries.	**reset mld-snooping group** { *ipv6-group-address* [*ipv6-source-address*] | **all** } [**vlan** *vlan-id* | **vsi** *vsi-name*]
Clear dynamic router port information.	**reset mld-snooping router-port** { **all** | **vlan** *vlan-id* | **vsi** *vsi-name* }
Clear statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping.	**reset mld-snooping statistics**

MLD snooping configuration examples

Example: Configuring VLAN-based IPv6 group policy and simulated joining

Network configuration

As shown in Figure 5, Router A runs MLDv1 and acts as the MLD querier, and Switch A runs MLDv1 snooping.

Configure the group policy and simulate joining to meet the following requirements:

- Host A and Host B receive only the IPv6 multicast data addressed to the IPv6 multicast group FF1E::101. IPv6 multicast data can be forwarded through GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 of Switch A uninterruptedly, even though Host A and Host B fail to receive the multicast data.
- Switch A will drop unknown IPv6 multicast data instead of flooding it in VLAN 100.

Figure 5 Network diagram

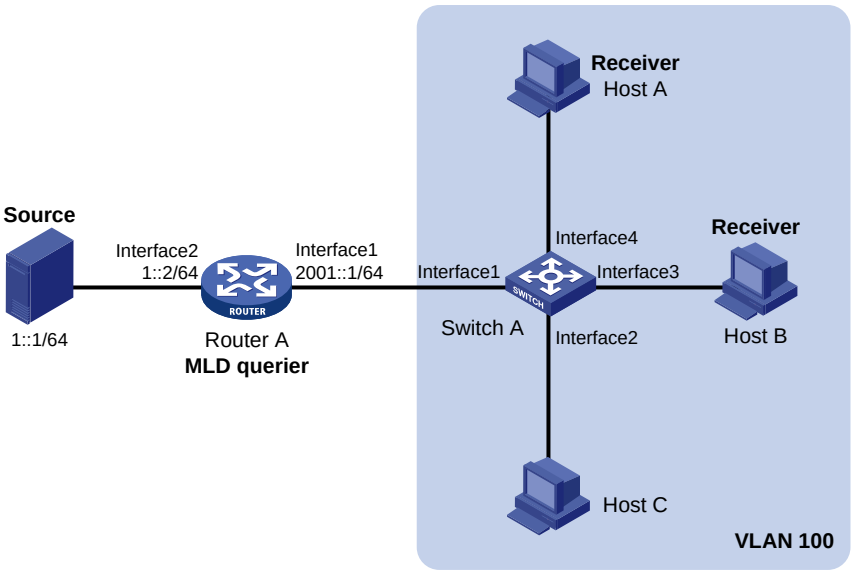


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 5.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

```
<RouterA> system-view
[RouterA] ipv6 multicast routing
[RouterA-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] mld enable
[RouterA-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

```
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] ipv6 pim dm
[RouterA-GigabitEthernet1/0/2] quit
```

2. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping, and enable dropping IPv6 unknown multicast data for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] mld-snooping drop-unknown
[SwitchA-vlan100] quit
```

Configure an IPv6 multicast group policy so that hosts in VLAN 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] mld-snooping
[SwitchA–mld-snooping] group-policy 2001 vlan 100
[SwitchA–mld-snooping] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 as simulated member hosts to join IPv6 multicast group FF1E::101.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
[SwitchA] interface gigabitethernet 1/0/4
[SwitchA-GigabitEthernet1/0/4] mld-snooping host-join ff1e::101 vlan 100
[SwitchA-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast groups FF1E::101 and FF1E::202. (Details not shown.)

Display dynamic MLD snooping group entries for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping group vlan 100
Total 1 entries.
```

```
VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                  (00:03:23)
      GE1/0/4                                  (00:04:10)
```

The output shows the following information:

- Host A and Host B have joined IPv6 multicast group FF1E::101 through the member ports GigabitEthernet 1/0/4 and GigabitEthernet 1/0/3 on Switch A, respectively.
- Host A and Host B have failed to join the multicast group FF1E::202.

Example: Configuring VLAN-based static ports

Network configuration

As shown in Figure 6:

- Router A runs MLDv1 and acts as the MLD querier. Switch A, Switch B, and Switch C run MLDv1 snooping.
- Host A and Host C are permanent receivers of IPv6 multicast group FF1E::101.

Configure static ports to meet the following requirements:

- To enhance the reliability of IPv6 multicast traffic transmission, configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C as static member ports for IPv6 multicast group FF1E::101.
- Suppose the STP runs on the network. To avoid data loops, the forwarding path from Switch A to Switch C is blocked. IPv6 multicast data flows to the receivers attached to Switch C only along the path of Switch A—Switch B—Switch C. When this path is blocked, a minimum of one MLD query-response cycle must be completed before IPv6 multicast data flows to the receivers along the path of Switch A—Switch C. In this case, the multicast delivery is interrupted during the process. For more information about the STP, see *Layer 2—LAN Switching Configuration Guide*.

  Configure GigabitEthernet 1/0/3 on Switch A as a static router port. Then, IPv6 multicast data can flow to the receivers nearly uninterrupted along the path of Switch A—Switch C when the path of Switch A—Switch B—Switch C is blocked.

Figure 6 Network diagram

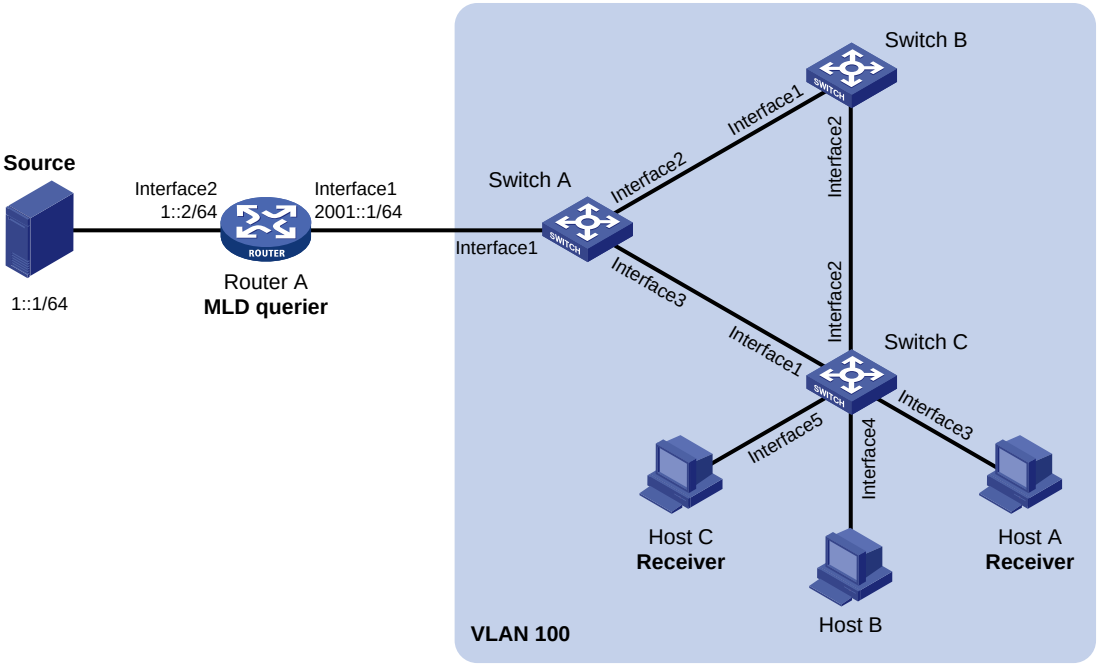

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4
Interface5	GigabitEthernet1/0/5

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 6.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] quit
```

Configure GigabitEthernet 1/0/3 as a static router port.

```
[SwitchA] interface gigabitethernet 1/0/3
[SwitchA-GigabitEthernet1/0/3] mld-snooping static-router-port vlan 100
[SwitchA-GigabitEthernet1/0/3] quit
```

3. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 gigabitethernet 1/0/2
```

Enable MLD snooping for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] quit
```

4. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/5 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/5
```

Enable MLD snooping for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] quit
```

Configure GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 as static member ports for IPv6 multicast group FF1E::101.

```
[SwitchC] interface gigabitethernet 1/0/3
[SwitchC-GigabitEthernet1/0/3] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/3] quit
[SwitchC] interface gigabitethernet 1/0/5
[SwitchC-GigabitEthernet1/0/5] mld-snooping static-group ff1e::101 vlan 100
[SwitchC-GigabitEthernet1/0/5] quit
```

Verifying the configuration

Display static router port information for VLAN 100 on Switch A.

```
[SwitchA] display mld-snooping static-router-port vlan 100
VLAN 100:
  Router ports (1 in total):
    GE1/0/3
```

The output shows that GigabitEthernet 1/0/3 on Switch A has become a static router port.

Display static MLD snooping group entries in VLAN 100 on Switch C.

```
[SwitchC] display mld-snooping static-group vlan 100
Total 1 entries).

VLAN 100: Total 1 entries).
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3
      GE1/0/5
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/5 on Switch C have become static member ports of IPv6 multicast group FF1E::101.

Example: Configuring the VLAN-based MLD snooping querier

Network configuration

As shown in Figure 7:

- The network is a Layer 2-only network.
- Source 1 and Source 2 send multicast data to IPv6 multicast groups FF1E::101 and FF1E::102, respectively.
- Host A and Host C are receivers of IPv6 multicast group FF1E::101, and Host B and Host D are receivers of IPv6 multicast group FF1E::102.
- All host receivers run MLDv1 and all switches run MLDv1 snooping. Switch A (which is close to the multicast sources) acts as the MLD snooping querier.

To prevent the switches from flooding unknown IPv6 packets in the VLAN, enable all the switches to drop unknown IPv6 multicast packets.

Figure 7 Network diagram

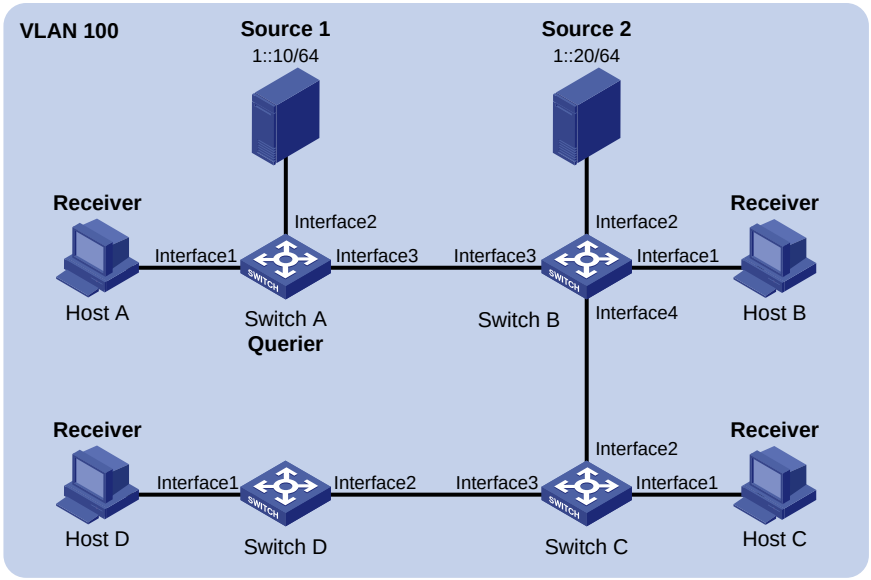

Table 3 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
   ```

   # Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping drop-unknown
   ```

   # Configure Switch A as the MLD snooping querier.

   ```
   [SwitchA-vlan100] MLD-snooping querier
   [SwitchA-vlan100] quit
   ```

2. Configure Switch B:

   # Enable the MLD snooping feature.

   ```
   <SwitchB> system-view
   [SwitchB] mld-snooping
   [SwitchB-mld-snooping] quit
   ```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchB] vlan 100
[SwitchB-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchB-vlan100] mld-snooping enable
[SwitchB-vlan100] mld-snooping drop-unknown
[SwitchB-vlan100] quit
```

3. Configure Switch C:

Enable the MLD snooping feature.

```
<SwitchC> system-view
[SwitchC] mld-snooping
[SwitchC-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/3 to the VLAN.

```
[SwitchC] vlan 100
[SwitchC-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/3
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchC-vlan100] mld-snooping enable
[SwitchC-vlan100] mld-snooping drop-unknown
[SwitchC-vlan100] quit
```

4. Configure Switch D:

Enable the MLD snooping feature.

```
<SwitchD> system-view
[SwitchD] mld-snooping
[SwitchD-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 and GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchD] vlan 100
[SwitchD-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/2
```

Enable MLD snooping, and enable dropping unknown IPv6 multicast data for VLAN 100.

```
[SwitchD-vlan100] mld-snooping enable
[SwitchD-vlan100] mld-snooping drop-unknown
[SwitchD-vlan100] quit
```

Verifying the configuration

Display statistics for MLD messages and IPv6 PIM hello messages learned through MLD snooping on Switch B.

```
[SwitchB] display mld-snooping statistics
Received MLD messages:
  MLD general queries: 19
    M-LAG: 19
  MLDv1 specific queries: 0
    M-LAG: 0
  MLDv2 specific queries: 0
    M-LAG: 0
  MLDv2 specific sg queries: 0
    M-LAG: 0
  MLDv1 reports: 19
```

```
    M-LAG: 19
  MLDv2 reports: 0
    M-LAG: 0
  MLDv2 reports with right and wrong records: 0
    M-LAG: 0
  MLD dones: 5
     M-LAG: 5
  Error MLD messages: 1
    M-LAG: 1
Sent MLD messages:
  MLDv1 specific queries: 0
  MLDv2 specific queries: 0
  MLDv2 specific sg queries: 0
Received IPv6 PIM hello: 0
```

The output shows that all switches except Switch A can receive the MLD general queries after Switch A acts as the MLD snooping querier.

Example: Configuring VLAN-based MLD snooping proxying

Network configuration

As shown in Figure 8, Router A runs MLDv1 and acts as the MLD querier. Switch A runs MLDv1 snooping. Configure MLD snooping proxying so that Switch A can perform the following actions:

- Forward MLD report and done messages to Router A.
- Respond to MLD queries sent by Router A and forward the queries to downstream hosts.

Figure 8 Network diagram

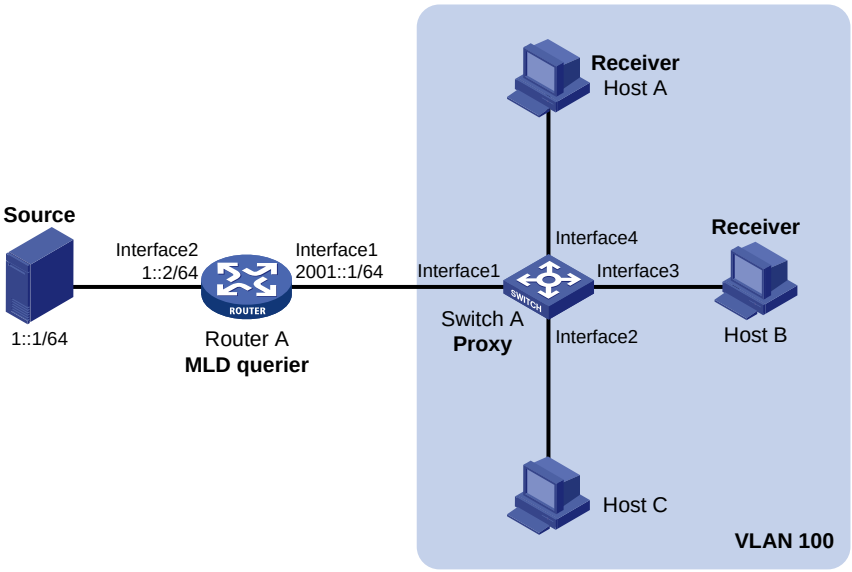

Table 4 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2

Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and subnet mask to each interface, as shown in Figure 8.

Procedure

1. Configure Router A:

   # Enable IPv6 multicast routing.

   ```
   <RouterA> system-view
   [RouterA] ipv6 multicast routing
   [RouterA-mrib6] quit
   ```

   # Enable MLD and IPv6 PIM-DM on GigabitEthernet 1/0/1.

   ```
   [RouterA] interface gigabitethernet 1/0/1
   [RouterA-GigabitEthernet1/0/1] mld enable
   [RouterA-GigabitEthernet1/0/1] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/1] quit
   ```

   # Enable IPv6 PIM-DM on GigabitEthernet 1/0/2.

   ```
   [RouterA] interface gigabitethernet 1/0/2
   [RouterA-GigabitEthernet1/0/2] ipv6 pim dm
   [RouterA-GigabitEthernet1/0/2] quit
   ```

2. Configure Switch A:

   # Enable the MLD snooping feature.

   ```
   <SwitchA> system-view
   [SwitchA] mld-snooping
   [SwitchA-mld-snooping] quit
   ```

   # Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

   ```
   [SwitchA] vlan 100
   [SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
   ```

   # Enable MLD snooping and MLD snooping proxying for the VLAN.

   ```
   [SwitchA-vlan100] mld-snooping enable
   [SwitchA-vlan100] mld-snooping proxy enable
   [SwitchA-vlan100] quit
   ```

Verifying the configuration

Send MLD reports from Host A and Host B to join IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (2 in total):
      GE1/0/3                                  (00:04:09)
      GE1/0/4                                  (00:03:06)
```

The output shows that GigabitEthernet 1/0/3 and GigabitEthernet 1/0/4 are member ports of IPv6 multicast group FF1E::101. Host A and Host B will receive IPv6 multicast data for the group.

Display MLD group membership information on Router A.

```
[RouterA] display mld group
MLD groups in total: 1
 GigabitEthernet1/0/1(2001::1):
  MLD groups reported in total: 1
   Group address: FF1E::101
    Last reporter: FE80::2FF:FFFF:FE00:1
    Uptime: 00:00:31
    Expires: 00:03:48
```

Send an MLD done message from Host A to leave IPv6 multicast group FF1E::101. (Details not shown.)

Display MLD snooping group entries on Switch A.

```
[SwitchA] display mld-snooping group
Total 1 entries.

VLAN 100: Total 1 entries.
  (::, FF1E::101)
    Host ports (1 in total):
      GE1/0/3                                  ( 00:01:23 )
```

The output shows that GigabitEthernet 1/0/3 is the only member port of IPv6 multicast group FF1E::101. Only Host B will receive IPv6 multicast data for the group.

Troubleshooting MLD snooping

Layer 2 multicast forwarding cannot function

Symptom

Layer 2 multicast forwarding cannot function through MLD snooping.

Solution

To resolve the problem:

1. Use the **display mld-snooping** command to display MLD snooping status.
2. If MLD snooping is not enabled, use the **mld-snooping** command in system view to enable the MLD snooping feature. Then, use the **mld-snooping enable** command in VLAN view or VSI view to enable MLD snooping for the VLAN or VSI.
3. If MLD snooping is enabled globally but not enabled for the VLAN or VSI, use the **mld-snooping enable** command in VLAN view or VSI view to enable MLD snooping for the VLAN or VSI.
4. If the problem persists, contact H3C Support.

IPv6 multicast group policy does not work

Symptom

Hosts can receive IPv6 multicast data for IPv6 multicast groups that are not permitted by the IPv6 multicast group policy.

Solution

To resolve the problem:

1. Use the **display acl ipv6** command to verify that the configured IPv6 ACL meets the IPv6 multicast group policy requirements.
2. Use the **display this** command in MLD-snooping view or in interface view to verify that the correct IPv6 multicast group policy has been applied. If the applied policy is not correct, use the **group-policy** or **mld-snooping group-policy** command to apply the correct IPv6 multicast group policy.
3. Use the **display mld-snooping** command to verify that dropping unknown IPv6 multicast data is enabled. If it is not, use the **drop-unknown** or **mld-snooping drop-unknown** command to enable dropping unknown IPv6 multicast data.
4. If the problem persists, contact H3C Support.

Configuring IPv6 PIM snooping

About IPv6 PIM snooping

IPv6 PIM snooping runs on Layer 2 devices. It works with MLD snooping to analyze received IPv6 PIM messages, and adds the ports that are interested in specific multicast data to an IPv6 PIM snooping routing entry. In this way, the multicast data can be forwarded to only the ports that are interested in the data.

Figure 1 Multicast packet transmission without or with IPv6 PIM snooping

As shown in Figure 1, Source 1 sends multicast data to multicast group G1, and Source 2 sends multicast data to multicast group G2. Receiver 1 belongs to G1, and Receiver 2 belongs to G2. The Layer 2 switch's interfaces that connect to the IPv6 PIM-capable routers are in the same VLAN or VSI.

- When the Layer 2 switch only runs MLD snooping, it performs the following actions:
  a. Maintains the router ports according to the received IPv6 PIM hello messages that IPv6 PIM-capable routers send.

b. Floods all other types of received IPv6 PIM messages except PIM hello messages in the VLAN or VSI.

c. Forwards all multicast data to all router ports in the VLAN or VSI.

Each IPv6 PIM-capable router in the VLAN, whether interested in the multicast data or not, can receive all multicast data and all IPv6 PIM messages except IPv6 PIM hello messages.

- When the Layer 2 switch runs both MLD snooping and IPv6 PIM snooping, it performs the following actions:

d. Examines whether an IPv6 PIM router is interested in the multicast data destined for a multicast group according to the received IPv6 PIM messages that the router sends.

e. Adds only the ports that connect to the router and are interested in the data to an IPv6 PIM snooping routing entry.

f. Forwards IPv6 PIM messages and the multicast data only to the router according to the multicast forwarding entry, which saves network bandwidth.

For more information about MLD snooping and the router port, see "Configuring MLD snooping."

Restrictions and guidelines: IPv6 PIM snooping configuration

As a best practice, do not configure IPv6 PIM snooping for secondary VLANs because IPv6 PIM snooping does not take effect on secondary VLANs. For more information about secondary VLANs, see *Layer 2—LAN Switching Configuration Guide*.

Make sure the maximum size of an IPv6 PIM join or prune message is smaller than the path MTU of devices connected to IPv6 PIM snooping devices. Otherwise, fragmented IPv6 PIM join or prune messages prevent IPv6 PIM snooping from correctly forwarding IPv6 multicast data. For more information about setting the maximum size of a join or prune message, see "Configuring IPv6 PIM."

IPv6 PIM snooping is supported only for IPv6 PIM-SM and IPv6 PIM-SSM. As a best practice, do not configure IPv6 PIM snooping in the IPv6 PIM-DM or IPv6 BIDIR-PIM network. For more information about IPv6 PIM, see "IPv6 PIM overview."

After you enable IPv6 PIM snooping for a VLAN or VSI, IPv6 PIM snooping takes effect only on ports that belong to the VLAN or VSI.

IPv6 PIM snooping tasks at a glance

To configure IPv6 PIM snooping, perform the following tasks:

1. Enabling IPv6 PIM snooping
2. (Optional.) Setting the aging time for global ports after a master/subordinate switchover
   - Setting the aging time for global neighbor ports
   - Setting the aging time for global downstream ports and global router ports

Enabling IPv6 PIM snooping

1. Enter system view.

   `system-view`
2. Enable the MLD snooping feature and enter MLD -snooping view.

   `mld-snooping`

   By default, MLD snooping is disabled.

For more information about this command, see *IP Multicast Command Reference*.

3. Return to system view.
   quit
4. Enter VLAN view or VSI view.
   - Enter VLAN view.
     vlan *vlan-id*
   - Enter VSI view.
     vsi *vsi-name*
5. Enable MLD snooping for the VLAN or VSI.
   mld-snooping enable

   By default, MLD snooping is disabled in a VLAN or VSI.

   For more information about this command, see *IP Multicast Command Reference*.
6. Enable IPv6 PIM snooping for the VLAN or VSI.
   ipv6 pim-snooping enable

   By default, IPv6 PIM snooping is disabled in a VLAN or VSI.

Setting the aging time for global ports after a master/subordinate switchover

About global ports

A global port is a virtual port on the master device, such as a Layer 2 aggregate interface, AC, N-PW, and U-PW. A global port that acts as a neighbor port, downstream port, or router port is called a global neighbor port, global downstream port, and global router port, respectively.

Perform this task to decrease Layer 2 IPv6 multicast data interruption caused by the aging of IPv6 PIM snooping entries after a master/subordinate switchover.

Restrictions and guidelines

For a global neighbor port, the set aging time does not take effect when the port receives an IPv6 PIM hello message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM hello message.

For a global router port or global downstream port, the set aging time does not take effect when the port receives an IPv6 PIM join message after a master/subordinate switchover. The aging time for the port is determined by the aging time in the IPv6 PIM join message.

Setting the aging time for global neighbor ports

1. Enter system view.
   system-view
2. Enter VLAN view or VSI view.
   - Enter VLAN view.
     vlan *vlan-id*
   - Enter VSI view.
     vsi *vsi-name*

3. Set the aging time for global neighbor ports after a master/subordinate switchover.

   pim-snooping graceful-restart neighbor-aging-time *seconds*

   By default, the aging time for global neighbor ports after a master/subordinate switchover is 105 seconds.

Setting the aging time for global downstream ports and global router ports

1. Enter system view.

   system-view

2. Enter VLAN view or VSI view.
   - Enter VLAN view.

     vlan *vlan-id*
   - Enter VSI view.

     vsi *vsi-name*

3. Set the aging time for global downstream ports and global router ports after a master/subordinate switchover.

   pim-snooping graceful-restart join-aging-time *seconds*

   By default, the aging time for downstream ports and global router ports after a master/subordinate switchover is 210 seconds.

Display and maintenance commands for IPv6 PIM snooping

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display IPv6 PIM snooping neighbor information.	**display ipv6 pim-snooping neighbor** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping router port information.	**display ipv6 pim-snooping router-port** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display IPv6 PIM snooping routing entries.	**display ipv6 pim-snooping routing-table** [**vlan** *vlan-id* | **vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**display ipv6 pim-snooping statistics**
Clear statistics for the IPv6 PIM messages learned through IPv6 PIM snooping.	**reset ipv6 pim-snooping statistics**

IPv6 PIM snooping configuration examples

Example: Configuring IPv6 PIM snooping

Network configuration

As shown in Figure 2:

- OSPFv3 runs on the network.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Receiver 1 and Receiver 2 belong to IPv6 multicast groups FF1E::101 and FF2E::101, respectively.
- Router C and Router D run MLD on GigabitEthernet 1/0/1.
- Router A, Router B, Router C, and Router D run IPv6 PIM-SM. GigabitEthernet 1/0/2 on Router A acts as a C-BSR and a C-RP.

Configure MLD snooping and IPv6 PIM snooping on Switch A. Then, Switch A forwards IPv6 PIM protocol packets and IPv6 multicast data packets only to routers that are connected to receivers.

Figure 2 Network diagram

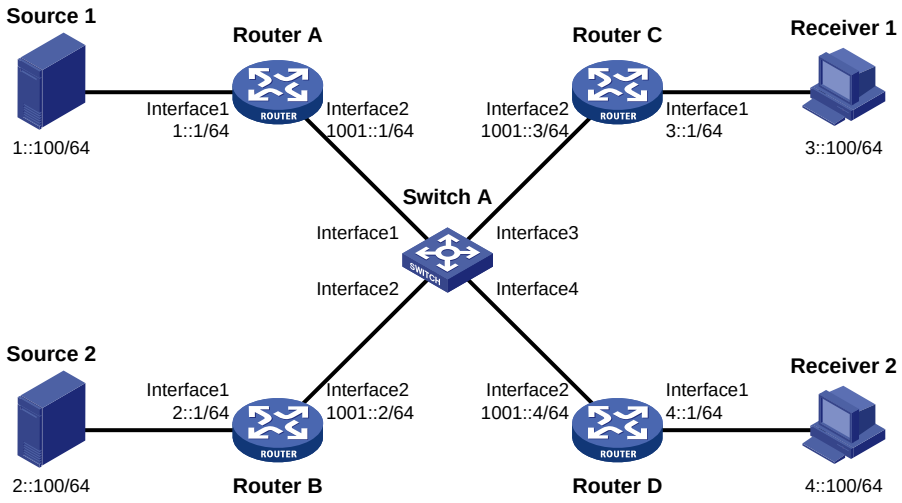

Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 2, and then configure OSPFv3 on the routers.

Procedure

1. Configure Router A:

Enable IPv6 multicast routing.

```
<RouterA> system-view
[RouterA] ipv6 multicast routing
[RouterA-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[RouterA] interface gigabitethernet 1/0/1
[RouterA-GigabitEthernet1/0/1] ipv6 pim sm
[RouterA-GigabitEthernet1/0/1] quit
[RouterA] interface gigabitethernet 1/0/2
[RouterA-GigabitEthernet1/0/2] ipv6 pim sm
[RouterA-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/2 as a C-BSR and a C-RP.

```
[RouterA] ipv6 pim
[RouterA-pim6] c-bsr 1001::1
[RouterA-pim6] c-rp 1001::1
[RouterA-pim6] quit
```

2. Configure Router B:

Enable IPv6 multicast routing.

```
<RouterB> system-view
[RouterB] ipv6 multicast routing
[RouterB-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[RouterB] interface gigabitethernet 1/0/1
[RouterB-GigabitEthernet1/0/1] ipv6 pim sm
[RouterB-GigabitEthernet1/0/1] quit
[RouterB] interface gigabitethernet 1/0/2
[RouterB-GigabitEthernet1/0/2] ipv6 pim sm
[RouterB-GigabitEthernet1/0/2] quit
```

3. Configure Router C:

Enable IPv6 multicast routing.

```
<RouterC> system-view
[RouterC] ipv6 multicast routing
[RouterC-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterC] interface gigabitethernet 1/0/1
[RouterC-GigabitEthernet1/0/1] mld enable
[RouterC-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterC] interface gigabitethernet 1/0/2
[RouterC-GigabitEthernet1/0/2] ipv6 pim sm
[RouterC-GigabitEthernet1/0/2] quit
```

4. Configure Router D:

Enable IPv6 multicast routing.

```
<RouterD> system-view
[RouterD] ipv6 multicast routing
[RouterD-mrib6] quit
```

Enable MLD on GigabitEthernet 1/0/1.

```
[RouterD] interface gigabitethernet 1/0/1
[RouterD-GigabitEthernet1/0/1] mld enable
[RouterD-GigabitEthernet1/0/1] quit
```

Enable IPv6 PIM-SM on GigabitEthernet 1/0/2.

```
[RouterD] interface gigabitethernet 1/0/2
[RouterD-GigabitEthernet1/0/2] ipv6 pim sm
[RouterD-GigabitEthernet1/0/2] quit
```

5. Configure Switch A:

Enable the MLD snooping feature.

```
<SwitchA> system-view
[SwitchA] mld-snooping
[SwitchA-mld-snooping] quit
```

Create VLAN 100, and assign GigabitEthernet 1/0/1 through GigabitEthernet 1/0/4 to the VLAN.

```
[SwitchA] vlan 100
[SwitchA-vlan100] port gigabitethernet 1/0/1 to gigabitethernet 1/0/4
```

Enable MLD snooping and IPv6 PIM snooping for VLAN 100.

```
[SwitchA-vlan100] mld-snooping enable
[SwitchA-vlan100] ipv6 pim-snooping enable
[SwitchA-vlan100] quit
```

Verifying the configuration

On Switch A, display IPv6 PIM snooping neighbor information for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping neighbor vlan 100
Total 4 neighbors.

VLAN 100: Total 4 neighbors.
  FE80::1
    Ports (1 in total):
      GE1/0/1                 (00:32:43)
  FE80::2
   Ports (1 in total):
      GE1/0/2                 (00:32:43)
  FE80::3
    Ports (1 in total):
      GE1/0/3                 (00:32:43)
  FE80::4
    Ports (1 in total):
      GE1/0/4                 (00:32:43)
```

The output shows that Router A, Router B, Router C, and Router D are IPv6 PIM snooping neighbors.

On Switch A, display IPv6 PIM snooping routing entries for VLAN 100.

```
[SwitchA] display ipv6 pim-snooping routing-table vlan 100
Total 4 entries.
FSM Flag: NI-no info, J-join, PP-prune pending

VLAN 100: Total 4 entries.
  (*, FF1E::101)
```

```
  Upstream neighbor: FE80::8CE5:7AFF:FE3F:107

    Downstream Ports (1 in total):
      GE1/0/4
        Expires: 00:03:05, FSM: J
```

The output shows the following information:

- Switch A will forward the multicast data intended for IPv6 multicast group FF1E::101 to only Router C.
- Switch A will forward the multicast data intended for IPv6 multicast group FF2E::101 to only Router D.

Troubleshooting IPv6 PIM snooping

This section describes common IPv6 PIM snooping problems and how to troubleshoot them.

IPv6 PIM snooping does not work on a Layer 2 device

Symptom

IPv6 PIM snooping does not work on a Layer 2 device.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to display information about MLD snooping and IPv6 PIM snooping.
2. If MLD snooping is not enabled, enable the MLD snooping feature, and then enable MLD snooping and IPv6 PIM snooping for the VLAN or VSI.
3. If IPv6 PIM snooping is not enabled, enable IPv6 PIM snooping for the VLAN or VSI.
4. If the problem persists, contact H3C Support.

Configuring IPv6 multicast VLANs

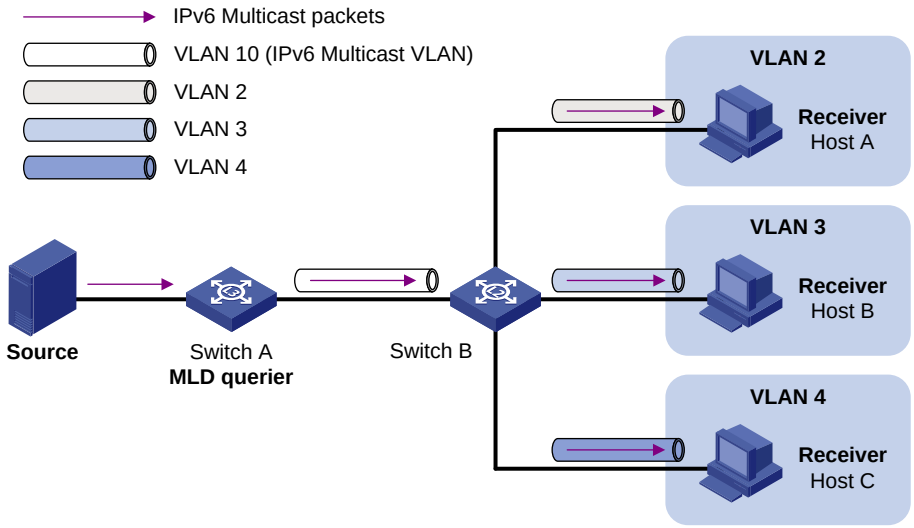
IPv6 multicast VLAN feature

As shown in Figure 1, Host A, Host B, and Host C are in different VLANs and the same IPv6 multicast group. When Switch A (Layer 3 device) receives IPv6 multicast data for that group, it forwards three copies of the data to Switch B (Layer 2 device). This occupies a large amount of bandwidth and increases the burden on the Layer 3 device.

Figure 1 Multicast transmission without the IPv6 multicast VLAN feature

After an IPv6 multicast VLAN is configured on Switch B, Switch A sends one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. This saves network bandwidth and lessens the burden on the Layer 3 device.

IPv6 multicast VLAN methods



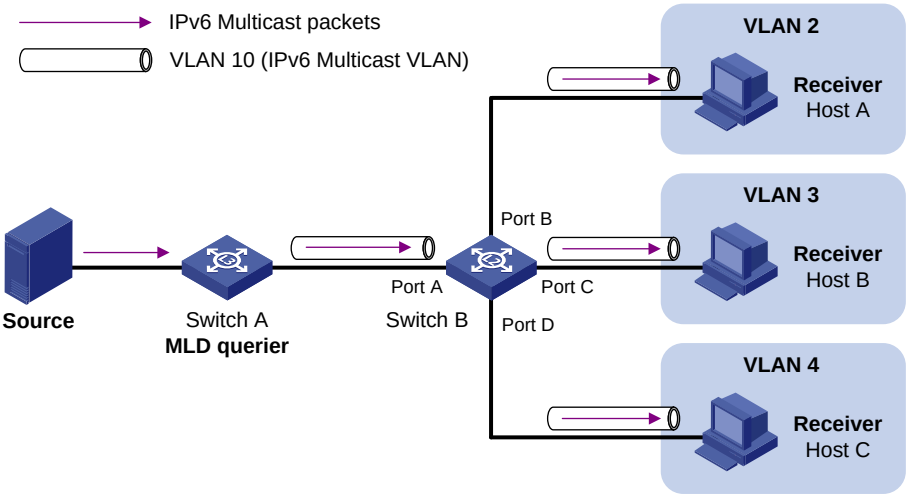
IPv6 multicast VLANs support sub-VLAN-based IPv6 multicast VLANs and port-based IPv6 multicast VLANs.

Sub-VLAN-based IPv6 multicast VLAN

As shown in Figure 2:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. VLAN 2 through VLAN 4 are sub-VLANs of VLAN 10.
- MLD snooping is enabled for the multicast VLAN and its sub-VLANs.

Figure 2 Sub-VLAN-based multicast VLAN



MLD snooping manages router ports in the IPv6 multicast VLAN and member ports in each sub-VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each sub-VLAN of the IPv6 multicast VLAN.

Port-based IPv6 multicast VLAN

As shown in Figure 3:

- Host A, Host B, and Host C are in VLAN 2 through VLAN 4, respectively. All the user ports (ports with attached hosts) on Switch B are hybrid ports.
- On Switch B, VLAN 10 is an IPv6 multicast VLAN. All the user ports are assigned to VLAN 10.
- MLD snooping is enabled for the IPv6 multicast VLAN and its sub-VLANs.

Figure 3 Port-based IPv6 multicast VLAN

MLD snooping manages the router ports and member ports in the IPv6 multicast VLAN. When Switch A receives IPv6 multicast data from the IPv6 multicast source, it sends only one copy of the IPv6 multicast data to the IPv6 multicast VLAN on Switch B. Then, Switch B sends a separate copy to each user port in the IPv6 multicast VLAN.

Restrictions and guidelines: IPv6 multicast VLAN configuration

The VLAN to be configured as an IPv6 multicast VLAN must exist.

If you have configured both a sub-VLAN-based IPv6 multicast VLAN and a port-based IPv6 multicast VLAN on a device, the port-based IPv6 multicast VLAN configuration takes effect.

Do not configure an IPv6 multicast VLAN on a device that is enabled with IPv6 multicast routing. Otherwise, the system displays errors. Do not enable IPv6 multicast routing on a device that is configured with IPv6 multicast VLANs. Otherwise, IPv6 multicast forwarding exceptions occur.

Do not configure a VLAN as an IPv6 multicast VLAN or an IPv6 sub-VLAN if the VLAN interface is enabled with IPv6 PIM or MLD. Otherwise, the system displays errors. Do not enable IPv6 PIM or MLD on a VLAN interface if the VLAN interface belongs to an IPv6 multicast VLAN or an IPv6 multicast sub-VLAN. Otherwise, IPv6 multicast forwarding exceptions occur.

Configuring a sub-VLAN-based IPv6 multicast VLAN

Restrictions and guidelines

The VLANs to be configured as sub-VLANs of an IPv6 multicast VLAN must exist and cannot be IPv6 multicast VLANs or sub-VLANs of any other IPv6 multicast VLANs.

Prerequisites

Before you configure a sub-VLAN-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN, and for the VLANs to be configured as sub-VLANs.

Procedure

1. Enter system view.

   system-view
2. Configure a VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.

   ipv6 multicast-vlan *vlan-id*

   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign VLANs to the IPv6 multicast VLAN as sub-VLANs.

   subvlan *vlan-list*

   By default, an IPv6 multicast VLAN does not have any sub-VLANs.

Configuring a port-based IPv6 multicast VLAN

Restrictions and guidelines

You can assign user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view or assign a user port to an IPv6 multicast VLAN in interface view.

A user port can belong to only one IPv6 multicast VLAN.

Prerequisites

Before you configure a port-based IPv6 multicast VLAN, you must complete the following tasks:

- Create VLANs as required.
- Enable MLD snooping for the VLAN to be configured as the IPv6 multicast VLAN.
- Enable MLD snooping for all the VLANs that contain the multicast receivers.
- Configure the attributes of user ports. Make sure the ports can forward packets from the VLAN to be configured as the IPv6 multicast VLAN and send the packets with the VLAN tag removed. For more information about configuring port attributes, see VLAN configuration in *Layer 2—LAN Switching Configuration Guide*.

Assigning user ports to an IPv6 multicast VLAN in IPv6 multicast VLAN view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Assign ports to the IPv6 multicast VLAN as user ports.
   port *interface-list*

Assigning user ports to an IPv6 multicast VLAN in interface view

1. Enter system view.
   system-view
2. Configure an IPv6 VLAN as an IPv6 multicast VLAN and enter IPv6 multicast VLAN view.
   ipv6 multicast-vlan *vlan-id*
   By default, a VLAN is not an IPv6 multicast VLAN.
3. Return to system view.
   quit
4. Enter Layer 2 interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
5. Assign the port to the IPv6 multicast VLAN as a user port.
   ipv6 port multicast-vlan *vlan-id*
   By default, a port does not belong to any IPv6 multicast VLAN.

Setting the maximum number of IPv6 multicast VLAN forwarding entries

About this task

You can set the maximum number of IPv6 multicast VLAN forwarding entries on the device. When the upper limit is reached, the device does not create IPv6 multicast VLAN forwarding entries until some entries age out or are manually removed.

Procedure

1. Enter system view.

system-view

2. Set the maximum number of IPv6 multicast VLAN forwarding entries.
   ipv6 multicast-vlan entry-limit *limit*
   By default, the maximum number of IPv6 multicast VLAN forwarding entries is 4096.

Display and maintenance commands for IPv6 multicast VLANs

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IPv6 multicast VLANs.	**display ipv6 multicast-vlan** [*vlan-id*]
Display IPv6 multicast VLAN forwarding entries.	**display ipv6 multicast-vlan forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **slot** *slot-number* | **subvlan** *vlan-id* | **vlan** *vlan-id*] *
Display information about information about IPv6 multicast group entries in IPv6 multicast VLANs.	**display ipv6 multicast-vlan group** [*ipv6-source-address* | *ipv6-group-address* | **slot** *slot-number* | **verbose** | **vlan** *vlan-id*] *
Clear IPv6 multicast group entries in IPv6 multicast VLANs.	**reset ipv6 multicast-vlan group** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **vlan** *vlan-id*] *

IPv6 multicast VLAN configuration examples

Example: Configuring sub-VLAN-based IPv6 multicast VLAN

Network configuration

As shown in Figure 4:

- Layer 3 device Switch A runs MLD and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a sub-VLAN-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends the IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 4 Network diagram

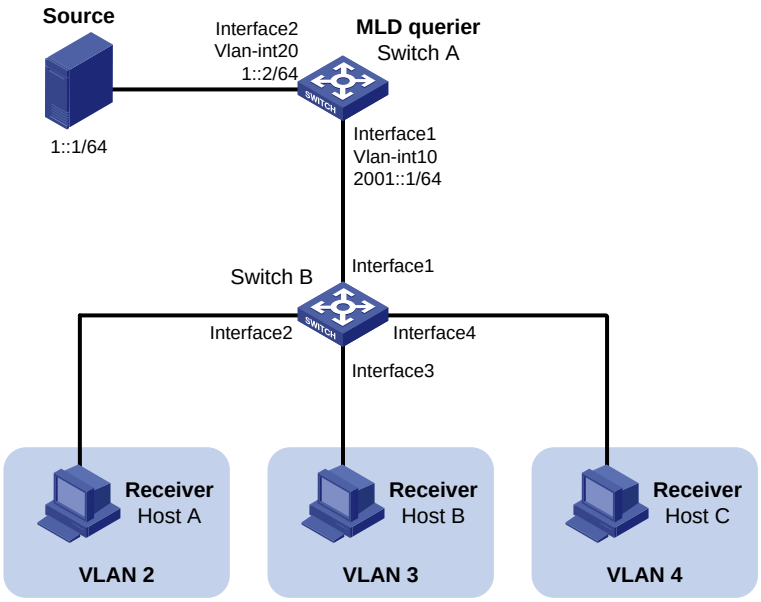


Table 1 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

Enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

```
[SwitchA] vlan 20
[SwitchA-vlan20] port gigabitethernet 1/0/2
[SwitchA-vlan20] quit
```

Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

```
[SwitchA] interface vlan-interface 20
[SwitchA-Vlan-interface20] ipv6 address 1::2 64
[SwitchA-Vlan-interface20] ipv6 pim dm
[SwitchA-Vlan-interface20] quit
```

Create VLAN 10.

```
[SwitchA] vlan 10
[SwitchA-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] port link-type hybrid
[SwitchA-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchA-GigabitEthernet1/0/1] quit
```

Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 2, assign GigabitEthernet 1/0/2 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, assign GigabitEthernet 1/0/3 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, assign GigabitEthernet 1/0/4 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] port gigabitethernet 1/0/4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Create VLAN 10, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Configure GigabitEthernet 1/0/1 as a hybrid port, and assign the port to VLAN 10 as a tagged VLAN member.

```
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] port link-type hybrid
[SwitchB-GigabitEthernet1/0/1] port hybrid vlan 10 tagged
[SwitchB-GigabitEthernet1/0/1] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN, and assign VLAN 2 through VLAN 4 as sub-VLANs to multicast VLAN 10.

```
[SwitchB] ipv6 multicast-vlan 10
[SwitchB-ipv6-mvlan-10] subvlan 2 to 4
[SwitchB-ipv6-mvlan-10] quit
```

Verifying the configuration

Display information about all IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(3 in total):
     2-4
  Port list(0 in total):
```

Display information about IPv6 multicast groups in IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan group
Total 1 entries.

IPv6 multicast VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Sub-VLANs (3 in total):
      VLAN 2
      VLAN 3
      VLAN 4
```

The output shows that IPv6 multicast group FF1E::101 belongs to IPv6 multicast VLAN 10. IPv6 multicast VLAN 10 contains sub-VLANs VLAN 2 through VLAN 4. Switch B will replicate the IPv6 multicast data of VLAN 10 to VLAN 2 through VLAN 4.

Example: Configuring port-based IPv6 multicast VLAN

Network configuration

As shown in Figure 5:

- Layer 3 device Switch A runs MLDv1 and acts as the MLD querier. Layer 2 device Switch B runs MLDv1 snooping.
- The IPv6 multicast source sends IPv6 multicast data to IPv6 multicast group FF1E::101. Receivers Host A, Host B, and Host C belong to VLAN 2, VLAN 3, and VLAN 4, respectively.

Configure a port-based IPv6 multicast VLAN on Switch B to meet the following requirements:

- Switch A sends IPv6 multicast data to Switch B through the IPv6 multicast VLAN.
- Switch B forwards the IPv6 multicast data to the receivers in different user VLANs.

Figure 5 Network diagram

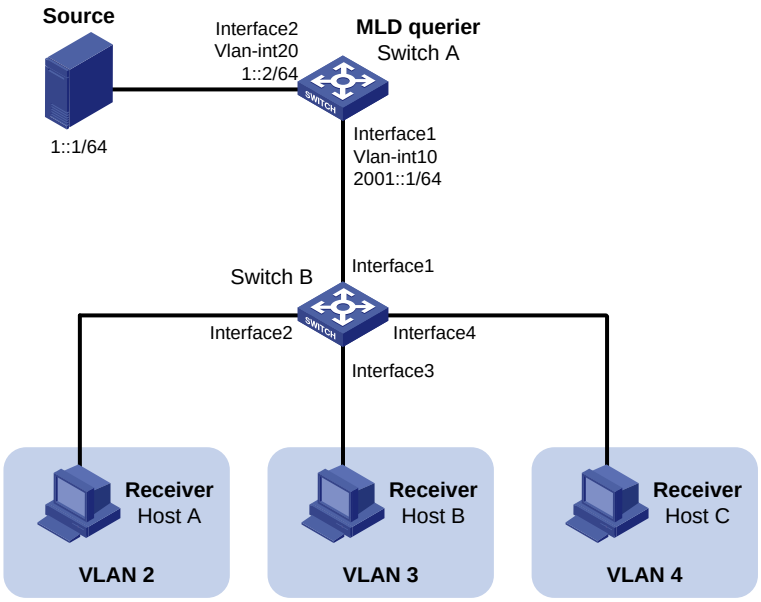

Table 2 Interface label and interface name mappings

Interface label	Interface name
Interface1	GigabitEthernet1/0/1
Interface2	GigabitEthernet1/0/2
Interface3	GigabitEthernet1/0/3
Interface4	GigabitEthernet1/0/4

Procedure

1. Configure Switch A:

   # Enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Create VLAN 20, and assign GigabitEthernet 1/0/2 to the VLAN.

   ```
   [SwitchA] vlan 20
   [SwitchA-vlan20] port gigabitethernet 1/0/2
   [SwitchA-vlan20] quit
   ```

   # Assign an IPv6 address to VLAN-interface 20, and enable IPv6 PIM-DM on the interface.

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] ipv6 address 1::2 64
   [SwitchA-Vlan-interface20] ipv6 pim dm
   [SwitchA-Vlan-interface20] quit
   ```

   # Create VLAN 10, and assign GigabitEthernet 1/0/1 to the VLAN.

   ```
   [SwitchA] vlan 10
   [SwitchA-vlan10] port gigabitethernet 1/0/1
   [SwitchA-vlan10] quit
   ```

   # Assign an IPv6 address to VLAN-interface 10, and enable MLD on the interface.

```
[SwitchA] interface vlan-interface 10
[SwitchA-Vlan-interface10] ipv6 address 2001::1 64
[SwitchA-Vlan-interface10] mld enable
[SwitchA-Vlan-interface10] quit
```

2. Configure Switch B:

Enable the MLD snooping feature.

```
<SwitchB> system-view
[SwitchB] mld-snooping
[SwitchB-mld-snooping] quit
```

Create VLAN 10, assign GigabitEthernet 1/0/1 to the VLAN, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 10
[SwitchB-vlan10] port gigabitethernet 1/0/1
[SwitchB-vlan10] mld-snooping enable
[SwitchB-vlan10] quit
```

Create VLAN 2, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 2
[SwitchB-vlan2] mld-snooping enable
[SwitchB-vlan2] quit
```

Create VLAN 3, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 3
[SwitchB-vlan3] mld-snooping enable
[SwitchB-vlan3] quit
```

Create VLAN 4, and enable MLD snooping for the VLAN.

```
[SwitchB] vlan 4
[SwitchB-vlan4] mld-snooping enable
[SwitchB-vlan4] quit
```

Configure GigabitEthernet 1/0/2 as a hybrid port, and configure VLAN 2 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] port link-type hybrid
[SwitchB-GigabitEthernet1/0/2] port hybrid pvid vlan 2
```

Assign GigabitEthernet 1/0/2 to VLAN 2 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 2 untagged
[SwitchB-GigabitEthernet1/0/2] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/2] quit
```

Configure GigabitEthernet 1/0/3 as a hybrid port, and configure VLAN 3 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/3
[SwitchB-GigabitEthernet1/0/3] port link-type hybrid
[SwitchB-GigabitEthernet1/0/3] port hybrid pvid vlan 3
```

Assign GigabitEthernet 1/0/3 to VLAN 3 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 3 untagged
[SwitchB-GigabitEthernet1/0/3] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/3] quit
```

Configure GigabitEthernet 1/0/4 as a hybrid port, and configure VLAN 4 as the PVID of the hybrid port.

```
[SwitchB] interface gigabitethernet 1/0/4
```

```
[SwitchB-GigabitEthernet1/0/4] port link-type hybrid
[SwitchB-GigabitEthernet1/0/4] port hybrid pvid vlan 4
```

Assign GigabitEthernet 1/0/4 to VLAN 4 and VLAN 10 as an untagged VLAN member.

```
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 4 untagged
[SwitchB-GigabitEthernet1/0/4] port hybrid vlan 10 untagged
[SwitchB-GigabitEthernet1/0/4] quit
```

Configure VLAN 10 as an IPv6 multicast VLAN.

```
[SwitchB] ipv6 multicast-vlan 10
```

Assign GigabitEthernet 1/0/2 and GigabitEthernet 1/0/3 to VLAN 10.

```
[SwitchB-ipv6-mvlan-10] port gigabitethernet 1/0/2 to gigabitethernet 1/0/3
[SwitchB-ipv6-mvlan-10] quit
```

Assign GigabitEthernet 1/0/4 to VLAN 10.

```
[SwitchB] interface gigabitethernet 1/0/4
[SwitchB-GigabitEthernet1/0/4] ipv6 port multicast-vlan 10
[SwitchB-GigabitEthernet1/0/4] quit
```

Verifying the configuration

Display information about IPv6 multicast VLANs on Switch B.

```
[SwitchB] display ipv6 multicast-vlan
Total 1 IPv6 multicast VLANs.

IPv6 multicast VLAN 10:
  Sub-VLAN list(0 in total):
  Port list(3 in total):
    GE1/0/2
    GE1/0/3
    GE1/0/4
```

Display dynamic MLD snooping forwarding entries on Switch B.

```
[SwitchB] display mld-snooping group
Total 1 entries.

VLAN 10: Total 1 entries.
  (::, FF1E::101)
    Host ports (3 in total):
      GE1/0/2         (00:03:23)
      GE1/0/3         (00:04:07)
      GE1/0/4         (00:04:16)
```

The output shows that MLD snooping maintains the user ports in the multicast VLAN (VLAN 10). Switch B will forward the IPv6 multicast data of VLAN 10 through these user ports.

Troubleshooting IPv6 PIM 65
A multicast distribution tree cannot be correctly built 65
IPv6 multicast data is abnormally terminated on an intermediate device 66
An RP cannot join an SPT in IPv6 PIM-SM 66
An RPT cannot be built or IPv6 multicast source registration fails in IPv6 PIM-SM 66

IPv6 PIM overview

IPv6 Protocol Independent Multicast (IPv6 PIM) provides IPv6 multicast forwarding by leveraging IPv6 unicast static routes or IPv6 unicast routing tables generated by any IPv6 unicast routing protocol. IPv6 PIM uses the underlying IPv6 unicast routing to generate an IPv6 multicast routing table without relying on any particular IPv6 unicast routing protocol.

IPv6 PIM uses the RPF mechanism to implement IPv6 multicast forwarding. For more information about RPF, see "Configuring IPv6 multicast routing and forwarding."

IPv6 PIM modes

Based on the implementation mechanism, IPv6 PIM includes the following modes:

- IPv6 Protocol Independent Multicast–Dense Mode (IPv6 PIM-DM).
- IPv6 Protocol Independent Multicast–Sparse Mode (IPv6 PIM-SM).
- IPv6 Bidirectional Protocol Independent Multicast (IPv6 BIDIR-PIM).
- IPv6 Protocol Independent Multicast Source-Specific Multicast (IPv6 PIM-SSM).

In this document, an IPv6 PIM domain refers to a network composed of IPv6 PIM devices.

IPv6 PIM-DM

IPv6 PIM-DM uses the push mode for multicast forwarding and is suitable for small networks with densely distributed IPv6 multicast members.

IPv6 PIM-DM assumes that all downstream nodes want to receive IPv6 multicast data from a source, so IPv6 multicast data is flooded to all downstream nodes on the network. Branches without downstream receivers are pruned from the forwarding trees, leaving only those branches that contain receivers. When the pruned branch has new receivers, the graft mechanism turns the pruned branch into a forwarding branch.

In IPv6 PIM-DM, the multicast forwarding paths for an IPv6 multicast group constitute a forwarding tree. The forwarding tree is rooted at the IPv6 multicast source and has multicast group members as its "leaves." Because the forwarding tree consists of the shortest paths from the IPv6 multicast source to the receivers, it is also called a "shortest path tree (SPT)."

IPv6 PIM-DM mechanisms include neighbor discovery, SPT building, graft, and assert.

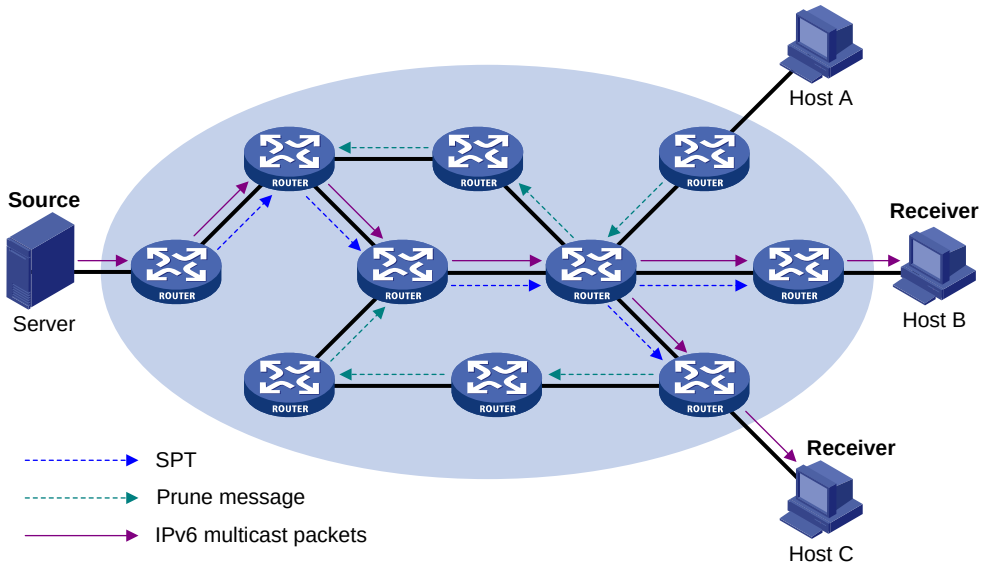
Neighbor discovery

In an IPv6 PIM domain, each IPv6 PIM interface periodically multicasts IPv6 PIM hello messages to all other IPv6 PIM devices on the local subnet. Through the exchanging of hello messages, all IPv6 PIM devices determine their IPv6 PIM neighbors, maintain IPv6 PIM neighboring relationship with other devices, and build and maintain SPTs.

SPT building

The process of building an SPT is the flood-and-prune process:

1. In an IPv6 PIM-DM domain, the IPv6 multicast data from the IPv6 multicast source S to the IPv6 multicast group G is flooded throughout the domain. A device performs an RPF check on the IPv6 multicast data. If the check succeeds, the device creates an (S, G) entry and forwards the data to all downstream nodes in the network. In the flooding process, all the devices in the IPv6 PIM-DM domain create the (S, G) entry.



2. The nodes without downstream receivers are pruned. A device that has no downstream receivers multicasts a prune message to all IPv6 PIM devices on the subnet. When the upstream node receives the prune message, it removes the receiving interface from the (S, G) entry. In this way, the upstream stream node stops forwarding subsequent packets addressed to that IPv6 multicast group down to this node.

NOTE:

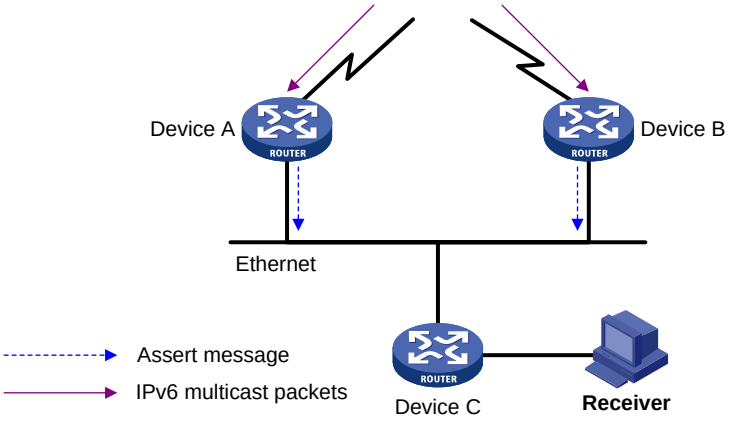
An (S, G) entry contains an IPv6 multicast source address S, an IPv6 multicast group address G, an outgoing interface list, and an incoming interface.

A prune process is initiated by a leaf device. As shown in Figure 1, the device interface that does not have any downstream receivers initiates a prune process by sending a prune message toward the IPv6 multicast source. This prune process goes on until only necessary branches are left in the IPv6 PIM-DM domain, and these necessary branches constitute an SPT.

Figure 1 SPT building

The pruned state of a branch has a finite holdtime timer. When the timer expires, IPv6 multicast data is again forwarded to the pruned branch. The flood-and-prune cycle takes place periodically to maintain the forwarding branches.

Graft



A previously pruned branch might have new downstream receivers. To reduce the latency for resuming the forwarding capability of this branch, a graft mechanism is used as follows:

1. The node that needs to receive the IPv6 multicast data sends a graft message to its upstream node, telling it to rejoin the SPT.
2. After receiving this graft message on an interface, the upstream node adds the receiving interface to the outgoing interface list of the (S, G) entry. It also sends a graft-ack message to the graft sender.
3. If the graft sender receives a graft-ack message, the graft process finishes. Otherwise, the graft sender continues to send graft messages at a graft retry interval until it receives an acknowledgment from its upstream node.

Assert

On a subnet with more than one multicast device, the assert mechanism shuts off duplicate multicast flows to the network. It does this by electing a unique multicast forwarder for the subnet.

Figure 2 Assert mechanism

As shown in Figure 2, after Device A and Device B receive an (S, G) packet from the upstream node, they both forward the packet to the local subnet. As a result, the downstream node Device C receives two identical multicast packets. In addition, both Device A and Device B, on their downstream interfaces, receive a duplicate packet forwarded by the other. After detecting this condition, both devices send an assert message to all IPv6 PIM devices on the local subnet through the interface that received the packet. The assert message contains the IPv6 multicast source address (S), the IPv6 multicast group address (G), and the metric preference and metric of the IPv6 unicast route/MBGP route/static multicast route to the IPv6 multicast source. By comparing these parameters, either Device A or Device B becomes the unique forwarder of the subsequent (S, G) packets on the subnet. The comparison process is as follows:

2. The device with a higher metric preference to the IPv6 multicast source wins.
3. If both devices have the same metric preference to the IPv6 multicast source, the device with a smaller metric to the IPv6 multicast source wins.
4. If both devices have the same metric, the device with a higher IPv6 link-local address on the downstream interface wins.

IPv6 PIM-SM

IPv6 PIM-DM uses the flood-and-prune cycles to build SPTs for IPv6 multicast data forwarding. Although an SPT has the shortest paths from the IPv6 multicast source to the receivers, it is built with a low efficiency. Therefore, IPv6 PIM-DM is not suitable for large- and medium-sized networks.

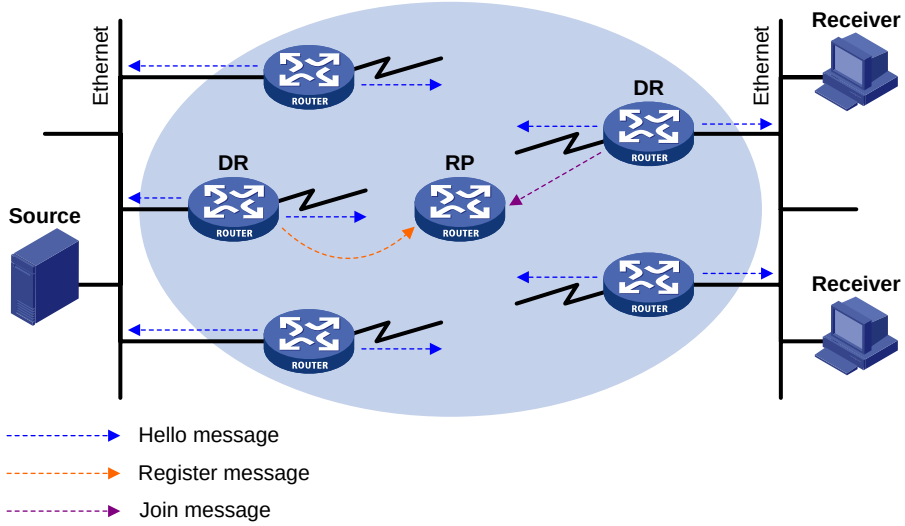
IPv6 PIM-SM uses the pull mode for IPv6 multicast forwarding, and it is suitable for large-sized and medium-sized networks with sparsely and widely distributed IPv6 multicast group members.

IPv6 PIM-SM assumes that no hosts need IPv6 multicast data. A multicast receiver must express its interest in the IPv6 multicast data for an IPv6 multicast group before the data is forwarded to it. A rendezvous point (RP) is the core of an IPv6 PIM-SM domain. Relying on the RP, SPTs and rendezvous point trees (RPTs) are established and maintained to implement IPv6 multicast data forwarding. An SPT is rooted at the IPv6 multicast source and has the RPs as its leaves. An RPT is rooted at the RP and has the receiver hosts as its leaves.

IPv6 PIM-SM mechanisms include neighbor discovery, DR election, RP discovery, Anycast RP, RPT building, multicast source registration, switchover to SPT, and assert.

Neighbor discovery

IPv6 PIM-SM uses the same neighbor discovery mechanism as IPv6 PIM-DM does. For more information, see "Neighbor discovery."



DR election

A designated router (DR) is required on both the source-side network and receiver-side network. A source-side DR acts on behalf of the IPv6 multicast source to send register messages to the RP. The receiver-side DR acts on behalf of the receiver hosts to send join messages to the RP.

IMPORTANT:

MLD must be enabled on the device that acts as the receiver-side DR. Otherwise, the receiver hosts attached to the DR cannot join any IPv6 multicast groups. For more information about MLD, see "Configuring MLD."

Figure 3 DR election

As shown in Figure 3, the DR election process is as follows:

2. The devices on the shared-media LAN send hello messages to one another. The hello messages contain the DR priority for DR election. The device with the highest DR priority is elected as the DR.
3. The device with the highest IPv6 link-local address wins the DR election under one of the following conditions:
   - All the devices have the same DR election priority.
   - A device does not support carrying the DR priority in hello messages.

If the DR fails, its IPv6 PIM neighbor lifetime expires, and the other devices initiate a new DR election.

RP discovery

An RP is the core of an IPv6 PIM-SM domain. An IPv6 multicast group can have only one RP for IPv6 multicast forwarding, and an RP can be designated to multiple IPv6 multicast groups.

RP selection mechanism

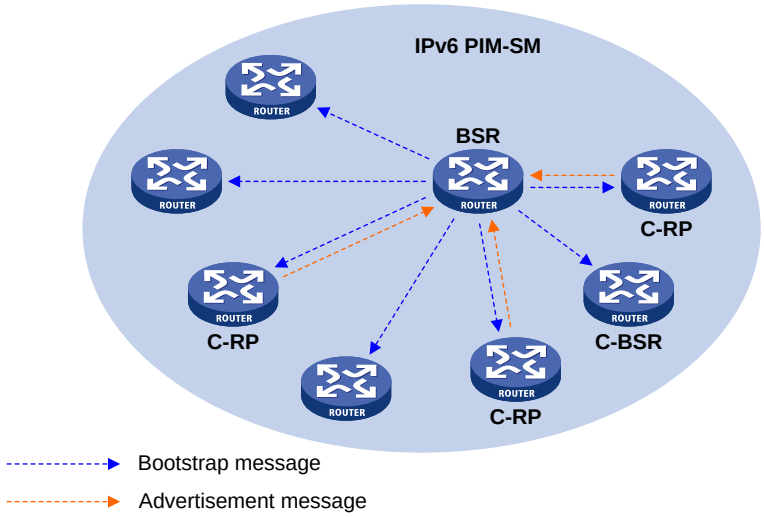
An RP can be statically configured, dynamically elected, or extracted from an IPv6 multicast address with embedded RP. The embedded RP takes precedence over the static RP and the dynamic RP. The priorities of the static RP and the dynamic RP depend on whether the static RP is preferred when the static RP is configured.

- If the static RP is preferred, the static RP takes precedence over the dynamic RP. The dynamic RP takes services over only when the static RP fails.
- If the static RP is not preferred, the dynamic RP takes precedence over the static RP. The static RP takes services over only when the dynamic RP fails.

Static RPs

A static RP can avoid a single point of failure and save network bandwidth that is consumed by frequent communications between C-RPs and the BSR.

Dynamic RP election



Dynamic RP election is implemented through the BSR mechanism. BSR mechanism includes the following roles:

- **Candidate-RPs (C-RPs)**—An RP is dynamically elected from C-RPs to provide services to an IPv6 multicast group.
- **BSR**—A BSR is the core of the administrative core of the IPv6 PIM-SM domain. It is responsible for collecting and advertising RP information in the whole domain. An IPv6 PIM-SM domain has only one BSR, and the BSR is elected from C-BSRs.
- **Candidate-BSRs (C-BSRs)**—Any devices in the IPv6 PIM-SM domain can act as C-BSRs and the BSR is elected from the C-BSRs. Once the BSR fails, a new BSR is elected from the C-BSRs to avoid multicast traffic interruption.

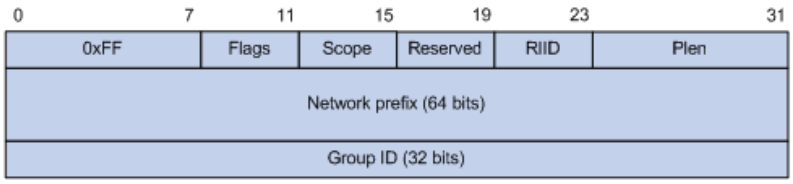
NOTE:

A device can act as a C-RP and a C-BSR at the same time.

Figure 4 Information exchange between C-RPs and BSR

As shown in Figure 4, an RP is elected as follows:

2. Each C-BSR sends a BSM to other devices in the IPv6 PIM-SM domain.
3. When a C-BSR receives a BSM from another C-BSR, it compares its own priority with the priority carried in the message. The C-BSR with a higher priority wins the BSR election. If a tie exists in the priority, the C-BSR with a higher IPv6 address wins. The loser uses the winner's



BSR address to replace its own BSR address and no longer regards itself as the BSR. The winner retains its own BSR address and continues to regard itself as the BSR.

4. Each C-RP periodically unicasts an advertisement message to the BSR. An advertisement message contains the address of the advertising C-RP and the IPv6 multicast group range to which it is designated.
5. The BSR collects these advertisement messages and organizes the C-RP information into an RP-set, which is a database of mappings between IPv6 multicast groups and RPs. The BSR encapsulates the RP-set information in the BSMs and advertises the BSMs to the entire IPv6 PIM-SM domain.
6. All devices in the IPv6 PIM-SM domain select an RP for an IPv6 multicast group based on the following rules:
   a. The C-RP that is designated to the smallest IPv6 multicast group range wins.
   b. If the C-RPs are designated to the same group ranges, the C-RP with the highest priority wins.
   c. If the C-RPs have the same priority, the C-RP with the largest hash value wins. The hash value is calculated through the hash algorithm.
   d. If the C-RPs have the same hash value, the C-RP with the highest IP address wins.

Embedded RP

The embedded RP mechanism enables a device to resolve the RP address from an IPv6 multicast group address to map the IPv6 multicast group to an RP. This RP can take the place of the configured static RP or the RP dynamically elected by the bootstrap mechanism. A DR does not need to learn the RP address beforehand. Figure 5 shows the format of an IPv6 multicast group address with embedded RP.

Figure 5 Format of an IPv6 multicast address with embedded RP

As shown in Figure 5, the requirements for each field are as follows:

- **First 8 bits**—Fixed to 0xFF.
- **Flags**—The R, P, and T bits must be set to 1.
- **Reserved**—Contains 4 bits and must be set to 0.
- **RIID**—Contains 4 bits and indicates the RP interface ID.
- **Plen**—Contains 8 bits and indicates the valid length (in bits) of the RP address prefix. This field value cannot be greater than 64 and cannot be 0.
- **Network prefix**—Contains 64 bits and indicates the prefix of the RP address. The valid length of the prefix is determined by the Plen field.
- **Group ID**—Reduced to 32 bits and indicates the ID of the IPv6 multicast group.

The process of discovering an embedded RP is as follows:

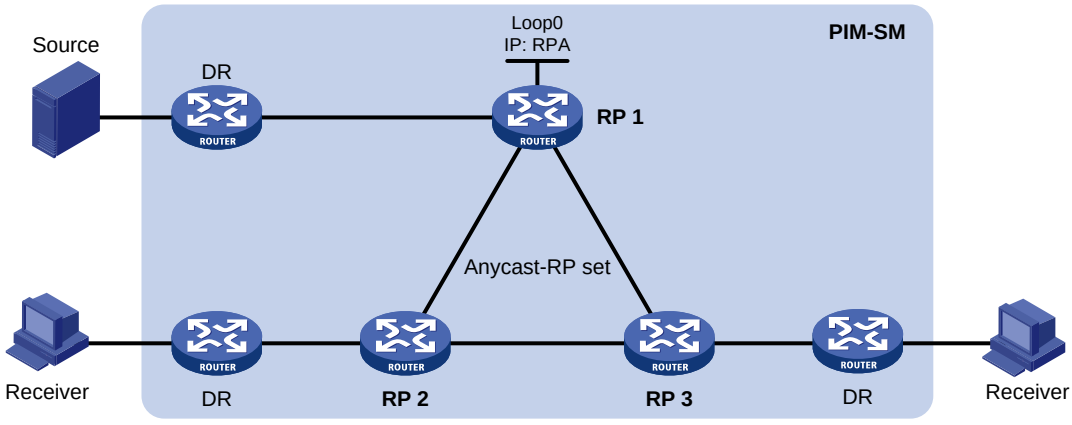
- At the receiver side, a receiver host initiates an MLD report to join an IPv6 multicast group. Upon receiving the MLD report, the receiver-side DR resolves the RP address embedded in the IPv6 multicast group address and uses the RP for the IPv6 multicast group.
- At the IPv6 multicast source side, the IPv6 multicast source sends an IPv6 multicast packet to an IPv6 multicast group. Upon receiving the IPv6 multicast packet, the source-side DR resolves

the RP address embedded in the IPv6 multicast address and uses the RP for the IPv6 multicast group.

Anycast RP

IPv6 PIM-SM requires only one active RP to serve each IPv6 multicast group. If the active RP fails, the multicast traffic might be interrupted. The Anycast RP mechanism enables redundancy backup among RPs by configuring multiple RPs with the same IPv6 address for one multicast group. An IPv6 multicast source registers with the closest RP or a receiver-side DR joins the closest RP to implement source information synchronization.

Anycast RP has the following benefits:



- **Optimal RP path**—An IPv6 multicast source registers with the closest RP to build an optimal SPT. A receiver joins the closest RP to build an optimal RPT.
- **Redundancy backup among RPs**—When an RP fails, the RP-related sources will register with the closest available RPs and the receiver-side DRs will join the closest available RPs. This provides redundancy backup among RPs.

Anycast RP is implemented by using either of the following methods:

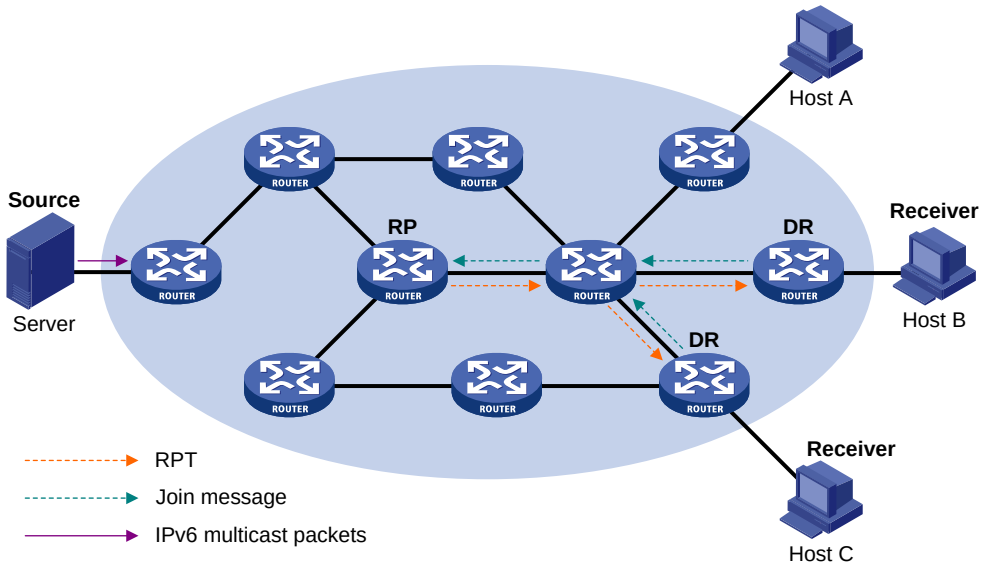
- **Anycast RP through MSDP**—In this method, you can configure multiple RPs with the same IP address for one multicast group and configure MSDP peering relationships between them. For more information about Anycast RP through MSDP, see "Configuring MSDP."
- **Anycast RP through IPv6 PIM-SM**—In this method, you can configure multiple RPs for one IPv6 multicast group and add them to an Anycast RP set. This method introduces the following concepts:
  - **Anycast RP set**—A set of RPs that are designated to the same IPv6 multicast group.
  - **Anycast RP member**—Each RP in the Anycast RP set.
  - **Anycast RP member address**—IPv6 address of each Anycast RP member for communication among the RP members.
  - **Anycast RP address**—IPv6 address of the Anycast RP set for communication within the IPv6 PIM-SM domain. It is also known as RPA.

  As shown in Figure 6, RP 1, RP 2, and RP 3 are members of an Anycast RP set.

Figure 6 Anycast RP through IPv6 PIM-SM

The following describes how Anycast RP through IPv6 PIM-SM is implemented:

a. RP 1 receives a register message destined to RPA. Because the message is not from other Anycast RP members (RP 2 or RP 3), RP 1 considers that the register message is from the DR. RP 1 changes the source IPv6 address of the register message to its own IPv6 address and sends the message to the other members (RP 2 and RP 3).



If a device acts as both a DR and an RP, it creates a register message, and then forwards the message to the other RP members.

b. After receiving the register message, RP 2 and RP 3 find out that the source address of the register message is an Anycast RP member address. They stop forwarding the message to other devices.

In Anycast RP implementation, an RP must forward the register message from the DR to other Anycast RP members to synchronize IPv6 multicast source information.

RPT building

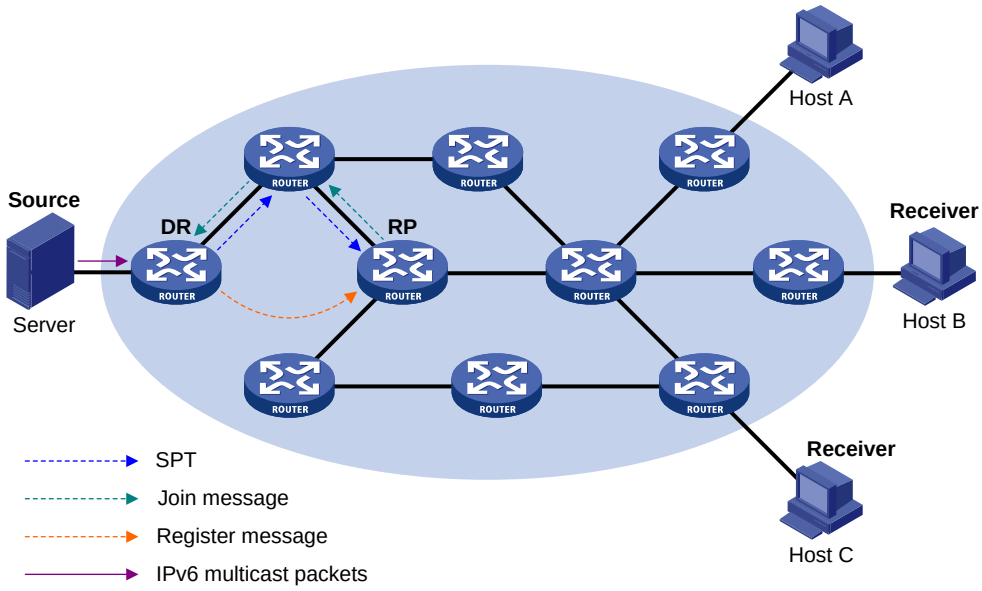
Figure 7 RPT building in an IPv6 PIM-SM domain

As shown in Figure 7, the process of building an RPT is as follows:

2. When a receiver wants to join the IPv6 multicast group G, it uses an MLD message to inform the receiver-side DR.

3. After getting the receiver information, the DR sends a join message, which travels hop by hop to the RP for the IPv6 multicast group.

4. The devices along the path from the DR to the RP form an RPT branch. Each device on this branch adds to its forwarding table a (*, G) entry, where the asterisk (*) represents any IPv6 multicast source. The RPT is rooted at the RP and has the DR as its leaf.



When the IPv6 multicast data addressed to the IPv6 multicast group G reaches the RP, the RP forwards the data to the DR along the established RPT. Finally, the DR forwards the IPv6 multicast data to the receiver hosts.

When a receiver is no longer interested in the IPv6 multicast data addressed to the IPv6 multicast group G, the receiver-side DR sends a prune message. The prune message goes hop by hop along the RPT to the RP. After receiving the prune message, the upstream node deletes the interface that connects to this downstream node from the outgoing interface list. At the same time, the upstream device checks for the existence of receivers for that IPv6 multicast group. If no receivers for the IPv6 multicast group exist, the device continues to forward the prune message to its upstream device.

IPv6 multicast source registration

The IPv6 multicast source uses the registration process to inform an RP of its presence.

Figure 8 IPv6 multicast source registration

As shown in Figure 8, the IPv6 multicast source registers with the RP as follows:

2. The IPv6 multicast source S sends the first multicast packet to the IPv6 multicast group G. When receiving the multicast packet, the source-side DR that directly connects to the IPv6 multicast source encapsulates the packet into a register message and unicasts the message to the RP.
3. After the RP receives the register message, it decapsulates it and forwards it down to the RPT. Meanwhile, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. Each device on this branch creates an (S, G) entry in its forwarding table.
4. The subsequent IPv6 multicast data from the IPv6 multicast source are forwarded to the RP along the SPT. When the IPv6 multicast data reaches the RP along the SPT, the RP forwards the data to the receivers along the RPT. Meanwhile, it unicasts a register-stop message to the source-side DR to prevent the DR from unnecessarily encapsulating the data.

Switchover to SPT

In an IPv6 PIM-SM domain, only one RP and one RPT provide services for a specific IPv6 multicast group. Before the switchover to SPT occurs, the source-side DR encapsulates all IPv6 multicast data in register messages and sends them to the RP. After receiving these register messages, the RP decapsulates them and forwards them to the receiver-side DR along the RPT.

IPv6 multicast forwarding along the RPT has the following weaknesses:

- Encapsulation and decapsulation are complex on the source-side DR and the RP.
- The path for an IPv6 multicast packet might not be the shortest one.
- The RP might be overloaded by IPv6 multicast traffic bursts.

To eliminate these weaknesses, IPv6 PIM-SM allows an RP or the receiver-side DR to initiate the switchover to SPT when the RP or DR receives IPv6 multicast traffic.

- The RP initiates the switchover to SPT:

  If the RP receives IPv6 multicast traffic, it sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path from the RP to the IPv6 multicast source constitute an SPT branch. The subsequent IPv6 multicast data is forwarded to the RP along the SPT without being encapsulated into register messages.

For more information about the switchover to SPT initiated by the RP, see "IPv6 multicast source registration."

- The receiver-side DR initiates the switchover to SPT:

  If the receiver-side DR receives IPv6 multicast traffic, it initiates the switchover to SPT as follows:

  a. The receiver-side DR sends an (S, G) source-specific join message toward the IPv6 multicast source. The devices along the path create an (S, G) entry in their forwarding table to constitute an SPT branch.

  b. When the multicast packets reach the device where the RPT and the SPT branches, the device drops the multicast packets that travel along the RPT. It then sends a prune message with the RP bit toward the RP.

  c. After receiving the prune message, the RP forwards it toward the IPv6 multicast source (supposed only one receiver exists). Thus, the switchover to SPT is completed. The subsequent IPv6 multicast packets for the IPv6 multicast group travel along the SPT from the IPv6 multicast source to the receiver hosts.

With the switchover to SPT, IPv6 PIM-SM builds SPTs more economically than IPv6 PIM-DM does.

Assert

IPv6 PIM-SM uses a similar assert mechanism as IPv6 PIM-DM does. For more information, see "Assert."

IPv6 BIDIR-PIM

In some many-to-many applications, such as a multi-side video conference, multiple receivers of an IPv6 multicast group might be interested in the IPv6 multicast data from multiple IPv6 multicast sources. With IPv6 PIM-DM or IPv6 PIM-SM, each device along the SPT must create an (S, G) entry for each IPv6 multicast source, consuming a lot of system resources.

IPv6 BIDIR-PIM addresses the problem. Derived from IPv6 PIM-SM, IPv6 BIDIR-PIM builds and maintains a bidirectional RPT, which is rooted at the RP and connects the IPv6 multicast sources and the receivers. Along the bidirectional RPT, the IPv6 multicast sources send IPv6 multicast data to the RP, and the RP forwards the data to the receivers. Each device along the bidirectional RPT needs to maintain only one (*, G) entry, saving system resources.

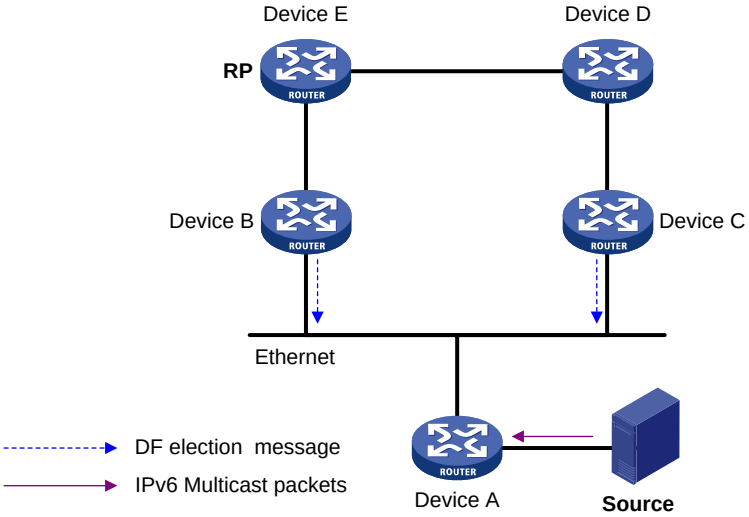
IPv6 BIDIR-PIM is suitable for a network with dense IPv6 multicast sources and receivers.

IPv6 BIDIR-PIM mechanisms include neighbor discovery, RP discovery, DF election, and bidirectional RPT building.

Neighbor discovery

IPv6 BIDIR-PIM uses the same neighbor discovery mechanism as IPv6 PIM-SM does. For more information, see "Neighbor discovery."

RP discovery



IPv6 BIDIR-PIM supports static RPs and dynamic RP election, and uses the same RP discovery mechanism as IPv6 PIM-SM, except that IPv6 BIDIR-PIM does not support embedded RP. For more information, see "RP discovery." In IPv6 BIDIR-PIM, an RPF interface is the interface toward an RP, and an RPF neighbor is the address of the next hop to the RP.

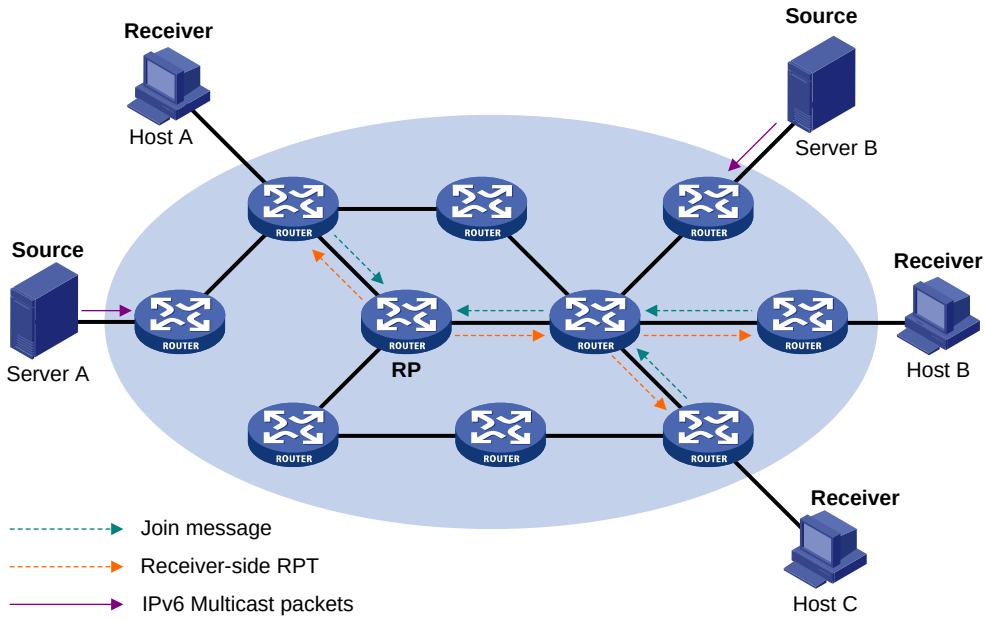
DF election

On a subnet with multiple multicast devices, duplicate multicast packets might be forwarded to the RP. To address this issue, IPv6 BIDIR-PIM uses a designated forwarder (DF) election mechanism to elect a unique DF on each subnet. Only the DFs can forward IPv6 multicast data to the RP.

DF election is not necessary for an RPL.

Figure 9 DF election

As shown in Figure 9, without the DF election mechanism, both Device B and Device C can receive IPv6 multicast packets from Device A. They also can forward the packets to downstream devices on the local subnet. As a result, the RP (Device E) receives duplicate IPv6 multicast packets.



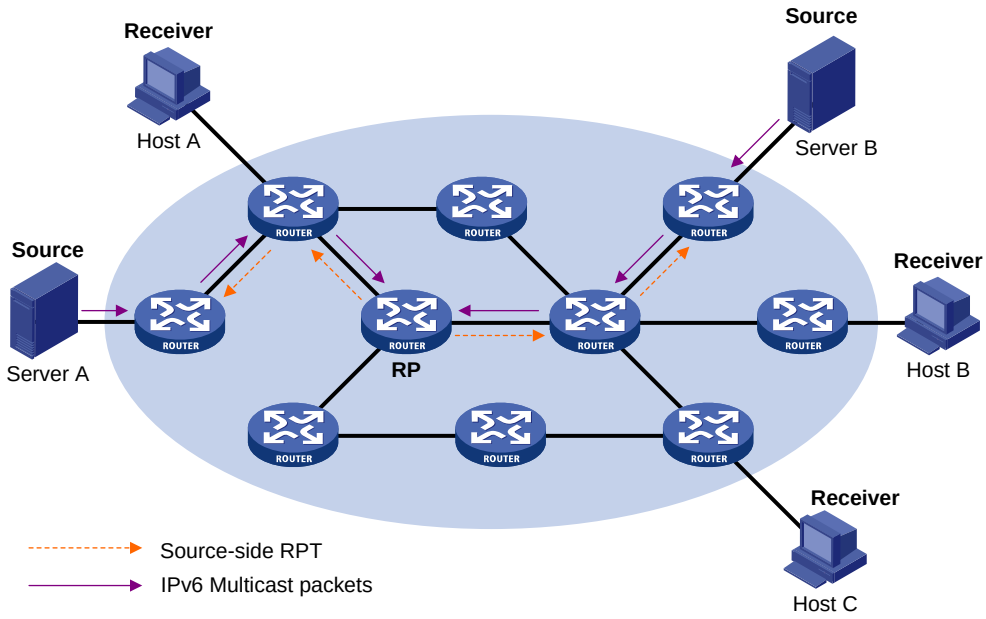
With the DF election mechanism, once receiving the RP information, Device B and Device C multicast a DF election message to all IPv6 PIM devices on the subnet to initiate a DF election process. The election message carries the RP's address, and the route preference and metric of the IPv6 unicast route, IPv6 MBGP route, or IPv6 multicast static route to the RP. A DF is elected as follows:

2. The device with higher route preference becomes the DF.
3. If the devices have the same route preference, the device with lower metric becomes the DF.
4. If the devices have the same metric, the device with the higher IP address becomes the DF.

Bidirectional RPT building

A bidirectional RPT comprises a receiver-side RPT and a source-side RPT. The receiver-side RPT is rooted at the RP and takes the devices that directly connect to the receivers as leaves. The source-side RPT is also rooted at the RP but takes the devices that directly connect to the IPv6 multicast sources as leaves. The processes for building these two RPTs are different.

Figure 10 RPT building at the receiver side



As shown in Figure 10, the process for building a receiver-side RPT is the same as the process for building an RPT in IPv6 PIM-SM:

2. When a receiver wants to join the IPv6 multicast group G, it uses an MLD message to inform the directly connected device.
3. After receiving the message, the device sends a join message, which is forwarded hop by hop to the RP for the IPv6 multicast group.
4. The devices along the path from the receiver's directly connected device to the RP form an RPT branch. Each device on this branch adds a (*, G) entry to its forwarding table.

After a receiver host leaves the IPv6 multicast group G, the directly connected device multicasts a prune message to all IPv6 PIM devices on the subnet. The prune message goes hop by hop along the reverse direction of the RPT to the RP. After receiving the prune message, an upstream node removes the interface that connects to the downstream node from the outgoing interface list. At the same time, the upstream device checks the existence of receivers for that IPv6 multicast group. If no receivers for the IPv6 multicast group exist, the device continues to forward the prune message to its upstream device.

Figure 11 RPT building at the IPv6 multicast source side

As shown in Figure 11, the process for building a source-side RPT is relatively simple:

5. When an IPv6 multicast source sends multicast packets to the IPv6 multicast group G, the DF in each subnet unconditionally forwards the packets to the RP.
6. The devices along the path from the source's directly connected device to the RP constitute an RPT branch. Each device on this branch adds a (*, G) entry to its forwarding table.

After a bidirectional RPT is built, the IPv6 multicast sources send multicast traffic to the RP along the source-side RPT. Then, the RP forwards the traffic to the receivers along the receiver-side RPT.

IMPORTANT:

If a receiver and a source are at the same side of the RP, the source-side RPT and the receiver-side RPT might meet at a node before reaching the RP. In this case, the multicast packets from the IPv6 multicast source to the receiver are directly forwarded by the node, instead of by the RP.

IPv6 administrative scoping

IPv6 administrative scoping mechanism

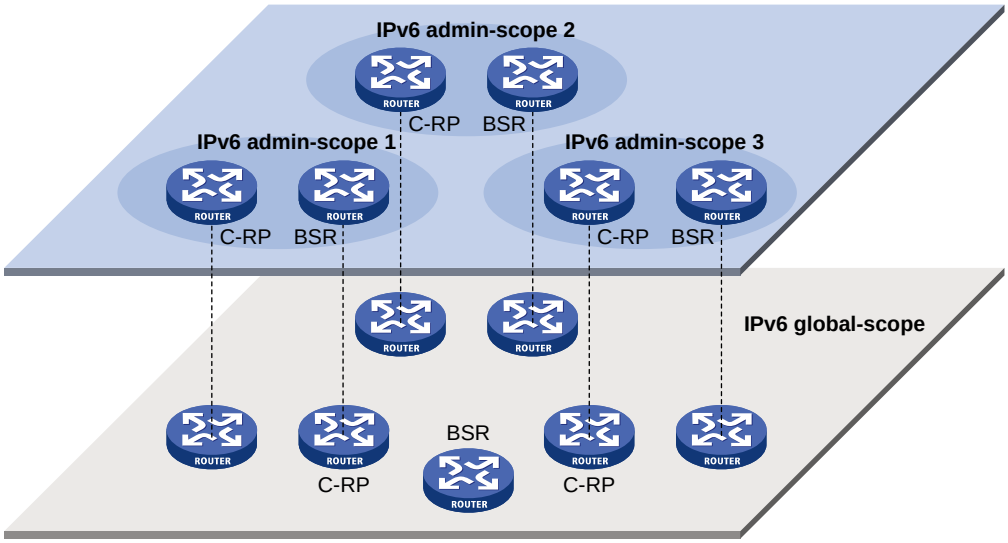
IPv6 administrative scoping mechanisms for IPv6 PIM-SM/IPv6 BIDIR-PIM include IPv6 non-scoped BSR mechanism and IPv6 administrative scoping mechanism.

- **IPv6 non-scoped BSR mechanism**—A domain contains only one BSR, which is responsible for advertising RP-set information within the entire domain. The information about all multicast groups is forwarded within the network that the BSR administers.
- **IPv6 administrative scoping mechanism**—To implement refined management, you can divide a domain into a global-scoped zone and multiple administratively-scoped zones (IPv6 admin-scoped zones). The administrative scoping mechanism effectively releases stress on the management in a single-BSR domain and enables provision of zone-specific services through private group addresses.

An IPv6 admin-scoped zone is designated to particular IPv6 multicast groups with the same scope field value in their group addresses. Zone border routers (ZBRs) form the boundary of an IPv6 admin-scoped zone. Each IPv6 admin-scoped zone maintains one BSR for IPv6 multicast groups

with the same scope field value. IPv6 multicast protocol packets, such as assert messages and BSMs, of these IPv6 multicast groups cannot cross the boundary of the IPv6 admin-scoped zone for the group range. The IPv6 multicast group ranges to which different IPv6 admin-scoped zones are designated can have intersections. However, the IPv6 multicast groups in an IPv6 admin-scoped zone are valid only within its local zone, and theses IPv6 multicast groups are regarded as private group addresses.

The IPv6 global-scoped zone can be regarded as a special IPv6 admin-scoped zone, and it maintains a BSR for the IPv6 multicast groups with the scope field value as 14.



Relationship between IPv6 admin-scoped zones and the IPv6 global-scoped zone

The IPv6 global-scoped zone and each IPv6 admin-scoped zone have their own C-RPs and BSRs. These devices are effective only on their respective zones, and the BSR election and the RP election are implemented independently. Each IPv6 admin-scoped zone has its own boundary. The IPv6 multicast information within a zone cannot cross this boundary in either direction. You can have a better understanding of the IPv6 global-scoped zone and IPv6 admin-scoped zones based on geographical locations and the scope field values.

- In view of geographical locations:

  An IPv6 admin-scoped zone is a logical zone for particular IPv6 multicast groups with the same scope field value. The IPv6 multicast packets for such IPv6 multicast groups are confined within the local IPv6 admin-scoped zone and cannot cross the boundary of the zone.

  Figure 12 Relationship in view of geographical locations

  As shown in Figure 12, for the IPv6 multicast groups with the same scope field value, the IPv6 admin-scoped zones must be geographically separated and isolated. The IPv6 global-scoped zone includes all devices in the IPv6 PIM-SM domain or IPv6 BIDIR-PIM domain. IPv6 multicast packets that do not belong to any IPv6 admin-scoped zones are forwarded in the entire IPv6 PIM-SM domain or IPv6 BIDIR-PIM domain.

- In view of the scope field values:

  In terms of the scope field values, the scope field in an IPv6 multicast group address shows the zone to which the IPv6 multicast group belongs.

Figure 13 IPv6 multicast address format

An IPv6 admin-scoped zone with a larger scope field value contains an IPv6 admin-scoped zone with a smaller scope field value. The zone with the scope field value of E is the IPv6 global-scoped zone. Table 1 lists the possible values of the scope field.

Table 1 Values of the Scope field

Value	Meaning	Remarks
0, F	Reserved	N/A
1	Interface-local scope	N/A
2	Link-local scope	N/A
3	Subnet-local scope	IPv6 admin-scoped zone.
4	Admin-local scope	IPv6 admin-scoped zone.
5	Site-local scope	IPv6 admin-scoped zone.
6, 7, 9 through D	Unassigned	IPv6 admin-scoped zone.
8	Organization-local scope	IPv6 admin-scoped zone.
E	Global scope	IPv6 global-scoped zone.

IPv6 PIM-SSM

The ASM model includes IPv6 PIM-DM and IPv6 PIM-SM. The SSM model can be implemented by leveraging part of the IPv6 PIM-SM technique. It is also called "IPv6 PIM-SSM."

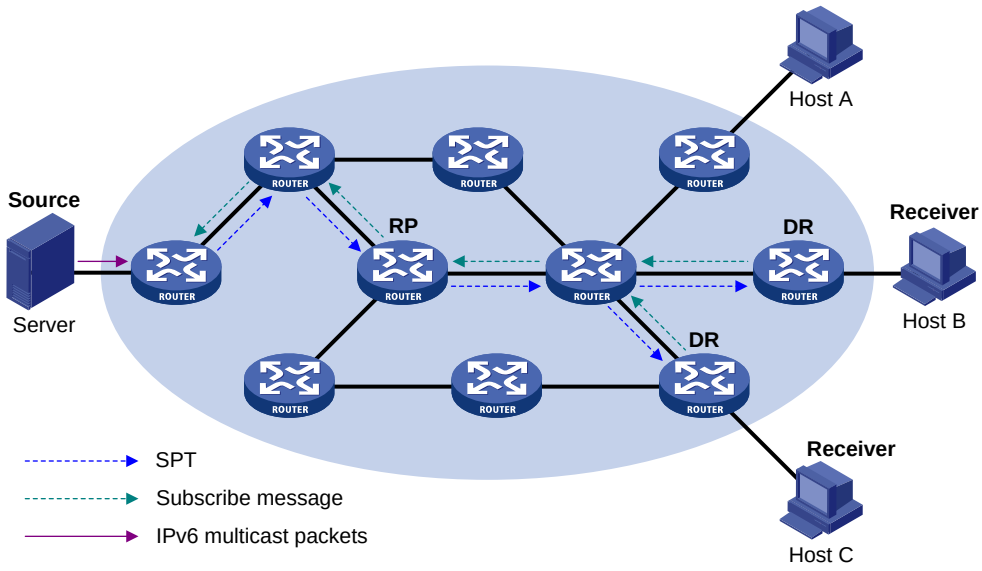
The SSM model provides a solution for source-specific multicast. It maintains the relationship between hosts and devices through MLDv2.

In actual applications, part of MLDv2 and IPv6 PIM-SM techniques are adopted to implement the SSM model. In the SSM model, because receivers have located an IPv6 multicast source, no RP or RPT is required. No source registration process is required for discovering IPv6 multicast sources in other IPv6 PIM domains.

IPv6 PIM-SSM mechanisms include neighbor discovery, DR election, and SPT building.

Neighbor discovery

IPv6 PIM-SSM uses the same neighbor discovery mechanism as IPv6 PIM-SM. For more information, see "Neighbor discovery."



DR election

IPv6 PIM-SSM uses the same DR election mechanism as IPv6 PIM-SM. For more information, see "DR election."

SPT building

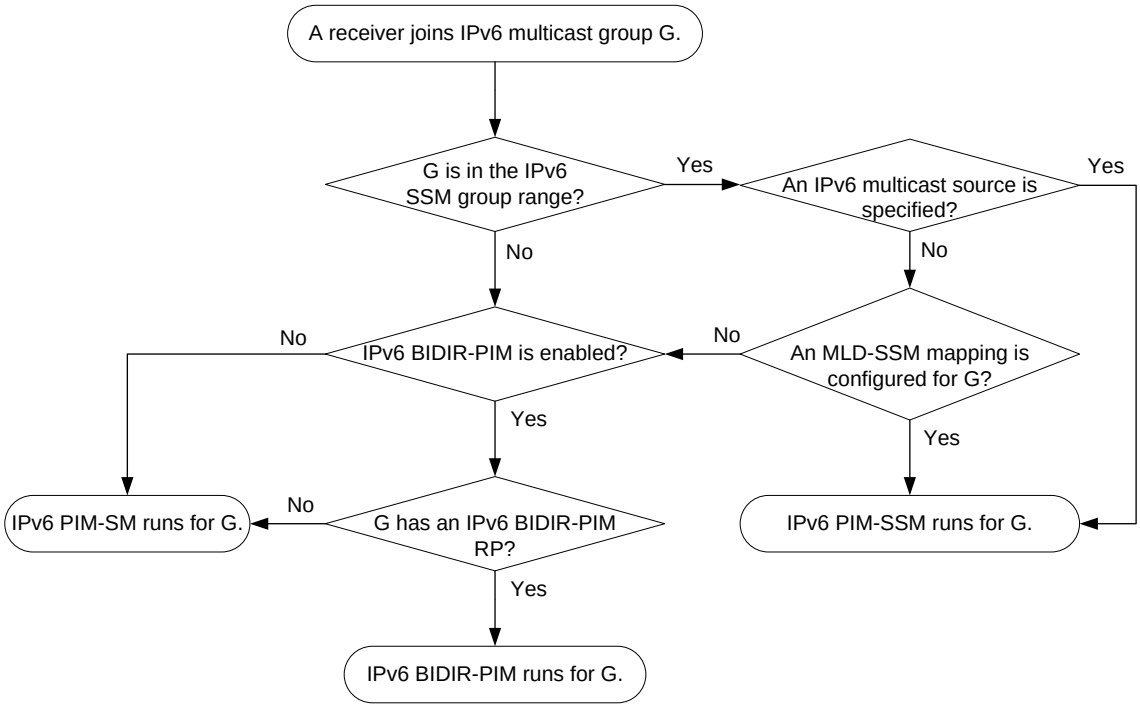
The decision to build an RPT for IPv6 PIM-SM or an SPT for IPv6 PIM-SSM depends on whether the IPv6 multicast group that the receiver host joins is in the IPv6 SSM group range. The IPv6 SSM group range reserved by IANA is FF3x::/32, where "x" represents any legal address scope.

Figure 14 SPT building in IPv6 PIM-SSM

As shown in Figure 14, Host B and Host C are receivers. They send MLDv2 report messages to their DRs to express their interest in the multicast information that the IPv6 multicast source S sends to the IPv6 multicast group G.

After receiving a report message, the DR first checks whether the group address in the message is in the IPv6 SSM group range and does the following:

- If the group address is in the IPv6 SSM group range, the DR sends a subscribe message hop by hop toward the IPv6 multicast source S. All devices along the path from the DR to the IPv6 multicast source create an (S, G) entry to build an SPT. The SPT is rooted the IPv6 multicast source S and has the receivers as its leaves. This SPT is the transmission channel in IPv6 PIM-SSM.
- If the group address is not in the IPv6 SSM group range, the receiver-side DR sends a (*, G) join message to the RP. The IPv6 multicast source registers with the source-side DR.



In IPv6 PIM-SSM, the term "subscribe message" refers to a join message.

Relationship among IPv6 PIM protocols

In an IPv6 PIM network, IPv6 PIM-DM cannot run together with IPv6 PIM-SM, IPv6 BIDIR-PIM, or IPv6 PIM-SSM. However, IPv6 PIM-SM, IPv6 BIDIR-PIM, and IPv6 PIM-SSM can run together. Figure 15 shows how the device selects one protocol from among them for a receiver trying to join a group.

For more information about MLD SSM mapping, see "Configuring MLD."

Figure 15 Relationship among IPv6 PIM protocols

IPv6 PIM support for VPNs

To support IPv6 PIM for VPNs, a multicast device that runs IPv6 PIM maintains an independent set of IPv6 PIM neighbor table, IPv6 multicast routing table, BSR information, and RP-set information for each VPN.

After receiving an IPv6 multicast data packet, the multicast device checks which VPN the IPv6 data packet belongs to. Then, the device forwards the IPv6 packet according to the IPv6 multicast routing table for that VPN or creates an IPv6 multicast routing entry for that VPN.

Protocols and standards

Configuring IPv6 PIM

Restrictions and guidelines: IPv6 PIM configuration

All the interfaces on a device must operate in the same IPv6 PIM mode on the public network or the same VPN instance.

To avoid IPv6 PIM routing table exceptions, do not use the same RP to provide services for IPv6 PIM-SM and IPv6 BIDIR-PIM when both of them run on the IPv6 PIM network.

Configuring IPv6 PIM-DM

IPv6 PIM-DM tasks at a glance

To configure IPv6 PIM-DM, perform the following tasks:

1. Enabling IPv6 PIM-DM
2. (Optional.) Configuring the state refresh feature
3. (Optional.) Setting the IPv6 PIM-DM graft retry timer
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-DM

Before you configure IPv6 PIM-DM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-DM

About this task

With IPv6 PIM-DM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-DM on all non-border interfaces of devices when you deploy an IPv6 PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

quit

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-DM.
   ipv6 pim dm
   By default, IPv6 PIM-DM is disabled.

Configuring the state refresh feature

About this task

- **State refresh capability**—Enables the IPv6 PIM device that is directly connected to the source to periodically send state refresh messages. It also enables other PIM devices to refresh pruned state timers after receiving the state refresh messages. Use this feature to prevent the pruned interfaces from resuming multicast forwarding.
- **State refresh interval**—Determines the interval at which a device sends state refresh messages.
- **Wait time before accepting a new state refresh message**—A device might receive duplicate state refresh messages within a short time. To prevent this situation, you can adjust the amount of time that the device must wait to accept a new state refresh message. If the device receives a new state refresh message before the timer expires, it discards the message. If the device receives a new state refresh message after the timer expires, it accepts the message, refreshes its own IPv6 PIM-DM state, and resets the waiting timer.
- **Hop limit value of state refresh messages**—The hop limit value of a state refresh message decrements by 1 whenever it passes a device before it is forwarded to the downstream node. The state refresh message is not forwarded when the hop limit comes down to 0. A state refresh message with a large hop limit value might cycle on a small network. To control the propagation scope of state refresh messages, configure an appropriate hop limit value based on the network size on the device directly connected with the IPv6 multicast source.

Restrictions and guidelines

Perform this task on all devices in the IPv6 PIM-DM domain.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable the state refresh feature.
   ipv6 pim state-refresh-capable
   By default, the state refresh feature is enabled.
4. Return to system view.
   quit
5. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
6. Set the state refresh interval.
   state-refresh-interval *interval*
   The default setting is 60 seconds.
7. Set the amount of time that the device must wait to accept a new state refresh message.
   state-refresh-rate-limit *time*

The default setting is 30 seconds.

8. Set the hop limit value of state refresh messages.
   state-refresh-hoplimit *hoplimit-value*
   The default setting is 255.

Setting the IPv6 PIM-DM graft retry timer

About this task

Perform this task to adjust the interval at which the device retransmits a graft message if it does not receive a graft-ack message from the upstream device.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv6 PIM-DM graft retry timer.
   ipv6 pim timer graft-retry *interval*
   By default, the IPv6 PIM-DM graft retry timer is 3 seconds.

Configuring IPv6 PIM-SM

IPv6 PIM-SM tasks at a glance

To configure IPv6 PIM-SM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. Configuring static RPs
   As a best practice, configure a static RP when only one dynamic RP exists in the network.
3. Configure dynamic RP election:
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring an IPv6 PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces

   As a best practice, configure dynamic RPs when multiple IPv6 PIM devices exist in the network.
4. Enabling embedded RP
   Enable embedded RP on each device for inter-domain communication when the devices are located in different IPv6 PIM-SM domains.
5. (Optional.) Configuring Anycast RP
6. (Optional.) Configuring IPv6 multicast source registration
7. (Optional.) Configuring the switchover to SPT
8. (Optional.) Configuring the delay time for DR election
9. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SM

Before you configure IPv6 PIM-SM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 multicast routing.

Enabling IPv6 PIM-SM

About this task

With IPv6 PIM-SM enabled on interfaces, devices can establish IPv6 PIM neighbor relationship and process IPv6 PIM messages from their IPv6 PIM neighbors.

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.

   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

   By default, IPv6 multicast routing is disabled.

   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

   quit
4. Enter interface view.

   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.

   ipv6 pim sm

   By default, IPv6 PIM-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by a single point of failure. The static RP can also avoid waste of bandwidth caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

In the IPv6 PIM-SM domain, you can configure the same static RP for multiple IPv6 multicast groups by using the same RP address but different ACLs.

You do not need to enable IPv6 PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for an IPv6 multicast group, only the static RP with the highest IPv6 address takes effect.

The static RP configuration must be the same on all devices in the IPv6 PIM-SM domain.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for IPv6 PIM-SM.

   static-rp *ipv6-rp-address* [{ *ipv6-acl-number* | **name** *ipv6-acl-name* }] | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To avoid C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and multicast group addresses.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the IPv6 PIM-SM domain because every C-BSR might become the BSR.

The device might use the BSR RP hash algorithm described in RFC 4601 or in RFC 2362 to calculate the RP for a multicast group. To ensure consistent group-to-RP mappings on all PIM devices in the IPv6 PIM-SM domain, specify the same BSR RP hash algorithm on the devices.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP.

   c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] *

4. (Optional.) Configure a C-RP policy.

   crp-policy *ipv6-acl-number*

   By default, no C-RP policies are configured. All C-RP advertisement messages are regarded as legal.

5. (Optional.) Configure the device to use the BSR RP hash algorithm described in RFC 2362.

   bsr-rp-mapping rfc2362

   By default, the device uses the BSR RP hash algorithm described in RFC 4601.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSR and other devices exchange a large amount of information in the IPv6 PIM-SM domain, reserve a large bandwidth between the C-BSR and other devices.

The C-BSR configuration on the devices in the IPv6 PIM-SM domain must be the same.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv6-acl-number*

   By default, no BSR policies are configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the interval for C-BSRs to send BSMs.
   c-bsr interval *interval*
   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits for BSMs from the BSR for 130 seconds before sending BSMs.

Configuring an IPv6 PIM domain border

About this task

An IPv6 PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of IPv6 PIM domain border interfaces partition a network into different IPv6 PIM-SM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Configure an IPv6 PIM domain border.

   ipv6 pim bsr-boundary

   By default, an interface is not an IPv6 PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the IPv6 PIM-SM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable BSM semantic fragmentation.

   undo bsm-fragment enable

   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated IPv6 multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Disable the device from forwarding BSMs out of their incoming interfaces.

   undo bsm-reflection enable

   By default, the device forwards BSMs out of their incoming interfaces.

Enabling embedded RP

Restrictions and guidelines

This feature is supported only for IPv6 multicast group addresses in the range of FF7x::/12 or FFFx::/12 and in compliance with RFC 3956.

Enable this feature on all devices in the IPv6 PIM-SM domain.

IPv6 BIDIR-PIM does not support embedded RP.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim[**vpn-instance** *vpn-instance-name*]
3. Enable embedded RP.
   embedded-rp [*ipv6-acl-number*]
   By default, embedded RP is disabled.

Configuring Anycast RP

Restrictions and guidelines

In an Anycast RP set, RP members must have an interface (for example, loopback interface) with the same IPv6 address. The IPv6 address must be configured as both a C-RP and the Anycast RP address.

To prevent the other Anycast RP member devices from discarding the BSM sent by the BSR, make sure the Anycast RP address is different from the BSR address.

As a best practice to ensure network performance, configure a maximum of 16 Anycast RP members for an Anycast RP set.

As a best practice, configure the IPv6 address of a loopback interface as the RP member address.

If you configure IPv6 addresses of multiple interfaces on the same device as RP member addresses, the lowest IPv6 address takes effect. The rest of the interface addresses become backup RP member addresses.

You must add the device where the Anycast RP resides as an RP member to the Anycast RP set.

Prerequisites

You must configure a static RPs or C-RPs in the IPv6 PIM-SM domain before you configure the Anycast RP. Use the address of the static RP or the dynamically elected RP as the Anycast RP address.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure Anycast RP.
   anycast-rp *ipv6-anycast-rp-address ipv6-member-address*
   You can repeat this command to add multiple RP member addresses to an Anycast RP set.

Configuring IPv6 multicast source registration

About this task

- **IPv6 PIM register policy**—An IPv6 PIM register policy enables an RP to filter register messages by using an ACL that specifies the IPv6 multicast sources and groups. The policy limits the multicast groups to which the RP is designated. If a register message is denied by the ACL or does not match the ACL, the RP discards the register message and sends a register-stop message to the source-side DR. The registration process stops.
- **Checksum computing method for register messages**—For information integrity of a register message, you can configure the device to calculate the checksum based on the entire register message. If a device cannot calculate the checksum based on the entire register message, you can configure the device to calculate the checksum based on the register message header.
- **Register suppression time**—The source-side DR stops sending register messages encapsulated with IPv6 multicast data and starts a register-stop timer upon receiving a register-stop message from the RP. Before the register-stop timer expires, the DR sends a null register message (a register message without encapsulated IPv6 multicast data) to the RP and starts a register probe timer. If the DR receives a register-stop message before the register probe timer expires, it resets its register-stop timer. If the DR does not receive a register-stop message when the register probe timer expires, the DR starts sending register messages with encapsulated data again.

  The register-stop timer is set to a random value chosen uniformly from (0.5 × register_suppression_time minus register_probe_time) to (1.5 × register_suppression_time minus register_probe_time). The register_probe_time is (5 seconds). You can adjust the register suppression time.

Restrictions and guidelines

On all C-RP devices, configure an IPv6 PIM register policy and the checksum computing method for register messages.

On all devices that might become the source-side DR, set the register suppression time.

As a best practice, set the suppression time to be longer than or equal to 11 seconds.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 PIM register policy.

   register-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 register policy is configured. All IPv6 register messages are regarded as legal.
4. Configure the device to calculate the checksum based on the entire register message.

   register-whole-checksum

   By default, the device calculates the checksum based on the header of a register message.
5. Set the register suppression time.

   register-suppression-timeout *interval*

   The default setting is 60 seconds.

Configuring the switchover to SPT

Restrictions and guidelines

Some devices cannot encapsulate IPv6 multicast data in register messages destined to the RP. As a best practice to avoid IPv6 multicast data forwarding failures, do not disable the switchover to SPT on C-RPs that might become the RP.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the switchover to SPT.

   spt-switch-threshold { **immediacy** | **infinity** } [**group-policy** *ipv6-acl-number*]

   By default, the first IPv6 multicast data packet triggers the RPT to SPT switchover.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure the delay time for DR election.

   ipv6 pim timer dr-elect-delay *delay-time*

   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring IPv6 BIDIR-PIM

IPv6 BIDIR-PIM tasks at a glance

To configure IPv6 BIDIR-PIM, perform the following tasks:

1. Enabling IPv6 BIDIR-PIM

2. Configuring static RPs

   As a best practice, configure a static R when only one dynamic RP exists in the network.
3. Configuring dynamic RPs
   - Configuring C-RPs
   - Configuring C-BSRs
   - (Optional.) Configuring the interval for C-BSRs to send BSMs
   - (Optional.) Configuring the timer for C-BSRs to wait BSMs from the BSR
   - (Optional.) Configuring an IPv6 PIM domain border
   - (Optional.) Disabling BSM semantic fragmentation
   - (Optional.) Disabling the device from forwarding BSMs out of their incoming interfaces
   - (Optional.) Setting the maximum number of IPv6 BIDIR-PIM RPs

   As a best practice, configure dynamic RPs when multiple IPv6 PIM devices exist in the network.

   You can configure static RPs, dynamic RPs, or both.
4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 BIDIR-PIM

Before you configure IPv6 BIDIR-PIM, you must complete the following tasks:

- Configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 PIM-SM.

Enabling IPv6 BIDIR-PIM

Restrictions and guidelines

As a best practice, enable IPv6 BIDIR-PIM on all non-border interfaces of devices when you deploy an IPv6 BIDIR-PIM.

Procedure

1. Enter system view.

   `system-view`
2. Enable IPv6 multicast routing and enter MRIB view.

   `ipv6 multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]

   By default, IPv6 multicast routing is disabled.

   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.

   `quit`
4. Enter interface view.

   `interface` *`interface-type interface-number`*
5. Enable IPv6 PIM-SM.

   `ipv6 pim sm`

   By default, IPv6 PIM-SM is disabled.
6. Return to system view.

   `quit`
7. Enter IPv6 PIM view

ipv6 pim [**vpn-instance** *vpn-instance-name*]

8. Enable IPv6 BIDIR-PIM.

   bidir-pim enable

   By default, IPv6 BIDIR-SM is disabled.

Configuring static RPs

About this task

If only one dynamic RP exists on a network, you can configure a static RP to avoid communication interruption caused by single-point failures. The static RP can also avoid bandwidth waste caused by frequent message exchanges between C-RPs and the BSR.

Restrictions and guidelines

The static RP configuration must be the same on all devices in the IPv6 BIDIR-PIM domain.

In an IPv6 BIDIR-PIM domain, you can configure the same static RP for different IPv6 multicast groups by using the same RP address but different ACLs.

You do not need to enable IPv6 PIM for an interface to be configured as a static RP.

If you configure multiple static RPs for an IPv6 multicast group, only the static RP with the highest IPv6 address takes effect.

You can specify an unused IP address for a static RP. This address must be on the same subnet as the link on which the static RP is configured. For example, if the IPv6 addresses of the interfaces at the two ends of a link are 1001::1/64 and 1001::2/64, you can specify the interface with IPv6 address 1001::100/64 as a static RP. As a result, the link becomes an RPL.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a static RP for IPv6 BIDIR-PIM.

   static-rp *ipv6-rp-address* **bidir** [{ *ipv6-acl-number* | **name** *ipv6-acl-name* } | **preferred**] *

   When both a static RP and a dynamically elected RP exist on the network, you can specify the **preferred** keyword to give priority to the static RP. The dynamic RP is used only when the static RP fails. If you do not specify the **preferred** keyword, the dynamic RP takes priority and the static RP is used only when the dynamic RP fails.

Configuring C-RPs

About this task

To guard against C-RP spoofing, configure a C-RP policy to filter C-RP advertisement messages by using an ACL that specifies the packet source address range and IPv6 multicast groups.

Restrictions and guidelines

Configure C-RPs on devices that reside in the backbone network.

Because the RP and other devices exchange a large amount of information in the IPv6 BIDIR-PIM domain, reserve a large bandwidth between C-RPs and other devices.

You must configure the same C-RP policy on all C-BSRs in the IPv6 BIDIR-PIM domain.

The device might use the BSR RP hash algorithm described in RFC 4601 or in RFC 2362 to calculate the RP for a multicast group. To ensure consistent group-to-RP mappings on all PIM devices in the IPv6 BIDIR-PIM domain, specify the same BSR RP hash algorithm on the devices.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-RP to provide services for IPv6 BIDIR-PIM.

   c-rp *ipv6-address* [**advertisement-interval** *adv-interval* | { **group-policy** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **scope** *scope-id* } | **holdtime** *hold-time* | **priority** *priority*] * **bidir**

4. (Optional.) Configure the device to use the RP hash algorithm described in RFC 2362.

   bsr-rp-mapping rfc2362

   By default, the device uses the BSR RP hash algorithm described in RFC 4601.

Configuring C-BSRs

About this task

You must configure C-BSRs when you configure dynamic RP election.

To prevent a legal BSR from being replaced by a malicious host, configure a BSR policy to filter BSR messages by using an ACL that specifies the legal BSR addresses.

Restrictions and guidelines

Configure C-BSRs on devices that reside in the backbone network.

Because the BSRs and other devices exchange a large amount of information in the IPv6 BIDIR-PIM domain, reserve a large bandwidth between the C-BSRs and other devices.

The C-BSR configuration on all devices in the same IPv6 BIDIR-PIM domain must be the same.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure a C-BSR.

   c-bsr *ipv6-address* [**scope** *scope-id*] [**hash-length** *hash-length* | **priority** *priority*] *

   By default, no C-BSRs exist.

4. (Optional.) Configure a BSR policy.

   bsr-policy *ipv6-acl-number*

   By default, no BSR policy is configured. All bootstrap messages are regarded as legal.

Configuring the interval for C-BSRs to send BSMs

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires (configured by using the **c-bsr holdtime** command). During this

period of time, the BSR periodically sends BSMs to all other devices in the PIM domain. The BSMs carry the IP address of the BSR, RP-set information, and RP aging time. Other devices in the PIM domain select an RP for a multicast group based on the RP-set information. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

In an IPv6 BIDIR-PIM network with active and backup RPs, when the link for the active RP fails, the backup RP must wait the active RP to age out before taking over. The aging time of the active RP is long because it must be longer than the sending interval of bootstrap messages, and the sending interval of BSMs is not configurable. You can use this command to set a smaller sending interval.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Configure the interval for C-BSRs to send BSMs.

   c-bsr interval *interval*

   By default, a C-BSR sends BSMs at 60-second intervals.

Configuring the timer for C-BSRs to wait BSMs from the BSR

About this task

After a C-BSR is elected as the BSR, all other C-BSRs stop sending BSMs to other devices until the timer for waiting BSMs expires. After the timer for waiting BSMs expires, all C-BSRs send BSMs to one another, triggering a new BSR election process.

Restrictions and guidelines

If you configure both the sending interval and the hold time, make sure the former is smaller than the latter. Otherwise, BSR election processes will be triggered frequently.

If you configure only one of them, the value of the other parameter can be calculated by using the formula: value of the unconfigured parameter = (value of the configured parameter–10)/2

If you configure only the hold time and the sending interval calculated by using the formula is smaller than 1 second, the actual sending interval is 1 second.

If you configure only the sending interval and the hold time calculated by using the formula is greater than the maximum value (2147483647 seconds), the actual hold time is 2147483647 seconds.

You must configure the same sending interval and hold time on all C-BSRs in one PIM domain. Otherwise, BSR election will be unstable, which causes multicast traffic forwarding problems.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the timer for C-BSRs to wait BSMs from the BSR.
   c-bsr holdtime *hold-time*
   By default, a C-BSR waits BSMs from the BSR for 130 seconds before sending BSMs.

Configuring an IPv6 PIM domain border

About this task

An IPv6 PIM domain border determines the transmission boundary of bootstrap messages. Bootstrap messages cannot cross the domain border in either direction. A number of PIM domain border interfaces partition a network into different IPv6 BIDIR-PIM domains.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 PIM domain border.
   ipv6 pim bsr-boundary
   By default, an interface is not an IPv6 PIM domain border.

Disabling BSM semantic fragmentation

About this task

BSM semantic fragmentation enables a BSR to split a BSM into multiple BSM fragments (BSMFs) if the BSM exceeds the MTU. In this way, a non-BSR device can update the RP-set information for a group range after receiving all BSMFs for the group range. The loss of one BSMF only affects the RP-set information of the group ranges that the fragment contains.

Restrictions and guidelines

If a device does not support BSM semantic fragmentation, it regards a BSMF as a BSM and updates the RP-set information each time it receives a BSMF. It learns only part of the RP-set information, which further affects the RP election. Therefore, if such a device exists in the IPv6 BIDIR-PIM domain, you must disable BSM semantic fragmentation on all C-BSRs.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Disable BSM semantic fragmentation.
   undo bsm-fragment enable
   By default, BSM semantic fragmentation is enabled.

Disabling the device from forwarding BSMs out of their incoming interfaces

About this task

By default, the device forwards BSMs out of their incoming interfaces. This default setting ensures that all devices on the subnet can receive BSMs even when they have inconsistent routing information. However, this default setting results in duplicated IPv6 multicast traffic. If you are sure that all the devices on the subnet have consistent routing information, you can disable the device from forwarding BSMs out of their incoming interfaces.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Disable the device from forwarding BSMs out of their incoming interfaces.
   undo bsm-reflection enable
   By default, the device forwards BSMs out of their incoming interfaces.

Setting the maximum number of IPv6 BIDIR-PIM RPs

About this task

In an IPv6 BIDIR-PIM domain, one DF election per RP is implemented on all IPv6 PIM-enabled interfaces. To avoid unnecessary DF elections, do not configure multiple RPs for IPv6 BIDIR-PIM.

This configuration sets a limit on the number of IPv6 BIDIR-PIM RPs. If the number of RPs exceeds the limit, excess RPs do not take effect and can be used only for DF election rather than IPv6 multicast data forwarding. The system does not delete these excess RPs. They must be deleted manually.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum number of IPv6 BIDIR-PIM RPs.
   bidir-rp-limit *limit*
   By default, the maximum number of IPv6 BIDIR-PIM RPs is 6.

Configuring IPv6 PIM-SSM

IPv6 PIM-SSM tasks at a glance

To configure IPv6 PIM-SSM, perform the following tasks:

1. Enabling IPv6 PIM-SM
2. (Optional.) Specifying the IPv6 SSM group range
3. (Optional.) Configuring the delay time for DR election

4. (Optional.) Configuring common IPv6 PIM features

Prerequisites for IPv6 PIM-SSM

Before you configure IPv6 PIM-SSM, you must complete the following tasks:

- Configure an IPv6 unicast IPv6 routing protocol so that all devices in the domain can interoperate at the network layer.
- Enable IPv6 PIM-SM.
- Enable MLDv2 on the IPv6 PIM devices that connect to IPv6 multicast receivers.

Enabling IPv6 PIM-SM

Restrictions and guidelines

As a best practice, enable IPv6 PIM-SM on all non-border interfaces of devices when you deploy an IPv6 PIM-SSM domain.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit
4. Enter interface view.
   interface *interface-type interface-number*
5. Enable IPv6 PIM-SM.
   ipv6 pim sm
   By default, IPv6 PIM-SM is disabled.

Specifying the IPv6 SSM group range

About this task

When an IPv6 PIM-SM enabled interface receives an IPv6 multicast packet, it checks whether the IPv6 multicast group address of the packet is in the IPv6 SSM group range. If the IPv6 multicast group address is in this range, the IPv6 PIM mode for this packet is IPv6 PIM-SSM. If the IPv6 multicast group address is not in this range, the IPv6 PIM mode is IPv6 PIM-SM.

Restrictions and guidelines

Configure the same IPv6 SSM group range on all devices in the entire IPv6 PIM-SM domain. Otherwise, IPv6 multicast information cannot be delivered through the IPv6 SSM model.

When a member of an IPv6 multicast group in the IPv6 SSM group range sends an MLDv1 report message, the device does not trigger a (*, G) join.

Procedure

1. Enter system view.
   system-view

2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure the IPv6 SSM group range.
   ssm-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   The default range is FF3x::/32, where x can be any valid scope.

Configuring the delay time for DR election

About this task

After a failed DR recovers, it will send IPv6 PIM hello messages and will be elected as the new DR immediately. In this case, transient multicast traffic loss will occur because the new DR has not generated a complete multicast forwarding table.

Perform this task to delay a recovered DR from being elected as the new DR. Before the delay timer expires, the current DR continues to forward multicast traffic, minimizing multicast traffic loss.

Restrictions and guidelines

As a best practice, perform this task on the user-side interface (interface enabled with MLD) only on the DR. If you perform this task on both the DR and a non-DR device and both of them fail, traffic loss will occur before the delay timer expires.

As a best practice to avoid sending repeated packets after the failed DR recovers, set the delay time to be longer than the interval for sending IPv6 PIM hello messages.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the delay time for DR election.
   ipv6 pim timer dr-elect-delay *delay-time*
   By default, a failed DR is elected as the new DR immediately after it recovers.

Configuring common IPv6 PIM features

Common IPv6 PIM feature tasks at a glance

All the following tasks are optional.

- Configuring an IPv6 multicast source policy
- Configuring an IPv6 PIM hello policy
- Configuring IPv6 PIM hello message options
- Dropping hello messages without the Generation ID option
- Enabling the device to send hello messages with a different Generation ID upon a port state change
- Configuring common IPv6 PIM timers
- Setting the maximum size of a join or prune message
- Configuring an IPv6 PIM join policy
- Setting the DSCP value for outgoing IPv6 PIM protocol packets

- Enabling BFD for IPv6 PIM
- Enabling IPv6 PIM passive mode
- Enabling IPv6 PIM NSR
- Enabling SNMP notifications for IPv6 PIM
- Enabling IPv6 PIM logging
- Enabling log message suppression for IPv6 PIM

Configuring an IPv6 multicast source policy

About this task

This feature enables the device to filter IPv6 multicast data by using an ACL that specifies the IPv6 multicast sources and the optional groups. It filters not only IPv6 multicast data packets but also IPv6 PIM register messages with IPv6 multicast data encapsulated. This also reduces the IPv6 multicast traffic on the network.

Procedure

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Configure an IPv6 multicast source policy.

   source-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 multicast source policy is configured. The device does not filter IPv6 multicast data packets.

Configuring an IPv6 PIM hello policy

About this task

This feature enables the device to filter IPv6 PIM hello messages by using an ACL that specifies the packet source addresses. It is used to guard against IPv6 PIM message attacks and to establish correct IPv6 PIM neighboring relationships.

If hello messages of an existing IPv6 PIM neighbor are filtered out by the policy, the neighbor is automatically removed when its aging timer expires.

Procedure

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Configure an IPv6 PIM hello policy.

   ipv6 pim neighbor-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* }

   By default, no IPv6 PIM hello policy is configured on an interface. All IPv6 PIM hello messages are regarded as legal.

Configuring IPv6 PIM hello message options

About this task

In either an IPv6 PIM-DM domain or an IPv6 PIM-SM domain, hello messages exchanged among devices contain the following configurable options:

- **DR_Priority** (for IPv6 PIM-SM only)—Priority for DR election. The device with the highest priority wins the DR election. You can configure this option for all the devices in a shared-media LAN that directly connects to the IPv6 multicast source or the receivers.
- **Holdtime**—IPv6 PIM neighbor lifetime. If a device receives no hello message from a neighbor when the neighbor lifetime expires, it regards the neighbor failed or unreachable.
- **LAN_Prune_Delay**—Delay of pruning a downstream interface on a shared-media LAN. This option has the LAN delay field, the override interval field, and the T bit.

  The LAN delay defines the IPv6 PIM message propagation delay. The override interval defines a time period for a downstream device to override a prune message. The T bit specifies the capability of tracking downstream device status on upstream devices.

  On the shared-media LAN, the propagation delay and override interval are used as follows:

  - If a device receives a prune message on its upstream interface, it means that there are downstream devices on the shared-media LAN. If this device still needs to receive multicast data, it must send a join message to override the prune message within the override interval.
  - When a device receives a prune message from its downstream interface, it does not immediately prune this interface. Instead, it starts a timer (the propagation delay plus the override interval). If interface receives a join message before the timer expires, the device does not prune the interface. Otherwise, the device prunes the interface.
- **Neighbor tracking**—If you enable neighbor tracking on an upstream device, this device can track the states of the downstream nodes for which the joined state holdtime timer has not expired. All join messages from downstream devices are accepted.

Restrictions and guidelines

If the propagation delay or override interval on different IPv6 PIM devices on a shared-media LAN is different, the largest ones apply.

If you enable neighbor tracking, you must enable it on all IPv6 PIM devices on a shared-media LAN or the upstream device to track join messages from every downstream device.

You can configure hello message options for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

Configuring hello message options globally

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the DR priority.

   hello-option dr-priority *priority*

   The default setting is 1.
4. Set the neighbor lifetime.

   hello-option holdtime *time*

   The default setting is 105 seconds.
5. Set the IPv6 PIM message propagation delay for a shared-media LAN.

hello-option lan-delay *delay*

The default setting is 500 milliseconds.

6. Set the override interval.

   hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Configuring hello message options on an interface

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Set the DR priority.

   ipv6 pim hello-option dr-priority *priority*

   The default setting is 1.

4. Set the neighbor lifetime.

   ipv6 pim hello-option holdtime *time*

   The default setting is 105 seconds.

5. Set the IPv6 PIM message propagation delay.

   ipv6 pim hello-option lan-delay *delay*

   The default setting is 500 milliseconds.

6. Set the override interval.

   ipv6 pim hello-option override-interval *interval*

   The default setting is 2500 milliseconds.

7. Enable neighbor tracking.

   ipv6 pim hello-option neighbor-tracking

   By default, neighbor tracking is disabled.

Dropping hello messages without the Generation ID option

About this task

A device generates a generation ID for hello messages when an interface is enabled with IPv6 PIM. The generation ID is a random value, but it changes only when the status of the device changes. If an IPv6 PIM device finds that the generation ID in a hello message from the upstream device has changed, it assumes that the status of the upstream device has changed. In this case, it sends a join message to the upstream device for status update. You can configure an interface to drop hello messages without the generation ID options to promptly know the status of an upstream device.

Procedure

1. Enter system view.

   system-view

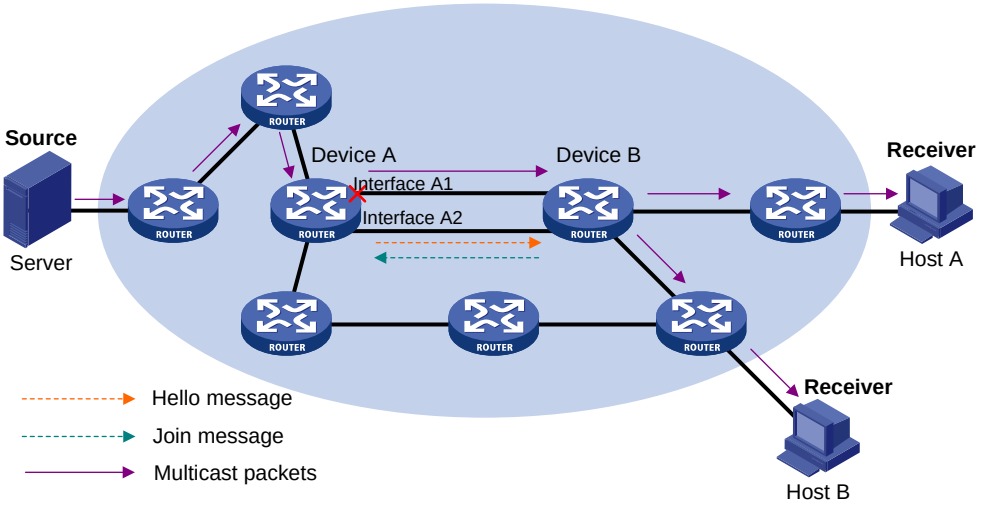
2. Enter interface view.

   interface *interface-type interface-number*

3. Enable the interface to drop hello messages without the Generation ID option.

ipv6 pim require-genid

By default, an interface accepts hello messages without the Generation ID option.



Enabling the device to send hello messages with a different Generation ID upon a port state change

About this task

As shown in Figure 16, Device B connects to Device A through two interfaces in the same VLAN (interface A1 and interface A2) for high availability. Device A sends multicast data to Device B through interface A. When interface A1 fails or recovers from failure, Device A sends multicast data to Device B through interface A2. When interface A1 recovers from failure, Device A sends multicast data to Device B through interface A1 again. In both cases, Device A does not immediately send hello messages with a different Generation ID and multicast data cannot be switched to the new path immediately.

After you perform this task, Device A will immediately send hello messages with a different Generation ID when the port state in the VLAN changes. Then, Device B will send an IPv6 PIM join message and update the multicast forwarding entry. Multicast data can be switched to the new path immediately.

Figure 16 Network diagram

Procedure

1. Enter system view.

   system-view

2. Enter VLAN interface view.

   interface vlan-interface *interface-number*

3. Enable the interface to send hello messages with a different Generation ID upon a port state change.

   ipv6 pim triggered-hello enable { **port-down** | **port-up** } *

   By default, the device does not send hello messages with a different Generation ID upon a port state change.

Configuring common IPv6 PIM timers

About this task

The following are common IPv6 PIM timers:

- **Hello interval**—Interval at which an IPv6 PIM device sends hello messages to discover IPv6 PIM neighbors and maintain IPv6 PIM neighbor relationship.
- **Triggered hello delay**—Maximum delay for sending a hello message to avoid collisions caused by simultaneous hello messages. After receiving a hello message, an IPv6 PIM device waits for a random time before sending a hello message. This random time is in the range of 0 to the triggered hello delay.
- **Join or prune interval**—Interval at which an IPv6 PIM device sends join or prune messages to its upstream devices for state update.
- **Joined/Pruned state holdtime**—Time for which an IPv6 PIM device keeps the joined/pruned state for the downstream interfaces. This joined/pruned state holdtime is contained in a join or prune message.
- **IPv6 multicast source lifetime**—Lifetime that an IPv6 PIM device maintains for an IPv6 multicast source. If a device does not receive subsequent IPv6 multicast data from the IPv6 multicast source S when the timer expires, it deletes the (S, G) entry for the IPv6 multicast source.

Restrictions and guidelines

To prevent upstream neighbors from aging out, set the join or prune interval to be less than the join or pruned state holdtime.

You can configure common IPv6 PIM timers for all interfaces in IPv6 PIM view or for the current interface in interface view. The configuration made in interface view takes priority over the configuration made in IPv6 PIM view.

As a best practice, use the defaults for a network without special requirements.

Configuring common IPv6 PIM timers globally

1. Enter system view.

   system-view
2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the hello interval.

   timer hello *interval*

   By default, the interval to send hello messages is 30 seconds.
4. Set the join or prune interval.

   timer join-prune *interval*

   By default, the interval to send join or prune messages is 60 seconds.

   This configuration takes effect after the current interval ends.
5. Set the joined/pruned state holdtime.

   holdtime join-prune *time*

   By default, the joined/pruned state holdtime timer is 210 seconds.
6. Set the IPv6 multicast source lifetime.

   source-lifetime *time*

   By default, the IPv6 multicast source lifetime is 210 seconds.

Configuring common IPv6 PIM timers on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the hello interval.
   ipv6 pim timer hello *interval*
   The default setting is 30 seconds.
4. Set the triggered hello delay.
   ipv6 pim triggered-hello-delay *delay*
   The default setting is 5 seconds.
5. Set the join or prune interval.
   ipv6 pim timer join-prune *interval*
   The default setting is 60 seconds.
   This configuration takes effect after the current interval ends.
6. Set the joined/pruned state holdtime.
   ipv6 pim holdtime join-prune *time*
   The default setting is 210 seconds.

Setting the maximum size of a join or prune message

Restrictions and guidelines

The loss of an oversized join or prune message might result in loss of massive information. You can set a small value for the size of a join or prune message to reduce the impact.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 PIM view.
   ipv6 pim [**vpn-instance** *vpn-instance-name*]
3. Set the maximum size of a join or prune message.
   jp-pkt-size *size*
   By default, the maximum size of a join or prune message is 1200 bytes.

Configuring an IPv6 PIM join policy

About this task

The IPv6 PIM join policy filters joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages to protect the device against invalid IPv6 PIM join or prune message attacks. The policy identifies valid joined IPv6 multicast source and groups in IPv6 PIM join or prune messages and filters out invalid joined IPv6 multicast source and groups. The device creates (*, G) or (S, G) entries only for valid joined IPv6 multicast sources and groups.

Procedure

1. Enter system view.
   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 PIM join policy to filter joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages.

   ipv6 pim join-policy { { *ipv6-acl-number* | **name** *ipv6-acl-name* } | [**asm** { *ipv6-acl-number* | **name** *ipv6-acl-name* } | **ssm** { *ipv6-acl-number* | **name** *ipv6-acl-name* }] * }

   By default, no IPv6 PIM join policy is configured and joined IPv6 multicast sources and groups in IPv6 PIM join or prune messages are not filtered.

Setting the DSCP value for outgoing IPv6 PIM protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.

   system-view

2. Enter IPv6 PIM view.

   ipv6 pim [**vpn-instance** *vpn-instance-name*]

3. Set the DSCP value for outgoing IPv6 PIM protocol packets.

   dscp *dscp-value*

   By default, the DSCP value is 48 for outgoing IPv6 PIM protocol packets.

Enabling BFD for IPv6 PIM

About this task

If a DR on a shared-media network fails, a new DR election process will start after the DR ages out. However, it might take a long period of time before other devices detect the link failures and trigger a new DR election. To start a new DR election process immediately after the original DR fails, you can enable BFD for IPv6 PIM to detect link failures among IPv6 PIM neighbors.

You must enable BFD for IPv6 PIM on all IPv6 PIM devices on a shared-media network. For more information about BFD, see *High Availability Configuration Guide*.

You must enable IPv6 PIM-DM or IPv6 PIM-SM on an interface before you configure this feature on the interface.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable BFD for IPv6 PIM.

   ipv6 pim bfd enable

   By default, BFD is disabled for IPv6 PIM.

Enabling IPv6 PIM passive mode

About this task

To guard against IPv6 PIM hello spoofing, you can enable IPv6 PIM passive mode on a receiver-side interface. The interface cannot receive or forward IPv6 PIM protocol messages (excluding register, register-stop and C-RP-Adv messages), and acts as the DR on the subnet.

Restrictions and guidelines

This feature takes effect only when IPv6 PIM-DM or IPv6 PIM-SM is enabled on the interface.

To avoid duplicate multicast data transmission and flow loop, do not enable this feature on a shared-media LAN with multiple IPv6 PIM devices.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IPv6 PIM passive mode on the interface.
   ipv6 pim passive
   By default, IPv6 PIM passive mode is disabled on an interface.

Enabling IPv6 PIM NSR

About this task

This feature enables IPv6 PIM to back up protocol state information, including IPv6 PIM neighbor information and routes, from the active process to the standby process. The standby process immediately takes over when the active process fails. Use this feature to avoid route flapping and forwarding interruption for IPv6 PIM when an active/standby switchover occurs.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 PIM NSR.
   ipv6 pim non-stop-routing
   By default, IPv6 PIM NSR is disabled.

Enabling SNMP notifications for IPv6 PIM

About this task

To report critical IPv6 PIM events to an NMS, enable SNMP notifications for IPv6 PIM. For PIM event notifications to be sent correctly, you must also configure SNMP as described in *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IPv6 PIM.

snmp-agent trap enable pim6 [**candidate-bsr-win-election** | **elected-bsr-lost-election** | **invalid-join-prune** | **invalid-register** | **interface-election** | **neighbor-loss** | **private-interface-election** | **private-neighbor-loss** | **private-new-neighbor** | **private-rp-mapping-change** | **rp-mapping-change**] *

By default, SNMP notifications for IPv6 PIM are enabled.

Enabling IPv6 PIM logging

About this task

To report critical IPv6 PIM events to the information center, enable IPv6 PIM logging. For IPv6 PIM log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IPv6 PIM logging or use the **ipv6 pim log suppress** command to enable log message suppression for IPv6 PIM.

Procedure

1. Enter system view.

   system-view
2. Enable IPv6 PIM logging.

   ipv6 pim log enable [**dr** | **error-packet** | **neighbor** | **rp**] *

   IPv6 PIM logging is enabled by default.

Enabling log message suppression for IPv6 PIM

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IPv6 PIM. With this feature configured, the speed of sending IPv6 PIM log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IPv6 PIM logging has been enabled using the **ipv6 pim log enable** command.

Procedure

1. Enter system view.

   system-view
2. Enable log message suppression for IPv6 PIM.

   ipv6 pim log suppress [**dr** | **error-packet** | **neighbor** | **rp**] *

   By default, log message suppression is enabled for IPv6 PIM.

Display and maintenance commands for IPv6 PIM

Execute **display** commands in any view.

Task	Command
Display register-tunnel interface information.	**display interface** [**register-tunnel** [*interface-number*]] [**brief** [**description**| **down**]]
Display BSR information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **bsr-info**
Display information about the routes used by IPv6 PIM.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **claimed-route** [*ipv6-source-address*]
Display C-RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **c-rp** [**local**]
Display DF information in the IPv6 BIDIR-PIM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **df-info** [*ipv6-rp-address*]
Display IPv6 PIM information on an interface.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**verbose**]
Display IPv6 PIM neighbor information.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **neighbor** [*ipv6-neighbor-address* | **interface** *interface-type interface-number* | **verbose**] *
Display IPv6 PIM routing entries.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-group-address* [*prefix-length*] | *ipv6-source-address* [*prefix-length*] | **flags** *flag-value* | **fsm** | **incoming-interface** *interface-type interface-number* | **mode** *mode-type* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **extranet** { **source-vpn-instance** *source-vpn-instance-name* | **source-public-instance** | **receive-vpn-instance** *receive-vpn-instance-name* | **receive-public-instance** }] *
Display RP information in the IPv6 PIM-SM domain.	**display ipv6 pim** [**vpn-instance** *vpn-instance-name*] **rp-info** [*ipv6-group-address*]
Display statistics for IPv6 PIM packets.	**display ipv6 pim statistics**

IPv6 PIM configuration examples

Example: Configuring IPv6 PIM-DM

Network configuration

As shown in Figure 17:

- OSPFv3 runs on the network.

- VOD streams are sent to receiver hosts in multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain is operating in the dense mode.
- Host A and Host C are multicast receivers in two stub networks N1 and N2.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 17 Network diagram

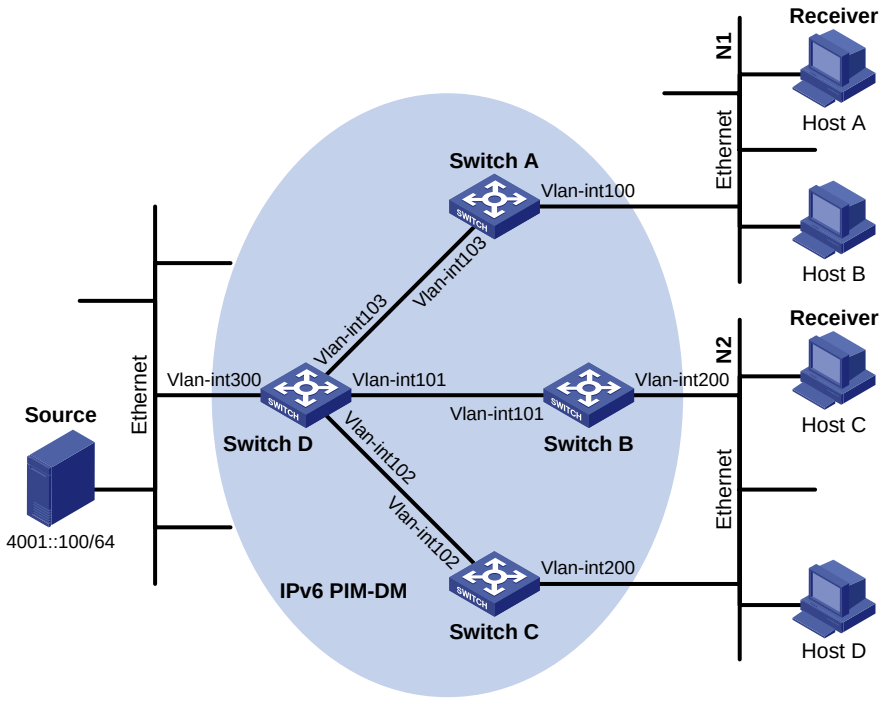


Table 2 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int103	1002::1/64	Switch D	Vlan-int103	1002::2/64
Switch B	Vlan-int200	2001::1/64	Switch D	Vlan-int101	2002::2/64
Switch B	Vlan-int101	2002::1/64	Switch D	Vlan-int102	3001::2/64
Switch C	Vlan-int200	2001::2/64	Switch D	Vlan-int300	4001::1/64
Switch C	Vlan-int102	3001::1/64	Switch D	Vlan-int103	1002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 17, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld enable
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-DM on VLAN-interface 103.

```
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-DM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

On Switch D, enable IPv6 multicast routing, and enable IPv6 PIM-DM on each interface.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] ipv6 pim dm
[SwitchD-Vlan-interface300] quit
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim dm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 101
[SwitchD-Vlan-interface101] ipv6 pim dm
[SwitchD-Vlan-interface101] quit
[SwitchD] interface vlan-interface 102
[SwitchD-Vlan-interface102] ipv6 pim dm
[SwitchD-Vlan-interface102] quit
```

Verifying the configuration

Display IPv6 PIM information on Switch D.

```
[SwitchD] display ipv6 pim interface
 Interface: Vlan300
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:1    (local)
 Interface: Vlan103
   NbrCnt: 0
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2    (local)
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3    (local)
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
```

```
   DR address: FE80::A01:201:4    (local)
```

Display IPv6 PIM neighboring relationship on Switch D.

```
[SwitchD] display ipv6 pim neighbor
 Total IPv6 pim neighbors: 3
  Neighbor: FE80::A01:101:1
    Interface: Vlan103
    Uptime: 00:04:00
    Expiry time: 00:01:29
    DR priority: 1
    Mode: N/A
  Neighbor: FE80::B01:102:2
    Interface: Vlan101
    Uptime: 00:04:16
    Expiry time: 00:01:29
    DR priority: 3
    Mode: N/A
  Neighbor: FE80::C01:103:3
    Interface: Vlan102
    Uptime: 00:03:54
    Expiry time: 00:01:17
    DR priority: 5
    Mode: N/A
```

Send an MLD report from Host A to join IPv6 multicast group FF0E::101. (Details not shown.)

Send IPv6 multicast data from IPv6 multicast source 4001::100/64 to IPv6 multicast group FF0E::101. (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 1 (*, G) entry; 1 (S, G) entry

 (*, FF0E::101)
     Protocol: pim-dm, Flag: WC
     UpTime: 00:01:24
     Upstream interface: NULL
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
         1: Vlan-interface100
             Protocol: mld, UpTime: 00:01:20, Expires: -

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: ACT
     UpTime: 00:01:20
     Upstream interface: Vlan-interface103
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
     Downstream interface(s) information:
     Total number of downstream interfaces: 1
```

```
        1: Vlan-interface100
            Protocol: pim-dm, UpTime: 00:01:20, Expires: -
```

Display IPv6 PIM multicast routing table information on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF0E::101)
     Protocol: pim-dm, Flag: LOC ACT
     UpTime: 00:02:19
     Upstream interface: Vlan-interface300
         Upstream neighbor: NULL
         RPF prime neighbor: NULL
     Downstream interface(s) information:
     Total number of downstream interfaces: 2
         1: Vlan-interface103
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
         2: Vlan-interface102
             Protocol: pim-dm, UpTime: 00:02:19, Expires: -
```

The output shows the following information:

- Switches on the SPT path (Switch A and Switch D) have the correct (S, G) entries.
- Switch A has a correct (*, G) entry.

Example: Configuring non-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 18:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in multicast. The receivers of different subnets form stub networks, and a minimum of one receiver host exist in each stub network. The entire IPv6 PIM-SM domain contains only one BSR.
- Host A and Host C are multicast receivers in the stub networks N1 and N2.
- Specify VLAN-interface 102 on Switch E as a C-BSR and a C-RP. The C-RP is designated to the IPv6 multicast group range FF0E::101/64. Specify VLAN-interface101 of Switch D as the static RP on all the switches to back up the dynamic RP.
- MLDv1 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 18 Network diagram

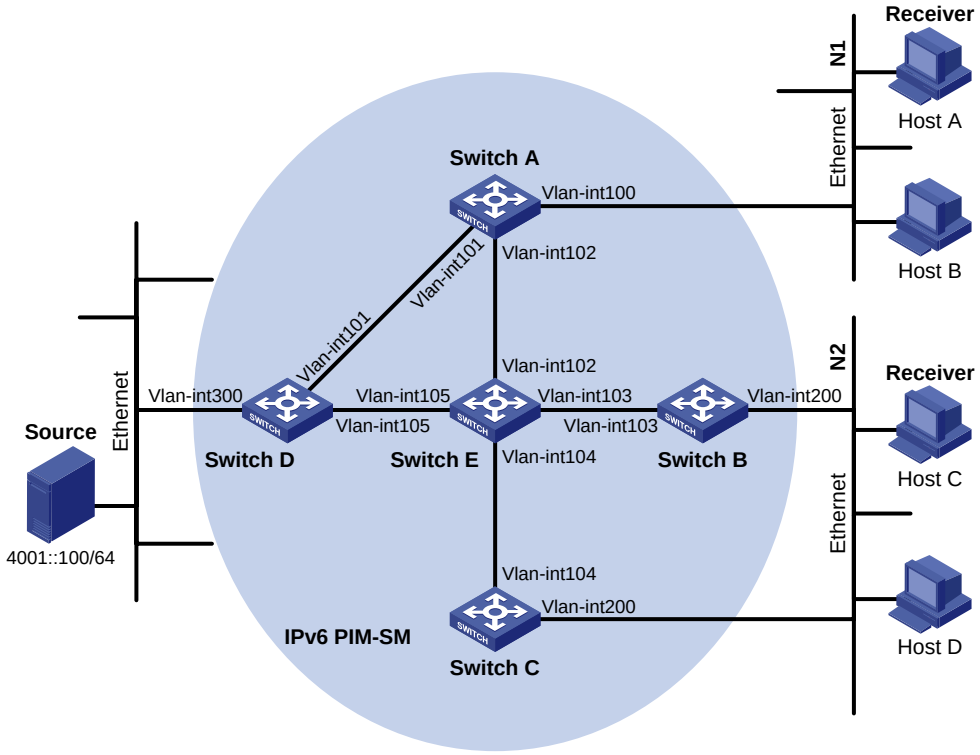

Table 3 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 18, and configure OSPFv3 on all switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100 (the interface that is connected to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   ```

```
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure C-BSRs, C-RPs, and static RPs:

On Switch E, configure the service scope of RP advertisements.

```
<SwitchE> system-view
[SwitchE] acl ipv6 basic 2005
[SwitchE-acl-ipv6-basic-2005] rule permit source ff0e::101 64
[SwitchE-acl-ipv6-basic-2005] quit
```

Configure VLAN-interface 102 as a C-BSR and a C-RP, and configure VLAN-interface 101 of Switch D as the static RP.

```
[SwitchE] ipv6 pim
[SwitchE-pim6] c-bsr 1003::2
[SwitchE-pim6] c-rp 1003::2 group-policy 2005
[SwitchE-pim6] static-rp 1002::2
[SwitchE-pim6] quit
```

On Switch A, configure VLAN-interface 101 of Switch D as a static RP.

```
[SwitchA] ipv6 pim
[SwitchA-pim6] static-rp 1002::2
[SwitchA-pim6] quit
```

Configure a static RP on Switch B, Switch C, and Switch D in the same way Switch A is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3
```

Display BSR information on Switch A.

```
[SwitchA] display ipv6 pim bsr-info
 Scope: non-scoped
```

```
    State: Accept Preferred
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
```

Display BSR information on Switch E.

```
[SwitchE] display ipv6 pim bsr-info
 Scope: non-scoped
    State: Elected
    Bootstrap timer: 00:01:44
    Elected BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:11:18
    Candidate BSR address: 1003::2
      Priority: 64
      Hash mask length: 126
```

Display RP information on Switch A.

```
[SwitchA] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF0E::101/64
       RP address               Priority  HoldTime  Uptime    Expires
       1003::2                  192       180       00:05:19  00:02:11

Static RP information:
       RP address               ACL   Mode    Preferred
       1002::2                  ----  pim-sm  No
```

Example: Configuring admin-scoped IPv6 PIM-SM

Network configuration

As shown in Figure 19:

- VOD streams are sent to receiver hosts in multicast. The entire IPv6 PIM-SM domain is divided into IPv6 admin-scoped zone 1 and the IPv6 global-scoped zone. Router B and Router C are ZBRs of IPv6 admin-scoped zone 1.
- Source 2 sends IPv6 multicast data to the IPv6 multicast group FF14::101, and Host A is an IPv6 multicast receiver. Source 1 sends IPv6 multicast data to the IPv6 multicast group FF1E::202, and Host A is an IPv6 multicast receiver.
- VLAN-interface 20 of Switch B acts as a C-BSR and a C-RP for IPv6 admin-scoped zone 1, and is designated to the IPv6 multicast groups with the scope field value of 4. VLAN-interface 50 of Switch D acts as a C-BSR and a C-RP for the IPv6 global-scoped zone, and it is designated to the IPv6 multicast groups with the scope field value of 14.
- MLDv1 runs between Switch A, Switch C, and the receivers that directly connect to them, respectively.

Figure 19 Network diagram

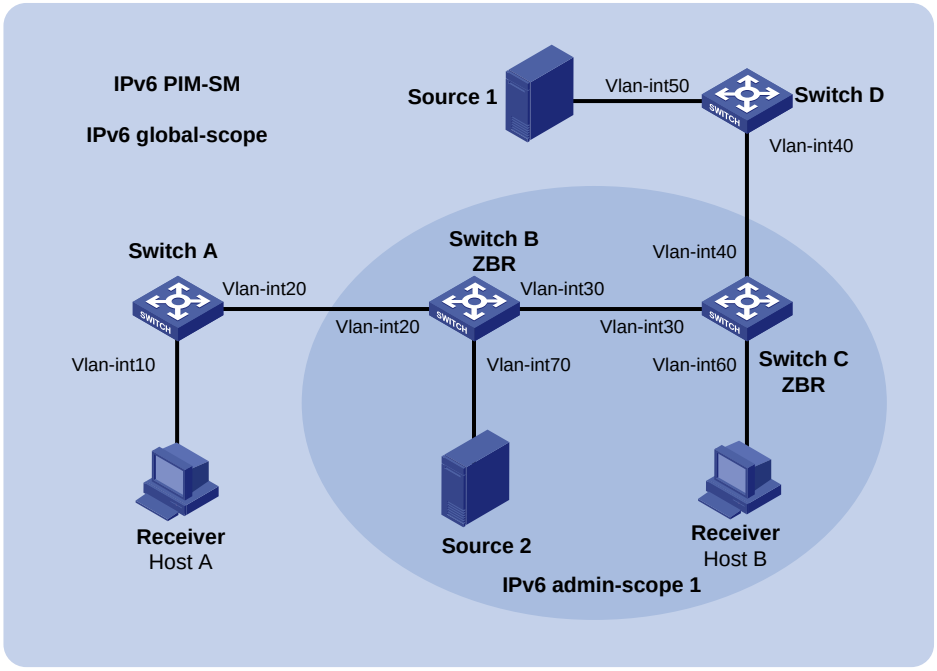

Table 4 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	500::1/64	Source 2	—	600::1/64
Switch A	Vlan-int10	1001::1/64	Switch D	Vlan-int50	500::2/64
Switch A	Vlan-int20	1002::1/64	Switch D	Vlan-int40	6001::1/64
Switch B	Vlan-int70	600::2/64	Switch C	Vlan-int30	2002::2/64
Switch B	Vlan-int20	1002::2/64	Switch C	Vlan-int60	3002::2/64
Switch B	Vlan-int30	2002::1/64	Switch C	Vlan-int40	6001::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface, and make sure the switches in the IPv6 PIM-DM domain can reach each other.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface (VLAN-interface 20).

   ```
   [SwitchA] interface vlan-interface 20
   [SwitchA-Vlan-interface20] mld enable
   [SwitchA-Vlan-interface20] quit
   ```

   # Enable IPv6 PIM-SM on VLAN-interface 10.

   ```
   [SwitchA] interface vlan-interface 10
   ```

```
[SwitchA-Vlan-interface10] ipv6 pim sm
[SwitchA-Vlan-interface10] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch C in the same way Switch A is configured. (Details not shown.)

On Switch B, enable IPv6 multicast routing, and enable IPv6 PIM-SM on each interface.

```
<SwitchB> system-view
[SwitchB] ipv6 multicast routing
[SwitchB-mrib6] quit
[SwitchB] interface vlan-interface 70
[SwitchB-Vlan-interface70] ipv6 pim sm
[SwitchB-Vlan-interface70] quit
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] ipv6 pim sm
[SwitchB-Vlan-interface20] quit
[SwitchB] interface vlan-interface 30
[SwitchB-Vlan-interface30] ipv6 pim sm
[SwitchB-Vlan-interface30] quit
```

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D in the same way Switch B is configured. (Details not shown.)

2. Configure IPv6 admin-scoped zone boundaries:

On Switch B, configure VLAN-interface 20 as the boundary of IPv6 admin-scoped zone 1.

```
[SwitchB] interface vlan-interface 20
[SwitchB-Vlan-interface20] ipv6 multicast boundary scope 4
[SwitchB-Vlan-interface20] quit
```

On Switch C, configure VLAN-interface 40 as the boundary of IPv6 admin-scoped zone 2.

```
<SwitchC> system-view
[SwitchC] interface vlan-interface 40
[SwitchC-Vlan-interface40] ipv6 multicast boundary scope 4
[SwitchC-Vlan-interface40] quit
```

3. Configure C-BSRs and C-RPs:

On Switch D, configure VLAN-interface 50 as a C-BSR and a C-RP for the IPv6 global-scoped zone.

```
[SwitchD] ipv6 pim
[SwitchD-pim6] c-bsr 6001::1
[SwitchD-pim6] c-rp 6001::1
[SwitchD-pim6] quit
```

Verifying the configuration

Display BSR information on Switch B.

```
[SwitchB] display ipv6 pim bsr-info
 Scope: non-scoped
     State: Accept Preferred
     Bootstrap timer: 00:01:25
     Elected BSR address: 6001::1
       Priority: 64
       Hash mask length: 126
       Uptime: 00:01:45
 Scope: 4
     State: Elected
```

```
    Bootstrap timer: 00:00:06
    Elected BSR address: 1002::2
      Priority: 64
      Hash mask length: 126
      Uptime: 00:04:54
    Candidate BSR address: 1002::2
      Priority: 64
      Hash mask length: 126
```

Display BSR information on Switch D.

```
[SwitchD] display ipv6 pim bsr-info
 Scope: non-scoped
    State: Elected
    Bootstrap timer: 00:00:49
    Elected BSR address: 6001::1
      Priority: 64
      Hash mask length: 126
      Uptime: 00:01:11
    Candidate BSR address: 6001::1
      Priority: 64
      Hash mask length: 126
```

Display RP information on Switch B.

```
[SwitchB] display ipv6 pim rp-info
 BSR RP information:
   Scope: non-scoped
     Group/MaskLen: FF00::/8
       RP address               Priority  HoldTime  Uptime    Expires
       6001::1                  192       180       00:38:59  00:02:07
   Scope: 4
     Group/MaskLen: FF04::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF14::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF24::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF34::/16
       RP address               Priority  HoldTime  Uptime    Expires
       1002::2 (local)          10        180       00:39:38  00:02:31
       6001::1                  192       180       00:38:28  00:02:31
     Group/MaskLen: FF44::/16
       RP address               Priority  HoldTime  Uptime    Expires

```

Example: Configuring IPv6 BIDIR-PIM

Network configuration

As shown in Figure 20:

- OSPFv3 runs on the network.
- VOD streams are sent to receiver hosts in IPv6 multicast.
- Source 1 and Source 2 send IPv6 multicast data to IPv6 multicast group FF14::101.
- Host A and Host B are receivers of this IPv6 multicast group.
- VLAN-interface 102 of Switch C acts as a C-BSR. Loopback 0 of Router C acts as the C-RP.
- MLDv1 runs between Switch B and Host A, and between Switch D and Host B.

Figure 20 Network diagram

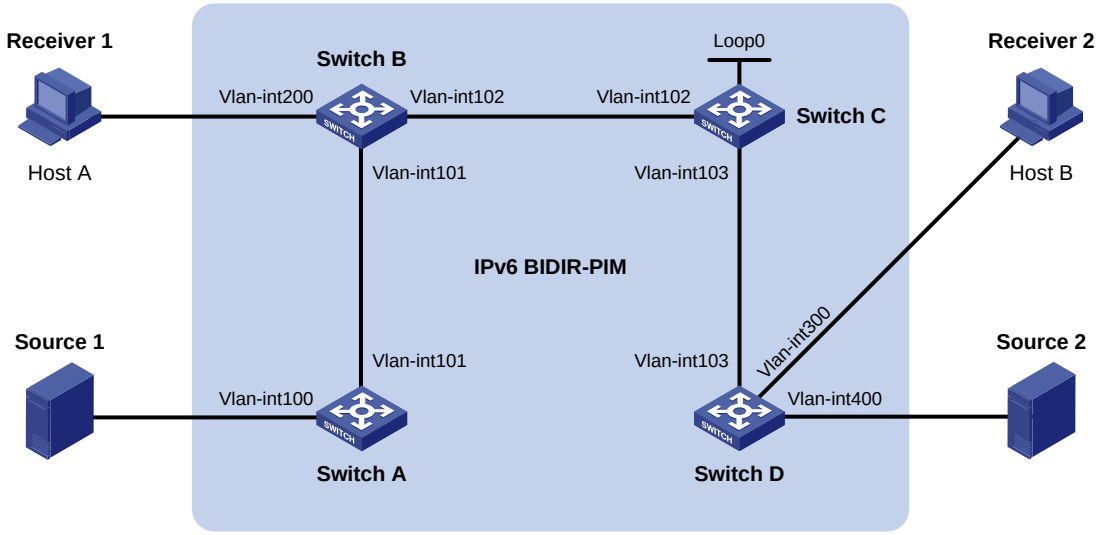

Table 5 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int400	5001::1/64
Switch B	Vlan-int200	2001::1/64	Switch D	Vlan-int103	3001::2/64
Switch B	Vlan-int101	1002::2/64	Source 1	—	1001::2/64
Switch B	Vlan-int102	2002::1/64	Source 2	—	5001::2/64
Switch C	Vlan-int102	2002::2/64	Receiver 1	—	2001::2/64
Switch C	Vlan-int103	3001::1/64	Receiver 2	—	4001::2/64
Switch C	Loop0	6001::1/128			

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 20, and configure OSPFv3 on the switches in the IPv6 BIDIR-PIM domain.

Procedure

1. Enable IPv6 multicast routing, IPv6 PIM-SM, IPv6 BIDIR-PIM, and MLD:

On Switch A, enable IPv6 multicast routing, enable IPv6 PIM-SM on each interface, and enable IPv6 BIDIR-PIM.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] ipv6 pim
[SwitchA-pim6] bidir-pim enable
[SwitchA-pim6] quit
```

On Switch B, enable IPv6 multicast routing.

```
<SwitchB> system-view
[SwitchB] ipv6 multicast routing
[SwitchB-mrib6] quit
```

Enable MLD on the receiver-side interface (VLAN-interface 200).

```
[SwitchB] interface vlan-interface 200
[SwitchB-Vlan-interface200] mld enable
[SwitchB-Vlan-interface200] quit
```

Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] ipv6 pim sm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] ipv6 pim sm
[SwitchB-Vlan-interface102] quit
```

Enable IPv6 BIDIR-PIM.

```
[SwitchB] ipv6 pim
[SwitchB-pim6] bidir-pim enable
[SwitchB-pim6] quit
```

On Switch C, enable IPv6 multicast routing, enable IPv6 PIM-SM on each interface, and enable IPv6 BIDIR-PIM.

```
<SwitchC> system-view
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
[SwitchC] interface vlan-interface 102
[SwitchC-Vlan-interface102] ipv6 pim sm
[SwitchC-Vlan-interface102] quit
[SwitchC] interface vlan-interface 103
[SwitchC-Vlan-interface103] ipv6 pim sm
[SwitchC-Vlan-interface103] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ipv6 pim sm
[SwitchC-LoopBack0] quit
[SwitchC] ipv6 pim
```

```
[SwitchC-pim6] bidir-pim enable
```

On Switch D, enable IPv6 multicast routing.

```
<SwitchD> system-view
[SwitchD] ipv6 multicast routing
[SwitchD-mrib6] quit
```

Enable MLD on the receiver-side interface (VLAN-interface 300).

```
[SwitchD] interface vlan-interface 300
[SwitchD-Vlan-interface300] mld enable
[SwitchD-Vlan-interface300] quit
```

Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] ipv6 pim sm
[SwitchD-Vlan-interface400] quit
```

Enable IPv6 BIDIR-PIM.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] ipv6 pim
[SwitchD-pim6] bidir-pim enable
[SwitchD-pim6] quit
```

2. On Switch C, configure VLAN interface 102 as a C-BSR, and loopback interface 0 as a C-RP for the entire IPv6 BIDIR-PIM domain.

```
[SwitchC-pim6] c-bsr 2002::2
[SwitchC-pim6] c-rp 6001::1 bidir
[SwitchC-pim6] quit
```

Verifying the configuration

1. Display IPv6 BIDIR-PIM DF information:

Display IPv6 BIDIR-PIM DF information on Switch A.

```
[SwitchA] display ipv6 pim df-info
RP address: 6001::1
  Interface: Vlan-interface100
    State     : Win        DF preference: 100
    DF metric : 2          DF uptime    : 01:08:50
    DF address: FE80::200:5EFF:FE71:2800 (local)
  Interface: Vlan-interface101
    State     : Lose       DF preference: 100
    DF metric : 1          DF uptime    : 01:07:49
    DF address: FE80::20F:E2FF:FE38:4E01
```

Display IPv6 BIDIR-PIM DF information on Switch B.

```
[SwitchB] display ipv6 pim df-info
RP address: 6001::1
  Interface:Vlan-interface200
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 01:24:09
    DF address: FE80::200:5EFF:FE71:2801 (local)
  Interface: Vlan-interface101
    State     : Win        DF preference: 100
```

```
    DF metric : 1          DF uptime    : 01:24:09
    DF address: FE80::20F:E2FF:FE38:4E01 (local)
  Interface: Vlan-interface102
    State     : Lose       DF preference: 0
    DF metric : 0          DF uptime    : 01:23:12
    DF address: FE80::20F:E2FF:FE15:5601
```

Display IPv6 BIDIR-PIM DF information on Switch C.

```
[SwitchC] display ipv6 pim df-info
RP address: 6001::1
  Interface: Loop0
    State     : -          DF preference: -
    DF metric : -          DF uptime    : -
    DF address: -
  Interface: Vlan-interface102
    State     : Win        DF preference: 0
    DF metric : 0          DF uptime    : 01:06:07
    DF address: FE80::20F:E2FF:FE15:5601 (local)
  Interface: Vlan-interface103
    State     : Win        DF preference: 0
    DF metric : 0          DF uptime    : 01:06:07
    DF address: FE80::20F:E2FF:FE15:5602 (local)
```

Display IPv6 BIDIR-PIM DF information on Switch D.

```
[SwitchD] display ipv6 pim df-info
RP address: 6001::1
  Interface: Vlan-interface300
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 01:19:53
    DF address: FE80::200:5EFF:FE71:2803 (local)
  Interface: Vlan-interface400
    State     : Win        DF preference: 100
    DF metric : 1          DF uptime    : 00:39:34
    DF address: FE80::200:5EFF:FE71:2802 (local)
  Interface: Vlan-interface103
    State     : Lose       DF preference: 0
    DF metric : 0          DF uptime    : 01:21:40
    DF address: FE80::20F:E2FF:FE15:5602
```

2. Display information about DFs for IPv6 multicast forwarding:

Display information about DFs for IPv6 multicast forwarding on Switch A.

```
[SwitchA] display ipv6 multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 6001::1
     Flags: 0x0
     Uptime: 00:08:32
     RPF interface: Vlan-interface101
     List of 1 DF interfaces:
       1: Vlan-interface100
```

Display information about DFs for IPv6 multicast forwarding on Switch B.

```
[SwitchB] display ipv6 multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 6001::1
     Flags: 0x0
     Uptime: 00:06:24
     RPF interface: Vlan-interface102
     List of 2 DF interfaces:
       1: Vlan-interface101
       2: Vlan-interface200
```

Display information about DFs for IPv6 multicast forwarding on Switch C.

```
[SwitchC] display ipv6 multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 6001::1
     Flags: 0x0
     Uptime: 00:07:21
     RPF interface: LoopBack0
     List of 2 DF interfaces:
       1: Vlan-interface102
       2: Vlan-interface103
```

Display information about DFs for IPv6 multicast forwarding on Switch D.

```
[SwitchD] display ipv6 multicast forwarding df-info
Total 1 RP, 1 matched

00001. RP address: 6001::1
     Flags: 0x0
     Uptime: 00:05:12
     RPF interface: Vlan-interface103
     List of 2 DF interfaces:
       1: Vlan-interface300
       2: Vlan-interface400
```

Example: Configuring IPv6 PIM-SSM

Network configuration

As shown in Figure 21:

- OSPFv3 runs on the network.
- Receivers receive VOD information through multicast. The receiver groups of different organizations form stub networks, and one or more receiver hosts exist in each stub network. The entire IPv6 PIM domain operates in the SSM mode.
- Host A and Host C are IPv6 multicast receivers on two stub networks N1 and N2.
- The SSM group range is FF3E::/64.
- MLDv2 runs between Switch A and N1, and between Switch B, Switch C, and N2.

Figure 21 Network diagram

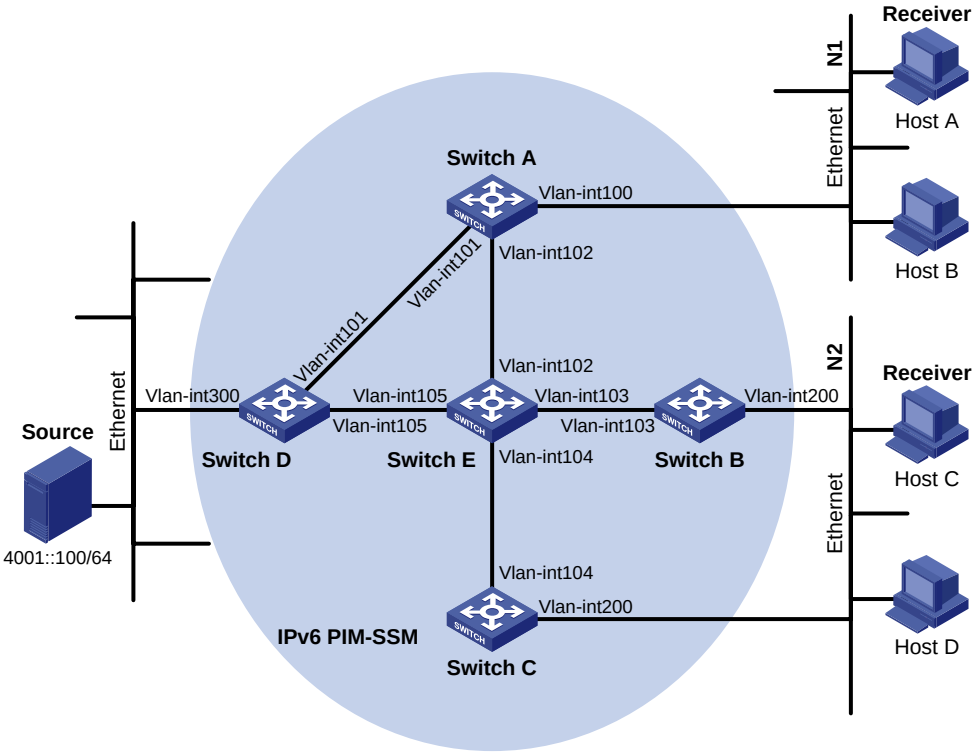

Table 6 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Switch A	Vlan-int100	1001::1/64	Switch D	Vlan-int300	4001::1/64
Switch A	Vlan-int101	1002::1/64	Switch D	Vlan-int101	1002::2/64
Switch A	Vlan-int102	1003::1/64	Switch D	Vlan-int105	4002::1/64
Switch B	Vlan-int200	2001::1/64	Switch E	Vlan-int104	3001::2/64
Switch B	Vlan-int103	2002::1/64	Switch E	Vlan-int103	2002::2/64
Switch C	Vlan-int200	2001::2/64	Switch E	Vlan-int102	1003::2/64
Switch C	Vlan-int104	3001::1/64	Switch E	Vlan-int105	4002::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 21, and configure OSPFv3 on the switches in the IPv6 PIM-SSM domain.

Procedure

1. Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLDv2 on VLAN-interface 100 (the interface that connects to the stub network).

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   ```

```
[SwitchA-Vlan-interface100] mld version 2
[SwitchA-Vlan-interface100] quit
```

Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim sm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing, MLD, and IPv6 PIM-SM on Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

Enable IPv6 multicast routing and IPv6 PIM-SM on Switch D and Switch E in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range FF3E::/64 on Switch A.

```
[SwitchA] acl ipv6 basic 2000
[SwitchA-acl-ipv6-basic-2000] rule permit source ff3e:: 64
[SwitchA-acl-ipv6-basic-2000] quit
[SwitchA] ipv6 pim
[SwitchA-pim6] ssm-policy 2000
[SwitchA-pim6] quit
```

3. Configure the IPv6 SSM group range on Switch B, Switch C, Switch D, and Switch E in the same way Switch B is configured. (Details not shown.)

Verifying the configuration

Display IPv6 PIM information on Switch A.

```
[SwitchA] display ipv6 pim interface
 Interface: Vlan101
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:2
 Interface: Vlan102
   NbrCnt: 1
   HelloInt: 30
   DR priority: 1
   DR address: FE80::A01:201:3
```

Send an MLDv2 report from Host A to join the IPv6 multicast source and group (4001::100/64, FF3E::101). (Details not shown.)

Display IPv6 PIM multicast routing table information on Switch A.

```
[SwitchA] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
     Protocol: pim-ssm, Flag: ACT
     UpTime: 00:00:11
     Upstream interface: Vlan-interface101
         Upstream neighbor: 1002::2
         RPF prime neighbor: 1002::2
```

```
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface100
            Protocol: mld, UpTime: 00:00:11, Expires: 00:03:25
```

Display IPv6 PIM multicast routing table information on Switch B.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 1 (S, G) entry

 (4001::100, FF3E::101)
    Protocol: pim-ssm, Flag: LOC
    UpTime: 00:08:02
    Upstream interface: Vlan-interface300
        Upstream neighbor: NULL
        RPF prime neighbor: NULL
    Downstream interface(s) information:
    Total number of downstream interfaces: 1
        1: Vlan-interface105
            Protocol: pim-ssm, UpTime: 00:08:02, Expires: 00:03:25
```

The output shows that switches on the SPT path (Switch A and Switch D) have generated the correct (S, G) entries.

Troubleshooting IPv6 PIM

A multicast distribution tree cannot be correctly built

Symptom

No IPv6 multicast forwarding entries are established on the devices (including devices directly connected with multicast sources or receivers) in an IPv6 PIM network. This means that an IPv6 multicast distribution tree cannot be correctly built.

Solution

To resolve the problem:

1. Use the **`display ipv6 routing-table`** command to verify that an IPv6 unicast route to the IPv6 multicast source or the RP is available.
2. Use the **`display ipv6 pim interface`** command to verify IPv6 PIM information on each interface, especially on the RPF interface. If IPv6 PIM is not enabled on the interfaces, use **`ipv6 pim dm`** or **`ipv6 pim sm`** to command enable IPv6 PIM-DM or IPv6 PIM-SM for the interfaces.
3. Use the **`display ipv6 pim neighbor`** command to verify that the RPF neighbor is an IPv6 PIM neighbor.
4. Verify that IPv6 PIM and MLD are enabled on the interfaces that directly connect to the IPv6 multicast sources or the receivers.
5. Use the **`display ipv6 pim interface verbose`** command to verify that the same IPv6 PIM mode is enabled on the RPF interface on a device and the connected interface of the device's RPF neighbor.
6. Use the **`display current-configuration`** command to verify that the same IPv6 PIM mode is enabled on all devices on the network. For IPv6 PIM-SM, verify that the BSR and C-RPs are correctly configured.

7. If the problem persists, contact H3C Support.

IPv6 multicast data is abnormally terminated on an intermediate device

Symptom

An intermediate device can receive IPv6 multicast data successfully, but the data cannot reach the last-hop device. An interface on the intermediate device receives IPv6 multicast data but does not create an (S, G) entry in the IPv6 PIM routing table.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IPv6 multicast forwarding boundary settings. Use the **ipv6 multicast boundary** command to change the multicast forwarding boundary settings to make the IPv6 multicast packet able to cross the boundary.
2. Use the **display current-configuration** command to verify the IPv6 multicast source policy. Change the ACL rule defined in the **source-policy** command so that the source/group address of the IPv6 multicast data can pass ACL filtering.
3. If the problem persists, contact H3C Support.

An RP cannot join an SPT in IPv6 PIM-SM

Symptom

An RPT cannot be correctly built, or an RP cannot join the SPT toward the IPv6 multicast source.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command to verify that an IPv6 unicast route to the RP is available on each device.
2. Use the **display ipv6 pim rp-info** command to verify that the dynamic RP information is consistent on all devices.
3. Use the **display ipv6 pim rp-info** command to verify that the same static RPs are configured on all devices on the network.
4. If the problem persists, contact H3C Support.

An RPT cannot be built or IPv6 multicast source registration fails in IPv6 PIM-SM

Symptom

The C-RPs cannot unicast advertisement messages to the BSR. The BSR does not advertise BSMs containing C-RP information and has no IPv6 unicast route to any C-RP. An RPT cannot be correctly established, or the source-side DR cannot register the IPv6 multicast source with the RP.

Solution

To resolve the problem:

1. Use the **display ipv6 routing-table** command on each device to view routing table information. Verify that IPv6 unicast routes to the C-RPs and the BSR are available on each device and that a route is available between each C-RP and the BSR.

2. Use the **display ipv6 pim bsr-info** command to verify that the BSR information exists on each device.
3. Use the **display ipv6 pim rp-info** command to verify that the RP information is correct on each device.
4. Use the **display ipv6 pim neighbor** command to verify that IPv6 PIM neighboring relationship has been correctly established among the devices.
5. If the problem persists, contact H3C Support.

Multicast VPN overview

Multicast VPN implements multicast delivery in VPNs.

Typical network diagram

As shown in Figure 1, VPN A contains Site 1 and Site 3, and VPN B contains Site 2 and Site 4.

Figure 1 Typical network diagram for multicast VPN

VPN multicast traffic between the PEs and the CEs is transmitted on a per-VPN-instance basis. The public network multicast traffic between the PEs and the P device is transmitted through the public network. Multicast VPN provides independent multicast services for the public network, VPN A, and VPN B.

For more information about CEs, PEs and Ps, see *MPLS Configuration Guide*.

MVPN scheme

MVPN is used to implement multicast VPN. MVPN only requires the PEs to support multiple VPN instances and the public network provided by the service provider to support multicast. There is no need to upgrade CEs and Ps or change their PIM configurations. The MVPN solution is transparent to CEs and Ps.

The device supports MDT-based MVPN.

Basic concepts in MDT-based MVPN

This section introduces the following basic concepts in MDT-based MVPN:

- **MVPN**—An MVPN logically defines the transmission boundary of the multicast traffic of a VPN over the public network. It also physically identifies all the PEs that support that VPN instance on the public network. Different VPN instances correspond to different MVPNs.
- **Multicast distribution tree (MDT)**—An MDT is a multicast distribution tree constructed by all PEs in the same VPN. MDT includes default MDT and data MDT.
- **Multicast tunnel (MT)**—An MT is a tunnel that interconnects all PEs in an MVPN. The local PE encapsulates a VPN multicast packet into a public network multicast packet and forwards it through the MT over the public network. The remote PE decapsulates the public network multicast packet to get the original VPN multicast packet.
- **Multicast tunnel interface (MTI)**—An MTI is the entrance or exit of an MT, equivalent to an entrance or exit of an MVPN. MTIs are automatically created when the MVPN for the VPN

instance is created. PEs use the MTI to access the MT. The local PE sends VPN data out of the MTI. The remote PEs receive the private data from their MTIs. An MTI runs the same PIM mode as the VPN instance to which the MTI belongs. PIM is enabled on MTIs when a minimum of one interface in the VPN instance is enabled with PIM. When PIM is disabled on all interfaces in the VPN instance, PIM is also disabled on MTIs.

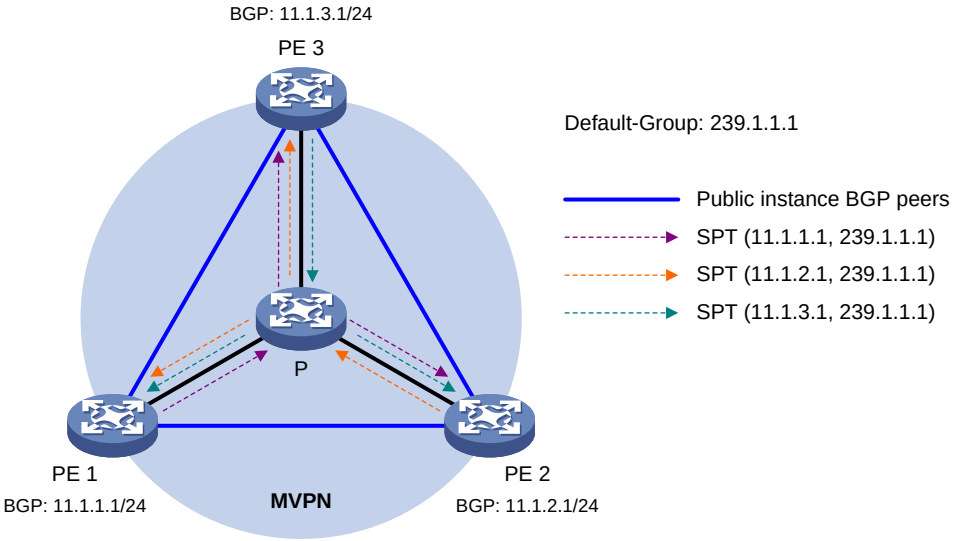
- **Default-group**—A default group is a unique multicast address assigned to each MVPN on the public network. It is the unique identifier of an MVPN on the public network and helps build the default MDT for an MVPN on the public network. A PE encapsulates a VPN multicast packet (a multicast protocol packet or a multicast data packet) into a public network multicast packet. The default group address is used as the public network multicast group.
- **Default MDT**—A default MDT uses a default group address as its group address. In a VPN, the default MDT is uniquely identified by the default group. A default MDT is automatically created after the default group is specified and will always exist on the public network, regardless of the presence of any multicast services on the public network or the VPN.
- **Data group**—An MVPN is assigned a unique data group for MDT switchover. The ingress PE selects a least used address from the data group range to encapsulate the VPN multicast packets when the multicast traffic of the VPN arrives at the PE. Other PEs are notified to use the address to forward the multicast traffic for that VPN. This initiates the switchover to the data MDT.
- **Data MDT**—A data MDT is an MDT that uses a data group as it group address. At MDT switchover, PEs with downstream receivers join a data group to build a data MDT. The ingress PE forwards the encapsulated VPN multicast traffic along the data MDT over the public network.

How MDT-based MVPN works

For a VPN instance, multicast data transmission on the public network is transparent. The VPN data is exchanged between the MTIs of the local PE and the remote PE. This implements the seamless transmission of the VPN data over the public network. However, the multicast data transmission process (the MDT transmission process) over the public network is very complicated.

NOTE:

The following types of PIM neighboring relationships exist in MVPN:



- **PE-P PIM neighboring relationship**—Established between the public network interface on a PE and the peer interface on the P device over the link.
- **PE-PE PIM neighboring relationship**—Established between PEs that are in the same VPN instance after they receive the PIM hello packets.
- **PE-CE PIM neighboring relationship**—Established between a PE interface that is bound with the VPN instance and the peer interface on the CE over the link.

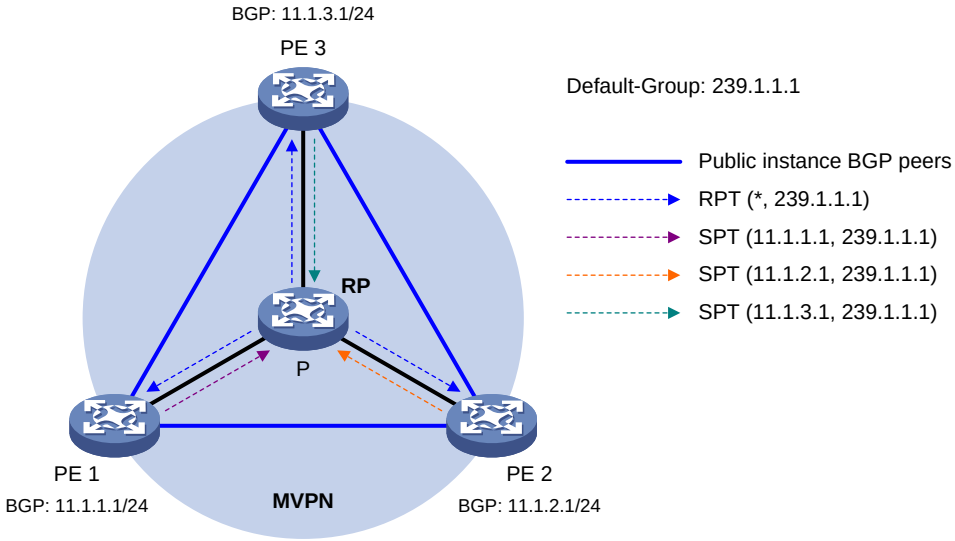
Default MDT establishment

The multicast routing protocol running on the public network can be PIM-DM, PIM-SM, BIDIR-PIM, or PIM-SSM. The process of creating a Default MDT is different in these PIM modes.

Default MDT establishment in a PIM-DM network

Figure 2 Default MDT establishment in a PIM-DM network

As shown in Figure 2, PIM-DM is enabled on the network, and all the PEs support VPN instance A. The process of establishing a default MDT is as follows:



1. To establish PIM neighboring relationships with PE 2 and PE 3 through the MTI for VPN instance A, PE 1 does the following:
   a. Encapsulates the PIM protocol packet of the private network into a public network multicast data packet. PE 1 does this by specifying the source address as the IP address of the MVPN source interface and the multicast group address as the default group address.
   b. Sends the multicast data packet to the public network.

   For other PEs that support VPN instance A as default group members, PE 1 of VPN instance A initiates a flood-prune process in the entire public network. A (11.1.1.1, 239.1.1.1) state entry is created on each device along the path on the public network. This forms an SPT with PE 1 as the root, and PE 2 and PE 3 as leaves.
2. At the same time, PE 2 and PE 3 separately initiate a similar flood-prune process.

   Finally, three independent SPTs are established in the MVPN, constituting the default MDT in the PIM-DM network.

Default MDT establishment in a PIM-SM network

Figure 3 Default MDT establishment in a PIM-SM network

As shown in Figure 3, PIM-SM is enabled on the network, and all the PEs support VPN instance A. The process of establishing a default MDT is as follows:

1. PE 1 initiates a join to the public network RP by specifying the multicast group address as the default group address in the join message. A (*, 239.1.1.1) state entry is created on each device along the path on the public network.
2. At the same time, PE 2 and PE 3 separately initiate a similar join process.

   Finally, an RPT is established in the MVPN, with the public network RP as the root and PE 1, PE 2, and PE 3 as leaves.
3. To establish PIM neighboring relationships with PE 2 and PE 3 through the MTI for VPN instance A, PE 1 does the following:

   a. Encapsulates the PIM protocol packet of the private network into a public network multicast data packet. PE 1 does this by specifying the source address as the IP address of the MVPN source interface and the multicast group address as the default group address.

   b. Sends the multicast data packet to the public network.

   The public network interface of PE 1 registers the multicast source with the public network RP, and the public network RP initiates a join to PE 1. A (11.1.1.1, 239.1.1.1) state entry is created on each device along the path on the public network.
4. At the same time, PE 2 and PE 3 separately initiate a similar register process.

   Finally, three SPTs between the PEs and the RP are established in the MVPN.

In the PIM-SM network, the RPT, or the (*, 239.1.1.1) tree, and the three independent SPTs constitute the default MDT.

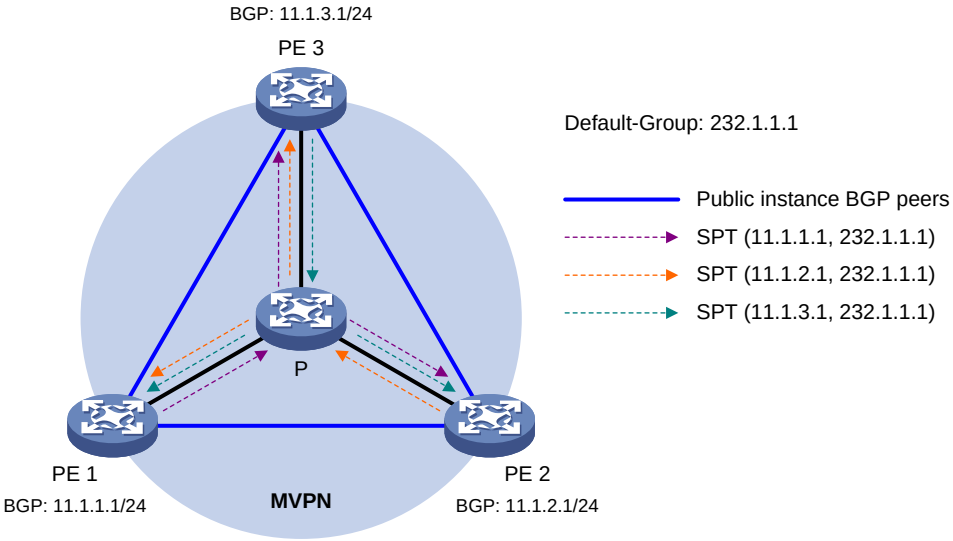
Default MDT establishment in a BIDIR-PIM network

Figure 4 Default MDT establishment in a BIDIR-PIM network

As shown in Figure 4, BIDIR-PIM runs on the network, and all the PEs support VPN instance A. The process of establishing a default MDT is as follows:

1. PE 1 initiates a join to the public network RP by specifying the multicast group address as the default group address in the join message. A (*, 239.1.1.1) state entry is created on each device along the path on the public network.

   At the same time, PE 2 and PE 3 separately initiate a similar join process. Finally, a receiver-side RPT is established in the MVPN, with the public network RP as the root and PE 1, PE 2, and PE 3 as leaves.



2. PE 1 sends a multicast packet with the default group address as the multicast group address. The DF of each network segment on the public network forwards the multicast packet to the RP. Each device on the path creates a (*, 239.1.1.1) state entry.

   At the same time, PE 2 and PE 3 separately initiate a similar process. Finally, three source-side RPTs are established in the MVPN, with PE 1, PE 2, and PE 3 as the roots and as the public network RP as the leave.

3. The receiver-side RPT and the three source-side RPTs constitute the default MDT in the BIDIR-PIM network.

Default MDT establishment in a PIM-SSM network

Figure 5 Default MDT establishment in a PIM-SSM network

As shown in Figure 5, PIM-SSM runs on the network, and all the PEs support VPN instance A. The process of establishing a default MDT is as follows:

1. PE 1, PE 2, and PE 3 exchange MDT route information (including BGP interface address and the default group address) through BGP.
2. PE 1 sends a subscribe message to PE 2 and PE 3. Each device on the public network creates an (S, G) entry. An SPT is established in the MVPN with PE 1 as the root and PE 2 and PE 3 as the leaves.

   At the same time, PE 2 and PE 3 separately initiate a similar process, and establish an SPT with itself as the root and the other PEs as the leaves.
3. The three independent SPTs constitute the default MDT in the PIM-SSM network.

In PIM-SSM, the term "subscribe message" refers to a join message.

Default MDT characteristics

No matter which PIM mode is running on the public network, the default MDT has the following characteristics:

- All PEs that support the same VPN instance join the default MDT.
- All multicast packets that belong to this VPN are forwarded along the default MDT to every PE on the public network, even if no active downstream receivers exist.

Default MDT-based delivery

After the default MDT is established, the multicast source forwards the VPN multicast data to the receivers in each site along the default MDT. The VPN multicast packets are encapsulated into public network multicast packets on the local PE, and transmitted along the default MDT. Then, they are decapsulated on the remote PE and transmitted in that VPN site.

VPN multicast data packets are forwarded across the public network differently in the following circumstances:

- If PIM-DM or PIM-SSM is running in the VPN, the multicast source forwards multicast data packets to the receivers along the VPN SPT across the public network.
- When PIM-SM is running in the VPN:

- Before the RPT-to-SPT switchover, if the multicast source and the VPN RP are in different sites, the VPN multicast data packets travel to the VPN RP along the VPN SPT across the public network. If the VPN RP and the receivers are in different sites, the VPN multicast data packets travel to the receivers along the VPN RPT over the public network.
- After the RPT-to-SPT switchover, if the multicast source and the receivers are in different sites, the VPN multicast data packets travel to the receivers along the VPN SPT across the public network.

- When BIDIR-PIM is running in the VPN, if the multicast source and the VPN RP are in different sites, the multicast source sends multicast data to the VPN RP across the public network along the source-side RPT. If the VPN RP and the receivers are in different sites, the multicast data packets travel to the receivers across the public network along the receiver-side RPT.

  For more information about RPT-to-SPT switchover, see "PIM overview."

The following example explains how multicast data packets are delivered based on the default MDT when PIM-DM is running in both the public network and the VPN network.

As shown in Figure 6:

- PIM-DM is running in both the public network and the VPN sites.
- Receiver of the VPN multicast group G (225.1.1.1) in Site 2 is attached to CE 2.
- Source in Site 1 sends multicast data to multicast group (G).
- The default group address used to forward public network multicast data is 239.1.1.1.

Figure 6 Multicast data packet delivery

A VPN multicast data packet is delivered across the public network as follows:

1. Source sends a VPN multicast data packet (192.1.1.1, 225.1.1.1) to CE 1.
2. CE 1 forwards the VPN multicast data packet along an SPT to PE 1, and the VPN instance on PE 1 examines the MVRF.

   If the outgoing interface list of the forwarding entry contains an MTI, PE 1 processes the VPN multicast data packet as described in step 3. The VPN instance on PE 1 considers the VPN multicast data packet to have been sent out of the MTI, because step 3 is transparent to it.
3. PE 1 encapsulates the VPN multicast data packet into a public network multicast packet (11.1.1.1, 239.1.1.1) by using the GRE method. The source IP address of the packet is the MVPN source interface 11.1.1.1, and the destination address is the default group address 239.1.1.1. PE 1 then forwards it to the public network.

4. The default MDT forwards the multicast data packet (11.1.1.1, 239.1.1.1) to the public network instance on all the PEs. After receiving this packet, every PE decapsulates it to get the original VPN multicast data packet, and passes it to the corresponding VPN instance. If a PE has a downstream interface for an SPT, it forwards the VPN multicast packet down the SPT. Otherwise, it discards the packet.
5. The VPN instance on PE 2 looks up the MVRF and finally delivers the VPN multicast data to Receiver.

   By now, the process of transmitting a VPN multicast data packet across the public network is completed.

MDT switchover

Switching from default MDT to data MDT

When a multicast packet of a VPN is transmitted through the default MDT on the public network, the packet is forwarded to all PEs that support that VPN instance. This occurs whether or not any active receivers exist in the attached sites. When the rate of the multicast traffic of that VPN is high, multicast data might get flooded on the public network. This increases the bandwidth use and brings extra burden on the PEs.

To optimize multicast transmission of large VPN multicast traffic that enters the public network, the MDT-based MVPN solution introduces a dedicated data MDT. The data MDT is built between the PEs that connect VPN multicast receivers and multicast sources. When specific network criteria are met, a switchover from the default MDT to the data MDT occurs to forward VPN multicast traffic to receivers.

The device initiates a switchover of the default MDT to the data MDT as follows:

1. The source-side PE (PE 1, for example) starts a data-delay timer when receiving the first multicast VPN packet that matches the switchover criterion.
2. When the data-delay timer expires, PE 1 sends an MDT switchover message to all the other PE devices down the default-MDT. This message contains the multicast source address, the multicast group address, and the least-used data-group address in the data-group range.
3. Each PE that receives this message examines whether it interfaces with a VPN that has receivers of that VPN multicast stream.

   If so, it joins the data MDT rooted at PE 1. Otherwise, it caches the message and will join the data MDT when it has attached receivers.
4. After sending the MDT switchover message, PE 1 starts the data-delay timer. When the timer expires, PE 1 uses the default group address to encapsulate the VPN multicast data. The multicast data is then forwarded down the data MDT.
5. After the multicast traffic is switched from the default MDT to the data MDT, PE 1 continues sending MDT switchover messages periodically. Subsequent PEs with attached receivers can then join the data MDT. When a downstream PE no longer has active receivers attached to it, it leaves the data MDT.

For a given VPN instance, the default MDT and the data MDT are both forwarding tunnels in the same MVPN. A default MDT is uniquely identified by a default group address, and a data MDT is uniquely identified by a data group address. Each default group is uniquely associated with a data group range.

Backward switching from data MDT to default MDT

After the VPN multicast traffic is switched to the data MDT, the multicast traffic conditions might change and no longer meet the switchover criterion. In this case, PE 1, as in the preceding example, initiates a backward MDT switchover process when any of the following criteria are met:

- The traffic rate of the VPN multicast data has dropped below the switchover threshold. In addition, the traffic rate has stayed lower than the threshold for a certain length of time (known as the data holddown period).

- The associated data group range is changed, and the data group address for encapsulating the VPN multicast data is out of the new address range.
- The ACL rule for controlling the switchover from the default MDT to the data MDT has changed, and the VPN multicast data fails to pass the new ACL rule.

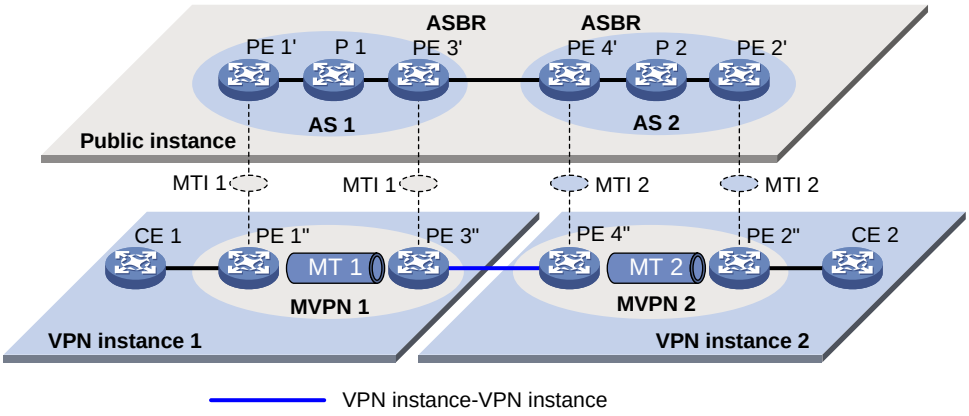
Inter-AS MDT-based MVPN

In an inter-AS VPN networking scenario, VPN sites are located in multiple ASs. These sites must be interconnected. Inter-AS VPN provides the following solutions:

- **VRF-to-VRF connections between ASBRs**—This solution is also called inter-AS option A.
- **EBGP redistribution of labeled VPN-IPv4 routes between ASBRs**—ASBRs advertise VPN-IPv4 routes to each other through MP-EBGP. This solution is also called inter-AS option B.
- **Multihop EBGP redistribution of labeled VPN-IPv4 routes between PE devices**—PEs advertise VPN-IPv4 routes to each other through MP-EBGP. This solution is also called inter-AS option C.

For more information about the three inter-AS VPN solutions, see MPLS L3VPN configuration in *MPLS Configuration Guide*.

Based on these solutions, there are three ways to implement inter-AS MVPN:



- MDT-based MVPN inter-AS option A.
- MDT-based MVPN inter-AS option B.
- MDT-based MVPN inter-AS option C.

MDT-based MVPN inter-AS option A

As shown in Figure 7:

- Two VPN instances are in AS 1 and AS 2.
- PE 3 and PE 4 are ASBRs for AS 1 and AS 2, respectively.
- PE 3 and PE 4 are interconnected through their respective VPN instance and treat each other as a CE.

Figure 7 MVPN inter-AS option A

To implement MVPN inter-AS option A, a separate MVPN must be created in each AS. Multicast data is transmitted between the VPNs in different ASs through the MDs.

Multicast packets of VPN instance 1 are delivered as follows:

1. CE 1 forwards the multicast packet of VPN instance 1 to PE 1.

2. PE 1 encapsulates the multicast packet into a public network packet and forwards it to PE 3 through the MTI interface in MVPN 1.
3. PE 3 considers PE 4 as a CE of VPN instance 1, so PE 3 forwards the multicast packet to PE 4.
4. PE 4 considers PE 3 as a CE of VPN instance 2, so it forwards the multicast packet to PE 2 through the MTI interface in MVPN 2 on the public network.
5. PE 2 forwards the multicast packet to CE 2.

Because only VPN multicast data is forwarded between ASBRs, different PIM modes can run within different ASs. However, the same PIM mode must run on all interfaces that belong to the same VPN (including interfaces with VPN bindings on ASBRs).

MDT-based MVPN inter-AS option B

In MVPN inter-AS option B, RPF vector and BGP connector are introduced:

- **RPF vector**—Attribute encapsulated in a PIM join message. It is the next hop of BGP MDT route from the local PE to the remote PE. Typically, it is the ASBR in the local AS.

  When a device receives the join message with the RPF vector, it first checks whether the RPF vector is its own IP address. If so, the device removes the RPF vector, and sends the message to its upstream neighbor according to the route to the remote PE. Otherwise, it keeps the RPF vector, looks up the route to the RPF vector, and sends the message to the next hop of the route. In this way, the PIM message can be forwarded across the ASs and an MDT is established.
- **BGP connector**—Attribute shared by BGP peers when they exchange IPv4 VPN routes. It is the IP address of the remote PE.

  The local PE fills the upstream neighbor address field with the BGP connector in a join message. This ensures that the message can pass the RPF check on the remote PE after it travels along the MT.

To implement MVPN inter-AS option B, only one MVPN needs to be established for the two ASs. VPN multicast data is transmitted between different ASs on the public network within this MVPN.

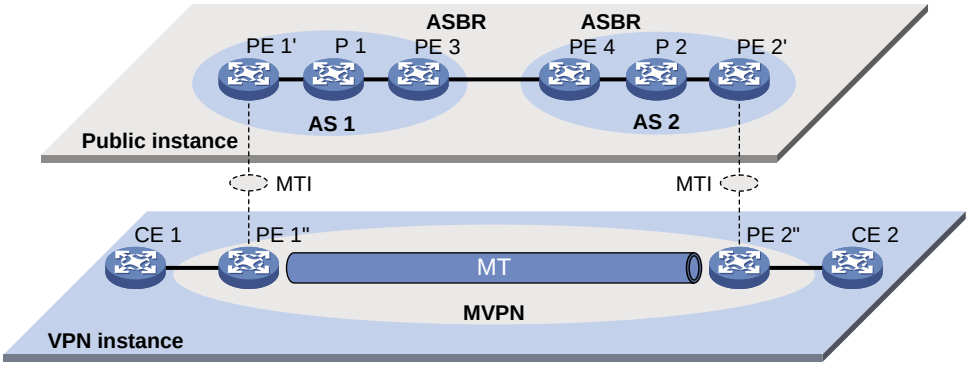
As shown in Figure 8:

- A VPN network involves AS 1 and AS 2.
- PE 3 and PE 4 are the ASBRs for AS 1 and AS 2, respectively.
- PE 3 and PE 4 are interconnected through MP-EBGP and treat each other as a P device.
- PE 3 and PE 4 advertise VPN-IPv4 routes to each other through MP-EBGP.
- An MT is established between PE 1 and PE 2 for delivering VPN multicast traffic across the ASs.

Figure 8 MVPN inter-AS option B

The establishment of the MDT on the public network is as follows:

1. PE 1 originates a PIM join message to join the SPT rooted at PE 2. In the join message, the upstream neighbor address is the IP address of PE 2 (the BGP connector). The RPF vector attribute is the IP address of PE 3. PE 1 encapsulates the join message as a public network packet and forwards it through the MTI.
2. P 1 determines that the RPF vector is not an IP address of its own. It looks up the routing table for a route to PE 3, and forwards the packet to PE 3.
3. PE 3 removes the RPF vector because the RPF vector is its own IP address. It fails to find a BGP MDT route to PE 2, so it encapsulates a new RPF vector (IP address of PE 4) in the packet and forwards it to PE 4.
4. PE 4 removes the RPF vector because the RPF vector is its own IP address. It has a local route to PE 2, so it forwards the packet to P 2, which is the next hop of the route to PE 2.
5. P 2 sends the packet to PE 2.
6. PE 2 receives the packet on the MTI and decapsulates the packet. The receiving interface is the RPF interface of the RPF route back to PE 1 for the join message, and the join message passes the RPF check. The SPT from PE 1 to PE 2 is established.



When PE 1 joins the SPT rooted at PE 1, PE 2 also initiates a join process to the SPT rooted at PE 1. A MDT is established when the two SPTs are finished.

MDT-based MVPN inter-AS option C

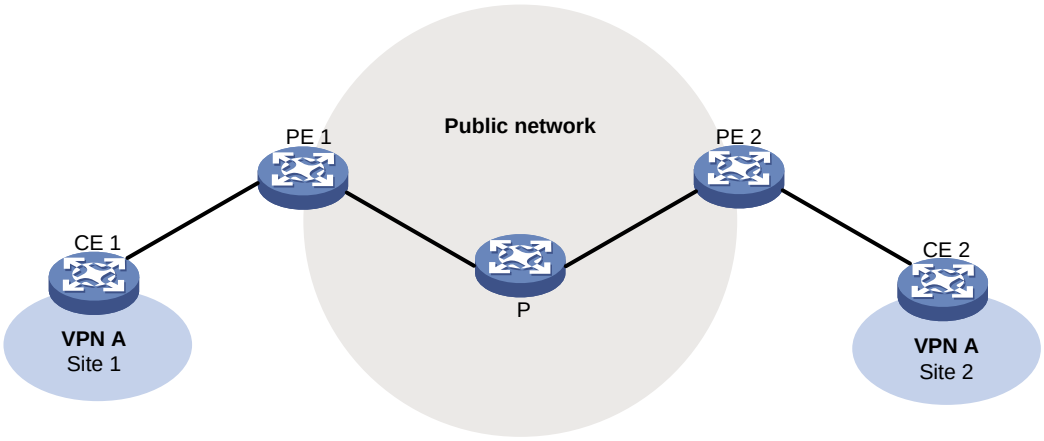
As shown in Figure 9:

- A VPN network involves AS 1 and AS 2.
- PE 3 and PE 4 are the ASBRs for AS 1 and AS 2, respectively.
- PE 3 and PE 4 are interconnected through MP-EBGP and treat each other as a P device.
- PEs in different ASs establish a multihop MP-EBGP session to advertise VPN-IPv4 routes to each other.

Figure 9 MVPN inter-AS option C

To implement MVPN inter-AS option C, only one MVPN needs to be created for the two ASs. Multicast data is transmitted between the two ASs through the MVPN.

Multicast packets are delivered as follows:



1. CE 1 forwards the VPN instance multicast packet to PE 1.
2. PE 1 encapsulates the multicast packet into a public network multicast packet and forwards it to PE 3 through the MTI interface on the public network.
3. PE 3 and PE 4 are interconnected through MP-EBGP, so PE 3 forwards the public network multicast packet to PE 4 along the VPN IPv4 route.
4. The public network multicast packet arrives at the MTI interface of PE 2 in AS 2. PE 2 decapsulates the public network multicast packet and forwards the VPN multicast packet to CE 2.

M6VPE

The multicast IPv6 VPN provider edge (M6VPE) feature enables PEs to transmit IPv6 multicast traffic of a VPN instance over the public network. Only the IPv4 network is available for the backbone network.

As shown in Figure 10, the public network runs IPv4 protocols, and sites of VPN instance **VPN A** run IPv6 multicast protocols. To transmit IPv6 multicast traffic between CE 1 and CE 2, configure M6VPE on the PEs.

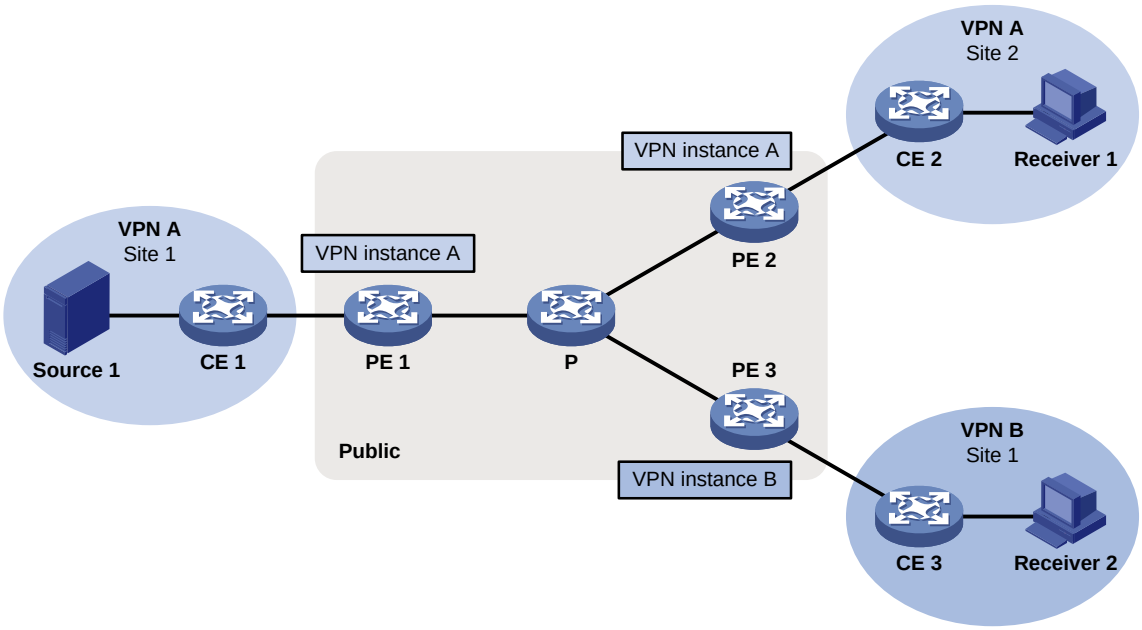
Figure 10 M6VPE network

IPv6 multicast traffic forwarding over the IPv4 public network is as follows:

1. CE 1 forwards an IPv6 multicast packet for VPN instance **VPN A** to PE 1.
2. PE 1 encapsulates the IPv6 multicast packet with an IPv4 packet header and transmits the IPv4 packet in the IPv4 backbone network.
3. PE 2 decapsulates the IPv4 packet and forwards the IPv6 multicast packet to CE 2.

MVPN extranet

MVPN extranet implements inter-VPN multicast traffic transmission. In MVPN extranet, the multicast source and receivers are in different VPNs. In actual application, the MVPN extranet solution ensures that the service provider in a VPN provides multicast services for users in other VPNs.



The following terms are used in the MVPN extranet solution:

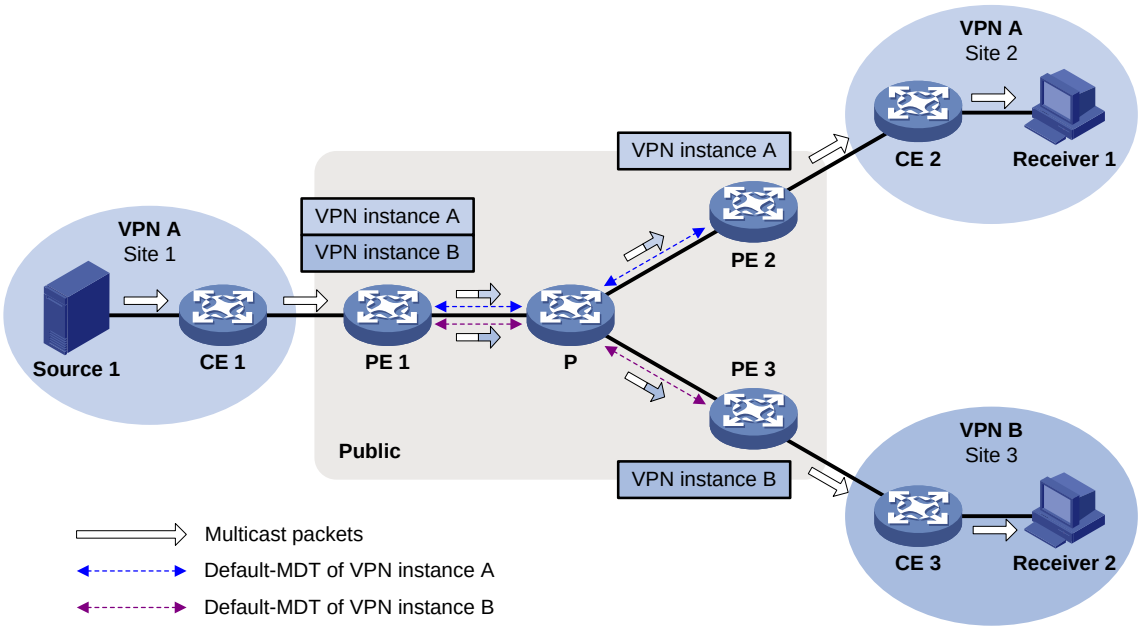
- **Source VPN instance**—VPN instance to which the multicast source belongs.
- **Receiver VPN instance**—VPN instance to which the multicast receiver belongs.
- **Source PE**—PE directly connected to the multicast source.
- **Receiver PE**—PE directly connected to multicast receivers.

As shown in Figure 11, multicast source Source 1 is in Site 1 of VPN A. Receiver 1 and Receiver 2 are located in Site 2 of VPN A and Site 1 of VPN B, respectively. MVPN enables Receiver 1 to receive multicast data from Source 1, and MVPN extranet enables Receiver 2 to receive multicast data from Source 1.

The MVPN extranet solution can be implemented through the source-PE-based MVPN extranet option or the receiver-PE-based MVPN extranet option.

Figure 11 MVPN extranet

Source-PE-based MVPN extranet option



To use this option, create a receiver VPN instance on the source PE and configure MVPN for this VPN instance.

This option is available only in MDT-based MVPN.

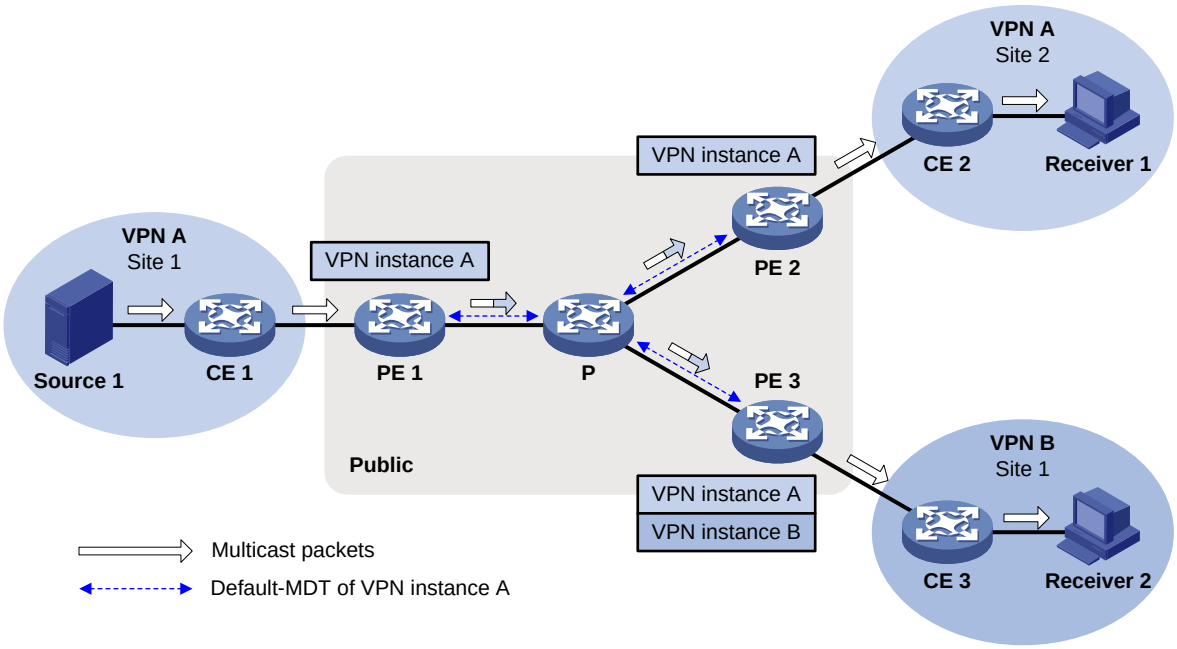
As shown in Figure 12, perform the following tasks:

1. For multicast traffic transmission from Site 1 to Site 2, configure MVPN for VPN A on PE 1 and PE 2.
2. For multicast traffic transmission from Site 1 to Site 3, create VPN B and configure MVPN for VPN B on PE 1.
3. Configure an MVPN extranet RPF selection policy for VPN B on PE 1.

Figure 12 Source-PE-based MVPN extranet option

When Receiver 2 in VPN B joins the multicast group that matches the policy, multicast packets from Source 1 are transmitted as follows:

4. PE 1 replicates and encapsulates the packets for VPN A and VPN B and forwards them.
5. The packets travel along default MDTs of VPN A and VPN B and arrive at PE 2 and PE 3.
6. PE 2 and PE 3 decapsulate and forward the packets to receivers.



Receiver-PE-based MVPN extranet option

To use this option, create a source VPN instance on the receiver PE and configure MVPN. This option is available in MDT-based MVPN and RSVP-TE-based MVPN. The following steps describe how to configure this option for MDT-based MVPN.

As shown in Figure 13, configure PEs as follows:

1. For multicast traffic transmission from Site 1 to Site 2, configure MVPN for VPN A on PE 1 and PE 2.
2. For multicast traffic transmission from Site 1 to Site 3, create VPN A and configure MVPN for VPN A on PE 3.
3. Configure an MVPN extranet RPF selection policy for VPN B on PE 3.

Figure 13 Receiver-PE-based MVPN extranet option

When Receiver 2 in VPN B joins the multicast group that matches the RPF selection policy, multicast packets from Source 1 are encapsulated on PE 1 and transmitted along the default MDT.

- When the packets arrive at PE 2, PE 2 decapsulates the packets and forwards them to Receiver 1.
- When the packets arrive at PE 3, PE 3 decapsulates the packets and forwards them to Receiver 2 based on the MVPN extranet RPF selection policy.

Protocols and standards

- RFC 6037, *Cisco Systems' Solution for Multicast in BGP/MPLS IP VPNs*
- RFC 6513, *Multicast in MPLS/BGP IP VPNs*
- RFC 6514, *BGP Encodings and Procedures for Multicast in MPLS/BGP IP VPNs*

Configuring multicast VPN

Restrictions and guidelines: Multicast VPN configuration

PIM FRR and IPv6 PIM FRR periodically monitor multicast traffic on the primary and backup incoming interfaces of each multicast forwarding entry to detect link failures. Use this feature only in a scenario with continued high-speed forwarding of multicast traffic. To avoid multicast traffic forwarding failures when multicast VPN is used, do not enable PIM FRR and IPv6 PIM FRR. For more information about PIM FRR and IPv6 PIM FRR, see "Configuring PIM" and "Configuring IPv6 PIM", respectively.

MDT-based MVPN tasks at a glance

To configure MDT-based MVPN, perform the following tasks on PEs:

1. Configuring MDT-based MVPN
   a. Enabling IP multicast routing for a VPN instance
   b. Creating an MDT-based MVPN instance
   c. Creating an MVPN address family
   d. Specifying the default group
   e. Specifying the MVPN source interface
   f. (Optional.) Configuring MDT switchover parameters
   g. (Optional.) Configuring the RPF vector feature
   h. (Optional.) Enabling data group reuse logging
   i. (Optional.) Setting the DSCP value for outgoing data group switchover packets
2. Configuring BGP MDT

   If PIM-SSM is running on the public network, you must configure BGP MDT.
   a. Configuring BGP MDT peers or peer groups
   b. (Optional.) Configuring a BGP MDT route reflector
   c. (Optional.) Configuring BGP MDT optimal route selection delay

Configuring MDT-based MVPN

Prerequisites for configuring MDT-based MVPN

Before you configure MDT-based MVPN, complete the following tasks:

- Configure a unicast routing protocol on the public network.
- Configure MPLS L3VPN on the public network.
- Configure PIM-DM, PIM-SM, BIDIR-PIM, or PIM-SSM on the public network.

Enabling IP multicast routing for a VPN instance

1. Enter system view.

system-view

2. Create a VPN instance and enter its view.
   ip vpn-instance *vpn-instance-name*
   For more information about this command, see *MPLS Command Reference*.
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   For more information about this command, see *MPLS Command Reference*.
4. Return to system view.
   quit
5. Enter interface view.
   interface *interface-type interface-number*
6. Associate the interface with the VPN instance.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is associated with no VPN instance and belongs to the public network.
   For more information about this command, see *MPLS Command Reference*.
7. Return to system view.
   quit
8. Enable IP multicast routing for the VPN instance and enter MRIB view of the VPN instance.
   IPv4:
   multicast routing vpn-instance *vpn-instance-name*
   By default, IPv4 multicast routing is disabled for a VPN instance.
   For more information about this command, see *IP Multicast Command Reference*.
   IPv6:
   ipv6 multicast routing vpn-instance *vpn-instance-name*
   By default, IPv6 multicast routing is disabled for a VPN instance.
   For more information about this command, see *IP Multicast Command Reference*.

Creating an MDT-based MVPN instance

About this task

To provide multicast services for a VPN instance, you must create an MDT-based MVPN instance on PEs that belong to the VPN instance. After the MVPN instance is created, the system automatically creates MTIs and binds them with the VPN instance.

You can create one or more MDT-based MVPN instances on a PE.

Procedure

1. Enter system view.
   system-view
2. Create an MDT-based MVPN instance and enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**

Creating an MVPN address family

About this task

You must create an MVPN IPv4 or IPv6 address family for a VPN instance before you can perform other MVPN VPN configuration tasks for the VPN instance. For a VPN instance, configurations in MVPN IPv4 address family view apply to its IPv4 multicast packets, and configurations in IPv6 address family view apply to its IPv6 multicast packets.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view of a VPN instance.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Create an MVPN address family and enter MVPN address family view.
   IPv4:
   address-family ipv4
   IPv6:
   address-family ipv6

Specifying the default group

Restrictions and guidelines

You must specify the same default group on all PEs that belong to the same MVPN.

The default group for an MVPN must be different from the default group and the data group used by any other MVPN.

For an MVPN that transmits both IPv4 and IPv6 multicast packets, you must specify the same default group in MVPN IPv4 address family view and IPv6 address family view.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Enter MVPN address family view.
   IPv4:
   address-family ipv4
   IPv6:
   address-family ipv6
4. Specify the default group.
   default-group *group-address*

Specifying the MVPN source interface

About this task

An MTI of a VPN instance uses the IP address of the MVPN source interface as the source address to encapsulate multicast packets for the VPN instance.

Restrictions and guidelines

For the PE to obtain correct routing information, you must specify the interface used for establishing BGP peer relationship as the MVPN source interface.

For an MVPN that transmits both IPv4 and IPv6 multicast packets, you must specify the same MVPN source interface in MVPN IPv4 and IPv6 address family views.

The MTI takes effect only after the default group and MVPN source interface are specified and the MTI obtains the public IP address of the MVPN source interface.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Enter MVPN address family view.
   IPv4:
   address-family ipv4
   IPv6:
   address-family ipv6
4. Specify the MVPN source interface.
   source *interface-type interface-number*
   By default, no MVPN source interface is specified.

Configuring MDT switchover parameters

About this task

The traffic rate of the private network multicast data might fluctuate around the MDT switchover threshold. To avoid frequent switching of multicast traffic between the default MDT and the data MDT, set the data-delay period and the data holddown period.

- MDT switchover does not take place immediately after the multicast traffic rate exceeds the switchover threshold. It takes place after a data-delay period, during which the traffic rate must stay higher than the switchover threshold.
- Likewise, a backward switchover does not take place immediately after the multicast traffic rate drops below the MDT switchover threshold. It takes place after a data holddown period, during which the traffic rate must stay lower than the switchover threshold.

Restrictions and guidelines

On a PE, the data group range for an MVPN cannot include the default group or data groups of any other MVPN.

All VPN instances share the data group resources. As a best practice to avoid data group resource exhaustion, specify a reasonable data group range for a VPN instance.

For an MVPN that transmits both IPv4 and IPv6 multicast packets, the data group range in MVPN IPv4 and IPv6 address family views cannot overlap.

If the public network runs PIM-SSM, the data group range for an MVPN on a PE can overlap with data group ranges for other MDs on other PEs.

If BIDIR-PIM runs in a VPN instance, the switchover from the default MDT to a data MDT is not supported.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Enter MVPN address family view.
   IPv4:
   address-family ipv4
   IPv6:
   address-family ipv6
4. Configure the data group range and the switchover criteria.
   data-group *group-address* { *mask-length* | *mask* } [**acl** *acl-number*]
   By default, no data group range exists, and the default MDT to data MDT switchover never occurs.
5. Set the data-delay period.
   data-delay *delay*
   By default, the data-delay period is 3 seconds.

Configuring the RPF vector feature

About this task

This feature enables the device to insert the RPF vector (IP address of the ASBR in the local AS) in PIM join messages for other devices to perform RPF check.

Restrictions and guidelines

Perform this task on PEs that have attached receivers.

For the device to work with other manufacturers' products on the RPF vector, you must enable RPF vector compatibility for all H3C P devices and H3C PE devices on the public network.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view of a VPN instance.
   multicast routing vpn-instance *vpn-instance-name*
3. Enable the RPF vector feature.
   rpf proxy vector
   By default, the RPF vector feature is disabled.
4. Enable RPF vector compatibility.
   multicast rpf-proxy-vector compatible
   By default, RPF vector compatibility is disabled.

Enabling data group reuse logging

About this task

For a given VPN, the number of VPN multicast streams to be switched to data MDTs might exceed the number of addresses in the data group range. In this case, the VPN instance on the source-side

PE can reuse the addresses in the address range. With data group reuse logging enabled, the address reuse information will be logged. Perform this task on PEs.

The group address reuse logging information has a severity level **informational**. For more information about the logging information, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Enter MVPN address family view.
   IPv4:
   address-family ipv4
   IPv6:
   address-family ipv6
4. Enable data group reuse logging.
   log data-group-reuse
   By default, data group reuse logging is disabled.

Setting the DSCP value for outgoing data group switchover packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MVPN view.
   multicast-vpn vpn-instance *vpn-instance-name* **mode mdt**
3. Setting the DSCP value for outgoing data group switchover packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing data group switchover packets.

Configuring BGP MDT

Configuring BGP MDT peers or peer groups

About this task

Perform this task so that the PE can exchange MDT information with the BGP peer or peer group. MDT information includes the IP address of the PE and default group to which the PE belongs. On a public network running PIM-SSM, the multicast VPN establishes a default MDT rooted at the PE (multicast source) based on the MDT information.

Prerequisites

Before you configure a BGP MDT peer or peer group, you must create a BGP peer or peer group in BGP instance view. For more information about creating a BGP peer or peer group, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Create a BGP IPv4 MDT address family and enter its view.

   address-family ipv4 mdt

   By default, no BGP IPv4 address family exists.
4. Enable the device to exchange MDT routing information with the BGP peer or the peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, the device cannot exchange BGP MDT routing information with a BGP peer or peer group.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Configuring a BGP MDT route reflector

About this task

- **Configuring a BGP MDT route reflector**—BGP MDT peers in the same AS must be fully meshed to maintain connectivity. However, when multiple BGP MDT peers exist in an AS, connection establishment among them might result in increased costs. To reduce connections between BGP MDT peers, you can configure one of them as a route reflector and specify other devices as clients.
- **Disabling routing reflection between clients**—When clients establish BGP MDT connections with the route reflector, the route reflector forwards (or reflects) BGP MDT routing information between clients. The clients are not required to be fully meshed. To save bandwidth if the clients have been fully meshed, you can disable the routing reflection between clients by using the **undo reflect between-clients** command.
- **Configuring the cluster ID of the route reflector**—The route reflector and its clients form a cluster. Typically, a cluster has only one route reflector whose router ID identifies the cluster. However, you can configure several route reflectors in a cluster to improve network reliability. To avoid routing loops, make sure the route reflectors in a cluster have the same cluster ID.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv4 MDT address family view.

   address-family ipv4 mdt
4. Configure the device as a route reflector and specify its peers or peer groups as clients.

   peer { *group-name* | *ip-address* [*mask-length*] } **reflect-client**

   By default, neither route reflectors nor clients exist.
5. (Optional.) Disable route reflection between clients.

undo reflect between-clients

By default, route reflection between clients is disabled.

For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

6. (Optional.) Configure the cluster ID of the route reflector.

   reflector cluster-id { *cluster-id* | *ip-address* }

   By default, a route reflector uses its router ID as the cluster ID.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Configuring BGP MDT optimal route selection delay

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP IPv4 MDT address family view.

   address-family ipv4 mdt

4. Set the optimal route selection delay timer. Choose the options to configure as needed:
   - Set the optimal route selection delay timer for all BGP routes.

     route-select delay *delay-value*
   - Set the optimal route selection delay timer for BGP routes from only neighbors that change from down state to up state.

     route-select suppress on-peer-up *milliseconds*

   By default, optimal route selection is not delayed.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Configuring an MVPN extranet RPF selection policy

About this task

MVPN extranet RPF routing policies are used for multicast transmission when multicast sources and receivers are located in different VPNs.

Restrictions and guidelines for configuring MVPN extranet RPF selection policies

The PIM modes in the source VPN instance and the receiver VPN instance must be the same. Only PIM-SM and PIM-SSM are supported.

Multicast packets can only be forwarded between two VPNs. The receiver VPN instance cannot also be the source VPN instance.

In PIM-SM mode, you can configure only one RPF selection policy for a multicast group in a VPN instance.

If an IPv4 MVPN extranet RPF selection policy with only the multicast group address specified is configured in the receiver VPN instance, the multicast traffic for the intra-VPN transmission will be interrupted.

To implement source-specific RPF selection in MVPN extranet, you must configure two MVPN extranet RPF routing policies as follows:

- In one policy, specify the address of the RP designated to the multicast group that requires inter-VPN multicast communication as the source address.
- In the other policy, specify the multicast source in the source VPN instance as the source address.

To implement source-and-group-specific RPF selection in MVPN extranet, you must configure two MVPN extranet RPF routing policies as follows:

- In one policy, specify the address of the RP designated to the multicast group as the source address, and specify the multicast group.
- In the other policy, specify the multicast source in the source VPN instance as the source address, and specify the multicast group.
- Make sure the multicast groups in the two policies are the same to avoid inter-VPN multicast transmission failure.

Prerequisites for configuring MVPN extranet RPF selection policies

Before you configure MVPN extranet RPF selection policies, you must configure MVPN.

For the source-PE-based MVPN extranet option, see "Configuring MDT-based MVPN."

For the receiver-PE-based MVPN extranet option, see "Configuring MDT-based MVPN."

Configuring an IPv4 MVPN extranet RPF selection policy

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Configure an IPv4 MVPN extranet RPF selection policy.

   multicast extranet select-rpf [**vpn-instance** *vpn-instance-name*] { **source** *source-address* { *mask* | *mask-length* } | **group** *group-address* { *mask* | *mask-length* } } *

   By default, no IPv4 MVPN extranet RPF selection policies are configured.

Configuring an IPv6 MVPN extranet RPF selection policy

1. Enter system view.

   system-view

2. Enter IPv6 MRIB view.

   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

3. Configure an IPv6 MVPN extranet RPF selection policy.

   ipv6 multicast extranet select-rpf { **vpn-instance** *vpn-instance-name* } { **source** *ipv6-source-address prefix-length* | **group** *ipv6-group-address prefix-length* }*

   By default, no IPv6 MVPN extranet RPF selection policies are configured.

Display and maintenance commands for multicast VPN

Execute **display** commands in any view and **reset** commands in user view.

Display and maintenance commands for MDT-based MVPN:

Task	Command
Display BGP MDT peer group information.	**display bgp** [**instance** *instance-name*] **group ipv4 mdt** [**group-name** *group-name*]
Display information about BGP MDT peers or peer groups.	**display bgp** [**instance** *instance-name*] **peer ipv4 mdt** [*ip-address mask-length* | { *ip-address* | **group-name** *group-name* } **log-info** | [*ip-address*] **verbose**]
Display information about BGP MVPN peers or peer groups.	**display bgp** [**instance** *instance-name*] **peer ipv4 mvpn** [*ip-address mask-length* | { *ip-address* | **group-name** *group-name* } **log-info** | [*ip-address*] **verbose**]
Display BGP MDT routing information.	**display bgp** [**instance** *instance-name*] **routing-table ipv4 mdt** [**route-distinguisher** *route-distinguisher*] [*ip-address* [**advertise-info** | **as-path** | **cluster-list**]]
Display information about BGP update groups for the BGP IPv4 MDT address family.	**display bgp** [**instance** *instance-name*] **update-group ipv4 mdt** [*ip-address*]
Display information about data groups for IPv4 multicast transmission that are received in a VPN instance.	**display multicast-vpn vpn-instance** *vpn-instance-name* **data-group receive** [**brief** | [**active** | **group** *group-address* | **sender** *source-address* | *vpn-source-address* [**mask** { *mask-length* | *mask* }] | *vpn-group-address* [**mask** { *mask-length* | *mask* }]] *]
Display information about data groups for IPv6 multicast transmission that are received in a VPN instance.	**display multicast-vpn vpn-instance** *vpn-instance-name* **ipv6 data-group receive** [**brief** | [**active** | **group** *group-address* | **sender** *source-address* | *vpn-source-address* [*mask-length*] | *vpn-group-address* [*mask-length*]] *]
Display information about data groups for IPv4 multicast transmission that are sent in a VPN instance.	**display multicast-vpn vpn-instance** *vpn-instance-name* **data-group send** [**group** *group-address* | **reuse** *interval* | *vpn-source-address* [**mask** { *mask-length* | *mask* }] | *vpn-group-address* [**mask** { *mask-length* | *mask* }]] *
Display information about data groups for IPv6 multicast transmission that are sent in a VPN instance.	**display multicast-vpn vpn-instance** *vpn-instance-name* **ipv6 data-group send** [**group** *group-address* | **reuse** *interval* | *vpn-source-address* [*mask-length*] | *vpn-group-address* [*mask-length*]] *
Display information about default groups for IPv4 multicast transmission.	**display multicast-vpn** [**vpn-instance** *vpn-instance-name*] **default-group** { **local** | **remote** }
Display information about default groups for IPv6 multicast transmission.	**display multicast-vpn** [**vpn-instance** *vpn-instance-name*] **ipv6 default-group** { **local** | **remote** }
Reset BGP sessions for BGP	**reset bgp** [**instance** *instance-name*] { *as-number*

Task	Command
IPv4 MDT address family.	| *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **ipv4 mdt**

For more information about the **display bgp group**, **display bgp peer**, **display bgp update-group**, and **reset bgp** commands, see BGP commands in *Layer 3—IP Routing Command Reference*.

Multicast VPN configuration examples

Example: Configuring intra-AS MDT-based MVPN

Network configuration

As shown in Figure 14, configure intra-AS MDT-based MVPN to meet the following requirements:

Item	Network configuration
Multicast sources and receivers	• In VPN instance **a**, S 1 is a multicast source, and R 1 is a receiver. • For VPN instance **a**, the default group is 239.1.1.1, and the data group range is 225.2.2.0 to 225.2.2.15.
VPN instances to which PE interfaces belong	• PE 1: VLAN-interface 20 belongs to VPN instance **a**. VLAN-interface 10 and Loopback 1 belong to the public network instance. • PE 2: VLAN-interface 60 belongs to VPN instance **a**. VLAN-interface 40 and Loopback 1 belong to the public network instance.
Unicast routing protocols and MPLS	• Configure OSPF on the public network, and configure RIP between the PEs and CEs. • Establish BGP peer connections between PE 1 and PE 2 on their respective Loopback 1. • Configure MPLS on the public network.
IP multicast routing	• Enable IP multicast routing on the P device. • Enable IP multicast routing on the public network on PE 1 and PE 2. • Enable IP multicast routing for VPN instance **a** on PE 1 and PE 2. • Enable IP multicast routing on CE 1 and CE 2.
IGMP	Enable IGMPv2 on VLAN-interface 60 of CE 2.
PIM	Enable PIM-SM on the public network and for VPN instances **a** and **b**: • Enable PIM-SM on all interfaces of the P device. • Enable PIM-SM on all public and private network interfaces of PE 1 and PE 2. • Enable PIM-SM on all interfaces that have no receiver hosts connected of CE 1 and CE 2. • Configure Loopback 1 of P as a C-BSR and a C-RP for the public network to provide services for all multicast groups. • Configure Loopback 2 of PE 1 as a C-BSR and a C-RP for VPN instance **a** to provide services for all multicast groups.

Figure 14 Network diagram

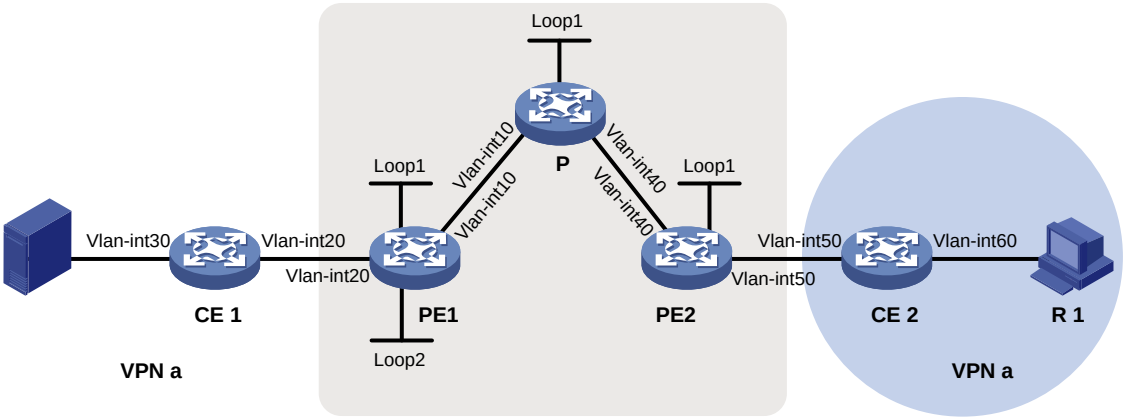


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
S 1	—	10.110.7.2/24	PE 3	—	10.110.9.2/24
P	Vlan-int10	192.168.6.2/24	CE a1	Vlan-int30	10.110.7.1/24
P	Vlan-int40	192.168.7.2/24	CE a2	Vlan-int20	10.110.2.2/24
P	Loop1	2.2.2.2/32	CE a2	Vlan-int60	10.110.9.1/24
PE 1	Vlan-int10	192.168.6.1/24	CE a2	Vlan-int50	10.110.4.2/24
PE 1	Vlan-int20	10.110.2.1/24	CE a3	Vlan-int40	192.168.7.1/24
PE 1	Loop1	1.1.1.1/32	CE a3	Vlan-int50	10.110.4.1/24
PE 1	Loop2	33.33.33.33/32	CE a3	Loop1	1.1.1.2/32

Procedure

1. Configure PE 1:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE1
[PE1] router id 1.1.1.1
[PE1] multicast routing
[PE1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE1] mpls lsr-id 1.1.1.1
[PE1] mpls ldp
[PE1-ldp] quit
```

Create a VPN instance named **a** and configure an RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance a
[PE1-vpn-instance-a] route-distinguisher 100:1
[PE1-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE1-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE1-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE1] multicast routing vpn-instance a
[PE1-mrib-a] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE1] interface loopback 1
[PE1-LoopBack1] ip address 1.1.1.1 32
[PE1-LoopBack1] pim sm
[PE1-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE1] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 family address for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a-ipv4] default-group 239.1.1.1
[PE1-mvpn-vpn-instance-a-ipv4] source loopback 1
[PE1-mvpn-vpn-instance-a-ipv4] data-group 225.2.2.0 28
[PE1-mvpn-vpn-instance-a-ipv4] quit
[PE1-mvpn-vpn-instance-a] quit
```

Assign an IP address to VLAN-interface 10.

```
[PE1] vlan 10
[PE1-vlan10] port gigabitethernet 1/0/1
[PE1-vlan10] quit
[PE1] interface vlan-interface 10
[PE1-Vlan-interface10] ip address 192.168.6.1 24
```

#Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 10.

```
[PE1-Vlan-interface10] pim sm
[PE1-Vlan-interface10] mpls enable
[PE1-Vlan-interface10] mpls ldp enable
[PE1-Vlan-interface10] quit
```

Associate VLAN-interface 20 with VPN instance **a**.

```
[PE1] vlan 20
[PE1-vlan20] port gigabitethernet 1/0/2
[PE1-vlan20] quit
[PE1] interface vlan-interface 20
[PE1-Vlan-interface20] ip binding vpn-instance a
```

Assign an IP address to VLAN-interface 20, and enable PIM-SM on the interface.

```
[PE1-Vlan-interface20] ip address 10.110.2.1 24
[PE1-Vlan-interface20] pim sm
[PE1-Vlan-interface20] quit
```

Associate Loopback 2 with VPN instance **a**.

```
[PE1] interface loopback 2
[PE1-LoopBack2] ip binding vpn-instance a
```

Assign an IP address to Loopback 2, and enable PIM-SM on the interface.

```
[PE1-LoopBack2] ip address 33.33.33.33 32
[PE1-LoopBack2] pim sm
[PE1-LoopBack2] quit
```

Configure Loopback 2 as a C-BSR and a C-RP.

```
[PE1] pim vpn-instance a
[PE1-pim-a] c-bsr 33.33.33.33
[PE1-pim-a] c-rp 33.33.33.33
```

```
[PE1-pim-a] quit
```

Configure BGP.

```
[PE1] bgp 100
[PE1-bgp-default] group vpn-g internal
[PE1-bgp-default] peer vpn-g connect-interface loopback 1
[PE1-bgp-default] peer 1.1.1.2 group vpn-g
[PE1–bgp-default] ip vpn-instance a
[PE1-bgp-default-a] address-family ipv4
[PE1-bgp-default-ipv4-a] import-route rip 2
[PE1-bgp-default-ipv4-a] import-route direct
[PE1-bgp-default-ipv4-a] quit
[PE1-bgp-default-a] quit
[PE1–bgp-default] address-family vpnv4
[PE1–bgp-default-vpnv4] peer vpn-g enable
[PE1–bgp-default-vpnv4] quit
[PE1-bgp-default] address-family ipv4 mdt
[PE1-bgp-default-mdt] peer vpn-g enable
[PE1-bgp-default-mdt] quit
[PE1–bgp-default] quit
```

Configure OSPF.

```
[PE1] ospf 1
[PE1-ospf-1] area 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
```

Configure RIP.

```
[PE1] rip 2 vpn-instance a
[PE1-rip-2] network 33.33.33.33 0.0.0.0
[PE1-rip-2] network 10.110.2.0 0.0.0.255
[PE1-rip-2] import-route bgp
[PE1-rip-2] quit
```

2. Configure PE 2:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] router id 1.1.1.2
[PE2] multicast routing
[PE2-mrib] quit
```

Configure an MPLS LSR ID, and enable LDP globally.

```
[PE2] mpls lsr-id 1.1.1.2
[PE2] mpls ldp
[PE2-ldp] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip address 1.1.1.2 32
[PE2-LoopBack1] pim sm
[PE2-LoopBack1] quit
```

Create a VPN instance named **a**, and configure an RD and route targets for VPN instance.

```
[PE2] ip vpn-instance a
[PE2-vpn-instance-a] route-distinguisher 100:1
[PE2-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE2-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE2-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE2] multicast routing vpn-instance a
[PE2-mrib-a] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE2] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE2-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE2-mvpn-vpn-instance-a-ipv4] default-group 239.1.1.1
[PE2-mvpn-vpn-instance-a-ipv4] source loopback 1
[PE2-mvpn-vpn-instance-a-ipv4] data-group 225.2.2.0 28
[PE2-mvpn-vpn-instance-a-ipv4] quit
[PE2-mvpn-vpn-instance-a] quit
```

Assign an IP address to VLAN-interface 40.

```
[PE2] vlan 40
[PE2-vlan40] port gigabitethernet 1/0/1
[PE2-vlan40] quit
[PE2] interface vlan-interface 40
[PE2-Vlan-interface40] ip address 192.168.7.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 40.

```
[PE2-Vlan-interface40] pim sm
[PE2-Vlan-interface40] mpls enable
[PE2-Vlan-interface40] mpls ldp enable
[PE2-Vlan-interface40] quit
```

Associate VLAN-interface 50 with VPN instance **a**, assign an IP address to VLAN-interface 50, and enable PIM-SM on the interface.

```
[PE2] vlan 50
[PE2-vlan50] port gigabitethernet 1/0/2
[PE2-vlan50] quit
[PE2] interface vlan-interface 50
[PE2-Vlan-interface50] ip binding vpn-instance a

[PE2-ospf-1] quit
```

Configure RIP.

```
[PE2] rip 2 vpn-instance a
[PE2-rip-2] network 10.110.4.0 0.0.0.255
[PE2-rip-2] import-route bgp
[PE2-rip-2] quit
```

3. Configure P:

Enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname P
[P] multicast routing
[P-mrib] quit
```

Configure an MPLS LSR ID, and enable LDP globally.

```
[P] mpls lsr-id 2.2.2.2
[P] mpls ldp
[P-ldp] quit
```

Assign an IP address to VLAN-interface 10.

```
[P] vlan 10
[P-vlan10] port gigabitethernet 1/0/1
[P-vlan10] quit
[P] interface vlan-interface 10
[P-Vlan-interface10] ip address 192.168.6.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 10.

```
[P-Vlan-interface10] pim sm
[P-Vlan-interface10] mpls enable
[P-Vlan-interface10] mpls ldp enable
[P-Vlan-interface10] quit
```

Assign an IP address to VLAN-interface 40.

```
[P] vlan 40
[P-vlan40] port gigabitethernet 1/0/2
[P-vlan40] quit
```

```
[P] interface vlan-interface 40
[P-Vlan-interface40] ip address 192.168.7.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 40.

```
[P-Vlan-interface40] pim sm
[P-Vlan-interface40] mpls enable
[P-Vlan-interface40] mpls ldp enable
[P-Vlan-interface40] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[P] interface loopback 1
[P-LoopBack1] ip address 2.2.2.2 32
[P-LoopBack1] pim sm
[P-LoopBack1] quit
```

Configure Loopback 1 as a C-BSR and a C-RP.

```
[P] pim
[P-pim] c-bsr 2.2.2.2
[P-pim] c-rp 2.2.2.2
[P-pim] quit
```

Configure OSPF.

```
[P] ospf 1
[P-ospf-1] area 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255

[P-ospf-1-area-0.0.0.0] quit
[P-ospf-1] quit
```

4. Configure CE 1:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CE1
[CE1] multicast routing
[CE1-mrib] quit
```

Assign an IP address to VLAN-interface 30, and enable PIM-SM on the interface.

```
[CE1] vlan 30
[CE1-vlan30] port gigabitethernet 1/0/1
[CE1-vlan30] quit
[CE1] interface vlan-interface 30
[CE1-Vlan-interface30] ip address 10.110.7.1 24
[CE1-Vlan-interface30] pim sm
[CE1-Vlan-interface30] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-SM on the interface.

```
[CE1] vlan 20
[CE1-vlan20] port gigabitethernet 1/0/2
[CE1-vlan20] quit
[CE1] interface vlan-interface 20
[CE1-Vlan-interface20] ip address 10.110.2.2 24
[CE1-Vlan-interface20] pim sm
[CE1-Vlan-interface20] quit
```

Configure RIP.

```
[CE1] rip 2
[CE1-rip-2] network 10.110.2.0 0.0.0.255
[CE1-rip-2] network 10.110.7.0 0.0.0.255
[CE1-rip-2] quit
```

5. Configure CE 2:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CE2
[CE2] multicast routing
[CE2-mrib] quit
```

Assign an IP address to VLAN-interface 60, and enable IGMP on the interface.

```
[CE2] vlan 60
[CE2-vlan60] port gigabitethernet 1/0/1
[CE2-vlan60] quit
[CE2] interface vlan-interface 60
[CE2-Vlan-interface60] ip address 10.110.9.1 24
[CE2-Vlan-interface60] igmp enable
[CE2-Vlan-interface60] quit
```

Assign an IP address to VLAN-interface 50, and enable PIM-SM on the interface.

```
[CE2] vlan 50
[CE2-vlan50] port gigabitethernet 1/0/2
[CE2-vlan50] quit
[CE2] interface vlan-interface 50
[CE2-Vlan-interface50] ip address 10.110.4.2 24
[CE2-Vlan-interface50] pim sm
[CE2-Vlan-interface50] quit
```

Configure RIP.

```
[CE2] rip 2
[CE2-rip-2] network 10.110.4.0 0.0.0.255
[CE2-rip-2] quit
```

Verifying the configuration

Display information about the local default group for IPv4 multicast transmission in each VPN instance on PE 1.

```
[PE1] display multicast-vpn default-group local
MVPN local default-group information:
 Group address    Source address   Interface     VPN instance
 239.1.1.1        1.1.1.1          MTunnel0      a
```

Display information about the local default group for IPv4 multicast transmission in each VPN instance on PE 2.

```
[PE2] display multicast-vpn default-group local
MVPN local default-group information:
 Group address    Source address   Interface     VPN instance
 239.1.1.1        1.1.1.2          MTunnel0      a
```

Example: Configuring intra-AS M6VPE

Network configuration

As shown in Figure 15, configure intra-AS M6VPE to meet the following requirements:

Item	Network configuration
Multicast sources and receivers	• In VPN instance **a**, S 1 is an IPv6 multicast source, and R 1 is a receiver. • For VPN instance **a**, the default group is 239.1.1.1, and the data group range is 225.2.2.0 to 225.2.2.15.
VPN instances to which PE interfaces belong	• PE 1: VLAN-interface 20 belongs to VPN instance **a**. VLAN-interface 10 and Loopback 1 belong to the public network. • PE 2: VLAN-interface 50 belongs to VPN instance **a**. VLAN-interface 40 and Loopback 1 belong to the public network.
Unicast routing protocols and MPLS	• Configure OSPF on the public network, and configure OSPFv3 between the PEs and the CEs. • Establish BGP peer connections between PE 1 and PE 2 on their respective Loopback 1.

Item	Network configuration
	• Configure MPLS on the public network.
IP multicast routing and IPv6 multicast routing	• Enable IP multicast routing on P. • Enable IP multicast routing for the public network on PE 1 and PE 2. • Enable IPv6 multicast routing for VPN instance **a** on PE 1 and PE 2. • Enable IPv6 multicast routing on CE 1 and CE 2.
MLDv1	Enable MLDv1 on VLAN-interface 60 of CE 2.
PIM and IPv6 PIM	Enable PIM-SM on the public network and IPv6 PIM-SM for VPN instances **a** and **b**: • Enable PIM-SM on all interfaces of P. • On PE 1 and PE 2, enable PIM-SM on all public network interfaces and IPv6 PIM-SM on private network interfaces. • Enable IPv6 PIM-SM on all interfaces that do not have attached receivers on CE 1 and CE 2. • Configure Loopback 1 of P as a C-BSR and a C-RP for the public network to provide services for all IPv4 multicast groups. • Configure Loopback 2 of PE 1 as a C-BSR and a C-RP for VPN instance **a** to provide services for all IPv6 multicast groups.

Figure 15 Network diagram

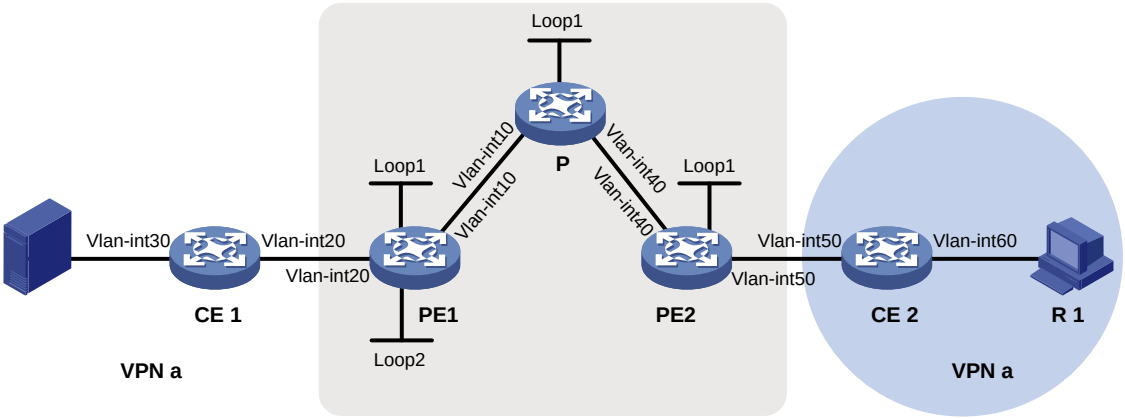

Table 2 Interface and IP address assignment

Device	Interface	IPv4/IPv6 address	Device	Interface	IPv4/IPv6 address
S 1	—	10:110:7::2/64	R 1	—	10:110:9::2/64
P	Vlan-int10	192.168.6.2/24	CE 1	Vlan-int30	10:110:7::1/64
P	Vlan-int40	192.168.7.2/24	CE 1	Vlan-int20	10:110:2::2/64
P	Loop1	2.2.2.2/32	CE 2	Vlan-int60	10:110:9::1/64
PE 1	Vlan-int10	192.168.6.1/24	CE 2	Vlan-int50	10:110:4::2/64
PE 1	Vlan-int20	10:110:2::1/64	PE 2	Vlan-int40	192.168.7.1/24
PE 1	Loop1	1.1.1.1/32	PE 2	Vlan-int50	10:110:4::1/64
PE 1	Loop2	33:33:33::33/128	PE 2	Loop1	1.1.1.2/32

Procedure

1. Configure PE 1:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE1
[PE1] router id 1.1.1.1
[PE1] multicast routing
[PE1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE1] mpls lsr-id 1.1.1.1
[PE1] mpls ldp
[PE1-ldp] quit
```

Create a VPN instance named **a**, and configure the RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance a
[PE1-vpn-instance-a] route-distinguisher 100:1
[PE1-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE1-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE1-vpn-instance-a] quit
```

Enable IPv6 multicast routing for VPN instance **a**.

```
[PE1] ipv6 multicast routing vpn-instance a
[PE1-mrib6-a] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE1] interface loopback 1
[PE1-LoopBack1] ip address 1.1.1.1 32
[PE1-LoopBack1] pim sm
[PE1-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE1] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv6 address family for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a] address-family ipv6
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a-ipv6] default-group 239.1.1.1
[PE1-mvpn-vpn-instance-a-ipv6] source loopback 1
[PE1-mvpn-vpn-instance-a-ipv6] data-group 225.2.2.0 28
[PE1-mvpn-vpn-instance-a-ipv6] quit
[PE1-mvpn-vpn-instance-a] quit
```

Assign an IP address to VLAN-interface 10.

```
[PE1] vlan 10
[PE1-vlan10] port gigabitethernet 1/0/1
[PE1-vlan10] quit
[PE1] interface vlan-interface 10

[PE1–bgp-default-vpnv6] quit
[PE1-bgp-default] address-family ipv4 mdt
[PE1-bgp-default-mdt] peer vpn-g enable
[PE1-bgp-default-mdt] quit
[PE1–bgp-default] quit
```

Configure OSPF.

```
[PE1] ospf 1
[PE1-ospf-1] area 0.0.0.0
```

```
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
```

Configure OSPFv3.

```
[PE1] ospfv3 2 vpn-instance a
[PE1-ospfv3-2] router-id 1.1.1.1
[PE1-ospfv3-2] import-route bgp4+
[PE1-ospfv3-2] import-route direct
[PE1-ospfv3-2] area 0
[PE1-ospfv3-2-area-0.0.0.0] quit
[PE1-ospfv3-2] quit
```

2. Configure PE 2:

Configure a global RD, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] router id 1.1.1.2
[PE2] multicast routing
[PE2-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE2] mpls lsr-id 1.1.1.2
[PE2] mpls ldp
[PE2-ldp] quit
```

Create a VPN instance named **a**, and configure the RD and route targets for the VPN instance.

```
[PE2] ip vpn-instance a
[PE2-vpn-instance-a] route-distinguisher 100:1
[PE2-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE2-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE2-vpn-instance-a] quit
```

Enable IPv6 multicast routing for VPN instance **a**.

```
[PE2] ipv6 multicast routing vpn-instance a
[PE2-mrib6-a] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip address 1.1.1.2 32
[PE2-LoopBack1] pim sm
[PE2-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE2] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv6 address family for VPN instance **a**.

```
[PE2-mvpn-vpn-instance-a] address-family ipv6
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE2-mvpn-vpn-instance-a-ipv6] default-group 239.1.1.1
[PE2-mvpn-vpn-instance-a-ipv6] source loopback 1
[PE2-mvpn-vpn-instance-a-ipv6] data-group 225.2.2.0 28
[PE2-mvpn-vpn-instance-a-ipv6] quit
```

```
[PE2-mvpn-vpn-instance-a] quit
```

Assign an IP address to VLAN-interface 40.

```
[PE2] vlan 40
[PE2-vlan40] port gigabitethernet 1/0/1
[PE2-vlan40] quit
[PE2] interface vlan-interface 40
[PE2-Vlan-interface40] ip address 192.168.7.1 24
```

[PE2-ospf-1] quit
```

Configure OSPFv3.

```
[PE2] ospfv3 2 vpn-instance a
[PE2-ospfv3-2] router-id 2.2.2.2
[PE2-ospfv3-2] import-route bgp4+
[PE2-ospfv3-2] import-route direct
[PE2-ospfv3-2] area 0
[PE2-ospfv3-2-area-0.0.0.0] quit
[PE2-ospfv3-2] quit
```

3. Configure P:

Enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname P
[P] multicast routing
[P-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[P] mpls lsr-id 2.2.2.2
[P] mpls ldp
[P-ldp] quit
```

Assign an IP address to VLAN-interface 10.

```
[P] vlan 10
[P-vlan10] port gigabitethernet 1/0/1
[P-vlan10] quit
[P] interface vlan-interface 10
[P-Vlan-interface10] ip address 192.168.6.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 10.

```
[P-Vlan-interface10] pim sm
[P-Vlan-interface10] mpls enable
[P-Vlan-interface10] mpls ldp enable
[P-Vlan-interface10] quit
```

Assign an IP address to VLAN-interface 40.

```
[P] vlan 40
[P-vlan40] port gigabitethernet 1/0/2
[P-vlan40] quit
[P] interface vlan-interface 40
[P-Vlan-interface40] ip address 192.168.7.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 40.

```
[P-Vlan-interface40] pim sm
[P-Vlan-interface40] mpls enable
[P-Vlan-interface40] mpls ldp enable
[P-Vlan-interface40] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[P] interface loopback 1
[P-LoopBack1] ip address 2.2.2.2 32
[P-LoopBack1] pim sm
[P-LoopBack1] quit
```

Configure Loopback 1 as a C-BSR and a C-RP.

```
[P] pim
[P-pim] c-bsr 2.2.2.2
[P-pim] c-rp 2.2.2.2
[P-pim] quit
```

Configure OSPF.

```
[P] ospf 1
[P-ospf-1] area 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255

[P-ospf-1-area-0.0.0.0] quit
[P-ospf-1] quit
```

4. Configure CE 1:

Enable IPv6 multicast routing.

```
<Sysname> system-view
[Sysname] sysname CE1
[CE1] ipv6 multicast routing
[CE1-mrib6] quit
```

Assign an IPv6 address to VLAN-interface 30.

```
[CE1-vlan30] port gigabitethernet 1/0/1
[CE1-vlan30] quit
[CE1] interface vlan-interface 30
[CE1-Vlan-interface30] ipv6 address 10:110:7::1 64
```

Configure VLAN-interface 30 to run OSPFv3 process 2 in Area 0, and enable IPv6 PIM-SM on the interface.

```
[CE1-Vlan-interface30] ospfv3 2 area 0.0.0.0
[CE1-Vlan-interface30] ipv6 pim sm
[CE1-Vlan-interface30] quit
```

Assign an IPv6 address to VLAN-interface 11.

```
[CE1] interface vlan-interface 11
[CE1-Vlan-interface11] ipv6 address 10:110:2::2 64
```

Configure VLAN-interface 20 to run OSPFv3 process 2 in Area 0, and enable IPv6 PIM-SM on the interface.

```
[CE1] vlan 20
[CE1-vlan20] port gigabitethernet 1/0/2
[CE1-vlan20] quit
[CE1-Vlan-interface20] ospfv3 2 area 0.0.0.0
[CE1-Vlan-interface20] ipv6 pim sm
[CE1-Vlan-interface20] quit
```

Configure OSPFv3.

```
[CE1] ospfv3 2
[CE1-ospfv3-2] router-id 6.6.6.6
[CE1-ospfv3-2] area 0.0.0.0
[CE1-ospfv3-2-area-0.0.0.0] quit
[CE1-ospfv3-2] quit
```

5. Configure CE 2:

Enable IPv6 multicast routing.

```
<Sysname> system-view
[Sysname] sysname CE2
[CE2] ipv6 multicast routing
[CE2-mrib6] quit
```

Assign an IPv6 address to VLAN-interface 60.

```
[CE2] vlan 60
[CE2-vlan60] port gigabitethernet 1/0/1
[CE2-vlan60] quit
[CE2] interface vlan-interface 60
[CE2-Vlan-interface60] ipv6 address 10:110:9::1 64
```

Configure VLAN-interface 60 to run OSPFv3 process 2 in Area 0, and enable MLD on the interface.

```
[CE2-Vlan-interface60] ospfv3 2 area 0.0.0.0
[CE2-Vlan-interface60] mld enable
[CE2-Vlan-interface60] quit
```

Assign an IPv6 address to VLAN-interface 50.

```
[CE2] vlan 50
[CE2-vlan50] port gigabitethernet 1/0/2
[CE2-vlan50] quit
[CE2] interface vlan-interface 50
[CE2-Vlan-interface50] ipv6 address 10:110:4::2 64
```

Configure VLAN-interface 50 to run OSPFv3 process 2 in Area 0, and enable IPv6 PIM-SM on the interface.

```
[CE2-Vlan-interface50] ospfv3 2 area 0.0.0.0
[CE2-Vlan-interface50] ipv6 pim sm
[CE2-Vlan-interface50] quit
```

Configure OSPFv3.

```
[CE2] ospfv3 2
[CE2-ospfv3-2] router-id 8.8.8.8
[CE2-ospfv3-2] area 0.0.0.0

Example: Configuring MDT-based MVPN inter-AS option B

Network configuration

As shown in Figure 16, configure inter-AS option B MDT-based MVPN to meet the following requirements:

Item	Network configuration
Multicast sources and receivers	• In VPN instance **a**, S 1 is a multicast source, and R 2 is a receiver. • In VPN instance **b**, S 2 is a multicast source, and R 1 is a receiver. • For VPN instance **a**, the default group is 232.1.1.1, and the data group range is 232.2.2.0 to 232.2.2.15. They are in the SSM group range. • For VPN instance **b**, the default group is 232.3.3.3, and the data group range is 232.4.4.0 to 232.4.4.15. They are in the SSM group range.
VPN instances to which PE interfaces belong	• PE 1: VLAN-interface 11 belongs to VPN instance **a**. VLAN-interface 12 belongs to VPN instance **b**. VLAN-interface 2 and Loopback 1 belong to the public network instance. • PE 2: VLAN-interface 3, VLAN-interface 4, and Loopback 1 belong to the public network instance. • PE 3: VLAN-interface 4, VLAN-interface 5, and Loopback 1 belong to the public network instance. • PE 4: VLAN-interface 13 belongs to VPN instance **a**. VLAN-interface 14 belongs to VPN instance **b**. VLAN-interface 6 and Loopback 1 belong to the public network instance.
Unicast routing protocols and MPLS	• Configure OSPF separately in AS 100 and AS 200, and configure OSPF between the PEs and CEs. • Establish IBGP peer connections between PE 1, PE 2, PE 3, and PE 4 on their respective Loopback 1. • Configure BGP MDT peer connections between PE 1, PE 2, PE 3, and PE 4 on their respective Loopback 1 and between PE 2 and PE 3 on their respective VLAN-interface 4. • Establish EBGP peer connections between VLAN-interface 4 on PE 2 and PE 3. • Configure MPLS separately in AS 100 and AS 200.
IP multicast routing	• Enable IP multicast routing on P 1 and P 2. • Enable IP multicast routing on the public network on PE 1, PE 2, PE 3, and PE 4. • Enable IP multicast routing for VPN instance **a** on PE 1 and PE 4. • Enable IP multicast routing for VPN instance **b** on PE 1 and PE 4. • Enable IP multicast routing on CE a1, CE a2, CE b1, and CE b2.
IGMP	• Enable IGMPv2 on VLAN-interface 23 of CE a2. • Enable IGMPv2 on VLAN-interface 24 of CE b2.
PIM	Enable PIM-SSM on the public network and PIM-SM on VPN instances **a** and **b**: • Enable PIM-SM on all interfaces of P 1 and P 2. • Enable PIM-SM on all public network interfaces of PE 2 and PE 3. • Enable PIM-SM on all public and private network interfaces of PE 1 and PE 4. • Enable PIM-SM on all interfaces that do not have attached receiver hosts on CE a1, CE a2, CE b1, and CE b2. • Configure VLAN-interface 11 of CE a1 as a C-BSR and a C-RP for VPN instance **a** to provide services for all multicast groups. • Configure VLAN-interface 12 of CE b1 as a C-BSR and a C-RP for VPN instance **b** to provide services for all multicast groups.
RPF vector	Enable the RPF vector feature on PE 1 and PE 4.

Figure 16 Network diagram

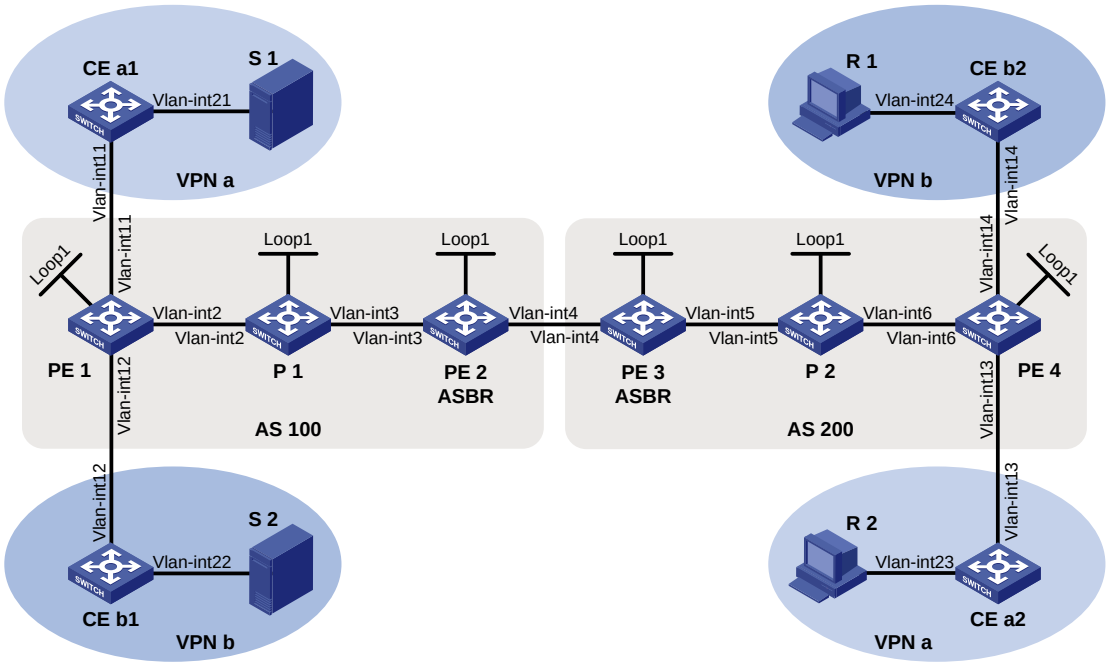

Table 3 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
S 1	—	12.1.1.100/24	R 1	—	12.4.1.100/24
S 2	—	12.2.1.100/24	R 2	—	12.3.1.100/24
PE 1	Vlan-int2	10.1.1.1/24	PE 3	Vlan-int5	10.4.1.1/24
PE 1	Vlan-int11	11.1.1.1/24	PE 3	Vlan-int4	10.3.1.2/24
PE 1	Vlan-int12	11.2.1.1/24	PE 3	Loop1	3.3.3.3/32
PE 1	Loop1	1.1.1.1/32	PE 4	Vlan-int6	10.5.1.2/24
PE 2	Vlan-int3	10.2.1.2/24	PE 4	Vlan-int13	11.3.1.1/24
PE 2	Vlan-int4	10.3.1.1/24	PE 4	Vlan-int14	11.4.1.1/24
PE 2	Loop1	2.2.2.2/32	PE 4	Loop1	4.4.4.4/24
P 1	Vlan-int2	10.1.1.2/24	P 2	Vlan-int6	10.5.1.1/24
P 1	Vlan-int3	10.2.1.1/24	P 2	Vlan-int5	10.4.1.2/24
P 1	Loop1	5.5.5.5/32	P 2	Loop1	6.6.6.6/32
CE a1	Vlan-int21	12.1.1.1/24	CE b1	Vlan-int22	12.2.1.1/24
CE a1	Vlan-int11	11.1.1.2/24	CE b1	Vlan-int12	11.2.1.2/24
CE a2	Vlan-int23	12.3.1.1/24	CE b2	Vlan-int24	12.4.1.1/24
CE a2	Vlan-int13	11.3.1.2/24	CE b2	Vlan-int14	11.4.1.2/24

Procedure

1. Configure PE 1:

   # Configure a global router ID, and enable IP multicast routing on the public network.

   ```
   <Sysname> system-view
   ```

```
[Sysname] sysname PE1
[PE1] router id 1.1.1.1
[PE1] multicast routing
[PE1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE1] mpls lsr-id 1.1.1.1
[PE1] mpls ldp
[PE1-ldp] quit
```

Create a VPN instance named **a**, and configure the RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance a
[PE1-vpn-instance-a] route-distinguisher 100:1
[PE1-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE1-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE1-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE1] multicast routing vpn-instance a
```

Enable the RPF vector feature.

```
[PE1-mrib-a] rpf proxy vector
[PE1-mrib-a] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE1] interface loopback 1
[PE1-LoopBack1] ip address 1.1.1.1 32
[PE1-LoopBack1] pim sm
[PE1-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE1] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a-ipv4] default-group 232.1.1.1
[PE1-mvpn-vpn-instance-a-ipv4] source loopback 1
[PE1-mvpn-vpn-instance-a-ipv4] data-group 232.2.2.0 28
[PE1-mvpn-vpn-instance-a-ipv4] quit
[PE1-mvpn-vpn-instance-a] quit
```

Create a VPN instance named **b**, and configure the RD and route targets for VPN instance.

```
[PE1] ip vpn-instance b
[PE1-vpn-instance-b] route-distinguisher 200:1
[PE1-vpn-instance-b] vpn-target 200:1 export-extcommunity
[PE1-vpn-instance-b] vpn-target 200:1 import-extcommunity
[PE1-vpn-instance-b] quit
```

Enable IP multicast routing for VPN instance **b**.

```
[PE1] multicast routing vpn-instance b
```

Enable the RPF vector feature.

```
[PE1-mrib-b] rpf proxy vector
[PE1-mrib-b] quit
```

Create an MDT-based MVPN for VPN instance **b**.

```
[PE1] multicast-vpn vpn-instance b mode mdt
```

Create an MVPN IPv4 address family for VPN instance **b**.

```
[PE1-mvpn-vpn-instance-b] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **b**.

```
[PE1-mvpn-vpn-instance-b-ipv4] default-group 232.3.3.3
[PE1-mvpn-vpn-instance-b-ipv4] source loopback 1
[PE1-mvpn-vpn-instance-b-ipv4] data-group 232.4.4.0 28
[PE1-mvpn-vpn-instance-b-ipv4] quit
[PE1-mvpn-vpn-instance-b] quit
```

Assign an IP address to VLAN-interface 2.

```
[PE1] vlan 2
[PE1-vlan2] port gigabitethernet 1/0/1
[PE1-vlan2] quit
[PE1] interface vlan-interface 2
[PE1-Vlan-interface2] ip address 10.1.1.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 2.

```
[PE1-Vlan-interface2] pim sm
[PE1-Vlan-interface2] mpls enable
[PE1-Vlan-interface2] mpls ldp enable
[PE1-Vlan-interface2] quit
```

Associate VLAN-interface 11 with VPN instance **a**.

```
[PE1] vlan 11
[PE1-vlan11] port gigabitethernet 1/0/2
[PE1-vlan11] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance a
```

Assign an IP address to VLAN-interface 11, and enable PIM-SM on the interface.

```
[PE1-Vlan-interface11] ip address 11.1.1.1 24
[PE1-Vlan-interface11] pim sm
[PE1-Vlan-interface11] quit
```

Associate VLAN-interface 12 with VPN instance **b**.

```
[PE1] vlan 12
[PE1-vlan12] port gigabitethernet 1/0/3
[PE1-vlan12] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance b
```

Assign an IP address to VLAN-interface 12, and enable PIM-SM on the interface.

```
[PE1-Vlan-interface12] ip address 11.2.1.1 24
[PE1-Vlan-interface12] pim sm
[PE1-Vlan-interface12] quit
```

Configure BGP.

```
[PE1] bgp 100
[PE1-bgp-default] peer 2.2.2.2 as-number 100
[PE1-bgp-default] peer 2.2.2.2 connect-interface loopback 1
[PE1–bgp-default] ip vpn-instance a
[PE1-bgp-default-a] address-family ipv4
[PE1-bgp-default-ipv4-a] import-route ospf 2
```

```
[PE1-bgp-default-ipv4-a] import-route direct
[PE1-bgp-default-ipv4-a] quit
[PE1-bgp-default-a] quit
[PE1–bgp-default] ip vpn-instance b
[PE1-bgp-default-b] address-family ipv4
[PE1-bgp-default-ipv4-b] import-route ospf 3
[PE1-bgp-default-ipv4-b] import-route direct
[PE1-bgp-default-ipv4-b] quit
[PE1-bgp-default-b] quit
[PE1–bgp-default] address-family vpnv4
[PE1–bgp-default-vpnv4] peer 2.2.2.2 enable
[PE1–bgp-default-vpnv4] quit
[PE1-bgp-default] address-family ipv4 mdt
[PE1-bgp-default-mdt] peer 2.2.2.2 enable
[PE1-bgp-default-mdt] quit
[PE1–bgp-default] quit
```

Configure OSPF.

```
[PE1] ospf 1
[PE1-ospf-1] area 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
[PE1] ospf 2 vpn-instance a
[PE1-ospf-2] import-route bgp
[PE1-ospf-2] area 0.0.0.0
[PE1-ospf-2-area-0.0.0.0] network 11.1.1.0 0.0.0.255
[PE1-ospf-2-area-0.0.0.0] quit
[PE1-ospf-2] quit
[PE1] ospf 3 vpn-instance b
[PE1-ospf-3] import-route bgp
[PE1-ospf-3] area 0.0.0.0
[PE1-ospf-3-area-0.0.0.0] network 11.2.1.0 0.0.0.255
[PE1-ospf-3-area-0.0.0.0] quit
[PE1-ospf-3] quit
```

2. Configure PE 2:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] router id 2.2.2.2
[PE2] multicast routing
[PE2-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE2] mpls lsr-id 2.2.2.2
[PE2] mpls ldp
[PE2-ldp] quit
```

Assign an IP address to VLAN-interface 3.

```
[PE2] vlan 3
```

```
[PE2-vlan3] port gigabitethernet 1/0/1
[PE2-vlan3] quit
[PE2] interface vlan-interface 3
[PE2-Vlan-interface3] ip address 10.2.1.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 3.

```
[PE2-Vlan-interface3] pim sm
[PE2-Vlan-interface3] mpls enable
[PE2-Vlan-interface3] mpls ldp enable
[PE2-Vlan-interface3] quit
```

Assign an IP address to VLAN-interface 4.

```
[PE2] vlan 4
[PE2-vlan4] port gigabitethernet 1/0/2
[PE2-vlan4] quit
[PE2] interface vlan-interface 4
[PE2-Vlan-interface4] ip address 10.3.1.1 24
```

Enable PIM-SM and MPLS on VLAN-interface 4.

```
[PE2-Vlan-interface4] pim sm
[PE2-Vlan-interface4] mpls enable
[PE2-Vlan-interface4] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip address 2.2.2.2 32
[PE2-LoopBack1] pim sm
[PE2-LoopBack1] quit
```

Configure BGP.

```
[PE2] bgp 100
[PE2-bgp-default] peer 1.1.1.1 as-number 100
[PE2-bgp-default] peer 1.1.1.1 connect-interface loopback 1
[PE2-bgp-default] peer 10.3.1.2 as-number 200
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] undo policy vpn-target
[PE2-bgp-default-vpnv4] peer 1.1.1.1 enable
[PE2-bgp-default-vpnv4] peer 10.3.1.2 enable
[PE2-bgp-default-vpnv4] quit
[PE2-bgp-default] address-family ipv4 mdt
[PE2-bgp-default-mdt] peer 1.1.1.1 enable
[PE2-bgp-default-mdt] peer 10.3.1.2 enable
[PE2-bgp-default-mdt] quit
[PE2–bgp-default] quit
```

Configure OSPF.

```
[PE2] ospf 1
[PE2-ospf-1] area 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
[PE2-ospf-1-area-0.0.0.0] quit
[PE2-ospf-1] quit
```

3. Configure PE 3:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE3
[PE3] router id 3.3.3.3
[PE3] multicast routing
[PE3-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE3] mpls lsr-id 3.3.3.3
[PE3] mpls ldp
[PE3-ldp] quit
```

Assign an IP address to VLAN-interface 5.

```
[PE3] vlan 5
[PE3-vlan5] port gigabitethernet 1/0/1
[PE3-vlan5] quit
[PE3] interface vlan-interface 5
[PE3-Vlan-interface5] ip address 10.4.1.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 5.

```
[PE3-Vlan-interface5] pim sm
[PE3-Vlan-interface5] mpls enable
[PE3-Vlan-interface5] mpls ldp enable
[PE3-Vlan-interface5] quit
```

Assign an IP address to VLAN-interface 4.

```
[PE3] vlan 4
[PE3-vlan4] port gigabitethernet 1/0/2
[PE3-vlan4] quit
[PE3] interface vlan-interface 4
[PE3-Vlan-interface4] ip address 10.3.1.2 24
```

Enable PIM-SM and MPLS on VLAN-interface 4.

```
[PE3-Vlan-interface4] pim sm
[PE3-Vlan-interface4] mpls enable
[PE3-Vlan-interface4] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE3] interface loopback 1
[PE3-LoopBack1] ip address 3.3.3.3 32
[PE3-LoopBack1] pim sm
[PE3-LoopBack1] quit
```

Configure BGP.

```
[PE3] bgp 200
[PE3-bgp-default] peer 4.4.4.4 as-number 200
[PE3-bgp-default] peer 4.4.4.4 connect-interface loopback 1
[PE3-bgp-default] peer 10.3.1.1 as-number 100
[PE3-bgp-default] address-family vpnv4
[PE3-bgp-default-vpnv4] undo policy vpn-target
[PE3-bgp-default-vpnv4] peer 4.4.4.4 enable
[PE3-bgp-default-vpnv4] peer 10.3.1.1 enable
[PE3-bgp-default-vpnv4] quit
[PE3-bgp-default] address-family ipv4 mdt
[PE3-bgp-default-mdt] peer 4.4.4.4 enable
[PE3-bgp-default-mdt] peer 10.3.1.1 enable
```

```
[PE3-bgp-default-mdt] quit
[PE3–bgp-default] quit
```

Configure OSPF.

```
[PE3] ospf 1
[PE3-ospf-1] area 0.0.0.0
[PE3-ospf-1-area-0.0.0.0] network 3.3.3.3 0.0.0.0
[PE3-ospf-1-area-0.0.0.0] network 10.4.1.0 0.0.0.255
[PE3-ospf-1-area-0.0.0.0] quit
[PE3-ospf-1] quit
```

4. Configure PE 4:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE4
[PE4] router id 4.4.4.4
[PE4] multicast routing
[PE4-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE4] mpls lsr-id 4.4.4.4
[PE4] mpls ldp
[PE4-ldp] quit
```

Create a VPN instance named **a**, and configure the RD and route targets for the VPN instance.

```
[PE4] ip vpn-instance a
[PE4-vpn-instance-a] route-distinguisher 100:1
[PE4-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE4-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE4-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE4] multicast routing vpn-instance a
```

Enable the RPF vector feature.

```
[PE4-mrib-a] rpf proxy vector
[PE4-mrib-a] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE4] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE4-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE4-mvpn-vpn-instance-a-ipv4] default-group 232.1.1.1
[PE4-mvpn-vpn-instance-a-ipv4] source loopback 1
[PE4-mvpn-vpn-instance-a-ipv4] data-group 232.2.2.0 28
[PE4-mvpn-vpn-instance-a-ipv4] quit
[PE4-mvpn-vpn-instance-a] quit
```

Create a VPN instance named **b**, and configure the RD and route targets for the VPN instance.

```
[PE4] ip vpn-instance b
[PE4-vpn-instance-b] route-distinguisher 200:1
[PE4-vpn-instance-b] vpn-target 200:1 export-extcommunity
```

```
[PE4-vpn-instance-b] vpn-target 200:1 import-extcommunity
[PE4-vpn-instance-b] quit
```

Enable IP multicast routing for VPN instance **b**.

```
[PE4] multicast routing vpn-instance b
```

Enable the RPF vector feature.

```
[PE4-mrib-b] rpf proxy vector
[PE4-mrib-b] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE4] interface loopback 1
[PE4-LoopBack1] ip address 4.4.4.4 32
[PE4-LoopBack1] pim sm
[PE4-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **b**.

```
[PE4] multicast-vpn vpn-instance b mode mdt
```

Create an MVPN IPv4 address family for VPN instance **b**.

```
[PE4-mvpn-vpn-instance-b] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **b**.

```
[PE4-mvpn-vpn-instance-b-ipv4] default-group 232.3.3.3
[PE4-mvpn-vpn-instance-b-ipv4] source loopback 1
[PE4-mvpn-vpn-instance-b-ipv4] data-group 232.4.4.0 28
[PE4-mvpn-vpn-instance-b-ipv4] quit
[PE4-mvpn-vpn-instance-b] quit
```

Assign an IP address to VLAN-interface 6.

```
[PE4] vlan 6
[PE4-vlan6] port gigabitethernet 1/0/1
[PE4-vlan6] quit
[PE4] interface vlan-interface 6
[PE4-Vlan-interface6] ip address 10.5.1.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 6.

```
[PE4-Vlan-interface6] pim sm
[PE4-Vlan-interface6] mpls enable
[PE4-Vlan-interface6] mpls ldp enable
[PE4-Vlan-interface6] quit
```

Associate VLAN-interface 13 with VPN instance **a**.

```
[PE4] vlan 13
[PE4-vlan13] port gigabitethernet 1/0/2
[PE4-vlan13] quit
[PE4] interface vlan-interface 13
[PE4-Vlan-interface13] ip binding vpn-instance a
```

Assign an IP address to VLAN-interface 13, and enable PIM-SM on the interface.

```
[PE4-Vlan-interface13] ip address 11.3.1.1 24
[PE4-Vlan-interface13] pim sm
[PE4-Vlan-interface13] quit
```

Associate VLAN-interface 14 with VPN instance **b.**

```
[PE4] vlan 14
[PE4-vlan14] port gigabitethernet 1/0/3
```

```
[PE4-vlan14] quit
[PE4] interface vlan-interface 14
[PE4-Vlan-interface14] ip binding vpn-instance b
```

Assign an IP address to VLAN-interface 14, and enable PIM-SM on the interface.

```
[PE4-Vlan-interface14] ip address 11.4.1.1 24
[PE4-Vlan-interface14] pim sm
[PE4-Vlan-interface14] quit
```

Configure BGP.

```
[PE4] bgp 200
[PE4-bgp-default] peer 3.3.3.3 as-number 200
[PE4-bgp-default] peer 3.3.3.3 connect-interface loopback 1
[PE4–bgp-default] ip vpn-instance a
[PE4-bgp-default-a] address-family ipv4
[PE4-bgp-default-ipv4-a] import-route ospf 2
[PE4-bgp-default-ipv4-a] import-route direct
[PE4-bgp-default-ipv4-a] quit
[PE4-bgp-default-a] quit
[PE4–bgp-default] ip vpn-instance b
[PE4-bgp-default-b] address-family ipv4
[PE4-bgp-default-ipv4-b] import-route ospf 3
[PE4-bgp-default-ipv4-b] import-route direct

5. Configure P 1:

Enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname P1
[P1] multicast routing
[P1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[P1] mpls lsr-id 5.5.5.5
[P1] mpls ldp
[P1-ldp] quit
```

Assign an IP address to VLAN-interface 2.

```
[P1] vlan 2
[P1-vlan2] port gigabitethernet 1/0/1
[P1-vlan2] quit
[P1] interface vlan-interface 2
[P1-Vlan-interface2] ip address 10.1.1.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 2.

```
[P1-Vlan-interface2] pim sm
[P1-Vlan-interface2] mpls enable
[P1-Vlan-interface2] mpls ldp enable
[P1-Vlan-interface2] quit
```

Assign an IP address to VLAN-interface 3.

```
[P1] vlan 3
[P1-vlan3] port gigabitethernet 1/0/2
[P1-vlan3] quit
[P1] interface vlan-interface 3
[P1-Vlan-interface3] ip address 10.2.1.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 3.

```
[P1-Vlan-interface3] pim sm
[P1-Vlan-interface3] mpls enable
[P1-Vlan-interface3] mpls ldp enable
[P1-Vlan-interface3] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[P1] interface loopback 1
[P1-LoopBack1] ip address 5.5.5.5 32
[P1-LoopBack1] pim sm
[P1-LoopBack1] quit
```

Configure OSPF.

```
[P1] ospf 1
[P1-ospf-1] area 0.0.0.0
[P1-ospf-1-area-0.0.0.0] network 5.5.5.5 0.0.0.0
[P1-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[P1-ospf-1-area-0.0.0.0] network 10.2.1.0 0.0.0.255
[P1-ospf-1-area-0.0.0.0] quit
[P1-ospf-1] quit
```

6. Configure P 2:

Enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname P2
[P2] multicast routing
[P2-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[P2] mpls lsr-id 6.6.6.6
[P2] mpls ldp
[P2-ldp] quit
```

Assign an IP address to VLAN-interface 6.

```
[P2] vlan 6
[P2-vlan6] port gigabitethernet 1/0/1
[P2-vlan6] quit
[P2] interface vlan-interface 6
[P2-Vlan-interface6] ip address 10.5.1.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 6.

```
[P2-Vlan-interface6] pim sm
[P2-Vlan-interface6] mpls enable
[P2-Vlan-interface6] mpls ldp enable
[P2-Vlan-interface6] quit
```

Assign an IP address to VLAN-interface 5.

```
[P2] vlan 5
[P2-vlan5] port gigabitethernet 1/0/2
[P2-vlan5] quit
[P2] interface vlan-interface 5
[P2-Vlan-interface5] ip address 10.4.1.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 5.

```
[P2-Vlan-interface5] pim sm
[P2-Vlan-interface5] mpls enable
[P2-Vlan-interface5] mpls ldp enable
[P2-Vlan-interface5] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[P2] interface loopback 1
[P2-LoopBack1] ip address 6.6.6.6 32
[P2-LoopBack1] pim sm
[P2-LoopBack1] quit
```

Configure OSPF.

```
[P2] ospf 1
[P2-ospf-1] area 0.0.0.0
[P2-ospf-1-area-0.0.0.0] network 6.6.6.6 0.0.0.0

Example: Configuring MDT-based MVPN inter-AS option C

Network configuration

As shown in Figure 17, configure inter-AS option C MDT-based MVPN to meet the following requirements:

Item	Network configuration
Multicast sources and receivers	• In VPN instance **a**, S 1 is a multicast source, and R 2 is a receiver. • In VPN instance **b**, S 2 is a multicast source, and R 1 is a receiver. • For VPN instance **a**, the default group is 239.1.1.1, and the data group range is 225.1.1.0 to 225.1.1.15. • For VPN instance **b**, the default group is 239.4.4.4, and the data group range is 225.4.4.0 to 225.4.4.15.
VPN instances to which PEs belong	• PE 1: VLAN-interface 11 belongs to VPN instance **b**. VLAN-interface 12 belongs to VPN instance **a**. VLAN-interface 2 and Loopback 1 belong to the public network instance. • PE 2: VLAN-interface 2, VLAN-interface 3, Loopback 1, and Loopback 2 belong to the public network instance. • PE 3: VLAN-interface 3, VLAN-interface 4, Loopback 1, and Loopback 2 belong to the public network instance. • PE 4: VLAN-interface 13 belongs to VPN instance **a**. VLAN-interface 14 belongs to VPN instance **b**. VLAN-interface 4 and Loopback 1 belong to the public network instance.
Unicast routing protocols and MPLS	• Configure OSPF separately in AS 100 and AS 200, and configure OSPF between the PEs and CEs. • Establish BGP peer connections between PE 1, PE 2, PE 3, and PE 4 on their respective Loopback 1. • Configure MPLS separately in AS 100 and AS 200.
IP multicast routing	• Enable IP multicast routing on the public network on PE 1, PE 2, PE 3, and PE 4. • Enable IP multicast routing for VPN instance **a** on PE 1 and PE 4.

Item	Network configuration
	• Enable IP multicast routing for VPN instance **b** on PE 1 and PE 4. • Enable IP multicast routing on CE a1, CE a2, CE b1, and CE b2.
IGMPv2	• Enable IGMPv2 on VLAN-interface 30 of CE a2. • Enable IGMPv2 on VLAN-interface 40 of CE b2.
PIM-SM	Enable PIM-SM on the public network and for VPN instances **a** and **b**: • Enable PIM-SM on all public network interfaces of PE 2 and PE 3. • Enable PIM-SM on all public and private network interfaces of PE 1 and PE 4. • Enable PIM-SM on all interfaces that do not have attached receiver hosts of CE a1, CE a2, CE b1, and CE b2. • Configure Loopback 2 of PE 2 and PE 3 as a C-BSR and a C-RP for their own AS to provide services for all multicast groups. • Configure Loopback 0 of CE a1 as a C-BSR and a C-RP for VPN instance **a** to provide services for all multicast groups. • Configure Loopback 0 of CE b1 as a C-BSR and a C-RP for VPN instance **b** to provide services for all multicast groups.
MSDP	Establish an MSDP peering relationship between PE 2 and PE 3 on their Loopback 1.

Figure 17 Network diagram

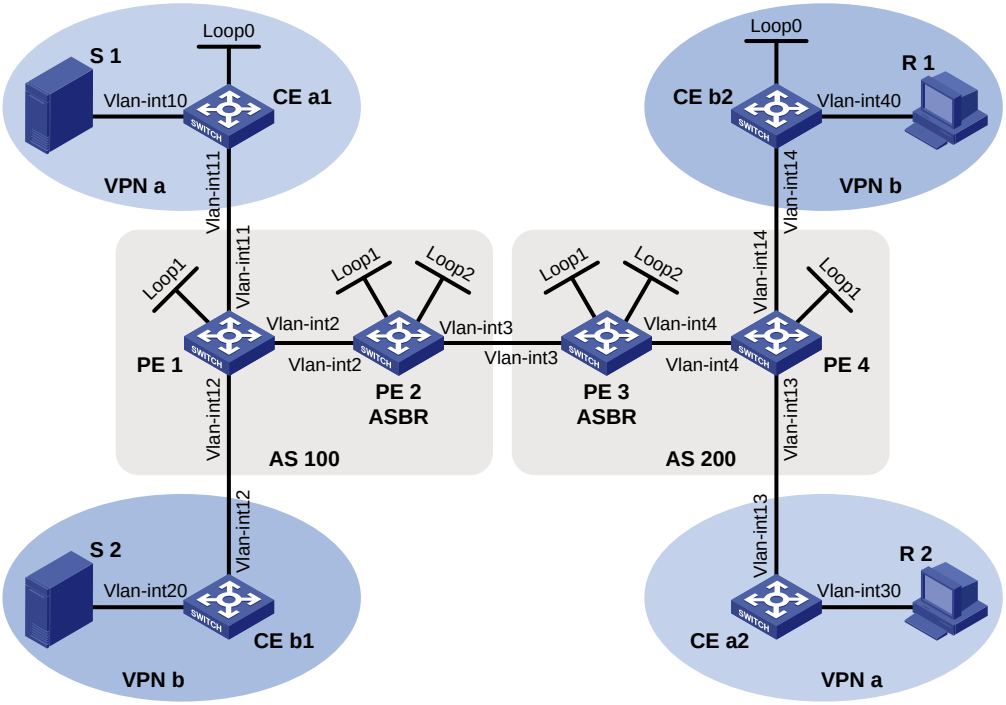

Table 4 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
S 1	—	10.11.5.2/24	R 1	—	10.11.8.2/24
S 2	—	10.11.6.2/24	R 2	—	10.11.7.2/24
PE 1	Vlan-int2	10.10.1.1/24	PE 3	Vlan-int4	10.10.2.1/24
PE 1	Vlan-int11	10.11.1.1/24	PE 3	Vlan-int3	192.168.1.2/24
PE 1	Vlan-int12	10.11.2.1/24	PE 3	Loop1	1.1.1.3/32

Device	Interface	IP address	Device	Interface	IP address
PE 1	Loop1	1.1.1.1/32	PE 3	Loop2	22.22.22.22/32
PE 2	Vlan-int2	10.10.1.2/24	PE 4	Vlan-int4	10.10.2.2/24
PE 2	Vlan-int3	192.168.1.1/24	PE 4	Vlan-int13	10.11.3.1/24
PE 2	Loop1	1.1.1.2/32	PE 4	Vlan-int14	10.11.4.1/32
PE 2	Loop2	11.11.11.11/32	PE 4	Loop1	1.1.1.4/32
CE a1	Vlan-int10	10.11.5.1/24	CE b1	Vlan-int20	10.11.6.1/24
CE a1	Vlan-int11	10.11.1.2/24	CE b1	Vlan-int12	10.11.2.2/24
CE a1	Loop0	2.2.2.2/32	CE b2	Vlan-int40	10.11.8.1/24
CE a2	Vlan-int30	10.11.7.1/24	CE b2	Vlan-int14	10.11.4.2/24
CE a2	Vlan-int13	10.11.3.2/24	CE b2	Loop0	3.3.3.3/32

Procedure

1. Configure PE 1:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE1
[PE1] router id 1.1.1.1
[PE1] multicast routing
[PE1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE1] mpls lsr-id 1.1.1.1
[PE1] mpls ldp
[PE1-ldp] quit
```

Create a VPN instance named **a**, and configure an RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance a
[PE1-vpn-instance-a] route-distinguisher 100:1
[PE1-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE1-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE1-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE1] multicast routing vpn-instance a
[PE1-mrib-a] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE1] interface loopback 1
[PE1-LoopBack1] ip address 1.1.1.1 32
[PE1-LoopBack1] pim sm
[PE1-LoopBack1] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE1] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a-ipv4] default-group 239.1.1.1
[PE1-mvpn-vpn-instance-a-ipv4] source loopback 1
[PE1-mvpn-vpn-instance-a-ipv4] data-group 225.1.1.0 28
[PE1-mvpn-vpn-instance-a-ipv4] quit
[PE1-mvpn-vpn-instance-a] quit
```

Create a VPN instance named **b**, and configure an RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance b
[PE1-vpn-instance-b] route-distinguisher 200:1
[PE1-vpn-instance-b] vpn-target 200:1 export-extcommunity
[PE1-vpn-instance-b] vpn-target 200:1 import-extcommunity
[PE1-vpn-instance-b] quit
```

Enable IP multicast routing for VPN instance **b**.

```
[PE1] multicast routing vpn-instance b
[PE1-mrib-b] quit
```

Create an MDT-based MVPN for VPN instance **b**.

```
[PE1] multicast-vpn vpn-instance b mode mdt
```

Create an MVPN IPv4 address family for VPN instance **b**.

```
[PE1-mvpn-vpn-instance-b] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **b**.

```
[PE1-mvpn-vpn-instance-b-ipv4] default-group 239.4.4.4
[PE1-mvpn-vpn-instance-b-ipv4] source loopback 1
[PE1-mvpn-vpn-instance-b-ipv4] data-group 225.4.4.0 28
[PE1-mvpn-vpn-instance-b-ipv4] quit
[PE1-mvpn-vpn-instance-b] quit
```

Assign an IP address to VLAN-interface 2.

```
[PE1] vlan 2
[PE1-vlan2] port gigabitethernet 1/0/1
[PE1-vlan2] quit
[PE1] interface vlan-interface 2
[PE1-Vlan-interface2] ip address 10.10.1.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 2.

```
[PE1-Vlan-interface2] pim sm
[PE1-Vlan-interface2] mpls enable
[PE1-Vlan-interface2] mpls ldp enable
[PE1-Vlan-interface2] quit
```

Associate VLAN-interface 11 with VPN instance **a**.

```
[PE1] vlan 11
[PE1-vlan11] port gigabitethernet 1/0/2
[PE1-vlan11] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance a
```

Assign an IP address to VLAN-interface 11, and enable PIM-SM on the interface.

```
[PE1-Vlan-interface11] ip address 10.11.1.1 24
[PE1-Vlan-interface11] pim sm
[PE1-Vlan-interface11] quit
```

Associate VLAN-interface 12 with VPN instance **b**.

```
[PE1] vlan 12
```

```
[PE1-vlan12] port gigabitethernet 1/0/3
[PE1-vlan12] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance b
```

Assign an IP address to VLAN-interface 12, and enable PIM-SM on the interface.

```
[PE1-Vlan-interface12] ip address 10.11.2.1 24
[PE1-Vlan-interface12] pim sm
[PE1-Vlan-interface12] quit
```

Configure BGP.

```
[PE1] bgp 100
[PE1-bgp-default] group pe1-pe2 internal
[PE1-bgp-default] peer pe1-pe2 connect-interface loopback 1
[PE1-bgp-default] peer 1.1.1.2 group pe1-pe2
[PE1-bgp-default] group pe1-pe4 external
[PE1-bgp-default] peer pe1-pe4 as-number 200
[PE1-bgp-default] peer pe1-pe4 ebgp-max-hop 255
[PE1-bgp-default] peer pe1-pe4 connect-interface loopback 1
[PE1-bgp-default] peer 1.1.1.4 group pe1-pe4
[PE1–bgp-default] ip vpn-instance a
[PE1-bgp-default-a] address-family ipv4
[PE1-bgp-default-ipv4-a] import-route ospf 2
[PE1-bgp-default-ipv4-a] import-route direct
[PE1-bgp-default-ipv4-a] quit
[PE1-bgp-default-a] quit
[PE1–bgp-default] ip vpn-instance b
[PE1-bgp-default-b] address-family ipv4
[PE1-bgp-default-ipv4-b] import-route ospf 3
[PE1-bgp-default-ipv4-b] import-route direct
[PE1-bgp-default-ipv4-b] quit
[PE1-bgp-default-b] quit
[PE1–bgp-default] address-family ipv4
[PE1-bgp-default-ipv4] peer pe1-pe2 enable
[PE1-bgp-default-ipv4] peer pe1-pe2 label-route-capability
[PE1-bgp-default-ipv4] quit
[PE1–bgp-default] address-family vpnv4
[PE1–bgp-default-vpnv4] peer pe1-pe4 enable
[PE1–bgp-default-vpnv4] quit
[PE1–bgp-default] quit
```

Configure OSPF.

```
[PE1] ospf 1
[PE1-ospf-1] area 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 10.10.1.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
[PE1] ospf 2 vpn-instance a
[PE1-ospf-2] import-route bgp
[PE1-ospf-2] area 0.0.0.0
```

```
[PE1-ospf-2-area-0.0.0.0] network 10.11.1.0 0.0.0.255
[PE1-ospf-2-area-0.0.0.0] quit
[PE1-ospf-2] quit
[PE1] ospf 3 vpn-instance b
[PE1-ospf-3] import-route bgp
[PE1-ospf-3] area 0.0.0.0
[PE1-ospf-3-area-0.0.0.0] network 10.11.2.0 0.0.0.255
[PE1-ospf-3-area-0.0.0.0] quit
[PE1-ospf-3] quit
```

2. Configure PE 2:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] router id 1.1.1.2
[PE2] multicast routing
[PE2-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE2] mpls lsr-id 1.1.1.2
[PE2] mpls ldp
[PE2-ldp] quit
```

Assign an IP address to VLAN-interface 2.

```
[PE2] vlan 2
[PE2-vlan2] port gigabitethernet 1/0/1
[PE2-vlan2] quit
[PE2] interface vlan-interface 2
[PE2-Vlan-interface2] ip address 10.10.1.2 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 2.

```
[PE2-Vlan-interface2] pim sm
[PE2-Vlan-interface2] mpls enable
[PE2-Vlan-interface2] mpls ldp enable
[PE2-Vlan-interface2] quit
```

Assign an IP address to VLAN-interface 3.

```
[PE2] vlan 3
[PE2-vlan3] port gigabitethernet 1/0/2
[PE2-vlan3] quit
[PE2] interface vlan-interface 3
[PE2-Vlan-interface3] ip address 192.168.1.1 24
```

Enable PIM-SM and MPLS on VLAN-interface 3.

```
[PE2-Vlan-interface3] pim sm
[PE2-Vlan-interface3] mpls enable
[PE2-Vlan-interface3] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip address 1.1.1.2 32
[PE2-LoopBack1] pim sm
[PE2-LoopBack1] quit
```

Assign an IP address to Loopback 2, and enable PIM-SM on the interface.

```
[PE2] interface loopback 2
[PE2-LoopBack2] ip address 11.11.11.11 32
[PE2-LoopBack2] pim sm
[PE2-LoopBack2] quit
```

Configure Loopback 2 as a C-BSR and a C-RP.

```
[PE2] pim
[PE2-pim] c-bsr 11.11.11.11
[PE2-pim] c-rp 11.11.11.11
[PE2-pim] quit
```

Configure VLAN-interface 3 as a PIM-SM domain border.

```
[PE2] interface vlan-interface 3
[PE2-Vlan-interface3] pim bsr-boundary
[PE2-Vlan-interface3] quit
```

Establish an MSDP peering relationship.

```
[PE2] msdp
[PE2-msdp] encap-data-enable
[PE2-msdp] peer 1.1.1.3 connect-interface loopback 1
```

Configure a routing policy.

```
[PE2] route-policy map1 permit node 1
[PE2-route-policy-map1-1] apply mpls-label
[PE2-route-policy-map1-1] quit
[PE2] route-policy map2 permit node 1
[PE2-route-policy-map2-1] apply mpls-label
[PE2-route-policy-map2-1] if-match mpls-label
[PE2-route-policy-map2-1] quit
```

Configure a static route.

```
[PE2] ip route-static 1.1.1.3 32 vlan-interface 3 192.168.1.2
```

Configure BGP.

```
[PE2] bgp 100
[PE2-bgp-default] group pe2-pe1 internal
[PE2-bgp-default] peer pe2-pe1 connect-interface loopback 1
[PE2-bgp-default] peer 1.1.1.1 group pe2-pe1
[PE2-bgp-default] group pe2-pe3 external
[PE2-bgp-default] peer pe2-pe3 as-number 200
[PE2-bgp-default] peer 192.168.1.2 group pe2-pe3
[PE2-bgp-default] address-family ipv4
[PE2-bgp-default-ipv4] peer pe2-pe1 enable
[PE2-bgp-default-ipv4] peer pe2-pe1 route-policy map2 export
[PE2-bgp-default-ipv4] peer pe2-pe1 label-route-capability
[PE2-bgp-default-ipv4] peer pe2-pe3 enable
[PE2-bgp-default-ipv4] peer pe2-pe3 route-policy map1 export
[PE2-bgp-default-ipv4] peer pe2-pe3 label-route-capability
[PE2-bgp-default-ipv4] import-route ospf 1
[PE2-bgp-default-ipv4] quit
[PE2–bgp-default] quit
```

Configure OSPF.

```
[PE2] ospf 1
[PE2-ospf-1] area 0.0.0.0
```

```
[PE2-ospf-1-area-0.0.0.0] network 1.1.1.2 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 11.11.11.11 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 10.10.1.0 0.0.0.255
[PE2-ospf-1-area-0.0.0.0] quit
[PE2-ospf-1] quit
```

3. Configure PE 3:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE3
[PE3] router id 1.1.1.3
[PE3] multicast routing
[PE3-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE3] mpls lsr-id 1.1.1.3
[PE3] mpls ldp
[PE3-ldp] quit
```

Assign an IP address to VLAN-interface 4.

```
[PE3] vlan 4
[PE3-vlan4] port gigabitethernet 1/0/1
[PE3-vlan4] quit
[PE3] interface vlan-interface 4
[PE3-Vlan-interface4] ip address 10.10.2.1 24
```

Enable PIM-SM, MPLS, and IPv4 LDP on VLAN-interface 4.

```
[PE3-Vlan-interface4] pim sm
[PE3-Vlan-interface4] mpls enable
[PE3-Vlan-interface4] mpls ldp enable
[PE3-Vlan-interface4] quit
```

Assign an IP address to VLAN-interface 3.

```
[PE3] vlan 3
[PE3-vlan3] port gigabitethernet 1/0/2
[PE3-vlan3] quit
[PE3] interface vlan-interface 3
[PE3-Vlan-interface3] ip address 192.168.1.2 24
```

Enable PIM-SM and MPLS on VLAN-interface 3.

```
[PE3-Vlan-interface3] pim sm
[PE3-Vlan-interface3] mpls enable
[PE3-Vlan-interface3] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[PE3] interface loopback 1
[PE3-LoopBack1] ip address 1.1.1.3 32
[PE3-LoopBack1] pim sm
[PE3-LoopBack1] quit
```

Assign an IP address to Loopback 2, and enable PIM-SM on the interface.

```
[PE3] interface loopback 2
[PE3-LoopBack2] ip address 22.22.22.22 32
[PE3-LoopBack2] pim sm
[PE3-LoopBack2] quit
```

Configure Loopback 2 as a C-BSR and a C-RP.

```
[PE3] pim
[PE3-pim] c-bsr 22.22.22.22
[PE3-pim] c-rp 22.22.22.22
[PE3-pim] quit
```

Configure VLAN-interface 3 as a PIM-SM domain border.

```
[PE3] interface vlan-interface 3
[PE3-Vlan-interface3] pim bsr-boundary
[PE3-Vlan-interface3] quit
```

Establish an MSDP peering relationship.

```
[PE3] msdp
[PE3-msdp] encap-data-enable
[PE3-msdp] peer 1.1.1.2 connect-interface loopback 1
```

Configure a static route.

```
[PE3] ip route-static 1.1.1.2 32 vlan-interface 3 192.168.1.1
```

Configure a routing policy.

```
[PE3] route-policy map1 permit node 1
[PE3-route-policy-map1-1] apply mpls-label
[PE3-route-policy-map1-1] quit
[PE3] route-policy map2 permit node 1
[PE3-route-policy-map2-1] apply mpls-label
[PE3-route-policy-map2-1] if-match mpls-label
[PE3-route-policy-map2-1] quit
```

Configure BGP.

```
[PE3] bgp 200
[PE3-bgp-default] group pe3-pe4 internal
[PE3-bgp-default] peer pe3-pe4 connect-interface loopback 1
[PE3-bgp-default] peer 1.1.1.4 group pe3-pe4
[PE3-bgp-default] group pe3-pe2 external

4. Configure PE 4:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE4
[PE4] router id 1.1.1.4
[PE4] multicast routing
[PE4-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE4] mpls lsr-id 1.1.1.4
[PE4] mpls ldp
[PE4-ldp] quit
```

Create a VPN instance named **a**, and configure an RD and route targets for the VPN instance.

```
[PE4] ip vpn-instance a
[PE4-vpn-instance-a] route-distinguisher 100:1
[PE4-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE4-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE4-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE4] multicast routing vpn-instance a
[PE4-mrib-a] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE4] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE4-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE4-mvpn-vpn-instance-a-ipv4] default-group 239.1.1.1
[PE4-mvpn-vpn-instance-a-ipv4] source loopback 1

[CEa1-ospf-1-area-0.0.0.0] quit
[CEa1-ospf-1] quit
```

6. Configure CE b1:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CEb1
[CEb1] multicast routing
[CEb1-mrib] quit
```

Assign an IP address to VLAN-interface 20, and enable PIM-SM on the interface.

```
[CEb1] vlan 20
[CEb1-vlan20] port gigabitethernet 1/0/1
[CEb1-vlan20] quit
[CEb1] interface vlan-interface 20
[CEb1-Vlan-interface20] ip address 10.11.6.1 24
[CEb1-Vlan-interface20] pim sm
[CEb1-Vlan-interface20] quit
```

Assign an IP address to VLAN-interface 12, and enable PIM-SM on the interface.

```
[CEb1] vlan 12
[CEb1-vlan12] port gigabitethernet 1/0/2
[CEb1-vlan12] quit
[CEb1] interface vlan-interface 12
[CEb1-Vlan-interface12] ip address 10.11.2.2 24
[CEb1-Vlan-interface12] pim sm
[CEb1-Vlan-interface12] quit
```

Configure OSPF.

```
[CEb1] ospf 1
[CEb1-ospf-1] area 0.0.0.0
[CEb1-ospf-1-area-0.0.0.0] network 10.11.2.0 0.0.0.255
[CEb1-ospf-1-area-0.0.0.0] network 10.11.6.0 0.0.0.255
[CEb1-ospf-1-area-0.0.0.0] quit
[CEb1-ospf-1] quit
```

7. Configure CE a2:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CEa2
[CEa2] multicast routing
[CEa2-mrib] quit
```

Assign an IP address to VLAN-interface 30, and enable IGMP on the interface.

```
[CEa2] vlan 30
[CEa2-vlan30] port gigabitethernet 1/0/1
[CEa2-vlan30] quit
[CEa2] interface vlan-interface 30
[CEa2-Vlan-interface30] ip address 10.11.7.1 24
[CEa2-Vlan-interface30] igmp enable
[CEa2-Vlan-interface30] quit
```

Assign an IP address to VLAN-interface 13, and enable PIM-SM on the interface.

```
[CEa2] vlan 13
[CEa2-vlan13] port gigabitethernet 1/0/2
[CEa2-vlan13] quit
[CEa2] interface vlan-interface 13
[CEa2-Vlan-interface13] ip address 10.11.3.2 24
[CEa2-Vlan-interface13] pim sm
[CEa2-Vlan-interface13] quit
```

Configure OSPF.

```
[CEa2] ospf 1
[CEa2-ospf-1] area 0.0.0.0
[CEa2-ospf-1-area-0.0.0.0] network 10.11.3.0 0.0.0.255
[CEa2-ospf-1-area-0.0.0.0] network 10.11.7.0 0.0.0.255
[CEa2-ospf-1-area-0.0.0.0] quit
[CEa2-ospf-1] quit
```

8. Configure CE b2:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CEb2
```

```
[CEb2] multicast routing
[CEb2-mrib] quit
```

Assign an IP address to VLAN-interface 40, and enable IGMP on the interface.

```
[CEb2] vlan 40
[CEb2-vlan40] port gigabitethernet 1/0/1
[CEb2-vlan40] quit
[CEb2] interface vlan-interface 40
[CEb2-Vlan-interface40] ip address 10.11.8.1 24
[CEb2-Vlan-interface40] igmp enable
[CEb2-Vlan-interface40] quit
```

Assign an IP address to VLAN-interface 14, and enable PIM-SM on the interface.

```
[CEb2] vlan 14
[CEb2-vlan14] port gigabitethernet 1/0/2
[CEb2-vlan14] quit
[CEb2] interface vlan-interface 14
[CEb2-Vlan-interface14] ip address 10.11.4.2 24
[CEb2-Vlan-interface14] pim sm
[CEb2-Vlan-interface14] quit
```

Assign an IP address to Loopback 1, and enable PIM-SM on the interface.

```
[CEb2] interface loopback 1

Example: Configuring receiver-PE-based MVPN extranet

Network configuration

As shown in Figure 18, configure MVPN extranet to meet the following requirements:

Item	Network configuration
Multicast sources and receivers	• In VPN instance **a**, S 1 is a multicast source. • In VPN instance **b**, R 1 is a receiver. • For VPN instance **a**, the default group is 239.1.1.1, and the data group range is 225.2.2.0 to 225.2.2.15.
VPN instances to which PE interfaces belong	• PE 1: VLAN-interface 11 belongs to VPN instance **a**. VLAN-interface 12 and Loopback 0 belong to the public network instance. • PE 2: VLAN-interface 12 belongs to VPN instance **b**. VLAN-interface 11 and Loopback 0 belong to the public network instance.
Unicast routing protocols and MPLS	• Configure OSPF on the public network and configure RIP between PEs and CEs. • Establish BGP peer connections between PE 1 and PE 2 on their respective Loopback 0. • Configure MPLS on the public network.
IP multicast routing	• Enable IP multicast routing on the P device. • Enable IP multicast routing for the public network on PE 1 and PE 2. • Enable IP multicast routing for VPN instance **a** on PE 1. • Enable IP multicast routing for VPN instance **b** on PE 2. • Enable IP multicast routing on CE 1 and CE 2.
IGMPv2	Enable IGMPv2 on VLAN-interface 12 of CE 2.
PIM-SM	Enable PIM-SM on the public network and for VPN instances **a** and **b**: • Enable PIM-SM on all interfaces of the P device. • Enable PIM-SM on all public and private network interfaces of PE 1 and PE 2. • Enable PIM-SM on all interfaces that do not have attached receiver hosts on CE 1 and CE 2. • Configure Loopback 0 of the P device as a C-BSR and a C-RP for the public network to provide services for all multicast groups. • Configure Loopback 1 of CE 1 as a C-BSR and a C-RP for VPN instance **a** to provide services for all multicast groups. • Configure Loopback 1 of PE 2 as a C-BSR and a C-RP for VPN instance **b** to provide services for all multicast groups.

Figure 18 Network diagram

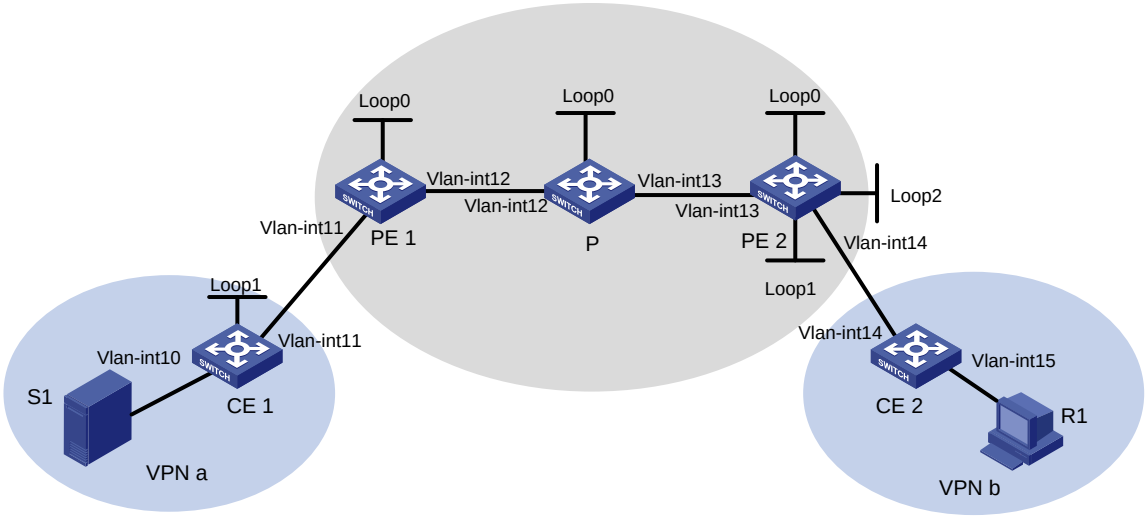

Table 5 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
S 1	—	10.110.7.2/24	PE 2	Vlan-int13	192.168.7.1/24
R 1	—	10.110.11.2/24	PE 2	Vlan-int14	10.110.3.2/24
P	Vlan-int12	192.168.6.1/24	PE 2	Loop0	1.1.1.2/32
P	Vlan-int13	192.168.7.2/24	PE 2	Loop1	20.20.20.20/32
P	Loop0	2.2.2.2/32	PE 2	Loop2	100.100.100.100/32
PE 1	Vlan-int11	10.110.2.1/24	CE 1	Vlan-int10	10.110.7.1/24
PE 1	Vlan-int12	192.168.6.2/24	CE 1	Vlan-int11	10.110.2.2/24
PE 1	Loop0	1.1.1.1/32	CE 1	Loop1	11.11.11.11/32
			CE 2	Vlan-int14	10.110.3.1/24
			CE 2	Vlan-int15	10.110.11.1/24

Procedure

1. Configure PE 1:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE1] router id 1.1.1.1
[PE1] multicast routing
[PE1-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE1] mpls lsr-id 1.1.1.1
[PE1] mpls ldp
[PE1-ldp] quit
```

Create a VPN instance named **a**, and configure an RD and route targets for the VPN instance.

```
[PE1] ip vpn-instance a
[PE1-vpn-instance-a] route-distinguisher 100:1
[PE1-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE1-vpn-instance-a] vpn-target 100:1 import-extcommunity
```

```
[PE1-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE1] multicast routing vpn-instance a
[PE1-mrib-a] quit
```

Assign an IP address to Loopback 0, and enable PIM-SM on the interface.

```
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 1.1.1.1 32
[PE1-LoopBack0] pim sm
[PE1-LoopBack0] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE1] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE1-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE1-mvpn-a-ipv4] default-group 239.1.1.1
[PE1-mvpn-a-ipv4] source loopback 0
[PE1-mvpn-a-ipv4] data-group 225.2.2.0 28
[PE1-mvpn-a-ipv4] quit
[PE1-mvpn-a] quit
```

Assign an IP address to VLAN-interface 12, and enable PIM-SM, MPLS, and IPv4 LDP on the interface.

```
[PE1] vlan 12
[PE1-vlan12] port gigabitethernet 1/0/2
[PE1-vlan12] quit
[PE1] interface vlan-interface12
[PE1-Vlan-interface12] ip address 192.168.6.2 24
[PE1-Vlan-interface12] pim sm
[PE1-Vlan-interface12] mpls enable
[PE1-Vlan-interface12] mpls ldp enable
[PE1-Vlan-interface12] quit
```

Associate VLAN-interface 11 with VPN instance **a**, assign an IP address to the interface and enable PIM-SM on the interface.

```
[PE1] vlan 11
[PE1-vlan11] port gigabitethernet 1/0/1
[PE1-vlan11] quit
[PE1] interface vlan-interface11
[PE1-Vlan-interface11] ip binding vpn-instance a
[PE1-Vlan-interface11] ip address 10.110.2.1 24
[PE1-Vlan-interface11] pim sm
[PE1-Vlan-interface11] quit
```

Configure BGP.

```
[PE1] bgp 100
[PE1-bgp-default] group vpn-g internal
[PE1-bgp-default] peer vpn-g connect-interface loopback 0
[PE1-bgp-default] peer 1.1.1.2 group vpn-g
[PE1–bgp-default] ip vpn-instance a
[PE1-bgp-default-a] address-family ipv4
```

```
[PE1-bgp-default-ipv4-a] import-route rip 2
[PE1-bgp-default-ipv4-a] import-route direct
[PE1-bgp-default-ipv4-a] quit
[PE1-bgp-default-a] quit
[PE1–bgp-default] address-family vpnv4
[PE1–bgp-default-vpnv4] peer vpn-g enable
[PE2–bgp-default-vpnv4] quit
[PE1–bgp-default] address-family ipv4 mdt
[PE1–bgp-default-mdt] peer vpn-g enable
[PE1–bgp-default-mdt] quit
[PE1–bgp-default] quit
```

Configure OSPF.

```
[PE1] ospf 1
[PE1-ospf-1] area 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
```

Configure RIP.

```
[PE1] rip 2 vpn-instance a
[PE1-rip-2] network 10.110.2.0 0.0.0.255
[PE1-rip-2] import-route bgp
[PE1-rip-2] quit
```

2. Configure PE 2:

Configure a global router ID, and enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname PE2
[PE2] router id 1.1.1.2
[PE2] multicast routing
[PE2-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[PE2] mpls lsr-id 1.1.1.2
[PE2] mpls ldp
[PE2-ldp] quit
```

Create a VPN instance named **a**, and configure an RD and route targets for the VPN instance.

```
[PE2] ip vpn-instance a
[PE2-vpn-instance-a] route-distinguisher 100:1
[PE2-vpn-instance-a] vpn-target 100:1 export-extcommunity
[PE2-vpn-instance-a] vpn-target 100:1 import-extcommunity
[PE2-vpn-instance-a] quit
```

Enable IP multicast routing for VPN instance **a**.

```
[PE2] multicast routing vpn-instance a
[PE2-mrib-a] quit
```

Assign an IP address to Loopback 0, and enable PIM-SM on the interface.

```
[PE2] interface loopback 0
[PE2-LoopBack0] ip address 1.1.1.2 32
[PE2-LoopBack0] pim sm
[PE2-LoopBack0] quit
```

Create an MDT-based MVPN for VPN instance **a**.

```
[PE2] multicast-vpn vpn-instance a mode mdt
```

Create an MVPN IPv4 address family for VPN instance **a**.

```
[PE2-mvpn-vpn-instance-a] address-family ipv4
```

Specify the default group, the MVPN source interface, and the data group range for VPN instance **a**.

```
[PE2-mvpn-a-ipv4] default-group 239.1.1.1
[PE2-mvpn-a-ipv4] source loopback 0
[PE2-mvpn-a-ipv4] data-group 225.2.2.0 28
[PE2-mvpn-a-ipv4] quit
[PE2-mvpn-a] quit
```

Create a VPN instance named **b**.

```
[PE2] ip vpn-instance b
[PE2-vpn-instance-b] quit
```

Enable IP multicast routing for VPN instance **b**.

```
[PE2] multicast routing vpn-instance b
```

Configure IPv4 MVPN extranet RPF selection policies.

```
[PE2-mrib-b] multicast extranet select-rpf vpn-instance a source 10.110.7.2 32 group 226.1.1.0 24
[PE2-mrib-b] multicast extranet select-rpf vpn-instance a source 20.20.20.20 32 group 226.1.1.0 24
[PE2-mrib-b] quit
```

Assign an IP address to VLAN-interface 13, and enable PIM-SM, MPLS, and IPv4 LDP on the interface.

```
[PE2] vlan 13
[PE2-vlan13] port gigabitethernet 1/0/1
[PE2-vlan13] quit
[PE2] interface vlan-interface13
[PE2-Vlan-interface13] ip address 192.168.7.1 24
[PE2-Vlan-interface13] pim sm
[PE2-Vlan-interface13] mpls enable
[PE2-Vlan-interface13] mpls ldp enable
[PE2-Vlan-interface13] quit
```

Associate VLAN-interface 14 with VPN instance **b**, assign an IP address to the interface, and enable PIM-SM on the interface.

```
[PE2] vlan 14
[PE2-vlan14] port gigabitethernet 1/0/2
[PE2-vlan14] quit
[PE2] interface vlan-interface14
[PE2-Vlan-interface14] ip binding vpn-instance b
[PE2-Vlan-interface14] ip address 10.110.3.2 24
[PE2-Vlan-interface14] pim sm
[PE2-Vlan-interface14] quit
```

Associate Loopback 1 with VPN instance **b**, assign an IP address to the interface, and enable PIM-SM on the interface.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip binding vpn-instance b
[PE2-LoopBack1] ip address 20.20.20.20 32
[PE2-LoopBack1] pim sm
```

```
[PE2-LoopBack1] quit
```

Configure Loopback 1 as a C-BSR and a C-RP for VPN instance **b**.

```
[PE2] pim vpn-instance b
[PE2-pim-b] c-bsr 20.20.20.20
[PE2-pim-b] c-rp 20.20.20.20
[PE2-pim-b] quit
```

Associate Loopback 2 with VPN instance **a**, assign an IP address to the interface, and enable PIM-SM on the interface.

```
[PE2] interface loopback 2
[PE2-LoopBack2] ip binding vpn-instance a
[PE2-LoopBack2] ip address 100.100.100.100 32
[PE2-LoopBack2] pim sm
[PE2-LoopBack2] quit
```

Configure BGP.

```
[PE2] bgp 100
[PE2-bgp-default] group vpn-g internal
[PE2-bgp-default] peer vpn-g connect-interface loopback 0
[PE2-bgp-default] peer 1.1.1.1 group vpn-g
[PE2–bgp-default] ip vpn-instance a
[PE2-bgp-default-a] address-family ipv4
[PE2-bgp-default-ipv4-a] import-route direct
[PE2-bgp-default-ipv4-a] quit
[PE2-bgp-default-a] quit
[PE2–bgp-default] address-family vpnv4
[PE2–bgp-default-vpnv4] peer vpn-g enable
[PE2–bgp-default-vpnv4] quit
[PE2–bgp-default] address-family ipv4 mdt
[PE2–bgp-default-mdt] peer vpn-g enable
[PE2–bgp-default-mdt] quit
[PE2–bgp-default] quit
```

Configure OSPF.

```
[PE2] ospf 1
[PE2-ospf-1] area 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 1.1.1.2 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] network 192.168.7.0 0.0.0.255
[PE2-ospf-1-area-0.0.0.0] quit
[PE2-ospf-1] quit
```

Configure RIP.

```
[PE2] rip 3 vpn-instance b
[PE2-rip-3] network 10.110.3.0 0.0.0.255
[PE2-rip-3] network 20.20.20.20 0.0.0.0
[PE2-rip-3] import-route bgp
[PE2-rip-3] quit
```

3. Configure the P device:

Enable IP multicast routing on the public network.

```
<Sysname> system-view
[Sysname] sysname P
[P] multicast routing
```

```
[P-mrib] quit
```

Configure an LSR ID, and enable LDP globally.

```
[P] mpls lsr-id 2.2.2.2
[P] mpls ldp
[P-ldp] quit
```

Assign an IP address to VLAN-interface 12, and enable PIM-SM, MPLS, and IPv4 LDP on the interface.

```
[P] vlan 12
[P-vlan12] port gigabitethernet 1/0/1
[P-vlan12] quit
[P] interface vlan-interface12
[P-Vlan-interface12] ip address 192.168.6.1 24
[P-Vlan-interface12] pim sm
[P-Vlan-interface12] mpls enable
[P-Vlan-interface12] mpls ldp enable
[P-Vlan-interface12] quit
```

Assign an IP address to VLAN-interface 13, and enable PIM-SM, MPLS, and IPv4 LDP on the interface.

```
[P] vlan 13
[P-vlan13] port gigabitethernet 1/0/2
[P-vlan13] quit
[P] interface vlan-interface13
[P-Vlan-interface13] ip address 192.168.7.2 24
[P-Vlan-interface13] pim sm
[P-Vlan-interface13] mpls enable
[P-Vlan-interface13] mpls ldp enable
[P-Vlan-interface13] quit
```

Assign an IP address to Loopback 0, and enable PIM-SM on the interface.

```
[P] interface loopback 0
[P-LoopBack0] ip address 2.2.2.2 32
[P-LoopBack0] pim sm
[P-LoopBack0] quit
```

Configure Loopback 0 as a C-BSR and a C-RP for the public network.

```
[P] pim
[P-pim] c-bsr 2.2.2.2
[P-pim] c-rp 2.2.2.2
[P-pim] quit
```

Configure OSPF.

```
[P] ospf 1
[P-ospf-1] area 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
[P-ospf-1-area-0.0.0.0] network 192.168.6.0 0.0.0.255
[P-ospf-1-area-0.0.0.0] network 192.168.7.0 0.0.0.255
[P-ospf-1-area-0.0.0.0] quit
```

4. Configure CE 1:

Enable IP multicast routing.

```
<Sysname> system-view
[Sysname] sysname CE1
```

```

Troubleshooting MDT-based MVPN

This section describes common MDT-based MVPN problems and how to troubleshoot them.

A default MDT cannot be established

Symptom

The default MDT cannot be established. PIM neighboring relationship cannot be established between PEs' interfaces that are in the same VPN instance.

Solution

To resolve the problem:

1. Use the **`display interface`** command to examine the MTI interface state and address encapsulation on the MTI.
2. Use the **`display multicast-vpn default-group`** command to verify that the same default group address has been configured for the same VPN instance on different PEs.
3. Use the **`display pim interface`** command to verify the following:
   - PIM is enabled on a minimum of one interface of the same VPN on different PEs.
   - The same PIM mode is running on all the interfaces of the same VPN instance on different PEs and on all the interfaces of the P device.

4. Use the **display ip routing-table** command to verify that a unicast route exists from the VPN instance on the local PE to the same VPN instance on each remote PE.
5. Use the **display bgp peer** command to verify that the BGP peer connections have been correctly configured.
6. If the problem persists, contact H3C Support.

An MVRF cannot be created

Symptom

A VPN instance cannot create an MVRF correctly.

Solution

To resolve the problem:

1. Use the **display pim bsr-info** command to verify that the BSR information exists on the public network and VPN instance. If it does not, verify that a unicast route exists to the BSR.
2. Use the **display pim rp-info** command to examine the RP information. If no RP information is available, verify that a unicast route exists to the RP. Use the **display pim neighbor** command to verify that the PIM adjacencies have been correctly established on the public network and the VPN.
3. Use the **ping** command to examine the connectivity between the VPN DR and the VPN RP.
4. If the problem persists, contact H3C Support.

Configuring IGMP

About IGMP

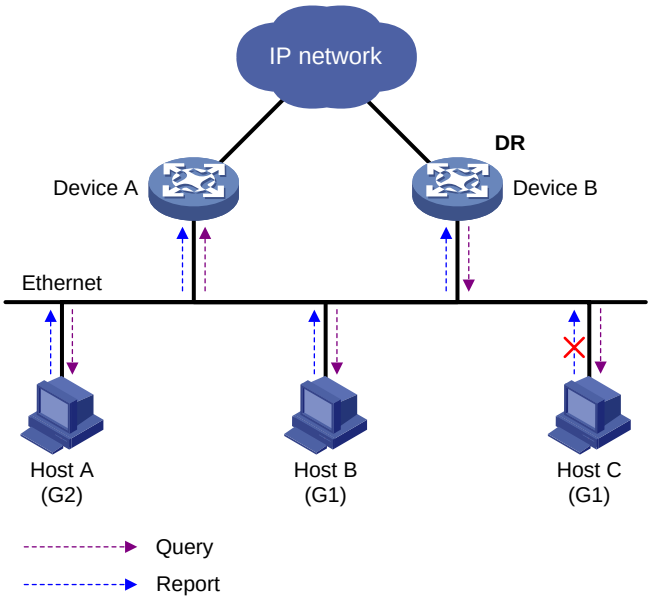
Internet Group Management Protocol (IGMP) establishes and maintains the multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

IGMP versions

IGMP has the following versions:

- IGMPv1 (defined by RFC 1112).
- IGMPv2 (defined by RFC 2236).
- IGMPv3 (defined by RFC 3376).

All IGMP versions support the ASM model. IGMPv3 can directly implement the SSM model. IGMPv1 and IGMPv2 must work with the IGMP SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."



IGMPv1 overview

IGMPv1 manages multicast group memberships based on the query and response mechanism.

All devices that run IGMP on the same subnet can get IGMP membership report messages (called reports) from hosts. However, only one device can act as the IGMP querier to send IGMP query messages (called queries). The querier election mechanism determines which device acts as the IGMP querier on the subnet.

In IGMPv1, the DR elected by the multicast routing protocol (such as PIM) acts as the IGMP querier. For more information about DR, see "PIM overview."

Figure 1 IGMP queries and reports

As shown in Figure 1, Host B and Host C are interested in the multicast data addressed to the multicast group G1. Host A is interested in the multicast data addressed to G2. The following process

describes how the hosts join the multicast groups and how the IGMP querier (Device B in Figure 1) maintains the multicast group memberships:

1. The hosts send unsolicited IGMP reports to the multicast groups they want to join without having to wait for the IGMP queries.
2. The IGMP querier periodically multicasts IGMP queries (with the destination address of 224.0.0.1) to all hosts and devices on the local subnet.
3. After receiving a query message, the host whose report delay timer expires first sends an IGMP report to multicast group G1 to announce its membership for G1. In this example, Host B sends the report message. After receiving the report from Host B, Host C suppresses its own report for G1.

   Because IGMP devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host IGMP report suppression, helps reduce traffic on the local subnet.
4. At the same time, Host A sends a report to the multicast group G2 after receiving a query.
5. Through the query and response process, the IGMP devices (Device A and Device B) determine that the local subnet has members of G1 and G2. The multicast routing protocol (PIM, for example) on the devices generates (*, G1) and (*, G2) multicast forwarding entries, where asterisk (*) represents any multicast source. These entries are the basis for subsequent multicast forwarding.
6. When the multicast data addressed to G1 or G2 reaches an IGMP device, the device looks up the multicast forwarding table. Based on the (*, G1) or (*, G2) entries, the device forwards the multicast data to the local subnet. Then, the receivers on the subnet can receive the data.

IGMPv1 does not define a leave group message (often called a leave message). When an IGMPv1 host is leaving a multicast group, it stops sending reports to that multicast group. If the subnet has no members for a multicast group, the IGMP devices will not receive any report addressed to that multicast group. In this case, the devices clear the information for that multicast group after a period of time.

IGMPv2 enhancements

Backwards-compatible with IGMPv1, IGMPv2 has introduced a querier election mechanism and a leave-group mechanism.

Querier election mechanism

In IGMPv1, the DR elected by the Layer 3 multicast routing protocol (such as PIM) acts as the querier.

IGMPv2 introduced an independent querier election mechanism. The querier election process is as follows:

1. Initially, every IGMPv2 device assumes itself to be the querier. Each device sends IGMP general query messages (called general queries) to all hosts and devices on the local subnet. The destination address is 224.0.0.1.
2. After receiving a general query, every IGMPv2 device compares the source IP address of the query with its own interface address. The device with the lowest IP address becomes the querier. All the other IGMPv2 devices become non-queriers.
3. All the non-queriers start the other querier present timer. If a device receives an IGMP query from the querier before the timer expires, it resets this timer. Otherwise, the device considers that the querier has timed out. In this case, the device initiates a new querier election process.

"Leave group" mechanism

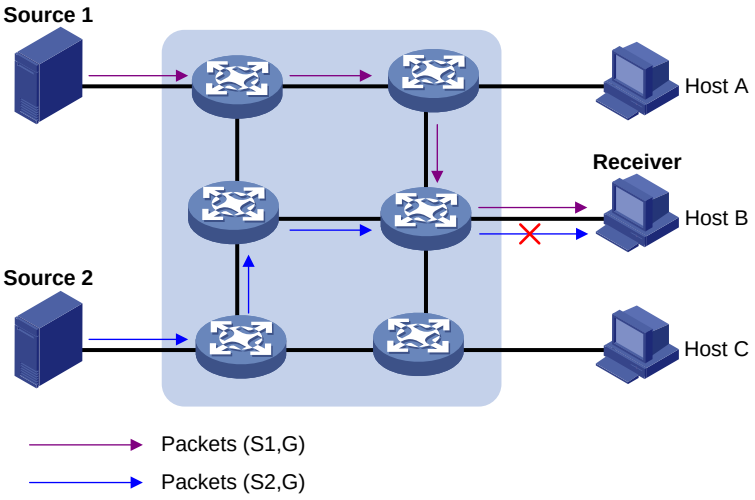
In IGMPv1, when a host leaves a multicast group, it does not send any notification to the multicast devices. The multicast devices determine whether a group has members by using the maximum response time. This adds to the leave latency.

In IGMPv2, when a host is leaving a multicast group, the following process occurs:

1. The host sends a leave message to all devices on the local subnet. The destination address of leave messages is 224.0.0.2.
2. After receiving the leave message, the querier sends a configurable number of IGMP group-specific queries to the group that the host is leaving. Both the destination address field and the group address field of the message are the address of the multicast group that is being queried.
3. One of the remaining members (if any on the subnet) in the group should send a report within the maximum response time advertised in the group-specific queries.
4. If the querier receives a report for the group before the maximum response timer expires, it maintains the memberships for the group. Otherwise, the querier assumes that the local subnet has no member hosts for the group and stops maintaining the memberships for the group.

IGMPv3 enhancements

IGMPv3 is based on and is compatible with IGMPv1 and IGMPv2. It enhances the control capabilities of hosts and the query and report capabilities of IGMP devices.



Enhancements in control capability of hosts

IGMPv3 introduced two source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified multicast sources. When a host joins a multicast group, one of the following occurs:

- If the host expects to receive multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host expects to reject multicast data from specific sources like S1, S2, …, it sends a report with the Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two multicast sources: Source 1 (S1) and Source 2 (S2). Both of these sources can send multicast data to the multicast group G. Host B wants to receive the multicast data addressed to G from Source 1 but not from Source 2.

Figure 2 Flow paths of source-and-group-specific multicast traffic

In IGMPv1 or IGMPv2, Host B cannot select multicast sources when it joins the multicast group G. The multicast streams from both Source 1 and Source 2 flow to Host B whether or not it needs them.

In IGMPv3, Host B can explicitly express that it needs to receive multicast data destined to the multicast group G from Source 1 but not from Source 2.

Enhancements in query and report capabilities

IGMPv3 introduces IGMP group-and-source queries and IGMP reports carrying group records.

- Query message carrying the source addresses

  IGMPv3 is compatible with IGMPv1 and IGMPv2 and supports IGMP general queries and IGMP group-specific queries. It also introduces IGMP group-and-source-specific queries.

  - A general query does not carry a group address or a source address.
  - A group-specific query carries a group address, but no source address.
  - A group-and-source-specific query carries a group address and one or more source addresses.

- Reports containing multiple group records

  Unlike an IGMPv1 or IGMPv2 report, an IGMPv3 report is destined to 224.0.0.22 and contains one or more group records. Each group record contains a multicast group address and a multicast source address list.

  Group records include the following categories:

  - **IS_IN**—The current filtering mode is Include. The report sender requests the multicast data only from the sources specified in the Source Address field.
  - **IS_EX**—The current filtering mode is Exclude. The report sender requests the multicast data from any sources except those specified in the Source Address field.
  - **TO_IN**—The filtering mode has changed from Exclude to Include.
  - **TO_EX**—The filtering mode has changed from Include to Exclude.
  - **ALLOW**—The Source Address field contains a list of additional sources from which the receiver wants to obtain data. If the current filtering mode is Include, these sources are added to the multicast source list. If the current filtering mode is Exclude, these sources are deleted from the multicast source list.
  - **BLOCK**—The Source Address field contains a list of the sources from which the receiver no longer wants to obtain data. If the current filtering mode is Include, these sources are deleted from the multicast source list. If the current filtering mode is Exclude, these sources are added to the multicast source list.

IGMP SSM mapping

An IGMPv3 host can explicitly specify multicast sources in its IGMPv3 reports. From the reports, the IGMP device can obtain the multicast source addresses and directly provide the SSM service. However, an IGMPv1 or IGMPv2 host cannot specify multicast sources in its IGMPv1 or IGMPv2 reports.

The IGMP SSM mapping feature enables the IGMP device to provide SSM support for IGMPv1 or IGMPv2 hosts. The device translates (*, G) in IGMPv1 or IGMPv2 reports into (G, INCLUDE, (S1, S2...)) based on the configured IGMP SSM mappings.

Figure 3 IGMP SSM mapping

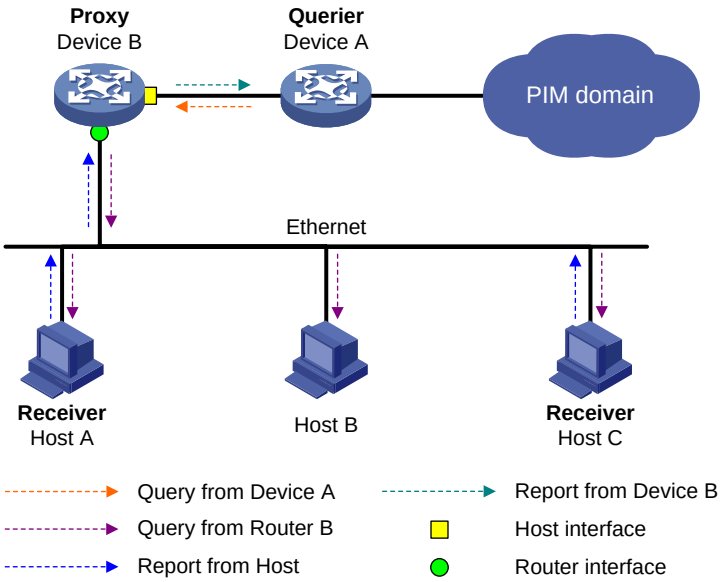
As shown in Figure 3, on an SSM network, Host A, Host B, and Host C run IGMPv1, IGMPv2, and IGMPv3, respectively. To provide the SSM service for Host A and Host B, you must configure the IGMP SSM mapping feature on Device A.

After IGMP SSM mappings are configured, Device A checks the multicast group address G in the received IGMPv1 or IGMPv2 report, and performs the following operations:

- If G is not in the SSM group range, Device A provides the ASM service.
- If G is in the SSM group range but does not match any IGMP SSM mapping, Device A drops the report.
- If G is in the SSM group range and matches IGMP SSM mappings, Device A translates (*, G) in the report into (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The IGMP SSM mapping feature does not process IGMPv3 reports.



For more information about SSM group ranges, see "PIM overview" and "Configuring PIM."

IGMP proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to run multicast routing protocols, such as PIM, on edge devices. Instead, you can configure IGMP proxying on these devices. With IGMP proxying configured, the edge device acts as an IGMP proxy:

- For the upstream IGMP querier, the IGMP proxy device acts as a host.
- For the downstream receiver hosts, the IGMP proxy device acts as an IGMP querier.

Figure 4 IGMP proxying

The following types of interfaces are defined in IGMP proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running IGMP. IGMP proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running IGMP. IGMP must be configured on this interface.

An IGMP proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or send join/leave messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received IGMP reports.

IGMP support for VPNs

IGMP maintains group memberships on a per-interface basis. After receiving an IGMP message on an interface, IGMP processes the packet within the VPN to which the interface belongs. IGMP only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 1112, *Host Extensions for IP Multicasting*
- RFC 2236, *Internet Group Management Protocol, Version 2*
- RFC 3376, *Internet Group Management Protocol, Version 3*

IGMP tasks at a glance

To configure IGMP, perform the following tasks:

1. Enabling IGMP
2. (Optional.) Configuring basic IGMP features
   - Specifying an IGMP version
   - Configuring a static group member
   - Configuring a multicast group policy
3. (Optional.) Adjusting IGMP performance
   - Configuring IGMP query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring IGMP SSM mappings
5. (Optional.) Configuring IGMP proxying
   - Enabling IGMP proxying
   - Enabling multicast forwarding on a non-querier interface
   - Configuring multicast load splitting for IGMP proxy interfaces
6. (Optional.) Enabling IGMP NSR
7. (Optional.) Setting the DSCP value for outgoing IGMP protocol packets
8. (Optional.) Enabling SNMP notifications for IGMP
9. (Optional.) Configuring IGMP logging
   - Enabling IGMP logging
   - Enabling log message suppression for IGMP

Prerequisites for IGMP

Before you configure IGMP, you must configure any unicast routing protocol so that all devices can interoperate at the network layer.

Enabling IGMP

Restrictions and guidelines

Enable IGMP on interfaces where the multicast group memberships are established and maintained.

For IGMP to take effect on an interface, you must configure the primary IP address for the interface.

Procedure

1. Enter system view.
   `system-view`
2. Enable IP multicast routing and enter MRIB view.
   `multicast routing` [**`vpn-instance`** *`vpn-instance-name`*]
   By default, IP multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   `quit`
4. Enter interface view.
   `interface` *`interface-type interface-number`*
5. Enable IGMP.
   `igmp enable`

By default, IGMP is disabled.

Configuring basic IGMP features

Specifying an IGMP version

Restrictions and guidelines

For IGMP to operate correctly, specify the same IGMP version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an IGMP version on the interface.
   igmp version *version-number*
   By default, the IGMP version on an interface is IGMPv2.

Configuring a static group member

About this task

You can configure an interface as a static group member of a multicast group. Then, the interface can always receive multicast data addressed to the specified multicast group.

A static group member does not respond to IGMP queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited IGMP report or leave message.

Restrictions and guidelines

The interface to be configured as a static group member has the following restrictions:

- If the interface is IGMP and PIM-SM enabled, it must be a PIM-SM DR.
- If the interface is IGMP enabled but not PIM-SM enabled, it must be an IGMP querier.

For more information about PIM-SM and DR, see "PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a static group member.
   igmp static-group *group-address* [**source** *source-address*]

Configuring a multicast group policy

About this task

This feature enables an interface to filter IGMP reports by using an ACL that specifies multicast groups and the optional sources. It is used to control the multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send IGMP reports.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a multicast group policy.
   igmp group-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* } [*version-number*]

Adjusting IGMP performance

Configuring IGMP query and response parameters

About this task

The following are IGMP query and response parameters:

- **IGMP querier's robustness variable**—Number of times for retransmitting IGMP queries in case of packet loss. A higher robustness variable makes the IGMP querier more robust, but increases the timeout time for multicast groups.
- **IGMP startup query interval**—Interval at which an IGMP querier sends IGMP general queries at startup.
- **IGMP startup query count**—Number of IGMP general queries that an IGMP querier sends at startup.
- **IGMP general query interval**—Interval at which an IGMP querier sends IGMP general queries to check for multicast group members on the network.
- **IGMP last member query interval**—In IGMPv2, it sets the interval at which a querier sends group-specific queries after receiving a leave message. In IGMPv3, it sets the interval at which a querier sends group-and-source-specific queries after receiving a report that changes multicast source and group mappings.
- **IGMP last member query count**—In IGMPv2, it sets the number of group-specific queries that a querier sends after receiving a leave message. In IGMPv3, it sets the number of group-and-source-specific queries that a querier sends after receiving a report that changes multicast source and group mappings.
- **IGMP maximum response time**—Maximum time before a receiver responds with a report to an IGMP general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the IGMP query. When the timer value for a group decreases to 0, the receiver sends an IGMP report to the group.
- **IGMP other querier present timer**—Lifetime for an IGMP querier after a non-querier receives an IGMP general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

To avoid frequent IGMP querier changes, set the IGMP other querier present timer greater than the IGMP general query interval. In addition, configure the same IGMP other querier present timer for all IGMP devices on the same subnet.

To avoid mistakenly deleting multicast receivers, set the IGMP general query interval greater than the maximum response time for IGMP general queries.

To speed up the response to IGMP queries and avoid simultaneous timer expirations that cause IGMP report traffic bursts, set an appropriate maximum response time.

- For IGMP general queries, the maximum response time is set by the **max-response-time** command.
- For IGMP group-specific queries and IGMP group-and-source-specific queries, the maximum response time equals the IGMP last member query interval.

The following configurations take effect only on the devices that run IGMPv2 and IGMPv3:

- Maximum response time for IGMP general queries.
- IGMP last member query interval.
- IGMP last member query count.
- IGMP other querier present interval.

You can configure the IGMP query and response parameters globally for all interfaces in IGMP view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the IGMP query and response parameters globally

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the IGMP querier's robustness variable.
   robust-count *count*
   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.
   startup-query-interval *interval*
   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.
   startup-query-count *count*
   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.
   query-interval *interval*
   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.
   last-member-query-interval *interval*
   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.
   last-member-query-count *count*
   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.
   max-response-time *time*
   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.
    other-querier-present-interval *interval*

By default, the IGMP other querier present timer is calculated by using the following formula: [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Configuring the IGMP query and response parameters on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the IGMP querier's robustness variable.

   igmp robust-count *count*

   By default, the IGMP querier's robustness variable is 2.
4. Set the IGMP startup query interval.

   igmp startup-query-interval *interval*

   By default, the IGMP startup query interval is equal to one quarter of the IGMP general query interval.
5. Set the IGMP startup query count.

   igmp startup-query-count *count*

   By default, the IGMP startup query count is equal to the IGMP querier's robustness variable.
6. Set the IGMP general query interval.

   igmp query-interval *interval*

   By default, the IGMP general query interval is 125 seconds.
7. Set the IGMP last member query interval.

   igmp last-member-query-interval *interval*

   By default, the IGMP last member query interval is 1 second.
8. Set the IGMP last member query count.

   igmp last-member-query-count *count*

   By default, the IGMP last member query count is equal to the IGMP querier's robustness variable.
9. Set the maximum response time for IGMP general queries.

   igmp max-response-time *time*

   By default, the maximum response time for IGMP general queries is 10 seconds.
10. Set the IGMP other querier present timer.

    igmp other-querier-present-interval *interval*

    By default, the IGMP other querier present timer is calculated by using the following formula:

    [IGMP general query interval] × [IGMP robustness variable] + [maximum response time for IGMP general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an IGMP querier to send leave notifications to the upstream without sending group-specific or group-and-source-specific queries after receiving a leave message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Restrictions and guidelines

The fast-leave processing configuration takes effect only when the device runs IGMPv2 or IGMPv3.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   igmp fast-leave [**group-policy** *ipv4-acl-number*]
   By default, fast-leave processing is disabled.

Configuring IGMP SSM mappings

About this task

This feature enables the device to provide SSM services for IGMPv1 or IGMPv2 hosts.

Restrictions and guidelines

This feature does not process IGMPv3 messages. Enable IGMPv3 on the receiver-side interface to ensure that IGMPv3 reports can be processed..

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Configure an IGMP SSM mapping.
   ssm-mapping *source-address* { *ipv4-acl-number* | **name** *ipv4-acl-name* }

Configuring IGMP proxying

Prerequisites for configuring IGMP proxying

Before you configure IGMP proxying, determine the router interfaces and host interfaces based on the network topology, and enable IGMP on the router interfaces.

Enabling IGMP proxying

Restrictions and guidelines

If IGMP proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward multicast traffic.

Enable IGMP proxying on the receiver-side interfaces.

On an interface enabled with IGMP proxying, only the **igmp version** command takes effect and other IGMP commands do not take effect.

If you enable both IGMP proxying and a multicast routing protocol (such as PIM or MSDP) on the same device, the multicast routing protocol does not take effect.

In IGMPv1, the DR is elected by PIM and acts as the IGMP querier. Because PIM does not take effect on a proxy device, a router interface running IGMPv1 cannot be elected as the DR. To ensure that the downstream receiver hosts on the router interface can receive multicast data, you must

enable multicast forwarding on the interface. For more information, see "Enabling multicast forwarding on a non-querier interface."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable IGMP proxying.
   igmp proxy enable
   By default, IGMP proxying is disabled.

Enabling multicast forwarding on a non-querier interface

About this task

Typically, only IGMP queriers can forward multicast traffic and non-queriers cannot. This prevents multicast data from being repeatedly forwarded. If a router interface on an IGMP proxy device failed in the querier election, enable multicast forwarding on the interface to forward multicast data to attached receiver hosts.

Restrictions and guidelines

A shared-media network might have multiple IGMP proxies, including one proxy acting as a querier. To avoid duplicate multicast traffic, do not enable multicast forwarding on any of the non-querier IGMP proxies for the network.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Enable multicast forwarding on the interface.
   igmp proxy forwarding
   By default, multicast forwarding is disabled on a non-querier interface.

Configuring multicast load splitting for IGMP proxy interfaces

About this task

If multiple IGMP proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards multicast traffic. You can enable multicast load splitting for IGMP proxy interfaces so that all the proxy interfaces can share multicast traffic.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Enable multicast load splitting for IGMP proxy interfaces.
   proxy multipath
   By default, multicast load splitting is disabled for IGMP proxy interfaces.

Enabling IGMP NSR

About this task

This feature backs up information about IGMP interfaces and IGMP multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP NSR.
   igmp non-stop-routing
   By default, IGMP NSR is disabled.

Setting the DSCP value for outgoing IGMP protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter IGMP view.
   igmp [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing IGMP protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing IGMP protocol packets.

Enabling SNMP notifications for IGMP

About this task

To report critical IGMP events to an SNMP NMS, enable SNMP notifications for IGMP.

For IGMP SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for IGMP.
   snmp-agent trap enable igmp [**join** | **leave**] *
   By default, SNMP notifications are enabled for IGMP.

Configuring IGMP logging

Enabling IGMP logging

About this task

To report critical IGMP events to the information center, enable IGMP logging. For IGMP log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see Network Management and Monitoring Configuration Guide.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable IGMP logging or use the **igmp log suppress** command to enable IGMP log message suppression.

Procedure

1. Enter system view.
   system-view
2. Enable IGMP logging.
   igmp log enable [**group**]
   IGMP logging is enabled by default.

Enabling log message suppression for IGMP

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for IGMP. With this feature configured, the speed of sending IGMP log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure IGMP logging has been enabled using the **igmp log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for IGMP.
   igmp log suppress [**group**]
   By default, log message suppression is enabled for IGMP.

Display and maintenance commands for IGMP

CAUTION:
The **reset igmp group** command might cause multicast data transmission failures.

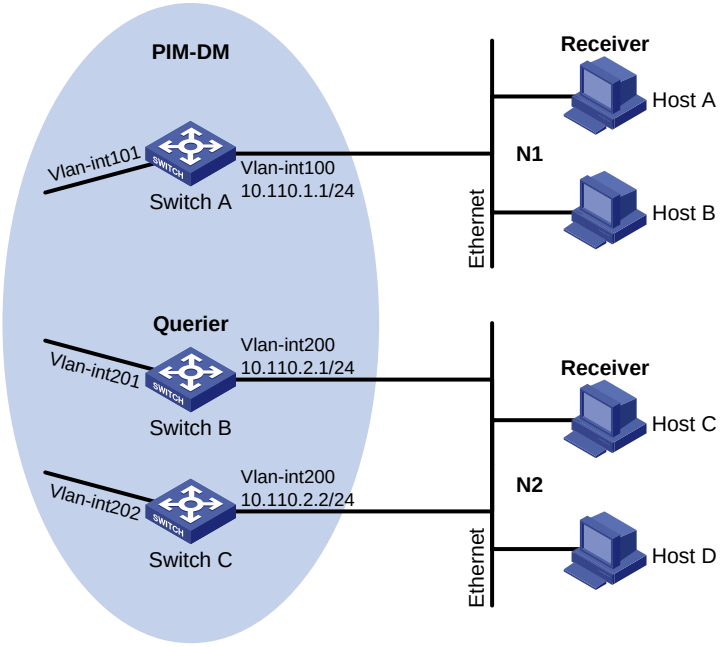
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about IGMP multicast groups.	**display igmp** [**vpn-instance** *vpn-instance-name*] **group** [*group-address* | **interface** *interface-type interface-number*] [**evpn**] [**static** | **verbose**]
Display IGMP information for interfaces.	**display igmp** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**host** | **proxy**] [**evpn**] [**verbose**]
Display multicast group membership information maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy group** [*group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display multicast routing entries maintained by the IGMP proxy.	**display igmp** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }]] * [**verbose**]
Display IGMP SSM mappings.	**display igmp** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *group-address*
Display authorization information for IGMP users.	**display igmp user-authorization** [**interface** *interface-type interface-number*]
Clear dynamic IGMP multicast group entries.	**reset igmp** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *group-address* [**mask** { *mask* | *mask-length* }] [*source-address* [**mask** { *mask* | *mask-length* }]] } }

IGMP configuration examples

Example: Configuring basic IGMP features

Network configuration



As shown in Figure 5:

- OSPF and PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are receiver hosts in N1 and N2, respectively.
- IGMPv2 runs between Switch A and N1, and between the other two switches and N2. Switch A acts as the IGMP querier in N1. Switch B acts as the IGMP querier in N2 because it has a lower IP address.

Configure the routers to meet the following requirements:

- The hosts in N1 can join only multicast group 224.1.1.1.
- The hosts in N2 can join any multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 5, and configure OSPF on the switches in the PIM-DM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, IGMP, and PIM-DM:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   ```

```
[SwitchB-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IP multicast routing.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] igmp enable
[SwitchC-Vlan-interface200] quit
```

Enable PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure a multicast group policy on Switch A so that hosts connected to VLAN-interface 100 can join only multicast group 224.1.1.1.

```
[SwitchA] acl basic 2001
[SwitchA-acl-ipv4-basic-2001] rule permit source 224.1.1.1 0
[SwitchA-acl-ipv4-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] igmp group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display IGMP information for VLAN-interface 200 on Switch B.

```
[SwitchB] display igmp interface vlan-interface 200
 Vlan-interface200(10.110.2.1):
   IGMP is enabled.
   IGMP version: 2
   Query interval for IGMP: 125s
   Other querier present time for IGMP: 255s
   Maximum query response time for IGMP: 10s
   Querier for IGMP: 10.110.2.1 (This router)
  IGMP groups reported in total: 1
```

Example: Configuring IGMP SSM mapping

Network configuration

As shown in Figure 6:

- OSPF runs on the network.
- The PIM-SM domain uses the SSM model for multicast delivery. The SSM group range is 232.1.1.0/24.
- IGMPv3 runs on VLAN-interface 400 of Switch D. The receiver host runs IGMPv2, and does not support IGMPv3. The receiver host cannot specify multicast sources in its membership reports.

- Source 1, Source 2, and Source 3 send multicast packets to multicast groups in the SSM group range 232.1.1.0/24.

Configure the IGMP SSM mapping feature on Switch D so that the receiver host can receive multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

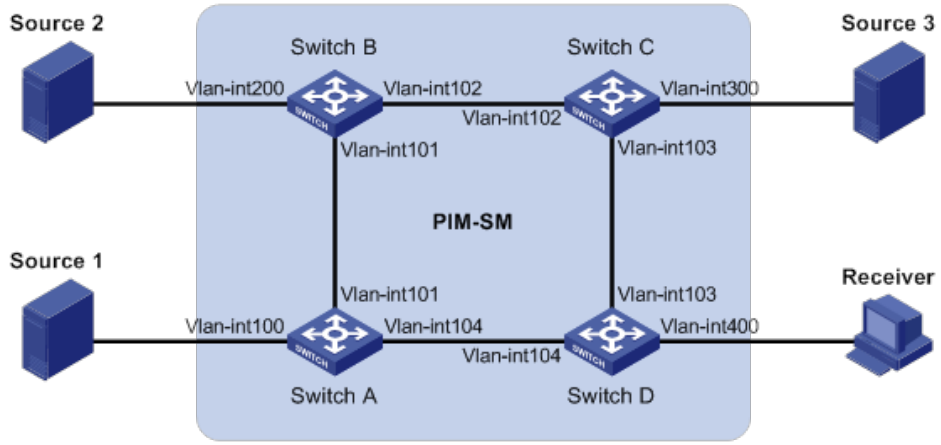


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Source 1	—	133.133.1.1/24	Source 3	—	133.133.3.1/24
Source 2	—	133.133.2.1/24	Receiver	—	133.133.4.1/24
Switch A	Vlan-int100	133.133.1.2/24	Switch C	Vlan-int300	133.133.3.2/24
Switch A	Vlan-int101	192.168.1.1/24	Switch C	Vlan-int103	192.168.3.1/24
Switch A	Vlan-int104	192.168.4.2/24	Switch C	Vlan-int102	192.168.2.2/24
Switch B	Vlan-int200	133.133.2.2/24	Switch D	Vlan-int400	133.133.4.2/24
Switch B	Vlan-int101	192.168.1.2/24	Switch D	Vlan-int103	192.168.3.2/24
Switch B	Vlan-int102	192.168.2.1/24	Switch D	Vlan-int104	192.168.4.1/24

Prerequisites

Assign an IP address and subnet mask to each interface as shown in Figure 6, and configure OSPF on the switches in the PIM-SM domain. (Details not shown.)

Procedure

1. Enable IP multicast routing, PIM-SM, and IGMP:

On Switch D, enable IP multicast routing.

```
<SwitchD> system-view
[SwitchD] multicast routing
[SwitchD-mrib] quit
```

Enable IGMPv3 on the receiver-side interface (VLAN-interface 400).

```
[SwitchD] interface vlan-interface 400
[SwitchD-Vlan-interface400] igmp enable
[SwitchD-Vlan-interface400] igmp version 3
[SwitchD-Vlan-interface400] quit
```

Enable PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the SSM group range:

On Switch D, specify 232.1.1.0/24 as the SSM group range.

```
[SwitchD] acl basic 2000
[SwitchD-acl-ipv4-basic-2000] rule permit source 232.1.1.0 0.0.0.255
[SwitchD-acl-ipv4-basic-2000] quit
[SwitchD] pim
[SwitchD-pim] ssm-policy 2000
[SwitchD-pim] quit
```

Configure the SSM group range on Switch A, Switch B, and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure IGMP SSM mappings on Switch D.

```
[SwitchD] igmp
[SwitchD-igmp] ssm-mapping 133.133.1.1 2000
[SwitchD-igmp] ssm-mapping 133.133.3.1 2000
[SwitchD-igmp] quit
```

Verifying the configuration

Display IGMP SSM mappings for multicast group 232.1.1.1 on Switch D.

```
[SwitchD] display igmp ssm-mapping 232.1.1.1
 Group: 232.1.1.1
 Source list:
        133.133.1.1
        133.133.3.1
```

On Switch D, display information about IGMP multicast groups that hosts have dynamically joined.

```
[SwitchD] display igmp group
IGMP groups in total: 1
 Vlan-interface400(133.133.4.2):
```

```
  IGMP groups reported in total: 1
   Group address   Last reporter   Uptime      Expires
   232.1.1.1       133.133.4.1     00:02:04    off
```

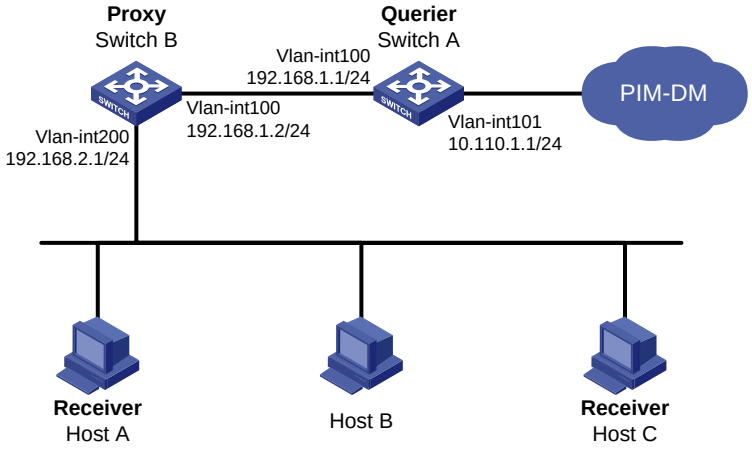
Display PIM routing entries on Switch D.

```
[SwitchD] display pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (133.133.1.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: 192.168.4.2
         RPF prime neighbor: 192.168.4.2
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -

 (133.133.3.1, 232.1.1.1)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: 192.168.3.1
         RPF prime neighbor: 192.168.3.1
     Downstream interface information:
     Total number of downstream interfaces: 1
         1: Vlan-interface400
             Protocol: igmp, UpTime: 00:13:25, Expires: -
```

Example: Configuring IGMP proxying



Network configuration

As shown in Figure 7:

- PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information sent to multicast group 224.1.1.1.

Configure the IGMP proxying feature on Switch B so that Switch B can maintain group memberships and forward multicast traffic without running PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IP address and subnet mask to each interface, as shown in Figure 7.

Procedure

1. Enable IP multicast routing, PIM-DM, IGMP, and IGMP proxying:

   # On Switch A, enable IP multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] multicast routing
   [SwitchA-mrib] quit
   ```

   # Enable PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable IGMP on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] igmp enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IP multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast routing
   [SwitchB-mrib] quit
   ```

   # Enable IGMP proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] igmp proxy enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable IGMP on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] igmp enable
   [SwitchB-Vlan-interface200] quit
   ```

Verifying the configuration

Display multicast group membership information maintained by the IGMP proxy on Switch B.

```
[SwitchB] display igmp proxy group
IGMP proxy group records in total: 1
```

```
Vlan-interface100(192.168.1.2):
 IGMP proxy group records in total: 1
  Group address      Member state      Expires
  224.1.1.1          Delay             00:00:02
```

Troubleshooting IGMP

No membership information on the receiver-side device

Symptom

When a host sends a report for joining multicast group G, no membership information of multicast group G exists on the device closest to that host.

Solution

To resolve the problem:

1. Use the **display igmp interface** command to verify that the networking, interface connection, and IP address configuration are correct.
2. Use the **display current-configuration** command to verify that multicast routing is enabled. If it is not enabled, use the **multicast routing** command in system view to enable IP multicast routing. In addition, verify that IGMP is enabled on the associated interfaces.
3. Use the **display igmp interface** command to verify that the IGMP version on the interface is lower than that on the host.
4. Use the **display current-configuration interface** command to verify that no multicast group policies have been configured to filter IGMP reports for multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different IGMP devices on the same subnet.

Solution

To resolve the problem:

1. Use the **display current-configuration** command to verify the IGMP information on the interfaces. Make sure the devices on the subnet have the same IGMP settings on their interfaces.
2. Use the **display igmp interface** command on all devices on the same subnet to verify the IGMP-related timer settings. Make sure the settings are consistent on all the devices.
3. Use the **display igmp interface** command to verify that all devices on the same subnet are running the same IGMP version.
4. If the problem persists, contact H3C Support.

Configuring MLD

About MLD

Multicast Listener Discovery (MLD) establishes and maintains IPv6 multicast group memberships between a Layer 3 multicast device and the hosts on the directly connected subnet.

MLD versions

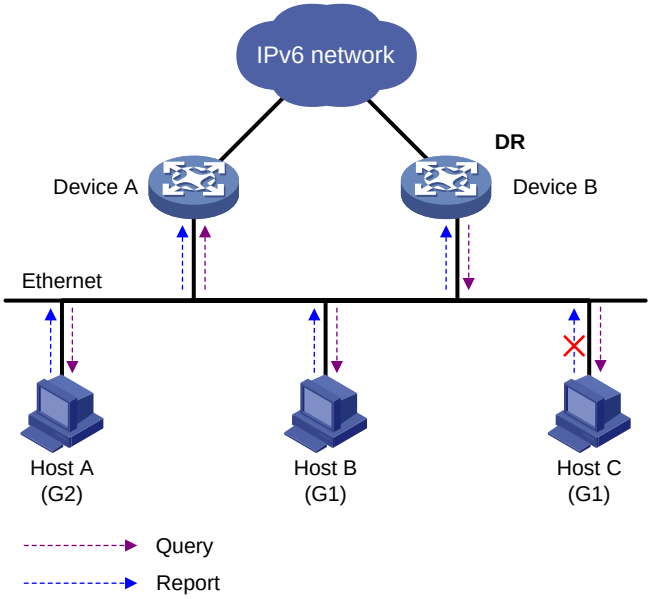
MLD has the following versions:

- MLDv1 (defined by RFC 2710), which is derived from IGMPv2.
- MLDv2 (defined by RFC 3810), which is derived from IGMPv3.

MLDv1 and MLDv2 support the ASM model. MLDv2 can directly implement the SSM model, but MLDv1 must work with the MLD SSM mapping feature to implement the SSM model. For more information about the ASM and SSM models, see "Multicast overview."

How MLDv1 works

MLDv1 implements IPv6 multicast listener management based on the query and response mechanism.



Electing the MLD querier

All IPv6 multicast devices that run MLD on the same subnet can monitor MLD listener report messages (often called reports) from hosts. However, only one device can act as the MLD querier to send MLD query messages (often called queries). A querier election mechanism determines which device acts as the MLD querier on the subnet.

1. Initially, every MLD device assumes itself as the querier. Each device sends MLD general query messages (often called general queries) to all hosts and devices on the local subnet. The destination address of the general queries is FF02::1.
2. After receiving a general query, every MLD device compares the source IPv6 address of the query with its own link-local interface address. The device with the lowest IPv6 address wins the querier election and becomes the querier. All the other devices become non-queriers.
3. All the non-queriers start a timer called the "other querier present timer." If a device receives an MLD query from the querier before the timer expires, it resets this timer. Otherwise, it considers that the querier has timed out. In this case, the device initiates a new querier election process.

Joining an IPv6 multicast group

Figure 1 MLD queries and reports

As shown in Figure 1, Host B and Host C want to receive the IPv6 multicast data addressed to IPv6 multicast group G1. Host A wants to receive the IPv6 multicast data addressed to G2. The following process describes how the hosts join the IPv6 multicast groups and how the MLD querier (Device B in Figure 1) maintains the IPv6 multicast group memberships:

1. The hosts send unsolicited MLD reports to the IPv6 multicast groups they want to join without having to wait for the MLD queries.
2. The MLD querier periodically multicasts MLD queries (with the destination address FF02::1) to all hosts and devices on the local subnet.
3. After receiving a query, the host whose report delay timer expires first sends an MLD report to the IPv6 multicast group G1 to announce its membership for G1. In this example, Host B sends the report. After hearing the report from Host B, Host C, which is on the same subnet as Host B, suppresses its own report for G1.

   Because the MLD devices already know that G1 has a minimum of one member, other members do not need to report their memberships. This mechanism, known as the host MLD report suppression, helps reduce traffic on the local subnet.
4. At the same time, because Host A is interested in G2, it sends a report to the IPv6 multicast group G2.
5. Through the query/report process, the MLD devices determine that G1 and G2 have members on the local subnet. The IPv6 multicast routing protocol (for example, IPv6 PIM) that is running on the devices generates (*, G1) and (*, G2) multicast forwarding entries. These entries are the basis for subsequent IPv6 multicast forwarding. The asterisk (*) represents any IPv6 multicast source.
6. When the IPv6 multicast data addressed to G1 or G2 reaches an MLD device, the device looks up the IPv6 multicast forwarding table. Based on the (*, G1) and (*, G2) entries, the device forwards the IPv6 multicast data to the local subnet. Then, the receivers on the subnet receive the data.

Leaving an IPv6 multicast group

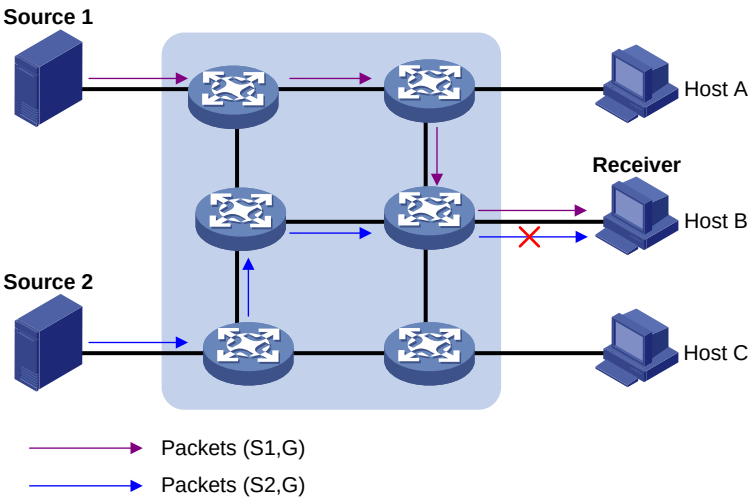
When a host is leaving an IPv6 multicast group, the following process occurs:

1. The host sends an MLD done message to all IPv6 multicast devices on the local subnet. The destination address of done messages is FF02::2.

2. After receiving the MLD done message, the querier sends a configurable number of multicast-address-specific queries to the group that the host is leaving. The IPv6 multicast addresses queried include both the destination address field and the group address field of the message.
3. One of the remaining members (if any on the subnet) in the group sends a report within the time of the maximum response time advertised in the multicast-address-specific queries.
4. If the querier receives a report for the group within the maximum response time, it maintains the memberships of the IPv6 multicast group. Otherwise, the querier assumes that no hosts on the subnet are interested in IPv6 multicast traffic addressed to that group and stops maintaining the memberships of the group.

MLDv2 enhancements

MLDv2 is based on and backwards-compatible with MLDv1. MLDv2 provides hosts with enhanced control capabilities and enhances the MLD state.



Enhancements in control capability of hosts

MLDv2 has introduced IPv6 multicast source filtering modes (Include and Exclude). These modes allow a host to receive or reject multicast data from the specified IPv6 multicast sources. When a host joins an IPv6 multicast group, one of the following occurs:

- If the host expects IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Include Sources (S1, S2, …)."
- If the host does not expect IPv6 multicast data from specific IPv6 multicast sources like S1, S2, …, it sends a report with Filter-Mode denoted as "Exclude Sources (S1, S2, …)."

As shown in Figure 2, the network has two IPv6 multicast sources, Source 1 (S1) and Source 2 (S2). Both of the sources can send IPv6 multicast data to IPv6 multicast group G. Host B wants to receive IPv6 multicast data addressed to G from Source 1 but not from Source 2.

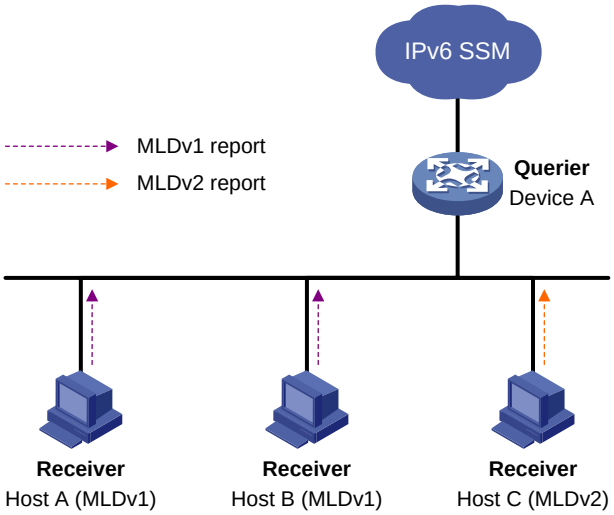
Figure 2 Flow paths of multicast-address-and-source-specific multicast traffic

In MLDv1, Host B cannot select IPv6 multicast sources when it joins IPv6 multicast group G. The IPv6 multicast streams from both Source 1 and Source 2 flow to Host B whether it needs them or not.

In MLDv2, Host B can explicitly express its interest in IPv6 multicast data destined to G from Source 1 but not from Source 2. Then, Host B receives only IPv6 multicast data from Source 1.

Enhancement in MLD state

A multicast device that is running MLDv2 maintains the multicast address state for each multicast address on each attached subnet. The multicast address state consists of the following information:



- **Filter mode**—Device keeps tracing the Include or Exclude state.
- **List of sources**—Device keeps tracing the newly added or deleted IPv6 multicast source.
- **Timers**—Filter timers, which include the time that the device waits before switching to the Include mode after an IPv6 multicast address times out, and source timers for source recording.

MLD SSM mapping

An MLDv2 host can explicitly specify multicast sources in its MLDv2 reports. From the reports, the MLD device can obtain the multicast source addresses and directly provide the SSM service. However, an MLDv1 host cannot specify multicast sources in its MLDv1 reports.

The MLD SSM mapping feature enables the MLD device to provide SSM support for MLDv1 receiver host. The device translates (*, G) in MLDv1 reports into (G, INCLUDE, (S1, S2...)) based on the configured MLD SSM mappings.

Figure 3 Network diagram

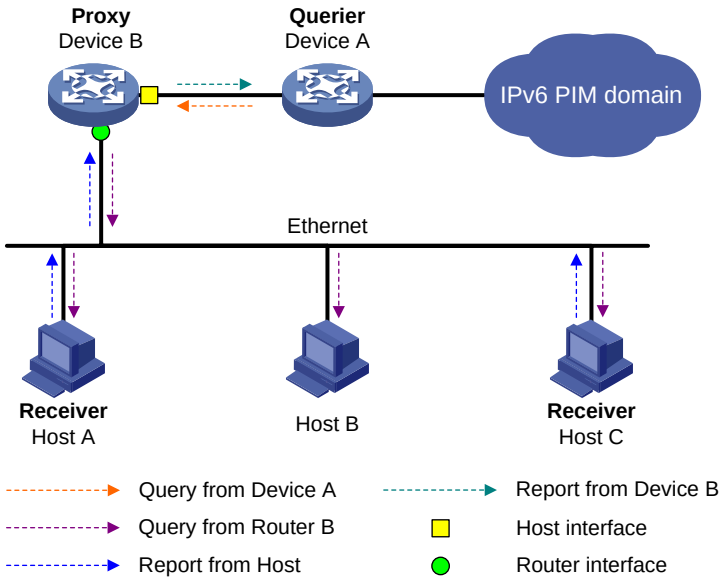
As shown in Figure 3, Host A and Host B on the IPv6 SSM network run MLDv1, and Host C runs MLDv2. To provide the SSM service for Host A and Host B, you must configure the MLD SSM mapping feature on Device A.

After MLD SSM mappings are configured, Device A checks the IPv6 multicast group address G carried in the message, and performs the following operations:

- If G is not in the IPv6 SSM group range, Device A provides the ASM service.
- If G is in the IPv6 SSM group range but does not match any MLD SSM mapping, Device A drops the report.
- If G is in the IPv6 SSM group range and matches MLD SSM mappings, Device A translates (*, G) in the report to (G, INCLUDE, (S1, S2...)) to provide SSM services.

NOTE:

The MLD SSM mapping feature does not process MLDv2 reports.



For more information about the IPv6 SSM group ranges, see "IPv6 PIM overview" and "Configuring IPv6 PIM."

MLD proxying

As shown in Figure 4, in a simple tree-shaped topology, it is not necessary to configure IPv6 multicast routing protocols, such as IPv6 PIM, on edge devices. Instead, you can configure MLD proxying on these devices. With MLD proxying configured, the edge device acts as an MLD proxy:

- For the upstream MLD querier, the MLD proxy device acts as a host.
- For the downstream receiver hosts, the MLD proxy device acts as an MLD querier.

Figure 4 Network diagram

The following interfaces are defined in MLD proxying:

- **Host interface**—An interface that is in the direction toward the root of the multicast forwarding tree. A host interface acts as a receiver host that is running MLD. MLD proxying must be enabled on this interface. This interface is also called the "proxy interface."
- **Router interface**—An interface that is in the direction toward the leaf of the multicast forwarding tree. A router interface acts as a router that is running MLD. MLD must be configured on this interface.

An MLD proxy device maintains a group membership database, which stores the group memberships on all the router interfaces. The host interfaces and router interfaces perform actions based on this membership database.

- The host interfaces respond to queries according to the membership database or sends join/done messages when the database changes.
- The router interfaces participate in the querier election, send queries, and maintain memberships based on received MLD reports.

MLD support for VPNs

MLD maintains group memberships on a per-interface basis. After receiving an MLD message on an interface, MLD processes the packet within the VPN to which the interface belongs. MLD only communicates with other multicast protocols within the same VPN instance.

Protocols and standards

- RFC 2710, *Multicast Listener Discovery (MLD) for IPv6*

- RFC 3810, *Multicast Listener Discovery Version 2 (MLDv2) for IPv6*

MLD tasks at a glance

To configure MLD, perform the following tasks:

1. Enabling MLD
2. (Optional.) Configuring basic MLD features
   - Specifying an MLD version
   - Configuring a static group member
   - Configuring an IPv6 multicast group policy
3. (Optional.) Adjusting MLD performance
   - Configuring MLD query and response parameters
   - Enabling fast-leave processing
4. (Optional.) Configuring MLD SSM mappings
5. (Optional.) Configuring MLD proxying
   - Enabling MLD proxying
   - Enabling IPv6 multicast forwarding on a non-querier interface
   - Enabling IPv6 multicast load splitting for MLD proxy interfaces
6. (Optional.) Enabling MLD NSR
7. (Optional.) Setting the DSCP value for outgoing MLD protocol packets
8. (Optional.) Enabling SNMP notifications for MLD
9. (Optional.) Configuring MLD logging
   - Enabling MLD logging
   - Enabling log message suppression for MLD

Prerequisites for MLD

Before you configure MLD, you must configure an IPv6 unicast routing protocol so that all devices can interoperate at the network layer.

Enabling MLD

Restrictions and guidelines

Perform this task on interfaces where IPv6 multicast group memberships are created and maintained.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.
   For more information about this command, see *IP Multicast Command Reference*.
3. Return to system view.
   quit

4. Enter interface view.
   interface *interface-type interface-number*
5. Enable MLD.
   mld enable
   By default, MLD is disabled.

Configuring basic MLD features

Specifying an MLD version

Restrictions and guidelines

For MLD to operate correctly, specify the same MLD version for all devices on the same subnet.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Specify an MLD version on the interface.
   mld version *version-number*
   By default, the MLD version on an interface is MLDv1.

Configuring a static group member

About this task

You can configure an interface as a static member of an IPv6 multicast group. Then, the interface can always receive IPv6 multicast data for the group.

A static group member does not respond to MLD queries. When you complete or cancel this configuration on an interface, the interface does not send an unsolicited MLD report or done message.

Restrictions and guidelines

The interface to be configured as a static member of an IPv6 multicast group has the following restrictions:

- If the interface is MLD and IPv6 PIM-SM enabled, it must be an IPv6 PIM-SM DR.
- If the interface is MLD enabled but not IPv6 PIM-SM enabled, it must be an MLD querier.

For more information about IPv6 PIM-SM and DR, see "IPv6 PIM overview."

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure a static group member.
   mld static-group *ipv6-group-address* [**source** *ipv6-source-address*]
   By default, an interface is not a static group member.

Configuring an IPv6 multicast group policy

About this task

This feature enables an interface to filter MLD reports by using an ACL that specifies IPv6 multicast groups and the optional sources. It is used to control the IPv6 multicast groups that the hosts attached to an interface can join.

Restrictions and guidelines

This configuration does not take effect on static group members, because static group members do not send MLD reports.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Configure an IPv6 multicast group policy on the interface.

   mld group-policy { *ipv6-acl-number* | **name** *ipv6-acl-name* } [*version-number*]

   By default, the hosts attached to an interface can join any IPv6 multicast group policy.

Adjusting MLD performance

Configuring MLD query and response parameters

About this task

The following are MLD query and response parameters:

- **MLD querier's robustness variable**—Number of times for retransmitting MLD queries in case of packet loss. A higher robustness variable makes the MLD querier more robust, but increases the timeout time for IPv6 multicast groups.
- **MLD startup query interval**—Interval at which an MLD querier sends MLD general queries at startup.
- **MLD startup query count**—Number of MLD general queries that an MLD querier sends at startup.
- **MLD general query interval**—Interval at which an MLD querier sends MLD general queries to check for IPv6 multicast group members on the network.
- **MLD last listener query interval**—In MLDv1, it sets the interval at which a querier sends multicast-address-specific queries after receiving a done message. In MLDv2, it sets the interval at which a querier sends multicast-address-and-source-specific queries after receiving a report that changes IPv6 multicast source and group mappings.
- **MLD last listener query count**—In MLDv1, it sets the number of multicast-address-specific queries that the querier sends after receiving a done message. In MLDv2, it sets the number of multicast-address-and-source-specific queries that the querier sends after receiving a report that changes IPv6 multicast group and source mappings.
- **MLD maximum response time**—Maximum time before a receiver responds with a report to an MLD general query. This per-group timer is initialized to a random value in the range of 0 to the maximum response time specified in the MLD query. When the timer value decreases to 0, the receiver sends an MLD report to the group.

- **MLD other querier present timer**—Lifetime for an MLD querier after a non-querier receives an MLD general query. If the non-querier does not receive a new query when this timer expires, the non-querier considers that the querier has failed and starts a new querier election.

Restrictions and guidelines

- To avoid frequent MLD querier changes, set the MLD other querier present timer greater than the MLD general query interval. In addition, configure the same MLD other querier present timer for all MLD devices on the same subnet.
- To speed up the response to MLD queries and avoid simultaneous timer expirations that cause MLD report traffic bursts, you must set an appropriate maximum response time.
  - For MLD general queries, the maximum response time is set by the **max-response-time** command.
  - For MLD multicast-address-specific queries or MLD multicast-address-and-source-specific queries, the maximum response time equals the MLD last listener query interval.
- You can configure MLD query and response parameters globally for all interfaces in MLD view or for an interface in interface view. The interface-specific configuration takes priority over the global configuration.

Configuring the MLD query and response parameters globally

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the MLD querier's robustness variable.
   robust-count *count*
   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.
   startup-query-interval *interval*
   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.
   startup-query-count *count*
   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.
   query-interval *interval*
   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.
   last-listener-query-interval *interval*
   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.
   last-listener-query-count *count*
   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.
   max-response-time *time*
   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.
    other-querier-present-timeout *time*

By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Configuring the MLD query and response parameters on an interface

1. Enter system view.

   system-view
2. Enter interface view.

   interface *interface-type interface-number*
3. Set the MLD querier's robustness variable.

   mld robust-count *count*

   By default, the MLD querier's robustness variable is 2.
4. Set the MLD startup query interval.

   mld startup-query-interval *interval*

   By default, the MLD startup query interval is equal to one quarter of the MLD general query interval.
5. Set the MLD startup query count.

   mld startup-query-count *count*

   By default, the MLD startup query count is equal to the MLD querier's robustness variable.
6. Set the MLD general query interval.

   mld query-interval *interval*

   By default, the MLD general query interval is 125 seconds.
7. Set the MLD last listener query interval.

   mld last-listener-query-interval *interval*

   By default, the MLD last listener query interval is 1 second.
8. Set the MLD last listener query count.

   mld last-listener-query-count *count*

   By default, the MLD last listener query count is equal to the MLD querier's robustness variable.
9. Set the maximum response time for MLD general queries.

   mld max-response-time *time*

   By default, the maximum response time for MLD general queries is 10 seconds.
10. Set the MLD other querier present timer.

    mld other-querier-present-timeout *time*

    By default, the MLD other querier present timer is calculated by using the following formula: [MLD general query interval] × [MLD robustness variable] + [maximum response time for MLD general queries] / 2.

Enabling fast-leave processing

About this task

This feature enables an MLD querier to send leave notifications to the upstream without sending multicast-address-specific or multicast-address-and-source-specific queries after receiving a done message. Use this feature to reduce leave latency and to preserve the network bandwidth.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.
   interface *interface-type interface-number*
3. Enable fast-leave processing.
   mld fast-leave [**group-policy** *ipv6-acl-number*]
   By default, fast-leave processing is disabled.

Configuring MLD SSM mappings

About this task

This feature enables the device to provide SSM services for MLDv1 hosts.

Restrictions and guidelines

This feature does not process MLDv2 messages. Enable MLDv2 on the receiver-side interface to ensure that MLDv2 reports from MLDv2 receiver hosts can be processed.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Configure an MLD SSM mapping.
   ssm-mapping *ipv6-source-address* { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   By default, no MLD SSM mapping is configured.

Configuring MLD proxying

Prerequisites for MLD proxying

Before you configure MLD proxying, determine the router interfaces and host interface based on the network topology. Then, enable MLD on the router interfaces.

Enabling MLD proxying

Restrictions and guidelines

- If MLD proxying is enabled on multiple interfaces, only the interface with the highest IP address will forward IPv6 multicast traffic.
- Enable MLD proxying on the receiver-side interfaces.
- On an interface enabled with MLD proxying, only the **mld version** command takes effect and other MLD commands do not take effect.
- If you enable both MLD proxying and an IPv6 multicast routing protocol on the same device, the IPv6 multicast routing protocol does not take effect.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.

interface *interface-type interface-number*

3. Enable MLD proxying.

   mld proxy enable

   By default, MLD proxying is disabled.

Enabling IPv6 multicast forwarding on a non-querier interface

About this task

Typically, only MLD queriers can forward IPv6 multicast traffic and non-queriers cannot. This prevents IPv6 multicast data from being repeatedly forwarded. If a router interface on the MLD proxy failed the querier election, enable IPv6 multicast forwarding on the interface to forward IPv6 multicast data to downstream receivers.

Restrictions and guidelines

A shared-media network might have multiple MLD proxies, including one proxy acting as a querier. To avoid duplicate IPv6 multicast traffic, do not enable IPv6 multicast forwarding on any of the non-querier MLD proxies for the network.

Procedure

1. Enter system view.

   system-view

2. Enter interface view.

   interface *interface-type interface-number*

3. Enable IPv6 multicast forwarding on a non-querier interface.

   mld proxy forwarding

   By default, IPv6 multicast forwarding is disabled on a non-querier interface.

Enabling IPv6 multicast load splitting for MLD proxy interfaces

About this task

If multiple MLD proxy interfaces exist on the device, only the proxy interface with the highest IP address forwards IPv6 multicast traffic. You can enable IPv6 multicast load splitting on the device so that all the proxy interfaces can share IPv6 multicast traffic.

Procedure

1. Enter system view.

   system-view

2. Enter MLD view.

   mld [**vpn-instance** *vpn-instance-name*]

3. Enable IPv6 multicast load splitting for MLD proxy interfaces.

   proxy multipath

   By default, IPv6 multicast load splitting is disabled for MLD proxy interfaces.

Enabling MLD NSR

About this task

This feature backs up information about MLD interfaces and MLD multicast groups to the standby process. The device recovers the information without cooperation of other devices when an active/standby switchover occurs. Use this feature to prevent an active/standby switchover from affecting the IPv6 multicast service.

Procedure

1. Enter system view.
   system-view
2. Enable MLD NSR.
   mld non-stop-routing
   By default, MLD NSR is disabled.

Setting the DSCP value for outgoing MLD protocol packets

About this task

The DSCP value determines the packet transmission priority. A greater DSCP value represents a higher priority.

Procedure

1. Enter system view.
   system-view
2. Enter MLD view.
   mld [**vpn-instance** *vpn-instance-name*]
3. Set the DSCP value for outgoing MLD protocol packets.
   dscp *dscp-value*
   By default, the DSCP value is 48 for outgoing MLD protocol packets.

Enabling SNMP notifications for MLD

About this task

To report critical MLD events to an SNMP NMS, enable SNMP notifications for MLD.

For MLD SNMP notifications to be sent correctly, you must also configure SNMP on the device. For more information about configuring SNMP, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for MLD.
   snmp-agent trap enable mld [**join** | **leave**] *
   By default, SNMP notifications are enabled for MLD.

Configuring MLD logging

Enabling MLD logging

About this task

To report critical MLD events to the information center, enable MLD logging. For MLD log messages to be sent correctly, you must also configure the information center on the device. For more information about configuring the information center, see Network Management and Monitoring Configuration Guide.

Restrictions and guidelines

Outputting a large amount of log messages degrades the device performance. To resolve this issue, disable MLD logging or use the **mld log suppress** command to enable log message suppression for MLD.

Procedure

1. Enter system view.
   system-view
2. Enable MLD logging.
   mld log enable [**group**]
   MLD logging is enabled by default.

Enabling log message suppression for MLD

About this task

Outputting a large amount of log messages degrades the device performance. To resolve this issue, perform this task to enable log message suppression for MLD. With this feature configured, the speed of sending MLD log messages to the information center will be decreased to reduce the load on the device.

Restrictions and guidelines

Before you configure this feature, make sure MLD logging has been enabled using the **mld log enable** command.

Procedure

1. Enter system view.
   system-view
2. Enable log message suppression for MLD.
   mld log suppress [**group**]
   By default, log message suppression is enabled for MLD.

Display and maintenance commands for MLD

CAUTION:
The **reset mld group** command might cause IPv6 multicast data transmission failures.

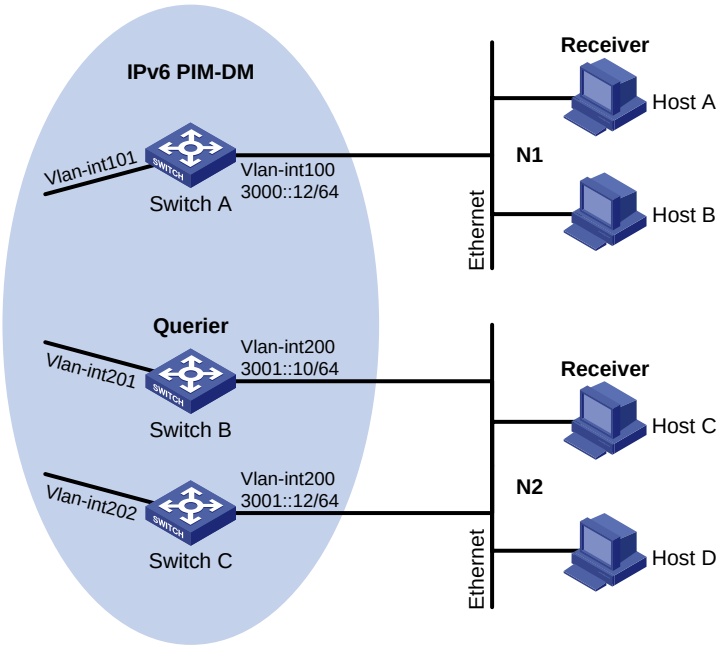
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about MLD multicast groups.	**display mld** [**vpn-instance** *vpn-instance-name*] **group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**static** | **verbose**]
Display MLD information for interfaces.	**display mld** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*] [**proxy**] [**verbose**]
Display IPv6 multicast routing entries maintained by the MLD proxy.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy group** [*ipv6-group-address* | **interface** *interface-type interface-number*] [**verbose**]
Display information about the MLD proxy routing table.	**display mld** [**vpn-instance** *vpn-instance-name*] **proxy routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*]] * [**verbose**]
Display MLD SSM mappings.	**display mld** [**vpn-instance** *vpn-instance-name*] **ssm-mapping** *ipv6-group-address*
Clear dynamic MLD multicast group entries.	**reset mld** [**vpn-instance** *vpn-instance-name*] **group** { **all** | **interface** *interface-type interface-number* { **all** | *ipv6-group-address* [*prefix-length*] [*ipv6-source-address* [*prefix-length*]] } }

MLD configuration examples

Example: Configuring basic MLD features

Network configuration



As shown in Figure 5:

- OSPFv3 and IPv6 PIM-DM run on the network.
- VOD streams are sent to receiver hosts in multicast. Receiver hosts of different organizations form stub networks N1 and N2. Host A and Host C are multicast receiver hosts in N1 and N2, respectively.
- MLDv1 runs between Switch A and N1, and between the other two switches (Switch B and Switch C) and N2.
- Switch A acts as the MLD querier in N1. Switch B acts as the MLD querier in N2 because it has a lower IPv6 address.

Configure the switches to meet the following requirements:

- The hosts in N1 can join only IPv6 multicast group FF1E::101.
- The hosts in N2 can join any IPv6 multicast groups.

Figure 5 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Figure 5, and configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable the IPv6 multicast routing, MLD, and IPv6 PIM-DM:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] mld enable
   [SwitchB-Vlan-interface200] quit
   ```

Enable IPv6 PIM-DM on VLAN-interface 201.

```
[SwitchB] interface vlan-interface 201
[SwitchB-Vlan-interface201] ipv6 pim dm
[SwitchB-Vlan-interface201] quit
```

On Switch C, enable IPv6 multicast routing.

```
<SwitchC> system-view
[SwitchC] ipv6 multicast routing
[SwitchC-mrib6] quit
```

Enable MLD on VLAN-interface 200.

```
[SwitchC] interface vlan-interface 200
[SwitchC-Vlan-interface200] mld enable
[SwitchC-Vlan-interface200] quit
```

Enable IPv6 PIM-DM on VLAN-interface 202.

```
[SwitchC] interface vlan-interface 202
[SwitchC-Vlan-interface202] ipv6 pim dm
[SwitchC-Vlan-interface202] quit
```

2. Configure an IPv6 multicast group policy on Switch A so that the hosts connected to VLAN-interface 100 can join only IPv6 multicast group FF1E::101.

```
[SwitchA] acl ipv6 basic 2001
[SwitchA-acl-ipv6-basic-2001] rule permit source ff1e::101 128
[SwitchA-acl-ipv6-basic-2001] quit
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] mld group-policy 2001
[SwitchA-Vlan-interface100] quit
```

Verifying the configuration

Display MLD information for VLAN-interface 200 on Switch B.

```
[SwitchB] display mld interface vlan-interface 200
 Vlan-interface200(FE80::200:5EFF:FE66:5100):
   MLD is enabled.
   MLD version: 1
   Query interval for MLD: 125s
   Other querier present time for MLD: 255s
   Maximum query response time for MLD: 10s
   Querier for MLD: FE80::200:5EFF:FE66:5100 (This router)
  MLD groups reported in total: 1
```

Example: Configuring MLD SSM mapping

Network configuration

As shown in Figure 6:

- OSPFv3 runs on the network.
- The IPv6 PIM-SM domain uses the SSM model for IPv6 multicast delivery. The SSM group range is FF3E::/64.
- MLDv2 runs on VLAN-interface 400 of Switch D. The receiver host runs MLDv1, and does not support MLDv2. The receiver host cannot specify IPv6 multicast sources in its membership reports.

- Source 1, Source 2, and Source 3 send IPv6 multicast packets to multicast groups in IPv6 SSM group range FF3E::/64.

Configure the MLD SSM mapping feature on Switch D so that the receiver host will receive IPv6 multicast data only from Source 1 and Source 3.

Figure 6 Network diagram

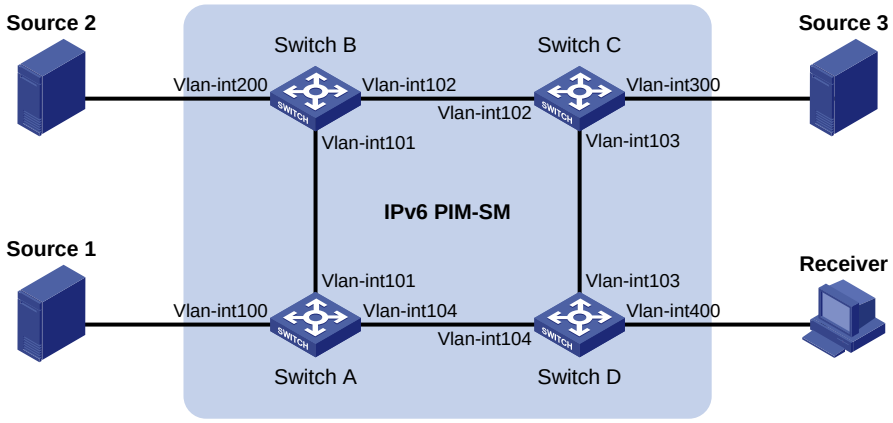


Table 1 Interface and IPv6 address assignment

Device	Interface	IPv6 address	Device	Interface	IPv6 address
Source 1	—	1001::1/64	Source 3	—	3001::1/64
Source 2	—	2001::1/64	Receiver	—	4001::1/64
Switch A	Vlan-int100	1001::2/64	Switch C	Vlan-int300	3001::2/64
Switch A	Vlan-int101	1002::1/64	Switch C	Vlan-int103	3002::1/64
Switch A	Vlan-int104	1003::1/64	Switch C	Vlan-int102	2002::2/64
Switch B	Vlan-int200	2001::2/64	Switch D	Vlan-int400	4001::2/64
Switch B	Vlan-int101	1002::2/64	Switch D	Vlan-int103	3002::2/64
Switch B	Vlan-int102	2002::1/64	Switch D	Vlan-int104	1003::2/64

Prerequisites

Assign an IPv6 address and prefix length to each interface as shown in Table 1, and configure OSPFv3 on the switches in the IPv6 PIM-SM domain.

Procedure

1. Enable IPv6 multicast routing, and enable IPv6 PIM-SM and MLD:

   # On Switch D, enable IPv6 multicast routing.

   ```
   <SwitchD> system-view
   [SwitchD] ipv6 multicast routing
   [SwitchD-mrib6] quit
   ```

   # Enable MLDv2 on the receiver-side interface (VLAN-interface 400).

   ```
   [SwitchD] interface vlan-interface 400
   [SwitchD-Vlan-interface400] mld enable
   [SwitchD-Vlan-interface400] mld version 2
   [SwitchD-Vlan-interface400] quit
   ```

   # Enable IPv6 PIM-SM on the other interfaces.

```
[SwitchD] interface vlan-interface 103
[SwitchD-Vlan-interface103] ipv6 pim sm
[SwitchD-Vlan-interface103] quit
[SwitchD] interface vlan-interface 104
[SwitchD-Vlan-interface104] ipv6 pim sm
[SwitchD-Vlan-interface104] quit
```

On Switch A, enable IPv6 multicast routing.

```
<SwitchA> system-view
[SwitchA] ipv6 multicast routing
[SwitchA-mrib6] quit
```

Enable IPv6 PIM-SM on each interface.

```
[SwitchA] interface vlan-interface 100
[SwitchA-Vlan-interface100] ipv6 pim sm
[SwitchA-Vlan-interface100] quit
[SwitchA] interface vlan-interface 101
[SwitchA-Vlan-interface101] ipv6 pim sm
[SwitchA-Vlan-interface101] quit
[SwitchA] interface vlan-interface 104
[SwitchA-Vlan-interface104] ipv6 pim sm
[SwitchA-Vlan-interface104] quit
```

Configure Switch B and Switch C in the same way Switch A is configured. (Details not shown.)

2. Configure the IPv6 SSM group range:

On Switch D, specify FF3E::/64 as the IPv6 SSM group range.

```
[SwitchD] acl ipv6 basic 2000
[SwitchD-acl-ipv6-basic-2000] rule permit source ff3e:: 64
[SwitchD-acl-ipv6-basic-2000] quit
[SwitchD] pim ipv6
[SwitchD-pim6] ssm-policy 2000
[SwitchD-pim6] quit
```

Configure Switch A, Switch B and Switch C in the same way Switch D is configured. (Details not shown.)

3. Configure MLD SSM mappings on Switch D.

```
[SwitchD] mld
[SwitchD-mld] ssm-mapping 1001::1 2000
[SwitchD-mld] ssm-mapping 3001::1 2000
[SwitchD-mld] quit
```

Verifying the configuration

Display MLD SSM mappings for IPv6 multicast group FF3E::101 on Switch D.

```
[SwitchD] display mld ssm-mapping ff3e::101
 Group: FF3E::101
 Source list:
        1001::1
        3001::1
```

On Switch D, display information about MLD multicast groups that hosts have dynamically joined.

```
[SwitchD] display mld group
MLD groups in total: 1
 Vlan-interface400(FE80::101):
```

```
  MLD groups reported in total: 1
   Group address: FF3E::101
    Last reporter: FE80::1
    Uptime: 00:02:04
    Expires: Off
```

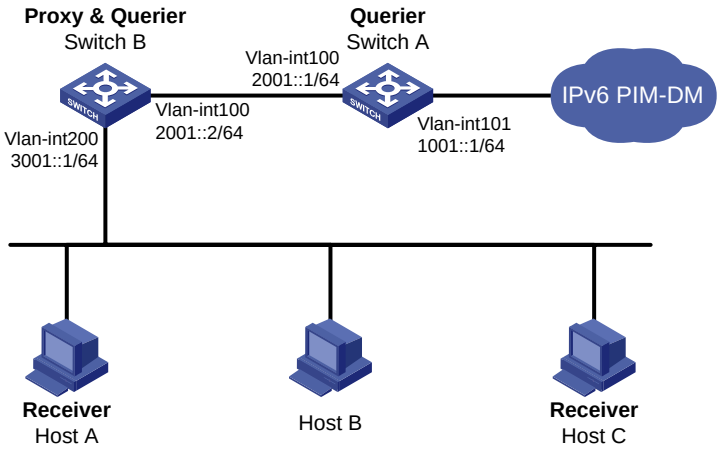
Display IPv6 PIM routing entries on Switch D.

```
[SwitchD] display ipv6 pim routing-table
 Total 0 (*, G) entry; 2 (S, G) entry

 (1001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface104
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -

 (3001::1, FF3E::101)
     Protocol: pim-ssm, Flag:
     UpTime: 00:13:25
     Upstream interface: Vlan-interface103
         Upstream neighbor: FE80::1
         RPF prime neighbor: FE80::1
     Downstream interface(s) information:
     Total number of downstreams: 1
         1: Vlan-interface400
             Protocol: mld, UpTime: 00:13:25, Expires: -
```

Example: Configuring MLD proxying



Network configuration

As shown in Figure 7:

- IPv6 PIM-DM runs on the core network.
- Host A and Host C on the stub network receive VOD information destined to IPv6 multicast group FF3E::101.

Configure the MLD proxying feature on Switch B so that Switch B can maintain group memberships and forward IPv6 multicast traffic without running IPv6 PIM-DM.

Figure 7 Network diagram

Prerequisites

Assign an IPv6 address and prefix length to each interface, as shown in Figure 7.

Procedure

1. Enable IPv6 multicast routing, IPv6 PIM-DM, MLD, and MLD proxying:

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchA] interface vlan-interface 101
   [SwitchA-Vlan-interface101] ipv6 pim dm
   [SwitchA-Vlan-interface101] quit
   ```

   # Enable MLD on VLAN-interface 100.

   ```
   [SwitchA] interface vlan-interface 100
   [SwitchA-Vlan-interface100] mld enable
   [SwitchA-Vlan-interface100] quit
   ```

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] multicast ipv6 routing-enable
   [SwitchB-mrib6] quit
   ```

   # Enable MLD proxying on VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] mld proxying enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable MLD on VLAN-interface 200.

   ```
   [SwitchB] interface vlan-interface 200
   [SwitchB-Vlan-interface200] mld enable
   [SwitchB-Vlan-interface200] quit
   ```

Verifying the configuration

Display IPv6 multicast group membership information maintained by the MLD proxy on Switch B.

```
[SwitchB] display mld proxy group
MLD proxy group records in total: 1
```

```
Vlan-interface100(FE80::16:1):
 MLD proxy group records in total: 1
  Group address: FF1E::1
   Member state: Delay
   Expires: 00:00:02
```

Troubleshooting MLD

No member information exists on the receiver-side device

Symptom

When a host sends a message to announce that it is joining IPv6 multicast group G, no member information of multicast group G exists on the immediate device.

Solution

To resolve the problem:

1. Use the **`display mld interface`** command to verify that the networking, interface connections, and IP address configuration are correct.
2. Use the **`display current-configuration`** command to verify that the IPv6 multicast routing is enabled. If it is not enabled, use the **`ipv6 multicast routing`** command in system view to enable IPv6 multicast routing. In addition, verify that MLD is enabled on the associated interfaces.
3. Use the **`display mld interface`** command to verify that the MLD version on the interface is lower than that on the host.
4. Use the **`display current-configuration interface`** command to verify that no IPv6 multicast group policies have been configured to filter MLD reports for IPv6 multicast group G.
5. If the problem persists, contact H3C Support.

Inconsistent membership information on the devices on the same subnet

Symptom

Different memberships are maintained on different MLD devices on the same subnet.

Solution

To resolve the problem:

1. Use the **`display current-configuration`** command to verify the MLD information on the interface. Make sure the devices on the subnet have the same MLD settings on their interfaces.
2. Use the **`display mld interface`** command on all devices on the same subnet to check the MLD timers for inconsistent configurations.
3. Use the **`display mld interface`** command to verify that all devices are running the same MLD version.
4. If the problem persists, contact H3C Support.

Configuring multicast routing and forwarding

About multicast routing and forwarding

Each multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the multicast routing protocols and statically configured multicast routing entries are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general multicast routing table. The optimal multicast routing entries in the general multicast routing table are added to the multicast forwarding table to guide multicast data forwarding.

RPF check mechanism

A multicast routing protocol uses reverse path forwarding (RPF) check to ensure the multicast data delivery along the correct path and to avoid data loops.

RPF check process

A multicast device performs the RPF check on a multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the unicast, MBGP, and static multicast routing tables.

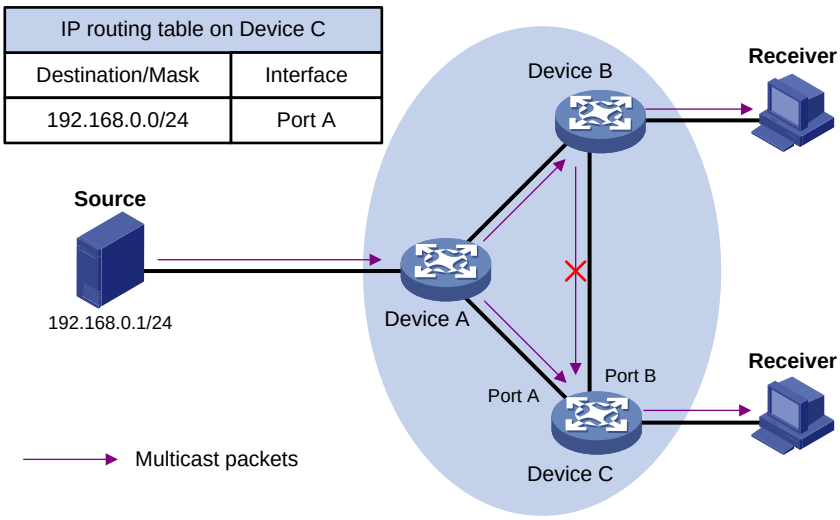
   The term "packet source" means different things in different situations:

   - For a packet that travels along the SPT, the packet source is the multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "PIM overview."
2. Selects one of the three optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with the highest subnet mask becomes the RPF route. If the routes have the same mask, the route with the highest route preference becomes the RPF route. If the routes have the same route preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with the highest route preference becomes the RPF route. If the routes have the same preference, the unicast route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IP address becomes the RPF route.

   The RPF route contains the RPF interface and RPF neighbor information.
   - If the RPF route is a unicast route or MBGP route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
   - If the RPF route is a static multicast route, the RPF interface and RPF neighbor are specified in the route.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.



- If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in multicast

Implementing an RPF check on each received multicast packet brings a big burden to the device. The use of a multicast forwarding table is the solution to this issue. When the device creates a multicast forwarding entry for an (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up the multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source and the RPF interface. Then, it creates a forwarding entry with the RPF interface as the incoming interface and makes the following judgments:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all the outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all the outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following actions:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

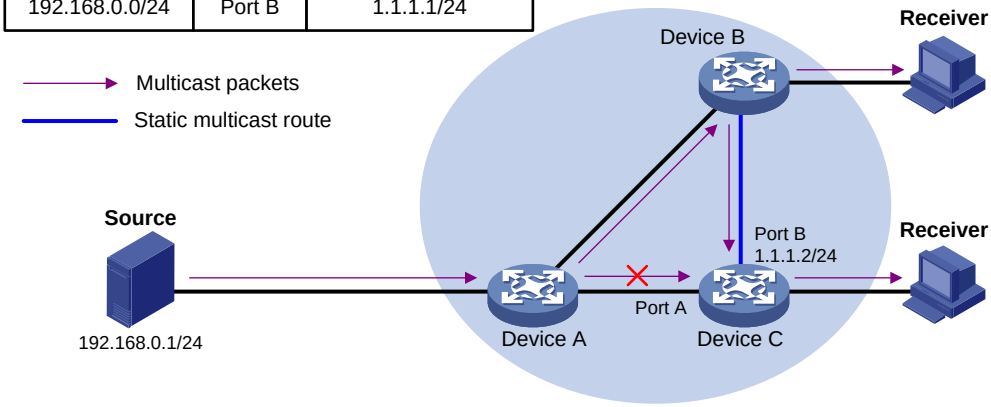
Figure 1 RPF check process

As shown in Figure 1, assume that unicast routes are available on the network, MBGP is not configured, and no static multicast routes have been configured on Device C. Multicast packets travel along the SPT from the multicast source to the receivers. The multicast forwarding table on Device C contains the (S, G) entry, with Port A as the incoming interface.

- If a multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.

- If a multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its unicast routing table and finds that the outgoing interface to the source (the RPF interface) is Port A. In this case, the (S, G) entry is correct, but the packet traveled along a wrong path. The packet fails the RPF check and Device C discards the packet.

Usages of static multicast routes



A static multicast route can change an RPF route or create an RPF route.

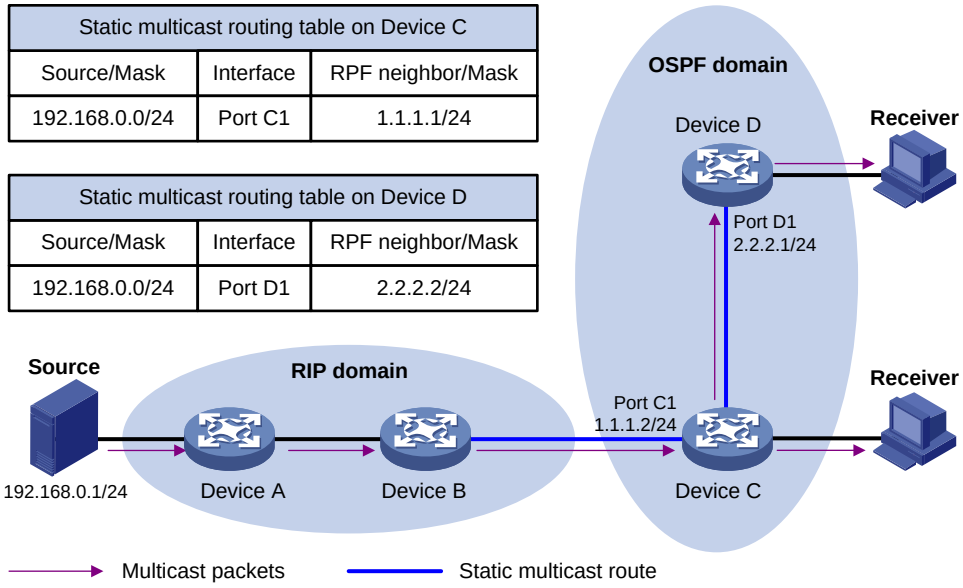
Changing an RPF route

Typically, the topology structure of a multicast network is the same as that of a unicast network, and multicast traffic follows the same transmission path as unicast traffic does. You can configure a static multicast route for a multicast source to change the RPF route. As a result, the device creates a transmission path for multicast traffic that is different from the transmission path for unicast traffic.

Figure 2 Changing an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port B	1.1.1.1/24

As shown in Figure 2, when no static multicast route is configured, Device C's RPF neighbor on the path back to the source is Device A. The multicast data from the source travels through Device A to Device C. You can configure a static multicast route on Device C and specify Device B as Device C's RPF neighbor on the path back to the source. The multicast data from the source travels along the path: Device A to Device B and then to Device C.



Creating an RPF route

When a unicast route is blocked, multicast forwarding might be stopped due to lack of an RPF route. You can configure a static multicast route to create an RPF route. In this way, a multicast routing entry is created to guide multicast forwarding.

Figure 3 Creating an RPF route

Static multicast routing table on Device C		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port C1	1.1.1.1/24

Static multicast routing table on Device D		
Source/Mask	Interface	RPF neighbor/Mask
192.168.0.0/24	Port D1	2.2.2.2/24

As shown in Figure 3, the RIP domain and the OSPF domain are unicast isolated from each other. For the receiver hosts in the OSPF domain to receive multicast packets from the multicast source in the RIP domain, you must configure Device C and Device D as follows:

- On Device C, configure a static multicast route for the multicast source and specify Device B as the RPF neighbor.
- On Device D, configure a static multicast route for the multicast source and specify Device C as the RPF neighbor.

Mtrace

Mtrace is a traceroute facility used to trace the path along which multicast group data travels from a source to a destination.

Device roles

Mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has a multicast-enabled interface on the same subnet as the destination and can forward specific multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the multicast source.
- **Client**—A client is a router that initiates an mtrace.

Process

The mtrace process is as follows:

1. The client sends an mtrace Query message (with a **hops** field indicating the maximum number of hops to trace) to the destination.
2. The LHR turns the received Query message to an mtrace Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

If the client does not receive a Reply message within the waiting time, the client initiates a hop-by-hop trace to determine which device on the path encountered an error. It sends a Query message with the **hops** field set to 1 and waits for a Reply message. If it does not receive a Reply message within the waiting time, the client determines that this hop encountered an error. If the client receives a Reply message within the waiting time, it sends a Query message with the **hops** field value increased by 1 and waits for a Reply message. This process continues until the client does not receive a Reply message within the waiting time any more.

Restrictions and guidelines: Multicast routing and forwarding configuration

During ISSU on a multichassis IRF, if the incoming interface of Layer 3 multicast traffic contains non-local member ports, Layer 3 multicast traffic interruption might occur when the device is rebooting.

Multicast routing and forwarding tasks at a glance

To configure multicast routing and forwarding, perform the following tasks:

1. Enabling IP multicast routing
2. (Optional.) Configuring static multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring multicast load splitting
5. (Optional.) Configuring a multicast forwarding boundary
6. (Optional.) Using mtrace to trace a multicast path
7. (Optional.) Setting the maximum number of cached unknown multicast packets
8. (Optional.) Setting the maximum number of copied multicast packets during software forwarding
9. (Optional.) Enabling multicast replication resource reuse

Prerequisites for multicast routing and forwarding

Before you configure multicast routing and forwarding, configure a unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IP multicast routing

About this task

Enable IP multicast routing before you configure any Layer 3 multicast functionality on the public network or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enable IP multicast routing and enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IP multicast routing is disabled.

Configuring static multicast routes

About this task

To configure a static multicast route for a multicast source, you can specify an RPF interface or an RPF neighbor for the multicast traffic from that source.

Restrictions and guidelines

Static multicast routes take effect only on the multicast devices on which they are configured, and will not be advertised throughout the network or redistributed to other devices.

Procedure

1. Enter system view.

   system-view

2. Configure a static multicast route.

   ip rpf-route-static [**vpn-instance** *vpn-instance-name*] *source-address* { *mask-length* | *mask* } { *gateway-address* | *interface-type interface-number* } [**preference** *preference*]

3. (Optional.) Delete all static multicast routes.

   delete ip rpf-route-static [**vpn-instance** *vpn-instance-name*]

   You can use the **undo ip rpf-route-static** command to delete a specific static multicast route or use the **delete ip rpf-route-static** command to delete all static multicast routes.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check mechanism."

Procedure

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Specify the longest prefix match principle.

   longest-match

   By default, the route preference principle is used.

Configuring multicast load splitting

About this task

You can enable the device to split multiple data flows on a per-source basis or on a per-source-and-group basis. This optimizes the traffic delivery.

Procedure

1. Enter system view.

   system-view

2. Enter MRIB view.

   multicast routing [**vpn-instance** *vpn-instance-name*]

3. Configure multicast load splitting.

   load-splitting { **balance-ecmp** | **balance-ucmp** | **ecmp** | **flow-ucmp** | **source** | **source-group** | **ucmp** }

   By default, multicast load splitting is disabled.

Configuring an IPv4 multicast flow policy

About this task

You can configure the estimated bandwidth for matching multicast flows through an IPv4 multicast flow policy on a downstream device if the following conditions exist:

- ECMP routes between the downstream device and an upstream device.
- The multicast load-splitting mode is **flow-ucmp**.

When the downstream device selects an incoming interface on the upstream device, it selects the link with the smallest bandwidth usage calculated based on the estimated bandwidth. If two links have the same bandwidth usage, the link with the higher next-hop IP address is selected.

The bandwidth usage is calculated according to the following formula: Bandwidth usage = (Used bandwidth+Estimated bandwidth)/(Total interface bandwidth x (1–Unicast reserved bandwidth)).

- The estimated bandwidth is configured by the **bandwidth** command in IPv4 multicast flow policy view.
- The total interface bandwidth is configured by the **bandwidth** command in interface view.
- The unicast reserved bandwidth is configured by the **flow-ucmp unicast reserve-bandwidth** or **multicast flow-ucmp unicast reserve-bandwidth** command.

Restrictions and guidelines for configuring an IPv4 multicast flow policy

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

Adding, deleting, or modifying an IPv4 multicast flow policy does not affect the link selection results of existing multicast flows and affects link selection for only new multicast flows. Before configuring the multicast load-splitting mode as **flow-ucmp**, you must plan the configuration of an IPv4 multicast flow policy and the unicast reserved bandwidth configuration.

The change of link bandwidth and the change in the number of ECMP routes do not affect the route selection of existing multicast flows.

This feature does not affect multicast source-side link selection, link selection in PIM-DM, RPT link selection in PIM-SM, or local RP link selection.

If both IPv4 and IPv6 multicast flows exist in the network, increase the unicast reserved bandwidth as needed to avoid congestion.

Creating an IPv4 multicast flow policy

1. Enter system view.

   system-view

2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Create an IPv4 multicast flow policy.
   - Create a custom IPv4 multicast flow policy.
     flow-policy name *policy-name*
   - Create the default IPv4 multicast flow policy.
     flow-policy default

Configuring the multicast group range

About this task

Perform this task to configure a multicast group range in which an IPv4 multicast flow policy takes effect. If a multicast group matches the ACL specified in an IPv4 multicast flow policy, the estimated bandwidth configured in the policy is used for the multicast flows of the multicast group.

Restrictions and guidelines

This feature is not supported by the default IPv4 multicast flow policy.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv4 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the multicast group range.
   acl { *ipv4-acl-number* | **name** *ipv4-acl-name* }
   By default, an IPv4 multicast flow policy does not take effect on any multicast groups.

Configuring the estimated bandwidth

About this task

The estimated bandwidth is selected for IPv4 multicast flows as follows:

1. If the multicast group of an IPv4 multicast flow matches the ACL specified in a custom IPv4 multicast flow policy, the estimated bandwidth configured in the policy is selected for the multicast flow.
2. If the multicast group of an IPv4 multicast flow does not match an ACL in any custom IPv4 multicast flow policy, the estimated bandwidth configured in the default policy is selected for the multicast flow.
3. If the default policy is not created or the estimated bandwidth is not configured in the default policy, the estimated bandwidth for the multicast flow is 0.

Procedure

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv4 multicast flow policy view.

flow-policy { **default** | **name** *policy-name* }

4. Configure the estimated bandwidth.
   bandwidth *bandwidth* { **gbps** | **kbps** | **mbps** }
   By default, the estimated bandwidth is 0.

Configuring the IPv4 unicast reserved bandwidth percentage

About this task

Perform this task when IPv4 unicast traffic and IPv4 multicast traffic coexist in the network. The available bandwidth for multicast traffic is calculated based on the total interface bandwidth and the configured IPv4 unicast reserved bandwidth percentage. For example, if the total interface bandwidth is 100 kbps and the unicast reserved bandwidth percentage is 20% (20 kbps), the available bandwidth for multicast traffic is 80 kbps.

Restrictions and guidelines

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

The **flow-ucmp unicast reserve-bandwidth** command takes effect on all interfaces, and the **multicast flow-ucmp unicast reserve-bandwidth** command takes effect only on the current interface. If you execute both commands, the latter has higher priority.

Setting the global IPv4 unicast reserved bandwidth percentage

1. Enter system view.
   system-view
2. Enter MRIB view.
   multicast routing [**vpn-instance** *vpn-instance-name*]
3. Set the global IPv4 unicast reserved bandwidth percentage.
   flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the global IPv4 unicast reserved bandwidth percentage is not set.

Setting the IPv4 unicast reserved bandwidth percentage on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv4 unicast reserved bandwidth percentage on the interface.
   multicast flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the IPv4 unicast reserved bandwidth percentage is not set on an interface.

Configuring a multicast forwarding boundary

About this task

You can configure an interface as a multicast forwarding boundary for a multicast group range. The interface cannot receive or forward multicast packets for the group range.

Restrictions and guidelines

You do not need to enable IP multicast before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure the interface as a multicast forwarding boundary for a multicast group range.
   multicast boundary *group-address* { *mask-length* | *mask* }
   By default, an interface is not a multicast forwarding boundary.

Using mtrace to trace a multicast path

Using mtrace1 to trace a multicast path

To use mtrace version 1 (mtrace1) to trace a multicast path, execute the following command in any view:

mtrace [**v1**] [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address*] [**verbose**]

Using mtrace2 to trace a multicast path

Restrictions and guidelines

For successful mtrace, do not specify a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Specify the UDP port number used by mtrace.
   mtrace-service port *number*
   By default, mtrace uses UDP port number 10240.
3. Use mtrace version 2 (mtrace2) to trace a multicast path.
   mtrace v2 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]
   Execute this command in any view.
   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown multicast packets

About this task

The device caches a multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly

dropping multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **multicast forwarding-table cache-unknown total** command to be far greater than the value in the **multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of unknown multicast packets that can be cached for an (S, G) entry.
   multicast forwarding-table cache-unknown per-entry *per-entry-limit*
   By default, the device can cache only one unknown multicast packet for an (S, G) entry.
3. Set the maximum number of unknown multicast packets that can be cached in total.
   multicast forwarding-table cache-unknown total *total-limit*
   By default, the device can cache 1024 unknown multicast packets in total.

Setting the maximum number of copied multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause multicast packets to be dropped.

CAUTION:
Perform this task under the guidance of H3C Support.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of copied multicast packets during software forwarding.
   multicast cpu-forwarding max-copy-count *count*
   The default setting is 5.

Enabling multicast replication resource reuse

About this task

Multicast replication resources are hardware resources used to replicate multicast traffic. By default, multiple (S, G) entries with the same outgoing interface use multiple multicast replication resources.

This feature allows (S, G) entries with the same outgoing interface to use the same multicast replication resource.

Restrictions and guidelines

For this feature to take effect ,you must use the **reboot** command to reboot the device.

Procedure

1. Enter system view.
   system-view
2. Enable multicast replication resource reuse.
   multicast replication-share enable
   By default, multicast replication resource reuse is disabled.

Display and maintenance commands for multicast routing and forwarding

CAUTION:
The **reset** commands might cause multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the MRIB.	**display mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display link selection information for IPv4 multicast flow policies.	**display multicast** [**vpn-instance** *vpn-instance-name*] **flow-policy info** [**interface** *interface-type interface-number* | **source** *source-address* | **group** *group-address* | **policy** { **default** | **name** *policy-name* }] *
Display multicast boundary information.	**display multicast** [**vpn-instance** *vpn-instance-name*] **boundary** [*group-address* [*mask-length* | *mask*]] [**interface** *interface-type interface-number*]
Display multicast fast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*source-address* | *group-address*] * [**slot** *slot-number*]
Display statistics for multicast forwarding events.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display multicast forwarding entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number*| **outgoing-interface** { **exclude** | **include** |

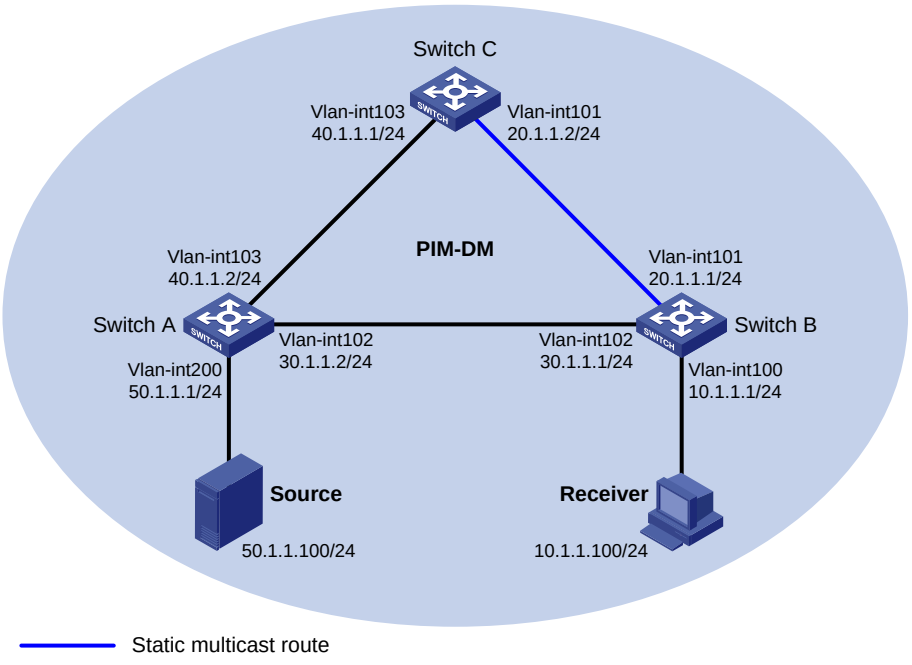
Task	Command
	match } *interface-type interface-number* | **replicate** *replicate-index* | **slot** *slot-number* | **statistics**] *
Display multicast forwarding capability information.	**display multicast forwarding-table capability [slot slot-number]**
Display information about the DF list in the multicast forwarding table.	**display multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table df-list** [*group-address*] [**verbose**] [**slot** *slot-number*]
Display multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static multicast routing entries.	**display multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*source-address* { *mask-length* | *mask* }]
Display RPF information for a multicast source.	**display multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *source-address* [*group-address*]
Display multicast replication resource information.	**display multicast replication-share info** [**outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index*] * [**slot** *slot-number*]
Clear multicast fast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *source-address* | *group-address* } * | **all** } [**slot** *slot-number*]
Clear statistics for multicast forwarding events.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear multicast forwarding entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear multicast routing entries.	**reset multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *source-address* [**mask** { *mask-length* | *mask* }] | *group-address* [**mask** { *mask-length* | *mask* }] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear a multicast routing entry, the associated multicast forwarding entry is also cleared.
- When you clear a multicast forwarding entry, the associated multicast routing entry is also cleared.

Multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 4:

- PIM-DM runs on the network.
- All switches on the network support multicast.
- Switch A, Switch B and Switch C run OSPF.
- Typically, the receiver host can receive the multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the multicast data from the source travels to the receiver through the path: Switch A to Switch C to Switch B. This is different from the unicast route.

Figure 4 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 4, and configure OSPF on the switches in the PIM-DM domain.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch B, enable IP multicast routing.

```
<SwitchB> system-view
[SwitchB] multicast routing
[SwitchB-mrib] quit
```

Enable IGMP on the receiver-side interface VLAN-interface 100.

```
[SwitchB] interface vlan-interface 100
[SwitchB-Vlan-interface100] igmp enable
[SwitchB-Vlan-interface100] quit
```

Enable PIM-DM on other interfaces.

```
[SwitchB] interface vlan-interface 101
[SwitchB-Vlan-interface101] pim dm
[SwitchB-Vlan-interface101] quit
[SwitchB] interface vlan-interface 102
[SwitchB-Vlan-interface102] pim dm
[SwitchB-Vlan-interface102] quit
```

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 200
[SwitchA-Vlan-interface200] pim dm
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IP multicast routing and PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. Configure a static multicast route on Switch B and specify Switch C as its RPF neighbor on the route to the source.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 20.1.1.2
```

Verifying the configuration

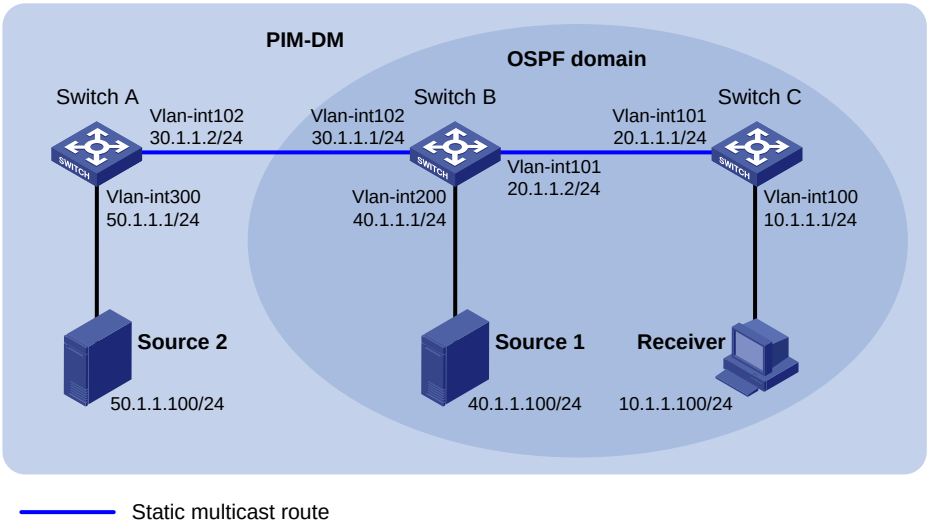
Display RPF information for the source on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route



Network configuration

As shown in Figure 5:

- PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPF, and have no unicast routes to Switch A.
- Typically, the receiver host receives the multicast data from Source 1 in the OSPF domain.

Configure the switches so that the receiver host receives multicast data from Source 2, which is outside the OSPF domain.

Figure 5 Network diagram

Prerequisites

Assign an IP address and subnet mask for each interface as shown in Figure 5, and configure OSPF on Switch B and Switch C.

Procedure

1. Enable IP multicast routing, and enable IGMP and PIM-DM:

   # On Switch C, enable IP multicast routing.

```
<SwitchC> system-view
[SwitchC] multicast routing
[SwitchC-mrib] quit
```

Enable IGMP on the receiver-side interface VLAN-interface 100.

```
[SwitchC] interface vlan-interface 100
[SwitchC-Vlan-interface100] igmp enable
[SwitchC-Vlan-interface100] quit
```

Enable PIM-DM on VLAN-interface 101.

```
[SwitchC] interface vlan-interface 101
[SwitchC-Vlan-interface101] pim dm
[SwitchC-Vlan-interface101] quit
```

On Switch A, enable IP multicast routing.

```
<SwitchA> system-view
[SwitchA] multicast routing
[SwitchA-mrib] quit
```

Enable PIM-DM on each interface.

```
[SwitchA] interface vlan-interface 300
[SwitchA-Vlan-interface300] pim dm
[SwitchA-Vlan-interface300] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IP multicast routing and PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display multicast rpf-info 50.1.1.100
[SwitchC] display multicast rpf-info 50.1.1.100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B or Switch C.

3. Configure a static multicast route:

Configure a static multicast route on Switch B and specify Switch A as its RPF neighbor on the route to Source 2.

```
[SwitchB] ip rpf-route-static 50.1.1.0 24 30.1.1.2
```

Configure a static multicast route on Switch C and specify Switch B as its RPF neighbor on the route to Source 2.

```
[SwitchC] ip rpf-route-static 10.1.1.0 24 20.1.1.2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface102, RPF neighbor: 30.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display multicast rpf-info 50.1.1.100
 RPF information about source 50.1.1.100:
     RPF interface: Vlan-interface101, RPF neighbor: 20.1.1.2
     Referenced route/mask: 50.1.1.0/24
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. The routes are the configured static routes.

Troubleshooting multicast routing and forwarding

Static multicast route failure

Symptom

No dynamic routing protocol is enabled on the device, and the physical status and link layer status of interfaces are both up, but the static multicast route fails.

Solution

To resolve the problem:

1. Use the **`display multicast routing-table static`** command to display information about static multicast routes. Verify that the static multicast route has been correctly configured and that the route entry exists in the static multicast routing table.
2. Check the type of interface that connects the static multicast route to the RPF neighbor. If the interface is not a point-to-point interface, be sure to specify the address for the RPF neighbor.
3. If the problem persists, contact H3C Support.

Configuring IPv6 multicast routing and forwarding

About IPv6 multicast routing and forwarding

Each IPv6 multicast routing protocol has its own routing table. Multicast routing information in routing entries generated by the IPv6 multicast routing protocols are summarized in a set of (S, G) and (*, G) entries. All the (S, G) and (*, G) entries form a general IPv6 multicast routing table. The optimal IPv6 multicast routing entries in the general IPv6 multicast routing table are added to the IPv6 multicast forwarding table to guide IPv6 multicast data forwarding.

RPF check mechanism

An IPv6 multicast routing protocol uses the reverse path forwarding (RPF) check mechanism to ensure IPv6 multicast data delivery along the correct path and to avoid data loops.

RPF check process

An IPv6 multicast device performs the RPF check on an IPv6 multicast packet as follows:

1. Chooses an optimal route back to the packet source separately from the IPv6 unicast and IPv6 MBGP routing tables.

   In RPF check, the "packet source" means difference things in difference situations:

   - For a packet that travels along the SPT, the packet source is the IPv6 multicast source.
   - For a packet that travels along the RPT, the packet source is the RP.
   - For a bootstrap message originated from the BSR, the packet source is the BSR.

   For more information about the concepts of SPT, RPT, source-side RPT, RP, and BSR, see "IPv6 PIM overview."
2. Selects one of the optimal routes as the RPF route as follows:
   - If the device uses the longest prefix match principle, the route with a higher prefix length becomes the RPF route. If the routes have the same prefix length, the route with a higher route preference becomes the RPF route. If the routes have the same route preference, the IPv6 MBGP route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IPv6 address becomes the RPF route.

     For more information about the route preference, see *Layer 3—IP Routing Configuration Guide*.
   - If the device does not use the longest prefix match principle, the route with a higher route preference becomes the RPF route. If the routes have the same route preference, the IPv6 MBGP route becomes the RPF route. If equal cost routes exist, the equal cost route with the highest next hop IPv6 address becomes the RPF route.

   In the RPF route, the outgoing interface is the RPF interface and the next hop is the RPF neighbor.
3. Determines whether the packet arrived at the RPF interface.
   - If the packet arrived at the RPF interface, the RPF check succeeds and the packet is forwarded.
   - If the packet arrived at the non-RPF interface, the RPF check fails and the packet is discarded.

RPF check implementation in IPv6 multicast

Implementing an RPF check on each received IPv6 multicast packet would heavily burden the device. The use of an IPv6 multicast forwarding table is the solution to this issue. When the device creates an IPv6 multicast forwarding entry for an IPv6 (S, G) packet, it sets the RPF interface of the packet as the incoming interface of the (S, G) entry. After the device receives another (S, G) packet, it looks up its IPv6 multicast forwarding table for a matching (S, G) entry.

- If no match is found, the device first determines the RPF route back to the packet source. Then, it creates a forwarding entry with the RPF interface as the incoming interface and performs one of the following tasks:
  - If the receiving interface is the RPF interface, the RPF check succeeds and the device forwards the packet out of all outgoing interfaces.
  - If the receiving interface is not the RPF interface, the RPF check fails and the device discards the packet.
- If a match is found and the matching forwarding entry contains the receiving interface, the device forwards the packet out of all outgoing interfaces.
- If a match is found but the matching forwarding entry does not contain the receiving interface, the device determines the RPF route back to the packet source. Then, the device performs one of the following tasks:
  - If the RPF interface is the incoming interface, it means that the forwarding entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and the device discards the packet.
  - If the RPF interface is not the incoming interface, it means that the forwarding entry has expired. The device replaces the incoming interface with the RPF interface and matches the receiving interface against the RPF interface. If the receiving interface is the RPF interface, the device forwards the packet out of all outgoing interfaces. Otherwise, it discards the packet.

Figure 1 RPF check process

As shown in Figure 1, assume that IPv6 unicast routes are available on the network. IPv6 MBGP is not configured. IPv6 multicast packets travel along the SPT from the multicast source to the receivers. The IPv6 multicast forwarding table on Device C contains the (S, G) entry, with Port A as the RPF interface.

- If an IPv6 multicast packet arrives at Device C on Port A, the receiving interface is the incoming interface of the (S, G) entry. Device C forwards the packet out of all outgoing interfaces.
- If an IPv6 multicast packet arrives at Device C on Port B, the receiving interface is not the incoming interface of the (S, G) entry. Device C searches its IPv6 unicast routing table and finds

that the outgoing interface to the source (the RPF interface) is Port A. This means that the (S, G) entry is correct but the packet traveled along a wrong path. The packet fails the RPF check, and Device C discards the packet.

IPv6 mtrace

IPv6 mtrace uses mtrace2 to trace the path along which IPv6 multicast group data travels from a source to a destination.

Device roles

IPv6 mtrace includes the following roles:

- **Last-hop router (LHR)**—An LHR is a router that has an IPv6 multicast-enabled interface on the same subnet as the destination and can forward specific IPv6 multicast data to the subnet.
- **First-hop router (FHR)**—An FHR is a router that is directly connected to the IPv6 multicast source.
- **Client**—A client is a router that initiates an mtrace2.

Process

The IPv6 mtrace process is as follows:

1. The client sends an mtrace2 Query message (with a **hops** field indicating the maximum number of hops to be traced) to the destination.
2. The LHR turns the received Query message to an mtrace2 Request message by adding local forwarding information and sends the Request message to the upstream neighbor.
3. Each router along the traced path adds its local forwarding information to the received Request message and sends the Request message to its upstream neighbor.
4. The FHR adds its local forwarding information to the received Request message. Then, it turns the Request message to an mtrace2 Reply message and sends the Reply message to the client.
5. The client interprets forwarding information in the Reply message and displays the information.

Restrictions and guidelines: IPv6 multicast routing and forwarding configuration

During ISSU on a multichassis IRF, if the incoming interface of Layer 3 multicast traffic contains non-local member ports, Layer 3 multicast traffic interruption might occur when the device is rebooting.

IPv6 multicast routing and forwarding tasks at a glance

To configure IPv6 multicast routing and forwarding, perform the following tasks:

1. Enabling IPv6 multicast routing
2. (Optional.) Configuring static IPv6 multicast routes
3. (Optional.) Specifying the longest prefix match principle
4. (Optional.) Configuring IPv6 multicast load splitting
5. (Optional.) Configuring an IPv6 multicast flow policy
6. (Optional.) Configuring an IPv6 multicast forwarding boundary

7. (Optional.) Using mtrace2 to trace an IPv6 multicast path
8. (Optional.) Setting the maximum number of cached unknown IPv6 multicast packets
9. (Optional.) Setting the maximum number of copied IPv6 multicast packets during software forwarding
10. (Optional.) Enabling IPv6 multicast replication resource reuse

Prerequisites for IPv6 multicast routing and forwarding

Before you configure multicast routing and forwarding, configure an IPv6 unicast routing protocol so that all devices in the domain can interoperate at the network layer.

Enabling IPv6 multicast routing

About this task

Enable IPv6 multicast routing before you configure any Layer 3 IPv6 multicast functionality in the public network or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast routing and enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
   By default, IPv6 multicast routing is disabled.

Configuring static IPv6 multicast routes

About this task

When configuring a static IPv6 multicast route for an IPv6 multicast source, you can specify an RPF interface or an RPF neighbor for the IPv6 multicast traffic from that source.

Restrictions and guidelines

Static IPv6 multicast routes take effect only on the IPv6 multicast devices on which they are configured, and will not be broadcast or redistributed to other devices.

Procedure

1. Enter system view.
   system-view
2. Configure a static multicast route.
   ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*] *ipv6-source-address prefix-length* { *ipv6-gateway-address* | *interface-type interface-number* } [**preference** *preference*]
3. (Optional.) Delete all static IPv6 multicast routes.
   delete ipv6 rpf-route-static [**vpn-instance** *vpn-instance-name*]
   To delete a single static IPv6 multicast route, use the **undo ip rpf-route-static** command.

Specifying the longest prefix match principle

About this task

You can enable the device to use the longest prefix match principle for RPF route selection. For more information about RPF route selection, see "RPF check process."

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Specify the longest prefix match principle for RPF route selection.
   longest-match
   By default, the route preference principle is used.

Configuring IPv6 multicast load splitting

About this task

You can enable the device to split multiple IPv6 multicast data flows on a per-source basis or on a per-source-and-group basis.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Configure IPv6 multicast load splitting.
   load-splitting { **balance-ecmp** | **balance-ucmp** | **ecmp** | **flow-ucmp** | **source** | **source-group** | **ucmp** }
   By default, IPv6 multicast load splitting is disabled.

Configuring an IPv6 multicast flow policy

About this task

You can configure the estimated bandwidth for matching IPv6 multicast flows through an IPv6 multicast flow policy on a downstream device if the following conditions exist:

- ECMP routes between the downstream device and an upstream device.
- The multicast load-splitting mode is **flow-ucmp**.

When the downstream device selects an incoming interface on the upstream device, it selects the link with the smallest bandwidth usage calculated based on the estimated bandwidth. If two links have the same bandwidth usage, the link with the higher next-hop IPv6 address is selected.

The bandwidth usage is calculated according to the following formula: Bandwidth usage = (Used bandwidth+Estimated bandwidth)/(Total interface bandwidth x (1–Unicast reserved bandwidth)).

- The estimated bandwidth is configured by the **bandwidth** command in IPv6 multicast flow policy view.

- The total interface bandwidth is configured by the **bandwidth** command in interface view.
- The unicast reserved bandwidth is configured by the **flow-ucmp unicast reserve-bandwidth** or **ipv6 multicast flow-ucmp unicast reserve-bandwidth** command.

Restrictions and guidelines for configuring an IPv6 multicast flow policy

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

Adding, deleting, or modifying an IPv6 multicast flow policy does not affect the link selection results of existing multicast flows and affects link selection for only new multicast flows. Before configuring the multicast load-splitting mode as **flow-ucmp**, you must plan the configuration of an IPv6 multicast flow policy and the unicast reserved bandwidth configuration.

The change of link bandwidth and the change in the number of ECMP routes do not affect the route selection of existing multicast flows.

This feature does not affect multicast source-side link selection, link selection in IPv6 PIM-DM, RPT link selection in IPv6 PIM-SM, or local RP link selection.

If both IPv4 and IPv6 multicast flows exist in the network, increase the unicast reserved bandwidth as needed to avoid congestion.

Creating an IPv6 multicast flow policy

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Create an IPv6 multicast flow policy.
   - Create a custom IPv6 multicast flow policy.
     flow-policy name *policy-name*
   - Create the default IPv6 multicast flow policy.
     flow-policy default

Configuring the multicast group range

About this task

Perform this task to configure a multicast group range in which an IPv6 multicast flow policy takes effect. If a multicast group matches the ACL specified in an IPv6 multicast flow policy, the estimated bandwidth configured in the policy is used for the multicast flows of the multicast group.

Restrictions and guidelines

This feature is not supported by the default IPv6 multicast flow policy.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

3. Enter IPv6 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the multicast group range.
   acl { *ipv6-acl-number* | **name** *ipv6-acl-name* }
   By default, an IPv6 multicast flow policy does not take effect on any multicast groups.

Configuring the estimated bandwidth

About this task

The estimated bandwidth is selected for IPv6 multicast flows as follows:

1. If the multicast group of an IPv6 multicast flow matches the ACL specified in a custom IPv6 multicast flow policy, the estimated bandwidth configured in the policy is selected for the multicast flow.
2. If the multicast group of an IPv6 multicast flow does not match an ACL in any custom IPv6 multicast flow policy, the estimated bandwidth configured in the default policy is selected for the multicast flow.
3. If the default policy is not created or the estimated bandwidth is not configured in the default policy, the estimated bandwidth for the multicast flow is 0.

Procedure

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.
   ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]
3. Enter IPv6 multicast flow policy view.
   flow-policy { **default** | **name** *policy-name* }
4. Configure the estimated bandwidth.
   bandwidth *bandwidth* { **gbps** | **kbps** | **mbps** }
   By default, the estimated bandwidth is 0.

Configuring the IPv6 unicast reserved bandwidth percentage

About this task

Perform this task when IPv6 unicast traffic and IPv6 multicast traffic coexist in the network. The available bandwidth for multicast traffic is calculated based on the total interface bandwidth and the configured IPv6 unicast reserved bandwidth percentage. For example, if the total interface bandwidth is 100 kbps and the unicast reserved bandwidth percentage is 20% (20 kbps), the available bandwidth for multicast traffic is 80 kbps.

Restrictions and guidelines

For this feature to take effect, you must configure the multicast load-splitting mode as **flow-ucmp**.

The **flow-ucmp unicast reserve-bandwidth** command takes effect on all interfaces, and the **ipv6 multicast flow-ucmp unicast reserve-bandwidth** command takes effect only on the current interface. If you execute both commands, the latter has higher priority.

Setting the global IPv6 unicast reserved bandwidth percentage

1. Enter system view.
   system-view
2. Enter IPv6 MRIB view.

ipv6 multicast routing [**vpn-instance** *vpn-instance-name*]

3. Set the global IPv6 unicast reserved bandwidth percentage.
   flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the global IPv6 unicast reserved bandwidth percentage is not set.

Setting the IPv6 unicast reserved bandwidth percentage on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Set the IPv6 unicast reserved bandwidth percentage on the interface.
   ipv6 multicast flow-ucmp unicast reserve-bandwidth *percentage*
   By default, the IPv6 unicast reserved bandwidth percentage is not set on an interface.

Configuring an IPv6 multicast forwarding boundary

About this task

You can configure an interface as an IPv6 multicast forwarding boundary for an IPv6 multicast group range. The interface cannot receive or forward IPv6 multicast packets for the groups in the range.

Restrictions and guidelines

You do not need to enable IPv6 multicast routing before this configuration.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Configure an IPv6 multicast forwarding boundary.
   ipv6 multicast boundary { *ipv6-group-address prefix-length* | **scope** { *scope-id* | **admin-local** | **global** | **organization-local** | **site-local** } }
   By default, an interface is not an IPv6 multicast forwarding boundary for any IPv6 multicast groups.

Using mtrace2 to trace an IPv6 multicast path

Restrictions and guidelines

For successful IPv6 mtrace, do not use a UDP port number used by other modules.

You must specify the same UDP port number on all devices on the traced path.

Procedure

1. Enter system view.
   system-view
2. (Optional.) Specify the UDP port number used by IPv6 mtrace.
   ipv6 mtrace-service port *number*

By default, IPv6 mtrace uses UDP port number 10240.

3. Use mtrace2 to trace an IPv6 multicast path.

   mtrace v2 ipv6 [**vpn-instance** *vpn-instance-name*] { *source-address* | *group-address* } * [**destination** *address* | **port** *number* | **wait-time** *time* | **max-hop** *count*] * [**verbose**]

   The UDP port number specified in this command must be the same as that specified in the **mtrace-service port** command.

Setting the maximum number of cached unknown IPv6 multicast packets

About this task

The device caches an IPv6 multicast packet for a period of time if no matching multicast forwarding entry is found for the packet. If a multicast forwarding entry is established for the packet within the time period, the device forwards the packet. This mechanism prevents the device from mistakenly dropping IPv6 multicast packets when the multicast forwarding entries for these packets are to be established.

You can set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry, in total, or both.

Restrictions and guidelines

As a best practice, set the value in the **ipv6 multicast forwarding-table cache-unknown total** command to be far greater than the value in the **ipv6 multicast forwarding-table cache-unknown per-entry** command.

Procedure

1. Enter system view.

   system-view

2. Set the maximum number of unknown IPv6 multicast packets that can be cached for an (S, G) entry.

   ipv6 multicast forwarding-table cache-unknown per-entry *per-entry-limit*

   By default, the device can cache only one unknown IPv6 multicast packet for an (S, G) entry.

3. Set the maximum number of unknown IPv6 multicast packets that can be cached in total.

   ipv6 multicast forwarding-table cache-unknown total *total-limit*

   By default, the device can cache 1024 unknown IPv6 multicast packets in total.

Setting the maximum number of copied IPv6 multicast packets during software forwarding

About this task

Setting a greater limit will cause high CPU usage and degrade forwarding performance. Setting a small limit will cause IPv6 multicast packets to be dropped.

CAUTION:

Perform this task under the guidance of H3C Support.

Procedure

1. Enter system view.
   system-view
2. Set the maximum number of copied IPv6 multicast packets during software forwarding.
   ipv6 multicast cpu-forwarding max-copy-count *count*
   The default setting is 5.

Enabling IPv6 multicast replication resource reuse

About this task

IPv6 multicast replication resources are hardware resources used to replicate IPv6 multicast traffic. By default, multiple IPv6 (S, G) entries with the same outgoing interface use multiple IPv6 multicast replication resources.

This feature allows IPv6 (S, G) entries with the same outgoing interface to use the same IPv6 multicast replication resource.

Restrictions and guidelines

For this feature to take effect ,you must use the **reboot** command to reboot the device.

Procedure

1. Enter system view.
   system-view
2. Enable IPv6 multicast replication resource reuse.
   ipv6 multicast replication-share enable
   By default, IPv6 multicast replication resource reuse is disabled.

Display and maintenance commands for IPv6 multicast routing and forwarding

CAUTION:
The **reset** commands might cause IPv6 multicast data transmission failures.

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display information about the interfaces maintained by the IPv6 MRIB.	**display ipv6 mrib** [**vpn-instance** *vpn-instance-name*] **interface** [*interface-type interface-number*]
Display IPv6 multicast boundary information.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **boundary** { **group** [*ipv6-group-address* [*prefix-length*]] | **scope** [*scope-id*] } [**interface** *interface-type interface-number*]
Display IPv6 multicast fast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** [*ipv6-source-address* |

Task	Command
	ipv6-group-address] * [**slot** *slot-number*]
Display statistics for IPv6 multicast forwarding events.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event** [**slot** *slot-number*]
Display IPv6 multicast forwarding entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index* | **slot** *slot-number* | **statistics**] *
Display IPv6 multicast forwarding capability information.	**display ipv6 multicast forwarding-table capability** [**slot slot-number**]
Display information about the DF list in the IPv6 multicast forwarding table.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table df-list** [*ipv6-group-address*] [**verbose**] [**slot** *slot-number*]
Display IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** [*ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* | **outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number*] *
Display static IPv6 multicast routing entries.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table static** [*ipv6-source-address* [*prefix-length*]]
Display RPF information for an IPv6 multicast source.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **rpf-info** *ipv6-source-address* [*ipv6-group-address*]
Display IPv6 multicast replication resource information.	**display ipv6 multicast replication-share info** [**outgoing-interface** { **exclude** | **include** | **match** } *interface-type interface-number* | **replicate** *replicate-index*] * [**slot** *slot-number*]
Display link selection information for IPv6 multicast flow policies.	**display ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **flow-policy info** [**interface** *interface-type interface-number* | **source** *source-address* | **group** *group-address* | **policy** { **default** | **name** *policy-name* }] *
Clear IPv6 multicast fast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **fast-forwarding cache** { { *ipv6-source-address* |

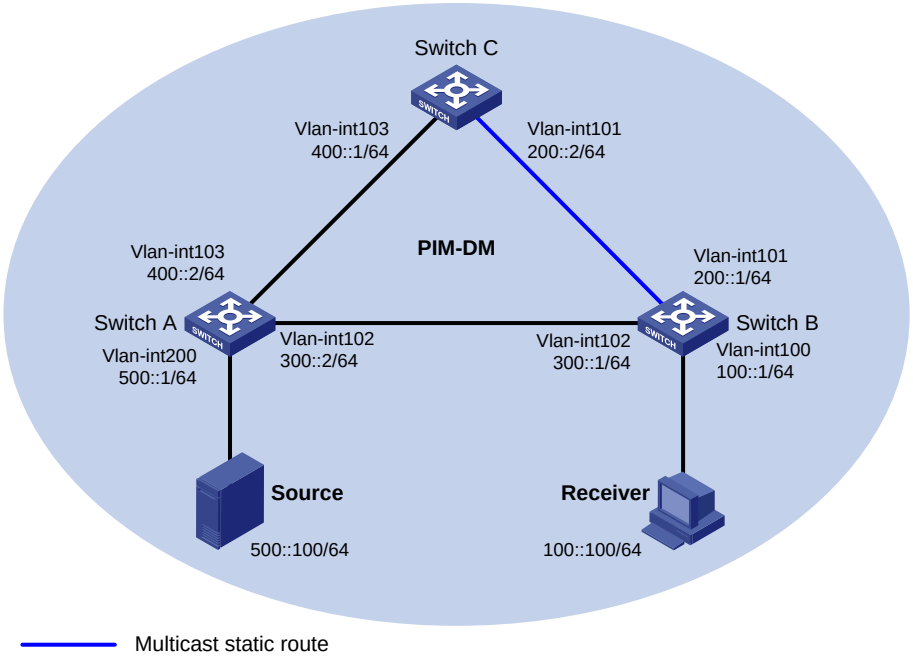
Task	Command
	ipv6-group-address } * | **all** } [**slot** *slot-number*]
Clear statistics for IPv6 multicast forwarding events.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding event**
Clear IPv6 multicast forwarding entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **forwarding-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** { *interface-type interface-number* } } * | **all** }
Clear IPv6 multicast routing entries.	**reset ipv6 multicast** [**vpn-instance** *vpn-instance-name*] **routing-table** { { *ipv6-source-address* [*prefix-length*] | *ipv6-group-address* [*prefix-length*] | **incoming-interface** *interface-type interface-number* } * | **all** }

NOTE:

- When you clear an IPv6 multicast routing entry, the associated IPv6 multicast forwarding entry is also cleared.
- When you clear an IPv6 multicast forwarding entry, the associated IPv6 multicast routing entry is also cleared.

IPv6 multicast routing and forwarding configuration examples

Example: Changing an RPF route



Network configuration

As shown in Figure 2:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IPv6 multicast.
- Switch A, Switch B, and Switch C run OSPFv3.
- Typically, the receiver host can receive the IPv6 multicast data from the source through the path: Switch A to Switch B, which is the same as the unicast route.

Configure the switches so that the IPv6 multicast data from the source travels to the receiver along the following path: Switch A to Switch C to Switch B. This path is different from the unicast route.

Figure 2 Network diagram

Prerequisites

1. Assign an IP address and prefix length for each interface, as shown in Figure 2.
2. Configure OSPFv3 on the switches in the IPv6 PIM-DM domain.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch B, enable IPv6 multicast routing.

   ```
   <SwitchB> system-view
   [SwitchB] ipv6 multicast routing
   [SwitchB-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchB] interface vlan-interface 100
   [SwitchB-Vlan-interface100] mld enable
   [SwitchB-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on the other interfaces.

   ```
   [SwitchB] interface vlan-interface 101
   [SwitchB-Vlan-interface101] ipv6 pim dm
   [SwitchB-Vlan-interface101] quit
   [SwitchB] interface vlan-interface 102
   [SwitchB-Vlan-interface102] ipv6 pim dm
   [SwitchB-Vlan-interface102] quit
   ```

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 200
   [SwitchA-Vlan-interface200] ipv6 pim dm
   ```

```
[SwitchA-Vlan-interface200] quit
[SwitchA] interface vlan-interface 102
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
[SwitchA] interface vlan-interface 103
[SwitchA-Vlan-interface103] ipv6 pim dm
[SwitchA-Vlan-interface103] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch C in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for the source on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: igp
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the current RPF route on Switch B is contributed by a unicast routing protocol and the RPF neighbor is Switch A.

3. On Switch B, configure a static IPv6 multicast route to the source and specify Switch C as the RPF neighbor.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for the source on Switch B.

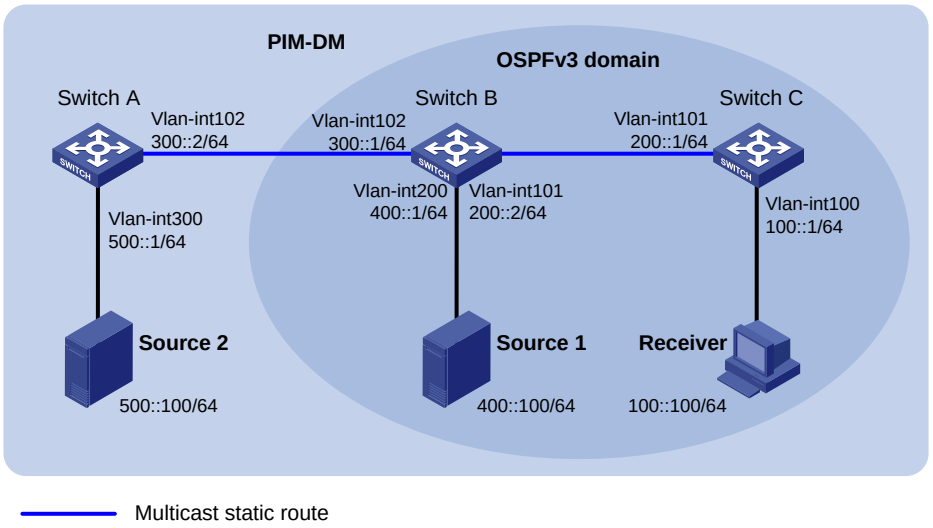
```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows the following information:

- The RPF route on Switch B is the configured static IPv6 multicast route.
- The RPF neighbor of Switch B is Switch C.

Example: Creating an RPF route

Network configuration



As shown in Figure 3:

- IPv6 PIM-DM runs on the network.
- All switches on the network support IP multicast.
- Switch B and Switch C run OSPFv3, and have no unicast routes to Switch A.

- Typically, the receiver host receives the IPv6 multicast data from the source 1 in the OSPFv3 domain.

Configure the switches so that the receiver host can receive IPv6 multicast data from Source 2, which is outside the OSPFv3 domain.

Figure 3 Network diagram

Prerequisites

1. Assign an IP address and subnet mask for each interface, as shown in Figure 3.
2. Configure OSPFv3 on Switch B and Switch C.

Procedure

1. Enable IPv6 multicast routing, and enable MLD and IPv6 PIM-DM:

   # On Switch C, enable IPv6 multicast routing.

   ```
   <SwitchC> system-view
   [SwitchC] ipv6 multicast routing
   [SwitchC-mrib6] quit
   ```

   # Enable MLD on the receiver-side interface VLAN-interface 100.

   ```
   [SwitchC] interface vlan-interface 100
   [SwitchC-Vlan-interface100] mld enable
   [SwitchC-Vlan-interface100] quit
   ```

   # Enable IPv6 PIM-DM on VLAN-interface 101.

   ```
   [SwitchC] interface vlan-interface 101
   [SwitchC-Vlan-interface101] ipv6 pim dm
   [SwitchC-Vlan-interface101] quit
   ```

   # On Switch A, enable IPv6 multicast routing.

   ```
   <SwitchA> system-view
   [SwitchA] ipv6 multicast routing
   [SwitchA-mrib6] quit
   ```

   # Enable IPv6 PIM-DM on each interface.

   ```
   [SwitchA] interface vlan-interface 300
   [SwitchA-Vlan-interface300] ipv6 pim dm
   [SwitchA-Vlan-interface300] quit
   [SwitchA] interface vlan-interface 102
   ```

```
[SwitchA-Vlan-interface102] ipv6 pim dm
[SwitchA-Vlan-interface102] quit
```

Enable IPv6 multicast routing and IPv6 PIM-DM on Switch B in the same way Switch A is configured. (Details not shown.)

2. Display RPF information for Source 2 on Switch B and Switch C.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
[SwitchC] display ipv6 multicast rpf-info 500::100
```

No output is displayed because no RPF routes to Source 2 exist on Switch B and Switch C.

3. Configure a static IPv6 multicast route:

Configure a static IPv6 multicast route on Switch B and specify Switch A as its RPF neighbor to Source 2.

```
[SwitchB] ipv6 rpf-route-static 500::100 64 300::2
```

Configure a static IPv6 multicast route on Switch C and specify Switch B as its RPF neighbor to Source 2.

```
[SwitchC] ipv6 rpf-route-static 500::100 64 200::2
```

Verifying the configuration

Display RPF information for Source 2 on Switch B.

```
[SwitchB] display ipv6 multicast rpf-info 500::100
 RPF information about source 50::100:
     RPF interface: Vlan-interface102, RPF neighbor: 300::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

Display RPF information for Source 2 on Switch C.

```
[SwitchC] display ipv6 multicast rpf-info 500::100
 RPF information about source 500::100:
     RPF interface: Vlan-interface101, RPF neighbor: 200::2
     Referenced prefix/prefix length: 500::/64
     Referenced route type: multicast static
     Route selection rule: preference-preferred
     Load splitting rule: disable
     Source AS: 0
     C-multicast route target: 0x0000000000000000
```

The output shows that the RPF routes to Source 2 exist on Switch B and Switch C. These RPF routes are the configured static IPv6 multicast routes.

Preface

This configuration guide describes the MPLS fundamentals and configuration procedures.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring basic MPLS

About MPLS

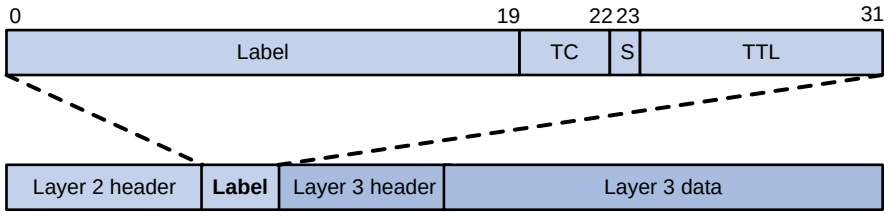
Multiprotocol Label Switching (MPLS) provides connection-oriented label switching over connectionless IP backbone networks. It integrates both the flexibility of IP routing and the simplicity of Layer 2 switching.

MPLS features

MPLS has the following features:

- **High speed and efficiency**—MPLS uses short- and fixed-length labels to forward packets, avoiding complicated routing table lookups.
- **Multiprotocol support**—MPLS resides between the link layer and the network layer. It can work over various link layer protocols (for example, Ethernet) to provide connection-oriented services for various network layer protocols (for example, IPv4 and IPX).
- **Good scalability**—The connection-oriented switching and multilayer label stack features enable MPLS to deliver various extended services, such as VPN, traffic engineering, and QoS.

Basic concepts



FEC

MPLS groups packets with the same characteristics (such as packets with the same destination or service class) into a forwarding equivalence class (FEC). Packets of the same FEC are handled in the same way on an MPLS network.

Label

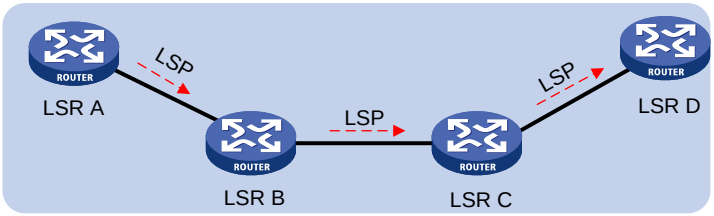
A label uniquely identifies an FEC and has local significance.

Figure 1 Format of a label

A label is encapsulated between the Layer 2 header and Layer 3 header of a packet. It is four bytes long and consists of the following fields:

- **Label**—20-bit label value.
- **TC**—3-bit traffic class, used for QoS. It is also called Exp.
- **S**—1-bit bottom of stack flag. A label stack can contain multiple labels. The label nearest to the Layer 2 header is called the top label, and the label nearest to the Layer 3 header is called the bottom label. The **S** field is set to 1 if the label is the bottom label and set to 0 if not.
- **TTL**—8-bit time to live field used for MPLS loop prevention.

LSR



A router that performs MPLS forwarding is a label switching router (LSR).

LSP

A label switched path (LSP) is the path along which packets of an FEC travel through an MPLS network.

An LSP is a unidirectional packet forwarding path. Two neighboring LSRs are called the upstream LSR and downstream LSR along the direction of an LSP. As shown in Figure 2, LSR B is the downstream LSR of LSR A, and LSR A is the upstream LSR of LSR B.

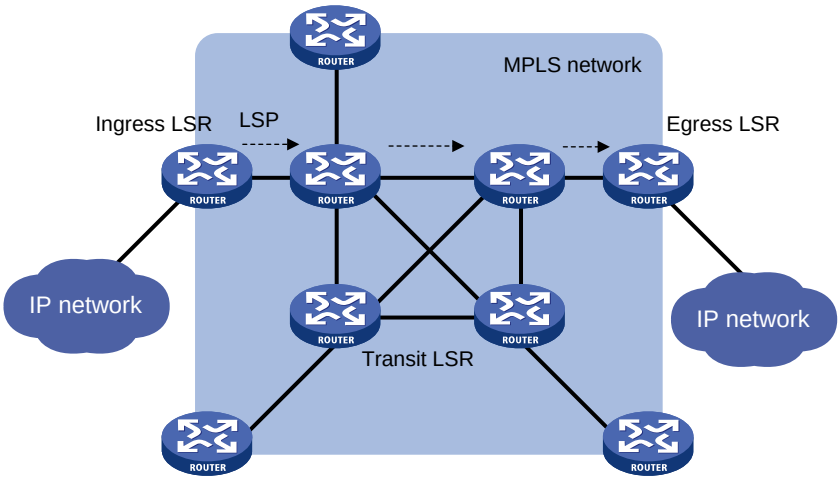
Figure 2 Label switched path

LFIB

The Label Forwarding Information Base (LFIB) on an MPLS network functions like the Forwarding Information Base (FIB) on an IP network. When an LSR receives a labeled packet, it searches the LFIB to obtain information for forwarding the packet. The information includes the label operation type, the outgoing label value, and the next hop.

Control plane and forwarding plane

An MPLS node consists of a control plane and a forwarding plane.



- **Control plane**—Assigns labels, distributes FEC-label mappings to neighbor LSRs, creates the LFIB, and establishes and removes LSPs.
- **Forwarding plane**—Forwards packets according to the LFIB.

MPLS network architecture

An MPLS network has the following types of LSRs:

- **Ingress LSR**—Ingress LSR of packets. It labels packets entering into the MPLS network.
- **Transit LSR**—Intermediate LSRs in the MPLS network. The transit LSRs on an LSP forward packets to the egress LSR according to labels.
- **Egress LSR**—Egress LSR of packets. It removes labels from packets and forwards the packets to their destination networks.

Figure 3 MPLS network architecture

LSP establishment

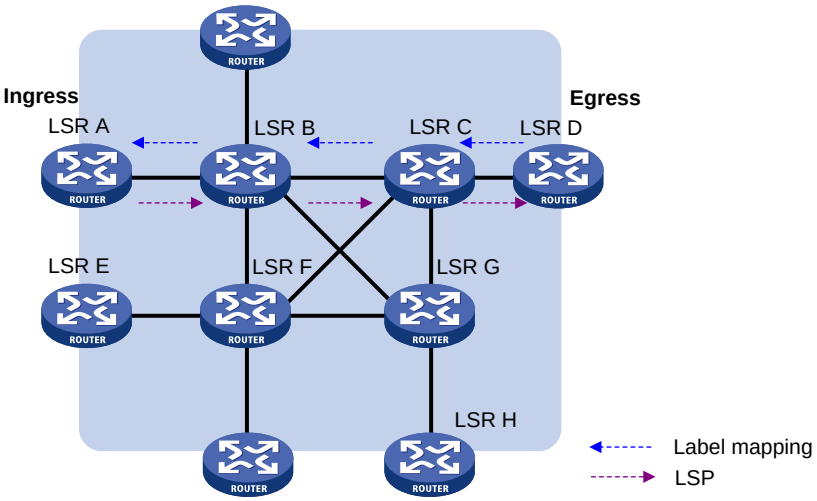
LSPs include static and dynamic LSPs.

Static LSP

To establish a static LSP, you must configure an LFIB entry on each LSR along the LSP. Establishing static LSPs consumes fewer resources than establishing dynamic LSPs, but static LSPs cannot automatically adapt to network topology changes. Therefore, static LSPs are suitable for small-scale networks with simple, stable topologies.

Dynamic LSP

A dynamic LSP is established by a label distribution protocol (also called an MPLS signaling protocol). A label distribution protocol classifies FECs, distributes FEC-label mappings, and establishes and maintains LSPs. Label distribution protocols include protocols designed specifically for label distribution, such as the Label Distribution Protocol (LDP), and protocols extended to support label distribution, such as MP-BGP.



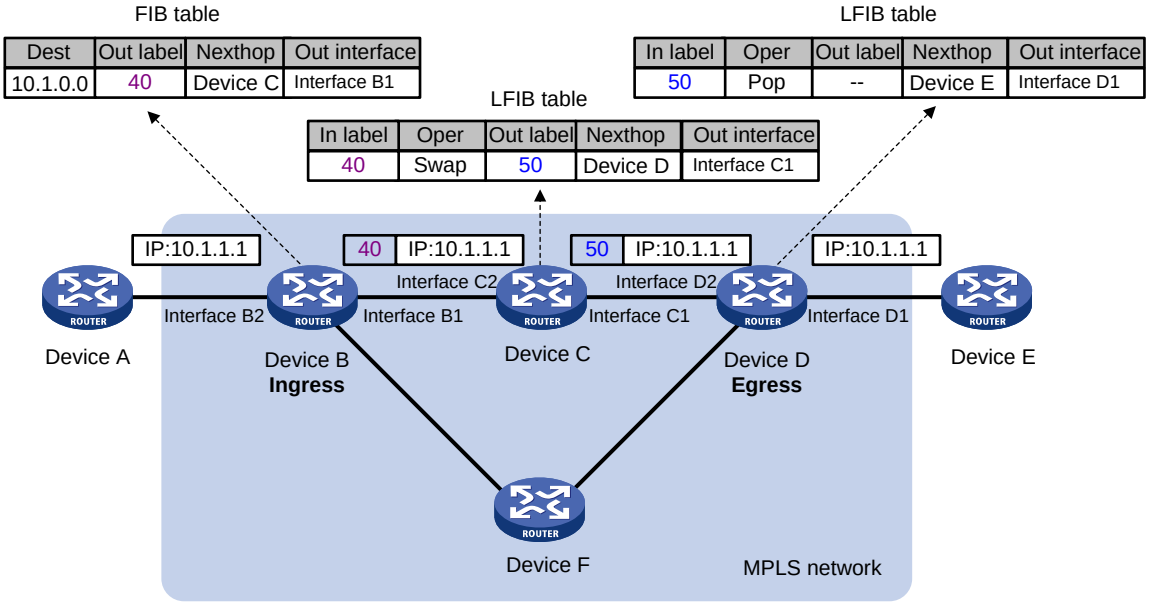
In this document, the term "label distribution protocols" refers to all protocols for label distribution. The term "LDP" refers to the RFC 5036 LDP.

A dynamic LSP is established in the following steps:

1. A downstream LSR classifies FECs according to destination addresses.
2. The downstream LSR assigns a label for each FEC, and distributes the FEC-label binding to its upstream LSR.
3. The upstream LSR establishes an LFIB entry for the FEC according to the binding information.

After all LSRs along the LSP establish an LFIB entry for the FEC, a dynamic LSP is established for the packets of this FEC.

Figure 4 Dynamic LSP establishment



MPLS forwarding

As shown in Figure 5, a packet is forwarded over the MPLS network as follows:

1. Device B (the ingress LSR) receives a packet with no label. Then, it performs the following operations:
   a. Identifies the FIB entry that matches the destination address of the packet.
   b. Adds the outgoing label (40, in this example) to the packet.
   c. Forwards the labeled packet out of Interface B1 to the next hop LSR Device C.
2. When receiving the labeled packet, Device C processes the packet as follows:
   a. Identifies the LFIB entry that has an incoming label of 40.
   b. Uses the outgoing label 50 of the entry to replace label 40 in the packet.
   c. Forwards the labeled packet out of Interface C1 to the next hop LSR Device D.
3. When receiving the labeled packet, Device D (the egress LSR) processes the packet as follows:
   a. Identifies the LFIB entry that has an incoming label of 50.
   b. Removes the label from the packet.
   c. Forwards the packet out of Interface D1 to the next hop LSR Device E.

   If the LFIB entry records no outgoing interface or next hop information, Device D performs the following operations:
   d. Identifies the FIB entry by the IP header.
   e. Forwards the packet according to the FIB entry.

Figure 5 MPLS forwarding

PHP

An egress node must perform two forwarding table lookups to forward a packet:

- Two LFIB lookups (if the packet has more than one label).
- One LFIB lookup and one FIB lookup (if the packet has only one label).

The penultimate hop popping (PHP) feature can pop the label at the penultimate node, so the egress node only performs one table lookup.

A PHP-capable egress node can send either of the following null labels to the penultimate node:

- **Implicit null label**—The value of an implicit null label is 3. If an incoming packet matches an LFIB entry containing the implicit null label, the penultimate node pops the top label and forwards the packet to the egress node. The egress node forwards the packet based on the header of its next layer.
- **Explicit null label**—The value of an explicit null label is 0 for IPv4 networks and 2 for IPv6 networks (value 2 is not supported in the current software version) . Sometimes, the egress node must use the TC field in the label to perform QoS. To keep the TC information, you can configure the egress node to send the penultimate node an explicit null label. If an incoming packet matches an LFIB entry containing the explicit null label, the penultimate hop replaces the top label value with value 0, and forwards the packet to the egress node. When the egress node receives the packet, it does not look up the LFIB table for the label of 0 or 2. The egress node gets the TC information from the label, pops the label, and then forwards the packet based on the header of its next layer.

Protocols and standards

- RFC 3031, *Multiprotocol Label Switching Architecture*
- RFC 3032, *MPLS Label Stack Encoding*
- RFC 5462, *Multiprotocol Label Switching (MPLS) Label Stack Entry: "EXP" Field Renamed to "Traffic Class" Field*

Restrictions and guidelines: basic MPLS configuration

Only advanced mode and expert mode support basic MPLS configuration. For more information about device operating modes, see device management configuration in *Fundamentals Configuration Guide*.

The device does not support MPLS forwarding for tunneled packets.

MPLS tasks at a glance

To configure basic MPLS, perform the following configuration tasks:

1. Enabling MPLS
2. (Optional.) Specifying the label type advertised by the egress node to the penultimate hop
3. (Optional.) Configuring TTL propagation

   When TTL propagation is enabled, the ingress node copies the TTL value of an IP packet to the TTL field of the label. The IP tracert facility can show the real path along which the packet has traveled.
4. (Optional.) Enabling sending MPLS TTL-expired messages
5. (Optional.) Enabling SNMP notifications for MPLS
6. (Optional.) Enabling private SNMP notifications for MPLS

Enabling MPLS

Prerequisites

Before you enable MPLS, configure static routes or an IGP protocol to ensure IP connectivity among LSRs.

Procedure

1. Enter system view.

   system-view
2. Configure an LSR ID for the local node.

   mpls lsr-id *lsr-id*

   By default, no LSR ID is configured.

   An LSR ID must be unique in an MPLS network and in IP address format. As a best practice, use the IP address of a loopback interface as an LSR ID.
3. Enter the view of the interface that needs to perform MPLS forwarding.

   interface *interface-type interface-number*
4. Enable MPLS on the interface.

   mpls enable

   By default, MPLS is disabled on the interface.

Specifying the label type advertised by the egress node to the penultimate hop

About this task

- Select the label type advertised by the egress node to the penultimate hop as follows:
- As a best practice, configure the egress node to advertise an implicit null label to the penultimate hop if the penultimate hop supports PHP.
- If you want to simplify packet forwarding on egress but keep labels to determine QoS policies, configure the egress node to advertise an explicit null label to the penultimate hop.
- Use non-null labels only in particular scenarios. For example, when OAM is configured on the egress node, the egress node can get the OAM function entity status only through non-null labels.

Restrictions and guidelines

For LDP LSPs, the **mpls label advertise** command triggers LDP to delete the LSPs established before the command is executed and then re-establish the LSPs.

For BGP LSPs, the **mpls label advertise** command takes effect only on the BGP LSPs established after the command is executed. To apply the new setting to BGP LSPs established before the command is executed, delete the routes corresponding to the BGP LSPs, and then redistribute the routes.

Procedure

1. Enter system view.

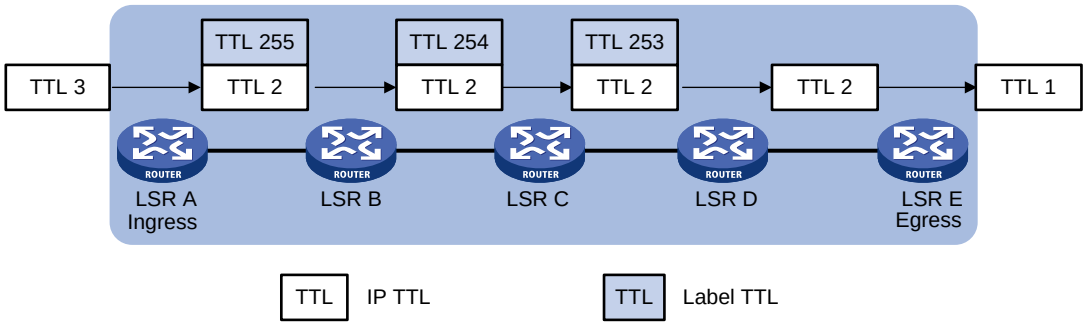
   system-view
2. Specify the label type advertised by the egress node to the penultimate hop.

   mpls label advertise { **explicit-null** | **implicit-null** | **non-null** }

   By default, an egress node advertises an implicit null label to the penultimate hop.

Configuring TTL propagation

About this task



When TTL propagation is enabled, the ingress node copies the TTL value of an IP packet to the TTL field of the label. Each LSR on the LSP decreases the label TTL value by 1. The LSR that pops the label copies the remaining label TTL value back to the IP TTL of the packet. The IP TTL value can reflect how many hops the packet has traversed in the MPLS network. The IP tracert facility can show the real path along which the packet has traveled.

Figure 6 TTL propagation

When TTL propagation is disabled, the ingress node sets the label TTL to 255. Each LSR on the LSP decreases the label TTL value by 1. The LSR that pops the label does not change the IP TTL value when popping the label. Therefore, the MPLS backbone nodes are invisible to user networks, and the IP tracert facility cannot show the real path in the MPLS network.

Figure 7 Without TTL propagation

Restrictions and guidelines

The TTL propagation configuration does not take effect on existing LSPs. To make the TTL propagation configuration take effect on existing LSPs, perform the following operation after you execute the **mpls ttl propagate** command:

- For static LSPs, re-configure the static LSPs.
- For dynamically esetablished LSPs, reset LDP sessions by using the **reset mpls ldp** command.

This feature affects only the propagation between IP TTL and label TTL. Within an MPLS network, TTL is always copied between the labels of an MPLS packet.

As a best practice, set the same TTL processing mode on all LSRs of an LSP.

To enable TTL propagation for a VPN, you must enable it on all PE devices in the VPN. Then, you can get the same traceroute result (hop count) from those PEs.

Procedure

1. Enter system view.
   system-view
2. Enable TTL propagation.

mpls ttl propagate { **public** | **vpn** }

By default, TTL propagation is enabled for public network packets and is disabled for VPN packets.

Enabling sending MPLS TTL-expired messages

About this task

This feature enables an LSR to generate an ICMP TTL-expired message upon receiving an MPLS packet with a TTL of 1. If the MPLS packet has only one label, the LSR sends the ICMP TTL-expired message back to the source through IP routing. If the MPLS packet has multiple labels, the LSR sends it along the LSP to the egress node, which then sends the message back to the source.

Procedure

1. Enter system view.

   system-view

2. Enable sending MPLS TTL-expired messages.

   mpls ttl expiration enable

   By default, this feature is enabled.

Enabling SNMP notifications for MPLS

About this task

To report critical MPLS events to an NMS, enable SNMP notifications for MPLS. For MPLS event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for MPLS.

   snmp-agent trap enable mpls

   By default, SNMP notifications for MPLS are disabled.

Enabling private SNMP notifications for MPLS

About this task

This feature enables generating SNMP notifications for specific MPLS events, such as the following:

- MPLS resources are exhausted.
- MPLS label usage exceeds the upper threshold or drops below the lower threshold.
- A static LSP goes up or down.

These MPLS event notifications are not defined in an RFC and are private MPLS notifications supported by Comware. For SNMP to output the private MPLS notifications correctly, you must also configure parameters for sending SNMP notifications. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

system-view

2. Enable private SNMP notifications for MPLS.

   snmp-agent trap enable mpls-private [**entryres–exhausted** | **hard-resource** | **label-layer-exceeded** | **label-threshold** | **label-total** | **resources-exceeded** | **slsp-label-dup** | **slsp-up-down** | **sr-label-conflict** | **tunnel-to-vpn**] *

   By default, private SNMP notifications for MPLS are disabled.

3. (Optional.) Configure alarm thresholds for MPLS label usage.

   mpls label-usage threshold-alarm percent { **dynamic** | **egress** | **egress6** | **l3vpn** | **srgb** | **srlb** | **static** | **vpls** | **vpws** } **upper-limit** *upper-percent* **lower-limit** *lower-percent*

   By default, the usage alarm upper threshold is 80% and lower threshold is 70% for all types of MPLS labels.

Display and maintenance commands for MPLS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display ILM entries.	**display mpls forwarding ilm** [*label*] [**slot** *slot-number*]
Display NHLFE entries.	**display mpls forwarding nhlfe** [*nid*] [**slot** *slot-number*]
Display MPLS interface information.	**display mpls interface** [*interface-type interface-number*]
Display usage information for MPLS labels.	**display mpls label** { *label-value1* [**to** *label-value2*] | **all** }
Display LSP information.	**display mpls lsp** [**egress** | **in-label** *label-value* | **ingress** | **outgoing-interface** *interface-type interface-number* | **protocol** { **bgp** | **ldp** | **local** | **static** } | **transit**] [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length*] [**verbose**]
Display MPLS Nexthop Information Base (NIB) information.	**display mpls nib** [*nib-id*]
Display usage information for NIDs.	**display mpls nid** [*nid-value1* [**to** *nid-value2*]]
Display MPLS summary information.	**display mpls summary**

Example: Configuring static LSPs 3

Configuring a static LSP

About static LSP

A static label switched path (LSP) is established by manually specifying the incoming label and outgoing label on each node (ingress, transit, or egress node) of the forwarding path.

Static LSPs consume fewer resources, but they cannot automatically adapt to network topology changes. Therefore, static LSPs are suitable for small and stable networks with simple topologies.

Restrictions and guidelines: Static LSP configuration

The outgoing label specified on an LSR must be the same as the incoming label specified on the directly connected downstream LSR.

LSPs are unidirectional. You must configure an LSP for each direction of the data forwarding path.

Only advanced mode and expert mode support static LSP. For more information about system operating modes, see device management in *Fundamentals Configuration Guide*.

The device does not support MPLS forwarding for tunneled packets.

Prerequisites for static LSP

Before you configure a static LSP, perform the following tasks:

- Identify the ingress node, transit nodes, and egress node of the static LSP.
- Enable MPLS on all interfaces that participate in MPLS forwarding. For more information, see "Configuring basic MPLS."
- Make sure the ingress node has a route to the destination address of the LSP.

Configuring the ingress node of a static LSP

About this task

The ingress node of a static LSP performs the following operations:

1. Determines a Forwarding Equivalence Class (FEC) for a packet according to the destination address.
2. Adds the label for that FEC into the packet.
3. Forwards the packet to the next hop or out of the outgoing interface.

On the ingress node, you must specify the outgoing label for the destination address (the FEC) and the next hop or the outgoing interface.

Restrictions and guidelines

On the ingress node, if you specify a next hop, make sure the ingress node has an active route to the next hop address.

Procedure

1. Enter system view.

system-view

2. Configure the ingress node of a static LSP.

   static-lsp ingress *lsp-name* **destination** *ip-address* { *mask* | *mask-length* } { **nexthop** *next-hop-ip-address* | **outgoing-interface** *interface-type interface-number* } **out-label** *out-label*

Configuring a transit node of a static LSP

About this task

A transit node swaps the label carried in a received packet with an outgoing label, and forwards the packet to the next hop or out of the outgoing interface.

On a transit node, you must specify the incoming label, the outgoing label, and the next hop or the outgoing interface.

Restrictions and guidelines

On a transit node, if you specify a next hop, make sure the transit node has an active route to the next hop address.

Procedure

1. Enter system view.

   system-view

2. Configure a transit node of a static LSP.

   static-lsp transit *lsp-name* **in-label** *in-label* { **nexthop** *next-hop-ip-address* | **outgoing-interface** *interface-type interface-number* } **out-label** *out-label*

Configuring the egress node of a static LSP

About this task

If PHP is not configured, the egress node processes a received packet as follows:

1. Pops the incoming label of the packet.
2. Performs label forwarding according to the inner label of the packet or performs IP forwarding.

Therefore, you must perform this task to specify the incoming label on the egress node.

You do not need to perform this task if PHP is configured. To configure PHP for a static LSP, set the outgoing label to 0 or 3 on the penultimate hop of the static LSP.

You can associate a static LSP with an LDP LSP to simplify packet processing when the following conditions are met:

- Packets are forwarded over the static LSP and the LDP LSP to the destination.
- The egress node of the static LSP is also the ingress node of the LDP LSP.

To associate a static LSP with an LDP LSP, specify the incoming label and destination address on the egress node of the static LSP. After receiving a packet with the specified incoming label, the egress node of the static LSP swaps the label with the outgoing label for the LDP LSP. Then, the node forwards the packet to the next hop for the LDP LSP.

Restrictions and guidelines

On the egress node, if you specify a destination address, make sure the egress node has a route to the destination address.

Procedure

1. Enter system view.

   system-view

2. Configure the egress node of a static LSP.

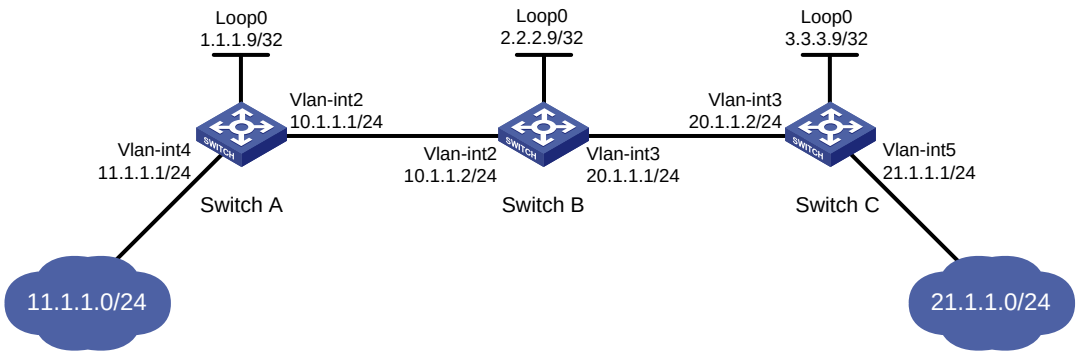
   static-lsp egress *lsp-name* **in-label** *in-label* [**destination** *ip-address* { *mask* | *mask-length* }]

Display and maintenance commands for static LSP

Execute **display** commands in any view.

Task	Command
Display static LSP information.	**display mpls static-lsp** [**lsp-name** *lsp-name* | **openflow**]

Static LSP configuration examples



Example: Configuring static LSPs

Network configuration

Switch A, Switch B, and Switch C all support MPLS.

Establish static LSPs between Switch A and Switch C, so that subnets 11.1.1.0/24 and 21.1.1.0/24 can access each other over MPLS.

Figure 1 Network diagram

Procedure

1. Create VLANs and assign IP addresses to interfaces:

   # Configure Switch A:

   ```
   <Sysname> system-view
   [Sysname] sysname SwitchA
   [SwitchA] vlan 2
   [SwitchA-vlan2] port gigabitethernet 1/0/1
   [SwitchA-vlan2] quit
   ```

```
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 24
[SwitchA-Vlan-interface2] undo shutdown
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ip address 11.1.1.1 24
[SwitchA-Vlan-interface4] undo shutdown
[SwitchA-Vlan-interface4] quit
[SwitchA] interface gigabitethernet 1/0/1
[SwitchA-GigabitEthernet1/0/1] undo shutdown
[SwitchA-GigabitEthernet1/0/1] quit
[SwitchA] interface gigabitethernet 1/0/2
[SwitchA-GigabitEthernet1/0/2] undo shutdown
[SwitchA-GigabitEthernet1/0/2] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 10.1.1.2 24
[SwitchB-Vlan-interface2] undo shutdown
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ip address 20.1.1.1 24
[SwitchB-Vlan-interface3] undo shutdown
[SwitchB-Vlan-interface3] quit
[SwitchB] interface gigabitethernet 1/0/1
[SwitchB-GigabitEthernet1/0/1] undo shutdown
[SwitchB-GigabitEthernet1/0/1] quit
[SwitchB] interface gigabitethernet 1/0/2
[SwitchB-GigabitEthernet1/0/2] undo shutdown
[SwitchB-GigabitEthernet1/0/2] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
```

```
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ip address 20.1.1.2 24
[SwitchC-Vlan-interface3] undo shutdown
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ip address 21.1.1.1 24
[SwitchC-Vlan-interface5] undo shutdown
[SwitchC-Vlan-interface5] quit
[SwitchC] interface gigabitethernet 1/0/1
[SwitchC-GigabitEthernet1/0/1] undo shutdown
[SwitchC-GigabitEthernet1/0/1] quit
[SwitchC] interface gigabitethernet 1/0/2
[SwitchC-GigabitEthernet1/0/2] undo shutdown
[SwitchC-GigabitEthernet1/0/2] quit
[SwitchC]interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] quit
```

2. Configure a static route to the destination address of each static LSP:

On Switch A, configure a static route to network 21.1.1.0/24.

```
[SwitchA] ip route-static 21.1.1.0 24 10.1.1.2
```

On Switch C, configure a static route to network 11.1.1.0/24.

```
[SwitchC] ip route-static 11.1.1.0 255.255.255.0 20.1.1.1
```

3. Configure basic MPLS on the switches:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] quit
```

4. Configure a static LSP from Switch A to Switch C:

Configure the LSP ingress node, Switch A.

```
[SwitchA] static-lsp ingress AtoC destination 21.1.1.0 24 nexthop 10.1.1.2 out-label
30
```

Configure the LSP transit node, Switch B.

```
[SwitchB] static-lsp transit AtoC in-label 30 nexthop 20.1.1.2 out-label 50
```

Configure the LSP egress node, Switch C.

```
[SwitchC] static-lsp egress AtoC in-label 50
```

5. Configure a static LSP from Switch C to Switch A:

Configure the LSP ingress node, Switch C.

```
[SwitchC] static-lsp ingress CtoA destination 11.1.1.0 24 nexthop 20.1.1.1 out-label
40
```

Configure the LSP transit node, Switch B.

```
[SwitchB] static-lsp transit CtoA in-label 40 nexthop 10.1.1.1 out-label 70
```

Configure the LSP egress node, Switch A.

```
[SwitchA] static-lsp egress CtoA in-label 70
```

Verifying the configuration

Display static LSP information on switches, for example, on Switch A.

```
[SwitchA] display mpls static-lsp
Total: 2
Name            FEC               In/Out Label Nexthop/Out Interface    State
AtoC            21.1.1.0/24       NULL/30      10.1.1.2                 Up
CtoA            -/-               70/NULL      -                        Up
```

Test the connectivity of the LSP from Switch A to Switch C.

```
[SwitchA] ping mpls -a 11.1.1.1 ipv4 21.1.1.0 24
MPLS ping FEC 21.1.1.0/24 with 100 bytes of data:
100 bytes from 20.1.1.2: Sequence=1 time=4 ms
100 bytes from 20.1.1.2: Sequence=2 time=1 ms
100 bytes from 20.1.1.2: Sequence=3 time=1 ms
100 bytes from 20.1.1.2: Sequence=4 time=1 ms
100 bytes from 20.1.1.2: Sequence=5 time=1 ms

--- Ping statistics for FEC 21.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/1/4 ms
```

Test the connectivity of the LSP from Switch C to Switch A.

```
[SwitchC] ping mpls -a 21.1.1.1 ipv4 11.1.1.0 24
MPLS ping FEC 11.1.1.0/24 with 100 bytes of data:
100 bytes from 10.1.1.1: Sequence=1 time=5 ms
100 bytes from 10.1.1.1: Sequence=2 time=1 ms
100 bytes from 10.1.1.1: Sequence=3 time=1 ms
100 bytes from 10.1.1.1: Sequence=4 time=1 ms
100 bytes from 10.1.1.1: Sequence=5 time=1 ms

--- Ping statistics for FEC 11.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/1/5 ms
```

Configuring LDP

About LDP

The Label Distribution Protocol (LDP) dynamically distributes FEC-label mapping information between LSRs to establish LSPs.

Terminology

LDP session

Two LSRs establish a TCP-based LDP session to exchange FEC-label mappings.

LDP peer

Two LSRs that use LDP to exchange FEC-label mappings are LSR peers.

Label spaces and LDP identifiers

Label spaces include the following types:

- **Per-interface label space**—Each interface uses a single, independent label space. Different interfaces can use the same label values.
- **Per-platform label space**—Each LSR uses a single label space. The device only supports the per-platform label space.

A six-byte LDP Identifier (LDP ID) identifies a label space on an LSR. It is in the format of <LSR ID>:<*label space number*>, where:

- The LSR ID takes four bytes to identity the LSR.
- The label space number takes two bytes to identify a label space within the LSR.

A label space number of 0 indicates that the label space is a per-platform label space. A label space number other than 0 indicates a per-interface label space.

LDP uses the same LDP ID format on IPv4 and IPv6 networks. An LDP ID must be globally unique.

FECs and FEC-label mappings

MPLS groups packets with the same characteristics (such as the same destination or service class) into a class, called an FEC. The packets of the same FEC are handled in the same way on an MPLS network.

An LSR assigns a label for an FEC and advertises the FEC-label mapping, or FEC-label binding, to its peers in a Label Mapping message.

LDP messages

LDP mainly uses the following types of messages:

- **Discovery messages**—Declare and maintain the presence of LSRs, such as Hello messages.
- **Session messages**—Establish, maintain, and terminate sessions between LDP peers, such as Initialization messages used for parameter negotiation and Keepalive messages used to maintain sessions.
- **Advertisement messages**—Create, alter, and remove FEC-label mappings, such as Label Mapping messages used to advertise FEC-label mappings.
- **Notification messages**—Provide advisory information and notify errors, such as Notification messages.

LDP uses UDP to transport discovery messages for efficiency, and uses TCP to transport session, advertisement, and notification messages for reliability.

LDP operation

LDP can operate on an IPv4 or IPv6 network, or a network where IPv4 coexists with IPv6. LDP operates similarly on IPv4 and IPv6 networks.

LDP operates in the following phases: discovering and maintaining LDP peers, establishing and maintaining LDP sessions, and establishing LSPs.

Discovering and maintaining LDP peers

LDP discovers peers in the following ways:

- **Basic Discovery**—Discovers directly connected LSRs.
  - On an IPv4 network, an LSR sends IPv4 Link Hello messages to multicast address 224.0.0.2. All directly connected LSRs can discover the LSR and establish an IPv4 Link Hello adjacency.
  - On an IPv6 network, an LSR sends IPv6 Link Hello messages to FF02:0:0:0:0:0:0:2. All directly connected LSRs can discover the LSR and establish an IPv6 Link Hello adjacency.
  - On a network where IPv4 and IPv6 coexist, an LSR sends both IPv4 and IPv6 Link Hello messages to each directly connected LSR and keeps both the IPv4 and IPv6 Link Hello adjacencies with a neighbor.
- **Extended Discovery**—Sends LDP IPv4 Targeted Hello messages to an IPv4 address or LDP IPv6 Targeted Hello messages to an IPv6 address. The destination LSR can discover the LSR and establish a hello adjacency. This mechanism is typically used in LDP session protection.

LDP can establish two hello adjacencies with a directly connected neighbor through both discovery mechanisms. It sends Hello messages at the hello interval to maintain a hello adjacency. If LDP receives no Hello message from a hello adjacency before the hello hold timer expires, it removes the hello adjacency.

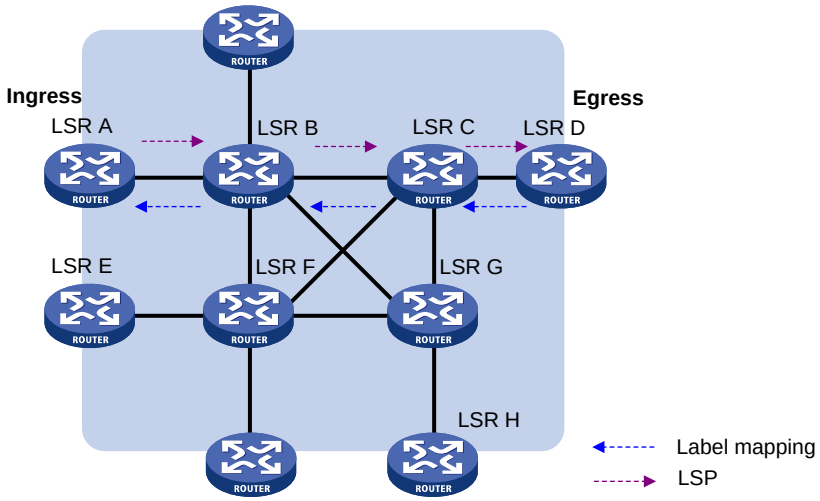
Establishing and maintaining LDP sessions

LDP establishes a session to a peer in the following steps:

1. Establishes a TCP connection to the neighbor.

   On a network where IPv4 and IPv6 coexist, LDP establishes an IPv6 TCP connection. If LDP does not receive new IPv6 Hello message in a long period of time, LDP tries to establish an IPv4 TCP connection.
2. Negotiates session parameters such as LDP version, label distribution method, and Keepalive timer, and establishes an LDP session to the neighbor if the negotiation succeeds.

After a session is established, LDP sends LDP PDUs (an LDP PDU carries one or more LDP messages) to maintain the session. If no information is exchanged between the LDP peers within the Keepalive interval, LDP sends Keepalive messages at the Keepalive interval to maintain the session. If LDP receives no LDP PDU from a neighbor before the keepalive hold timer expires, or the last hello adjacency with the neighbor is removed, LDP terminates the session.



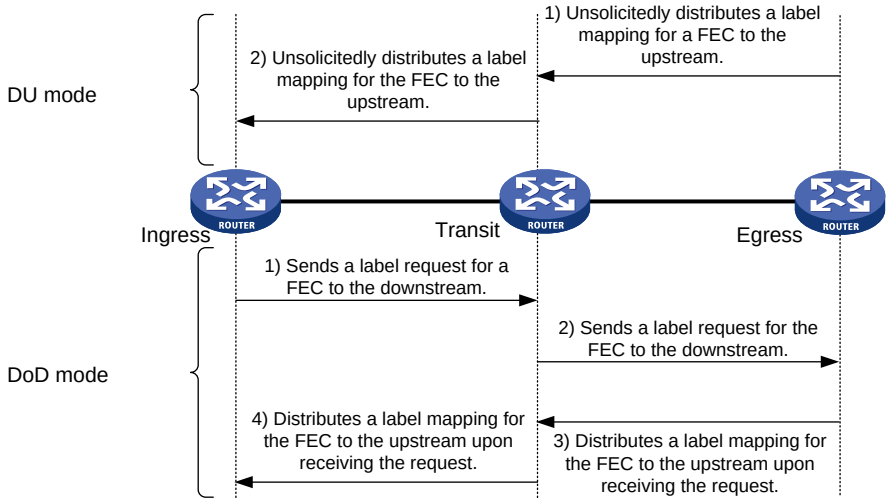
LDP can also send a Shutdown message to a neighbor to terminate the LDP session.

An LSR can establish only one LDP session to a neighbor. The session can be used to exchange IPv4 and IPv6 FEC-label mappings at the same time.

Establishing LSPs

LDP classifies FECs according to destination IP addresses in IP routing entries, creates FEC-label mappings, and advertises the mappings to LDP peers through LDP sessions. After an LDP peer receives an FEC-label mapping, it uses the received label and the label locally assigned to that FEC to create an LFIB entry for that FEC. When all LSRs (from the Ingress to the Egress) establish an LFIB entry for the FEC, an LSP is established exclusively for the FEC.

Figure 1 Dynamically establishing an LSP



Label distribution and control

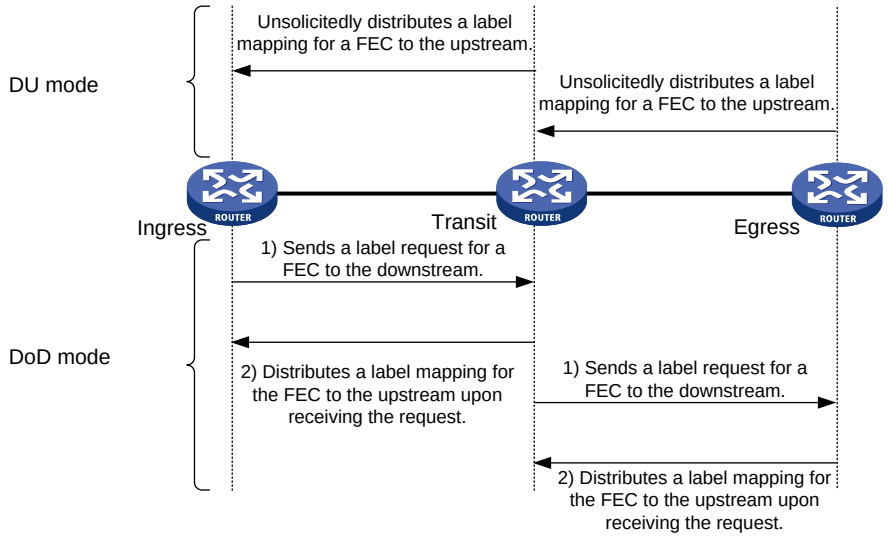
Label advertisement modes

LDP advertises label-FEC mappings in one of the following ways:

- **Downstream Unsolicited (DU) mode**—Distributes FEC-label mappings to the upstream LSR, without waiting for label requests. The device supports only the DU mode.
- **Downstream on Demand (DoD) mode**—Sends a label request for an FEC to the downstream LSR. After receiving the label request, the downstream LSR distributes the FEC-label mapping for that FEC to the upstream LSR.

Figure 2 Label advertisement modes

NOTE:



To successfully establish an LSP, a pair of upstream and downstream LSRs must use the same label advertisement mode.

Label distribution control

LDP controls label distribution in one of the following ways:

- **Independent label distribution**—Distributes an FEC-label mapping to an upstream LSR at any time. An LSR might distribute a mapping for an FEC to its upstream LSR before it receives a label mapping for that FEC from its downstream LSR. As shown in Figure 3, in DU mode, each LSR distributes a label mapping for an FEC to its upstream LSR whenever it is ready to label-switch the FEC. The LSRs do not need to wait for a label mapping for the FEC from its downstream LSR. In DoD mode, an LSR distributes a label mapping for an FEC to its upstream LSR after it receives a label request for the FEC. The LSR does not need to wait for a label mapping for the FEC from its downstream LSR.

  Figure 3 Independent label distribution control mode

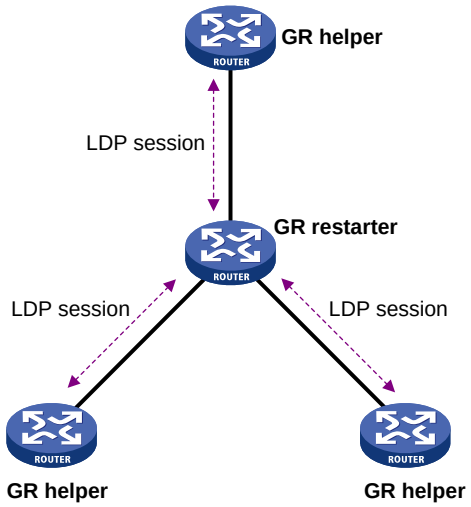
- **Ordered label distribution**—Distributes a label mapping for an FEC to its upstream LSR only after it receives a label mapping for that FEC from its downstream LSR unless the local node is the egress node of the FEC. As shown in Figure 2, in DU mode, an LSR distributes a label mapping for an FEC to its upstream LSR only if it receives a label mapping for the FEC from its downstream LSR. In DoD mode, when an LSR (Transit) receives a label request for an FEC from its upstream LSR (Ingress), it continues to send a label request for the FEC to its downstream LSR (Egress). After the transit LSR receives a label mapping for the FEC from the egress LSR, it distributes a label mapping for the FEC to the ingress LSR.

Label retention mode

The label retention mode specifies whether an LSR maintains a label mapping for an FEC learned from a neighbor that is not its next hop.

- **Liberal label retention**—Retains a received label mapping for an FEC regardless of whether the advertising LSR is the next hop of the FEC. This mechanism allows for quicker adaptation to topology changes, but it wastes system resources because LDP has to keep useless labels. The device only supports liberal label retention.
- **Conservative label retention**—Retains a received label mapping for an FEC only when the advertising LSR is the next hop of the FEC. This mechanism saves label resources, but it cannot quickly adapt to topology changes.

LDP GR



LDP Graceful Restart (GR) preserves label forwarding information when the signaling protocol or control plane fails, so that LSRs can still forward packets according to forwarding entries.

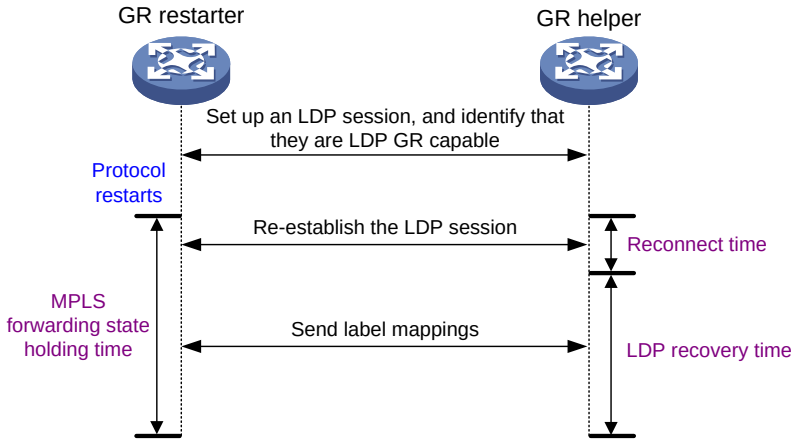
As shown in Figure 4, GR defines the following roles:

- **GR restarter**—An LSR that performs GR. It must be GR-capable.
- **GR helper**—A neighbor LSR that helps the GR restarter to complete GR.

The device can act as a GR restarter or a GR helper.

Figure 4 LDP GR

As shown in Figure 4, LDP GR operates as follows:



2. LSRs establish an LDP session. The L flag of the Fault Tolerance TLV in their Initialization messages is set to 1 to indicate that they support LDP GR.
3. When LDP restarts, the GR restarter starts the MPLS Forwarding State Holding timer, and marks the MPLS forwarding entries as stale. When the GR helper detects that the LDP session to the GR restarter goes down, it performs the following operations:
   a. Marks the FEC-label mappings learned from the session as stale.
   b. Starts the Reconnect timer received from the GR restarter.
4. After LDP completes restart, the GR restarter re-establishes an LDP session to the GR helper.
   - If the LDP session is not set up before the Reconnect timer expires, the GR helper deletes the stale FEC-label mappings and the corresponding MPLS forwarding entries.
   - If the LDP session is successfully set up before the Reconnect timer expires, the GR restarter sends the remaining time of the MPLS Forwarding State Holding timer to the GR helper.

     The remaining time is sent as the LDP Recovery time.
5. After the LDP session is re-established, the GR helper starts the LDP Recovery timer.
6. The GR restarter and the GR helper exchange label mappings and update their MPLS forwarding tables.

   The GR restarter compares each received label mapping against stale MPLS forwarding entries. If a match is found, the restarter deletes the stale mark for the matching entry. Otherwise, it adds a new entry for the label mapping.

   The GR helper compares each received label mapping against stale FEC-label mappings. If a match is found, the helper deletes the stale mark for the matching mapping. Otherwise, it adds the received FEC-label mapping and a new MPLS forwarding entry for the mapping.
7. When the MPLS Forwarding State Holding timer expires, the GR restarter deletes all stale MPLS forwarding entries.
8. When the LDP Recovery timer expires, the GR helper deletes all stale FEC-label mappings.

Figure 5 LDP GR operation

LDP NSR

To use LDP nonstop routing (NSR), the device must have a minimum of two MPUs.

LDP NSR ensures nonstop services of LDP when LDP has redundant processes on multiple MPUs. In contrast to Graceful Restart, NSR does not require an LDP peer to recover MPLS forwarding information.

LDP NSR backs up protocol states and data (including LDP session and LSP information) from the active process to the standby process. When the LDP active process fails, the standby process becomes active and takes over processing seamlessly. The LDP peers are not notified of the LDP interruption. The LDP session stays in Operational state, and the forwarding is not interrupted.

The LDP active process fails when one of the following situations occurs:

- The active process restarts.
- The MPU where the active process resides fails.
- The MPU where the active process resides performs an ISSU.
- The LDP process is operating at a different location than the one determined by the process placement feature.

LDP-IGP synchronization

Basic operating mechanism

LDP establishes LSPs based on the IGP optimal route. If LDP is not synchronized with IGP, MPLS traffic forwarding might be interrupted.

LDP is not synchronized with IGP when one of the following situations occurs:

- A link is up, and IGP advertises and uses this link. However, LDP LSPs on this link have not been established.
- An LDP session on a link is down, and LDP LSPs on the link have been removed. However, IGP still uses this link.
- The **Ordered** label distribution control mode is used. IGP used the link before the local device received the label mappings from the downstream LSR to establish LDP LSPs.

After LDP-IGP synchronization is enabled, IGP advertises the actual cost of a link only when LDP convergence on the link is completed. Before LDP convergence is completed, IGP advertises the maximum cost of the link. In this way, the link is visible on the IGP topology, but IGP does not select

this link as the optimal route when other links are available. Therefore, the device can avoid discarding MPLS packets when there is not an LDP LSP established on the optimal route.

LDP convergence on a link is completed when both the following situations occur:

- The local device establishes an LDP session to a minimum of one peer, and the LDP session is already in **Operational** state.
- The local device has distributed the label mappings to a minimum of one peer.

Notification delay for LDP convergence completion

By default, LDP immediately sends a notification to IGP that LDP convergence has completed. However, immediate notifications might cause MPLS traffic forwarding interruptions in one of the following scenarios:

- LDP peers use the **Ordered** label distribution control mode. The device has not received a label mapping from downstream at the time LDP notifies IGP that LDP convergence has completed.
- A large number of label mappings are distributed from downstream. Label advertisement is not completed when LDP notifies IGP that LDP convergence has completed.

To avoid traffic forwarding interruptions in these scenarios, configure the notification delay. When LDP convergence on a link is completed, LDP waits before notifying IGP.

Notification delay for LDP restart or active/standby switchover

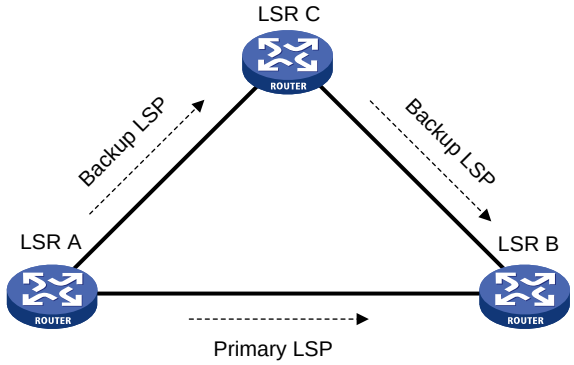
When an LDP restart or an active/standby switchover occurs, LDP takes time to converge, and LDP notifies IGP of the LDP-IGP synchronization status as follows:

- If a notification delay is not configured, LDP immediately notifies IGP of the current synchronization states during convergence, and then updates the states after LDP convergence. This could impact IGP processing.
- If a notification delay is configured, LDP notifies IGP of the LDP-IGP synchronization states in bulk when one of the following events occurs:
  - LDP recovers to the state before the restart or switchover.
  - The maximum delay timer expires.

LDP FRR

LDP LFA FRR

A link or router failure on a path can cause packet loss until LDP establishes a new LSP on the new path. LDP Loop Free Alternate (LFA) FRR enables fast rerouting to minimize the failover time. LDP FRR is based on IP FRR and is enabled automatically after IP FRR is enabled.



You can use one of the following methods to enable IP FRR:

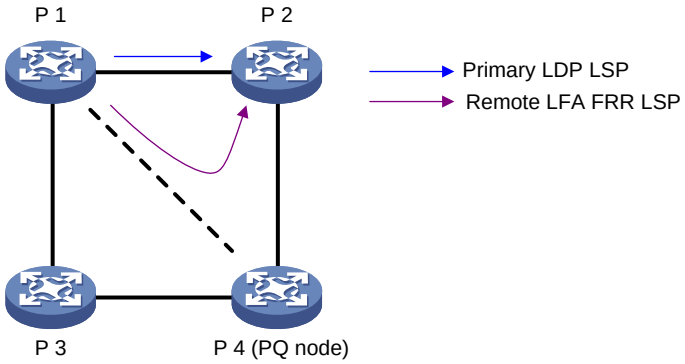
- Configure an IGP to automatically calculate a backup next hop.
- Configure an IGP to specify a backup next hop by using a routing policy.

As shown in Figure 6, configure IP FRR on LSR A. The IGP automatically calculates a backup next hop or it specifies a backup next hop through a routing policy. LDP creates a primary LSP and a backup LSP according to the primary route and the backup route calculated by IGP. When the primary LSP operates correctly, it forwards the MPLS packets. When the primary LSP fails, LDP directs packets to the backup LSP.

When packets are forwarded through the backup LSP, IGP calculates the optimal path based on the new network topology. When IGP route convergence occurs, LDP establishes a new LSP according to the optimal path. If a new LSP is not established after IGP route convergence, traffic forwarding might be interrupted. As a best practice, enable LDP-IGP synchronization to work with LDP LFA FRR to reduce traffic interruption.

Figure 6 Network diagram for LDP LFA FRR

LDP remote LFA FRR



LDP LFA FRR might not be able to compute backup paths for full backup coverage on a large-scale network. To address this issue, you can deploy LDP remote LFA FRR.

As shown in Figure 7, P 1 is the source node. P 2 is the destination node. The primary LDP LSP is P 1—P 2. LDP remote LFA FRR can establish a backup LDP LSP (P 1—P 4—P 2) to protect the primary LDP LSP, as follows:

1. The IGP calculates the PQ node (P 4) using the remote LFA algorithm.
2. LDP does the following:
   a. Automatically creates the remote peer according to the PQ node address.
   b. Establishes the remote LDP session between the source node and the PQ node.
   c. Assigns a label to the destination address on the session so as to establish the remote LFA FRR LSP (P 1—P 4—P 2).

When the primary LDP LSP fails, P 1 instantly switches traffic to the remote LFA FRR LSP to minimize traffic loss. For more information about remote LFA, see IS-IS configuration in *Layer 3—IP Routing Configuration Guide*.

Figure 7 LDP remote LFA FRR

LDP diagnostic troubleshooting

Use LDP diagnostic troubleshooting to verify whether the LDP module is running correctly. For example, whether LDP sessions can be established successfully and whether LDP peers run correctly without flapping. For more information about LDP diagnostic troubleshooting, see diagnostic troubleshooting configuration in *Network Management and Monitoring Configuration Guide*.

Protocols

- RFC 5036, *LDP Specification*
- *draft-ietf-mpls-ldp-ipv6-09.txt*

Restrictions and guidelines: LDP configuration

Only advanced mode and expert mode support LDP. For more information about system operating modes, see device management in *Fundamentals Configuration Guide*.

The device does not support MPLS forwarding for tunneled packets.

LDP tasks at a glance

To configure LDP, perform the following tasks:

1. Enabling LDP
2. (Optional.) Tuning and optimizing LDP
   - Configuring Hello parameters
   - Configuring LDP session parameters
   - Configuring LDP backoff
   - Setting a DSCP value for outgoing LDP packets
3. (Optional.) Tuning and controlling LSP generation
   - Configuring LDP to redistribute BGP unicast routes
   - Configuring an LSP generation policy
   - Configuring a label mapping propagation policy
4. (Optional.) Distributing and managing LDP labels
   - Configuring the LDP label distribution control mode
   - Configuring a label advertisement policy
   - Configuring a label acceptance policy
   - Disabling distribution of public label mappings to remote LDP peers
5. (Optional.) Configuring LDP MD5 authentication
6. (Optional.) Configuring LDP loop detection parameters

   This feature is applicable to an MPLS network where most of the devices do not support the TTL mechanism, such as ATM switches.
7. (Optional.) Enhancing LDP availability
   - Configuring LDP session protection
   - Configuring LDP GR
   - Configuring LDP NSR
   - Configuring LDP-IGP synchronization
   - Configuring LDP FRR
8. (Optional.) Enabling SNMP notifications for LDP
9. (Optional.) Enabling private SNMP notifications for LDP

Enabling LDP

Restrictions and guidelines for enabling LDP

To enable LDP, you must first enable LDP globally and then enable LDP on relevant interfaces.

Enabling LDP globally

1. Enter system view.
   system-view
2. Enable LDP for the local node or for a VPN.
   - Enable LDP for the local node and enter LDP view.
     mpls ldp
   - Execute the following commands in sequence to enable LDP for a VPN, and then enter LDP-VPN instance view:
     mpls ldp
     vpn-instance *vpn-instance-name*

   By default, LDP is globally disabled.
3. Configure an LDP LSR ID.
   lsr-id *lsr-id*
   By default, the LDP LSR ID is the same as the MPLS LSR ID.

Enabling LDP on an interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   If the interface is bound to a VPN instance, you must enable LDP for the VPN instance by using the **vpn-instance** command in LDP view.
3. Enable IPv4 LDP on the interface.
   mpls ldp enable
   By default, IPv4 LDP is disabled on an interface.
4. Enable IPv6 LDP on the interface.
   mpls ldp ipv6 enable
   By default, IPv6 LDP is disabled on an interface.

Configuring Hello parameters

About hello timers

LDP has the following hello timers:

- Link Hello hold time and Link Hello interval.

If an interface is enabled with both IPv4 LDP and IPv6 LDP, the parameters configured on the interface can be used for both IPv4 and IPv6 Link Hello messages.

- Targeted Hello hold time and Targeted Hello interval for a peer.

Restrictions and guidelines for hello parameter configuration

Changes to hello parameters do not take effect on established LDP sessions. To apply the changes to existing LDP sessions on a network, you must use the **reset mpls ldp** command to reset all LDP sessions on that network.

Setting Link Hello timers

1. Enter system view.
   system-view
2. Enter the view of the interface where you want to establish an LDP session.
   interface *interface-type interface-number*
3. Set the Link Hello hold time.
   mpls ldp timer hello-hold *timeout*
   By default, the Link Hello hold time is 15 seconds.
4. Set the Link Hello interval.
   mpls ldp timer hello-interval *interval*
   By default, the Link Hello interval is 5 seconds.

Setting Targeted Hello timers for an LDP peer

1. Enter system view.
   system-view
2. Enter LDP view.
   mpls ldp
3. Specify an LDP peer and enter LDP peer view. The device will send unsolicited Targeted Hellos to the peer and can respond to the Targeted Hellos received from the peer.
   targeted-peer { *ipv4-address* | *ipv6-address* } [*peer-name*]
   By default, the device does not send Targeted Hellos to a peer, or respond to Targeted Hellos received from a peer.
4. Set the Targeted Hello hold time.
   mpls ldp timer hello-hold *timeout*
   By default, the Targeted Hello hold time is 45 seconds.
5. Set the Target Hello interval.
   mpls ldp timer hello-interval *interval*
   By default, the Targeted Hello interval is 15 seconds.

Configuring LDP session parameters

About LDP session parameters

An LDP session has the following parameters:

- Keepalive hold time and Keepalive interval.
- LDP transport address—IP address for establishing TCP connections.

LDP uses Basic Discovery and Extended Discovery mechanisms to discovery LDP peers and establish LDP sessions with them.

Restrictions and guidelines for configuring LDP session parameters

When you configure LDP session parameters, follow these guidelines:

- The configured LDP transport address must be the IP address of an up interface on the device. Otherwise, no LDP session can be established.
- Make sure the LDP transport addresses of the local and peer LSRs can reach each other. Otherwise, no TCP connection can be established.
- Changes to LDP session parameters do not take effect on established LDP sessions. To apply the changes to existing LDP sessions on a network, you must use the **reset mpls ldp** command to reset all LDP sessions on that network.

Configuring LDP sessions parameters for Basic Discovery mechanism

1. Enter system view.

   system-view
2. Enter the view of the LDP session interface (the interface where you want to establish an LDP session).

   interface *interface-type interface-number*
3. Set the Keepalive hold time.

   mpls ldp timer keepalive-hold *timeout*

   By default, the Keepalive hold time is 45 seconds.
4. Set the Keepalive interval.

   mpls ldp timer keepalive-interval *interval*

   By default, the Keepalive interval is 15 seconds.
5. Configure the IPv4 LDP transport address.

   mpls ldp transport-address { *ipv4-address* | **interface** }

   The default LDP IPv4 transport address is the local LSR ID if the interface where you want to establish an LDP session belongs to the public network. If the interface belongs to a VPN, the default LDP IPv4 transport address is the primary IP address of the interface.

   If the LDP session interface belongs to a VPN instance, the interface with the IP address specified by this command must belong to the same VPN instance.
6. Configure the IPv6 LDP transport address.

   mpls ldp transport-address *ipv6-address*

   By default, no IPv6 LDP transport address is specified.

Configuring LDP IPv4 sessions parameters for Extended Discovery mechanism

1. Enter system view.

   system-view

2. Enter LDP view.

   mpls ldp

3. Specify an IPv4 LDP peer and enter LDP peer view. The device will send unsolicited IPv4 Targeted Hellos to the peer and can respond to IPv4 Targeted Hellos received from the targeted peer.

   targeted-peer *ipv4-address* [*peer-name*]

   By default, the device does not send IPv4 Targeted Hellos to a peer, or respond to IPv4 Targeted Hellos received from a peer.

4. Set the Keepalive hold time.

   mpls ldp timer keepalive-hold *timeout*

   By default, the Keepalive hold time is 45 seconds.

5. Set the Keepalive interval.

   mpls ldp timer keepalive-interval *interval*

   By default, the Keepalive interval is 15 seconds.

6. Configure the LDP transport address.

   mpls ldp transport-address *ipv4-address*

   By default, the LDP transport address is the LSR ID of the local device.

Configuring LDP IPv6 sessions parameters for Extended Discovery mechanism

1. Enter system view.

   system-view

2. Enter LDP view.

   mpls ldp

3. Specify an IPv6 LDP peer and enter LDP peer view. The device will send unsolicited IPv6 Targeted Hellos to the peer and can respond to IPv6 Targeted Hellos received from the targeted IPv6 peer.

   targeted-peer *ipv6-address* [*peer-name*]

   By default, the device does not send IPv6 Targeted Hellos to a peer, or respond to IPv6 Targeted Hellos received from a peer.

4. Set the Keepalive hold time.

   mpls ldp timer keepalive-hold *timeout*

   By default, the Keepalive hold time is 45 seconds.

5. Set the Keepalive interval.

   mpls ldp timer keepalive-interval *interval*

   By default, the Keepalive interval is 15 seconds.

6. Configure the LDP transport address.

   mpls ldp transport-address *ipv6-address*

   By default, the LDP IPv6 transport address is not configured.

Configuring LDP backoff

About this task

If LDP session parameters (for example, the label advertisement mode) are incompatible, two LDP peers cannot establish a session, and they will keep negotiating with each other.

The LDP backoff mechanism can mitigate this problem by using an initial delay timer and a maximum delay timer. After failing to establish a session to a peer LSR for the first time, LDP does not start an attempt until the initial delay timer expires. If the session setup fails again, LDP waits for two times the initial delay before the next attempt, and so forth until the maximum delay time is reached. After that, the maximum delay time will always take effect.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view:
     mpls ldp
   - Execute the following commands in sequence to enter LDP-VPN instance view:
     mpls ldp
     vpn-instance *vpn-instance-name*
3. Set the initial delay time and maximum delay time.
   backoff initial *initial-time* **maximum** *maximum-time*
   By default, the initial delay time is 15 seconds, and the maximum delay time is 120 seconds.

Setting a DSCP value for outgoing LDP packets

About this task

To control the transmission preference of outgoing LDP packets, set a DSCP value for outgoing LDP packets.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view.
   mpls ldp
3. Set a DSCP value for outgoing LDP packets.
   dscp *dscp-value*
   By default, the DSCP value for outgoing LDP packets is 48.

Configuring LDP to redistribute BGP unicast routes

About this task

By default, LDP automatically redistributes IGP routes, including the BGP routes that have been redistributed into IGP. Then, LDP assigns labels to the IGP routes and labeled BGP routes, if these

routes are permitted by an LSP generation policy. LDP does not automatically redistribute BGP unicast routes if the routes are not redistributed into the IGP.

For example, on a carrier's carrier network where IGP is not configured between a PE of a Level 1 carrier and a CE of a Level 2 carrier, LDP cannot redistribute BGP unicast routes to assign labels to them. For this network to operate correctly, you can enable LDP to redistribute BGP unicast routes. If the routes are permitted by an LSP generation policy, LDP assigns labels to them to establish LSPs. For more information about carrier's carrier, see "Configuring MPLS L3VPN."

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view.
     mpls ldp
   - Execute the following commands in sequence to enter LDP-VPN instance view:
     mpls ldp
     vpn-instance *vpn-instance-name*
3. Enable LDP to redistribute BGP IPv4 unicast routes.
   import bgp [*as-number*]
   By default, LDP does not redistribute BGP IPv4 unicast routes.
4. Enable LDP to redistribute BGP IPv6 unicast routes.
   ipv6 import bgp [*as-number*]
   By default, LDP does not redistribute BGP IPv6 unicast routes.

Configuring an LSP generation policy

About this task

LDP assigns labels to the routes that have been redistributed into LDP to generate LSPs. An LSP generation policy specifies which redistributed routes can be used by LDP to generate LSPs to control the number of LSPs, as follows:

- Use all routes to establish LSPs.
  On loopback interfaces, only routes with a 32-bit mask can trigger LDP to establish LSPs.
- Use the routes permitted by an IP prefix list to establish LSPs. For information about IP prefix list configuration, see *Layer 3—IP Routing Configuration Guide*.
- Use only IPv4 host routes with a 32-bit mask or IPv6 host routes with a 128-bit prefix to establish LSPs.

Restrictions and guidelines

By default, LDP uses only IPv4 host routes with a 32-bit mask or IPv6 host routes with a 128-bit prefix to establish LSPs. The other two methods can result in more LSPs than the default policy. To change the policy, make sure the system resources and bandwidth resources are sufficient.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view.

mpls ldp

- Execute the following commands in sequence to enter LDP-VPN instance view:

  mpls ldp

  vpn-instance *vpn-instance-name*

3. Configure an IPv4 LSP generation policy.

   lsp-trigger { **all** | **prefix-list** *prefix-list-name* }

   By default, LDP uses only the redistributed IPv4 routes with a 32-bit mask to establish LSPs.

4. Configure an IPv6 LSP generation policy.

   ipv6 lsp-trigger { **all** | **prefix-list** *prefix-list-name* }

   By default, LDP uses only the redistributed IPv6 routes with a 128-bit prefix to establish LSPs.

Configuring a label mapping propagation policy

About this task

In an LDP network, LSRs establish LSPs by advertising label mapping messages. When a PE acts as both an ingress LSR and a transit LSR, there might be a large number of transit LSPs on the PE. You can configure a label mapping propagation policy on the PE to reduce the number of transit LSPs and thus save network resources. A label mapping propagation policy allows the PE to advertise only permitted label mappings to the peers to establish transit LSPs.

Restrictions and guidelines

If you execute both the **lsp-trigger** and **propagate mapping** commands, establishment of transit LSPs is controlled by the **propagate mapping** command.

Procedure

1. Enter system view.

   system-view

2. Enter LDP view or LDP-VPN instance view.

   - Enter LDP view.

     mpls ldp

   - Execute the following commands in sequence to enter LDP-VPN instance view:

     mpls ldp

     vpn-instance *vpn-instance-name*

3. Configure a label mapping propagation policy.

   propagate mapping { **none** | **prefix-list** *prefix-list-name* }

   By default, no label mapping propagation policy is configured. The device advertises all IPv4 prefix label mappings permitted by the LSP generation policy.

Configuring the LDP label distribution control mode

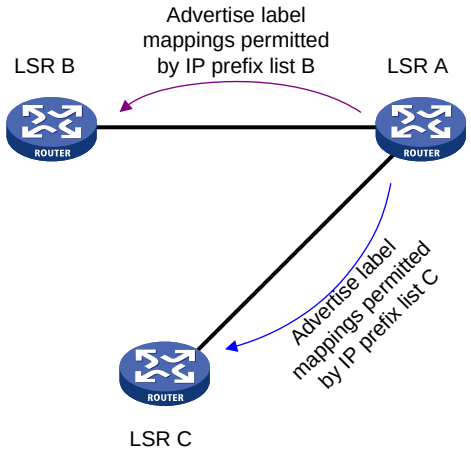
1. Enter system view.

   system-view

2. Enter LDP view or enter LDP-VPN instance view.

- Enter LDP view.
  mpls ldp
- Execute the following commands in sequence to enter LDP-VPN instance view:
  mpls ldp
  vpn-instance *vpn-instance-name*

3. Configure the label distribution control mode.
   label-distribution { **independent** | **ordered** }
   By default, the Ordered label distribution mode is used.



Configuring a label advertisement policy

About this task

A label advertisement policy uses IP prefix lists to control the FEC-label mappings advertised to peers.

As shown in Figure 8, LSR A advertises label mappings for FECs permitted by IP prefix list B to LSR B. It advertises label mappings for FECs permitted by IP prefix list C to LSR C.

Figure 8 Label advertisement control diagram

Restrictions and guidelines

A label advertisement policy on an LSR and a label acceptance policy on its upstream LSR can achieve the same purpose. As a best practice, use label advertisement policies to reduce network load if downstream LSRs support label advertisement control.

Before you configure an LDP label advertisement policy, create an IP prefix list. For information about IP prefix list configuration, see routing policy configuration in *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view.
     mpls ldp
   - Execute the following commands in sequence to enter LDP-VPN instance view:
     mpls ldp

vpn-instance *vpn-instance-name*

3. Configure an IPv4 label advertisement policy.

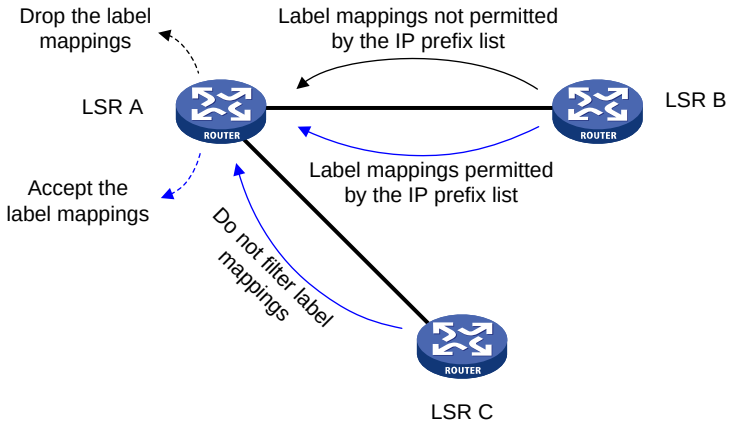
   advertise-label prefix-list *prefix-list-name* [**peer** *peer-prefix-list-name*]

   By default, LDP advertises all IPv4 FEC-label mappings permitted by the LSP generation policy to all peers.

4. Configure an IPv6 label advertisement policy.

   ipv6 advertise-label prefix-list *prefix-list-name* [**peer** *peer-prefix-list-name*]

   By default, LDP advertises all IPv6 FEC-label mappings permitted by the LSP generation policy to all peers.



Configuring a label acceptance policy

About this task

A label acceptance policy uses an IP prefix list to control the label mappings received from a peer.

As shown in Figure 9, LSR A uses an IP prefix list to filter label mappings from LSR B, and it does not filter label mappings from LSR C.

Figure 9 Label acceptance control diagram

Restrictions and guidelines

A label advertisement policy on an LSR and a label acceptance policy on its upstream LSR can achieve the same purpose. As a best practice, use the label advertisement policy to reduce network load.

You must create an IP prefix list before you configure a label acceptance policy. For information about IP prefix list configuration, see routing policy configuration in *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

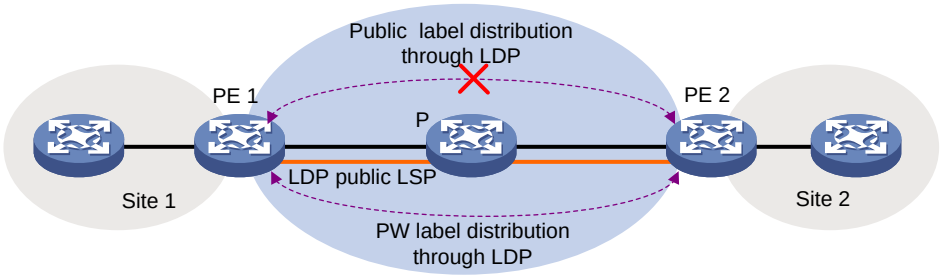
2. Enter LDP view or enter LDP-VPN instance view.

   - Enter LDP view.

     mpls ldp

- Execute the following commands in sequence to enter LDP-VPN instance view:
  mpls ldp
  vpn-instance *vpn-instance-name*

3. Configure an IPv4 label acceptance policy.
   accept-label peer *peer-lsr-id* **prefix-list** *prefix-list-name*
   By default, LDP accepts all IPv4 FEC-label mappings.
4. Configure an IPv6 label acceptance policy.
   ipv6 accept-label peer *peer-lsr-id* **prefix-list** *prefix-list-name*
   By default, LDP accepts all IPv6 FEC-label mappings.



Disabling distribution of public label mappings to remote LDP peers

About this task

As shown in Figure 10, PEs on an MPLS L2VPN or VPLS network that uses LDP as the signaling protocol must establish remote LDP sessions to distribute the label mappings for PW label assignment. Typically, the public tunnel that transports PWs is established hop by hop with P devices in between, rather than directly between PEs. It is not necessary to distribute public labels on the remote LDP session between PEs.

By default, LDP distributes public label mappings to remote peers through remote LDP sessions. This causes PEs to store public labels unnecessarily. To conserve system resources, disable LDP from distributing public label mappings to its remote peers.

Figure 10 Disabling distribution of public label mappings to remote LDP peers

Restrictions and guidelines

This feature does not affect PW label distribution via LDP for L2VPN.

To prevent LDP from distributing public label mappings to any remote peers, use the **targeted-peer label-mapping restricted** command in LDP view. To prevent LDP from distributing public label mappings to a remote peer, use the **label-mapping disable** command in LDP peer view. For a remote LDP peer, the configuration in its peer view takes priority over the configuration in LDP view. The configuration in LDP view takes effect only if no setting is configured for this feature in LDP peer view.

This feature does not apply to the remote LDP sessions established by using the **accept target-hello** command or by the remote LFA feature. These types of remote LDP sessions can distribute public label mappings, whether this feature is enabled or not.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view.
   mpls ldp
3. Disable distribution of public label mappings to any remote peers
   targeted-peer label-mapping restricted
   By default, the system allows distribution of public label mappings to remote peers.
4. Enter LDP peer view.
   targeted-peer *ipv4-address*
5. Enable or disable distribution of public label mappings to the specified remote LDP peer.
   label-mapping { **enable** | **disable** }
   By default, distribution of public label mappings to remote peers depends on the setting for the **targeted-peer label-mapping restricted** command in LDP view.
   To have this command take effect, make sure the address specified in the **targeted-peer** command is the LSR ID of a remote device.

Configuring LDP MD5 authentication

About this task

To improve security for LDP sessions, you can configure MD5 authentication for the underlying TCP connections to check the integrity of LDP messages.

Restrictions and guidelines

For two LDP peers to establish an LDP session successfully, make sure the LDP MD5 authentication configuration on the LDP peers are consistent.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view.
     mpls ldp
   - Execute the following commands in sequence to enter LDP-VPN instance view:
     mpls ldp
     vpn-instance *vpn-instance-name*
3. Enable LDP MD5 authentication.
   md5-authentication *peer-lsr-id* { **cipher** | **plain** } *string*
   By default, LDP MD5 authentication is disabled.

Configuring LDP loop detection parameters

About this task

The device does not support LDP loop detection. However, you must configure LDP loop detection parameters on the device so the device can establish an LDP session with a neighbor in the following situation:

- The neighbor device supports LDP loop detection.
- The neighbor device requires both devices of the LDP session to advertise the same loop detection settings during LDP session negotiation.

Restrictions and guidelines

Configuring LDP loop detection parameters enables the device to have the loop detection negotiation capability during LDP session establishment. The device still cannot perform LDP loop detection.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view or enter LDP-VPN instance view.
   - Enter LDP view.
     mpls ldp
   - Execute the following commands in sequence to enter LDP-VPN instance view:
     mpls ldp
     vpn-instance *vpn-instance-name*
3. Enable loop detection.
   loop-detect
   By default, loop detection is disabled.
4. (Optional.) Set the maximum hop count.
   maxhops *hop-number*
   By default, the maximum hop count is 32.
5. (Optional.) Set the path vector limit.
   pv-limit *pv-number*
   By default, the path vector limit is 32.

Configuring LDP session protection

About this task

If two LDP peers have both a direct link and an indirect link in between, you can configure this feature to protect their LDP session when the direct link fails.

LDP establishes both a Link Hello adjacency over the direct link and a Targeted Hello adjacency over the indirect link with the peer. When the direct link fails, LDP deletes the Link Hello adjacency but still maintains the Targeted Hello adjacency. In this way, the LDP session between the two peers is kept available, and the FEC-label mappings based on this session are not deleted. When the direct link recovers, the LDP peers do not need to re-establish the LDP session or re-learn the FEC-label mappings.

When you enable the session protection feature, you can also specify the session protection duration. If the Link Hello adjacency does not recover within the duration, LDP deletes the Targeted Hello adjacency and the LDP session. If you do not specify the session protection duration, the two peers will always maintain the LDP session over the Targeted Hello adjacency.

Restrictions and guidelines

LDP session protection is applicable only to IPv4 networks.

Procedure

1. Enter system view.

system-view

2. Enter LDP view.
   mpls ldp
3. Enable the session protection feature.
   session protection [**duration** *time*] [**peer** *peer-prefix-list-name*]
   By default, session protection is disabled.

Configuring LDP GR

Prerequisites

Before you configure LDP GR, enable LDP on the GR restarter and GR helpers.

Restrictions and guidelines

The LDP GR configuration is required only on a GR restarter. Because the role (GR restarter or helper) of a device in a GR process is unpredictable, configure LDP GR on all involved devices as a best practice.

Procedure

1. Enter system view.
   system-view
2. Enter LDP view.
   mpls ldp
3. Enable LDP GR.
   graceful-restart
   By default, LDP GR is disabled.
4. (Optional.) Set the Reconnect timer for LDP GR.
   graceful-restart timer reconnect *reconnect-time*
   By default, the Reconnect time is 120 seconds.
5. (Optional.) Set the MPLS Forwarding State Holding timer for LDP GR.
   graceful-restart timer forwarding-hold *hold-time*
   By default, the MPLS Forwarding State Holding time is 180 seconds.

Configuring LDP NSR

1. Enter system view.
   system-view
2. Enter LDP view.
   mpls ldp
3. Enable LDP NSR.
   non-stop-routing
   By default, LDP NSR is disabled.

Configuring LDP-IGP synchronization

Restrictions and guidelines for LDP-IGP synchronization

After you enable LDP-IGP synchronization for an OSPF process, OSPF area, or an IS-IS process, LDP-IGP synchronization is enabled on the OSPF process interfaces or the IS-IS process interfaces.

You can execute the **mpls ldp igp sync disable** command to disable LDP-IGP synchronization on interfaces where LDP-IGP synchronization is not required.

LDP-IGP synchronization protection is only applicable to an IPv4 network.

LDP-IGP synchronization is not supported for an OSPF process and its OSPF areas if the OSPF process belongs to a VPN instance.

LDP-IGP synchronization is not supported for an IS-IS process that belongs to a VPN instance.

Configuring LDP-OSPF synchronization

Configuring LDP-OSPF synchronization for an OSPF process

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enable LDP-OSPF synchronization.
   mpls ldp sync
   By default, LDP-OSPF synchronization is disabled.
4. (Optional.) Disable LDP-OSPF synchronization on an interface:
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
   c. Disable LDP-IGP synchronization on the interface.
      mpls ldp igp sync disable
      By default, LDP-IGP synchronization is enabled on an interface.
5. (Optional.) Configure LDP-OSPF synchronization parameters:
   a. Return to system view.
      quit
   b. Enter LDP view.
      mpls ldp
   c. Set the delay for LDP to notify IGP of the LDP convergence.
      igp sync delay *time*
      By default, LDP immediately notifies IGP of the LDP convergence completion.
   d. Set the maximum delay for LDP to notify IGP of the LDP-IGP synchronization status after an LDP restart or active/standby switchover.
      igp sync delay on-restart *time*
      By default, the maximum notification delay is 90 seconds.

Configuring LDP-OSPF synchronization for an OSPF area

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id*] *
3. Enter area view.
   area *area-id*
4. Enable LDP-OSPF synchronization.
   mpls ldp sync
   By default, LDP-OSPF synchronization is disabled.
5. (Optional.) Disable LDP-OSPF synchronization on an interface:
   a. Return to system view.
      quit
   b. Enter interface view.
      interface *interface-type interface-number*
   c. Disable LDP-IGP synchronization on the interface.
      mpls ldp igp sync disable
      By default, LDP-IGP synchronization is enabled on an interface.
6. (Optional.) Configure LDP-OSPF synchronization parameters:
   a. Return to system view.
      quit
   b. Enter LDP view.
      mpls ldp
   c. Set the delay for LDP to notify IGP of the LDP convergence.
      igp sync delay *time*
      By default, LDP immediately notifies IGP of the LDP convergence completion.
   d. Set the maximum delay for LDP to notify IGP of the LDP-IGP synchronization status after an LDP restart or active/standby switchover.
      igp sync delay on-restart *time*
      By default, the maximum notification delay is 90 seconds.

Configuring LDP IS-IS synchronization

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis [*process-id*]
3. Enable LDP-ISIS synchronization.
   mpls ldp sync [**level-1** | **level-2**]
   By default, LDP-ISIS synchronization is disabled.
4. (Optional.) Disable LDP-ISIS synchronization on an interface:
   a. Return to system view.
      quit
   b. Enter interface view.

interface *interface-type interface-number*

c. Disable LDP-IGP synchronization on the interface.

mpls ldp igp sync disable

By default, LDP-IGP synchronization is enabled on an interface.

5. (Optional.) Configure LDP-IGP synchronization parameters:

a. Return to system view.

quit

b. Enter LDP view.

mpls ldp

c. Set the delay for LDP to notify IGP of the LDP convergence completion.

igp sync delay *time*

By default, LDP immediately notifies IGP of the LDP convergence completion.

d. Set the maximum delay for LDP to notify IGP of the LDP-IGP synchronization status after an LDP restart or an active/standby switchover occurs.

igp sync delay on-restart *time*

By default, the maximum notification delay is 90 seconds.

Configuring LDP FRR

Configuring LDP LFA FRR

LDP FRR is based on IP FRR, and is enabled automatically after IP FRR is enabled. For information about configuring IP FRR, see *Layer 3—IP Routing Configuration Guide*.

Configuring LDP remote LFA FRR

Restrictions and guidelines

In a remote LFA network, configure this feature on the PQ nodes.

Procedure

1. Enter system view.

system-view

2. Enter LDP view.

mpls ldp

3. Enable the device to automatically set up targeted LDP sessions on receiving Targeted Hellos.

accept target-hello { **all** | **prefix-list** *prefix-list-name* }

By default, the device does not automatically establish targeted LDP sessions when it receives Targeted Hellos.

Enabling SNMP notifications for LDP

About this task

This command enables generating SNMP notifications for LDP upon LDP session changes, as defined in RFC 3815. For LDP event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for LDP.
   snmp-agent trap enable ldp
   By default, SNMP notifications for LDP are enabled.

Enabling private SNMP notifications for LDP

About this task

This feature enables generating SNMP notifications for the following events:

- LDP configuration consistency checks on multiple links between LDP peers.
- The number of LDP sessions exceeds the upper threshold.
- The number of LDP sessions drops below the lower threshold from the upper threshold.

These notifications are not defined in an RFC and are private LDP notifications supported by Comware. For SNMP to output the private LDP notifications correctly, you must also configure parameters for sending SNMP notifications. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enable private SNMP notifications for LDP.
   snmp-agent trap enable ldp-private
   By default, private SNMP notifications for LDP are disabled.

Display and maintenance commands for LDP

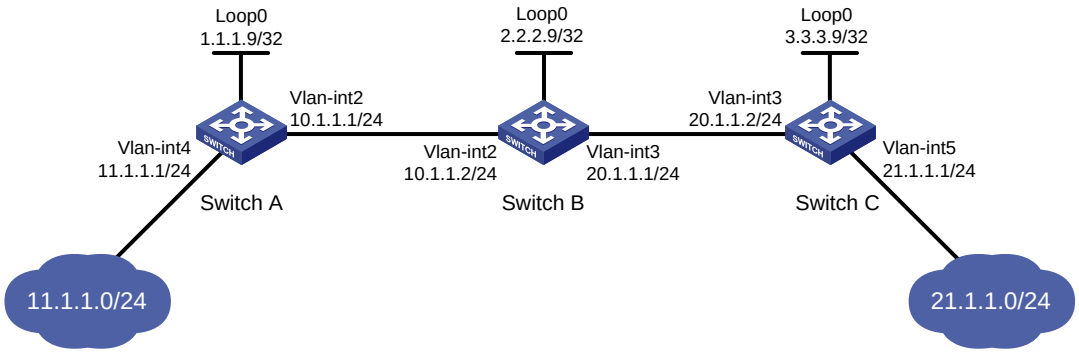
Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display LDP discovery information.	**display mpls ldp discovery** [**vpn-instance** *vpn-instance-name*] [[**interface** *interface-type interface-number* | **peer** *peer-lsr-id*] [**ipv6**] | **targeted-peer** { *ipv4-address* | *ipv6-address* }] [**verbose**]
Display error TCP packets received by the LDP session.	**display mpls ldp error-packet**
Display LDP FEC-label mapping information.	**display mpls ldp fec** [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | *ipv6-address prefix-length* | [**ipv6**] [**summary**]]
Display LDP-IGP synchronization information.	**display mpls ldp igp sync** [**interface** *interface-type interface-number*]

Task	Command
Display LDP interface information.	**display mpls ldp interface** [**vpn-instance** *vpn-instance-name*] [*interface-type interface-number*] [**ipv6**]
Display LDP LSP information.	**display mpls ldp lsp** [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | *ipv6-address prefix-length* | **ipv6**]
Display LDP running parameters.	**display mpls ldp parameter** [**vpn-instance** *vpn-instance-name*]
Display LDP peer and session information.	**display mpls ldp peer** [**vpn-instance** *vpn-instance-name*] [*peer-lsr-id*] [**verbose**]
Display LDP summary information.	**display mpls ldp summary** [**all** | **vpn-instance** *vpn-instance-name*]
Display information about LDP session interruptions.	**display mpls ldp troubleshooting** [[**vpn-instance** *vpn-instance-name*] **peer** *peer-lsr-id*]
Reset LDP sessions.	**reset mpls ldp** [**vpn-instance** *vpn-instance-name*] [**peer** *peer-id*]

IPv4 LDP configuration examples

Example: Configuring LDP LSPs



Network configuration

Switch A, Switch B, and Switch C all support MPLS.

Configure LDP to establish LSPs between Switch A and Switch C, so subnets 11.1.1.0/24 and 21.1.1.0/24 can reach each other over MPLS.

Configure LDP to establish LSPs only for destinations 1.1.1.9/32, 2.2.2.9/32, 3.3.3.9/32, 11.1.1.0/24, and 21.1.1.0/24 on Switch A, Switch B, and Switch C.

Figure 11 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv4 LSPs automatically, enable IPv4 LDP on each LSR.
- To establish IPv4 LDP LSPs, configure an IPv4 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPF.
- To control the number of IPv4 LSPs, configure an IPv4 LSP generation policy on each LSR.

Procedure

1. Create VLANs and assign IP addresses to interfaces:

Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 24
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ip address 11.1.1.1 24
[SwitchA-Vlan-interface4] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 10.1.1.2 24
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ip address 20.1.1.1 24
[SwitchB-Vlan-interface3] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] vlan 3
```

```
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ip address 20.1.1.2 24
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ip address 21.1.1.1 24
[SwitchC-Vlan-interface5] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] quit
```

2. Configure OSPF on each switch to ensure IP connectivity between them:

Configure Switch A.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 11.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[SwitchC-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 21.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

Verify that the switches have learned the routes to each other. This example uses Switch A.

```
[SwitchA] display ip routing-table

Destinations : 18       Routes : 18

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
1.1.1.9/32         Direct  0   0           127.0.0.1       InLoop0
2.2.2.9/32         O_INTRA 10  1           10.1.1.2        Vlan2
```

```
3.3.3.9/32          O_INTRA 10  2           10.1.1.2        Vlan2
10.1.1.0/24         Direct  0   0           10.1.1.1        Vlan2
10.1.1.1/32         Direct  0   0           127.0.0.1       InLoop0
10.1.1.255/32       Direct  0   0           10.1.1.1        Vlan2
11.1.1.0/24         Direct  0   0           11.1.1.1        Vlan4
11.1.1.1/32         Direct  0   0           127.0.0.1       InLoop0
11.1.1.255/32       Direct  0   0           11.1.1.1        Vlan4
20.1.1.0/24         O_INTRA 10  2           10.1.1.2        Vlan2
21.1.1.0/24         O_INTRA 10  3           10.1.1.2        Vlan2
127.0.0.0/8         Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

3. Enable MPLS and IPv4 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp enable
[SwitchA-Vlan-interface2] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp enable
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp enable
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
[SwitchC-ldp] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp enable
[SwitchC-Vlan-interface3] quit
```

4. Configure IPv4 LSP generation policies:

On Switch A, create IP prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchA] ip prefix-list switcha index 10 permit 1.1.1.9 32
```

```
[SwitchA] ip prefix-list switcha index 20 permit 2.2.2.9 32
[SwitchA] ip prefix-list switcha index 30 permit 3.3.3.9 32
[SwitchA] ip prefix-list switcha index 40 permit 11.1.1.0 24
[SwitchA] ip prefix-list switcha index 50 permit 21.1.1.0 24
[SwitchA] mpls ldp
[SwitchA-ldp] lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IP prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchB] ip prefix-list switchb index 10 permit 1.1.1.9 32
[SwitchB] ip prefix-list switchb index 20 permit 2.2.2.9 32
[SwitchB] ip prefix-list switchb index 30 permit 3.3.3.9 32
[SwitchB] ip prefix-list switchb index 40 permit 11.1.1.0 24
[SwitchB] ip prefix-list switchb index 50 permit 21.1.1.0 24
[SwitchB] mpls ldp
[SwitchB-ldp] lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IP prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchC] ip prefix-list switchc index 10 permit 1.1.1.9 32
[SwitchC] ip prefix-list switchc index 20 permit 2.2.2.9 32
[SwitchC] ip prefix-list switchc index 30 permit 3.3.3.9 32
[SwitchC] ip prefix-list switchc index 40 permit 11.1.1.0 24
[SwitchC] ip prefix-list switchc index 50 permit 21.1.1.0 24
[SwitchC] mpls ldp
[SwitchC-ldp] lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

Verifying the configuration

Display LDP LSP information on the switches, for example, on Switch A.

```
[SwitchA] display mpls ldp lsp
Status Flags: * - stale, L - liberal, B - backup, N/A – unavailable
FECs: 5           Ingress: 3          Transit: 3      Egress: 2

FEC               In/Out Label        Nexthop         OutInterface/LSINDEX
1.1.1.9/32        3/-
                  -/1279(L)
2.2.2.9/32        -/3                 10.1.1.2        Vlan2
                  1279/3              10.1.1.2        Vlan2
3.3.3.9/32        -/1278              10.1.1.2        Vlan2
                  1278/1278           10.1.1.2        Vlan2
11.1.1.0/24       1277/-
                  -/1277(L)
21.1.1.0/24       -/1276              10.1.1.2        Vlan2
                  1276/1276           10.1.1.2        Vlan2
```

Test the connectivity of the LDP LSP from Switch A to Switch C.

```
[SwitchA] ping mpls -a 11.1.1.1 ipv4 21.1.1.0 24
MPLS ping FEC 21.1.1.0/24 with 100 bytes of data:
100 bytes from 20.1.1.2: Sequence=1 time=1 ms
```

```
100 bytes from 20.1.1.2: Sequence=2 time=1 ms
100 bytes from 20.1.1.2: Sequence=3 time=8 ms
100 bytes from 20.1.1.2: Sequence=4 time=2 ms
100 bytes from 20.1.1.2: Sequence=5 time=1 ms

--- Ping statistics for FEC 21.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/2/8 ms
```

Test the connectivity of the LDP LSP from Switch C to Switch A.

```
[SwitchC] ping mpls -a 21.1.1.1 ipv4 11.1.1.0 24
MPLS ping FEC 11.1.1.0/24 with 100 bytes of data:
100 bytes from 10.1.1.1: Sequence=1 time=1 ms
100 bytes from 10.1.1.1: Sequence=2 time=1 ms
100 bytes from 10.1.1.1: Sequence=3 time=1 ms
100 bytes from 10.1.1.1: Sequence=4 time=1 ms
100 bytes from 10.1.1.1: Sequence=5 time=1 ms

--- Ping statistics for FEC 11.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/1/1 ms
```

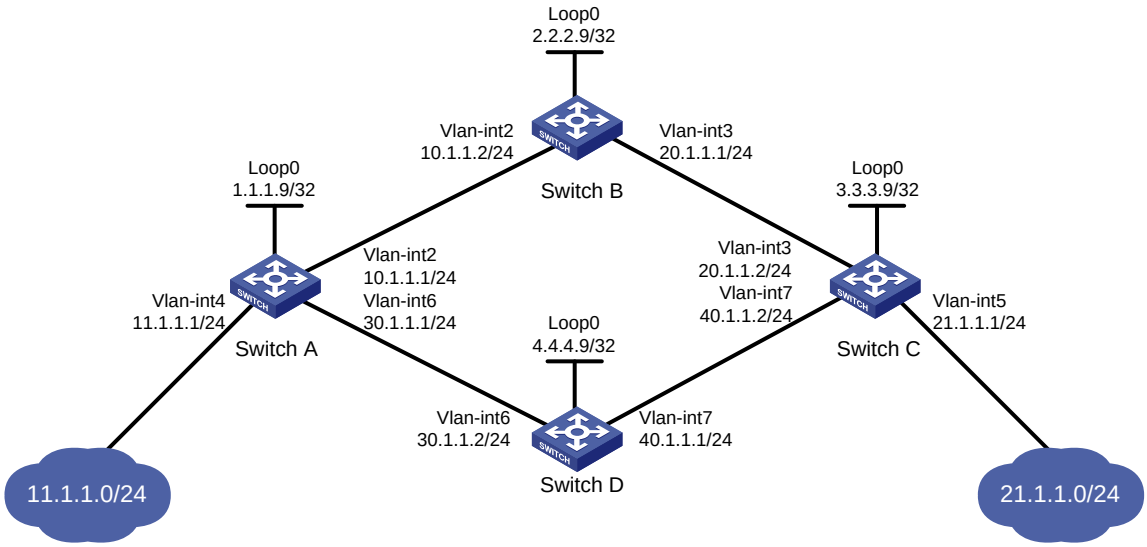
Example: Configuring label acceptance control



Network configuration

Two links, Switch A—Switch B—Switch C and Switch A—Switch D—Switch C, exist between subnets 11.1.1.0/24 and 21.1.1.0/24.

Configure LDP to establish LSPs only for routes to subnets 11.1.1.0/24 and 21.1.1.0/24.

Configure LDP to establish LSPs only on the link Switch A—Switch B—Switch C to forward traffic between subnets 11.1.1.0/24 and 21.1.1.0/24.

Figure 12 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv4 LSPs automatically, enable IPv4 LDP on each LSR.
- To establish IPv4 LDP LSPs, configure an IPv4 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPF.
- To ensure that LDP establishes IPv4 LSPs only for the routes 11.1.1.0/24 and 21.1.1.0/24, configure IPv4 LSP generation policies on each LSR.
- To ensure that LDP establishes IPv4 LSPs only over the link Switch A—Switch B—Switch C, configure IPv4 label acceptance policies as follows:

- Switch A accepts only the label mapping for FEC 21.1.1.0/24 received from Switch B. Switch A denies the label mapping for FEC 21.1.1.0/24 received from Switch D.
- Switch C accepts only the label mapping for FEC 11.1.1.0/24 received from Switch B. Switch C denies the label mapping for FEC 11.1.1.0/24 received from Switch D.

Prerequisites

Before configuration, disable the spanning tree feature globally or map each VLAN to an MSTI. For more information, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Create VLANs and assign IP addresses to interfaces:

Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 24
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ip address 11.1.1.1 24
[SwitchA-Vlan-interface4] quit
[SwitchA] vlan 6
[SwitchA-vlan6] port gigabitethernet 1/0/3
[SwitchA-vlan6] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] ip address 30.1.1.1 24
[SwitchA-Vlan-interface6] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 10.1.1.2 24
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ip address 20.1.1.1 24
[SwitchB-Vlan-interface3] quit
```

```
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ip address 20.1.1.2 24
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ip address 21.1.1.1 24
[SwitchC-Vlan-interface5] quit
[SwitchC] vlan 7
[SwitchC-vlan7] port gigabitethernet 1/0/3
[SwitchC-vlan7] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] ip address 40.1.1.2 24
[SwitchC-Vlan-interface7] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] quit
```

Configure Switch D.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[SwitchD] vlan 6
[SwitchD-vlan6] port gigabitethernet 1/0/1
[SwitchD-vlan6] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] ip address 30.1.1.2 24
[SwitchD-Vlan-interface6] quit
[SwitchD] vlan 7
[SwitchD-vlan7] port gigabitethernet 1/0/2
[SwitchD-vlan7] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] ip address 40.1.1.1 24
[SwitchD-Vlan-interface7] quit
[SwitchD] interface loopback 0
[SwitchD-LoopBack0] ip address 4.4.4.9 32
[SwitchD-LoopBack0] quit
```

2. Configure MSTP:

Configure Switch A.

```
[SwitchA] stp region-configuration
```

```
[SwitchA-mst-region] region-name example
[SwitchA-mst-region] instance 2 vlan 2
[SwitchA-mst-region] instance 4 vlan 4
[SwitchA-mst-region] instance 6 vlan 6
[SwitchA-mst-region] revision-level 0
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

Configure Switch B.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] region-name example
[SwitchB-mst-region] instance 2 vlan 2
[SwitchB-mst-region] instance 3 vlan 3
[SwitchB-mst-region] revision-level 0
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

Configure Switch C.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] region-name example
[SwitchC-mst-region] instance 3 vlan 3
[SwitchC-mst-region] instance 5 vlan 5
[SwitchC-mst-region] instance 7 vlan 7
[SwitchC-mst-region] revision-level 0
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Configure Switch D.

```
[SwitchD] stp region-configuration
[SwitchD-mst-region] region-name example
[SwitchD-mst-region] instance 6 vlan 6
[SwitchD-mst-region] instance 7 vlan 7
[SwitchD-mst-region] revision-level 0
[SwitchD-mst-region] active region-configuration
[SwitchD-mst-region] quit
[SwitchD] stp global enable
```

3. Configure OSPF:

Configure Switch A.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 11.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
[SwitchB] ospf
```

```
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[SwitchC-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 40.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 21.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
[SwitchD] ospf
[SwitchD-ospf-1] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 4.4.4.9 0.0.0.0
[SwitchD-ospf-1-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] network 40.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

4. Enable MPLS and IPv4 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp enable
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] mpls enable
[SwitchA-Vlan-interface6] mpls ldp enable
[SwitchA-Vlan-interface6] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp enable
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp enable
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
[SwitchC-ldp] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp enable
[SwitchC-Vlan-interface3] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] mpls enable
[SwitchC-Vlan-interface7] mpls ldp enable
[SwitchC-Vlan-interface7] quit
```

Configure Switch D.

```
[SwitchD] mpls lsr-id 4.4.4.9
[SwitchD] mpls ldp
[SwitchD-ldp] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] mpls enable
[SwitchD-Vlan-interface6] mpls ldp enable
[SwitchD-Vlan-interface6] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] mpls enable
[SwitchD-Vlan-interface7] mpls ldp enable
[SwitchD-Vlan-interface7] quit
```

5. Configure IPv4 LSP generation policies:

On Switch A, create IP prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchA] ip prefix-list switcha index 10 permit 11.1.1.0 24
[SwitchA] ip prefix-list switcha index 20 permit 21.1.1.0 24
[SwitchA] mpls ldp
[SwitchA-ldp] lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IP prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchB] ip prefix-list switchb index 10 permit 11.1.1.0 24
[SwitchB] ip prefix-list switchb index 20 permit 21.1.1.0 24
[SwitchB] mpls ldp
[SwitchB-ldp] lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IP prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchC] ip prefix-list switchc index 10 permit 11.1.1.0 24
[SwitchC] ip prefix-list switchc index 20 permit 21.1.1.0 24
[SwitchC] mpls ldp
[SwitchC-ldp] lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

On Switch D, create IP prefix list **switchd**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchD] ip prefix-list switchd index 10 permit 11.1.1.0 24
```

```
[SwitchD] ip prefix-list switchd index 20 permit 21.1.1.0 24
[SwitchD] mpls ldp
[SwitchD-ldp] lsp-trigger prefix-list switchd
[SwitchD-ldp] quit
```

6. Configure IPv4 label acceptance policies:

On Switch A, create IP prefix list **prefix-from-b** to permit subnet 21.1.1.0/24. Switch A uses this list to filter FEC-label mappings received from Switch B.

```
[SwitchA] ip prefix-list prefix-from-b index 10 permit 21.1.1.0 24
```

On Switch A, create IP prefix list **prefix-from-d** to deny subnet 21.1.1.0/24. Switch A uses this list to filter FEC-label mappings received from Switch D.

```
[SwitchA] ip prefix-list prefix-from-d index 10 deny 21.1.1.0 24
```

On Switch A, configure label acceptance policies to filter FEC-label mappings received from Switch B and Switch D.

```
[SwitchA] mpls ldp
[SwitchA-ldp] accept-label peer 2.2.2.9 prefix-list prefix-from-b
[SwitchA-ldp] accept-label peer 4.4.4.9 prefix-list prefix-from-d
[SwitchA-ldp] quit
```

On Switch C, create IP prefix list **prefix-from-b** to permit subnet 11.1.1.0/24. Switch C uses this list to filter FEC-label mappings received from Switch B.

```
[SwitchC] ip prefix-list prefix-from-b index 10 permit 11.1.1.0 24
```

On Switch C, create IP prefix list **prefix-from-d** to deny subnet 11.1.1.0/24. Switch A uses this list to filter FEC-label mappings received from Switch D.

```
[SwitchC] ip prefix-list prefix-from-d index 10 deny 11.1.1.0 24
```

On Switch C, configure label acceptance policies to filter FEC-label mappings received from Switch B and Switch D.

```
[SwitchC] mpls ldp
[SwitchC-ldp] accept-label peer 2.2.2.9 prefix-list prefix-from-b
[SwitchC-ldp] accept-label peer 4.4.4.9 prefix-list prefix-from-d
[SwitchC-ldp] quit
```

Verifying the configuration

Display LDP LSP information on the switches, for example, on Switch A. Verify that the next hop of the LSP for FEC 21.1.1.0/24 is Switch B (10.1.1.2). The LSP has been established over the link Switch A—Switch B—Switch C, not over the link Switch A—Switch D—Switch C.

```
[SwitchA] display mpls ldp lsp
Status Flags: * - stale, L - liberal, B - backup, N/A - unavailable
FECs: 2           Ingress: 1           Transit: 1           Egress: 1

FEC                In/Out Label        Nexthop         OutInterface/LSINDEX
11.1.1.0/24        24128/-
21.1.1.0/24        -/24127             10.1.1.2        Vlan2
                   24127/24127         10.1.1.2        Vlan2
```

Test the connectivity of the LDP LSP from Switch A to Switch C.

```
[SwitchA] ping mpls -a 11.1.1.1 ipv4 21.1.1.0 24
MPLS ping FEC 21.1.1.0/24 with 100 bytes of data:
100 bytes from 20.1.1.2: Sequence=1 time=1 ms
100 bytes from 20.1.1.2: Sequence=2 time=1 ms
100 bytes from 20.1.1.2: Sequence=3 time=8 ms
100 bytes from 20.1.1.2: Sequence=4 time=2 ms
```

```
100 bytes from 20.1.1.2: Sequence=5 time=1 ms

--- Ping statistics for FEC 21.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/2/8 ms
```

Test the connectivity of the LDP LSP from Switch C to Switch A.

```
[SwitchC] ping mpls -a 21.1.1.1 ipv4 11.1.1.0 24
MPLS ping FEC 11.1.1.0/24 with 100 bytes of data:
100 bytes from 10.1.1.1: Sequence=1 time=1 ms
100 bytes from 10.1.1.1: Sequence=2 time=1 ms
100 bytes from 10.1.1.1: Sequence=3 time=1 ms
100 bytes from 10.1.1.1: Sequence=4 time=1 ms
100 bytes from 10.1.1.1: Sequence=5 time=1 ms

--- Ping statistics for FEC 11.1.1.0/24 ---
5 packets transmitted, 5 packets received, 0.0% packet loss
Round-trip min/avg/max = 1/1/1 ms
```

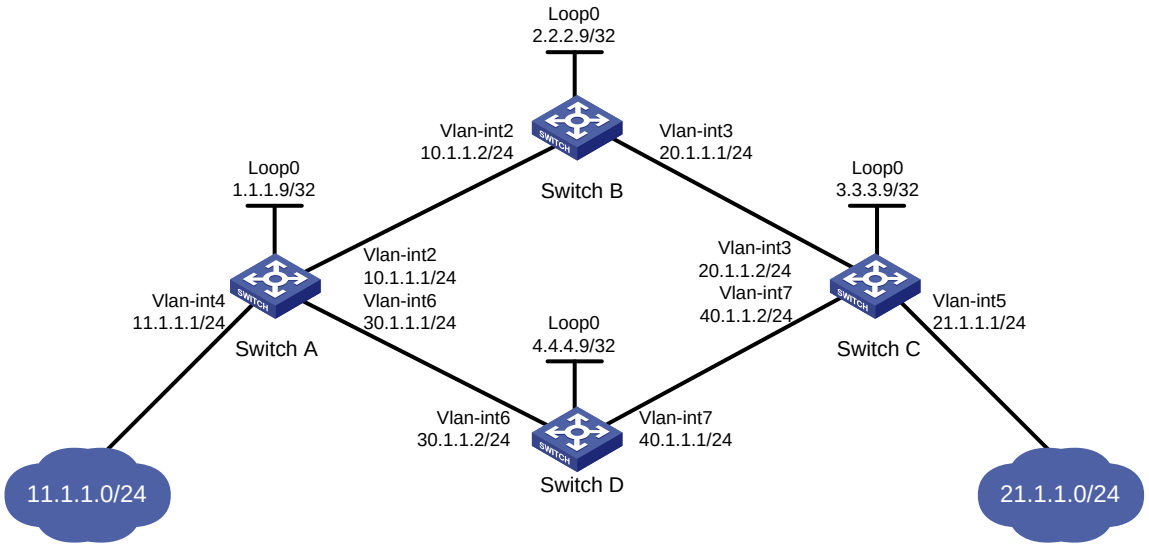
Example: Configuring label advertisement control



Network configuration

Two links, Switch A—Switch B—Switch C and Switch A—Switch D—Switch C, exist between subnets 11.1.1.0/24 and 21.1.1.0/24.

Configure LDP to establish LSPs only for routes to subnets 11.1.1.0/24 and 21.1.1.0/24.

Configure LDP to establish LSPs only on the link Switch A—Switch B—Switch C to forward traffic between subnets 11.1.1.0/24 and 21.1.1.0/24.

Figure 13 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv4 LSPs automatically, enable Ipv4 LDP on each LSR.
- To establish Ipv4 LDP LSPs, configure an Ipv4 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPF.
- To ensure that LDP establishes Ipv4 LSPs only for the routes 11.1.1.0/24 and 21.1.1.0/24, configure Ipv4 LSP generation policies on each LSR.
- To ensure that LDP establishes Ipv4 LSPs only over the link Switch A—Switch B—Switch C, configure Ipv4 label advertisement policies as follows:

- Switch A advertises only the label mapping for FEC 11.1.1.0/24 to Switch B.
- Switch C advertises only the label mapping for FEC 21.1.1.0/24 to Switch B.
- Switch D does not advertise label mapping for FEC 21.1.1.0/24 to Switch A. Switch D does not advertise label mapping for FEC 11.1.1.0/24 to Switch C.

Procedure

1. Create VLANs and assign IP addresses to interfaces:

Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ip address 10.1.1.1 24
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ip address 11.1.1.1 24
[SwitchA-Vlan-interface4] quit
[SwitchA] vlan 6
[SwitchA-vlan6] port gigabitethernet 1/0/3
[SwitchA-vlan6] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] ip address 30.1.1.1 24
[SwitchA-Vlan-interface6] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ip address 10.1.1.2 24
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ip address 20.1.1.1 24
[SwitchB-Vlan-interface3] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ip address 20.1.1.2 24
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ip address 21.1.1.1 24
[SwitchC-Vlan-interface5] quit
[SwitchC] vlan 7
[SwitchC-vlan7] port gigabitethernet 1/0/3
[SwitchC-vlan7] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] ip address 40.1.1.2 24
[SwitchC-Vlan-interface7] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] quit
```

Configure Switch D.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[SwitchD] vlan 6
[SwitchD-vlan6] port gigabitethernet 1/0/1
[SwitchD-vlan6] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] ip address 30.1.1.2 24
[SwitchD-Vlan-interface6] quit
[SwitchD] vlan 7
[SwitchD-vlan7] port gigabitethernet 1/0/2
[SwitchD-vlan7] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] ip address 40.1.1.1 24
[SwitchD-Vlan-interface7] quit
[SwitchD] interface loopback 0
[SwitchD-LoopBack0] ip address 4.4.4.9 32
[SwitchD-LoopBack0] quit
```

2. Configure MSTP:

Configure Switch A.

```
[SwitchA] stp region-configuration
[SwitchA-mst-region] region-name example
[SwitchA-mst-region] instance 2 vlan 2
[SwitchA-mst-region] instance 4 vlan 4
```

```
[SwitchA-mst-region] instance 6 vlan 6
[SwitchA-mst-region] revision-level 0
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

Configure Switch B.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] region-name example
[SwitchB-mst-region] instance 2 vlan 2
[SwitchB-mst-region] instance 3 vlan 3
[SwitchB-mst-region] revision-level 0
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

Configure Switch C.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] region-name example
[SwitchC-mst-region] instance 3 vlan 3
[SwitchC-mst-region] instance 5 vlan 5
[SwitchC-mst-region] instance 7 vlan 7
[SwitchC-mst-region] revision-level 0
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Configure Switch D.

```
[SwitchD] stp region-configuration
[SwitchD-mst-region] region-name example
[SwitchD-mst-region] instance 6 vlan 6
[SwitchD-mst-region] instance 7 vlan 7
[SwitchD-mst-region] revision-level 0
[SwitchD-mst-region] active region-configuration
[SwitchD-mst-region] quit
[SwitchD] stp global enable
```

3. Configure OSPF:

Configure Switch A.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 11.1.1.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

Configure Switch B.

```
[SwitchB] ospf
[SwitchB-ospf-1] area 0
[SwitchB-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[SwitchB-ospf-1-area-0.0.0.0] network 10.1.1.0 0.0.0.255
```

```
[SwitchB-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchB-ospf-1-area-0.0.0.0] quit
[SwitchB-ospf-1] quit
```

Configure Switch C.

```
[SwitchC] ospf
[SwitchC-ospf-1] area 0
[SwitchC-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[SwitchC-ospf-1-area-0.0.0.0] network 20.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 40.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] network 21.1.1.0 0.0.0.255
[SwitchC-ospf-1-area-0.0.0.0] quit
[SwitchC-ospf-1] quit
```

Configure Switch D.

```
[SwitchD] ospf
[SwitchD-ospf-1] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 4.4.4.9 0.0.0.0
[SwitchD-ospf-1-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] network 40.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

4. Enable MPLS and Ipv4 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp enable
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] mpls enable
[SwitchA-Vlan-interface6] mpls ldp enable
[SwitchA-Vlan-interface6] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp enable
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp enable
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
```

```
[SwitchC-ldp] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp enable
[SwitchC-Vlan-interface3] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] mpls enable
[SwitchC-Vlan-interface7] mpls ldp enable
[SwitchC-Vlan-interface7] quit
```

Configure Switch D.

```
[SwitchD] mpls lsr-id 4.4.4.9
[SwitchD] mpls ldp
[SwitchD-ldp] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] mpls enable
[SwitchD-Vlan-interface6] mpls ldp enable
[SwitchD-Vlan-interface6] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] mpls enable
[SwitchD-Vlan-interface7] mpls ldp enable
[SwitchD-Vlan-interface7] quit
```

5. Configure Ipv4 LSP generation policies:

On Switch A, create IP prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchA] ip prefix-list switcha index 10 permit 11.1.1.0 24
[SwitchA] ip prefix-list switcha index 20 permit 21.1.1.0 24
[SwitchA] mpls ldp
[SwitchA-ldp] lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IP prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchB] ip prefix-list switchb index 10 permit 11.1.1.0 24
[SwitchB] ip prefix-list switchb index 20 permit 21.1.1.0 24
[SwitchB] mpls ldp
[SwitchB-ldp] lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IP prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchC] ip prefix-list switchc index 10 permit 11.1.1.0 24
[SwitchC] ip prefix-list switchc index 20 permit 21.1.1.0 24
[SwitchC] mpls ldp
[SwitchC-ldp] lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

On Switch D, create IP prefix list **switchd**, and configure LDP to use only the routes permitted by the prefix list to establish LSPs.

```
[SwitchD] ip prefix-list switchd index 10 permit 11.1.1.0 24
[SwitchD] ip prefix-list switchd index 20 permit 21.1.1.0 24
[SwitchD] mpls ldp
[SwitchD-ldp] lsp-trigger prefix-list switchd
```

```
[SwitchD-ldp] quit
```

6. Configure Ipv4 label advertisement policies:

On Switch A, create IP prefix list **prefix-to-b** to permit subnet 11.1.1.0/24. Switch A uses this list to filter FEC-label mappings advertised to Switch B.

```
[SwitchA] ip prefix-list prefix-to-b index 10 permit 11.1.1.0 24
```

On Switch A, create IP prefix list **peer-b** to permit 2.2.2.9/32. Switch A uses this list to filter peers.

```
[SwitchA] ip prefix-list peer-b index 10 permit 2.2.2.9 32
```

On Switch A, configure a label advertisement policy to advertise only the label mapping for FEC 11.1.1.0/24 to Switch B.

```
[SwitchA] mpls ldp
[SwitchA-ldp] advertise-label prefix-list prefix-to-b peer peer-b
[SwitchA-ldp] quit
```

On Switch C, create IP prefix list **prefix-to-b** to permit subnet 21.1.1.0/24. Switch C uses this list to filter FEC-label mappings advertised to Switch B.

```
[SwitchC] ip prefix-list prefix-to-b index 10 permit 21.1.1.0 24
```

On Switch C, create IP prefix list **peer-b** to permit 2.2.2.9/32. Switch C uses this list to filter peers.

```
[SwitchC] ip prefix-list peer-b index 10 permit 2.2.2.9 32
```

On Switch C, configure a label advertisement policy to advertise only the label mapping for FEC 21.1.1.0/24 to Switch B.

```
[SwitchC] mpls ldp
[SwitchC-ldp] advertise-label prefix-list prefix-to-b peer peer-b
[SwitchC-ldp] quit
```

On Switch D, create IP prefix list **prefix-to-a** to deny subnet 21.1.1.0/24. Switch D uses this list to filter FEC-label mappings to be advertised to Switch A.

```
[SwitchD] ip prefix-list prefix-to-a index 10 deny 21.1.1.0 24
[SwitchD] ip prefix-list prefix-to-a index 20 permit 0.0.0.0 0 less-equal 32
```

On Switch D, create IP prefix list **peer-a** to permit 1.1.1.9/32. Switch D uses this list to filter peers.

```
[SwitchD] ip prefix-list peer-a index 10 permit 1.1.1.9 32
```

On Switch D, create IP prefix list **prefix-to-c** to deny subnet 11.1.1.0/24. Switch D uses this list to filter FEC-label mappings to be advertised to Switch C.

```
[SwitchD] ip prefix-list prefix-to-c index 10 deny 11.1.1.0 24
[SwitchD] ip prefix-list prefix-to-c index 20 permit 0.0.0.0 0 less-equal 32
```

On Switch D, create IP prefix list **peer-c** to permit subnet 3.3.3.9/32. Switch D uses this list to filter peers.

```
[SwitchD] ip prefix-list peer-c index 10 permit 3.3.3.9 32
```

On Switch D, configure a label advertisement policy. This policy ensures that Switch D does not advertise label mappings for FEC 21.1.1.0/24 to Switch A, and does not advertise label mappings for FEC 11.1.1.0/24 to Switch C.

```
[SwitchD] mpls ldp
[SwitchD-ldp] advertise-label prefix-list prefix-to-a peer peer-a
[SwitchD-ldp] advertise-label prefix-list prefix-to-c peer peer-c
[SwitchD-ldp] quit
```

Verifying the configuration

Display LDP LSP information on each switch. Verify that Switch A and Switch C have received FEC-label mappings only from Switch B. Switch B has received FEC-label mappings from both

Switch A and Switch C. Switch D does not receive FEC-label mappings from Switch A or Switch C. LDP has established an LSP only over the link Switch A—Switch B—Switch C.

```
[SwitchA] display mpls ldp lsp
Status Flags: * - stale, L - liberal, B - backup, N/A - unavailable

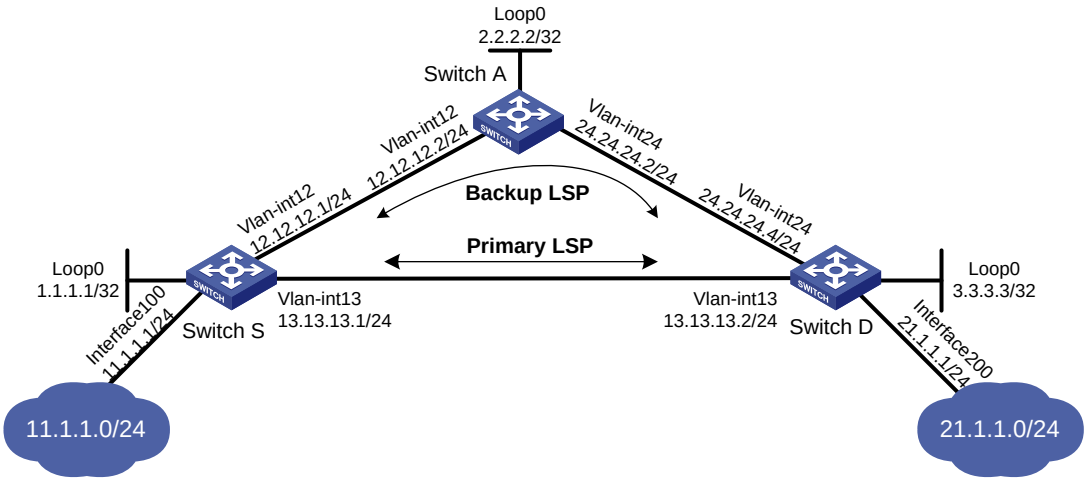
Example: Configuring LDP FRR



Network configuration

Switch S, Switch A, and Switch D reside in the same OSPF domain. Configure OSPF FRR so LDP can establish a primary LSP and a backup LSP on the Switch S—Switch D and the Switch S—Switch A—Switch D links, respectively.

When the primary LSP operates correctly, traffic between subnets 11.1.1.0/24 and 21.1.1.0/24 is forwarded through the LSP.

When the primary LSP fails, traffic between the two subnets is immediately switched to the backup LSP.

Figure 14 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv4 LSPs automatically, enable IPv4 LDP on each LSR.
- To establish IPv4 LDP LSPs, configure an IPv4 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPF.
- To ensure that LDP establishes IPv4 LSPs only for the routes 11.1.1.0/24 and 21.1.1.0/24, configure IPv4 LSP generation policies on each LSR.
- To allow LDP to establish backup LSRs, configure OSPF FRR on Switch S and Switch D.

Prerequisites

Before configuration, disable the spanning tree feature globally or map each VLAN to an MSTI. For more information, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Create VLANs and assign IP addresses to interfaces:

Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] vlan 12
[SwitchA-vlan12] port gigabitethernet 1/0/1
[SwitchA-vlan12] quit
[SwitchA] interface vlan-interface 12
[SwitchA-Vlan-interface12] ip address 12.12.12.2 24
[SwitchA-Vlan-interface12] quit
[SwitchA] vlan 24
[SwitchA-vlan24] port gigabitethernet 1/0/2
[SwitchA-vlan24] quit
[SwitchA] interface vlan-interface 24
[SwitchA-Vlan-interface24] ip address 24.24.24.2 24
[SwitchA-Vlan-interface24] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 2.2.2.2 32
[SwitchA-LoopBack0] quit
```

Configure Switch S.

```
<Sysname> system-view
[Sysname] sysname SwitchS
[SwitchS] vlan 12
[SwitchS-vlan12] port gigabitethernet 1/0/1
[SwitchS-vlan12] quit
[SwitchS] interface vlan-interface 12
[SwitchS-Vlan-interface12] ip address 12.12.12.1 24
[SwitchS-Vlan-interface12] quit
[SwitchS] vlan 13
[SwitchS-vlan13] port gigabitethernet 1/0/2
[SwitchS-vlan13] quit
[SwitchS] interface vlan-interface 13
[SwitchS-Vlan-interface13] ip address 13.13.13.1 24
[SwitchS-Vlan-interface13] quit
[SwitchS] vlan 100
[SwitchS-vlan100] port gigabitethernet 1/0/3
[SwitchS-vlan100] quit
[SwitchS] interface vlan-interface 100
[SwitchS-Vlan-interface100] ip address 11.1.1.1 24
[SwitchS-Vlan-interface100] quit
[SwitchS] interface loopback 0
[SwitchS-LoopBack0] ip address 1.1.1.1 32
[SwitchS-LoopBack0] quit
```

Configure Switch D.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[SwitchD] vlan 13
[SwitchD-vlan13] port gigabitethernet 1/0/1
[SwitchD-vlan13] quit
[SwitchD] interface vlan-interface 13
[SwitchD-Vlan-interface13] ip address 13.13.13.2 24
[SwitchD-Vlan-interface13] quit
[SwitchD] vlan 24
[SwitchD-vlan24] port gigabitethernet 1/0/2
[SwitchD-vlan24] quit
[SwitchD] interface vlan-interface 24
[SwitchD-Vlan-interface24] ip address 24.24.24.4 24
[SwitchD-Vlan-interface24] quit
[SwitchD] vlan 200
[SwitchD-vlan200] port gigabitethernet 1/0/3
[SwitchD-vlan200] quit
[SwitchD] interface vlan-interface 200
[SwitchD-Vlan-interface200] ip address 21.1.1.1 24
[SwitchD-Vlan-interface200] quit
[SwitchD] interface loopback 0
[SwitchD-LoopBack0] ip address 3.3.3.3 32
[SwitchD-LoopBack0] quit
```

2. Configure OSPF:

Configure Switch A.

```
[SwitchA] ospf
[SwitchA-ospf-1] area 0
[SwitchA-ospf-1-area-0.0.0.0] network 2.2.2.2 0.0.0.0
[SwitchA-ospf-1-area-0.0.0.0] network 12.12.12.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] network 24.24.24.0 0.0.0.255
[SwitchA-ospf-1-area-0.0.0.0] quit
[SwitchA-ospf-1] quit
```

Configure Switch S.

```
[SwitchS] ospf
[SwitchS-ospf-1] area 0
[SwitchS-ospf-1-area-0.0.0.0] network 1.1.1.1 0.0.0.0
[SwitchS-ospf-1-area-0.0.0.0] network 12.12.12.0 0.0.0.255
[SwitchS-ospf-1-area-0.0.0.0] network 13.13.13.0 0.0.0.255
[SwitchS-ospf-1-area-0.0.0.0] network 11.1.1.0 0.0.0.255
[SwitchS-ospf-1-area-0.0.0.0] quit
[SwitchS-ospf-1] quit
```

Configure Switch D.

```
[SwitchD] ospf
[SwitchD-ospf-1] area 0
[SwitchD-ospf-1-area-0.0.0.0] network 3.3.3.3 0.0.0.0
[SwitchD-ospf-1-area-0.0.0.0] network 13.13.13.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] network 24.24.24.0 0.0.0.255
```

```
[SwitchC-ospf-1-area-0.0.0.0] network 21.1.1.0 0.0.0.255
[SwitchD-ospf-1-area-0.0.0.0] quit
[SwitchD-ospf-1] quit
```

3. Configure OSPF FRR by using one of the following methods:

- (Method 1.) Enable OSPF FRR to calculate a backup next hop by using the LFA algorithm:

  # Configure Switch S.

  ```
  [SwitchS] bfd echo-source-ip 10.10.10.10
  [SwitchS] ospf 1
  [SwitchS-ospf-1] fast-reroute lfa
  [SwitchS-ospf-1] quit
  ```

  # Configure Switch D.

  ```
  [SwitchD] bfd echo-source-ip 11.11.11.11
  [SwitchD] ospf 1
  [SwitchD-ospf-1] fast-reroute lfa
  [SwitchD-ospf-1] quit
  ```

- (Method 2.) Enable OSPF FRR to specify a backup next hop by using a routing policy:

  # Configure Switch S.

  ```
  [SwitchS] bfd echo-source-ip 10.10.10.10
  [SwitchS] ip prefix-list abc index 10 permit 21.1.1.0 24
  [SwitchS] route-policy frr permit node 10
  [SwitchS-route-policy-frr-10] if-match ip address prefix-list abc
  [SwitchS-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
  12 backup-nexthop 12.12.12.2
  [SwitchS-route-policy-frr-10] quit
  [SwitchS] ospf 1
  [SwitchS-ospf-1] fast-reroute route-policy frr
  [SwitchS-ospf-1] quit
  ```

  # Configure Switch D.

  ```
  [SwitchD] bfd echo-source-ip 10.10.10.10
  [SwitchD] ip prefix-list abc index 10 permit 11.1.1.0 24
  [SwitchD] route-policy frr permit node 10
  [SwitchD-route-policy-frr-10] if-match ip address prefix-list abc
  [SwitchD-route-policy-frr-10] apply fast-reroute backup-interface vlan-interface
  24 backup-nexthop 24.24.24.2
  [SwitchD-route-policy-frr-10] quit
  [SwitchD] ospf 1
  [SwitchD-ospf-1] fast-reroute route-policy frr
  [SwitchD-ospf-1] quit
  ```

4. Enable MPLS and IPv4 LDP:

Configure Switch S.

```
[SwitchS] mpls lsr-id 1.1.1.1
[SwitchS] mpls ldp
[SwitchS-mpls-ldp] quit
[SwitchS] interface vlan-interface 12
[SwitchS-Vlan-interface12] mpls enable
[SwitchS-Vlan-interface12] mpls ldp enable
[SwitchS-Vlan-interface12] quit
[SwitchS] interface vlan-interface 13
```

```
[SwitchS-Vlan-interface13] mpls enable
[SwitchS-Vlan-interface13] mpls ldp enable
[SwitchS-Vlan-interface13] quit
```

Configure Switch D.

```
[SwitchD] mpls lsr-id 3.3.3.3
[SwitchD] mpls ldp
[SwitchD-mpls-ldp] quit
[SwitchD] interface vlan-interface 13
[SwitchD-Vlan-interface13] mpls enable
[SwitchD-Vlan-interface13] mpls ldp enable
[SwitchD-Vlan-interface13] quit
[SwitchD] interface vlan-interface 24
[SwitchD-Vlan-interface24] mpls enable
[SwitchD-Vlan-interface24] mpls ldp enable
[SwitchD-Vlan-interface24] quit
```

Configure Switch A.

```
[SwitchA] mpls lsr-id 2.2.2.2
[SwitchA] mpls ldp
[SwitchA-mpls-ldp] quit
[SwitchA] interface vlan-interface 12
[SwitchA-Vlan-interface12] mpls enable
[SwitchA-Vlan-interface12] mpls ldp enable
[SwitchA-Vlan-interface12] quit
[SwitchA] interface vlan-interface 24
[SwitchA-Vlan-interface24] mpls enable
[SwitchA-Vlan-interface24] mpls ldp enable
[SwitchA-Vlan-interface24] quit
```

5. Configure IPv4 LSP generation policies so LDP uses all static routes and IGP routes to establish LSPs:

Configure Switch S.

```
[SwitchS] mpls ldp
[SwitchS-ldp] lsp-trigger all
[SwitchS-ldp] quit
```

Configure Switch D.

```
[SwitchD] mpls ldp
[SwitchD-ldp] lsp-trigger all
[SwitchD-ldp] quit
```

Configure Switch A.

```
[SwitchA] mpls ldp
[SwitchA-ldp] lsp-trigger all
[SwitchA-ldp] quit
```

Verifying the configuration

Execute the **display mpls ldp lsp** command on Switch S and Switch D to verify that primary and backup LSPs have been established between them. An LSP is backup if a letter B in brackets is displayed next to its outgoing label. Take Switch S for example.

```
[SwitchS] display mpls ldp lsp 21.1.1.0 24
Status Flags: * - stale, L - liberal, B - backup, N/A - unavailable
FECs: 1           Ingress: 2           Transit: 2           Egress: 0
```

```
FEC                 In/Out Label        Nexthop         OutInterface/LSINDEX
21.1.1.0/24         -/24126             13.13.13.2      Vlan13
                    24122/24126         13.13.13.2      Vlan13
                    -/24122(B)          12.12.12.2      Vlan12
                    24122/24122(B)      12.12.12.2      Vlan12
```

Configuration files (OSPF FRR method 1)

```

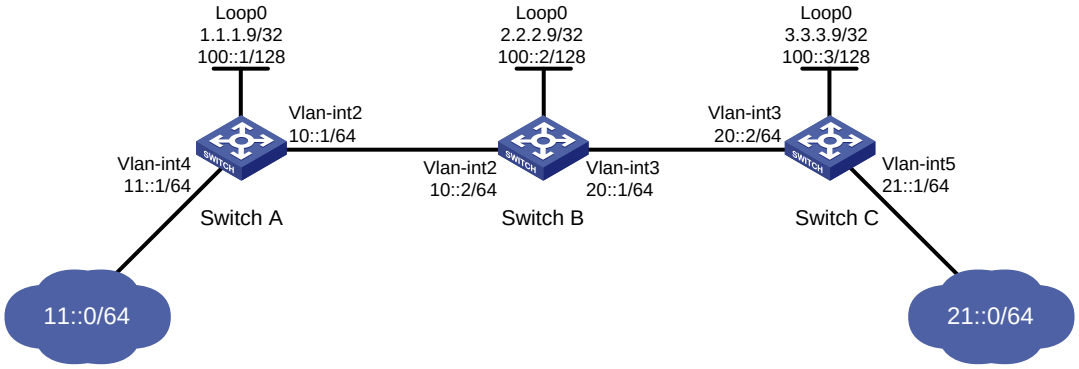
IPv6 LDP configuration examples

Example: Configuring IPv6 LDP LSP



Network configuration

Switch A, Switch B, and Switch C all support MPLS.

Configure LDP to establish IPv6 LSPs between Switch A and Switch C, so subnets 11::0/64 and 21::0/64 can reach each other over MPLS.

Configure LDP to establish IPv6 LSPs only for destinations 100::1/128, 100::2/128, 100::3/128, 11::0/64, and 21::0/64 on Switch A, Switch B, and Switch C.

Figure 15 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv6 LSPs automatically, enable IPv6 LDP on each LSR.
- To establish IPv6 LDP LSPs, configure an IPv6 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPFv3.
- To control the number of IPv6 LSPs, configure an IPv6 LSP generation policy on each LSR.

Procedure

1. Create VLANs and assign IP addresses to interfaces:

   # Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ipv6 address 10::1 64
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ipv6 address 11::1 64
[SwitchA-Vlan-interface4] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] ipv6 address 100::1 128
[SwitchA-LoopBack0] quit
```

   # Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ipv6 address 10::2 64
[SwitchB-Vlan-interface2] quit
```

```
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ipv6 address 20::1 64
[SwitchB-Vlan-interface3] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[SwitchB-LoopBack0] ipv6 address 100::2 128
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ipv6 address 20::2 64
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ipv6 address 21::1 64
[SwitchC-Vlan-interface5] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] ipv6 address 100::3 128
[SwitchC-LoopBack0] quit
```

2. Configure OSPFv3 on each switch to ensure IP connectivity between them:

Configure Switch A.

```
[SwitchA] ospfv3
[SwitchA-ospfv3-1] router-id 1.1.1.9
[SwitchA-ospfv3-1] area 0
[SwitchA-ospfv3-1-area-0.0.0.0] quit
[SwitchA-ospfv3-1] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchA-LoopBack0] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface4] quit
```

Configure Switch B.

```
[SwitchB] ospfv3
[SwitchB-ospfv3-1] router-id 2.2.2.9
```

```
[SwitchB-ospfv3-1] area 0
[SwitchB-ospfv3-1-area-0.0.0.0] quit
[SwitchB-ospfv3-1] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchB-LoopBack0] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] ospfv3
[SwitchC-ospfv3-1] router-id 3.3.3.9
[SwitchC-ospfv3-1] area 0
[SwitchC-ospfv3-1-area-0.0.0.0] quit
[SwitchC-ospfv3-1] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchC-LoopBack0] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface3] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface5] quit
```

Verify that the switches have learned the routes to each other. This example uses Switch A.

```
[SwitchA] display ipv6 routing-table

Destinations : 13       Routes : 13

Destination: ::1/128                                    Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: ::FFFF:127.0.0.0/104                       Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: 10::/64                                    Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : Vlan2                                      Cost      : 0

Destination: 10::1/128                                  Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0
```

```
Destination: 11::/64                                    Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : Vlan4                                      Cost      : 0

Destination: 11::1/128                                  Protocol  : Direct
NextHop    : ::1                                        Preference: 0

Destination: 20::/64                                    Protocol  : O_INTRA
NextHop    : FE80::7AAF:ABFF:FE27:302                   Preference: 10
Interface  : Vlan2                                      Cost      : 2

Destination: 21::/64                                    Protocol  : O_INTRA
NextHop    : FE80::7AAF:ABFF:FE27:302                   Preference: 10
Interface  : Vlan2                                      Cost      : 3

Destination: 100::1/128                                 Protocol  : Direct
NextHop    : ::1                                        Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: 100::2/128                                 Protocol  : O_INTRA
NextHop    : FE80::20C:29FF:FE9D:EAC0                   Preference: 10
Interface  : Vlan2                                      Cost      : 1

Destination: 100::3/128                                 Protocol  : O_INTRA
NextHop    : FE80::20C:29FF:FE9D:EAC0                   Preference: 10
Interface  : Vlan2                                      Cost      : 2

Destination: FE80::/10                                  Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : InLoop0                                    Cost      : 0

Destination: FF00::/8                                   Protocol  : Direct
NextHop    : ::                                         Preference: 0
Interface  : NULL0                                      Cost      : 0
```

3. Enable MPLS and IPv6 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp ipv6 enable
[SwitchA-Vlan-interface2] mpls ldp transport-address 10::1
[SwitchA-Vlan-interface2] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
```

```
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp ipv6 enable
[SwitchB-Vlan-interface2] mpls ldp transport-address 10::2
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp ipv6 enable
[SwitchB-Vlan-interface3] mpls ldp transport-address 20::1
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
[SwitchC-ldp] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp ipv6 enable
[SwitchC-Vlan-interface3] mpls ldp transport-address 20::2
[SwitchC-Vlan-interface3] quit
```

4. Configure IPv6 LSP generation policies:

On Switch A, create IPv6 prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchA] ipv6 prefix-list switcha index 10 permit 100::1 128
[SwitchA] ipv6 prefix-list switcha index 20 permit 100::2 128
[SwitchA] ipv6 prefix-list switcha index 30 permit 100::3 128
[SwitchA] ipv6 prefix-list switcha index 40 permit 11::0 64
[SwitchA] ipv6 prefix-list switcha index 50 permit 21::0 64
[SwitchA] mpls ldp
[SwitchA-ldp] ipv6 lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IPv6 prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchB] ipv6 prefix-list switchb index 10 permit 100::1 128
[SwitchB] ipv6 prefix-list switchb index 20 permit 100::2 128
[SwitchB] ipv6 prefix-list switchb index 30 permit 100::3 128
[SwitchB] ipv6 prefix-list switchb index 40 permit 11::0 64
[SwitchB] ipv6 prefix-list switchb index 50 permit 21::0 64
[SwitchB] mpls ldp
[SwitchB-ldp] ipv6 lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IPv6 prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchC] ipv6 prefix-list switchc index 10 permit 100::1 128
[SwitchC] ipv6 prefix-list switchc index 20 permit 100::2 128
[SwitchC] ipv6 prefix-list switchc index 30 permit 100::3 128
[SwitchC] ipv6 prefix-list switchc index 40 permit 11::0 64
[SwitchC] ipv6 prefix-list switchc index 50 permit 21::0 64
```

```
[SwitchC] mpls ldp
[SwitchC-ldp] ipv6 lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

Verifying the configuration

Display IPv6 LDP LSP information on the switches, for example, on Switch A.

```
[SwitchA] display mpls ldp lsp ipv6
Status Flags: * - stale, L - liberal, B - backup, N/A - unavailable
FECs: 5           Ingress: 3           Transit: 3           Egress: 2

Nexthop     : FE80::7AAF:ABFF:FE27:302
```

Test the connectivity of the IPv6 LDP LSP from Switch A to Switch C.

```
[SwitchA] ping ipv6 -a 11::1 21::1
Ping6(56 data bytes) 11::1 --> 21::1, press CTRL+C to break
56 bytes from 21::1, icmp_seq=0 hlim=63 time=1.000 ms
56 bytes from 21::1, icmp_seq=1 hlim=63 time=2.000 ms
56 bytes from 21::1, icmp_seq=2 hlim=63 time=1.000 ms
56 bytes from 21::1, icmp_seq=3 hlim=63 time=2.000 ms
56 bytes from 21::1, icmp_seq=4 hlim=63 time=2.000 ms

--- Ping6 statistics for 21::1 ---
```

```
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/1.600/2.000/0.490 ms
```

Test the connectivity of the IPv6 LDP LSP from Switch C to Switch A.

```
[SwitchC] ping ipv6 -a 21::1 11::1
Ping6(56 data bytes) 21::1 --> 11::1, press CTRL+C to break
56 bytes from 11::1, icmp_seq=0 hlim=63 time=1.000 ms
56 bytes from 11::1, icmp_seq=1 hlim=63 time=3.000 ms
56 bytes from 11::1, icmp_seq=2 hlim=63 time=0.000 ms
56 bytes from 11::1, icmp_seq=3 hlim=63 time=2.000 ms
56 bytes from 11::1, icmp_seq=4 hlim=63 time=2.000 ms

--- Ping6 statistics for 11::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/1.600/3.000/1.020 ms
```

#
return
```

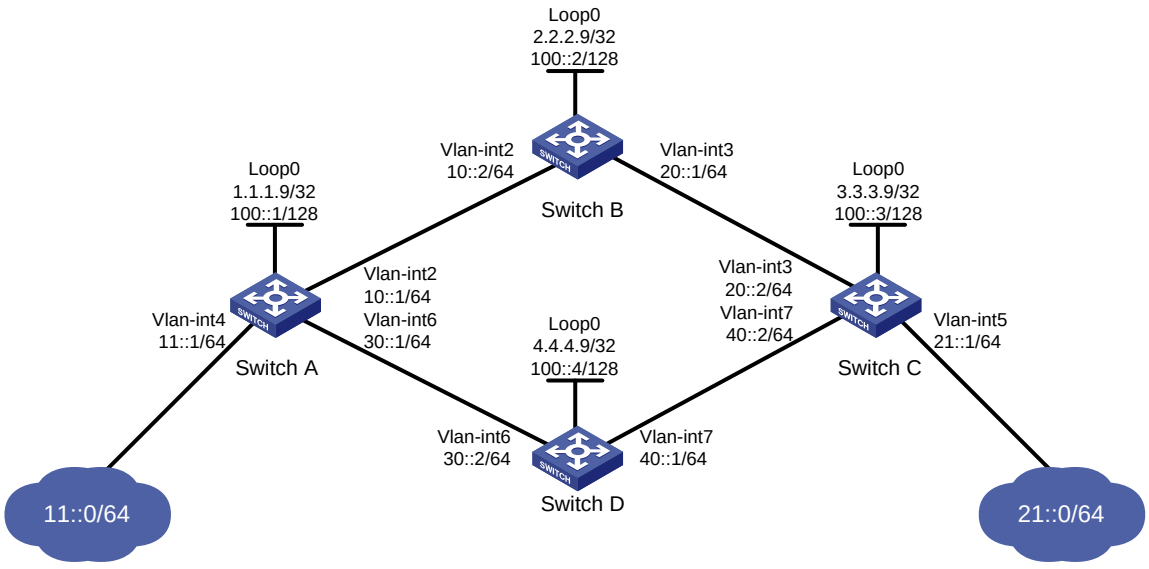
Example: Configuring IPv6 label acceptance control



Network configuration

Two links, Switch A—Switch B—Switch C and Switch A—Switch D—Switch C, exist between subnets 11::0/64 and 21::0/64.

Configure LDP to establish LSPs only for routes to subnets 11::0/64 and 21::0/64.

Configure LDP to establish LSPs only on the link Switch A—Switch B—Switch C to forward traffic between subnets 11::0/64 and 21::0/64.

Figure 16 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv6 LSPs automatically, enable IPv6 LDP on each LSR.
- To establish IPv6 LDP LSPs, configure an IPv6 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPFv3.

- To ensure that LDP establishes IPv6 LSPs only for the routes 11::0/64 and 21::0/64, configure IPv6 LSP generation policies on each LSR.
- To ensure that LDP establishes IPv6 LSPs only over the link Switch A—Switch B—Switch C, configure IPv6 label acceptance policies as follows:
  - Switch A accepts only the label mapping for FEC 21::0/64 received from Switch B. Switch A denies the label mapping for FEC 21::0/64 received from Switch D.
  - Switch C accepts only the label mapping for FEC 11::0/64 received from Switch B. Switch C denies the label mapping for FEC 11::0/64 received from Switch D.

Procedure

1. Create VLANs, assign IP addresses to the VLAN interfaces, and configure OSPFv3 on each switch to ensure IP connectivity between them:

Configure Switch A.

```
<Sysname> system-view
[Sysname] sysname SwitchA
[RouterA] ospfv3
[RouterA-ospfv3-1] router-id 1.1.1.9
[RouterA-ospfv3-1] area 0
[RouterA-ospfv3-1-area-0.0.0.0] quit
[RouterA-ospfv3-1] quit
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ipv6 address 10::1 64
[SwitchA-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ipv6 address 11::1 64
[SwitchA-Vlan-interface4] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface4] quit
[SwitchA] vlan 6
[SwitchA-vlan6] port gigabitethernet 1/0/3
[SwitchA-vlan6] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] ip address 30::1 64
[SwitchA-Vlan-interface6] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface6] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] ipv6 address 100::1 128
[SwitchA-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
```

```
[RouterB] ospfv3
[RouterB-ospfv3-1] router-id 2.2.2.9
[RouterB-ospfv3-1] area 0
[RouterB-ospfv3-1-area-0.0.0.0] quit
[RouterB-ospfv3-1] quit
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ipv6 address 10::2 64
[SwitchB-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ipv6 address 20::1 64
[SwitchB-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface3] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[RouterB-LoopBack0] ipv6 address 100::2 128
[RouterB-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[RouterC] ospfv3
[RouterC-ospfv3-1] router-id 3.3.3.9
[RouterC-ospfv3-1] area 0
[RouterC-ospfv3-1-area-0.0.0.0] quit
[RouterC-ospfv3-1] quit
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ipv6 address 20::2 64
[SwitchC-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ipv6 address 21::1 64
[SwitchC-Vlan-interface5] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface5] quit
[SwitchC] vlan 7
[SwitchC-vlan7] port gigabitethernet 1/0/3
```

```
[SwitchC-vlan7] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] ipv6 address 40::2 64
[SwitchC-Vlan-interface7] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface7] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] ipv6 address 100::3 128
[SwitchC-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchC-LoopBack0] quit
```

Configure Switch D.

```
<Sysname> system-view
[Sysname] sysname SwitchD
[RouterD] ospfv3
[RouterD-ospfv3-1] router-id 4.4.4.9
[RouterD-ospfv3-1] area 0
[RouterD-ospfv3-1-area-0.0.0.0] quit
[RouterD-ospfv3-1] quit
[SwitchD] vlan 6
[SwitchD-vlan6] port gigabitethernet 1/0/1
[SwitchD-vlan6] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] ipv6 address 30::2 64
[SwitchD-Vlan-interface6] ospfv3 1 area 0.0.0.0
[SwitchD-Vlan-interface6] quit
[SwitchD] vlan 7
[SwitchD-vlan7] port gigabitethernet 1/0/2
[SwitchD-vlan7] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] ipv6 address 40::1 24
[SwitchD-Vlan-interface7] ospfv3 1 area 0.0.0.0
[SwitchD-Vlan-interface7] quit
[SwitchD] interface loopback 0
[SwitchD-LoopBack0] ip address 4.4.4.9 32
[SwitchD-LoopBack0] ipv6 address 100::4 128
[SwitchD-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchD-LoopBack0] quit
```

2. Configure MSTP:

Configure Switch A.

```
[SwitchA] stp region-configuration
[SwitchA-mst-region] region-name example
[SwitchA-mst-region] instance 2 vlan 2
[SwitchA-mst-region] instance 4 vlan 4
[SwitchA-mst-region] instance 6 vlan 6
[SwitchA-mst-region] revision-level 0
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

Configure Switch B.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] region-name example
[SwitchB-mst-region] instance 2 vlan 2
[SwitchB-mst-region] instance 3 vlan 3
[SwitchB-mst-region] revision-level 0
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

Configure Switch C.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] region-name example
[SwitchC-mst-region] instance 3 vlan 3
[SwitchC-mst-region] instance 5 vlan 5
[SwitchC-mst-region] instance 7 vlan 7
[SwitchC-mst-region] revision-level 0
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Configure Switch D.

```
[SwitchD] stp region-configuration
[SwitchD-mst-region] region-name example
[SwitchD-mst-region] instance 6 vlan 6
[SwitchD-mst-region] instance 7 vlan 7
[SwitchD-mst-region] revision-level 0
[SwitchD-mst-region] active region-configuration
[SwitchD-mst-region] quit
[SwitchD] stp global enable
```

3. Enable MPLS and IPv6 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp ipv6 enable
[SwitchA-Vlan-interface2] mpls ldp transport-address 10::1
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] mpls enable
[SwitchA-Vlan-interface6] mpls ldp ipv6 enable
[SwitchA-Vlan-interface6] mpls ldp transport-address 30::1
[SwitchA-Vlan-interface6] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
```

```
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp ipv6 enable
[SwitchB-Vlan-interface2] mpls ldp transport-address 10::2
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp ipv6 enable
[SwitchB-Vlan-interface3] mpls ldp transport-address 20::1
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
[SwitchC-ldp] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp ipv6 enable
[SwitchC-Vlan-interface3] mpls ldp transport-address 20::2
[SwitchC-Vlan-interface3] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] mpls enable
[SwitchC-Vlan-interface7] mpls ldp ipv6 enable
[SwitchC-Vlan-interface7] mpls ldp transport-address 40::2
[SwitchC-Vlan-interface7] quit
```

Configure Switch D.

```
[SwitchD] mpls lsr-id 4.4.4.9
[SwitchD] mpls ldp
[SwitchD-ldp] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] mpls enable
[SwitchD-Vlan-interface6] mpls ldp ipv6 enable
[SwitchD-Vlan-interface6] mpls ldp transport-address 30::2
[SwitchD-Vlan-interface6] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] mpls enable
[SwitchD-Vlan-interface7] mpls ldp ipv6 enable
[SwitchD-Vlan-interface7] mpls ldp transport-address 40::1
[SwitchD-Vlan-interface7] quit
```

4. Configure IPv6 LSP generation policies:

On Switch A, create IPv6 prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchA] ipv6 prefix-list switcha index 10 permit 11::0 64
[SwitchA] ipv6 prefix-list switcha index 20 permit 21::0 64
[SwitchA] mpls ldp
[SwitchA-ldp] ipv6 lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IPv6 prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchB] ipv6 prefix-list switchb index 10 permit 11::0 64
```

```
[SwitchB] ipv6 prefix-list switchb index 20 permit 21::0 64
[SwitchB] mpls ldp
[SwitchB-ldp] ipv6 lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IPv6 prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchC] ipv6 prefix-list switchc index 10 permit 11::0 64
[SwitchC] ipv6 prefix-list switchc index 20 permit 21::0 64
[SwitchC] mpls ldp
[SwitchC-ldp] ipv6 lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

On Switch D, create IPv6 prefix list **switchd**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchD] ipv6 prefix-list switchd index 10 permit 11::0 64
[SwitchD] ipv6 prefix-list switchd index 20 permit 21::0 64
[SwitchD] mpls ldp
[SwitchD-ldp] ipv6 lsp-trigger prefix-list switchd
[SwitchD-ldp] quit
```

5. Configure IPv6 label acceptance policies:

On Switch A, create IPv6 prefix list **prefix-from-b** to permit subnet 21::0/64. Switch A uses this list to filter FEC-label mappings received from Switch B.

```
[SwitchA] ipv6 prefix-list prefix-from-b index 10 permit 21::0 64
```

On Switch A, create IPv6 prefix list **prefix-from-d** to deny subnet 21::0/64. Switch A uses this list to filter FEC-label mappings received from Switch D.

```
[SwitchA] ipv6 prefix-list prefix-from-d index 10 deny 21::0 64
```

On Switch A, configure IPv6 label acceptance policies to filter FEC-label mappings received from Switch B and Switch D.

```
[SwitchA] mpls ldp
[SwitchA-ldp] ipv6 accept-label peer 2.2.2.9 prefix-list prefix-from-b
[SwitchA-ldp] ipv6 accept-label peer 4.4.4.9 prefix-list prefix-from-d
[SwitchA-ldp] quit
```

On Switch C, create IPv6 prefix list **prefix-from-b** to permit subnet 11::0/64. Switch C uses this list to filter FEC-label mappings received from Switch B.

```
[SwitchC] ipv6 prefix-list prefix-from-b index 10 permit 11::0 64
```

On Switch C, create IPv6 prefix list **prefix-from-d** to deny subnet 11::0/64. Switch A uses this list to filter FEC-label mappings received from Switch D.

```
[SwitchC] ipv6 prefix-list prefix-from-d index 10 deny 11::0 64
```

On Switch C, configure IPv6 label acceptance policies to filter FEC-label mappings received from Switch B and Switch D.

```
[SwitchC] mpls ldp
[SwitchC-ldp] ipv6 accept-label peer 2.2.2.9 prefix-list prefix-from-b
[SwitchC-ldp] ipv6 accept-label peer 4.4.4.9 prefix-list prefix-from-d
[SwitchC-ldp] quit
```

Verifying the configuration

Display IPv6 LDP LSP information on the switches, for example, on Switch A. Verify that the next hop of the IPv6 LSP for FEC 21::0/64 is Switch B (FE80::20C:29FF:FE9D:EAC0). The IPv6 LSP has been established over the link Switch A—Switch B—Switch C, not over the link Switch A—Switch D—Switch C.

```
[SwitchA] display mpls ldp lsp ipv6
```

```
Status Flags: * - stale, L - liberal, B - backup, N/A - unavailable
FECs: 2           Ingress: 1           Transit: 1           Egress: 1

FEC: 11::/64
In/Out Label: 24128/-                          OutInterface : -
Nexthop     : -

FEC: 21::/64
In/Out Label: -/24127                          OutInterface : Vlan2
Nexthop     : FE80::7ABF:12FF:FE6C:202
In/Out Label: 24127/24127                      OutInterface : Vlan2
Nexthop     : FE80::7ABF:12FF:FE6C:202
```

Test the connectivity of the IPv6 LDP LSP from Switch A to Switch C.

```
[SwitchA] ping ipv6 -a 11::1 21::1
Ping6(56 data bytes) 11::1 --> 21::1, press CTRL+C to break
56 bytes from 21::1, icmp_seq=0 hlim=63 time=1.000 ms
56 bytes from 21::1, icmp_seq=1 hlim=63 time=1.000 ms
56 bytes from 21::1, icmp_seq=2 hlim=63 time=1.000 ms
56 bytes from 21::1, icmp_seq=3 hlim=63 time=0.000 ms
56 bytes from 21::1, icmp_seq=4 hlim=63 time=1.000 ms

--- Ping6 statistics for 21::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/0.800/1.000/0.400 ms
```

Test the connectivity of the IPv6 LDP LSP from Switch C to Switch A.

```
[SwitchC] ping ipv6 -a 21::1 11::1
Ping6(56 data bytes) 21::1 --> 11::1, press CTRL+C to break
56 bytes from 11::1, icmp_seq=0 hlim=63 time=1.000 ms
56 bytes from 11::1, icmp_seq=1 hlim=63 time=1.000 ms
56 bytes from 11::1, icmp_seq=2 hlim=63 time=2.000 ms
56 bytes from 11::1, icmp_seq=3 hlim=63 time=1.000 ms
56 bytes from 11::1, icmp_seq=4 hlim=63 time=1.000 ms

--- Ping6 statistics for 11::1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 1.000/1.200/2.000/0.400 ms
```

```

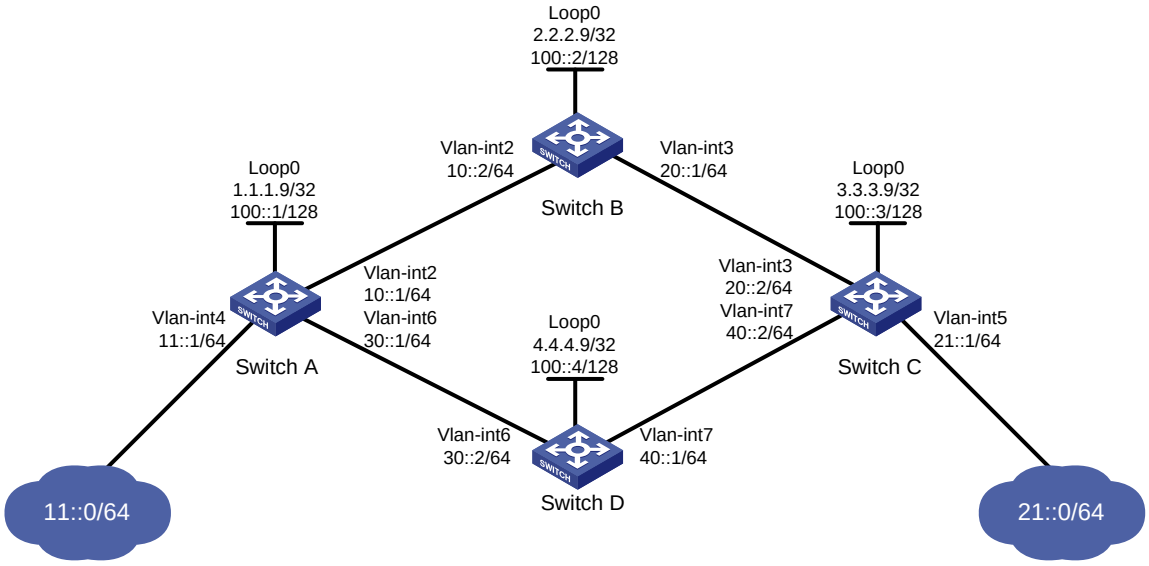
Example: Configuring IPv6 label advertisement control



Network configuration

Two links, Switch A—Switch B—Switch C and Switch A—Switch D—Switch C, exist between subnets 11::0/64 and 21::0/64.

Configure LDP to establish LSPs only for routes to subnets 11::0/64 and 21::0/64.

Configure LDP to establish LSPs only on the link Switch A—Switch B—Switch C to forward traffic between subnets 11::0/64 and 21::0/64.

Figure 17 Network diagram

Requirements analysis

- To ensure that the LSRs establish IPv6 LSPs automatically, enable IPv6 LDP on each LSR.
- To establish IPv6 LDP LSPs, configure an IPv6 routing protocol to ensure IP connectivity between the LSRs. This example uses OSPFv3.
- To ensure that LDP establishes IPv6 LSPs only for the routes 11::0/64 and 21::0/64, configure IPv6 LSP generation policies on each LSR.
- To ensure that LDP establishes IPv6 LSPs only over the link Switch A—Switch B—Switch C, configure IPv6 label advertisement policies as follows:
  - Switch A advertises only the label mapping for FEC 11::0/64 to Switch B.
  - Switch C advertises only the label mapping for FEC 21::0/64 to Switch B.
  - Switch D does not advertise label mapping for FEC 21::0/64 to Switch A. Switch D does not advertise label mapping for FEC 11::0/64 to Switch C.

Prerequisites

Before configuration, disable the spanning tree feature globally or map each VLAN to an MSTI. For more information, see *Layer 2—LAN Switching Configuration Guide*.

Procedure

1. Create VLANs, assign IP addresses to the VLAN interfaces, and configure OSPFv3 on each switch to ensure IP connectivity between them:

   # Configure Switch A.

   ```
   <Sysname> system-view
   ```

```
[Sysname] sysname SwitchA
[RouterA] ospfv3
[RouterA-ospfv3-1] router-id 1.1.1.9
[RouterA-ospfv3-1] area 0
[RouterA-ospfv3-1-area-0.0.0.0] quit
[RouterA-ospfv3-1] quit
[SwitchA] vlan 2
[SwitchA-vlan2] port gigabitethernet 1/0/1
[SwitchA-vlan2] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] ipv6 address 10::1 64
[SwitchA-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface2] quit
[SwitchA] vlan 4
[SwitchA-vlan4] port gigabitethernet 1/0/2
[SwitchA-vlan4] quit
[SwitchA] interface vlan-interface 4
[SwitchA-Vlan-interface4] ipv6 address 11::1 64
[SwitchA-Vlan-interface4] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface4] quit
[SwitchA] vlan 6
[SwitchA-vlan6] port gigabitethernet 1/0/3
[SwitchA-vlan6] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] ipv6 address 30::1 64
[SwitchA-Vlan-interface6] ospfv3 1 area 0.0.0.0
[SwitchA-Vlan-interface6] quit
[SwitchA] interface loopback 0
[SwitchA-LoopBack0] ip address 1.1.1.9 32
[SwitchA-LoopBack0] ipv6 address 100::1 128
[SwitchA-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchA-LoopBack0] quit
```

Configure Switch B.

```
<Sysname> system-view
[Sysname] sysname SwitchB
[RouterB] ospfv3
[RouterB-ospfv3-1] router-id 2.2.2.9
[RouterB-ospfv3-1] area 0
[RouterB-ospfv3-1-area-0.0.0.0] quit
[RouterB-ospfv3-1] quit
[SwitchB] vlan 2
[SwitchB-vlan2] port gigabitethernet 1/0/1
[SwitchB-vlan2] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] ipv6 address 10::2 64
[SwitchB-Vlan-interface2] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface2] quit
[SwitchB] vlan 3
```

```
[SwitchB-vlan3] port gigabitethernet 1/0/2
[SwitchB-vlan3] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] ipv6 address 20::1 64
[SwitchB-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchB-Vlan-interface3] quit
[SwitchB] interface loopback 0
[SwitchB-LoopBack0] ip address 2.2.2.9 32
[RouterB-LoopBack0] ipv6 address 100::2 128
[RouterB-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchB-LoopBack0] quit
```

Configure Switch C.

```
<Sysname> system-view
[Sysname] sysname SwitchC
[RouterC] ospfv3
[RouterC-ospfv3-1] router-id 3.3.3.9
[RouterC-ospfv3-1] area 0
[RouterC-ospfv3-1-area-0.0.0.0] quit
[RouterC-ospfv3-1] quit
[SwitchC] vlan 3
[SwitchC-vlan3] port gigabitethernet 1/0/1
[SwitchC-vlan3] quit
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] ipv6 address 20::2 64
[SwitchC-Vlan-interface3] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface3] quit
[SwitchC] vlan 5
[SwitchC-vlan5] port gigabitethernet 1/0/2
[SwitchC-vlan5] quit
[SwitchC] interface vlan-interface 5
[SwitchC-Vlan-interface5] ipv6 address 21::1 64
[SwitchC-Vlan-interface5] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface5] quit
[SwitchC] vlan 7
[SwitchC-vlan7] port gigabitethernet 1/0/3
[SwitchC-vlan7] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] ipv6 address 40::2 64
[SwitchC-Vlan-interface7] ospfv3 1 area 0.0.0.0
[SwitchC-Vlan-interface7] quit
[SwitchC] interface loopback 0
[SwitchC-LoopBack0] ip address 3.3.3.9 32
[SwitchC-LoopBack0] ipv6 address 100::3 128
[SwitchC-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchC-LoopBack0] quit
```

Configure Switch D.

```
<Sysname> system-view
[Sysname] sysname SwitchD
```

```
[RouterD] ospfv3
[RouterD-ospfv3-1] router-id 4.4.4.9
[RouterD-ospfv3-1] area 0
[RouterD-ospfv3-1-area-0.0.0.0] quit
[RouterD-ospfv3-1] quit
[SwitchD] vlan 6
[SwitchD-vlan6] port gigabitethernet 1/0/1
[SwitchD-vlan6] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] ipv6 address 30::2 64
[SwitchD-Vlan-interface6] ospfv3 1 area 0.0.0.0
[SwitchD-Vlan-interface6] quit
[SwitchD] vlan 7
[SwitchD-vlan7] port gigabitethernet 1/0/2
[SwitchD-vlan7] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] ipv6 address 40::1 24
[SwitchD-Vlan-interface7] ospfv3 1 area 0.0.0.0
[SwitchD-Vlan-interface7] quit
[SwitchD] interface loopback 0
[SwitchD-LoopBack0] ip address 4.4.4.9 32
[SwitchD-LoopBack0] ipv6 address 100::4 128
[SwitchD-LoopBack0] ospfv3 1 area 0.0.0.0
[SwitchD-LoopBack0] quit
```

2. Configure MSTP:

Configure Switch A.

```
[SwitchA] stp region-configuration
[SwitchA-mst-region] region-name example
[SwitchA-mst-region] instance 2 vlan 2
[SwitchA-mst-region] instance 4 vlan 4
[SwitchA-mst-region] instance 6 vlan 6
[SwitchA-mst-region] revision-level 0
[SwitchA-mst-region] active region-configuration
[SwitchA-mst-region] quit
[SwitchA] stp global enable
```

Configure Switch B.

```
[SwitchB] stp region-configuration
[SwitchB-mst-region] region-name example
[SwitchB-mst-region] instance 2 vlan 2
[SwitchB-mst-region] instance 3 vlan 3
[SwitchB-mst-region] revision-level 0
[SwitchB-mst-region] active region-configuration
[SwitchB-mst-region] quit
[SwitchB] stp global enable
```

Configure Switch C.

```
[SwitchC] stp region-configuration
[SwitchC-mst-region] region-name example
[SwitchC-mst-region] instance 3 vlan 3
```

```
[SwitchC-mst-region] instance 5 vlan 5
[SwitchC-mst-region] instance 7 vlan 7
[SwitchC-mst-region] revision-level 0
[SwitchC-mst-region] active region-configuration
[SwitchC-mst-region] quit
[SwitchC] stp global enable
```

Configure Switch D.

```
[SwitchD] stp region-configuration
[SwitchD-mst-region] region-name example
[SwitchD-mst-region] instance 6 vlan 6
[SwitchD-mst-region] instance 7 vlan 7
[SwitchD-mst-region] revision-level 0
[SwitchD-mst-region] active region-configuration
[SwitchD-mst-region] quit
[SwitchD] stp global enable
```

3. Enable MPLS and IPv6 LDP:

Configure Switch A.

```
[SwitchA] mpls lsr-id 1.1.1.9
[SwitchA] mpls ldp
[SwitchA-ldp] quit
[SwitchA] interface vlan-interface 2
[SwitchA-Vlan-interface2] mpls enable
[SwitchA-Vlan-interface2] mpls ldp ipv6 enable
[SwitchA-Vlan-interface2] mpls ldp transport-address 10::1
[SwitchA-Vlan-interface2] quit
[SwitchA] interface vlan-interface 6
[SwitchA-Vlan-interface6] mpls enable
[SwitchA-Vlan-interface6] mpls ldp ipv6 enable
[SwitchA-Vlan-interface6] mpls ldp transport-address 30::1
[SwitchA-Vlan-interface6] quit
```

Configure Switch B.

```
[SwitchB] mpls lsr-id 2.2.2.9
[SwitchB] mpls ldp
[SwitchB-ldp] quit
[SwitchB] interface vlan-interface 2
[SwitchB-Vlan-interface2] mpls enable
[SwitchB-Vlan-interface2] mpls ldp ipv6 enable
[SwitchB-Vlan-interface2] mpls ldp transport-address 10::2
[SwitchB-Vlan-interface2] quit
[SwitchB] interface vlan-interface 3
[SwitchB-Vlan-interface3] mpls enable
[SwitchB-Vlan-interface3] mpls ldp ipv6 enable
[SwitchB-Vlan-interface3] mpls ldp transport-address 20::1
[SwitchB-Vlan-interface3] quit
```

Configure Switch C.

```
[SwitchC] mpls lsr-id 3.3.3.9
[SwitchC] mpls ldp
[SwitchC-ldp] quit
```

```
[SwitchC] interface vlan-interface 3
[SwitchC-Vlan-interface3] mpls enable
[SwitchC-Vlan-interface3] mpls ldp ipv6 enable
[SwitchC-Vlan-interface3] mpls ldp transport-address 20::2
[SwitchC-Vlan-interface3] quit
[SwitchC] interface vlan-interface 7
[SwitchC-Vlan-interface7] mpls enable
[SwitchC-Vlan-interface7] mpls ldp ipv6 enable
[SwitchC-Vlan-interface7] mpls ldp transport-address 40::2
[SwitchC-Vlan-interface7] quit
```

Configure Switch D.

```
[SwitchD] mpls lsr-id 4.4.4.9
[SwitchD] mpls ldp
[SwitchD-ldp] quit
[SwitchD] interface vlan-interface 6
[SwitchD-Vlan-interface6] mpls enable
[SwitchD-Vlan-interface6] mpls ldp ipv6 enable
[SwitchD-Vlan-interface6] mpls ldp transport-address 30::2
[SwitchD-Vlan-interface6] quit
[SwitchD] interface vlan-interface 7
[SwitchD-Vlan-interface7] mpls enable
[SwitchD-Vlan-interface7] mpls ldp ipv6 enable
[SwitchD-Vlan-interface7] mpls ldp transport-address 40::1
[SwitchD-Vlan-interface7] quit
```

4. Configure IPv6 LSP generation policies:

On Switch A, create IPv6 prefix list **switcha**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchA] ipv6 prefix-list switcha index 10 permit 11::0 64
[SwitchA] ipv6 prefix-list switcha index 20 permit 21::0 64
[SwitchA] mpls ldp
[SwitchA-ldp] ipv6 lsp-trigger prefix-list switcha
[SwitchA-ldp] quit
```

On Switch B, create IPv6 prefix list **switchb**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchB] ipv6 prefix-list switchb index 10 permit 11::0 64
[SwitchB] ipv6 prefix-list switchb index 20 permit 21::0 64
[SwitchB] mpls ldp
[SwitchB-ldp] ipv6 lsp-trigger prefix-list switchb
[SwitchB-ldp] quit
```

On Switch C, create IPv6 prefix list **switchc**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchC] ipv6 prefix-list switchc index 10 permit 11::0 64
[SwitchC] ipv6 prefix-list switchc index 20 permit 21::0 64
[SwitchC] mpls ldp
[SwitchC-ldp] ipv6 lsp-trigger prefix-list switchc
[SwitchC-ldp] quit
```

On Switch D, create IPv6 prefix list **switchd**, and configure LDP to use only the routes permitted by the prefix list to establish IPv6 LSPs.

```
[SwitchD] ipv6 prefix-list switchd index 10 permit 11::0 64
```

```
[SwitchD] ipv6 prefix-list switchd index 20 permit 21::0 64
[SwitchD] mpls ldp
[SwitchD-ldp] ipv6 lsp-trigger prefix-list switchd
[SwitchD-ldp] quit
```

5. Configure IPv6 label advertisement policies:

On Switch A, create IPv6 prefix list **prefix-to-b** to permit subnet 11::0/64. Switch A uses this list to filter FEC-label mappings advertised to Switch B.

```
[SwitchA] ipv6 prefix-list prefix-to-b index 10 permit 11::0 64
```

On Switch A, create IP prefix list **peer-b** to permit 2.2.2.9/32. Switch A uses this list to filter peers.

```
[SwitchA] ip prefix-list peer-b index 10 permit 2.2.2.9 32
```

On Switch A, configure an IPv6 label advertisement policy to advertise only the label mapping for FEC 11::0/64 to Switch B.

```
[SwitchA] mpls ldp
[SwitchA-ldp] ipv6 advertise-label prefix-list prefix-to-b peer peer-b
[SwitchA-ldp] quit
```

On Switch C, create IPv6 prefix list **prefix-to-b** to permit subnet 21::0/64. Switch C uses this list to filter FEC-label mappings advertised to Switch B.

```
[SwitchC] ipv6 prefix-list prefix-to-b index 10 permit 21::0 64
```

On Switch C, create IP prefix list **peer-b** to permit 2.2.2.9/32. Switch C uses this list to filter peers.

```
[SwitchC] ip prefix-list peer-b index 10 permit 2.2.2.9 32
```

On Switch C, configure an IPv6 label advertisement policy to advertise only the label mapping for FEC 21::0/64 to Switch B.

```
[SwitchC] mpls ldp
[SwitchC-ldp] ipv6 advertise-label prefix-list prefix-to-b peer peer-b
[SwitchC-ldp] quit
```

On Switch D, create IPv6 prefix list **prefix-to-a** to deny subnet 21::0/64. Switch D uses this list to filter FEC-label mappings to be advertised to Switch A.

```
[SwitchD] ipv6 prefix-list prefix-to-a index 10 deny 21::0 64
[SwitchD] ipv6 prefix-list prefix-to-a index 20 permit 0::0 0 less-equal 128
```

On Switch D, create IP prefix list **peer-a** to permit 1.1.1.9/32. Switch D uses this list to filter peers.

```
[SwitchD] ip prefix-list peer-a index 10 permit 1.1.1.9 32
```

On Switch D, create IPv6 prefix list **prefix-to-c** to deny subnet 11::0/64. Switch D uses this list to filter FEC-label mappings to be advertised to Switch C.

```
[SwitchD] ipv6 prefix-list prefix-to-c index 10 deny 11::0 64
[SwitchD] ipv6 prefix-list prefix-to-c index 20 permit 0::0 0 less-equal 128
```

On Switch D, create IP prefix list **peer-c** to permit subnet 3.3.3.9/32. Switch D uses this list to filter peers.

```
[SwitchD] ip prefix-list peer-c index 10 permit 3.3.3.9 32
```

On Switch D, configure an IPv6 label advertisement policy. This policy ensures that Switch D does not advertise label mappings for FEC 21::0/64 to Switch A, and does not advertise label mappings for FEC 11::0/64 to Switch C.

```
[SwitchD] mpls ldp
[SwitchD-ldp] ipv6 advertise-label prefix-list prefix-to-a peer peer-a
[SwitchD-ldp] ipv6 advertise-label prefix-list prefix-to-c peer peer-c
[SwitchD-ldp] quit
```

Verifying the configuration

Display LDP LSP information on the switches, for example, on Switch A. Verify that Switch A and Switch C have received FEC-label mappings only from Switch B. Switch B has received FEC-label mappings from both Switch A and Switch C. Switch D does not receive FEC-label mappings from Switch A or Switch C. LDP has established an IPv6 LSP only over the link Switch A—Switch B—Switch C.

```
[SwitchA] display mpls ldp lsp ipv6

Configuring tunnel policies

About tunnel policies

Tunnel policies enable a PE to forward traffic for each MPLS VPN over a preferred tunnel or load share the traffic over multiple tunnels. Using tunnel policies can facilitate network planning and management and reduce processing overhead on PEs.

For more information about MPLS VPN, see "Configuring MPLS L3VPN."

Restrictions and guidelines: Tunnel policy configuration

Only advanced mode and expert mode support tunnel policy. For more information about system operating modes, see device management in *Fundamentals Configuration Guide*.

The device does not support MPLS forwarding for tunneled packets.

To configure a VPN to exclusively use a tunnel, perform the following operations:

1. Use the **preferred-path** command to specify the tunnel as the preferred tunnel in a tunnel policy.
2. Apply the policy only to that VPN.

Configuring a tunnel policy

1. Enter system view.
   system-view
2. Create a tunnel policy, and enter tunnel policy view.
   tunnel-policy *tunnel-policy-name*
3. Configure the tunnel policy.
   Choose one option as needed:
   select-seq [**strict**] **lsp load-balance-number** *number*
   By default, the policy selects only one tunnel.

Display and maintenance commands for tunnel policies

Execute **display** commands in any view.

Task	Command
Display tunnel information.	**display mpls tunnel** { **all** | **statistics** | [**vpn-instance** *vpn-instance-name*] **destination** *ipv4-address* }
Display tunnel policy information.	**display tunnel-policy** [*tunnel-policy-name*]

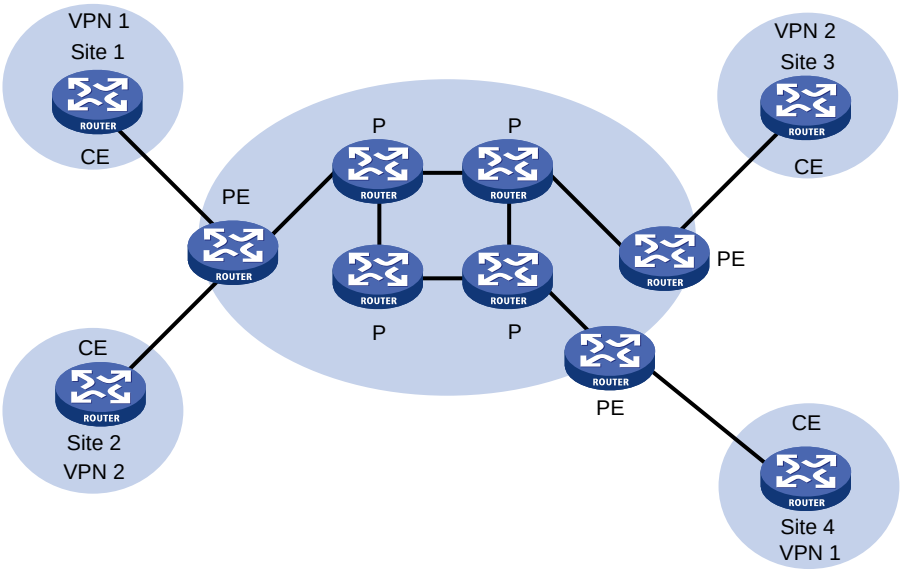
Configuring MPLS L3VPN

About MPLS L3VPN



MPLS L3VPN is a L3VPN technology used to interconnect geographically dispersed VPN sites. MPLS L3VPN uses BGP to advertise VPN routes and uses MPLS to forward VPN packets over a service provider backbone.

Basic MPLS L3VPN architecture

As shown in Figure 1, a basic MPLS L3VPN architecture has the following types of devices:

- **Customer edge device**—A CE device resides on a customer network and has one or more interfaces directly connected to a service provider network. It does not support MPLS.
- **Provider edge device**—A PE device resides at the edge of a service provider network and is connected to one or more CEs. All MPLS VPN services are processed on PEs.
- **Provider device**—A P device is a core device on a service provider network. It is not directly connected to any CEs. A P device has only basic MPLS forwarding capability and does not handle VPN routing information.

Figure 1 Basic MPLS L3VPN architecture

MPLS L3VPN concepts

Site

A site has the following features:

- A site is a group of IP systems with IP connectivity that does not rely on any service provider networks.
- The classification of a site depends on the topology relationship of the devices, rather than the geographical positions. However, the devices at a site are, in most cases, adjacent to each other geographically.

- The devices at a site can belong to multiple VPNs, which means that a site can belong to multiple VPNs.
- A site is connected to a provider network through one or more CEs. A site can contain multiple CEs, but a CE can belong to only one site.

Sites connected to the same provider network can be classified into different sets by policies. Only the sites in the same set can access each other through the provider network. Such a set is called a VPN.

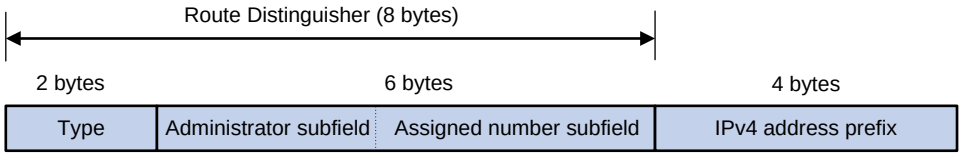
VPN instance

VPN instances implement route isolation, data independence, and data security for VPNs.

A VPN instance has the following components:

- A separate Label Forwarding Information Base (LFIB).
- An IP routing table.
- Interfaces bound to the VPN instance.
- VPN instance administration information, including route distinguishers (RDs), route targets (RTs), and route filtering policies.

To associate a site with a VPN instance, bind the VPN instance to the PE's interface connected to the site. A site can be associated with only one VPN instance, and different sites can be associated with the same VPN instance. A VPN instance contains the VPN membership and routing rules of associated sites.



VPN-IPv4 address

Each VPN independently manages its address space. The address spaces of VPNs might overlap. For example, if both VPN 1 and VPN 2 use the addresses on subnet 10.110.10.0/24, address space overlapping occurs.

BGP cannot process overlapping VPN address spaces. For example, if both VPN 1 and VPN 2 use the subnet 10.110.10.0/24 and each advertise a route destined for the subnet, BGP selects only one of them. This results in the loss of the other route.

Multiprotocol BGP (MP-BGP) can solve this problem by advertising VPN-IPv4 addresses (also called VPNv4 addresses).

Figure 2 VPN-IPv4 address structure

As shown in Figure 2, a VPN-IPv4 address consists of 12 bytes. The first eight bytes represent the RD, followed by a four-byte IPv4 prefix. The RD and the IPv4 prefix form a unique VPN-IPv4 prefix.

An RD can be in one of the following formats:

- When the Type field is 0, the Administrator subfield occupies two bytes, the Assigned number subfield occupies four bytes, and the RD format is *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- When the Type field is 1, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit IPv4 address*:*16-bit user-defined number*. For example, 172.1.1.1:1.
- When the Type field is 2, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

NOTE:

When you configure an RD through CLI, you can specify an AS number in integer format or dotted decimal notation. For example, 65536:1 and 1.0:1 specify the same RD.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the Administrator subfield to any private AS number or private IP address.

Route target attribute

MPLS L3VPN uses route target (also called VPN target) community attributes to control the advertisement of VPN routing information. A VPN instance on a PE supports the following types of route target attributes:

- **Export target attribute**—A PE sets the export target attribute for VPN-IPv4 routes learned from directly connected sites before advertising them to other PEs.
- **Import target attribute**—A PE checks the export target attribute of VPN-IPv4 routes received from other PEs. If the export target attribute matches the import target attribute of a VPN instance, the PE adds the routes to the routing table of the VPN instance.

Route target attributes define which sites can receive VPN-IPv4 routes, and from which sites a PE can receive routes.

Like RDs, route target attributes can be one of the following formats:

- *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- *32-bit IPv4 address:16-bit user-defined number*. For example, 172.1.1.1:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

NOTE:

When you configure an RD from the CLI, you can specify an AS number in integer format or dotted decimal notation. For example, values 65536:1 and 1.0:1 specify the same RD.

-

MP-BGP

MP-BGP supports multiple address families, including IPv4 multicast and VPN-IPv4 address families.

In MPLS L3VPN, MP-BGP advertises VPN-IPv4 routes for VPN sites between PEs.

MPLS L3VPN route advertisement

In a basic MPLS L3VPN, CEs and PEs are responsible for advertising VPN routing information. P routers maintain only the routes within the backbone. A PE maintains only routing information for directly connected VPNs, rather than for all VPNs.

VPN routing information is advertised through the path local CE—ingress PE—egress PE—remote CE.

Route advertisement from the local CE to the ingress PE

The CE advertises standard IPv4 routing information to the ingress PE over a static route, RIP route, OSPF route, IS-IS route, EBGP route, or IBGP route.

Route advertisement from the ingress PE to the egress PE

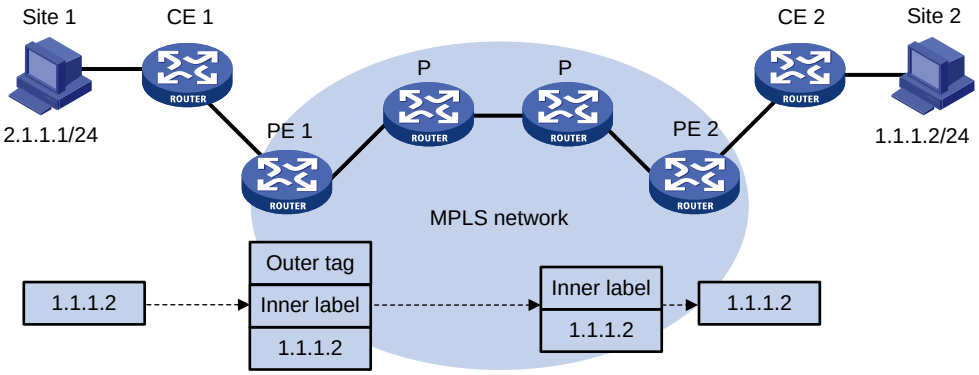
The ingress PE performs the following operations:

1. Adds RDs and route target attributes to these standard IPv4 routes and assign these routes MPLS labels to create VPN-IPv4 routes.

2. Saves the VPN-IPv4 routes to the routing table of the VPN instance created for the CE.
3. Advertises the VPN-IPv4 routes (with export targets and MPLS labels) to the egress PE through MP-BGP.

Route advertisement from the egress PE to the remote CE

After receiving the VPN-IPv4 routes, the egress PE performs the following operations:



1. Compares the routes' export target attributes with the local import target attributes.
2. Adds the routes to the routing table of the VPN instance if the export and local import target attributes match each other.
3. Restores the VPN-IPv4 routes to the original IPv4 routes.
4. Advertises those routes to the connected CE over a static route, RIP route, OSPF route, IS-IS route, EBGP route, or IBGP route.

MPLS L3VPN packet forwarding

In a basic MPLS L3VPN (within a single AS), a PE adds the following information into VPN packets:

- **Outer tag**—Identifies the public tunnel from the local PE to the remote PE. The public tunnel can be an LSP or a GRE tunnel. Based on the outer tag, a VPN packet can be forwarded along the public tunnel to the remote PE. For a GRE public tunnel, the outer tag is the GRE encapsulation. For an LSP tunnel, the outer tag is an MPLS label.
- **Inner label**—Identifies the remote VPN site. The remote PE uses the inner label to forward packets to the target VPN site. MP-BGP advertises inner labels for VPN-IPv4 routes among PEs.

Figure 3 VPN packet forwarding

As shown in Figure 3, a VPN packet is forwarded from Site 1 to Site 2 by using the following process:

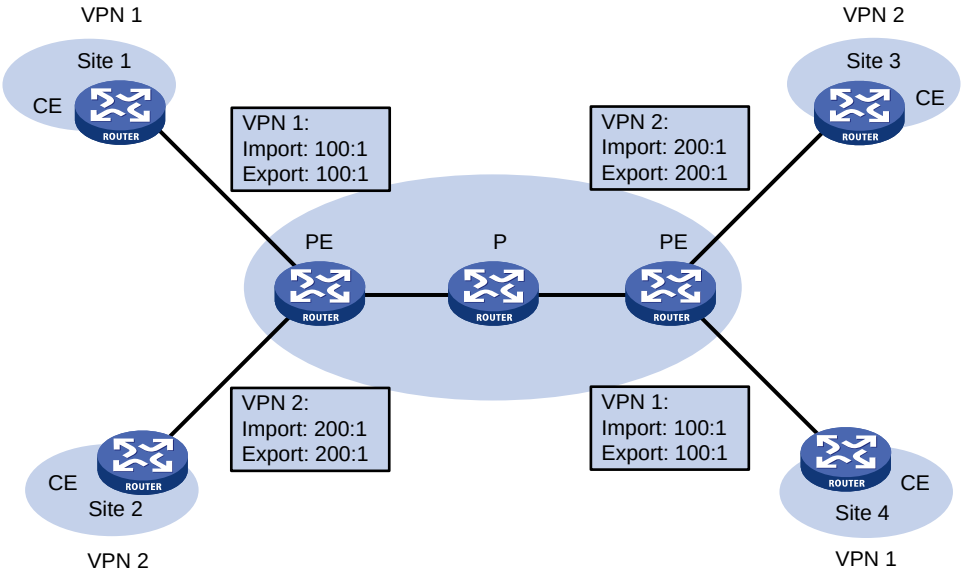
1. Site 1 sends an IP packet with the destination address 1.1.1.2. CE 1 transmits the packet to PE 1.
2. PE 1 performs the following operations:
   a. Finds the matching VPN route based on the inbound interface and destination address of the packet.
   b. Labels the packet with both the inner label and the outer tag.
   c. Forwards the packet to the public tunnel.
3. P devices forward the packet to PE 2 by the outer tag.
   - If the outer tag is an MPLS label, the label is removed from the packet at the penultimate hop.
   - If the outer tag is GRE encapsulation, PE 2 removes the GRE encapsulation.
4. PE 2 performs the following operations:

a. Uses the inner label to find the matching VPN instance to which the destination address of the packet belongs.
b. Looks up the routing table of the VPN instance for the output interface.
c. Removes the inner label and forwards the packet out of the interface to CE 2.

5. CE 2 transmits the packet to the destination through IP forwarding.

When two sites of a VPN are connected to the same PE, the PE directly forwards packets between the two sites through the VPN routing table without adding any tag or label.

MPLS L3VPN networking schemes



In MPLS L3VPNs, route target attributes are used to control the advertisement and reception of VPN routes between sites. They work independently and can be configured with multiple values to support flexible VPN access control and implement multiple types of VPN networking schemes.

Basic VPN networking scheme

In the simplest case, all users in a VPN form a closed user group. They can forward traffic to each other but cannot communicate with any user outside the VPN.

For the basic VPN networking scheme, you must assign a route target to each VPN for identifying the export target attribute and import target attribute of the VPN. Moreover, this route target cannot be used by any other VPNs.

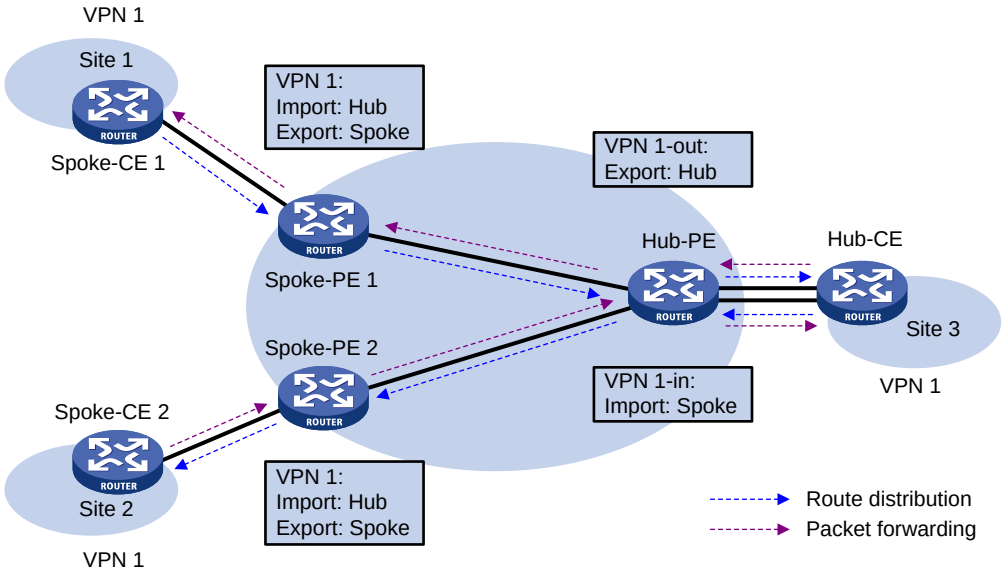
Figure 4 Network diagram for basic VPN networking scheme

As shown in Figure 4, the route target for VPN 1 is 100:1, while that for VPN 2 is 200:1. The two VPN 1 sites can communicate with each other, and the two VPN 2 sites can communicate with each other. However, the VPN 1 sites cannot communicate with the VPN 2 sites.

Hub and spoke networking scheme

The hub and spoke networking scheme is suitable for a VPN where all users must communicate with each other through an access control device.

In a hub and spoke network as shown in Figure 5, configure route targets as follows:



- On spoke PEs (PEs connected to spoke sites), set the export target to Spoke and the import target to Hub.
- On the hub PE (PE connected to the hub site), use two interfaces that each belong to a different VPN instance to connect the hub CE. One VPN instance receives routes from spoke PEs and

has the import target set to Spoke. The other VPN instance advertises routes to spoke PEs and has the export target set to Hub.

These route targets rules produce the following results:

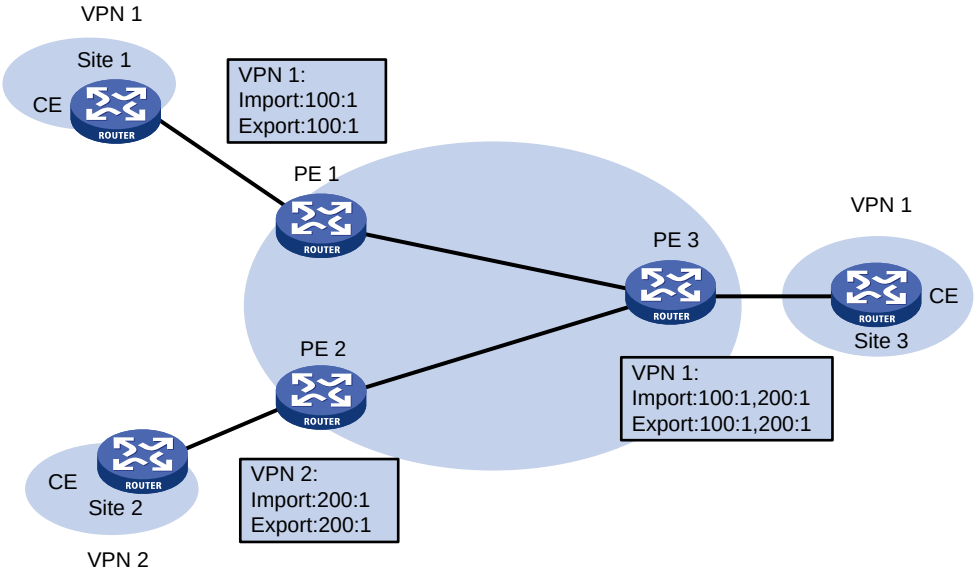
- The hub PE can receive all VPN-IPv4 routes from spoke PEs.
- All spoke PEs can receive VPN-IPv4 routes advertised by the hub PE.
- The hub PE advertises the routes learned from a spoke PE to the other spoke PEs so the spoke sites can communicate with each other through the hub site.
- The import target attribute of a spoke PE is different from the export target attribute of any other spoke PE. Any two spoke PEs do not directly advertise VPN-IPv4 routes to each other. Therefore, they cannot directly access each other.

Figure 5 Network diagram for hub and spoke network

A route in Site 1 is advertised to Site 2 by using the following process:

Table 1 Spoke-CE 1 advertises a route in Site 1 to Spoke-PE 1.

2. Spoke-PE 1 changes the route to a VPN-IPv4 route and advertises the VPN-IPv4 route to Hub-PE through MP-BGP.
3. Hub-PE adds the VPN-IPv4 route into the routing table of VPN 1-in, changes it to the original IPv4 route, and advertises the IPv4 route to Hub-CE.
4. Hub-CE advertises the IPv4 route back to Hub-PE.
5. Hub-PE adds the IPv4 route to the routing table of VPN 1-out, changes it to a VPN-IPv4 route, and advertises the VPN-IPv4 route to Spoke-PE 2 through MP-BGP.
6. Spoke-PE 2 changes the VPN-IPv4 route to the original IPv4 route, and advertises the IPv4 route to Site 2.



After spoke sites exchange routes through the hub site, they can communicate with each other through the hub site.

Extranet networking scheme

The extranet networking scheme allows specific resources in a VPN to be accessed by users not in the VPN.

In this networking scheme, if a VPN instance needs to access a shared site, the export target attribute and the import target attribute of the VPN instance must be contained in the import target attribute and the export target attribute of the VPN instance of the shared site, respectively.

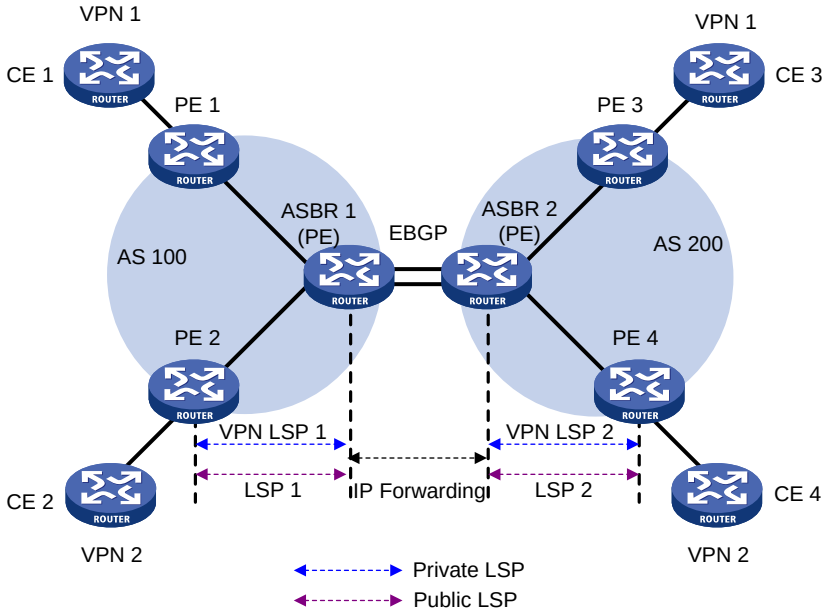
Figure 6 Network diagram for extranet networking scheme

As shown in Figure 6, route targets configured on PEs produce the following results:

- PE 3 can receive VPN-IPv4 routes from PE 1 and PE 2.
- PE 1 and PE 2 can receive VPN-IPv4 routes advertised by PE 3.
- Site 1 and Site 3 of VPN 1 can communicate with each other, and Site 2 of VPN 2 and Site 3 of VPN 1 can communicate with each other.
- PE 3 advertises neither the VPN-IPv4 routes received from PE 1 to PE 2 nor the VPN-IPv4 routes received from PE 2 to PE 1 (routes learned from an IBGP neighbor are not advertised to any other IBGP neighbor). Therefore, Site 1 of VPN 1 and Site 2 of VPN 2 cannot communicate with each other.

Inter-AS VPN

In an inter-AS VPN networking scenario, multiple sites of a VPN are connected to multiple ISPs in different ASs, or to multiple ASs of an ISP.



Inter AS-VPN provides the following solutions:

- **VRF-to-VRF connections between ASBRs**—This solution is also called inter-AS option A.
- **EBGP redistribution of labeled VPN-IPv4 routes between ASBRs**—ASBRs advertise VPN-IPv4 routes to each other through MP-EBGP. This solution is also called inter-AS option B.
- **Multihop EBGP redistribution of labeled VPN-IPv4 routes between PE routers**—PEs advertise VPN-IPv4 routes to each other through MP-EBGP. This solution is also called inter-AS option C.

Inter-AS option A

In this solution, PEs of two ASs are directly connected, and each PE is also the ASBR of its AS. Each PE treats the other as a CE and advertises unlabeled IPv4 unicast routes through EBGP. The PEs associate a VPN instance with a minimum of one interface.

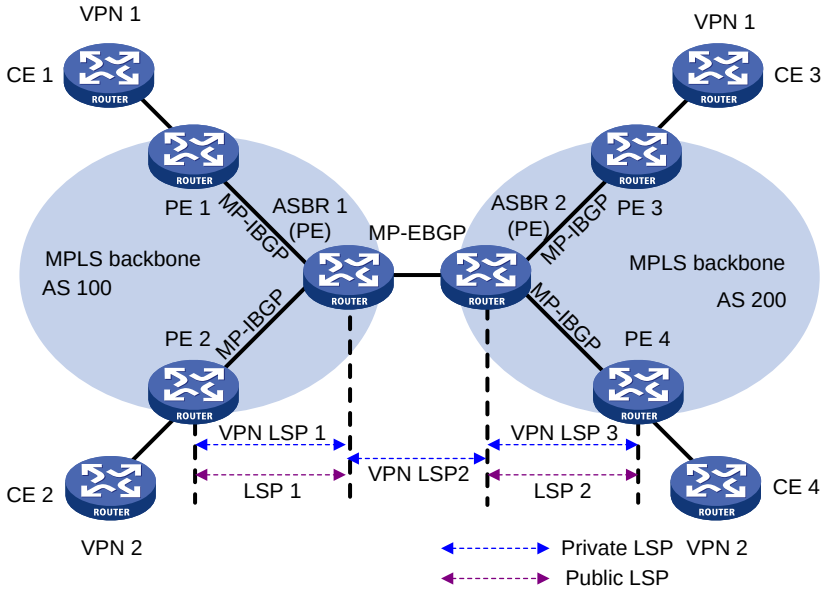
Figure 7 Network diagram for inter-AS option A

As shown in Figure 7, in VPN 1, routes are advertised from CE 1 to CE 3 by using the following process:

Table 2 PE 1 advertises the VPN routes learned from CE 1 to ASBR 1 through MP-IBGP.

2. ASBR 1 performs the following operations:
   a. Adds the routes to the routing table of the VPN instance whose import target attribute matches the export target attribute of the routes.
   b. Advertises the routes as IPv4 unicast routes to its CE (ASBR 2) through EBGP.
3. ASBR 2 adds the IPv4 unicast routes to the routing table of the VPN instance that is bound to the receiving interface, and advertises the routes to PE 3 through MP-IBGP.
4. PE 3 advertises the received routes to CE 3.

Packets forwarded within an AS are VPN packets that carry two labels. Packets forwarded between ASBRs are common IP packets.



Inter-AS option A is easy to carry out because no special configuration is required on the PEs acting as the ASBRs.

However, it has limited scalability because the PEs acting as the ASBRs must manage all the VPN routes and create VPN instances on a per-VPN basis. This leads to excessive VPN-IPv4 routes on the PEs. Associating a separate interface with each VPN also requires additional system resources.

Inter-AS option B

In this solution, two ASBRs use MP-EBGP to exchange VPN-IPv4 routes that they obtain from the PEs in their respective ASs.

Figure 8 Network diagram for inter-AS option B

As shown in Figure 8, in VPN 1, routes are advertised from CE 1 to CE 3 by using the following process:

Table 3 PE 1 advertises the VPN routes learned from CE 1 to ASBR 1 through MP-IBGP.

Assume that the inner label assigned by PE 1 for the routes is L1.

2. ASBR 1 advertises the VPN-IPv4 routes to ASBR 2 through MP-EBGP.

   Before advertising the routes, ASBR 1 modifies the next hop as its own address, assigns a new inner label (L2) to the routes, and associates L1 with L2.

3. ASBR 2 advertises the VPN-IPv4 routes to PE 3 through MP-IBGP.

   Before advertising the routes, ASBR 2 modifies the next hop as its own address, assigns a new inner label (L3) to the routes, and associates L2 with L3.

4. PE 3 advertises the received routes to CE 3.

A packet is forwarded from CE 3 to CE 1 by using the following process:

Table 4 PE 3 encapsulates the received packet with two labels, and forwards the encapsulated packet to ASBR 2.

One of the labels is L3, and the other is the outer tag for the public tunnel from PE 3 to ASBR 2.

5. ASBR 2 removes the outer tag, replaces L3 with L2, and forwards the packet to ASBR 1.

   Packets between ASBR 1 and ASBR 2 carry only one inner label.

6. ASBR 1 replaces L2 with L1, adds the outer tag of the public tunnel from ASBR 1 to PE 1, and forwards the packet to PE 1.

7. PE 1 removes the inner label and outer tag and forwards the packet to CE 1.

In this solution, ASBRs must receive all inter-AS VPN routes. Therefore, ASBRs cannot filter incoming VPN-IPv4 routes by route targets.

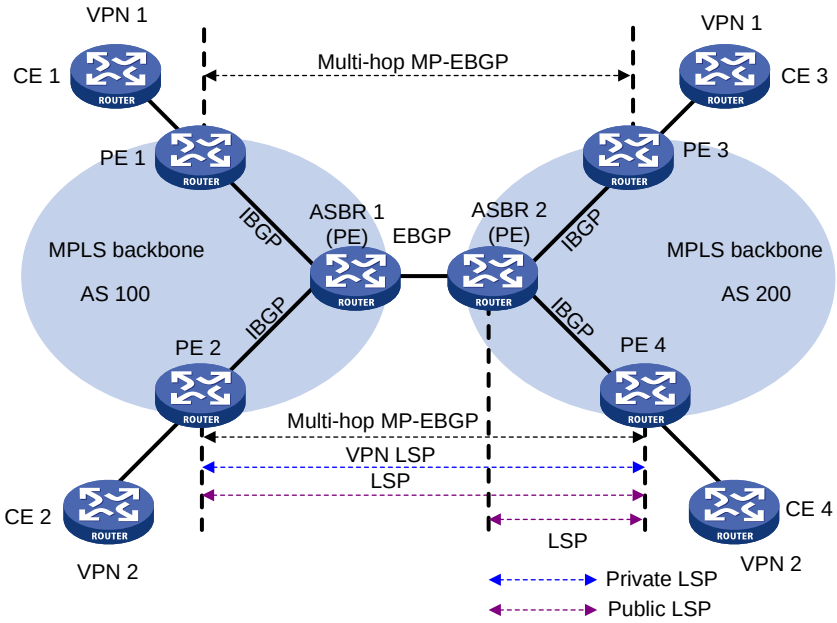
Inter-AS option B has better scalability than option A. However, it requires that ASBRs maintain and advertise VPN routes.

Inter-AS option C

The Inter-AS option A and option B solutions require that the ASBRs maintain and advertise VPN-IPv4 routes. When every AS needs to exchange a great amount of VPN routes, the ASBRs

might become bottlenecks, which hinders network extension. Inter-AS option C has better scalability because it makes PEs directly exchange VPN-IPv4 routes.

In this solution, PEs exchange VPN-IPv4 routes over a multihop MP-EBGP session. Each PE must have a route to the peer PE and a label for the route so that the inter-AS public tunnel between the PEs can be set up. Inter-AS option C sets up a public tunnel by using the following methods:



- Method 1:
  - **a.** The PE and the ASBR within an AS establish a public tunnel by using a label distribution protocol such as LDP.
  - **b.** The local and remote ASBRs advertise labeled IPv4 unicast routes through BGP to establish an inter-AS public tunnel.

    Labeled IPv4 unicast route advertisement refers to the process of assigning MPLS labels to IPv4 unicast routes and advertising IPv4 unicast routes and their labels.
- Method 2:

  In method 2, the PE and ASBR within an AS do not need to establish an IBGP peer relationship.
  - **c.** The local ASBR redistributes IGP routes to the BGP routing table, assigns labels to the routes, and advertises the labeled routes to the remote ASBR.
  - **d.** The remote ASBR redistributes BGP routes to the IGP routing table.
  - **e.** The local and remote PEs then can learn the route s to reach each other. After the PEs learn the routes to each other, they establish a public tunnel by using a label distribution protocol such as LDP.

The following is an example of configuring inter-AS option C by using method 1.

Figure 9 Network diagram for inter-AS option C (method 1)

As shown in Figure 9, in VPN 1, routes are advertised from CE 1 to CE 3 by using the following process:

2. PE 1 advertises the VPN routes learned from CE 1 as VPN-IPv4 routes to PE 3 through multihop MP-EBGP.

   Assume that the inner label assigned by PE 1 for the routes is Lx.
3. PE 3 advertises the received routes to CE 3.

Setting up an inter-AS public tunnel is difficult in this solution. A public tunnel, for example, the one from PE 3 to PE 1, is set up by using the following process:

Table 5 Within AS 100, the public tunnel from ASBR 1 to PE 1 is set up by using a label distribution protocol, for example, LDP.

Assume that the outgoing label for the public tunnel on ASBR 1 is L1.

4. ASBR 1 advertises labeled IPv4 unicast routes to ASBR 2 through EBGP.

   The route destined for PE 1 and the label (L2) assigned by ASBR 1 for the route are advertised from ASBR 1 to ASBR 2. The next hop of the route is ASBR 1. The public tunnel from ASBR 2 to ASBR 1 is set up. The incoming label for the public tunnel on ASBR 1 is L2.

5. ASBR 2 advertises labeled IPv4 unicast routes to PE 3 through IBGP.

   The route destined for PE 1 and the label (L3) assigned by ASBR 2 for the route are advertised from ASBR 2 to PE 3. The next hop for the route is ASBR 2. The public tunnel from PE 3 to ASBR 2 is set up. The incoming label for the public tunnel on ASBR 2 is L3, and the outgoing label is L2.

6. MPLS packets cannot be forwarded directly from PE 3 to ASBR 2. Within AS 200, the public tunnel from PE 3 to ASBR 2 is required to be set up hop by hop through a label distribution protocol, for example, LDP.

   Assume that the outgoing label for the public tunnel on PE 3 is Lv.

After route advertisement and public tunnel setup, a packet is forwarded from CE 3 to CE 1 by using the following process:

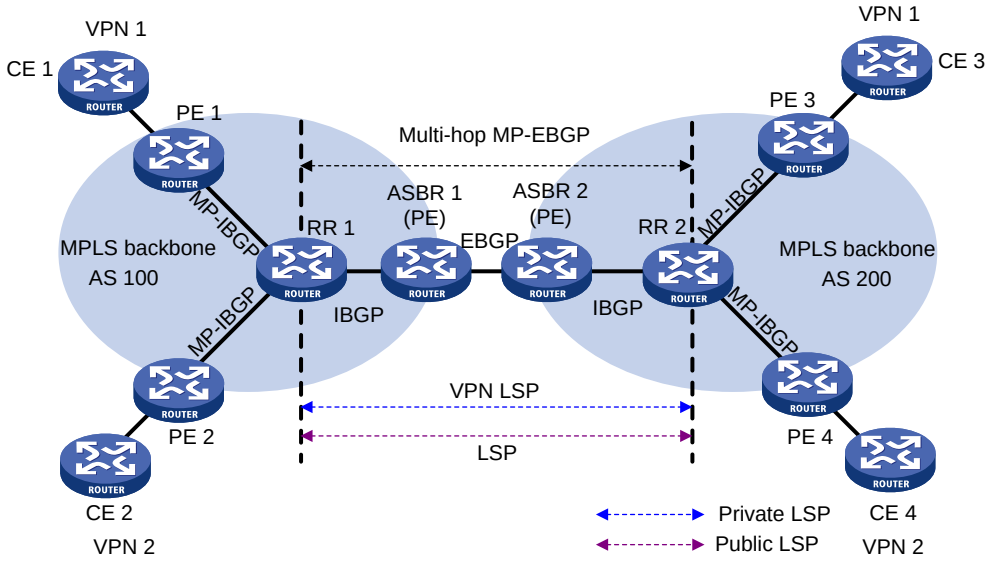


Table 6 PE 3 performs the following routing table lookups for the packet:

   a. Finds a matching route with next hop PE 1 and inner label Lx, and encapsulates the packet with label Lx.
   b. Finds the route to PE 1 with next hop ASBR 2 and label L3, and encapsulates the packet with label L3 as the outer label.
   c. Finds the route to ASBR 2 with outgoing label Lv, and encapsulates the packet with label Lv as the outmost label.

7. AS 200 transmits the packet to ASBR 2 by the outmost label.
8. ASBR 2 removes the outmost label, replaces L3 with L2, and forwards the packet to ASBR 1.
9. ASBR 1 replaces L2 with L1, and forwards the packet.
10. AS 100 transmits the packet to PE 1 by the outer label.
11. PE 1 removes the outer label, and forwards the packet to CE 1 according to the inner label Lx.

As shown in Figure 10, to improve scalability, you can specify a route reflector (RR) in each AS to exchange VPN-IPv4 routes with PEs in the same AS. The RR in each AS maintains all VPN-IPv4 routes. The RRs in two ASs establish a multihop MP-EBGP session to advertise VPN-IPv4 routes.

Figure 10 Network diagram for inter-AS option C using RRs

Carrier's carrier

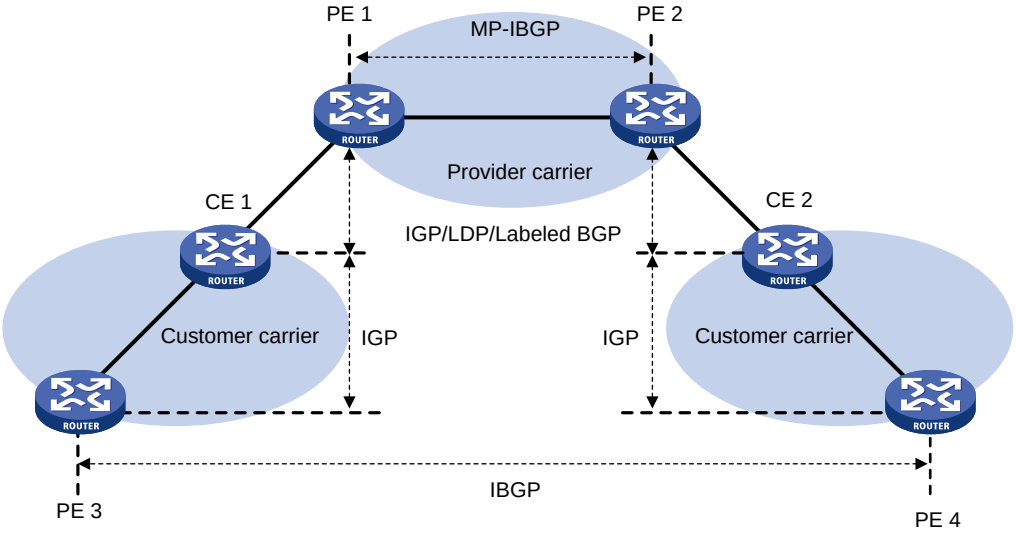
If a customer of an MPLS L3VPN service provider is also a service provider:

- The MPLS L3VPN service provider is called the provider carrier or the Level 1 carrier.
- The customer is called the customer carrier or the Level 2 carrier.

This networking model is referred to as carrier's carrier.

The PEs of the Level 2 carrier directly exchange customer networks over a BGP session. The Level 1 carrier only learns the backbone networks of the Level 2 carrier, without learning customer networks.

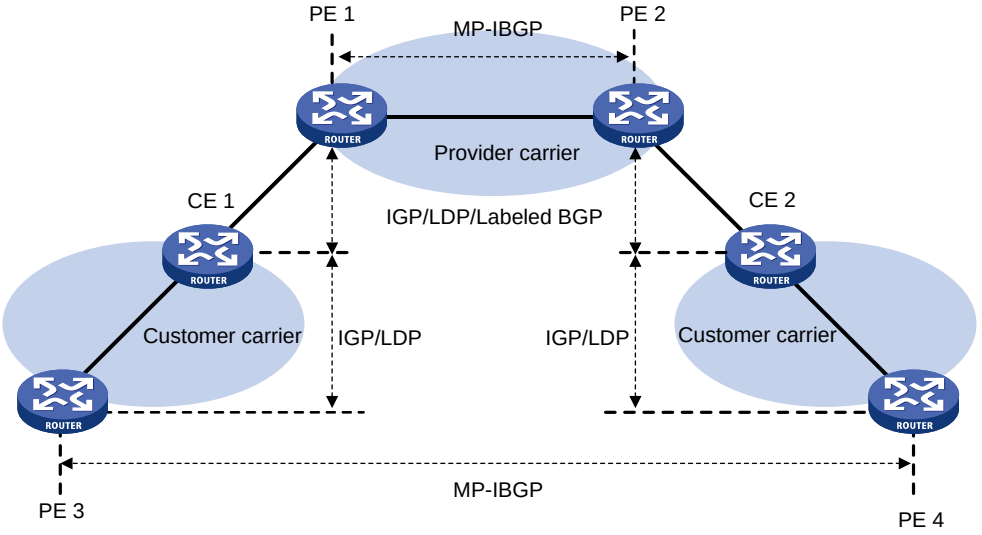
For packets between customer networks to travel through the Level 1 carrier, the PE of the Level 1 carrier and the CE of the Level 2 carrier must assign labels to the backbone networks of the Level 2 carrier. The CE of the Level 2 carrier is a PE within the Level 2 carrier network.



Follow these guidelines to assign labels:

- If the PE and the CE are in the same AS, you must configure IGP and LDP between them. If they are in different ASs, you must configure MP-EBGP to assign labels to IPv4 unicast routes exchanged between them.
- You must enable MPLS on the CE of the Level 2 carrier regardless of whether the PE and CE are in the same AS.

A Level 2 carrier can be an ordinary ISP or an MPLS L3VPN service provider.



As shown in Figure 11, when the customer carrier is an ordinary ISP, its PEs and CEs run IGP to communicate with each other. The PEs do not need to run MPLS. PE 3 and PE 4 exchange customer network routes (IPv4 unicast routes) through an IBGP session.

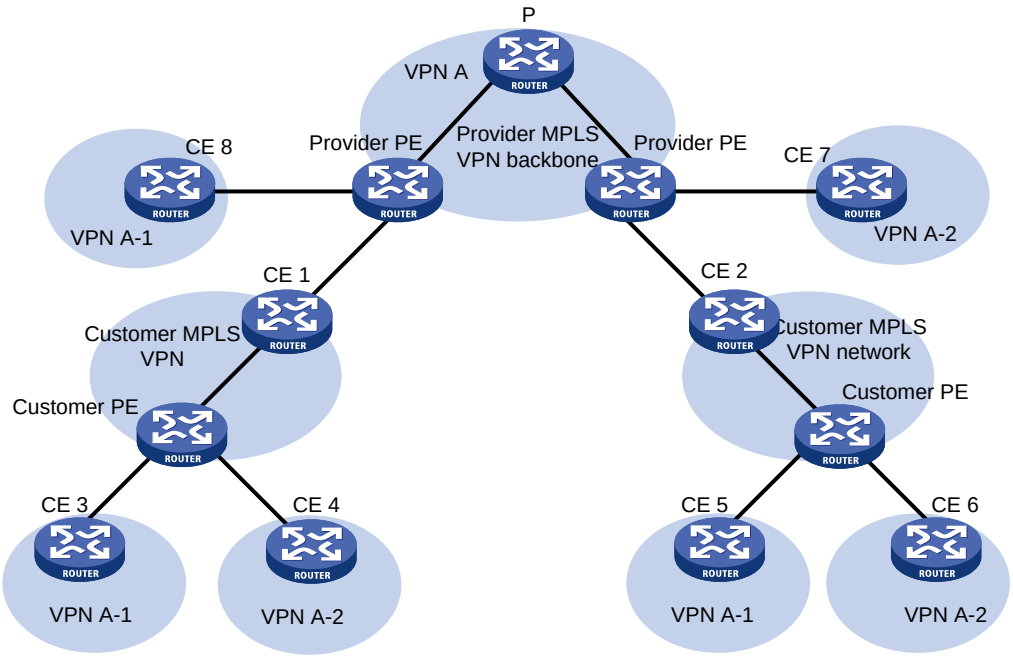
Figure 11 Scenario where the Level 2 carrier is an ISP

As shown in Figure 12, when the customer carrier is an MPLS L3VPN service provider, its PEs and CEs must run IGP and LDP to communicate with each other. PE 3 and PE 4 exchange customer network routes (VPN-IPv4 routes) through an MP-IBGP session.

Figure 12 Scenario where the Level 2 carrier is an MPLS L3VPN service provider

NOTE:

As a best practice, establish equal cost LSPs between the Level 1 carrier and the Level 2 carrier if equal cost routes exist between them.



Nested VPN

The nested VPN technology exchanges VPNv4 routes between PEs and CEs of the ISP MPLS L3VPN and allows a customer to manage its own internal VPNs. Figure 13 shows a nested VPN network. On the service provider's MPLS VPN network, there is a customer VPN named VPN A. The customer VPN contains two sub-VPNs, VPN A-1 and VPN A-2.

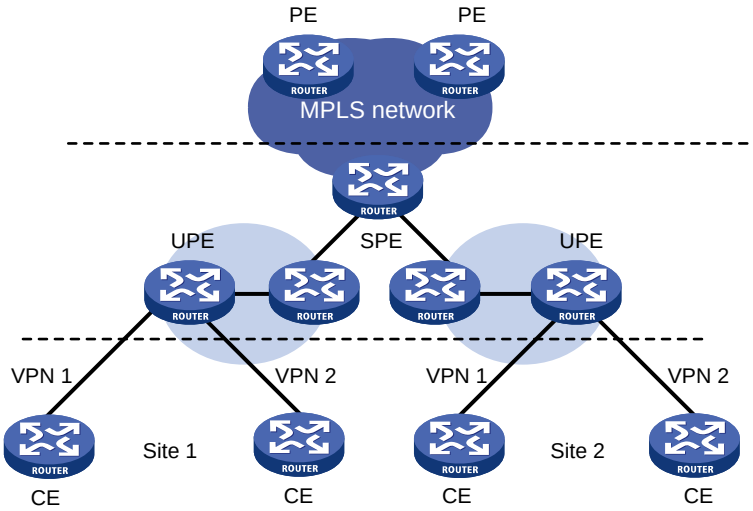
The service provider PEs consider the customer's network as a common VPN user and do not join any sub-VPNs. The service provider CE devices (CE 1 and CE 2) exchange VPNv4 routes including sub-VPN routing information with the service provider PEs, which implements the propagation of the sub-VPN routing information throughout the customer network.

The nested VPN technology supports both symmetric networking and asymmetric networking. Sites of the same VPN can have the same number or different numbers of internal VPNs. Nested VPN also supports multiple-level nesting of internal VPNs.

Figure 13 Network diagram for nested VPN

In a nested VPN network, routing information is propagated by using the following process:

Table 7 After receiving VPN routes from customer CEs, a customer PE advertises VPN-IPv4 routes to the provider CEs through MP-BGP.



2. The provider CEs advertise the VPN-IPv4 routes to a provider PE through MP-BGP.
3. After receiving a VPN-IPv4 route, the provider PE keeps the customer's internal VPN information, and appends the customer's MPLS VPN attributes on the service provider network. It replaces the RD of the VPN-IPv4 route with the RD of the customer's MPLS VPN on the service provider network. It also adds the export route-target (ERT) attribute of the customer's MPLS VPN on the service provider network to the extended community attribute list of the route. The internal VPN information for the customer is maintained on the provider PE.
4. The provider PE advertises VPN-IPv4 routes carrying the comprehensive VPN information to the other PEs of the service provider.
5. After another provider PE receives the VPN-IPv4 routes, it matches the VPN-IPv4 routes to the import targets of its local VPNs. Each local VPN accepts routes of its own and advertises them to provider CEs. If a provider CE (such as CE 7 and CE 8 in Figure 13) is connected to a provider PE through an IPv4 connection, the PE advertises IPv4 routes to the CE. If it is a VPN-IPv4 connection (a customer MPLS VPN network), the PE advertises VPN-IPv4 routes to the CE.
6. After receiving VPN-IPv4 routes from the provider CE, a customer PE matches those routes to local import targets. Each customer VPN accepts only its own routes and advertises them to connected customer CEs (such as CE 3, CE 4, CE 5, and CE 6 in Figure 13).

HoVPN

Hierarchy of VPN (HoVPN), also called Hierarchy of PE (HoPE), prevents PEs from being bottlenecks and is applicable to large-scale VPN deployment.

HoVPN divides PEs into underlayer PEs (UPEs) or user-end PEs, and superstratum PEs (SPEs) or service provider-end PEs. UPEs and SPEs have different functions and comprise a hierarchical PE. The HoPE and common PEs can coexist in an MPLS network.

Figure 14 Basic architecture of HoVPN

As shown in Figure 14, UPEs and SPEs play the following different roles:

- A UPE is directly connected to CEs. It provides user access. It maintains the routes of directly connected VPN sites. It does not maintain the routes of the remote sites in the VPN, or it only maintains their summary routes. A UPE assigns inner labels to the routes of its directly connected sites, and advertises the labels along with VPN routes to the SPE through MP-BGP. A UPE features high access capability, small routing table capacity, and low forwarding performance.
- An SPE is connected to UPEs and resides inside the service provider network. It manages and advertises VPN routes. It maintains all the routes of the VPNs connected through UPEs, including the routes of both the local and remote sites. An SPE advertises routes along with labels to UPEs, including the default routes of VPN instances or summary routes and the routes permitted by the routing policy. By using routing policies, you can control which sites in a VPN can communicate with each other. An SPE features large routing table capacity, high forwarding performance, and fewer interface resources.

Either MP-IBGP or MP-EBGP can run between SPE and UPE. When MP-IBGP runs between SPE and UPEs, the SPE acts as the RR of multiple UPEs and reflects routes between UPEs.

HoVPN supports HoPE recursion:

- An HoPE can act as a UPE to form a new HoPE with an SPE.
- An HoPE can act as an SPE to form a new HoPE with multiple UPEs.

HoVPN supports multilevel recursion. In HoPE recursion, the concepts of SPE and UPE are relative. A PE might be the SPE of its underlayer PEs and a UPE of its SPE at the same time.

Figure 15 Recursion of HoPEs

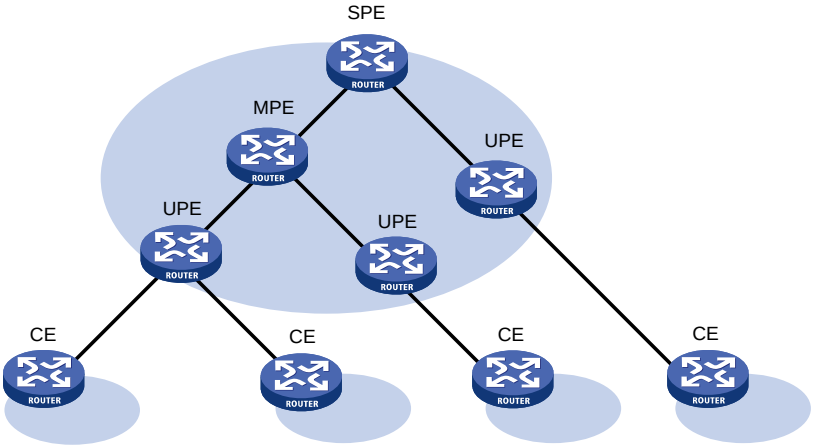


Figure 15 shows a three-level HoPE. The PE in the middle is called the middle-level PE (MPE). MP-BGP runs between SPE and MPE, and between MPE and UPE.

MP-BGP advertises the following routes:

- All the VPN routes of UPEs to the SPEs.
- The default routes of the VPN instance of the SPEs or the VPN routes permitted by the routing policies to the UPEs.

The SPE maintains the VPN routes of all sites in the HoVPN. Each UPE maintains only VPN routes of its directly connected sites. An MPE has fewer routes than the SPE but has more routes than a UPE.

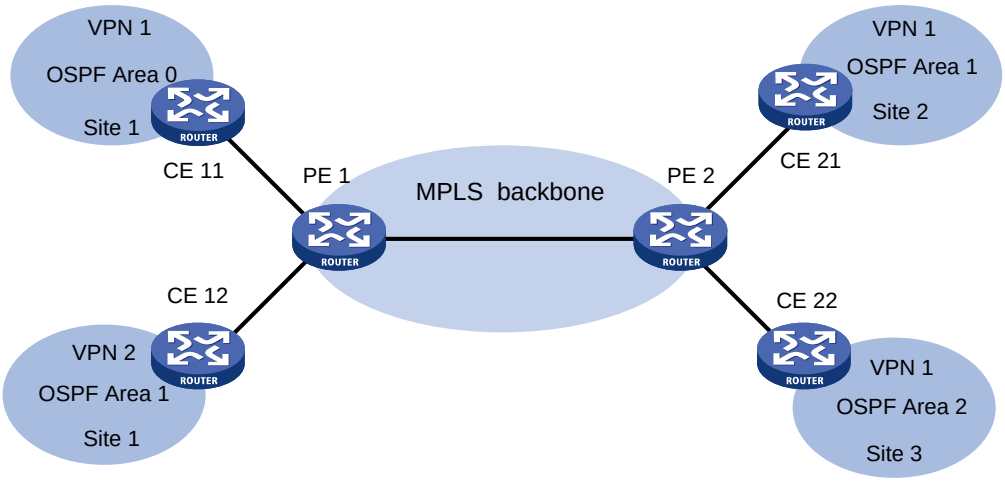
OSPF VPN extension

This section describes the OSPF VPN extension. For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

OSPF for VPNs on a PE

If OSPF runs between a CE and a PE to exchange VPN routes, the PE must support multiple OSPF instances to create independent routing tables for VPN instances. Each OSPF process is bound to a VPN instance. Routes learned by an OSPF process are added into the routing table of the bound VPN instance.

OSPF area configuration between a PE and a CE



The OSPF area between a PE and a CE can be either a non-backbone area or a backbone area.

In the OSPF VPN extension application, the MPLS VPN backbone is considered the backbone area (area 0). The area 0 of each site must be connected to the MPLS VPN backbone (physically connected or logically connected through a virtual link) because OSPF requires that the backbone area be contiguous.

BGP/OSPF interaction

If OSPF runs between PEs and CEs, each PE redistributes BGP routes to OSPF and advertises the routes to CEs through OSPF. OSPF considers the routes redistributed from BGP as external routes but the OSPF routes actually belong to the same OSPF domain. This problem can be resolved by configuring the same domain ID for sites in an OSPF domain.

Figure 16 Network diagram for BGP/OSPF interaction

As shown in Figure 16, CE 11, CE 21, and CE 22 belong to the same VPN and the same OSPF domain.

Before domain ID configuration, VPN 1 routes are advertised from CE 11 to CE 21 and CE 22 by using the following process:

Table 8 PE 1 redistributes OSPF routes from CE 11 into BGP, and advertises the VPN routes to PE 2 through BGP.

2. PE 2 redistributes the BGP routes to OSPF, and advertises them to CE 21 and CE 22 in AS External LSAs (Type 5) or NSSA External LSAs (Type 7).

After domain ID configuration, VPN 1 routes are advertised from CE 11 to CE 21 and CE 22 by using the following process:

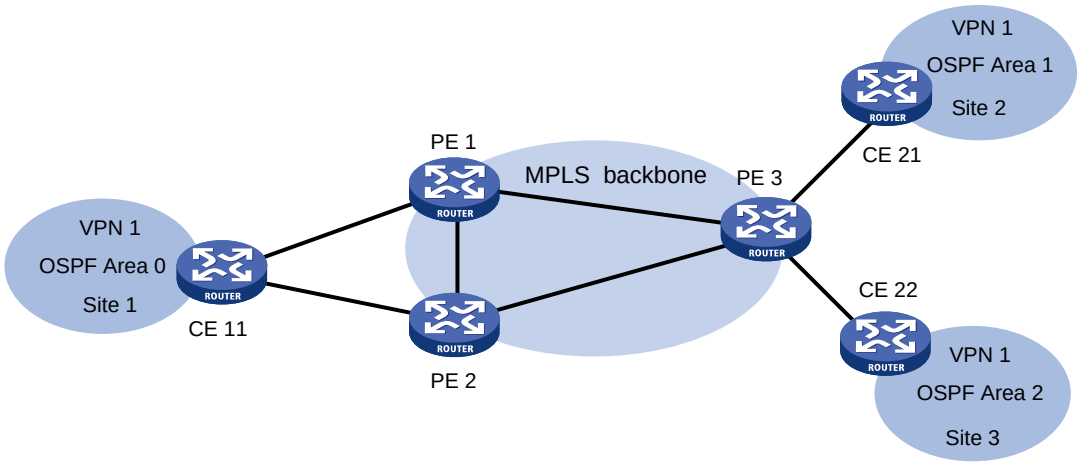


Table 9 PE 1 redistributes OSPF routes into BGP, adds the domain ID to the redistributed BGP VPNv4 routes as a BGP extended community attribute, and advertises the routes to PE 2.

3. PE 2 compares the domain ID in the received routes with the locally configured domain ID. If they are the same and the received routes are intra-area or inter-area routes, OSPF advertises these routes in Network Summary LSAs (Type 3). Otherwise, OSPF advertises these routes in AS External LSAs (Type 5) or NSSA External LSAs (Type 7).

Routing loop avoidance

As shown in Figure 17, Site 1 is connected to two PEs. When a PE advertises VPN routes learned from MP-BGP to Site 1 through OSPF, the routes might be received by the other PE. This results in a routing loop.

Figure 17 Network diagram for routing loop avoidance

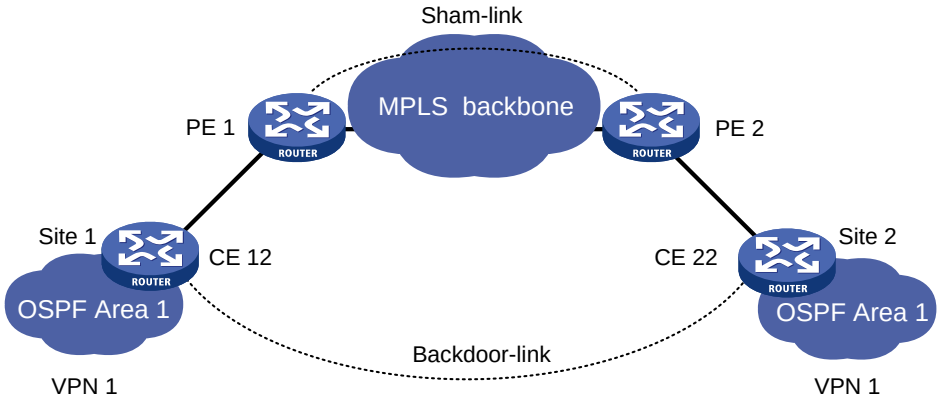
OSPF VPN extension uses the following tags to avoid routing loops:

- Down bit, or DN bit. An OSPF process for a VPN instance uses the DN bit to avoid routing loops as follows:

  When a PE redistributes BGP routes into OSPF and creates Type 3 LSAs, Type 5 LSAs, or Type 7 LSAs, it sets the DN bit for the LSAs. When receiving the LSAs advertised by CE 11, the other PE ignores the LSAs whose DN bit is set to avoid routing loops.

- VPN route tag, the external route tag in redistributed routes of a VPN instance. An OSPF process for a VPN instance uses the route tag to avoid routing loops as follows:

  The two PEs connected to the same site use the same route tag. When a PE redistributes BGP routes into OSPF and creates Type 5 or 7 LSAs, it adds the route tag to the LSAs. When receiving the Type 5 or 7 LSAs advertised by CE 11, the other PE compares the route tag in the LSAs against the local route tag. If they are the same, the PE ignores the LSAs to avoid routing loops.



OSPF sham link

As shown in Figure 18, two routes exist between Site 1 and Site 2 of VPN 1:

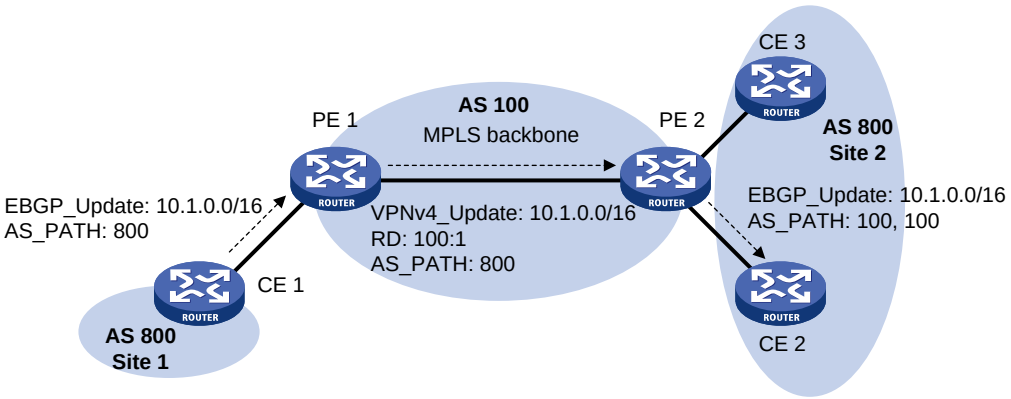
- **A route over MPLS backbone**—It is an inter-area route if PE 1 and PE 2 have the same domain ID, or is an external route if PE 1 and PE 2 are configured with no domain ID or with different domain IDs.
- **A direct route between CEs**—It is an intra-area route that is called a backdoor link.

VPN traffic is always forwarded through the backdoor link because it has a higher priority than the inter-area route. To forward VPN traffic over the inter-area route, you can establish a sham link between the two PEs to change the inter-area route to an intra-area route.

Figure 18 Network diagram for sham link

A sham link is considered a virtual point-to-point link within a VPN and is advertised in a Type 1 LSA. It is identified by the source IP address and destination IP address that are the local PE address and the remote PE address in the VPN address space. Typically, the source and destination addresses are loopback interface addresses with a 32-bit mask.

To add a route to the destination IP address of a sham link to a VPN instance, the remote PE must advertise the source IP address of the sham link as a VPN-IPv4 address through MP-BGP. To avoid routing loops, a PE does not advertise the sham link's destination address.



BGP AS number substitution and SoO attribute

BGP detects routing loops by examining AS numbers. If EBGP runs between PE and CE, you must assign different AS numbers to geographically different sites or configure the BGP AS number substitution feature to ensure correct transmission of routing information.

The BGP AS number substitution feature allows geographically different CEs to use the same AS number. If the AS_PATH of a route contains the AS number of a CE, the PE replaces the AS number with its own AS number before advertising the route to that CE.

After you enable the BGP AS number substitution feature, the PE performs BGP AS number substitution for all routes and re-advertises them to connected CEs in the peer group.

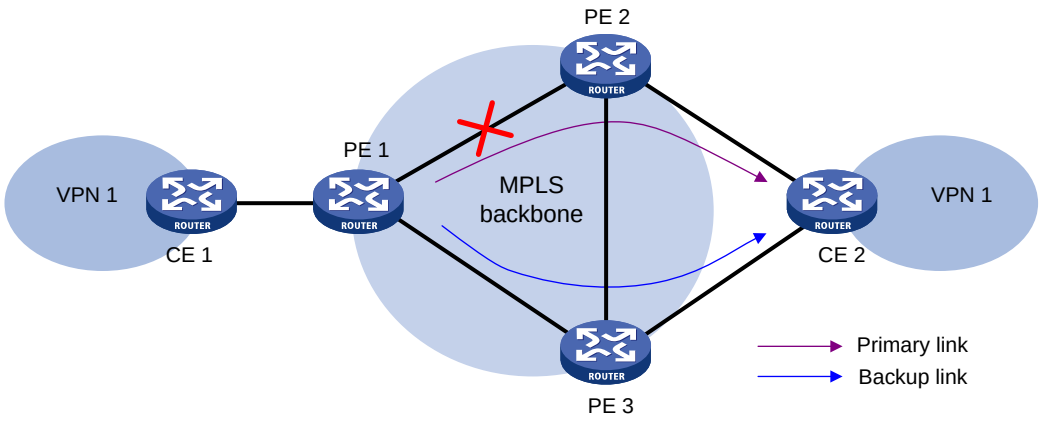
Figure 19 Application of BGP AS number substitution and SoO attribute

As shown in Figure 19, both Site 1 and Site 2 use the AS number 800. AS number substitution is enabled on PE 2 for CE 2. Before advertising updates received from CE 1 to CE 2, PE 2 substitutes its own AS number 100 for the AS number 800. In this way, CE 2 can correctly receive the routing information from CE 1.

However, the AS number substitution feature also introduces a routing loop in Site 2 because route updates originated from CE 3 can be advertised back to Site 2 through PE 2 and CE 2. To remove the routing loop, you can configure the same SoO attribute on PE 2 for CE 2 and CE 3. PE 2 adds the SoO attribute to route updates received from CE 2 or CE 3, and checks the SoO attribute of route updates to be advertised to CE 2 or CE 3. The SoO attribute of the route updates from CE 3 is the same as the SoO attribute for CE 2, and PE 2 does not advertise route updates to CE 2.

For more information about the SoO attribute, see *Layer 3—IP Routing Configuration Guide*.

MPLS L3VPN FRR



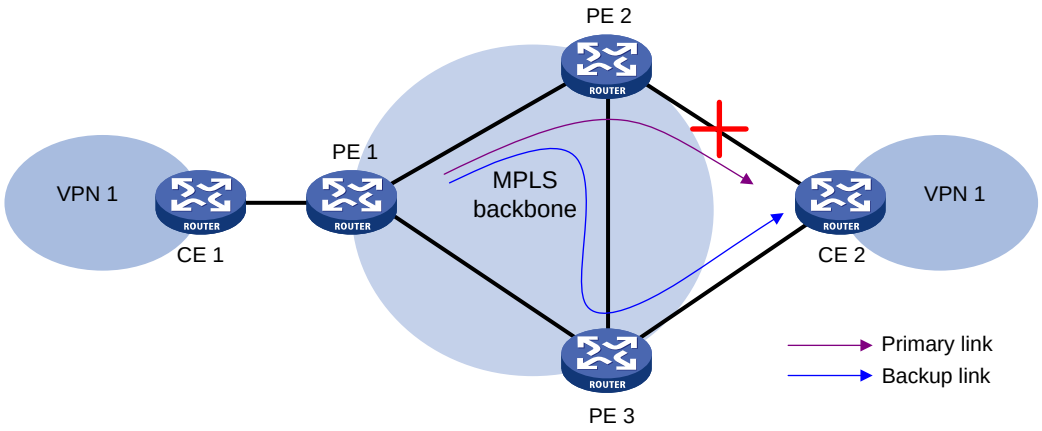
MPLS L3VPN Fast Reroute (FRR) is applicable to a dual-homed scenario. By using BFD to detect the primary link, FRR enables a PE to use the backup link when the primary link fails. The PE then selects a new optimal route, and uses the new optimal route to forward traffic.

MPLS L3VPN FRR supports the following types of backup:

- VPNv4 route backup for a VPNv4 route.
- VPNv4 route backup for an IPv4 route.
- IPv4 route backup for a VPNv4 route.

VPNv4 route backup for a VPNv4 route

Figure 20 Network diagram



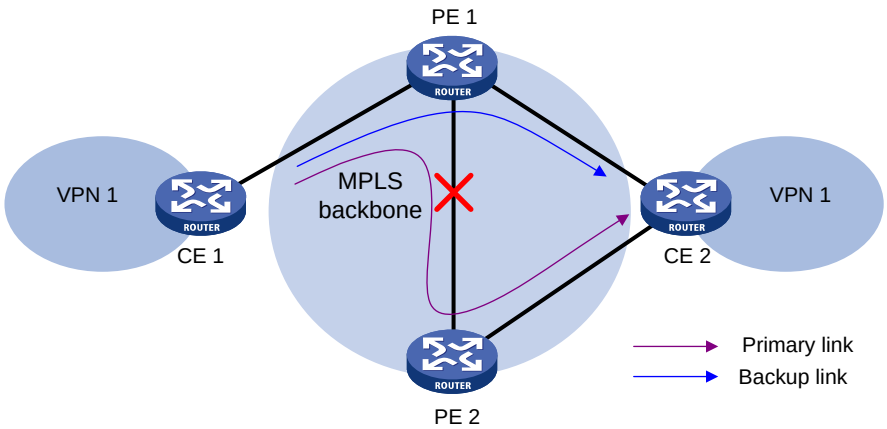
As shown in Figure 20, configure FRR on the ingress node PE 1, and specify the backup next hop for VPN 1 as PE 3. When PE 1 receives a VPNv4 route to CE 2 from both PE 2 and PE 3, it uses the route from PE 2 as the primary link, and the route from PE 3 as the backup link.

When the tunnel PE 1—PE 2 operates correctly, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—CE 2. When the tunnel fails, the traffic goes through the path CE 1—PE 1—PE 3—CE 2.

In this scenario, PE 1 is responsible for primary link detection and traffic switchover.

VPNv4 route backup for an IPv4 route

Figure 21 Network diagram



As shown in Figure 21, configure FRR on the egress node PE 2, and specify the backup next hop for VPN 1 as PE 3. When PE 2 receives an IPv4 route from CE 2 and a VPNv4 route from PE 3 (both routes are destined for VPN 1 connected to CE 2), PE 2 uses the IPv4 route as the primary link, and the VPNv4 route as the backup link.

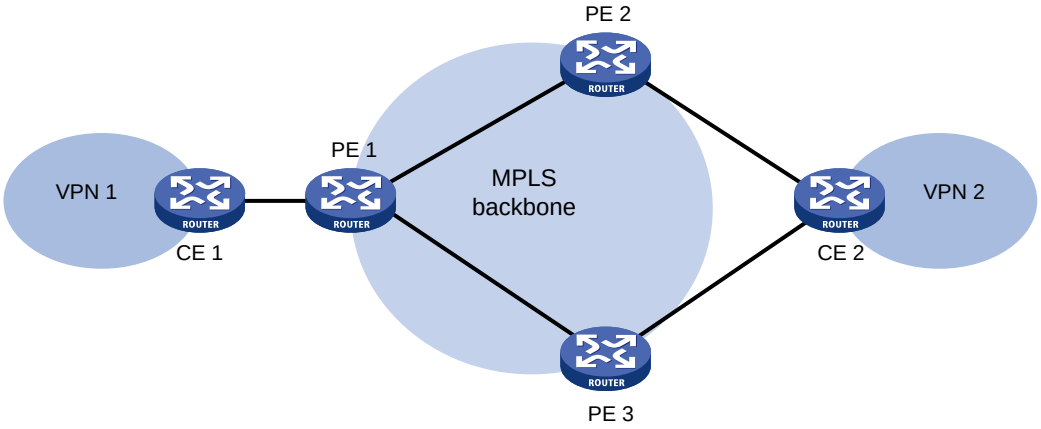
PE 2 uses ARP or echo-mode BFD to detect the connectivity of the link from PE 2 to CE 2. When the link operates correctly, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—CE 2. When the link fails, PE 2 switches traffic to the link PE 2—PE 3—CE 2, and traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—PE 3—CE 2. This avoids traffic interruption before route convergence completes (switching to the link CE 1—PE 1—PE 3—CE 2).

In this scenario, PE 2 is responsible for primary link detection and traffic switchover.

IPv4 route backup for a VPNv4 route

Figure 22 Network diagram

As shown in Figure 22, configure FRR on PE 1, and specify the backup next hop for VPN 1 as CE 2. When PE 1 receives an IPv4 route from CE 2 and a VPNv4 route from PE 2 (both routes are destined for VPN 1 connected to CE 2), PE 1 uses the VPNv4 route as the primary link, and the IPv4 route as the backup link.



When the tunnel operates correctly, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—CE 2. When the tunnel fails, the traffic goes through the path CE 1—PE 1—CE 2.

In this scenario, PE 1 is responsible for primary link detection and traffic switchover.

ECMP VPN route redistribution

This feature enables a VPN instance to redistribute all routes that have the same prefix and RD into its routing table. Based on the ECMP routes, the device can perform load sharing (as configured by the **balance** command) or MPLS L3VPN FRR. For more information about the **balance** command, see BGP in *Layer 3—IP Routing Command Reference*.

Figure 23 Network diagram

As shown in Figure 23, CE 1 accesses the backbone network through VPN instance **VPN1** created on PE 1. The RD of VPN instance **VPN1** is 1:1. CE 2 accesses the backbone network through VPN instances created on PE 2 and PE 3. The VPN instances created on PE 2 and PE 3 have the same name **VPN2** and the same RD 1:2. VPN instances **VPN1** and **VPN2** can communicate with each other.

Both PE 2 and PE 3 can advertise routes from CE 2 to PE 1, and the advertised routes have the same RD 1:2. By default, BGP redistributes only the optimal route into the routing table of VPN instance **VPN1**. After you enable this feature on VPN instance **VPN1**, BGP redistributes routes from both PE 2 and PE 3 to the routing table of VPN instance **VPN1**. The two routes can be used for load balancing or MPLS L3VPN FRR.

Protocols and standards

- RFC 3107, *Carrying Label Information in BGP-4*
- RFC 4360, *BGP Extended Communities Attribute*
- RFC 4364, *BGP/MPLS IP Virtual Private Networks (VPNs)*
- RFC 4577, *OSPF as the Provider/Customer Edge Protocol for BGP/MPLS IP Virtual Private Networks (VPNs)*

MPLS L3VPN tasks at a glance

Unless otherwise indicated, configure MPLS L3VPN on PEs.

To configure MPLS L3VPN, perform the following tasks:

1. Configuring MPLS L3VPN basics
   a. Configuring VPN instances
   b. Configuring routing between a PE and a CE
   c. Configuring routing between PEs
   d. (Optional.) Configuring BGP VPNv4 route control

2. Configuring advanced MPLS L3VPN networks

   Choose the following tasks as needed:

   - Configuring inter-AS VPN

     Perform this task when sites of a VPN are connected to different ASs of an ISP.
   - Configuring nested VPN

     Deploy the nest VPN when a large number of VPNs exist and you want to hide from the outside of the customer internal VPNs.
   - Configuring HoVPN

     HoVPN prevents PEs from being bottlenecks and is applicable to large-scale VPN deployment.
3. (Optional.) Specifying the VPN label processing mode on the egress PE
4. (Optional.) Configuring MPLS L3VPN FRR
5. (Optional.) Controlling route advertisement and reception in an MPLS L3VPN network
   - Configuring an OSPF sham link
   - Configuring BGP AS number substitution and SoO attribute
   - Configuring BGP RT filtering

     Perform this task to reduce the number of routes advertised in an MPLS L3VPN.
   - Configuring the BGP additional path feature

     Perform this task to enable BGP to advertise multiple routes with the same prefix and different next hops to a peer or peer group.
   - Configuring link bandwidth attributes for BGP VPNv4 routes
   - Minimizing the priority of BGP routes sent to peers
   - Specifying a local network to be advertised in the public instance or a VPN instance
   - Configuring BGP VPNv4 routes to use private network next hops
   - Configuring route replication

     Perform this task to enable mutual replication of routes between public and VPN instances or between different VPN instances so that the public and VPN instances or different VPN instances can communicate with each other.
   - Enabling ECMP VPN route redistribution

     Perform this task to enable a VPN instance to redistribute all routes that have the same prefix and RD into its routing table to perform load sharing or MPLS L3VPN FRR.
   - Enabling prioritized withdrawal of specific routes

     Perform this task to configure BGP to send the withdrawal messages of specific routes prior to other routes to achieve fast switchover of traffic and reduce the traffic interruption time.
6. (Optional.) Maintaining MPLS L3VPN networks
   - Enabling SNMP notifications for MPLS L3VPN
   - Enabling logging for BGP route flapping

Prerequisites for MPLS L3VPN

Before you configure basic MPLS L3VPN, perform the following tasks:

1. Configure an IGP on the PEs and P devices to ensure IP connectivity within the MPLS backbone.
2. Configure basic MPLS for the MPLS backbone.
3. Configure MPLS LDP on the PEs and P devices to establish LDP LSPs.

Configuring VPN instances

All VPN instance configurations are performed on PEs.

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Restrctions and guidelines

Deleting the RD for an VPN instance will cause the BGP-VPN instance configuration for the VPN instance to be deleted. When you perform this operation, make sure you fully understand its impact on the service.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter VPN instance view.
   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for a VPN instance.
4. (Optional.) Configure a description for the VPN instance.
   description *text*
   By default, no description is configured for a VPN instance.
5. (Optional.) Configure a VPN ID for the VPN instance.
   vpn-id *vpn-id*
   By default, no VPN ID is configured for a VPN instance.
6. (Optional.) Configure an SNMP context for the VPN instance.
   snmp context-name *context-name*
   By default, no SNMP context is configured.

Associating a VPN instance with a Layer 3 interface

Table 10 Enter system view.

   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Associate a VPN instance with the interface.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is not associated with a VPN instance and belongs to the public network.

CAUTION:
Associating a VPN instance with an interface or disassociating a VPN instance from an

interface will clear the IP address and routing protocol settings of the interface.

The **ip binding vpn-instance** command deletes the IP address of the current interface. You must reconfigure an IP address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

IPv4 VPN prefers the configurations in VPN instance IPv4 address family view over the configurations in VPN instance view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv4 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Execute the following commands in sequence to enter VPN instance IPv4 address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from learning too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

7. Apply a tunnel policy to the VPN instance.

   tnl-policy *tunnel-policy-name*

   By default, only one LSP tunnel is selected (no load balancing).

   If the specified tunnel policy does not exist, the default tunnel policy is used.

   For information about tunnel policies, see "Configuring tunnel policies."

Configuring routing between a PE and a CE

Configuring static routing between a PE and a CE

About this task

Perform this configuration on the PE. On the CE, configure a common static route.

For more information about static routing, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

Configuring RIP between a PE and a CE

About this task

Perform this configuration on the PE. On the CE, create a common RIP process.

For more information about RIP, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*

   A RIP process can belong to only one VPN instance.

3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.

Configuring OSPF between a PE and a CE

About this task

Perform this configuration on the PE. On the CE, create a common OSPF process.

For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Create an OSPF process for a VPN instance and enter the OSPF view.

   ospf [*process-id* | **router-id** *router-id*] * **vpn-instance** *vpn-instance-name*

Parameter	Usage guidelines
router-id *router-id*	An OSPF process bound to a VPN instance does not use the public network router ID configured in system view. Therefore, you must specify a router ID when creating a process or configure an IP address for a minimum of one interface in the bound VPN instance.
vpn-instance *vpn-instance-name*	An OSPF process can belong to only one VPN instance. If you delete a VPN instance, all OSPF processes of the VPN instance are also deleted.

3. Redistribute BGP routes.

   import-route bgp [*as-number*] [**allow-ibgp**] [**cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, OSPF does not redistribute routes from other routing protocols.

   If the **vpn-instance-capability simple** command is not configured for the OSPF process, the **allow-ibgp** keyword is optional to redistribute VPNv4 routes learned from MP-IBGP peers. In any other cases, if you do not specify the **allow-ibgp** keyword, the OSPF process does not redistribute VPNv4 routes learned from MP-IBGP peers.

4. (Optional.) Confiure OSPF route attributes:

   a. Set an OSPF domain ID.

      domain-id *domain-id* [**secondary**]

      The default domain ID is 0.

Description	Restrictions and guidelines
The domain ID is carried in the routes of the OSPF process. When redistributing routes from the OSPF process, BGP adds the domain ID as an extended community attribute into BGP route.	An OSPF process can be configured with only one primary domain ID. Domain IDs of different OSPF processes can be the same. All OSPF processes of a VPN must be configured with the same domain ID.

   b. (Optional.) Configure the type codes of OSPF extended community attributes.

      ext-community-type { **domain-id** *type-code1* | **router-id** *type-code2* | **route-type** *type-code3* }

      By default, the type codes for Domain ID, Router ID, and Route Type are 0x0005, 0x0107, 0x0306, respectively.

   c. Configure the external route tag value for VPN redistributed routes on a PE.

      route-tag *tag-value*

      By default, if BGP runs within an MPLS backbone, and the BGP AS number is not greater than 65535, the first two octets of the external route tag are 0xD000 and the last two octets are the local BGP AS number. If the AS number is greater than 65535, the external route tag is 0.

   d. Set the DN bit in OSPF LSAs.

      dn-bit-set { **ase** | **nssa** | **summary** }

      By default, when a PE redistributes BGP routes into OSPF and creates OSPF LSAs, it sets the DN bit for the Network Summary LSA (Type 3 LSA), AS External LSA (Type 5 LSA), and NSSA External LSA (Type 7 LSA).

   e. Configure OSPF to check the DN bit in OSPF LSAs.

      dn-bit-check { **ase** | **nssa** | **summary** }

By default, OSPF on a PE checks the DN bit of Network Summary LSA (Type 3 LSA), AS External LSA (Type 5 LSA), and NSSA External LSA (Type 7 LSA).

f. Enable external route check for OSPF LSAs.

route-tag-check enable

By default, the external route check feature is enabled for OSPF LSAs.

5. Create an OSPF area and enter area view.

area *area-id*

6. Enable OSPF on the interface attached to the specified network in the area.

network *ip-address wildcard-mask*

By default, an interface neither belongs to any area nor runs OSPF.

Configuring IS-IS between a PE and a CE

About this task

Perform this configuration on the PE. On the CE, configure common IS-IS.

For more information about IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

system-view

2. Create an IS-IS process for a VPN instance and enter IS-IS view.

isis [*process-id*] **vpn-instance** *vpn-instance-name*

An IS-IS process can belong to only one VPN instance.

3. Configure a network entity title for the IS-IS process.

network-entity *net*

By default, no NET is configured.

4. Return to system view.

quit

5. Enter interface view.

interface *interface-type interface-number*

6. Enable the IS-IS process on the interface.

isis enable [*process-id*]

By default, no IS-IS process is enabled on the interface.

Configuring EBGP between a PE and a CE

Configuring the PE

1. Enter system view.

system-view

2. Enable a BGP instance and enter BGP instance view.

bgp *as-number* [**instance** *instance-name*]

By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

ip vpn-instance *vpn-instance-name*

Configuration commands in BGP-VPN instance view are the same as those in BGP instance view. For more information, see BGP in *Layer 3—IP Routing Configuration Guide*.

4. Configure the CE as the VPN EBGP peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

   For more information about this command, see BGP in *Layer 3—IP Routing Configuration Guide*.

5. Create the BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

6. Enable IPv4 unicast route exchange with the specified peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with a peer.

7. Redistribute the routes of the local CE.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   A PE must redistribute the routes of the local CE into its VPN routing table so it can advertise them to the peer PE.

8. Allow the local AS number to appear in the AS_PATH attribute of a received route, and set the maximum number of repetitions.

   peer { *group-name* | *ip-address* [*mask-length*] } **allow-as-loop** [*number*]

   By default, BGP discards incoming route updates that contain the local AS number.

   Execute this command in a hub-spoke network where EBGP is running between a PE and a CE to enable the PE to receive the route updates from the CE.

Configuring the CE

1. Enter system view.

   system-view

2. Enable a BGP instance and enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Configure the PE as a BGP peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

4. Create the BGP IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

5. Enable IPv4 unicast route exchange with the specified peer or peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with any peer.

6. Configure route redistribution.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   A CE must redistribute its routes to the PE so the PE can advertise them to the peer CE.

Configuring IBGP between a PE and a CE

Restrictions and guidelines

Use IBGP between PE and CE only in a basic MPLS L3VPN network. In networks such as Hub&Spoke, Extranet, inter-AS VPN, carrier's carrier, nested VPN, and HoVPN, you cannot use IBGP between PE and CE.

Configuring the PE

1. Enter system view.

   system-view

2. Enable a BGP instance and enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

   Configuration commands in BGP-VPN instance view are the same as those in BGP instance view. For more information, see *Layer 3—IP Routing Configuration Guide*.

4. Configure the CE as the VPN IBGP peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

5. Create the BGP-VPN IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

6. Enable IPv4 unicast route exchange with the specified peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with any peer.

7. Configure the CE as a client of the RR to enable the PE to advertise routes learned from the IBGP peer CE to other IBGP peers.

   peer { *group-name* | *ip-address* [*mask-length*] } **reflect-client**

   By default, no RR or RR client is configured.

   Configuring an RR does not change the next hop of a route. To change the next hop of a route, configure an inbound policy on the receiving side.

8. (Optional.) Enable route reflection between clients.

   reflect between-clients

   By default, route reflection between clients is enabled.

9. (Optional.) Configure the cluster ID for the RR.

   reflector cluster-id { *cluster-id* | *ip-address* }

   By default, the RR uses its own router ID as the cluster ID.

   If multiple RRs exist in a cluster, use this command to configure the same cluster ID for all RRs in the cluster to avoid routing loops.

Configuring the CE

1. Enter system view.

   system-view

2. Enable a BGP instance and enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Configure the PE as an IBGP peer.

peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

4. Create the BGP IPv4 unicast address family and enter its view.
   address-family ipv4 [**unicast**]
5. Enable IPv4 unicast route exchange with the specified peer.
   peer { *group-name* | *ip-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with a peer.
6. Configure route redistribution.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   A CE must redistribute its routes to the PE so the PE can advertise them to the peer CE.

Configuring routing between PEs

1. Enter system view.
   system-view
2. Enable a BGP instance and enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the remote PE as a BGP peer.
   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*
4. (Optional.) Specify the source interface for TCP connections.
   peer { *group-name* | *ip-address* [*mask-length*] } **connect-interface** *interface-type interface-number*
   By default, BGP uses the output interface of the optimal route destined for the peer as the source interface.
5. Create the BGP VPNv4 address family and enter its view.
   address-family vpnv4
6. Enable BGP VPNv4 route exchange with the specified peer.
   peer { *group-name* | *ip-address* [*mask-length*] } **enable**
   By default, BGP does not exchange BGP VPNv4 routes with a peer.

Configuring BGP VPNv4 route control

About BGP VPNv4 route control

BGP VPNv4 route control is configured similarly with BGP route control, except that it is configured in BGP VPNv4 address family view. For more information about BGP route control, see *Layer 3—IP Routing Configuration Guide*.

Controlling BGP VPNv4 route advertisement, reception, and saving

1. Enter system view.
   system-view
2. Enter BGP instance view.

bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Advertise a default VPN route to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **default-route-advertise vpn-instance** *vpn-instance-name*

   By default, no default VPN route is advertised to a peer or peer group.

5. Set the maximum number of routes BGP can receive from a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **route-limit** *prefix-number* [{ **alert-only** | **discard** | **reconnect** *reconnect-time* } | *percentage-value*] *

   By default, the number of routes that BGP can receive from a peer or peer group is not limited.

6. Save all route updates from a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **keep-all-routes**

   By default, BGP does not save route updates from a peer.

Setting a preferred value for received routes

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Set a preferred value for routes received from a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value** *value*

   By default, the preferred value for routes received from a peer or peer group is 0.

Configuring BGP VPNv4 route reflection

About this task

To ensure the connectivity of IBGP peers, you must establish full-mesh IBGP connections, which costs massive network and CPU resources.

To reduce IBGP connections in the network, you can configure a router as a route reflector (RR) and configure other routers as its clients. You only need to establish IBGP connections between the RR and its clients to enable the RR to forward routes to the clients.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Configure the device as a route reflector and specify a peer or peer group as its client.

peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**

By default, no route reflector or client is configured.

5. (Optional.) Enable route reflection between clients.

   reflect between-clients

   By default, route reflection between clients is enabled.

6. (Optional.) Configure a cluster ID for the RR.

   reflector cluster-id { *cluster-id* | *ip-address* }

   By default, the RR uses its own router ID as the cluster ID.

7. (Optional.) Configure a filtering policy for reflected routes.

   rr-filter *ext-comm-list-number*

   By default, the RR does not filter reflected routes.

8. (Optional.) Enable the route reflector to change the attributes of routes to be reflected.

   reflect change-path-attribute

   By default, the route reflector cannot change the attributes of routes to be reflected.

Configuring BGP VPNv4 route attributes

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Configure the NEXT_HOP attribute.
   - Set the device as the next hop for routes sent to a peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

     By default, the device uses its address as the next hop for routes advertised to peers.
   - Configure the device to not change the next hop of routes advertised to a peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-invariable**

   By default, the device uses its address as the next hop for routes advertised to peers.

   On an RR in an inter-AS option C scenario, you must configure this command to not change the next hop of VPNv4 routes advertised to BGP peers and RR clients.

5. Configure the AS_PATH attribute.
   - Allow the local AS number to appear in the AS_PATH attribute of a received route and set the maximum number of repetitions.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop** [*number*]

     By default, BGP discards incoming routes that contain the local AS number.
   - Remove private AS numbers in BGP updates sent to an EBGP peer or peer group.

     peer { *group-name* | *ipv4-address* [*mask-length*] } **public-as-only** [{ **force** | **limited** } [**replace**] [**include-peer-as**]]

     By default, BGP updates sent to an EBGP peer or peer group can carry both public and private AS numbers.

6. Advertise the COMMUNITY attribute to a peer or peer group.

peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise-community**

By default, BGP does not advertise the COMMUNITY attribute to a peer or peer group.

7. Configure the SoO attribute for a peer for peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **soo** *site-of-origin*

   By default, the SoO attribute is not configured.

8. Advertise the Tag community in the extended community attribute to the specified peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] | *ipv6-address* [*prefix-length*] } **advertise tag**

   By default, BGP does not advertise the Tag extended community to a peer or peer group.

Configuring BGP VPNv4 route filtering

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Filter advertised routes.

   filter-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* | **prefix-list** *prefix-list-name* } **export** [**direct** | { **isis** | **ospf** | **rip** } *process-id* | **static**]

   By default, BGP does not filter advertised routes.

5. Filter received routes.

   filter-policy { *ipv4-acl-number* | **name** *ipv4-acl-name* | **prefix-list** *prefix-list-name* } **import**

   By default, BGP does not filter received routes.

6. Configure AS_PATH list-based route filtering for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-path-acl** *as-path-acl-number* { **export** | **import** }

   By default, AS_PATH list-based route filtering is not configured.

7. Configure ACL-based route filtering for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **filter-policy** { *ipv4-acl-number* | **name** *ipv4-acl-name* } { **export** | **import** }

   By default, ACL-based route filtering is not configured.

8. Configure IP prefix list-based route filtering for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **prefix-list** *prefix-list-name* { **export** | **import** }

   By default, no IP prefix list-based route filtering is configured.

9. Apply a routing policy to routes advertised to or received from a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** *route-policy-name* { **export** | **import** }

   By default, no routing policy is applied for a peer.

10. Enable route target filtering for received BGP VPNv4 routes.

    policy vpn-target

By default, route target filtering is enabled for received VPNv4 routes. Only VPNv4 routes whose export route target attribute matches the local import route target attribute are added to the routing table.

11. Enable the first AS number check for EBGP route advertisement to EBGP peers.

    peer-as-check enable

    By default, BGP does not check the first AS number of a received route and advertises the route to other peers.

    After you execute this command, BGP checks the first AS number of a received route. If the AS number of an EBGP peer is the first AS number of the EBGP route to be advertised, BGP will not advertise the route to that EBGP peer.

Configuring BGP VPNv4 route dampening

About this task

This feature enables BGP to not select unstable routes as optimal routes.

Restrictions and guidelines

This feature applies only to IBGP routes.

If an IBGP peer goes down after you configure this feature, VPNv4 routes coming from the peer are dampened but not deleted.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Configure BGP VPNv4 route dampening.

   dampening ibgp[*half-life-reachable half-life-unreachable reuse suppress ceiling* | **route-policy** *route-policy-name*] *

   By default, BGP VPNv4 route dampening is not configured.

Configuring BGP VPNv4 optimal route selection delay

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Set the BGP VPNv4 optimal route selection delay timer. Choose one or more of the following tasks:

   - Configure optimal route selection delay for all BGP routes in the address family.

     route-select delay *delay-value*

   - Configure optimal route selection delay only for BGP routes from a peer within the specified time after the peer state changes from down to up.

     route-select suppress on-peer-up *milliseconds*

By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed.

Advertising BGP RPKI validation state to a peer or peer group

Restrictions and guidelines

BGP advertises the BGP RPKI validation state to a peer or peer group through the extended community attribute. For more information about BGP RPKI, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP VPNv4 address family view.
   address-family vpnv4
4. Advertise the BGP RPKI validation state to the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise origin-as-validation**

   By default, BGP does not advertise the BGP RPKI validation state.

Configuring inter-AS VPN

Configuring inter-AS option A

Inter-AS option A applies to scenarios with a few VPNs.

To configure inter-AS option A, create VPN instances on PEs and ASBRs. The VPN instances on PEs are used to allow CEs to access the network. The VPN instances on ASBRs are used to access the peer ASBRs. An ASBR considers the peer ASBR as a CE.

The route targets configured on the PEs must match those configured on the ASBRs in the same AS to make sure VPN routes sent by the PEs (or ASBRs) can be received by the ASBRs (or PEs). Route targets configured on the PEs in different ASs do not have such requirements.

Configuring inter-AS option B

Restrictions and guidelines

An ASBR always sets itself as the next hop of VPNv4 routes advertised to an MP-IBGP peer regardless of the **peer next-hop-local** command.

Configuring a PE

Configure basic MPLS L3VPN, and specify the ASBR in the same AS as an MP-IBGP peer. The route targets for the VPN instances on the PEs in different ASs must match for the same VPN.

Configuring an ASBR

1. Enter system view.

system-view

2. Enable MPLS and LDP on the interface connected to an internal router of the AS:
   a. Configure an LSR ID for the local LSR.
      mpls lsr-id *lsr-id*
      By default, no LSR ID is configured.
   b. Enable LDP on the local LSR and enter LDP view.
      mpls ldp
      By default, LDP is disabled.
   c. Return to system view.
      quit
   d. Enter interface view of the interface connected to an internal router of the AS.
      interface *interface-type interface-number*
   e. Enable MPLS on the interface.
      mpls enable
      By default, MPLS is disabled on the interface.
   f. Enable MPLS LDP on the interface.
      mpls ldp enable
      By default, MPLS LDP is disabled on the interface.
   g. Return to system view.
      quit
3. Enable MPLS on the interface connected to the remote ASBR:
   a. Enter interface view of the interface connected to the remote ASBR.
      interface *interface-type interface-number*
   b. Enable MPLS on the interface.
      mpls enable
      By default, MPLS is disabled on the interface.
   c. Return to system view.
      quit
4. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
5. Configure PEs in the same AS as IBGP peers and ASBRs in different ASs as EBGP peers.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
6. Enter BGP VPNv4 address family view.
   address-family vpnv4
7. Enable BGP to exchange VPNv4 routes with the PE in the same AS and the ASBR in another AS.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP cannot exchange VPNv4 routes with a peer.
8. Disable route target filtering of received VPNv4 routes.
   undo policy vpn-target
   By default, route target filtering is enabled for received VPNv4 routes.

Configuring inter-AS option C (method 1)

Restrictions and guidelines

PEs are not directly connected. For the PEs to establish neighbor relationships, execute the **peer ebgp-max-hop** command to enable the local router to establish an EBGP session to an indirectly-connected peer.

Prerequisites

Before you configure inter-AS option C, perform the following tasks:

- Configure BGP to advertise routes destined for a PE on PEs or ASBRs. For more information, see *Layer 3—IP Routing Configuration Guide*.
- Configure VPN instances on PEs.
- Configure routing between PE and CE.

Configuring a PE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Configure the ASBR in the same AS as an IBGP peer and configure the PE of another AS as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
4. Create the BGP IPv4 unicast address family and enter its view.
   address-family ipv4 [**unicast**]
5. Enable BGP to exchange IPv4 unicast routes with the ASBR in the same AS.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with any peer.
6. Enable BGP to exchange labeled IPv4 routes with the ASBR in the same AS.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **label-route-capability**
   By default, BGP cannot exchange labeled routes with any IPv4 peer or peer group.
7. Return to BGP instance view.
   quit
8. Enter BGP VPNv4 address family view.
   address-family vpnv4
9. Enable BGP to exchange VPNv4 routes with the PE in different ASs.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP cannot exchange VPNv4 routes with any peer.
10. (Optional.) Configure the PE to not change the next hop of routes advertised to the peer.
    peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-invariable**
    By default, the device uses its address as the next hop of routes advertised to peers.
    Configure this command on the RR so the RR does not change the next hop of advertised VPNv4 routes.

Configuring an ASBR

1. Enter system view.
   system-view

2. Configure a routing policy:
   a. Create a routing policy, and enter routing policy view.
      route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
   b. Match IPv4 routes carrying labels.
      if-match mpls-label

      By default, no MPLS label match criterion is configured.

      You can configure **if-match** clauses in the routing policy to filter routes. Routes surviving the filtering are assigned labels, and all others are advertised as common IPv4 routes.
   c. Set labels for IPv4 routes.
      apply mpls-label

      By default, no MPLS label is set for IPv4 routes.
   d. Return to system view.
      quit
3. Enable MPLS and LDP on the interface connected to an internal router of the AS:
   a. Configure an LSR ID for the local LSR.
      mpls lsr-id *lsr-id*

      By default, no LSR ID is configured.
   b. Enable LDP on the local LSR and enter LDP view.
      mpls ldp

      By default, LDP is disabled.
   c. Return to system view.
      quit
   d. Enter interface view of the interface connected to an internal router of the AS.
      interface *interface-type interface-number*
   e. Enable MPLS on the interface.
      mpls enable

      By default, MPLS is disabled on the interface.
   f. Enable MPLS LDP on the interface.
      mpls ldp enable

      By default, MPLS LDP is disabled on the interface.
   g. Return to system view.
      quit
4. Enable MPLS on the interface connected to the remote ASBR.
   a. Enter interface view of the interface connected to the remote ASBR.
      interface *interface-type interface-number*
   b. Enable MPLS on the interface.
      mpls enable

      By default, MPLS is disabled on the interface.
   c. Return to system view.
      quit
5. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
6. Configure PEs in the same AS as IBGP peers and ASBRs in different ASs as EBGP peers.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

7. Create BGP IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

8. Enable BGP to exchange IPv4 unicast routes with the PE in the same AS and the ASBR in another AS.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP cannot exchange IPv4 unicast routes with a peer.

9. Enable BGP to exchange labeled IPv4 routes with the PE in the same AS and the ASBR in another AS.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **label-route-capability**

   By default, BGP cannot exchange labeled IPv4 routes with a peer.

10. Specify the device as the next hop of routes sent to a peer or peer group.

    peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

    By default, the device does not set itself as the next hop for routes sent to a peer or peer group.

11. Apply a routing policy to routes advertised to or received from a peer or peer group.

    peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** *route-policy-name* { **export** | **import** }

    By default, no routing policy is applied.

Configuring inter-AS option C (method 2)

Restrictions and guidelines

PEs are not directly connected. For the PEs to establish neighbor relationships, execute the **peer ebgp-max-hop** command to enable the local router to establish an EBGP session to an indirectly-connected peer.

Prerequisites

Before you configure inter-AS option C (method 2), perform the following tasks:

- Configure BGP on the PE or ASBR to advertise the route destined for the PE. For more information, see BGP configuration in *Layer 3—IP Routing Configuration Guide*.
- Configure VPN instances on PEs.
- Configure routing between PE and CE.

Configuring a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Configure the PE in another AS as an EBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

4. Enter BGP VPNv4 address family view.

   address-family vpnv4

5. Enable BGP to exchange VPNv4 routes with the PE in another AS.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP cannot exchange VPNv4 routes with any peer.

6. (Optional.) Configure the PE to not change the next hop of routes advertised to the peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-invariable**

By default, the device uses its address as the next hop of routes advertised to peers.

Configure this command on the RR so the RR does not change the next hop of advertised VPNv4 routes.

Configuring an ASBR

1. Enter system view.

   system-view

2. Configure a routing policy:

   a. Create a routing policy, and enter routing policy view.

      route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*

   b. Match IPv4 routes carrying labels.

      if-match mpls-label

      By default, no MPLS label match criterion is configured.

      You can configure **if-match** clauses in the routing policy to filter routes. Routes surviving the filtering are assigned labels, and all others are advertised as common IPv4 routes.

   c. Set labels for IPv4 routes.

      apply mpls-label

      By default, no MPLS label is set for IPv4 routes.

   d. Return to system view.

      quit

3. Enable MPLS and LDP on the interface connected to an internal router of the AS:

   a. Configure an LSR ID for the local LSR.

      mpls lsr-id *lsr-id*

      By default, no LSR ID is configured.

   b. Enable LDP on the local LSR and enter LDP view.

      mpls ldp

      By default, LDP is disabled.

   c. Return to system view.

      quit

   d. Enter interface view of the interface connected to an internal router of the AS.

      interface *interface-type interface-number*

   e. Enable MPLS on the interface.

      mpls enable

      By default, MPLS is disabled on the interface.

   f. Enable MPLS LDP on the interface.

      mpls ldp enable

      By default, MPLS LDP is disabled on the interface.

   g. Return to system view.

      quit

4. Enable MPLS on the interface connected to the remote ASBR.

   a. Enter interface view of the interface connected to the remote ASBR.

      interface *interface-type interface-number*

   b. Enable MPLS on the interface.

      mpls enable

      By default, MPLS is disabled on the interface.

c. Return to system view.

quit

5. Enter BGP instance view.

bgp *as-number* [**instance** *instance-name*]

6. Configure the ASBR in another AS as an EBGP peer.

peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

7. Create BGP IPv4 unicast address family and enter its view.

address-family ipv4 [**unicast**]

8. Enable BGP to exchange IPv4 unicast routes with the ASBR in another AS.

peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

By default, BGP cannot exchange IPv4 unicast routes with a peer.

9. Enable BGP to exchange labeled IPv4 routes with the ASBR in another AS.

peer { *group-name* | *ipv4-address* [*mask-length*] } **label-route-capability**

By default, BGP cannot exchange labeled IPv4 routes with a peer.

10. Specify the device as the next hop of routes sent to a peer or peer group.

peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-local**

By default, the device does not set itself as the next hop for routes sent to an IBGP peer or peer group.

11. Apply a routing policy to routes advertised to or received from a peer or peer group.

peer { *group-name* | *ipv4-address* [*mask-length*] } **route-policy** *route-policy-name* { **export** | **import** }

By default, no routing policy is applied.

Configuring nested VPN

Restrictions and guidelines

When you configure nested VPN, follow these guidelines:

- The address spaces of sub-VPNs of a VPN cannot overlap.
- Do not assign nested VPN peers addresses that public network peers use.
- Nested VPN does not support multihop EBGP. A provider PE and a provider CE must use the addresses of the directly connected interfaces to establish a neighbor relationship.

Procedure

1. Connect the customer CE to the customer PE:
   a. Configure VPN instances on the customer PE.

   See "Configuring VPN instances."

   b. Configure route exchange between customer PE and customer CE.

   See "Configuring routing between a PE and a CE."

2. Configure the customer PE to exchange sub-VPN routing information with the provider CE:
   a. Configure BGP VPNv4 route exchange between customer PE and provider CE.

   See "Configuring routing between PEs."

   b. Execute the following commands in sequence to configure the provider CE to receive all VPNv4 routes (not filter VPNv4 routes by route targets).

   system-view

bgp *as-number* [**instance** *instance-name*]

address-family vpnv4

undo policy vpn-target

By default, route target filtering is enabled for received VPNv4 routes. Only VPNv4 routes whose export route target attribute matches the local import route target attribute are added to the routing table.

This step is not required in a nested VPN network when no provider CE is deployed and the customer PE is connected directly to the provider PE.

3. Connect the provider CE to the provider PE:
   a. Configure VPN instances on the provider PE.

      See "Configuring VPN instances."
   b. Configure route exchange between the provider CE and provider PE.

      See "Configuring routing between a PE and a CE."
4. Configure BGP VPNv4 route exchange between the provider PE and provider CE:

   This step contains only configurations on the provider PE. For information about configuring the provider CE, see "Configuring routing between PEs." If the customer PE is directly connected to the provider PE, you must configure provider CE settings on the customer PE because the PE also functions as a provider CE.
   a. Execute the following commands in sequence to enter BGP VPNv4 address family view:

      system-view

      bgp *as-number* [**instance** *instance-name*]

      address-family vpnv4
   b. Enable nested VPN.

      nesting-vpn

      By default, nested VPN is disabled.
   c. Return to BGP instance view.

      quit
   d. Enter BGP-VPN instance view.

      ip vpn-instance *vpn-instance-name*
   e. Configure the provider CE as a BGP peer.

      peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
   f. Create BGP-VPN VPNv4 address family and enter BGP-VPN VPNv4 address family view.

      address-family vpnv4
   g. Enable BGP VPNv4 route exchange with the peer CE or the peer group of the peer CE.

      peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

      By default, BGP does not exchange VPNv4 routes with any peer.
   h. (Optional.) Configure the SoO attribute for the BGP peer or peer group.

      peer { *group-name* | *ipv4-address* [*mask-length*] } **soo** *site-of-origin*

      By default, the SoO attribute is not configured.
5. Configure BGP VPNv4 route exchange between provider PEs.

   See "Configuring routing between PEs."

Configuring HoVPN

Configuring the UPE

Configure basic MPLS L3VPN settings on the UPE.

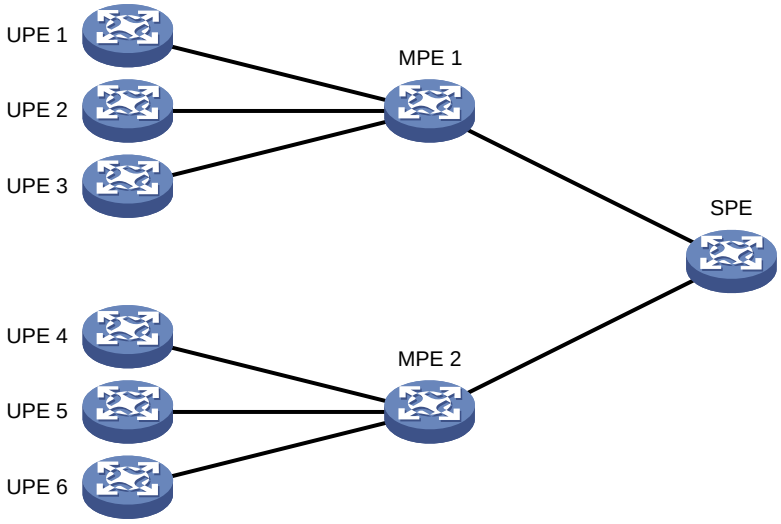
Configuring the SPE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Specify a BGP peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
4. Enter BGP VPNv4 address family view.
   address-family vpnv4
5. Enable BGP VPNv4 route exchange with the peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange VPNv4 routes with any peer.
6. Specify the BGP peer or peer group as a UPE.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **upe**
   By default, no peer is a UPE.
7. Advertise routes to the UPE.
   - Advertise a default VPN route to the UPE.
     peer { *group-name* | *ipv4-address* [*mask-length*] } **default-route-advertise vpn-instance** *vpn-instance-name*
     The device advertises a default route using the local address as the next hop to the UPE, regardless of whether the default route exists in the local routing table.
   - Advertise routes permitted by a routing policy to the UPE.
     peer { *group-name* | *ipv4-address* [*mask-length*] } **upe route-policy** *route-policy-name* **export**

   By default, no route is advertised to the UPE.

   Do not configure both commands.
8. Return to BGP instance view.
   quit
9. Create a BGP-VPN instance and enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
   You do not need to associate the VPN instance to an interface on the SPE.
   This step adds the learned VPNv4 routes to the BGP routing table of the VPN instance.

Configuring route re-origination



About this task

In an HoVPN network, different UPEs communicate with each other through MPEs and SPEs. You can configure route re-origination on MPEs to reduce the number of private network labels that a UPE receives for VPNv4 routes.

As shown in Figure 24, if a network contains many UPEs that use the per-VPN-instance label allocation mode, and the MPEs in the network use the per-next-hop label allocation mode, the SPE will receive a large number of labels, which might cause traffic forwarding errors.

To resolve this issue, you can configure route re-origination on MPEs. The MPEs then can redistribute the BGP routes received from UPEs into local VPN instances and reoriginate these routes. The MPEs can modify the information of the reoriginated routes. After setting the per-VPN instance label allocation mode, the MPEs only need to allocate the number of VPN labels equal to the number of local VPN instances, regardless of the number of UPEs. The SPE only needs to receive the VPN labels allocated by the MPEs, significantly reducing the resource load on the SPE.

Figure 24 Route re-origination

Restrictions and guidelines

This feature can reoriginate the BGP routes that are imported into a local VPN instance and have a different RD from that of the local VPN instance. It cannot reoriginate the BGP routes that are received from remote peers and have the same RD as that of the local VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
5. Configure the device to re-originate the optimal routes in the VPN instance and advertise the re-originated routes to VPNv4 peers.

advertise route-reoriginate [**route-policy** *route-policy-name*] [**replace-rt**]

By default, the device does not re-originate the optimal routes in a VPN instance, and it sends the original VPNv4 routes to VPNv4 peers.

Specifying the VPN label processing mode on the egress PE

About this task

An egress PE can process VPN labels in either POPGO or POP mode:

- **POPGO forwarding**—Pops the label and forwards the packet out of the output interface corresponding to the label.
- **POP forwarding**—Pops the label and forwards the packet through the FIB table.

Restrictions and guidelines

The POPGO forwarding mode (**vpn popgo**) and per-VPN instance label allocation mode (**label-allocation-mode per-vrf**) are mutually exclusive. Do not configure both modes in a BGP instance. For more information about the **label-allocation-mode** command, see *Layer 3—IP Routing Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Specify the VPN label processing mode as POPGO forwarding.
   vpn popgo
   The default is POP forwarding.

Configuring MPLS L3VPN FRR

About MPLS L3VPN FRR

You can use the following methods to configure MPLS L3VPN FRR:

- **Method 1**—Execute the **pic** command in BGP-VPN IPv4 unicast address family view. The device calculates a backup next hop for each BGP route in the VPN instance if there are two or more unequal-cost routes to reach the destination.
- **Method 2**—Execute the **fast-reroute route-policy** command in BGP-VPN IPv4 unicast address family view to use a routing policy. In the routing policy, specify a backup next hop by using the **apply fast-reroute backup-nexthop** command. The backup next hop calculated by the device must be the same as the specified backup next hop. Otherwise, the device does not generate a backup next hop for the primary route. You can also configure **if-match** clauses in the routing policy to identify the routes protected by FRR.

If both methods are configured, Method 2 takes precedence over Method 1.

Restrictions and guidelines

Executing the **pic** command in BGP-VPN IPv4 unicast address family view might cause routing loops. Use it with caution.

Configuring FRR by using a routing policy

1. Enter system view.

   system-view
2. Configure BFD.
   - Configure the source IP address for BFD echo packets.

     bfd echo-source-ip *ip-address*

     By default, the source IP address for BFD echo packets is not configured.

     This command is required when echo-mode BFD is used to detect primary route connectivity in VPNv4 route backup for an IPv4 route. For more information about this command, see *High Availability Command Reference*.
3. Configure a routing policy:
   a. Create a routing policy and enter routing policy view.

      route-policy *route-policy-name* **permit node** *node-number*

   b. Set the backup next hop for FRR.

      apply fast-reroute backup-nexthop *ip-address*

      By default, no backup next hop address is set for FRR.

   c. Return to system view.

      quit

   For more information about the commands, see *Layer 3—IP Routing Command Reference*.
4. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
5. (Optional.) Use echo-mode BFD to detect the connectivity to the next hop of the primary route.

   primary-path-detect bfd echo

   By default, ARP is used to detect the connectivity to the next hop.

   Use this command if necessary in VPNv4 route backup an IPv4 route.

   For more information about this command, see *Layer 3—IP Routing Command Reference*.
6. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*
7. Enter BGP-VPN IPv4 unicast address family view.

   address-family ipv4 [**unicast**]
8. Apply a routing policy to FRR.

   fast-reroute route-policy *route-policy-name*

   By default, no routing policy is applied to FRR.

   The **apply fast-reroute backup-nexthop** command can take effect in the routing policy that is being used. Other **apply** commands do not take effect.

   For more information about the command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Enabling MPLS L3VPN FRR for BGP-VPN IPv4 unicast address family

1. Enter system view.
   system-view
2. Configure BFD.
   - Configure the source IP address for BFD echo packets.
     bfd echo-source-ip *ip-address*

     By default, the source IP address for BFD echo packets is not configured.

     This command is required when echo-mode BFD is used to detect primary route connectivity in VPNv4 route backup for an IPv4 route. For more information about this command, see BFD commands in *High Availability Command Reference*.
3. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
4. (Optional.) Use echo-mode BFD to detect the connectivity to the next hop of the primary route.
   primary-path-detect bfd echo

   By default, ARP is used to detect the connectivity to the next hop.

   Use this command if necessary in VPNv4 route backup an IPv4 route.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.
5. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
6. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
7. Enable MPLS L3VPN FRR for the address family.
   pic

   By default, MPLS L3VPN FRR is disabled.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Configuring an OSPF sham link

About OSPF sham links

When a backdoor link exists between the two sites of a VPN, you can create a sham link between PEs to forward VPN traffic through the sham link on the backbone rather than the backdoor link. A sham link is considered an OSPF intra-area route.

The source and destination addresses of the sham link must be loopback interface addresses with 32-bit masks. The loopback interfaces must be bound to VPN instances, and their addresses are advertised through BGP.

Prerequisites

Before you configure an OSPF sham link, perform the following tasks:

- Configure basic MPLS L3VPN (OSPF is used between PE and CE).

- Configure OSPF in the LAN where customer CEs reside.

Redistributing the loopback interface address

1. Enter system view.
   system-view
2. Create a loopback interface and enter loopback interface view.
   interface loopback *interface-number*
3. Associate the loopback interface with a VPN instance.
   ip binding vpn-instance *vpn-instance-name*

   By default, the interface is not associated with any VPN instances and belongs to the public network.
4. Configure an IP address for the loopback interface.
   ip address *ip-address* { *mask-length* | *mask* }

   By default, no IP address is configured for the loopback interface.
5. Return to system view.
   quit
6. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
7. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
8. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
9. Redistribute direct routes into BGP (including the loopback interface route).
   import-route direct

   By default, no direct routes are redistributed into BGP.

Creating a sham link

1. Enter system view.
   system-view
2. Enter OSPF view.
   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *

   As a best practice, specify a router ID.
3. Set the external route tag for imported VPN routes.
   route-tag *tag-value*

   By default, if BGP runs within an MPLS backbone, and the BGP AS number is not greater than 65535, the first two octets of the external route tag are 0xD000 and the last two octets are the local BGP AS number. If the AS number is greater than 65535, the external route tag is 0.
4. Enter OSPF area view.
   area *area-id*
5. Configure a sham link.
   sham-link *source-ip-address destination-ip-address* [**cost** *cost-value* | **dead** *dead-interval* | **hello** *hello-interval* | { **authentication-none** | { **hmac-md5** | **hmac-sha-256** | **hmac-sm3** | **md5** } [*key-id* { **cipher** | **plain** }

string] | **keychain** *keychain-name* | **simple** [{ **cipher** | **plain** } *string*] } | **retransmit** *retrans-interval* | **trans-delay** *delay* | **ttl-security hops** *hop-count*] *

Configuring BGP AS number substitution and SoO attribute

About this task

When CEs at different sites have the same AS number, configure the BGP AS number substitution feature to avoid route loss.

When a PE uses different interfaces to connect different CEs in a site, the BGP AS number substitution feature introduces a routing loop. To remove the routing loop, configure the SoO attribute on the PE.

For more information about the BGP AS number substitution feature and the SoO attribute, see "BGP AS number substitution and SoO attribute."

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Enable the BGP AS number substitution feature.
   peer { *ipv4-address* [*mask-length*] | *group-name* } **substitute-as**
   By default, BGP AS number substitution is disabled.
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. (Optional.) Configure the SoO attribute for a BGP peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **soo** *site-of-origin*
   By default, the SoO attribute is not configured.

Configuring BGP RT filtering

About this task

The BGP RT filtering feature reduces the number of routes advertised in an MPLS L3VPN.

After RT filtering is configured, a PE advertises its import target attribute to the peer PEs in the RT filter address family. The peer PEs use the received import target attribute to filter routes and advertise only the routes that match the attribute to the PE.

When a large number of IBGP peers exist, the BGP RT filtering and the route reflection features are used together as a best practice. Route reflection reduces the number of IBGP connections. BGP RT filtering reduces the number of routes advertised in the network.

For more information about the BGP RT filtering commands, see *Layer 3—IP Routing Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv4 RT filter address family view.
   address-family ipv4 rtfilter
4. Enable the device to exchange routing information with a peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, the device cannot exchange routing information with a peer or peer group.
5. (Optional.) Advertise a default route to a peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **default-route-advertise** [**route-policy** *route-policy-name*]
   By default, no default route is advertised.
6. (Optional.) Set a preferred value for routes received from a peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **preferred-value** *value*
   By default, the preferred value for routes received from a peer or peer group is 0.
7. (Optional.) Configure the device as a route reflector and specify a peer or peer group as its client.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**
   By default, no route reflector or client is configured.
8. (Optional.) Enable route reflection between clients.
   reflect between-clients
   By default, route reflection between clients is enabled.
9. (Optional.) Configure the cluster ID of the route reflector.
   reflector cluster-id { *cluster-id* | *ipv4-address* }
   By default, a route reflector uses its own router ID as the cluster ID.
10. (Optional.) Set the optimal route selection delay timer. Choose one or more of the following tasks:
    - Configure optimal route selection delay for all BGP routes in the address family.
      route-select delay *delay-value*
    - Configure optimal route selection delay only for BGP routes from a peer within the specified time after the peer state changes from down to up.
      route-select suppress on-peer-up *milliseconds*

    By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed.

Configuring the BGP additional path feature

About this task

By default, BGP advertises only one optimal route. When the optimal route fails, traffic forwarding will be interrupted until route convergence completes.

The BGP additional path (Add-Path) feature enables BGP to advertise multiple routes with the same prefix and different next hops to a peer or peer group. When the optimal route fails, the suboptimal route becomes the optimal route, which shortens the traffic interruption time.

You can enable the BGP additional path sending, receiving, or both sending and receiving capabilities on a BGP peer. For two BGP peers to successfully negotiate the additional path capabilities, make sure one end has the sending capability and the other end has the receiving capability.

For more information about the BGP additional path configuration commands, see BGP commands in *Layer 3—IP Routing Command Reference*.

Procedure

1. Enter system view.

   system-view
2. Enter BGP VPNv4 address family view or BGP-VPN VPNv4 address family view.
   - Execute the following commands in sequence to enter BGP VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family vpnv4
   - Execute the following commands in sequence to enter BGP-VPN VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family vpnv4
3. Configure the BGP additional path capabilities.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **additional-paths** { **receive** | **send** } *

   By default, no BGP additional path capabilities are configured.
4. Set the maximum number of Add-Path optimal routes that can be advertised to a peer or peer group.

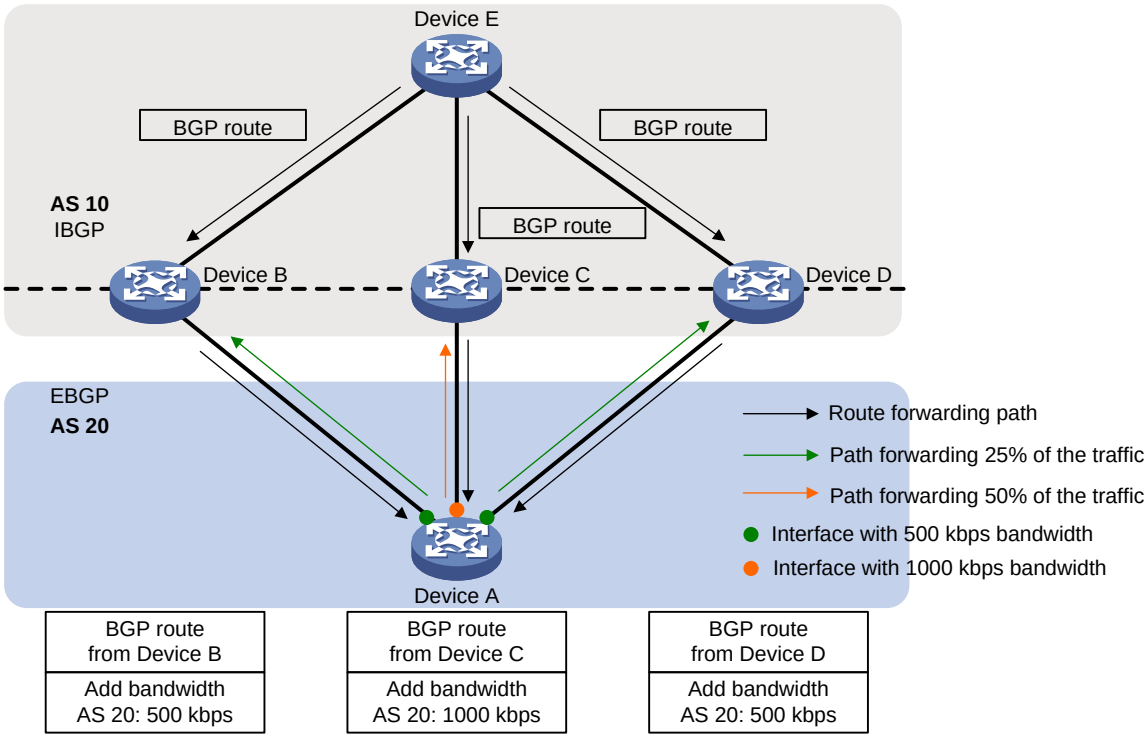
   peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise additional-paths best** *number*

   By default, a maximum of one Add-Path optimal route can be advertised to a peer or peer group.
5. Set the maximum total number of Add-Path optimal routes that can be advertised to all peers.

   additional-paths select-best *best-number*

   By default, a maximum total number of one Add-Path optimal route can be advertised to all peers.

   This command is not supported in BGP-VPN VPNv4 address family view.



Configuring link bandwidth attributes for BGP VPNv4 routes

About this task

ECMP load balancing equally distributes traffic to the equal-cost links without considering link bandwidth differences. This might cause insufficient usage of high-speed links and traffic congestion on low-speed links. To resolve this issue, you can configure Unequal Cost Multiple Path (UCMP) load balancing based on the link bandwidth attributes of BGP routes.

The link bandwidth attribute of a route indicates the link bandwidth of the outgoing interface of the route. After UCMP load balancing is enabled for an EBGP peer on the device, the device adds the link bandwidth attribute into the route received from the EBGP peer. This attribute carries the AS number of the current BGP process and the interface bandwidth for establishing a direct EBGP session. UCMP BGP routes are formed in the following situation: BGP route load balancing is configured by using the **balance** command in BGP-VPN IPv4 address family view. All the BGP routes for load balancing carry a link bandwidth attribute. In traffic forwarding, the proportion of the traffic carried on each BGP route is that of the route's link bandwidth to the total link bandwidth of all UCMP routes. As shown in Figure 25, Device A receives routes for the same destination address from three EBGP peers. Assume Device A adds link bandwidth attribute values 500 kbps, 1000 kbps, and 500 kbps for the three BGP routes. The traffic load proportions carried on the three BGP routes are 25%, 50%, and 25%, respectively. For more information the **balance** command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Figure 25 UCMP load balancing based on BGP routes with link bandwidth attributes

By default, the BGP routes with link bandwidth attributes are advertised only to IBGP peers and the added link bandwidth attributes are optional non-transitive attributes. You can change the advertisement rule for BGP routes with link bandwidth attributes as needed:

- To advertise link bandwidth attributes to EBGP peers, execute the **peer advertise ebgp bandwidth** command.
- To make BGP peers that cannot identify link bandwidth attributes to carry link bandwidth attributes when they forward BGP routes, execute the **peer advertise bandwidth transitive** command. This command can convert the link bandwidth attributes carried in BGP routes into optional transitive attributes.

Restrictions and guidelines

When you configure this feature to add link bandwidth attributes to BGP routes, follow these restrictions and guidelines:

- This feature applies only to direct EBGP peers or peer groups. If the specified peer or peer group becomes an indirectly connected neighbor, the device no longer adds link bandwidth attributes to the routes received from that neighbor.

- Only if all BGP routes for the same destination address carry the link bandwidth attributes, can these routes provide UCMP load balancing. Otherwise, the routes can only provide ECMP load balancing.
- A BGP route can carry a maximum of one link bandwidth attribute. If a received route already has a link bandwidth attribute, the device cannot add a link bandwidth attribute to the route any more.

In advertisement of BGP routes with link bandwidth attributes, the following restrictions apply:

- If you use the **peer route-policy export** command to apply a routing policy to a BGP peer/peer group, and the routing policy uses the **apply extcommunity** command to configure a link bandwidth attribute for BGP routes, that link bandwidth attribute will be carried in the BGP routes advertised to the BGP peer/peer group.
- When the device receives a BGP route with a link bandwidth attribute, the device deletes the link bandwidth attribute before advertising the route if the next hop address of the route needs to be changed before advertisement. This is because the forwarding link instructed by this route has changed and thus the carried link bandwidth no longer indicates the bandwidth of the actual forwarding link. This restriction does not exist if the device receives a route without a link bandwidth attribute and then adds a link bandwidth attribute to the route.
- For UCMP routes, if the Add-Path feature is configured to advertise only one optimal route, the optimal route advertised will carry a link bandwidth attribute that is the total link bandwidth of all UCMP routes. If the Add-Path feature is configured to advertise more than one optimal route, the advertised routes carry their respective link bandwidth attributes.

Procedure

1. Enter system view.

   system-view

2. Enter BGP VPNv4 address family view or BGP-VPN VPNv4 address family view.
   - Execute the following commands in sequence to enter BGP VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family vpnv4
   - Execute the following commands in sequence to enter BGP-VPN VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family vpnv4

3. Configure a link bandwidth attribute for a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **bandwidth** [*bandwidth-value*]

   By default, no link bandwidth attribute is configured for a peer or peer group.

4. (Optional.) Configure the device to advertise link bandwidth attributes to EBGP peers.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise ebgp bandwidth**

   By default, the device does not advertise link bandwidth attributes to EBGP peers.

5. (Optional.) Convert the link bandwidth attributes to optional transitive attributes in the BGP routes to be advertised to a peer or peer group.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **advertise bandwidth transitive**

   By default, the link bandwidth attributes in BGP routes are optional non-transitive attributes.

Minimizing the priority of BGP routes sent to peers

Minimizing the priority of BGP routes sent to a peer after the peer state changes from down to up

About this task

By default, a device immediately sends BGP routes to a peer after the peer comes up. If ARP entry convergence is not completed on the device, traffic matching the BGP routes might fail to be forwarded, causing packet loss. You can configure this feature to resolve this issue.

After you configure this feature on a device, the device works as follows:

- After a peer comes up, the device minimizes the priority (sets the local preference to 0 and the MED value to 4294967295) of BGP routes sent to the peer within the specified time. Therefore, the peer will not select BGP routes sent by the device as the optimal routes.
- After the specified timer expires, the device will immediately send BGP routes with the original priority to the peer. All subsequent BGP routes that the device sends to the peer carry the original priority.

If ARP entry convergence is completed on the device before the specified timer expires, you can manually restore the priority of BGP routes by executing either of the following commands:

- **`reset bgp advertise lowest-priority on-peer-up`**: After you execute this command, the device restores the priority of BGP routes sent to peers whose timers have not expired and immediately sends the routes to those peers. However, the device still minimizes the priority of BGP routes sent to a peer after the peer comes up.
- **`undo advertise lowest-priority on-peer-up duration`**: After you execute this command, the device immediately sends BGP routes with the original priority to peers whose timers have not expired. All subsequent BGP routes that the device sends to a peer carry the original priority even if the peer state changes.

Restrictions and guidelines

You can execute the **`advertise lowest-priority on-peer-up duration`** command multiple times to edit the duration for the device to minimize the priority of BGP routes. This command takes effect as follows:

- If the timer for a peer has not expired, the command takes effect immediately and the timer is reset. For example, if you execute the **`advertise lowest-priority on-peer-up duration`** *`10`* command, and then execute the **`advertise lowest-priority on-peer-up duration`** *`6`* command six seconds after the state of a peer changes from down to up, the device minimizes the priority of BGP routes sent to the peer for the next six seconds.
- If the timer has not started or has expired for all peers, the command takes effect when the state of a peer changes from down to up.

If you execute the **`advertise lowest-priority on-peer-up duration`** or **`advertise lowest-priority on-startup duration`** command together with the **`bgp update-delay on-startup`** or **`route-update-delay`** command or execute the **`advertise lowest-priority on-peer-up duration`** and **`advertise lowest-priority on-startup duration`** commands together, the configuration result is as shown in Table 11.

Table 11 Configuration results

Command A	Command B	Configuration result
`bgp update-delay`	**`advertise lowest-priority`**	In an address family where command B is executed, command

on-startup	**on-startup duration** (in address family view)	B takes effect and command A does not take effect. In an address family where command B is not executed, command A takes effect.
	advertise lowest-priority on-peer-up duration (in address family view)	In an address family where command B is not executed, command A takes effect. Suppose that the timer specified by command A is TA and the timer specified by command B is TB. In an address family where command B is executed, the configuration result is as follows: • If TA ≥ TB, only command A takes effect. • If TA < TB, the device does not send BGP routes to peers within the time period specified by TA, and then sends BGP routes with the minimized priority to peers within the time period obtained by TB - TA. After that, the device immediately sends BGP routes with the original priority to peers and stops minimizing the priority of BGP routes.
route-update-delay	**advertise lowest-priority on-startup duration** (in BGP VPNv4 or BGP-VPN VPNv4 address family view)	Suppose that the timer specified by command B is TB, and the longer one between the timer specified by the **peer route-update-interval** command and the timer specified by command A is TS. In BGP VPNv4 or BGP-VPN VPNv4 address family view, the configuration result is as follows: • If TS ≥ TB, command A takes effect. • If TS < TB, the device does not send BGP routes to peers within the time period specified by TS, and then sends BGP routes with the minimized priority to peers within the time period obtained by TB - TS. After that, the device immediately sends BGP routes with the original priority to peers and stops minimizing the priority of BGP routes. For a peer, if the **peer route-update-interval** command does not specify the peer, TS is the longer one between the default value of the **peer route-update-interval** command and the timer specified by command A.
	advertise	Suppose that the timer specified by

	lowest-priority on-peer-up duration (in BGP VPNv4 or BGP-VPN VPNv4 address family view)	command B is TB, and the longer one between the timer specified by the **peer route-update-interval** command and the timer specified by command A is TS. In BGP VPNv4 or BGP-VPN VPNv4 address family view, the configuration result is as follows: • If TS ≥ TB, command A takes effect. • If TS < TB, the device does not send BGP routes to peers within the time period specified by TS, and then sends BGP routes with the minimized priority to peers within the time period obtained by TB - TS. After that, the device immediately sends BGP routes with the original priority to peers and stops minimizing the priority of BGP routes. For a peer, if the **peer route-update-interval** command does not specify the peer, TS is the longer one between the default value of the **peer route-update-interval** command and the timer specified by command A.
advertise lowest-priority on-peer-up duration (in address family view)	**advertise lowest-priority on-startup duration** (in address family view)	Command A and command B are mutually exclusive in an address family.

For more information about the **advertise lowest-priority on-peer-up duration**, **advertise lowest-priority on-startup duration**, **peer route-update-interval**, **route-update-delay**, and **bgp update-delay on-startup** commands, see BGP commands in *Layer 3—IP Routing Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enter BGP VPNv4 address family view or BGP-VPN VPNv4 address family view.
   - Execute the following commands in sequence to enter BGP VPNv4 address family view:
     bgp *as-number* [**instance** *instance-name*]
     address-family vpnv4
   - Execute the following commands in sequence to enter BGP-VPN VPNv4 address family view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
     address-family vpnv4

3. Minimize the priority of BGP routes sent to a peer within the specified time after the peer state changes from down to up.

   advertise lowest-priority on-peer-up duration *seconds*

   By default, the device does not minimize the priority of BGP routes sent to peers.

Minimizing the priority of BGP routes sent to peers after the device restarts

About this task

By default, a device immediately sends BGP routes to its peers after the device restarts and its BGP process restores. If ARP entry convergence is not completed on the device, traffic matching the BGP routes might fail to be forwarded, causing packet loss. You can configure this feature to resolve this issue.

After you configure this feature on a device, the device works as follows:

- After the device restarts and its BGP process restores, the device minimizes the priority (sets the local preference to 0 and the MED value to 4294967295) of BGP routes sent to its peers within the specified time. Therefore, the peers will not select BGP routes sent by the device as the optimal routes.
- After the specified timer expires, the device will immediately send BGP routes with the original priority to its peers. All subsequent BGP routes that the device sends to its peers carry the original priority.

If ARP entry convergence is completed on the device before the specified timer expires, you can manually restore the priority of BGP routes by executing either of the following commands:

- **reset bgp advertise lowest-priority on-startup**: After you execute this command, the device restores the priority of BGP routes sent to peers and immediately sends the routes to peers. However, the device still minimizes the priority of BGP routes sent to its peers after the device restarts.
- **undo advertise lowest-priority on-startup duration**: After you execute this command, the device immediately sends BGP routes with the original priority to its peers. All subsequent BGP routes that the device sends to its peers carry the original priority even if the device restarts.

Restrictions and guidelines

This feature takes effect after you save the configuration and restart the device.

The confjiguration results differ if you execute the **advertise lowest-priority on-peer-up duration** or **advertise lowest-priority on-startup duration** command together with the **bgp update-delay on-startup** or **route-update-delay** command, or if you execute the **advertise lowest-priority on-peer-up duration** and **advertise lowest-priority on-startup duration** commands together. For more information about the configuration results, see "Minimizing the priority of BGP routes sent to a peer after the peer state changes from down to up."

For more information about the **advertise lowest-priority on-peer-up duration**, **advertise lowest-priority on-startup duration**, **peer route-update-interval**, **route-update-delay**, and **bgp update-delay on-startup** commands, see BGP commands in *Layer 3—IP Routing Command Reference*.

Procedure

1. Enter system view.

   system-view

2. Enter BGP VPNv4 address family view or BGP-VPN VPNv4 address family view.
   - Execute the following commands in sequence to enter BGP VPNv4 address family view:
     bgp *as-number* [**instance** *instance-name*]
     address-family vpnv4
   - Execute the following commands in sequence to enter BGP-VPN VPNv4 address family view:
     bgp *as-number* [**instance** *instance-name*]
     ip vpn-instance *vpn-instance-name*
     address-family vpnv4
3. Minimize the priority of BGP routes sent to peers within the specified time after the device restarts and its BGP process restores.
   advertise lowest-priority on-startup duration *seconds*
   By default, the device does not minimize the priority of BGP routes sent to peers.

Restoring the priority of BGP routes sent to peers

About this task

After configuring the device to minimize the priority of BGP routes sent to a peer within the specified time after the device restarts or after the peer state changes from down to up, you can perform this task to manually restore the priority of BGP routes. After you configure this feature, the device restores the priority of BGP routes sent to peers whose timers have not expired and immediately sends the routes to those peers. However, the device still minimizes the priority of BGP routes sent to a peer after the peer comes up or after the device restarts.

Procedure

Execute the following command in user view to restore the priority of BGP routes sent to peers:

reset bgp [**instance** *instance-name*] **advertise lowest-priority** { **on-peer-up** | **on-startup** }

Specifying a local network to be advertised in the public instance or a VPN instance

About this task

This feature specifies a local network of the public instance or a VPN instance. Then, you can configure BGP to redistribute the network (by using the **import-route local-aggregate** command) and advertise the network. For more information about the **import-route local-aggregate** command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Restrictions and guidelines

The specified local network route must exist and be active in the routing table of the public instance or VPN instance.

Procedure

1. Enter system view.
   system-view
2. Enter public instance IPv4 address family view or VPN instance IPv4 address family view.

- Execute the following commands in sequence to enter public instance IPv4 address family view:

  ip public-instance

  address-family ipv4

- Execute the following commands in sequence to enter VPN instance IPv4 address family view:

  ip vpn-instance *vpn-instance-name*

  address-family ipv4

3. Specify a local network to be advertised.

   network *ipv4-address* [*mask-length* | *mask*]

   By default, no local network in the public instance or a VPN instance will be advertised.

Configuring BGP VPNv4 routes to use private network next hops

About this task

By default, the device does not change the next hop attribute of a received BGP VPNv4 route. The next hop address of a BGP VPNv4 route is a public address. This feature changes the next hop of a BGP VPNv4 route received from a peer or peer group to an IP address in the VPN instance. The outgoing label of the VPNv4 route is also changed to an invalid value. For example, the device received a VPNv4 route and its next hop address is 10.1.1.1, which is a public address by default. After this feature is configured, the next hop address changes to private address 10.1.1.1.

Restrictions and guidelines

After you configure this feature, the following applies:

- The device re-establishes the BGP sessions to the specified peer or to all peers in the specified peer group.
- The device receives a BGP VPNv4 route only when its RD is the same as a local RD.
- When advertising a BGP VPNv4 route received from the specified peer or peer group, the device does not change the route target attribute of the route.
- If you delete a VPN instance or its RD, BGP VPNv4 routes received from the specified peer or peer group and in the VPN instance will be deleted.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view:

   address-family vpnv4

4. Change the next hop of a BGP VPNv4 route received from a peer or peer group to a VPN instance address.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **next-hop-vpn**

   By default, the device does not change the next hop attribute of a received BGP VPNv4 route, and the next hop belongs to the public network.

Configuring route replication

Configuring the public instance

About this task

Configure the public instance to enable the mutual access between public network and private network users.

Restrictions and guidelines

In an MPLS L3VPN network, for the public network and the VPN network to communicate with each other through route target matching, perform the following tasks:

- Configure matching route targets for the public instance and VPN instance.
- Use the **route-replicate enable** command in BGP instance view to enable mutual BGP route replication between the public and VPN instances.

Procedure

1. Enter system view.

   system-view
2. Enter public instance view.

   ip public-instance
3. Configure an RD for the public instance.

   route-distinguisher *route-distinguisher*

   By default, no RD is configured for the public instance.
4. Configure a route target for the public instance.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route target is configured for the public instance.
5. Set the maximum number of active route prefixes supported by the public instance.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, no limit is set for the number of active route prefixes supported by the public instance.
6. Enter public instance IPv4 address family view.

   address-family ipv4
7. Configure a route target for the IPv4 address family of the public instance.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route target is configured for the IPv4 address family of the public instance.
8. Apply an import routing policy to the public instance.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.
9. Apply an export routing policy to the public instance.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.
10. Set the maximum number of active route prefixes supported by the public instance.

    routing-table limit *number* { *warn-threshold* | **simply-alert** }

By default, no limit is set for the number of active route prefixes supported by the public instance.

The configuration in public instance IPv4 address family view takes precedence over the configuration in public instance view.

Configuring route replication for public and VPN instances

About this task

In a BGP/MPLS L3VPN network, only VPN instances that have matching route targets can communicate with each other.

The route replication feature provides the following functions:

- Enables a VPN instance to communicate with the public network or other VPN instances by replicating routes from the public instance or other VPN instances.
- Enables the public network to communicate with a VPN instance by replicating routes from the VPN instance to the public instance.

In an intelligent traffic control network, traffic of different tenants is assigned to different VPNs. To enable the tenants to communicate with the public network, configure this feature to replicate routes from the public instance to the VPN instances.

VLINK direct routes are generated based on ARP entries learned by interfaces. The **route-replicate from vpn-instance protocol direct** and **route-replicate from public protocol direct** commands replicate VLINK direct routes, but the VLINK direct routes cannot be added to the FIB, causing traffic forwarding failures. To address this issue, you can specify the **vlink-direct** keyword to replicate VLINK direct routes and add the VLINK direct routes to the FIB.

Configuring a VPN instance to replicate routes from the public instance or another VPN instance

1. Enter system view.

   system-view
2. Enter VPN instance view.

   ip vpn-instance *vpn-instance-name*
3. Enter VPN instance IPv4 address family view.

   address-family ipv4
4. Replicate routes from the public instance or other VPN instances.

   route-replicate from { **public** | **vpn-instance** *vpn-instance-name* } **protocol** { **bgp** *as-number* | **direct** | **static** | { **isis** | **ospf** | **rip** } *process-id* | **vlink-direct** } [**advertise**] [**route-policy** *route-policy-name*]

   By default, a VPN instance cannot replicate routes from the public instance or other VPN instances.

Configuing the public instance to replicate routes from a VPN instance

1. Enter system view.

   system-view
2. Enter public instance view.

   ip public-instance
3. Enter public instance IPv4 address family view.

   address-family ipv4
4. Replicate routes from a VPN instance to the public instance.

route-replicate from vpn-instance *vpn-instance-name* **protocol** { **bgp** *as-number* | **direct** | **static** | { **isis** | **ospf** | **rip** } *process-id* | **vlink-direct** } [**advertise**] [**route-policy** *route-policy-name*]

By default, the public instance cannot replicate routes from VPN instances.

Configuring BGP route replication between public and VPN instances

About this task

In traffic cleaning scenarios, traffic between the public and private networks are filtered by firewalls and traffic of different tenants is assigned to different VPNs. To enable the tenants to communicate with the public network under the protection of firewalls, BGP route replication between public and VPN instances is required.

By default, only VPN instances that have matching route targets can redistribute BGP routes from each other, while the public instance and VPN instances cannot. After you configure this feature, the public instance and VPN instances that have matching route targets can replicate BGP routes from each other, enabling communication between the public network and VPN users.

This feature also replicates the BGP route attributes, so that the device can select proper forwarding paths according to the route attributes.

Restrictions and guidelines

After this feature is enabled, the public network and VPNs cannot be isolated. Configure this feature only in specific scenarios, for example, the traffic cleaning scenario.

To use this feature to implement IPv4 route replication between the public instance and a VPN instance, make sure the VPN instance and the BGP IPv4 unicast address family have been created.

Procedure

1. Enter system view.

   system-view
2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]
3. Enable BGP route replication between public and VPN instances.

   route-replicate enable

   By default, BGP route replication between public and VPN instances is disabled.

Configuring route re-origination

About this task

By default, BGP routes in different VPN instances are isolated. In some networks, a device might need to advertise routes across VPN instances or advertise the routes in a VPN instance through other VPN instances to hide the routing information of the VPN instance.

After you configure this feature, the current VPN instance will re-originate the BGP unicast routes from other VPN instances that have the same route target as the current VPN instance. Locally redistributed routes (such as the IGP routes redistributed by using the **import-route** command) will not be re-originated. The re-originated routes can be advertised to BGP peers.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Enter BGP-VPN IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

5. Re-originate BGP unicast routes from other VPN instances.

   advertise route-reoriginate [**route-policy** *route-policy-name*] [**replace-rt**]

   By default, a VPN instance cannot re-originate BGP unicast routes from other VPN instances.

Enabling ECMP VPN route redistribution

About this task

For multiple routes that have the same prefix and RD, a VPN instance redistributes only the optimal route into its routing table by default. This feature enables a VPN instance to redistribute all routes that have the same prefix and RD into its routing table to perform load sharing or MPLS L3VPN FRR.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter a BGP address family view.
   - Enter BGP IPv4 unicast address family view.

     address-family ipv4 [**unicast**]
   - Execute the following commands in sequence to enter BGP-VPN IPv4 unicast address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4 [**unicast**]

4. Enable ECMP VPN route redistribution.

   vpn-route cross multipath

   By default, ECMP VPN route redistribution is disabled. If multiple routes have the same prefix and RD, a VPN instance redistributes only the optimal route into its routing table.

In BGP IPv4 unicast address family view,this command redistributes ECMP routes to the routing table of the public instance.

Enabling prioritized withdrawal of specific routes

About this task

This feature enables BGP to send the withdrawal messages of specific routes prior to other routes. This can achieve fast switchover of traffic on the specified routes to available routes to reduce the traffic interruption time.

Procedure

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP VPNv4 address family view.

   address-family vpnv4

4. Enable prioritized withdrawal of the routes that match the specified routing policy.

   update-first route-policy *route-policy-name*

   By default, BGP does not send the withdrawal messages of specific routes prior to other routes.

Enabling SNMP notifications for MPLS L3VPN

About this task

To report critical MPLS L3VPN events to an NMS, enable SNMP notifications for MPLS L3VPN. For MPLS L3VPN event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enable SNMP notifications for MPLS L3VPN.

   snmp-agent trap enable l3vpn [**vrf-down** | **vrf-up**] *

   By default, SNMP notifications for MPLS L3VPN are enabled.

Enabling logging for BGP route flapping

About this task

This feature enables BGP to generate logs for BGP route flappings that trigger log generation. The generated logs are sent to the information center. For the logs to be output correctly, you must also configure information center on the device. For more information about the information center, see *Network Management and Monitoring Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter BGP VPNv4 address family view or BGP-VPN VPNv4 address family view.

   - Execute the following commands in sequence to enter BGP VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     address-family vpnv4

   - Execute the following commands in sequence to enter BGP-VPN VPNv4 address family view:

     bgp *as-number* [**instance** *instance-name*]

     ip vpn-instance *vpn-instance-name*

     address-family vpnv4

3. Enable logging for BGP route flapping.

   log-route-flap *monitor-time monitor-count* [*log-count-limit* | **route-policy** *route-policy-name*] *

   By default, logging for BGP route flapping is disabled.

Display and maintenance commands for MPLS L3VPN

Resetting BGP connections

You can soft-reset or reset BGP sessions to apply new BGP configurations. A soft reset operation updates BGP routing information without tearing down BGP connections. A reset operation updates BGP routing information by tearing down, and then re-establishing BGP connections. Soft reset requires that BGP peers have route refresh capability.

Execute the following commands in user view to soft reset or reset BGP connections:

Task	Command
Soft-reset BGP sessions for the VPNv4 address family.	**refresh bgp** [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **vpnv4** [**vpn-instance** *vpn-instance-name*]
Soft-reset BGP sessions for the BGP IPv4 RT filter family.	**refresh bgp** [**instance** *instance-name*] { *ipv4-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **ipv4 rtfilter**
Reset BGP sessions for the VPNv4 address family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **internal** | **group** *group-name* } **vpnv4** [**vpn-instance** *vpn-instance-name*]
Reset BGP sessions for the BGP IPv4 RT filter family.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ipv4-address* [*mask-length*] | **all** | **external** | **internal** | **group** *group-name* } **ipv4 rtfilter**

For more information about the **refresh bgp vpnv4** and **reset bgp vpnv4** commands, see *Layer 3—IP Routing Command Reference*.

Displaying MPLS L3VPN information

Execute the following commands in any view to display MPLS L3VPN:

Task	Command
Display BGP VPNv4 route dampening parameters.	**display bgp** [**instance** *instance-name*] **dampening parameter vpnv4**
Display BGP RT filter peer group information.	**display bgp** [**instance** *instance-name*] **group ipv4 rtfilter** [**group-name** *group-name*]
Display BGP VPNv4 peer group information.	**display bgp** [**instance** *instance-name*] **group vpnv4** [**vpn-instance** *vpn-instance-name*] [**group-name** *group-name*]
Display BGP RT filter information.	**display bgp** [**instance** *instance-name*] **ipv4 rtfilter** [**peer** *ipv4-address* [**statistics**] |

Task	Command
	statistics]
Display BGP RT filter peer information.	**display bgp** [**instance** *instance-name*] **peer ipv4 rtfilter** [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*] **verbose**]
Display BGP VPNv4 peer information.	**display bgp** [**instance** *instance-name*] **peer vpnv4** [**vpn-instance** *vpn-instance-name*] [*ipv4-address mask-length* | { *ipv4-address* | **group-name** *group-name* } **log-info** | [*ipv4-address*] **verbose**]
Display information about dampened BGP VPNv4 routes.	**display bgp** [**instance** *instance-name*] **routing-table dampened vpnv4**
Display BGP VPNv4 route flapping information.	**display bgp** [**instance** *instance-name*] **routing-table flap-info vpnv4** [*ipv4-address* [{ *mask* | *mask-length* } [**longest-match**]] | **as-path-acl** *as-path-acl-number*]
Display incoming labels for BGP IPv4 unicast routes.	**display bgp** [**instance** *instance-name*] **routing-table ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] **inlabel**
Display outgoing labels for BGP IPv4 unicast routes.	**display bgp** [**instance** *instance-name*] **routing-table ipv4** [**unicast**] [**vpn-instance** *vpn-instance-name*] **outlabel**
Display BGP RT filter routing information.	**display bgp** [**instance** *instance-name*] **routing-table ipv4 rtfilter** [**default-rt** [**advertise-info** | **as-path** | **cluster-list**] | [**origin-as** *as-number*] [*route-target* [**advertise-info** | **as-path** | **cluster-list**]] | **peer** *ipv4-address* { **advertised-routes** | **received-routes** } [**default-rt** | [**origin-as** *as-number*] [*route-target*] | **statistics**] | **statistics**]
Display BGP VPNv4 routes.	**display bgp** [**instance** *instance-name*] **routing-table vpnv4** [[**route-distinguisher** *route-distinguisher*] [*ipv4-address* [{ *mask-length* | *mask* } [**longest-match**]] | *ipv4-address* [*mask-length* | *mask*] **advertise-info** | *ipv4-address* [*mask-length* | *mask*] { **as-path** | **cluster-list** | **community** | **ext-community** } | [**vpn-instance** *vpn-instance-name*] **peer** *ipv4-address* { **advertised-routes** | **received-routes** } [*ipv4-address* [*mask-length* | *mask*] | **statistics**] | **statistics**] **display bgp** [**instance** *instance-name*] **routing-table vpnv4** [**route-distinguisher** *route-distinguisher*] **as-path-acl** { *as-path-acl-number* | *as-path-acl-name* } **display bgp** [**instance** *instance-name*] **routing-table vpnv4** [**route-distinguisher**

Task	Command
	route-distinguisher] [**statistics**] **community** [*community-number*&<1-32> | *aa:nn*&<1-32>] [**internet** | **no-advertise** | **no-export** | **no-export-subconfed**] [**whole-match**] **display bgp** [**instance** *instance-name*] **routing-table vpnv4** [**route-distinguisher** *route-distinguisher*] [**statistics**] **community-list** *basic-community-list-number* | *adv-community-list-number* | *comm-list-name* } [**whole-match**] **display bgp** [**instance** *instance-name*] **routing-table vpnv4** [**route-distinguisher** *route-distinguisher*] [**statistics**] **ext-community** [**bandwidth** *link-bandwidth-value* | **rt** *route-target* | **soo** *site-of-origin*]&<1-32> [**whole-match**]
Display incoming labels for BGP VPNv4 routes.	**display bgp** [**instance** *instance-name*] **routing-table vpnv4 inlabel**
Display outgoing labels for BGP VPNv4 routes.	**display bgp** [**instance** *instance-name*] **routing-table vpnv4 outlabel**
Display BGP IPv4 RT filter address family update group information.	**display bgp** [**instance** *instance-name*] **update-group ipv4 rtfilter** [*ipv4-address*]
Display BGP VPNv4 address family update group information.	**display bgp** [**instance** *instance-name*] **update-group vpnv4** [**vpn-instance** *vpn-instance-name*] [*ipv4-address*]
Display the FIB of a VPN instance.	**display fib vpn-instance** *vpn-instance-name*
Display FIB entries that match the specified destination IP address in the specified VPN instance.	**display fib vpn-instance** *vpn-instance-name ip-address* [*mask-length* | *mask*]
Display the routing table for a VPN instance.	**display ip routing-table vpn-instance** *vpn-instance-name* [**statistics** | **verbose**]
Display information about a specific or all VPN instances.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]
Display OSPF sham link information.	**display ospf** [*process-id*] **sham-link** [**area** *area-id*]
Clear BGP VPNv4 route dampening information and release dampened routes.	**reset bgp** [**instance** *instance-name*] **dampening vpnv4** [*ipv4-address* [*mask* | *mask-length*]]
Clear BGP VPNv4 route flapping statistics.	**reset bgp** [**instance** *instance-name*] **flap-info vpnv4** [*ipv4-address* [*mask* | *mask-length*] | **as-path-acl** *as-path-acl-number* | **peer** *ipv4-address* [*mask-length*]]

For more information about the **display ip routing-table**, **display bgp group vpnv4**, **display bgp peer vpnv4**, and **display bgp update-group vpnv4** commands, see *Layer 3—IP Routing Command Reference*.

MPLS L3VPN configuration examples

Example: Configuring basic MPLS L3VPN

Network configuration

CE 1 and CE 3 belong to VPN 1. CE 2 and CE 4 belong to VPN 2.

VPN 1 uses route target attribute 111:1. VPN 2 uses route target attribute 222:2. Users of different VPNs cannot access each other.

EBGP is used to exchange VPN routing information between CE and PE.

PEs use OSPF to communicate with each other and use MP-IBGP to exchange VPN routing information.

Figure 26 Network diagram

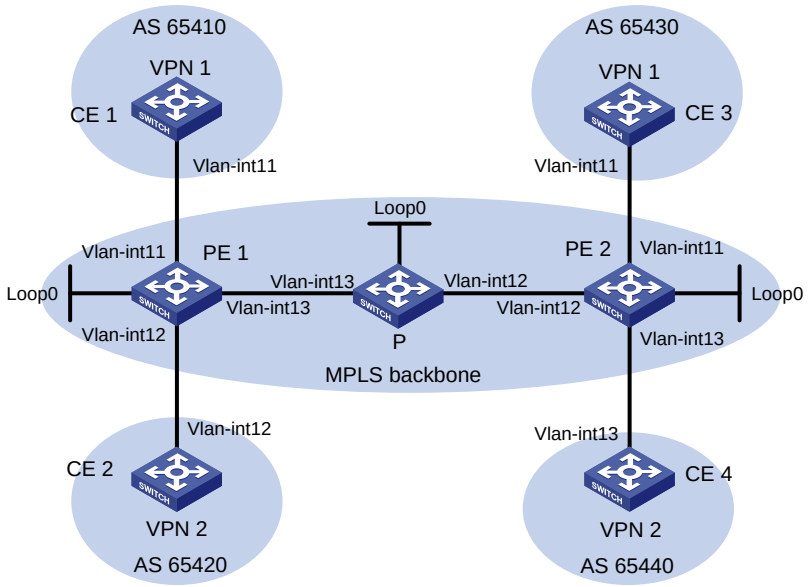


Table 12 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Vlan-int11	10.1.1.1/24	P	Loop0	2.2.2.9/32
PE 1	Loop0	1.1.1.9/32		Vlan-int12	172.2.1.1/24
	Vlan-int11	10.1.1.2/24		Vlan-int13	172.1.1.2/24
	Vlan-int13	172.1.1.1/24	PE 2	Loop0	3.3.3.9/32
	Vlan-int12	10.2.1.2/24		Vlan-int12	172.2.1.2/24
CE 2	Vlan-int12	10.2.1.1/24		Vlan-int11	10.3.1.2/24
CE 3	Vlan-int11	10.3.1.1/24		Vlan-int13	10.4.1.2/24
CE 4	Vlan-int13	10.4.1.1/24			

Procedure

1. Configure an IGP on the MPLS backbone to ensure IP connectivity within the backbone:

   # Configure PE 1.

```
<PE1> system-view
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 1.1.1.9 32
[PE1-LoopBack0] quit
[PE1] interface vlan-interface 13
[PE1-Vlan-interface13] ip address 172.1.1.1 24
[PE1-Vlan-interface13] quit
[PE1] ospf
[PE1-ospf-1] area 0
[PE1-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[PE1-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[PE1-ospf-1-area-0.0.0.0] quit
[PE1-ospf-1] quit
```

   # Configure the P device.

```
<P> system-view
[P] interface loopback 0
[P-LoopBack0] ip address 2.2.2.9 32
[P-LoopBack0] quit
[P] interface vlan-interface 13
[P-Vlan-interface13] ip address 172.1.1.2 24
[P-Vlan-interface13] quit
[P] interface vlan-interface 12
[P-Vlan-interface12] ip address 172.2.1.1 24
[P-Vlan-interface12] quit
[P] ospf
[P-ospf-1] area 0
[P-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[P-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[P-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[P-ospf-1-area-0.0.0.0] quit
[P-ospf-1] quit
```

   # Configure PE 2.

```
<PE2> system-view
[PE2] interface loopback 0
[PE2-LoopBack0] ip address 3.3.3.9 32
[PE2-LoopBack0] quit
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] ip address 172.2.1.2 24
[PE2-Vlan-interface12] quit
[PE2] ospf
[PE2-ospf-1] area 0
[PE2-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[PE2-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[PE2-ospf-1-area-0.0.0.0] quit
[PE2-ospf-1] quit
```

Execute the **display ospf peer** command to verify that OSPF adjacencies in Full state have been established between PE 1, P, and PE 2. Execute the **display ip routing-table** command to verify that the PEs have learned the routes to the loopback interfaces of each other. (Details not shown.)

2. Configure basic MPLS and MPLS LDP on the MPLS backbone to establish LDP LSPs:

Configure PE 1.

```
[PE1] mpls lsr-id 1.1.1.9
[PE1] mpls ldp
[PE1-ldp] quit
[PE1] interface vlan-interface 13
[PE1-Vlan-interface13] mpls enable
[PE1-Vlan-interface13] mpls ldp enable
[PE1-Vlan-interface13] quit
```

Configure the P device.

```
[P] mpls lsr-id 2.2.2.9
[P] mpls ldp
[P-ldp] quit
[P] interface vlan-interface 13
[P-Vlan-interface13] mpls enable
[P-Vlan-interface13] mpls ldp enable
[P-Vlan-interface13] quit
[P] interface vlan-interface 12
[P-Vlan-interface12] mpls enable
[P-Vlan-interface12] mpls ldp enable
[P-Vlan-interface12] quit
```

Configure PE 2.

```
[PE2] mpls lsr-id 3.3.3.9
[PE2] mpls ldp
[PE2-ldp] quit
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] mpls enable
[PE2-Vlan-interface12] mpls ldp enable
[PE2-Vlan-interface12] quit
```

Execute the **display mpls ldp peer** command to verify that LDP sessions in Operational state have been established between PE 1, P, and PE 2. Execute the **display mpls ldp lsp** command to verify that the LSPs have been established by LDP. (Details not shown.)

3. Configure VPN instances on PEs:

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 100:1
[PE1-vpn-instance-vpn1] vpn-target 111:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 100:2
[PE1-vpn-instance-vpn2] vpn-target 222:2
[PE1-vpn-instance-vpn2] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance vpn1
```

```
[PE1-Vlan-interface11] ip address 10.1.1.2 24
[PE1-Vlan-interface11] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn2
[PE1-Vlan-interface12] ip address 10.2.1.2 24
[PE1-Vlan-interface12] quit
```

Configure PE 2.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 200:1
[PE2-vpn-instance-vpn1] vpn-target 111:1
[PE2-vpn-instance-vpn1] quit
[PE2] ip vpn-instance vpn2
[PE2-vpn-instance-vpn2] route-distinguisher 200:2
[PE2-vpn-instance-vpn2] vpn-target 222:2
[PE2-vpn-instance-vpn2] quit
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] ip binding vpn-instance vpn1
[PE2-Vlan-interface11] ip address 10.3.1.2 24
[PE2-Vlan-interface11] quit
[PE2] interface vlan-interface 13
[PE2-Vlan-interface13] ip binding vpn-instance vpn2
[PE2-Vlan-interface13] ip address 10.4.1.2 24
[PE2-Vlan-interface13] quit
```

Configure IP addresses for the CEs according to Figure 26. (Details not shown.)

Execute the **display ip vpn-instance** command on the PEs to display the configuration of the VPN instance.

Use the **ping** command on the PEs to verify that the PEs can ping their attached CEs.

4. Establish EBGP peer relationships between PEs and CEs, and redistribute VPN routes into BGP:

Configure CE 1.

```
<CE1> system-view
[CE1] bgp 65410
[CE1-bgp-default] peer 10.1.1.2 as-number 100
[CE1-bgp-default] address-family ipv4 unicast
[CE1-bgp-default-ipv4] peer 10.1.1.2 enable
[CE1-bgp-default-ipv4] import-route direct
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
```

Configure the other three CEs in the same way that CE 1 is configured. (Details not shown.)

Configure PE 1.

```
[PE1] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 10.1.1.1 as-number 65410
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 10.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] ip vpn-instance vpn2
```

```
[PE1-bgp-default-vpn2] peer 10.2.1.1 as-number 65420
[PE1-bgp-default-vpn2] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn2] peer 10.2.1.1 enable
[PE1-bgp-default-ipv4-vpn2] quit
[PE1-bgp-default-vpn2] quit
[PE1-bgp-default] quit
```

Configure PE 2 in the same way that PE 1 is configured. (Details not shown.)

Execute the **display bgp peer ipv4 vpn-instance** command on the PEs to verify that a BGP peer relationship in Established state has been established between a PE and a CE. (Details not shown.)

5. Establish an MP-IBGP peer relationship between PEs:

Configure PE 1.

```
[PE1] bgp 100
[PE1-bgp-default] peer 3.3.3.9 as-number 100
[PE1-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 3.3.3.9 enable
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] quit
```

Configure PE 2.

```
[PE2] bgp 100
[PE2-bgp-default] peer 1.1.1.9 as-number 100
[PE2-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 1.1.1.9 enable
[PE2-bgp-default-vpnv4] quit
[PE2-bgp-default] quit
```

Execute the **display bgp peer vpnv4** command on the PEs to verify that a BGP peer relationship in Established state has been established between the PEs. (Details not shown.)

Verifying the configuration

Execute the **display ip routing-table vpn-instance** command on the PEs.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask    Proto  Pre  Cost         NextHop         Interface
0.0.0.0/32          Direct 0    0            127.0.0.1       InLoop0
10.1.1.0/24         Direct 0    0            10.1.1.2        Vlan11

10.1.1.255/32       Direct 0    0            10.1.1.2        Vlan11
10.3.1.0/24         BGP    255  0            3.3.3.9         Vlan13
127.0.0.0/8         Direct 0    0            127.0.0.1       InLoop0
127.0.0.0/32        Direct 0    0            127.0.0.1       InLoop0
127.0.0.1/32        Direct 0    0            127.0.0.1       InLoop0
127.255.255.255/32  Direct 0    0            127.0.0.1       InLoop0
224.0.0.0/4         Direct 0    0            0.0.0.0         NULL0
224.0.0.0/24        Direct 0    0            0.0.0.0         NULL0
```

```
255.255.255.255/32  Direct 0    0           127.0.0.1       InLoop0
```

The output shows that PE 1 has a route to the remote CE. Output on PE 2 is similar.

Verify that CEs of the same VPN can ping each other, whereas those of different VPNs cannot. For example, CE 1 can ping CE 3 (10.3.1.1) but cannot ping CE 4 (10.4.1.1). (Details not shown.)

Example: Configuring a hub-spoke network

Network configuration

The Spoke-CEs cannot communicate directly. They can communicate only through Hub-CE.

Configure EBGP between the Spoke-CEs and Spoke-PEs and between Hub-CE and Hub-PE to exchange VPN routing information.

Configure OSPF between the Spoke-PEs and Hub-PE to implement communication between the PEs, and configure MP-IBGP between them to exchange VPN routing information.

Figure 27 Network diagram

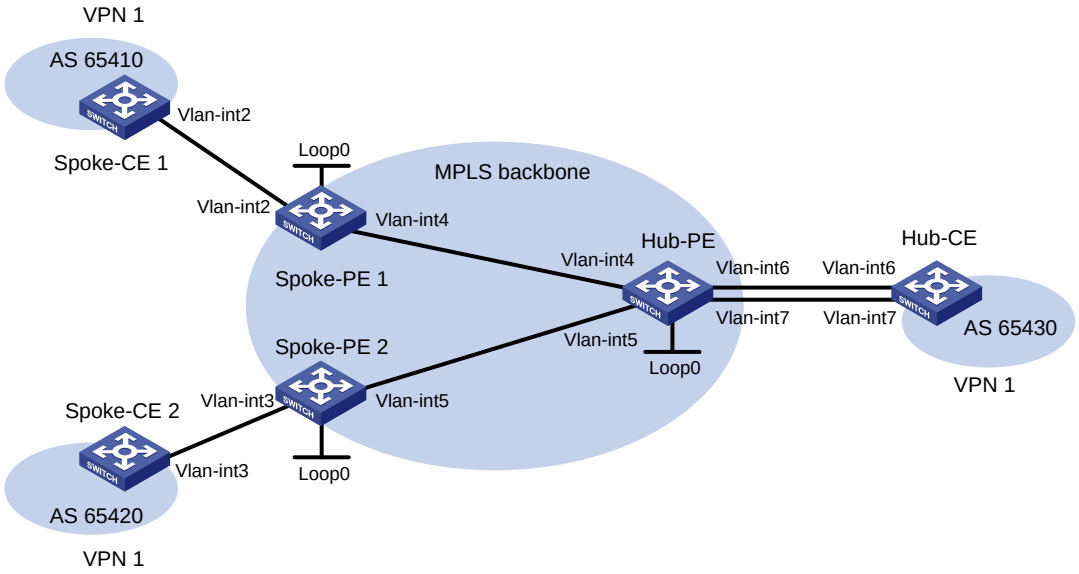

Table 13 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
Spoke-CE 1	Vlan-int2	10.1.1.1/24	Hub-CE	Vlan-int6	10.3.1.1/24
Spoke-PE 1	Loop0	1.1.1.9/32		Vlan-int7	10.4.1.1/24
	Vlan-int2	10.1.1.2/24	Hub-PE	Loop0	2.2.2.9/32
	Vlan-int4	172.1.1.1/24		Vlan-int4	172.1.1.2/24
Spoke-CE 2	Vlan-int3	10.2.1.1/24		Vlan-int5	172.2.1.2/24
Spoke-PE 2	Loop0	3.3.3.9/32		Vlan-int6	10.3.1.2/24
	Vlan-int3	10.2.1.2/24		Vlan-int7	10.4.1.2/24
	Vlan-int5	172.2.1.1/24			

Procedure

1. Configure an IGP on the MPLS backbone to ensure IP connectivity within the backbone:

Configure Spoke-PE 1.

```
<Spoke-PE1> system-view
[Spoke-PE1] interface loopback 0
[Spoke-PE1-LoopBack0] ip address 1.1.1.9 32
[Spoke-PE1-LoopBack0] quit
[Spoke-PE1] interface vlan-interface 4
[Spoke-PE1-Vlan-interface4] ip address 172.1.1.1 24
[Spoke-PE1-Vlan-interface4] quit
[Spoke-PE1] ospf
[Spoke-PE1-ospf-1] area 0
[Spoke-PE1-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[Spoke-PE1-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[Spoke-PE1-ospf-1-area-0.0.0.0] quit
[Spoke-PE1-ospf-1] quit
```

Configure Spoke-PE 2.

```
<Spoke-PE2> system-view
[Spoke-PE2] interface loopback 0
[Spoke-PE2-LoopBack0] ip address 3.3.3.9 32
[Spoke-PE2-LoopBack0] quit
[Spoke-PE2] interface vlan-interface 5
[Spoke-PE2-Vlan-interface5] ip address 172.2.1.1 24
[Spoke-PE2-Vlan-interface5] quit
[Spoke-PE2] ospf
[Spoke-PE2-ospf-1] area 0
[Spoke-PE2-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[Spoke-PE2-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[Spoke-PE2-ospf-1-area-0.0.0.0] quit
[Spoke-PE2-ospf-1] quit
```

Configure Hub-PE.

```
<Hub-PE> system-view
[Hub-PE] interface loopback 0
[Hub-PE-LoopBack0] ip address 2.2.2.9 32
[Hub-PE-LoopBack0] quit
[Hub-PE] interface vlan-interface 4
[Hub-PE-Vlan-interface4] ip address 172.1.1.2 24
[Hub-PE-Vlan-interface4] quit
[Hub-PE] interface vlan-interface 5
[Hub-PE-Vlan-interface5] ip address 172.2.1.2 24
[Hub-PE-Vlan-interface5] quit
[Hub-PE] ospf
[Hub-PE-ospf-1] area 0
[Hub-PE-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[Hub-PE-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[Hub-PE-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[Hub-PE-ospf-1-area-0.0.0.0] quit
[Hub-PE-ospf-1] quit
```

Execute the **`display ospf peer`** command on the devices to verify that OSPF adjacencies in Full state have been established between Spoke-PE 1, Spoke-PE 2, and Hub-PE. Execute

the **display ip routing-table** command on the devices to verify that the PEs have learned the routes to the loopback interfaces of each other. (Details not shown.)

2. Configure basic MPLS and MPLS LDP on the MPLS backbone to establish LDP LSPs:

Configure Spoke-PE 1.

```
[Spoke-PE1] mpls lsr-id 1.1.1.9
[Spoke-PE1] mpls ldp
[Spoke-PE1-ldp] quit
[Spoke-PE1] interface vlan-interface 4
[Spoke-PE1-Vlan-interface4] mpls enable
[Spoke-PE1-Vlan-interface4] mpls ldp enable
[Spoke-PE1-Vlan-interface4] quit
```

Configure Spoke-PE 2.

```
[Spoke-PE2] mpls lsr-id 3.3.3.9
[Spoke-PE2] mpls ldp
[Spoke-PE2-ldp] quit
[Spoke-PE2] interface vlan-interface 5
[Spoke-PE2-Vlan-interface5] mpls enable
[Spoke-PE2-Vlan-interface5] mpls ldp enable
[Spoke-PE2-Vlan-interface5] quit
```

Configure Hub-PE.

```
[Hub-PE] mpls lsr-id 2.2.2.9
[Hub-PE] mpls ldp
[Hub-PE-ldp] quit
[Hub-PE] interface vlan-interface 4
[Hub-PE-Vlan-interface4] mpls enable
[Hub-PE-Vlan-interface4] mpls ldp enable
[Hub-PE-Vlan-interface4] quit
[Hub-PE] interface vlan-interface 5
[Hub-PE-Vlan-interface5] mpls enable
[Hub-PE-Vlan-interface5] mpls ldp enable
[Hub-PE-Vlan-interface5] quit
```

Execute the **display mpls ldp peer** command on the devices to verify that LDP sessions in Operational state have been established between Spoke-PE 1, Spoke-PE 2, and Hub-PE. Execute the **display mpls ldp lsp** command on the devices to verify that the LSPs have been established by LDP. (Details not shown.)

3. Configure VPN instances on the Spoke-PEs and Hub-PE:

Configure Spoke-PE 1.

```
[Spoke-PE1] ip vpn-instance vpn1
[Spoke-PE1-vpn-instance-vpn1] route-distinguisher 100:1
[Spoke-PE1-vpn-instance-vpn1] vpn-target 111:1 import-extcommunity
[Spoke-PE1-vpn-instance-vpn1] vpn-target 222:2 export-extcommunity
[Spoke-PE1-vpn-instance-vpn1] quit
[Spoke-PE1] interface vlan-interface 2
[Spoke-PE1-Vlan-interface2] ip binding vpn-instance vpn1
[Spoke-PE1-Vlan-interface2] ip address 10.1.1.2 24
[Spoke-PE1-Vlan-interface2] quit
```

Configure Spoke-PE 2.

```
[Spoke-PE2] ip vpn-instance vpn1
```

```
[Spoke-PE2-vpn-instance-vpn1] route-distinguisher 100:2
[Spoke-PE2-vpn-instance-vpn1] vpn-target 111:1 import-extcommunity
[Spoke-PE2-vpn-instance-vpn1] vpn-target 222:2 export-extcommunity
[Spoke-PE2-vpn-instance-vpn1] quit
[Spoke-PE2] interface vlan-interface 3
[Spoke-PE2-Vlan-interface3] ip binding vpn-instance vpn1
[Spoke-PE2-Vlan-interface3] ip address 10.2.1.2 24
[Spoke-PE2-Vlan-interface3] quit
```

Configure Hub-PE.

```
[Hub-PE] ip vpn-instance vpn1-in
[Hub-PE-vpn-instance-vpn1-in] route-distinguisher 100:3
[Hub-PE-vpn-instance-vpn1-in] vpn-target 222:2 import-extcommunity
[Hub-PE-vpn-instance-vpn1-in] quit
[Hub-PE] ip vpn-instance vpn1-out
[Hub-PE-vpn-instance-vpn1-out] route-distinguisher 100:4
[Hub-PE-vpn-instance-vpn1-out] vpn-target 111:1 export-extcommunity
[Hub-PE-vpn-instance-vpn1-out] quit
[Hub-PE] interface vlan-interface 6
[Hub-PE-Vlan-interface6] ip binding vpn-instance vpn1-in
[Hub-PE-Vlan-interface6] ip address 10.3.1.2 24
[Hub-PE-Vlan-interface6] quit
[Hub-PE] interface vlan-interface 7
[Hub-PE-Vlan-interface7] ip binding vpn-instance vpn1-out
[Hub-PE-Vlan-interface7] ip address 10.4.1.2 24
[Hub-PE-Vlan-interface7] quit
```

Configure IP addresses for the CEs according to Figure 27Table 13. (Details not shown.)

Execute the **display ip vpn-instance** command on the PEs to display the configuration of the VPN instance.

Use the **ping** command on the PEs to verify that the PEs can ping their attached CEs.

4. Establish EBGP peer relationships between the PEs and CEs, and redistribute VPN routes into BGP:

Configure Spoke-CE 1.

```
<Spoke-CE1> system-view
[Spoke-CE1] bgp 65410
[Spoke-CE1-bgp-default] peer 10.1.1.2 as-number 100
[Spoke-CE1-bgp-default] address-family ipv4
[Spoke-CE1-bgp-default-ipv4] peer 10.1.1.2 enable
[Spoke-CE1-bgp-default-ipv4] import-route direct
[Spoke-CE1-bgp-default-ipv4] quit
[Spoke-CE1-bgp-default] quit
```

Configure Spoke-CE 2.

```
<Spoke-CE2> system-view
[Spoke-CE2] bgp 65420
[Spoke-CE2-bgp-default] peer 10.2.1.2 as-number 100
[Spoke-CE2-bgp-default] address-family ipv4
[Spoke-CE2-bgp-default-ipv4] peer 10.2.1.2 enable
[Spoke-CE2-bgp-default-ipv4] import-route direct
[Spoke-CE2-bgp-default-ipv4] quit
```

```
[Spoke-CE2-bgp-default] quit
```

Configure Hub-CE.

```
<Hub-CE> system-view
[Hub-CE] bgp 65430
[Hub-CE-bgp-default] peer 10.3.1.2 as-number 100
[Hub-CE-bgp-default] peer 10.4.1.2 as-number 100
[Hub-CE-bgp-default] address-family ipv4
[Hub-CE-bgp-default-ipv4] peer 10.3.1.2 enable
[Hub-CE-bgp-default-ipv4] peer 10.4.1.2 enable
[Hub-CE-bgp-default-ipv4] import-route direct
[Hub-CE-bgp-default-ipv4] quit
[Hub-CE-bgp-default] quit
```

Configure Spoke-PE 1.

```
[Spoke-PE1] bgp 100
[Spoke-PE1-bgp-default] ip vpn-instance vpn1
[Spoke-PE1-bgp-default-vpn1] peer 10.1.1.1 as-number 65410
[Spoke-PE1-bgp-default-vpn1] address-family ipv4
[Spoke-PE1-bgp-default-ipv4-vpn1] peer 10.1.1.1 enable
[Spoke-PE1-bgp-default-ipv4-vpn1] quit
[Spoke-PE1-bgp-default-vpn1] quit
[Spoke-PE1-bgp-default] quit
```

Configure Spoke-PE 2.

```
[Spoke-PE2] bgp 100
[Spoke-PE2-bgp-default] ip vpn-instance vpn1
[Spoke-PE2-bgp-default-vpn1] peer 10.2.1.1 as-number 65420
[Spoke-PE2-bgp-default-vpn1] address-family ipv4
[Spoke-PE2-bgp-default-ipv4-vpn1] peer 10.2.1.1 enable
[Spoke-PE2-bgp-default-ipv4-vpn1] quit
[Spoke-PE2-bgp-default-vpn1] quit
[Spoke-PE2-bgp-default] quit
```

Configure Hub-PE.

```
[Hub-PE] bgp 100
[Hub-PE-bgp-default] ip vpn-instance vpn1-in
[Hub-PE-bgp-default-vpn1-in] peer 10.3.1.1 as-number 65430
[Hub-PE-bgp-default-vpn1-in] address-family ipv4
[Hub-PE-bgp-default-ipv4-vpn1-in] peer 10.3.1.1 enable
[Hub-PE-bgp-default-ipv4-vpn1-in] quit
[Hub-PE-bgp-default-vpn1-in] quit
[Hub-PE-bgp-default] ip vpn-instance vpn1-out
[Hub-PE-bgp-default-vpn1-out] peer 10.4.1.1 as-number 65430
[Hub-PE-bgp-default-vpn1-out] address-family ipv4
[Hub-PE-bgp-default-ipv4-vpn1-out] peer 10.4.1.1 enable
[Hub-PE-bgp-default-ipv4-vpn1-out] peer 10.4.1.1 allow-as-loop 2
[Hub-PE-bgp-default-ipv4-vpn1-out] quit
[Hub-PE-bgp-default-vpn1-out] quit
[Hub-PE-bgp-default] quit
```

Execute the **display bgp peer ipv4 vpn-instance** command on the PEs to verify that a BGP peer relationship in Established state has been established between a PE and a CE. (Details not shown.)

5. Establish an MP-IBGP peer relationship between the Spoke-PEs and Hub-PE:

Configure Spoke-PE 1.

```
[Spoke-PE1] bgp 100
[Spoke-PE1-bgp-default] peer 2.2.2.9 as-number 100
[Spoke-PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[Spoke-PE1-bgp-default] address-family vpnv4
[Spoke-PE1-bgp-default-vpnv4] peer 2.2.2.9 enable
[Spoke-PE1-bgp-default-vpnv4] quit
[Spoke-PE1-bgp-default] quit
```

Configure Spoke-PE 2.

```
[Spoke-PE2] bgp 100
[Spoke-PE2-bgp-default] peer 2.2.2.9 as-number 100
[Spoke-PE2-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[Spoke-PE2-bgp-default] address-family vpnv4
[Spoke-PE2-bgp-default-vpnv4] peer 2.2.2.9 enable
[Spoke-PE2-bgp-default-vpnv4] quit
[Spoke-PE2-bgp-default] quit
```

Configure Hub-PE.

```
[Hub-PE] bgp 100
[Hub-PE-bgp-default] peer 1.1.1.9 as-number 100
[Hub-PE-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[Hub-PE-bgp-default] peer 3.3.3.9 as-number 100
[Hub-PE-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[Hub-PE-bgp-default] address-family vpnv4
[Hub-PE-bgp-default-vpnv4] peer 1.1.1.9 enable
[Hub-PE-bgp-default-vpnv4] peer 3.3.3.9 enable
[Hub-PE-bgp-default-vpnv4] quit
[Hub-PE-bgp-default] quit
```

Execute the **display bgp peer vpnv4** command on the PEs to verify that a BGP peer relationship in Established state has been established between the PEs. (Details not shown.)

Verifying the configuration

Execute the **display ip routing-table vpn-instance** command on the PEs to display the routes to the CEs. This example uses Spoke-PE 1 to verify that the next hop of the route from a Spoke-PE to its connected Spoke-CE is Hub-PE.

```
[Spoke-PE1] display ip routing-table vpn-instance vpn1

Destinations : 15        Routes : 15

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.1.1.0/24        Direct  0   0           10.1.1.2        Vlan2
10.1.1.0/32        Direct  0   0           10.1.1.2        Vlan2
10.1.1.2/32        Direct  0   0           127.0.0.1       InLoop0
10.1.1.255/32      Direct  0   0           10.1.1.2        Vlan2
10.2.1.0/24        BGP     255 0           2.2.2.9         Vlan4
```

```
10.3.1.0/24         BGP     255 0           2.2.2.9         Vlan4
10.4.1.0/24         BGP     255 0           2.2.2.9         Vlan4
127.0.0.0/8         Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32        Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

Verify that Spoke-CE 1 and Spoke-CE 2 can ping each other. The TTL value indicates that traffic from Spoke-CE 1 to Spoke-CE 2 passes six hops (255-250+1) and is forwarded through Hub-CE. This example uses Spoke-CE 1 to verify their connectivity.

```
[Spoke-CE1] ping 10.2.1.1
Ping 10.2.1.1 (10.2.1.1): 56 data bytes, press CTRL+C to break
56 bytes from 10.2.1.1: icmp_seq=0 ttl=250 time=1.000 ms
56 bytes from 10.2.1.1: icmp_seq=1 ttl=250 time=2.000 ms
56 bytes from 10.2.1.1: icmp_seq=2 ttl=250 time=0.000 ms
56 bytes from 10.2.1.1: icmp_seq=3 ttl=250 time=1.000 ms
56 bytes from 10.2.1.1: icmp_seq=4 ttl=250 time=0.000 ms

--- Ping statistics for 10.2.1.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.000/0.800/2.000/0.748 ms
```

Example: Configuring MPLS L3VPN inter-AS option A

Network configuration

CE 1 and CE 2 belong to the same VPN. CE 1 accesses the network through PE 1 in AS 100, and CE 2 accesses the network through PE 2 in AS 200.

Configure MPLS L3VPN inter-AS option A, and use the VRF-to-VRF method to manage VPN routes.

Run OSPF on the MPLS backbone in each AS.

Figure 28 Network diagram

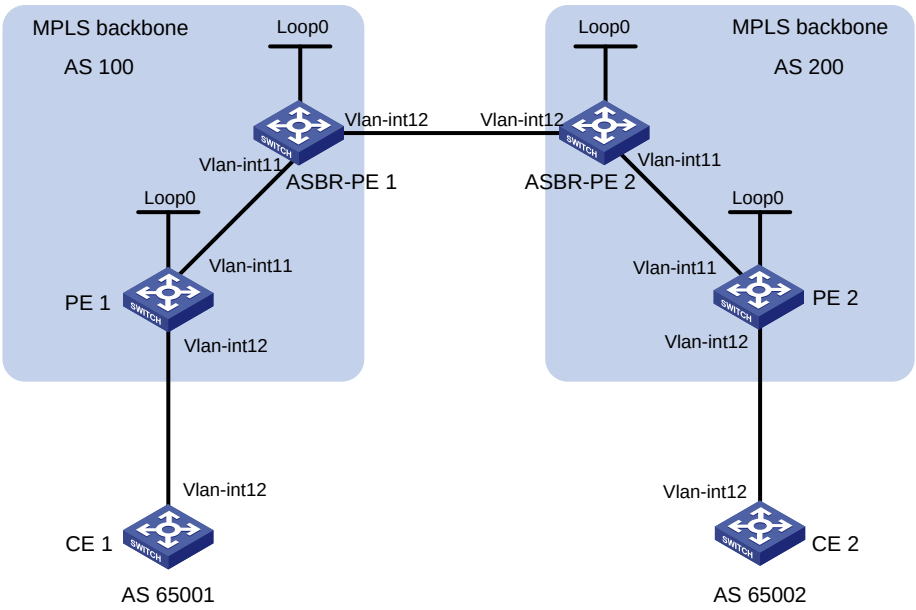

Table 14 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Vlan-int12	10.1.1.1/24	CE 2	Vlan-int12	10.2.1.1/24
PE 1	Loop0	1.1.1.9/32	PE 2	Loop0	4.4.4.9/32
	Vlan-int12	10.1.1.2/24		Vlan-int12	10.2.1.2/24
	Vlan-int11	172.1.1.2/24		Vlan-int11	162.1.1.2/24
ASBR-PE 1	Loop0	2.2.2.9/32	ASBR-PE 2	Loop0	3.3.3.9/32
	Vlan-int11	172.1.1.1/24		Vlan-int11	162.1.1.1/24
	Vlan-int12	192.1.1.1/24		Vlan-int12	192.1.1.2/24

Procedure

1. Configure IGP on the MPLS backbone to implement the connectivity in the backbone.

   This example uses OSPF. (Details not shown.)

   # Execute the **`display ospf peer`** command to verify that each ASBR-PE has established an OSPF adjacency in Full state with the PE in the same AS, and that PEs and ASBR-PEs in the same AS have learned the routes to the loopback interfaces of each other. Verify that each ASBR-PE and the PE in the same AS can ping each other. (Details not shown.)

2. Configure basic MPLS and MPLS LDP on the MPLS backbone to establish LDP LSPs:

   # Configure basic MPLS on PE 1, and enable MPLS LDP on the interface connected to ASBR-PE 1.

   ```
   <PE1> system-view
   [PE1] mpls lsr-id 1.1.1.9
   [PE1] mpls ldp
   [PE1-ldp] quit
   [PE1] interface vlan-interface 11
   [PE1-Vlan-interface11] mpls enable
   [PE1-Vlan-interface11] mpls ldp enable
   ```

```
[PE1-Vlan-interface11] quit
```

Configure basic MPLS on ASBR-PE 1, and enable MPLS LDP on the interface connected to PE 1.

```
<ASBR-PE1> system-view
[ASBR-PE1] mpls lsr-id 2.2.2.9
[ASBR-PE1] mpls ldp
[ASBR-PE1-ldp] quit
[ASBR-PE1] interface vlan-interface 11
[ASBR-PE1-Vlan-interface11] mpls enable
[ASBR-PE1-Vlan-interface11] mpls ldp enable
[ASBR-PE1-Vlan-interface11] quit
```

Configure basic MPLS on ASBR-PE 2, and enable MPLS LDP on the interface connected to PE 2.

```
<ASBR-PE2> system-view
[ASBR-PE2] mpls lsr-id 3.3.3.9
[ASBR-PE2] mpls ldp
[ASBR-PE2-ldp] quit
[ASBR-PE2] interface vlan-interface 11
[ASBR-PE2-Vlan-interface11] mpls enable
[ASBR-PE2-Vlan-interface11] mpls ldp enable
[ASBR-PE2-Vlan-interface11] quit
```

Configure basic MPLS on PE 2, and enable MPLS LDP on the interface connected to ASBR-PE 2.

```
<PE2> system-view
[PE2] mpls lsr-id 4.4.4.9
[PE2] mpls ldp
[PE2-ldp] quit
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] mpls enable
[PE2-Vlan-interface11] mpls ldp enable
[PE2-Vlan-interface11] quit
```

Execute the **display mpls ldp peer** command on the devices to verify that the session status is Operational, and that each PE and the ASBR-PE in the same AS have established a neighbor relationship. (Details not shown.)

3. Configure VPN instances on PEs:

For the same VPN, the route targets for the VPN instance on the PE must match those for the VPN instance on the ASBR-PE in the same AS. This is not required for PEs in different ASs.

Configure CE 1.

```
<CE1> system-view
[CE1] interface vlan-interface 12
[CE1-Vlan-interface12] ip address 10.1.1.1 24
[CE1-Vlan-interface12] quit
```

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 100:2
[PE1-vpn-instance-vpn1] vpn-target 100:1 both
[PE1-vpn-instance-vpn1] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn1
```

```
[PE1-Vlan-interface12] ip address 10.1.1.2 24
[PE1-Vlan-interface12] quit
```

Configure CE 2.

```
<CE2> system-view
[CE2] interface vlan-interface 12
[CE2-Vlan-interface12] ip address 10.2.1.1 24
[CE2-Vlan-interface12] quit
```

Configure PE 2.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance] route-distinguisher 200:2
[PE2-vpn-instance] vpn-target 200:1 both
[PE2-vpn-instance] quit
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] ip binding vpn-instance vpn1
[PE2-Vlan-interface12] ip address 10.2.1.2 24
[PE2-Vlan-interface12] quit
```

On ASBR-PE 1, create a VPN instance, and bind the instance to the interface connected to ASBR-PE 2. ASBR-PE 1 considers ASBR-PE 2 to be its CE.

```
[ASBR-PE1] ip vpn-instance vpn1
[ASBR-PE1-vpn-instance-vpn1] route-distinguisher 100:1
[ASBR-PE1-vpn-instance-vpn1] vpn-target 100:1 both
[ASBR-PE1-vpn-instance-vpn1] quit
[ASBR-PE1] interface vlan-interface 12
[ASBR-PE1-Vlan-interface12] ip binding vpn-instance vpn1
[ASBR-PE1-Vlan-interface12] ip address 192.1.1.1 24
[ASBR-PE1-Vlan-interface12] quit
```

On ASBR-PE 2, create a VPN instance, and bind the instance to the interface connected to ASBR-PE 1. ASBR-PE 2 considers ASBR-PE 1 to be its CE.

```
[ASBR-PE2] ip vpn-instance vpn1
[ASBR-PE2-vpn-instance-vpn1] route-distinguisher 200:1
[ASBR-PE2-vpn-instance-vpn1] vpn-target 200:1 both
[ASBR-PE2-vpn-instance-vpn1] quit
[ASBR-PE2] interface vlan-interface 12
[ASBR-PE2-Vlan-interface12] ip binding vpn-instance vpn1
[ASBR-PE2-Vlan-interface12] ip address 192.1.1.2 24
[ASBR-PE2-Vlan-interface12] quit
```

Execute the **`display ip vpn-instance`** command to display VPN instance configurations. Verify that the PEs can ping the CEs, and the ASBR-PEs can ping each other. (Details not shown.)

4. Establish EBGP peer relationships between PEs and CEs, and redistribute VPN routes into BGP:

Configure CE 1.

```
[CE1] bgp 65001
[CE1-bgp-default] peer 10.1.1.2 as-number 100
[CE1-bgp-default] address-family ipv4 unicast
[CE1-bgp-default-ipv4] peer 10.1.1.2 enable
[CE1-bgp-default-ipv4] import-route direct
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
```

Configure PE 1.

```
[PE1] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 10.1.1.1 as-number 65001
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 10.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Configure CE 2.

```
[CE2] bgp 65002
[CE2-bgp-default] peer 10.2.1.2 as-number 200
[CE2-bgp-default] address-family ipv4 unicast
[CE2-bgp-default-ipv4] peer 10.2.1.2 enable
[CE2-bgp-default-ipv4] import-route direct
[CE2-bgp-default-ipv4] quit
[CE2-bgp-default] quit
```

Configure PE 2.

```
[PE2] bgp 200
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] peer 10.2.1.1 as-number 65002
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] peer 10.2.1.1 enable
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

5. Establish an MP-IBGP peer relationship between each PE and the ASBR-PE in the same AS, and an EBGP peer relationship between the ASBR-PEs:

Configure PE 1.

```
[PE1] bgp 100
[PE1-bgp-default] peer 2.2.2.9 as-number 100
[PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 2.2.2.9 enable
[PE1-bgp-default-vpnv4] peer 2.2.2.9 next-hop-local
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] quit
```

Configure ASBR-PE 1.

```
[ASBR-PE1] bgp 100
[ASBR-PE1-bgp-default] ip vpn-instance vpn1
[ASBR-PE1-bgp-default-vpn1] peer 192.1.1.2 as-number 200
[ASBR-PE1-bgp-default-vpn1] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4-vpn1] peer 192.1.1.2 enable
[ASBR-PE1-bgp-default-ipv4-vpn1] quit
[ASBR-PE1-bgp-default-vpn1] quit
[ASBR-PE1-bgp-default] peer 1.1.1.9 as-number 100
[ASBR-PE1-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[ASBR-PE1-bgp-default] address-family vpnv4
```

```
[ASBR-PE1-bgp-default-vpnv4] peer 1.1.1.9 enable
[ASBR-PE1-bgp-default-vpnv4] peer 1.1.1.9 next-hop-local
[ASBR-PE1-bgp-default-vpnv4] quit
[ASBR-PE1-bgp-default] quit
```

Configure ASBR-PE 2.

```
[ASBR-PE2] bgp 200
[ASBR-PE2-bgp-default] ip vpn-instance vpn1
[ASBR-PE2-bgp-default-vpn1] peer 192.1.1.1 as-number 100
[ASBR-PE2-bgp-default-vpn1] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4-vpn1] peer 192.1.1.1 enable
[ASBR-PE2-bgp-default-ipv4-vpn1] quit
[ASBR-PE2-bgp-default-vpn1] quit
[ASBR-PE2-bgp-default] peer 4.4.4.9 as-number 200
[ASBR-PE2-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[ASBR-PE2-bgp-default] address-family vpnv4
[ASBR-PE2-bgp-default-vpnv4] peer 4.4.4.9 enable
[ASBR-PE2-bgp-default-vpnv4] peer 4.4.4.9 next-hop-local
[ASBR-PE2-bgp-default-vpnv4] quit
[ASBR-PE2-bgp-default] quit
```

Configure PE 2.

```
[PE2] bgp 200
[PE2-bgp-default] peer 3.3.3.9 as-number 200
[PE2-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 3.3.3.9 enable
[PE2-bgp-default-vpnv4] peer 3.3.3.9 next-hop-local
[PE2-bgp-default-vpnv4] quit
[PE2-bgp-default] quit
```

Verifying the configuration

Verify that the CEs can learn the interface routes from each other and ping each other. (Details not shown.)

Example: Configuring MPLS L3VPN inter-AS option B

Network configuration

Site 1 and Site 2 belong to the same VPN. CE 1 of Site 1 accesses the network through PE 1 in AS 100. CE 2 of Site 2 accesses the network through PE 2 in AS 600. PEs in the same AS run IS-IS.

PE 1 and ASBR-PE 1 exchange VPNv4 routes through MP-IBGP. PE 2 and ASBR-PE 2 exchange VPNv4 routes through MP-IBGP. ASBR-PE 1 and ASBR-PE 2 exchange VPNv4 routes through MP-EBGP.

ASBRs do not perform route target filtering of received VPN-IPv4 routes.

Figure 29 Network diagram

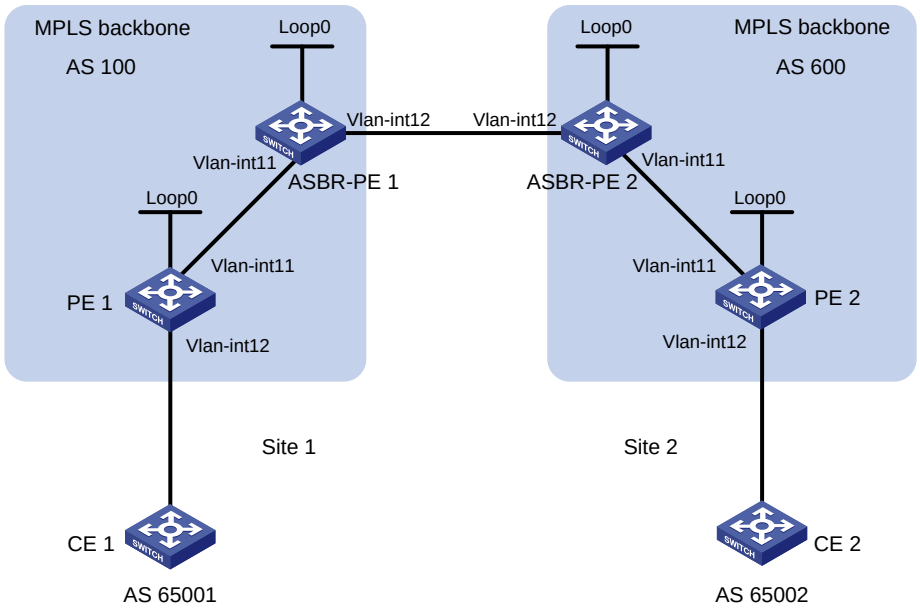

Table 15 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
PE 1	Loop0	2.2.2.9/32	PE 2	Loop0	5.5.5.9/32
	Vlan-int12	30.0.0.1/8		Vlan-int12	20.0.0.1/8
	Vlan-int11	1.1.1.2/8		Vlan-int11	9.1.1.2/8
ASBR-PE 1	Loop0	3.3.3.9/32	ASBR-PE 2	Loop0	4.4.4.9/32
	Vlan-int11	1.1.1.1/8		Vlan-int11	9.1.1.1/8
	Vlan-int12	11.0.0.2/8		Vlan-int12	11.0.0.1/8

Procedure

1. Configure PE 1:

   # Configure IS-IS on PE 1.

```
<PE1> system-view
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0001.00
[PE1-isis-1] quit
```

   # Configure the LSR ID, and enable MPLS and LDP.

```
[PE1] mpls lsr-id 2.2.2.9
[PE1] mpls ldp
[PE1-ldp] quit
```

   # Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip address 1.1.1.2 255.0.0.0
[PE1-Vlan-interface11] isis enable 1
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] mpls ldp enable
[PE1-Vlan-interface11] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 2.2.2.9 32
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 11:11
[PE1-vpn-instance-vpn1] vpn-target 1:1 2:2 import-extcommunity
[PE1-vpn-instance-vpn1] vpn-target 1:1 export-extcommunity
[PE1-vpn-instance-vpn1] quit
```

Bind the interface connected to CE 1 to the created VPN instance.

```
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn1
[PE1-Vlan-interface12] ip address 30.0.0.1 8
[PE1-Vlan-interface12] quit
```

Enable BGP on PE 1.

```
[PE1] bgp 100
```

Configure IBGP peer 3.3.3.9 as a VPNv4 peer.

```
[PE1-bgp-default] peer 3.3.3.9 as-number 100
[PE1-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 3.3.3.9 enable
[PE1-bgp-default-vpnv4] quit
```

Redistribute direct routes to the VPN routing table of **vpn1**.

```
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] import-route direct
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

2. Configure ASBR-PE 1:

Enable IS-IS on ASBR-PE 1.

```
<ASBR-PE1> system-view
[ASBR-PE1] isis 1
[ASBR-PE1-isis-1] network-entity 10.0000.0000.0000.0002.00
[ASBR-PE1-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[ASBR-PE1] mpls lsr-id 3.3.3.9
[ASBR-PE1] mpls ldp
[ASBR-PE1-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE1] interface vlan-interface11
[ASBR-PE1-Vlan-interface11] ip address 1.1.1.1 255.0.0.0
[ASBR-PE1-Vlan-interface11] isis enable 1
[ASBR-PE1-Vlan-interface11] mpls enable
[ASBR-PE1-Vlan-interface11] mpls ldp enable
[ASBR-PE1-Vlan-interface11] quit
```

Configure VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE1] interface vlan-interface 12
[ASBR-PE1-Vlan-interface12] ip address 11.0.0.2 255.0.0.0
[ASBR-PE1-Vlan-interface12] mpls enable
[ASBR-PE1-Vlan-interface12] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[ASBR-PE1] interface loopback 0
[ASBR-PE1-LoopBack0] ip address 3.3.3.9 32
[ASBR-PE1-LoopBack0] isis enable 1
[ASBR-PE1-LoopBack0] quit
```

Enable BGP on ASBR-PE 1.

```
[ASBR-PE1] bgp 100
[ASBR-PE1-bgp-default] peer 2.2.2.9 as-number 100
[ASBR-PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[ASBR-PE1-bgp-default] peer 11.0.0.1 as-number 600
[ASBR-PE1-bgp-default] peer 11.0.0.1 connect-interface vlan-interface 12
```

Disable route target based filtering of received VPNv4 routes.

```
[ASBR-PE1-bgp-default] address-family vpnv4
[ASBR-PE1-bgp-default-vpnv4] undo policy vpn-target
```

Configure both IBGP peer 2.2.2.0 and EBGP peer 11.0.0.1 as VPNv4 peers.

```
[ASBR-PE1-bgp-default-vpnv4] peer 11.0.0.1 enable
[ASBR-PE1-bgp-default-vpnv4] peer 2.2.2.9 enable
[ASBR-PE1-bgp-default-vpnv4] quit
[ASBR-PE1-bgp-default] quit
[ASBR-PE1-bgp-default] quit
```

3. Configure ASBR-PE 2:

Enable IS-IS on ASBR-PE 2.

```
<ASBR-PE2> system-view
[ASBR-PE2] isis 1
[ASBR-PE2-isis-1] network-entity 10.0000.0000.0000.0003.00
[ASBR-PE2-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[ASBR-PE2] mpls lsr-id 4.4.4.9
[ASBR-PE2] mpls ldp
[ASBR-PE2-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE2] interface vlan-interface 11
[ASBR-PE2-Vlan-interface11] ip address 9.1.1.1 255.0.0.0
[ASBR-PE2-Vlan-interface11] isis enable 1
[ASBR-PE2-Vlan-interface11] mpls enable
[ASBR-PE2-Vlan-interface11] mpls ldp enable
[ASBR-PE2-Vlan-interface11] quit
```

Configure VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE2] interface vlan-interface 12
[ASBR-PE2-Vlan-interface12] ip address 11.0.0.1 255.0.0.0
[ASBR-PE2-Vlan-interface12] mpls enable
[ASBR-PE2-Vlan-interface12] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[ASBR-PE2] interface loopback 0
[ASBR-PE2-LoopBack0] ip address 4.4.4.9 32
[ASBR-PE2-LoopBack0] isis enable 1
[ASBR-PE2-LoopBack0] quit
```

Enable BGP on ASBR-PE 2.

```
[ASBR-PE2] bgp 600
[ASBR-PE2-bgp-default] peer 11.0.0.2 as-number 100
[ASBR-PE2-bgp-default] peer 11.0.0.2 connect-interface vlan-interface 12
[ASBR-PE2-bgp-default] peer 5.5.5.9 as-number 600
[ASBR-PE2-bgp-default] peer 5.5.5.9 connect-interface loopback 0
```

Disable route target based filtering of received VPNv4 routes.

```
[ASBR-PE2-bgp-default] address-family vpnv4
[ASBR-PE2-bgp-default-vpnv4] undo policy vpn-target
```

Configure both IBGP peer 5.5.5.9 and EBGP peer 11.0.0.2 as VPNv4 peers.

```
[ASBR-PE2-bgp-default-vpnv4] peer 11.0.0.2 enable
[ASBR-PE2-bgp-default-vpnv4] peer 5.5.5.9 enable
[ASBR-PE2-bgp-default-vpnv4] quit
[ASBR-PE2-bgp-default] quit
```

4. Configure PE 2:

Enable IS-IS on PE 2.

```
<PE2> system-view
[PE2] isis 1
[PE2-isis-1] network-entity 10.0000.0000.0000.0004.00
[PE2-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[PE2] mpls lsr-id 5.5.5.9
[PE2] mpls ldp
[PE2-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] ip address 9.1.1.2 255.0.0.0
[PE2-Vlan-interface11] isis enable 1
[PE2-Vlan-interface11] mpls enable
[PE2-Vlan-interface11] mpls ldp enable
[PE2-Vlan-interface11] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[PE2] interface loopback 0
[PE2-LoopBack0] ip address 5.5.5.9 32
[PE2-LoopBack0] isis enable 1
[PE2-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 12:12
[PE2-vpn-instance-vpn1] vpn-target 1:1 2:2 import-extcommunity
[PE2-vpn-instance-vpn1] vpn-target 2:2 export-extcommunity
[PE2-vpn-instance-vpn1] quit
```

Bind the interface connected to CE 2 to the created VPN instance.

```
[PE2] interface vlan-interface12
[PE2-Vlan-interface12] ip binding vpn-instance vpn1
[PE2-Vlan-interface12] ip address 20.0.0.1 8
[PE2-Vlan-interface12] quit
```

Enable BGP on PE 2.

```
[PE2] bgp 600
```

Configure IBGP peer 4.4.4.9 as a VPNv4 peer.

```
[PE2-bgp-default] peer 4.4.4.9 as-number 600
[PE2-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 4.4.4.9 enable
[PE2-bgp-default-vpnv4] quit
```

Redistribute direct routes to the VPN routing table of **vpn1**.

```
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] import-route direct
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

Verifying the configuration

Use the following command on PE 1 to verify its connectivity to PE 2.

```
[PE1] ping -a 30.0.0.1 -vpn-instance vpn1 20.0.0.1
Ping 20.0.0.1 (20.0.0.1) from 30.0.0.1: 56 data bytes, press CTRL+C to break
56 bytes from 20.0.0.1: icmp_seq=0 ttl=255 time=1.208 ms
56 bytes from 20.0.0.1: icmp_seq=1 ttl=255 time=0.867 ms
56 bytes from 20.0.0.1: icmp_seq=2 ttl=255 time=0.551 ms
56 bytes from 20.0.0.1: icmp_seq=3 ttl=255 time=0.566 ms
56 bytes from 20.0.0.1: icmp_seq=4 ttl=255 time=0.570 ms

--- Ping statistics for 20.0.0.1 ---
5 packet(s) transmitted, 5 packet(s) received, 0.0% packet loss
round-trip min/avg/max/std-dev = 0.551/0.752/1.208/0.257 ms
```

Example: Configuring MPLS L3VPN inter-AS option C (method 1)

Network configuration

Site 1 and Site 2 belong to the same VPN. Site 1 accesses the network through PE 1 in AS 100. Site 2 accesses the network through PE 2 in AS 600. PEs in the same AS run IS-IS.

PE 1 and ASBR-PE 1 exchange labeled IPv4 routes through IBGP. PE 2 and ASBR-PE 2 exchange labeled IPv4 routes through IBGP. PE 1 and PE 2 exchange VPNv4 routes through MP-EBGP.

ASBR-PE 1 and ASBR-PE 2 use their respective routing policies and label routes received from each other.

ASBR-PE 1 and ASBR-PE 2 use EBGP to exchange labeled IPv4 routes.

Figure 30 Network diagram

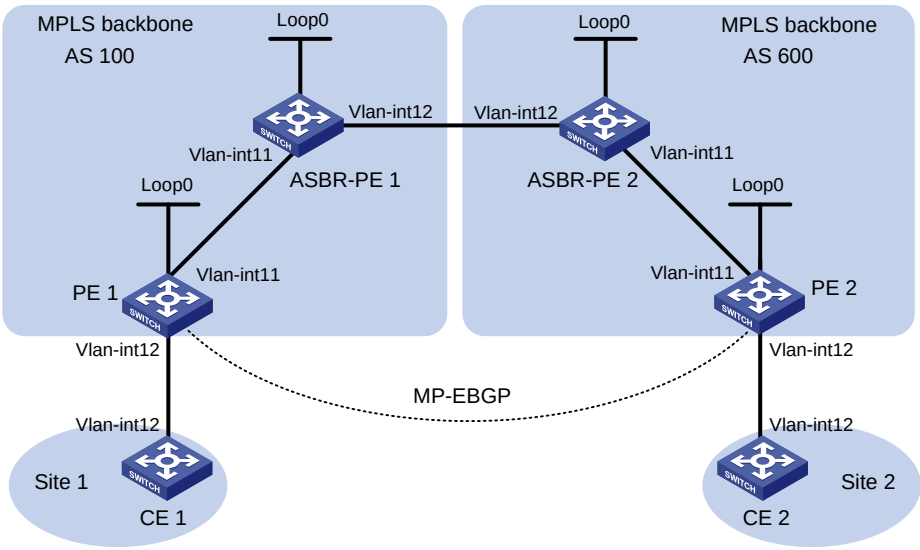

Table 16 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
PE 1	Loop0	2.2.2.9/32	PE 2	Loop0	5.5.5.9/32
	Vlan-int11	1.1.1.2/8		Vlan-int11	9.1.1.2/8
	Vlan-int12	30.0.0.1/24		Vlan-int12	20.0.0.1/24
ASBR-PE 1	Loop0	3.3.3.9/32	ASBR-PE 2	Loop0	4.4.4.9/32
	Vlan-int11	1.1.1.1/8		Vlan-int11	9.1.1.1/8
	Vlan-int12	11.0.0.2/8		Vlan-int12	11.0.0.1/8
CE 1	Vlan-int12	30.0.0.2/24	CE 2	Vlan-int12	20.0.0.2/24

Procedure

1. Configure CE 1:

   # Configure an IP address for VLAN-interface 12.

   ```
   <CE1> system-view
   [CE1] interface vlan-interface 12
   [CE1-Vlan-interface12] ip address 30.0.0.2 24
   [CE1-Vlan-interface12] quit
   ```

   # Establish an EBGP peer relationship with PE 1, and redistribute VPN routes.

   ```
   [CE1] bgp 65001
   [CE1-bgp-default] peer 30.0.0.1 as-number 100
   [CE1-bgp-default] address-family ipv4 unicast
   [CE1-bgp-default-ipv4] peer 30.0.0.1 enable
   [CE1-bgp-default-ipv4] import-route direct
   [CE1-bgp-default-ipv4] quit
   [CE1-bgp-default] quit
   ```

2. Configure PE 1:

   # Configure IS-IS on PE 1.

   ```
   <PE1> system-view
   ```

```
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0001.00
[PE1-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[PE1] mpls lsr-id 2.2.2.9
[PE1] mpls ldp
[PE1-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip address 1.1.1.2 255.0.0.0
[PE1-Vlan-interface11] isis enable 1
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] mpls ldp enable
[PE1-Vlan-interface11] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 2.2.2.9 32
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 11:11
[PE1-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE1-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[PE1-vpn-instance-vpn1] quit
```

Associate VLAN-interface 12 with VPN instance **vpn1**, and specify the IP address for the interface.

```
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn1
[PE1-Vlan-interface12] ip address 30.0.0.1 24
[PE1-Vlan-interface12] quit
```

Enable BGP on PE 1.

```
[PE1] bgp 100
```

Enable the capability to advertise labeled routes to IBGP peer 3.3.3.9 and to receive labeled routes from the peer.

```
[PE1-bgp-default] peer 3.3.3.9 as-number 100
[PE1-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[PE1-bgp-default] address-family ipv4 unicast
[PE1-bgp-default-ipv4] peer 3.3.3.9 enable
[PE1-bgp-default-ipv4] peer 3.3.3.9 label-route-capability
[PE1-bgp-default-ipv4] quit
```

Configure the maximum hop count from PE 1 to EBGP peer 5.5.5.9 as 10.

```
[PE1-bgp-default] peer 5.5.5.9 as-number 600
[PE1-bgp-default] peer 5.5.5.9 connect-interface loopback 0
[PE1-bgp-default] peer 5.5.5.9 ebgp-max-hop 10
```

Configure peer 5.5.5.9 as a VPNv4 peer.

```
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 5.5.5.9 enable
```

```
[PE1-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 1, and add the learned BGP routes to the routing table of VPN instance **vpn1**.

```
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.0.0.2 as-number 65001
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 30.0.0.2 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

3. Configure ASBR-PE 1:

Enable IS-IS on ASBR-PE 1.

```
<ASBR-PE1> system-view
[ASBR-PE1] isis 1
[ASBR-PE1-isis-1] network-entity 10.0000.0000.0000.0002.00
[ASBR-PE1-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[ASBR-PE1] mpls lsr-id 3.3.3.9
[ASBR-PE1] mpls ldp
[ASBR-PE1-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE1] interface vlan-interface 11
[ASBR-PE1-Vlan-interface11] ip address 1.1.1.1 255.0.0.0
[ASBR-PE1-Vlan-interface11] isis enable 1
[ASBR-PE1-Vlan-interface11] mpls enable
[ASBR-PE1-Vlan-interface11] mpls ldp enable
[ASBR-PE1-Vlan-interface11] quit
```

Configure VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE1] interface vlan-interface 12
[ASBR-PE1-Vlan-interface12] ip address 11.0.0.2 255.0.0.0
[ASBR-PE1-Vlan-interface12] mpls enable
[ASBR-PE1-Vlan-interface12] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[ASBR-PE1] interface loopback 0
[ASBR-PE1-LoopBack0] ip address 3.3.3.9 32
[ASBR-PE1-LoopBack0] isis enable 1
[ASBR-PE1-LoopBack0] quit
```

Create routing policies.

```
[ASBR-PE1] route-policy policy1 permit node 1
[ASBR-PE1-route-policy-policy1-1] apply mpls-label
[ASBR-PE1-route-policy-policy1-1] quit
[ASBR-PE1] route-policy policy2 permit node 1
[ASBR-PE1-route-policy-policy2-1] if-match mpls-label
[ASBR-PE1-route-policy-policy2-1] apply mpls-label
[ASBR-PE1-route-policy-policy2-1] quit
```

Enable BGP on ASBR-PE 1, and apply the routing policy **policy2** to routes advertised to IBGP peer 2.2.2.9.

```
[ASBR-PE1] bgp 100
```

```
[ASBR-PE1-bgp-default] peer 2.2.2.9 as-number 100
[ASBR-PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] peer 2.2.2.9 enable
[ASBR-PE1-bgp-default-ipv4] peer 2.2.2.9 route-policy policy2 export
```

Enable the capability to advertise labeled routes to IBGP peer 2.2.2.9 and to receive labeled routes from the peer.

```
[ASBR-PE1-bgp-default-ipv4] peer 2.2.2.9 label-route-capability
```

Redistribute routes from IS-IS process 1 to BGP.

```
[ASBR-PE1-bgp-default-ipv4] import-route isis 1
[ASBR-PE1-bgp-default-ipv4] quit
```

Apply the routing policy **policy1** to routes advertised to EBGP peer 11.0.0.1.

```
[ASBR-PE1-bgp-default] peer 11.0.0.1 as-number 600
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 enable
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 route-policy policy1 export
```

Enable the capability to advertise labeled routes to EBGP peer 11.0.0.1 and to receive labeled routes from the peer.

```
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 label-route-capability
[ASBR-PE1-bgp-default-ipv4] quit
[ASBR-PE1-bgp-default] quit
```

4. Configure ASBR-PE 2:

Enable IS-IS on ASBR-PE 2.

```
<ASBR-PE2> system-view
[ASBR-PE2] isis 1
[ASBR-PE2-isis-1] network-entity 10.0000.0000.0000.0003.00
[ASBR-PE2-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[ASBR-PE2] mpls lsr-id 4.4.4.9
[ASBR-PE2] mpls ldp
[ASBR-PE2-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE2] interface vlan-interface 11
[ASBR-PE2-Vlan-interface11] ip address 9.1.1.1 255.0.0.0
[ASBR-PE2-Vlan-interface11] isis enable 1
[ASBR-PE2-Vlan-interface11] mpls enable
[ASBR-PE2-Vlan-interface11] mpls ldp enable
[ASBR-PE2-Vlan-interface11] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[ASBR-PE2] interface loopback 0
[ASBR-PE2-LoopBack0] ip address 4.4.4.9 32
[ASBR-PE2-LoopBack0] isis enable 1
[ASBR-PE2-LoopBack0] quit
```

Configure VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE2] interface vlan-interface 12
[ASBR-PE2-Vlan-interface12] ip address 11.0.0.1 255.0.0.0
[ASBR-PE2-Vlan-interface12] mpls enable
[ASBR-PE2-Vlan-interface12] quit
```

Create routing policies.

```
[ASBR-PE2] route-policy policy1 permit node 1
[ASBR-PE2-route-policy-policy1-1] apply mpls-label
[ASBR-PE2-route-policy-policy1-1] quit
[ASBR-PE2] route-policy policy2 permit node 1
[ASBR-PE2-route-policy-policy2-1] if-match mpls-label
[ASBR-PE2-route-policy-policy2-1] apply mpls-label
[ASBR-PE2-route-policy-policy2-1] quit
```

Enable BGP on ASBR-PE 2, and enable the capability to advertise labeled routes to IBGP peer 5.5.5.9 and to receive labeled routes from the peer.

```
[ASBR-PE2] bgp 600
[ASBR-PE2-bgp-default] peer 5.5.5.9 as-number 600
[ASBR-PE2-bgp-default] peer 5.5.5.9 connect-interface loopback 0
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] peer 5.5.5.9 enable
[ASBR-PE2-bgp-default-ipv4] peer 5.5.5.9 label-route-capability
```

Apply routing policy **policy2** to routes advertised to IBGP peer 5.5.5.9.

```
[ASBR-PE2-bgp-default-ipv4] peer 5.5.5.9 route-policy policy2 export
```

Redistribute routes from IS-IS process 1 into BGP.

```
[ASBR-PE2-bgp-default-ipv4] import-route isis 1
[ASBR-PE2-bgp-default-ipv4] quit
```

Apply routing policy **policy1** to routes advertised to EBGP peer 11.0.0.2.

```
[ASBR-PE2-bgp-default] peer 11.0.0.2 as-number 100
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 enable
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 route-policy policy1 export
```

Enable the capability to advertise labeled routes to EBGP peer 11.0.0.2 and to receive labeled routes from the peer.

```
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 label-route-capability
[ASBR-PE2-bgp-default-ipv4] quit
[ASBR-PE2-bgp-default] quit
```

5. Configure PE 2:

Enable IS-IS on PE 2.

```
<PE2> system-view
[PE2] isis 1
[PE2-isis-1] network-entity 10.0000.0000.0000.0004.00
[PE2-isis-1] quit
```

Configure the LSR ID, and enable MPLS and LDP.

```
[PE2] mpls lsr-id 5.5.5.9
[PE2] mpls ldp
[PE2-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] ip address 9.1.1.2 255.0.0.0
[PE2-Vlan-interface11] isis enable 1
[PE2-Vlan-interface11] mpls enable
[PE2-Vlan-interface11] mpls ldp enable
[PE2-Vlan-interface11] quit
```

Configure Loopback 0, and enable IS-IS on it.

```
[PE2] interface loopback 0
[PE2-LoopBack0] ip address 5.5.5.9 32
[PE2-LoopBack0] isis enable 1
[PE2-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 11:11
[PE2-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE2-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[PE2-vpn-instance-vpn1] quit
```

Associate VLAN-interface 12 with VPN instance **vpn1**, and specify the IP address for the interface.

```
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] ip binding vpn-instance vpn1
[PE2-Vlan-interface12] ip address 20.0.0.1 24
[PE2-Vlan-interface12] quit
```

Enable BGP on PE 2.

```
[PE2] bgp 600
```

Enable the capability to advertise labeled routes to IBGP peer 4.4.4.9 and to receive labeled routes from the peer.

```
[PE2-bgp-default] peer 4.4.4.9 as-number 600
[PE2-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[PE2-bgp-default] address-family ipv4 unicast
[PE2-bgp-default-ipv4] peer 4.4.4.9 enable
[PE2-bgp-default-ipv4] peer 4.4.4.9 label-route-capability
[PE2-bgp-default-ipv4] quit
```

Configure the maximum hop count from PE 2 to EBGP peer 2.2.2.9 as 10.

```
[PE2-bgp-default] peer 2.2.2.9 as-number 100
[PE2-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[PE2-bgp-default] peer 2.2.2.9 ebgp-max-hop 10
```

Configure peer 2.2.2.9 as a VPNv4 peer.

```
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 2.2.2.9 enable
[PE2-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 2, and add the learned BGP routes to the routing table of VPN instance **vpn1**.

```
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] peer 20.0.0.2 as-number 65002
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] peer 20.0.0.2 enable
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

6. Configure CE 2:

Configure an IP address for VLAN-interface 12.

```
<CE2> system-view
[CE2] interface vlan-interface 12
```

```
[CE2-Vlan-interface12] ip address 20.0.0.2 24
[CE2-Vlan-interface12] quit
```

Establish an EBGP peer relationship with PE 2, and redistribute VPN routes.

```
[CE2] bgp 65002
[CE2-bgp-default] peer 20.0.0.1 as-number 600
[CE2-bgp-default] address-family ipv4 unicast
[CE2-bgp-default-ipv4] peer 20.0.0.1 enable
[CE2-bgp-default-ipv4] import-route direct
[CE2-bgp-default-ipv4] quit
[CE2-bgp-default] quit
```

Verifying the configuration

Execute the **`display ip routing table`** command on CE 1 and CE 2 to verify that CE 1 and CE 2 have a route to each other. Verify that CE 1 and CE 2 can ping each other. (Details not shown.)

Example: Configuring MPLS L3VPN inter-AS option C (method 2)

Network configuration

Site 1 and Site 2 belong to the same VPN. Site 1 accesses the network through PE 1 in AS 100, and Site 2 accesses the network through PE 2 in AS 600. PEs in the same AS run IS-IS.

PE 1 and PE 2 are MP-EBGP peers and exchange VPNv4 routes.

ASBR-PE 1 and ASBR-PE 2 label the routes received from each other, use EBGP to exchange labeled IPv4 routes, and redistribute IGP and BGP routes from each other.

Figure 31 Network diagram

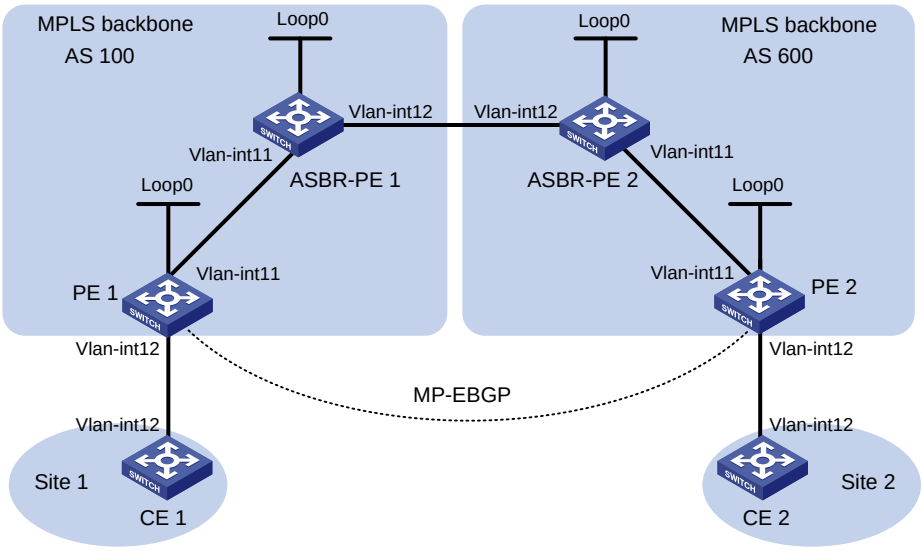

Table 17 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
PE 1	Loop0	2.2.2.9/32	PE 2	Loop0	5.5.5.9/32
	Vlan-int11	1.1.1.2/8		Vlan-int11	9.1.1.2/8
	Vlan-int12	30.0.0.1/24		Vlan-int12	20.0.0.1/24

ASBR-PE 1	Loop0	3.3.3.9/32	ASBR-PE 2	Loop0	4.4.4.9/32
	Vlan-int11	1.1.1.1/8		Vlan-int11	9.1.1.1/8
	Vlan-int12	11.0.0.2/8		Vlan-int12	11.0.0.1/8
CE 1	Vlan-int12	30.0.0.2/24	CE 2	Vlan-int12	20.0.0.2/24

Procedure

1. Configure CE 1:

Configure an IP address for VLAN-interface 12.

```
<CE1> system-view
[CE1] interface vlan-interface 12
[CE1-Vlan-interface12] ip address 30.0.0.2 24
[CE1-Vlan-interface12] quit
```

Establish an EBGP peer relationship with PE 1, and redistribute VPN routes.

```
[CE1] bgp 65001
[CE1-bgp-default] peer 30.0.0.1 as-number 100
[CE1-bgp-default] address-family ipv4 unicast
[CE1-bgp-default-ipv4] peer 30.0.0.1 enable
[CE1-bgp-default-ipv4] import-route direct
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
```

2. Configure PE 1:

Configure IS-IS on PE 1.

```
<PE1> system-view
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0001.00
[PE1-isis-1] quit
```

Configure an LSR ID, and enable MPLS and LDP.

```
[PE1] mpls lsr-id 2.2.2.9
[PE1] mpls ldp
[PE1-ldp] quit
```

Configure interface VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip address 1.1.1.2 255.0.0.0
[PE1-Vlan-interface11] isis enable 1
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] mpls ldp enable
[PE1-Vlan-interface11] quit
```

Configure interface Loopback 0, and enable IS-IS on it.

```
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 2.2.2.9 32
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 11:11
[PE1-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE1-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
```

```
[PE1-vpn-instance-vpn1] quit
```

Associate VLAN-interface 12 with VPN instance **vpn1**, and specify an IP address for the interface.

```
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn1
[PE1-Vlan-interface12] ip address 30.0.0.1 24
[PE1-Vlan-interface12] quit
```

Enable BGP on PE 1.

```
[PE1] bgp 100
```

Configure the maximum hop count from PE 1 to EBGP peer 5.5.5.9 as 10.

```
[PE1-bgp-default] peer 5.5.5.9 as-number 600
[PE1-bgp-default] peer 5.5.5.9 connect-interface loopback 0
[PE1-bgp-default] peer 5.5.5.9 ebgp-max-hop 10
```

Configure peer 5.5.5.9 as a VPNv4 peer.

```
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 5.5.5.9 enable
[PE1-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 1, and add the learned BGP routes to the routing table of VPN instance **vpn1**.

```
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.0.0.2 as-number 65001
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 30.0.0.2 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

3. Configure ASBR-PE 1:

Enable IS-IS on ASBR-PE 1.

```
<ASBR-PE1> system-view
[ASBR-PE1] isis 1
[ASBR-PE1-isis-1] network-entity 10.0000.0000.0000.0002.00
```

Redistribute BGP routes.

```
[ASBR-PE1-isis-1] address-family ipv4 unicast
[ASBR-PE1-isis-1-ipv4] import-route bgp
[ASBR-PE1-isis-1-ipv4] quit
[ASBR-PE1-isis-1] quit
```

Configure an LSR ID, and enable MPLS and LDP.

```
[ASBR-PE1] mpls lsr-id 3.3.3.9
[ASBR-PE1] mpls ldp
[ASBR-PE1-ldp] quit
```

Configure VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE1] interface vlan-interface 11
[ASBR-PE1-Vlan-interface11] ip address 1.1.1.1 255.0.0.0
[ASBR-PE1-Vlan-interface11] isis enable 1
[ASBR-PE1-Vlan-interface11] mpls enable
[ASBR-PE1-Vlan-interface11] mpls ldp enable
[ASBR-PE1-Vlan-interface11] quit
```

Configure interface VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE1] interface vlan-interface 12
[ASBR-PE1-Vlan-interface12] ip address 11.0.0.2 255.0.0.0
[ASBR-PE1-Vlan-interface12] mpls enable
[ASBR-PE1-Vlan-interface12] quit
```

Configure interface Loopback 0, and enable IS-IS on it.

```
[ASBR-PE1] interface loopback 0
[ASBR-PE1-LoopBack0] ip address 3.3.3.9 32
[ASBR-PE1-LoopBack0] isis enable 1
[ASBR-PE1-LoopBack0] quit
```

Create routing policy **policy**1.

```
[ASBR-PE1] route-policy policy1 permit node 1
[ASBR-PE1-route-policy-policy1-1] apply mpls-label
[ASBR-PE1-route-policy-policy1-1] quit
```

Enable BGP on ASBR-PE 1, and redistribute routes from IS-IS process 1.

```
[ASBR-PE1] bgp 100
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] import-route isis 1
[ASBR-PE1-bgp-default-ipv4] quit
```

Apply the routing policy **policy1** to routes advertised to EBGP peer 11.0.0.1.

```
[ASBR-PE1-bgp-default] peer 11.0.0.1 as-number 600
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 enable
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 route-policy policy1 export
```

Enable the capability to advertise labeled routes to EBGP peer 11.0.0.1 and to receive labeled routes from the peer.

```
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 label-route-capability
[ASBR-PE1-bgp-default-ipv4] quit
[ASBR-PE1-bgp-default] quit
```

4. Configure ASBR-PE 2:

Enable IS-IS on ASBR-PE 2.

```
<ASBR-PE2> system-view
[ASBR-PE2] isis 1
[ASBR-PE2-isis-1] network-entity 10.0000.0000.0000.0003.00
```

Redistribute BGP routes.

```
[ASBR-PE2-isis-1] address-family ipv4 unicast
[ASBR-PE2-isis-1-ipv4] import-route bgp
[ASBR-PE2-isis-1-ipv4] quit
[ASBR-PE2-isis-1] quit
```

Configure an LSR ID, and enable MPLS and LDP.

```
[ASBR-PE2] mpls lsr-id 4.4.4.9
[ASBR-PE2] mpls ldp
[ASBR-PE2-ldp] quit
```

Configure interface VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[ASBR-PE2] interface vlan-interface 11
[ASBR-PE2-Vlan-interface11] ip address 9.1.1.1 255.0.0.0
[ASBR-PE2-Vlan-interface11] isis enable 1
[ASBR-PE2-Vlan-interface11] mpls enable
[ASBR-PE2-Vlan-interface11] mpls ldp enable
```

```
[ASBR-PE2-Vlan-interface11] quit
```

Configure interface Loopback 0, and enable IS-IS on it.

```
[ASBR-PE2] interface loopback 0
[ASBR-PE2-LoopBack0] ip address 4.4.4.9 32
[ASBR-PE2-LoopBack0] isis enable 1
[ASBR-PE2-LoopBack0] quit
```

Configure interface VLAN-interface 12, and enable MPLS on it.

```
[ASBR-PE2] interface vlan-interface 12
[ASBR-PE2-Vlan-interface12] ip address 11.0.0.1 255.0.0.0
[ASBR-PE2-Vlan-interface12] mpls enable
[ASBR-PE2-Vlan-interface12] quit
```

Create routing policy **policy**1.

```
[ASBR-PE2] route-policy policy1 permit node 1
[ASBR-PE2-route-policy-policy1-1] apply mpls-label
[ASBR-PE2-route-policy-policy1-1] quit
```

Enable BGP on ASBR-PE 2, and redistribute routes from IS-IS process 1.

```
[ASBR-PE2] bgp 600
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] import-route isis 1
[ASBR-PE2-bgp-default-ipv4] quit
```

Apply routing policy **policy1** to routes advertised to EBGP peer 11.0.0.2.

```
[ASBR-PE2-bgp-default] peer 11.0.0.2 as-number 100
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 enable
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 route-policy policy1 export
```

Enable the capability to advertise labeled routes to EBGP peer 11.0.0.2 and to receive labeled routes from the peer.

```
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 label-route-capability
[ASBR-PE2-bgp-default-ipv4] quit
[ASBR-PE2-bgp-default] quit
```

5. Configure PE 2:

Enable IS-IS on PE 2.

```
<PE2> system-view
[PE2] isis 1
[PE2-isis-1] network-entity 10.0000.0000.0000.0004.00
[PE2-isis-1] quit
```

Configure an LSR ID, and enable MPLS and LDP.

```
[PE2] mpls lsr-id 5.5.5.9
[PE2] mpls ldp
[PE2-ldp] quit
```

Configure interface VLAN-interface 11, and enable IS-IS, MPLS, and LDP on the interface.

```
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] ip address 9.1.1.2 255.0.0.0
[PE2-Vlan-interface11] isis enable 1
[PE2-Vlan-interface11] mpls enable
[PE2-Vlan-interface11] mpls ldp enable
[PE2-Vlan-interface11] quit
```

Configure interface Loopback 0, and enable IS-IS on it.

```
[PE2] interface loopback 0
[PE2-LoopBack0] ip address 5.5.5.9 32
[PE2-LoopBack0] isis enable 1
[PE2-LoopBack0] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 11:11
[PE2-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE2-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[PE2-vpn-instance-vpn1] quit
```

Associate interface VLAN-interface 12 with VPN instance **vpn1**, and specify an IP address for the interface.

```
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] ip binding vpn-instance vpn1
[PE2-Vlan-interface12] ip address 20.0.0.1 24
[PE2-Vlan-interface12] quit
```

Enable BGP on PE 2.

```
[PE2] bgp 600
```

Configure the maximum hop count from PE 2 to EBGP peer 2.2.2.9 as 10.

```
[PE2-bgp-default] peer 2.2.2.9 as-number 100
[PE2-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[PE2-bgp-default] peer 2.2.2.9 ebgp-max-hop 10
```

Configure peer 2.2.2.9 as a VPNv4 peer.

```
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 2.2.2.9 enable
[PE2-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 2, and add the learned BGP routes to the routing table of VPN instance **vpn1**.

```
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] peer 20.0.0.2 as-number 65002
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] peer 20.0.0.2 enable
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

6. Configure CE 2:

Configure an IP address for interface VLAN-interface 12.

```
<CE2> system-view
[CE2] interface vlan-interface 12
[CE2-Vlan-interface12] ip address 20.0.0.2 24
[CE2-Vlan-interface12] quit
```

Establish an EBGP peer relationship with PE 2, and redistribute VPN routes.

```
[CE2] bgp 65002
[CE2-bgp-default] peer 20.0.0.1 as-number 600
[CE2-bgp-default] address-family ipv4 unicast
[CE2-bgp-default-ipv4] peer 20.0.0.1 enable
[CE2-bgp-default-ipv4] import-route direct
```

```
[CE2-bgp-default-ipv4] quit
[CE2-bgp-default] quit
```

Verifying the configuration

Execute the **display ip routing table** command on CE 1 and CE 2 to verify that CE 1 and CE 2 have a route to each other. Verify that CE 1 and CE 2 can ping each other. (Details not shown.)

Example: Configuring MPLS L3VPN carrier's carrier in the same AS

Network configuration

Configure carrier's carrier for the scenario shown in Figure 32. In this scenario:

- PE 1 and PE 2 are the provider carrier's PE switches. They provide VPN services for the customer carrier.
- CE 1 and CE 2 are the customer carrier's switches. They are connected to the provider carrier's backbone as CE switches.
- PE 3 and PE 4 are the customer carrier's PE switches. They provide MPLS L3VPN services for the end customers.
- CE 3 and CE 4 are customers of the customer carrier.
- The customer carrier and the provider carrier reside in the same AS.

The key to carrier's carrier deployment is to configure exchange of two kinds of routes:

- Exchange of the customer carrier's internal routes on the provider carrier's backbone.
- Exchange of the end customers' VPN routes between PE 3 and PE 4, the PEs of the customer carrier. In this process, an MP-IBGP peer relationship must be established between PE 3 and PE 4.

Figure 32 Network diagram

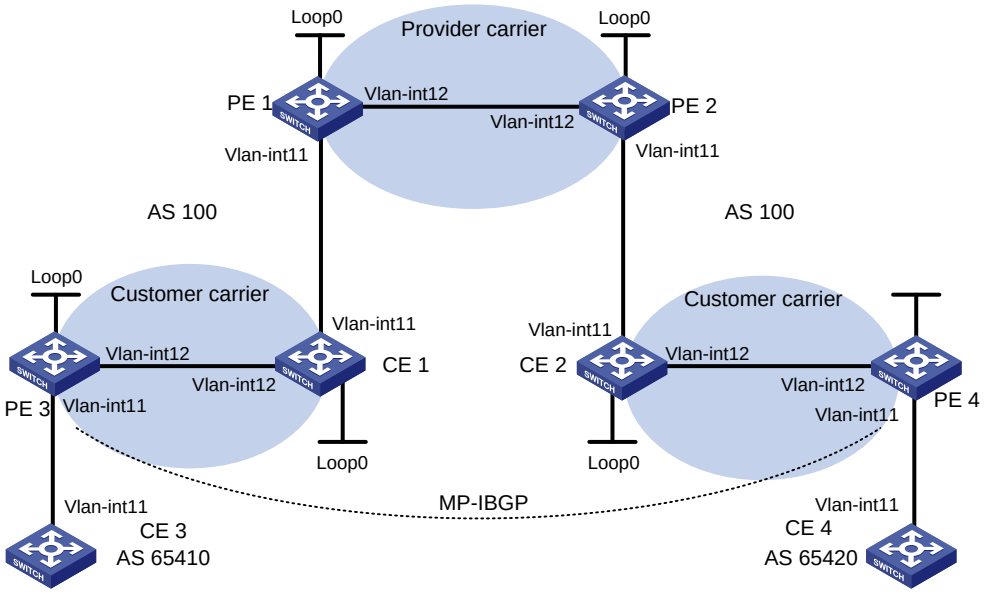

Table 18 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 3	Vlan-int11	100.1.1.1/24	CE 4	Vlan-int11	120.1.1.1/24

Device	Interface	IP address	Device	Interface	IP address
PE 3	Loop0	1.1.1.9/32	PE 4	Loop0	6.6.6.9/32
	Vlan-int11	100.1.1.2/24		Vlan-int11	120.1.1.2/24
	Vlan-int12	10.1.1.1/24		Vlan-int12	20.1.1.2/24
CE 1	Loop0	2.2.2.9/32	CE 2	Loop0	5.5.5.9/32
	Vlan-int12	10.1.1.2/24		Vlan-int11	21.1.1.2/24
	Vlan-int11	11.1.1.1/24		Vlan-int12	20.1.1.1/24
PE 1	Loop0	3.3.3.9/32	PE 2	Loop0	4.4.4.9/32
	Vlan-int11	11.1.1.2/24		Vlan-int12	30.1.1.2/24
	Vlan-int12	30.1.1.1/24		Vlan-int11	21.1.1.1/24

Procedure

1. Configure MPLS L3VPN on the provider carrier backbone. Enable IS-IS as the IGP, enable LDP between PE 1 and PE 2, and establish an MP-IBGP peer relationship between the PEs:

Configure PE 1.

```
<PE1> system-view
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 3.3.3.9 32
[PE1-LoopBack0] quit
[PE1] mpls lsr-id 3.3.3.9
[PE1] mpls ldp
[PE1-ldp] quit
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0004.00
[PE1-isis-1] quit
[PE1] interface loopback 0
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip address 30.1.1.1 24
[PE1-Vlan-interface12] isis enable 1
[PE1-Vlan-interface12] mpls enable
[PE1-Vlan-interface12] mpls ldp enable
[PE1-Vlan-interface12] mpls ldp transport-address interface
[PE1-Vlan-interface12] quit
[PE1] bgp 100
[PE1-bgp-default] peer 4.4.4.9 as-number 100
[PE1-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 4.4.4.9 enable
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] quit
```

Configure PE 2 in the same way that PE 1 is configured. (Details not shown.)

On PE 1 or PE 2, execute the following commands:

- Execute the **display mpls ldp peer** command to verify that an LDP session in Operational state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **display bgp peer vpnv4** command to verify that a BGP peer relationship in Established state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **display isis peer** command to verify that the IS-IS neighbor relationship has been established between PE 1 and PE 2. (Details not shown.)

2. Configure the customer carrier network. Enable IS-IS as the IGP, and enable LDP between PE 3 and CE 1, and between PE 4 and CE 2:

Configure PE 3.

```
<PE3> system-view
[PE3] interface loopback 0
[PE3-LoopBack0] ip address 1.1.1.9 32
[PE3-LoopBack0] quit
[PE3] mpls lsr-id 1.1.1.9
[PE3] mpls ldp
[PE3-ldp] quit
[PE3] isis 2
[PE3-isis-2] network-entity 10.0000.0000.0000.0001.00
[PE3-isis-2] quit
[PE3] interface loopback 0
[PE3-LoopBack0] isis enable 2
[PE3-LoopBack0] quit
[PE3] interface vlan-interface 12
[PE3-Vlan-interface12] ip address 10.1.1.1 24
[PE3-Vlan-interface12] isis enable 2
[PE3-Vlan-interface12] mpls enable
[PE3-Vlan-interface12] mpls ldp enable
[PE3-Vlan-interface12] mpls ldp transport-address interface
[PE3-Vlan-interface12] quit
```

Configure CE 1.

```
<CE1> system-view
[CE1] interface loopback 0
[CE1-LoopBack0] ip address 2.2.2.9 32
[CE1-LoopBack0] quit
[CE1] mpls lsr-id 2.2.2.9
[CE1] mpls ldp
[CE1-ldp] quit
[CE1] isis 2
[CE1-isis-2] network-entity 10.0000.0000.0000.0002.00
[CE1-isis-2] quit
[CE1] interface loopback 0
[CE1-LoopBack0] isis enable 2
[CE1-LoopBack0] quit
[CE1] interface vlan-interface 12
[CE1-Vlan-interface12] ip address 10.1.1.2 24
[CE1-Vlan-interface12] isis enable 2
[CE1-Vlan-interface12] mpls enable
[CE1-Vlan-interface12] mpls ldp enable
```

```
[CE1-Vlan-interface12] mpls ldp transport-address interface
[CE1-Vlan-interface12] quit
```

PE 3 and CE 1 can establish an LDP session and IS-IS neighbor relationship between them.

Configure PE 4 and CE 2 in the same way that PE 3 and CE 1 are configured. (Details not shown.)

3. Allow CEs of the customer carrier to access PEs of the provider carrier, and redistribute IS-IS routes to BGP and BGP routes to IS-IS on the PEs:

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 200:1
[PE1-vpn-instance-vpn1] vpn-target 1:1
[PE1-vpn-instance-vpn1] quit
[PE1] mpls ldp
[PE1-ldp] vpn-instance vpn1
[PE1-ldp-vpn-instance-vpn1] quit
[PE1-ldp] quit
[PE1] isis 2 vpn-instance vpn1
[PE1-isis-2] network-entity 10.0000.0000.0000.0003.00
[PE1-isis-2] address-family ipv4
[PE1-isis-2-ipv4] import-route bgp
[PE1-isis-2-ipv4] quit
[PE1-isis-2] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance vpn1
[PE1-Vlan-interface11] ip address 11.1.1.2 24
[PE1-Vlan-interface11] isis enable 2
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] mpls ldp enable
[PE1-Vlan-interface11] mpls ldp transport-address interface
[PE1-Vlan-interface11] quit
[PE1] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] import-route isis 2
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Configure CE 1.

```
[CE1] interface vlan-interface 11
[CE1-Vlan-interface11] ip address 11.1.1.1 24
[CE1-Vlan-interface11] isis enable 2
[CE1-Vlan-interface11] mpls enable
[CE1-Vlan-interface11] mpls ldp enable
[CE1-Vlan-interface11] mpls ldp transport-address interface
[CE1-Vlan-interface11] quit
```

PE 1 and CE 1 can establish an LDP session and an IS-IS neighbor relationship between them.

Configure PE 2 and CE 2 in the same way that PE 1 and CE 1 are configured. (Details not shown.)

4. Connect the CEs of the end customers and the PEs of the customer carrier:

   # Configure CE 3.

```
<CE3> system-view
[CE3] interface vlan-interface11
[CE3-Vlan-interface11] ip address 100.1.1.1 24
[CE3-Vlan-interface11] quit
[CE3] bgp 65410
[CE3-bgp-default] peer 100.1.1.2 as-number 100
[CE3-bgp-default] address-family ipv4 unicast
[CE3-bgp-default-ipv4] peer 100.1.1.2 enable
[CE3-bgp-default-ipv4] import-route direct
[CE3-bgp-default-ipv4] quit
[CE3-bgp-default] quit
```

   # Configure PE 3.

```
[PE3] ip vpn-instance vpn1
[PE3-vpn-instance-vpn1] route-distinguisher 100:1
[PE3-vpn-instance-vpn1] vpn-target 1:1
[PE3-vpn-instance-vpn1] quit
[PE3] interface Vlan-interface 11
[PE3-Vlan-interface11] ip binding vpn-instance vpn1
[PE3-Vlan-interface11] ip address 100.1.1.2 24
[PE3-Vlan-interface11] quit
[PE3] bgp 100
[PE3-bgp-default] ip vpn-instance vpn1
[PE3-bgp-default-vpn1] peer 100.1.1.1 as-number 65410
[PE3-bgp-default-vpn1] address-family ipv4 unicast
[PE3-bgp-default-ipv4-vpn1] peer 100.1.1.1 enable
[PE3-bgp-default-ipv4-vpn1] quit
[PE3-bgp-default-vpn1] quit
[PE3-bgp-default] quit
```

   # Configure PE 4 and CE 4 in the same way that PE 3 and CE 3 are configured. (Details not shown.)

5. Configure MP-IBGP peer relationship between the PEs of the customer carrier to exchange the end customers' VPN routes:

   # Configure PE 3.

```
[PE3] bgp 100
[PE3-bgp-default] peer 6.6.6.9 as-number 100
[PE3-bgp-default] peer 6.6.6.9 connect-interface loopback 0
[PE3-bgp-default] address-family vpnv4
[PE3-bgp-default-vpnv4] peer 6.6.6.9 enable
[PE3-bgp-default-vpnv4] quit
[PE3-bgp-default] quit
```

   # Configure PE 4 in the same way that PE 3 is configured. (Details not shown.)

Verifying the configuration

1. Display the public network routing table and VPN routing table on the provider carrier PEs, for example, on PE 1:

   # Verify that the public network routing table contains only routes of the provider carrier network.

```
[PE1] display ip routing-table

Destinations : 14        Routes : 14

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0

4. Verify that PE 3 and PE 4 can ping each other. (Details not shown.)
5. Verify that CE 3 and CE 4 can ping each other. (Details not shown.)

Example: Configuring MPLS L3VPN carrier's carrier in different ASs

Network configuration

Configure carrier's carrier for the scenario shown in Figure 33. In this scenario:

- PE 1 and PE 2 are the provider carrier's PE switches. They provide VPN services for the customer carrier.
- CE 1 and CE 2 are the customer carrier's switches. They are connected to the provider carrier's backbone as CE switches.
- PE 3 and PE 4 are the customer carrier's PE switches. They provide MPLS L3VPN services for the end customers.
- CE 3 and CE 4 are customers of the customer carrier.
- The customer carrier and the provider carrier reside in different ASs.

The key to carrier's carrier deployment is to configure exchange of two kinds of routes:

- Exchange of the customer carrier's internal routes on the provider carrier's backbone.
- Exchange of the end customers' VPN routes between PE 3 and PE 4, the PEs of the customer carrier. In this process, an MP-EBGP peer relationship must be established between PE 3 and PE 4.

Figure 33 Network diagram

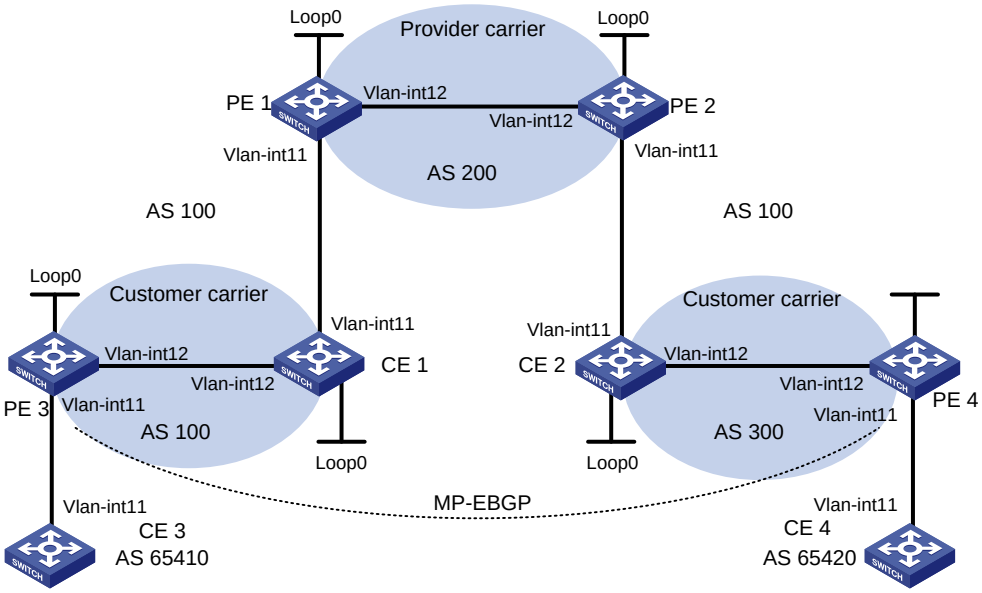

Table 19 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 3	Vlan-int11	100.1.1.1/24	CE 4	Vlan-int11	120.1.1.1/24
PE 3	Loop0	1.1.1.9/32	PE 4	Loop0	6.6.6.9/32
	Vlan-int11	100.1.1.2/24		Vlan-int11	120.1.1.2/24
	Vlan-int12	10.1.1.1/24		Vlan-int12	20.1.1.2/24
CE 1	Loop0	2.2.2.9/32	CE 2	Loop0	5.5.5.9/32
	Vlan-int12	10.1.1.2/24		Vlan-int11	21.1.1.2/24
	Vlan-int11	11.1.1.1/24		Vlan-int12	20.1.1.1/24
PE 1	Loop0	3.3.3.9/32	PE 2	Loop0	4.4.4.9/32
	Vlan-int11	11.1.1.2/24		Vlan-int12	30.1.1.2/24
	Vlan-int12	30.1.1.1/24		Vlan-int11	21.1.1.1/24

Procedure

1. Configure MPLS L3VPN on the provider carrier backbone. Enable IS-IS as the IGP, enable LDP between PE 1 and PE 2, and establish an MP-IBGP peer relationship between the PEs:

   # Configure PE 1.

```
<PE1> system-view
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 3.3.3.9 32
[PE1-LoopBack0] quit
[PE1] mpls lsr-id 3.3.3.9
[PE1] mpls ldp
[PE1-ldp] quit
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0004.00
```

```
[PE1-isis-1] quit
[PE1] interface loopback 0
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip address 30.1.1.1 24
[PE1-Vlan-interface12] isis enable 1
[PE1-Vlan-interface12] mpls enable
[PE1-Vlan-interface12] mpls ldp enable
[PE1-Vlan-interface12] mpls ldp transport-address interface
[PE1-Vlan-interface12] quit
[PE1] bgp 100
[PE1-bgp-default] peer 4.4.4.9 as-number 100
[PE1-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 4.4.4.9 enable
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] quit
```

Configure PE 2 in the same way that PE 1 is configured. (Details not shown.)

On PE 1 or PE 2, execute the following commands:

- Execute the **display mpls ldp peer** command to verify that an LDP session in Operational state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **display bgp peer vpnv4** command to verify that a BGP peer relationship in Established state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **display isis peer** command to verify that the IS-IS neighbor relationship has been established between PE 1 and PE 2. (Details not shown.)

2. Configure the customer carrier network. Enable IS-IS as the IGP, and enable LDP between PE 3 and CE 1, and between PE 4 and CE 2:

Configure PE 3.

```
<PE3> system-view
[PE3] interface loopback 0
[PE3-LoopBack0] ip address 1.1.1.9 32
[PE3-LoopBack0] quit
[PE3] mpls lsr-id 1.1.1.9
[PE3] mpls ldp
[PE3-ldp] quit
[PE3] isis 2
[PE3-isis-2] network-entity 10.0000.0000.0000.0001.00
[PE3-isis-2] quit
[PE3] interface loopback 0
[PE3-LoopBack0] isis enable 2
[PE3-LoopBack0] quit
[PE3] interface vlan-interface 12
[PE3-Vlan-interface12] ip address 10.1.1.1 24
[PE3-Vlan-interface12] isis enable 2
[PE3-Vlan-interface12] mpls enable
[PE3-Vlan-interface12] mpls ldp enable
[PE3-Vlan-interface12] mpls ldp transport-address interface
```

```
[PE3-Vlan-interface12] quit
```

Configure CE 1.

```
<CE1> system-view
[CE1] interface loopback 0
[CE1-LoopBack0] ip address 2.2.2.9 32
[CE1-LoopBack0] quit
[CE1] mpls lsr-id 2.2.2.9
[CE1] mpls ldp
[CE1-ldp] import bgp
[CE1-ldp] quit
[CE1] isis 2
[CE1-isis-2] network-entity 10.0000.0000.0000.0002.00
[CE1-isis-2] address-family ipv4
[CE1-isis-2-ipv4] import-route bgp
[CE1-isis-2-ipv4] quit
[CE1-isis-2] quit
[CE1] interface loopback 0
[CE1-LoopBack0] isis enable 2
[CE1-LoopBack0] quit
[CE1] interface vlan-interface 12
[CE1-Vlan-interface12] ip address 10.1.1.2 24
[CE1-Vlan-interface12] isis enable 2
[CE1-Vlan-interface12] mpls enable
[CE1-Vlan-interface12] mpls ldp enable
[CE1-Vlan-interface12] mpls ldp transport-address interface
[CE1-Vlan-interface12] quit
```

PE 3 and CE 1 can establish an LDP session and IS-IS neighbor relationship between them.

Configure PE 4 and CE 2 in the same way that PE 3 and CE 1 are configured. (Details not shown.)

3. Allow CEs of the customer carrier to access PEs of the provider carrier:

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 200:1
[PE1-vpn-instance-vpn1] vpn-target 1:1
[PE1-vpn-instance-vpn1] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance vpn1
[PE1-Vlan-interface11] ip address 11.1.1.2 24
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] quit
[PE1] bgp 200
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 11.1.1.1 as-number 100
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 11.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] peer 11.1.1.1 label-route-capability
[PE1-bgp-default-ipv4-vpn1] peer 11.1.1.1 route-policy csc export
[PE1-bgp-default-ipv4-vpn1] quit
```

```
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
[PE1] route-policy csc permit node 0
[PE1-route-policy-csc-0] apply mpls-label
[PE1-route-policy-csc-0] quit
```

Configure CE 1.

```
[CE1] interface vlan-interface 11
[CE1-Vlan-interface11] ip address 11.1.1.1 24
[CE1-Vlan-interface11] mpls enable
[CE1-Vlan-interface11] quit
[CE1] bgp 100
[CE1-bgp-default] peer 11.1.1.2 as-number 200
[CE1-bgp-default] address-family ipv4 unicast
[CE1-bgp-default-ipv4] peer 11.1.1.2 enable
[CE1-bgp-default-ipv4] peer 11.1.1.2 label-route-capability
[CE1-bgp-default-ipv4] peer 11.1.1.2 route-policy csc export
[CE1-bgp-default-ipv4] import-route isis 2
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
[CE1] route-policy csc permit node 0
[CE1-route-policy-csc-0] apply mpls-label
[CE1-route-policy-csc-0] quit
```

PE 1 and CE 1 can establish a BGP session and exchange labeled IPv4 unicast routes through BGP.

Configure PE 2 and CE 2 in the same way that PE 1 and CE 1 are configured. (Details not shown.)

4. Connect CEs of the end customers and the PEs of the customer carrier:

Configure CE 3.

```
<CE3> system-view
[CE3] interface vlan-interface 11
[CE3-Vlan-interface11] ip address 100.1.1.1 24
[CE3-Vlan-interface11] quit
[CE3] bgp 65410
[CE3-bgp-default] peer 100.1.1.2 as-number 100
[CE3-bgp-default] address-family ipv4 unicast
[CE3-bgp-default-ipv4] peer 100.1.1.2 enable
[CE3-bgp-default-ipv4] import-route direct
[CE3-bgp-default-ipv4] quit
[CE3-bgp-default] quit
```

Configure PE 3.

```
[PE3] ip vpn-instance vpn1
[PE3-vpn-instance-vpn1] route-distinguisher 100:1
[PE3-vpn-instance-vpn1] vpn-target 1:1
[PE3-vpn-instance-vpn1] quit
[PE3] interface vlan-interface 11
[PE3-Vlan-interface11] ip binding vpn-instance vpn1
[PE3-Vlan-interface11] ip address 100.1.1.2 24
[PE3-Vlan-interface11] quit
```

```
[PE3] bgp 100
[PE3-bgp-default] ip vpn-instance vpn1
[PE3-bgp-default-vpn1] peer 100.1.1.1 as-number 65410
[PE3-bgp-default-vpn1] address-family ipv4 unicast
[PE3-bgp-default-ipv4-vpn1] peer 100.1.1.1 enable
[PE3-bgp-default-ipv4-vpn1] quit
[PE3-bgp-default-vpn1] quit
[PE3-bgp-default] quit
```

Configure PE 4 and CE 4 in the same way that PE 3 and CE 3 are configured. (Details not shown.)

5. Configure an MP-EBGP peer relationship between the PEs of the customer carrier to exchange the VPN routes of the end customers:

Configure PE 3.

```
[PE3] bgp 100
[PE3-bgp-default] peer 6.6.6.9 as-number 300
[PE3-bgp-default] peer 6.6.6.9 connect-interface loopback 0
[PE3-bgp-default] peer 6.6.6.9 ebgp-max-hop 10
[PE3-bgp-default] address-family vpnv4
[PE3-bgp-default-vpnv4] peer 6.6.6.9 enable
[PE3-bgp-default-vpnv4] quit
[PE3-bgp-default] quit
```

Configure PE 4 in the same way that PE 3 is configured. (Details not shown.)

Verifying the configuration

1. Display the public network routing table and VPN routing table on the provider carrier PEs, for example, on PE 1:

Verify that the public network routing table contains only routes of the provider carrier network.

```
[PE1] display ip routing-table

Destinations : 14        Routes : 14

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
3.3.3.9/32         Direct  0   0           127.0.0.1       InLoop0
4.4.4.9/32         IS_L1   15  10          30.1.1.2        Vlan12
30.1.1.0/24        Direct  0   0           30.1.1.1        Vlan12
30.1.1.0/32        Direct  0   0           30.1.1.1        Vlan12
30.1.1.1/32        Direct  0   0           127.0.0.1       InLoop0
30.1.1.255/32      Direct  0   0           30.1.1.1        Vlan12
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

Verify that the VPN routing table contains the internal routes of the customer carrier, but it does not contain the VPN routes that the customer carrier maintains.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 14        Routes : 14

```

4. Verify that PE 3 and PE 4 can ping each other. (Details not shown.)
5. Verify that CE 3 and CE 4 can ping each other. (Details not shown.)

Example: Configuring nested VPN

Network configuration

The service provider provides nested VPN services for users, as shown in Figure 34.

- PE 1 and PE 2 are PE devices on the service provider backbone. Both of them support the nested VPN feature.
- CE 1 and CE 2 are connected to the service provider backbone. Both of them support VPNv4 routes.
- PE 3 and PE 4 are PE devices of the customer VPN. Both of them support MPLS L3VPN.
- CE 3 through CE 6 are CE devices of the sub-VPNs for the customer VPN.

The key of nested VPN configuration is to understand the processing of routes of sub-VPNs on the service provider PEs:

- When receiving a VPNv4 route from a CE (CE 1 or CE 2 in this example), a service provider PE performs the following operations:
  a. Replaces the RD of the VPNv4 route with the RD of the MPLS VPN on the service provider network where the CE resides.
  b. Adds the export target attribute of the MPLS VPN on the service provider network to the extended community attribute list.
  c. Forwards the VPNv4 route.
- To implement exchange of sub-VPN routes between customer PEs and service provider PEs, MP-EBGP peers must be established between service provider PEs and customer CEs.

Figure 34 Network diagram

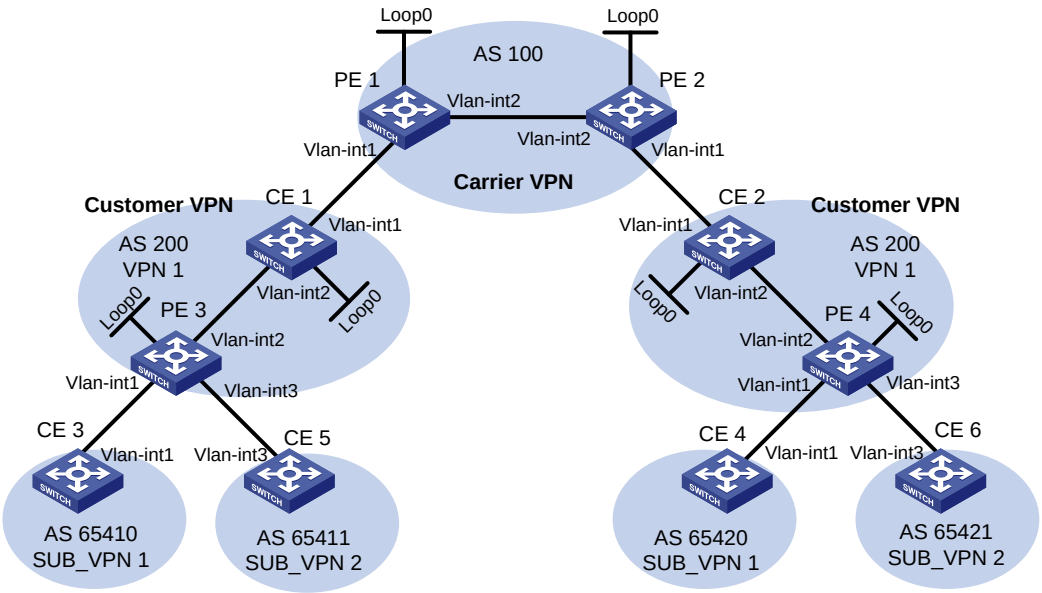

Table 20 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Loop0	2.2.2.9/32	CE 2	Loop0	5.5.5.9/32
	Vlan-int2	10.1.1.2/24		Vlan-int1	21.1.1.2/24
	Vlan-int1	11.1.1.1/24		Vlan-int2	20.1.1.1/24
CE 3	Vlan-int1	100.1.1.1/24	CE 4	Vlan-int1	120.1.1.1/24
CE 5	Vlan-int3	110.1.1.1/24	CE 6	Vlan-int3	130.1.1.1/24
PE 1	Loop0	3.3.3.9/32	PE 2	Loop0	4.4.4.9/32
	Vlan-int1	11.1.1.2/24		Vlan-int1	21.1.1.1/24

Device	Interface	IP address	Device	Interface	IP address
	Vlan-int2	30.1.1.1/24		Vlan-int2	30.1.1.2/24
PE 3	Loop0	1.1.1.9/32	PE 4	Loop0	6.6.6.9/32
	Vlan-int1	100.1.1.2/24		Vlan-int1	120.1.1.2/24
	Vlan-int2	10.1.1.1/24		Vlan-int2	20.1.1.2/24
	Vlan-int3	110.1.1.2/24		Vlan-int3	130.1.1.2/24

Procedure

1. Configure MPLS L3VPN on the service provider backbone. Use IS-IS as the IGP protocol, enable LDP, and establish an MP-IBGP peer relationship between PE 1 and PE 2:

Configure PE 1.

```
<PE1> system-view
[PE1] interface loopback 0
[PE1-LoopBack0] ip address 3.3.3.9 32
[PE1-LoopBack0] quit
[PE1] mpls lsr-id 3.3.3.9
[PE1] mpls ldp
[PE1-ldp] quit
[PE1] isis 1
[PE1-isis-1] network-entity 10.0000.0000.0000.0004.00
[PE1-isis-1] quit
[PE1] interface loopback 0
[PE1-LoopBack0] isis enable 1
[PE1-LoopBack0] quit
[PE1] interface vlan-interface 2
[PE1-Vlan-interface2] ip address 30.1.1.1 24
[PE1-Vlan-interface2] isis enable 1
[PE1-Vlan-interface2] mpls enable
[PE1-Vlan-interface2] mpls ldp enable
[PE1-Vlan-interface2] quit
[PE1] bgp 100
[PE1-bgp-default] peer 4.4.4.9 as-number 100
[PE1-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 4.4.4.9 enable
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] quit
```

Configure PE 2 in the same way that PE 1 is configured. (Details not shown.)

On PE 1 or PE 2, execute the following commands:

- Execute the **`display mpls ldp peer`** command to verify that an LDP session in Operational state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **`display bgp peer vpnv4`** command to verify that a BGP peer relationship in Established state has been established between PE 1 and PE 2. (Details not shown.)
- Execute the **`display isis peer`** command to verify that the IS-IS neighbor relationship has been established between PE 1 and PE 2. (Details not shown.)

2. Configure the customer VPN. Use IS-IS as the IGP protocol, and enable LDP between PE 3 and CE 1, and between PE 4 and CE 2:

Configure PE 3.

```
<PE3> system-view
[PE3] interface loopback 0
[PE3-LoopBack0] ip address 1.1.1.9 32
[PE3-LoopBack0] quit
[PE3] mpls lsr-id 1.1.1.9
[PE3] mpls ldp
[PE3-ldp] quit
[PE3] isis 2
[PE3-isis-2] network-entity 10.0000.0000.0000.0001.00
[PE3-isis-2] quit
[PE3] interface loopback 0
[PE3-LoopBack0] isis enable 2
[PE3-LoopBack0] quit
[PE3] interface vlan-interface 2
[PE3-Vlan-interface2] ip address 10.1.1.1 24
[PE3-Vlan-interface2] isis enable 2
[PE3-Vlan-interface2] mpls enable
[PE3-Vlan-interface2] mpls ldp enable
[PE3-Vlan-interface2] quit
```

Configure CE 1.

```
<CE1> system-view
[CE1] interface loopback 0
[CE1-LoopBack0] ip address 2.2.2.9 32
[CE1-LoopBack0] quit
[CE1] mpls lsr-id 2.2.2.9
[CE1] mpls ldp
[CE1-ldp] quit
[CE1] isis 2
[CE1-isis-2] network-entity 10.0000.0000.0000.0002.00
[CE1-isis-2] quit
[CE1] interface loopback 0
[CE1-LoopBack0] isis enable 2
[CE1-LoopBack0] quit
[CE1] interface vlan-interface 2
[CE1-Vlan-interface2] ip address 10.1.1.2 24
[CE1-Vlan-interface2] isis enable 2
[CE1-Vlan-interface2] mpls enable
[CE1-Vlan-interface2] mpls ldp enable
[CE1-Vlan-interface2] quit
```

An LDP session and an IS-IS neighbor relationship can be established between PE 3 and CE 1.

Configure PE 4 and CE 2 in the same way that PE 3 and CE 1 are configured. (Details not shown.)

3. Connect CE 1 and CE 2 to service provider PEs:

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
```

```
[PE1-vpn-instance-vpn1] route-distinguisher 200:1
[PE1-vpn-instance-vpn1] vpn-target 1:1
[PE1-vpn-instance-vpn1] quit
[PE1] interface vlan-interface 1
[PE1-Vlan-interface1] ip binding vpn-instance vpn1
[PE1-Vlan-interface1] ip address 11.1.1.2 24
[PE1-Vlan-interface1] mpls enable
[PE1-Vlan-interface1] quit
[PE1] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 11.1.1.1 as-number 200
[PE1-bgp-default-vpn1] address-family ipv4
[PE1-bgp-default-ipv4-vpn1] peer 11.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Configure CE 1.

```
[CE1] interface vlan-interface 1
[CE1-Vlan-interface1] ip address 11.1.1.1 24
[CE1-Vlan-interface1] mpls enable
[CE1-Vlan-interface1] quit
[CE1] bgp 200
[CE1-bgp-default] peer 11.1.1.2 as-number 100
[CE1-bgp-default] address-family ipv4
[CE1-bgp-default-ipv4] peer 11.1.1.2 enable
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
```

Configure PE 2 and CE 2 in the same way that PE 1 and CE 1 are configured. (Details not shown.)

4. Connect sub-VPN CEs to the customer VPN PEs:

Configure CE 3.

```
<CE3> system-view
[CE3] interface vlan-interface 1
[CE3-Vlan-interface1] ip address 100.1.1.1 24
[CE3-Vlan-interface1] quit
[CE3] bgp 65410
[CE3-bgp-default] peer 100.1.1.2 as-number 200
[CE3-bgp-default] address-family ipv4 unicast
[CE3-bgp-default-ipv4] peer 100.1.1.2 enable
[CE3-bgp-default-ipv4] import-route direct
[CE3-bgp-default-ipv4] quit
[CE3-bgp-default] quit
```

Configure CE 5.

```
<CE5> system-view
[CE5] interface vlan-interface 3
[CE5-Vlan-interface3] ip address 110.1.1.1 24
[CE5-Vlan-interface3] quit
[CE5] bgp 65411
```

```
[CE5-bgp-default] peer 110.1.1.2 as-number 200
[CE5-bgp-default] address-family ipv4 unicast
[CE5-bgp-default-ipv4] peer 110.1.1.2 enable
[CE5-bgp-default-ipv4] import-route direct
[CE5-bgp-default-ipv4] quit
[CE5-bgp-default] quit
```

Configure PE 3.

```
[PE3] ip vpn-instance SUB_VPN1
[PE3-vpn-instance-SUB_VPN1] route-distinguisher 100:1
[PE3-vpn-instance-SUB_VPN1] vpn-target 2:1
[PE3-vpn-instance-SUB_VPN1] quit
[PE3] interface vlan-interface 1
[PE3-Vlan-interface1] ip binding vpn-instance SUB_VPN1
[PE3-Vlan-interface1] ip address 100.1.1.2 24
[PE3-Vlan-interface1] quit
[PE3] ip vpn-instance SUB_VPN2
[PE3-vpn-instance-SUB_VPN2] route-distinguisher 101:1
[PE3-vpn-instance-SUB_VPN2] vpn-target 2:2
[PE3-vpn-instance-SUB_VPN2] quit
[PE3] interface vlan-interface 3
[PE3-Vlan-interface3] ip binding vpn-instance SUB_VPN2
[PE3-Vlan-interface3] ip address 110.1.1.2 24
[PE3-Vlan-interface3] quit
[PE3] bgp 200
[PE3-bgp-default] ip vpn-instance SUB_VPN1
[PE3-bgp-default-SUB_VPN1] peer 100.1.1.1 as-number 65410
[PE3-bgp-default-SUB_VPN1] address-family ipv4 unicast
[PE3-bgp-default-ipv4-SUB_VPN1] peer 100.1.1.1 enable
[PE3-bgp-default-ipv4-SUB_VPN1] quit
[PE3-bgp-default-SUB_VPN1] quit
[PE3-bgp-default] ip vpn-instance SUB_VPN2
[PE3-bgp-default-SUB_VPN2] peer 100.1.1.1 as-number 65411
[PE3-bgp-default-SUB_VPN2] address-family ipv4 unicast
[PE3-bgp-default-ipv4-SUB_VPN2] peer 110.1.1.1 enable
[PE3-bgp-default-ipv4-SUB_VPN2] quit
[PE3-bgp-default-SUB_VPN2] quit
[PE3-bgp-default] quit
```

Configure PE 4, CE 4, and CE 6 in the same way that PE 3, CE 3, and CE 5 are configured. (Details not shown.)

5. Establish MP-EBGP peer relationships between service provider PEs and their CEs to exchange user VPNv4 routes:

On PE 1, enable nested VPN and VPNv4 route exchange with CE 1.

```
[PE1] bgp 100
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] nesting-vpn
[PE1-bgp-default-vpnv4] quit
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] address-family vpnv4
```

```
[PE1-bgp-default-vpnv4-vpn1] peer 11.1.1.1 enable
[PE1-bgp-default-vpnv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Enable CE 1 to exchange VPNv4 routes with PE 1.

```
[CE1] bgp 200
[CE1-bgp-default] address-family vpnv4
[CE1-bgp-default-vpnv4] peer 11.1.1.2 enable
```

Allow the local AS number to appear in the AS-PATH attribute of the routes received.

```
[CE1-bgp-default-vpnv4] peer 11.1.1.2 allow-as-loop 2
```

Disable route target based filtering of received VPNv4 routes.

```
[CE1-bgp-default-vpnv4] undo policy vpn-target
[CE1-bgp-default-vpnv4] quit
[CE1-bgp-default] quit
```

Configure PE 2 and CE 2 in the same way that PE 1 and CE 1 are configured. (Details not shown.)

6. Establish MP-IBGP peer relationships between sub-VPN PEs and CEs of the customer VPN to exchange VPNv4 routes of sub-VPNs:

Configure PE 3.

```
[PE3] bgp 200
[PE3-bgp-default] peer 2.2.2.9 as-number 200
[PE3-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[PE3-bgp-default] address-family vpnv4
[PE3-bgp-default-vpnv4] peer 2.2.2.9 enable
```

Allow the local AS number to appear in the AS-PATH attribute of the routes received.

```
[PE3-bgp-default-vpnv4] peer 2.2.2.9 allow-as-loop 2
[PE3-bgp-default-vpnv4] quit
[PE3-bgp-default] quit
```

Configure CE 1.

```
[CE1] bgp 200
[CE1-bgp-default] peer 1.1.1.9 as-number 200
[CE1-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[CE1-bgp-default] address-family vpnv4
[CE1-bgp-default-vpnv4] peer 1.1.1.9 enable
[CE1-bgp-default-vpnv4] undo policy vpn-target
[CE1-bgp-default-vpnv4] quit
[CE1-bgp-default] quit
```

Configure PE 4 and CE 2 in the same way that PE 3 and CE 1 are configured. (Details not shown.)

Verifying the configuration

1. Display the public routing table and VPN routing table on the provider PEs, for example, on PE 1:

Verify that the public routing table contains only routes on the service provider network.

```
[PE1] display ip routing-table

Destinations : 14        Routes : 14

Destination/Mask   Proto   Pre Cost        NextHop         Interface
```

```
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
3.3.3.9/32         Direct  0   0           127.0.0.1       InLoop0
4.4.4.9/32         IS_L1   15  10          30.1.1.2        Vlan2
30.1.1.0/24        Direct  0   0           30.1.1.1        Vlan2
30.1.1.0/32        Direct  0   0           30.1.1.1        Vlan2
30.1.1.1/32        Direct  0   0           127.0.0.1       InLoop0
30.1.1.255/32      Direct  0   0           30.1.1.1        Vlan2
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0

255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

2. Display the VPNv4 routing table on the provider CEs, for example, on CE 1.

Verify that the VPNv4 routing table on the customer VPN contains internal sub-VPN routes.

```
[CE1] display bgp routing-table vpnv4

 BGP local router ID is 2.2.2.9
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
               Origin: i - IGP, e - EGP, ? - incomplete

 Total number of routes from all PEs: 4
```

```
 Route distinguisher: 100:1

```

5. Verify that CE 3 and CE 4 can ping each other. (Details not shown.)

6. Verify that CE5 and CE 6 can ping each other. (Details not shown.)

7. Verify that CE 3 and CE 6 cannot ping each other. (Details not shown.)

Example: Configuring HoVPN

Network configuration

There are two levels of networks, the backbone and the MPLS VPN networks, as shown in Figure 35.

- SPEs act as PEs to allow MPLS VPNs to access the backbone.
- UPEs act as PEs of the MPLS VPNs to allow end users to access the VPNs.
- Performance requirements for the UPEs are lower than those for the SPEs.
- SPEs advertise routes permitted by the routing policies to UPEs, permitting CE 1 and CE 3 in VPN 1 to communicate with each other, and forbidding CE 2 and CE 4 in VPN 2 from communicating with each other.

Figure 35 Network diagram

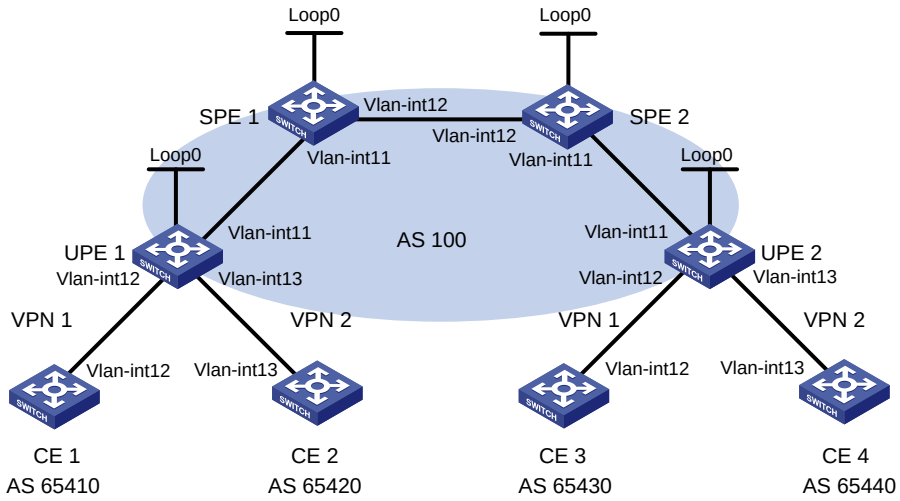

Table 21 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Vlan-int12	10.2.1.1/24	CE 3	Vlan-int12	10.1.1.1/24
CE 2	Vlan-int13	10.4.1.1/24	CE 4	Vlan-int13	10.3.1.1/24
UPE 1	Loop0	1.1.1.9/32	UPE 2	Loop0	4.4.4.9/32
	Vlan-int11	172.1.1.1/24		Vlan-int11	172.2.1.1/24
	Vlan-int12	10.2.1.2/24		Vlan-int12	10.1.1.2/24
	Vlan-int13	10.4.1.2/24		Vlan-int13	10.3.1.2/24
SPE 1	Loop0	2.2.2.9/32	SPE 2	Loop0	3.3.3.9/32
	Vlan-int11	172.1.1.2/24		Vlan-int11	172.2.1.2/24
	Vlan-int12	180.1.1.1/24		Vlan-int12	180.1.1.2/24

Procedure

1. Configure UPE 1:

   # Configure basic MPLS and MPLS LDP to establish LDP LSPs.

   ```
   <UPE1> system-view
   [UPE1] interface loopback 0
   ```

```
[UPE1-LoopBack0] ip address 1.1.1.9 32
[UPE1-LoopBack0] quit
[UPE1] mpls lsr-id 1.1.1.9
[UPE1] mpls ldp
[UPE1-ldp] quit
[UPE1] interface vlan-interface 11
[UPE1-Vlan-interface11] ip address 172.1.1.1 24
[UPE1-Vlan-interface11] mpls enable
[UPE1-Vlan-interface11] mpls ldp enable
[UPE1-Vlan-interface11] quit
```

Configure the IGP protocol (OSPF, in this example).

```
[UPE1] ospf
[UPE1-ospf-1] area 0
[UPE1-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[UPE1-ospf-1-area-0.0.0.0] network 1.1.1.9 0.0.0.0
[UPE1-ospf-1-area-0.0.0.0] quit
[UPE1-ospf-1] quit
```

Configure VPN instances **vpn1** and **vpn2**, allowing CE 1 and CE 2 to access UPE 1.

```
[UPE1] ip vpn-instance vpn1
[UPE1-vpn-instance-vpn1] route-distinguisher 100:1
[UPE1-vpn-instance-vpn1] vpn-target 100:1 both
[UPE1-vpn-instance-vpn1] quit
[UPE1] ip vpn-instance vpn2
[UPE1-vpn-instance-vpn2] route-distinguisher 100:2
[UPE1-vpn-instance-vpn2] vpn-target 100:2 both
[UPE1-vpn-instance-vpn2] quit
[UPE1] interface vlan-interface 12
[UPE1-Vlan-interface12] ip binding vpn-instance vpn1
[UPE1-Vlan-interface12] ip address 10.2.1.2 24
[UPE1-Vlan-interface12] quit
[UPE1] interface vlan-interface 13
[UPE1-Vlan-interface13] ip binding vpn-instance vpn2
[UPE1-Vlan-interface13] ip address 10.4.1.2 24
[UPE1-Vlan-interface13] quit
```

Establish an MP-IBGP peer relationship with SPE 1.

```
[UPE1] bgp 100
[UPE1-bgp-default] peer 2.2.2.9 as-number 100
[UPE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[UPE1-bgp-default] address-family vpnv4
[UPE1-bgp-default-vpnv4] peer 2.2.2.9 enable
[UPE1-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 1.

```
[UPE1-bgp-default] ip vpn-instance vpn1
[UPE1-bgp-default-vpn1] peer 10.2.1.1 as-number 65410
[UPE1-bgp-default-vpn1] address-family ipv4 unicast
[UPE1-bgp-default-ipv4-vpn1] peer 10.2.1.1 enable
[UPE1-bgp-default-ipv4-vpn1] quit
[UPE1-bgp-default-vpn1] quit
```

Establish an EBGP peer relationship with CE 2.

```
[UPE1-bgp-default] ip vpn-instance vpn2
[UPE1-bgp-default-vpn2] peer 10.4.1.1 as-number 65420
[UPE1-bgp-default-vpn2] address-family ipv4 unicast
[UPE1-bgp-default-ipv4-vpn2] peer 10.4.1.1 enable
[UPE1-bgp-default-ipv4-vpn2] quit
[UPE1-bgp-default-vpn2] quit
[UPE1-bgp-default] quit
```

2. Configure CE 1.

```
<CE1> system-view
[CE1] interface vlan-interface 12
[CE1-Vlan-interface12] ip address 10.2.1.1 255.255.255.0
[CE1-Vlan-interface12] quit
[CE1] bgp 65410
[CE1-bgp-default] peer 10.2.1.2 as-number 100
[CE1-bgp-default] address-family ipv4 unicast
[CE1-bgp-default-ipv4] peer 10.2.1.2 enable
[CE1-bgp-default-ipv4] import-route direct
[CE1-bgp-default-ipv4] quit
[CE1-bgp-default] quit
```

3. Configure CE 2.

```
<CE2> system-view
[CE2] interface vlan-interface 13
[CE2-Vlan-interface13] ip address 10.4.1.1 255.255.255.0
[CE2-Vlan-interface13] quit
[CE2] bgp 65420
[CE2-bgp-default] peer 10.4.1.2 as-number 100
[CE2-bgp-default] address-family ipv4 unicast
[CE2-bgp-default-ipv4] peer 10.4.1.2 enable
[CE2-bgp-default-ipv4] import-route direct
[CE2-bgp-default-ipv4] quit
[CE2-bgp-default] quit
```

4. Configure UPE 2:

Configure basic MPLS and MPLS LDP to establish LDP LSPs.

```
<UPE2> system-view
[UPE2] interface loopback 0
[UPE2-Loopback0] ip address 4.4.4.9 32
[UPE2-Loopback0] quit
[UPE2] mpls lsr-id 4.4.4.9
[UPE2] mpls ldp
[UPE2-ldp] quit
[UPE2] interface vlan-interface 11
[UPE2-Vlan-interface11] ip address 172.2.1.1 24
[UPE2-Vlan-interface11] mpls enable
[UPE2-Vlan-interface11] mpls ldp enable
[UPE2-Vlan-interface11] quit
```

Configure the IGP protocol (OSPF, in this example).

```
[UPE2] ospf
```

```
[UPE2-ospf-1] area 0
[UPE2-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[UPE2-ospf-1-area-0.0.0.0] network 4.4.4.9 0.0.0.0
[UPE2-ospf-1-area-0.0.0.0] quit
[UPE2-ospf-1] quit
```

Configure VPN instances **vpn1** and **vpn2**, allowing CE 3 and CE 4 to access UPE 2.

```
[UPE2] ip vpn-instance vpn1
[UPE2-vpn-instance-vpn1] route-distinguisher 300:1
[UPE2-vpn-instance-vpn1] vpn-target 100:1 both
[UPE2-vpn-instance-vpn1] quit
[UPE2] ip vpn-instance vpn2
[UPE2-vpn-instance-vpn2] route-distinguisher 400:2
[UPE2-vpn-instance-vpn2] vpn-target 100:2 both
[UPE2-vpn-instance-vpn2] quit
[UPE2] interface vlan-interface 12
[UPE2-Vlan-interface12] ip binding vpn-instance vpn1
[UPE2-Vlan-interface12] ip address 10.1.1.2 24
[UPE2-Vlan-interface12] quit
[UPE2] interface vlan-interface 13
[UPE2-Vlan-interface13] ip binding vpn-instance vpn2
[UPE2-Vlan-interface13] ip address 10.3.1.2 24
[UPE2-Vlan-interface13] quit
```

Establish an MP-IBGP peer relationship with SPE 2.

```
[UPE2] bgp 100
[UPE2-bgp-default] peer 3.3.3.9 as-number 100
[UPE2-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[UPE2-bgp-default] address-family vpnv4
[UPE2-bgp-default-vpnv4] peer 3.3.3.9 enable
[UPE2-bgp-default-vpnv4] quit
```

Establish an EBGP peer relationship with CE 3.

```
[UPE2-bgp-default] ip vpn-instance vpn1
[UPE2-bgp-default-vpn1] peer 10.1.1.1 as-number 65430
[UPE2-bgp-default-vpn1] address-family ipv4 unicast
[UPE2-bgp-default-ipv4-vpn1] peer 10.1.1.1 enable
[UPE2-bgp-default-ipv4-vpn1] quit
[UPE2-bgp-default-vpn1] quit
```

Establish an EBGP peer relationship with CE 4.

```
[UPE2-bgp-default] ip vpn-instance vpn2
[UPE2-bgp-default-vpn2] peer 10.3.1.1 as-number 65440
[UPE2-bgp-default-vpn2] address-family ipv4 unicast
[UPE2-bgp-default-ipv4-vpn2] peer 10.3.1.1 enable
[UPE2-bgp-default-ipv4-vpn2] quit
[UPE2-bgp-default-vpn2] quit
[UPE2-bgp-default] quit
```

5. Configure CE 3.

```
<CE3> system-view
[CE3] interface vlan-interface 12
[CE3-Vlan-interface12] ip address 10.1.1.1 255.255.255.0
```

```
[CE3-Vlan-interface12] quit
[CE3] bgp 65430
[CE3-bgp-default] peer 10.1.1.2 as-number 100
[CE3-bgp-default] address-family ipv4 unicast
[CE3-bgp-default-ipv4] peer 10.1.1.2 enable
[CE3-bgp-default-ipv4] import-route direct
[CE3-bgp-default-ipv4] quit
[CE3-bgp-default] quit
```

6. Configure CE 4.

```
<CE4> system-view
[CE4] interface vlan-interface 13
[CE4-Vlan-interface13] ip address 10.3.1.1 255.255.255.0
[CE4-Vlan-interface13] quit
[CE4] bgp 65440
[CE4-bgp-default] peer 10.3.1.2 as-number 100
[CE4-bgp-default] address-family ipv4 unicast
[CE4-bgp-default-ipv4] peer 10.3.1.2 enable
[CE4-bgp-default-ipv4] import-route direct
[CE4-bgp-default-ipv4] quit
[CE4-bgp-default] quit
```

7. Configure SPE 1:

Configure basic MPLS and MPLS LDP to establish LDP LSPs.

```
<SPE1> system-view
[SPE1] interface loopback 0
[SPE1-LoopBack0] ip address 2.2.2.9 32
[SPE1-LoopBack0] quit
[SPE1] mpls lsr-id 2.2.2.9
[SPE1] mpls ldp
[SPE1-ldp] quit
[SPE1] interface vlan-interface 11
[SPE1-Vlan-interface11] ip address 172.1.1.2 24
[SPE1-Vlan-interface11] mpls enable
[SPE1-Vlan-interface11] mpls ldp enable
[SPE1-Vlan-interface11] quit
[SPE1] interface vlan-interface 12
[SPE1-Vlan-interface12] ip address 180.1.1.1 24
[SPE1-Vlan-interface12] mpls enable
[SPE1-Vlan-interface12] mpls ldp enable
[SPE1-Vlan-interface12] quit
```

Configure the IGP protocol (OSPF, in this example).

```
[SPE1] ospf
[SPE1-ospf-1] area 0
[SPE1-ospf-1-area-0.0.0.0] network 2.2.2.9 0.0.0.0
[SPE1-ospf-1-area-0.0.0.0] network 172.1.1.0 0.0.0.255
[SPE1-ospf-1-area-0.0.0.0] network 180.1.1.0 0.0.0.255
[SPE1-ospf-1-area-0.0.0.0] quit
[SPE1-ospf-1] quit
```

Configure VPN instances **vpn1** and **vpn2**.

```
[SPE1] ip vpn-instance vpn1
[SPE1-vpn-instance-vpn1] route-distinguisher 500:1
[SPE1-vpn-instance-vpn1] vpn-target 100:1 both
[SPE1-vpn-instance-vpn1] quit
[SPE1] ip vpn-instance vpn2
[SPE1-vpn-instance-vpn2] route-distinguisher 700:1
[SPE1-vpn-instance-vpn2] vpn-target 100:2 both
[SPE1-vpn-instance-vpn2] quit
```

Establish MP-IBGP peer relationships with SPE 2 and UPE 1, and specify UPE 1 as a UPE.

```
[SPE1] bgp 100
[SPE1-bgp-default] peer 1.1.1.9 as-number 100
[SPE1-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[SPE1-bgp-default] peer 3.3.3.9 as-number 100
[SPE1-bgp-default] peer 3.3.3.9 connect-interface loopback 0
[SPE1-bgp-default] address-family vpnv4
[SPE1-bgp-default-vpnv4] peer 3.3.3.9 enable
[SPE1-bgp-default-vpnv4] peer 1.1.1.9 enable
[SPE1-bgp-default-vpnv4] peer 1.1.1.9 upe
[SPE1-bgp-default-vpnv4] peer 1.1.1.9 next-hop-local
[SPE1-bgp-default-vpnv4] quit
```

Create BGP-VPN instances for VPN instances **vpn1** and **vpn2**, so the VPNv4 routes learned according to the RT attributes can be added into the BGP routing tables of the corresponding VPN instances.

```
[SPE1-bgp-default] ip vpn-instance vpn1
[SPE1-bgp-default-vpn1] quit
[SPE1-bgp-default] ip vpn-instance vpn2
[SPE1-bgp-default-vpn2] quit
[SPE1-bgp-default] quit
```

Advertise to UPE 1 the routes permitted by a routing policy (the routes of CE 3).

```
[SPE1] ip prefix-list hope index 10 permit 10.1.1.1 24
[SPE1] route-policy hope permit node 0
[SPE1-route-policy-hope-0] if-match ip address prefix-list hope
[SPE1-route-policy-hope-0] quit
[SPE1] bgp 100
[SPE1-bgp-default] address-family vpnv4
[SPE1-bgp-default-vpnv4] peer 1.1.1.9 upe route-policy hope export
[SPE1-bgp-default-vpnv4] quit
[SPE1-bgp-default] quit
```

8. Configure SPE 2:

Configure basic MPLS and MPLS LDP to establish LDP LSPs.

```
<SPE2> system-view
[SPE2] interface loopback 0
[SPE2-LoopBack0] ip address 3.3.3.9 32
[SPE2-LoopBack0] quit
[SPE2] mpls lsr-id 3.3.3.9
[SPE2] mpls ldp
[SPE2-ldp] quit
[SPE2] interface vlan-interface 12
```

```
[SPE2-Vlan-interface12] ip address 180.1.1.2 24
[SPE2-Vlan-interface12] mpls enable
[SPE2-Vlan-interface12] mpls ldp enable
[SPE2-Vlan-interface12] quit
[SPE2] interface vlan-interface 11
[SPE2-Vlan-interface11] ip address 172.2.1.2 24
[SPE2-Vlan-interface11] mpls enable
[SPE2-Vlan-interface11] mpls ldp enable
[SPE2-Vlan-interface11] quit
```

Configure the IGP protocol (OSPF, in this example).

```
[SPE2] ospf
[SPE2-ospf-1] area 0
[SPE2-ospf-1-area-0.0.0.0] network 3.3.3.9 0.0.0.0
[SPE2-ospf-1-area-0.0.0.0] network 172.2.1.0 0.0.0.255
[SPE2-ospf-1-area-0.0.0.0] network 180.1.1.0 0.0.0.255
[SPE2-ospf-1-area-0.0.0.0] quit
[SPE2-ospf-1] quit
```

Configure VPN instances **vpn1** and **vpn2**.

```
[SPE2] ip vpn-instance vpn1
[SPE2-vpn-instance-vpn1] route-distinguisher 600:1
[SPE2-vpn-instance-vpn1] vpn-target 100:1 both
[SPE2-vpn-instance-vpn1] quit
[SPE2] ip vpn-instance vpn2
[SPE2-vpn-instance-vpn2] route-distinguisher 800:1
[SPE2-vpn-instance-vpn2] vpn-target 100:2 both
[SPE2-vpn-instance-vpn2] quit
```

Establish MP-IBGP peer relationships with SPE 1 and UPE 2, and specify UPE 2 as a UPE.

```
[SPE2] bgp 100
[SPE2-bgp-default] peer 4.4.4.9 as-number 100
[SPE2-bgp-default] peer 4.4.4.9 connect-interface loopback 0
[SPE2-bgp-default] peer 2.2.2.9 as-number 100
[SPE2-bgp-default] peer 2.2.2.9 connect-interface loopback 0
[SPE2-bgp-default] address-family vpnv4
[SPE2-bgp-default-vpnv4] peer 2.2.2.9 enable
[SPE2-bgp-default-vpnv4] peer 4.4.4.9 enable
[SPE2-bgp-default-vpnv4] peer 4.4.4.9 upe
[SPE2-bgp-default-vpnv4] peer 4.4.4.9 next-hop-local
[SPE2-bgp-default-vpnv4] quit
```

Create BGP-VPN instances for VPN instances **vpn1** and **vpn2**, so the VPNv4 routes learned according to the RT attributes can be added into the BGP routing tables of the corresponding VPN instances.

```
[SPE2-bgp-default] ip vpn-instance vpn1
[SPE2-bgp-default-vpn1] quit
[SPE2-bgp-default] ip vpn-instance vpn2
[SPE2-bgp-default-vpn2] quit
[SPE2-bgp-default] quit
```

Advertise to UPE 2 the routes permitted by a routing policy (the routes of CE 1).

```
[SPE2] ip prefix-list hope index 10 permit  10.2.1.1 24
```

```
[SPE2] route-policy hope permit node 0
[SPE2-route-policy-hope-0] if-match ip address prefix-list hope
[SPE2-route-policy-hope-0] quit
[SPE2] bgp 100
[SPE2-bgp-default] address-family vpnv4
[SPE2-bgp-default-vpnv4] peer 4.4.4.9 upe route-policy hope export
[SPE2-bgp-default-vpnv4] quit
[SPE2-bgp-default] quit
```

Verifying the configuration

Verify that CE 1 and CE3 can learn each other's interface routes and can ping each other. CE 2 and CE 4 cannot learn each other's interface routes and cannot ping each other. (Details not shown.)

Example: Configuring an OSPF sham link

Network configuration

As shown in Figure 36, CE 1 and CE 2 belong to VPN 1. Configure an OSPF sham link between PE 1 and PE 2 so traffic between the CEs is forwarded through the MPLS backbone instead of the backdoor link.

Figure 36 Network diagram

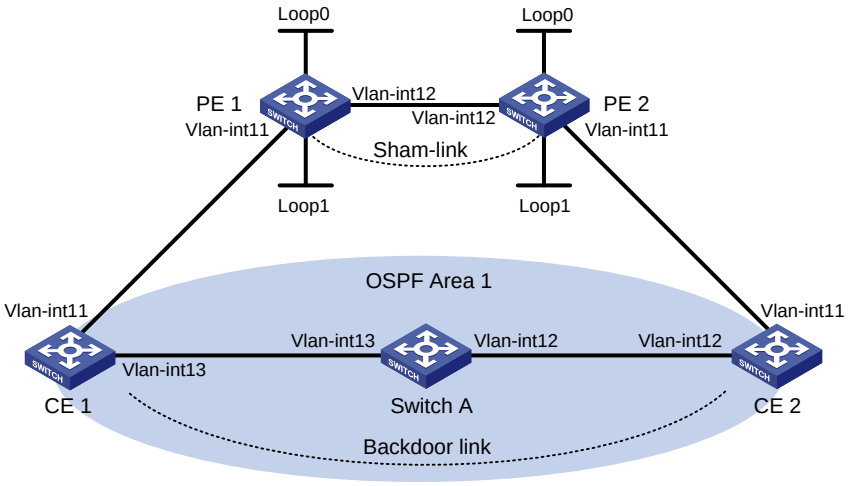

Table 22 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Vlan-int11	100.1.1.1/24	CE 2	Vlan-int11	120.1.1.1/24
	Vlan-int13	20.1.1.1/24		Vlan-int12	30.1.1.2/24
PE 1	Loop0	1.1.1.9/32	PE 2	Loop0	2.2.2.9/32
	Loop1	3.3.3.3/32		Loop1	5.5.5.5/32
	Vlan-int11	100.1.1.2/24		Vlan-int11	120.1.1.2/24
	Vlan-int12	10.1.1.1/24		Vlan-int12	10.1.1.2/24
Switch A	Vlan-int11	20.1.1.2/24			
	Vlan-int12	30.1.1.1/24			

Procedure

1. Configure OSPF on the customer networks:

   # Configure conventional OSPF on CE 1, Switch A, and CE 2 to advertise subnet addresses of the interfaces (see Figure 36Table 22). (Details not shown.)

   # Set the cost value to 2 for both the link between CE 1 and Switch A, and the link between CE 2 and Switch A. (Details not shown.)

   # Execute the **display ip routing-table** command to verify that CE 1 and CE 2 have learned the route to each other. (Details not shown.)

2. Configure MPLS L3VPN on the backbone:

   # Configure basic MPLS and MPLS LDP on PE 1 to establish LDP LSPs.

   ```
   <PE1> system-view
   [PE1] interface loopback 0
   [PE1-LoopBack0] ip address 1.1.1.9 32
   [PE1-LoopBack0] quit
   [PE1] mpls lsr-id 1.1.1.9
   [PE1] mpls ldp
   [PE1-ldp] quit
   [PE1] interface vlan-interface 12
   [PE1-Vlan-interface12] ip address 10.1.1.1 24
   [PE1-Vlan-interface12] mpls enable
   [PE1-Vlan-interface12] mpls ldp enable
   [PE1-Vlan-interface12] quit
   ```

   # Configure PE 1 to take PE 2 as an MP-IBGP peer.

   ```
   [PE1] bgp 100
   [PE1-bgp-default] peer 2.2.2.9 as-number 100
   [PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 0
   [PE1-bgp-default] address-family vpnv4
   [PE1-bgp-default-vpnv4] peer 2.2.2.9 enable
   [PE1-bgp-default-vpnv4] quit
   [PE1-bgp-default] quit
   ```

   # Configure OSPF on PE 1.

   ```
   [PE1]ospf 1
   [PE1-ospf-1]area 0
   [PE1-ospf-1-area-0.0.0.0]network 1.1.1.9 0.0.0.0
   [PE1-ospf-1-area-0.0.0.0]network 10.1.1.0 0.0.0.255
   [PE1-ospf-1-area-0.0.0.0]quit
   [PE1-ospf-1]quit
   ```

   # Configure basic MPLS and MPLS LDP on PE 2 to establish LDP LSPs.

   ```
   <PE2> system-view
   [PE2] interface loopback 0
   [PE2-LoopBack0] ip address 2.2.2.9 32
   [PE2-LoopBack0] quit
   [PE2] mpls lsr-id 2.2.2.9
   [PE2] mpls ldp
   [PE2-ldp] quit
   [PE2] interface vlan-interface 12
   [PE2-Vlan-interface12] ip address 10.1.1.2 24
   [PE2-Vlan-interface12] mpls enable
   ```

```
[PE2-Vlan-interface12] mpls ldp enable
[PE2-Vlan-interface12] quit
```

Configure PE 2 to take PE 1 as an MP-IBGP peer.

```
[PE2] bgp 100
[PE2-bgp-default] peer 1.1.1.9 as-number 100
[PE2-bgp-default] peer 1.1.1.9 connect-interface loopback 0
[PE2-bgp-default] address-family vpnv4
[PE2-bgp-default-vpnv4] peer 1.1.1.9 enable
[PE2-bgp-default-vpnv4] quit
[PE2-bgp-default] quit
```

Configure OSPF on PE 2.

```
[PE2]ospf 1
[PE2-ospf-1]area 0
[PE2-ospf-1-area-0.0.0.0]network 2.2.2.9 0.0.0.0
[PE2-ospf-1-area-0.0.0.0]network 10.1.1.0 0.0.0.255
[PE2-ospf-1-area-0.0.0.0]quit
[PE2-ospf-1]quit
```

3. Configure PEs to allow CE access:

Configure PE 1.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 100:1
[PE1-vpn-instance-vpn1] vpn-target 1:1
[PE1-vpn-instance-vpn1] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] ip binding vpn-instance vpn1
[PE1-Vlan-interface11] ip address 100.1.1.2 24
[PE1-Vlan-interface11] quit
[PE1] ospf 100 vpn-instance vpn1
[PE1-ospf-100] domain-id 10
[PE1-ospf-100] area 1
[PE1-ospf-100-area-0.0.0.1] network 100.1.1.0 0.0.0.255
[PE1-ospf-100-area-0.0.0.1] quit
[PE1-ospf-100] quit
[PE2] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] import-route ospf 100
[PE1-bgp-default-ipv4-vpn1] import-route direct
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Configure PE 2.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 100:2
[PE2-vpn-instance-vpn1] vpn-target 1:1
[PE2-vpn-instance-vpn1] quit
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] ip binding vpn-instance vpn1
```

```
[PE2-Vlan-interface11] ip address 120.1.1.2 24
[PE2-Vlan-interface11] quit
[PE2] ospf 100 vpn-instance vpn1
[PE2-ospf-100] domain-id 10
[PE2-ospf-100] area 1
[PE2-ospf-100-area-0.0.0.1] network 120.1.1.0 0.0.0.255
[PE2-ospf-100-area-0.0.0.1] quit
[PE2-ospf-100] quit
[PE2] bgp 100
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] import-route ospf 100
[PE2-bgp-default-ipv4-vpn1] import-route direct
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

Execute the **display ip routing-table vpn-instance** command on the PEs. Verify that the path to the peer CE is along the OSPF route across the customer networks, instead of the BGP route across the backbone. (Details not shown.)

4. Configure a sham link:

Configure PE 1.

```
[PE1] interface loopback 1
[PE1-LoopBack1] ip binding vpn-instance vpn1
[PE1-LoopBack1] ip address 3.3.3.3 32
[PE1-LoopBack1] quit
[PE1] ospf 100
[PE1-ospf-100] area 1
[PE1-ospf-100-area-0.0.0.1] sham-link 3.3.3.3 5.5.5.5
[PE1-ospf-100-area-0.0.0.1] quit
[PE1-ospf-100] quit
```

Configure PE 2.

```
[PE2] interface loopback 1
[PE2-LoopBack1] ip binding vpn-instance vpn1
[PE2-LoopBack1] ip address 5.5.5.5 32
[PE2-LoopBack1] quit
[PE2] ospf 100
[PE2-ospf-100] area 1
[PE2-ospf-100-area-0.0.0.1] sham-link 5.5.5.5 3.3.3.3
[PE2-ospf-100-area-0.0.0.1] quit
[PE2-ospf-100] quit
```

Verifying the configuration

Execute the **display ip routing-table vpn-instance** command on the PEs to verify the following results (details not shown):

- The path to the peer CE is now along the BGP route across the backbone.
- A route to the sham link destination address exists.

Execute the **display ip routing-table** command on the CEs. Verify that the next hop of the OSPF route to the peer CE is the interface connected to the PE (VLAN interface 11). This means that the VPN traffic to the peer CE is forwarded over the backbone. (Details not shown.)

Verify that a sham link has been established on PEs, for example, on PE 1.

```
[PE1] display ospf sham-link

          OSPF Process 100 with Router ID 100.1.1.2
                  Sham link
Area            Neighbor ID     Source IP       Destination IP  State  Cost
 0.0.0.1         120.1.1.2       3.3.3.3         5.5.5.5         P-2-P  1
```

Verify that the peer state is Full on PE 1.

```
[PE1] display ospf sham-link area 1

          OSPF Process 100 with Router ID 100.1.1.2

 Sham link: 3.3.3.3 --> 5.5.5.5
 Neighbor ID: 120.1.1.2        State: Full
 Area: 0.0.0.1
 Cost: 1  State: P-2-P  Type: Sham
 Timers: Hello 10, Dead 40, Retransmit 5, Transmit Delay 1
 Request list: 0  Retransmit list: 0
```

Example: Configuring BGP AS number substitution

Network configuration

As shown in Figure 37, CE 1 and CE 2 belong to VPN 1, and are connected to PE 1 and PE 2, respectively. The two CEs have the same AS number, 600.

Configure BGP AS number substitution on the PEs to enable the CEs to communicate with each other.

Figure 37 Network diagram

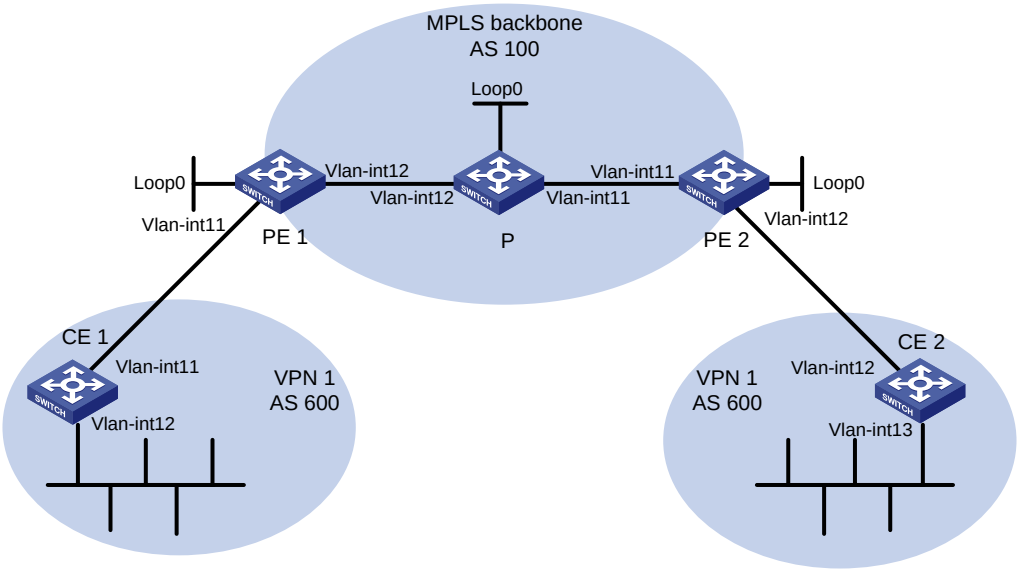

Table 23 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Vlan-int11	10.1.1.1/24	P	Loop0	2.2.2.9/32

Device	Interface	IP address	Device	Interface	IP address
	Vlan-int12	100.1.1.1/24		Vlan-int11	30.1.1.1/24
PE 1	Loop0	1.1.1.9/32		Vlan-int12	20.1.1.2/24
	Vlan-int11	10.1.1.2/24	PE 2	Loop0	3.3.3.9/32
	Vlan-int12	20.1.1.1/24		Vlan-int11	30.1.1.2/24
CE 2	Vlan-int12	10.2.1.1/24		Vlan-int12	10.2.1.2/24
	Vlan-int13	200.1.1.1/24			

Procedure

1. Configure basic MPLS L3VPN:
   - Configure OSPF on the MPLS backbone to allow the PEs and P device to learn the routes of the loopback interfaces from each other.
   - Configure basic MPLS and MPLS LDP on the MPLS backbone to establish LDP LSPs.
   - Establish an MP-IBGP peer relationship between the PEs to advertise VPNv4 routes.
   - Configure the VPN instance of VPN 1 on PE 2 to allow CE 2 to access the network.
   - Configure the VPN instance of VPN 1 on PE 1 to allow CE 1 to access the network.
   - Configure BGP as the PE-CE routing protocol, and redistribute routes of the CEs into the PEs.

   For more information about basic MPLS L3VPN configurations, see "Example: Configuring basic MPLS L3VPN."

   # Execute the **display ip routing-table** command on CE 2. The output shows that CE 2 has learned the route to network 10.1.1.0/24, where the interface used by CE 1 to access PE 1 resides. However, it has not learned the route to the VPN (100.1.1.0/24) behind CE 1.

```
<CE2> display ip routing-table

Destinations : 17        Routes : 17

```

Enable BGP update packet debugging on PE 2. The output shows that PE 2 has advertised the route for 100.1.1.1/32, and the AS_PATH is 100 600.

```
<PE2> terminal monitor
<PE2> terminal logging level 7
<PE2> debugging bgp update vpn-instance vpn1 10.2.1.1 ipv4
<PE2> refresh bgp all export ipv4 vpn-instance vpn1
*Jun 13 16:12:52:096 2012 PE2 BGP/7/DEBUG:
        BGP.vpn1: Send UPDATE to peer 10.2.1.1 for following destinations:
        Origin       : Incomplete
        AS Path      : 100 600
        Next Hop     : 10.2.1.2
        100.1.1.0/24,
```

Execute the **display bgp routing-table ipv4 peer received-routes** command on CE 2 to verify that CE 2 has not received the route to 100.1.1.0/24.

```
<CE2> display bgp routing-table ipv4 peer 10.2.1.2 received-routes

 Total number of routes: 2

 BGP local router ID is 200.1.1.1
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
               Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn
```

```
* >e 10.1.1.0/24        10.2.1.2                              0       100?
*  e 10.2.1.0/24        10.2.1.2        0                     0       100?
```

2. Configure BGP AS number substitution on PE 2.

```
<PE2> system-view
[PE2] bgp 100
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] peer 10.2.1.1 substitute-as
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] peer 10.2.1.1 enable
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

Verifying the configuration

The output shows that among the routes advertised by PE 2 to CE 2, the AS_PATH of 100.1.1.0/24 has changed from 100 600 to 100 100.

```
*Jun 13 16:15:59:456 2012 PE2 BGP/7/DEBUG:
        BGP.vpn1: Send UPDATE to peer 10.2.1.1 for following destinations:
        Origin       : Incomplete

```

Verify that the VLAN interfaces of CE 1 and CE 2 can ping each other. (Details not shown.)

Example: Configuring BGP AS number substitution and SoO attribute

Network configuration

CE 1, CE 2, and CE 3 belong to VPN 1, and are connected to PE1, PE 2, and PE 3, respectively.

CE 1 and CE 2 reside in the same site. CE1, CE2, and CE 3 all use AS number 600.

- To avoid route loss, configure BGP AS number substitution on PEs.
- To avoid routing loops, configure the same SoO attribute on PE 1 and PE 2 for CE 1 and CE 2.

Figure 38 Network diagram

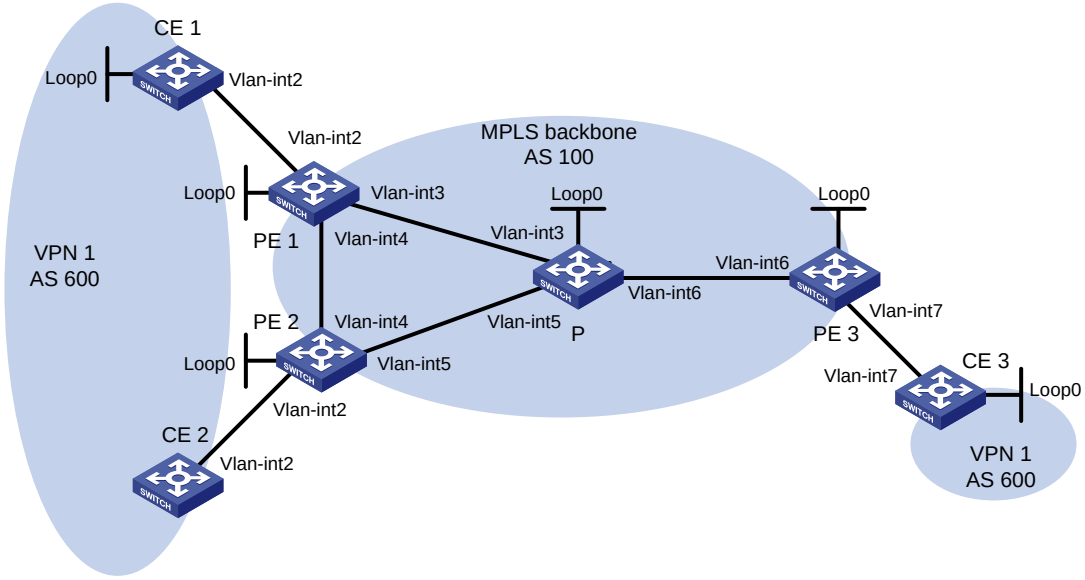

Table 24 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Loop0	100.1.1.1/32	CE 3	Loop0	200.1.1.1/32
	Vlan-int2	10.1.1.1/24		Vlan-int7	10.3.1.1/24

Device	Interface	IP address	Device	Interface	IP address
CE 2	Vlan-int2	10.2.1.1/24	PE 2	Loop0	2.2.2.9/32
PE 1	Loop0	1.1.1.9/32		Vlan-int2	10.2.1.2/24
	Vlan-int2	10.1.1.2/24		Vlan-int4	40.1.1.2/24
	Vlan-int3	30.1.1.1/24		Vlan-int5	50.1.1.1/24
	Vlan-int4	40.1.1.1/24	P	Loop0	3.3.3.9/32
PE 3	Loop0	4.4.4.9/32		Vlan-int3	30.1.1.2/24
	Vlan-int6	60.1.1.2/24		Vlan-int5	50.1.1.2/24
	Vlan-int7	10.3.1.2/24		Vlan-int6	60.1.1.1/24

Procedure

1. Configure basic MPLS L3VPN:
   - Configure OSPF on the MPLS backbone to allow the PEs and P device to learn the routes of the loopback interfaces from each other.
   - Configure basic MPLS and MPLS LDP on the MPLS backbone to establish LDP LSPs.
   - Establish an MP-IBGP peer relationship between the PEs to advertise VPN IPv4 routes.
   - Configure the VPN instance of VPN 1 on PE 1 to allow CE 1 to access the network.
   - Configure the VPN instance of VPN 1 on PE 2 to allow CE 2 to access the network.
   - Configure the VPN instance of VPN 1 on PE 3 to allow CE 3 to access the network.
   - Configure BGP as the PE-CE routing protocol, and redistribute routes of the CEs into the PEs.

   For more information about basic MPLS L3VPN configurations, see "Example: Configuring basic MPLS L3VPN."
2. Configure BGP AS number substitution:

   # Configure BGP AS number substitution on PE 1, PE 2, and PE 3. For more information about the configuration, see "Example: Configuring BGP AS number substitution."

   # Display routing information on CE 2. The output shows that CE 2 has learned the route for 100.1.1.1/32 from CE 1. A routing loop has occurred because CE1 and CE 2 reside in the same site.

```
<CE2> display bgp routing-table ipv4 peer 10.2.1.2 received-routes

 Total number of routes: 6

 BGP local router ID is 1.1.1.9
 Status codes: * - valid, > - best, d - dampened, h - history,
               s - suppressed, S - stale, i - internal, e - external
               a - additional-path
               Origin: i - IGP, e - EGP, ? - incomplete

     Network            NextHop         MED        LocPrf     PrefVal Path/Ogn

* >e 10.1.1.0/24        10.2.1.2                              0       100?
*    10.2.1.0/24        10.2.1.2        0                     0       100?
*    10.2.1.1/32        10.2.1.2        0                     0       100?
* >e 10.3.1.0/24        10.2.1.2                              0       100?
* >e 100.1.1.1/32       10.2.1.2                              0       100 100?
```

```
* >e 200.1.1.1/32       10.2.1.2                                0       100 100?
```

3. Configure BGP SoO attribute:

On PE 1, configure the SoO attribute as 1:100 for CE 1.

```
<PE1> system-view
[PE1] bgp 100
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] address-family ipv4
[PE1-bgp-default-ipv4-vpn1] peer 10.1.1.1 soo 1:100
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

On PE 2, configure the SoO attribute as 1:100 for CE 2.

```
<PE2> system-view
[PE2] bgp 100
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] address-family ipv4
[PE2-bgp-default-ipv4-vpn1] peer 10.2.1.1 soo 1:100
[PE2-bgp-default-ipv4-vpn1] quit
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

Verifying the configuration

PE 2 does not advertise routes received from CE 1 to CE 2 because the same SoO attribute has been configured for the CEs. Display the routing table of CE 2. The output shows that the route 100.1.1.1/32 has been removed.

```
<CE2> display ip routing-table

Example: Configuring MPLS L3VPN FRR through VPNv4 route backup for an IPv4 route

Network configuration

CE 1 and CE 2 belong to VPN 1.

Configure EBGP between CEs and PEs to exchange VPN routes.

Configure OSPF to ensure connectivity between PEs, and configure MP-IBGP to exchange VPNv4 routing information between PEs.

Configure MPLS L3VPN FRR on PE 2 to achieve the following purposes:

- When the link PE 2—CE 2 operates correctly, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—CE 2.
- When BFD detects that the link between PE 2 and CE 2 fails, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—PE 3—CE 2.

Figure 39 Network diagram

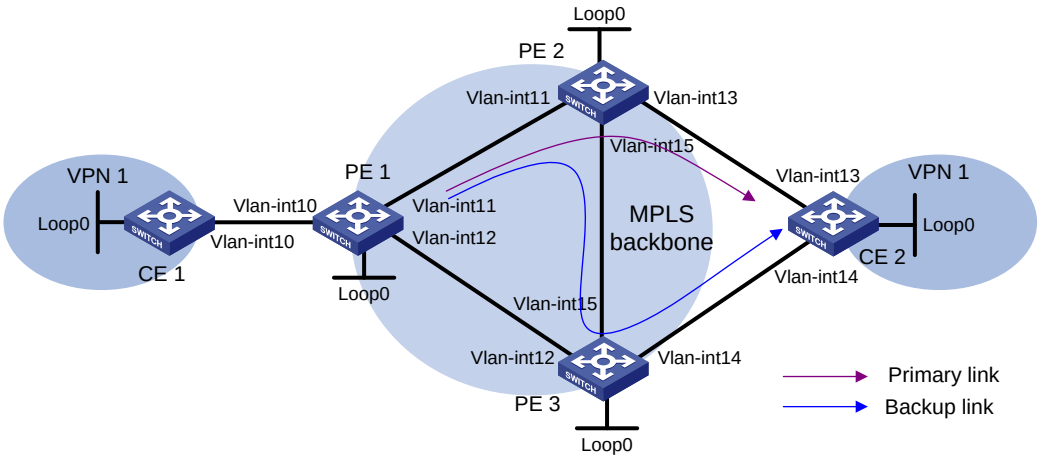

Table 25 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
CE 1	Loop0	5.5.5.5/32	PE 2	Loop0	2.2.2.2/32
	Vlan-int10	10.2.1.1/24		Vlan-int11	172.1.1.2/24
PE 1	Loop0	1.1.1.1/32		Vlan-int13	10.1.1.2/24
	Vlan-int10	10.2.1.2/24		Vlan-int15	172.3.1.2/24
	Vlan-int11	172.1.1.1/24	PE 3	Loop0	3.3.3.3/32
	Vlan-int12	172.2.1.1/24		Vlan-int12	172.2.1.3/24
CE 2	Loop0	4.4.4.4/32		Vlan-int14	10.3.1.2/24
	Vlan-int13	10.1.1.1/24		Vlan-int15	172.3.1.3/24
	Vlan-int14	10.3.1.1/24			

Procedure

1. Configure IP addresses and masks for interfaces as shown in Figure 39Table 25, and configure BGP and MPLS L3VPN. (Details not shown.)

For more information about configuring basic MPLS L3VPN, see "Example: Configuring basic MPLS L3VPN."

2. Configure MPLS L3VPN FRR on PE 2:

Configure the source IP address of BFD echo packets as 12.1.1.1.

```
<PE2> system-view
[PE2] bfd echo-source-ip 12.1.1.1
```

Create routing policy **frr**, and specify the backup next hop as 3.3.3.3 for the route to 4.4.4.4/32.

```
[PE2] ip prefix-list abc index 10 permit 4.4.4.4 32
[PE2] route-policy frr permit node 10
[PE2-route-policy-frr-10] if-match ip address prefix-list abc
[PE2-route-policy-frr-10] apply fast-reroute backup-nexthop 3.3.3.3
[PE2-route-policy-frr-10] quit
```

Use echo-mode BFD to detect the primary route connectivity.

```
[PE2] bgp 100
[PE2-bgp-default] primary-path-detect bfd echo
```

Configure FRR for VPN instance **vpn1** to use routing policy **frr**.

```
[PE2-bgp-default] ip vpn-instance vpn1
[PE2-bgp-default-vpn1] address-family ipv4 unicast
[PE2-bgp-default-ipv4-vpn1] fast-reroute route-policy frr
```

Specify the preferred value as 200 for BGP routes received from CE 2. This value is greater than the preferred value (0) for routes from PE 3, so PE 2 prefers the routes from CE 2.

```
[PE2-bgp-default-ipv4-vpn1] peer 10.1.1.1 preferred-value 200
[PE2-bgp-default-vpn1] quit
[PE2-bgp-default] quit
```

Verifying the configuration

Display detailed information about the route to 4.4.4.4/32 on PE 2. The output shows the backup next hop for the route.

```
[PE2] display ip routing-table vpn-instance vpn1 4.4.4.4 32 verbose

Configuring MPLS L2VPN

MPLS L2VPN provides point-to-point and point-to-multipoint connections. This chapter describes only the MPLS L2VPN technologies that provide point-to-point connections. For information about the MPLS L2VPN technologies that provide point-to-multipoint connections, see "Configuring VPLS."

About MPLS L2VPN

MPLS L2VPN is an implementation of Pseudo Wire Emulation Edge-to-Edge (PWE3). It offers Layer 2 VPN services over an MPLS or IP backbone. MPLS L2VPN can transparently transmit Layer 2 data for different data link layer protocols such as Ethernet and ATM.

Basic concepts of MPLS L2VPN

CE

A customer edge (CE) is a customer device directly connected to the service provider network.

PE

A provider edge (PE) is a service provider device connected to one or more CEs. It provides VPN access by mapping and forwarding packets between user networks and public tunnels.

AC

An attachment circuit (AC) is a link between a CE and a PE, such as an FR DLCI, ATM VPI/VCI, Ethernet interface, VLAN, or PPP connection.

PW

A Pseudowire (PW) is a virtual bidirectional connection between two PEs. An MPLS PW comprises a pair of LSPs in opposite directions.

Public tunnel

A public tunnel is a connection that carries one or more PWs across the MPLS or IP backbone. It can be an LSP tunnel, a GRE tunnel,.

Cross-connect

A cross-connect connects two physical or virtual circuits such as ACs and PWs. It switches packets between the two physical or virtual circuits. Cross-connects include AC to AC cross-connect, AC to PW cross-connect, and PW to PW cross-connect.

Site ID

A site ID uniquely identifies a site in a VPN. Sites in different VPNs can have the same site ID.

RD

A route distinguisher (RD) is added before a site ID to distinguish the sites that have the same site ID but reside in different VPNs. An RD and a site ID uniquely identify a VPN site.

Label block

A label block is a set of labels. It includes the following parameters:

- **Label base**—The LB specifies the initial label value of the label block. A PE automatically selects an LB value that cannot be manually modified.

- **Label range**—The LR specifies the number of labels that the label block contains. The LB and LR determine the labels contained in the label block. For example, if the LB is 1000 and the LR is 5, the label block contains labels 1000 through 1004.
- **Label-block offset**—The LO specifies the offset of a label block. If the existing label block becomes insufficient as the VPN sites increase, you can add a new label block to enlarge the label range. A PE uses an LO to identify the position of the new label block. The LO value of a label block is the sum of the LRs of all previously assigned label blocks. For example, if the LR and LO of the first label block are 10 and 0, the LO of the second label block is 10. If the LR of the second label block is 20, the LO of the third label block is 30.

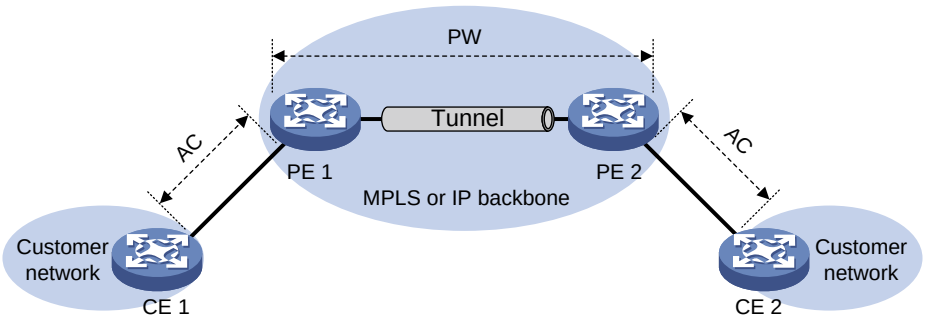
A label block with LB, LO, and LR as 1000, 10, and 5, respectively, is represented as 1000/10/5.

For example, a VPN has 10 sites, and a PE assigns the first label block LB1/0/10 to the VPN. When another 15 sites are added, the PE keeps the first label block and assigns the second label block LB2/10/15 to extend the network. LB1 and LB2 are the initial label values that are randomly selected by the PE.

Route target

PEs use the BGP route target attribute (also called VPN target attribute) to manage BGP L2VPN information advertisement. PEs support the following types of route target attributes:

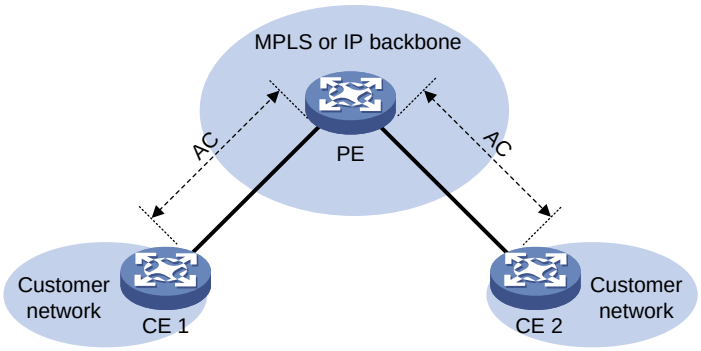
- **Export target attribute**—When a PE sends L2VPN information to the peer PE in a BGP update message, it sets the route target attribute in the update message to an export target. L2VPN information includes the site ID, RD, and label block.
- **Import target attribute**—When a PE receives an update message from the peer PE, it checks the route target attribute in the update message. If the route target value matches an import target, the PE accepts the L2VPN information in the update message.



Route target attributes determine from which PEs a PE can receive L2VPN information.

MPLS L2VPN network models

MPLS L2VPN network models include the remote connection and local connection models.



As shown in Figure 1, the remote connection model connects two CEs through a PW on an MPLS or IP backbone.

Figure 1 Remote connection model

As shown in Figure 2, the local connection model connects two CEs to the same PE so the CEs can communicate through the PE.

Figure 2 Local connection model

Remote connection establishment

To set up a remote MPLS L2VPN connection:

1. Set up a public tunnel to carry one or more PWs between PEs.
2. Set up a PW to connect customer networks.
3. Set up an AC between a PE and a CE.
4. Bind the AC to the PW.

After the PE receives packets from the AC, it adds the PW label into the packets and sends the packets to the peer PE through the public tunnel.

After the peer PE receives the packets from the public tunnel, it removes the PW label of the packets and forwards the packets to the AC bound to the PW.

Setting up a public tunnel

The public tunnel can be an LSP or GRE tunnel.

If multiple public tunnels exist between two PEs, you can configure a tunnel policy to control tunnel selection. For more information about tunnel policies, see "Configuring tunnel policies."

If a PW is established over an LSP tunnel, packets on the PW have two labels. The outer label is the public LSP tunnel label that MPLS uses to forward the packet to the peer PE. The inner label is the PW label that the peer PE uses to forward the packet to the destination CE.

Setting up a PW

PWs include static PWs, LDP PWs, BGP PWs, and Circuit Cross Connect (CCC) PWs.

- Static PW establishment

  To establish a static PW, configure the peer PE address, and the incoming and outgoing PW labels for the PW on the two PEs. Static PWs consume a small amount of resources but have complex configurations.

- LDP PW establishment

  To establish an LDP PW, configure LDP and specify the peer PE address on the two PEs. LDP defines a new FEC type named PW ID FEC for PEs to exchange PW-label bindings. The new FEC type uses a PW ID and a PW data encapsulation type to identify a PW. The PW ID is the ID of the PW between PEs. The PW data encapsulation type specifies the encapsulation type for data transmitted over the PW, such as ATM, FR, Ethernet, or VLAN. PEs advertise the PW label and PW ID FEC in label mapping messages to create a PW. Dynamic PWs have simple configurations but consume more resources than static PWs.

- BGP PW establishment

  To establish BGP PWs, BGP advertises label block information in an extended BGP update to PEs in the same VPN. Each PE uses the received label block information to calculate outgoing

labels and uses its own label block to calculate incoming labels. After two PEs complete label calculation, a BGP PW is established between them.

BGP PWs have the following features:

- **Simplified configuration**—There is no need to manually specify peer PEs. A PE automatically find peer PEs after receiving label block information from the peer PEs.
- **Reduced workload**—Label block advertisement enables assigning labels for multiple PWs at one time.

- CCC PW establishment

  To establish a CCC PW, manually specify the incoming and outgoing labels for the PW on the PEs, and create two static LSPs in opposite directions on P devices between PEs. There is no need to configure a public tunnel for the CCC PW. CCC employs only one level of label to transfer packets. The static LSPs on the P devices transfer data only for the CCC PW. They cannot be used by other connections or MPLS L3VPN.

Setting up an AC

Set up an AC by configuring a link layer connection between a PE and a CE.

An AC is an Ethernet service instance on a Layer 2 Ethernet interface or Layer 2 aggregate interface. It forwards packets that are received on the interface and meet the match criteria of the Ethernet service instance to the bound PW. If the match criterion is VLAN ID, the VLAN is unique on a per interface basis rather than on a global basis.

NOTE:

When VLANs are globally unique, packets with the same VLAN ID are forwarded over the PW bound with that VLAN ID regardless of the receiving interfaces. If VLANs are unique on a per interface basis, packets with the same VLAN ID from different interfaces can be forwarded over different PWs.

Binding the AC to the PW

Bind the Layer 3 physical interface, Layer 3 subinterface, or Ethernet service instance to the PW, so the PE forwards packets between the AC and the PW.

Local connection establishment

To set up a local MPLS L2VPN connection between two CEs:

1. Set up ACs:

   Configure the link layer protocol to set up an AC between the PE and each CE. For more information, see "Setting up an AC."

2. Bind the two ACs:

   Bind the PE's interfaces connected to the two CEs so the PE can forward packets between CEs.

TDM-CEM

Time Division Multiplexing Circuit Emulation (TDM-CEM) encapsulates TDM bit-streams as PWs over a Packet Switched Network (PSN).

PWE3 TDM-CEM has the following modes:

- **Structure Agnostic TDM over Packet (SAToP)**—Considers all TDM data as pure bit streams, and fragments and encapsulates the bit streams into packets. SAToP does not interpret TDM data or participate in the TDM signaling.
- **Circuit Emulation Service over PSN (CESoPSN)**—Identifies and processes the TDM frame format and signaling, and encapsulates the structured TDM data as packets.

TDM has the stringent clock requirements to deliver real-time synchronization services. PSN does not have the stringent clock requirements. To transport TDM services through PSN, use one of the following clock recovery modes on an egress PE to implement clock recovery:

- **Adaptive Clock Recovery (ACR)**—Based on packet arrival rate and jitter buffer fill level. ACR is used when the ingress and egress PEs do not have a common clock source.
- **Differential Clock Recovery (DCR)**—Based on time stamps received in RTP header. DCR is used when the ingress and egress PEs have a common clock source.

PW data encapsulation types

MPLS L2VPN transports Layer 2 data of different data link layer protocols through PWs. A PE encapsulates a Layer 2 packet received from an AC according to the PW data encapsulation type.

Relationship between AC types and PW data encapsulation types

The PW data encapsulation type is determined by the link type of the AC.

Table 1 Relationship between AC types and PW data encapsulation types

AC type	PW data encapsulation type
Ethernet	Ethernet
	VLAN

Ethernet over MPLS

Ethernet over MPLS uses MPLS L2VPN to connect Ethernets, and delivers Ethernet packets through a PW over the MPLS backbone.

The following PW data encapsulation types are available for Ethernet over MPLS:

- **Ethernet**—P-tag is not transferred on a PW.
  - For a packet from a CE:
    - If the packet contains a P-tag, the PE removes the P-tag, and adds a PW label and an outer tag into the packet before forwarding it.
    - If the packet contains no P-tag, the PE directly adds a PW label and an outer tag into the packet before forwarding it.
  - For a packet to a CE:
    - If the access mode is configured as VLAN by using the **ac interface** command, the PE adds a P-tag into the packet before sending it to the CE.
    - If the access mode is configured as Ethernet by using the **ac interface** command, the PE directly sends the packet to the CE.

    You cannot rewrite or remove existing tags.
- **VLAN**—Packets transmitted over a PW must carry a P-tag.
  - For a packet from a CE:
    - If the peer PE does not require the ingress to rewrite the P-tag, the PE keeps the P-tag unchanged for the packet, and then encapsulates the packet. If the packet contains no P-tag, the PE adds a null label (the label value is 0) into the packet, and then encapsulates the packet.
    - If the peer PE requires the ingress to rewrite the P-tag, the PE changes the P-tag to the expected VLAN tag (the tag value might be 0), and then adds a PW label and an outer tag into the packet. If the packet contains no P-tag, the PE adds a VLAN tag expected by the peer PE (the tag value might be 0), and then adds a PW label and an outer tag into the packet.
  - For a packet to a CE:

- If the access mode is configured as VLAN by using the **ac interface** command, the PE rewrites or retains the P-tag before forwarding the packet.
- If the access mode is configured as Ethernet by using the **ac interface** command, the PE removes the P-tag before forwarding the packet.

Ethernet over MPLS supports the following modes:

- **Port mode**—A Layer 3 Ethernet interface is bound to a PW. Packets received from the Layer 3 Ethernet interface are forwarded through the bound PW. The default PW data encapsulation type for port mode is Ethernet.

  Figure 3 Packet encapsulation in port mode

- **VLAN mode**—A Layer 3 Ethernet subinterface is bound to a PW. Packets received from the VLAN are forwarded through the bound PW. The peer PE can modify the VLAN tag as needed. The default PW data encapsulation type for VLAN mode is VLAN.
- **Flexible mode**—An Ethernet service instance on a Layer 2 Ethernet interface or Layer 2 aggregate interface is bound to a PW. Packets that are received from the interface and meet the match criteria of the Ethernet service instance are forwarded through the bound PW. You can configure flexible match criteria for the Ethernet service instance. For example, configure the Ethernet service instance to match all packets, tagged packets, or untagged packets. The default PW data encapsulation type for flexible mode is VLAN. Flexible mode can also implement the port and VLAN modes through match criteria configuration.

PPP/HDLC over MPLS

PPP/HDLC over MPLS uses MPLS L2VPN to connect PPPs or HDLC networks, and delivers PPP or HDLC packets through a PW over the MPLS backbone.

If the link type of the AC is PPP, the PW data encapsulation type is PPP. If the link type of the AC is HDLC, the PW data encapsulation type is HDLC.

PPP/HDLC over MPLS supports only the port mode. You can associate a Layer 3 interface whose encapsulation type is PPP or HDLC with a PW.

In a PPP/HDLC over MPLS network, a PE processes a PPP or HDLC packet as follows:

1. After receiving a packet from a Layer 3 interface, the PE searches for the PW bound to the interface.

2. The PE encapsulates the packet and sends the packet to the peer PE through the PW.

3. The peer PE removes the outer encapsulation to get the original PPP or HDLC packet, and then forwards the packet to the user network.

TDM-CEM

TDM-CEM uses MPLS L2VPN to deliver TDM packets through a PW over the MPLS backbone. If the link type of the AC is E1 or T1, the following PW data encapsulation types are available:

- **SAToP**—Provides unstructured, transparent TDM transport of E1 or T1 frames through a PW over the MPLS backbone. All time slots on an E1 or T1 interface are forwarded through the same PW. SAToP includes structure-agnostic E1 over packet and structure-agnostic T1 (DS1) over packet.

  After you create an unstructured CEM interface and bind it to a PW, all bit streams received from the interface are forwarded through the PW.
- **CESoPSN basic mode**—Provides structured TDM transport of E1 or T1 frames through a PW.

  After you create a structured CEM interface and bind it to a PW, the bit streams of the specified time slots received from the interface are forwarded through the PW.

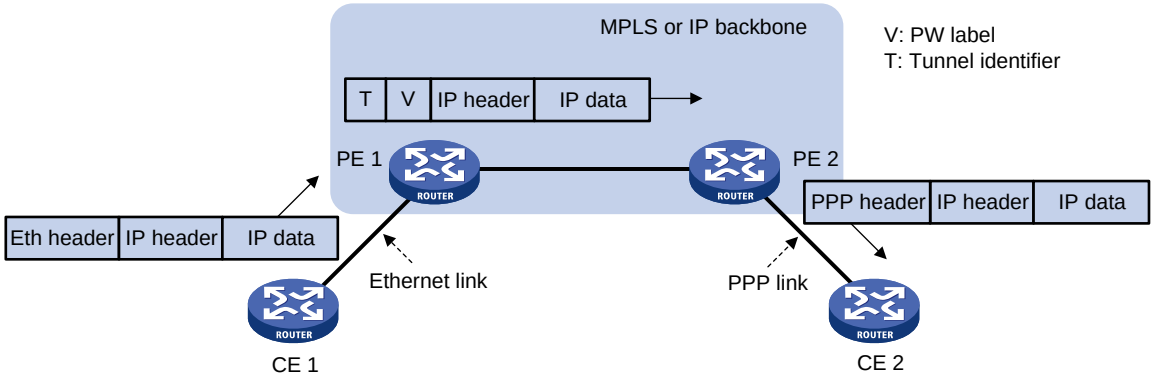
Control word

The control word field is between the MPLS label stack and the Layer 2 data. It carries control information for the Layer 2 frame, for example, the sequence number.

The control word feature has the following functions:

- Avoids fragment disorder. In multipath forwarding, fragments received might be disordered. The control word feature reorders the fragments according to the sequence number carried in the control word field.
- Transfers specific Layer 2 frame flags, such as the FECN bit and BECN bit of Frame Relay.
- Identifies the original payload length for packets that include padding.

When the PW data encapsulation type is FR DLCI or ATM AAL5 SDU VCC, packets on the PW always carry the control word field, and the control word feature cannot be disabled.



When the PW data encapsulation type is Ethernet or VLAN, the control word field is optional. You can configure whether to carry the control word field in packets sent on the PW. If you enable the control word feature on both PEs, packets transmitted on the PW carry the control word field. Otherwise, the packets do not carry the control word field.

MPLS L2VPN interworking

CEs might connect to PEs through various types of links, such as ATM, FR, HDLC, Ethernet, and PPP. MPLS L2VPN interworking connects such CEs and allow them to communicate.

MPLS L2VPN supports Ethernet interworking and IP interworking modes. The device only supports IP interworking. Only local MPLS L2VPN connections, static PWs, LDP PWs, and remote CCC connections support the interworking feature.

Figure 4 Ethernet to PPP interworking

As shown in Figure 4, a packet in an MPLS L2VPN interworking scenario is forwarded as follows:

2. CE 1 sends an Ethernet frame destined for CE 2 to PE 1.

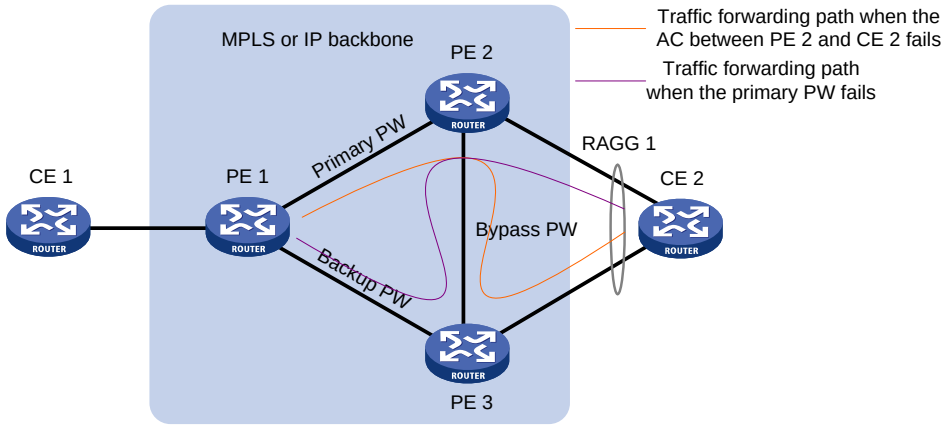
3. PE 1 checks whether the packet encapsulated in the received Ethernet frame is an IP packet.
   - If yes, PE 1 removes the Ethernet header, adds PW label V and tunnel label T to the IP packet, and forwards the packet to PE 2 through the tunnel.
   - If not, PE 1 drops the frame.

4. PE 2 obtains the output interface according to the PW label V in the received packet, removes the PW label, adds an PPP header, and forwards the PPP frame through the output interface to CE 2.

In an MPLS L2VPN interworking scenario, link layer negotiation packets cannot be delivered on the backbone network. Therefore, Layer 2 connections cannot be established between CEs. CEs must establish Layer 2 connections with the PEs. For example, CE 2 and PE 2 must perform PPP negotiation to establish a PPP connection.

Bypass PW

To resolve the problem, you can create a single bypass PW or double bypass PWs between PE 2 and PE 3.



Single bypass PW

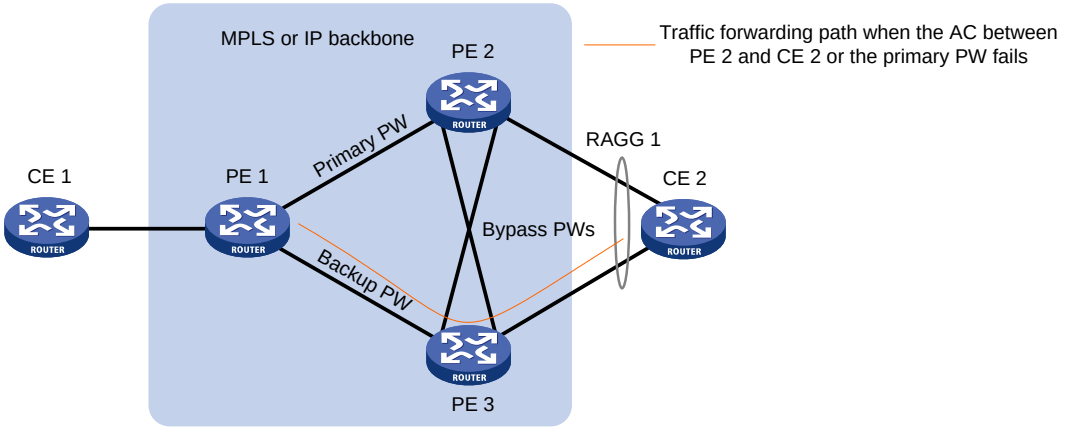
As shown in Figure 5, after you create a single bypass PW between PE 2 and PE 3, the bypass PW provides both PW bypass and AC bypass. Traffic is forwarded as follows:

- When the AC between PE 2 and CE 2 fails, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—PE 3—CE 2.
- When the primary PW fails, traffic from CE 2 to CE 1 goes through the path CE 2—PE 2—PE 3—PE 1—CE 1.

In a single bypass PW network, traffic is switched to the bypass PW instead of the backup PW when the AC or primary PW fails.

Figure 5 Single bypass PW

Double bypass PWs



Double bypass PWs refer to an AC-bypass PW used to forward traffic when the AC fails and a PW-bypass PW used to forward traffic when the primary PW fails. Compared with single bypass PWs, double bypass PWs reduce the traffic switchover time and provide higher reliability.

As shown in Figure 6, after you create double bypass PWs between PE 2 and PE 3, traffic is forwarded as follows:

- When the AC between PE 2 and CE 2 fails, traffic from CE 1 to CE 2 goes through the path CE 1—PE 1—PE 2—PE 3—CE 2. The traffic is forwarded from PE 2 to PE 3 through the AC-bypass PW. After the primary/backup PW switchover completes, the traffic is switched to the backup PW, so the final traffic forwarding path is CE 1—PE 1—PE 3—CE 2.

- When the primary PW fails, traffic from CE 2 to CE 1 goes through the path CE 2—PE 2—PE 3—PE 1—CE 1. The traffic is forwarded from PE 2 to PE 3 through the PW-bypass PW. . After the primary/backup PW switchover completes, the traffic is switched to the backup PW, so the final traffic forwarding path is CE 2—PE 3—PE 1—CE 1.

Figure 6 Double bypass PWs

MPLS L2VPN diagnostic troubleshooting

This feature identifies whether the MPLS L2VPN module functions correctly, for exampel, whether PWs have been established successfully and whether PW flapping has occurred to help you locate MPLS L2VPN exceptions. For more information about MPLS L2VPN diagnostic troubleshooting, see diagnostic troubleshooting configuration in *Network Management and Monitoring Configuration Guide*.

Restrictions and guidelines: MPLS L2VPN configuration

For this feature to take effect, use the **system-working-mode** command to set the system operating mode to advanced or expert and restart the device before you configure this feature. For more information about the **system-working-mode** command, see "Managing the device" in *Fundamentals Configuration Guide*.

MPLS L2VPN tasks at a glance

Configuring a remote connection

1. Enabling L2VPN
2. Configuring an AC

   Configuring an Ethernet service instance on an interface
3. Configuring a cross-connect
4. Configuring a PW

   Configure a static PW, LDP PW, BGP PW, and remote CCC connection as needed.
   - (Optional.) Configuring a PW class
   - Configuring a static PW

- Configuring an LDP PW
- Configuring a BGP PW
- Configuring a remote CCC connection

5. Binding an AC to a cross-connect
6. (Optional.) Maintaining an MPLS L2VPN network

   Enabling SNMP notifications for L2VPN PW

Configuring a local connection

1. Enabling L2VPN
2. Configuring an AC

   To create a local connection, you must configure two ACs.

   Configuring an Ethernet service instance on an interface
3. Configuring a cross-connect
4. Binding an AC to a cross-connect

   Perform this task to bind the two ACs to the same cross-connect.

Prerequisites for MPLS L2VPN

To establish an MPLS L2VPN, you must perform the following tasks:

1. Configure an IGP to achieve IP connectivity within the backbone.
2. Configure basic MPLS, or LDP to set up public tunnels across the backbone.

Enabling L2VPN

Prerequisites

Before you enable L2VPN, perform the following tasks:

- Configure an LSR ID for the PE with the **mpls lsr-id** command.
- Enable MPLS with the **mpls enable** command on the core-facing interface of the PE.

For more information about the **mpls lsr-id** and **mpls enable** commands, see *MPLS Command Reference*.

Procedure

1. Enter system view.

   system-view
2. Enable L2VPN.

   l2vpn enable

   By default, L2VPN is disabled.

Configuring an Ethernet service instance on an interface

About this task

When the PE is connected to a CE through a Layer 2 Ethernet interface or Layer 2 aggregate interface, you can configure an Ethernet service instance on the interface to match packets for the AC.

Restrictions and guidelines

For information about configuring the match criterion of an Ethernet service instance by using the **encapsulation** command, see MPLS L2VPN commands in *MPLS Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Create an Ethernet service instance and enter Ethernet service instance view.
   service-instance *instance-id*
4. Configure a packet match criterion for the Ethernet service instance.
   - Match packets with the specified inner VLAN IDs.
     encapsulation c-vid { *vlan-id* | *vlan-id-list* }
   - Match packets with the specified outer VLAN IDs.
     encapsulation s-vid { *vlan-id* | *vlan-id-list* } [**only-tagged**]
   - Match packets with the specified outer VLAN IDs and the specified inner VLAN IDs.
     encapsulation s-vid *vlan-id* **c-vid** { *vlan-id-list* | **all** }
   - Match packets that do not have a VLAN tag.
     encapsulation untagged

   By default, no packet match criterion is configured.

Configuring a cross-connect

1. Enter system view.
   system-view
2. Create a cross-connect group and enter cross-connect group view.
   xconnect-group *group-name*
3. (Optional.) Configure a description for the cross-connect group.
   description *text*

   By default, no description is configured for a cross-connect group.
4. (Optional.) Enable the cross-connect group.
   undo shutdown

By default, the cross-connect group is enabled.

5. Create a cross-connect and enter cross-connect view.

   connection *connection-name*

6. (Optional.) Set an MTU for the PW.

   mtu *size*

   The default MTU is 1500 bytes.

   The two PEs on an LDP PW must have the same MTU configured for the PW. Otherwise, the PW cannot come up.

Configuring a PW

Configuring a PW class

About this task

You can configure PW attributes such as the PW data encapsulation type and enable control word in a PW class. PWs with the same attributes can use the same PW class.

Procedure

1. Enter system view.

   system-view

2. Create a PW class and enter PW class view.

   pw-class *class-name*

   By default, no PW classes exist.

3. Enable control word.

   control-word enable

   By default, control word is disabled.

4. Specify the PW data encapsulation type.

   pw-type { **ethernet** | **vlan** }

   By default, the PW data encapsulation type is VLAN.

Configuring a static PW

1. Enter system view.

   system-view

2. Enter cross-connect group view.

   xconnect-group *group-name*

3. Enter cross-connect view.

   connection *connection-name*

4. Configure a static PW, and enter cross-connect PW view.

   peer *ip-address* **pw-id** *pw-id* **in-label** *label-value* **out-label** *label-value* [**pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *

Configuring an LDP PW

About this task

After an LDP PW is created, the PE automatically sends a targeted hello to create an LDP session to the peer PE. Then, the PE exchanges the PW ID FEC and PW label mapping with the peer.

Prerequisites

Before you configure an LDP PW, enable global and interface MPLS LDP on the PE. For information about MPLS LDP configuration, see "Configuring LDP."

Procedure

1. Enter system view.
   system-view
2. Enter cross-connect group view.
   xconnect-group *group-name*
3. Enter cross-connect view.
   connection *connection-name*
4. Configure an LDP PW, and enter cross-connect PW view.
   peer *ip-address* **pw-id** *pw-id* [**pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *

Configuring a BGP PW

Configuring BGP to advertise MPLS L2VPN label block information

1. Enter system view.
   system-view
2. Enable BGP instance and enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is disabled.
3. Configure the remote PE as a BGP peer.
   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*
   For more information about this command, see *Layer 3—IP Routing Command Reference*.
4. Create the BGP L2VPN address family and enter BGP L2VPN address family view.
   address-family l2vpn
5. Enable BGP to exchange BGP L2VPN information with the specified peer or peer group.
   peer { *group-name* | *ip-address* [*mask-length*] } **enable**
   By default, BGP cannot exchange BGP L2VPN information with any peer or peer group.
   For more information about this command, see *Layer 3—IP Routing Command Reference*.
6. Enable BGP to exchange label block information with the specified peer or peer group.
   peer { *group-name* | *ip-address* [*mask-length*] } **signaling** [**non-standard**]
   By default, BGP can exchange label block information with a BGP L2VPN peer or peer group by using RFC 4761 MP_REACH_NLRI.
7. Configure the BGP L2VPN address family.
   For more information, see "Configuring BGP L2VPN address family."
8. Reset BGP L2VPN sessions.

For more information, see "Resetting BGP sessions of L2VPN address family."

Creating a BGP PW

1. Enter system view.

   system-view

2. Enter cross-connect group view.

   xconnect-group *group-name*

3. Configure the cross-connect group to automatically discover neighbors and create PWs through BGP and enter auto-discovery cross-connect group view.

   auto-discovery bgp

   By default, a cross-connect group does not automatically discover neighbors or create PWs through BGP.

4. Configure an RD for the cross-connect group.

   route-distinguisher *route-distinguisher*

   By default, no RD is configured for the cross-connect group.

5. Configure route targets for the cross-connect group.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured for the cross-connect group.

6. (Optional.) Specify a PW class for the auto-discovery cross-connect group.

   pw-class *class-name*

   By default, no PW class is specified.

7. (Optional.) Set an MTU for the PW.

   mtu *size*

   The default MTU is 1500 bytes.

8. Create a local site and enter site view.

   site *site-id* [**range** *range-value*] [**default-offset** *default-offset*]

9. Create a cross-connect and enter auto-discovery cross-connect view.

   connection remote-site-id *remote-site-id*

   After you execute this command, a PW to the specified remote site is created and is bound to the cross-connect.

10. (Optional.) Specify a tunnel policy for the auto-discovery cross-connect.

    tunnel-policy *tunnel-policy-name*

    By default, no tunnel policy is specified.

Configuring BGP L2VPN address family

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

3. Enter BGP L2VPN address family view.

   address-family l2vpn

4. Permit the local AS number to appear in routes from the specified peer or peer group and specify the appearance times.

   peer { *group-name* | *ip-address* [*mask-length*] } **allow-as-loop** [*number*]

By default, the local AS number is not allowed in routes from a peer or peer group.

For more information about this command, see *Layer 3—IP Routing Command Reference*.

5. Enable route target-based filtering of incoming BGP L2VPN information.

   policy vpn-target

   By default, route target-based filtering of incoming BGP L2VPN information is enabled.

6. Configure BGP route reflection:

   a. Configure the router as a route reflector and specify a peer or peer group as its client.

      peer { *group-name* | *ip-address* [*mask-length*] } **reflect-client**

      By default, no route reflector or client is configured.

   b. Enable L2VPN information reflection between clients.

      reflect between-clients

      By default, L2VPN information reflection between clients is enabled.

   c. Configure the cluster ID of the route reflector.

      reflector cluster-id { *cluster-id* | *ip-address* }

      By default, a route reflector uses its own router ID as the cluster ID.

   d. Configure a filtering policy for reflected L2VPN information.

      rr-filter *ext-comm-list-number*

      By default, the route reflector does not filter reflected L2VPN information.

   For more information about the commands, see *Layer 3—IP Routing Command Reference*.

7. Configure optimal route selection delay.

   - Set the optimal route selection delay timer for an address family.

     route-select delay *delay-value*

   - Enable optimal route selection delay based on DOWN-to-UP peer state changes and set a delay timer.

     route-select suppress on-peer-up *milliseconds*

   By default, optimal route selection is not delayed.

   For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Resetting BGP sessions of L2VPN address family

To reset BGP sessions of the L2VPN address family, execute one of the following command in user view:

- Perform manual soft-reset for BGP sessions of the L2VPN address family.

  refresh bgp [**instance** *instance-name*] { *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **l2vpn**

- Reset BGP sessions of the L2VPN address family.

  reset bgp [**instance** *instance-name*] { *as-number* | *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **l2vpn**

For more information about the commands, see *Layer 3—IP Routing Command Reference*.

Configuring a remote CCC connection

Restrictions and guidelines

The outgoing label specified on a device must be the same as the incoming label specified on the next-hop device.

CCC connection settings such as the encapsulation type and control word feature must be consistent on the two PEs. Otherwise, the PEs might fail to forward packets over the CCC connection.

Procedure

1. Configure the PE devices of the CCC connection:
   a. Enter system view.
      system-view
   b. Enter cross-connect group view.
      xconnect-group *group-name*
   c. Enter cross-connect view.
      connection *connection-name*
   d. Create a remote CCC connection.
      ccc in-label *in-label-value* **out-label** *out-label-value* { **nexthop** *nexthop* | **out-interface** *interface-type interface-number* } [**pw-class** *class-name*]
      Use the **out-interface** keyword to specify the outgoing interface only on a point-to-point link. On other types of interfaces such as Layer 3 Ethernet interfaces and VLAN interfaces, you must use the **nexthop** keyword to specify the IP address of the next hop.
2. Configure P devices of the CCC connection:
   a. Enter system view.
      system-view
   b. Configure a static LSP for each direction of the CCC connection.
      static-lsp transit *lsp-name* **in-label** *in-label* { **nexthop** *next-hop-ip-address* | **outgoing-interface** *interface-type interface-number* } **out-label** *out-label*
      For more information about this command, see *MPLS Command Reference*.

Binding an AC to a cross-connect

About binding an AC to a cross-connect

On a Layer 2 Ethernet or Layer 2 aggregate interface, you can create an Ethernet service instance and bind it to a cross-connect. The Ethernet service instance matches packets received on that interface. The matching packets are then forwarded to the bound PW or another AC. An Ethernet service instance can match all packets, tagged packets, or untagged packets.

When you bind an AC to a cross-connect, you can associate Track with the AC. Then, the AC is up only when one or more of the associated track entries are positive.

Restrictions and guidelines for binding an AC to a cross-connect

If a Layer 2 Ethernet interface has been added to a link aggregation group, you cannot bind an Ethernet service instance on the interface to a cross-connect, and vice versa.

Binding an Ethernet service instance to a non-BGP cross-connect

1. Enter system view.
   system-view
2. Enter cross-connect group view.
   xconnect-group *group-name*
3. Enter cross-connect view.
   connection *connection-name*
4. Bind the Ethernet service instance on the interface to the cross-connect and enter cross-connect AC view.
   ac interface *interface-type interface-number*[**track** *track-entry-number*&<1-3>]
   By default, no Ethernet service instance is bound to the cross-connect.

Binding an Ethernet service instance to a BGP cross-connect

1. Enter system view.
   system-view
2. Enter cross-connect group view.
   xconnect-group *group-name*
3. Enter auto-discovery cross-connect group view.
   auto-discovery bgp
4. Enter site view.
   site *site-id* [**range** *range-value*] [**default-offset** *default-offset-value*]
5. Enter auto-discovery cross-connect view.
   connection remote-site-id *remote-site-id*
6. Bind the Ethernet service instance on the interface to the BGP cross-connect.
   ac interface *interface-type interface-number*[**track** *track-entry-number*&<1-3>]
   By default, no Ethernet service instance is bound to the BGP cross-connect.

Enabling SNMP notifications for L2VPN PW

About this task

This feature enables L2VPN to generate SNMP notifications when the device does not support L2VPN flow labels, or PW deletions, CCC up and down, PW switchovers, or PW status changes occur. For L2VPN event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for L2VPN PW.

snmp-agent trap enable l2vpn [**ccc-up-down** | **flow-label-nonsupport** | **pw-delete** | **pw-switch** | **pw-up-down**] *

By default, SNMP notifications for L2VPN PW are disabled.

Display and maintenance commands for MPLS L2VPN

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display BGP L2VPN peer group information.	**display bgp** [**instance** *instance-name*] **group l2vpn** [**group-name** *group-name*]
Display L2VPN label block information discovered by BGP.	**display bgp** [**instance** *instance-name*] **l2vpn signaling** [**peer** *ip-address* { **advertised** | **received** } | **route-distinguisher** *route-distinguisher* [**site-id** *site-id* [**label-offset** *label-offset* [**advertise-info**]]]]
Display BGP L2VPN peer information.	**display bgp** [**instance** *instance-name*] **peer l2vpn** [*ip-address mask-length* | **group-name** *group-name* **log-info** | *ip-address* { **log-info** | **verbose** } | **verbose**]
Display BGP L2VPN update group information.	**display bgp** [**instance** *instance-name*] **update-group l2vpn** [*ip-address*]
Display L2VPN label block information.	**display l2vpn bgp** [**peer** *ip-address* | **local**] [**xconnect-group** *group-name*] [**verbose**]
Display cross-connect forwarding information.	**display l2vpn forwarding** { **ac** | **pw** } [**xconnect-group** *group-name*] [**slot** *slot-number*] [**verbose]**
Display LDP PW label information.	**display l2vpn ldp** [**peer** *ip-address* [**pw-id** *pw-id*] | **xconnect-group** *group-name*] [**verbose**]
Display L2VPN PW information.	**display l2vpn pw** [**xconnect-group** *group-name*] [**protocol** { **bgp** | **ldp** | **static** }] [**verbose**]
Display L2VPN PW state machine information.	**display l2vpn pw state-machine** [**vsi** *vsi-name* | **xconnect-group** *group-name*]
Display PW class information.	**display l2vpn pw-class** [*class-name*]
Display Ethernet service instance information.	**display l2vpn service-instance** [**interface** *interface-type interface-number* [**service-instance** *instance-id*]] [**verbose**]
Display cross-connect group information.	**display l2vpn xconnect-group** [**name** *group-name*] [**verbose**]
Reset BGP sessions for L2VPN.	**reset bgp** [**instance** *instance-name*] { *as-number* | *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **l2vpn**

For more information about the **display bgp group l2vpn**, **display bgp peer l2vpn**, **display bgp update-group l2vpn**, and **reset bgp l2vpn** commands, see *Layer 3—IP Routing Command Reference*.

Configuring VPLS

About VPLS

Virtual Private LAN Service (VPLS) delivers a point-to-multipoint L2VPN service over an MPLS or IP backbone. The provider backbone emulates a switch to connect all geographically dispersed sites of each customer network. The backbone is transparent to the customer sites. The sites can communicate with each other as if they were on the same LAN.

Basic VPLS architecture

Figure 1 Basic VPLS architecture

As shown in Figure 1, the VPLS architecture mainly includes the following components:

- **CE**—A customer edge device is directly connected to the service provider network.
- **PE**—A provider edge device connects one or more CEs to the service provider network. A PE implements VPN access by mapping and forwarding packets between private networks and public network tunnels. A PE can be a UPE or NPE in a hierarchical VPLS.
- **AC**—An attachment circuit, physical or virtual, connects a CE and a PE, such as an Ethernet link or a VLAN.
- **PW**—A pseudowire is a bidirectional virtual connection between two PEs. An MPLS PW consists of two unidirectional MPLS LSPs in opposite directions.
- **Tunnel**—A tunnel can be an LSP tunnel, a GRE tunnel, . It carries one or more PWs over an IP/MPLS backbone. If a PW is carried on an LSP or MPLS TE tunnel, each packet on the PW contains two labels. The inner label is the PW label, which identifies the PW and ensures that the packet is forwarded to the correct VSI. The outer label is the public LSP or MPLS TE tunnel label, which ensures that the packet is correctly forwarded to the remote PE.
- **VPLS instance**—A customer network might contain multiple geographically dispersed sites (such as site 1 and site 3 in Figure 1.) The service provider uses VPLS to connect all the sites to

create a single Layer 2 VPN, which is referred to as a VPLS instance. Sites in different VPLS instances cannot communicate with each other at Layer 2.

- **VSI**—A virtual switch instance provides Layer 2 switching services for a VPLS instance on a PE. A VSI acts as a virtual switch that has all the functions of a conventional Ethernet switch, including source MAC address learning, MAC address aging, and flooding. VPLS uses VSIs to forward Layer 2 data packets in VPLS instances.

Creating a PW

In a VPLS network, PEs use PWs to forward packets among VPN sites.

A PW is created as follow:

1. Specify the address of the remote PE or configure an auto-discovery protocol to automatically find the remote PE. BGP is the most commonly used auto-discovery protocol.
2. Specify the incoming label and the outgoing label for the PW on the two PEs to create the PW. You can also use LDP or BGP to advertise the PW-label binding to the remote PE to establish the unidirectional LSPs. The PW is created once the two unidirectional LSPs are created.

PW types

PEs use PWs to forward packets among VPN sites. PWs include static PWs, LDP PWs, BGP PWs, and BGP auto-discovery LDP PWs.

Static PW

To create a static PW, specify the address of the remote PE, the incoming label, and the outgoing label.

LDP PW

To create an LDP PW, specify the address of the remote PE, and use LDP to advertise the PW-label binding to the remote PE. After the two PEs receive the PW-label binding from each other, they establish an LDP PW. The FEC type in the LDP message is PWid FEC Element that includes the PW ID field (FEC 128). The PW ID identifies the PW bound to the PW label.

BGP PW

To create a BGP PW, configure BGP to advertise label block information to the remote PE. After the two PEs receive label block information from each other, they use the label block information to calculate the incoming and outgoing labels and create the BGP PW. A PE also uses the received label block information to automatically find the remote PE.

BGP auto-discovery LDP PW

To create a BGP auto-discovery LDP PW, configure BGP to automatically find the remote PE, and use LDP to advertise the PW-label binding to the remote PE. After the two PEs receive the PW-label binding from each other, they establish a BGP auto-discovery LDP PW.

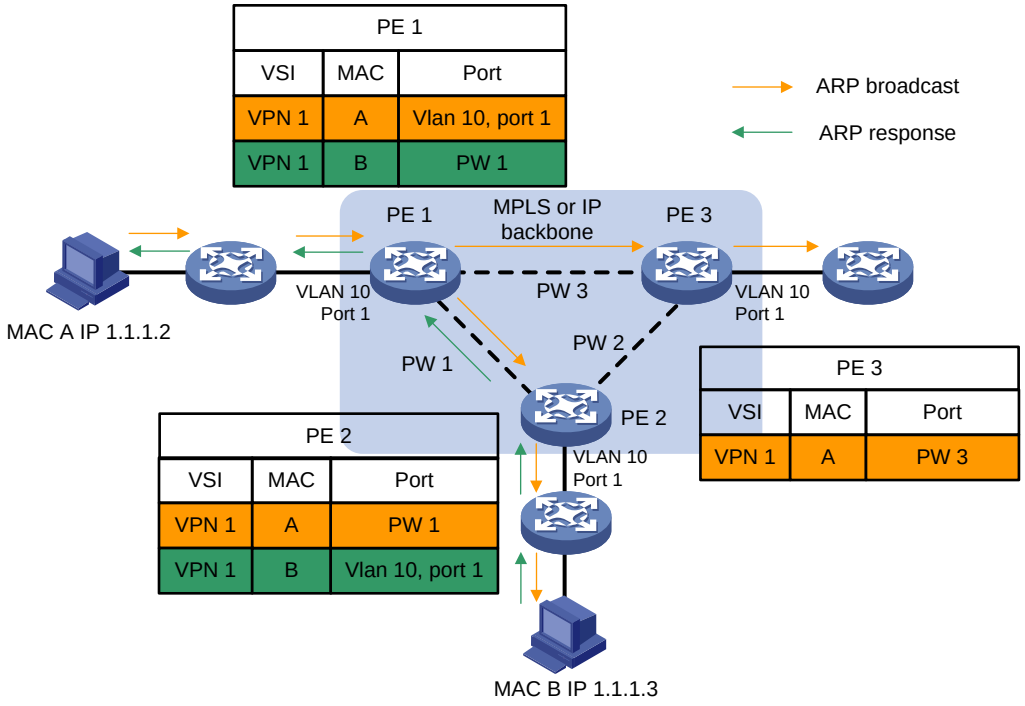
The information advertised by BGP includes the ID (for example, LSR ID) and VPLS ID of the advertising PE. The receiving PE compares the received VPLS ID with its own VPLS ID. If the two VPLS IDs are identical, the two PEs use LDP to establish a PW. If not, the PEs do not establish a PW. The FEC type in the LDP message is Generalized PWid FEC Element (FEC 129), which contains the VPLS ID, Source Attachment Individual Identifier (SAII), and Target Attachment Individual Identifier (TAII). The SAII is the LSR ID of the advertising PE. The TAII identifies the remote PE and is advertised by the remote PE. VPLS ID+SAII+TAII uniquely identifies a PW in a VPLS instance.

MAC address learning, aging, and withdrawal

Source MAC address learning

VPLS provides reachability through source MAC learning. A PE maintains a MAC address table for each VSI.

As shown in Figure 2, a PE learns source MAC addresses in the following ways:



- Learning the source MAC addresses of directly connected sites.

  If the source MAC address of a packet from a CE does not exist in the MAC address table, the PE learns the source MAC address of the AC connected to the CE.

- Learning the source MAC addresses of remote sites connected through PWs.

  A VSI regards a PW as a logical Ethernet interface. If the source MAC address of a packet from a PW does not exist in the MAC address table, the PE learns the source MAC address on the PW of the VSI.

Figure 2 Source MAC address learning on a PE

MAC address aging

The MAC address table uses an aging timer for each dynamic MAC address entry. If no packet is received from a MAC address before the aging timer expires, VPLS deletes the MAC address.

MAC address withdrawal

When an AC or a PW goes down, the PE deletes MAC addresses on the AC or PW. Then it sends an LDP address withdrawal message to notify all other PEs in the VPLS instance to delete those MAC addresses.

Traffic forwarding and flooding

Unicast traffic forwarding and flooding

After a PE receives a unicast packet from an AC, the PE searches the MAC address table of the VSI bound to the AC for packet forwarding.

- If a match is found, the PE forwards the packet according to the matching entry.
  - If the outgoing interface in the entry is a PW, the PE inserts the PW label to the packet, and adds the public tunnel header to the packet. It then forwards the packet to the remote PE over the PW. If the PW is carried on an LSP tunnel, each packet on the PW contains two labels. The inner label is the PW label, which identifies the PW and ensures that the packet is forwarded to the correct VSI. The outer label is the public LSP tunnel label, which ensures that the packet is correctly forwarded to the remote PE.
  - If the outgoing interface in the entry is a local interface, the PE directly forwards the packet to the local interface.
- If no match is found, the PE floods the packet to all other ACs and PWs in the VSI.

After a PE receives a unicast packet from a PW, the PE searches the MAC address table of the VSI bound to the PW for packet forwarding.

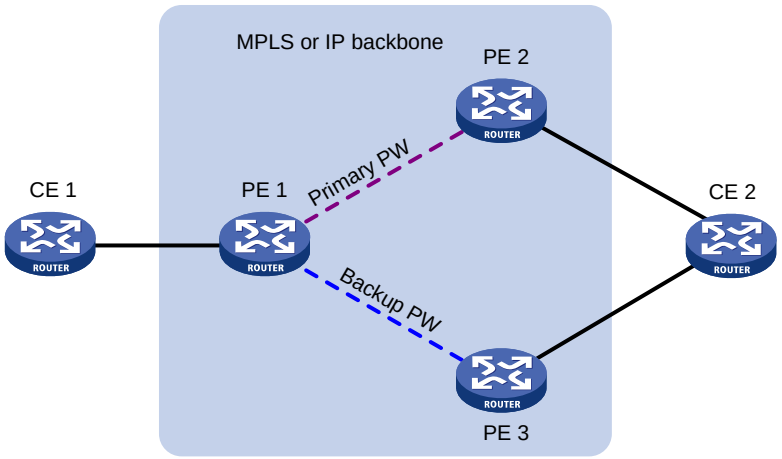
- If a match is found, the PE forwards the packet through the outgoing interface in the matching entry.
- If no match is found, the PE floods the packet to all ACs in the VSI.

Multicast and broadcast traffic forwarding and flooding

After a PE receives a multicast or broadcast packet from an AC, the PE floods the packet to all other ACs and the PWs in the VSI bound to the AC.

After a PE receives a multicast or broadcast packet from a PW, the PE floods the packet to all ACs in the VSI bound to the PW.

PW full mesh and split horizon



A Layer 2 network requires a loop prevention protocol such as STP to avoid loops. However, a loop prevention protocol on PEs brings management and maintenance difficulties. Therefore, VPLS uses the following methods to prevent loops:

- **Full mesh**—Every two PEs in a VPLS instance must establish a PW. The PWs form a full mesh among PEs in the VPLS instance.
- **Split horizon**—A PE does not forward packets received from a PW to any other PWs in the same VSI but only forwards those packets to ACs.

PW redundancy

PW redundancy provides redundant links between PEs so that the customer networks can communicate when the path over one PW fails. As shown in Figure 3, PE 1 establishes two PWs (one primary and one backup). The CEs communicate through the primary PW. When the primary PW fails, PE 1 brings up the backup PW and forwards packets from CE 1 to CE 2 through the backup PW. When CE 2 receives the packets, it updates its MAC address table, so that packets from CE 2 to CE 1 also travel through the backup PW. Only static PWs and LDP PWs support PW redundancy.

Figure 3 PW redundancy

VPLS determines whether the primary PW fails according to the LDP session status or the BFD result. The backup PW is used when one of the following conditions exists:

- The public tunnel of the primary PW is deleted, or BFD detects that the public tunnel has failed.
- The primary PW is deleted because the LDP session between PEs goes down, or BFD detects that the primary PW has failed.
- A manual PW switchover is performed.

A PW can be in either of the following states:

- **Active**—The PW is in active state and can forward packets.
- **Standby**—The PW is in standby state and cannot forward packets.

LDP PWs support the independent and master/slave PW redundancy operation modes.

- **Independent mode**—The two PEs of a PW use LDP to advertise their respective PW active/standby state to each other. A PW can forward traffic only when it is up and active at both ends of the PW. In this mode, make sure both PEs of a PW use the independent PW redundancy operation mode.
- **Master/slave mode**—One PE of a PW operates as the master node and the other PE operates as the slave node. The master PE determines the PW active/standby state and then uses LDP to advertise the PW state to the slave PE. The slave PE uses the same PW state as the master PE based on the information received from the master PE. In this way, the master and slave PEs for the set of redundant PWs can use the same active PW to forward user packets.

  A slave node does not advertise the PW active/standby state to the master node, and the master node ignores the PW active/standby state received from the slave nodes.

Restrictions and guidelines: VPLS configuration

A PE does not transmit LACP and LLDP packets through the VPLS network.

If a PE is enabled with the spanning tree feature, the PE does not transmit BPDUs through the VPLS network. To enable the PE to transmit BPDUs through the VPLS network, use the **`stp transparent enable`** command to enable BPDU transparent transmission for the PE. For more information about the **`stp transparent enable`** command, see STP commands in *Layer 2—LAN Switching Command Reference*.

The next-hop outgoing interface on the public network on the PW side cannot be a Layer 3 Ethernet subinterface.

VPLS tasks at a glance

Perform the following configuration tasks on a PE:

1. Enabling L2VPN
2. Configuring an AC
3. Configuring a VSI
4. Configuring a PW

   Choose the following tasks as needed:

   - (Optional.) Configuring a PW class
   - Configuring a static PW
   - Configuring an LDP PW
   - Configuring a BGP PW
   - Configuring a BGP auto-discovery LDP PW
   - (Optional.) Configuring the BGP L2VPN address family

     You can configure this task to control route advertisement and selection in BGP L2VPN address family when you configure a BGP PW or BGP auto-discovery LDP PW.
   - (Optional.) Maintaining BGP sessions

     If BGP configuration is changed, you can reset or soft-reset BGP sessions to validate the new configuration for BGP PWs and BGP auto-discovery LDP PWs.
5. Binding an AC to a VSI
6. (Optional.) Configuring PW redundancy
7. (Optional.) Configuring MAC address learning
8. (Optional.) Enabling VPLS statistics
9. (Optional.) Enabling SNMP notifications for L2VPN PW

Prerequisites for VPLS

To configure a VPLS network, perform the following tasks:

- Configure an IGP to ensure IP connectivity within the backbone.
- Configure basic MPLS, LDP, GRE, to establish public tunnels on the backbone network.

If the public tunnel is a GRE tunnel, perform the following tasks:

- Configure an LSR ID for the PE by using the **`mpls lsr-id`** command.
- Enable MPLS with the **`mpls enable`** command on the backbone interface of the PE.

For more information about the **`mpls lsr-id`** and **`mpls enable`** commands, see *MPLS Command Reference*.

Enabling L2VPN

1. Enter system view.

   `system-view`
2. Enable L2VPN.

   `l2vpn enable`

   By default, L2VPN is disabled.

Configuring an AC

Configuring an Ethernet service instance

About this task

When the PE is connected to a CE through a Layer 2 Ethernet or Layer 2 aggregate interface, configure an Ethernet service instance on the interface to match packets from the AC. The Ethernet service instance provides flexible methods for matching packets to be forwarded in the VSI.

Restrictions and guidelines

For information about configuring the match criterion of an Ethernet service instance by using the **encapsulation** command, see VPLS commands in *MPLS Command Reference*.

Procedure

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view.
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view.
     interface bridge-aggregation *interface-number*
3. Create an Ethernet service instance and enter Ethernet service instance view.
   service-instance *instance-id*
4. Configure a packet match criterion for the Ethernet service instance.
   - Match packets with the specified inner VLAN IDs.
     encapsulation c-vid { *vlan-id* | *vlan-id-list* }
   - Match packets with the specified outer VLAN IDs.
     encapsulation s-vid { *vlan-id* | *vlan-id-list* } [**only-tagged**]
   - Match packets with the specified outer VLAN ID and inner VLAN IDs.
     encapsulation s-vid *vlan-id* **c-vid** { *vlan-id-list* | **all** }
   - Match packets that have a VLAN tag or packets that do not have a VLAN tag.
     encapsulation untagged

   By default, no packet match criterion is configured.

Configuring a VSI

1. Enter system view.
   system-view
2. Create a VSI and enter VSI view.
   vsi *vsi-name*
3. (Optional.) Configure a description for the VSI.
   description *text*

   By default, no description is configured for a VSI.
4. (Optional.) Set the default PW ID for the VSI.
   default-pw-id *default-pw-id*

By default, no default PW ID is configured for the VSI.

5. Set an MTU for the VSI.

   mtu *size*

   By default, the MTU of a VSI is 1500 bytes.

   This command takes effect only on protocol packets and does not take effect on forwarded data packets.

6. (Optional.) Enable the VSI.

   undo shutdown

   By default, a VSI is enabled.

Configuring a PW

Configuring a PW class

About this task

In a PW class, you can configure PW attributes such as the PW data encapsulation type. To simplify PW configuration, you can configure PWs with the same attributes by referencing the same PW class.

Procedure

1. Enter system view.

   system-view

2. Create a PW class and enter PW class view.

   pw-class *class-name*

   By default, no PW classes exist.

3. (Optional.) Specify the PW data encapsulation type.

   pw-type { **ethernet** | **vlan** } [**force-for-vpls**]

   By default, the PW data encapsulation type is VLAN.

Configuring a static PW

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Specify static signaling for PWs, and enter VSI static view.

   pwsignaling static

   By default, no PW signaling protocol is specified.

4. Configure a static PW, and enter VSI static PW view.

   peer *ip-address* [**pw-id** *pw-id*] **in-label** *label-value* **out-label** *label-value* [**no-split-horizon** | **pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *

Parameter	Description
pw-id *pw-id*	If both the default PW ID in the **default-pw-id** command and a PW ID in the **peer** command are configured, the PW ID in the **peer** command is used. If only the default PW ID is configured, the default PW ID is used. If no default PW ID is configured, you must provide a PW ID in the **peer** command.
no-split-horizon	You must specify the **no-split-horizon** keyword to disable split horizon when you configure an NPE to establish a U-PW with a UPE.

Configuring an LDP PW

Prerequisites

Before you configure an LDP PW, enable global and interface MPLS LDP on the PE. For information about MPLS LDP configuration, see "Configuring LDP."

Procedure

1. Enter system view.

   system-view
2. Enter VSI view.

   vsi *vsi-name*
3. Specify LDP signaling for PWs, and enter VSI LDP signaling view.

   pwsignaling ldp

   By default, no PW signaling protocol is specified.
4. Configure an LDP PW, and enter VSI LDP PW view.

   peer *ip-address* [**pw-id** *pw-id*] [**no-split-horizon** | **pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *

Parameter	Description
pw-id *pw-id*	If both the default PW ID in the **default-pw-id** command and a PW ID in the **peer** command are configured, the PW ID in the **peer** command is used. If only the default PW ID is configured, the default PW ID is used. If no default PW ID is configured, you must provide a PW ID in the **peer** command.
no-split-horizon	You must specify the **no-split-horizon** keyword to disable split horizon when you configure an NPE to establish a U-PW with a UPE.

Configuring a BGP PW

Configuring BGP to advertise VPLS label block information

1. Enter system view.

   system-view
2. Enable BGP instance and enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is disabled.

For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

3. Configure the remote PE as a BGP peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

   For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

4. Create the BGP L2VPN address family and enter BGP L2VPN address family view.

   address-family l2vpn

5. Enable BGP to exchange L2VPN information with the specified peer or peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, BGP cannot exchange L2VPN information with any peer or peer group.

   For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

6. Enable BGP to exchange label block information with the specified peer or peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **signaling**

   By default, BGP can exchange label block information with a BGP L2VPN peer or peer group.

7. (Optional.) Configure the BGP L2VPN address family.

   For more information, see "Configuring the BGP L2VPN address family."

8. (Optional.) Maintain BGP sessions.

   For more information, see "Maintaining BGP sessions."

Creating a BGP PW

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Configure the VSI to automatically discover neighbors through BGP and enter auto-discovery VSI view.

   auto-discovery bgp

   By default, a VSI does not automatically discover neighbors through BGP.

4. Configure an RD for the auto-discovery VSI.

   route-distinguisher *route-distinguisher*

   By default, no RD is configured for the auto-discovery VSI.

5. Configure route targets for the auto-discovery VSI.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured for the auto-discovery VSI.

6. (Optional.) Specify a PW class for the auto-discovery VSI.

   pw-class *class-name*

   By default, no PW class is specified.

7. (Optional.) Specify a tunnel policy for the auto-discovery VSI.

   tunnel-policy *tunnel-policy-name*

   By default, no tunnel policy is specified.

8. Use BGP to create a PW to an automatically discovered remote PE and enter auto-discovery VSI BGP signaling view.

   signaling-protocol bgp

By default, no signaling protocol is specified.

9. Create a local site.

   site *site-id* [**range** *range-value*] [**default-offset** *default-offset*]

Configuring a BGP auto-discovery LDP PW

Prerequisites for configuring a BGP auto-discovery LDP PW

Before you perform this configuration, enable MPLS LDP on interfaces and globally. For more information, see "Configuring LDP."

Configuring BGP to advertise VPLS PE information

1. Enter system view.

   system-view

2. Enable BGP instance and enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is disabled.

   For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

3. Configure the remote PE as a BGP peer.

   peer { *group-name* | *ip-address* [*mask-length*] } **as-number** *as-number*

   For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

4. Create the BGP L2VPN address family and enter BGP L2VPN address family view.

   address-family l2vpn

5. Enable BGP to exchange VPLS PE information with the specified peer or peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **enable**

   By default, BGP cannot exchange VPLS PE information with a peer or peer group.

   For more information about this command, see BGP in *Layer 3—IP Routing Command Reference*.

6. Enable BGP to exchange VPLS PE information with the specified peer or peer group.

   peer { *group-name* | *ip-address* [*mask-length*] } **auto-discovery** [**non-standard**]

   By default, BGP can exchange VPLS PE information with a BGP L2VPN peer or peer group by using RFC 6074 MP_REACH_NLRI.

7. (Optional.) Configure the BGP L2VPN address family.

   For more information, see "Configuring the BGP L2VPN address family."

8. (Optional.) Maintain BGP sessions.

   For more information, see "Maintaining BGP sessions."

Creating a BGP auto-discovery LDP PW

1. Enter system view.

   system-view

2. Enter VSI view.

   vsi *vsi-name*

3. Configure the VSI to automatically discover neighbors through BGP and enter auto-discovery VSI view.

   auto-discovery bgp

By default, a VSI does not automatically discover neighbors through BGP.

4. Configure an RD for the auto-discovery VSI.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for the auto-discovery VSI.
5. Configure route targets for the auto-discovery VSI.
   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]
   By default, no route targets are configured for the auto-discovery VSI.
6. (Optional.) Specify a PW class for the auto-discovery VSI.
   pw-class *class-name*
   By default, no PW class is specified.
7. (Optional.) Specify a tunnel policy for the auto-discovery VSI.
   tunnel-policy *tunnel-policy-name*
   By default, no tunnel policy is specified.
8. Use LDP to create a PW to an automatically discovered remote PE and enter auto-discovery VSI LDP signaling view.
   signaling-protocol ldp
   By default, no signaling protocol is specified.
9. Configure a VPLS ID for the VSI.
   vpls-id *vpls-id*
   By default, no VPLS ID is configured.

Configuring the BGP L2VPN address family

About this task

When you configure a BGP PW or a BGP auto-discovery LDP PW, you can perform this task to control route advertisement and selection in the BGP L2VPN address family.

Procedure

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP L2VPN address family view.
   address-family l2vpn
4. Permit the local AS number to appear in routes from the specified peer or peer group and specify the maximum number of the appearances.
   peer { *group-name* | *ip-address* [*mask-length*] } **allow-as-loop** [*number*]
   By default, the local AS number is not allowed in routes from a peer or peer group.
5. Enable route target-based filtering of incoming BGP L2VPN information.
   policy vpn-target
   By default, route target-based filtering of incoming BGP L2VPN information is enabled.
6. Configure BGP route reflection.
   - Configure the device as a route reflector and specify a peer or peer group as its client.
     peer { *group-name* | *ip-address* [*mask-length*] } **reflect-client**

By default, no route reflector or client is configured.

- Enable L2VPN information reflection between clients.

  reflect between-clients

  By default, L2VPN information reflection is enabled between clients.
- Configure the cluster ID of the route reflector.

  reflector cluster-id { *cluster-id* | *ip-address* }

  By default, a route reflector uses its own router ID as the cluster ID.
- Configure the route reflector to filter reflected L2VPN information.

  rr-filter *ext-comm-list-number*

  By default, a route reflector does not filter reflected L2VPN information.

7. Set the optimal route selection delay timer.

route-select delay *delay-value*

By default, the optimal route selection delay timer is 0 seconds, which means optimal route selection is not delayed. For more information about this command, see BGP commands in *Layer 3—IP Routing Command Reference*.

Maintaining BGP sessions

About this task

If BGP configuration is changed, you can reset or soft-reset BGP sessions to validate the new configuration for BGP PWs and BGP auto-discovery LDP PWs.

A soft reset updates BGP routing information without tearing down BGP connections. A reset operation updates BGP routing information by tearing down, and then re-establishing BGP connections. Soft reset requires that BGP peers have route refresh capability (support the ROUTE-REFRESH message).

For more information about the commands in this task, see BGP in *Layer 3—IP Routing Command Reference*.

Procedure

To maintain BGP sessions, execute one of the following commands in user view:

- Soft-reset L2VPN BGP sessions.

  refresh bgp [**instance** *instance-name*] { *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } { **export** | **import** } **l2vpn**
- Reset L2VPN BGP sessions.

  reset bgp [**instance** *instance-name*] { *as-number* | *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **l2vpn**

Binding an AC to a VSI

About binding an AC to a VSI

On a Layer 2 Ethernet or Layer 2 aggregate interface, you can create an Ethernet service instance and bind it to a VSI. The Ethernet service instance matches packets received on the interface. The matching packets are then forwarded based on the MAC address table of the VSI. An Ethernet service instance can match all packets, tagged packets, or untagged packets.

When you bind an AC to a VSI, you can associate Track with the AC. Then, the AC is up only when one or more of the associated track entries are positive.

Restrictions and guidelines for binding an AC to a VSI

If a Layer 2 Ethernet interface has been added to a link aggregation group, you cannot bind an Ethernet service instance on the interface to a VSI, and vice versa.

Binding an Ethernet service instance to a VSI

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view:
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view:
     interface bridge-aggregation *interface-number*
3. Create an Ethernet service instance and enter Ethernet service instance view.
   service-instance *instance-id*
   By default, no Ethernet service instances exist.
4. Bind the Ethernet service instance to a VSI.
   xconnect vsi *vsi-name* [**access-mode** { **ethernet** | **vlan** }] [**track** *track-entry-number*&<1-3>]
   By default, an Ethernet service instance is not bound to any VSI.

Configuring PW redundancy

Configuring static PW redundancy

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Specify static signaling for PWs, and enter VSI static view.
   pwsignaling static
   By default, no PW signaling protocol is specified for the VSI.
4. (Optional.) Specify the switchover mode and set the wait time for the switchover.
   revertive { **wtr** *wtr-time* | **never** }
   By default, the switchover mode is revertive and the switchover wait time is 0 seconds.
5. Configure a static PW and enter VSI static PW view.
   peer *ip-address* [**pw-id** *pw-id*] [**in-label** *label-value* **out-label** *label-value*] [**no-split-horizon** | **pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *
6. Configure a backup static PW and enter VSI static backup PW view.
   backup-peer *ip-address* [**pw-id** *pw-id*] **in-label** *label-value* **out-label** *label-value* [**pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *

If both the default PW ID in the **default-pw-id** command and a PW ID in the **backup-peer** command are configured, the PW ID in the **backup-peer** command is used. If only the default PW ID is configured, the default PW ID is used. If no default PW ID is configured, you must provide a PW ID in the **backup-peer** command.

7. (Optional.) Manually switch the traffic:
   a. Return to user view.
      return
   b. Manually switch traffic of the PW to its backup PW.
      l2vpn switchover peer *ip-address* **pw-id** *pw-id*

Configuring LDP PW redundancy

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Specify LDP signaling for PWs, and enter VSI LDP signaling view.
   pwsignaling ldp
   By default, no PW signaling protocol is specified for the VSI.
4. (Optional.) Use the master/slave PW redundancy mode and configure the local PE as the master node.
   pw-redundancy { **independent** | **master** }
   By default, the PW redundancy mode is master/slave and the local PE operates as the slave node.
   Do not configure this command on the local PE if the remote PE does not support the master/slave PW redundancy mode.
5. (Optional.) Specify the switchover mode and set the wait time for the switchover.
   revertive { **wtr** *wtr-time* | **never** }
   By default, the switchover mode is revertive and the switchover wait time is 0 seconds.
6. Configure an LDP PW and enter VSI LDP PW view.
   peer *ip-address* [**pw-id** *pw-id*] [**ignore-standby-state** | **no-split-horizon** | **pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *
   For the local PE to ignore the PW active/standby states received from the remote PE, specify the **ignore-standby-state** keyword.
7. Configure a backup LDP PW and enter VSI LDP backup PW view.
   backup-peer *ip-address* [**pw-id** *pw-id*] [**pw-class** *class-name* | **tunnel-policy** *tunnel-policy-name*] *
   If both the default PW ID in the **default-pw-id** command and a PW ID in the **backup-peer** command are configured, the PW ID in the **backup-peer** command is used. If only the default PW ID is configured, the default PW ID is used. If no default PW ID is configured, you must provide a PW ID in the **backup-peer** command.
8. (Optional.) Manually switch the traffic:
   a. Return to user view.
      return
   b. Manually switch traffic of the PW to its backup PW.
      l2vpn switchover peer *ip-address* **pw-id** *pw-id*

Configuring MAC address learning

Procedure

1. Enter system view.
   system-view
2. Enter VSI view.
   vsi *vsi-name*
3. Enable MAC address learning for the VSI.
   mac-learning enable
   By default, MAC address learning is enabled for a VSI.

Enabling VPLS statistics

Enabling packet statistics for an AC

Restrictions and guidelines for enabling packet statistics for an AC

If the AC is an Ethernet service instance, follow these restrictions and guidelines:

- To display packet statistics for the Ethernet service instance, use the **display l2vpn service-instance verbose** command. To clear packet statistics for the Ethernet service instance, use the **reset l2vpn statistics ac** command.
- Packet statistics for the Ethernet service instance takes effect only when you bind the Ethernet service instance to a VSI. If you change the bound VSI during the statistics collection, the packet statistics are re-collected.

Enabling packet statistics for an Ethernet service instance

1. Enter system view.
   system-view
2. Enter interface view.
   - Enter Layer 2 Ethernet interface view:
     interface *interface-type interface-number*
   - Enter Layer 2 aggregate interface view:
     interface bridge-aggregation *interface-number*
3. Enter Ethernet service instance view.
   service-instance *instance-id*
4. Enable packet statistics for the Ethernet service instance.
   statistics enable
   By default, packet statistics is disabled for an Ethernet service instance.

Setting the L2VPN traffic statistics collection interval

About this task

Perform this task to set the L2VPN traffic statistics collection interval ACs.

Procedure

1. Enter system view.
   system-view
2. Set the L2VPN traffic statistics collection interval.
   l2vpn statistics interval *interval*
   By default, the L2VPN traffic statistics collection interval is 15 minutes.

Enabling SNMP notifications for L2VPN PW

About this task

This feature enables L2VPN to generate SNMP notifications when the device does not support L2VPN flow labels, or PW deletions, PW switchovers, or PW status changes occur. For L2VPN event notifications to be sent correctly, you must also configure SNMP on the device. For more information about SNMP configuration, see the network management and monitoring configuration guide for the device.

Procedure

1. Enter system view.
   system-view
2. Enable SNMP notifications for L2VPN PW.
   snmp-agent trap enable l2vpn [**flow-label-nonsupport** | **pw-delete** | **pw-switch** | **pw-up-down**] *
   By default, SNMP notifications for L2VPN PW are disabled.

Display and maintenance commands for VPLS

Execute **display** commands in any view and **reset** commands in user view.

Task	Command
Display BGP L2VPN peer group information.	**display bgp** [**instance** *instance-name*] **group l2vpn** [**group-name** *group-name*]
Display VPLS PE information discovered by BGP.	**display bgp** [**instance** *instance-name*] **l2vpn auto-discovery** [**peer** *ip-address* { **advertised** | **received** } | **route-distinguisher** *route-distinguisher* [**pe-address** *ip-address* [**advertise-info**]]]
Display VPLS label block information discovered by BGP.	**display bgp** [**instance** *instance-name*] **l2vpn signaling** [**peer** *ip-address* { **advertised** | **received** } | **route-distinguisher** *route-distinguisher* [**site-id** *site-id* [**label-offset** *label-offset* [**advertise-info**]]]]
Display BGP L2VPN peer information.	**display bgp** [**instance** *instance-name*] **peer l2vpn** [*ip-address mask-length* | **group-name** *group-name* **log-info** | *ip-address* { **log-info** | **verbose** } |

	verbose]
Display BGP L2VPN update group information.	**display bgp** [**instance** *instance-name*] **update-group l2vpn** [*ip-address*]
Display information about automatically discovered VPLS PEs.	**display l2vpn auto-discovery** [**peer** *ip-address*] [**vsi** *vsi-name*]
Display VPLS label block information.	**display l2vpn bgp** [**instance** *instance-name*] [**peer** *ip-address* | **local**] [**vsi** *vsi-name*] [**verbose**]
Display L2VPN forwarding information.	**display l2vpn forwarding** { **ac** | **pw** } [**vsi** *vsi-name*] [**slot** *slot-number*] [**verbose**]
Display MAC address table information for one or all VSIs.	**display l2vpn mac-address** [**vsi** *vsi-name*] [**dynamic**] [**count** | **verbose**]
Display the MAC address move records for all VSIs after the device is started.	**display l2vpn mac-address mac-move** [**slot** *slot-number*]
Display L2VPN PW information.	**display l2vpn mac-address** [**vsi** *vsi-name*] [**dynamic**] [**count** | **verbose**]
Display PW class information.	**display l2vpn pw-class** [*class-name*] [**verbose**]
Display Ethernet service instance information.	**display l2vpn service-instance** [**interface** *interface-type interface-number* [**service-instance** *instance-id*]] [**verbose**]
Display VSI information.	**display l2vpn vsi** [**name** *vsi-name*] [**verbose**]
Reset L2VPN BGP sessions.	**reset bgp** { *as-number* | *ip-address* [*mask-length*] | **all** | **external** | **group** *group-name* | **internal** } **l2vpn**
Clear MAC address entries for one or all VSIs.	**reset l2vpn mac-address** [**vsi** *vsi-name*]

Configuring MPLS OAM

About MPLS OAM

MPLS Operation, Administration, and Maintenance (OAM) provides fault management tools for the following purposes:

- MPLS data plane connectivity verification.
- Data plane and control plane consistency verification.
- Fault locating.

Fault management tools

MPLS OAM provides on-demand fault management tools, which must be triggered manually, such as MPLS ping and MPLS tracert.

MPLS ping

MPLS ping tests the connectivity of a tunnel. At the ingress node, MPLS ping adds the label associated with a tunnel into an MPLS echo request and sends it to the egress node over the tunnel. The egress node processes the request and returns an MPLS echo reply to the ingress node. An MPLS echo reply with a success notification indicates that the tunnel is available for data forwarding. An MPLS echo reply with an error code indicates that the tunnel has failed.

MPLS tracert

MPLS tracert displays the path that a tunnel travels from the ingress to the egress to locate errors on the tunnel. MPLS tracert consecutively sends MPLS echo requests along the tunnel, with the TTL increasing from 1 to a specific value. Each hop along the tunnel returns an MPLS echo reply to the ingress due to TTL timeout so the ingress can collect information about each hop along the tunnel. This information allows you to locate the failed node or access information for each hop, for example, the label allocated by each downstream hop.

Protocols and standards

- RFC 4379, *Detecting Multi-Protocol Label Switched (MPLS) Data Plane Failures*

Restrictions and guidelines: MPLS OAM configuration

Only advanced mode and expert mode support MPLS OAM. For more information about system operating modes, see device management in *Fundamentals Configuration Guide*.

The device does not support MPLS forwarding for tunneled packets.

Verifying LSP connectivity

About LSP connectivity verification

To verify LSP connectivity, you can use the **ping mpls out-labels** command or the **tracert mpls out-labels** command to trigger LSP connectivity verification as needed.

Performing MPLS ping for LSPs

To verify MPLS LSP connectivity by specifying the outgoing labels, execute the following command in any view:

ping mpls [**-a** *source-ip* | **-c** *count* | **-exp** *exp-value* | **-h** *ttl-value* | **-m** *wait-time* | **-r** *reply-mode* | **-rtos** *tos-value* | **-s** *packet-size* | **-t** *time-out* | **-v**] * **out-labels** *out-label-value*&<1-5> **interface** *interface-type interface-number* [**nexthop** *nexthop-address*]

Performing MPLS tracert for LSPs

To trace the path that the LSPs of the specified outgoing labels take from the ingress node to the egress node, execute the following command in any view:

tracert mpls [**-a** *source-ip* | **-exp** *exp-value* | **-h** *ttl-value* | **-r** *reply-mode* | **-rtos** *tos-value* | **-t** *time-out* | **-v** | **fec-check**]* **out-labels** *out-label-value*&<1-5> **interface** *interface-type interface-number* [**nexthop** *nexthop-address*]

Configuring MCE

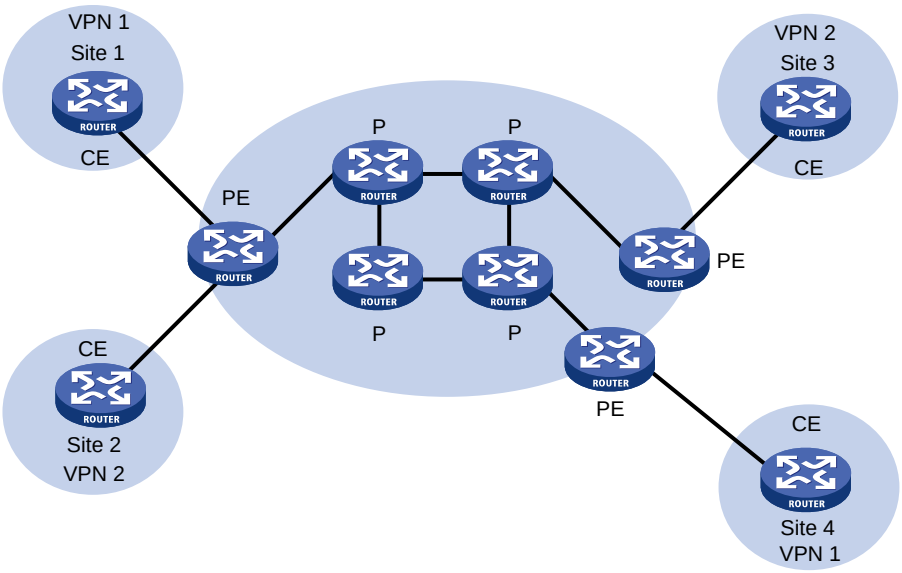
About MCE

The Multi-VPN Instance Customer Edge (MCE) feature allows multiple VPNs to share a CE with ensured data security in an MPLS L3VPN network. MCE provides traffic separation between VPNs by distinguishing routes of the VPNs.

MPLS L3VPN problems solved by MCE

MPLS L3VPN is a L3VPN technology used to interconnect geographically dispersed VPN sites. MPLS L3VPN uses BGP to advertise VPN routes and uses MPLS to forward VPN packets over a service provider backbone.

In conventional MPLS L3VPN, a VPN site must exclusively use a CE to connect a PE. With increasing business, a private network must be divided into multiple VPNs and the VPNs must be isolated from one another for data security. Using a CE exclusively for each VPN costs much in buying and maintaining the network devices. Using a common CE for multiple VPNs cannot ensure data security because the VPNs use the same routing table.



The MCE feature offers balance between cost and security. It creates multiple VPN instances on a CE to provide logically separated routing tables and address spaces for the VPNs, so the VPNs can share the CE. This CE is called the MCE device.

Basic MPLS L3VPN architecture

A basic MPLS L3VPN architecture has the following types of devices:

- **Customer edge device**—A CE device resides on a customer network and has one or more interfaces directly connected to a service provider network. It does not support MPLS.
- **Provider edge device**—A PE device resides at the edge of a service provider network and is connected to one or more CEs. All MPLS VPN services are processed on PEs.
- **Provider device**—A P device is a core device on a service provider network. It is not directly connected to any CEs. A P device has only basic MPLS forwarding capability and does not handle VPN routing information.

Figure 1 Basic MPLS L3VPN architecture

MCE-related MPLS L3VPN concepts

Site

A site has the following features:

- A site is a group of IP systems with IP connectivity that does not rely on any service provider networks.
- The classification of a site depends on the topology relationship of the devices, rather than the geographical positions. However, the devices at a site are, in most cases, adjacent to each other geographically.
- The devices at a site can belong to multiple VPNs, which means that a site can belong to multiple VPNs.
- A site is connected to a provider network through one or more CEs. A site can contain multiple CEs, but a CE can belong to only one site.

Sites connected to the same provider network can be classified into different sets by policies. Only the sites in the same set can access each other through the provider network. Such a set is called a VPN.

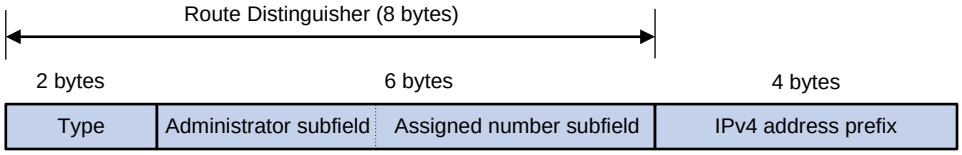
VPN instance

VPN instances implement route isolation, data independence, and data security for VPNs.

A VPN instance has the following components:

- A separate Label Forwarding Information Base (LFIB).
- An IP routing table.
- Interfaces bound to the VPN instance.
- VPN instance administration information, including route distinguishers (RDs), route targets (RTs), and route filtering policies.

To associate a site with a VPN instance, bind the VPN instance to the PE's interface connected to the site. A site can be associated with only one VPN instance, and different sites can be associated with the same VPN instance. A VPN instance contains the VPN membership and routing rules of associated sites.



VPN-IPv4 address

Each VPN independently manages its address space. The address spaces of VPNs might overlap. For example, if both VPN 1 and VPN 2 use the addresses on subnet 10.110.10.0/24, address space overlapping occurs.

Multiprotocol BGP (MP-BGP) can solve this problem by advertising VPN-IPv4 addresses (also called VPNv4 addresses).

As shown in Figure 2, a VPN-IPv4 address consists of 12 bytes. The first eight bytes represent the RD, followed by a four-byte IPv4 prefix. The RD and the IPv4 prefix form a unique VPN-IPv4 prefix.

Figure 2 VPN-IPv4 address structure

An RD can be in one of the following formats:

- When the Type field is 0, the Administrator subfield occupies two bytes, the Assigned number subfield occupies four bytes, and the RD format is *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- When the Type field is 1, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit IPv4 address*:*16-bit user-defined number*. For example, 172.1.1.1:1.
- When the Type field is 2, the Administrator subfield occupies four bytes, the Assigned number subfield occupies two bytes, and the RD format is *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

To guarantee global uniqueness for a VPN-IPv4 address, do not set the Administrator subfield to any private AS number or private IP address.

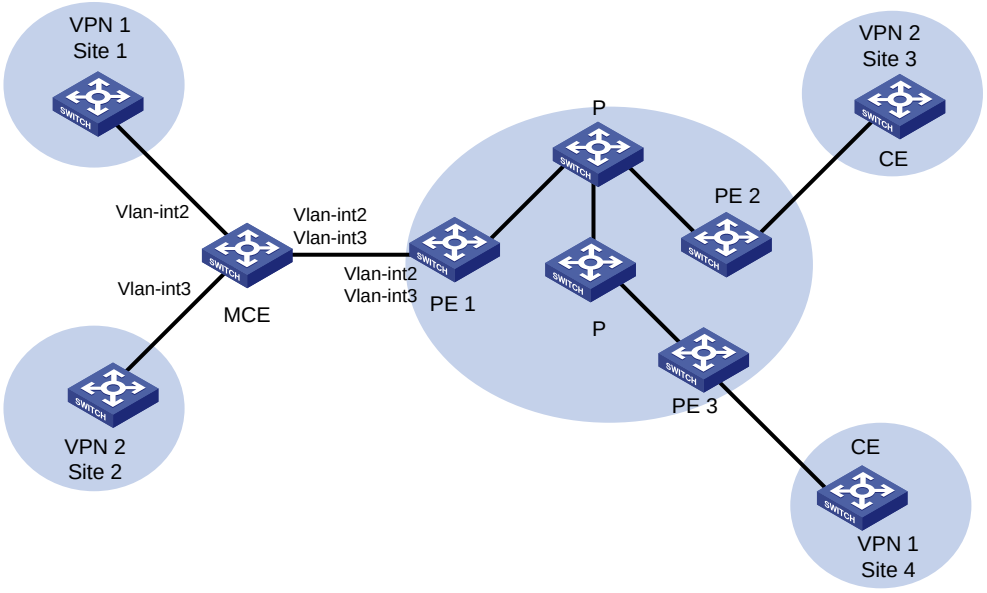
Route target attribute

MPLS L3VPN uses route target community attributes to control the advertisement of VPN routing information. A VPN instance on a PE supports the following types of route target attributes:

- **Export target attribute**—A PE sets the export target attribute for VPN-IPv4 routes learned from directly connected sites before advertising them to other PEs.
- **Import target attribute**—A PE checks the export target attribute of VPN-IPv4 routes received from other PEs. If the export target attribute matches the import target attribute of a VPN instance, the PE adds the routes to the routing table of the VPN instance.

Route target attributes define which sites can receive VPN-IPv4 routes, and from which sites a PE can receive routes.

Like RDs, route target attributes can be one of the following formats:



- *16-bit AS number*:*32-bit user-defined number*. For example, 100:1.
- *32-bit IPv4 address:16-bit user-defined number*. For example, 172.1.1.1:1.
- *32-bit AS number*:*16-bit user-defined number*, where the minimum value of the AS number is 65536. For example, 65536:1.

MCE working mechanism

As shown in Figure 3, the MCE exchanges private routes with VPN sites and PE 1, and adds the private routes to the routing tables of corresponding VPN instances.

- **Route exchange between MCE and VPN site**—Create VPN instances VPN 1 and VPN 2 on the MCE. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE adds a received route to the routing table of the VPN instance that is bound to the receiving interface.
- **Route exchange between MCE and PE**—The MCE connects to PE 1 through trunk links. On PE 1, create VPN instances for VPN 1 and VPN 2. Bind VLAN-interface 2 to VPN 1, and VLAN-interface 3 to VPN 2. The MCE and PE add a received route to the routing table of the VPN instance that is bound to the receiving interface.

Figure 3 Network diagram for the MCE feature

You can configure static routes, RIP, OSPF, IS-IS, EBGP, or IBGP between an MCE and a VPN site and between an MCE and a PE.

NOTE:

To implement dynamic IP assignment for DHCP clients in private networks, you can configure DHCP server or DHCP relay agent on the MCE. When the MCE functions as the DHCP server, the IP addresses assigned to different private networks cannot overlap.

Restrictions and guidelines: MCE configuration

On the MCE, disable routing loop detection to avoid route loss during route calculation, and disable route redistribution between routing protocols to save system resources.

MCE tasks at a glance

To configure MCE, perform the following tasks:

1. Configuring VPN instances

   Perform the following VPN instance tasks on PEs and MCEs:

   a. Creating a VPN instance
   b. Associating a VPN instance with a Layer 3 interface
   c. (Optional.) Configuring route related attributes for a VPN instance
2. Configuring routing between an MCE and a VPN site

3. Configuring routing between an MCE and a PE

Configuring VPN instances

Creating a VPN instance

About this task

A VPN instance is a collection of the VPN membership and routing rules of its associated site. A VPN instance might correspond to more than one VPN.

Procedure

1. Enter system view.
   system-view
2. Create a VPN instance and enter VPN instance view.
   ip vpn-instance *vpn-instance-name*
3. Configure an RD for the VPN instance.
   route-distinguisher *route-distinguisher*
   By default, no RD is configured for a VPN instance.
4. (Optional.) Configure a description for the VPN instance.
   description *text*
   By default, no description is configured for a VPN instance.
5. (Optional.) Configure a VPN ID for the VPN instance.
   vpn-id *vpn-id*
   By default, no VPN ID is configured for a VPN instance.

Associating a VPN instance with a Layer 3 interface

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
   This interface connects the device to the CE.
3. Associate a VPN instance with the interface.
   ip binding vpn-instance *vpn-instance-name*
   By default, an interface is not associated with a VPN instance and it belongs to the public network.

CAUTION:
Associating a VPN instance with an interface or disassociating a VPN instance from an interface will clear the IP address and routing protocol settings of the interface.

Configuration of this command deletes the IP address of the current interface. You must reconfigure an IP address for the interface after configuring the command.

Configuring route related attributes for a VPN instance

Restrictions and guidelines

If you configure route related attributes in both VPN instance view and VPN instance IPv4 address family view, IPv4 VPN uses the configuration in VPN instance IPv4 address family view.

Prerequisites

Before you perform this task, create the routing policies to be used by this task. For information about routing policies, see *Layer 3—IP Routing Configuration Guide*.

Procedure

1. Enter system view.

   system-view

2. Enter VPN instance view or VPN instance IPv4 address family view.
   - Enter VPN instance view.

     ip vpn-instance *vpn-instance-name*
   - Execute the following commands in sequence to enter VPN instance IPv4 address family view:

     ip vpn-instance *vpn-instance-name*

     address-family ipv4

3. Configure route targets.

   vpn-target *vpn-target*&<1-8> [**both** | **export-extcommunity** | **import-extcommunity**]

   By default, no route targets are configured.

4. Set the maximum number of active routes.

   routing-table limit *number* { *warn-threshold* | **simply-alert** }

   By default, the number of active routes in a VPN instance is not limited.

   Setting the maximum number of active routes for a VPN instance can prevent the device from learning too many routes.

5. Apply an import routing policy.

   import route-policy *route-policy*

   By default, all routes matching the import target attribute are accepted.

6. Apply an export routing policy.

   export route-policy *route-policy*

   By default, routes to be advertised are not filtered.

Configuring routing between an MCE and a VPN site

Configuring static routing between an MCE and a VPN site

About this task

An MCE can reach a VPN site through a static route. Static routing on a traditional CE is globally effective and does not support address overlapping among VPNs. An MCE supports binding a static route to a VPN instance, so that the static routes of different VPN instances can be isolated from each other.

Perform this configuration on the MCE. On the VPN site, configure a common static route.

Procedure

1. Enter system view.
   system-view
2. Configure a static route for a VPN instance.
   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }
3. (Optional.) Configure the default preference for static routes.
   ip route-static default-preference *default-preference*
   The default preference is 60.

Configuring RIP between an MCE and a VPN site

About this task

Binding RIP processes to VPN instances can isolate routes of different VPNs. For more information about RIP, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common RIP process.

Procedure

1. Enter system view.
   system-view
2. Create a RIP process for a VPN instance and enter RIP view.
   rip [*process-id*] **vpn-instance** *vpn-instance-name*
   A RIP process can belong to only one VPN instance.
3. Enable RIP on the interface attached to the specified network.
   network *network-address* [*wildcard-mask*]
   By default, RIP is disabled on an interface.
4. Redistribute remote site routes advertised by the PE into RIP.
   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *
   By default, no route is redistributed into RIP.

Configuring OSPF between an MCE and a VPN site

About this task

Binding OSPF processes to VPN instances can isolate routes of different VPNs. For more information about OSPF, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, create a common OSPF process.

Procedure

1. Enter system view.
   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.

ospf [*process-id*] **router-id** *router-id* **vpn-instance** *vpn-instance-name*

Keywords	Usage guidelines
router-id *router-id*	An OSPF process that is bound to a VPN instance does not use the public network router ID configured in system view. Therefore, you must specify a router ID when creating a process or configure an IP address for a minimum of one interface in the VPN instance.
vpn-instance *vpn-instance-name*	An OSPF process can belong to only one VPN instance. If you delete a VPN instance, all OSPF processes of the VPN instance are also deleted.

3. Redistribute remote site routes advertised by the PE into OSPF.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
4. Create an OSPF area and enter OSPF area view.

   area *area-id*
5. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to any area nor runs OSPF.

Configuring IS-IS between an MCE and a VPN site

About this task

Binding IS-IS processes to VPN instances can isolate routes of different VPNs. For more information about IS-IS, see *Layer 3—IP Routing Configuration Guide*.

Perform this configuration on the MCE. On a VPN site, configure a common IS-IS process.

Procedure

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

   An IS-IS process can belong to only one VPN instance.
3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.
4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]
5. Redistribute remote site routes advertised by the PE into IS-IS.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.
   quit
7. Enter interface view.
   interface *interface-type interface-number*
8. Enable the IS-IS process on the interface.
   isis enable [*process-id*]
   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a VPN site

About this task

To run EBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise the VPN network addresses it can reach to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
   Commands in BGP-VPN instance view are the same as those in BGP instance view. For more information, see *Layer 3—IP Routing Configuration Guide*.
4. Configure the VPN site as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. (Optional.) Allow the local AS number to appear in the AS_PATH attribute of routes received from the peer, and set the maximum number of repetitions.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **allow-as-loop** [*number*]
   By default, BGP discards incoming route updates that contain the local AS number.
8. Redistribute remote site routes advertised by the PE into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

system-view

2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Configure the MCE as an EBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
4. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
5. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
6. Redistribute the IGP routes of the VPN into BGP.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a VPN site

About this task

To run IBGP between an MCE and a VPN site, you must configure a BGP peer for each VPN instance on the MCE, and redistribute the IGP routes of each VPN instance on the VPN site.

Restrictions and guidelines

You must configure a VPN site to advertise VPN network addresses to the connected MCE.

Configuring the MCE

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the VPN site as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer or peer group.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers or peer groups.
7. (Optional.) Configure the local device as the RR, and specify the peer as the client of the RR.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **reflect-client**
   By default, no RR or RR client is configured.
   After you configure a VPN site as an IBGP peer, the MCE does not advertise the BGP routes learned from the VPN site to other IBGP peers, including VPNv4 peers. The MCE advertises

routes learned from a VPN site only when you configure the VPN site as a client of the RR (the MCE).

8. Redistribute remote site routes advertised by the PE into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring the VPN site

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Configure the MCE as an IBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

4. Enter BGP IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

5. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

6. Redistribute the IGP routes of the VPN into BGP.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring routing between an MCE and a PE

About routing between an MCE and a PE

MCE-PE routing configuration includes these tasks:

- Binding the MCE-PE interfaces to VPN instances.
- Performing route configurations.
- Redistributing VPN routes into the routing protocol running between the MCE and the PE.

Perform the following configurations on the MCE. For information about configuring the PE, see the documentation for the PE.

Configuring static routing between an MCE and a PE

1. Enter system view.

   system-view

2. Configure a static route for a VPN instance.

   ip route-static vpn-instance *s-vpn-instance-name dest-address* { *mask-length* | *mask* } { *interface-type interface-number* [*next-hop-address*] | *next-hop-address* [**public**] | **vpn-instance** *d-vpn-instance-name next-hop-address* }

3. (Optional.) Set the default preference for static routes.

ip route-static default-preference *default-preference*

The default preference is 60.

Configuring RIP between an MCE and a PE

1. Enter system view.

   system-view
2. Create a RIP process for a VPN instance and enter RIP view.

   rip [*process-id*] **vpn-instance** *vpn-instance-name*
3. Enable RIP on the interface attached to the specified network.

   network *network-address* [*wildcard-mask*]

   By default, RIP is disabled on an interface.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, no routes are redistributed into RIP.

Configuring OSPF between an MCE and a PE

1. Enter system view.

   system-view
2. Create an OSPF process for a VPN instance and enter OSPF view.

   ospf [*process-id* | **router-id** *router-id* | **vpn-instance** *vpn-instance-name*] *
3. Disable routing loop detection.

   vpn-instance-capability simple

   By default, routing loop detection is enabled and the MCE does not receive OSPF routes from the PE.
4. Redistribute the VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **nssa-only** | **route-policy** *route-policy-name* | **tag** *tag* | **type** *type*] *

   By default, no routes are redistributed into OSPF.
5. Create an OSPF area and enter OSPF area view.

   area *area-id*
6. Enable OSPF on the interface attached to the specified network in the area.

   network *ip-address wildcard-mask*

   By default, an interface neither belongs to an area nor runs OSPF.

Configuring IS-IS between an MCE and a PE

1. Enter system view.

   system-view
2. Create an IS-IS process for a VPN instance and enter IS-IS view.

   isis [*process-id*] **vpn-instance** *vpn-instance-name*

3. Configure a network entity title.

   network-entity *net*

   By default, no NET is configured.

4. Create the IS-IS IPv4 unicast address family and enter its view.

   address-family ipv4 [**unicast**]

5. Redistribute VPN routes.

   import-route *protocol* [*as-number*] [*process-id* | **all-processes** | **allow-ibgp**] [**allow-direct** | **cost** *cost-value* | **cost-type** { **external** | **internal** } | [**level-1** | **level-1-2** | **level-2**] | **route-policy** *route-policy-name* | **tag** *tag*] *

   By default, IS-IS does not redistribute routes from any other routing protocol.

   If you do not specify the route level in the command, the command redistributes routes to the level-2 routing table by default.

6. Return to system view.

   quit

7. Enter interface view.

   interface *interface-type interface-number*

8. Enable the IS-IS process on the interface.

   isis enable [*process-id*]

   By default, no IS-IS process is enabled on the interface.

Configuring EBGP between an MCE and a PE

1. Enter system view.

   system-view

2. Enter BGP instance view.

   bgp *as-number* [**instance** *instance-name*]

   By default, BGP is not enabled.

3. Enter BGP-VPN instance view.

   ip vpn-instance *vpn-instance-name*

4. Configure the PE as an EBGP peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*

5. Enter BGP-VPN IPv4 unicast address family view.

   address-family ipv4 [**unicast**]

6. Enable BGP to exchange IPv4 unicast routes with the specified peer.

   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**

   By default, BGP does not exchange IPv4 unicast routes with peers.

7. Redistribute the VPN routes of the VPN site.

   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]

   By default, no routes are redistributed into BGP.

Configuring IBGP between an MCE and a PE

1. Enter system view.

system-view

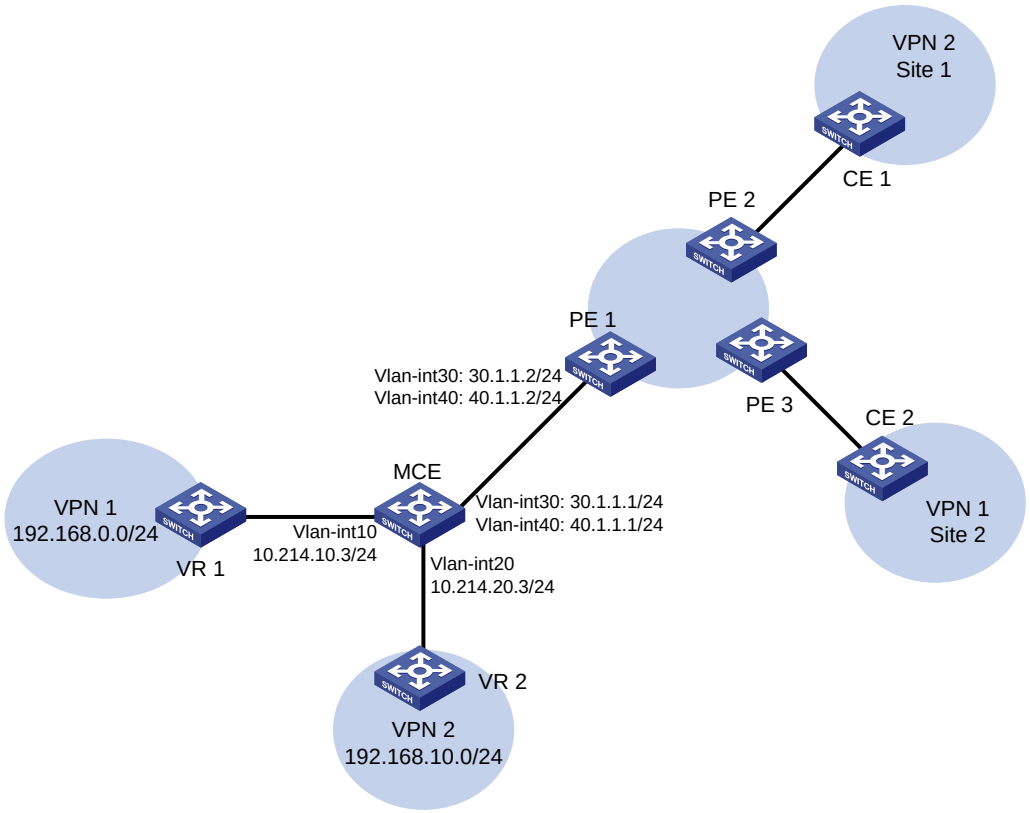
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
   By default, BGP is not enabled.
3. Enter BGP-VPN instance view.
   ip vpn-instance *vpn-instance-name*
4. Configure the PE as an IBGP peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **as-number** *as-number*
5. Enter BGP-VPN IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
6. Enable BGP to exchange IPv4 unicast routes with the specified peer.
   peer { *group-name* | *ipv4-address* [*mask-length*] } **enable**
   By default, BGP does not exchange IPv4 unicast routes with peers.
7. Redistribute the VPN routes of the VPN site.
   import-route *protocol* [{ *process-id* | **all-processes** } [**allow-direct** | **med** *med-value* | **route-policy** *route-policy-name*] *]
   By default, no routes are redistributed into BGP.

Display and maintenance commands for MCE

Execute **display** commands in any view.

Task	Command
Display VPN instance information.	**display ip vpn-instance** [**instance-name** *vpn-instance-name*]

For commands that display routing tables for VPN instances, see *Layer 3—IP Routing Command Reference*.



MCE configuration examples

Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE

Network configuration

As shown in Figure 4, VPN 2 runs OSPF. The edge devices of VPN 1 and VPN 2 are VR 1 and VR 2, respectively. Configure the MCE device to separate routes from different VPNs and to advertise the VPN routes to PE 1 through OSPF.

Figure 4 Network diagram

Procedure

1. Configure the VPN instances on the MCE and PE 1:

   # On the MCE, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

   ```
   <MCE> system-view
   [MCE] ip vpn-instance vpn1
   [MCE-vpn-instance-vpn1] route-distinguisher 10:1
   [MCE-vpn-instance-vpn1] vpn-target 10:1
   [MCE-vpn-instance-vpn1] quit
   [MCE] ip vpn-instance vpn2
   [MCE-vpn-instance-vpn2] route-distinguisher 20:1
   [MCE-vpn-instance-vpn2] vpn-target 20:1
   [MCE-vpn-instance-vpn2] quit
   ```

   # Bind VLAN-interface 10 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 10
   [MCE-Vlan-interface10] ip binding vpn-instance vpn1
   [MCE-Vlan-interface10] ip address 10.214.10.3 24
   [MCE-Vlan-interface10] quit
   ```

   # Bind VLAN-interface 20 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

   ```
   [MCE] interface vlan-interface 20
   [MCE-Vlan-interface20] ip binding vpn-instance vpn2
   [MCE-Vlan-interface20] ip address 10.214.20.3 24
   ```

```
[MCE-Vlan-interface20] quit
```

On PE 1, configure VPN instances **vpn1** and **vpn2**, and specify an RD and route targets for each VPN instance.

```
<PE1> system-view
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 10:1
[PE1-vpn-instance-vpn1] vpn-target 10:1
[PE1-vpn-instance-vpn1] quit
[PE1] ip vpn-instance vpn2
[PE1-vpn-instance-vpn2] route-distinguisher 20:1
[PE1-vpn-instance-vpn2] vpn-target 20:1
[PE1-vpn-instance-vpn2] quit
```

2. Configure routing between the MCE and VPN sites:

The MCE is connected to VPN 1 directly, and no routing protocol is enabled in VPN 1. Therefore, you can configure static routes.

On VR 1, assign IP address 10.214.10.2/24 to the interface connected to MCE and 192.168.0.1/24 to the interface connected to VPN 1. Add ports to VLANs correctly. (Details not shown.)

On VR 1, configure a default route with the next hop being 10.214.10.3.

```
<VR1> system-view
[VR1] ip route-static 0.0.0.0 0.0.0.0 10.214.10.3
```

On the MCE, configure a static route to 192.168.0.0/24 with the next hop 10.214.10.2. Bind the static route to VPN instance **vpn1**.

```
[MCE] ip route-static vpn-instance vpn1 192.168.0.0 24 10.214.10.2
```

On the MCE, display the routing information maintained for VPN instance **vpn1**.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24     Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32     Direct  0   0           10.214.10.3     Vlan10
10.214.10.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32   Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24     Static  60  0           10.214.10.2     Vlan10
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has a static route for VPN instance **vpn1**.

Run OSPF in VPN 2. Create OSPF process 20 and bind it to VPN instance **vpn2** on the MCE, so that the MCE can learn the routes of VPN 2 and add them to the routing table of VPN instance **vpn2**.

```
[MCE] ospf 2 vpn-instance vpn2
```

Advertise subnet 10.214.20.0.

```
[MCE-ospf-2] area 0
[MCE-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[MCE-ospf-2-area-0.0.0.0] quit
[MCE-ospf-2] quit
```

On VR 2, assign IP address 10.214.20.2/24 to the interface connected to MCE and 192.168.10.1/24 to the interface connected to VPN 2. (Details not shown.)

Configure OSPF process 2, and advertise subnets 192.168.10.0 and 10.214.20.0.

```
<VR2> system-view
[VR2] ospf 2
[VR2-ospf-2] area 0
[VR2-ospf-2-area-0.0.0.0] network 192.168.10.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] network 10.214.20.0 0.0.0.255
[VR2-ospf-2-area-0.0.0.0] quit
[VR2-ospf-2] quit
```

On the MCE, display the routing information maintained for VPN instance **vpn2**.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
10.214.20.0/24     Direct  0   0           10.214.20.3     Vlan20
10.214.20.0/32     Direct  0   0           10.214.20.3     Vlan20
10.214.20.3/32     Direct  0   0           127.0.0.1       InLoop0
10.214.20.255/32   Direct  0   0           10.214.20.3     Vlan20
127.0.0.0/8        Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32       Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32       Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
192.168.10.0/24    O_INTRA 10  2           10.214.20.2     Vlan20
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private routes of VPN 2. The MCE maintains the routes of VPN 1 and those of VPN2 in two different routing tables. In this way, routes from different VPNs are separated.

3. Configure routing between the MCE and PE 1:

On the MCE, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 30
[MCE-Vlan-interface30] ip binding vpn-instance vpn1
[MCE-Vlan-interface30] ip address 30.1.1.1 24
[MCE-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[MCE] interface vlan-interface 40
[MCE-Vlan-interface40] ip binding vpn-instance vpn2
[MCE-Vlan-interface40] ip address 40.1.1.1 24
[MCE-Vlan-interface40] quit
```

On PE 1, bind VLAN-interface 30 to VPN instance **vpn1**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 30
[PE1-Vlan-interface30] ip binding vpn-instance vpn1
[PE1-Vlan-interface30] ip address 30.1.1.2 24
[PE1-Vlan-interface30] quit
```

Bind VLAN-interface 40 to VPN instance **vpn2**, and configure an IP address for the VLAN interface.

```
[PE1] interface vlan-interface 40
[PE1-Vlan-interface40] ip binding vpn-instance vpn2
[PE1-Vlan-interface40] ip address 40.1.1.2 24
[PE1-Vlan-interface40] quit
```

Configure the IP address of the interface Loopback 0 as 101.101.10.1 for the MCE and as 100.100.10.1 for PE 1. Specify the loopback interface address as the router ID for the MCE and PE 1. (Details not shown.)

Enable OSPF process 10 on the MCE, and bind the process to VPN instance **vpn1**.

```
[MCE] ospf 10 router-id 101.101.10.1 vpn-instance vpn1
```

Disable OSPF routing loop detection for the VPN instance.

```
[MCE-ospf-10] vpn-instance-capability simple
```

Set the domain ID to 10.

```
[MCE-ospf-10] domain-id 10
```

On the MCE, advertise subnet 30.1.1.0 in area 0, and redistribute the static route of VPN 1.

```
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] import-route static
[MCE-ospf-10] quit
```

On PE 1, enable OSPF process 10, and bind the process to VPN instance **vpn1**.

```
[PE1] ospf 10 router-id 100.100.10.1 vpn-instance vpn1
```

Set the domain ID to 10.

```
[PE1-ospf-10] domain-id 10
```

Advertise subnet 30.1.1.0 in area 0.

```
[PE1-ospf-10] area 0
[PE1-ospf-10-area-0.0.0.0] network 30.1.1.0 0.0.0.255
[PE1-ospf-10-area-0.0.0.0] quit
[PE1-ospf-10] quit
```

Use similar procedures to configure OSPF process 20 between MCE and PE 1 and redistribute VPN 2's routing information. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the static route of VPN 1 through OSPF.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface
0.0.0.0/32         Direct  0   0           127.0.0.1       InLoop0
30.1.1.0/24        Direct  0   0           30.1.1.2        Vlan30
30.1.1.0/32        Direct  0   0           30.1.1.2        Vlan30
```

```
30.1.1.2/32        Direct  0   0           127.0.0.1       InLoop0

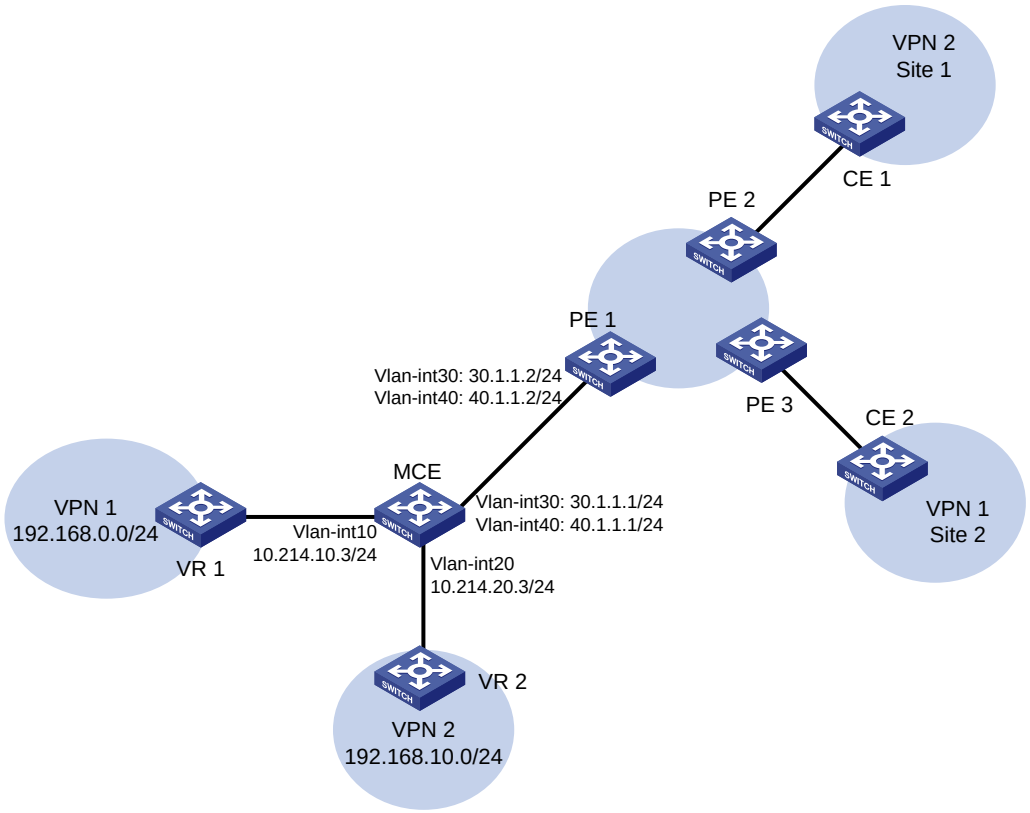
192.168.10.0/24    O_ASE2  150 1           40.1.1.1        Vlan40
224.0.0.0/4        Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24       Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32 Direct  0   0           127.0.0.1       InLoop0
```

The routing information for the two VPNs has been redistributed into the routing tables on PE 1.



Example: Configuring the MCE that uses EBGP to advertise VPN routes to the PE

Network configuration

As shown in Figure 5, configure the MCE to advertise the routes of VPNs 1 and 2 to PE 1, so that the sites of each VPN can communicate with each other over the MPLS backbone.

Run OSPF in both VPN 1 and VPN 2. Run EBGP between the MCE and PE 1.

Figure 5 Network diagram

Procedure

1. Create VPN instances on the MCE and PE 1, and bind the VPN instances to VLAN interfaces. For the configuration procedure, see "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE."
2. Configure routing between the MCE and VPN sites:

   # Enable an OSPF process on the devices in the two VPNs, and advertise the subnets. (Details not shown.)

   # Configure OSPF on the MCE, and bind OSPF process 10 to VPN instance **vpn1** to learn the routes of VPN 1.

```
<MCE> system-view
[MCE] ospf 10 router-id 10.10.10.1 vpn-instance vpn1
[MCE-ospf-10] area 0
[MCE-ospf-10-area-0.0.0.0] network 10.214.10.0 0.0.0.255
[MCE-ospf-10-area-0.0.0.0] quit
[MCE-ospf-10] quit
```

   # Display the routing table of VPN 1 on the MCE.

```
[MCE] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0
10.214.10.0/24      Direct  0   0           10.214.10.3     Vlan10
10.214.10.0/32      Direct  0   0           10.214.10.3     Vlan10
```

```
10.214.10.3/32      Direct  0   0           127.0.0.1       InLoop0
10.214.10.255/32    Direct  0   0           10.214.10.3     Vlan10
127.0.0.0/8         Direct  0   0           127.0.0.1       InLoop0
127.0.0.0/32        Direct  0   0           127.0.0.1       InLoop0
127.0.0.1/32        Direct  0   0           127.0.0.1       InLoop0
127.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
192.168.0.0/24      O_INTRA 10  2           10.214.10.2     Vlan10
224.0.0.0/4         Direct  0   0           0.0.0.0         NULL0
224.0.0.0/24        Direct  0   0           0.0.0.0         NULL0
255.255.255.255/32  Direct  0   0           127.0.0.1       InLoop0
```

The output shows that the MCE has learned the private route of VPN 1 through OSPF process 10.

On the MCE, bind OSPF process 20 to VPN instance **vpn2** to learn the routes of VPN 2. The configuration procedure is similar to that for OSPF process 10.

The output shows that the MCE has learned the private route of VPN 2 through OSPF.

```
[MCE] display ip routing-table vpn-instance vpn2

Destinations : 13        Routes : 13

Destination/Mask    Proto   Pre Cost        NextHop         Interface
0.0.0.0/32          Direct  0   0           127.0.0.1       InLoop0

```

3. Configure routing between the MCE and PE 1:

Configure the ports between the MCE and PE 1 as trunk ports. The configuration procedure is similar to that described in "Example: Configuring the MCE that uses OSPF to advertise VPN routes to the PE." (Details not shown.)

Enable BGP in AS 100 on the MCE.

```
[MCE] bgp 100
```

Enter the BGP-VPN instance view of VPN instance **vpn1**.

```
[MCE-bgp-default] ip vpn-instance vpn1
```

Specify the EBGP peer PE 1 in AS 200.

```
[MCE-bgp-default-vpn1] peer 30.1.1.2 as-number 200
```

Activate the EBGP VPNv4 peer PE 1, and redistribute routing information from OSPF process 10 to BGP.

```
[MCE-bgp-default-vpn1] address-family ipv4
[MCE-bgp-default-ipv4-vpn1] peer 30.1.1.2 enable
[MCE-bgp-default-ipv4-vpn1] import-route ospf 10
```

```
[MCE-bgp-default-ipv4-vpn1] quit
[MCE-bgp-default-vpn1] quit
[MCE-bgp-default] quit
```

On PE 1, enable BGP in AS 200, and specify the MCE as its EBGP peer.

```
[PE1] bgp 200
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.1.1.1 as-number 100
[PE1-bgp-default-vpn1] address-family ipv4
[PE1-bgp-default-ipv4-vpn1] peer 30.1.1.1 enable
[PE1-bgp-default-ipv4-vpn1] quit
[PE1-bgp-default-vpn1] quit
[PE1-bgp-default] quit
```

Use similar procedures to configure VPN 2 settings on MCE and PE 1. (Details not shown.)

Verifying the configuration

Verify that PE 1 has learned the OSPF route of VPN 1 through BGP.

```
[PE1] display ip routing-table vpn-instance vpn1

Destinations : 13        Routes : 13

Destination/Mask   Proto   Pre Cost        NextHop         Interface

Preface

This configuration guide describes the Segment Routing fundamentals and configuration procedures.

This preface includes the following topics about the documentation:

- Audience.
- Conventions.
- Documentation feedback.

Audience

This documentation is intended for:

- Network planners.
- Field technical support and servicing engineers.
- Network administrators working with the S5570S-EI and S5500V3-SI switch series.

Conventions

The following information describes the conventions used in the documentation.

Command conventions

Convention	Description
Boldface	**Bold** text represents commands and keywords that you enter literally as shown.
Italic	*Italic* text represents arguments that you replace with actual values.
[ ]	Square brackets enclose syntax choices (keywords or arguments) that are optional.
{ x | y | ... }	Braces enclose a set of required syntax choices separated by vertical bars, from which you select one.
[x | y | ...]	Square brackets enclose a set of optional syntax choices separated by vertical bars, from which you select one or none.
{ x | y | ... } *	Asterisk marked braces enclose a set of required syntax choices separated by vertical bars, from which you select a minimum of one.
[x | y | ...] *	Asterisk marked square brackets enclose optional syntax choices separated by vertical bars, from which you select one choice, multiple choices, or none.
&<1-n>	The argument or keyword and argument combination before the ampersand (&) sign can be entered 1 to n times.
#	A line that starts with a pound (#) sign is comments.

GUI conventions

Convention	Description
Boldface	Window names, button names, field names, and menu items are in Boldface. For example, the **New User** window opens; click **OK**.
>	Multi-level menus are separated by angle brackets. For example, **File** > **Create** > **Folder**.

Symbols

Convention	Description
WARNING!	An alert that calls attention to important information that if not understood or followed can result in personal injury.
CAUTION:	An alert that calls attention to important information that if not understood or followed can result in data loss, data corruption, or damage to hardware or software.
IMPORTANT:	An alert that calls attention to essential information.
NOTE:	An alert that contains additional or supplementary information.
TIP:	An alert that provides helpful information.

Network topology icons

Convention	Description
	Represents a generic network device, such as a router, switch, or firewall.
	Represents a routing-capable device, such as a router or Layer 3 switch.
	Represents a generic switch, such as a Layer 2 or Layer 3 switch, or a router that supports Layer 2 forwarding and other Layer 2 features.
	Represents an access controller, a unified wired-WLAN module, or the access controller engine on a unified wired-WLAN switch.
	Represents an access point.
	Represents a wireless terminator unit.
	Represents a wireless terminator.
	Represents a mesh access point.
	Represents omnidirectional signals.
	Represents directional signals.
	Represents a security product, such as a firewall, UTM, multiservice security gateway, or load balancing device.
	Represents a security module, such as a firewall, load balancing, NetStream, SSL VPN, IPS, or ACG module.

Examples provided in this document

Examples in this document might use devices that differ from your device in hardware model, configuration, or software version. It is normal that the port numbers, sample output, screenshots, and other information in the examples differ from what you have on your device.

Documentation feedback

You can e-mail your comments about product documentation to info@h3c.com.

We appreciate your comments.

Configuring SR-MPLS

About SR-MPLS

Segment Routing (SR) is a source routing technology. The source node selects a path for the packets, and then encodes the path in the packet header as an ordered list of segments. Each segment is identified by the segment identifier (SID). The SR nodes along the path forward the packets based on the SIDs in the packets. Only the source node needs to maintain the path status.

SR can operate with MPLS. In an MPLS network, SR uses MPLS labels as SIDs to forward packets on an LSP.

SR-MPLS characteristics

SR-MPLS has the following characteristics:

- SR-MPLS forwards packets based on the existing MPLS infrastructure. No infrastructure modifications are needed to implement SR on an MPLS network. For more information about the MPLS infrastructure, see MPLS basics configuration in *MPLS Configuration Guide*.
- SR-MPLS expands and optimizes existing IGPs and BGP, and uses the IGPs and BGP to distribute labels.

Basic concepts

- **SR node**—A node enabled with the SR-MPLS feature. The ingress node (source node) adds labels to packets. The transit nodes forward packets based on labels. The egress node removes labels and forwards packets to the destination networks. SR nodes form an SR domain.
- **Segment**—An instruction an SR node executes on the incoming packet.
- **SID**—Segment ID, which is MPLS label in SR-MPLS.
- **Segment type**—The following types of segments are available:
  - **Prefix segment**—SIDs are assigned to nodes based on destination address prefix. The nodes create prefix-specific forwarding entries.
  - **Adjacency segment**—SIDs are assigned to nodes based on adjacency.
- **SRLSP**—Segment routing label switched path, an LSP along which SR uses MPLS labels as SIDs to forward packets.
- **SRGB**—Segment routing global block, a range of global labels dedicated for SR-MPLS prefix SIDs. Different nodes can have different SRGBs. The minimum label value of an SRGB label range is referred to as the base value of the SRGB. Labels 16000 through 24000 are reserved for SRGBs.
- **SRLB**—Segment routing local block, a range of local labels dedicated for SR-MPLS adjacency SIDs. All nodes share the same SRLB. The minimum label value of the SRLB label range is referred to as the base value of the SRLB.

How SR-MPLS works

SR-MPLS involves the following steps:

1. Label allocation for all nodes and links along the packet forwarding paths.

The following methods are available:

- Static segment configuration
- Dynamic SID allocation

2. Label forwarding entry installation based on SIDs. All SR-MPLS devices in the SR domain use the allocated labels to create label forwarding entries.
3. SRLSP setup. You can manually configure SRLSPs, or use an IGP, BGP, or a controller to dynamically create SRLSPs.

When the ingress node of an SRLSP receives a packet, it adds labels to the packet and forwards the packet to the egress node through the SRLSP. After receiving a packet from the SRLSP, the egress node removes the label and forwards the packet based on the routing table.

Static segment configuration

Static SR-MPLS provides the following methods for configuring static segments for a destination:

- **Prefix segment method**—Manually configure the incoming label, outgoing label, and next hop for the destination address prefix on each SR node.
- **Adjacency segment method**—Manually configure the incoming label and next hop for the adjacency to the neighbor on each SR node.

Dynamic SID allocation through an IGP

SR-MPLS expands IGP protocols such as IS-IS to advertise SIDs in IGP protocol packets. SR-MPLS provides the following methods for dynamically allocating and advertising SIDs:

- **Prefix SID**—After you configure an SID for the loopback address on each SR node, the SIDs uniquely identify the SR nodes. All SR nodes in the SR domain use an IGP to advertise their own prefix SIDs. After receiving advertised prefix SIDs, each SR node calculates the prefix SIDs to the advertisers.

  The prefix SID advertisement can be one of the following types:

  - **Absolute value advertisement**—Each SR node advertises the prefix SID absolute value and the SRGB.
  - **Index value advertisement**—Each SR node advertises the prefix SID index and the SRGB.

    Each SR node is assigned a globally unique index value for the node's prefix. The prefix SID an SR node allocates to a prefix equals the SRGB base of the SR node plus the index for that prefix.

NOTE:

The device supports only the index value advertisement in the current software release.

- **Adjacency SID**—SR nodes use an IGP to advertise SIDs allocated to the IGP adjacencies (that is, the links to its IGP neighbors). The SIDs are used to identify the links.

  The adjacency SIDs can be allocated automatically or manually.

  - **Automatic adjacency SID allocation**—SR nodes allocate labels in SRLBs to the IGP adjacencies as SIDs.
  - **Manual adjacency SID allocation**—You can assign adjacency SID by using absolute values or index values. If you use index values, the adjacency SID of a link is the base value of the SRLB plus the index value for the link.

Dynamic SID allocation through BGP

SR-MPLS expands BGP to advertise prefix SIDs in BGP protocol packets. BGP uses routing policies to assign SIDs to prefixes when redistributing routes. The SIDs uniquely identify the SR nodes. All SR nodes in the SR domain use BGP to advertise their own prefix SIDs, including the SIDs and SID index values. From received advertisement packets, each SR node derives the prefix SIDs for the advertisers.

BGP prefix SIDs can be exchanged between BGP peers only through IPv4 unicast routes.

Dynamic SID allocation through BGP applies to MPLS VPN inter-AS option C networks.

Label forwarding entry installation based on SIDs

Label forwarding entry installation based on IGP prefix SIDs

Label forwarding entries based on prefix SIDs can be static or dynamic.

- **Static label forwarding entries**—The device creates local label forwarding entries based on manually configured incoming labels, outgoing labels, and next hops.
- **Dynamic label forwarding entries**—The device uses the IGP to flood in the SR domain the local SRGB and the index of the prefix SID for the local loopback interface. Based on the flooded information, the other devices in the domain calculates their local label forwarding entries by using the following rules:
  - Incoming label = Local SRGB base value + Index
  - Outgoing label = SRGB base value of the next hop + Index

Figure 1 Creating label forwarding entries based on IGP prefix SIDs

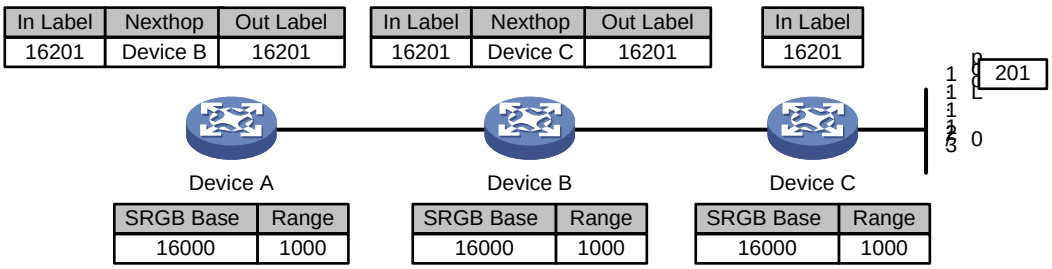

Figure 1 shows how dynamic label forwarding entries are created. After you assign index value 201 to loopback address 1.1.1.1/32 on Device C, Device C uses an IGP packet to advertise the index value and its local SRGB. Then, the devices calculate incoming and outgoing labels according to the previously mentioned label calculation rules.

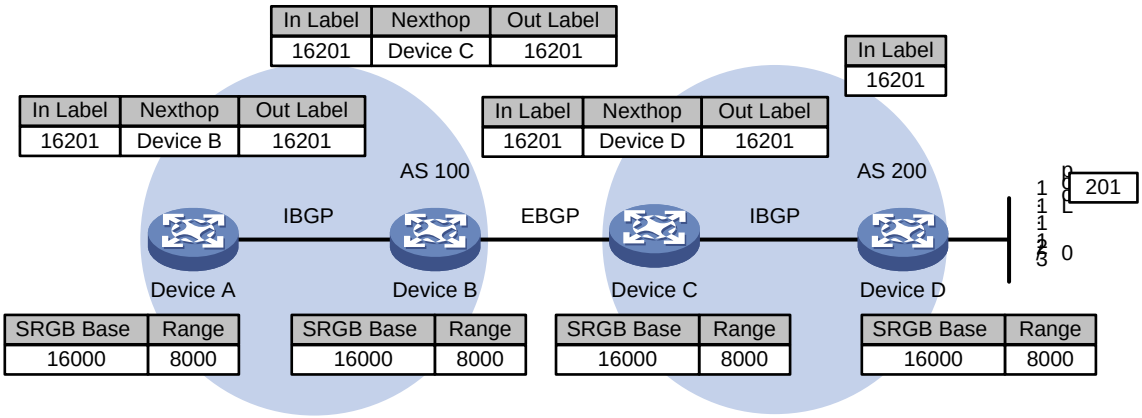
- Devices C calculates its incoming label, which is 16201.
- Device B calculates its incoming label and outgoing label and creates a label forwarding entry. The incoming label is 16201. The outgoing label is 16201. The next hop is Device C.
- Device A calculates its incoming label and outgoing label and creates a label forwarding entry. The incoming label is 16201. The outgoing label is 16201. The next hop is Device B.

Label forwarding entry installation based on BGP prefix SIDs

The device redistributes routes to BGP and assigns prefix SIDs to redistributed routes based on routing policies. Then, the device uses BGP to flood in the SR domain the prefix SIDs and the indexes of the prefix SIDs. Based on the flooded information, the other devices in the domain calculates their local label forwarding entries by using the following rules:

- Incoming label = Local SRGB base value + Index
- Outgoing label = Received SID

Figure 2 Creating label forwarding entries based on BGP prefix SIDs



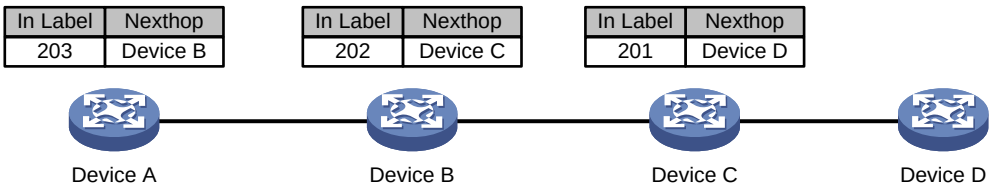


Figure 2 shows how label forwarding entries are created. After you assign index value 201 to loopback address 1.1.1.1/32 on Device D, Device D redistributes the route of the address and assigns it an SID (16201 in this example). Then, the device uses a BGP packet to advertise the SID and index value. The devices in the SR domain calculate incoming and outgoing labels according to the previously mentioned label calculation rules and create label forwarding entries.

- Devices D calculates its incoming label, which is 16201.
- Device C calculates its incoming label and outgoing label and creates a label forwarding entry. The incoming label is 16201. The outgoing label is 16201. The next hop is Device D.
- Device B calculates its incoming label and outgoing label and creates a label forwarding entry. The incoming label is 16201. The outgoing label is 16201. The next hop is Device C.
- Device A calculates its incoming label and outgoing label and creates a label forwarding entry. The incoming label is 16201. The outgoing label is 16201. The next hop is Device B.

Label forwarding entry installation based on adjacency SIDs

When using adjacency SIDs, each device allocates a static or dynamic incoming label to the link to its neighbor. The label has local significance. Multiple devices can use the same adjacency SID.

Figure 3 Creating label forwarding entries based on adjacency SIDs

As shown in Figure 3, the devices are running the same IGP. After IGP adjacencies are established between the devices, Device A, Device B, and Device C allocates labels and creates label forwarding entries as follows:

- Device A allocates label 203 to the link to its neighbor Device B.
- Device B allocates label 202 to the link to its neighbor Device C.
- Device C allocates label 201 to the link to its neighbor Device D.
- Device A creates a label forwarding entry with incoming label 203 and next hop Device B.
- Device B creates a label forwarding entry with incoming label 202 and next hop Device C.
- Device C creates a label forwarding entry with incoming label 201 and next hop Device D.

SRLSP setup

You can use the following methods to create SRLSPs:

- Manually configure an SRLSP.

  To configure an SRLSP, you must specify the label stack for packets to be forwarded along the SRLSP on the ingress node. Each label in the stack corresponds to a prefix SID or adjacency SID. The system can look for the outgoing label and next hop based on the prefix SID or adjacency SID.
- Configure SR nodes to use BGP or an IGP to dynamically establish an SRLSP.

  SR nodes follow these steps to establish SRLSPs:

  a. Use BGP or an IGP to collect prefix SID information from the SR-MPLS network.

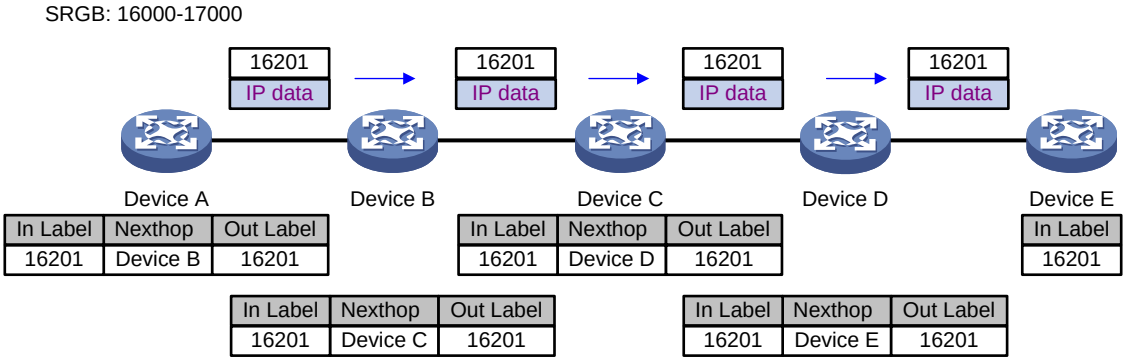
  b. Calculate the shortest paths to other SR nodes based on the collected prefix SID information and the BGP or IGP network topology.

  c. Establish SRLSPs based on the shortest paths.
- Configure a controller to deploy SRLSP configuration to the device so the device creates SRLSPs accordingly.

  For more information about controller configuration, see the user guide for the controller.

Packet forwarding in SR-MPLS

Based on the SID allocation method, SR-MPLS uses one of the following packet forwarding methods:



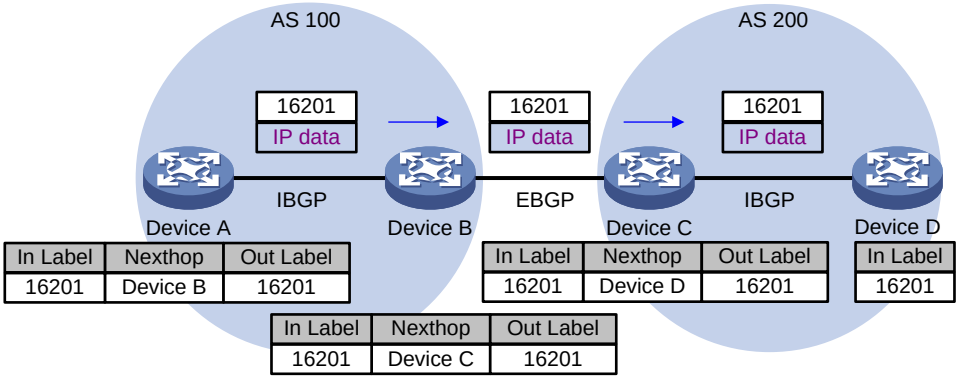
- **Prefix SID-based packet forwarding**—The ingress node encapsulates the prefix SID for the egress node to a packet. The transit nodes forward the packet based on label forwarding entries.
- **Adjacency SID-based packet forwarding**—The ingress node encapsulates the label stack that contains the adjacency SIDs of all links along the forwarding path to a packet. Each transit node uses the top label in the label stack to determine the next hop and pops the top label before forwarding the packet to the next hop.
- **Prefix and adjacency SID-based packet forwarding**—The nodes use prefix SID-based packet forwarding in combination with adjacency-based packet forwarding.

Prefix SID-based packet forwarding within the same AS

Figure 4 shows how a packet is forwarded along the SRLSP from Device A to Device E based on prefix SIDs. In this example, the outgoing label for the packet is 16201 on Device A.

1. Ingress node Device A searches for a forwarding entry for label 16201, adds outgoing label 16201 to the packet and sends the packet to the next hop (Device B).
2. When transit node Device B receives the packet, it searches for a label forwarding entry that matches the label in the packet. Then, Device B uses the outgoing label of the matched entry (16201) to replace the label in the packet and forwards the packet to the next hop (Device C).
3. Transit nodes Device C and Device D process the packet in the same way Device B does.
4. When egress node Device E receives the packet, it removes the label and forwards the packet by IP address.

Figure 4 Prefix SID-based packet forwarding within the same AS

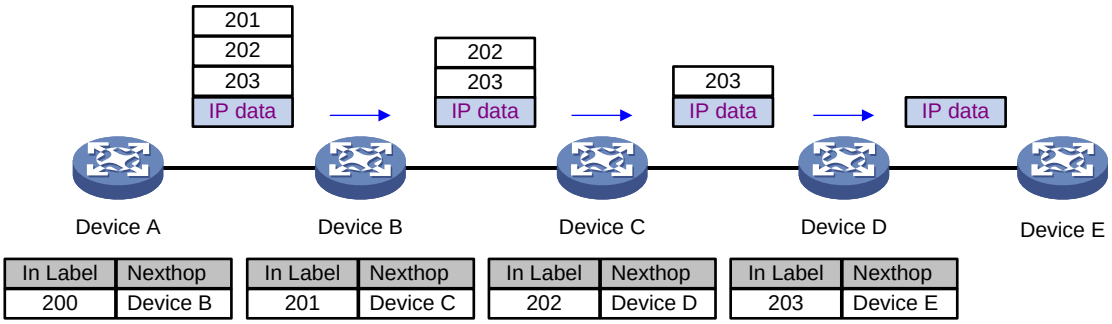


Prefix SID-based packet forwarding across ASs

Figure 5 shows how a packet is forwarded along the SRLSP from Device A to Device D based on prefix SIDs. In this example, the outgoing label for the packet is 16201 on Device A.

1. Ingress node Device A searches for a forwarding entry for label 16201, adds outgoing label 16201 to the packet, and sends the packet to the next hop (Device B).
2. When transit node Device B receives the packet, it searches for a label forwarding entry that matches the label in the packet (16201). Then, Device B uses the outgoing label of the matched entry (16201) to replace the label in the packet and forwards the packet to the next hop (Device C).
3. Transit nodes Device C processes the packet in the same way Device B does.
4. When egress node Device D receives the packet, it removes the label and forwards the packet by IP address.

Figure 5 Prefix SID-based packet forwarding across ASs



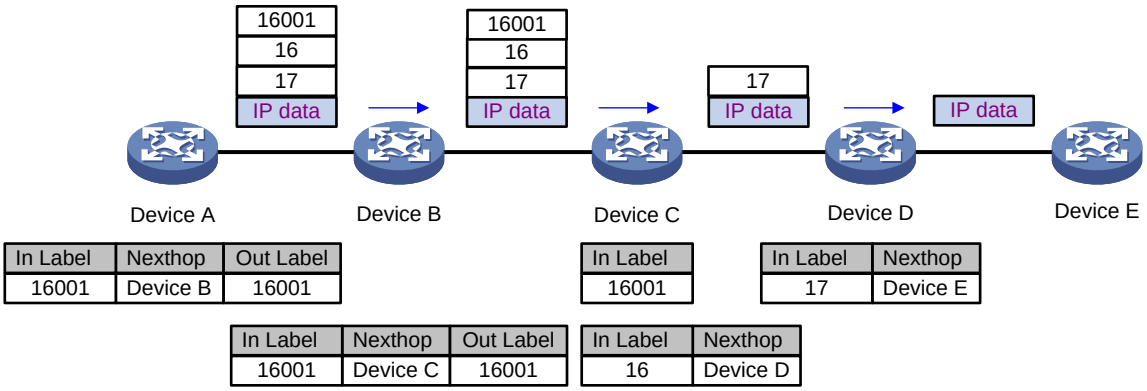
Adjacency SID-based packet forwarding

Figure 6 shows how a packet is forwarded along the SRLSP from Device A to Device E based on adjacency SIDs. In this example, the label stack for the packet is configured as (200, 201, 202, and 203) on Device A.

1. Ingress node Device A searches for a forwarding entry for the top label (200) to determine the next hop. Then, Device A adds label stack (201, 202, and 203) to the packet, and forwards the packet to the next hop (Device B).
2. When transit node Device B receives the packet, it searches for a forwarding entry for the top label (201) to determine the next hop. Then, Device B removes the top label from the stack and forwards the packet to the next hop (Device C).

3. When transit node Device C receives the packet, it searches for a forwarding entry for the top label (202) to determine the next hop. Then, Device C removes the top label from the stack and forwards the packet to the next hop (Device D).
4. When transit node Device D receives the packet, it searches for a forwarding entry for the label (203) to determine the next hop. Then, Device D removes the label stack from the packet and forwards the packet to the next hop (Device E).
5. When egress node Device E receives the packet, it forwards the packet by IP address.

Figure 6 Adjacency SID-based packet forwarding



Prefix and adjacency SID-based packet forwarding

Figure 7 shows how a packet is forwarded along the SRLSP from Device A to Device E based on prefix SIDs and adjacency SIDs. In this example, the index value for the prefix SID of Device C is 1. The prefix SIDs for Device A, Device B, and Device C are all 16001. The Adjacency SIDs that Device C and Device D allocate to the adjacencies are 16 and 17, respectively. On Device A, the label stack for the packet is (16001, 16, 17).

1. Ingress node Device A searches for a forwarding entry for label 16001 to determine the outgoing label (16001) and next hop (Device B). Device adds label stack (16001, 16, 17) to the packet and sends the packet to the next hop (Device B).
2. When transit node Device B receives the packet, it searches for a label forwarding entry that matches the top label in the label stack (16001). Then, Device B uses the outgoing label of the matched entry (16001) to replace the top label and forwards the packet to the next hop (Device C).
3. When transit node Device C receives the packet, it removes the top label 16001 and searches for a forwarding entry for the next label (16) to determine the next hop. Then, Device C removes label 16 from the stack and forwards the packet to the next hop (Device D).
4. When transit node Device D receives the packet, it searches for a forwarding entry for the label (17) to determine the next hop. Then, Device D removes the label stack from the packet and forwards the packet to the next hop (Device E).
5. When egress node Device E receives the packet, it forwards the packet by IP address.

Figure 7 Prefix and adjacency SID-based packet forwarding

MPLS SR and LDP interworking

SR-MPLS and LDP interworking enables SR-MPLS networks and MPLS LDP networks to communicate and cooperate for MPLS forwarding.

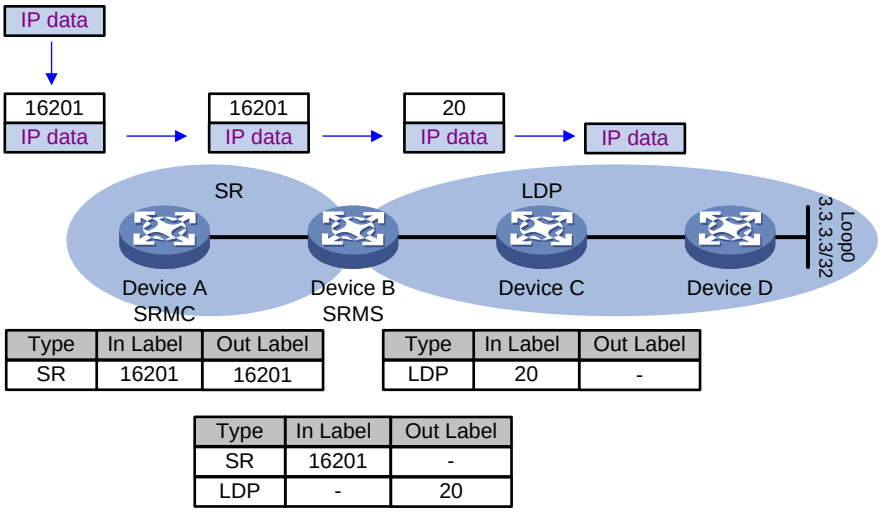
SR-MPLS and LDP interworking supports the following modes:

- **SR to LDP**—Maps prefixes on an LDP network to SR-MPLS SIDs to forward traffic from an SR-MPLS network to an MPLS LDP network.
- **LDP to SR**—Uses an IGP protocol to advertise SIDs and associates SIDs with LDP labels to forward traffic from an MPLS LDP network to an SR-MPLS network.
- **SR over LDP**—Enables SR-MPLS networks to communicate through an LDP network.

SR to LDP

The SR to LDP mode defines the following roles:

- **Segment Routing Mapping Server (SRMS)**—Advertises prefix-SID mappings on behalf of SR-incapable devices (LDP devices). You need to configure prefix-SID mappings on the SRMS.
- **Segment Routing Mapping Client (SRMC)**—Receives prefix-SID mappings advertised by the SRMS and creates SR-MPLS label forwarding entries.



As shown in Figure 8, Device A and Device B are running SR-MPLS, and Device B, Device C, and Device D are running LDP. After Device D assigns a label for destination address 3.3.3.3/32, Device B and Device C each install an LDP label forwarding entry.

The following steps establish a mapping between the SRLSP and the LDP LSP:

1. Device B acts as an SRMS. It assigns SID index value 201 to the IP address of loopback interface 0 on Device D (3.3.3.3/32), and then advertises an IP prefix-SID mapping TLV to Device A.
2. Device A acts as an SRMC. After receiving the advertised mapping TLV, it creates an SR-MPLS label forwarding entry.

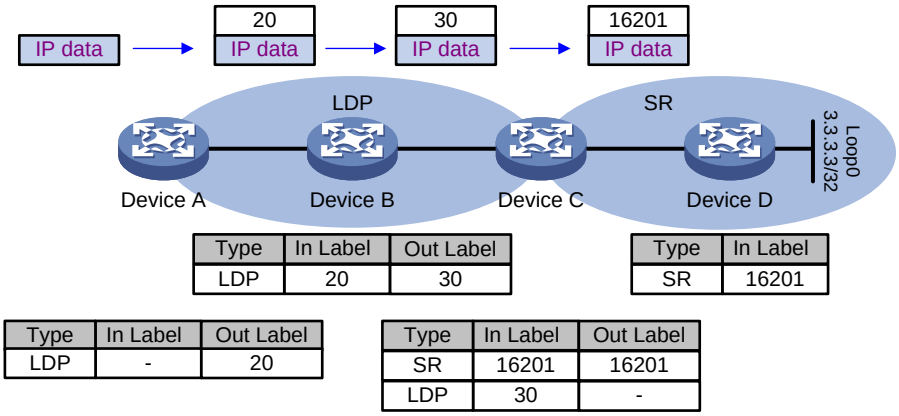
A mapping is established between the SRLSP and the LDP LSP.

Figure 8 SR to LDP packet forwarding

If Device A uses an SRLSP to send a packet to Device D, the packet is forwarded as follows:

3. Ingress node Device A adds label 16201 to the packet and then sends the packet to transit node Device B.
4. When transit node Device B receives the packet, it searches for a label forwarding entry that matches incoming label 16201. Because the entry does not have an outgoing label, Device B searches for a valid LDP outgoing label for destination address 3.3.3.3/32. Then, Device B adds the LDP label (20) to the packet as the SR outgoing label and forwards the packet to the next hop (Device C).
5. When transit node Device C receives the packet, it searches for an LDP label forwarding entry for incoming label 20. Then, it removes the label from the packet and forwards the packet to egress node Device D.
6. The egress node forwards the packet by IP address.

LDP to SR



As shown in Figure 9, Device C and Device D are running SR-MPLS, and Device A, Device B, and Device C are running LDP. Each device running LDP assigns a label to destination address 3.3.3.3/32 and then installs an LDP label forwarding entry.

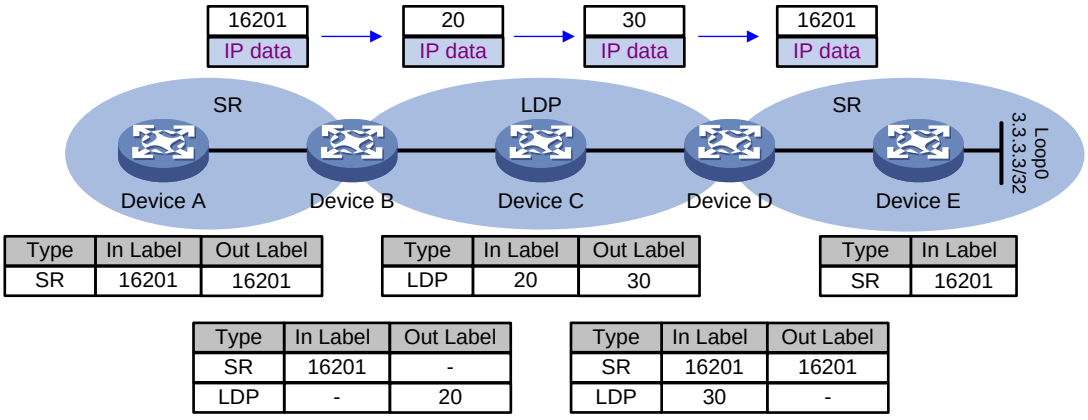
The following steps establish an association between the SR-MPLS label and the LDP label:

1. After you assign SID index value 201 to the IP address of loopback interface 0 on Device D (3.3.3.3/32), Device D sends an IGP protocol packet to advertise the index value and the local SRGB.
2. After receiving the packet, Device C creates an SR-MPLS label forwarding entry.

The SR-MPLS label and the LDP label are associated on Device C.

Figure 9 LDP to SR packet forwarding

A packet from Device A to Device D is forwarded as follows:



3. Ingress node Device A adds an LDP label (20) to the packet and forwards the packets to the next hop (Device B).
4. Device B searches for an LDP label forwarding entry, uses 30 as the outgoing label, and forwards the packet to the next hop (Device C).
5. Device C searches for an LDP label forwarding entry for incoming label 30 and finds no outgoing label. Because valid SR-MPLS outgoing label 16201 exists for the destination address 3.3.3.3.32, Device C uses the label (16201) as the outgoing label and forwards the packet to Device D.
6. Egress node Device D deletes label 16201 from the packet and forwards the packet by IP address.

SR over LDP

For SR-MPLS networks to communicate across an LDP network, the SR/LDP border devices must be able to connect the SR LSP and the LDP LSP as follows:

- **SR-MPLS to LDP interworking**—The border device installs SR-to-LDP label forwarding entries. For a packet from the SR-MPLS network to the LDP network, the SR-MPLS label forwarding entry on the border device does not have an outgoing label. The border device uses the outgoing label of the LDP label forwarding entry for the same destination address as the outgoing label of the packet.
- **LDP to SR-MPLS interworking**—The border device installs LDP-to-SR label forwarding entries. For a packet from the LDP network to the SR-MPLS network, the LDP forwarding entry on the border device does not have an outgoing label. The border device must use the outgoing label of the SR-MPLS forwarding entry for the same destination address as the outgoing label of the packet.

Figure 10 SR-MPLS over LDP

As shown in Figure 10, Device A, Device B, Device D, and Device E are running SR-MPLS. After you assign index value 201 to loopback interface address 3.3.3.3/32 on Device E, Device E will advertise the index value and the local SRGB. After Device A, Device B, and Device D receive the message, they will install their respective SR-MPLS label forwarding entries. Device B, Device C, and Device D are running LDP. They allocate labels to destination address 3.3.3.3/32 to generate the LDP label forwarding entries.

A packet that Device A sends to Device E will be forwarded as follows:

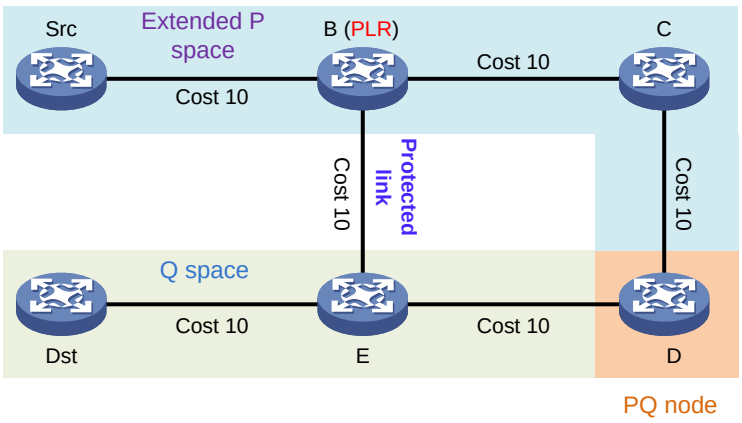
1. Ingress node Device A encapsulates label 16201 to the packet and forwards the packet to transit node Device B.
2. Transit node Device B searches for an SR-MPLS label forwarding entry for incoming label 16201 and finds that the entry does not have an outgoing label. Because an LDP label forwarding entry with outgoing label 20 exists for the destination address (3.3.3.3/32), Device B encapsulates outgoing label 20 in the packet. Then Device B sends the packet to transit node Device C.
3. Device C forwards the packet to Device D based on its LDP label forwarding entries. The outgoing label is 30.
4. Device D searches for an LDP label forwarding entry for incoming label 30 and finds that the entry does not have an outgoing label. Because an SR-MPLS label forwarding entry with outgoing label 16201 exists for the destination address (3.3.3.3/32), Device B encapsulates outgoing label 16201 in the packet. Then Device D sends the packet to egress node Device E.
5. Egress node Device E deletes the incoming label and forwards the packet by IP address.

TI-LFA FRR

Topology-Independent Loop-Free Alternate Fast Re-Route (TI-LFA FRR) provides link and node protection. When a link or node fails, TI-LFA FRR switches the traffic to the backup path to ensure continuous data forwarding.

TI-LFA FRR background

To minimize traffic loss during the route reconvergence process in SR-MPLS, you can enable the FRR feature on the device directly connected to the protected link or node. The device enabled with FRR is called the Point of Local Repair (PLR). The PLR calculates the shortest path to the destination and calculates an FRR backup path at the same time, and then writes the information into the FIB table. When a protected link or node fails, traffic is rerouted through the FRR backup path on the PLR node, without the need for the network topology to reconverge, significantly reducing traffic loss. FRR has the following mechanisms:



- **Loop-Free Alternate Fast Reroute (LFA FRR)**—To calculate the backup path, LFA FRR identifies a protected neighboring node (LFA node) of the PLR, enabling traffic to be forwarded to the destination node without passing through the protected link or node. In some scenarios, especially in a ring network, LFA FRR cannot calculate a backup path, making it topology dependent. According to RFC 6571, LFA FRR has a topology coverage of 80% to 90%.
- **Remote Loop-Free Alternate Fast Reroute (RLFA FRR)**—To improve the topology coverage of LFA FRR, RFC 7490 defines RLFA FRR, which enables traffic to be forwarded from the PLR to an RLFA FRR node and reach the destination node without passing through the protected link or node. Compared to LFA FRR, RLFA FRR does not restrict the protective node to being a neighbor of the PLR, providing more protection possibilities and increasing the topology coverage to 95% to 99%.
- **TI-LFA FRR suitable for SRv6 and SR-MPLS**—Compared to LFA FRR and RLFA FRR, TI-LFA FRR is topology independent, meaning FRR backup path calculation is not restricted by the network topology. PLR can automatically calculate a TI-LFA FRR backup path as long as a bypass forwarding path is available.

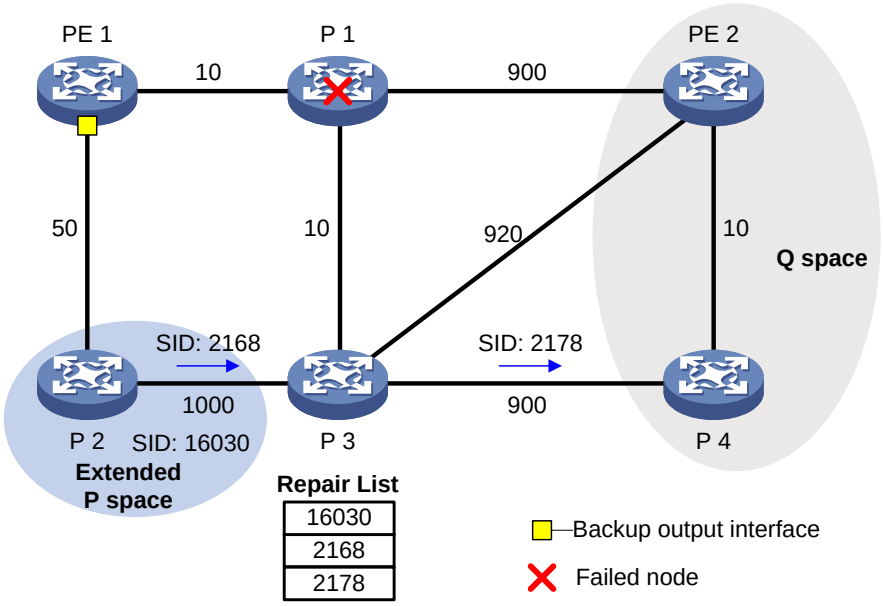
TI-LFA FRR concepts

TI-LFA FRR uses the concepts of RLFA FRR defined in RFC 7490:

- **P space**—A set of nodes reachable (using pre-convergence paths) from the PLR without using the protected link or node (including equal-cost path splits). Nodes in the P space are called P nodes.Calculation of P nodes typically involves building an SPF tree with the PLR as the root node, and then identifying nodes on the SPF tree that meet the loop-free requirement.
- **Extended P space**—A set of nodes reachable (using pre-convergence paths) from the neighbors of the PLR (except for the protected node) without using the protected link or node (including equal-cost path splits). The P space is a subset of the extended P space. Nodes in the extended P space are also called P nodes. Neighbor nodes of the PLR are N nodes. As shown in Figure 11, the expanded P space contains nodes Src, B, C, and D. The P nodes meet the following loop-free requirement: Distance (N, P) < Distance (N, PLR) + Distance (PLR, P).
- **Q space**—A set of nodes that can reach (using pre-convergence paths) the destination without using the protected link or node (including equal-cost path splits). Nodes in the Q space are called Q nodes.

Figure 11 TI-LFA FRR concepts

TI-LFA FRR path calculation



As shown in Figure 12, PE 1 is the source node. P 1 is the faulty node. PE 2 is the destination node. The numbers on links represent the link costs. A data flow traverses PE 1, P 1, and PE 2. To protect data against P 1 failure, TI-LFA FRR calculates the extended P space, Q space, shortest path tree

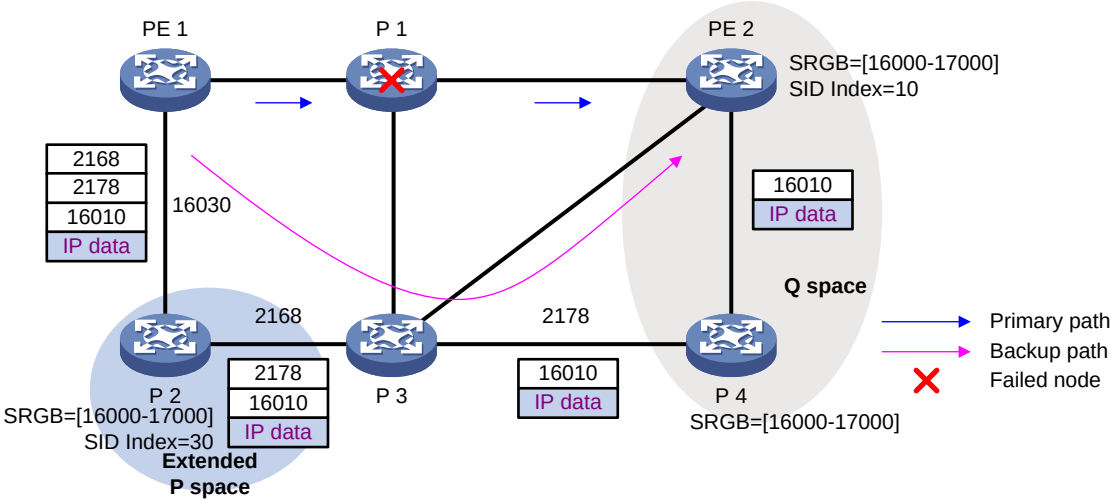
converged after P 1 fails, repair list, and backup outgoing interface, and creates the backup forwarding entry.

TI-LFA FRR calculates the backup path by using the following steps:

1. Calculates the extended P space: P 2.
2. Calculates the Q space: PE 2 and P 4.
3. Calculates the shortest path tree converged after P 1 fails: PE 1 --> P 2 --> P 4 --> PE 2.
4. Calculates the repair list: Node label of P 2 (16030), adjacency label of P 2 to P 3 (2168), and adjacency label of P 3 to P 4 (2178).
5. Calculates the backup outgoing interface, that is, the outgoing interface to the next hop after the link from PE 1 to P 1 fails.

Figure 12 TI-LFA FRR diagram

TI-LFA FRR forwarding process



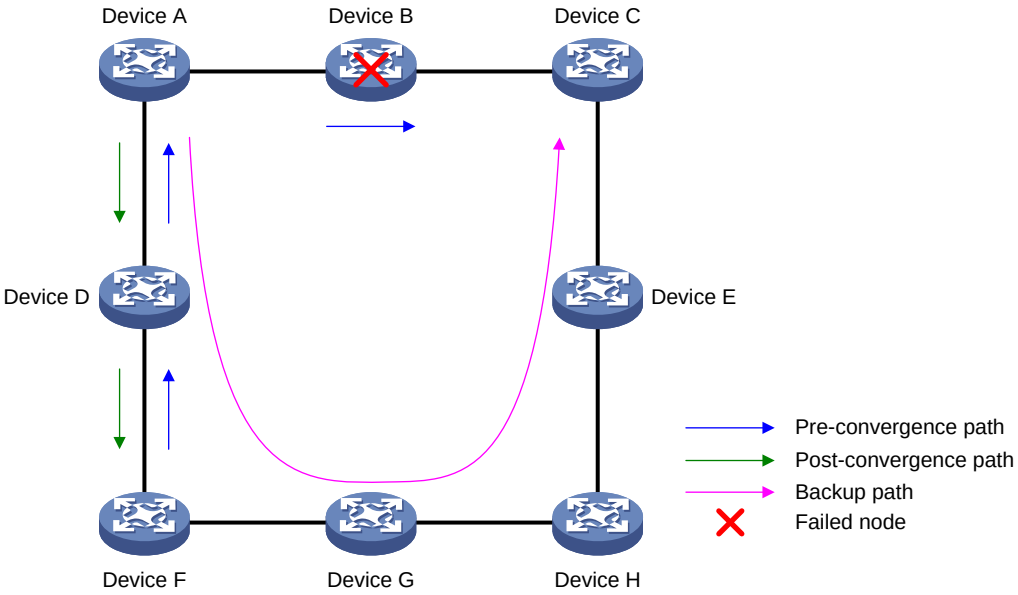
After TI-LFA FRR finishes backup path calculation, traffic will be switched to the backup path in response to a primary path failure.

As shown in Figure 13, P 2 is a P node and P 4 is a Q node. When the next hop on the primary path (P 1) fails, TI-LFA FRR switches the traffic to the backup path. The following are the detailed steps:

1. PE 1 encapsulates a label stack to a packet according to the repair list. The labels, from the outmost to inmost, are as follows:
   - Node label of P node P2 (16030), which equals the SRGB base value of PE 1 plus the SID index value of P 2.
   - Adjacency labels from P node P2 to Q node P 4, which are 2168 and 2178.
   - The destination's node label 16010, which equals the SRGB base value of Q node P 4 plus the SID index value of destination node PE 2.
2. P2 receives the packet, searches for a label forwarding entry based on the outmost label, pops label 2168, and forwards the packet to P 3.
3. P3 receives the packet, searches for a label forwarding entry based on the outmost label, pops label 2178, and forwards the packet to P 4.

4. P4 receives the packet, and searches for a label forwarding entry based on the outmost label. Because the outgoing label is 16010 and the next hop is PE 2, P 4 encapsulates 16010 as the outmost label and forwards the packet to PE 2.

Figure 13 Data forwarding over the TI-LFA FRR backup path

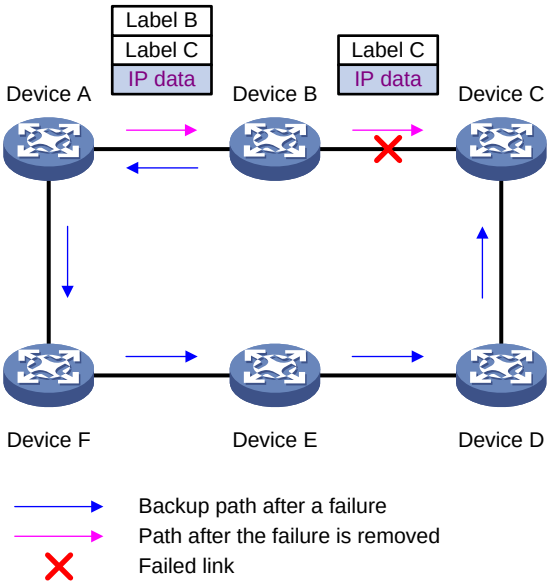


Microloop avoidance after a network failure

As shown in Figure 14, when Device B fails, traffic to Device C will be switched to the backup path calculated by TI-LFA. After Device A finishes route convergence, traffic will be switched to the post-convergence path. If Device D and Device F have not finished route convergence and still forward traffic along the pre-convergence path, a loop is formed between Device A and Device F. The loop exists until Device D and Device F finish route convergence.

FRR microloop avoidance and SR microloop avoidance can resolve this issue. After you configure TI-LFA, Device A first switches traffic to the backup path calculated by TI-LFA when Device B fails. Then, Device A waits for Device D and Device F to finish route convergence before starting route convergence. After Device A also finishes route convergence, Device A switches the traffic to the converged route.

Figure 14 Diagram for microloop avoidance after a network failure



Microloop avoidance after a failure recovery

As shown in Figure 15, before the link between Device B and Device C recovers, traffic traverses along the backup path. After the link recovers, Device A will forward the traffic to Device B if Device A finishes route convergence before Device B. Before Device B also finishes route convergence, Device B still forwards the traffic along the backup path. A loop is formed between Device A and Device B.

SR microloop avoidance can resolve this issue. After the link recovers, SR microloop avoidance automatically calculates the optimal path from Device A to Device C and forwards traffic along the path. To forward a packet along the newly calculated path, Device A adds, for example, the adjacency label from Device B to Device C to the packet and then sends the packet to Device B. Then, Device B forwards the packet to Device C based on the path information.

When the microloop avoidance RIB-update-delay timer expires, Device B should have finished route convergence. Device A does not add path information to packets anymore, and it forwards packets to Device C as usual.

Figure 15 Diagram for microloop avoidance after a failure recovery

Restrictions and guidelines: SR-MPLS configuration

This feature is supported only when the device operates in expert mode. For more inforamtion about device operating modes, see device management configuration in *Fundamentals Configuration Guide*.

For BGP-based SR, the SRGB range is fixed (16000 through 24000). To use both BGP and an IGP to advertise prefix SIDs, set the SRGB range for MPLS to 16000 through 24000.

SR-MPLS tasks at a glance

IP traffic forwarding over SRLSPs tasks at a glance

To forward IP traffic over SRLSPs, perform the following configuration tasks:

1. Configuring segments

   Select one of the following tasks:

   - Configuring static segments
   - Configuring IGP-based SID advertisement

2. (Optional.) Configuring the device to prefer SRLSPs in traffic forwarding
3. (Optional.) Configuring SR-MPLS and LDP interworking
4. (Optional.) Configuring TI-LFA FRR

Configuring static segments

Prerequisites for static segment configuration

Before you configure static segments for a static SRLSP, perform the following tasks:

- Determine the ingress node, transit nodes, and egress node of the static SRLSP.
- Enable MPLS on all nodes and interfaces that will participate in MPLS forwarding. For information about enabling MPLS, see basic MPLS configuration in *MPLS Configuration Guide*.

Configuring a static adjacency segment

Restrictions and guidelines

This task is required on all nodes of a static SRLSP.

Multiple static SRLSPs can share an adjacency segment.

If you specify the next hop address for a static adjacency segment, make sure the following requirements are met:

- The device has a route to the next hop address.
- MPLS is enabled on the outgoing interface of the route.

If you specify an outgoing interface for a static adjacency segment, make sure the following requirements are met:

- The interface is up.
- The interface can receive direct routes.
- MPLS is enabled on the interface.

A static adjacency segment must use a different incoming label than existing static LSPs, static PWs, and static CRLSPs. If not, the configured adjacency segment is unavailable. The adjacency segment cannot become available even if you change the incoming label of the static LSP, static PW, or static CRLSP. To resolve this problem, you must delete the existing adjacency segment and configure a new one with a different incoming label.

Procedure

1. Enter system view.

   system-view

2. Configure a static adjacency segment.

   static-sr-mpls adjacency *adjacency-path-name* **in-label** *label-value* { **nexthop** *ip-address* | **outgoing-interface** *interface-type interface-number* }

   The next hop address for a static adjacency segment cannot be a local public IP address.

Configuring a static prefix segment

Restrictions and guidelines

This task is required on all nodes of a static SRLSP.

Multiple static SRLSPs to the same destination can share a prefix segment.

A prefix segment must use the next hop or outgoing interface of the optimal route (non-BGP route) to the destination address of the prefix segment. You can configure multiple prefix segments to the destination address for load sharing if the optimal route has more than one next hop or outgoing interface. To avoid configuration failure, make sure all prefix segments use the same prefix segment name and incoming label.

Procedure

1. Enter system view.

   system-view

2. Configure a static prefix segment.

   static-sr-mpls prefix *prefix-path-name* **destination** *ip-address* { *mask-length* | *mask* } **in-label** *in-label-value* [{ **nexthop** *ip-address* | **outgoing-interface** *interface-type interface-number* } **out-label** *out-label-value*]

   The next hop address for a static prefix segment cannot be a local public IP address.

Configuring IGP-based SID advertisement

IGP-based prefix SID advertisement tasks at a glance

Perform the following tasks on each node along an SRLSP:

1. Configuring the IGP to support SR-MPLS
2. Configuring prefix SIDs
3. Configuring the MPLS SRGB

   Perform this task if you are configuring prefix SIDs.

IGP-based adjacency SID advertisement tasks at a glance

Perform the following tasks on each node along an SRLSP:

1. Configuring the IGP to support SR-MPLS
2. Enabling SR-MPLS adjacency label allocation for the IGP

   The device will allocate SIDs to adjacencies randomly.
3. (Optional.) Assigning adjacency SIDs

   You can assign adjacency SIDs to adjacencies manually.

Prerequisites for configuring IGP-based SID advertisement

Before you configure IGP-based SID advertisement, perform the following tasks:

- Determine the ingress node, transit nodes, and egress node of an SRLSP.
- Determine the following items for each node:
  - Index value for the prefix SID.
  - MPLS SRGB.
- Enable MPLS on all nodes and interfaces that will participate in MPLS forwarding. For information about enabling MPLS, see basic MPLS configuration in *MPLS Configuration Guide*.

Configuring the IGP to support SR-MPLS

Prerequisites

For SR-MPLS to take effect, set the IS-IS cost style to wide, compatible, or wide-compatible before configuring IS-IS to support SR-MPLS. For more information about the cost style, see IS-IS configuration in *Layer 3—IP Routing Configuration Guide*.

Configuring IS-IS to support SR-MPLS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4
4. Enable SR-MPLS.
   segment-routing mpls
   By default, SR-MPLS is disabled.

Configuring prefix SIDs

About this task

Configuring a prefix SID in loopback interface view binds the SID with the IP address of the loopback interface.

To configure a prefix SID, use one of the following methods:

- Specify an absolute value in the SRGB. The absolute value is used as the prefix SID.
- Specify an index value. The sum of the index value and the SRGB base value is used as the prefix SID. The prefix SID must be in the SRGB.

Restrictions and guidelines

To use a prefix SID for a group of SR nodes in anycast scenarios, specify the **n-flag-clear** keyword to set the Node-SID flag bit of the prefix SID to 0.

To configure an IS-IS prefix SID, you must enable an IS-IS process on the loopback interface.

Configuring an IS-IS prefix SID

1. Enter system view.
   system-view
2. Enter loopback interface view.
   interface loopback *interface-number*
3. Configure an IS-IS prefix SID.
   isis [**process-id** *process-id*] **prefix-sid** { **absolute** *absolute-value* | **index** *index-value* } [**n-flag-clear**] [**explicit-null**]
   By default, no IS-IS prefix SID is configured.

Enabling SR-MPLS adjacency label allocation for the IGP

Restrictions and guidelines

For this feature to take effect, you must enable SR-MPLS.

Enabling SR-MPLS adjacency label allocation for IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4
4. Enable SR-MPLS adjacency label allocation.
   segment-routing adjacency enable
   By default, SR-MPLS adjacency label allocation is disabled.

Assigning adjacency SIDs

About this task

After you enable SR-MPLS adjacency label allocation, the device randomly allocates adjacency SIDs to the links to its IGP neighbors. If the link to an IGP neighbor flaps, the adjacency SID of the link keeps changing. For a link to always use the same adjacency SID, use this feature to assign a specific adjacency SID to the link.

Restrictions and guidelines

To assign adjacency SIDs by using absolute values, make sure the SIDs are in the label range of the SRLB. To assign adjacency SIDs by using index values, make sure the index values plus the base value of the SRLB are in the label range of the SRLB.

The assigned adjacency SIDs take effect after you enable SR-MPLS and SR-MPLS adjacency label allocation.

Prerequisites

Before assigning adjacency SIDs, execute the **display mpls label** command to display the usage status of the labels that you want to assign as adjacency SIDs. Make sure the labels are in **Idle** state.

A label that is not in **Idle** state is being used by another protocol. If you assign it to a link as an adjacency SID, the adjacency SID is not available even if the status of the label changes to **Idle** later. To use the adjacency SID, you must remove the adjacency SID assignment and assign the adjacency SID again.

Assigning adjacency SIDs to IS-IS adjacencies

1. Enter system view.
   system-view
2. Enter interface view.
   interface *interface-type interface-number*
3. Assign an adjacency SID to an IS-IS adjacency link.
   isis adjacency-sid { **absolute** *absolute-value* | **index** *index-value* } [**nexthop** *nexthop-address*]
   By default, an IS-IS adjacency link does not have an adjacency SID.

Configuring the MPLS SRGB

Restrictions and guidelines

To configure the SRGB of a node successfully, make sure the SRGB contains the prefix SID configured for the node.

MPLS reserves labels in the range of 16000 to 24000 for SRGB. The minimum and maximum label values of the SRGB must be in the range.

Configuring the MPLS SRGB for IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Configure the MPLS SRGB.
   segment-routing global-block *minivalue maxivalue*
   By default, the minimum label value is 16000, and the maximum label value is 24000.

Configuring BGP-based SID advertisement

BGP-based SID advertisement tasks at a glance

Perform the following tasks on each node along an SRLSP:

1. Configuring BGP to support SR-MPLS
2. Configuring BGP prefix SIDs

Prerequisites for configuring BGP-based SID advertisement

Before you configure BGP-based SID advertisement, perform the following tasks:

- Determine the ingress node, transit nodes, and egress node of an SRLSP.
- Determine the index value for the prefix SID of each node:
- Enable MPLS on all nodes and interfaces that will participate in MPLS forwarding. For information about enabling MPLS, see basic MPLS configuration in *MPLS Configuration Guide*.

Configuring BGP to support SR-MPLS

1. Enter system view.
   system-view
2. Enable BGP and enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Create the BGP IPv4 unicast address family and enter its view.
   address-family ipv4 [**unicast**]
4. Enable SR-MPLS.
   segment-routing mpls
   By default, SR-MPLS is disabled.

Configuring BGP prefix SIDs

About this task

By specifying a prefix SID for a routing policy and applying the policy to redistributed routes, you can define the binding between the SID and the prefix.

Restrictions and guidelines

To configure BGP prefix SIDs, you must enable the capability to exchange labeled routes with peers.

Configuring a BGP prefix SID

1. Enter system view.
   system-view
2. Enter BGP instance view.
   bgp *as-number* [**instance** *instance-name*]
3. Enter BGP IPv4 unicast address family view.
   address-family ipv4 [**unicast**]
4. Redistribute routes from IS-IS and apply a routing policy to the redistributed routes.
   import-route isis *process-id* **route-policy** *route-policy-name*
5. Return to BGP instance view.
   quit
6. Return to system view.
   quit
7. Enter the routing policy view.
   route-policy *route-policy-name* { **deny** | **permit** } **node** *node-number*
8. Specify a label index value.
   apply label-index *index-value*

   By default, a routing policy does not have a label index value.

Configuring the device to prefer SRLSPs in traffic forwarding

About this task

This feature enables the device to preferentially use SRLSPs to forward traffic when both SRLSPs and LDP LSPs are available for traffic forwarding. If you do not configure this feature, the device prefers to use LDP LSPs for traffic forwarding.

Restrictions and guidelines

This feature takes effect only when SR-MPLS is enabled and SRLSPs use prefix SIDs.

Configuring the device to prefer SRLSPs established by IS-IS in traffic forwarding

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4

4. Configure the device to prefer SRLSPs in traffic forwarding.
   segment-routing sr-prefer [**prefix-list** *prefix-list-name*]
   By default, the device prefers LDP LSPs to SRLSPs.

Configuring SR-MPLS and LDP interworking

Restrictions and guidelines for SR-MPLS and LDP interworking

To configure SR-MPLS and LDP interworking, make sure the SRLSP uses prefix SIDs.

In the current software version, the SRMS and SRMC devices support only IS-IS-based SR-MPLS.

SR to LDP tasks at a glance

SRMS tasks at a glance

Perform the following tasks on an SRMS:

1. Enabling SR-MPLS on the SRMS:
   a. Configuring the IGP to support SR-MPLS
   b. Configuring prefix SIDs
   c. Configuring the MPLS SRGB
2. Enabling advertisement of locally configured prefix-SID mappings
3. Configuring prefix-SID mappings

SRMC tasks at a glance

Perform the following tasks on each SRMC:

1. Enabling SR-MPLS on the SRMC:
   a. Configuring the IGP to support SR-MPLS
   b. Configuring prefix SIDs
   c. Configuring the MPLS SRGB
2. Enabling reception of advertised prefix-SID mappings

LDP to SR tasks at a glance

1. Configuring the IGP to support SR-MPLS
2. Configuring prefix SIDs
3. Configuring the MPLS SRGB

SR over LDP tasks at a glance

1. Configuring the IGP to support SR-MPLS
2. Configuring prefix SIDs
3. Configuring the MPLS SRGB

Prerequisites for SR-MPLS and LDP internetworking

Before you configure SR-MPLS and LDP internetworking, perform the following tasks:

- Determine the ingress node, transit nodes, and egress node of an SRLSP.
- Determine the index value for the prefix SID of each node.
- Enable MPLS on all nodes and interfaces that will participate in MPLS forwarding. For information about enabling MPLS, see basic MPLS configuration in *MPLS Configuration Guide*.

Enabling advertisement of locally configured prefix-SID mappings

Restrictions and guidelines

Configure this feature on the device that acts as the SRMS.

Configuring IS-IS to advertise locally configured prefix-SID mappings

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4
4. Enable advertisement of locally configured prefix-SID mappings.
   segment-routing mapping-server advertise-local
   By default, advertisement is disabled for locally configured prefix-SID mappings.

Configuring prefix-SID mappings

Restrictions and guidelines

Configure this feature on the device that acts as the SRMS.

The specified prefixes must not belong to any existing prefix-SID mappings.

Prerequisites

Before you configure prefix-SID mappings in bulk, plan the number of mappings carefully.

Procedure

1. Enter system view.
   system-view
2. Enable SR and enter segment routing view.
   segment-routing
3. Configure a prefix-SID mapping.
   mapping-server prefix-sid-map *ip-address mask-length start-value* [**range** *range-value*] [**attached**]
   By default, no prefix-SID mappings exist.
   If you specify a value greater than 65535 for the *range-value* argument, the prefix-SID mappings cannot be advertised through IS-IS or OSPF.

Enabling reception of advertised prefix-SID mappings

Restrictions and guidelines

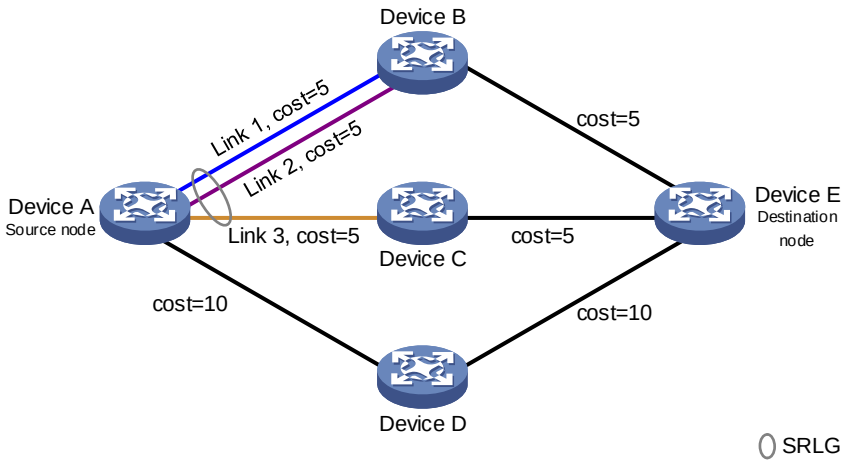
Configure this feature on the devices that act as the SRMCs.

Configuring IS-IS to receive advertised prefix-SID mappings.

1. Enter system view.
   `system-view`
2. Enter IS-IS view.
   `isis` *`process-id`*
3. Enter IS-IS IPv4 unicast address family view.
   `address-family ipv4`
4. Enable reception of prefix-SID mappings.
   `segment-routing mapping-server receive`
   By default, reception of prefix-SID mappings is enabled.

Configuring TI-LFA FRR

Restrictions and guidelines for TI-LFA FRR



TI-LFA FRR is not supported on static SR networks.

In SR-MPLS and LDP interworking scenarios, you must configure the device to prefer the IS-IS SRLSP to the LDP LSP. This rule ensures the effectiveness of the TI-LFA FRR backup next hop.

By default, no backup path can be calculated by TI-LFA FRR if the next hops of equal-cost primary paths on the source node are different. To address this issue, you can add all equal-cost primary paths on the source node to the same SRLG.

As shown in Figure 16, three equivalent paths Link 1, Link 2, and Link 3 are available from source node Device A to destination node Device E, with their next hops different. For TI-LFA FRR to calculate backup paths, you must add Link 1, Link 2, and Link 3 to the same SRLG.

Figure 16 Using TI-LFA FRR to calculate backup paths in the IS-IS ECMP scenario

TI-LFA FRR tasks at a glance

1. Enabling TI-LFA FRR
2. (Optional.) Disabling an interface from participating in TI-LFA calculation

   On the source node, disable TI-LFA on the route's outgoing interface to the next hop on the primary path.
3. (Optional.) Configuring microloop avoidance

Enabling TI-LFA FRR

Enabling TI-LFA FRR for IS-IS

1. Enter system view.

   system-view
2. Enter IS-IS view.

   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.

   address-family ipv4
4. Enable LFA FRR for IS-IS.

   fast-reroute lfa [**level-1** | **level-2**]

   By default, LFA FRR is disabled for IS-IS.
5. Enable TI-LFA FRR for IS-IS.

   fast-reroute ti-lfa [**per-prefix**] [**route-policy** *route-policy-name* | **host**] [**level-1** | **level-2**]

   By default, TI-LFA FRR is disabled for IS-IS.
6. (Optional.) Set the priority for the FRR backup path selection policy.

   fast-reroute tiebreaker { **lowest-cost** | **node-protecting** } **preference** *preference* [**level-1** | **level-2**]

   By default, the priority values of the lowest-cost and node-protection backup path selection policies are 20 and 40, respectively.

Disabling an interface from participating in TI-LFA calculation

1. Enter system view.

   system-view
2. Enter the view of IS-IS interface.

   interface *interface-type interface-number*
3. Disable the interface from participating in TI-LFA calculation.

   isis fast-reroute ti-lfa disable [**per-prefix**] [**route-policy** *route-policy-name* | **host**] [**level-1** | **level-2**]

   By default, an IS-IS interface participates in TI-LFA calculation.

Configuring microloop avoidance

About this task

The following microloop avoidance methods are available:

- **FRR microloop avoidance**—Provides microloop avoidance after a network failure.

On a network deployed with TI-LFA FRR, when a node or link fails, traffic will be switched to the backup path calculated by TI-LFA. If devices on the backup path have not finished route convergence, a loop is formed between the source node (failed node or the previous node along the link) and a device on the backup path. The loop exists until the devices on the backup path finish route convergence.

To resolve this issue, FRR microloop avoidance first switches traffic to the backup path calculated by TI-LFA after the node or link failure. Then, the source node waits for the nodes on the backup path to finish route convergence before starting route convergence.

- **SR microloop avoidance**—Provides microloop avoidance both after a network failure and after a failure recovery.

  After a network failure occurs or recovers, route convergence occurs on relevant network devices. Because of non-simultaneous convergence on network devices, microloops might be formed. After you configure SR microloop avoidance, the devices will forward traffic along the specified path before route convergence is finished on all the relevant network devices. Because the forwarding path is independent of route convergence, microloops are avoided.

  To leave sufficient time for IGP to finish route convergence, set the SR microloop avoidance RIB-update-delay timer. Before the timer expires, failure relevant devices will forward traffic along the specified path. After the timer expires, IGP route convergence should have finished and traffic will traverse along the IGP-calculated path.

Restrictions and guidelines

If you configure both FRR microloop avoidance and SR microloop avoidance, SR microloop avoidance takes effect.

Configuring FRR microloop avoidance for IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4
4. Enable FRR microloop avoidance for IS-IS.
   fast-reroute microloop-avoidance enable [**level-1** | **level-2**]
   By default, FRR microloop avoidance is disabled for IS-IS.
5. (Optional.) Set the FRR microloop avoidance RIB-update-delay time.
   fast-reroute microloop-avoidance rib-update-delay *delay-time* [**level-1** | **level-2**]
   By default, the FRR microloop avoidance RIB-update-delay time is 5000 ms.

Configuring SR microloop avoidance for IS-IS

1. Enter system view.
   system-view
2. Enter IS-IS view.
   isis *process-id*
3. Enter IS-IS IPv4 unicast address family view.
   address-family ipv4
4. Enable SR microloop avoidance for IS-IS.
   segment-routing microloop-avoidance enable [**level-1** | **level-2**]
   By default, SR microloop avoidance is disabled for IS-IS.
5. (Optional.) Set the SR microloop avoidance RIB-update-delay time.

segment-routing microloop-avoidance rib-update-delay *delay-time* [**level-1** | **level-2**]

By default, the SR microloop avoidance RIB-update-delay time is 5000 ms.

Display and maintenance commands for SR-MPLS

Execute **display** commands in any view.

Task	Command
Display BGP SR label ranges.	**display bgp** [*instance instance-name*] **segment-routing label-range**
Display IS-IS SR adjacency segment information.	**display isis segment-routing adjacency** [*process-id*]
Display IS-IS SRGB information.	**display isis segment-routing global-block** [**level-1** | **level-2**] [*process-id*]
Display IS-IS SR prefix-SID mappings.	**display isis segment-routing prefix-sid-map** [**active-policy** | **backup-policy**] [*process-id*] [**verbose**]
Display static SRLSP and adjacency segment information.	**display mpls static-sr-mpls** { **lsp** [*lsp-name*] | **adjacency** [*adjacency-path-name*] }
Display static prefix segment information.	**display mpls static-sr-mpls prefix** [**path** *lsp-name* | **destination** *ip-address* [*mask* | *mask-length*]]
Display prefix-SID mappings.	**display segment-routing mapping-server prefix-sid-map** [*ip-address mask-length* | **verbose**]

SR-MPLS configuration examples

Network configuration

As shown in Figure 17, complete the following tasks:

- Start IS-IS and enable IS-IS-based SR-MPLS on the PEs in the same AS.
- Configure PE 1 and ASBR-PE 1 to exchange labeled IPv4 routes through IBGP. Enable BGP-based SR-MPLS.
- Configure PE 2 and ASBR-PE 2 to exchange labeled IPv4 routes through IBGP. Enable BGP-based SR-MPLS.
- Establish an MP-EBGP peer relationship between PE 1 and PE 2 to exchange VPNv4 routes.
- Configure ASBR-PE 1 and ASBR-PE 2 to exchange labeled IPv4 routes through EBGP. Enable BGP-based SR-MPLS.
- Configure dynamic SID allocation on loopback interfaces of the devices. Then, establish an SRLSP based on the allocated SIDs and configure an MPLS TE tunnel over the SRLSP to transmit data.

Figure 17 Network diagram

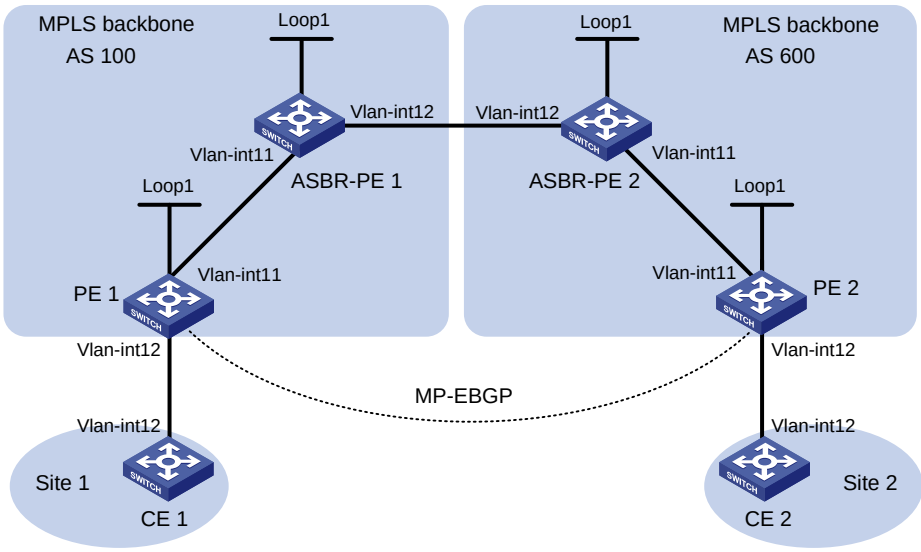


Table 1 Interface and IP address assignment

Device	Interface	IP address	Device	Interface	IP address
PE 1	Loop1	2.2.2.9/32	PE 2	Loop1	5.5.5.9/32
	Vlan-int11	1.1.1.2/8		Vlan-int11	9.1.1.2/8
	Vlan-int12	30.0.0.1/24		Vlan-int12	20.0.0.1/24
ASBR-PE 1	Loop1	3.3.3.9/32	ASBR-PE 2	Loop1	4.4.4.9/32
	Vlan-int11	1.1.1.1/8		Vlan-int11	9.1.1.1/8
	Vlan-int12	11.0.0.2/8		Vlan-int12	11.0.0.1/8
CE 1	Vlan-int12	30.0.0.2/24	CE 2	Vlan-int12	20.0.0.2/24

Procedure

1. Configure IP addresses and masks for interfaces. (Details not shown.)
2. Configure CE 1:

   # Assign an IP address to interface VLAN-interface 12.

   ```
   <CE1> system-view
   [CE1] interface vlan-interface 12
   [CE1-Vlan-interface12] ip address 30.0.0.2 24
   [CE1-Vlan-interface12] quit
   ```

   # Establish an EBGP peer relationship with PE 1, and redistribute VPN routes.

   ```
   [CE1] bgp 65001
   [CE1-bgp-default] peer 30.0.0.1 as-number 100
   [CE1-bgp-default] address-family ipv4 unicast
   [CE1-bgp-default-ipv4] peer 30.0.0.1 enable
   [CE1-bgp-default-ipv4] import-route direct
   ```

3. Configure PE 1:

   # Start IS-IS on PE 1, set the LSR ID, and enable MPLS and MPLS TE.

   ```
   <PE1> system-view
   ```

```
[PE1] isis 1
[PE1-isis-1] network-entity 00.0000.0000.0001.00
[PE1-isis-1] cost-style wide
[PE1-isis-1] quit
[PE1] mpls lsr-id 2.2.2.9
[PE1] mpls te
[PE1-te] quit
[PE1] interface vlan-interface 11
[PE1-Vlan-interface11] isis enable 1
[PE1-Vlan-interface11] mpls enable
[PE1-Vlan-interface11] quit
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] mpls enable
[PE1-Vlan-interface12] quit
[PE1] interface loopback 1
[PE1-LoopBack1] ip address 2.2.2.9 32
[PE1-LoopBack1] isis enable 1
[PE1-LoopBack1] quit
```

Enable SR-MPLS in IS-IS IPv4 unicast address family view and configure an IS-IS prefix SID.

```
[PE1] isis 1
[PE1-isis-1] address-family ipv4
[PE1-isis-1-ipv4] segment-routing mpls
[PE1-isis-1-ipv4] quit
[PE1-isis-1] quit
[PE1] interface loopback 1
[PE1-LoopBack1] isis prefix-sid index 20
[PE1-LoopBack1] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE1] ip vpn-instance vpn1
[PE1-vpn-instance-vpn1] route-distinguisher 11:11
[PE1-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE1-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[PE1-vpn-instance-vpn1] quit
```

Associate VLAN-interface 12 with VPN instance **vpn1**, and assign an IP address to the interface.

```
[PE1] interface vlan-interface 12
[PE1-Vlan-interface12] ip binding vpn-instance vpn1
[PE1-Vlan-interface12] ip address 30.0.0.1 24
[PE1-Vlan-interface12] quit
```

Create a routing policy and specify a label index value.

```
[PE1] route-policy policy1 permit node 1
[PE1-route-policy-policy1-1] apply label-index 10
[PE1-route-policy-policy1-1] quit
```

Start BGP on PE 1. Enable the capability to exchange labeled routes with IBGP peer 3.3.3.9.

```
[PE1] bgp 100
[PE1-bgp-default] peer 3.3.3.9 as-number 100
[PE1-bgp-default] peer 3.3.3.9 connect-interface loopback 1
[PE1-bgp-default] address-family ipv4 unicast
```

```
[PE1-bgp-default-ipv4] peer 3.3.3.9 enable
[PE1-bgp-default-ipv4] peer 3.3.3.9 label-route-capability
```

Enable SR-MPLS.

```
[PE1-bgp-default-ipv4] segment-routing mpls
```

Redistribute the route of loopback interface 1 to BGP and apply the routing policy.

```
[PE1-bgp-default-ipv4] network 2.2.2.9 32 route-policy policy1
[PE1-bgp-default-ipv4] quit
```

Configure the maximum number of hops from PE 1 to EBGP peer 5.5.5.9 as 10.

```
[PE1-bgp-default] peer 5.5.5.9 as-number 600
[PE1-bgp-default] peer 5.5.5.9 connect-interface loopback 1
[PE1-bgp-default] peer 5.5.5.9 ebgp-max-hop 10
```

Configure peer 5.5.5.9 as a VPNv4 peer.

```
[PE1-bgp-default] address-family vpnv4
[PE1-bgp-default-vpnv4] peer 5.5.5.9 enable
[PE1-bgp-default-vpnv4] quit
```

Configure CE 1 as an EBGP peer of PE 1 and install the learned BGP routes in the routing table of the VPN instance.

```
[PE1-bgp-default] ip vpn-instance vpn1
[PE1-bgp-default-vpn1] peer 30.0.0.2 as-number 65001
[PE1-bgp-default-vpn1] address-family ipv4 unicast
[PE1-bgp-default-ipv4-vpn1] peer 30.0.0.2 enable
```

4. Configure ASBR-PE 1:

Start IS-IS on ASBR-PE 1, set the LSR ID, and enable MPLS and MPLS TE.

```
<ASBR-PE1> system-view
[ASBR-PE1] isis 1
[ASBR-PE1-isis-1] network-entity 00.0000.0000.0002.00
[ASBR-PE1-isis-1] cost-style wide
[ASBR-PE1-isis-1] quit
[ASBR-PE1] mpls lsr-id 3.3.3.9
[ASBR-PE1] mpls te
[ASBR-PE1-te] quit
[ASBR-PE1] interface vlan-interface 11
[ASBR-PE1-Vlan-interface11] isis enable 1
[ASBR-PE1-Vlan-interface11] mpls enable
[ASBR-PE1-Vlan-interface11] quit
[ASBR-PE1] interface vlan-interface 12
[ASBR-PE1-Vlan-interface12] mpls enable
[ASBR-PE1-Vlan-interface12] quit
[ASBR-PE1] interface loopback 1
[ASBR-PE1-LoopBack1] ip address 3.3.3.9 32
[ASBR-PE1-LoopBack1] isis enable 1
[ASBR-PE1-LoopBack1] quit
```

Enable SR-MPLS in IS-IS IPv4 unicast address family view and configure an IS-IS prefix SID.

```
[ASBR-PE1] isis 1
[ASBR-PE1-isis-1] address-family ipv4
[ASBR-PE1-isis-1-ipv4] segment-routing mpls
[ASBR-PE1-isis-1-ipv4] quit
[ASBR-PE1-isis-1] quit
```

```
[ASBR-PE1] interface loopback 1
[ASBR-PE1-LoopBack1] isis prefix-sid index 30
[ASBR-PE1-LoopBack1] quit
```

Start BGP on ASBR-PE 1. Enable the capability to exchange labeled routes with IBGP peer 2.2.2.9.

```
[ASBR-PE1] bgp 100
[ASBR-PE1-bgp-default] peer 2.2.2.9 as-number 100
[ASBR-PE1-bgp-default] peer 2.2.2.9 connect-interface loopback 1
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] peer 2.2.2.9 enable
[ASBR-PE1-bgp-default-ipv4] peer 2.2.2.9 label-route-capability
```

Enable SR-MPLS.

```
[ASBR-PE1-bgp-default-ipv4] segment-routing mpls
[ASBR-PE1-bgp-default-ipv4] quit
```

Enable the capability to exchange labeled routes with EBGP peer 11.0.0.1.

```
[ASBR-PE1-bgp-default] peer 11.0.0.1 as-number 600
[ASBR-PE1-bgp-default] address-family ipv4 unicast
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 enable
[ASBR-PE1-bgp-default-ipv4] peer 11.0.0.1 label-route-capability
[ASBR-PE1-bgp-default-ipv4] quit
[ASBR-PE1-bgp-default] quit
```

5. Configure ASBR-PE 2:

Start IS-IS on ASBR-PE 2, set the LSR ID, and enable MPLS and MPLS TE.

```
<ASBR-PE2> system-view
[ASBR-PE2] isis 1
[ASBR-PE2-isis-1] network-entity 00.0000.0000.0003.00
[ASBR-PE2-isis-1] cost-style wide
[ASBR-PE2-isis-1] quit
[ASBR-PE2] mpls lsr-id 4.4.4.9
[ASBR-PE2] mpls te
[ASBR-PE2-te] quit
[ASBR-PE2] interface vlan-interface 11
[ASBR-PE2-Vlan-interface11] isis enable 1
[ASBR-PE2-Vlan-interface11] mpls enable
[ASBR-PE2-Vlan-interface11] quit
[ASBR-PE2] interface vlan-interface 12
[ASBR-PE2-Vlan-interface12] mpls enable
[ASBR-PE2-Vlan-interface12] quit
[ASBR-PE2] interface loopback 1
[ASBR-PE2-LoopBack1] ip address 4.4.4.9 32
[ASBR-PE2-LoopBack1] isis enable 1
[ASBR-PE2-LoopBack1] quit
```

Enable SR-MPLS in IS-IS IPv4 unicast address family view and configure an IS-IS prefix SID.

```
[ASBR-PE2] isis 1
[ASBR-PE2-isis-1] address-family ipv4
[ASBR-PE2-isis-1-ipv4] segment-routing mpls
[ASBR-PE2-isis-1-ipv4] quit
[ASBR-PE2-isis-1] quit
```

```
[ASBR-PE2] interface loopback 1
[ASBR-PE2-LoopBack1] isis prefix-sid index 40
[ASBR-PE2-LoopBack1] quit
```

Start BGP on ASBR-PE 2. Enable the capability to exchange labeled routes with IBGP peer 5.5.5.9.

```
[ASBR-PE2] bgp 600
[ASBR-PE2-bgp-default] peer 5.5.5.9 as-number 600
[ASBR-PE2-bgp-default] peer 5.5.5.9 connect-interface loopback 1
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] peer 5.5.5.9 enable
[ASBR-PE2-bgp-default-ipv4] peer 5.5.5.9 label-route-capability
```

Enable SR-MPLS.

```
[ASBR-PE2-bgp-default-ipv4] segment-routing mpls
[ASBR-PE2-bgp-default-ipv4] quit
```

Enable the capability to exchange labeled routes with EBGP peer 11.0.0.2.

```
[ASBR-PE2-bgp-default] peer 11.0.0.2 as-number 100
[ASBR-PE2-bgp-default] address-family ipv4 unicast
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 enable
[ASBR-PE2-bgp-default-ipv4] peer 11.0.0.2 label-route-capability
[ASBR-PE2-bgp-default-ipv4] quit
[ASBR-PE2-bgp-default] quit
```

6. Configure PE 2:

Start IS-IS on PE 2, set the LSR ID, and enable MPLS and MPLS TE.

```
<PE2> system-view
[PE2] isis 1
[PE2-isis-1] network-entity 00.0000.0000.0004.00
[PE2-isis-1] cost-style wide
[PE2-isis-1] quit
[PE2] mpls lsr-id 5.5.5.9
[PE2] mpls te
[PE2-te] quit
[PE2] interface vlan-interface 11
[PE2-Vlan-interface11] isis enable 1
[PE2-Vlan-interface11] mpls enable
[PE2-Vlan-interface11] quit
[PE2] interface vlan-interface 12
[PE2-Vlan-interface12] mpls enable
[PE2-Vlan-interface12] quit
[PE2] interface loopback 1
[PE2-LoopBack1] ip address 5.5.5.9 32
[PE2-LoopBack1] isis enable 1
[PE2-LoopBack1] quit
```

Enable SR-MPLS in IS-IS IPv4 unicast address family view and configure an IS-IS prefix SID.

```
[PE2] isis 1
[PE2-isis-1] address-family ipv4
[PE2-isis-1-ipv4] segment-routing mpls
[PE2-isis-1-ipv4] quit
[PE2-isis-1] quit
```

```
[PE2] interface loopback 1
[PE2-LoopBack1] isis prefix-sid index 50
[PE2-LoopBack1] quit
```

Create VPN instance **vpn1**, and configure the RD and route target attributes.

```
[PE2] ip vpn-instance vpn1
[PE2-vpn-instance-vpn1] route-distinguisher 11:11
[PE2-vpn-instance-vpn1] vpn-target 1:1 2:2 3:3 import-extcommunity
[PE2-vpn-instance-vpn1] vpn-target 3:3 export-extcommunity
[PE2-vpn-instance-vpn1] quit
```

Associate VLAN-interface 12 with VPN instance **vpn1**, and assign an IP address to the interface.

```
